You authenticate BFD sessions by specifying an authentication algorithm and keychain, and then associating that configuration information with a security authentication keychain using the keychain name.

The following sections describe the supported authentication algorithms, security keychains, and level of authentication that can be configured:

- [BFD Authentication Algorithms on page 3107](#)
- [Security Authentication Keychains on page 3108](#)
- [Strict Versus Loose Authentication on page 3108](#)

### **BFD Authentication Algorithms**

Junos OS supports the following algorithms for BFD authentication:

- **simple-password**—Plain-text password. One to 16 bytes of plain text are used to authenticate the BFD session. One or more passwords can be configured. This method is the least secure and should be used only when BFD sessions are not subject to packet interception.
- **keyed-md5**—Keyed Message Digest 5 hash algorithm for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed MD5 uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. With this method, packets are accepted at the receiving

end of the session if one of the keys matches and the sequence number is greater than or equal to the last sequence number received. Although more secure than a simple password, this method is vulnerable to replay attacks. Increasing the rate at which the sequence number is updated can reduce this risk.

- **meticulous-keyed-md5**—Meticulous keyed Message Digest 5 hash algorithm. This method works in the same manner as keyed MD5, but the sequence number is updated with every packet. Although more secure than keyed MD5 and simple passwords, this method might take additional time to authenticate the session.
- **keyed-sha-1**—Keyed Secure Hash Algorithm I for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed SHA uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. The key is not carried within the packets. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than the last sequence number received.
- **meticulous-keyed-sha-1**—Meticulous keyed Secure Hash Algorithm I. This method works in the same manner as keyed SHA, but the sequence number is updated with every packet. Although more secure than keyed SHA and simple passwords, this method might take additional time to authenticate the session.

**NOTE:** Nonstop active routing (NSR) is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

---

### **Security Authentication Keychains**

The security authentication keychain defines the authentication attributes used for authentication key updates. When the security authentication keychain is configured and associated with a protocol through the keychain name, authentication key updates can occur without interrupting routing and signaling protocols.

The authentication keychain contains one or more keychains. Each keychain contains one or more keys. Each key holds the secret data and the time at which the key becomes valid. The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

BFD allows multiple clients per session, and each client can have its own keychain and algorithm defined. To avoid confusion, we recommend specifying only one security authentication keychain.

### **Strict Versus Loose Authentication**

By default, strict authentication is enabled, and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure *loose checking*. When loose checking is configured, packets are accepted without authentication being checked at each end of the session. This feature is intended for transitional periods only.

---

### Example: Configuring BFD Authentication for Static Routes

---

This example shows how to configure Bidirectional Forwarding Detection (BFD) authentication for static routes.

- [Requirements on page 3109](#)
- [Overview on page 3109](#)
- [Configuration on page 3110](#)
- [Verification on page 3113](#)

#### **Requirements**

Junos OS Release 9.6 or later (Canada and United States version).

BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

#### **Overview**

You can configure authentication for BFD sessions running over IPv4 and IPv6 static routes. Routing instances and logical systems are also supported.

The following steps are needed to configure authentication on a BFD session:

1. Specify the BFD authentication algorithm for the static route.
2. Associate the authentication keychain with the static route.
3. Configure the related security authentication keychain. This must be configured on the main router.

**TIP:** We recommend that you specify loose authentication checking if you are transitioning from nonauthenticated sessions to authenticated sessions.

[edit]

```
user@host> set routing-options static route ipv4 bfd-liveness-detection  
authentication loose-check
```

---

[Figure 88 on page 3110](#) shows the sample network.

Figure 88: Customer Routes Connected to a Service Provider

**Configuration**

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device B**

```

set interfaces ge-1/2/0 unit 0 description B->D
set interfaces ge-1/2/0 unit 0 family inet address 172.16.1.1/24
set interfaces lo0 unit 57 family inet address 10.0.0.1/32
set interfaces lo0 unit 57 family inet address 10.0.0.2/32
set routing-options static route 192.168.47.0/24 next-hop 172.16.1.2
set routing-options static route 192.168.47.0/24 bfd-liveness-detection minimum-interval 1000
set routing-options static route 192.168.47.0/24 bfd-liveness-detection authentication key-chain bfd-kc4
set routing-options static route 192.168.47.0/24 bfd-liveness-detection authentication algorithm keyed-sha-1
set security authentication-key-chains key-chain bfd-kc4 key 5 secret "$9$JhZHmn6Ap0In/9ApOcSs24oaZikPft3wY24ZG.mz36AtOIEyMWxSrlKvM-dbs2aDkP5FtOIQFclev7N"
set security authentication-key-chains key-chain bfd-kc4 key 5 start-time "2011-1-12:00:00 -0800"

```

**Device D**

```

set interfaces ge-1/2/0 unit 1 description D->B
set interfaces ge-1/2/0 unit 1 family inet address 172.16.1.2/24
set interfaces lo0 unit 2 family inet address 192.168.47.5/32
set interfaces lo0 unit 2 family inet address 192.168.47.6/32
set routing-options static route 0.0.0.0/0 next-hop 172.16.1.1
set routing-options static route 0.0.0.0/0 bfd-liveness-detection minimum-interval 1000
set routing-options static route 0.0.0.0/0 bfd-liveness-detection authentication key-chain bfd-kc4

```

```

set routing-options static route 0.0.0.0/0 bfd-liveness-detection authentication algorithm
  keyed-sha-1
set security authentication-key-chains key-chain bfd-kc4 key 5 secret
  "$9$JhZHmn6Ap0In/9ApOcSs24oaZikPfT3wY24ZG.mz36AtOIEyMWxSrlKvM-dbs2a
  DkP5FtOIQFclev7N"
set security authentication-key-chains key-chain bfd-kc4 key 5 start-time
  "2011-1-1.12:00:00 -0800"

```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure BFD for static routes:

1. On Device B, configure the interfaces.

```

[edit interfaces]
user@B# set ge-1/2/0 unit 0 description B->D
user@B# set ge-1/2/0 unit 0 family inet address 172.16.1.1/24

```

```

user@B# set lo0 unit 57 family inet address 10.0.0.1/32
user@B# set lo0 unit 57 family inet address 10.0.0.2/32

```

2. On Device B, create a static route and set the next-hop address.

```

[edit routing-options]
user@B# set static route 192.168.47.0/24 next-hop 172.16.1.2

```

3. On Device B, configure BFD for the static route.

```

[edit routing-options]
user@B# set static route 192.168.47.0/24 bfd-liveness-detection minimum-interval
  1000

```

4. On Device B, specify the algorithm (**keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**, or **simple-password**) to use for BFD authentication on the static route.

```

[edit routing-options]
user@B# set static route 192.168.47.0/24 bfd-liveness-detection authentication
  algorithm keyed-sha-1

```

**NOTE:** Nonstop active routing (NSR) is not supported with the meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

5. On Device B, specify the keychain to be used to associate BFD sessions on the specified route with the unique security authentication keychain attributes.

This should match the keychain name configured at the **[edit security authentication key-chains]** hierarchy level.

```

[edit routing-options]

```

```
user@B# set static route 192.168.47.0/24 bfd-liveness-detection authentication
key-chain bfd-kc4
```

6. On Device B, specify the unique security authentication information for BFD sessions:

- The matching keychain name as specified in Step 5.
- At least one key, a unique integer between 0 and 63. Creating multiple keys allows multiple clients to use the BFD session.
- The secret data used to allow access to the session.
- The time at which the authentication key becomes active, in the format *yyyy-mm-dd.hh:mm:ss*.

```
[edit security authentication-key-chains key-chain bfd-kc4]
user@B# set key 5 secret
"$9$JhZHmn6Ap0In/9ApOcSs24oaZikPfT3wY24ZG.mz36AtOIEyMWxSrlKvM-dbs2a
DkP5Ft0IQFclev7N"
user@B# set key 5 start-time "2011-1-1.12:00:00 -0800"
```

7. If you are done configuring Device B, commit the configuration.

```
[edit]
user@B# commit
```

8. Repeat the configuration on Device D.

The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

### Results

Confirm your configuration by issuing the **show interfaces**, **show routing-options**, and **show security** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
Device B user@B# show interfaces
ge-1/2/0 {
  unit 0 {
    description B->D;
    family inet {
      address 172.16.1.1/24;
    }
  }
}
lo0 {
  unit 57 {
    family inet {
      address 10.0.0.1/32;
      address 10.0.0.2/32;
    }
  }
}

user@B# show routing-options
static {
```

```

route 192.168.47.0/24 {
  next-hop 172.16.1.2;
  bfd-liveness-detection {
    minimum-interval 1000;
    authentication {
      key-chain bfd-kc4;
      algorithm keyed-sha-1;
    }
  }
}
}

user@B# show security
authentication-key-chains {
  key-chain bfd-kc4 {
    key 5 {
      secret
        "$9$hZHmn6Ap0ln/9ApOcSs24oaZikPft3wY24ZG.mz36AtOIEyMWxSrlKvM-dbs2a
        DkP5FtOIQFclev7N"; ## SECRET-DATA
      start-time "2011-1-1.12:00:00 -0800";
    }
  }
}

```

### Verification

Confirm that the configuration is working properly.

- [Verifying That BFD Sessions Are Up on page 3113](#)
- [Viewing Details About the BFD Session on page 3113](#)
- [Viewing Extensive BFD Session Information on page 3114](#)

### Verifying That BFD Sessions Are Up

**Purpose** Verify that the BFD sessions are up.

**Action** From operational mode, enter the **show bfd session** command.

```
user@B> show bfd session
```

| Address    | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2 | Up    | ge-1/2/0.0 | 3.000       | 1.000             | 3          |

```
1 sessions, 1 clients
```

```
Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps
```

**Meaning** The command output shows that the BFD session is up.

### Viewing Details About the BFD Session

**Purpose** View details about the BFD sessions and make sure that authentication is configured.

**Action** From operational mode, enter the **show bfd session detail** command.

```
user@B> show bfd session detail
```

| Address    | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2 | Up    | ge-1/2/0.0 | 3.000       | 1.000             | 3          |

Client Static, TX interval 1.000, RX interval 1.000, **Authenticate**  
 Session up time 00:53:58  
 Local diagnostic NbrSignal, remote diagnostic None  
 Remote state Up, version 1  
 Logical system 9, routing table index 22

1 sessions, 1 clients  
 Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps

**Meaning** In the command output, **Authenticate** is displayed to indicate that BFD authentication is configured.

#### *Viewing Extensive BFD Session Information*

**Purpose** View more detailed information about the BFD sessions.

**Action** From operational mode, enter the **show bfd session extensive** command.

```
user@B> show bfd session extensive
```

| Address    | State | Interface  | Time  | Interval | Multiplier |
|------------|-------|------------|-------|----------|------------|
| 172.16.1.2 | Up    | ge-1/2/0.0 | 3.000 | 1.000    | 3          |

Client Static, TX interval 1.000, RX interval 1.000, **Authenticate**  
 keychain bfd-kc4, algo keyed-sha-1, mode strict  
 Session up time 01:39:45  
 Local diagnostic NbrSignal, remote diagnostic None  
 Remote state Up, version 1  
 Logical system 9, routing table index 22  
 Min async interval 1.000, min slow interval 1.000  
 Adaptive async TX interval 1.000, RX interval 1.000  
 Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3  
 Remote min TX interval 1.000, min RX interval 1.000, multiplier 3  
 Local discriminator 3, remote discriminator 4  
 Echo mode disabled/inactive  
 Authentication enabled/active, keychain bfd-kc4, algo keyed-sha-1, mode strict

1 sessions, 1 clients  
 Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps

**Meaning** In the command output, **Authenticate** is displayed to indicate that BFD authentication is configured. The output for the **extensive** command provides the keychain name, the authentication algorithm, and the mode for each client in the session.

| <b>Description</b>              | <p>Determine whether static, aggregate, or generated routes are removed from the routing and forwarding tables when they become inactive. Static routes are only removed from the routing table if the next hop becomes unreachable. This can occur if the local or neighbor interface goes down. Routes that have been configured to remain continually installed in the routing and forwarding tables are marked with <b>reject</b> next hops when they are inactive.</p> <ul style="list-style-type: none"> <li>• <b>active</b>—Remove a route from the routing and forwarding tables when it becomes inactive.</li> <li>• <b>passive</b>—Have a route remain continually installed in the routing and forwarding tables even when it becomes inactive.</li> </ul> <p>Include the <b>active</b> statement when configuring an individual route in the <b>route</b> portion of the <b>static</b> statement to override a <b>passive</b> option specified in the <b>defaults</b> portion of the statement.</p>                                                                                                                                                                                                                                                                                |

| Description         | Configure aggregate routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Options             | <p><b>aggregate-options</b>—Additional information about aggregate routes that is included with the route when it is installed in the routing table. Specify zero or more of the following options in <b>aggregate-options</b>. Each option is explained separately.</p> <ul style="list-style-type: none"> <li>• (<b>active</b>   <b>passive</b>);</li> <li>• <b>as-path</b> &lt;<i>as-path</i>&gt; &lt;origin (egp   igp   incomplete)&gt; &lt;atomic-aggregate&gt; &lt;aggregator <i>as-number</i> <i>ip-address</i>&gt;;</li> <li>• (<b>brief</b>   <b>full</b>);</li> <li>• <b>community</b> [ <i>community-ids</i> ];</li> <li>• <b>discard</b>;</li> <li>• (<b>metric</b>   <b>metric2</b>   <b>metric3</b>   <b>metric4</b>) <i>value</i> &lt;type <i>type</i>&gt;;</li> <li>• (<b>preference</b>   <b>preference2</b>   <b>color</b>   <b>color2</b>) <i>preference</i> &lt;type <i>type</i>&gt;;</li> <li>• <b>tag</b> <i>metric type number</i>;</li> </ul> <p><b>defaults</b>—Specify global aggregate route options. These options only set default attributes inherited by all newly created aggregate routes. These are treated as global defaults</p> |

and apply to all the aggregate routes you configure in the **aggregate** statement. This part of the **aggregate** statement is optional.

**route *destination-prefix***—Configure a nondefault aggregate route:

- **default**—For the default route to the destination. This is equivalent to specifying an IP address of **0.0.0.0/0**.
- ***destination-prefix/prefix-length***—***destination-prefix*** is the network portion of the IP address, and ***prefix-length*** is the destination prefix length.

The **policy** statement is explained separately.

|                                 |                                                                                                                |
|---------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.                                                           |
|                                 | routing-control—To add this statement to the configuration.                                                    |

| <b>Description</b>         | <p>Associate BGP autonomous system (AS) path information with a static, aggregate, or generated route.</p> <p>In Junos OS Release 9.1 and later, the numeric range for the AS number is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, <i>BGP Support for Four-octet AS Number Space</i>. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of Junos OS support 2-byte AS numbers.</p> <p>In Junos OS Release 9.2 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: <i>&lt;16-bit high-order value in decimal&gt;.&lt;16-bit low-order value in decimal&gt;</i>. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format. You can specify a value in the range from 0.0 through 65535.65535 in AS-dot notation format.</p>                                                          |
| <b>Default</b>             | No AS path information is associated with static routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><b>aggregator</b>—(Optional) Attach the BGP <b>aggregator</b> path attribute to the aggregate route. You must specify the last AS number that formed the aggregate route (encoded as two octets) for <b>as-number</b>, followed by the IP address of the BGP system that formed the aggregate route for <b>ip-address</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**as-path**—(Optional) AS path to include with the route. It can include a combination of individual AS path numbers and AS sets. Enclose sets in brackets ( [ ] ). The first AS number in the path represents the AS immediately adjacent to the local AS. Each subsequent number represents an AS that is progressively farther from the local AS, heading toward the origin of the path. You cannot specify a regular expression for **as-path**. You must use a complete, valid AS path.

**atomic-aggregate**—(Optional) Attach the BGP **atomic-aggregate** path attribute to the aggregate route. This path attribute indicates that the local system selected a less specific route instead of a more specific route.

**origin egp**—(Optional) BGP origin attribute that indicates that the path information originated in another AS.

**origin igp**—(Optional) BGP origin attribute that indicates that the path information originated within the local AS.

**origin incomplete**—(Optional) BGP origin attribute that indicates that the path information was learned by some other means.

| <b>Description</b>         | <p>Specify the routing device's AS number.</p> <p>An autonomous system (AS) is a set of routing devices that are under a single technical administration and that generally use a single interior gateway protocol (IGP) and metrics to propagate routing information within the set of routing devices. An AS appears to other ASs to have a single, coherent interior routing plan and presents a consistent picture of what destinations are reachable through it. ASs are identified by a number that is assigned by the Network Information Center (NIC) in the United States (<a href="http://www.isi.edu">http://www.isi.edu</a>).</p> <p>If you are using BGP on the routing device, you must configure an AS number.</p> <p>The AS path attribute is modified when a route is advertised to an EBGP peer. Each time a route is advertised to an EBGP peer, the local routing device prepends its AS number to the existing path attribute, and a value of 1 is added to the AS number.</p> <p>In Junos OS Release 9.1 and later, the numeric range is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, <i>BGP Support for Four-octet AS Number Space</i>. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of Junos OS support 2-byte AS numbers.</p> <p>In Junos OS Release 9.3 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: <i>&lt;16-bit high-order value in decimal&gt;.&lt;16-bit low-order value in decimal&gt;</i>. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.</p> |

Use a number assigned to you by the NIC.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Range:** 1 through 4,294,967,295 ( $2^{32} - 1$ ) in plain-number format for 4-byte AS numbers

In this example, the 4-byte AS number 65,546 is represented in plain-number format:

```
[edit]
routing-options {
  autonomous-system 65546;
}
```

**Range:** 0.0 through 65535.65535 in AS-dot notation format for 4-byte numbers

In this example, 1.10 is the AS-dot notation format for 65,546:

```
[edit]
routing-options {
  autonomous-system 1.10;
}
```

**Range:** 1 through 65,535 in plain-number format for 2-byte AS numbers (this is a subset of the 4-byte range)

In this example, the 2-byte AS number 60,000 is represented in plain-number format:

```
[edit]
routing-options {
  autonomous-system 60000;
}
```

**asdot-notation**—(Optional) Display the configured 4-byte autonomous system number in the AS-dot notation format.

**Default:** Even if a 4-byte AS number is configured in the AS-dot notation format, the default is to display the AS number in the plain-number format.

**loops number**—(Optional) Specify the number of times detection of the AS number in the AS\_PATH attribute causes the route to be discarded or hidden. For example, if you configure **loops 1**, the route is hidden if the AS number is detected in the path one or more times. This is the default behavior. If you configure **loops 2**, the route is hidden if the AS number is detected in the path two or more times.

**Range:** 1 through 10

**Default:** 1

**NOTE:** When you specify the same AS number in more than one routing instance on the local routing device, you must configure the same number of loops for the AS number in each instance. For example, if you configure a value of 3 for the loops statement in a VRF routing instance that uses the same AS number as that of the master instance, you must also configure a value of 3 loops for the AS number in the master instance.

Use the **independent-domain** option if the loops statement must be enabled only on a subset of routing instances.

---

The remaining statement is explained separately.

**Options**    **authentication algorithm** *algorithm-name* —Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, or **meticulous-keyed-sha-1**.

**authentication key-chain** *key-chain-name* —Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

**authentication loose-check**—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

**detection-time threshold** *milliseconds*—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**holddown-interval** *milliseconds*—Configure an interval specifying how long a BFD session must remain up before a state change notification is sent. If the BFD session goes down and then comes back up during the hold-down interval, the timer is restarted.

**Range:** 0 through 255,000

**Default:** 0

**local-address** *ip-address*—Enable a multihop BFD session and configure the source address for the BFD session.

**minimum-interval** *milliseconds*—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the **transmit-interval**, **minimum-interval**, and **minimum-receive-interval** statements.

**Range:** 1 through 255,000

**minimum-receive-interval** *milliseconds*—Configure the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the **minimum-interval** statement at the **[edit routing-options static route destination-prefix bfd-liveness-detection]** hierarchy level.

**Range:** 1 through 255,000

**minimum-receive-ttl** *number*—Configure the time to live (TTL) for the multihop BFD session.

**Range:** 1 through 255

**Default:** 255

**multiplier** *number*—Configure number of hello packets not received by the neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255

**Default:** 3

**neighbor *address***—Configure a next-hop address for the BFD session for a next hop specified as an interface name.

**no-adaptation**—Specify for BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

**transmit-interval threshold *milliseconds***—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295

**transmit-interval minimum-interval *milliseconds***—Configure the minimum interval at which the routing device transmits hello packets to a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement at the **[edit routing-options static route *destination-prefix* bfd-liveness-detection]** hierarchy level.

**Range:** 1 through 255,000

**version**—Configure the BFD version to detect: **1** (BFD version 1) or **automatic** (autodetect the BFD version).

**Default:** automatic

**Release Information** Statement introduced in Junos OS Release 9.5.  
 Statement introduced in Junos OS Release 9.5 for EX Series switches.  
 Statement introduced in Junos OS Release 12.3 for ACX Series routers.  
 Support for BMP version 3 introduced in Junos OS Release 13.3.

**Description** Configure the BGP Monitoring Protocol (BMP), which enables the routing device to collect data from the BGP Adjacency-RIB-In routing tables and periodically send that data to a monitoring station.

**Options** The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
 routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.2 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | <p>Disable distributed periodic packet management (PPM) processing for Link Aggregation Control Protocol (LACP) packets and run all PPM processing for LACP packets on the Routing Engine.</p> <p>This statement disables distributed PPM processing for only LACP packets. You can disable distributed PPM processing for all packets that use PPM and run all PPM processing on the Routing Engine by configuring the <b>no-delegate-processing</b> statement in the [edit routing-options <a href="#">ppm</a>] hierarchy.</p> |
|                                 | <div>  <p><b>BEST PRACTICE:</b> We generally recommend that you disable distributed PPM only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.</p> </div>                                                                                                                                                                                       |
| <b>Default</b>                  | Distributed PPM processing is enabled for all packets that use PPM.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>         | Associate BGP community information with a static, aggregate, or generated route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Default</b>             | No BGP community information is associated with static routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>             | <p><b><i>community-ids</i></b>—One or more community identifiers. The <b><i>community-ids</i></b> format varies according to the type of attribute that you use.</p> <p>The BGP community attribute format is <b><i>as-number:community-value</i></b>:</p> <ul style="list-style-type: none"> <li>• <b><i>as-number</i></b>—AS number of the community member. It can be a value from 1 through 65,535. The AS number can be a decimal or hexadecimal value.</li> <li>• <b><i>community-value</i></b>—Identifier of the community member. It can be a number from 0 through 65,535.</li> </ul> <p>For more information about BGP community attributes, see the “Configuring the Extended Communities Attribute” section in the <i>Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices</i>.</p> <p>For specifying the BGP community attribute only, you also can specify <b><i>community-ids</i></b> as one of the following well-known community names defined in RFC 1997:</p> <ul style="list-style-type: none"> <li>• <b>no-advertise</b>—Routes containing this community name are not advertised to other BGP peers.</li> <li>• <b>no-export</b>—Routes containing this community name are not advertised outside a BGP confederation boundary.</li> </ul> |

- **no-export-subconfed**—Routes containing this community are advertised to IBGP peers with the same AS number, but not to members of other confederations.

**NOTE:** Extended community attributes are not supported at the [edit routing-options] hierarchy level. You must configure extended communities at the [edit policy-options] hierarchy level. For information about configuring extended communities, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

| <b>Description</b>              | <p>Specify the routing device's confederation AS number.</p> <p>If you administer multiple ASs that contain a very large number of BGP systems, you can group them into one or more <i>confederations</i>. Each confederation is identified by its own AS number, which is called a <i>confederation AS number</i>. To external ASs, a confederation appears to be a single AS. Thus, the internal topology of the ASs making up the confederation is hidden.</p> <p>The BGP path attributes <b>NEXT_HOP</b>, <b>LOCAL_PREF</b>, and <b>MULTI_EXIT_DISC</b>, which normally are restricted to a single AS, are allowed to be propagated throughout the ASs that are members of the same confederation.</p> <p>Because each confederation is treated as if it were a single AS, you can apply the same routing policy to all the ASs that make up the confederation.</p> <p>Grouping ASs into confederations reduces the number of BGP connections required to interconnect ASs.</p> <p>If you are using BGP, you can enable the local routing device to participate as a member of an AS confederation. To do this, include the <b>confederation</b> statement.</p> <p>Specify the AS confederation identifier, along with the peer AS numbers that are members of the confederation.</p> <p>Note that peer adjacencies do not form if two BGP neighbors disagree about whether an adjacency falls within a particular confederation.</p> |

| <b>Description</b>              | <p>Do not forward packets addressed to this destination. Instead, drop the packets, do not send ICMP unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.</p> <p>To propagate static routes into the routing protocols, include the <b>discard</b> statement when you define the route, along with a routing policy.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                 | <p> <b>NOTE:</b> In other vendors' software, a common way to propagate static routes into routing protocols is to configure the routes so that the next-hop routing device is the loopback address (commonly, 127.0.0.1). However, configuring static routes in this way (by including a statement such as <b>route address/mask-length next-hop 127.0.0.1</b>) does not propagate the static routes, because the forwarding table ignores static routes whose next-hop routing device is the loopback address.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Default</b>                  | When an aggregate route becomes active, it is installed in the routing table with a reject next hop, which means that ICMP unreachable messages are sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>         | <p>Specify the name of the routing table from which Junos OS should export routing information. For any individual RIB group, only one table can be specified in the <b>export-rib</b> statement.</p>                                                                                                                                                                                                                                                          |

The **export-rib** statement specifies the source table from which routing information is advertised.

One common use of the **export-rib** statement is interdomain routing. The export RIB is the table used when BGP extracts routes to advertise to peers. In multicast interdomain routing, for example, the export RIB is likely to be inet.2.

Another use of **export-rib** is dynamic route leaking between the global routing table (inet.0) and a VRF routing table (*instance.inet.0*). For example, you can use a RIB group to copy routes learned in the VRF into the global routing table, inet.0, or copy routes learned in inet.0 into a VRF. You define the use of this RIB group in the VRF's BGP configuration. In a routing policy you can do dynamic filtering of routes. For instance, you can use an import policy to only copy routes with certain communities into the global routing table.

For example:

```
rib-groups {
  rib-interface-routes-v4 {
    import-rib [ inet.0 VRF.inet.0 ];
  }
  rib-import-VRF-routes-to-inet0-v4 {
    export-rib VRF.inet.0;
    import-rib [ VRF.inet.0 inet.0 ];
    import-policy rib-import-VRF-routes-to-inet0-v4;
  }
  rib-import-inet0-routes-to-VRF-v4 {
    export-rib inet.0;
    import-rib [ inet.0 VRF.inet.0 ];
    import-policy rib-import-inet0-routes-to-VRF-v4;
  }
}
routing-options {
  interface-routes {
    rib-group {
```

```

        inet rib-interface-routes-v4;
    }
}
protocols {
    bgp {
        group iBGP-peers {
            type internal;
            family inet {
                unicast {
                    rib-group rib-import-inet0-routes-to-VRF-v4;
                }
            }
        }
    }
}
routing-instances {
    VRF {
        routing-options {
            interface-routes {
                rib-group {
                    inet rib-interface-routes-v4;
                }
            }
        }
        protocols {
            bgp {
                group peersin-VRF {
                    family inet {
                        unicast {
                            rib-group rib-import-VRF-routes-to-inet0-v4;
                        }
                    }
                }
            }
        }
    }
}
}

```

**Options** *routing-table-name*—Routing table group name.

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Specify a backup path in case the primary path becomes unusable.</p> <p>You specify one or more objects with common characteristics within a group. All objects are treated as /32 host addresses. The objects can be a LAN interface, a router ID, or a point-to-point link. Sequence is insignificant.</p> <p>Changing the fate-sharing database does not affect existing established LSPs until the next CSPF reoptimization. The fate-sharing database does affect fast-reroute detour path computations.</p>                                                                                                                                                                                                                                                                     |
| <b>Options</b>                  | <p><b>cost <i>value</i></b>—Cost assigned to the group.</p> <p><b>Range:</b> 1 through 65,535</p> <p><b>Default:</b> 1</p> <p><b>from <i>address</i></b>—Address of the router or address of the LAN/NBMA interface. For example, an Ethernet network with four hosts in the same fate-sharing group would require you to list all four of the separate <b>from</b> addresses in the group.</p> <p><b>group <i>group-name</i></b>—Each fate-sharing group must have a name, which can have a maximum of 32 characters, including letters, numbers, periods (.), and hyphens (-). You can define up to 512 groups.</p> <p><b>to <i>address</i></b>—(Optional) Address of egress router. For point-to-point link objects, you must specify both a <b>from</b> and a <b>to</b> address.</p> |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## flow-map

---

**Syntax**

