**show chassis environment (ACX2000 Universal Access Router)**

```

user@host> show chassis environment
Class Item                               Status      Measurement
PCB Left                                OK          44 degrees C / 111 degrees F
SFP+ Xcvr                               OK          50 degrees C / 122 degrees F
FEB                                      OK          70 degrees C / 158 degrees F
PCB Up                                  OK          63 degrees C / 145 degrees F
PCB Mid                                 OK          66 degrees C / 150 degrees F
Telecom Mod                             OK          65 degrees C / 149 degrees F
Routing Engine                           OK          54 degrees C / 129 degrees F
Heater off

```

**show chassis environment (ACX4000 Universal Access Router)**

On the ACX4000 router, the MIC output of the **show chassis environment** command varies depending on the number of temperature channels present in the installed MIC.

```

user@host> show chassis environment

| <b>Description</b>                                          | (M120, M320, MX Series, and T Series routers, EX8200 switches, and PTX Series Packet Transport Routers only) Display environmental information about the Control Boards                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

(CBs). For information about the meaning of “CBs” on the switches, see *EX Series Switches Hardware and CLI Terminology Mapping*.

**Options**    **none**—Display environmental information about all CBs. For a TX Matrix router, display environmental information about all CBs on the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display environmental information about all CBs on the TX Matrix Plus router and its attached T1600 or T4000 routers.

**all-members**—(MX Series routers only) (Optional) Display environmental information about the CBs on all the members of the Virtual Chassis configuration.

**interconnect-device**—(QFabric systems only) Display environmental information about CBs on the Interconnect device.

**lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display environmental information about the CBs on the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display environmental information about the CBs on the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

**scc**—(TX Matrix router only) (Optional) Display environmental information about the CBs in the TX Matrix router (switch-card chassis).

**sfc number**—(TX Matrix Plus router only) (Optional) Display environmental information about the CBs in the TX Matrix Plus router (or switch-fabric chassis).

**slot**—(Optional) Display environmental information about the specified CB. On routers and PTX Series Packet Transport Routers, replace **slot** with **0** or **1**. On EX Series switches replace **slot** with **0**, **1**, or **2**. On QFX Series switches, replace **slot** with **0** or **1**.

(Not on switches.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>PMBus device</b> (on MX240, MX480, and MX960 routers with Enhanced MX SCB) | <p>Enhanced SCB on MX 240, MX480, and MX960 routers allows the system to save power by supplying only the amount of voltage that is required. Configurable PMBus devices are used to provide the voltage for each individual device. There is one PMBus device for each XF ASIC so that the output can be customized to each device. The following PMBus device information is displayed for routers with Enhanced MX SCB:</p> <ul style="list-style-type: none"> <li>• <b>Expected voltage</b></li> <li>• <b>Measured voltage</b></li> <li>• <b>Measured current</b></li> <li>• <b>Calculated power</b></li> </ul> |

## Sample Output

| <b>Description</b>                                   | (M40e, M120, M160, M320, MX Series, T Series routers, EX Series, QFX Series, and PTX Series routers only) Display environmental information about Flexible PIC Concentrators (FPCs).                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                                       | <b>none</b> —Display environmental information about all FPCs. On a TX Matrix router, display environmental information about all FPCs on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about all FPCs on the TX Matrix Plus router and its attached routers.                                                                                                                                                                                                                               |

**all-members**—(MX Series routers only) (Optional) Display environmental information for the FPCs in all the members of the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display environmental information for the FPCs in the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display environmental information for the FPCs in the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**slot or fpc-slot**—(Optional) Display environmental information about an individual FPC:

- (TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, if you specify the number of the T640 router by using only the **lcc *number*** option (the recommended method), replace **slot** with a value from 0 through 7. Similarly, on a TX Matrix Plus router, if you specify the number of the router by using only the **lcc *number*** option (the recommended method), replace **slot** with a value from 0 through 7. Otherwise, replace **slot** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis environment fpc 1 lcc 1
user@host> show chassis environment fpc 9
```

- M120 router—Replace **slot** with a value from 0 through 5.
- MX240 router—Replace **slot** with a value from 0 through 2.
- MX480 router—Replace **slot** with a value from 0 through 5.
- MX960 router—Replace **slot** with a value from 0 through 11.
- MX2010 router—Replace **slot** with a value from 0 through 9.
- MX2020 router—Replace **slot** with a value from 0 through 19.
- Other routers—Replace **slot** with a value from 0 through 7.
- EX Series switches:

- EX3200 switches and EX4200 standalone switches—Replace **slot** with 0.
- EX4200 switches in a Virtual Chassis configuration—Replace **slot** with a value from 0 through 9 (switch's member ID).
- EX6210 switches—Replace **slot** with a value from 0 through 3 (line card only), 4 or 5 (line card or Switch Fabric and Rotating Engine (SRE) module), or 6 through 9 (line card only).
- EX8208 switches—Replace **slot** with a value from 0 through 7 (line card).
- EX8216 switches—Replace **slot** with a value from 0 through 15 (line card).
- QFX3500 switches —Replace **fpc-slot** with 0 through 15.
- PTX5000 Packet Transport Router—Replace **fpc-slot** with 0 through 7.

| <b>Description</b>                              | Display Power Entry Module (PEM) environmental status information.                                                                                                                                                                                                                                                                                                                                     |

**NOTE:** The new high-capacity (4100W) enhanced DC PEM on MX960 routers includes a new design that can condition the input voltage. This results in the output voltage differing from the input voltage. The earlier generation of DC PEMs coupled the input power directly to the output, thereby making it safe to assume that the output voltage was equal to the input voltage.

- Options** **none**—Display environmental information about both PEMs. For the TX Matrix router, display environmental information about the PEMs, the TX Matrix router, and its attached T640 routers. For the TX Matrix Plus router, display environmental information about the PEMs, the TX Matrix Plus router, and its attached routers.
- all-members**—(MX Series routers only) (Optional) Display environmental information about the PEMs in all the member routers of the Virtual Chassis configuration.
- interconnect-device *name***—(QFabric systems only) (Optional) Display chassis environmental information about the PEMs in the Interconnect device.
- lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.  
Replace *number* with the following values depending on the LCC configuration:
- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
  - 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
  - 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
  - 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- local**—(MX Series routers only) (Optional) Display environmental information about the PEM in the local Virtual Chassis member.
- member *member-id***—(MX Series routers only) (Optional) Display environmental information about the PEM in the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.
- node-device *name***—(QFabric systems only) (Optional) Display chassis environmental information about the PEMs in the Node device.
- scc**—(TX Matrix routers only) (Optional) Display environmental information about the PEM in the TX Matrix router (switch-card chassis).
- sfc**—(TX Matrix Plus routers only) (Optional) Display environmental information about the PEM in the TX Matrix Plus router (or switch-fabric chassis).
- slot** —(Optional) Display environmental information about an individual PEM. Replace *slot* with 0 or 1.

**Output Fields** Table 28 on page 655 lists the output fields for the **show chassis environment pem** command. Output fields are listed in the approximate order in which they appear.

**Table 28: show chassis environment pem Output Fields**

| Field Name             | Field Description                                                                                                                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PEM slot status</b> | Number of the PEM slot.                                                                                                                                                                                             |
| <b>State</b>           | Status of the PEM.                                                                                                                                                                                                  |
| <b>Temperature</b>     | Temperature of the air flowing past the PEM.                                                                                                                                                                        |
| <b>AC Input</b>        | Status of the AC input for the specified component                                                                                                                                                                  |
| <b>AC Output</b>       | Status of the AC output for the specified component.                                                                                                                                                                |
| <b>DC input</b>        | Status of the DC input for the specified component.                                                                                                                                                                 |
| <b>DC output</b>       | Status of the DC output for the specified component.                                                                                                                                                                |
| <b>Load</b>            | (Not available on M40e or M160 routers) Information about the load on supply, in percentage of rated current being used.                                                                                            |
| <b>Voltage</b>         | (M120, M160, M320, T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about voltage supplied to the PEM.<br><br>(MX104 routers only) Information about voltage supplied by the PEM to the system. |
| <b>Current</b>         | (T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about the PEM current.                                                                                                                        |
| <b>Power</b>           | (T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about the PEM power.                                                                                                                          |

Table 28: show chassis environment pem Output Fields (*continued*)

| Field Name        | Field Description                                                                                                     |
|-------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>SCG/CB/SIB</b> | (T640, T1600, TX Matrix, and TX Matrix Plus routers only) SONET Clock Generator/Control Board/Switch Interface Board. |
| <b>FAN</b>        | (T640, T1600, and T4000 routers with six-input DC power supply only) Information about the DC output to the fan.      |

## Sample Output

### show chassis environment pem (M40e Router)

```
user@host> show chassis environment pem
PEM 0 status:
  State                Online
  Temperature           OK
  AC input              OK
  DC output             OK
```

### show chassis environment pem (M120 Router)

```
user@host> show chassis environment pem
PEM 0 status:
  State                Online
  Temperature           OK
  DC Input:            OK
  DC Output:           OK
  Load                Less than 20 percent
  Voltage:
    48.0 V input       52864 mV
    48.0 V fan supply  41655 mV
    3.3 V              3399 mV
PEM 1 status:
  State                Online
  Temperature           OK
  DC Input:            OK
  DC Output:           OK
  Load                Less than 20 percent
  Voltage:
    48.0 V input       54537 mV
    48.0 V fan supply  42910 mV
    3.3 V              3506 mV
```

### show chassis environment pem (M160 Router)

```
user@host> show chassis environment pem
PEM 0 status:
  State                Online
  Temperature           OK
  DC input              OK
  DC output             OK
  Load                Less than 20 percent
  Voltage:
    48.0 V input       54833 mV
    48.0 V fan supply  50549 mV
    8.0 V bias         8239 mV
    5.0 V bias         5006 mV
```

**show chassis environment pem (M320 Router)**

```

user@host> show chassis environment pem
PEM 2 status:
  State                Online
  Temperature           OK
  DC input              OK
  Load                 Less than 40 percent
    48.0 V input        51853 mV
    48.0 V fan supply   48877 mV
    8.0 V bias          8449 mV
    5.0 V bias          4998 mV
PEM 3 status:
  State                Online
  Temperature           OK
  DC input              OK
  Load                 Less than 40 percent
    48.0 V input        51717 mV
    48.0 V fan supply   49076 mV
    8.0 V bias          8442 mV
    5.0 V bias          4998 mV

```

**show chassis environment pem (MX104 Router)**

```

user@host> show chassis environment pem
PEM 0 status:
  State                Online
  Temperature           OK
  DC Output:           OK
  Voltage:
    12.0 V output       12281 mV
    3.3 V output        3353 mV
PEM 1 status:
  State                Empty

```

**show chassis environment pem (MX240 Router)**

```

user@host> show chassis environment pem
PEM 0 status:
  State                Online
  Temperature           OK
  DC Output:           OK
PEM 1 status:
  State                Online
  Temperature           OK
  DC Output:           OK

```

**show chassis environment pem (MX480 Router)**

```

user@host> show chassis environment pem
PEM 0 status:
  State                Online
  Temperature           OK
  DC Input:            OK
  DC Output:           OK
  Voltage:
PEM 1 status:
  State                Online
  Temperature           OK
  DC Input:            OK

```

```

DC Output:          OK
Voltage:

```

### show chassis environment pem (MX960 Router)

```

user@host> show chassis environment pem
PEM 2 status:

| <b>Description</b>                                                  | Display Routing Engine environmental status information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                                                      | <b>none</b> —Display environmental information about all Routing Engines. For a TX Matrix router, display environmental information about all Routing Engines on the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

environmental information about all Routing Engines on the TX Matrix Plus router and its attached routers.

**all-members**—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in all member routers in the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display environmental information about the Routing Engines for the Interconnect device.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the specified member in the Virtual Chassis configuration. Replace *member-id* with the value of 0 or 1.

**scc**—(TX Matrix router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix router (switch-card chassis).

**sfc**—(TX Matrix Plus router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix Plus router (or switch-fabric chassis).

**slot**—(Optional) Display environmental information about an individual Routing Engine. On M10i, M20, M40e, M120, M160, M320, MX Series, MX104 routers, MX2010 routers, MX2020 routers, and T Series routers, replace *slot* with **0** or **1**. On M5, M7i, M10, and M40 routers and on the J Series router, replace *slot* with **0**. On EX3200 and EX4200 standalone switches, replace *slot* with **0**. On EX4200 switches in a Virtual Chassis configuration and on EX8208 and EX8216 switches, replace *slot* with **0** or **1**. On the QFX3500 switch, there is only one Routing Engine, so you do not need to specify the slot number. On PTX Series Packet Transport Routers, replace *slot* with **0** or **1**.

**Output Fields** Table 29 on page 664 lists the output fields for the **show chassis environment routing-engine** command. Output fields are listed in the approximate order in which they appear.

**Table 29: show chassis environment routing-engine Output Fields**

| Field Name                        | Field Description                                                                                                                                                                                                                                                                           |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Routing engine slot status</b> | Number of the Routing Engine slot: 0 or 1.                                                                                                                                                                                                                                                  |
| <b>State</b>                      | Status of the Routing Engine: <ul style="list-style-type: none"> <li>• <b>Online Master</b>—Routing Engine is online, operating as Master.</li> <li>• <b>Online Standby</b>—Routing Engine is online, operating as Standby.</li> <li>• <b>Offline</b>—Routing Engine is offline.</li> </ul> |
| <b>Temperature</b>                | Temperature of the air flowing past the Routing Engine.                                                                                                                                                                                                                                     |
| <b>CPU Temperature</b>            | (PTX Series and T4000 Core Routers only) Temperature of the air flowing past the Routing Engine CPU.                                                                                                                                                                                        |

## Sample Output

### show chassis environment routing-engine (Nonredundant)

```
user@host> show chassis environment routing-engine
Routing Engine 0 status:
  State                Online Master
  Temperature          27 degrees C / 80 degrees
```

### show chassis environment routing-engine (Redundant)

```
user@host> show chassis environment routing-engine
Route Engine 0 status:
  State:                Online Master
  Temperature:          26 degrees C / 78 degrees F
Route Engine 1 status:
  State:                Online Standby
  Temperature:          26 degrees C / 78 degrees F
```

### show chassis environment routing-engine (MX104 Router)

```
user@ host >show chassis environment routing-engine
```

```

Routing Engine 0 status:
  State           Online Master
  Temperature      34 degrees C / 93 degrees F
  CPU Temperature  43 degrees C / 109 degrees F
Routing Engine 1 status:
  State           Online Standby
  Temperature      33 degrees C / 91 degrees F
  CPU Temperature  39 degrees C / 102 degrees F

```

#### show chassis environment routing-engine (MX2010 Router)

```

user@host> show chassis environment routing-engine
Routing Engine 0 status:
  State           Online Master
  Temperature      37 degrees C / 98 degrees F
  CPU Temperature  37 degrees C / 98 degrees F
Routing Engine 1 status:
  State           Online Standby
  Temperature      35 degrees C / 95 degrees F
  CPU Temperature  34 degrees C / 93 degrees F

```

#### show chassis environment routing-engine (MX2020 Router)

```

user@host> show chassis environment routing-engine
Routing Engine 0 status:
  State           Online Master
  Temperature      35 degrees C / 95 degrees F
  CPU Temperature  34 degrees C / 93 degrees F
Routing Engine 1 status:
  State           Online Standby
  Temperature      44 degrees C / 111 degrees F
  CPU Temperature  43 degrees C / 109 degrees F

```

#### show chassis environment routing-engine (TX Matrix Plus Router)

```

user@host> show chassis environment routing-engine
sfc0-re0:
-----
Routing Engine 0 status:
  State           Online Master
  Temperature      26 degrees C / 78 degrees F
Routing Engine 1 status:
  State           Online Standby
  Temperature      28 degrees C / 82 degrees F

lcc0-re0:
-----
Routing Engine 0 status:
  State           Online Master
  Temperature      30 degrees C / 86 degrees F
Routing Engine 1 status:
  State           Online Standby
  Temperature      29 degrees C / 84 degrees F

```

#### show chassis environment routing-engine (T4000 Core Router)

```

user@host> show chassis environment routing-engine
Routing Engine 0 status:
  State           Online Master
  Temperature      33 degrees C / 91 degrees F
  CPU Temperature  50 degrees C / 122 degrees F
Routing Engine 1 status:

```

|                 |                              |
|-----------------|------------------------------|
| State           | Online Standby               |
| Temperature     | 33 degrees C / 91 degrees F  |
| CPU Temperature | 46 degrees C / 114 degrees F |

#### show chassis environment routing-engine (QFX Series)

```
user@switch> show chassis environment routing-engine
Routing Engine 0 status:
  State           Online Master
  Temperature      42 degrees C / 107 degrees F
```

#### show chassis environment routing-engine interconnect-device (QFabric System)

```
user@switch> show chassis environment routing-engine interconnect-device interconnect1
routing-engine interconnect-device interconnect1
Routing Engine 0 status:
  State           Online Standby
  Temperature      52 degrees C / 125 degrees F
Routing Engine 1 status:
  State           Online Master
  Temperature      57 degrees C / 134 degrees F
```

#### show chassis environment routing-engine (PTX5000 Packet Transport Router)