```
flow-map flow-map-name {  
    bandwidth (bps | adaptive);  
    forwarding-cache {  
        timeout (never non-discard-entry-only | minutes);  
    }  
    policy [ policy-names ];  
    redundant-sources [ addresses ];  
}
```

[edit logical-systems *logical-system-name* routing-options multicast],  
[edit routing-instances *routing-instance-name* routing-options multicast],  
[edit routing-options multicast]

**Release Information** Statement introduced in Junos OS Release 8.2.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Configure multicast flow maps.

**Options** *flow-map-name*—Name of the flow-map.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Configure multicast forwarding cache properties. These properties include threshold suppression and reuse limits, the threshold at which a warning message is logged, and timeout values.</p> <p>Specify a value for the threshold at which to suppress new multicast forwarding cache entries and an optional reuse value for the threshold at which the router begins to create new multicast forwarding cache entries. The range for both is from 1 through 200,000. If configured, the reuse value should be less than the suppression threshold value. The suppression value is mandatory. If you do not specify the optional reuse value, then the number of multicast forwarding cache entries is limited to the suppression value. A new entry is created as soon as the number of multicast forwarding cache entries falls below the suppression value.</p> <p>You can configure the thresholds globally for the multicast forwarding cache or individually for the IPv4 and IPv6 multicast forwarding caches. Configuring the <b>threshold</b> statement globally for the multicast forwarding cache or including the <b>family</b> statement to configure the thresholds for the IPv4 and IPv6 multicast forwarding caches are mutually exclusive.</p> |
| <b>Default</b>             | By default, there are no limits on the number of multicast forwarding cache entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>             | <p><b>family (inet   inet6)</b>—(Optional) Apply the configured thresholds to either IPv4 or IPv6 multicast forwarding cache entries.</p> <p><b>Default:</b> By default, the configured thresholds are applied to both IPv4 and IPv6 multicast forwarding cache entries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## forwarding-options (chassis)

**Syntax** forwarding options *profile-name* {  
     num-65-127-prefix *value*  
     lpm-profile *prefix-65-127-disable*  
 }

**Hierarchy Level** [edit *chassis*]

**Release Information** Statement introduced in Junos 13.2 for the QFX Series.

**Description** Configure a unified forwarding table profile to allocate the amount a memory available for the following:

- MAC addresses
- Layer 3 host entries
- Longest prefix match table entries

**Options** *profile-name*—name of the profile to use for memory allocation in the unified forwarding table. [Table 173 on page 2255](#) lists the profiles you can choose and the associated values for each type of entry.

**Table 246: Unified Forwarding Table Profiles**

| Profile Name               | MAC Table     | Host Table (unicast and multicast addresses) |              |             |             |             |             |
|----------------------------|---------------|----------------------------------------------|--------------|-------------|-------------|-------------|-------------|
|                            | MAC Addresses | IPv4 unicast                                 | IPv6 unicast | IPv4 (*, G) | IPv4 (S, G) | IPv6 (*, G) | IPv6 (S, G) |
| l2-profile-one             | 288K          | 16K                                          | 8K           | 8K          | 8K          | 4K          | 4K          |
| l2-profile-two             | 224K          | 80K                                          | 40K          | 40K         | 40K         | 20K         | 20K         |
| l2-profile-three (default) | 160K          | 144K                                         | 72K          | 72K         | 72K         | 36K         | 36K         |
| l3-profile                 | 96K           | 208K                                         | 104K         | 104K        | 104K        | 52K         | 52K         |
| lpm-profile*               | 32K           | 16K                                          | 8K           | 8K          | 8K          | 4K          | 4K          |

\* This profile supports only IPv4 in Junos OS 13.2X51-D10. With Junos OS 13.2X51-D15 it supports IPv4 and IPv6.

Note that if the host stores the maximum number of entries for any given type, the entire table is full and is unable to accommodate *any* entries of any other type. For information about valid combinations of table entries see [“Understanding the Unified Forwarding Table” on page 2066](#).

You configure the memory allocation for LPM table entries differently depending on whether you use Junos OS 13.2X51-D10 or Junos OS 13.2X51-D15 and later. To learn

how to configure memory allocation for LPM table entries see [“Configuring the Unified Forwarding Table” on page 2217](#).

| Description         | Configure generated routes, which are used as routes of last resort.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Options             | <p><b>defaults</b>—(Optional) Specify global generated route options. These options only set default attributes inherited by all newly created generated routes. These are treated as global defaults and apply to all the generated routes you configure in the <b>generate</b> statement.</p> <p><b>generate-options</b>—Additional information about generated routes, which is included with the route when it is installed in the routing table. Specify zero or more of the following options in <b>generate-options</b>. Each option is explained separately.</p> <ul style="list-style-type: none"><li>• (<b>active</b>   <b>passive</b>);</li><li>• <b>as-path</b> <i>&lt;as-path&gt;</i> <i>&lt;origin (egp   igp   incomplete)&gt;</i> <i>&lt;atomic-aggregate&gt;</i> <i>&lt;aggregator as-number in-address&gt;</i>;</li><li>• (<b>brief</b>   <b>full</b>);</li><li>• <b>community</b> [<i>community-ids</i>];</li><li>• <b>discard</b>;</li><li>• (<b>metric</b>   <i>metric2</i>   <i>metric3</i>   <i>metric4</i>) <i>value</i> <i>&lt;type type&gt;</i>;</li><li>• (<b>preference</b>   <i>preference2</i>   <b>color</b>   <i>color2</i>) <i>preference</i> <i>&lt;type type&gt;</i>;</li><li>• <b>tag</b> <i>metric type number</i>;</li></ul> <p><b>route destination-prefix</b>—Configure a non-default generated route:</p> <ul style="list-style-type: none"><li>• <b>default</b>—For the default route to the destination. This is equivalent to specifying an IP address of 0.0.0.0/0.</li></ul> |

- *destination-prefix/prefix-length—/destination-prefix* is the network portion of the IP address, and *prefix-length* is the destination prefix length.

The **policy** statement is explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation** • *Example: Conditionally Generating Static Routes*

## import (Routing Options)

**Syntax** `import [ policy-names ];`

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options resolution **rib**],  
[edit logical-systems *logical-system-name* routing-options resolution **rib**],  
[edit routing-instances *routing-instance-name* routing-options resolution **rib**],  
[edit routing-options resolution **rib**]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Specify one or more import policies to use for route resolution.

**Options** *policy-names*—Name of one or more import policies.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation** • *Example: Configuring Route Resolution on PE Routers*

| <b>Description</b>                                                                                                                                                                                                            | <p>Specify the name of the routing table into which Junos OS should import routing information. The first routing table name you enter is the primary routing table. Any additional names you enter identify secondary routing tables. When a protocol imports routes, it imports them into the primary and any secondary routing tables. If the primary route is deleted, the secondary route also is deleted. For IPv4 import routing tables, the primary routing table must be <b>inet.0</b> or <b>routing-instance-name.inet.0</b>. For IPv6 import routing tables, the primary routing table must be <b>inet6.0</b>.</p> <p>In Junos OS Release 9.5 and later, you can configure an IPv4 import routing table that includes both IPv4 and IPv6 routing tables. Including both types of routing tables permits you, for example, to populate an IPv6 routing table with IPv6 addresses that are compatible with IPv4. In releases prior to Junos OS Release 9.5, you could configure an import routing table with only either IPv4 or IPv6 routing tables.</p> |
| <div>  <b>NOTE:</b> On EX Series switches, only dynamically learned routes can be imported from one routing table group to another. </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

This statement is implemented on the Packet Forward Engine to speed up forwarding information base (FIB) updates. Configuring this statement significantly speeds convergence times. The only downside of configuring this statement is that some additional FIB memory overhead is required. Unless routes have an extremely high number of next hops, this increased memory usage should not be noticeable. |

| <b>Description</b>              | Configure whether Junos OS installs all static routes into the forwarding table. Even if you configure a route so it is not installed in the forwarding table, the route is still eligible to be exported from the routing table to other protocols.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <p><b>install</b>—Explicitly install all static routes into the forwarding table. Include this statement when configuring an individual route in the <b>route</b> portion of the <b>static</b> statement to override a <b>no-install</b> option specified in the <b>defaults</b> portion of the statement.</p> <p><b>no-install</b>—Do not install the route into the forwarding table, even if it is the route with the lowest preference.</p> <p><b>Default:</b> install</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>              | <p>Enable multicast traffic on an interface.</p> <p>By default, multicast packets are forwarded by enabling Protocol Independent Multicast (PIM) on an interface. PIM adds multicast routes into the routing table.</p> <p>You can also configure multicast packets to be forwarded over a static route, such as a static route associated with an LSP next hop. Multicast packets are accepted on an interface and forwarded over a static route in the forwarding table. This is useful when you want to enable multicast traffic on a specific interface without configuring PIM on the interface.</p> <p>You cannot enable multicast traffic on an interface and configure PIM on the same interface simultaneously.</p> <p>Static routes must be configured before you can enable multicast on an interface. Configuring the <b>interface</b> statement alone does not install any routes into the routing table. This feature relies on the static route configuration.</p> |
| <b>Options</b>                  | <p><b><i>interface-names</i></b>—Name of one or more interfaces on which to enable multicast traffic.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Hierarchy Level</b>     | [edit <a href="#">routing-instances</a> ]                         |
| <b>Release Information</b> | Statement introduced in Junos OS Release 11.3 for the QFX Series. |
| <b>Description</b>         | For virtual router routing instances, configure an interface.     |

**NOTE:**

- You must configure only interfaces from the Node devices assigned to the network Node group. If you try to configure interfaces from the Node devices assigned to server Node groups, the configuration does not commit.
  - You can configure an interface for one routing instance only.
-

[edit logical-systems *logical-system-name* routing-options],  
[edit routing-instances *routing-instance-name* routing-options],  
[edit routing-options]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**NOTE:** On EX Series switches, only dynamically learned routes can be imported from one routing table group to another.

---

**Description** Associate a routing table group with the routing device's interfaces, and specify routing table groups into which interface routes are imported.

By default, IPv4 interface routes (also called direct routes) are imported into routing table **inet.0**, and IPv6 interface routes are imported into routing table **inet6.0**. If you are configuring alternate routing tables for use by some routing protocols, it might be necessary to import the interface routes into the alternate routing tables. To define the routing tables into which interface routes are imported, you create a routing table group and associate it with the routing device's interfaces.

To create the routing table groups, include the **passive** statement at the **[edit routing-options]** hierarchy level.

If you have configured a routing table, configure the OSPF primary instance at the **[edit protocols ospf]** hierarchy level with the statements needed for your network so that routes are installed in **inet.0** and in the forwarding table. Make sure to include the routing table group.

To export local routes, include the **export** statement.

To export LAN routes, include the **lan** option. To export point-to-point routes, include the **point-to-point** option.

Only local routes on point-to-point interfaces configured with a destination address are exportable.

- Options**
- inet**—Specify the IPv4 address family.
  - inet6**—Specify the IPv6 address family.
  - lan**—Export LAN routes.
  - point-to-point**—Export point-to-point routes.

The remaining statements are explained separately.

- Required Privilege Level**
- routing—To view this statement in the configuration.
  - routing-control—To add this statement to the configuration.

## local-address (Routing Options)

**Syntax** `local-address address;`

**Hierarchy Level**

```
[edit logical-systems logical-system-name routing-instances routing-instance-name
  routing-options multicast backup-pe-group group-name],
[edit logical-systems logical-system-name routing-options multicast backup-pe-group
  group-name],
[edit routing-instances routing-instance-name routing-options multicast backup-pe-group
  group-name],
[edit routing-options multicast backup-pe-group group-name]
```

**Release Information**

Statement introduced in Junos OS Release 9.0.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Configure the address of the local PE for ingress PE redundancy when point-to-multipoint LSPs are used for multicast distribution.

**Options** **address**—Address of local PEs in the backup group.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

- Related Documentation**

| <b>Release Information</b> | Statement introduced in Junos OS Release 8.0.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.                                                                                                  |
| <b>Description</b>         | Configure a limit for the number of routes installed in a routing table based upon the route path.                                                                                                                                                                                          |

**NOTE:** The `maximum-paths` statement is similar to the `maximum-prefixes` statement. The `maximum-prefixes` statement limits the number of unique destinations in a routing instance. For example, suppose a routing instance has the following routes:

```
OSPF 10.10.10.0/24
ISIS 10.10.10.0/24
```

These are two routes, but only one destination (prefix). The `maximum-paths` limit applies the total number of routes (two). The `maximum-prefixes` limit applies to the total number of unique prefixes (one).

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Options</b> | <p><code>log-interval <i>seconds</i></code>—(Optional) Minimum time interval (in seconds) between log messages.</p> <p><b>Range:</b> 5 through 86,400</p> <p><code>log-only</code>—(Optional) Sets the route limit as an advisory limit. An advisory limit triggers only a warning, and additional routes are not rejected.</p> <p><code><i>path-limit</i></code>—Maximum number of routes. If this limit is reached, a warning is triggered and additional routes are rejected.</p> <p><b>Range:</b> 1 through 4,294,967,295 (<math>2^{32} - 1</math>)</p> <p><b>Default:</b> No default</p> <p><code>threshold <i>value</i></code>—(Optional) Percentage of the maximum number of routes that starts triggering a warning. You can configure a percentage of the <code><i>path-limit</i></code> value that starts triggering the warnings.</p> <p><b>Range:</b> 1 through 100</p> |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**NOTE:** When the number of routes reaches the **threshold** value, routes are still installed into the routing table while warning messages are sent. When the number of routes reaches the *path-limit* value, then additional routes are rejected.

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

Prefix limits apply only to dynamic routing protocols and are not applicable to static or interface routes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <div>  <p><b>NOTE:</b> The <code>maximum-prefixes</code> statement is similar to the <code>maximum-paths</code> statement. The <code>maximum-prefixes</code> statement limits the number of unique destinations in a routing instance. For example, suppose a routing instance has the following routes:</p> <pre> OSPF 10.10.10.0/24 ISIS 10.10.10.0/24 </pre> <p>These are two routes, but only one destination (prefix). The <code>maximum-paths</code> limit applies the total number of routes (two). The <code>maximum-prefixes</code> limit applies to the total number of unique prefixes (one).</p> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p><b>log-interval <i>seconds</i></b>—(Optional) Minimum time interval (in seconds) between log messages.</p> <p><b>Range:</b> 5 through 86,400</p> <p><b>log-only</b>—(Optional) Sets the prefix limit as an advisory limit. An advisory limit triggers only a warning, and additional routes are not rejected.</p> <p><b><i>prefix-limit</i></b>—Maximum number of route prefixes. If this limit is reached, a warning is triggered and any additional routes are rejected.</p> <p><b>Range:</b> 1 through 4,294,967,295</p> <p><b>Default:</b> No default</p> <p><b>threshold <i>value</i></b>—(Optional) Percentage of the maximum number of prefixes that starts triggering a warning. You can configure a percentage of the <b><i>prefix-limit</i></b> value that starts triggering the warnings.</p> |

**Range:** 1 through 100

**NOTE:** When the number of routes reaches the threshold value, routes are still installed into the routing table while warning messages are sent. When the number of routes reaches the *prefix-limit* value, then additional routes are rejected.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## med-igp-update-interval

**Syntax** med-igp-update-interval *minutes*;

**Hierarchy Level** [edit routing-options]

**Release Information** Statement introduced in Junos OS Release 9.0  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Configure a timer for how long to delay updates for the multiple exit discriminator (MED) path attribute for BGP groups and peers configured with the **metric-out igp offset delay-med-update** statement. The timer delays MED updates for the interval configured unless the MED is lower than the previously advertised attribute or another attribute associated with the route has changed or if the BGP peer is responding to a refresh route request.

**Options** *minutes*—Interval to delay MED updates.  
**Range:** 10 through 600  
**Default:** 10 minutes

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | Configure the types of system logging messages sent about the routing protocols process to the system message logging file. These messages are also displayed on the system console. You can log messages at a particular level, or up to and including a particular level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><b>level <i>level</i></b>—Severity of the message. It can be one or more of the following levels, in order of decreasing urgency:</p> <ul style="list-style-type: none"><li>• <b>alert</b>—Conditions that should be corrected immediately, such as a corrupted system database.</li><li>• <b>critical</b>—Critical conditions, such as hard drive errors.</li><li>• <b>debug</b>—Software debugging messages.</li><li>• <b>emergency</b>—Panic or other conditions that cause the system to become unusable.</li><li>• <b>error</b>—Standard error conditions.</li><li>• <b>info</b>—Informational messages.</li><li>• <b>notice</b>—Conditions that are not error conditions, but might warrant special handling.</li><li>• <b>warning</b>—System warning messages.</li></ul> <p><b>upto level <i>level</i></b>—Log all messages up to a particular level.</p> |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | <p>Configure the rendezvous point (RP) routing device that resides between a customer edge-facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain to translate PIM join or prune messages into corresponding Internet Group Management Protocol (IGMP) report or leave messages. The routing device then transmits the report or leave messages by proxying them to one or two upstream interfaces that you configure on the RP routing device. Including the <b>pim-to-igmp-proxy</b> statement enables you to use IGMP to forward IPv4 multicast traffic across the PIM sparse mode domains.</p> <p>The remaining statement is explained separately.</p> |

| <b>Description</b>         | <p>Associate a routing policy when configuring an aggregate or generated route's destination prefix in the <b>routes</b> part of the <b>aggregate</b> or <b>generate</b> statement. This provides the equivalent of an import routing policy filter for the destination prefix. That is, each potential contributor to an aggregate route, along with any aggregate options, is passed through the policy filter. The policy then can accept or reject the route as a contributor to the aggregate route.</p> <p>If the contributor is accepted, the policy can modify the default preferences. The contributor with the numerically smallest prefix becomes the most preferred, or <i>primary</i>, contributor. A rejected contributor still can contribute to a less specific aggregate route. If you do not specify a policy filter, all candidate routes contribute to an aggregate route.</p> <p>The following algorithm is used to compare two generated contributing routes in order to determine which one is the primary or preferred contributor:</p> <ol style="list-style-type: none"> <li>1. Compare the protocol's <b>preference</b> of the contributing routes. The lower the preference, the better the route. This is similar to the comparison that is done while determining the best route for the routing table.</li> <li>2. Compare the protocol's <b>preference2</b> of the contributing routes. The lower <b>preference2</b> value is better. If only one route has <b>preference2</b>, then this route is preferred.</li> <li>3. The preference values are the same. Proceed with a numerical comparison of the prefixes' values. <ol style="list-style-type: none"> <li>a. The primary contributor is the numerically smallest prefix value.</li> <li>b. If the two prefixes are numerically equal, the primary contributor is the route that has the smallest prefix length value.</li> </ol> </li> </ol> |

At this point, the two routes are the same. The primary contributor does not change. An additional next hop is available for the existing primary contributor.

A rejected contributor still can contribute to less specific generated route. If you do not specify a policy filter, all candidate routes contribute to a generated route.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.2.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.<br>Statement introduced in Junos OS Release 12.3 for ACX Series routers.                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | Configure a flow map policy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                  | <i>policy-names</i> —Name of one or more policies for flow mapping.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## policy-options

```
Syntax  policy-options
        application-maps application-map-name {
            application application-name {
                code-points [ aliases ] [ bit-patterns ];
            }
        }
        policy-statement policy-name {
            term term-name {
                from {
                    family family-name;
                    match-conditions;
                    policy subroutine-policy-name;
                    prefix-list prefix-list-name;
                    prefix-list-filter prefix-list-name match-type <actions>;
                    route-filter destination-prefix match-type <actions>;
                    source-address-filter source-prefix match-type <actions>;
                }
                to {
                    match-conditions;
                    policy subroutine-policy-name;
                }
                then actions;
            }
        }
```

**Hierarchy Level** [edit]

**Release Information** Statement introduced in Junos OS Release 12.1 for the QFX Series.  
Statement introduced in Junos OS Release 12.1 for the EX Series.

**Description** Configure options such as application maps for DCBX application protocol exchange and policy statements.

**Required Privilege Level** storage—To view this statement in the configuration.  
storage-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Define a routing policy, including subroutine policies.</p> <p>A <i>term</i> is a named structure in which match conditions and actions are defined. Routing policies are made up of one or more terms. Each routing policy term is identified by a term name. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks.</p> <p>Each term contains a set of match conditions and a set of actions:</p> <ul style="list-style-type: none"> <li>Match conditions are criteria that a route must match before the actions can be applied. If a route matches all criteria, one or more actions are applied to the route.</li> <li>Actions specify whether to accept or reject the route, control how a series of policies are evaluated, and manipulate the characteristics associated with a route.</li> </ul> <p>Generally, a router compares a route against the match conditions of each term in a routing policy, starting with the first and moving through the terms in the order in which they are defined, until a match is made and an explicitly configured or default action of</p> |

**accept** or **reject** is taken. If none of the terms in the policy match the route, the router compares the route against the next policy, and so on, until either an action is taken or the default policy is evaluated.

If none of the match conditions of each term evaluates to true, the final action is executed. The final action is defined in an unnamed term. Additionally, you can define a default action (either **accept** or **reject**) that overrides any action intrinsic to the protocol.

The order of match conditions in a term is not relevant, because a route must match all match conditions in a term for an action to be taken.

To list the routing policies under the **[edit policy-options]** hierarchy level by **policy-statement *policy-name*** in alphabetical order, enter the **show policy-options** configuration command.

**Options** *actions*—(Optional) One or more actions to take if the conditions match. The actions are described in *Configuring Flow Control Actions*.

**family** *family-name*—(Optional) Specify an address family protocol. Specify **inet** for IPv4. Specify **inet6** for 128-bit IPv6, and to enable interpretation of IPv6 router filter addresses. For IS-IS traffic, specify **iso**. For IPv4 multicast VPN traffic, specify **inet-mvpn**. For IPv6 multicast VPN traffic, specify **inet6-mvpn**. For multicast-distribution-tree (MDT) IPv4 traffic, specify **inet-mdt**. For BGP route target VPN traffic, specify **route-target**.

**NOTE:** When **family** is not specified, the routing device or routing instance uses the address family or families carried by BGP. If multiprotocol BGP (MP-BGP) is enabled, the policy defaults to the protocol family or families carried in the network layer reachability information (NLRI) as configured in the **family** statement for BGP. If MP-BGP is not enabled, the policy uses the default BGP address family unicast IPv4.

**from**—(Optional) Match a route based on its source address.

**match-conditions**—(Optional in **from** statement; required in **to** statement) One or more conditions to use to make a match. The qualifiers are described in *Routing Policy Match Conditions*.

**policy** *subroutine-policy-name*—Use another policy as a match condition within this policy. The name identifying the subroutine policy can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" "). Policy names cannot take the form **\_\_.\*-internal\_\_**, as this form is reserved. For information about how to configure subroutines, see *Understanding Policy Subroutines in Routing Policy Match Conditions*.

**policy-name**—Name that identifies the policy. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" ").

**prefix-list** *prefix-list-name*—Name of a list of IPv4 or IPv6 prefixes.

**prefix-list-filter** *prefix-list-name*—Name of a prefix list to evaluate using qualifiers; *match-type* is the type of match (see *Configuring Prefix List Filters*), and *actions* is the action to take if the prefixes match.

**route-filter** *destination-prefix match-type <actions>*—(Optional) List of routes on which to perform an immediate match; *destination-prefix* is the IPv4 or IPv6 route prefix to match, *match-type* is the type of match (see *Configuring Route Lists*), and *actions* is the action to take if the *destination-prefix* matches.

**source-address-filter** *source-prefix match-type <actions>*—(Optional) Unicast source addresses in multiprotocol BGP (MBGP) and Multicast Source Discovery Protocol (MSDP) environments on which to perform an immediate match. *source-prefix* is

the IPv4 or IPv6 route prefix to match, **match-type** is the type of match (see *Configuring Route Lists*), and **actions** is the action to take if the **source-prefix** matches.

**term term-name**—Name that identifies the term. The term name must be unique in the policy. It can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" "). A policy statement can include multiple terms. We recommend that you name all terms. However, you do have the option to include an unnamed term which must be the final term in the policy. To configure an unnamed term, omit the **term** statement when defining match conditions and actions.

**to**—(Optional) Match a route based on its destination address or the protocols into which the route is being advertised.

**then**—(Optional) Actions to take on matching routes. The actions are described in *Configuring Flow Control Actions* and *Configuring Actions That Manipulate Route Characteristics*.

| <b>Description</b>              | <p>(M120, M320, MX Series, T Series, TX Matrix routers, M7i and M10i routers with Enhanced CFEB [CFEB-E], EX Series switches, and QFX Series only) Disable distributed periodic packet management (PPM) to the Packet Forwarding Engine (on routers), to access ports (on EX3200 and EX4200 switches, and QFX Series), or to line cards (on EX6200 and EX8200 switches).</p> <p>After you disable PPM, PPM processing continues to run on the Routing Engine.</p> <p>In Junos OS Release 8.2, PPM was moved from the Routing Engine to the Packet Forwarding Engine, access ports, or line cards. The <b>no-delegate-processing</b> statement disables the default behavior and restores the legacy behavior.</p> |
| <b>Default</b>                  | Distributed PPM processing is enabled for all protocols that use PPM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <b>no-delegate-processing</b> —Disable PPM to the Packet Forwarding Engine, access ports, or line cards. Distributed PPM is enabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-instances *routing-instance-name*],  
[edit routing-instances *routing-instance-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.

Support for RIPv6 introduced in Junos OS Release 9.0.  
Statement introduced in Junos OS Release 11.1 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Specify the protocol for a routing instance. You can configure multiple instances of many protocol types. Not all protocols are supported on the switches. See the switch CLI.

**Options** **bgp**—Specify BGP as the protocol for a routing instance.  
**isis**—Specify IS-IS as the protocol for a routing instance.  
**ldp**—Specify LDP as the protocol for a routing instance.  
**l2vpn**—Specify Layer 2 VPN as the protocol for a routing instance.  
**msdp**—Specify the Multicast Source Discovery Protocol (MSDP) for a routing instance.  
**mstp**—Specify the Multiple Spanning Tree Protocol (MSTP) for a virtual switch routing instance.  
**ospf**—Specify OSPF as the protocol for a routing instance.  
**ospf3**—Specify OSPF version 3 (OSPFv3) as the protocol for a routing instance.

**NOTE:** OSPFv3 supports the **no-forwarding**, **virtual-router**, and **vrf** routing instance types only.

---

**pim**—Specify the Protocol Independent Multicast (PIM) protocol for a routing instance.  
**rip**—Specify RIP as the protocol for a routing instance.  
**ripng**—Specify RIP next generation (RIPv6) as the protocol for a routing instance.  
**rstp**—Specify the Rapid Spanning Tree Protocol (RSTP) for a virtual switch routing instance.  
**vstp**—Specify the VLAN Spanning Tree Protocol (VSTP) for a virtual switch routing instance.  
**vpls**—Specify VPLS as the protocol for a routing instance.

**Required Privilege Level** **routing**—To view this statement in the configuration.

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.  
 Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description** Configure a static route with multiple possible next hops, each of which can have its own preference value, IGP metric that is used when the route is exported into an IGP, and Bidirectional Forwarding Detection (BFD) settings. If multiple links are operational, the one with the most preferred next hop is used. The most preferred next hop is the one with the lowest preference value.

**Options** *address*—IPv4, IPv6, or ISO network address of the next hop.  
*interface-name*—Name of the interface on which to configure an independent metric or preference for a static route. To configure an unnumbered interface as the next-hop

interface for a static route, specify **qualified-next-hop *interface-name***, where *interface-name* is the name of the IPv4 or IPv6 unnumbered interface.

**NOTE:** For an Ethernet interface to be configured as the qualified next hop for a static route, it must be an unnumbered interface.

To configure an Ethernet interface as an unnumbered interface, configure the `unnumbered-address <interface-name>` statement at the [edit interfaces <interface-name> unit <logical-unit-number> family <family-name>] hierarchy level as described in *Configuring an Unnumbered Interface*.

The remaining statements are explained separately.

| <b>Description</b>              | <p>Configure the router to perform custom route resolution on protocol next hops of routes in a certain routing table. The protocol next hop is used to determine the forwarding next-hop.</p> <p>For example, you might want to direct <b>inet.2</b> route resolution to use topology routing tables <b>:red.inet.0</b> and <b>:blue.inet.0</b> for protocol next-hop IP address lookups. Or you might want to direct <b>bgp.l3vpn.0</b> to use the information in <b>inet.0</b> to resolve routes, thus overriding the default behavior, which is to use <b>inet.3</b>.</p> <p>You can specify up to two routing tables in the <b>resolution-ribs</b> statement. The route resolution scheme first checks the first-listed routing table for the protocol next-hop address. If the address is found, it uses this entry. If it is not found, the resolution scheme checks second-listed routing table. Hence, only one routing table is used for each protocol nexthop address. For example, if you configure <b>resolution rib bgp.l3vpn.0 resolution-ribs [inet.0 inet.3]</b>, <b>inet.0</b> is checked first and then <b>inet.3</b> is checked.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 20px;"> <p> <b>NOTE:</b> Customizing route resolution might cause the routing protocol process (rpd) to consume more memory resources than it ordinarily would. When you customize route resolution, we recommend that you check the memory resources by running the <b>show system processes</b> and the <b>show task memory</b> commands. For more information, see <i>Routing Protocol Process Memory FAQs</i>.</p> </div> <p>The remaining statements are explained separately.</p> |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>Specify one or more routing tables to use for route resolution.</p> <p>This statement enables you to override the default routing tables that Junos OS uses for route resolution. For example, suppose that the resolution routing table is <b>inet.3</b>, but you want to allow fallback resolution through <b>inet.0</b>. One example use case is overriding the <b>bgp.rtarget.0</b> (<b>family route-target</b>) routing table resolution from using only <b>inet.3</b> to using both <b>inet.3</b> and <b>inet.0</b>.</p> |
| <b>Options</b>                  | <b><i>routing-table-names</i></b> —Name of one or more routing tables.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Required Privilege Level</b> | <b>routing</b> —To view this statement in the configuration.<br><b>routing-control</b> —To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | Configure statically configured routes to be deleted from or retained in the forwarding table when the routing protocol process shuts down normally:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Default</b>                  | Statically configured routes are deleted from the forwarding table when the routing protocol process shuts down normally. Doing this greatly reduces the time required to restart a system that has a large number of routes in its routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <b>no-retain</b> —Delete statically configured routes from the forwarding table when the routing protocol process shuts down normally. To explicitly specify that routes be deleted from the forwarding table, include the <b>no-retain</b> statement. Include this statement when configuring an individual route in the <b>route</b> portion of the <b>static</b> statement to override a <b>retain</b> option specified in the <b>defaults</b> portion of the statement.<br><br><b>retain</b> —Have a static route remain in the forwarding table when the routing protocol process shuts down normally. Doing this greatly reduces the time required to restart a system that has a large number of routes in its routing table.                                                                                                                                                                                                |

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Create a routing table.

Explicitly creating a routing table with ***routing-table-name*** is optional if you are not adding any static, martian, aggregate, or generated routes to the routing table and if you also are creating a routing table group.

**NOTE:** The IPv4 multicast routing table (`inet.1`) and the IPv6 multicast routing table (`inet6.1`) are not supported for this statement.

**Default** If you do not specify a routing table name with the *routing-table-name* option, the software uses the default routing tables, which are `inet.0` for unicast routes and `inet.1` for the multicast cache.

**Options** *routing-table-name*—Name of the routing table, in the following format:  
*protocol [.identifier]*.

In a routing instance, the routing table name must include the routing instance name.

For example, if the routing instance name is `link0`, the routing table name might be `link0.inet6.0`.

- *protocol* is the protocol family. It can be `inet6` for the IPv6 family, `inet` for the IPv4 family, `iso` for the ISO protocol family, or *instance-name.iso.0* for an ISO routing instance.
- *identifier* is a positive integer that specifies the instance of the routing table.

**Default:** `inet.0`

The remaining statements are explained separately.

**Required Privilege Level** `routing`—To view this statement in the configuration.  
`routing-control`—To add this statement to the configuration.

| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>         | <p>Group one or more routing tables to form a routing table group. A routing protocol can import routes into all the routing tables in the group and can export routes from a single routing table.</p> <p>Each routing table group must contain one or more routing tables that Junos OS uses when importing routes (specified in the <b>import-rib</b> statement) and optionally can contain one routing table group that Junos OS uses when exporting routes to the routing protocols (specified in the <b>export-rib</b> statement).</p> <p>The first routing table you specify is the <i>primary routing table</i>, and any additional routing tables are the <i>secondary routing tables</i>.</p> <p>The primary routing table determines the address family of the routing table group. To configure an IP version 4 (IPv4) routing table group, specify <b>inet.0</b> as the primary routing table. To configure an IP version 6 (IPv6) routing table group, specify <b>inet6.0</b> as the primary routing table. If you configure an IPv6 routing table group, the primary and all secondary routing tables must be IPv6 routing tables (<b>inet6.x</b>).</p> <p>In Junos OS Release 9.5 and later, you can include both IPv4 and IPv6 routing tables in an IPv4 import routing table group using the <b>import-rib</b> statement. In releases prior to Junos OS Release 9.5, you can only include either IPv4 or IPv6 routing tables in the same <b>import-rib</b> statement. The ability to configure an import routing table group with both IPv4 and IPv6 routing tables enables you, for example, to populate the <b>inet6.3</b> routing table with IPv6 addresses that are compatible with IPv4. Specify <b>inet.0</b> as the primary routing table, and specify <b>inet6.3</b> as a secondary routing table.</p> |

**NOTE:** On EX Series switches, only dynamically learned routes can be imported from one routing table group to another.

**NOTE:** If you configure an import routing table group that includes both IPv4 and IPv6 routing tables, any corresponding export routing table group must include only IPv4 routing tables.

If you have configured a routing table, configure the OSPF primary instance at the **[edit protocols ospf]** hierarchy level with the statements needed for your network so that routes are installed in **inet.0** and in the forwarding table. Make sure to include the routing table group. For more information, see *Example: Configuring Multiple Routing Instances of OSPF*.

After specifying the routing table from which to import routes, you can apply one or more policies to control which routes are installed in the routing table group. To apply a policy to routes being imported into the routing table group, include the **import-policy** statement.

**Options** *group-name*—Name of the routing table group. The name must start with a letter and can include letters, numbers, and hyphens.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## route-record

---

**Syntax** route-record;

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-options],  
[edit routing-options]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Export the AS path and routing information to the traffic sampling process.

Before you can perform flow aggregation, the routing protocol process must export the AS path and routing information to the sampling process.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.<br>Statement introduced in Junos OS Release 12.3 for ACX Series routers.                                                                                                                                                                                          |
| <b>Description</b>         | Specify the routing device's IP address.<br><br>The router identifier is used by BGP and OSPF to identify the routing device from which a packet originated. The router identifier usually is the IP address of the local routing device. If you do not configure a router identifier, the IP address of the first interface to come online is used. This is usually the loopback interface. Otherwise, the first hardware interface with an IP address is used. |

**NOTE:** We strongly recommend that you configure the router identifier under the [edit routing-options] hierarchy level to avoid unpredictable behavior if the interface address on a loopback interface changes.

For more information about the router identifier in OSPF, see [“Example: Configuring an OSPF Router Identifier” on page 4102](#).

You must configure a router-id in order for BGP and OSPF to function in a routing instance. Use the **show route instance detail** command to display the router-id value for a routing instance. If the router-id is **0.0.0.0**, then the routing instance has no router-id.

For more information about the router identifier in OSPF, see [“Example: Configuring an OSPF Router Identifier” on page 4102](#).

**NOTE:** If you run OSPF for IPv6 or BGP for IPv6 in a routing instance, you must configure an IPv4 router identifier (router-id) in the routing instance itself. In other words, the IPv4 router-id in the main routing instance is not inherited by other routing instances. Even if you run *only* IPv6 OSPF or BGP in a routing instance, the IPv4 router-id must be configured because OSPF and BGP, even when used exclusively with IPv6, use the IPv4 router-id for handshaking. If you do not configure the IPv4 router-id in the IPv6 OSPF or BGP routing instance, then the IPv6 protocols will use invalid IPv4 address 0.0.0.0 and the adjacencies and connections will fail.

## scope-policy

---

**Syntax** `scope-policy [ policy-names ];`

**Hierarchy Level** `[edit logical-systems logical-system-name routing-options multicast],`  
`[edit routing-options multicast]`

**NOTE:** You can configure a scope policy at these two hierarchy levels only. You cannot apply a scope policy to a specific routing instance, because all scoping policies are applied to all routing instances. However, you can apply the `scope` statement to a specific routing instance at the `[edit routing-instances routing-instance-name routing-options multicast]` or `[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options multicast]` hierarchy level.

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.  
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description** Apply policies for scoping. The policy must be correctly configured at the **edit policy-options policy-statement** hierarchy level.

**Options** *policy-names*—Name of one or more multicast scope policies.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## static (Routes)

---

**Syntax**