```
user@switch> show chassis environment routing-engine
Routing Engine 0 status:
  State           Online Master
  Temperature      55 degrees C / 131 degrees F
  CPU Temperature  66 degrees C / 150 degrees F
Routing Engine 1 status:
  State           Online Standby
  Temperature      52 degrees C / 125 degrees F
  CPU Temperature  64 degrees C / 147 degrees F
```

## show chassis fan

|                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Release Information</b>                                         | Command introduced in Junos OS Release 10.0 on MX Series 3D Universal Edge Routers, M120 routers, and M320 routers, T320 routers, T640 routers, T1600 routers, TX Matrix Routers, and TX Matrix Plus routers.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.<br>Command introduced in Junos OS Release 11.4 for EX Series switches.<br>Command introduced in Junos OS Release 12.3 for PTX5000 Packet Transport Routers.<br>Command introduced in Junos OS Release 12.1 for T4000 routers.<br>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.<br>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.<br>Command introduced in Junos OS Release 12.3 for ACX Series Routers.<br>Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers. |
| <b>Description</b>                                                 | (T Series routers, TX Matrix routers, TX Matrix Plus routers, M120 routers, M320 routers, MX104 routers, MX2010 routers, MX2020 routers, MX Series 3D Universal Edge Routers,                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

QFX3008-I Interconnect devices, EX Series switches, and PTX Series Packet Transport Routers only) Show information about the fan tray and fans.

**Options**    **all-members**—(MX Series routers only) (Optional) Display information about the fan tray and fans for all members of the Virtual Chassis configuration.

**local**—(MX Series routers only) (Optional) Display information about the fan tray and fans for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display information about the fan tray and fans for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace *member-id* variable with a value 0 or 1.

**interconnect-device *name***—(QFX3000-G QFabric systems only) (Optional) Display information about the fan tray and fans for the specified QFX3008-I Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display information about the fan tray and fans for the specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display information about the fan tray and fans for the specified router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**scc**—(TX Matrix routers only) (Optional) Display information about the fan tray and fans for the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display information about the fan tray and fans for the TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with 0.

**Required Privilege Level**

**Description** On routers and switches, display the version levels of the firmware running on the System Control Board (SCB), Switching and Forwarding Module (SFM), System and Switch Board (SSB), Forwarding Engine Board (FEB), Flexible PIC Concentrators (FPCs), and Routing Engines. On a TX Matrix Plus router, display the version levels of the firmware running on the FPCs and the Switch Processor Mezzanine Board (SPMBs).

On EX2200, EX3200, and EX4200 switches, and the QFX Series, display the version levels of the firmware running on the switch. On an EX8208 switch, display the version levels of the firmware running on the Switch Fabric and Routing Engine (SRE) modules and on the line cards (shown as FPCs). On an EX8216 switch, display the version levels of the firmware running on the Routing Engine (RE) modules and on the line cards (shown as FPCs).

**Options** **none**—Display the version levels of the firmware running. For an EX4200 switch that is a member of a Virtual Chassis, display version levels for all members. For a TX Matrix router, display version levels for the firmware on the TX Matrix router and on all the T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, display version levels for the firmware on the TX Matrix Plus router and on all the routers connected to the TX Matrix Plus router.

**all-members**—(MX Series routers only) (Optional) Display the version levels of the firmware running for all members of the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems) (Optional) Display the version levels of the firmware running on the Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display version levels for the firmware on a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the version levels for the firmware on a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display the version levels of the firmware running for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display the version levels of the firmware running for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**node-device**—(QFabric systems only) (Optional) Display the version levels of the firmware running on the Node device.

**scc**—(TX Matrix router only) (Optional) Display version levels for the firmware on the TX Matrix router (switch-card chassis).

**sfc number**—(TX Matrix Plus router only) (Optional) Display version levels for the firmware on the TX Matrix Plus router (or switch-fabric chassis). Replace **number** with **0**.

**detail**—(EX3200, EX3300, EX4200, and EX4500 standalone and Virtual Chassis member switches only) (Optional) Display version levels of the firmware running on the switch for its programmable hardware components.

**Required Privilege Level**

**Output Fields**

[Table 31 on page 683](#) lists the output fields for the **show chassis firmware** command. Output fields are listed in the approximate order in which they appear.

Table 31: show chassis firmware Output Fields

| Field Name                | Field Description                                                                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Part</b>               | (MX Series, MX2010, and MX2020 routers) Chassis part name.                                                                                                                                                 |
| <b>Type</b>               | (MX Series, MX2010, and MX2020 routers) Type of firmware: On routers: <b>ROM</b> or <b>O/S</b> . On switches: <b>uboot</b> or <b>loader</b> .                                                              |
| <b>Version</b>            | (MX Series, MX2010, and MX2020 routers) Version of firmware running on the chassis part.                                                                                                                   |
| <b>FPC</b>                | ( <i>detail</i> option only) Number of FPC.<br>For a standalone switch, the value is 0.<br>For a Virtual Chassis configuration, value in the range of 0-9; refers to the member ID assigned to the switch. |
| <b>AFEB</b>               | (MX104 routers) Version of the compact Forwarding Engine Board.                                                                                                                                            |
| <b>Boot</b>               | ( <i>detail</i> option only) Version of the SYSPLD.                                                                                                                                                        |
| <b>PoE</b>                | ( <i>detail</i> option only) Version of the PoE firmware.                                                                                                                                                  |
| <b>PFE-&lt;number&gt;</b> | ( <i>detail</i> option only) Version of the PFE used in the switch.                                                                                                                                        |
| <b>PHY-</b>               | ( <i>detail</i> option only) Version of the physical layer device (PHY) used in the switch.                                                                                                                |
| <b>microcode</b>          | ( <i>detail</i> option only) Microcode of the physical layer devices (PHY) used in the switch.                                                                                                             |
| <b>uboot</b>              | ( <i>detail</i> option only) Version of the u-boot used in the switch.                                                                                                                                     |
| <b>loader</b>             | ( <i>detail</i> option only) Version of the loader used in the switch.                                                                                                                                     |

## Sample Output

### show chassis firmware (M10 Router)

```

user@host> show chassis firmware
Part                Type      Version
Forwarding engine board ROM       Juniper ROM Monitor Version 4.1b2
                   O/S        Version 4.1I1 by tlim on 2000-04-24 11:27

```

### show chassis firmware (M20 Router)

```

user@host> show chassis firmware

| <b>Release Information</b>                                          | Command introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Command introduced in Junos OS Release 9.0 for EX Series switches.

Command introduced in Junos OS Release 11.1 for QFX Series.

Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.

Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.

Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.

**Description** Display status information about the installed Flexible PIC Concentrators (FPCs) and PICs.

**Options** **none**—Display status information for all FPCs. On a TX Matrix router, display status information for all FPCs on the attached T640 routers in the routing matrix. On a TX Matrix Plus router, display status information for all FPCs on the attached routers in the routing matrix.

**NOTE:** In EX8200 switches, line cards initialize Packet Forwarding Engine during startup. If an error occurs during hardware initialization, the FPCs with bad hardware parts power down after transferring the debug information to the Routing Engine. The Routing Engine marks the FPC offline, logs the error in system log messages (/var/log/messages), and generates an alarm to inform the user.

See the following sample output:

```
user@host> show chassis fpc
```

| Utilization (%) | Temp | CPU   | Utilization (%) | Memory         |
|-----------------|------|-------|-----------------|----------------|
| Slot State      | (C)  | Total | Interrupt       | DRAM (MB) Heap |
| Buffer          |      |       |                 |                |
| 0 Empty         |      |       |                 |                |

| 6 Empty         |      |       |                 |                |
| 7 Online        | 26   | 4     | 0               | 1024 0         |
| 32              |      |       |                 |                |

The following sample output shows the alarm raised for the failed FPCs.

```
user@host > show chassis alarms
4 alarms currently active
```

| Alarm time              | Class | Description                          |
|-------------------------|-------|--------------------------------------|
| 2011-03-24 00:52:51 UTC | Major | FPC 5 Hard errors                    |
| 2011-03-24 00:52:31 UTC | Major | Fan Tray Failure                     |
| 2011-03-24 00:52:31 UTC | Major | Fan Tray Failure                     |
| 2011-03-24 00:51:26 UTC | Minor | Loss of communication with Backup RE |

**NOTE:** On T4000 routers, when you include the enhanced-mode statement at the [edit chassis network-services] hierarchy level and reboot the system, only the T4000 Type 5 FPCs present on the router become online while the remaining FPCs are offline, and FPC misconfiguration alarms are generated. The show chassis alarm command output displays FPC misconfiguration (FPC *fpc-slot* misconfig) as the reason for the generation the alarms.

The following sample output shows the FPC status after the enhanced-mode statement is configured on the T4000 router. The T4000 Type 5 FPC present in slot 5 becomes online while the remaining FPCs are offline.

```
user@host> show chassis fpc
```

The following sample output shows FPC misconfiguration alarms.

```
user@host > show chassis alarms
```

3 alarms currently active

| Alarm time              | Class | Description     |
|-------------------------|-------|-----------------|
| 2011-03-24 00:52:51 PST | Major | FPC 1 misconfig |
| 2011-03-24 00:52:31 PST | Major | FPC 2 misconfig |
| 2011-03-24 00:52:31 PST | Major | FPC 3 misconfig |

**detail**—(Optional) Display detailed status information for all FPCs or for the FPC in the specified slot (see *fpc-slot* or *slot*).

**all-members**—(MX Series routers and EX Series switches only) (Optional) Display status information for all FPCs on all members of the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display status information for all FPCs on the Interconnect device.

***fpc-slot***—(Optional) FPC slot number:

- (TX Matrix and TX Matrix Plus router only)—On a TX Matrix router, if you specify the number of the T640 router (line-card chassis) by using the **lcc number** option (the recommended method), replace ***fpc-slot*** with a value from 0 through 7. Otherwise, replace ***fpc-slot*** with a value from 0 through 31. Likewise, on a TX Matrix Plus router, if you specify the number of the specified router (line-card chassis) by using the **lcc number** option (the recommended method), replace ***fpc-slot*** with

a value from 0 through 7. Otherwise, replace *fpc-slot* with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis fpc detail 1 lcc 1
user@host> show chassis fpc detail 9
```

- M120 router—Replace *fpc-slot* with a value from 0 through 5.
- MX80 router—Replace *fpc-slot* with a value from 0 through 1.
- MX104 router—Replace *fpc-slot* with a value from 0 through 2.
- MX240 router—Replace *fpc-slot* with a value from 0 through 2.
- MX480 router—Replace *fpc-slot* with a value from 0 through 5.
- MX-960 router—Replace *fpc-slot* with a value from 0 through 11.
- MX2010 router—Replace *fpc-slot-number* with a value from 0 through 9.
- MX2020 router—Replace *fpc-slot-number* with a value from 0 through 19.
- Other routers—Replace *fpc-slot* with a value from 0 through 7.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace *fpc-slot* with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace *fpc-slot* with a value from 0 through 9.
  - EX6210 switches—Replace *fpc-slot* with a value from 0 through 9.
  - EX8208 switches—Replace *fpc-slot* with a value from 0 through 7.
  - EX8216 switches—Replace *fpc-slot* with a value from 0 through 15.
- QFX Series:
  - QFX3500 switches—Replace *fpc-slot* with 0.
  - QFabric systems—Replace *fpc-slot* with 0 through 31 on the Interconnect device.
- PTX Series Packet Transport Routers:
  - PTX5000 Packet Transport Router—Replace *fpc-slot* with a value from 0 through 7.
- ACX Series Universal Access Routers:
  - ACX1000 and ACX2000 Universal Access Routers—Replace *fpc-slot* with 0.

**local**—(MX Series routers and EX Series switches only) (Optional) Display status information for all FPCs on the local Virtual Chassis member.

**member *member-id***—(MX Series routers and EX Series switches only) (Optional) Display status information for all FPCs on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display status information for each Node device. Each Node device is equivalent to an FPC.

**pic-status**—(Optional) Display status information for all PICs or for the PIC in the specified slot (see *fpc-slot*).

**NOTE:** On T1600 routers, Type 4 FPCs with ASICs based on the SL2.0 chipset do not support the 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (10x10GE [LAN/WAN] SFPP). If you issue the `show chassis fpc` command with the `pic-status` option, the CLI displays the string “Not Supported” for 10x10GE (LAN/WAN) SFPP PICs installed on such FPCs. The following is a sample output:

```
user@host> show chassis fpc pic-status
Slot 0  Online      E2-FPC Type 1
        PIC 0  Online      1x G/E SFP, 1000 BASE
        PIC 1  Online      Adaptive Services-II
        PIC 2  Online      1x G/E IQ, 1000 BASE
        PIC 3  Online      1x G/E IQ, 1000 BASE
Slot 1  Online      FPC Type 3-ES
        PIC 0  Present     UNUSED- Not Supported
Slot 2  Online      FPC Type 4-ES
        PIC 0  Offline     4x OC-192 SONET XFP
        PIC 1  Present     10x10GE(LAN/WAN) SFPP- Not Supported
<<<<<<
Slot 4  Offline     FPC Type 1-ES
Slot 5  Offline     FPC Type 2-ES
Slot 6  Online      E2-FPC Type 3
        PIC 0  Online      1x OC-192 SONET XFP
        PIC 1  Online      4x OC-48 SONET
        PIC 2  Online      4x OC-48 SONET
        PIC 3  Online      MultiServices 500
Slot 7  Online      FPC Type 4-ES
        PIC 0  Online      4x 10GE (LAN/WAN) XFP
        PIC 1  Online      4x 10GE (LAN/WAN) XFP
```

In addition, an entry is logged in the system log messages (/var/log/messages) that the PIC is not supported. The following is a sample message logged in the system log:

```
Apr  5 08:47:36  router1 chassisd[2770]: CHASSISD_UNSUPPORTED_PIC:
        PIC 1 in FPC 2 (type 763, version 257) is not supported
```

If you see this issue, contact Juniper Networks Technical Assistance Center (JTAC) for a possible fix. For more information about this issue and a possible solution, see [PSN-2010-03-696](#).

**NOTE:** When there is a double-bit ECC error in a network processor's memory, the Channelized OC3/STM1 (Multi-Rate) Circuit Emulation MIC with SFP or Channelized E1/T1 Circuit Emulation MIC is switched to the offline state.