```
static {
  defaults {
    static-options;
  }
  rib-group group-name;
  route destination-prefix {
    next-hop address;
    next-hop options;
    qualified-next-hop address {
      metric metric;
      preference preference;
    }
    static-options;
  }
}
```

**Hierarchy Level** [edit routing-options],  
[edit routing-options rib *routing-table-name*]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure static routes to be installed in the routing table. You can specify any number of routes within a single **static** statement, and you can specify any number of **static** options in the configuration.

**Options** **defaults**—Specify global static route options. These options only set default attributes inherited by all newly created static routes. These are treated as global defaults and apply to all the static routes you configure in the **static** statement. This part of the **static** statement is optional.

**route destination-prefix**—Destination of the static route.

- **defaults**—For the default route to the destination. This is equivalent to specifying an IP address of 0.0.0.0/0.
- **destination-prefix/prefix-length**—**destination-prefix** is the network portion of the IP address, and **prefix-length** is the destination prefix length.
- **next-hop address**—Reach the next-hop routing device by specifying an IP address, an interface name, or an ISO network entity title (NET).
- **nsap-prefix**—**nsap-prefix** is the network service access point (NSAP) address for ISO.

**next-hop options**—Additional information for how to manage forwarding of packets to the next hop.

- **discard**—Do not forward packets addressed to this destination. Instead, drop the packets, do not send ICMP unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.

- **iso-net**—Reach the next-hop routing device by specifying an ISO NSAP.
- **next-table *routing-table-name***—Name of the next routing table to the destination.
- **receive**—Install a receive route for this destination into the routing table.
- **reject**—Do not forward packets addressed to this destination. Instead, drop the packets, send ICMP unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.

**static-options**—(Optional under **route**) Additional information about static routes, which is included with the route when it is installed in the routing table.

You can specify one or more of the following in **static-options**. Each of the options is explained separately.

- **(active | passive);**
- **(install | no-install);**
- **(metric | metric2 | metric3 | metric4) *value* <type type>;**
- **(preference | preference2 | color | color2) *preference* <type type>;**
- **(resolve | no-resolve);**
- **(no-retain | retain);**

The remaining statements are explained separately.

| Description              | <p>Configure the global suppression, reuse, and warning log message thresholds for multicast forwarding cache limits. You can configure the thresholds globally for the multicast forwarding cache or individually for the IPv4 and IPv6 multicast forwarding caches. Configuring the <b>threshold</b> statement globally for the multicast forwarding cache or including the <b>family</b> statement to configure the thresholds for the IPv4 and IPv6 multicast forwarding caches are mutually exclusive.</p> <p>To confirm the configured threshold values, use the <b>show multicast forwarding-cache statistics</b> command.</p>                                                                                                                                                                                                                                                                                                          |
| Options                  | <p><b>reuse <i>value</i></b>—(Optional) Value at which to begin creating new multicast forwarding cache entries. If configured, this number should be less than the <b>suppress</b> value.</p> <p><b>Range:</b> 1 through 200,000</p> <p><b>suppress <i>value</i></b>—Value at which to begin suppressing new multicast forwarding cache entries. This value is mandatory. This number should be greater than the <b>reuse</b> value.</p> <p><b>Range:</b> 1 through 200,000</p> <p>The remaining statement is explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                       |
| Required Privilege Level | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>         | <p>Define tracing operations that track all routing protocol functionality in the routing device.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Default</b>             | If you do not include this statement, no global tracing operations are performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>             | <p><b>Values:</b></p> <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place global routing protocol tracing output in the file <b>routing-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and</p>                                                                                                                                                                                                 |

so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 10 files

**flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. These are the global routing protocol tracing options:

- **all**—All tracing operations
- **condition-manager**—Condition-manager events
- **config-internal**—Configuration internals
- **general**—All normal operations and routing table changes (a combination of the **normal** and **route** trace operations)
- **graceful-restart**—Graceful restart operations
- **normal**—All normal operations
- **nsr-packet**—Detailed trace information for BFD nonstop active routing only
- **nsr-synchronization**—Tracing operations for nonstop active routing
- **nsr-synchronization-detail**—(MPLS only) Tracing operations for nonstop active routing in detail
- **parse**—Configuration parsing
- **policy**—Routing policy operations and actions
- **regex-parse**—Regular-expression parsing
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

**Required Privilege** routing and trace—To view this statement in the configuration.  
**Level** routing-control and trace-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure at least one, but not more than two, upstream interfaces on the rendezvous point (RP) routing device that resides between a customer edge-facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain. The RP routing device translates PIM join or prune messages into corresponding IGMP report or leave messages (if you include the <a href="#">pim-to-igmp-proxy</a> statement), or into corresponding MLD report or leave messages (if you include the <a href="#">pim-to-mld-proxy</a> statement). The routing device then proxies the IGMP or MLD report or leave messages to one or both upstream interfaces to forward IPv4 multicast traffic (for IGMP) or IPv6 multicast traffic (for MLD) across the PIM domains.</p>                                                                                                                                                        |
| <b>Options</b>                  | <p><b><i>interface-names</i></b>—Names of one or two upstream interfaces to which the RP routing device proxies IGMP or MLD report or leave messages for transmission of multicast traffic across PIM domains. You can specify a maximum of two upstream interfaces on the RP routing device. To configure a set of two upstream interfaces, specify the full interface names, including all physical and logical address components, within square brackets ( [ ] ).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## CHAPTER 34

# Administration

- [Routine Monitoring on page 3223](#)
- [Operational Commands on page 3225](#)

## Routine Monitoring

---

- [Monitoring Routing Information on page 3223](#)
- [Verifying That Virtual Router Routing Instances Are Working on page 3224](#)

## Monitoring Routing Information

**Purpose** Use the monitoring functionality to view the **inet.0** routing table on the routing device.

**Action** To view the routing table, enter the following commands in the CLI interface:

- **show route terse**
- **show route detail**

**Meaning** [Table 247 on page 3223](#) describes the different filters, their functions, and the associated actions.

[Table 248 on page 3224](#) summarizes key output fields in the routing information display.

**Table 247: Filtering Route Messages**

| Field               | Function                                                                                                                             | Your Action                                 |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------|
| Destination Address | Specifies the destination address of the route.                                                                                      | Enter the destination address.              |
| Next hop address    | Specifies the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it. | Enter the next hop address.                 |
| Best route          | Specifies only the best route available.                                                                                             | Select the view details of the best route.  |
| Inactive routes     | Specifies the inactive routes.                                                                                                       | Select the view details of inactive routes. |
| Exact route         | Specifies the exact route.                                                                                                           | Select the view details of the exact route. |

Table 247: Filtering Route Messages (*continued*)

| Field         | Function                                                         | Your Action                                                     |
|---------------|------------------------------------------------------------------|-----------------------------------------------------------------|
| Hidden routes | Specifies the hidden routes.                                     | Select the view details of hidden routes.                       |
| Search        | Applies the specified filter and displays the matching messages. | To apply the filter and display messages, click <b>Search</b> . |

Table 248: Summary of Key Routing Information Output Fields

| Field                  | Values                                                                                                                 | Additional Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Static Route Addresses | The list of static route addresses.                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Protocol               | Protocol from which the route was learned: <b>Static</b> , <b>Direct</b> , <b>Local</b> .                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Preference             | The preference is the individual preference value for the route.                                                       | The route preference is used as one of the route selection criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Next-Hop               | Network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it. | <p>If a next hop is listed as <b>Discard</b>, all traffic with that destination address is discarded rather than routed. This value generally means that the route is a static route for which the <b>discard</b> attribute has been set.</p> <p>If a next hop is listed as <b>Reject</b>, all traffic with that destination address is rejected. This value generally means that the address is unreachable. For example, if the address is a configured interface address and the interface is unavailable, traffic bound for that address is rejected.</p> <p>If a next hop is listed as <b>Local</b>, the destination is an address on the host (either the loopback address or Ethernet management port 0 address, for example).</p> |
| Age                    | How long the route has been active.                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| State                  | Flags for this route.                                                                                                  | There are many possible flags.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Verifying That Virtual Router Routing Instances Are Working

**Purpose** After creating a virtual router routing instance, verify that it has been set up properly.

**Action** 1. Use the **show route instance** command to list all the routing instances and their properties:

```
user@switch> show route instance
```

| Instance                    | Type           | Active/holddown/hidden |
|-----------------------------|----------------|------------------------|
| Primary RIB                 |                |                        |
| master                      | forwarding     |                        |
| inet.0                      |                | 4/0/1                  |
| __juniper_private1__        | forwarding     |                        |
| __juniper_private1__.inet.0 |                | 1/0/3                  |
| __juniper_private2__        | forwarding     |                        |
| __juniper_private2__.inet.0 |                | 0/0/1                  |
| __juniper_private3__        | forwarding     |                        |
| __juniper_private3__.inet.0 |                | 1/0/2                  |
| __juniper_private4__        | forwarding     |                        |
| __juniper_private4__.inet.0 |                | 4/0/2                  |
| __master.anon__             | forwarding     |                        |
| r1                          | virtual-router |                        |
| r2                          | virtual-router |                        |

- Use the **show route forwarding-table** command to view the forwarding table information for each routing instance:

```
user@switch> show route forwarding-table
Routing table: r1---qfabric.inet
Internet:
Destination      Type RtRef Next hop      Type Index NhRef Netif
default          perm  0          Type Index NhRef Netif
0.0.0.0/32       perm  0          dscd  1626  1
224.0.0.0/4      perm  0          mdsc  1627  1
224.0.0.1/32     perm  0 224.0.0.1  mcst  1623  1
255.255.255.255/32 perm  0          bcst  1624  1
```

**Meaning** The output displays the routing table information and confirms that the virtual router routing instances have been created and the links are up.

| Description                 | <p>Display the distribution of autonomous system (AS) paths that the local routing device is using (usually through the routing table). Use this command to debug problems for AS paths and to understand how AS paths have been manipulated through a policy (through the <b>as-path-prepend</b> action) or through aggregation.</p> <p>AS paths are stored in a hash table. A hash table is one method for fast lookup. Each entry in the table is called a bucket. Junos OS computes a hash value that indicates in which bucket the AS path is stored. The AS paths are dispersed among the hash buckets so that a manageable number of AS paths is stored in each bucket. Only unique AS paths are stored. Duplicate AS paths increase a reference count, but do not increase the number of AS paths stored in the hash table.</p> |
| Options                     | <p><b>none</b>—Display basic information about AS paths that the local routing device is using (same as brief).</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 250: show as-path domain Output Fields**

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                               |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Domain</b>       | Number of independent AS domains. The AS paths of an independent AS domain are not shared with the AS paths and AS path attributes of other domains, including the master routing instance domain.                                                                                                                                              |
| <b>Primary</b>      | Primary AS number.                                                                                                                                                                                                                                                                                                                              |
| <b>References</b>   | Path reference count.                                                                                                                                                                                                                                                                                                                           |
| <b>Number Paths</b> | Number of known AS paths.                                                                                                                                                                                                                                                                                                                       |
| <b>Flags</b>        | Information about the AS path: <ul style="list-style-type: none"> <li>• <b>ASLoop</b>—Path contains an AS loop.</li> <li>• <b>Atomic</b>—Path includes the ATOMIC_AGGREGATE path attribute.</li> <li>• <b>Local</b>—Path was created by local aggregation.</li> <li>• <b>Master</b>—Path was created by the master routing instance.</li> </ul> |
| <b>Local AS</b>     | AS number of the local routing device.                                                                                                                                                                                                                                                                                                          |

Table 250: show as-path domain Output Fields (*continued*)

| Field Name   | Field Description                                       |
|--------------|---------------------------------------------------------|
| <b>Loops</b> | How many times this AS number can appear in an AS path. |

## Sample Output

show as-path domain

```
user@host> show as-path domain
Domain: 1          Primary: 10458
References:        3 Paths:      30383
Flags: Master
Local AS: 10458   Loops: 1
```

| <b>Release Information</b>         | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>                 | <p>Display autonomous system (AS) path summary information.</p> <p>AS paths are stored in a hash table. A hash table is one method for fast lookup. Each entry in the table is called a bucket. Junos OS computes a hash value that indicates in which bucket the AS path is stored. The AS paths are dispersed among the hash buckets so that a manageable number of AS paths is stored in each bucket. Only unique AS paths are stored. Duplicate AS paths increase a reference count, but do not increase the number of AS paths stored in the hash table.</p> |
| <b>Options</b>                     | <p><b>none</b>—(Optional) Display AS path summary information for all routing instances.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>                                                                                                                                                                                                                                                                                                          |
| <b>Required Privilege Level</b>    | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>              | Display information about IPv6 router advertisements, including statistics about messages sent and received on interfaces, and information received from advertisements from other routers.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b>none</b>—Display all IPv6 router advertisement information for all interfaces.</p> <p><b>conflicts</b>—(Optional) Display only the IPv6 router advertisement information that is conflicting.</p> <p><b>interface <i>interface</i></b>—(Optional) Display IPv6 router advertisement information for the specified interface.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>prefix <i>prefix/prefix length</i></b>—(Optional) Display IPv6 router advertisement information for the specified prefix.</p> |
| <b>Additional Information</b>   | The display identifies conflicting information by enclosing the value the router is advertising in brackets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Output Fields</b>            | Table 253 on page 3239 describes the output fields for the <b>show ipv6 router-advertisement</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 253: show ipv6 router-advertisement Output Fields

| Field Name          | Field Description                                                               |
|---------------------|---------------------------------------------------------------------------------|
| Interface           | Name of the interface.                                                          |
| Advertisements sent | Number of router advertisements sent and the elapsed time since they were sent. |

Table 253: show ipv6 router-advertisement Output Fields (*continued*)

| Field Name              | Field Description                                                                                                             |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Solicits received       | Number of solicitation messages received.                                                                                     |
| Advertisements received | Number of router advertisements received.                                                                                     |
| Advertisements from     | Names of interfaces from which router advertisements have been received and the elapsed time since the last one was received. |
| Managed                 | Managed address configuration flag: 0 (stateless) or 1 (stateful).                                                            |
| Other configuration     | Other stateful configuration flag: 0 (stateless) or 1 (stateful).                                                             |
| Reachable time          | Time that a node identifies a neighbor as reachable after receiving a reachability confirmation, in milliseconds.             |
| Default lifetime        | Default lifetime, in seconds: from 0 seconds to 18.2 hours. A setting of 0 indicates that the router is not a default router. |
| Retransmit timer        | Time between retransmitted Neighbor Solicitation messages, in milliseconds.                                                   |
| Current hop limit       | Configured current hop limit.                                                                                                 |
| Prefix                  | Name and length of the prefix.                                                                                                |
| Valid lifetime          | How long the prefix remains valid for onlink determination.                                                                   |
| Preferred lifetime      | How long the prefix generated by stateless autoconfiguration remains preferred.                                               |
| On link                 | Onlink flag: 0 (not onlink) or 1 (onlink).                                                                                    |
| Autonomous              | Autonomous address configuration flag: 0 (not autonomous) or 1 (autonomous).                                                  |

## Sample Output

### show ipv6 router-advertisement

```

user@host> show ipv6 router-advertisement
Interface: fe-0/1/1.0
  Advertisements sent: 0
  Solicits received: 0
  Advertisements received: 0
Interface: fxp0.0
  Advertisements sent: 0
  Solicits received: 0
  Advertisements received: 1
  Advertisement from fe80::2d0:b7ff:fe1e:7b0e, heard 00:00:13 ago
  Managed: 0
  Other configuration: 0 [1]
  Reachable time: 0 ms
  Default lifetime: 1800 sec

```

```
Retransmit timer: 0 ms
Current hop limit: 64
```

#### show ipv6 router-advertisement conflicts

```
user@host> show ipv6 router-advertisement conflicts
Interface: fxp0.0
  Advertisement from fe80::2d0:b7ff:fe1e:7b0e, heard 00:01:08 ago
  Other configuration: 0 [1]
```

#### show ipv6 router-advertisement prefix

```
user@host> show ipv6 router-advertisement prefix 8040::/16
Interface: fe-0/1/3.0
  Advertisements sent: 3, last sent 00:04:11 ago
  Solicits received: 0
  Advertisements received: 3
  Advertisement from fe80::290:69ff:fe9a:5403, heard 00:00:05 ago
  Managed: 0
  Other configuration: 0
  Reachable time: 0 ms
  Default lifetime: 180 sec [1800 sec]
  Retransmit timer: 0 ms
  Current hop limit: 64
  Prefix: 8040:1::/64
    Valid lifetime: 2592000 sec
    Preferred lifetime: 604800 sec
    On link: 1
    Autonomous: 1
```

## show route

| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <i>number routes</i>       | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive). A holddown route was once the active route and is no longer the active route. The route is in the holddown state because a protocol still has interest in the route, meaning that the interest bit is set. A protocol might have its interest bit set on the previously active route because the protocol is still advertising the route. The route will be deleted after all protocols withdraw their advertisement of the route and remove their interest bit. A persistent holddown state often means that the interested protocol is not releasing its interest bit properly.</li> </ul> <p>However, if you have configured advertisement of multiple routes (with the <b>add-path</b> or <b>advertise-inactive</b> statement), the holddown bit is most likely set because BGP is advertising the route as an active route. In this case, you can ignore the holddown state because nothing is wrong.</p> <ul style="list-style-type: none"> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul> |
| <i>destination-prefix</i>  | <p>Route destination (for example:10.0.0.1/24). Sometimes the route information is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only. For example, 10.1.1.195:NoCtrlWord:1:1:Local/96): <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul>                                                                                                                                                                      |

Table 254: show route Output Fields (*continued*)

| Field Name                                        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [ <i>protocol, preference</i> ]                   | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• - —A hyphen indicates the last active route.</li> <li>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                                   |
| <i>weeks:days</i><br><i>hours:minutes:seconds</i> | How long the route been known (for example, <b>2w4d 13:11:14</b> , or 2 weeks, 4 days, 13 hours, 11 minutes, and 14 seconds).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| metric                                            | Cost value of the indicated route. For routes within an AS, the cost is determined by the IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| localpref                                         | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| from                                              | Interface from which the route was received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| AS path                                           | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• I—IGP.</li> <li>• E—EGP.</li> <li>• ?—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• ( )—Parentheses enclose a confederation.</li> <li>• ( [ ] )—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |

Table 254: show route Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>validation-state</b> | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>to</b>               | <p>Next hop to the destination. An angle bracket (&gt;) indicates that the route is the selected route.</p> <p>If the destination is <b>Discard</b>, traffic is dropped.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>via</b>              | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> <li>• <b>lsp-path-name</b>—Name of the LSP used to reach the next hop.</li> <li>• <b>label-action</b>—MPLS label and operation occurring at the next hop. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label). For VPNs, expect to see multiple <b>push</b> operations, corresponding to the inner and outer labels required for VPN routes (in the case of a direct PE-to-PE connection, the VPN route would have the inner label push only).</li> </ul> |

## Sample Output

### show route

```

user@host> show route
inet.0: 11 destinations, 12 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

1:65500:1:10.0.0.20/240
    *[MVPN/70] 19:53:41, metric2 1
        Indirect
1:65500:1:10.0.0.40/240
    *[BGP/170] 19:53:29, localpref 100, from 10.0.0.30
        AS path: I
        > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
        [BGP/170] 19:53:26, localpref 100, from 10.0.0.33
        AS path: I
        > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
1:65500:1:10.0.0.60/240
    *[BGP/170] 19:53:29, localpref 100, from 10.0.0.30

```

```

AS path: I
> to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF
[BGP/170] 19:53:25, localpref 100, from 10.0.0.33
AS path: I
> to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF

```

## show route

The following sample output shows a VPN route with composite next hops enabled. The first **Push** operation corresponds to the outer label. The second **Push** operation corresponds to the inner label.

```

user@host> show route 70.0.0.0

13979:665001.inet.0: 871 destinations, 3556 routes (871 active, 0 holddown, 0
hidden)
+ = Active Route, - = Last Active, * = Both

70.0.0.0/24      @[BGP/170] 00:28:32, localpref 100, from 10.9.9.160
                  AS path: 13980 ?, validation-state: unverified
                  > to 10.100.0.42 via ae2.0, Push 16, Push 300368(top)
                  [BGP/170] 00:28:28, localpref 100, from 10.9.9.169
                  AS path: 13980 ?, validation-state: unverified
                  > to 10.100.0.42 via ae2.0, Push 126016, Push 300368(top)

| <b>Release Information</b>         | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                         |
| <b>Description</b>                 | Display information about all routes in all routing tables, including private, or internal, tables.                                                                                                                                                                                                                                           |
| <b>Options</b>                     | <b>none</b> —Display information about all routes in all routing tables, including private, or internal, tables.<br><br><b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.                                                                 |
| <b>Required Privilege Level</b>    | view                                                                                                                                                                                                                                                                                                                                          |
| <b>List of Sample Output</b>       | <a href="#">show route all on page 3253</a>                                                                                                                                                                                                                                                                                                   |
| <b>Output Fields</b>               | In Junos OS Release 9.5 and later, only the output fields for the <b>show route all</b> command display all routing tables, including private, or hidden, routing tables. The output field table of the <a href="#">show route</a> command does not display entries for private, or hidden, routing tables in Junos OS Release 9.5 and later. |

## Sample Output

### show route all

The following example displays a snippet of output from the **show route** command and then displays the same snippet of output from the **show route all** command:

```
user@host> show route
mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
0          *[MPLS/0] 2d 02:24:39, metric 1
            Receive
1          *[MPLS/0] 2d 02:24:39, metric 1
            Receive
2          *[MPLS/0] 2d 02:24:39, metric 1
            Receive
800017     *[VPLS/7] 1d 14:00:16
            > via vt-3/2/0.32769, Pop
800018     *[VPLS/7] 1d 14:00:26
            > via vt-3/2/0.32772, Pop
```

```
user@host> show route all
mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
0          *[MPLS/0] 2d 02:19:12, metric 1
            Receive
1          *[MPLS/0] 2d 02:19:12, metric 1
            Receive
2          *[MPLS/0] 2d 02:19:12, metric 1
            Receive
800017     *[VPLS/7] 1d 13:54:49
            > via vt-3/2/0.32769, Pop
800018     *[VPLS/7] 1d 13:54:59
            > via vt-3/2/0.32772, Pop
vt-3/2/0.32769 [VPLS/7] 1d 13:54:49
              Unusable
vt-3/2/0.32772 [VPLS/7] 1d 13:54:59
              Unusable
```

## show route aspath-regex

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>                 | Display the entries in the routing table that match the specified autonomous system (AS) path regular expression.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                     | <p><i>regular-expression</i>—Regular expression that matches an entire AS path.</p> <p><i>logical-system</i> (all   <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Additional Information</b>      | <p>You can specify a regular expression as:</p> <ul style="list-style-type: none"> <li>• An individual AS number</li> <li>• A period wildcard used in place of an AS number</li> <li>• An AS path regular expression that is enclosed in parentheses</li> </ul> <p>You also can include the operators described in the table of AS path regular expression operators in the <i>Junos Policy Framework Configuration Guide</i>. The following list summarizes these operators:</p> <ul style="list-style-type: none"> <li>• <b>{<i>m,n</i>}</b>—At least <i>m</i> and at most <i>n</i> repetitions of the AS path term.</li> <li>• <b>{<i>m</i>}</b>—Exactly <i>m</i> repetitions of the AS path term.</li> <li>• <b>{<i>m</i>,}</b>—<i>m</i> or more repetitions of the AS path term.</li> <li>• <b>*</b>—Zero or more repetitions of an AS path term.</li> <li>• <b>+</b>—One or more repetitions of an AS path term.</li> <li>• <b>?</b>—Zero or one repetition of an AS path term.</li> <li>• <b><i>aspath_term</i>   <i>aspath_term</i></b>—Match one of the two AS path terms.</li> </ul> <p>When you specify more than one AS number or path term, or when you include an operator in the regular expression, enclose the entire regular expression in quotation marks. For example, to match any path that contains AS number 234, specify the following command:</p> <pre>show route aspath-regex ". * 234 . *"</pre> |

|                          |                                                                                                                                                                                      |

| Description                 | Display the route entries in each routing table that are members of a Border Gateway Protocol (BGP) community.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Options                     | <p><b><i>as-number:community-value</i></b>—One or more community identifiers. <b><i>as-number</i></b> is the AS number, and <b><i>community-value</i></b> is the community identifier. When you specify more than one community identifier, enclose the identifiers in double quotation marks. Community identifiers can include wildcards.</p> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| Additional Information      | Specifying the community option displays all routes matching the community found within the routing table. The community option does not limit the output to only the routes being advertised to the neighbor after any egress routing policy.                                                                                                                                                                                                                                                                                                                                                                 |
| Required Privilege Level    | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Description                              | Display the BGP routes for which updates might have been reduced because of route flap damping.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Options                                  | <b>brief   detail   extensive   terse</b> —(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.<br><br><b>decayed</b> —Display route damping entries that might no longer be valid, but are not suppressed.<br><br><b>history</b> —Display entries that have already been withdrawn, but have been logged.<br><br><b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.<br><br><b>suppressed</b> —Display entries that have been suppressed and are no longer being installed into the forwarding table or exported by routing protocols. |
| Required Privilege Level                 | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <i>routing-table-name</i>                    | Name of the routing table—for example, <b>inet.0</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels              |
| <b>destinations</b>                          | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels              |
| <b>number routes</b>                         | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b></li> <li>• <b>holdddown</b> (routes that are in a pending state before being declared inactive)</li> <li>• <b>hidden</b> (the routes are not used because of a routing policy)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | All levels              |
| <b>destination-prefix (entry, announced)</b> | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b> |
| <b>[protocol, preference]</b>                | Protocol from which the route was learned and the preference value for the route. <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p> | All levels              |
| <b>Next-hop reference count</b>              | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |
| <b>Source</b>                                | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |
| <b>Next hop</b>                              | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>via</b>                                   | Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive</b> |
| <b>Protocol next hop</b>                     | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b> |
| <b>Indirect next hop</b>                     | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>State</b>                                 | Flags for this route. For a description of possible values for this field, see the output field table for the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> |

Table 255: show route damping Output Fields (*continued*)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Level of Output  |

| <b>Output Fields</b>               | Table 256 on page 3271 describes the output fields for the <b>show route detail</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                    |

**Table 256: show route detail Output Fields**

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                                                                                                                                                                                                                                                                                                                |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                         |
| <i>number routes</i>       | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li><b>active</b> (routes that are active)</li> <li><b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li><b>hidden</b> (routes that are not used because of a routing policy)</li> </ul> |

Table 256: show route detail Output Fields (*continued*)

| Field Name                                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>route-destination</i><br>(entry, announced) | <p>Route destination (for example:10.0.0.1/24). The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul> |
| <b>label stacking</b>                          | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <i>[protocol, preference]</i>                  | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+—</b>A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>—</b>A hyphen indicates the last active route.</li> <li>• <b>*—</b>An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                             |
| <b>Level</b>                                   | <p>(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Next-hop reference count</b>                      | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Flood nexthop branches exceed maximum message</b> | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Source</b>                                        | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Next hop</b>                                      | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>via</b>                                           | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul> |
| <b>Label-switched-path<br/><i>lsp-path-name</i></b>  | Name of the LSP used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Label operation</b>                               | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Interface</b>                                     | (Local only) Local interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Protocol next hop</b>                             | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Indirect next hop</b>                             | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>State</b>                                         | State of the route (a route can be in more than one state). See <a href="#">Table 258 on page 3277</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Local AS</b>                                      | AS number of the local routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Age</b>                                           | How long the route has been known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>AIGP</b>                                          | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Metricn</b>                                       | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>MED-plus-IGP</b>        | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>TTL-Action</b>          | <p>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</p> <p>For sample output, see <a href="#">show route table</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Task</b>                | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Announcement bits</b>   | List of protocols that announce this route. <b>n-Resolve inet</b> indicates that the route is used for route resolution for next hops found in the routing table. <b>n</b> is an index used by Juniper Networks customer support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>AS path</b>             | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li><b>I</b>—IGP.</li> <li><b>E</b>—EGP.</li> <li><b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li><b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li><b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.</li> <li><b>[ ]</b>—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li><b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li><b>( )</b>—Parentheses enclose a confederation.</li> <li><b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| <b>validation-state</b>    | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li><b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li><b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li><b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li><b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>FECs bound to route</b> | Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 256: show route detail Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                   |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary Upstream          | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path. |
| RPF Nexthops              | When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.                                             |
| Label                     | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.                         |
| weight                    | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.                                                                                                                                                  |
| VC Label                  | MPLS label assigned to the Layer 2 circuit virtual connection.                                                                                                                                                                                                                                                      |
| MTU                       | Maximum transmission unit (MTU) of the Layer 2 circuit.                                                                                                                                                                                                                                                             |
| VLAN ID                   | VLAN identifier of the Layer 2 circuit.                                                                                                                                                                                                                                                                             |
| Prefixes bound to route   | Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.                                                                                                                                                                                                                  |
| Communities               | Community path attribute for the route. See <a href="#">Table 259 on page 3279</a> for all possible values for this field.                                                                                                                                                                                          |
| Layer2-info: encaps       | Layer 2 encapsulation (for example, VPLS).                                                                                                                                                                                                                                                                          |
| control flags             | Control flags: <b>none</b> or <b>Site Down</b> .                                                                                                                                                                                                                                                                    |
| mtu                       | Maximum transmission unit (MTU) information.                                                                                                                                                                                                                                                                        |
| Label-Base, range         | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                              |
| status vector             | Layer 2 VPN and VPLS network layer reachability information (NLRI).                                                                                                                                                                                                                                                 |
| Accepted Multipath        | Current active path when BGP multipath is configured.                                                                                                                                                                                                                                                               |
| Accepted MultipathContrib | Path currently contributing to BGP multipath.                                                                                                                                                                                                                                                                       |
| Localpref                 | Local preference value included in the route.                                                                                                                                                                                                                                                                       |
| Router ID                 | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                    |
| Primary Routing Table     | In a routing table group, the name of the primary routing table in which the route resides.                                                                                                                                                                                                                         |
| Secondary Tables          | In a routing table group, the name of one or more secondary tables in which the route resides.                                                                                                                                                                                                                      |

Table 257 on page 3276 describes all possible values for the Next-hop Types output field.

**Table 257: Next-hop Types Output Field Values**

| Next-Hop Type                   | Description                                                                                                                                                                                                                                                                    |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Broadcast (bcast)</b>        | Broadcast next hop.                                                                                                                                                                                                                                                            |
| <b>Deny</b>                     | Deny next hop.                                                                                                                                                                                                                                                                 |
| <b>Discard</b>                  | Discard next hop.                                                                                                                                                                                                                                                              |
| <b>Flood</b>                    | Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast. |
| <b>Hold</b>                     | Next hop is waiting to be resolved into a unicast or multicast type.                                                                                                                                                                                                           |
| <b>Indexed (idxd)</b>           | Indexed next hop.                                                                                                                                                                                                                                                              |
| <b>Indirect (indr)</b>          | Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.                                                   |
| <b>Interface</b>                | Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.                                                                                                                   |
| <b>Local (locl)</b>             | Local address on an interface. This next-hop type causes packets with this destination address to be received locally.                                                                                                                                                         |
| <b>Multicast (mcst)</b>         | Wire multicast next hop (limited to the LAN).                                                                                                                                                                                                                                  |
| <b>Multicast discard (mdsc)</b> | Multicast discard.                                                                                                                                                                                                                                                             |
| <b>Multicast group (mgrp)</b>   | Multicast group member.                                                                                                                                                                                                                                                        |
| <b>Receive (recv)</b>           | Receive.                                                                                                                                                                                                                                                                       |
| <b>Reject (rjct)</b>            | Discard. An ICMP unreachable message was sent.                                                                                                                                                                                                                                 |
| <b>Resolve (rslv)</b>           | Resolving next hop.                                                                                                                                                                                                                                                            |
| <b>Routed multicast (mcrt)</b>  | Regular multicast next hop.                                                                                                                                                                                                                                                    |

Table 257: Next-hop Types Output Field Values (*continued*)

| Next-Hop Type         | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Router</b>         | <p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> <li>• Must not be a direct or local subnet for the routing device.</li> <li>• Must have a next hop that is directly connected to the routing device.</li> </ul> |
| <b>Table</b>          | Routing table next hop.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Unicast (ucst)</b> | Unicast.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Unilist (ulst)</b> | List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.                                                                                                                                                                                                                                                                                                                |

[Table 258 on page 3277](#) describes all possible values for the State output field. A route can be in more than one state (for example, <**Active NoReadvrt Int Ext**>).

Table 258: State Output Field Values

| Value                                        | Description                                                                      |
|----------------------------------------------|----------------------------------------------------------------------------------|
| <b>Accounting</b>                            | Route needs accounting.                                                          |
| <b>Active</b>                                | Route is active.                                                                 |
| <b>Always Compare MED</b>                    | Path with a lower multiple exit discriminator (MED) is available.                |
| <b>AS path</b>                               | Shorter AS path is available.                                                    |
| <b>Cisco Non-deterministic MED selection</b> | Cisco nondeterministic MED is enabled, and a path with a lower MED is available. |
| <b>Clone</b>                                 | Route is a clone.                                                                |
| <b>Cluster list length</b>                   | Length of cluster list sent by the route reflector.                              |
| <b>Delete</b>                                | Route has been deleted.                                                          |
| <b>Ex</b>                                    | Exterior route.                                                                  |
| <b>Ext</b>                                   | BGP route received from an external BGP neighbor.                                |

Table 258: State Output Field Values (*continued*)

| Value                                                    | Description                                                                                                                                                                          |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>FlashAll</b>                                          | Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes. |
| <b>Hidden</b>                                            | Route not used because of routing policy.                                                                                                                                            |
| <b>IfCheck</b>                                           | Route needs forwarding RPF check.                                                                                                                                                    |
| <b>IGP metric</b>                                        | Path through next hop with lower IGP metric is available.                                                                                                                            |
| <b>Inactive reason</b>                                   | Flags for this route, which was not selected as best for a particular destination.                                                                                                   |
| <b>Initial</b>                                           | Route being added.                                                                                                                                                                   |
| <b>Int</b>                                               | Interior route.                                                                                                                                                                      |
| <b>Int Ext</b>                                           | BGP route received from an internal BGP peer or a BGP confederation peer.                                                                                                            |
| <b>Interior &gt; Exterior &gt; Exterior via Interior</b> | Direct, static, IGP, or EBGP path is available.                                                                                                                                      |
| <b>Local Preference</b>                                  | Path with a higher local preference value is available.                                                                                                                              |
| <b>Martian</b>                                           | Route is a martian (ignored because it is obviously invalid).                                                                                                                        |
| <b>MartianOK</b>                                         | Route exempt from martian filtering.                                                                                                                                                 |
| <b>Next hop address</b>                                  | Path with lower metric next hop is available.                                                                                                                                        |
| <b>No difference</b>                                     | Path from neighbor with lower IP address is available.                                                                                                                               |
| <b>NoReadvrt</b>                                         | Route not to be advertised.                                                                                                                                                          |
| <b>NotBest</b>                                           | Route not chosen because it does not have the lowest MED.                                                                                                                            |
| <b>Not Best in its group</b>                             | Incoming BGP AS is not the best of a group (only one AS can be the best).                                                                                                            |
| <b>NotInstall</b>                                        | Route not to be installed in the forwarding table.                                                                                                                                   |
| <b>Number of gateways</b>                                | Path with a greater number of next hops is available.                                                                                                                                |
| <b>Origin</b>                                            | Path with a lower origin code is available.                                                                                                                                          |
| <b>Pending</b>                                           | Route pending because of a hold-down configured on another route.                                                                                                                    |

Table 258: State Output Field Values (*continued*)

| Value                                 | Description                                                                                                                                                                                                                       |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Release</b>                        | Route scheduled for release.                                                                                                                                                                                                      |
| <b>RIB preference</b>                 | Route from a higher-numbered routing table is available.                                                                                                                                                                          |
| <b>Route Distinguisher</b>            | 64-bit prefix added to IP subnets to make them unique.                                                                                                                                                                            |
| <b>Route Metric or MED comparison</b> | Route with a lower metric or MED is available.                                                                                                                                                                                    |
| <b>Route Preference</b>               | Route with lower preference value is available                                                                                                                                                                                    |
| <b>Router ID</b>                      | Path through a neighbor with lower ID is available.                                                                                                                                                                               |
| <b>Secondary</b>                      | Route not a primary route.                                                                                                                                                                                                        |
| <b>Unusable path</b>                  | Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> <li>• The route is damped.</li> <li>• The route is rejected by an import policy.</li> <li>• The route is unresolved.</li> </ul> |
| <b>Update source</b>                  | Last tiebreaker is the lowest IP address value.                                                                                                                                                                                   |

Table 259 on page 3279 describes the possible values for the Communities output field.

Table 259: Communities Output Field Values

| Value                                                   | Description                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area-number</i>                                      | 4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.                                        |
| <b>bandwidth: local AS number:link-bandwidth-number</b> | Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute. |
| <b>domain-id</b>                                        | Unique configurable number that identifies the OSPF domain.                                                                                                                                                                                                                           |
| <b>domain-id-vendor</b>                                 | Unique configurable number that further identifies the OSPF domain.                                                                                                                                                                                                                   |
| <i>link-bandwidth-number</i>                            | Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second).                                                                                                                                                                                                               |
| <i>local AS number</i>                                  | Local AS number: from 1 through 65,535.                                                                                                                                                                                                                                               |
| <i>options</i>                                          | 1 byte. Currently this is only used if the route type is 5 or 7. Setting the least significant bit in the field indicates that the route carries a type 2 metric.                                                                                                                     |

Table 259: Communities Output Field Values (*continued*)

| Value                                | Description                                                                                                                                                                                                                                           |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>origin</b>                        | (Used with VPNs) Identifies where the route came from.                                                                                                                                                                                                |
| <b>ospf-route-type</b>               | 1 byte, encoded as 1 or 2 for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); 3 for summary routes; 5 for external routes (area number must be 0); 7 for NSSA routes; or 129 for sham link endpoint addresses. |
| <b>route-type-vendor</b>             | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x8000</b> . The format is <b>area-number:ospf-route-type:options</b> .                                          |
| <b>rte-type</b>                      | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x0306</b> . The format is <b>area-number:ospf-route-type:options</b> .                                          |
| <b>target</b>                        | Defines which VPN the route participates in; <b>target</b> has the format <b>32-bit IP address:16-bit number</b> . For example, 10.19.0.0:100.                                                                                                        |
| <b>unknown IANA</b>                  | Incoming IANA codes with a value between <b>0x1</b> and <b>0x7fff</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.                                                                                      |
| <b>unknown OSPF vendor community</b> | Incoming IANA codes with a value above <b>0x8000</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.                                                                                                       |

| <b>Description</b>                 | Display policy-based route export information. Policy-based export simplifies the process of exchanging route information between routing instances.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                     | <p><b>none</b>—(Same as <b>brief</b>.) Display standard information about policy-based export for all instances and routing tables on all systems.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>instance &lt;instance-name&gt;</b>—(Optional) Display a particular routing instance for which policy-based export is currently enabled.</p> <p><b>logical-system (all   logical-system-name)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>routing-table-name</b>—(Optional) Display information about policy-based export for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the <b>show route export inet</b> command).</p> |
| <b>Required Privilege Level</b>    | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Output Fields</b>               | <a href="#">Table 260 on page 3290</a> lists the output fields for the <b>show route export</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Table 260: show route export Output Fields

| Field Name                 | Field Description                                                                                                                                           | Level of Output   |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| Table or <i>table-name</i> | Name of the routing tables that either import or export routes.                                                                                             | All levels        |
| Routes                     | Number of routes exported from this table into other tables. If a particular route is exported to different tables, the counter will only increment by one. | <b>brief</b> none |

Table 260: show route export Output Fields (*continued*)

| Field Name    | Field Description                                                                                                                                                                                                                                                                                                                                                                 | Level of Output   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| Export        | Whether the table is currently exporting routes to other tables: <b>Y</b> or <b>N</b> (Yes or No).                                                                                                                                                                                                                                                                                | <b>brief</b> none |
| Import        | Tables currently importing routes from the originator table. (Not displayed for tables that are not exporting any routes.)                                                                                                                                                                                                                                                        | <b>detail</b>     |
| Flags         | ( <b>instance</b> keyword only) Flags for this feature on this instance: <ul style="list-style-type: none"> <li>• <b>config auto-policy</b>—The policy was deduced from the configured IGP export policies.</li> <li>• <b>cleanup</b>—Configuration information for this instance is no longer valid.</li> <li>• <b>config</b>—The instance was explicitly configured.</li> </ul> | <b>detail</b>     |
| Options       | ( <b>instance</b> keyword only) Configured option displays the type of routing tables the feature handles: <ul style="list-style-type: none"> <li>• <b>unicast</b>—Indicates <i>instance.inet.0</i>.</li> <li>• <b>multicast</b>—Indicates <i>instance.inet.2</i>.</li> <li>• <b>unicast multicast</b>—Indicates <i>instance.inet.0</i> and <i>instance.inet.2</i>.</li> </ul>    | <b>detail</b>     |
| Import policy | ( <b>instance</b> keyword only) Policy that <b>route export</b> uses to construct the import-export matrix. Not displayed if the instance type is <b>vrf</b> .                                                                                                                                                                                                                    | <b>detail</b>     |
| Instance      | ( <b>instance</b> keyword only) Name of the routing instance.                                                                                                                                                                                                                                                                                                                     | <b>detail</b>     |
| Type          | ( <b>instance</b> keyword only) Type of routing instance: <b>forwarding</b> , <b>non-forwarding</b> , or <b>vrf</b> .                                                                                                                                                                                                                                                             | <b>detail</b>     |

## Sample Output

### show route export

```

user@host> show route export
Table      Export      Routes
inet.0     N            0
black.inet.0 Y           3
red.inet.0 Y            4

```

### show route export detail

```

user@host> show route export detail
inet.0                                     Routes:      0
black.inet.0                             Routes:      3
  Import: [ inet.0 ]
red.inet.0                               Routes:      4
  Import: [ inet.0 ]

```

### show route export instance detail

```

user@host> show route export instance detail
Instance: master                          Type: forwarding
Flags: <config auto-policy> Options: <unicast multicast>
Import policy: [ (ospf-master-from-red || isis-master-from-black) ]

```

Instance: black  
Instance: red

Type: non-forwarding  
Type: non-forwarding

| <i>number routes</i>                           | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive).</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <i>route-destination</i><br>(entry, announced) | <p>Route destination (for example: 10.0.0.1/24). The <b>entry</b> value is the number of route for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul> |
| <b>TSI</b>                                     | Protocol header information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>label stacking</b>                          | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of two or more exits this router with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>[protocol, preference]</b>                  | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                            |

Table 261: show route extensive Output Fields (*continued*)

| Field Name                                           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Level</b>                                         | (IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Route Distinguisher</b>                           | IP subnet augmented with a 64-bit prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>PMSI</b>                                          | Provider multicast service interface (MVPN routing table).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Next-hop type</b>                                 | Type of next hop. For a description of possible values for this field, see the Output Field table in the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Next-hop reference count</b>                      | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Flood nexthop branches exceed maximum message</b> | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Source</b>                                        | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Next hop</b>                                      | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>via</b>                                           | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul> |
| <b>Label-switched-path lsp-path-name</b>             | Name of the LSP used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Label operation</b>                               | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Offset</b>                                        | Whether the metric has been increased or decreased by an offset value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Interface</b>                                     | (Local only) Local interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Protocol next hop</b>                             | Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 261: show route extensive Output Fields (*continued*)

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>label-operation</i></b> | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                 |
| <b>Indirect next hops</b>     | <p>When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved.</p> <p>When BGP PIC Edge is enabled, the output lines that contain <b>Indirect next hop: weight</b> follow next hops that the software can use to repair paths where a link failure occurs. The next-hop weight has one of the following values:</p> <ul style="list-style-type: none"> <li>• 0x1 indicates active next hops.</li> <li>• 0x4000 indicates passive next hops.</li> </ul> |
| <b>State</b>                  | State of the route (a route can be in more than one state). See the Output Field table in the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Session ID</b>             | The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA).                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Weight</b>                 | <p>Weight for the backup path. If the weight of an indirect next hop is larger than zero, the weight value is shown.</p> <p>For sample output, see <a href="#">show route table</a>.</p>                                                                                                                                                                                                                                                                                                                                     |

Table 261: show route extensive Output Fields (*continued*)

| Field Name      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inactive reason | <p>If the route is inactive, the reason for its current state is indicated. Typical reasons include:</p> <ul style="list-style-type: none"> <li>• <b>Active preferred</b>—Currently active route was selected over this route.</li> <li>• <b>Always compare MED</b>—Path with a lower multiple exit discriminator (MED) is available.</li> <li>• <b>AS path</b>—Shorter AS path is available.</li> <li>• <b>Cisco Non-deterministic MED selection</b>—Cisco nondeterministic MED is enabled and a path with a lower MED is available.</li> <li>• <b>Cluster list length</b>—Path with a shorter cluster list length is available.</li> <li>• <b>Forwarding use only</b>—Path is only available for forwarding purposes.</li> <li>• <b>IGP metric</b>—Path through the next hop with a lower IGP metric is available.</li> <li>• <b>IGP metric type</b>—Path with a lower OSPF link-state advertisement type is available.</li> <li>• <b>Interior &gt; Exterior &gt; Exterior via Interior</b>—Direct, static, IGP, or EBGp path is available.</li> <li>• <b>Local preference</b>—Path with a higher local preference value is available.</li> <li>• <b>Next hop address</b>—Path with a lower metric next hop is available.</li> <li>• <b>No difference</b>—Path from a neighbor with a lower IP address is available.</li> <li>• <b>Not Best in its group</b>—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed).</li> <li>• <b>Number of gateways</b>—Path with a higher number of next hops is available.</li> <li>• <b>Origin</b>—Path with a lower origin code is available.</li> <li>• <b>OSPF version</b>—Path does not support the indicated OSPF version.</li> <li>• <b>RIB preference</b>—Route from a higher-numbered routing table is available.</li> <li>• <b>Route distinguisher</b>—64-bit prefix added to IP subnets to make them unique.</li> <li>• <b>Route metric or MED comparison</b>—Route with a lower metric or MED is available.</li> <li>• <b>Route preference</b>—Route with a lower preference value is available.</li> <li>• <b>Router ID</b>—Path through a neighbor with a lower ID is available.</li> <li>• <b>Unusable path</b>—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved.</li> <li>• <b>Update source</b>—Last tiebreaker is the lowest IP address value.</li> </ul> |
| Local AS        | Autonomous system (AS) number of the local routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Age             | How long the route has been known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| AIGP            | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Metric          | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MED-plus-IGP    | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TTL-Action      | <p>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</p> <p>For sample output, see <a href="#">show route table</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Task</b>                          | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Announcement bits</b>             | List of protocols that announce this route. <b>n-Resolve inet</b> indicates that the route is used for route resolution for next hops found in the routing table. <b>n</b> is an index used by Juniper Networks customer support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>AS path</b>                       | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| <b>validation-state</b>              | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>FECs bound to route</b>           | Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>AS path: I &lt;Originator&gt;</b> | (For route reflected output only) Originator ID attribute set by the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Primary Upstream</b>              | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>RPF Nexthops</b>                  | When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Table 261: show route extensive Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Label                   | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.                      |
| weight                  | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.                                                                                                                                               |
| VC Label                | MPLS label assigned to the Layer 2 circuit virtual connection.                                                                                                                                                                                                                                                   |
| MTU                     | Maximum transmission unit (MTU) of the Layer 2 circuit.                                                                                                                                                                                                                                                          |
| VLAN ID                 | VLAN identifier of the Layer 2 circuit.                                                                                                                                                                                                                                                                          |
| Cluster list            | (For route reflected output only) Cluster ID sent by the route reflector.                                                                                                                                                                                                                                        |
| Originator ID           | (For route reflected output only) Address of router that originally sent the route to the route reflector.                                                                                                                                                                                                       |
| Prefixes bound to route | Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.                                                                                                                                                                                                               |
| Communities             | Community path attribute for the route. See the Output Field table in the <a href="#">show route detail</a> command for all possible values for this field.                                                                                                                                                      |
| Layer2-info: encaps     | Layer 2 encapsulation (for example, VPLS).                                                                                                                                                                                                                                                                       |
| control flags           | Control flags: <b>none</b> or Site Down.                                                                                                                                                                                                                                                                         |
| mtu                     | Maximum transmission unit (MTU) information.                                                                                                                                                                                                                                                                     |
| Label-Base, range       | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                           |
| status vector           | Layer 2 VPN and VPLS network layer reachability information (NLRI).                                                                                                                                                                                                                                              |
| Localpref               | Local preference value included in the route.                                                                                                                                                                                                                                                                    |
| Router ID               | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                 |
| Primary Routing Table   | In a routing table group, the name of the primary routing table in which the route resides.                                                                                                                                                                                                                      |
| Secondary Tables        | In a routing table group, the name of one or more secondary tables in which the route resides.                                                                                                                                                                                                                   |
| Originating RIB         | Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of inet.0 resolving through inet.0 and inet.3, this field indicates which routing table, inet.0 or inet.3, provided the best path for a particular prefix. |
| Node path count         | Number of nodes in the path.                                                                                                                                                                                                                                                                                     |

Table 261: show route extensive Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                     |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Forwarding nexthops</b> | Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it. |

## Sample Output

### show route extensive

```

user@host> show route extensive
inet.0: 22 destinations, 23 routes (21 active, 0 holddown, 1 hidden)
10.10.0.0/16 (1 entry, 1 announced)

## show route flow validation

**List of Syntax** [Syntax on page 3310](#)  
[Syntax \(EX Series Switches\) on page 3310](#)

**Syntax** show route flow validation  
 <brief | detail>  
 <ip-prefix>  
 <table *table-name*>  
 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches)** show route flow validation  
 <brief | detail>  
 <ip-prefix>  
 <table *table-name*>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Display flow route information.

**Options** none—Display flow route information.

**brief | detail**—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

**ip-prefix**—(Optional) IP address for the flow route.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**table *table-name***—(Optional) Display flow route information for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the **show route flow validation inet** command).

**Required Privilege Level** view

**List of Sample Output** [show route flow validation on page 3311](#)

**Output Fields** [Table 262 on page 3310](#) lists the output fields for the **show route flow validation** command. Output fields are listed in the approximate order in which they appear.

**Table 262: show route flow validation Output Fields**

| Field Name                | Field Description                                | Level of Output |
|---------------------------|--------------------------------------------------|-----------------|
| <i>routing-table-name</i> | Name of the routing table (for example, inet.0). | All levels      |
| <i>prefix</i>             | Route address.                                   | All levels      |
| Active unicast route      | Active route in the routing table.               | All levels      |

Table 262: show route flow validation Output Fields (*continued*)

| Field Name                  | Field Description                                                       | Level of Output |
|-----------------------------|-------------------------------------------------------------------------|-----------------|
| Dependent flow destinations | Number of flows for which there are routes in the routing table.        | All levels      |
| Origin                      | Source of the route flow.                                               | All levels      |
| Neighbor AS                 | Autonomous system identifier of the neighbor.                           | All levels      |
| Flow destination            | Number of entries and number of destinations that match the route flow. | All levels      |
| Unicast best match          | Destination that is the best match for the route flow.                  | All levels      |
| Flags                       | Information about the route flow.                                       | All levels      |

## Sample Output

### show route flow validation