```
user@host> show chassis fpc pic-status
Slot 1   Online      MPC Type 2 3D Q
PIC 0    Offline     1xC0C12/4xC0C3 CH-CE- ECC error detected
```

**lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**Output Fields** Table 32 on page 698 lists the output fields for the **show chassis fpc** command. Output fields are listed in the approximate order in which they appear.

**Table 32: show chassis fpc Output Fields**

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output          |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| <b>Slot or Slot State</b>      | <p>Slot number and state. The state can be one of the following conditions:</p> <ul style="list-style-type: none"> <li>• <b>Dead</b>—Held in reset because of errors.</li> <li>• <b>Diag</b>—Slot is being ignored while the FPC is running diagnostics.</li> <li>• <b>Dormant</b>—Held in reset.</li> <li>• <b>Empty</b>—No FPC is present.</li> <li>• <b>Offline</b>—(PTX Series Packet Transport Routers only) One of the following two states is displayed: <ul style="list-style-type: none"> <li>• <b>FPC offlined due to unreachable destinations</b></li> <li>• <b>FPC Offlined due to degraded FPC action</b></li> </ul> </li> <li>• <b>Online</b>—FPC is online and running.</li> <li>• <b>Present</b>—FPC is detected by the chassis daemon but either is not supported by the current version of Junos OS or is inserted in the wrong slot. The output also states either <b>Hardware Not Supported</b> or <b>Hardware Not In Right Slot</b>. The FPC is coming up but not yet online.</li> <li>• <b>Probed</b>—Probe is complete; awaiting restart of the Packet Forwarding Engine.</li> <li>• <b>Probe-wait</b>—Waiting to be probed.</li> </ul> | all levels               |
| <b>Logical slot</b>            | Slot number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | all levels               |
| <b>Temp (C) or Temperature</b> | Temperature of the air passing by the FPC, in degrees Celsius or in both Celsius and Fahrenheit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | all levels<br>all levels |

Table 32: show chassis fpc Output Fields (*continued*)

| Field Name                           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Level of Output |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Temperature (PTX Series)</b>      | On PTX Series Packet Transport Routers, temperature details are provided in degrees Celsius and Fahrenheit. Output includes: <ul style="list-style-type: none"> <li>• Temperature (PMB)—Temperature of the air passing by the Processor Mezzanine Board (PMB) at the bottom of the FPC.</li> <li>• Temperature (Intake)—Temperature of the air flowing into the chassis.</li> <li>• Temperature (Exhaust)—Exhaust temperatures for multiple zones (Exhaust A and Exhaust B).</li> <li>• Temperature (TLn)—Temperature of the specified Lookup ASIC (TL) of the packet forwarding engine on the FPC.</li> <li>• Temperature (TQn)—Temperature of the specified Queuing and Memory Interface ASIC (TQ) of the packet forwarding engine on the FPC.</li> </ul> | <b>detail</b>   |
| <b>Total CPU Utilization (%)</b>     | Total percentage of CPU being used by the FPC's processor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | all levels      |
| <b>Interrupt CPU Utilization (%)</b> | Of the total CPU being used by the FPC's processor, the percentage being used for interrupts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | none specified  |
| <b>Memory DRAM (MB)</b>              | Total DRAM, in megabytes, available to the FPC's processor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | none specified  |
| <b>Heap Utilization (%)</b>          | Percentage of heap space (dynamic memory) being used by the FPC's processor. If this number exceeds 80 percent, there may be a software problem (memory leak).<br><br><b>NOTE:</b> On MX Series routers and EX Series switches in a broadband edge environment, heap utilization levels higher than 70 percent can affect unified ISSU, router stability, or scaling capability.                                                                                                                                                                                                                                                                                                                                                                            | none specified  |
| <b>Buffer Utilization (%)</b>        | Percentage of buffer space being used by the FPC's processor for buffering internal messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | none specified  |
| <b>Total CPU DRAM</b>                | Amount of DRAM available to the FPC's CPU.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>detail</b>   |
| <b>Total RLDRAM</b>                  | Amount of reduced latency dynamic random access memory (RLDRAM) available to the FPC CPU.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail</b>   |
| <b>Total DDR DRAM</b>                | Amount of double data rate dynamic random access memory (DDR DRAM) available to the FPC CPU.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail</b>   |
| <b>Total SRAM</b>                    | Amount of static RAM (SRAM) used by the FPC's CPU.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail</b>   |
| <b>Total SDRAM</b>                   | Total amount of memory used for storing packets and notifications.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail</b>   |

| <b>Description</b>                                  | <p>Display a list of all Flexible PIC Concentrators (FPCs) and PICs installed in the router or switch chassis, including the hardware version level and serial number.</p> <p>In the EX Series switch command output, FPC refers to the following:</p> <ul style="list-style-type: none"> <li>On EX2200 switches, EX3200 switches, EX4200 standalone switches, and EX4500 switches—Refers to the switch; FPC <i>number</i> is always 0.</li> <li>On EX4200 switches in a Virtual Chassis configuration—Refers to the member of a Virtual Chassis; FPC <i>number</i> equals the member ID, from 0 through 9.</li> <li>On EX8208 and EX8216 switches—Refers to a line card; FPC <i>number</i> equals the slot number for the line card.</li> </ul> <p>On QFX3500 and QFX5100 standalone switches, both the FPC and FPC <i>number</i> are always 0.</p> <p>On T4000 Type 5 FPCs, there are no <b>top temperature sensor</b> or <b>bottom temperature sensor</b> parameters. Instead, <b>fan intake temperature sensor</b> and <b>fan exhaust temperature sensors</b> parameters are displayed.</p> <p>Starting from Junos OS Release 11.4, the output of the <b>show chassis hardware models</b> operational mode command displays the enhanced midplanes FRU model numbers (CHAS-BP3-MX240-S, CHAS-BP3-MX480-S or CHAS-BP3-MX960-S) based on the</p> |

router. Prior to release 11.4, the FRU model numbers are left blank when the router has enhanced midplanes. Note that the enhanced midplanes are introduced through the Junos OS Release 13.3, but can be supported on all Junos OS releases.

Starting with Junos OS Release 14.1, the output of the **show chassis hardware detail | extensive | clei-models | models** operational mode command displays the new DC power supply module (PSM) and power distribution unit (PDU) that are added to provide power to the high-density FPC (FPC2-PTX-P1A) and other components in a PTX5000 Packet Transport Router.

**Options** **none**—Display information about hardware. For a TX Matrix router, display information about the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display information about the TX Matrix Plus router and its attached routers.

**clei-models**—(Optional) Display Common Language Equipment Identifier (CLEI) barcode and model number for orderable field-replaceable units (FRUs).

**detail**—(Optional) Include RAM and disk information in output.

**extensive**—(Optional) Display ID EEPROM information.

**all-members**—(MX Series routers only) (Optional) Display hardware-specific information for all the members of the Virtual Chassis configuration.

**interconnect-device name**—(QFabric systems only) (Optional) Display hardware-specific information for the Interconnect device.

**lcc number**—(TX Matrix routers and TX Matrix Plus router only) (Optional) On a TX Matrix router, display hardware information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display hardware information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display hardware-specific information for the local Virtual Chassis members.

**member member-id**—(MX Series routers and EX Series switches) (Optional) Display hardware-specific information for the specified member of the Virtual Chassis configuration. Replace *member-id* variable with a value 0 or 1.

**models**—(Optional) Display model numbers and part numbers for orderable FRUs and, for components that use ID EEPROM format v2, the CLEI code.

**node-device *name***—(QFabric systems only) (Optional) Display hardware-specific information for the Node device.

**scc**—(TX Matrix router only) (Optional) Display hardware information for the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus router only) (Optional) Display hardware information for the TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with **0**.

**Additional Information** The **show chassis hardware detail** command now displays DIMM information for the following Routing Engines:

**Table 33: Routing Engines Displaying DIMM Information**

| Routing Engines             | Routers                         |
|-----------------------------|---------------------------------|
| RE-S-1800x2 and RE-S-1800x4 | MX240, MX480, and MX960 routers |
| RE-A-1800x2                 | M120 and M320 routers           |

In Junos OS Release 11.4 and later, the output for the **show chassis hardware models** operational mode command for MX Series routers display the enhanced midplanes FRU model numbers—CHAS-BP3-MX240-S, CHAS-BP3-MX480-S, or CHAS-BP3-MX960-S—based on the router. In releases before Junos OS Release 11.4, the FRU model numbers are left blank when the router has enhanced midplanes. Note that the enhanced midplanes are introduced through Junos OS Release 13.3, but can be supported on all Junos OS releases.

**Output Fields**    [Table 34 on page 735](#) lists the output fields for the **show chassis hardware** command. Output fields are listed in the approximate order in which they appear.

Table 34: show chassis hardware Output Fields

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Item</b>          | <p>Chassis component:</p> <ul style="list-style-type: none"> <li>(EX Series switches)—Information about the chassis, Routing Engine (SRE and Routing Engine modules in EX8200 switches), power supplies, fan trays, and LCD panel. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs). Information about the backplane, midplane, and SIBs (SF modules) is displayed for EX8200 switches. See <i>EX Series Switches Hardware and CLI Terminology Mapping</i>.</li> <li>(MX Series routers and EX Series switches)—Information about the backplane, Routing Engine, Power Entry Modules (PEMs), and fan trays. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs), Modular Port Concentrators (MPCs) and associated Modular Interface Cards (MICs), or Dense Port Concentrators (DPCs). MX80 routers have a single Routing Engine and a built-in Packet Forwarding Engine that attaches directly to MICs. The Packet Forwarding Engine has two “pseudo” FPCs (FPC 0 and FPC1). MX80 routers also have a Forwarding Engine Board (FEB). MX104 routers have a built-in Packet forwarding Engine and a Forwarding Engine Board (FEB). The Packet Forwarding Engine of the MX104 router has three “pseudo” FPCs (FPC0, FPC1, and FPC2).</li> <li>(M Series routers, except for the M320 router)—Information about the backplane; power supplies; fan trays; Routing Engine; maxicab (the connection between the Routing Engine and the backplane, for the M40 router only); SCB, SSB, SFM, or FEB; MCS and PCG (for the M160 router only); each FPC and PIC; and each fan, blower, and impeller.</li> <li>(M120, M320, and T Series routers)—Information about the backplane, power supplies, fan trays, midplane, FPM (craft interface), CIP, PEM, SCG, CB, FPC, PIC, SFP, SPMB, and SIB.</li> <li>(QFX Series)—Information about the chassis, Pseudo CB, Routing Engine, power supplies, fan trays, Interconnect devices, and Node devices. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs).</li> <li>(PTX Series)—Information about the chassis, midplane, craft interface (FPM), power distribution units (PDUs) and Power Supply Modules (PSMs), Centralized Clock Generators (CCGs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Flexible PIC Concentrators (FPCs), PICs, Switch Interface Boards (SIBs), and fan trays (vertical and horizontal).</li> <li>(MX2010 and MX2020 routers)—Information about the chassis, midplane, craft interface (FPM), power midplane (PMP), Power Supply Modules (PSMs), Power Distribution Modules (PDMs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Switch Fabric Boards (SFBs), Flexible PIC Concentrators (FPCs), PICs, adapter cards (ADCs) and fan trays.</li> </ul> | All levels      |
| <b>Version</b>       | Revision level of the chassis component.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | All levels      |
| <b>Part number</b>   | Part number of the chassis component.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | All levels      |
| <b>Serial number</b> | Serial number of the chassis component. The serial number of the backplane is also the serial number of the router chassis. Use this serial number when you need to contact Juniper Networks Customer Support about the router or switch chassis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | All levels      |

Table 34: show chassis hardware Output Fields (*continued*)

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output  |

| <b>Description</b>                                       | <p>Display the information that appears on the LCD panel of EX3200, EX3300, EX4200, EX4500, EX6200, and EX8200 switches, XRE200 External Routing Engines, QFX Series standalone switches, and Interconnect devices and Node devices within a QFabric system. Display the status of the currently selected port parameter of the Status LED for each network port on the device.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                                           | <p><b>none</b>—Display the information that appears on the LCD panel (for any EX Series member switch in a Virtual Chassis or for XRE200 External Routing Engines, display the information for all Virtual Chassis members). Display the status of the currently selected port parameter of the Status LED for each network port.</p> <p><b>fpc-slot &lt;<i>fpc-slot-number</i>&gt;</b>—(Optional) Display the information as follows:</p> <ul style="list-style-type: none"> <li>(EX3200, EX3300, EX4200, and EX4500 switches, or the QFX Series) Display the information that appears on the LCD panel for either an FPC slot with no <i>fpc-slot-number</i> value specified or for the FPC slot specified by <b>fpc-slot 0</b>. <b>fpc-slot</b> refers to the switch itself and <b>0</b> is the only valid value for <i>fpc-slot-number</i>. Output for these options is the same as for the <b>none</b> option.</li> </ul> <p>Also display the status of the currently selected port parameter of the Status LED for each network port.</p> <ul style="list-style-type: none"> <li>(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) If no <i>fpc-slot-number</i> value is specified, display the information that appears on the LCD panel for all members of the Virtual Chassis. Output for this option is the same as for the <b>none</b> option. If the <i>fpc-slot-number</i> value is specified (it equals the <i>member-id</i> value), display the information for the specified member.</li> </ul> <p>Also display the status of the currently selected port parameter of the Status LED for each network port.</p> <ul style="list-style-type: none"> <li>(EX6200 or EX8200 switches)—Display the information that appears on the LCD panel for the line card in the line-card slot specified by the <i>fpc-slot-number</i> value.</li> </ul> |

Also display the status of the currently selected port parameter of the Status LED for each network port.

**interconnect-device *device-id***—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Interconnect device.

**menu**—(Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel.

**menu all-members**—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for all Virtual Chassis members.

**menu local**—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the Virtual Chassis member from which you issued the command.

**menu member *member-id***—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the specified Virtual Chassis member.

**node-device *device-id***—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Node device.

**Output Fields** [Table 35 on page 905](#) lists the output fields for the **show chassis lcd** command. Output fields are listed in the approximate order in which they appear.

**Table 35: show chassis lcd Output Fields**

| Field Name                                                                                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>membernumber</b> (XRE200 External Routing Engine)                                                | Member ID of the device whose content is being displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Front panel contents for slot</b>                                                                | FPC slot number of the switch whose content is being displayed. The number is always <b>0</b> , except for EX4200 switches in a Virtual Chassis, where it is the member ID value.                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Front panel contents</b> (EX6200, EX8200 switch, XRE200 External Routing Engine, and QFX Series) | <p>On EX6200 switches, EX8200 switches, and XRE200 External Routing Engines, no slot number is displayed.</p> <p>On XRE200 External Routing Engines, this field appears under the <b>member number</b> field for each member device in the EX8200 Virtual Chassis.</p>                                                                                                                                                                                                                                                                                       |
| <b>LCD screen</b>                                                                                   | <p>The first line displays the hostname (for Virtual Chassis members, displays the member ID, the current role, and hostname; for EX8200 switches, displays <b>RE</b> and the hostname). The second line displays the currently selected port parameter of the Status LED and the alarms counter. The Status LED port parameters are:</p> <ul style="list-style-type: none"> <li>• <b>ADM</b>—Administrative</li> <li>• <b>SPD</b>—Speed</li> <li>• <b>DPX</b>—Duplex</li> <li>• <b>POE</b>—Power over Ethernet (EX3200 and EX4200 switches only)</li> </ul> |
| <b>LEDs status</b>                                                                                  | Current state of the Alarms, System, and Master LEDs (chassis status LEDs).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Interface</b>                                                                                    | Names of the interfaces on the switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>LED (ADM/SPD/DPX/POE)</b>                                                                        | <p>State of the currently selected port parameter of the Status LED for the interface. The Status LED port parameters are:</p> <p><b>NOTE:</b> The XRE200 External Routing Engine always displays the <b>NA</b> parameter. The QFX Series products do not have any of the port parameters listed below.</p> <ul style="list-style-type: none"> <li>• <b>ADM</b>—Administrative</li> <li>• <b>SPD</b>—Speed</li> <li>• <b>DPX</b>—Duplex</li> <li>• <b>NA</b>—Not applicable.</li> <li>• <b>POE</b>—Power over Ethernet</li> </ul>                            |
| <b>fpcx</b>                                                                                         | On standalone EX Series and QFX Series switches, always <b>0</b> . On EX Series Virtual Chassis member switches, member ID of the Virtual Chassis member whose LCD menu is displayed.                                                                                                                                                                                                                                                                                                                                                                        |

## Sample Output

**show chassis lcd (Two-Member EX4200 Virtual Chassis)**

```
user@switch> show chassis lcd
```

## Front panel contents for slot: 0

```
-----
LCD screen:
  00:BK switch1

```

#### show chassis lcd fpc-slot 2 (EX8200 Switch)

```
show chassis lcd fpc-slot 2
```

| Interface | LED (ADM/SPD/DPX) |
|-----------|-------------------|
| xe-2/0/0  | Off               |
| xe-2/0/1  | Off               |
| xe-2/0/2  | Off               |
| xe-2/0/3  | Off               |
| xe-2/0/4  | Off               |
| xe-2/0/5  | Off               |
| xe-2/0/6  | Off               |
| xe-2/0/7  | Off               |

#### show chassis lcd menu (EX4200 Switch)

```
user@switch> show chassis lcd menu
fpc0:
```

```

-----
status-menu
status-menu vcp-status
status-menu power-status
status-menu environ-menu
status-menu show-version
maintenance-menu
maintenance-menu halt-menu
maintenance-menu system-reboot
maintenance-menu rescue-config
maintenance-menu vc-uplink-config
maintenance-menu factory-default

```

On an EX4200 switch in a Virtual Chassis, the output for the **show chassis lcd menu** **all-members** command is the same as the output for the **show chassis lcd menu** command.

#### show chassis lcd menu (EX8200 Switch)

```

user@switch> show chassis lcd menu
status-menu
status-menu sf-status1-menu
status-menu sf-status2-menu
status-menu psu-status1-menu

```

```
status-menu psu-status2-menu
status-menu environ-menu
status-menu show-version
maintenance-menu
maintenance-menu halt-menu
maintenance-menu system-reboot
maintenance-menu rescue-config
maintenance-menu factory-default
```

| <b>Release Information</b>           | Command introduced in Junos OS Release 10.1 for EX Series switches.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>                   | Display the status and colors of the chassis LEDs on the front panel of the switch. A major alarm (red) indicates a critical error condition that requires immediate action. A minor alarm (yellow) indicates a noncritical condition that requires monitoring or maintenance. A minor alarm that is left unchecked might cause interruption in service or performance degradation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                       | <p><b>none</b>—Display the status of the chassis status LEDs (for EX4200 switches configured as a Virtual Chassis, display the information for all Virtual Chassis members).</p> <p><b>fpc-slot &lt;<i>fpc-slot-number</i>&gt;</b>—(Optional) (Not on EX2200 switches) Display the information as follows:</p> <ul style="list-style-type: none"><li>(EX3200, standalone EX4200, standalone QFX3500, and EX4500 switches)<br/>Display the status of the chassis status LEDs for either an FPC slot with no <i>fpc-slot-number</i> value specified or for the FPC slot specified by <b>fpc-slot 0</b>. <i>fpc-slot</i> refers to the switch itself and <b>0</b> is the only valid value for <i>fpc-slot-number</i>. Output for these options is the same as for the <b>none</b> option.</li><li>(EX4200 switches in a Virtual Chassis with two or more members) If no <i>fpc-slot-number</i> value is specified, display the status of the chassis status LEDs for all members of the Virtual Chassis. Output for this option is the same as for the <b>none</b> option. If the <i>fpc-slot-number</i> value is specified (it equals the <i>member-id</i> value), display the status of the chassis status LEDs for the specified member.</li><li>(EX8200 switches)—Display the status of the chassis status LEDs for the line card in the line-card slot specified by the <i>fpc-slot-number</i> value.</li></ul> <p><b>interconnect-device <i>name</i></b>—</p> <p>— (QFabric systems only) (Optional) Display the status of the chassis and interface status LEDs for the Interconnect device.</p> <p><b>node-device <i>name</i></b>— (QFabric systems only) (Optional) Display the status of the chassis and interface status LEDs for the Node device.</p> |

| <b>Description</b>                    | Display the physical location of the chassis. This command can only be used on the master Routing Engine.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                        | <b>none</b> —Display all information about the physical location of the chassis. On a TX Matrix router, display all information about the physical location of the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display all information about the physical location of the TX Matrix Plus router and its attached routers.<br><br><b>all-members</b> —(MX Series routers only) (Optional) Display the physical location of the chassis for all the member routers in the Virtual Chassis configuration.<br><br><b>fpc</b> —(TX Matrix router and TX Matrix Plus router only) (Optional) Display the physical location of all Flexible PIC Concentrators (FPCs).<br><br><b>interconnect-device <i>name</i></b> —(QFabric systems only) (Optional) Display the physical location of the Interconnect device.<br><br><b>interface by-name <i>name</i></b> —(TX Matrix and TX Matrix Plus routers only) (Optional) Display the physical location of a specified interface name. On a TX Matrix router, this option displays the FPC number and T640 router (line-card chassis) number associated |

with the specified interface. On a TX Matrix Plus router, this option displays the FPC number and router (line-card chassis) number associated with the specified interface.

**interface by-slot fpc *number* lcc *number***—(TX Matrix and TX Matrix Plus router only)

(Optional) On a TX Matrix router, display the global FPC number of an interface by specifying its local FPC number and T640 router (line-card chassis) number. On a TX Matrix Plus router, display the global FPC number of an interface by specifying its local FPC number and router (line-card chassis) number.

- The global FPC number is the FPC slot number when all the FPC slots in the routing matrix are considered: **0** through **31**. On TX Matrix Plus router with 3D SIBs, the value is **0** through **63**. The local FPC number is the FPC slot number on a particular T640 router.
- For **fpc**, replace *number* with a value from **0** through **7**.
- For **lcc**, replace *number* with a value from **0** through **7**.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the physical location of a specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display the physical location of a specified router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display the physical location of the chassis for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display the physical location of the chassis for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display the physical location of the Node device.

**scc**—(TX Matrix routers only) (Optional) Display the physical location of the TX Matrix router (switch-card chassis).

**sfc**—(TX Matrix Plus routers only) (Optional) Display the physical location of the TX Matrix Plus router (or switch-fabric chassis).

**Required Privilege Level** view

| Floor        | Floor information.                                                                                                                                                                                                               |
| Global FPC   | Global FPC number. The FPC slot number, when all FPC slots in the routing matrix are considered. The range of values is 0 through 31. On TX Matrix Plus router with 3D SIBs the value is 0 through 63.                           |
| LATA         | Local access transport area information.                                                                                                                                                                                         |
| LCC          | Line-card chassis number. On a TX Matrix router, the number of a particular T640 router connected to the TX Matrix router. On a TX Matrix Plus router, the number of a particular router connected to the TX Matrix Plus router. |
| Local FPC    | Local FPC number. On a TX Matrix router, the FPC slot number on a particular T640 router. On a TX Matrix Plus router, the FPC slot number on a particular router.                                                                |

## Sample Output

**show chassis location**

```
user@host> show chassis location
country-code: US
postal-code: 94404
Building: Building 2, Floor: 2
```

**show chassis location fpc (TX Matrix Router)**

```

user@host> show chassis location fpc
Global FPC    LCC    Local FPC
    17         2        1
    21         2        5

```

**show chassis location interface by-slot (TX Matrix Router)**

```

user@host> show chassis location interface by-slot fpc 1 lcc 1
Global FPC: 9

```

**show chassis location fpc (TX Matrix Plus Router)**

```

user@host> show chassis location fpc
Global FPC    LCC    Local FPC
    0         0        0
    1         0        1

```

**show chassis location interface by-slot (TX Matrix Plus Router)**

```

user@host> show chassis location interface by-slot fpc 2 lcc 1
Global FPC: 10

```

**show chassis location (QFX3500 Switches)**

```

user@switch> show chassis location
country-code: US
postal-code: 94404
Building: Building 2, Floor: 2

```

**show chassis location (QFabric Systems)**