```

user@host> show route flow validation
inet.0:
10.0.5.0/24Active unicast route
Dependent flow destinations: 1
Origin: 192.168.224.218, Neighbor AS: 65001
Flow destination (3 entries, 1 match origin)
Unicast best match: 10.0.5.0/24
Flags: SubtreeApex Consistent

```

## show route forwarding-table

---

|                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Options **all** and **vlan** introduced in Junos OS Release 9.6.  
 Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

**NOTE:** The Routing Engine copies the forwarding table to the Packet Forwarding Engine, the part of the router that is responsible for forwarding packets. To display the entries in the Packet Forwarding Engine's forwarding table, use the **show pfe route** command.

**Options** **none**—Display the routes in the forwarding tables. By default, the **show route forwarding-table** command does not display information about private, or internal, forwarding tables.

**detail | extensive | summary**—(Optional) Display the specified level of output.

**all**—(Optional) Display routing table entries for all forwarding tables, including private, or internal, tables.

**bridge-domain (all | bridge-domain-name)**—(MX Series routers only) (Optional) Display route entries for all bridge domains or the specified bridge domain.

**ccc interface-name**—(Optional) Display route entries for the specified circuit cross-connect interface.

**destination destination-prefix**—(Optional) Destination prefix.

**family family**—(Optional) Display routing table entries for the specified family: **fibre-channel**, **fmembers**, **inet**, **inet6**, **iso**, **mpls**, **tnp**, **unix**, **vpls**, or **vlan-classification**.

**interface-name interface-name**—(Optional) Display routing table entries for the specified interface.

**label name**—(Optional) Display route entries for the specified label.

**lcc number**—(TX Matrix and TX matrix Plus routers only) (Optional) On a routing matrix composed of a TX Matrix router and T640 routers, display information for the specified T640 router (or line-card chassis) connected to the TX Matrix router. On a routing matrix composed of the TX Matrix Plus router and T1600 or T4000 routers, display information for the specified router (line-card chassis) connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**learning-vlan-id** *learning-vlan-id*—(MX Series routers only) (Optional) Display learned information for all VLANs or for the specified VLAN.

**matching** *matching*—(Optional) Display routing table entries matching the specified prefix or prefix length.

**multicast**—(Optional) Display routing table entries for multicast routes.

**table** (**default** | *logical-system-name/routing-instance-name* | *routing-instance-name*)—(Optional) Display route entries for all the routing tables in the main routing instance or for the specified routing instance. If your device supports logical systems, you can also display route entries for the specified logical system and routing instance. To view the routing instances on your device, use the [show route instance](#) command.

**vlan** (**all** | *vlan-name*)—(Optional) Display information for all VLANs or for the specified VLAN.

**vpn** *vpn*—(Optional) Display routing table entries for a specified VPN.

| Next hop Type (Type)       | <p>Next-hop type. When the <b>detail</b> keyword is used, the next-hop type might be abbreviated (as indicated in parentheses):</p> <ul style="list-style-type: none"> <li>• <b>broadcast (bcst)</b>—Broadcast.</li> <li>• <b>deny</b>—Deny.</li> <li>• <b>discard (dscd)</b> —Discard.</li> <li>• <b>hold</b>—Next hop is waiting to be resolved into a unicast or multicast type.</li> <li>• <b>indexed (idxd)</b>—Indexed next hop.</li> <li>• <b>indirect (indr)</b>—Indirect next hop.</li> <li>• <b>local (locl)</b>—Local address on an interface.</li> <li>• <b>routed multicast (mcrst)</b>—Regular multicast next hop.</li> <li>• <b>multicast (mcst)</b>—Wire multicast next hop (limited to the LAN).</li> <li>• <b>multicast discard (mdsc)</b>—Multicast discard.</li> <li>• <b>multicast group (mgrp)</b>—Multicast group member.</li> <li>• <b>receive (rcv)</b>—Receive.</li> <li>• <b>reject (rjct)</b>—Discard. An ICMP unreachable message was sent.</li> <li>• <b>resolve (rslv)</b>—Resolving the next hop.</li> <li>• <b>unicast (ucst)</b>—Unicast.</li> <li>• <b>unilist (ulst)</b>—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.</li> </ul> | <b>detail extensive</b>      |
| Index                      | Software index of the next hop that is used to route the traffic for a given prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive none</b> |
| Route interface-index      | Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b>             |
| Reference (NhRef)          | Number of routes that refer to this next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive none</b> |
| Next-hop interface (Netif) | Interface used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive none</b> |
| Weight                     | Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible (see the <b>Balance</b> field description).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>extensive</b>             |
| Balance                    | Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a router is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b>             |
| RPF interface              | List of interfaces from which the prefix can be accepted. Reverse path forwarding (RPF) information is displayed only when <b>rpf-check</b> is configured on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>extensive</b>             |

## Sample Output

### show route forwarding-table extensive (RPF)

The next example is based on the following configuration, which enables an RPF check on all routes that are learned from this interface, including the interface route:

```
so-1/1/0 {
  unit 0 {
    family inet {
      rpf-check;
      address 15.95.1.2/30;
    }
  }
}
```

```
user@host> show route forwarding-table extensive
```

```
Routing table: inet [Index 0]
Internet:
...
...
Destination: 15.95.1.3/32
Route type: destination
Route reference: 0                               Route interface-index: 67
```

```

Flags: sent to PFE
Nexthop: 15.95.1.3
Next-hop type: broadcast          Index: 328      Reference: 1
Next-hop interface: so-1/1/0.0

**Output Fields** Table 142 on page 2003 lists the output fields for the **show route instance** command. Output fields are listed in the approximate order in which they appear.

**Table 264: show route instance Output Fields**

| Field Name                       | Field Description                                                                                                                                                                                                                                                  | Level of Output                  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|
| Instance or <i>instance-name</i> | Name of the routing instance.                                                                                                                                                                                                                                      | All levels                       |
| Operational Routing Instances    | ( <b>operational</b> keyword only) Names of all operational routing instances.                                                                                                                                                                                     | —                                |
| Type                             | Type of routing instance: <b>forwarding</b> , <b>l2vpn</b> , <b>no-forwarding</b> , <b>vpls</b> , <b>virtual-router</b> , or <b>vrf</b> .                                                                                                                          | All levels                       |
| State                            | State of the routing instance: <b>active</b> or <b>inactive</b> .                                                                                                                                                                                                  | <b>brief detail</b> none         |
| Interfaces                       | Name of interfaces belonging to this routing instance.                                                                                                                                                                                                             | <b>brief detail</b> none         |
| Restart State                    | Status of graceful restart for this instance: <b>Pending</b> or <b>Complete</b> .                                                                                                                                                                                  | <b>detail</b>                    |
| Path selection timeout           | Maximum amount of time, in seconds, remaining until graceful restart is declared complete. The default is <b>300</b> .                                                                                                                                             | <b>detail</b>                    |
| Tables                           | Tables (and number of routes) associated with this routing instance.                                                                                                                                                                                               | <b>brief detail</b> none         |
| Route-distinguisher              | Unique route distinguisher associated with this routing instance.                                                                                                                                                                                                  | <b>detail</b>                    |
| Vrf-import                       | VPN routing and forwarding instance import policy name.                                                                                                                                                                                                            | <b>detail</b>                    |
| Vrf-export                       | VPN routing and forwarding instance export policy name.                                                                                                                                                                                                            | <b>detail</b>                    |
| Vrf-import-target                | VPN routing and forwarding instance import target community name.                                                                                                                                                                                                  | <b>detail</b>                    |
| Vrf-export-target                | VPN routing and forwarding instance export target community name.                                                                                                                                                                                                  | <b>detail</b>                    |
| Fast-reroute-priority            | Fast reroute priority setting for a VPLS routing instance: <b>high</b> , <b>medium</b> , or <b>low</b> . The default is <b>low</b> .                                                                                                                               | <b>detail</b>                    |
| Restart State                    | Restart state: <ul style="list-style-type: none"> <li><b>Pending;protocol-name</b>—List of protocols that have not yet completed graceful restart for this routing table.</li> <li><b>Complete</b>—All protocols have restarted for this routing table.</li> </ul> | <b>detail</b>                    |
| Primary rib                      | Primary table for this routing instance.                                                                                                                                                                                                                           | <b>brief</b> none <b>summary</b> |
| Active/holddown/hidden           | Number of active, hold-down, and hidden routes.                                                                                                                                                                                                                    | All levels                       |

## Sample Output

### show route instance

```

user@host> show route instance
Instance              Type
Primary RIB
master                forwarding
inet.0                16/0/1
iso.0                 1/0/0
mpls.0                0/0/0
inet6.0               2/0/0
l2circuit.0          0/0/0
__juniper_private1__ forwarding
__juniper_private1__.inet.0 12/0/0
__juniper_private1__.inet6.0 1/0/0

```

### show route instance detail (Graceful Restart Complete)

```

user@host> show route instance detail

## Sample Output

### show route range

```
user@host> show route range

inet.0: 11 destinations, 11 routes (10 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

10.10.0.0/16      *[Static/5] 00:30:01
                  > to 192.168.71.254 via fxp0.0
10.209.0.0/16    *[Static/5] 00:30:01
```

```
10.255.71.14/32      > to 192.168.71.254 via fxp0.0
                    *[Direct/0] 00:30:01
                    > via lo0.0
172.16.0.0/12       *[Static/5] 00:30:01
                    > to 192.168.71.254 via fxp0.0
192.168.0.0/16      *[Static/5] 00:30:01
                    > to 192.168.71.254 via fxp0.0
192.168.64.0/21     *[Direct/0] 00:30:01
                    > via fxp0.0
192.168.71.14/32    *[Local/0] 00:30:01
                    Local via fxp0.0
192.168.102.0/23    *[Static/5] 00:30:01
                    > to 192.168.71.254 via fxp0.0
...
```

### show route range destination-prefix

```
user@host> show route range 192.168.0.0/16

inet.0: 11 destinations, 11 routes (10 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

192.168.0.0/16      *[Static/5] 00:31:14
                    > to 192.168.71.254 via fxp0.0
192.168.64.0/21     *[Direct/0] 00:31:14
                    > via fxp0.0
192.168.71.14/32    *[Local/0] 00:31:14
                    Local via fxp0.0
192.168.102.0/23    *[Static/5] 00:31:14
                    > to 192.168.71.254 via fxp0.0
```

### show route range detail

```
user@host> show route range detail

| <i>number routes</i>                            | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b></li> <li>• <b>holddown</b> (routes that are in pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul> | All levels              |
| Prefix                                          | Destination prefix.                                                                                                                                                                                                                                                                                                                      | none <b>brief</b>       |
| MED                                             | Multiple exit discriminator value included in the route.                                                                                                                                                                                                                                                                                 | none <b>brief</b>       |
| <i>destination-prefix</i><br>(entry, announced) | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.                                                                                                                                                    | <b>detail extensive</b> |
| Route Distinguisher                             | 64-bit prefix added to IP subnets to make them unique.                                                                                                                                                                                                                                                                                   | <b>detail extensive</b> |
| Label-Base, range                               | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                                                   | <b>detail extensive</b> |
| VPN Label                                       | Virtual private network (VPN) label. Packets are sent between CE and PE routing devices by advertising VPN labels. VPN labels transit over either an RSVP or an LDP label-switched path (LSP) tunnel.                                                                                                                                    | <b>detail extensive</b> |
| Next hop                                        | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.                                                                                                                                                                                                                                        | All levels              |
| Localpref or Lclpref                            | Local preference value included in the route.                                                                                                                                                                                                                                                                                            | All levels              |

Table 266: show route receive-protocol Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Level of Output  |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| AS path             | <p>Autonomous system (AS) path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used the AS-path merge process, as defined in RFC 4893.</li> <li>• <b>[ ]</b>—If more than one AS number is configured on the router, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> | All levels       |
| Cluster list        | (For route reflected output only) Cluster ID sent by the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | detail extensive |
| Originator ID       | (For route reflected output only) Address of routing device that originally sent the route to the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | detail extensive |
| Communities         | Community path attribute for the route. See the Output Field table in the <a href="#">show route detail</a> command for all possible values for this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | detail extensive |

| <b>Description</b>                 | <p>Display the entries in the next-hop resolution database. This database provides for recursive resolution of next hops through other prefixes in the routing table.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                     | <p><b>none</b>—Display standard information about all entries in the next-hop resolution database.</p> <p><b>brief   detail   extensive   summary</b>—(Optional) Display the specified level of output.</p> <p><b>index <i>index</i></b>—(Optional) Show the index of the resolution tree.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>prefix <i>network/destination-prefix</i></b>—(Optional) Display database entries for the specified address.</p> <p><b>table <i>routing-table-name</i></b>—(Optional) Display information about a particular routing table (for example, <b>inet.0</b>) where policy-based export is currently enabled.</p> <p><b>unresolved</b>—(Optional) Display routes that could not be resolved.</p> |
| <b>Required Privilege Level</b>    | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Output Fields** Table 267 on page 3380 describes the output fields for the **show route resolution** command. Output fields are listed in the approximate order in which they appear.

**Table 267: show route resolution Output Fields**

| Field Name                         | Field Description                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i>          | Name of the routing table whose prefixes are resolved using the entries in the route resolution database. For routing table groups, this is the name of the primary routing table whose prefixes are resolved using the entries in the route resolution database.                                                                                     |
| <b>Tree index</b>                  | Tree index identifier.                                                                                                                                                                                                                                                                                                                                |
| <b>Nodes</b>                       | Number of nodes in the tree.                                                                                                                                                                                                                                                                                                                          |
| <b>Reference count</b>             | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                            |
| <b>Contributing routing tables</b> | Routing tables used for next-hop resolution.                                                                                                                                                                                                                                                                                                          |
| <b>Originating RIB</b>             | Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of <b>inet.0</b> resolving through <b>inet.0</b> and <b>inet.3</b> , this field indicates which routing table, <b>inet.0</b> or <b>inet.3</b> , provided the best path for a particular prefix. |
| <b>Metric</b>                      | Metric associated with the forwarding next hop.                                                                                                                                                                                                                                                                                                       |
| <b>Node path count</b>             | Number of nodes in the path.                                                                                                                                                                                                                                                                                                                          |
| <b>Forwarding next hops</b>        | Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.                                                                                                                                                                 |

## Sample Output

### show route resolution detail

```

user@host> show route resolution detail

| <b>Description</b>                 | <p>Display summary statistics about the entries in the routing table.</p> <p>CPU utilization might increase while the device learns routes. We recommend that you use the <b>show route summary</b> command after the device learns and enters the routes into the routing table. Depending on the size of your network, this might take several minutes. If you receive a “timeout communicating with routing daemon” error when using the <b>show route summary</b> command, wait several minutes before attempting to use the command again. This is not a critical system error, but you might experience a delay in using the command-line interface (CLI).</p> |
| <b>Options</b>                     | <p><b>none</b>—Display summary statistics about the entries in the routing table.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>table <i>routing-table-name</i></b>—(Optional) Display summary statistics for all routing tables whose name begins with this string (for example, <b>inet.0</b> and <b>inet6.0</b> are both displayed when you run the <b>show route summary table inet</b> command). If you only want to display statistics for a specific routing table, make sure to enter the exact name of that routing table.</p>      |
| <b>Required Privilege Level</b>    | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Router ID  | Address of the local routing device. |

Table 268: show route summary Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i> | Name of the routing table (for example, <b>inet.0</b> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>destinations</b>       | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>routes</b>             | Number of routes in the routing table: <ul style="list-style-type: none"> <li><b>active</b>—Number of routes that are active.</li> <li><b>holddown</b>—Number of routes that are in the hold-down state before being declared inactive.</li> <li><b>hidden</b>—Number of routes that are not used because of routing policy.</li> </ul>                                                                                                                                                                                                                                                                                                                                                     |
| <b>Limit/Threshold</b>    | Displays the configured route limits for the routing table set with the <b>maximum-prefixes</b> and the <b>maximum-paths</b> statements. If you do not configure route limits for the routing table, the show output does not display this information. <ul style="list-style-type: none"> <li><b>destinations</b>—The first number represents the maximum number of route prefixes installed in the routing table. The second number represents the number of route prefixes that trigger a warning message.</li> <li><b>routes</b>—The first number represents the maximum number of routes. The second number represents the number of routes that trigger a warning message.</li> </ul> |
| <b>Direct</b>             | Routes on the directly connected network.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Local</b>              | Local routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <i>protocol-name</i>      | Name of the protocol from which the route was learned. For example, <b>OSPF</b> , <b>RSVP</b> , and <b>Static</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Sample Output

### show route summary

```

user@host> show route summary
Autonomous system number: 69
Router ID: 10.255.71.52
Maximum-ECMP: 32
inet.0: 24 destinations, 25 routes (23 active, 0 holddown, 1 hidden)
Restart Complete
      Direct:    6 routes,      5 active
      Local:    4 routes,      4 active
      OSPF:     5 routes,      4 active
      Static:   7 routes,      7 active
      IGMP:     1 routes,      1 active
      PIM:      2 routes,      2 active

inet.3: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
Restart Complete
      RSVP:      2 routes,      2 active

iso.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)

```

```
Restart Complete
  Direct:      1 routes,      1 active

mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
  MPLS:       3 routes,      3 active
  VPLS:       4 routes,      2 active

inet6.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
Restart Complete
  Direct:      2 routes,      2 active
  PIM:         2 routes,      2 active
  MLD:         1 routes,      1 active

green.l2vpn.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
  BGP:         2 routes,      2 active
  L2VPN:       2 routes,      2 active

red.l2vpn.0: 3 destinations, 3 routes (3 active, 0 holddown, 0 hidden)
Restart Complete
  BGP:         2 routes,      2 active
  L2VPN:       1 routes,      1 active

bgp.l2vpn.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
  BGP:         4 routes,      4 active
```

#### show route summary table

```
user@host> show route summary table inet
Router ID: 192.168.0.1

inet.0: 32 destinations, 34 routes (31 active, 0 holddown, 1 hidden)
  Direct:      6 routes,      5 active
  Local:       9 routes,      9 active
  OSPF:        3 routes,      1 active
  Static:     13 routes,     13 active
  ICMP:        1 routes,      1 active
  PIM:         2 routes,      2 active

inet.1: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
  Multicast:    1 routes,      1 active

inet6.0: 3 destinations, 3 routes (3 active, 0 holddown, 0 hidden)
  Local:        1 routes,      1 active
  PIM:          2 routes,      2 active

inet6.1: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
  Multicast:    1 routes,      1 active
```

#### show route summary table (with Route Limits Configured for the Routing Table)

```
user@host> show route summary table VPN-A.inet.0
Autonomous system number: 100
Router ID: 10.255.182.142

VPN-A.inet.0: 13 destinations, 14 routes (13 active, 0 holddown, 0 hidden)
Limit/Threshold: 2000/200 destinations 20/12 routes
  Direct:      2 routes,      2 active
  Local:       1 routes,      1 active
```

|       |           |          |
|-------|-----------|----------|
| OSPF: | 4 routes, | 3 active |
| BGP:  | 4 routes, | 4 active |
| IGMP: | 1 routes, | 1 active |
| PIM:  | 2 routes, | 2 active |

## show route table

---

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Sample Output

### show route table bgp.l2vpn

```

user@host> show route table bgp.l2vpn
bgp.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

192.168.24.1:1:4:1/96
    *[BGP/170] 01:08:58, localpref 100, from 192.168.24.1
    AS path: I
    > to 10.0.16.2 via fe-0/0/1.0, label-switched-path am

```

### show route table bgp.l3vpn.0

```

user@host> show route table bgp.l3vpn.0
bgp.l3vpn.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.255.71.15:100:10.255.71.17/32
    *[BGP/170] 00:03:59, MED 1, localpref 100, from
10.255.71.15
    AS path: I
    > via so-2/1/0.0, Push 100020, Push 100011(top)
10.255.71.15:200:10.255.71.18/32
    *[BGP/170] 00:03:59, MED 1, localpref 100, from
10.255.71.15
    AS path: I
    > via so-2/1/0.0, Push 100021, Push 100011(top)

```

### show route table bgp.l3vpn.0 detail

```

**Table 269: show route terse Output Fields**

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                                                                                                                                                                                                                                                                                                                |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                         |
| <i>number routes</i>       | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li><b>active</b> (routes that are active)</li> <li><b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li><b>hidden</b> (routes that are not used because of a routing policy)</li> </ul> |

Table 269: show route terse Output Fields (*continued*)

| Field Name       | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>route key</i> | Key for the state of the route: <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul>                                                                                                                                                                                                                |
| <b>A</b>         | Active route. An asterisk (*) indicates this is the active route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>V</b>         | Validation status of the route: <ul style="list-style-type: none"> <li>• <b>?</b>—Not evaluated. Indicates that the route was not learned through BGP.</li> <li>• <b>I</b>—Invalid. Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>N</b>—Unknown. Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>V</b>—Valid. Indicates that the prefix and autonomous system pair are found in the database.</li> </ul> |
| Destination      | Destination of the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>P</b>         | Protocol through which the route was learned: <ul style="list-style-type: none"> <li>• <b>A</b>—Aggregate</li> <li>• <b>B</b>—BGP</li> <li>• <b>C</b>—CCC</li> <li>• <b>D</b>—Direct</li> <li>• <b>G</b>—GMPLS</li> <li>• <b>I</b>—IS-IS</li> <li>• <b>L</b>—L2CKT, L2VPN, LDP, Local</li> <li>• <b>K</b>—Kernel</li> <li>• <b>M</b>—MPLS, MSDP</li> <li>• <b>O</b>—OSPF</li> <li>• <b>P</b>—PIM</li> <li>• <b>R</b>—RIP, RIPng</li> <li>• <b>S</b>—Static</li> <li>• <b>T</b>—Tunnel</li> </ul>                                                                                                                                                                                     |
| <b>Prf</b>       | Preference value of the route. In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.                                                                                              |
| Metric 1         | First metric value in the route. For routes learned from BGP, this is the MED metric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Metric 2         | Second metric value in the route. For routes learned from BGP, this is the IGP metric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Table 269: show route terse Output Fields (*continued*)

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                                          |

### Direct Routes Not Leaked Between Routing Instances

---

**Problem** **Description:** Direct routes are not exported (leaked) between virtual routing instances. For example, consider the following scenario:

- Switch with two virtual routing instances:
  - Routing instance 1 connects to downstream device through interface xe-0/0/1.
  - Routing instance 2 connects to upstream device through interface xe-0/0/2.

If you enable route leaking between the routing instances (by using the **rib-group** statement, for example), the downstream device cannot connect to the upstream device because the switch connects to the upstream device over a direct route and these routes are not leaked between instances.

**NOTE:** You can see a route to the upstream device in the routing table of the downstream device, but this route is not functional.

Indirect routes *are* leaked between routing instances, so the downstream device can connect to any upstream devices that are connected to the switch over indirect routes.

**Solution** This is expected behavior.

## Understanding BGP

BGP is an exterior gateway protocol (EGP) that is used to exchange routing information among routers in different autonomous systems (ASs). BGP routing information includes the complete route to each destination. BGP uses the routing information to maintain a database of network reachability information, which it exchanges with other BGP systems. BGP uses the network reachability information to construct a graph of AS connectivity, which enables BGP to remove routing loops and enforce policy decisions at the AS level.

Multiprotocol BGP (MBGP) extensions enable BGP to support IP version 6 (IPv6). MBGP defines the attributes `MP_REACH_NLRI` and `MP_UNREACH_NLRI`, which are used to carry IPv6 reachability information. Network layer reachability information (NLRI) update messages carry IPv6 address prefixes of feasible routes.

BGP allows for policy-based routing. You can use routing policies to choose among multiple paths to a destination and to control the redistribution of routing information.

BGP uses TCP as its transport protocol, using port 179 for establishing connections. Running over a reliable transport protocol eliminates the need for BGP to implement update fragmentation, retransmission, acknowledgment, and sequencing.

The Junos OS routing protocol software supports BGP version 4. This version of BGP adds support for Classless Interdomain Routing (CIDR), which eliminates the concept of network classes. Instead of assuming which bits of an address represent the network by looking at the first octet, CIDR allows you to explicitly specify the number of bits in the network address, thus providing a means to decrease the size of the routing tables. BGP version 4 also supports aggregation of routes, including the aggregation of AS paths.

This section discusses the following topics:

- [Autonomous Systems on page 3424](#)
- [AS Paths and Attributes on page 3424](#)
- [External and Internal BGP on page 3425](#)
- [Multiple Instances of BGP on page 3425](#)

---

### Autonomous Systems

An *autonomous system* (AS) is a set of routers that are under a single technical administration and normally use a single interior gateway protocol and a common set of metrics to propagate routing information within the set of routers. To other ASs, an AS appears to have a single, coherent interior routing plan and presents a consistent picture of what destinations are reachable through it.

---

### AS Paths and Attributes

The routing information that BGP systems exchange includes the complete route to each destination, as well as additional information about the route. The route to each destination is called the *AS path*, and the additional route information is included in *path attributes*. BGP uses the AS path and the path attributes to completely determine the network topology. Once BGP understands the topology, it can detect and eliminate

routing loops and select among groups of routes to enforce administrative preferences and routing policy decisions.

### External and Internal BGP

BGP supports two types of exchanges of routing information: exchanges among different ASs and exchanges within a single AS. When used among ASs, BGP is called *external BGP* (EBGP) and BGP sessions perform *inter-AS routing*. When used within an AS, BGP is called *internal BGP* (IBGP) and BGP sessions perform *intra-AS routing*.

Figure 89 on page 3425 illustrates ASs, IBGP, and EBGP.

Figure 89: ASs, EBGP, and IBGP

A BGP system shares network reachability information with adjacent BGP systems, which are referred to as *neighbors* or *peers*.

BGP systems are arranged into *groups*. In an IBGP group, all peers in the group—called *internal peers*—are in the same AS. Internal peers can be anywhere in the local AS and do not have to be directly connected to one another. Internal groups use routes from an IGP to resolve forwarding addresses. They also propagate external routes among all other internal routers running IBGP, computing the next hop by taking the BGP next hop received with the route and resolving it using information from one of the interior gateway protocols.

In an EBGP group, the peers in the group—called *external peers*—are in different ASs and normally share a subnet. In an external group, the next hop is computed with respect to the interface that is shared between the external peer and the local router.

### Multiple Instances of BGP

You can configure multiple instances of BGP at the following hierarchy levels:

- [edit routing-instances *routing-instance-name* protocols]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols]

Multiple instances of BGP are primarily used for Layer 3 VPN support.

IGP peers and external BGP (EBGP) peers (both nonmultihop and multihop) are all supported for routing instances. BGP peering is established over one of the interfaces configured under the **routing-instances** hierarchy.

**NOTE:** When a BGP neighbor sends BGP messages to the local routing device, the incoming interface on which these messages are received must be configured in the same routing instance that the BGP neighbor configuration exists in. This is true for neighbors that are a single hop away or multiple hops away.

Routes learned from the BGP peer are added to the **instance-name.inet.0** table by default. You can configure import and export policies to control the flow of information into and out of the instance routing table.

For Layer 3 VPN support, configure BGP on the provider edge (PE) router to receive routes from the customer edge (CE) router and to send the instances' routes to the CE router if necessary. You can use multiple instances of BGP to maintain separate per-site forwarding tables for keeping VPN traffic separate on the PE router.

You can configure import and export policies that allow the service provider to control and rate-limit traffic to and from the customer.

You can configure an EBGP multihop session for a VRF routing instance. Also, you can set up the EBGP peer between the PE and CE routers by using the loopback address of the CE router instead of the interface addresses.

## BGP Routes Overview

A BGP route is a destination, described as an IP address prefix, and information that describes the path to the destination.

The following information describes the path:

- AS path, which is a list of numbers of the ASs that a route passes through to reach the local router. The first number in the path is that of the last AS in the path—the AS closest to the local router. The last number in the path is the AS farthest from the local router, which is generally the origin of the path.
- Path attributes, which contain additional information about the AS path that is used in routing policy.

BGP peers advertise routes to each other in update messages.

BGP stores its routes in the Junos OS routing table (**inet.0**). The routing table stores the following information about BGP routes:

- Routing information learned from update messages received from peers

- Local routing information that BGP applies to routes because of local policies
- Information that BGP advertises to BGP peers in update messages

For each prefix in the routing table, the routing protocol process selects a single best path, called the active path. Unless you configure BGP to advertise multiple paths to the same destination, BGP advertises only the active path.

The BGP router that first advertises a route assigns it one of the following values to identify its origin. During route selection, the lowest origin value is preferred.