```

user@switch> show chassis location interconnect-device interconnect1
country-code: US
postal-code: 94404
Building: Building 2, Floor: 2

```

## show chassis mac-addresses

| <b>Description</b>                                                  | Display the media access control (MAC) addresses for the router, switch chassis, or switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>                                                      | <b>none</b> —(TX Matrix, TX Matrix Plus routers, and the QFX Series) Display the MAC addresses for the router chassis or switch. On a TX Matrix router, display MAC addresses on the                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display MAC addresses on the TX Matrix Plus router and its attached routers.

**all-members**—(MX Series routers only) (Optional) Display the MAC addresses for all the member routers of the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display the MAC addresses for the Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display MAC addresses for a specified T640 router (line-card chassis) that is connected to the TX Matrix Plus router. On a TX Matrix Plus router, display MAC addresses for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display the MAC addresses for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display the MAC addresses for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display the MAC addresses for the specified Node group.

**scc**—(TX Matrix routers only) (Optional) Display MAC addresses for the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display MAC addresses for the TX Matrix Plus router (or switch-fabric chassis).

**Required Privilege Level**

**Output Fields** Table 38 on page 932 lists the output fields for the **show chassis mac-addresses** command. Output fields are listed in the approximate order in which they appear.

**Table 38: show chassis mac-addresses Output Fields**

| Field Name              | Field Description                                                             |
|-------------------------|-------------------------------------------------------------------------------|
| MAC address information |                                                                               |
| Public base address     | Base address of the MAC addresses allocated to this router or switch.         |
| Public count            | Number of allocated public addresses.                                         |
| Private base address    | Base address of the private MAC addresses allocated to this router or switch. |
| Private count           | Number of allocated private addresses.                                        |

## Sample Output

### show chassis mac-addresses

```

user@host> show chassis mac-addresses
MAC address information
  Public base address  0:90:69:0:4:0
  Public count         1008
  Private base address 0:90:69:0:7:f0
  Private count        16

```

### show chassis mac-addresses (MX104 Router)

```

user@host > show chassis mac-addresses
MAC address information:
  Public base address  b0:a8:6e:a1:e8:58
  Public count         2032
  Private base address b0:a8:6e:a1:f0:48
  Private count        16

```

### show chassis mac-addresses (MX2010 Router)

```

user@host> show chassis mac-addresses
MAC address information:
  Public base address  64:87:88:04:50:00
  Public count         1984
  Private base address 64:87:88:04:57:c0
  Private count        64

```

**show chassis mac-addresses (MX2020 Router)**

```

user@host> show chassis mac-addresses
MAC address information:
  Public base address    2c:21:72:70:20:00
  Public count           4032
  Private base address   2c:21:72:70:2f:c0
  Private count          64

```

**show chassis mac-addresses (TX Matrix Router)**

```

user@host> show chassis mac-addresses

| <b>Description</b>                                                 | Display status information about the PIC installed in the specified Flexible PIC Concentrator (FPC) and PIC slot.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                                                     | <b>fpc-slot <i>slot-number</i></b> —Display information about the PIC in this particular FPC slot:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

- On a TX Matrix router, if you specify the number of the T640 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis pic fpc-slot 1 lcc 1 pic-slot 1
user@host> show chassis pic fpc-slot 9 pic-slot 1
```

- M120 routers only—Replace **slot-number** with a value from 0 through 5.
- MX80 routers only—Replace **slot-number** with a value from 0 through 1.
- MX104 routers only—Replace **slot-number** with a value from 0 through 2.
- MX240 routers only—Replace **slot-number** with a value from 0 through 2.
- MX480 routers only—Replace **slot-number** with a value from 0 through 5.
- MX960 routers only—Replace **slot-number** with a value from 0 through 11.
- MX2010 routers only—Replace **slot-number** with a value from 0 through 9.
- MX2020 routers only—Replace **slot-number** with a value from 0 through 19.
- Other routers—Replace **slot-number** with a value from 0 through 7.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace **slot-number** with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace **slot-number** with a value from 0 through 9 (switch's member ID).
  - EX8208 switches—Replace **slot-number** with a value from 0 through 7 (line card).
  - EX8216 switches—Replace **slot-number** with a value from 0 through 15 (line card).
- QFX Series:
  - QFX3500 and QFX5100 standalone switches—Replace **slot-number** with 0. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.
  - QFabric systems—Replace **slot-number** with any number between 0 and 15. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.

**all-members**—(MX Series routers and EX Series switches only) (Optional) Display PIC information for all member routers in the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display PIC information for a specified Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display PIC information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display PIC information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the local Virtual Chassis member.

**member *member-id***—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display PIC information for a specified Node device.

**pic-slot *slot-number***—Display information about the PIC in this particular PIC slot. For routers, replace *slot-number* with a value from 0 through 3. For EX3200 and EX4200 switches, replace *slot-number* with 0 for built-in network interfaces and 1 for interfaces on uplink modules. For EX8208 and EX8216 switches, replace *slot-number* with 0. For the QFX3500 standalone switch and the QFabric system, replace *slot-number* with 0 or 1.

**transport**—Display PIC information for optical transport network.

| <b>Channelization</b>                                            | Indicates whether channelization is enabled or disabled on the DS3/E3 MIC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Sample Output

### show chassis pic fpc-slot pic-slot

```

user@host> show chassis pic fpc-slot 2 pic-slot 0
PIC fpc slot 2 pic slot 0 information:
Type                               10x 1GE(LAN), 1000 BASE

```

```

ASIC type           H chip
State               Online
PIC version         1.1
Uptime              1 day, 50 minutes, 58 seconds
PIC Port Information:
Port      Cable      Xcvr      Xcvr Vendor
Number    Type        Vendor Name  Part Number
0         GIGE 1000EX  FINISAR CORP.  FTRJ8519P1BNL-J3
1         GIGE 1000EX  FINISAR CORP.  FTRJ-8519-7D-JUN

```

#### show chassis pic fpc-slot pic-slot (PIC Offline)

```

user@host> show chassis pic fpc-slot 1 pic-slot 0
PIC fpc slot 1 pic slot 0 information:
State               Offline

```

#### show chassis pic fpc-slot pic-slot (FPC Offline)

```

user@host> show chassis pic fpc-slot 1 pic-slot 0
FPC 1 is not online

```

#### show chassis pic fpc-slot pic-slot (FPC Not Present)

```

user@host> show chassis pic fpc-slot 4 pic-slot 0
FPC slot 4 is empty

```

#### show chassis pic fpc-slot pic-slot (PIC Not Present)

```

user@host> show chassis pic fpc-slot 5 pic-slot 2
FPC 5, PIC 2 is empty

```

#### show chassis pic fpc-slot pic-slot (M120 Router)

```

user@host> show chassis pic fpc-slot 3 pic-slot 0
PC slot 3, PIC slot 0 information:
Type               2x G/E IQ, 1000 BASE
ASIC type          IQ GE 2 VLAN-TAG FPGA
State              Online
PIC version         1.16
Uptime              3 hours, 3 minutes

PIC Port Information:
Port      Cable      Xcvr      Xcvr Vendor
Number    Type        Vendor Name  Part Number
0         GIGE 1000SX  FINISAR CORP.  FTRJ8519P1BNL-J3
1         GIGE 1000SX  FINISAR CORP.  FTRJ-8519-7D-JUN

```

#### show chassis pic fpc-slot pic-slot (MX104 Router)

```

user@host> show chassis pic fpc-slot 1 pic-slot 1
FPC slot 1, PIC slot 1 information:
Type               10x 1GE(LAN) -E SFP
State              Online
PIC version         1.1
Uptime              1 hour, 30 minutes, 59 seconds

PIC port information:
Fiber              Xcvr vendor      Wave-      Xcvr
Port Cable type    type Xcvr vendor    part number  length
Firmware
3   GIGE 1000T    n/a  Methode Elec.  SP7041-M1-JN  n/a      0.0

```

**Syntax**    show chassis routing-engine  
                  <bios | *slot*>

**Syntax (EX Series Switches)**    show chassis routing-engine  
                                          <*slot*>

**Syntax (T Series routers)**    show chassis routing-engine  
                                          <bios | *slot*>

**Syntax (TX Matrix Routers)**    show chassis routing-engine  
                                          <bios | *slot*>  
                                          <lcc *number* | scc>

**Syntax (TX Matrix Plus Routers)**    show chassis routing-engine  
                                          <bios | *slot*>  
                                          <lcc *number* | sfc *number*>

**Syntax (QFX Series)**    show chassis routing-engine  
                                  <interconnect-device *name*>  
                                  <node-device *name*>

**Syntax (MX Series Routers)**    show chassis routing-engine  
                                          <bios | *slot*>  
                                          <all-members>  
                                          <local>  
                                          <member *member-id*>

**Syntax (MX2010 3D Universal Edge Routers)**    show chassis routing-engine  
                                          <bios | *slot*>

**Syntax (MX2020 3D Universal Edge Routers)**    show chassis routing-engine  
                                          <bios | *slot*>

**Syntax (MX104 3D Universal Edge Routers)**    show chassis routing-engine

**Syntax (ACX Series Universal Access Routers)** `show chassis routing-engine`

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
**sfc** option introduced for the TX Matrix Plus router in Junos OS Release in 9.6.  
 Command introduced in Junos OS Release 11.1 for QFX Series.  
 Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.  
 Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.  
 Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.  
 Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.

**Description** Display the status of the Routing Engine.

**Options** **none**—Display information about one or more Routing Engines. On a TX Matrix router, display information about all Routing Engines on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display information about all Routing Engines on the TX Matrix Plus router and its attached routers.

**all-members**—(MX Series routers only) (Optional) Display Routing Engine information for all members of the Virtual Chassis configuration.

**bios**—(Optional) Display the (BIOS) firmware version.

**interconnect-device *number***—(QFabric systems only) (Optional) Display Routing Engine information for a specified Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display Routing Engine information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display Routing Engine information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display Routing Engine information for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display Routing Engine information for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-device *number***—(QFabric systems only) (Optional) Display Routing Engine information for a specified Node device.

**scc**—(TX Matrix routers only) (Optional) Display Routing Engine information for the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display Routing Engine information for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**slot**—(Systems with multiple Routing Engines) (Optional) Display information for an individual Routing Engine. Replace *slot* with 0 or 1. For QFX3500 switches, there is only one Routing Engine, so you do not need to specify the slot number.

**Output Fields** [Table 41 on page 955](#) lists the output fields for the **show chassis routing-engine** command. Output fields are listed in the approximate order in which they appear.

**Table 41: show chassis routing-engine Output Fields**

| Field Name                         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Slot</b>                        | (Systems with single and multiple Routing Engines) Slot number.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Current state</b>               | (Systems with multiple Routing Engines) Current state of the Routing Engine: <b>Master</b> , <b>Backup</b> , or <b>Disabled</b> .                                                                                                                                                                                                                                                                                                                                                             |
| <b>Election priority</b>           | (Systems with multiple Routing Engines) Election priority for the Routing Engine: <b>Master</b> or <b>Backup</b> .                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Temperature</b>                 | Temperature of the air flowing past the Routing Engine.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>CPU Temperature</b>             | Temperature of the CPU.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>DRAM</b>                        | Total DRAM available to the Routing Engine's processor.<br><br>Starting with Junos OS Release 12.3R1, the DRAM field displays both available memory and installed memory.                                                                                                                                                                                                                                                                                                                     |
| <b>Memory utilization</b>          | Percentage of Routing Engine memory being used.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>CPU utilization</b>             | Information about the Routing Engine's CPU utilization: <ul style="list-style-type: none"> <li>• <b>User</b>—Percentage of CPU time being used by user processes.</li> <li>• <b>Background</b>—Percentage of CPU time being used by background processes.</li> <li>• <b>Kernel</b>—Percentage of CPU time being used by kernel processes.</li> <li>• <b>Interrupt</b>—Percentage of CPU time being used by interrupts.</li> <li>• <b>Idle</b>—Percentage of CPU time that is idle.</li> </ul> |
| <b>Model</b>                       | Routing Engine model number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Serial ID</b>                   | (Systems with multiple Routing Engines) Identification number of the Routing Engine in this slot.                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Start time</b>                  | Time at which the Routing Engine started running.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Uptime</b>                      | How long the Routing Engine has been running.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Routing Engine BIOS Version</b> | BIOS version being run by the Routing Engine.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Table 41: show chassis routing-engine Output Fields (*continued*)

| Field Name         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last reboot reason | <p>Reason for last reboot, including:</p> <ul style="list-style-type: none"> <li><b>power cycle/failure</b>—Halt of the Routing Engine using the <b>halt</b> command, powering down using the power button on the chassis or any other method (such as removal of the control board or Routing Engine), and then powering back the Routing Engine. A halt of the operating system also occurs if you enter the <b>request system halt</b> command. You can enter this command to halt the system operations on the chassis or specific Routing Engines. To restart the software, press any key on the keyboard.</li> <li><b>watchdog</b>—Reboot due to a hardware watchdog. A watchdog is a hardware monitoring process that examines the health and performance of the router to enable the device to recover from failures. A watchdog checks for problems at certain intervals, and reboots the routing engine if a problem is encountered.</li> <li><b>reset-button reset</b>—(Not available on the J Series router or EX Series switch) Reboot due to pressing of the reset button on the Routing Engine.</li> <li><b>power-button hard power off</b>—Reboot due to pressing of the power button on the chassis. A powering down of the software also occurs if you enter the <b>request system power-off</b> command. You can enter this command to power down the chassis or specific Routing Engines; you can then restart the software.</li> <li><b>misc hardware reason</b>—Reboot due to miscellaneous hardware reasons.</li> <li><b>thermal shutdown</b>—Reboot due to the router or switch reaching a critical temperature at which point it is unsafe to continue operations.</li> <li><b>hard disk failure</b>—Reboot due to a hard disk or solid-state drive (SSD) failure.</li> <li><b>reset from debugger</b>—Reboot due to reset from the debugger.</li> <li><b>chassis control reset</b>—Restart the chassis process that manages PICs, FPCs, and other hardware components. The chassis control module that runs the Routing Engine performs management and monitoring functions, and it provides a single access point for operational and maintenance functions. A reset of the chassis management process occurs when you enter the <b>restart chassis-control</b> command.</li> <li><b>bios auto recovery reset</b>—Reboot due to a BIOS auto-recovery reset.</li> <li><b>could not be determined</b>—Reboot due to an undetermined reason.</li> <li><b>Router rebooted after a normal shutdown</b>—Reboot due to a normal shutdown. This reason is displayed if the Routing Engine is powered down by pushing and holding the online/offline button on the Routing Engine faceplate for 30 seconds, and then powered back. A reboot of the software also occurs if you enter the <b>request system reboot</b> command. You can enter this command to reboot the chassis or specific Routing Engines.</li> </ul> |
| Load averages      | Routing Engine load averages for the last 1, 5, and 15 minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Sample Output

### show chassis routing-engine (M5 Router)

```

user@host> show chassis routing-engine
Routing Engine status:
  Temperature                25 degrees C / 77 degrees F
  DRAM                       768 MB
  Memory utilization         21 percent
  CPU utilization:
    User                      0 percent
    Background                0 percent
    Kernel                    0 percent
    Interrupt                  0 percent

```

```

Idle 100 percent
Model RE-2.0
Serial ID 31000007349bf701
Start time 2003-12-04 09:42:17 PST
Uptime 26 days, 1 hour, 12 minutes, 27 seconds
Last reboot reason Router rebooted after a normal shutdown
Load averages: 1 minute 5 minute 15 minute
                0.00 0.01 0.00

```

### show chassis routing-engine (M10 Router)

```

user@host> show chassis routing-engine
Routing Engine status:
  Temperature 25 degrees C / 77 degrees F
  DRAM 768 MB
  Memory utilization 21 percent
  CPU utilization:
    User 0 percent
    Background 0 percent
    Kernel 0 percent
    Interrupt 0 percent
    Idle 100 percent
  Model RE-2.0
  Serial ID 31000007349bf701
  Start time 2003-12-04 09:42:17 PST
  Uptime 26 days, 1 hour, 12 minutes, 27 seconds
  Last reboot reason Router rebooted after a normal shutdown
  Load averages: 1 minute 5 minute 15 minute
                  0.00 0.01 0.00

```

### show chassis routing-engine (M20 Router)

```

user@host> show chassis routing-engine
Routing Engine status:
  Slot 0:
    Current state Master
    Election priority Master (default)
    Temperature 29 degrees C / 84 degrees F
    DRAM 768 MB
    Memory utilization 20 percent
    CPU utilization:
      User 1 percent
      Background 0 percent
      Kernel 2 percent
      Interrupt 0 percent
      Idle 97 percent
    Model RE-2.0
    Serial ID 58000007348d9a01
    Start time 2003-12-30 07:05:47 PST
    Uptime 3 hours, 41 minutes, 14 seconds
    Last reboot reason Router rebooted after a normal shutdown
    Load averages: 1 minute 5 minute 15 minute
                    0.00 0.02 0.00

  Routing Engine status:
    Slot 1:
      Current state Backup
      Election priority Backup (default)
      Temperature 29 degrees C / 84 degrees F
      DRAM 768 MB
      Memory utilization 0 percent
      CPU utilization:

```

```

User                0 percent
Background          0 percent
Kernel              1 percent
Interrupt            0 percent
Idle                99 percent
Model               RE-2.0
Serial ID            d800000734745701
Start time           2003-06-17 16:37:33 PDT
Uptime               195 days, 18 hours, 47 minutes, 9 seconds
Last reboot reason   Router rebooted after a normal shutdown

```

### show chassis routing-engine (M40 Router)

```

user@host> show chassis routing-engine
Routing Engine status:
  Temperature        25 degrees C / 77 degrees F
  DRAM                768 MB
  Memory utilization  21 percent
  CPU utilization:
    User              0 percent
    Background        0 percent
    Kernel             0 percent
    Interrupt          0 percent
    Idle              100 percent
  Model              RE-2.0
  Serial ID           31000007349bf701
  Start time          2003-12-04 09:42:17 PST
  Uptime              26 days, 1 hour, 12 minutes, 27 seconds
  Last reboot reason   Router rebooted after a normal shutdown
  Load averages:      1 minute   5 minute  15 minute
                      0.00        0.01    0.00

```

### show chassis routing-engine (M120 Router)

```

user@host> show chassis routing-engine
Routing Engine status:
Slot 0:
  Current state        Master
  Election priority     Master (default)
  Temperature          46 degrees C / 114 degrees F
  CPU temperature       44 degrees C / 111 degrees F
  DRAM                 2048 MB
  Memory utilization    18 percent
  CPU utilization:
    User                0 percent
    Background          0 percent
    Kernel               5 percent
    Interrupt            0 percent
    Idle                95 percent
  Model                RE-A-1000
  Serial ID             1000621154
  Start time            2006-10-31 17:10:05 PST
  Uptime                14 minutes, 31 seconds
  Last reboot reason     Router rebooted after a normal shutdown
  Load averages:        1 minute   5 minute  15 minute
                      0.02        0.07    0.07

Routing Engine status:
Slot 1:
  Current state        Backup
  Election priority     Backup (default)
  Temperature          45 degrees C / 113 degrees F

```

```

CPU temperature          42 degrees C / 107 degrees F
DRAM                    2048 MB
Memory utilization       15 percent
CPU utilization:
  User                   0 percent

| <b>Description</b>                                                  | Display chassis temperature threshold settings, in degrees Celsius.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                                                      | <b>none</b> —Display the temperature threshold details.<br><br><b>all-members</b> —(MX Series routers only) (Optional) Display the chassis temperature threshold settings of all member routers in the Virtual Chassis configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**interconnect-device *name***—(QFabric systems only) (Optional) Display the chassis temperature threshold settings of the Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the temperature threshold details of a specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display the temperature threshold details of a specified router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display the chassis temperature threshold settings of the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display the chassis temperature threshold settings of the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display the chassis temperature threshold settings of the Node device.

**scc**—(TX Matrix routers only) (Optional) Display the temperature threshold details of the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) On TX Matrix Plus routers, display the temperature threshold details of the TX Matrix Plus router, which is the switch-fabric chassis. Replace *number* with 0.

| <b>Description</b>              | <p>(QFabric systems only) Display the status of the two cooling system zones on the Interconnect device. Zone 1 consists of eight (0 – 7) front cards, which are cooled by two fan trays. Zone 2 consists of two control boards and eight rear cards, which are cooled by eight (0 – 7) fan trays. On MX2010 and MX2020 routers, display the status of the cooling system zones of the chassis. Zone 0 consists of the Control Board, ten (0–9) FPCs, and their respective PICs, Switch Fabric Boards, and Adapter Cards. Zone 1 consists of the Routing Engine, Control Board, and Switch Processor Mezzanine Boards.</p>                                                                                                        |

| Measurement                                                                    | Fan tray speed utilization in percentage.                                                                                                                                                                                                  |
| Status                                                                         | Status of the specified item. Status can be <b>OK</b> , <b>Absent</b> , or <b>Offline</b> .                                                                                                                                                |

## Sample Output

### show chassis zones interconnect-device (QFabric System)

```
user@switch> show chassis zones interconnect-device interconnect1
Slot          Beacon State
FPC           0          OFF
```

### show chassis zones (MX2010 Router)

```
user@host> show chassis zones
```

```

ZONE 0 Status
  Driving FRU          FPC 6
  Temperature          81 degrees C / 177 degrees F
  Condition            HIGH TEMP
  Num Fans Missing     0
  Num Fans Failed      0
  Fan Duty Cycle       30

ZONE 1 Status
  Driving FRU          SFB 0 Exhaust-Zone1
  Temperature          71 degrees C / 159 degrees F
  Condition            WARM TEMP
  Num Fans Missing     0
  Num Fans Failed      0
  Fan Duty Cycle       30

```

| Field Name             | Field Description                                                                                                                                                                                                        |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLI complete-on-space  | Capability to complete a partial command entry when you type a space or a tab: <b>on</b> or <b>off</b> .                                                                                                                 |
| CLI idle-timeout       | Maximum time that an individual session can be idle before the user is logged out from the router or switch. When this feature is enabled, the number of minutes is displayed. Otherwise, the state is <b>disabled</b> . |
| CLI restart-on-upgrade | CLI is set to prompt you to restart the router or switch after upgrading the software: <b>on</b> or <b>off</b> .                                                                                                         |
| CLI screen-length      | Number of lines of text that the terminal screen displays.                                                                                                                                                               |
| CLI screen-width       | Number of characters in a line on the terminal screen.                                                                                                                                                                   |
| CLI terminal           | Terminal type.                                                                                                                                                                                                           |
| CLI is operating in    | Mode: <b>enhanced</b> .                                                                                                                                                                                                  |
| CLI timestamp          | Date and time format for the timestamp. If the timestamp is not set, the state is <b>disabled</b> .                                                                                                                      |
| CLI working directory  | Pathname of the working directory.                                                                                                                                                                                       |

## Sample Output

show cli

```
user@host> show cli
CLI complete-on-space set to on
CLI idle-timeout disabled
CLI restart-on-upgrade set to on
CLI screen-length set to 47
CLI screen-width set to 132
CLI terminal is 'vt100'
CLI is operating in enhanced mode
CLI timestamp disabled
CLI working directory is '/var/home/regress'
```

## show cli authorization

| <b>Output Fields</b>            | <a href="#">Table 45 on page 1001</a> lists the output fields for the <b>show cli authorization</b> command. In the table, all possible permissions are displayed and output fields are listed in alphabetical order. |

**Table 45: show cli authorization Output Fields**

| Field Name       | Field Description                              |
|------------------|------------------------------------------------|
| access           | Can view access configuration information.     |
| access-control   | Can modify access configuration.               |
| admin            | Can view user account information.             |
| admin-control    | Can modify user account information.           |
| clear            | Can clear learned network information.         |
| configure        | Can enter configuration mode.                  |
| control          | Can modify any configuration.                  |
| edit             | Can edit configuration files.                  |
| field            | Reserved for field (debugging) support.        |
| firewall         | Can view firewall configuration information.   |
| firewall-control | Can modify firewall configuration information. |
| floppy           | Can read from and write to removable media.    |
| flow-tap         | Can view flow-tap configuration information.   |

Table 45: show cli authorization Output Fields (*continued*)

| Field Name                            | Field Description                                                                                                 |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>flow-tap-control</b>               | Can configure flow-tap configuration information.                                                                 |
| <b>idp-profiler-operation</b>         | Can configure Profiler data.                                                                                      |
| <b>interface</b>                      | Can view interface configuration information.                                                                     |
| <b>interface-control</b>              | Can modify interface configuration information.                                                                   |
| <b>maintenance</b>                    | Can perform system maintenance.                                                                                   |
| <b>network</b>                        | Can access the network by entering the <b>ping</b> , <b>ssh</b> , <b>telnet</b> , and <b>traceroute</b> commands. |
| <b>pgcp-session-mirroring</b>         | Can view Packet Gateway Control Protocol session mirroring configuration.                                         |
| <b>pgcp-session-mirroring-control</b> | Can modify Packet Gateway Control Protocol session mirroring configuration all-control.                           |
| <b>reset</b>                          | Can reset or restart interfaces and system processes.                                                             |
| <b>rollback</b>                       | Can roll back to previous configurations.                                                                         |
| <b>routing</b>                        | Can view routing configuration information.                                                                       |
| <b>routing-control</b>                | Can modify routing configuration information.                                                                     |
| <b>secret</b>                         | Can view passwords and authentication keys in the configuration.                                                  |
| <b>secret-control</b>                 | Can modify passwords and authentication keys in the configuration.                                                |
| <b>security</b>                       | Can view security configuration information.                                                                      |
| <b>security-control</b>               | Can modify security configuration information.                                                                    |
| <b>shell</b>                          | Can start a local shell.                                                                                          |
| <b>snmp</b>                           | Can view SNMP configuration information.                                                                          |
| <b>snmp-control</b>                   | Can modify SNMP configuration information.                                                                        |
| <b>system</b>                         | Can view system configuration information.                                                                        |
| <b>system-control</b>                 | Can modify system configuration information.                                                                      |
| <b>trace</b>                          | Can view trace file settings information.                                                                         |

Table 45: show cli authorization Output Fields (*continued*)

| Field Name                | Field Description                                               |
|---------------------------|-----------------------------------------------------------------|
| <b>trace-control</b>      | Can modify trace file settings information.                     |
| <b>view</b>               | Can view current values and statistics.                         |
| <b>view-configuration</b> | Can view all configuration information (not including secrets). |

## Sample Output

### show cli authorization

```

user@host> show cli authorization
Current user: 'remote' login: 'user' class ''
Permissions:
  admin      -- Can view user accounts
  admin-control-- Can modify user accounts
  clear      -- Can clear learned network information
  configure  -- Can enter configuration mode
  control    -- Can modify any configuration
  edit       -- Can edit full files
  field      -- Special for field (debug) support
  floppy     -- Can read and write from the floppy
  interface  -- Can view interface configuration
  interface-control-- Can modify interface configuration
  network    -- Can access the network
  reset      -- Can reset/restart interfaces and daemons
  routing    -- Can view routing configuration
  routing-control-- Can modify routing configuration
  shell      -- Can start a local shell
  snmp       -- Can view SNMP configuration
  snmp-control-- Can modify SNMP configuration
  system     -- Can view system configuration
  system-control-- Can modify system configuration
  trace      -- Can view trace file settings
  trace-control-- Can modify trace file settings
  view       -- Can view current values and statistics
  maintenance -- Can become the super-user
  firewall   -- Can view firewall configuration
  firewall-control-- Can modify firewall configuration
  secret     -- Can view secret configuration
  secret-control-- Can modify secret configuration
  rollback   -- Can rollback to previous configurations
  security   -- Can view security configuration
  security-control-- Can modify security configuration
  access     -- Can view access configuration
  access-control-- Can modify access configuration
  view-configuration-- Can view all configuration (not including secrets)
  flow-tap   -- Can view flow-tap configuration
  flow-tap-control-- Can configure flow-tap service
Individual command authorization:
  Allow regular expression: none
  Deny regular expression: none
  Allow configuration regular expression: none
  Deny configuration regular expression: none

```

| <b>Release Information</b>      | Command introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Display diagnostics data and alarms for Gigabit Ethernet, 10-Gigabit Ethernet, and QSFP+ optical transceivers installed in a QFX Series product. The information provided by this command is known as digital optical monitoring (DOM) information.</p> <p>Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transponder vendors. Generally, a high alarm or low alarm indicates that the optics module is not operating properly. This information can be used to diagnose why a transceiver is not working.</p> |
| <b>Options</b>                  | <i>interface-name</i> —Name of the interface associated with the port in which the transceiver is installed.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 48: show interfaces diagnostics optics Output Fields**

| Field Name                           | Field Description                                                                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Physical interface                   | Displays the name of the physical interface.                                                                                                                       |
| Laser bias current                   | Displays the magnitude of the laser bias power setting current, in milliamperes. The laser bias provides direct modulation of laser diodes and modulates currents. |
| Laser output power                   | Displays the laser output power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).                                                                         |
| Module temperature                   | Displays the temperature, in Celsius and Fahrenheit.                                                                                                               |
| Module voltage                       | Displays the voltage, in volts.                                                                                                                                    |
| (Not available for XFP transceivers) |                                                                                                                                                                    |

Table 48: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name                                                                           | Field Description                                                                                             |
|--------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>Laser rx power</b><br>(Not available for SFP and SFP+ transceivers)               | Displays the laser received optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).          |
| <b>Receiver signal average optical power</b><br>(Not available for XFP transceivers) | Displays the receiver signal average optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm). |
| <b>Laser bias current high alarm</b>                                                 | Displays whether the laser bias power setting high alarm is <b>On</b> or <b>Off</b> .                         |
| <b>Laser bias current low alarm</b>                                                  | Displays whether the laser bias power setting low alarm is <b>On</b> or <b>Off</b> .                          |
| <b>Laser bias current high warning</b>                                               | Displays whether the laser bias power setting high warning is <b>On</b> or <b>Off</b> .                       |
| <b>Laser bias current low warning</b>                                                | Displays whether the laser bias power setting low warning is <b>On</b> or <b>Off</b> .                        |
| <b>Laser output power high alarm</b>                                                 | Displays whether the laser output power high alarm is <b>On</b> or <b>Off</b> .                               |
| <b>Laser output power low alarm</b>                                                  | Displays whether the laser output power low alarm is <b>On</b> or <b>Off</b> .                                |
| <b>Laser output power high warning</b>                                               | Displays whether the laser output power high warning is <b>On</b> or <b>Off</b> .                             |
| <b>Laser output power low warning</b>                                                | Displays whether the laser output power low warning is <b>On</b> or <b>Off</b> .                              |
| <b>Module temperature high alarm</b>                                                 | Displays whether the module temperature high alarm is <b>On</b> or <b>Off</b> .                               |
| <b>Module temperature low alarm</b>                                                  | Displays whether the module temperature low alarm is <b>On</b> or <b>Off</b> .                                |
| <b>Module temperature high warning</b>                                               | Displays whether the module temperature high warning is <b>On</b> or <b>Off</b> .                             |
| <b>Module temperature low warning</b>                                                | Displays whether the module temperature low warning is <b>On</b> or <b>Off</b> .                              |
| <b>Module voltage high alarm</b><br>(Not available for XFP transceivers)             | Displays whether the module voltage high alarm is <b>On</b> or <b>Off</b> .                                   |
| <b>Module voltage low alarm</b><br>(Not available for XFP transceivers)              | Displays whether the module voltage low alarm is <b>On</b> or <b>Off</b> .                                    |
| <b>Module voltage high warning</b><br>(Not available for XFP transceivers)           | Displays whether the module voltage high warning is <b>On</b> or <b>Off</b> .                                 |
| <b>Module voltage low warning</b><br>(Not available for XFP transceivers)            | Displays whether the module voltage low warning is <b>On</b> or <b>Off</b> .                                  |
| <b>Laser rx power high alarm</b>                                                     | Displays whether the receive laser power high alarm is <b>On</b> or <b>Off</b> .                              |

Table 48: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name                                                                 | Field Description                                                                                                                                                                  |
|----------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Laser rx power low alarm                                                   | Displays whether the receive laser power low alarm is <b>On</b> or <b>Off</b> .                                                                                                    |
| Laser rx power high warning                                                | Displays whether the receive laser power high warning is <b>On</b> or <b>Off</b> .                                                                                                 |
| Laser rx power low warning                                                 | Displays whether the receive laser power low warning is <b>On</b> or <b>Off</b> .                                                                                                  |
| Laser bias current high alarm threshold                                    | Displays the vendor-specified threshold for the laser bias current high alarm.                                                                                                     |
| Module not ready alarm<br>(Not available for SFP and SFP+ transceivers)    | Displays whether the module not ready alarm is <b>On</b> or <b>Off</b> . When the output is <b>On</b> , the module has an operational fault.                                       |
| Module power down alarm<br>(Not available for SFP and SFP+ transceivers)   | Displays whether the module power down alarm is <b>On</b> or <b>Off</b> . When the output is <b>On</b> , the module is in a limited power mode, low for normal operation.          |
| Tx data not ready alarm<br>(Not available for SFP and SFP+ transceivers)   | Any condition leading to invalid data on the transmit path. Displays whether the Tx data not ready alarm is <b>On</b> or <b>Off</b> .                                              |
| Tx not ready alarm<br>(Not available for SFP and SFP+ transceivers)        | Any condition leading to invalid data on the transmit path. Displays whether the Tx not ready alarm is <b>On</b> or <b>Off</b> .                                                   |
| Tx laser fault alarm<br>(Not available for SFP and SFP+ transceivers)      | Laser fault condition. Displays whether the Tx laser fault alarm is <b>On</b> or <b>Off</b> .                                                                                      |
| Tx CDR loss of lock alarm<br>(Not available for SFP and SFP+ transceivers) | Transmit clock and data recovery (CDR) loss of lock. Loss of lock on the transmit side of the CDR. Displays whether the Tx CDR loss of lock alarm is <b>On</b> or <b>Off</b> .     |
| Rx not ready alarm<br>(Not available for SFP and SFP+ transceivers)        | Any condition leading to invalid data on the receive path. Displays whether the Rx not ready alarm is <b>On</b> or <b>Off</b> .                                                    |
| Rx loss of signal alarm<br>(Not available for SFP and SFP+ transceivers)   | Receive loss of signal alarm. When <b>on</b> , indicates insufficient optical input power to the module. Displays whether the Rx loss of signal alarm is <b>On</b> or <b>Off</b> . |
| Rx CDR loss of lock alarm<br>(Not available for SFP and SFP+ transceivers) | Receive CDR loss of lock. Loss of lock on the receive side of the CDR. Displays whether the Rx CDR loss of lock alarm is <b>On</b> or <b>Off</b> .                                 |
| Laser bias current low alarm threshold                                     | Displays the vendor-specified threshold for the laser bias current low alarm.                                                                                                      |
| Laser bias current high warning threshold                                  | Displays the vendor-specified threshold for the laser bias current high warning.                                                                                                   |

Table 48: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name                                                                    | Field Description                                                                |
|-------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| Laser bias current low warning threshold                                      | Displays the vendor-specified threshold for the laser bias current low warning.  |
| Laser output power high alarm threshold                                       | Displays the vendor-specified threshold for the laser output power high alarm.   |
| Laser output power low alarm threshold                                        | Displays the vendor-specified threshold for the laser output power low alarm.    |
| Laser output power high warning threshold                                     | Displays the vendor-specified threshold for the laser output power high warning. |
| Laser output power low warning threshold                                      | Displays the vendor-specified threshold for the laser output power low warning.  |
| Module temperature high alarm threshold                                       | Displays the vendor-specified threshold for the module temperature high alarm.   |
| Module temperature low alarm threshold                                        | Displays the vendor-specified threshold for the module temperature low alarm.    |
| Module temperature high warning threshold                                     | Displays the vendor-specified threshold for the module temperature high warning. |
| Module temperature low warning threshold                                      | Displays the vendor-specified threshold for the module temperature low warning.  |
| Module voltage high alarm threshold<br>(Not available for XFP transceivers)   | Displays the vendor-specified threshold for the module voltage high alarm.       |
| Module voltage low alarm threshold<br>(Not available for XFP transceivers)    | Displays the vendor-specified threshold for the module voltage low alarm.        |
| Module voltage high warning threshold<br>(Not available for XFP transceivers) | Displays the vendor-specified threshold for the module voltage high warning.     |
| Module voltage low warning threshold<br>(Not available for XFP transceivers)  | Displays the vendor-specified threshold for the module voltage low warning.      |
| Laser rx power high alarm threshold                                           | Displays the vendor-specified threshold for the laser Rx power high alarm.       |
| Laser rx power low alarm threshold                                            | Displays the vendor-specified threshold for the laser Rx power low alarm.        |
| Laser rx power high warning threshold                                         | Displays the vendor-specified threshold for the laser Rx power high warning.     |

Table 48: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name                           | Field Description                                                           |
|--------------------------------------|-----------------------------------------------------------------------------|
| Laser rx power low warning threshold | Displays the vendor-specified threshold for the laser Rx power low warning. |