- **0**—The router originally learned the route through an IGP (OSPF, IS-IS, or a static route).
- **1**—The router originally learned the route through an EGP (most likely BGP).
- **2**—The route's origin is unknown.

- [Example: Advertising Multiple Paths in BGP on page 3659](#)

## BGP Messages Overview

All BGP messages have the same fixed-size header, which contains a marker field that is used for both synchronization and authentication, a length field that indicates the length of the packet, and a type field that indicates the message type (for example, open, update, notification, keepalive, and so on).

This section discusses the following topics:

- [Open Messages on page 3427](#)
- [Update Messages on page 3428](#)
- [Keepalive Messages on page 3428](#)
- [Notification Messages on page 3428](#)

### Open Messages

After a TCP connection is established between two BGP systems, they exchange BGP open messages to create a BGP connection between them. Once the connection is established, the two systems can exchange BGP messages and data traffic.

Open messages consist of the BGP header plus the following fields:

- **Version**—The current BGP version number is 4.
- **Local AS number**—You configure this by including the **autonomous-system** statement at the **[edit routing-options]** or **[edit logical-systems *logical-system-name* routing-options]** hierarchy level.
- **Hold time**—Proposed hold-time value. You configure the local hold time with the BGP **hold-time** statement.
- **BGP identifier**—IP address of the BGP system. This address is determined when the system starts and is the same for every local interface and every BGP peer. You can

configure the BGP identifier by including the **router-id** statement at the **[edit routing-options]** or **[edit logical-systems *logical-system-name* routing-options]** hierarchy level. By default, BGP uses the IP address of the first interface it finds in the router.

- Parameter field length and the parameter itself—These are optional fields.

---

### Update Messages

BGP systems send update messages to exchange network reachability information. BGP systems use this information to construct a graph that describes the relationships among all known ASs.

Update messages consist of the BGP header plus the following optional fields:

- Unfeasible routes length—Length of the withdrawn routes field
- Withdrawn routes—IP address prefixes for the routes being withdrawn from service because they are no longer deemed reachable
- Total path attribute length—Length of the path attributes field; it lists the path attributes for a feasible route to a destination
- Path attributes—Properties of the routes, including the path origin, the multiple exit discriminator (MED), the originating system's preference for the route, and information about aggregation, communities, confederations, and route reflection
- Network layer reachability information (NLRI)—IP address prefixes of feasible routes being advertised in the update message

---

### Keepalive Messages

BGP systems exchange keepalive messages to determine whether a link or host has failed or is no longer available. Keepalive messages are exchanged often enough so that the hold timer does not expire. These messages consist only of the BGP header.

---

### Notification Messages

BGP systems send notification messages when an error condition is detected. After the message is sent, the BGP session and the TCP connection between the BGP systems are closed. Notification messages consist of the BGP header plus the error code and subcode, and data that describes the error.

### Understanding External BGP Peering Sessions

---

To establish point-to-point connections between peer autonomous systems (ASs), you configure a BGP session on each interface of a point-to-point link. Generally, such sessions are made at network exit points with neighboring hosts outside the AS.

[Figure 90 on page 3430](#) shows an example of a BGP peering session.

Figure 90: BGP Peering Session

In [Figure 90 on page 3430](#), Router A is a gateway router for AS 3, and Router B is a gateway router for AS 10. For traffic internal to either AS, an interior gateway protocol (IGP) is used (OSPF, for instance). To route traffic between peer ASs, a BGP session is used.

You arrange BGP routing devices into groups of peers. Different peer groups can have different group types, AS numbers, and route reflector cluster identifiers.

To define a BGP group that recognizes only the specified BGP systems as peers, statically configure all the system's peers by including one or more **neighbor** statements. The peer neighbor's address can be either an IPv6 or IPv4 address.

As the number of external BGP (EBGP) groups increases, the ability to support a large number of BGP sessions might become a scaling issue. The preferred way to configure a large number of BGP neighbors is to configure a few groups consisting of multiple neighbors per group. Supporting fewer EBGP groups generally scales better than supporting a large number of EBGP groups. This becomes more evident in the case of hundreds of EBGP groups when compared with a few EBGP groups with multiple peers in each group.

After the BGP peers are established, BGP routes are not automatically advertised by the BGP peers. At each BGP-enabled device, policy configuration is required to export the local, static, or IGP-learned routes into the BGP RIB and then advertise them as BGP routes to the other peers. BGP's advertisement policy, by default, does not advertise any non-BGP routes (such as local routes) to peers.

### Example: Configuring External BGP Point-to-Point Peer Sessions

This example shows how to configure BGP point-to-point peer sessions.

- [Requirements on page 3430](#)
- [Overview on page 3431](#)
- [Configuration on page 3431](#)
- [Verification on page 3433](#)

#### Requirements

Before you begin, if the default BGP policy is not adequate for your network, configure routing policies to filter incoming BGP routes and to advertise BGP routes.

### Overview

Figure 91 on page 3431 shows a network with BGP peer sessions. In the sample network, Device E in AS 17 has BGP peer sessions to a group of peers called **external-peers**. Peers A, B, and C reside in AS 22 and have IP addresses 10.10.10.2, 10.10.10.6, and 10.10.10.10. Peer D resides in AS 79, at IP address 10.21.7.2. This example shows the configuration on Device E.

Figure 91: Typical Network with BGP Peer Sessions

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set interfaces ge-1/2/0 unit 0 description to-A
set interfaces ge-1/2/0 unit 0 family inet address 10.10.10.1/30
set interfaces ge-0/0/1 unit 5 description to-B
set interfaces ge-0/0/1 unit 5 family inet address 10.10.10.5/30
set interfaces ge-0/1/0 unit 9 description to-C
set interfaces ge-0/1/0 unit 9 family inet address 10.10.10.9/30
set interfaces ge-1/2/1 unit 21 description to-D
set interfaces ge-1/2/1 unit 21 family inet address 10.21.7.1/30
set protocols bgp group external-peers type external
set protocols bgp group external-peers peer-as 22
set protocols bgp group external-peers neighbor 10.10.10.2
set protocols bgp group external-peers neighbor 10.10.10.6
set protocols bgp group external-peers neighbor 10.10.10.10
set protocols bgp group external-peers neighbor 10.21.7.2 peer-as 79
set routing-options autonomous-system 17
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the BGP peer sessions:

1. Configure the interfaces to Peers A, B, C, and D.

```
[edit interfaces]
user@E# set ge-1/2/0 unit 0 description to-A
user@E# set ge-1/2/0 unit 0 family inet address 10.10.10.1/30
user@E# set ge-0/0/1 unit 5 description to-B
user@E# set ge-0/0/1 unit 5 family inet address 10.10.10.5/30
user@E# set ge-0/1/0 unit 9 description to-C
user@E# set ge-0/1/0 unit 9 family inet address 10.10.10.9/30
user@E# set ge-1/2/1 unit 21 description to-D
user@E# set ge-1/2/1 unit 21 family inet address 10.21.7.1/30
```

2. Set the autonomous system (AS) number.

```
[edit routing-options]
user@E# set autonomous-system 17
```

3. Create the BGP group, and add the external neighbor addresses.

```
[edit protocols bgp group external-peers]
user@E# set neighbor 10.10.10.2
user@E# set neighbor 10.10.10.6
user@E# set neighbor 10.10.10.10
```

4. Specify the autonomous system (AS) number of the external AS.

```
[edit protocols bgp group external-peers]
user@E# set peer-as 22
```

5. Add Peer D, and set the AS number at the individual neighbor level.

The neighbor configuration overrides the group configuration. So, while **peer-as 22** is set for all the other neighbors in the group, **peer-as 79** is set for neighbor 10.21.7.2.

```
[edit protocols bgp group external-peers]
user@E# set neighbor 10.21.7.2 peer-as 79
```

6. Set the peer type to external BGP (EBGP).

```
[edit protocols bgp group external-peers]
user@E# set type external
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@E# show interfaces
ge-1/2/0 {
  unit 0 {
    description to-A;
    family inet {
      address 10.10.10.1/30;
```

```

    }
  }
}
ge-0/0/1 {
  unit 5 {
    description to-B;
    family inet {
      address 10.10.10.5/30;
    }
  }
}
ge-0/1/0 {
  unit 9 {
    description to-C;
    family inet {
      address 10.10.10.9/30;
    }
  }
}
ge-1/2/1 {
  unit 21 {
    description to-D;
    family inet {
      address 10.21.7.1/30;
    }
  }
}

[edit]
user@E# show protocols
bgp {
  group external-peers {
    type external;
    peer-as 22;
    neighbor 10.10.10.2;
    neighbor 10.10.10.6;
    neighbor 10.10.10.10;
    neighbor 10.21.7.2 {
      peer-as 79;
    }
  }
}

[edit]
user@E# show routing-options
autonomous-system 17;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying BGP Neighbors on page 3434](#)
- [Verifying BGP Groups on page 3436](#)
- [Verifying BGP Summary Information on page 3436](#)

### *Verifying BGP Neighbors*

**Purpose** Verify that BGP is running on configured interfaces and that the BGP session is active for each neighbor address.

**Action** From operational mode, run the **show bgp neighbor** command.

```
user@E> show bgp neighbor
Peer: 10.10.10.2+179 AS 22      Local: 10.10.10.1+65406 AS 17

### Example: Configuring External BGP on Logical Systems with IPv6 Interfaces

This example shows how to configure external BGP (EBGP) point-to-point peer sessions on logical systems with IPv6 interfaces.

- [Requirements on page 3437](#)
- [Overview on page 3437](#)
- [Configuration on page 3438](#)
- [Verification on page 3447](#)

#### Requirements

In this example, no special configuration beyond device initialization is required.

#### Overview

Junos OS supports EBGP peer sessions by means of IPv6 addresses. An IPv6 peer session can be configured when an IPv6 address is specified in the **neighbor** statement. This example uses EUI-64 to generate IPv6 addresses that are automatically applied to the interfaces. An EUI-64 address is an IPv6 address that uses the IEEE EUI-64 format for the interface identifier portion of the address (the last 64 bits).

**NOTE:** Alternatively, you can configure EBGP sessions using manually assigned 128-bit IPv6 addresses.

If you use 128-bit link-local addresses for the interfaces, you must include the **local-interface** statement. This statement is valid only for 128-bit IPv6 link-local addresses and is mandatory for configuring an IPv6 EBGP link-local peer session.

Configuring EBGP peering using link-local addresses is only applicable for directly connected interfaces. There is no support for multihop peering.

After your interfaces are up, you can use the **show interfaces terse** command to view the EUI-64-generated IPv6 addresses on the interfaces. You must use these generated

addresses in the BGP **neighbor** statements. This example demonstrates the full end-to-end procedure.

In this example, Frame Relay interface encapsulation is applied to the logical tunnel (lt) interfaces. This is a requirement because only Frame Relay encapsulation is supported when IPv6 addresses are configured on the lt interfaces.

Figure 92 on page 3438 shows a network with BGP peer sessions. In the sample network, Router R1 has five logical systems configured. Device E in autonomous system (AS) 17 has BGP peer sessions to a group of peers called **external-peers**. Peers A, B, and C reside in AS 22. This example shows the step-by-step configuration on Logical System A and Logical System E.

**Figure 92: Typical Network with BGP Peer Sessions**

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

#### Device A

```
set logical-systems A interfaces lt-0/1/0 unit 1 description to-E
set logical-systems A interfaces lt-0/1/0 unit 1 encapsulation frame-relay
set logical-systems A interfaces lt-0/1/0 unit 1 dlci 1
```

```

set logical-systems A interfaces lt-0/1/0 unit 1 peer-unit 25
set logical-systems A interfaces lt-0/1/0 unit 1 family inet6 address 2001:db8:0:1::/64
  eui-64
set logical-systems A interfaces lo0 unit 1 family inet6 address 2001:db8::1/128
set logical-systems A protocols bgp group external-peers type external
set logical-systems A protocols bgp group external-peers peer-as 17
set logical-systems A protocols bgp group external-peers neighbor
  2001:db8:0:1:2a0:a502:0:19da
set logical-systems A routing-options router-id 1.1.1.1
set logical-systems A routing-options autonomous-system 22

```

**Device B**

```

set logical-systems B interfaces lt-0/1/0 unit 6 description to-E
set logical-systems B interfaces lt-0/1/0 unit 6 encapsulation frame-relay
set logical-systems B interfaces lt-0/1/0 unit 6 dlci 6
set logical-systems B interfaces lt-0/1/0 unit 6 peer-unit 5
set logical-systems B interfaces lt-0/1/0 unit 6 family inet6 address 2001:db8:0:2::/64
  eui-64
set logical-systems B interfaces lo0 unit 2 family inet6 address 2001:db8::2/128
set logical-systems B protocols bgp group external-peers type external
set logical-systems B protocols bgp group external-peers peer-as 17
set logical-systems B protocols bgp group external-peers neighbor
  2001:db8:0:2:2a0:a502:0:5da
set logical-systems B routing-options router-id 2.2.2.2
set logical-systems B routing-options autonomous-system 22

```

**Device C**

```

set logical-systems C interfaces lt-0/1/0 unit 10 description to-E
set logical-systems C interfaces lt-0/1/0 unit 10 encapsulation frame-relay
set logical-systems C interfaces lt-0/1/0 unit 10 dlci 10
set logical-systems C interfaces lt-0/1/0 unit 10 peer-unit 9
set logical-systems C interfaces lt-0/1/0 unit 10 family inet6 address 2001:db8:0:3::/64
  eui-64
set logical-systems C interfaces lo0 unit 3 family inet6 address 2001:db8::3/128
set logical-systems C protocols bgp group external-peers type external
set logical-systems C protocols bgp group external-peers peer-as 17
set logical-systems C protocols bgp group external-peers neighbor
  2001:db8:0:3:2a0:a502:0:9da
set logical-systems C routing-options router-id 3.3.3.3
set logical-systems C routing-options autonomous-system 22

```

**Device D**

```

set logical-systems D interfaces lt-0/1/0 unit 7 description to-E
set logical-systems D interfaces lt-0/1/0 unit 7 encapsulation frame-relay
set logical-systems D interfaces lt-0/1/0 unit 7 dlci 7
set logical-systems D interfaces lt-0/1/0 unit 7 peer-unit 21
set logical-systems D interfaces lt-0/1/0 unit 7 family inet6 address 2001:db8:0:4::/64
  eui-64

set logical-systems E routing-options autonomous-system 17

```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the BGP peer sessions:

1. Run the **show interfaces terse** command to verify that the physical router has a logical tunnel (lt) interface.

```

user@R1> show interfaces terse
Interface           Admin Link Proto  Local           Remote
...
lt-0/1/0             up    up
...

```

2. On Logical System A, configure the interface encapsulation, peer-unit number, and DLCI to reach Logical System E.

```

user@R1> set cli logical-system A
Logical system: A
[edit]

```

```

user@R1:A> edit
Entering configuration mode
[edit]
user@R1:A# edit interfaces
[edit interfaces]
user@R1:A# set lt-0/1/0 unit 1 encapsulation frame-relay
user@R1:A# set lt-0/1/0 unit 1 dlci 1
user@R1:A# set lt-0/1/0 unit 1 peer-unit 25

```

3. On Logical System A, configure the network address for the link to Peer E, and configure a loopback interface.

```

[edit interfaces]
user@R1:A# set lt-0/1/0 unit 1 description to-E
user@R1:A# set lt-0/1/0 unit 1 family inet6 address 2001:db8:0:1::/64 eui-64
user@R1:A# set lo0 unit 1 family inet6 address 2001:db8::1/128

```

4. On Logical System E, configure the interface encapsulation, peer-unit number, and DLCI to reach Logical System A.

```

user@R1> set cli logical-system E
Logical system: E
[edit]
user@R1:E> edit
Entering configuration mode
[edit]
user@R1:E# edit interfaces
[edit interfaces]
user@R1:E# set lt-0/1/0 unit 25 encapsulation frame-relay
user@R1:E# set lt-0/1/0 unit 25 dlci 1
user@R1:E# set lt-0/1/0 unit 25 peer-unit 1

```

5. On Logical System E, configure the network address for the link to Peer A, and configure a loopback interface.

```

[edit interfaces]
user@R1:E# set lt-0/1/0 unit 25 description to-A
user@R1:E# set lt-0/1/0 unit 25 family inet6 address 2001:db8:0:1::/64 eui-64
user@R1:E# set lo0 unit 5 family inet6 address 2001:db8::5/128

```

6. Run the **show interfaces terse** command to see the IPv6 addresses that are generated by EUI-64.

The 2001 addresses are used in this example in the BGP **neighbor** statements.

**NOTE:** The fe80 addresses are link-local addresses and are not used in this example.

```

user@R1:A> show interfaces terse
Interface          Admin Link Proto  Local              Remote
Logical system: A

betsy@tp8:A> show interfaces terse
Interface          Admin Link Proto  Local              Remote
lt-0/1/0
lt-0/1/0.1          up    up    inet6    2001:db8:0:1:2a0:a502:0:1da/64

```

```

fe80::2a0:a502:0:1da/64
1o0
1o0.1                up    up    inet6  2001:db8::1
                                fe80::2a0:a50f:fc56:1da

user@R1:E> show interfaces terse
Interface            Admin Link Proto  Local              Remote
1t-0/1/0
1t-0/1/0.25          up    up    inet6  2001:db8:0:1:2a0:a502:0:19da/64
                                fe80::2a0:a502:0:19da/64
1o0
1o0.5                up    up    inet6  2001:db8::5
                                fe80::2a0:a50f:fc56:1da

```

7. Repeat the interface configuration on the other logical systems.

### Configuring the External BGP Sessions

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the BGP peer sessions:

1. On Logical System A, create the BGP group, and add the external neighbor address.
 

```
[edit protocols bgp group external-peers]
user@R1:A# set neighbor 2001:db8:0:1:2a0:a502:0:19da
```
2. On Logical System E, create the BGP group, and add the external neighbor address.
 

```
[edit protocols bgp group external-peers]
user@R1:E# set neighbor 2001:db8:0:1:2a0:a502:0:1da
```
3. On Logical System A, specify the autonomous system (AS) number of the external AS.
 

```
[edit protocols bgp group external-peers]
user@R1:A# set peer-as 17
```
4. On Logical System E, specify the autonomous system (AS) number of the external AS.
 

```
[edit protocols bgp group external-peers]
user@R1:E# set peer-as 22
```
5. On Logical System A, set the peer type to EBGP.
 

```
[edit protocols bgp group external-peers]
user@R1:A# set type external
```
6. On Logical System E, set the peer type to EBGP.
 

```
[edit protocols bgp group external-peers]
user@R1:E# set type external
```
7. On Logical System A, set the autonomous system (AS) number and router ID.
 

```
[edit routing-options]
user@R1:A# set router-id 1.1.1.1
user@R1:A# set autonomous-system 22
```

8. On Logical System E, set the AS number and router ID.

```
[edit routing-options]
user@R1:E# set router-id 5.5.5.5
user@R1:E# set autonomous-system 17
```

9. Repeat these steps for Peers A, B, C, and D.

**Results** From configuration mode, confirm your configuration by entering the **show logical-systems** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@R1# show logical-systems

}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying BGP Neighbors on page 3447](#)
- [Verifying BGP Groups on page 3450](#)
- [Verifying BGP Summary Information on page 3450](#)
- [Checking the Routing Table on page 3450](#)

### Verifying BGP Neighbors

**Purpose** Verify that BGP is running on configured interfaces and that the BGP session is active for each neighbor address.

**Action** From operational mode, run the **show bgp neighbor** command.

```

user@R1:E> show bgp neighbor
Peer: 2001:db8:0:1:2a0:a502:0:1da+54987 AS 22 Local:

### Understanding Internal BGP Peering Sessions

When two BGP-enabled devices are in the same autonomous system (AS), the BGP session is called an *internal* BGP session, or IBGP session. BGP uses the same message types on IBGP and external BGP (EBGP) sessions, but the rules for when to send each message and how to interpret each message differ slightly. For this reason, some people refer to IBGP and EBGP as two separate protocols.

Figure 93: Internal and External BGP

In [Figure 93 on page 3452](#), Device Jackson, Device Memphis, and Device Biloxi have IBGP peer sessions with each other. Likewise, Device Miami and Device Atlanta have IBGP peer sessions between each other.

The purpose of IBGP is to provide a means by which EBGP route advertisements can be forwarded throughout the network. In theory, to accomplish this task you could redistribute all of your EBGP routes into an interior gateway protocol (IGP), such as OSPF or IS-IS. This, however, is not recommended in a production environment because of the large number of EBGP routes in the Internet and because of the way that IGPs operate. In short, with that many routes the IGP churns or crashes.

Generally, the loopback interface (lo0) is used to establish connections between IBGP peers. The loopback interface is always up as long as the device is operating. If there is a route to the loopback address, the IBGP peering session stays up. If a physical interface address is used instead and that interface goes up and down, the IBGP peering session also goes up and down. Thus the loopback interface provides fault tolerance in case the physical interface or the link goes down, if the device has link redundancy.

While IBGP neighbors do not need to be directly connected, they do need to be fully meshed. In this case, fully meshed means that each device is logically connected to every

other device through neighbor peer relationships. The **neighbor** statement creates the mesh. Because of the full mesh requirement of IBGP, you must configure individual peering sessions between all IBGP devices in the AS. The full mesh need not be physical links. Rather, the configuration on each routing device must create a full mesh of peer sessions (using multiple **neighbor** statements).

**NOTE:** The requirement for a full mesh is waived if you configure a confederation or route reflection.

To understand the full-mesh requirement, consider that an IBGP-learned route cannot be readvertised to another IBGP peer. The reason for preventing the readvertisement of IBGP routes and requiring the full mesh is to avoid routing loops within an AS. The AS path attribute is the means by which BGP routing devices avoid loops. The path information is examined for the local AS number only when the route is received from an EBGP peer. Because the attribute is only modified across AS boundaries, this system works well. However, the fact that the attribute is only modified across AS boundaries presents an issue inside the AS. For example, suppose that routing devices A, B, and C are all in the same AS. Device A receives a route from an EBGP peer and sends the route to Device B, which installs it as the active route. The route is then sent to Device C, which installs it locally and sends it back to Device A. If Device A installs the route, a loop is formed within the AS. The routing devices are not able to detect the loop because the AS path attribute is not modified during these advertisements. Therefore, the BGP protocol designers decided that the only assurance of never forming a routing loop was to prevent an IBGP peer from advertising an IBGP-learned route within the AS. For route reachability, the IBGP peers are fully meshed.

IBGP supports multihop connections, so IBGP neighbors can be located anywhere within the AS and often do not share a link. A recursive route lookup resolves the loopback peering address to an IP forwarding next hop. The lookup service is provided by static routes or an IGP such as OSPF, or BGP routes.

### Example: Configuring Internal BGP Peer Sessions

This example shows how to configure internal BGP peer sessions.

- [Requirements on page 3453](#)
- [Overview on page 3453](#)
- [Configuration on page 3455](#)
- [Verification on page 3462](#)

#### **Requirements**

No special configuration beyond device initialization is required before you configure this example.

#### **Overview**

In this example, you configure internal BGP (IBGP) peer sessions. The loopback interface (lo0) is used to establish connections between IBGP peers. The loopback interface is always up as long as the device is operating. If there is a route to the loopback address,

the IBGP peer session stays up. If a physical interface address is used instead and that interface goes up and down, the IBGP peer session also goes up and down. Thus, if the device has link redundancy, the loopback interface provides fault tolerance in case the physical interface or one of the links goes down.

When a device peers with a remote device's loopback interface address, the local device expects BGP update messages to come from (be sourced by) the remote device's loopback interface address. The **local-address** statement enables you to specify the source information in BGP update messages. If you omit the **local-address** statement, the expected source of BGP update messages is based on the device's source address selection rules, which normally results in the egress interface address being the expected source of update messages. When this happens, the peer session is not established because a mismatch exists between the expected source address (the egress interface of the peer) and the actual source (the loopback interface of the peer). To make sure that the expected source address matches the actual source address, specify the loopback interface address in the **local-address** statement.

Because IBGP supports multihop connections, IBGP neighbors can be located anywhere within the autonomous system (AS) and often do not share a link. A recursive route lookup resolves the loopback peer address to an IP forwarding next hop. In this example, this service is provided by OSPF. Although interior gateway protocol (IGP) neighbors do not need to be directly connected, they do need to be fully meshed. In this case, fully meshed means that each device is logically connected to every other device through neighbor peer relationships. The **neighbor** statement creates the mesh.

**NOTE:** The requirement for a full mesh is waived if you configure a confederation or route reflection.

---

After the BGP peers are established, BGP routes are not automatically advertised by the BGP peers. At each BGP-enabled device, policy configuration is required to export the local, static, or IGP-learned routes into the BGP routing information base (RIB) and then advertise them as BGP routes to the other peers. BGP's advertisement policy, by default, does not advertise any non-BGP routes (such as local routes) to peers.

In the sample network, the devices in AS 17 are fully meshed in the group **internal-peers**. The devices have loopback addresses 192.168.6.5, 192.163.6.4, and 192.168.40.4.

Figure 94 on page 3455 shows a typical network with internal peer sessions.

- [Configuring Device B on page 3458](#)
- [Configuring Device C on page 3460](#)

**CLI Quick Configuration**

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device A**

```

set interfaces ge-0/1/0 unit 1 description to-B
set interfaces ge-0/1/0 unit 1 family inet address 10.10.10.1/30
set interfaces lo0 unit 1 family inet address 192.168.6.5/32
set protocols bgp group internal-peers type internal
set protocols bgp group internal-peers description "connections to B and C"
set protocols bgp group internal-peers local-address 192.168.6.5
set protocols bgp group internal-peers export send-direct
set protocols bgp group internal-peers neighbor 192.163.6.4
set protocols bgp group internal-peers neighbor 192.168.40.4
set protocols ospf area 0.0.0.0 interface lo0.1 passive
set protocols ospf area 0.0.0.0 interface ge-0/1/0.1
set policy-options policy-statement send-direct term 2 from protocol direct
set policy-options policy-statement send-direct term 2 then accept
set routing-options router-id 192.168.6.5
set routing-options autonomous-system 17

```

**Device B**

```

set interfaces ge-0/1/0 unit 2 description to-A
set interfaces ge-0/1/0 unit 2 family inet address 10.10.10.2/30
set interfaces ge-0/1/1 unit 5 description to-C
set interfaces ge-0/1/1 unit 5 family inet address 10.10.10.5/30
set interfaces lo0 unit 2 family inet address 192.163.6.4/32
set protocols bgp group internal-peers type internal
set protocols bgp group internal-peers description "connections to A and C"
set protocols bgp group internal-peers local-address 192.163.6.4
set protocols bgp group internal-peers export send-direct
set protocols bgp group internal-peers neighbor 192.168.40.4
set protocols bgp group internal-peers neighbor 192.168.6.5

```

```
set protocols ospf area 0.0.0.0 interface lo0.2 passive
set protocols ospf area 0.0.0.0 interface ge-0/1/0.2
set protocols ospf area 0.0.0.0 interface ge-0/1/1.5
set policy-options policy-statement send-direct term 2 from protocol direct
set policy-options policy-statement send-direct term 2 then accept
set routing-options router-id 192.163.6.4
set routing-options autonomous-system 17
```

**Device C**

```
set interfaces ge-0/1/0 unit 6 description to-B
set interfaces ge-0/1/0 unit 6 family inet address 10.10.10.6/30
set interfaces lo0 unit 3 family inet address 192.168.40.4/32
set protocols bgp group internal-peers type internal
set protocols bgp group internal-peers description "connections to A and B"
set protocols bgp group internal-peers local-address 192.168.40.4
set protocols bgp group internal-peers export send-direct
set protocols bgp group internal-peers neighbor 192.163.6.4
set protocols bgp group internal-peers neighbor 192.168.6.5
set protocols ospf area 0.0.0.0 interface lo0.3 passive
set protocols ospf area 0.0.0.0 interface ge-0/1/0.6
set policy-options policy-statement send-direct term 2 from protocol direct
set policy-options policy-statement send-direct term 2 then accept
set routing-options router-id 192.168.40.4
set routing-options autonomous-system 17
```

### *Configuring Device A*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure internal BGP peer sessions on Device A:

1. Configure the interfaces.

```
[edit interfaces ge-0/1/0 unit 1]
user@A# set description to-B
user@A# set family inet address 10.10.10.1/30
```

```
[edit interfaces]
user@A# set lo0 unit 1 family inet address 192.168.6.5/32
```

2. Configure BGP.

The **neighbor** statements are included for both Device B and Device C, even though Device A is not directly connected to Device C.