## Sample Output

### show interfaces diagnostics optics xe-0/0/1 (SFP+ Transceiver)

```

user@host> show interfaces diagnostics optics xe-0/0/1
Physical interface: xe-0/0/1
  Laser bias current           : 4.968 mA
  Laser output power          : 0.4940 mW / -3.06 dBm
  Module temperature          : 27 degrees C / 81 degrees F
  Module voltage              : 3.2310 V
  Receiver signal average optical power : 0.0000
  Laser bias current high alarm : Off
  Laser bias current low alarm  : Off
  Laser bias current high warning : Off
  Laser bias current low warning : Off
  Laser output power high alarm  : Off
  Laser output power low alarm   : Off
  Laser output power high warning : Off
  Laser output power low warning : Off
  Module temperature high alarm  : Off
  Module temperature low alarm   : Off
  Module temperature high warning : Off
  Module temperature low warning : Off

| <b>Description</b>                | List log files, display log file contents, or display information about users who have logged in to the router or switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                    | <b>none</b> —List all log files.<br><br><b>&lt;all-lcc   lcc number   scc&gt;</b> —(TX Matrix routers only) (Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace <i>number</i> with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).<br><br><b>device-type</b> —(QFabric system only) (Optional) Display log messages for only one of the following device types: <ul style="list-style-type: none"><li>• <b>director-device</b>—Display logs for Director devices.</li><li>• <b>infrastructure-device</b>—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).</li><li>• <b>interconnect-device</b>—Display logs for Interconnect devices.</li><li>• <b>node-device</b>—Display logs for Node devices.</li></ul> |

**NOTE:** If you specify the **device-type** optional parameter, you must also specify either the **device-id** or **device-alias** optional parameter.

---

**(device-id | device-alias)**—If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

**filename**—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

**NOTE:** The *filename* parameter is mandatory for the QFabric system. If you did not configure a syslog filename, specify the default filename of messages.

**user <username>**—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include *username*, display logging information about the specified user.

**Required Privilege Level** trace

| <b>Output Fields</b>            | <a href="#">Table 49 on page 1017</a> describes the output fields for the <b>show ntp associations</b> command. Output fields are listed in the approximate order in which they appear.  |

**Table 49: show ntp associations Output Fields**

| Field Name    | Field Description                                                                                                               |
|---------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>remote</b> | Address or name of the remote NTP peer.                                                                                         |
| <b>refid</b>  | Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of <b>0.0.0.0</b> . |
| <b>st</b>     | Stratum of the remote peer.                                                                                                     |
| <b>t</b>      | Type of peer: <b>b</b> (broadcast), <b>l</b> (local), <b>m</b> (multicast), or <b>u</b> (unicast).                              |
| <b>when</b>   | When the last packet from the peer was received.                                                                                |
| <b>poll</b>   | Polling interval, in seconds.                                                                                                   |
| <b>reach</b>  | Reachability register, in octal.                                                                                                |
| <b>delay</b>  | Current estimated delay of the peer, in milliseconds.                                                                           |
| <b>offset</b> | Current estimated offset of the peer, in milliseconds.                                                                          |
| <b>disp</b>   | Current estimated dispersion of the peer, in milliseconds.                                                                      |

Table 49: show ntp associations Output Fields (*continued*)

| Field Name       | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>peer-name</i> | <p>Peer name and status of the peer in the clock selection process:</p> <ul style="list-style-type: none"> <li>• space—Discarded because of a high stratum value or failed sanity checks.</li> <li>• x—Designated "falseticker" by the intersection algorithm.</li> <li>• .—Culled from the end of the candidate list.</li> <li>• — —Discarded by the clustering algorithm.</li> <li>• +—Included in the final selection set.</li> <li>• #—Selected for synchronization, but the distance exceeds the maximum.</li> <li>• *—Selected for synchronization.</li> <li>• o—Selected for synchronization, but the packets-per-second (pps) signal is in use.</li> </ul> |

## Sample Output

| <b>Output Fields</b>            | <a href="#">Table 50 on page 1019</a> describes the output fields for the <b>show ntp status</b> command. Output fields are listed in the approximate order in which they appear.        |

**Table 50: show ntp status Output Fields**

| Field Name                  | Field Description                                                                                                                                                                                                                                         |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>status</b>               | System status word, a code representing the status items listed.                                                                                                                                                                                          |
| <b>leap_none</b>            | Indicates a normal synchronized state with no leap seconds imminent. Other options could be <b>leap_add_sec</b> , <b>leap_del_sec</b> , or <b>leap_alarm</b> , indicating a leap second will be added, deleted, or a leap second requirement is upcoming. |
| <b>sync_ntp</b>             | Indicates the current synchronization source, in this case, an NTP server. Other options include <b>sync_alarm</b> and <b>sync_unspec</b> , both indicating that the router has not been synched.                                                         |
| <b>x events</b>             | Indicates the number of events that have occurred since that last code change. An event is often the receipt of an NTP polling message.                                                                                                                   |
| <b>event_peer/strat_chg</b> | Describes the most recent event, in this case, the stratum of the peer server changed.                                                                                                                                                                    |
| <b>version</b>              | A detailed description of the version of NTP being used.                                                                                                                                                                                                  |
| <b>processor</b>            | Indicates the current hardware platform and version of the processor.                                                                                                                                                                                     |
| <b>system</b>               | Detailed description of the name and version of the operating system in use.                                                                                                                                                                              |
| <b>leap</b>                 | The number of leap seconds in use.                                                                                                                                                                                                                        |

Table 50: show ntp status Output Fields (*continued*)

| Field Name            | Field Description                                                                                                                                                                                                                         |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>stratum</b>        | The stratum of the peer server. Anything greater than 1 is a secondary reference source, and the number roughly represents the number of hops away from the stratum 1 server.. Stratum 1 is a primary reference, such as an atomic clock. |
| <b>precision</b>      | The precision of the peer clock, how precisely the frequency and time can be maintained with this particular timekeeping system.                                                                                                          |
| <b>rootdelay</b>      | The total roundtrip delay to the primary reference source, in seconds.                                                                                                                                                                    |
| <b>rootdispersion</b> | The maximum error relative to the primary reference source, in seconds.                                                                                                                                                                   |
| <b>peer</b>           | An identification number of the peer in use.                                                                                                                                                                                              |
| <b>refid</b>          | Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of 0.0.0.0.                                                                                                                   |
| <b>reftime</b>        | The local time, in timestamp format, when the local clock was last updated. If the local clock has never been synchronized, the value is zero.                                                                                            |
| <b>poll</b>           | The NTP broadcast message polling interval, in seconds.                                                                                                                                                                                   |
| <b>clock</b>          | The current time on the local router clock.                                                                                                                                                                                               |
| <b>state</b>          | The current mode of NTP operation, where 1 is symmetric active, 2 is symmetric passive, 3 is client, 4 is server, and 5 is broadcast.                                                                                                     |
| <b>offset</b>         | Current estimated offset of the peer, in milliseconds. Indicates the time difference between the reference clock and the local clock.                                                                                                     |
| <b>frequency</b>      | The frequency of the clock.                                                                                                                                                                                                               |
| <b>jitter</b>         | Indicates the magnitude of jitter, in milliseconds, between several time queries.                                                                                                                                                         |
| <b>stability</b>      | A measure of how well this clock can maintain a constant frequency.                                                                                                                                                                       |

## Sample Output

### show ntp status

```

user@host> show ntp status
assID=0 status=0544 leap_none, sync_local_proto, 4 events, event_peer/strat_chg,
version="ntpd 4.2.2p1@1.1570-o Tue May 19 13:57:55 UTC 2009 (1)",
processor="x86_64", system="Linux/2.6.18-164.el5", leap=00, stratum=4,

## show subscribers

---

**Syntax**    show subscribers  
              <detail | extensive | terse>  
              <aci-interface-set-name *aci-interface-set-name*>  
              <address *address*>  
              <agent-circuit-identifier *agent-circuit-identifier-substring*>  
              <client-type *client-type*>  
              <count>  
              <id>  
              <interface *interface*>  
              <logical-system *logical-system*>  
              <mac-address *mac-address*>  
              <physical-interface *physical-interface-name*>  
              <profile-name *profile-name*>  
              <routing-instance *routing-instance*>  
              <stacked-vlan-id *stacked-vlan-id*>  
              <subscriber-state *subscriber-state*>  
              <user-name *user-name*>  
              <vci *vci-identifier*>  
              <vpi *vpi-identifier*>  
              <vlan-id *vlan-id*>

**Release Information**    Command introduced in Junos OS Release 9.3.  
                              Command introduced in Junos OS Release 9.3 for EX Series switches.  
                              **client-type**, **mac-address**, **subscriber-state**, and **extensive** options introduced in Junos OS Release 10.2.  
                              **count** option usage with other options introduced in Junos OS Release 10.2.  
                              Command introduced in Junos OS Release 11.1 for the QFX Series.  
                              Options **aci-interface-set-name** and **agent-circuit-identifier** introduced in Junos OS Release 12.2.  
                              The **physical-interface** and **user-name** options introduced in Junos OS Release 12.3.  
                              Options **vci** and **vpi** introduced in Junos OS Release 12.3R3 and supported in later 12.3Rx releases.  
                              Options **vci** and **vpi** supported in Junos OS Release 13.2 and later releases. (Not supported in Junos OS Release 13.1.)

**Description**    Display information for active subscribers.

**Options**    **detail | extensive | terse**—(Optional) Display the specified level of output.

**aci-interface-set-name**—(Optional) Display all dynamic subscriber sessions that use the specified agent circuit identifier (ACI) interface set. Use the ACI interface set name generated by the router, such as aci-1003-ge-1/0/0.4001, and not the actual ACI value found in the DHCP or PPPoE control packets.

**address**—(Optional) Display subscribers whose IP address matches the specified address. You must specify the IPv4 or IPv6 address prefix without a netmask (for example, 192.168.17.1). If you specify the IP address as a prefix with a netmask (for example, 192.168.17.1/32), the router displays a message that the IP address is invalid, and rejects the command.

***agent-circuit-identifier-substring***—(Optional) Display all dynamic subscriber sessions whose ACI value matches the specified substring.

***client-type***—(Optional) Display subscribers whose client type matches the specified client type (DHCP, L2TP, PPP, PPPOE, VLAN, or static).

***count***—(Optional) Display the count of total subscribers and active subscribers for any specified option. You can use the ***count*** option alone or with the ***address***, ***client-type***, ***interface***, ***logical-system***, ***mac-address***, ***profile-name***, ***routing-instance***, ***stacked-vlan-id***, ***subscriber-state***, or ***vlan-id*** options.

***id***—(Optional) Display a specific subscriber session whose session id matches the specified subscriber ID. You can display subscriber IDs by using the ***show subscribers extensive*** or the ***show subscribers interface extensive*** commands.

***interface***—(Optional) Display subscribers whose interface matches the specified interface.

***logical-system***—(Optional) Display subscribers whose logical system matches the specified logical system.

***mac-address***—(Optional) Display subscribers whose MAC address matches the specified MAC address.

***physical-interface-name***—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose physical interface matches the specified physical interface.

***profile-name***—(Optional) Display subscribers whose dynamic profile matches the specified profile name.

***routing-instance***—(Optional) Display subscribers whose routing instance matches the specified routing instance.

***stacked-vlan-id***—(Optional) Display subscribers whose stacked VLAN ID matches the specified stacked VLAN ID.

***subscriber-state***—(Optional) Display subscribers whose subscriber state matches the specified subscriber state (ACTIVE, CONFIGURED, INIT, TERMINATED, or TERMINATING).

***user-name***—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose username matches the specified subscriber name.

***vci-identifier***—(MX Series routers with MPCs and ATM MICs with SFP only) (Optional) Display active ATM subscribers whose ATM virtual circuit identifier (VCI) matches the specified VCI identifier. The range of values is **0** through **255**.

***vpi-identifier***—(MX Series routers with MPCs and ATM MICs with SFP only) (Optional) Display active ATM subscribers whose ATM virtual path identifier (VPI) matches the specified VPI identifier. The range of values is **0** through **65535**.

***vlan-id***—(Optional) Display subscribers whose VLAN ID matches the specified VLAN ID.

**NOTE:** Due to display limitations, logical system and routing instance output values are truncated when necessary.

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Output Fields** [Table 51 on page 1025](#) lists the output fields for the **show subscribers** command. Output fields are listed in the approximate order in which they appear.

**Table 51: show subscribers Output Fields**

| Field Name                        | Field Description                                                                                                                                                                                                                                   |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b>                  | Interface associated with the subscriber. The router or switch displays subscribers whose interface matches or begins with the specified interface.<br><br>The * character indicates a continuation of addresses for the same session.              |
| <b>IP Address/VLAN ID</b>         | Subscriber IP address or VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i><br><br>No IP address or VLAN ID is assigned to an L2TP tunnel-switched session. For these subscriber sessions the value is <b>Tunnel-switched</b> . |
| <b>User Name</b>                  | Name of subscriber.                                                                                                                                                                                                                                 |
| <b>LS:RI</b>                      | Logical system and routing instance associated with the subscriber.                                                                                                                                                                                 |
| <b>Type</b>                       | Subscriber client type (DHCP, L2TP, PPP, PPPoE, STATIC-INTERFACE, VLAN).                                                                                                                                                                            |
| <b>IP Address</b>                 | Subscriber IPv4 address.                                                                                                                                                                                                                            |
| <b>IP Netmask</b>                 | Subscriber IP netmask.                                                                                                                                                                                                                              |
| <b>Primary DNS Address</b>        | IP address of primary DNS server.                                                                                                                                                                                                                   |
| <b>Secondary DNS Address</b>      | IP address of secondary DNS server.                                                                                                                                                                                                                 |
| <b>Primary WINS Address</b>       | IP address of primary WINS server.                                                                                                                                                                                                                  |
| <b>Secondary WINS Address</b>     | IP address of secondary WINS server.                                                                                                                                                                                                                |
| <b>IPv6 Address</b>               | Subscriber IPv6 address, or multiple addresses.                                                                                                                                                                                                     |
| <b>IPv6 Prefix</b>                | Subscriber IPv6 prefix. If you are using DHCPv6 prefix delegation, this is the delegated prefix.                                                                                                                                                    |
| <b>IPv6 User Prefix</b>           | IPv6 prefix obtained through ND/RA.                                                                                                                                                                                                                 |
| <b>IPv6 Address Pool</b>          | Subscriber IPv6 address pool. The IPv6 address pool is used to allocate IPv6 prefixes to the DHCPv6 clients.                                                                                                                                        |
| <b>IPv6 Network Prefix Length</b> | Length of the network portion of the IPv6 address.                                                                                                                                                                                                  |
| <b>IPv6 Prefix Length</b>         | Length of the subscriber IPv6 prefix.                                                                                                                                                                                                               |

Table 51: show subscribers Output Fields (*continued*)

| Field Name                        | Field Description                                                                                                                                                                                                                                                                   |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Logical System</b>             | Logical system associated with the subscriber.                                                                                                                                                                                                                                      |
| <b>Routing Instance</b>           | Routing instance associated with the subscriber.                                                                                                                                                                                                                                    |
| <b>Interface Type</b>             | Whether the subscriber interface is <b>Static</b> or <b>Dynamic</b> .                                                                                                                                                                                                               |
| <b>Interface Set</b>              | Internally generated name of the dynamic ACI interface set used by the subscriber session.                                                                                                                                                                                          |
| <b>Interface Set Type</b>         | Interface type of the ACI interface set: <b>Dynamic</b> . This is the only ACI interface set type currently supported.                                                                                                                                                              |
| <b>Interface Set Session ID</b>   | Identifier of the dynamic ACI interface set entry in the session database.                                                                                                                                                                                                          |
| <b>Underlying Interface</b>       | Name of the underlying interface for the subscriber session.                                                                                                                                                                                                                        |
| <b>Dynamic Profile Name</b>       | Dynamic profile used for the subscriber.                                                                                                                                                                                                                                            |
| <b>Dynamic Profile Version</b>    | Version number of the dynamic profile used for the subscriber.                                                                                                                                                                                                                      |
| <b>MAC Address</b>                | MAC address associated with the subscriber.                                                                                                                                                                                                                                         |
| <b>State</b>                      | Current state of the subscriber session ( <b>Init</b> , <b>Configured</b> , <b>Active</b> , <b>Terminating</b> , <b>Tunneled</b> ).                                                                                                                                                 |
| <b>L2TP State</b>                 | Current state of the L2TP session, <b>Tunneled</b> or <b>Tunnel-switched</b> . When the value is <b>Tunnel-switched</b> , two entries are displayed for the subscriber; the first entry is at the LNS interface on the LTS and the second entry is at the LAC interface on the LTS. |
| <b>Tunnel switch Profile Name</b> | Name of the L2TP tunnel switch profile that initiates tunnel switching.                                                                                                                                                                                                             |
| <b>Local IP Address</b>           | IP address of the local gateway (LAC).                                                                                                                                                                                                                                              |
| <b>Remote IP Address</b>          | IP address of the remote peer (LNS).                                                                                                                                                                                                                                                |
| <b>VLAN Id</b>                    | VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .                                                                                                                                                                                                            |
| <b>Stacked VLAN Id</b>            | Stacked VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .                                                                                                                                                                                                    |
| <b>RADIUS Accounting ID</b>       | RADIUS accounting ID associated with the subscriber.                                                                                                                                                                                                                                |
| <b>Agent Circuit ID</b>           | Option 82 agent circuit ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.                                                                                |
| <b>Agent Remote ID</b>            | Option 82 agent remote ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.                                                                                 |
| <b>DHCP Relay IP Address</b>      | IP address used by the DHCP relay agent.                                                                                                                                                                                                                                            |