```
[edit protocols bgp group internal-peers]
user@A# set type internal
user@A# set description "connections to B and C"
user@A# set local-address 192.168.6.5
user@A# set export send-direct
user@A# set neighbor 192.163.6.4
user@A# set neighbor 192.168.40.4
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
```

```

user@A# set interface lo0.1 passive
user@A# set interface ge-0/1/0.1

```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```

[edit policy-options policy-statement send-direct term 2]
user@A# set from protocol direct
user@A# set then accept

```

5. Configure the router ID and the AS number.

```

[edit routing-options]
user@A# set router-id 192.168.6.5
user@A# set autonomous-system 17

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@A# show interfaces
ge-0/1/0 {
  unit 1 {
    description to-B;
    family inet {
      address 10.10.10.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.6.5/32;
    }
  }
}

user@A# show policy-options
policy-statement send-direct {
  term 2 {
    from protocol direct;
    then accept;
  }
}

user@A# show protocols
bgp {
  group internal-peers {
    type internal;
    description "connections to B and C";
    local-address 192.168.6.5;
    export send-direct;
    neighbor 192.163.6.4;
    neighbor 192.168.40.4;
  }
}

```

```
}
}
ospf {
  area 0.0.0.0 {
    interface lo0.1 {
      passive;
    }
    interface ge-0/1/0.1;
  }
}

user@A# show routing-options
router-id 192.168.6.5;
autonomous-system 17;
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Configuring Device B**

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure internal BGP peer sessions on Device B:

1. Configure the interfaces.

```
[edit interfaces ge-0/1/0 unit 2]
user@B# set description to-A
user@B# set family inet address 10.10.10.2/30
```

```
[edit interfaces ge-0/1/1]
user@B# set unit 5 description to-C
user@B# set unit 5 family inet address 10.10.10.5/30
```

```
[edit interfaces]
user@B# set lo0 unit 2 family inet address 192.163.6.4/32
```

2. Configure BGP.

The **neighbor** statements are included for both Device B and Device C, even though Device A is not directly connected to Device C.

```
[edit protocols bgp group internal-peers]
user@B# set type internal
user@B# set description "connections to A and C"
user@B# set local-address 192.163.6.4
user@B# set export send-direct
user@B# set neighbor 192.168.40.4
user@B# set neighbor 192.168.6.5
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@B# set interface lo0.2 passive
user@B# set interface ge-0/1/0.2
user@B# set interface ge-0/1/1.5
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 2]
user@B# set from protocol direct
user@B# set then accept
```

5. Configure the router ID and the AS number.

```
[edit routing-options]
user@B# set router-id 192.163.6.4
user@B# set autonomous-system 17
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@B# show interfaces
ge-0/1/0 {
  unit 2 {
    description to-A;
    family inet {
      address 10.10.10.2/30;
    }
  }
}
ge-0/1/1 {
  unit 5 {
    description to-C;
    family inet {
      address 10.10.10.5/30;
    }
  }
}

    }
  }
}

user@B# show policy-options
policy-statement send-direct {
  term 2 {
    from protocol direct;
    then accept;
  }
}

user@B# show protocols
bgp {
  group internal-peers {
    type internal;
```

```
        description "connections to A and C";
        local-address 192.163.6.4;
        export send-direct;
        neighbor 192.168.40.4;
        neighbor 192.168.6.5;
    }
}
ospf {
    area 0.0.0.0 {
        interface lo0.2 {
            passive;
        }
        interface ge-0/1/0.2;
        interface ge-0/1/1.5;
    }
}
```

```
user@B# show routing-options
router-id 192.163.6.4;
autonomous-system 17;
```

If you are done configuring the device, enter **commit** from configuration mode.

### *Configuring Device C*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure internal BGP peer sessions on Device C:

1. Configure the interfaces.

```
[edit interfaces ge-0/1/0 unit 6]
user@C# set description to-B
user@C# set family inet address 10.10.10.6/30

[edit interfaces]
user@C# set lo0 unit 3 family inet address 192.168.40.4/32
```

2. Configure BGP.

The **neighbor** statements are included for both Device B and Device C, even though Device A is not directly connected to Device C.

```
[edit protocols bgp group internal-peers]
user@C# set type internal
user@C# set description "connections to A and B"
user@C# set local-address 192.168.40.4
user@C# set export send-direct
user@C# set neighbor 192.163.6.4
user@C# set neighbor 192.168.6.5
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@C# set interface lo0.3 passive
user@C# set interface ge-0/1/0.6
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 2]
user@C# set from protocol direct
user@C# set then accept
```

5. Configure the router ID and the AS number.

```
[edit routing-options]
user@C# set router-id 192.168.40.4
user@C# set autonomous-system 17
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@C# show interfaces
ge-0/1/0 {
  unit 6 {
    description to-B;
    family inet {
      address 10.10.10.6/30;
    }
  }
}
lo0 {
  unit 3 {
    family inet {
      address 192.168.40.4/32;
    }
  }
}

user@C# show policy-options
policy-statement send-direct {
  term 2 {
    from protocol direct;
    then accept;
  }
}

user@C# show protocols
bgp {
  group internal-peers {
    type internal;
    description "connections to A and B";
    local-address 192.168.40.4;
    export send-direct;
    neighbor 192.163.6.4;
    neighbor 192.168.6.5;
  }
}
ospf {
```

```
area 0.0.0.0 {  
    interface lo0.3 {  
        passive;  
    }  
    interface ge-0/1/0.6;  
}  
}
```

```
user@C# show routing-options  
router-id 192.168.40.4;  
autonomous-system 17;
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying BGP Neighbors on page 3462](#)
- [Verifying BGP Groups on page 3463](#)
- [Verifying BGP Summary Information on page 3464](#)
- [Verifying That BGP Routes Are Installed in the Routing Table on page 3464](#)

### **Verifying BGP Neighbors**

**Purpose** Verify that BGP is running on configured interfaces and that the BGP session is active for each neighbor address.

**Action** From operational mode, enter the **show bgp neighbor** command.

```
user@A> show bgp neighbor  
Peer: 192.163.6.4+179 AS 17    Local: 192.168.6.5+58852 AS 17

### Verifying BGP Groups

**Purpose** Verify that the BGP groups are configured correctly.

**Action** From operational mode, enter the **show bgp group** command.

```

user@A> show bgp group
Group Type: Internal   AS: 17                               Local AS: 17

### Verifying BGP Summary Information

**Purpose** Verify that the BGP configuration is correct.

**Action** From operational mode, enter the **show bgp summary** command.

```
user@A> show bgp summary
Groups: 1 Peers: 2 Down peers: 0
Table Tot Paths Act Paths Suppressed History Damp State Pending
inet.0 5 0 0 0 0 0 0
Peer AS InPkt OutPkt OutQ Flaps Last Up/Dwn
State|#Active/Received/Accepted/Damped...
192.163.6.4 17 2441 2432 0 0 18:18:52
0/3/3/0 0/0/0/0
192.168.40.4 17 2432 2430 0 0 18:18:48
0/2/2/0 0/0/0/0
```

### Verifying That BGP Routes Are Installed in the Routing Table

**Purpose** Verify that the export policy configuration is causing the BGP routes to be installed in the routing tables of the peers.

**Action** From operational mode, enter the **show route protocol bgp** command.

```
user@A> show route protocol bgp
inet.0: 7 destinations, 12 routes (7 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.10.10.0/30 [BGP/170] 07:09:57, localpref 100, from 192.163.6.4
AS path: I
> to 10.10.10.2 via ge-0/1/0.1
10.10.10.4/30 [BGP/170] 07:09:57, localpref 100, from 192.163.6.4
AS path: I
> to 10.10.10.2 via ge-0/1/0.1
[BGP/170] 07:07:12, localpref 100, from 192.168.40.4
AS path: I
> to 10.10.10.2 via ge-0/1/0.1
192.163.6.4/32 [BGP/170] 07:09:57, localpref 100, from 192.163.6.4
AS path: I
> to 10.10.10.2 via ge-0/1/0.1
192.168.40.4/32 [BGP/170] 07:07:12, localpref 100, from 192.168.40.4
AS path: I
> to 10.10.10.2 via ge-0/1/0.1
```

### Example: Configuring Internal BGP Peering Sessions on Logical Systems

This example shows how to configure internal BGP peer sessions on logical systems.

- [Requirements on page 3465](#)
- [Overview on page 3465](#)

- [Configuration on page 3465](#)
- [Verification on page 3472](#)

### Requirements

In this example, no special configuration beyond device initialization is required.

### Overview

In this example, you configure internal BGP (IBGP) peering sessions.

In the sample network, the devices in AS 17 are fully meshed in the group **internal-peers**. The devices have loopback addresses 192.168.6.5, 192.163.6.4, and 192.168.40.4.

[Figure 95 on page 3465](#) shows a typical network with internal peer sessions.

**Figure 95: Typical Network with IBGP Sessions**

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set logical-systems A interfaces lt-0/1/0 unit 1 description to-B
set logical-systems A interfaces lt-0/1/0 unit 1 encapsulation ethernet
set logical-systems A interfaces lt-0/1/0 unit 1 peer-unit 2
set logical-systems A interfaces lt-0/1/0 unit 1 family inet address 10.10.10.1/30
set logical-systems A interfaces lo0 unit 1 family inet address 192.168.6.5/32
set logical-systems A protocols bgp group internal-peers type internal
set logical-systems A protocols bgp group internal-peers local-address 192.168.6.5
set logical-systems A protocols bgp group internal-peers export send-direct
set logical-systems A protocols bgp group internal-peers neighbor 192.163.6.4
set logical-systems A protocols bgp group internal-peers neighbor 192.168.40.4
set logical-systems A protocols ospf area 0.0.0.0 interface lo0.1 passive
set logical-systems A protocols ospf area 0.0.0.0 interface lt-0/1/0.1
set logical-systems A policy-options policy-statement send-direct term 2 from protocol
  direct
set logical-systems A policy-options policy-statement send-direct term 2 then accept
set logical-systems A routing-options router-id 192.168.6.5
```

```

set logical-systems A routing-options autonomous-system 17
set logical-systems B interfaces lt-0/1/0 unit 2 description to-A
set logical-systems B interfaces lt-0/1/0 unit 2 encapsulation ethernet
set logical-systems B interfaces lt-0/1/0 unit 2 peer-unit 1
set logical-systems B interfaces lt-0/1/0 unit 2 family inet address 10.10.10.2/30
set logical-systems B interfaces lt-0/1/0 unit 5 description to-C
set logical-systems B interfaces lt-0/1/0 unit 5 encapsulation ethernet
set logical-systems B interfaces lt-0/1/0 unit 5 peer-unit 6
set logical-systems B interfaces lt-0/1/0 unit 5 family inet address 10.10.10.5/30
set logical-systems B interfaces lo0 unit 2 family inet address 192.163.6.4/32
set logical-systems B protocols bgp group internal-peers type internal
set logical-systems B protocols bgp group internal-peers local-address 192.163.6.4
set logical-systems B protocols bgp group internal-peers export send-direct
set logical-systems B protocols bgp group internal-peers neighbor 192.168.40.4
set logical-systems B protocols bgp group internal-peers neighbor 192.168.6.5
set logical-systems B protocols ospf area 0.0.0.0 interface lo0.2 passive
set logical-systems B protocols ospf area 0.0.0.0 interface lt-0/1/0.2
set logical-systems B protocols ospf area 0.0.0.0 interface lt-0/1/0.5
set logical-systems B policy-options policy-statement send-direct term 2 from protocol
    direct
set logical-systems B policy-options policy-statement send-direct term 2 then accept
set logical-systems B routing-options router-id 192.163.6.4
set logical-systems B routing-options autonomous-system 17
set logical-systems C interfaces lt-0/1/0 unit 6 description to-B
set logical-systems C interfaces lt-0/1/0 unit 6 encapsulation ethernet
set logical-systems C interfaces lt-0/1/0 unit 6 peer-unit 5
set logical-systems C interfaces lt-0/1/0 unit 6 family inet address 10.10.10.6/30
set logical-systems C interfaces lo0 unit 3 family inet address 192.168.40.4/32
set logical-systems C protocols bgp group internal-peers type internal
set logical-systems C protocols bgp group internal-peers local-address 192.168.40.4
set logical-systems C protocols bgp group internal-peers export send-direct
set logical-systems C protocols bgp group internal-peers neighbor 192.163.6.4
set logical-systems C protocols bgp group internal-peers neighbor 192.168.6.5
set logical-systems C protocols ospf area 0.0.0.0 interface lo0.3 passive
set logical-systems C protocols ospf area 0.0.0.0 interface lt-0/1/0.6
set logical-systems C policy-options policy-statement send-direct term 2 from protocol
    direct
set logical-systems C policy-options policy-statement send-direct term 2 then accept
set logical-systems C routing-options router-id 192.168.40.4
set logical-systems C routing-options autonomous-system 17

```

### Device A

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure internal BGP peer sessions on Device A:

1. Configure the interfaces.
 

```

[edit logical-systems A interfaces lt-0/1/0 unit 1]
user@R1# set description to-B
user@R1# set encapsulation ethernet
user@R1# set peer-unit 2
user@R1# set family inet address 10.10.10.1/30

```

```

user@R1# set family inet address 192.168.6.5/32
user@R1# up
user@R1# up
[edit logical-systems A interfaces]
user@R1# set lo0 unit 1 family inet address 192.168.6.5/32
user@R1# exit
[edit]
user@R1# edit logical-systems B interfaces lt-0/1/0
[edit logical-systems B interfaces lt-0/1/0]
user@R1# set unit 2 description to-A
user@R1# set unit 2 encapsulation ethernet
user@R1# set unit 2 peer-unit 1
user@R1# set unit 2 family inet address 10.10.10.2/30
user@R1# set unit 5 description to-C
user@R1# set unit 5 encapsulation ethernet
user@R1# set unit 5 peer-unit 6
user@R1# set family inet address 10.10.10.5/30
user@R1# up
[edit logical-systems B interfaces]
user@R1# set lo0 unit 2 family inet address 192.163.6.4/32
user@R1# exit
[edit]
user@R1# edit logical-systems C interfaces lt-0/1/0 unit 6
[edit logical-systems C interfaces lt-0/1/0 unit 6]
set description to-B
set encapsulation ethernet
set peer-unit 5
set family inet address 10.10.10.6/30
user@R1# up
user@R1# up
[edit logical-systems C interfaces]
set lo0 unit 3 family inet address 192.168.40.4/32

```

## 2. Configure BGP.

On Logical System A, the **neighbor** statements are included for both Device B and Device C, even though Logical System A is not directly connected to Device C.

```

[edit logical-systems A protocols bgp group internal-peers]
user@R1# set type internal
user@R1# set local-address 192.168.6.5
user@R1# set export send-direct
user@R1# set neighbor 192.163.6.4
user@R1# set neighbor 192.168.40.4

```

```

[edit logical-systems B protocols bgp group internal-peers]
user@R1# set type internal
user@R1# set local-address 192.163.6.4
user@R1# set export send-direct
user@R1# set neighbor 192.168.40.4
user@R1# set neighbor 192.168.6.5

```

```

[edit logical-systems C protocols bgp group internal-peers]
user@R1# set type internal
user@R1# set local-address 192.168.40.4
user@R1# set export send-direct

```

```
user@R1# set neighbor 192.163.6.4
user@R1# set neighbor 192.168.6.5
```

3. Configure OSPF.

```
[edit logical-systems A protocols ospf area 0.0.0.0]
user@R1# set interface lo0.1 passive
user@R1# set interface lt-0/1/0.1
```

```
[edit logical-systems A protocols ospf area 0.0.0.0]
user@R1# set interface lo0.2 passive
user@R1# set interface lt-0/1/0.2
user@R1# set interface lt-0/1/0.5
```

```
[edit logical-systems A protocols ospf area 0.0.0.0]
user@R1# set interface lo0.3 passive
user@R1# set interface lt-0/1/0.6
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit logical-systems A policy-options policy-statement send-direct term 2]
user@R1# set from protocol direct
user@R1# set then accept
```

```
[edit logical-systems B policy-options policy-statement send-direct term 2]
user@R1# set from protocol direct
user@R1# set then accept
```

```
[edit logical-systems C policy-options policy-statement send-direct term 2]
user@R1# set from protocol direct
user@R1# set then accept
```

5. Configure the router ID and the autonomous system (AS) number.

```
[edit logical-systems A routing-options]
user@R1# set router-id 192.168.6.5
user@R1# set autonomous-system 17
```

```
[edit logical-systems B routing-options]
user@R1# set router-id 192.163.6.4
user@R1# set autonomous-system 17
```

```
[edit logical-systems C routing-options]
user@R1# set router-id 192.168.40.4
user@R1# set autonomous-system 17
```

**Results** From configuration mode, confirm your configuration by entering the **show logical-systems** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show logical-systems
A {
```

```

interfaces {
  lt-0/1/0 {
    unit 1 {
      description to-B;
      encapsulation ethernet;
      peer-unit 2;

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying BGP Neighbors on page 3472](#)
- [Verifying BGP Groups on page 3473](#)
- [Verifying BGP Summary Information on page 3473](#)
- [Verifying That BGP Routes Are Installed in the Routing Table on page 3474](#)

### Verifying BGP Neighbors

**Purpose** Verify that BGP is running on configured interfaces and that the BGP session is active for each neighbor address.

**Action** From the operational mode, enter the **show bgp neighbor** command.

```
user@R1> show bgp neighbor logical-system A
Peer: 192.163.6.4+179 AS 17   Local: 192.168.6.5+58852 AS 17
  Type: Internal   State: Established   Flags: <Sync>
  Last State: OpenConfirm   Last Event: RecvKeepAlive
  Last Error: None
  Export: [ send-direct ]

### Example: Configuring BGP Local Preference

- [Understanding the BGP Local Preference on page 3474](#)
- [Example: Configuring the Local Preference Value for BGP Routes on page 3475](#)

#### Understanding the BGP Local Preference

Internal BGP (IBGP) sessions use a metric called the *local preference*, which is carried in IBGP update packets in the path attribute LOCAL\_PREF. When an autonomous system

(AS) has multiple routes to another AS, the local preference indicates the degree of preference for one route over the other routes. The route with the highest local preference value is preferred.

The LOCAL\_PREF path attribute is always advertised to IBGP peers and to neighboring confederations. It is never advertised to external BGP (EBGP) peers. The default behavior is to not modify the LOCAL\_PREF path attribute if it is present.

The LOCAL\_PREF path attribute applies at export time only, when the routes are exported from the routing table into BGP.

If a BGP route is received without a LOCAL\_PREF attribute, the route is stored in the routing table and advertised by BGP as if it were received with a LOCAL\_PREF value of 100. A non-BGP route that is advertised by BGP is advertised with a LOCAL\_PREF value of 100 by default.

### **Example: Configuring the Local Preference Value for BGP Routes**

This example shows how to configure local preference in internal BGP (IBGP) peer sessions.

- [Requirements on page 3475](#)
- [Overview on page 3475](#)
- [Configuration on page 3476](#)
- [Verification on page 3486](#)

#### **Requirements**

No special configuration beyond device initialization is required before you configure this example.

#### **Overview**

To change the local preference metric advertised in the path attribute, you must include the **local-preference** statement, specifying a value from 0 through 4,294,967,295 ( $2^{32} - 1$ ).

There are several reasons you might want to prefer one path over another. For example, compared to other paths, one path might be less expensive to use, might have higher bandwidth, or might be more stable.

[Figure 96 on page 3476](#) shows a typical network with internal peer sessions and multiple exit points to a neighboring AS.

Figure 96: Typical Network with IBGP Sessions and Multiple Exit Points

To reach Device R4, Device R1 can take a path through either Device R2 or Device R3. By default, the local preference is 100 for either route. When the local preferences are equal, Junos OS has rules for breaking the tie and choosing a path. (See *Understanding BGP Path Selection*.) In this example, the active route is through Device R2 because the router ID of Device R2 is lower than the router ID of Device R3. The following example shows how to override the default behavior with an explicit setting for the local preference. The example configures a local preference of 300 on Device R3, thereby making Device R3 the preferred path to reach Device R4.

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
Device R1
set interfaces fe-1/2/0 unit 1 family inet address 12.12.12.1/24
set interfaces fe-1/2/1 unit 2 family inet address 13.13.13.1/24
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.1.1
set protocols bgp group internal export send-direct
set protocols bgp group internal neighbor 192.168.2.1
set protocols bgp group internal neighbor 192.168.3.1
set protocols ospf area 0.0.0.0 interface lo0.1 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.1
```

```

set protocols ospf area 0.0.0.0 interface fe-1/2/1.2
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 123
set routing-options router-id 192.168.1.1

```

Device R2

```

set interfaces fe-1/2/0 unit 3 family inet address 12.12.12.2/24
set interfaces fe-1/2/1 unit 4 family inet address 24.24.24.2/24
set interfaces lo0 unit 2 family inet address 192.168.2.1/32
set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.2.1
set protocols bgp group internal export send-direct
set protocols bgp group internal neighbor 192.168.1.1
set protocols bgp group internal neighbor 192.168.3.1
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 4
set protocols bgp group external neighbor 24.24.24.4
set protocols ospf area 0.0.0.0 interface lo0.2 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.3
set protocols ospf area 0.0.0.0 interface fe-1/2/1.4
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 123
set routing-options router-id 192.168.2.1

```

Device R3

```

set interfaces fe-1/2/0 unit 5 family inet address 13.13.13.3/24

set routing-options router-id 192.168.3.1

```

Device R4

```

set interfaces fe-1/2/0 unit 7 family inet address 24.24.24.4/24
set interfaces fe-1/2/1 unit 8 family inet address 34.34.34.4/24
set interfaces lo0 unit 4 family inet address 192.168.4.1/32
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 123
set protocols bgp group external neighbor 34.34.34.3
set protocols bgp group external neighbor 24.24.24.2
set policy-options policy-statement send-direct term 1 from protocol direct

```

```
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 4
set routing-options router-id 192.168.4.1
```

### *Configuring Device R1*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.

```
[edit interfaces fe-1/2/0 unit 1]
user@R1# set family inet address 12.12.12.1/24
```

```
[edit interfaces fe-1/2/1 unit 2]
user@R1# set family inet address 13.13.13.1/24
```

```
[edit interfaces lo0 unit 1]
user@R1# set family inet address 192.168.1.1/32
```

2. Configure BGP.

```
[edit protocols bgp group internal]
user@R1# set type internal
user@R1# set local-address 192.168.1.1
user@R1# set export send-direct
user@R1# set neighbor 192.168.2.1
user@R1# set neighbor 192.168.3.1
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R1# set interface lo0.1 passive
user@R1# set interface fe-1/2/0.1
user@R1# set interface fe-1/2/1.2
```

4. Configure a policy that accepts direct routes.

**NOTE:** Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

---

```
[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct
user@R1# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R1# set autonomous-system 123
user@R1# set router-id 192.168.1.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 12.12.12.1/24;
    }
  }
}
fe-1/2/1 {
  unit 2 {
    family inet {
      address 13.13.13.1/24;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.1.1/32;
    }
  }
}

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R1# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.1.1;
    export send-direct;
    neighbor 192.168.2.1;
    neighbor 192.168.3.1;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.1 {
      passive;
    }
    interface fe-1/2/0.1;
    interface fe-1/2/1.2;
  }
}

user@R1# show routing-options

```

```
autonomous-system 123;  
router-id 192.168.1.1;
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Configuring Device R2**

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.  

```
[edit interfaces fe-1/2/0 unit 3]  
user@R2# set family inet address 12.12.12.21/24  
  
[edit interfaces fe-1/2/1 unit 4]  
user@R2# set family inet address 24.24.24.2/24  
  
[edit interfaces lo0 unit 2]  
user@R2# set family inet address 192.168.2.1/32
```
2. Configure BGP.  

```
[edit protocols bgp group internal]  
user@R2# set type internal  
user@R2# set local-address 192.168.2.1  
user@R2# set export send-direct  
user@R2# set neighbor 192.168.1.1  
user@R2# set neighbor 192.168.3.1  
  
[edit protocols bgp group external]  
user@R2# set type external  
user@R2# set export send-direct  
user@R2# set peer-as 4  
user@R2# set neighbor 24.24.24.4
```
3. Configure OSPF.  

```
[edit protocols ospf area 0.0.0.0]  
user@R2# set interface lo0.2 passive  
user@R2# set interface fe-1/2/0.3  
user@R2# set interface fe-1/2/1.4
```
4. Configure a policy that accepts direct routes.

**NOTE:** Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

---

```
[edit policy-options policy-statement send-direct term 1]  
user@R2# set from protocol direct  
user@R2# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R2# set autonomous-system 123
user@R2# set router-id 192.168.2.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 3 {
    family inet {
      address 12.12.12.2/24;
    }
  }
}
fe-1/2/1 {
  unit 4 {
    family inet {
      address 24.24.24.2/24;
    }
  }
}
lo0 {

If you are done configuring the device, enter **commit** from configuration mode.

### *Configuring Device R3*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R3:

1. Configure the interfaces.  
  
[edit interfaces fe-1/2/0 unit 5]  
user@R3# set family inet address 13.13.13.3/24  
  
[edit interfaces fe-1/2/1 unit 6]  
user@R3# set family inet address 34.34.34.3/24  
  
[edit interfaces lo0 unit 3]  
user@R3# set family inet address 192.168.3.1/32
2. Configure BGP.  
  
[edit protocols bgp group internal]  
user@R3# set type internal  
user@R3# set local-address 192.168.3.1  
user@R3# set export send-direct  
user@R3# set neighbor 192.168.1.1  
user@R3# set neighbor 192.168.2.1  
  
[edit protocols bgp group external]  
user@R3# set type external  
user@R3# set export send-direct  
user@R3# set peer-as 4  
user@R3# set neighbor 34.34.34.4
3. Configure OSPF.  
  
[edit protocols ospf area 0.0.0.0]  
user@R3# set interface lo0.3 passive  
user@R3# set interface fe-1/2/0.5

```
user@R3# set interface fe-1/2/1.6
```

4. Configure a policy that accepts direct routes.

**NOTE:** Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
```

```
user@R3# set from protocol direct
```

```
user@R3# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
```

```
user@R3# set autonomous-system 123
```

```
user@R3# set router-id 192.168.3.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
```

```
fe-1/2/0 {
  unit 5 {
    family inet {
      address 13.13.13.3/24;
    }
  }
}
fe-1/2/1 {
  unit 6 {
    family inet {
      address 34.34.34.3/24;
    }
  }
}
lo0 {
  unit 3 {
    family inet {
      address 192.168.3.1/32;
    }
  }
}
```

```
user@R3# show policy-options
```

```
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}
```

```
user@R3# show protocols
```

```
bgp {
  group internal {
    type internal;
    local-address 192.168.3.1;
    export send-direct;
    neighbor 192.168.1.1;
    neighbor 192.168.2.1;
  }
  group external {
    type external;
    export send-direct;
    peer-as 4;
    neighbor 34.34.34.4;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.3 {
      passive;
    }
    interface fe-1/2/0.5;
    interface fe-1/2/1.6;
  }
}

user@R3# show routing-options
autonomous-system 123;
router-id 192.168.3.1;
```

If you are done configuring the device, enter **commit** from configuration mode.

#### ***Configuring Device R4***

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R4:

1. Configure the interfaces.  

```
[edit interfaces fe-1/2/0 unit 7]
user@R4# set family inet address 24.24.24.4/24

[edit interfaces fe-1/2/1 unit 8]
user@R4# set family inet address 34.34.34.4/24

[edit interfaces lo0 unit 4]
user@R4# set family inet address 192.168.4.1/32
```
2. Configure BGP.  

```
[edit protocols bgp group external]
user@R4# set type external
user@R4# set export send-direct
user@R4# set peer-as 123
```

```
user@R4# set neighbor 34.34.34.3
user@R4# set neighbor 24.24.24.2
```

3. Configure a policy that accepts direct routes.

**NOTE:** Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R4# set from protocol direct
user@R4# set then accept
```

4. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R4# set autonomous-system 4
user@R4# set router-id 192.168.4.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R4# show interfaces
fe-1/2/0 {
  unit 7 {
    family inet {
      address 24.24.24.4/24;
    }
  }
}
fe-1/2/1 {
  unit 8 {
    family inet {
      address 34.34.34.4/24;
    }
  }
}
lo0 {
  unit 4 {
    family inet {
      address 192.168.4.1/32;
    }
  }
}

user@R4# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}
```

```
user@R4# show protocols
bgp {
  group external {
    type external;
    export send-direct;
    peer-as 123;
    neighbor 34.34.34.3;
    neighbor 24.24.24.2;
  }
}

user@R4# show routing-options
autonomous-system 4;
router-id 192.168.4.1;
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Checking the Active Path From Device R1 to Device R4 on page 3486](#)
- [Altering the Local Preference to Change the Path Selection on page 3487](#)
- [Rechecking the Active Path From Device R1 to Device R4 on page 3487](#)

### **Checking the Active Path From Device R1 to Device R4**

**Purpose** Verify that the active path from Device R1 to Device R4 goes through Device R2.

**Action** From operational mode, enter the **show route protocol bgp** command.

```
user@R1> show route protocol bgp
inet.0: 11 destinations, 18 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

12.12.12.0/24      [BGP/170] 00:11:48, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
13.13.13.0/24      [BGP/170] 00:11:48, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
24.24.24.0/24      [BGP/170] 00:11:48, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
34.34.34.0/24      [BGP/170] 00:11:48, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
192.168.2.1/32     [BGP/170] 00:11:48, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
192.168.3.1/32     [BGP/170] 00:11:48, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
192.168.4.1/32     *[BGP/170] 00:05:14, localpref 100, from 192.168.2.1
                  AS path: 4 I
                  > to 12.12.12.2 via fe-1/2/0.1
                  [BGP/170] 00:05:14, localpref 100, from 192.168.3.1
```

```

AS path: 4 I
> to 13.13.13.3 via fe-1/2/1.2

```

**Meaning** The asterisk (\*) shows that the preferred path is through Device R2. In the default configuration, Device R2 has a lower router ID than Device R3. The router ID is controlling the path selection.

#### *Altering the Local Preference to Change the Path Selection*

**Purpose** Change the path so that it goes through Device R3.

**Action** From configuration mode, enter the **set local-preference 300** command.