Table 51: show subscribers Output Fields (*continued*)

| Field Name                                  | Field Description                                                                                                                                                                                                                                     |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ATM VPI</b>                              | (MX Series routers with MPCs and ATM MICs with SFP only) ATM virtual path identifier (VPI) on the subscriber's physical interface.                                                                                                                    |
| <b>ATM VCI</b>                              | (MX Series routers with MPCs and ATM MICs with SFP only) ATM virtual circuit identifier (VCI) for each VPI configured on the subscriber interface.                                                                                                    |
| <b>Login Time</b>                           | Date and time at which the subscriber logged in.                                                                                                                                                                                                      |
| <b>Effective shaping-rate</b>               | Actual downstream traffic shaping rate for the subscriber, in kilobits per second.                                                                                                                                                                    |
| <b>IPv4 rpf-check Fail Filter Name</b>      | Name of the filter applied by the dynamic profile to IPv4 packets that fail the RPF check.                                                                                                                                                            |
| <b>IPv6 rpf-check Fail Filter Name</b>      | Name of the filter applied by the dynamic profile to IPv6 packets that fail the RPF check.                                                                                                                                                            |
| <b>DHCP Options</b>                         | len = number of hex values in the message. The hex values specify the type, length, value (TLV) for DHCP options, as defined in RFC 2132.                                                                                                             |
| <b>Session ID</b>                           | ID number for a subscriber service session.                                                                                                                                                                                                           |
| <b>Underlying Session ID</b>                | For DHCPv6 subscribers on a PPPoE network, displays the session ID of the underlying PPPoE interface.                                                                                                                                                 |
| <b>Service Sessions</b>                     | Number of service sessions (that is, a service activated using RADIUS CoA) associated with the subscribers.                                                                                                                                           |
| <b>Service Session Name</b>                 | Service session profile name.                                                                                                                                                                                                                         |
| <b>Session Timeout (seconds)</b>            | Number of seconds of access provided to the subscriber before the session is automatically terminated.                                                                                                                                                |
| <b>Idle Timeout (seconds)</b>               | Number of seconds subscriber can be idle before the session is automatically terminated.                                                                                                                                                              |
| <b>IPv6 Delegated Address Pool</b>          | Name of the pool used for DHCPv6 prefix delegation.                                                                                                                                                                                                   |
| <b>IPv6 Delegated Network Prefix Length</b> | Length of the prefix configured for the IPv6 delegated address pool.                                                                                                                                                                                  |
| <b>IPv6 Interface Address</b>               | Address assigned by the Framed-Ipv6-Prefix AAA attribute.                                                                                                                                                                                             |
| <b>IPv6 Framed Interface Id</b>             | Interface ID assigned by the Framed-Interface-Id AAA attribute.                                                                                                                                                                                       |
| <b>ADF IPv4 Input Filter Name</b>           | Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style. |

Table 51: show subscribers Output Fields (*continued*)

| Field Name                         | Field Description                                                                                                                                                                                                                                      |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ADF IPv4 Output Filter Name</b> | Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style. |
| <b>ADF IPv6 Input Filter Name</b>  | Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.  |
| <b>ADF IPv6 Output Filter Name</b> | Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style. |
| <b>IPv4 Input Filter Name</b>      | Name assigned to the IPv4 input filter (client or service session).                                                                                                                                                                                    |
| <b>IPv4 Output Filter Name</b>     | Name assigned to the IPv4 output filter (client or service session).                                                                                                                                                                                   |
| <b>IPv6 Input Filter Name</b>      | Name assigned to the IPv6 input filter (client or service session).                                                                                                                                                                                    |
| <b>IPv6 Output Filter Name</b>     | Name assigned to the IPv6 output filter (client or service session).                                                                                                                                                                                   |
| <b>IFL Input Filter Name</b>       | Name assigned to the logical interface input filter (client or service session).                                                                                                                                                                       |
| <b>IFL Output Filter Name</b>      | Name assigned to the logical interface output filter (client or service session).                                                                                                                                                                      |

## Sample Output

### show subscribers (IPv4)

```

user@host> show subscribers
Interface          IP Address/VLAN ID  User Name          LS:RI
ge-1/3/0.1073741824 100                 WHOLESALE-CLIENT  default:default
demux0.1073741824   100.0.0.10         RETAILER1-CLIENT  test1:retailer1
demux0.1073741825   101.0.0.3          RETAILER2-CLIENT  test1:retailer2
demux0.1073741826   102.0.0.3          RETAILER2-CLIENT  test1:retailer2

```

### show subscribers (IPv6)

```

user@host> show subscribers
Interface          IP Address/VLAN ID  User Name          LS:RI
ge-1/0/0.0         2001::c0:0:0:0/74  WHOLESALE-CLIENT  default:default
*                  2002::1/128        subscriber-25      default:default

```

### show subscribers (IPv4 and IPv6 Dual Stack)

```

user@host> show subscribers
Interface          IP Address/VLAN ID  User Name
LS:RI
demux0.1073741834  0x8100.1002 0x8100.1
default:default
demux0.1073741835  0x8100.1001 0x8100.1
default:default
pp0.1073741836     61.1.1.1        dualstackuser1@ISP1.com

```

```

default:ASP-1
*                2041:1:1::/48
*                2061:1:1:1::/64
pp0.1073741837   23.1.1.3                dualstackuser2@ISP1.com
default:ASP-1
*                2001:1:2:5::/64

```

### show subscribers (LNS on MX Series Routers)

```

user@host> show subscribers
Interface      IP Address/VLAN ID  User Name      LS:RI
si-4/0/0.1     192.168.4.1         xyz@example.com default:default

```

### show subscribers (L2TP Switched Tunnels)

```

user@host> show subscribers
Interface      IP Address/VLAN ID  User Name      LS:RI
si-2/1/0.1073741842 Tunnel-switched    ap@lts.com     default:default

si-2/1/0.1073741843 Tunnel-switched    ap@lts.com     default:default

```

### show subscribers client-type dhcp detail

```

user@host> show subscribers client-type dhcp detail
Type: DHCP
IP Address: 100.20.9.7
IP Netmask: 255.255.0.0
Logical System: default
Routing Instance: default
Interface: demux0.1073744127
Interface type: Dynamic
Dynamic Profile Name: dhcp-demux-prof
MAC Address: 00:10:95:00:00:98
State: Active
Radius Accounting ID: jnpr :2304
Login Time: 2009-08-25 14:43:52 PDT

Type: DHCP
IP Address: 100.20.10.7
IP Netmask: 255.255.0.0
Logical System: default
Routing Instance: default
Interface: demux0.1073744383
Interface type: Dynamic

MAC Address: 00:10:94:00:01:f3
State: Active
Radius Accounting ID: jnpr :2560
Login Time: 2009-08-25 14:43:56 PDT

```

### show subscribers count

```

user@host> show subscribers count
Total Subscribers: 188, Active Subscribers: 188

```

### show subscribers address detail (IPv6)

```

user@host> show subscribers address 100.16.12.137 detail

```

```
Type: PPPoE
User Name: pppoeTerV6User1Svc
IP Address: 100.16.12.137
IP Netmask: 255.0.0.0
IPv6 User Prefix: 1016:0:0:c88::/64
Logical System: default
Routing Instance: default
Interface: pp0.1073745151
Interface type: Dynamic
Underlying Interface: demux0.8201
Dynamic Profile Name: pppoe-client-profile
MAC Address: 00:0d:02:01:00:01
Session Timeout (seconds): 31622400
Idle Timeout (seconds): 86400
State: Active
Radius Accounting ID: jnpr demux0.8201:6544
Session ID: 6544
Agent Circuit ID: if13720
Agent Remote ID: if13720
Login Time: 2012-05-21 13:37:27 PDT
Service Sessions: 1
```

#### show subscribers detail (IPv4)

```
user@host> show subscribers detail
Type: DHCP
IP Address: 100.20.9.7
IP Netmask: 255.255.0.0
Primary DNS Address: 192.168.17.1
Secondary DNS Address: 192.168.17.2
Primary WINS Address: 192.168.22.1
Secondary WINS Address: 192.168.22.2
Logical System: default
Routing Instance: default
Interface: demux0.1073744127
Interface type: Dynamic

| <b>Description</b>              | Display active system alarms.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | This command has no options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Additional Information</b>   | <p>System alarms are preset. They include a <i>configuration</i> alarm that appears when no rescue configuration alarm is set and a <i>license</i> alarm that appears when a software feature is configured and no valid license is configured for the feature. On EX6200 switches, an alarm can be triggered by an internal link error. For more information about system alarms, see the <i>Junos OS Administration Library for Routing Devices</i>.</p> <p>In Junos OS release 11.1 and later, alarms for fans also show the slot number of the malfunctioning fans in the CLI output.</p> <p>Starting with Junos OS Release 13.2, you can view degraded fabric alarms on a routing matrix based on TX Matrix Plus router with 3D SIBs. The alarm indicates that the source FPC is running with a degraded fabric condition. This alarm is an early warning of a possible fabric black-hole condition. When the degraded fabric alarm is raised on the source FPC, you can take remedial action to avoid a fabric black-hole condition. The degraded fabric alarm is raised on the source FPC if both the following conditions are met:</p> <ul style="list-style-type: none"> <li>• The active Packet Forwarding Engine destinations are reachable on one or no active switching planes.</li> <li>• At least one of the inactive switching planes has a fault that causes the destination Packet Forwarding Engine to become unreachable.</li> </ul> |

| <b>Description</b> | Information about the alarm.                                  |

## Sample Output

### show system alarms

```

user@host> show system alarms
2 alarms currently active
Alarm time          Class    Description
2005-02-24 17:29:34 UTC  Minor    IPsec VPN tunneling usage requires a
license
2005-02-24 17:29:34 UTC  Minor    Rescue configuration is not sent

```

### show system alarms (Fan Tray)

```

user@host> show system alarms
4 alarms currently active
Alarm time          Class    Description
2010-11-11 20:27:38 UTC  Major    Side Fan Tray 7 Failure
2010-11-11 20:27:13 UTC  Minor    Side Fan Tray 7 Overspeed
2010-11-11 20:27:13 UTC  Major    Side Fan Tray 5 Failure
2010-11-11 20:27:13 UTC  Major    Side Fan Tray 0 Failure

```

### show system alarms (QFX Series)

```

user@switch> show system alarms
2 alarms currently active
Alarm time Class Description
2005-02-24 17:29:34 UTC Minor Rescue configuration is not sent

```

### show system alarms (EX6200)

```

user@switch> show system alarms
2 alarms currently active
Alarm time          Class    Description
2013-04-05 16:51:41 PDT  Major    FPC 8 internal link errors detected
2013-04-04 18:05:35 PDT  Minor    Rescue configuration is not set

```

### show system alarms (TX Matrix Plus router with 3D SIBs)

```

user@router> show system alarms

sfc0-re0:
-----
2 alarms currently active

| <b>Description</b>                                    | Display the state and checksum values for file systems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>                                        | <p><b>none</b>—Display the state and checksum values for all file systems.</p> <p><b>all-chassis</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display file system MD5 hash and permissions information for all of the chassis.</p> <p><b>all-lcc</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display file system MD5 hash and permissions information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display file system MD5 hash and permissions information for all T1600 or T4000 routers connected to the TX Matrix Plus router.</p> <p><b>all-members</b>—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on all members of the Virtual Chassis configuration.</p> <p><b>lcc <i>number</i></b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display file system MD5 hash and permissions information for a specific T640 router</p> |

that is connected to the TX Matrix router. On a TX Matrix Plus router, display file system MD5 hash and permissions information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**infrastructure *name***—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for a fabric control Routing Engine or a fabric control Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for the Interconnect device.

**local**—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on the local Virtual Chassis member.

**member *member-id***—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for the Node group

**root-only**—(Optional) Check only the root (/) file system. On a QFabric system, you can check the root (/) file system on the infrastructure (fabric manager Routing Engine and fabric control Routing Engine), Interconnect device, or Node group.

**scc**—(TX Matrix routers only) (Optional) Display file system MD5 hash and permissions information for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display file system MD5 hash and permissions information for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**Additional Information** To redirect the output to a file, issue the following command:

***ssh device-name 'show system audit root-only' > output-file***

If you save the output of the **show system audit root-only** command to a file, you can compare it to subsequent output from the command to determine whether anything has changed.

By default, when you issue the **show system audit** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

| <b>Description</b>                    | Display initial messages generated by the system kernel upon startup. These messages are the contents of <code>/var/run/dmesg.boot</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>                        | <b>none</b> —Display all boot time messages.<br><br><b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display boot time messages for all of the chassis.<br><br><b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for all T640 routers connected to a TX Matrix router. On a TX Matrix Plus router, display boot time messages for all connected T1600 or T4000 LCCs.<br><br><b>all-members</b> —(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on all members of the Virtual Chassis configuration. |

**infrastructure *name***—(QFabric systems only) (Optional) Display boot time messages on the fabric control Routing Engine or fabric manager Routing engines.

**interconnect-device *name***—(QFabric systems only) (Optional) Display boot time messages on the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for a specific T640 router connected to a TX Matrix router. On a TX Matrix Plus router, display boot time messages for a specific router connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display boot time messages on the Node group.

**scc**—(TX Matrix routers only) (Optional) Display boot time messages for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display boot time messages for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system boot-messages** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Required Privilege Level** view

| <b>Description</b>                    | Display information about the buffer pool that the Routing Engine uses for local traffic. Local traffic is the routing and management traffic that is exchanged between the Routing Engine and the Packet Forwarding Engine within the router or switch, as well as the routing and management traffic from IP (that is, from OSPF, BGP, SNMP, ping operations, and so on).                                                                                                              |
| <b>Options</b>                        | <b>none</b> —Show all buffer statistics.<br><br><b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show buffer statistics for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, show buffer statistics for all routers connected to the TX Matrix Plus router.<br><br><b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show buffer statistics for all of the chassis. |

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for all members of the Virtual Chassis configuration.

**infrastructure *name***—(QFabric systems only) (Optional) Show buffer statistics for a fabric control Routing Engine or a fabric control Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Show buffer statistics for the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show buffer statistics for a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, show buffer statistics for a specific router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Show buffer statistics for the Node group

**sfc**—(TX Matrix Plus routers only) (Optional) Show buffer statistics for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system buffers** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

A special type of memory buffer called a *cluster* is 2 KB in size. For more information, see *The Design and Implementation of the 4.4BSD Operation System* by McKusic, Bostic, Karels, and Quarterman.

|                          |                                                                                                                                                                                                                                                                                                                                                                                     |

| Output Fields            | <a href="#">Table 53 on page 1061</a> describes the output fields for the <b>show system buffers</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                               |

Table 53: show system buffers Output Fields

| Field Name                                           | Field Description                                                                                                                                                                                                                                      |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mbufs in use</b>                                  | Memory buffers (mbufs) are 128-byte buffers that are used for various purposes inside the kernel. Each memory buffer has a type, and the output itemizes the amount allocated for each type. Types with no memory buffers allocated are not displayed. |
| <b>mbufs allocated to packet headers</b>             | Number of memory buffers currently holding packet headers                                                                                                                                                                                              |
| <b>mbufs allocated to control blocks</b>             | Number of memory buffers currently holding the state for sockets.                                                                                                                                                                                      |
| <b>mbufs allocated to send data</b>                  | Number of memory buffers currently holding socket send data.                                                                                                                                                                                           |
| <b>mbufs allocated to pfe refill data</b>            | Number of memory buffers currently holding Packet Forwarding Engine refill data.                                                                                                                                                                       |
| <b>mbufs allocated to fxp data</b>                   | Number of memory buffers currently holding fxp data.                                                                                                                                                                                                   |
| <b>mbufs allocated to socket names and addresses</b> | Number of memory buffers currently holding addresses for sockets.                                                                                                                                                                                      |
| <b>mbuf clusters in use</b>                          | Allocation statistics for memory buffer clusters.                                                                                                                                                                                                      |
| <b>allocated to network</b>                          | Total amount of memory in use by the networking and interprocess communication (IPC) code.                                                                                                                                                             |
| <b>requests for memory denied</b>                    | Number of times a memory allocation request within the IPC and networking code failed.                                                                                                                                                                 |
| <b>requests for memory delayed</b>                   | Number of times a memory allocation request within the IPC and networking code was postponed.                                                                                                                                                          |
| <b>calls to protocol drain routines</b>              | Number of times a memory allocation request within the IPC and networking code triggered a memory reclamation attempt.                                                                                                                                 |

## Sample Output

### show system buffers

```

user@host> show system buffers
397/893/1290 mbufs in use (current/cache/total)
395/331/726/30000 mbuf clusters in use (current/cache/total/max)
384/256 mbuf+clusters out of packet secondary zone in use (current/cache)
0/0/0/0 4k (page size) jumbo clusters in use (current/cache/total/max)
0/0/0/0 9k jumbo clusters in use (current/cache/total/max)
0/0/0/0 16k jumbo clusters in use (current/cache/total/max)
889K/885K/1774K bytes allocated to network (current/cache/total)
0/0/0 requests for mbufs denied (mbufs/clusters/mbuf+clusters)
0/0/0 requests for jumbo clusters denied (4k/9k/16k)
0/5/1024 sfbufs in use (current/peak/max)

```

```
0 requests for sbufs denied
0 requests for sbufs delayed
0 requests for I/O initiated by sendfile
0 calls to protocol drain routines
```

#### show system buffers scc (TX Matrix Router)

```
user@host> show system buffers scc
213 mbufs in use:
    11 mbufs allocated to packet headers
    26 mbufs allocated to socket names and addresses
    2 mbufs allocated to socket options
    17 mbufs allocated to socket send data
    2 mbufs allocated to pfe data
    155 mbufs allocated to fxp data (rx)
    511 mbufs allocated to <mbuf type 86>
    256 mbufs allocated to <mbuf type 92>
924/1162 mbuf clusters in use
2788 Kbytes allocated to network (75% in use)
0 requests for memory denied
0 requests for memory delayed
0 calls to protocol drain routines
```

#### show system buffers sfc (TX Matrix Plus Router)

```
user@host> show system buffers sfc 0

**Table 54: show system certificate Output Fields**

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Certificate identifier</b>   | Unique identifier associated with a certificate. The certificate identifier is the common name of the subject.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Issuer</b><br><b>Subject</b> | Information about the certificate issuer and the distinguished name (DN) of the issuer, respectively: <ul style="list-style-type: none"> <li>• <b>Organization</b>—Name of the owner's organization.</li> <li>• <b>Organizational unit</b>—Name of the owner's department.</li> <li>• <b>Country</b>—Two-character country code in which the owner's system is located.</li> <li>• <b>State</b>—State in the USA in which the owner is using the certificate.</li> <li>• <b>Locality</b>—City in which the owner's system is located.</li> <li>• <b>Common name</b>—Name of the owner of the certificate.</li> <li>• <b>E-mail address</b>—E-mail address of the owner of the certificate.</li> </ul> |
| <b>Validity</b>                 | When a certificate is valid.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Signature algorithm</b>      | Encryption algorithm applied to the installed certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Public key algorithm</b>     | Encryption algorithm applied to the public key.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Sample Output

### show system certificate

```
user@host> show system certificate
Certificate identifier: Dallas-v3
Issuer:
Organization: Juniper Networks, Organizational unit: Juniper CA,
Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas CA,
E-mail address:ca@juniper.net
Subject:
Organization: Juniper Networks, Organizational unit: Juniper CA,
Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas-v3,
E-mail address:ca@juniper.net
Validity:
Not before: Mar 13 03:23:25 2004 GMT
Not after: Mar 24 03:23:25 2014 GMT
Signature algorithm: sha1WithRSAEncryption
Public key algorithm: dsaEncryption
```

### show system certificate (QFX Series)

```
user@host> show system certificate
Certificate identifier: Dallas-v3
Issuer:
Organization: Juniper Networks, Organizational unit: Juniper CA,
Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas CA,
E-mail address:ca@juniper.net
Subject:

## Sample Output

### show system commit

```
user@host> show system commit
0   2003-07-28 19:14:04 PDT by root via other
1   2003-07-25 22:01:36 PDT by regress via cli
2   2003-07-25 22:01:32 PDT by regress via cli
3   2003-07-25 21:30:13 PDT by root via button
4   2003-07-25 13:46:48 PDT by regress via cli
5   2003-07-25 05:33:21 PDT by root via autoinstall
...
rescue 2002-05-10 15:32:03 PDT by root via other
```

### show system commit (At a Particular Time)

```
user@host> show system commit
commit requested by root via cli at Tue May  7 15:59:00 2002
```

### show system commit (At the Next Reboot)

```
user@host> show system commit
commit requested by root via cli at reboot
```

### show system commit (Rollback Pending)

```
user@host> show system commit
0 2005-01-05 15:00:37 PST by root via cli commit confirmed, rollback in 3mins
```

### show system commit (QFX Series)

```
user@switch> show system commit
0 2011-11-25 19:17:49 PST by root via cli
```

## show system configuration archival

---

**Syntax**    show system configuration archival

**Release Information**    Introduced in Junos OS Release 7.6.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Display directory and number of files queued for archival transfer.

**NOTE:** The [edit system configuration] hierarchy is not available on QFabric systems.

---

**Options**    This command has no options.

**Required Privilege Level**    maintenance

**List of Sample Output**    [show system configuration archival on page 1070](#)

### Sample Output

show system configuration archival

```
user@host> show system configuration archival

/var/transfer/config/:
total 8
```

## show system configuration rescue

**sfc** option introduced for the TX Matrix Plus router in Junos OS Release 9.6.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display information about the active IP sockets on the Routing Engine. Use this command to verify which servers are active on a system and what connections are currently in progress.

**Options** **none**—Display information about all active IP sockets on the Routing Engine.

**extensive**—(Optional) Display exhaustive system process information, which, for TCP connections, includes the TCP control block. This option is useful for debugging TCP connections.

**all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system connection activity for all the routers in the chassis.

**all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system connection activity for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system connection activity for all connected T1600 or T4000 LCCs

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for all members of the Virtual Chassis configuration.

**inet | inet6**—(Optional) Display IPv4 connections or IPv6 connections, respectively.

**infrastructure name**—(QFabric systems only) (Optional) Display system connection activity for the fabric control Routing Engines or fabric manager Routing Engines.

**interconnect-device name**—(QFabric systems only) (Optional) Display system connection activity for the Interconnect device.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system connection activity for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system connection activity for a specific router that is connected to the TX Matrix Plus router. Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display system connection activity for the Node group.

**scc**—(TX Matrix routers only) (Optional) Display system connection activity for the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix routers only) (Optional) Display system connection activity for the TX Matrix Plus router.

**show-routing-instances**—(Optional) Display routing instances.

**Additional Information** By default, when you issue the **show system connections** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** [Table 56 on page 1075](#) describes the output fields for the **show system connections** command. Output fields are listed in the approximate order in which they appear.

**Table 56: show system connections Output Fields**

| Field Name    | Field Description                                                                                |
|---------------|--------------------------------------------------------------------------------------------------|
| <b>Proto</b>  | Protocol of the socket: IP, TCP, or UDP for IPv4 or IPv6.                                        |
| <b>Recv-Q</b> | Number of input packets received by the protocol and waiting to be processed by the application. |
| <b>Send-Q</b> | Number of output packets sent by the application and waiting to be processed by the protocol.    |

Table 56: show system connections Output Fields (*continued*)

| Field Name       | Field Description                                                                                                                                                                                                              |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local Address    | Local address and port of the socket, separated by a period. An asterisk (*) indicates that the bound address is the wildcard address. Server sockets typically have the wildcard address and a well-known port bound to them. |
| Foreign Address  | Foreign address and port of the socket, separated by a period. An asterisk (*) indicates that the address or port is a wildcard.                                                                                               |
| Routing Instance | (Displayed only when the <b>show-routing-instance</b> option is used.) Routing instances associated with active IP sockets on the Routing Engine.                                                                              |
| (state)          | For TCP, the protocol state of the socket.                                                                                                                                                                                     |

| <b>Release Information</b>            | Command introduced before Junos OS Release 8.5.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.<br><b>re0</b> , <b>re1</b> , and <b>routing-engine</b> options introduced for dual routing engines in Junos OS Release 13.1.                                                        |

**Description** Show core files on all routers or switches running Junos OS. You can use the **show system core-dumps** command to show a list of system core files created when the router or switch has failed. This command can be useful for diagnostic purposes. Each list item includes the file permissions, number of links, owner, group, size, modification date, and path and filename. If dual routing engines are present, you can view core-dump files for either routing engine or both routing engines together. On a QFabric system, you can view core-dump files on individual QFabric system devices as well as on the entire QFabric system.

You can use the option **core-filename** and its options **core-file-info**, **brief**, and **detail** to display more information about the specified core-dump files.

**Options** **none**—Display a list of all existing core-dump files.

**NOTE:** If dual routing engines are present, lists only the core-dump files for the active routing engine.

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a routing matrix based on a TX Matrix router, display system core files for the TX Matrix router switch-card chassis [SCC] and all the T640 routers [LCCs] connected to the TX Matrix router.

On a routing matrix based on a TX Matrix Plus router, display system core files for the TX Matrix Plus router (switch-fabric chassis [SFC]) and all the T1600 routers [LCCs] connected to the TX Matrix Plus router.

**<all-lcc | lcc number>**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a routing matrix based on the TX Matrix router, display core dump files for all T640 routers (line-card chassis [LCCs]) or a specific T640 router [LCC] connected to the TX Matrix router.

On a routing matrix based on the TX Matrix Plus router, display logging information for all T1600 routers (line-card chassis [LCCs]) or a specific T1600 router (LCC) connected to the TX Matrix Plus router. When using the **lcc number** option, replace **number** with a value from 0 through 3.

**NOTE:** The **all-chassis** option displays system core files for the SCC or SFC and the LCCs connected to the SCC or SFC in the routing matrix while the **all-lcc** option only displays system core files for the LCCs in the routing matrix.

**all-members**—(EX4200 switches) (Optional) Display system core files on all members of the Virtual Chassis configuration.

**brief**—(Optional) View details of a binary file.

**component** (*UUID | serial number | all*)—(QFabric systems only) (Optional) Display a list of core-dump files located on individual QFabric system device or on the entire QFabric system.

**core-file-info**—(Optional) Display the stack trace of a core file.

**core-filename**—(Optional) Name of a specific core file to display.

**detail**—(Optional) View stack trace with details of the binary file.

**display-order** (*timestamp-sort | alphanumeric-sort*)—(QFabric systems only) (Optional) Display list of debug artifacts generated within the specified period—for example, within the last hour, within the last 20 minutes, or within the last 32 seconds—or according to their filename.

**display-period** (*hours | minutes | seconds*)—(QFabric systems only) (Optional) Display core-dump files generated within the specified period—for example, within the last hour, within the last 20 minutes, or within the last 32 seconds.

**kernel-crashinfo component** (*UUID | serial number*)—(QFabric systems only) (Optional) Display kernel crash information from the EEPROM on a QFabric system device.

**local**—(EX4200 switches only) (Optional) Display system core files on the local Virtual Chassis member.

**member** *member-id*—(EX4200 switches only) (Optional) Display system core files on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

**re0**—(Dual routing engines only) Display the core-dump files on re0.

**re1**—(Dual routing engines only) Display the core-dump files on re1.

**repository** (*core | log*)—(QFabric systems only) (Optional) Specify either the core or log repository in which to view core-dump files.

**routing-engine** (*backup | both | local | master | other*)—(Dual routing engines only) Display a list of core-dump files for either the backup, local, master, or other routing engine or both routing engines.

**scc**—(TX Matrix routers only) (Optional) Display system core files on the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus routers only) (Optional) Display system core files on the TX Matrix Plus router (or switch-fabric chassis).

**Required Privilege Level**

**Output Fields** Table 57 on page 1095 describes the output fields for the **show system core-dumps** command. Output fields are listed in the approximate order in which they appear.

**Table 57: show system core-dumps Output Fields**

| Field Name                                | Field Description                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Permissions</i>                        | Read/write permissions for the file named.                                                                                                                                                                                                                                                                                                  |
| <i>Links</i>                              | Number of links to the file.                                                                                                                                                                                                                                                                                                                |
| <i>Owner</i>                              | Name of the file owner.                                                                                                                                                                                                                                                                                                                     |
| <i>Group</i>                              | Name of the group with file access.                                                                                                                                                                                                                                                                                                         |
| <i>File size</i>                          | File size in bytes.                                                                                                                                                                                                                                                                                                                         |
| <i>Modified</i>                           | Last file modification date and time.                                                                                                                                                                                                                                                                                                       |
| <i>Path/filename</i>                      | File path where the file resides and the filename.                                                                                                                                                                                                                                                                                          |
| <b>Repository scope:</b>                  | Repository where core-dump files and log files are stored. The core-dump files are located in the <b>core</b> repository, and the log files are located in the <b>log</b> repository. The default <b>Repository scope</b> is shared since both the <b>core</b> and <b>log</b> repositories are shared by all of the QFabric system devices. |
| <b>Repository head:</b>                   | Path to the top-level repository location.                                                                                                                                                                                                                                                                                                  |
| <b>Repository name:</b>                   | Name of the repository: <b>core</b> or <b>log</b> .                                                                                                                                                                                                                                                                                         |
| <b>List of nodes for core repository:</b> | List of core-dump files associated with a particular QFabric system device located in the core repository.                                                                                                                                                                                                                                  |
| <b>Node Group</b>                         | Name of the QFabric system device.                                                                                                                                                                                                                                                                                                          |
| <b>Node Identifier</b>                    | UUID or serial number of the QFabric system device.                                                                                                                                                                                                                                                                                         |
| <b>Num</b>                                | Number of core-dump and log files.                                                                                                                                                                                                                                                                                                          |

Table 57: show system core-dumps Output Fields (*continued*)

| Field Name                                | Field Description                                                                                                                                                      |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Model</b>                              | Model number of the QFabric system device.                                                                                                                             |
| <b>Usage</b>                              | Usage of the repository in megabytes.                                                                                                                                  |
| <b>Total usage of core repository:</b>    | Total usage of core-dump files associated with a particular QFabric system device located in the core repository. Usage is specified in megabytes and as a percentage. |
| <b>Total usage of log repository:</b>     | Total usage of log files associated with a particular QFabric system device located in the log repository. Usage is specified in megabytes and as a percentage.        |
| <b>List of nodes for core repository:</b> | List of core-dump files associated with a particular QFabric system device located in the core repository.                                                             |
| <b>List of nodes for log repository:</b>  | List of log files associated with a particular QFabric system device located in the log repository.                                                                    |
| <b>Filename</b>                           | Name of the core-dump file.                                                                                                                                            |
| <b>Date</b>                               | Last core-dump file modification date and time.                                                                                                                        |
| <b>Size</b>                               | Size of the core-dump file.                                                                                                                                            |
| <b>Core filename</b>                      | Filename of the core-dump file.                                                                                                                                        |
| <b>Process name</b>                       | Name of the process that is generating a core-dump file or log file.                                                                                                   |
| <b>Release</b>                            | Junos OS release.                                                                                                                                                      |
| <b>Build server</b>                       | Junos OS build server.                                                                                                                                                 |
| <b>Build date</b>                         | Junos OS build date.                                                                                                                                                   |
| <b>Stack trace</b>                        | Stack trace of the core-dump file.                                                                                                                                     |

## Sample Output

### show system core-dumps

This example shows the command output if core files exist.

```
user@switch> show system core-dumps
-rw----- 1 root wheel 268369920 Jun 18 17:59 /var/crash/vmcore.0
-rw-rw---- 1 root field 3371008 Jun 18 17:53 /var/tmp/rpd.core.0
-rw-r--r-- 1 root wheel 27775914 Jun 18 17:59 /var/crash/kernel.0
```

### show system core-dumps

This example shows the command output if core files do not exist.

```
user@host> show system core-dumps
/var/crash/*core*: No such file or directory
/var/tmp/*core*: No such file or directory
/var/crash/kernel.*: No such file or directory
```

### show system core-dumps routing-engine both

This example shows the command output if dual routing engines are present.

```
user@host> show system core-dumps routing-engine both

| <b>Description</b>                    | Display directory usage information.                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                        | none—Display all directory usage information.                                                                                                                                                                                                                                                                                 |

**all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display directory usage information about all the T640 routers (in a routing matrix based on a TX Matrix router). Display directory usage information about all the T1600 or T4000 routers (in a routing matrix based on a TX Matrix Plus router) in the chassis.

**all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display directory information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display directory information for all connected T1600 or T4000 LCCs.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display directory information for all members of the Virtual Chassis configuration.

**depth *number***—(Optional) Depth of the directory to traverse. This option is useful when you want to limit the output shown for a large file system.

**infrastructure *name***— (QFabric systems only) (Optional) Display directory information for the fabric control Routing Engines and fabric manager Routing Engines.

**interconnect-device *name***— (QFabric systems only) (Optional) Display directory information for the Interconnect device.

**node-group *name***— (QFabric systems only) (Optional) Display directory information for the Node group.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display directory information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display directory information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display directory information for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display directory information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

***path***—(Optional) Path or root directory to traverse.

**scc**—(TX Matrix router only) (Optional) Display directory information for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display directory information for the TX Matrix Plus router. Replace *number* with 0.

**Output Fields** [Table 58 on page 1108](#) describes the output fields for the **show system directory-usage** command. Output fields are listed in the approximate order in which they appear.

**Table 58: show system directory-usage Output Fields**

| Field Name            | Field Description                             |
|-----------------------|-----------------------------------------------|
| <i>bytes</i>          | Number of bytes used by files in a directory. |
| <i>directory-name</i> | Name of the directory.                        |

## Sample Output

| <b>Licenses used</b>      | <p>Number of licenses used by a router or switch. You use this information to verify that the number of licenses used matches the number configured. If a licensed feature is configured, the feature is considered used.</p> <p><b>NOTE:</b> In Junos OS Release 10.1 and later, the <b>Licenses used</b> column displays the actual usage count based on the number of active sessions or connections as reported by the corresponding feature daemons. This is applicable for scalable license-based features such as Subscriber Access (<b>scale-subscriber</b>), L2TP (<b>scale-l2tp</b>), Mobile IP (<b>scale-mobile-ip</b>), and so on.</p>                                                                                                                                        |
| <b>Licenses installed</b> | <p>Information about the installed license key:</p> <ul style="list-style-type: none"> <li>• <b>License identifier</b>—Identifier associated with a license key.</li> <li>• <b>State</b>—State of the license key: <b>valid</b> or <b>invalid</b>. An <b>invalid</b> state indicates that the key was entered incorrectly or is not valid for the specific device.</li> <li>• <b>License version</b>—Version of a license. The version indicates how the license is validated, the type of signature, and the signer of the license key.</li> <li>• <b>Valid for device</b>—Device that can use a license key.</li> <li>• <b>Group defined</b>—Group membership of a device.</li> <li>• <b>Features</b>—Feature associated with a license, such as data link switching (DLSw).</li> </ul> |
| <b>Licenses needed</b>    | Number of licenses required for features being used but not yet properly licensed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Expiry</b>             | Amount of time left within the grace period before a license is required for a feature being used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Sample Output

### show system license

```
user@host> show system license
```

```
License usage:
```

| Feature name                  | Licenses<br>used | Licenses<br>installed | Licenses<br>needed | Expiry    |
|-------------------------------|------------------|-----------------------|--------------------|-----------|
| subscriber-accounting         | 2                | 2                     | 0                  | permanent |
| subscriber-authentication     | 1                | 2                     | 0                  | permanent |
| subscriber-address-assignment | 2                | 2                     | 0                  | permanent |
| subscriber-vlan               | 2                | 2                     | 0                  | permanent |
| subscriber-ip                 | 0                | 2                     | 0                  | permanent |
| scale-subscriber              | 2                | 3                     | 0                  | permanent |
| scale-l2tp                    | 4                | 5                     | 0                  | permanent |
| scale-mobile-ip               | 1                | 2                     | 0                  | permanent |

```
Licenses installed:
```

```
License identifier: XXXXXXXXXX
```

```
License version: 2
```

```
Features:
```

```
subscriber-accounting - Per Subscriber Radius Accounting
permanent
subscriber-authentication - Per Subscriber Radius Authentication
permanent
subscriber-address-assignment - Radius/SRC Address Pool Assignment
permanent
subscriber-vlan - Dynamic Auto-sensed Vlan
```

```

    permanent
subscriber-ip    - Dynamic and Static IP
    permanent

```

### show system license installed

```

user@host> show system license installed
License identifier: XXXXXXXXXX
License version: 2
Features:
  subscriber-accounting - Per Subscriber Radius Accounting
    permanent
  subscriber-authentication - Per Subscriber Radius Authentication
    permanent
  subscriber-address-assignment - Radius/SRC Address Pool Assignment
    permanent
  subscriber-vlan - Dynamic Auto-sensed Vlan
    permanent
  subscriber-ip - Dynamic and Static IP
    permanent

```

### show system license keys

```

user@host> show system license keys
XXXXXXXXXX xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxx

```

### show system license usage

```

user@host> show system license usage
License usage:

```

| Feature name                  | Licenses<br>used | Licenses<br>installed | Licenses<br>needed | Expiry    |
|-------------------------------|------------------|-----------------------|--------------------|-----------|
| subscriber-accounting         | 2                | 2                     | 0                  | permanent |

upgrade
    permanent

```

### show system license installed (MX104 Routers)

In the following output, ports 0 and 1 are activated by installing the license to activate the first two built-in ports.

```

user@host > show system license installed
License identifier: XXXXXXXXXX
License version: 2
Features:
MX104-2x10Gig-port-0-1 - MX104 2X10Gig Builtin Port(xe-2/0/0 & xe-2/0/1)
upgrade
    permanent

```

### show system license keys (MX104 Routers)

In the following output, ports 0 and 1 are activated by installing the license to activate the first two built-in ports.

```

user@host > show system license keys

XXXXXXXXXX xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxx

```

### show system license usage (MX104 Routers)

In the following output, ports 0 and 1 are activated by installing the license to activate the first two built-in ports.

```

user@host > show system license usage

```

| Feature name           | Licenses used | Licenses installed | Expiry needed |           |
|------------------------|---------------|--------------------|---------------|-----------|
| scale-subscriber       | 0             | 1000               | 0             | permanent |
| scale-l2tp             | 0             | 1000               | 0             | permanent |