```

[edit protocols bgp group internal]
user@R3# set local-preference 300
user@R3# commit

```

#### *Rechecking the Active Path From Device R1 to Device R4*

**Purpose** Verify that the active path from Device R1 to Device R4 goes through Device R3.

**Action** From operational mode, enter the **show route protocol bgp** command.

```

user@R1> show route protocol bgp
inet.0: 11 destinations, 17 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

12.12.12.0/24      [BGP/170] 00:16:48, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
13.13.13.0/24      [BGP/170] 00:00:22, localpref 300, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
24.24.24.0/24      [BGP/170] 00:16:48, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
34.34.34.0/24      [BGP/170] 00:00:22, localpref 300, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
192.168.2.1/32      [BGP/170] 00:16:48, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
192.168.3.1/32      [BGP/170] 00:00:22, localpref 300, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
192.168.4.1/32      *[BGP/170] 00:00:21, localpref 300, from 192.168.3.1
                  AS path: 4 I
                  > to 13.13.13.3 via fe-1/2/1.2

```

**Meaning** The asterisk (\*) shows that the preferred path is through Device R3. In the altered configuration, Device R3 has a higher local preference than Device R2. The local preference is controlling the path selection.

---

### Understanding the MED Attribute

The BGP multiple exit discriminator (MED, or MULTI\_EXIT\_DISC) is a non-transitive attribute, meaning that it is not propagated throughout the Internet, but only to adjacent autonomous systems (ASs). The MED attribute is optional, meaning that it is not always sent with the BGP updates. The purpose of MED is to influence how other ASs enter your AS to reach a certain prefix.

The MED attribute has a value that is referred to as a *metric*. If all other factors in determining an exit point are equal, the exit point with the lowest metric is preferred.

If a MED is received over an external BGP link, it is propagated over internal links to other BGP-enabled devices within the AS.

BGP update messages include a MED metric if the route was learned from BGP and already had a MED metric associated with it, or if you configure the MED metric in the configuration file.

A MED metric is advertised with a route according to the following general rules:

- A more specific metric overrides a less specific metric. That is, a group-specific metric overrides a global BGP metric, and a peer-specific metric overrides a global BGP or group-specific metric.
- A metric defined with a routing policy overrides a metric defined with the **metric-out** statement.
- If any metric is defined, it overrides a metric received in a route.
- If the received route does not have an associated MED metric, and if you do not explicitly configure a metric value, no metric is advertised. When you do not explicitly configure a metric value, the MED value is equivalent to zero (0) when advertising an active route.

Because the AS path rather than the number of hops between hosts is the primary criterion for BGP route selection, an AS with multiple connections to a peer AS can have multiple equivalent AS paths. When the routing table contains two routes to the same host in a neighboring AS, a MED metric assigned to each route can determine which to include in the forwarding table. The MED metric you assign can force traffic through a particular exit point in an AS.

[Figure 97 on page 3489](#) illustrates how MED metrics are used to determine route selection.

Figure 97: Default MED Example

Figure 97 on page 3489 shows AS 1 and AS 2 connected by two separate BGP links to Routers C and D. Host E in AS 1 is located nearer to Router C. Host F, also in AS 1, is located nearer to Router D. Because the AS paths are equivalent, two routes exist for each host, one through Router C and one through Router D. To force all traffic destined for Host E through Router C, the network administrator for AS 1 assigns a MED metric for each router to Host E at its exit point. A MED metric of 10 is assigned to the route to Host E through Router C, and a MED metric of 20 is assigned to the route to Host E through Router D. BGP routers in AS 2 select the route with the lower MED metric for the forwarding table.

By default, only the MEDs of routes that have the same peer ASs are compared. However, you can configure the routing table path selection options listed in Table 270 on page 3489 to compare MEDs in different ways. The MED options are not mutually exclusive and can be configured in combination or independently. For the MED options to take effect, you must configure them uniformly all through your network. The MED option or options you configure determine the route selected. Thus we recommend that you carefully evaluate your network for preferred routes before configuring the MED options.

Table 270: MED Options for Routing Table Path Selection

| Option (Name)                                          | Function                                                                                                        | Use                                                                                                                                                                                                                                            |
|--------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Always comparing MEDs<br>( <b>always-compare-med</b> ) | Ensures that the MEDs for paths from peers in different ASs are always compared in the route selection process. | Useful when all enterprises participating in a network agree on a uniform policy for setting MEDs. For example, in a network shared by two ISPs, both must agree that a certain path is the better path to configure the MED values correctly. |

Table 270: MED Options for Routing Table Path Selection (*continued*)

| Option (Name)                                                                   | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Use                                                                                                                                                                     |
|---------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Adding IGP cost to MED ( <b>med-plus-igp</b> )                                  | <p>Before comparing MED values for path selection, adds to the MED the cost of the IGP route to the BGP next-hop destination.</p> <p>This option replaces the MED value for the router, but does not affect the IGP metric comparison. As a result, when multiple routes have the same value after the MED-plus-IPG comparison, and route selection continues, the IGP route metric is also compared, even though it was added to the MED value and compared earlier in the selection process.</p>                                   | Useful when the downstream AS requires the complete cost of a certain route that is received across multiple ASs.                                                       |
| Applying Cisco IOS nondeterministic behavior ( <b>cisco-non-deterministic</b> ) | <p>Specifies the nondeterministic behavior of the Cisco IOS software:</p> <ul style="list-style-type: none"> <li>The active path is always first. All nonactive but eligible paths follow the active path and are maintained in the order in which they were received. Ineligible paths remain at the end of the list.</li> <li>When a new path is added to the routing table, path comparisons are made among all routes, including those paths that must never be selected because they lose the MED tie-breaking rule.</li> </ul> | We recommend that you do not configure this option, because the nondeterministic behavior sometimes prevents the system from properly comparing the MEDs between paths. |

### Example: Configuring the MED Attribute Directly

This example shows how to configure a multiple exit discriminator (MED) metric to advertise in BGP update messages.

- [Requirements on page 3490](#)
- [Overview on page 3490](#)
- [Configuration on page 3492](#)
- [Verification on page 3502](#)

#### Requirements

No special configuration beyond device initialization is required before you configure this example.

#### Overview

To directly configure a MED metric to advertise in BGP update messages, include the **metric-out** statement:

```
metric-out (metric | minimum-igp offset | igp delay-med-update | offset);
```

**metric** is the primary metric on all routes sent to peers. It can be a value in the range from 0 through 4,294,967,295 ( $2^{32} - 1$ ).

The following optional settings are also supported:

- **minimum-igp**—Sets the metric to the minimum metric value calculated in the interior gateway protocol (IGP) to get to the BGP next hop. If a newly calculated metric is greater than the minimum metric value, the metric value remains unchanged. If a newly calculated metric is lower, the metric value is lowered to that value.
- **igp**—Sets the metric to the most recent metric value calculated in the IGP to get to the BGP next hop.
- **delay-med-update**—Delays sending MED updates when the MED value increases. Include the **delay-med-update** statement when you configure the **igp** statement. The default interval to delay sending updates, unless the MED is lower or another attribute associated with the route has changed is 10 minutes. Include the **med-igp-update-interval minutes** statement at the [edit routing-options] hierarchy level to modify the default interval.
- **offset**—Specifies a value for **offset** to increase or decrease the metric that is used from the metric value calculated in the IGP. The metric value is offset by the value specified. The metric calculated in the IGP (by specifying either **igp** or **igp-minimum**) is increased if the **offset** value is positive. The metric calculated in the IGP (by specifying either **igp** or **igp-minimum**) is decreased if the **offset** value is negative.

**offset** can be a value in the range from  $-2^{31}$  through  $2^{31} - 1$ . Note that the adjusted metric can never go below 0 or above  $2^{32} - 1$ .

Figure 98 on page 3491 shows a typical network with internal peer sessions and multiple exit points to a neighboring autonomous system (AS).

Figure 98: Typical Network with IBGP Sessions and Multiple Exit Points

8041151

Device R4 has multiple loopback interfaces configured to simulate advertised prefixes. The extra loopback interface addresses are 44.44.44.44/32 and 144.144.144.144/32. This example shows how to configure Device R4 to advertise a MED value of 30 to Device R3 and a MED value of 20 to Device R2. This causes all of the devices in AS 123 to prefer the path through Device R2 to reach AS 4.

### **Configuration**

- [Configuring Device R3 on page 3497](#)
- [Configuring Device R4 on page 3500](#)

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```
set interfaces fe-1/2/0 unit 1 family inet address 12.12.12.1/24
set interfaces fe-1/2/1 unit 2 family inet address 13.13.13.1/24
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.1.1
set protocols bgp group internal export send-direct
set protocols bgp group internal neighbor 192.168.2.1
set protocols bgp group internal neighbor 192.168.3.1
set protocols ospf area 0.0.0.0 interface lo0.1 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.1
set protocols ospf area 0.0.0.0 interface fe-1/2/1.2
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 123
set routing-options router-id 192.168.1.1
```

**Device R2**

```
set interfaces fe-1/2/0 unit 3 family inet address 12.12.12.2/24
set interfaces fe-1/2/1 unit 4 family inet address 24.24.24.2/24
set interfaces lo0 unit 2 family inet address 192.168.2.1/32
set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.2.1
set protocols bgp group internal export send-direct
set protocols bgp group internal neighbor 192.168.1.1
set protocols bgp group internal neighbor 192.168.3.1
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 4
set protocols bgp group external neighbor 24.24.24.4
set protocols ospf area 0.0.0.0 interface lo0.2 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.3
set protocols ospf area 0.0.0.0 interface fe-1/2/1.4
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 123
set routing-options router-id 192.168.2.1
```

**Device R3**

```

set interfaces fe-1/2/0 unit 5 family inet address 13.13.13.3/24
set interfaces fe-1/2/1 unit 6 family inet address 34.34.34.3/24
set interfaces lo0 unit 3 family inet address 192.168.3.1/32
set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.3.1
set protocols bgp group internal export send-direct
set protocols bgp group internal neighbor 192.168.1.1
set protocols bgp group internal neighbor 192.168.2.1
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 4
set protocols bgp group external neighbor 34.34.34.4
set protocols ospf area 0.0.0.0 interface lo0.3 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.5
set protocols ospf area 0.0.0.0 interface fe-1/2/1.6
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 123
set routing-options router-id 192.168.3.1

```

**Device R4**

```

set interfaces fe-1/2/0 unit 7 family inet address 24.24.24.4/24
set interfaces fe-1/2/1 unit 8 family inet address 34.34.34.4/24
set interfaces lo0 unit 4 family inet address 192.168.4.1/32
set interfaces lo0 unit 4 family inet address 44.44.44.44/32
set interfaces lo0 unit 4 family inet address 144.144.144.144/32
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 123
set protocols bgp group external neighbor 34.34.34.3 metric-out 30
set protocols bgp group external neighbor 24.24.24.2 metric-out 20
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 4
set routing-options router-id 192.168.4.1

```

### Configuring Device R1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.
 

```

[edit interfaces fe-1/2/0 unit 1]
user@R1# set family inet address 12.12.12.1/24

[edit interfaces fe-1/2/1 unit 2]
user@R1# set family inet address 13.13.13.1/24

[edit interfaces lo0 unit 1]
user@R1# set family inet address 192.168.1.1/32

```
2. Configure BGP.

```
[edit protocols bgp group internal]
user@R1# set type internal
user@R1# set local-address 192.168.1.1
user@R1# set export send-direct
user@R1# set neighbor 192.168.2.1
user@R1# set neighbor 192.168.3.1
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R1# set interface lo0.1 passive
user@R1# set interface fe-1/2/0.1
user@R1# set interface fe-1/2/1.2
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct
user@R1# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R1# set autonomous-system 123
user@R1# set router-id 192.168.1.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 12.12.12.1/24;
    }
  }
}
fe-1/2/1 {
  unit 2 {
    family inet {
      address 13.13.13.1/24;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.1.1/32;
    }
  }
}

user@R1# show policy-options
```

```

policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R1# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.1.1;
    export send-direct;
    neighbor 192.168.2.1;
    neighbor 192.168.3.1;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.1 {
      passive;
    }
    interface fe-1/2/0.1;
    interface fe-1/2/1.2;
  }
}

user@R1# show routing-options
autonomous-system 123;
router-id 192.168.1.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Device R2

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.
 

```

[edit interfaces fe-1/2/0 unit 3]
user@R2# set family inet address 12.12.12.21/24

[edit interfaces fe-1/2/1 unit 4]
user@R2# set family inet address 24.24.24.2/24

[edit interfaces lo0 unit 2]
user@R2# set family inet address 192.168.2.1/32

```
2. Configure BGP.
 

```

[edit protocols bgp group internal]
user@R2# set type internal
user@R2# set local-address 192.168.2.1

```

```
user@R2# set export send-direct
user@R2# set neighbor 192.168.1.1
user@R2# set neighbor 192.168.3.1
```

```
[edit protocols bgp group external]
user@R2# set type external
user@R2# set export send-direct
user@R2# set peer-as 4
user@R2# set neighbor 24.24.24.4
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R2# set interface lo0.2 passive
user@R2# set interface fe-1/2/0.3
user@R2# set interface fe-1/2/1.4
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R2# set from protocol direct
user@R2# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R2# set autonomous-system 123
user@R2# set router-id 192.168.2.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 3 {
    family inet {
      address 12.12.12.2/24;
    }
  }
}
fe-1/2/1 {
  unit 4 {
    family inet {
      address 24.24.24.2/24;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 192.168.2.1/32;
    }
  }
}
```

```

    }
  }

user@R2# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R2# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.2.1;
    export send-direct;
    neighbor 192.168.1.1;
    neighbor 192.168.3.1;
  }
  group external {
    type external;
    export send-direct;
    peer-as 4;
    neighbor 24.24.24.4;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.2 {
      passive;
    }
    interface fe-1/2/0.3;
    interface fe-1/2/1.4;
  }
}

user@R2# show routing-options
autonomous-system 123;
router-id 192.168.2.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Device R3

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R3:

1. Configure the interfaces.
 

```

[edit interfaces fe-1/2/0 unit 5]
user@R3# set family inet address 13.13.13.3/24

[edit interfaces fe-1/2/1 unit 6]

```

```
user@R3# set family inet address 34.34.34.3/24
```

```
[edit interfaces lo0 unit 3]
```

```
user@R3# set family inet address 192.168.3.1/32
```

2. Configure BGP.

```
[edit protocols bgp group internal]
```

```
user@R3# set type internal
```

```
user@R3# set local-address 192.168.3.1
```

```
user@R3# set export send-direct
```

```
user@R3# set neighbor 192.168.1.1
```

```
user@R3# set neighbor 192.168.2.1
```

```
[edit protocols bgp group external]
```

```
user@R3# set type external
```

```
user@R3# set export send-direct
```

```
user@R3# set peer-as 4
```

```
user@R3# set neighbor 34.34.34.4
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
```

```
user@R3# set interface lo0.3 passive
```

```
user@R3# set interface fe-1/2/0.5
```

```
user@R3# set interface fe-1/2/1.6
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
```

```
user@R3# set from protocol direct
```

```
user@R3# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
```

```
user@R3# set autonomous-system 123
```

```
user@R3# set router-id 192.168.3.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
```

```
fe-1/2/0 {
```

```
  unit 5 {
```

```
    family inet {
```

```
      address 13.13.13.3/24;
```

```
    }
```

```
  }
```

```
fe-1/2/1 {
```

```
  unit 6 {
```

```

        family inet {
            address 34.34.34.3/24;
        }
    }
}
lo0 {
    unit 3 {
        family inet {
            address 192.168.3.1/32;
        }
    }
}

user@R3# show policy-options
policy-statement send-direct {
    term 1 {
        from protocol direct;
        then accept;
    }
}

user@R3# show protocols
bgp {
    group internal {
        type internal;
        local-address 192.168.3.1;
        export send-direct;
        neighbor 192.168.1.1;
        neighbor 192.168.2.1;
    }
    group external {
        type external;
        export send-direct;
        peer-as 4;
        neighbor 34.34.34.4;
    }
}
ospf {
    area 0.0.0.0 {
        interface lo0.3 {
            passive;
        }
        interface fe-1/2/0.5;
        interface fe-1/2/1.6;
    }
}

user@R3# show routing-options
autonomous-system 123;
router-id 192.168.3.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Device R4

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R4:

1. Configure the interfaces.

```
[edit interfaces fe-1/2/0 unit 7]
user@R4# set family inet address 24.24.24.4/24
```

```
[edit interfaces fe-1/2/1 unit 8]
user@R4# set family inet address 34.34.34.4/24
```

```
[edit interfaces lo0 unit 4]
user@R4# set family inet address 192.168.4.1/32
user@R4# set family inet address 44.44.44.44/32
user@R4# set family inet address 144.144.144.144/32
```

Device R4 has multiple loopback interface addresses to simulate advertised prefixes.

2. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R4# set from protocol direct
user@R4# set then accept
```

3. Configure BGP.

```
[edit protocols bgp group external]
user@R4# set type external
user@R4# set export send-direct
user@R4# set peer-as 123
```

4. Configure a MED value of 30 for neighbor Device R3, and a MED value of 20 for neighbor Device R2.

```
[edit protocols bgp group external]
user@R4# set neighbor 34.34.34.3 metric-out 30
user@R4# set neighbor 24.24.24.2 metric-out 20
```

This configuration causes autonomous system (AS) 123 (of which Device R1, Device R2, and Device R3 are members) to prefer the path through Device R2 to reach AS 4.

5. Configure the router ID and AS number.

```
[edit routing-options]
user@R4# set autonomous-system 4
user@R4# set router-id 192.168.4.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output

does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R4# show interfaces
fe-1/2/0 {
  unit 7 {
    family inet {
      address 24.24.24.4/24;
    }
  }
}
fe-1/2/1 {
  unit 8 {
    family inet {
      address 34.34.34.4/24;
    }
  }
}
lo0 {
  unit 4 {
    family inet {
      address 192.168.4.1/32;
      address 44.44.44.44/32;
      address 144.144.144.144/32;
    }
  }
}

user@R4# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R4# show protocols
bgp {
  group external {
    type external;
    export send-direct;
    peer-as 123;
    neighbor 34.34.34.3 {
      metric-out 30;
    }
    neighbor 24.24.24.2 {
      metric-out 20;
    }
  }
}

user@R4# show routing-options
autonomous-system 4;
router-id 192.168.4.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

**Verification**

Confirm that the configuration is working properly.

- [Checking the Active Path From Device R1 to Device R4 on page 3502](#)
- [Verifying That Device R4 Is Sending Its Routes Correctly on page 3502](#)

**Checking the Active Path From Device R1 to Device R4**

**Purpose** Verify that the active path goes through Device R2.

**Action** From operational mode, enter the **show route protocol bgp** command.

```

user@R1> show route protocol bgp
inet.0: 13 destinations, 19 routes (13 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

12.12.12.0/24      [BGP/170] 3d 22:52:38, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
13.13.13.0/24      [BGP/170] 3d 03:15:16, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2

                  > to 12.12.12.2 via fe-1/2/0.1
34.34.34.0/24      [BGP/170] 3d 03:15:16, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
44.44.44.44/32     *[BGP/170] 01:41:11, MED 20, localpref 100, from 192.168.2.1
                  AS path: 4 I
                  > to 12.12.12.2 via fe-1/2/0.1
144.144.144.144/32 *[BGP/170] 00:08:13, MED 20, localpref 100, from 192.168.2.1
                  AS path: 4 I
                  > to 12.12.12.2 via fe-1/2/0.1
192.168.2.1/32      [BGP/170] 3d 22:52:38, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
192.168.3.1/32      [BGP/170] 3d 03:15:16, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
192.168.4.1/32     *[BGP/170] 01:41:11, MED 20, localpref 100, from 192.168.2.1
                  AS path: 4 I
                  > to 12.12.12.2 via fe-1/2/0.1

```

**Meaning** The asterisk (\*) shows that the preferred path is through Device R2. The reason for the path selection is listed as MED 20.

**Verifying That Device R4 Is Sending Its Routes Correctly**

**Purpose** Make sure that Device R4 is sending update messages with a value of 20 to Device R2 and a value of 30 to Device R3.

**Action** From operational mode, enter the **show route advertising-protocol bgp 24.24.24.2** command.

```

user@R4> show route advertising-protocol bgp 24.24.24.2

```

```
inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
  Prefix                Nexthop          MED      Lclpref    AS path
* 24.24.24.0/24         Self              20
* 34.34.34.0/24         Self              20
* 44.44.44.44/32        Self              20
* 144.144.144.144/32    Self              20
* 192.168.4.1/32        Self              20
```

```
user@R4> show route advertising-protocol bgp 34.34.34.3
inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
  Prefix                Nexthop          MED      Lclpref    AS path
* 24.24.24.0/24         Self              30
* 34.34.34.0/24         Self              30
* 44.44.44.44/32        Self              30
* 144.144.144.144/32    Self              30
* 192.168.4.1/32        Self              30
```

**Meaning** The MED column shows that Device R4 is sending the correct MED values to its two external BGP (EBGP) neighbors.

### Example: Configuring the MED Using Route Filters

This example shows how to configure a policy that uses route filters to modify the multiple exit discriminator (MED) metric to advertise in BGP update messages.

- [Requirements on page 3503](#)
- [Overview on page 3503](#)
- [Configuration on page 3504](#)
- [Verification on page 3514](#)

#### Requirements

No special configuration beyond device initialization is required before you configure this example.

#### Overview

To configure a route-filter policy that modifies the advertised MED metric in BGP update messages, include the **metric** statement in the policy action.

[Figure 99 on page 3504](#) shows a typical network with internal peer sessions and multiple exit points to a neighboring autonomous system (AS).

Figure 99: Typical Network with IBGP Sessions and Multiple Exit Points

Device R4 has multiple loopback interfaces configured to simulate advertised prefixes. The extra loopback interface addresses are 44.44.44.44/32 and 144.144.144.144/32. This example shows how to configure Device R4 to advertise a MED value of 30 to Device R3 for all routes except 144.144.144.144. For 144.144.144.144, a MED value of 10 is advertised to Device 3. A MED value of 20 is advertised to Device R2, regardless of the route prefix.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

#### Device R1

```
set interfaces fe-1/2/0 unit 1 family inet address 12.12.12.1/24
set interfaces fe-1/2/1 unit 2 family inet address 13.13.13.1/24
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.1.1
set protocols bgp group internal export send-direct
set protocols bgp group internal neighbor 192.168.2.1
set protocols bgp group internal neighbor 192.168.3.1
set protocols ospf area 0.0.0.0 interface lo0.1 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.1
set protocols ospf area 0.0.0.0 interface fe-1/2/1.2
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 123
set routing-options router-id 192.168.1.1
```

#### Device R2

```
set interfaces fe-1/2/0 unit 3 family inet address 12.12.12.2/24
set interfaces fe-1/2/1 unit 4 family inet address 24.24.24.2/24
set interfaces lo0 unit 2 family inet address 192.168.2.1/32
```

```

set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.2.1
set protocols bgp group internal export send-direct
set protocols bgp group internal neighbor 192.168.1.1
set protocols bgp group internal neighbor 192.168.3.1
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 4
set protocols bgp group external neighbor 24.24.24.4
set protocols ospf area 0.0.0.0 interface lo0.2 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.3
set protocols ospf area 0.0.0.0 interface fe-1/2/1.4
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 123
set routing-options router-id 192.168.2.1

```

**Device R3**

```

set interfaces fe-1/2/0 unit 5 family inet address 13.13.13.3/24
set interfaces fe-1/2/1 unit 6 family inet address 34.34.34.3/24
set interfaces lo0 unit 3 family inet address 192.168.3.1/32
set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.3.1
set protocols bgp group internal export send-direct
set protocols bgp group internal neighbor 192.168.1.1
set protocols bgp group internal neighbor 192.168.2.1
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 4
set protocols bgp group external neighbor 34.34.34.4
set protocols ospf area 0.0.0.0 interface lo0.3 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.5
set protocols ospf area 0.0.0.0 interface fe-1/2/1.6
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 123
set routing-options router-id 192.168.3.1

```

**Device R4**

```

set interfaces fe-1/2/0 unit 7 family inet address 24.24.24.4/24
set interfaces fe-1/2/1 unit 8 family inet address 34.34.34.4/24
set interfaces lo0 unit 4 family inet address 192.168.4.1/32
set interfaces lo0 unit 4 family inet address 44.44.44.44/32
set interfaces lo0 unit 4 family inet address 144.144.144.144/32
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 123
set protocols bgp group external neighbor 34.34.34.3 export med-10
set protocols bgp group external neighbor 34.34.34.3 export med-30
set protocols bgp group external neighbor 24.24.24.2 metric-out 20
set policy-options policy-statement med-10 from route-filter 144.144.144.144/32 exact
set policy-options policy-statement med-10 then metric 10
set policy-options policy-statement med-10 then accept
set policy-options policy-statement med-30 from route-filter 0.0.0.0/0 longer
set policy-options policy-statement med-30 then metric 30
set policy-options policy-statement med-30 then accept
set policy-options policy-statement send-direct term 1 from protocol direct

```

```
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 4
set routing-options router-id 192.168.4.1
```

### *Configuring Device R1*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the device interfaces.

```
[edit interfaces fe-1/2/0 unit 1]
user@R1# set family inet address 12.12.12.1/24
```

```
[edit interfaces fe-1/2/1 unit 2]
user@R1# set family inet address 13.13.13.1/24
```

```
[edit interfaces lo0 unit 1]
user@R1# set family inet address 192.168.1.1/32
```

2. Configure BGP.

```
[edit protocols bgp group internal]
user@R1# set type internal
user@R1# set local-address 192.168.1.1
user@R1# set export send-direct
user@R1# set neighbor 192.168.2.1
user@R1# set neighbor 192.168.3.1
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R1# set interface lo0.1 passive
user@R1# set interface fe-1/2/0.1
user@R1# set interface fe-1/2/1.2
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct
user@R1# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R1# set autonomous-system 123
user@R1# set router-id 192.168.1.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output

does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 12.12.12.1/24;
    }
  }
}
fe-1/2/1 {
  unit 2 {
    family inet {
      address 13.13.13.1/24;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.1.1/32;
    }
  }
}

user@R1# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.1.1;
    export send-direct;
    neighbor 192.168.2.1;
    neighbor 192.168.3.1;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.1 {
      passive;
    }
    interface fe-1/2/0.1;
    interface fe-1/2/1.2;
  }
}

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R1# show routing-options
autonomous-system 123;
router-id 192.168.1.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

### **Configuring Device R2**

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the device interfaces.

```
[edit interfaces fe-1/2/0 unit 3]
user@R2# set family inet address 12.12.12.21/24
```

```
[edit interfaces fe-1/2/1 unit 4]
user@R2# set family inet address 24.24.24.2/24
```

```
[edit interfaces lo0 unit 2]
user@R2# set family inet address 192.168.2.1/32
```

2. Configure BGP.

```
[edit protocols bgp group internal]
user@R2# set type internal
user@R2# set local-address 192.168.2.1
user@R2# set export send-direct
user@R2# set neighbor 192.168.1.1
user@R2# set neighbor 192.168.3.1
```

```
[edit protocols bgp group external]
user@R2# set type external
user@R2# set export send-direct
user@R2# set peer-as 4
user@R2# set neighbor 24.24.24.4
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R2# set interface lo0.2 passive
user@R2# set interface fe-1/2/0.3
user@R2# set interface fe-1/2/1.4
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R2# set from protocol direct
user@R2# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R2# set autonomous-system 123
user@R2# set router-id 192.168.2.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R2# show interfaces
fe-1/2/0 {
  unit 3 {
    family inet {
      address 12.12.12.2/24;
    }
  }
}
fe-1/2/1 {
  unit 4 {
    family inet {
      address 24.24.24.2/24;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 192.168.2.1/32;
    }
  }
}
}

user@R2# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.2.1;
    export send-direct;
    neighbor 192.168.1.1;
    neighbor 192.168.3.1;
  }
  group external {
    type external;
    export send-direct;
    peer-as 4;
    neighbor 24.24.24.4;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.2 {
      passive;
    }
    interface fe-1/2/0.3;
    interface fe-1/2/1.4;
  }
}

user@R2# show policy-options
policy-statement send-direct {

```

```
term 1 {  
    from protocol direct;  
    then accept;  
}  
}  
  
user@R2# show routing-options  
autonomous-system 123;  
router-id 192.168.2.1;
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Configuring Device R3**

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R3:

1. Configure the device interfaces.

```
[edit interfaces fe-1/2/0 unit 5]  
user@R3# set family inet address 13.13.13.3/24
```

```
[edit interfaces fe-1/2/1 unit 6]  
user@R3# set family inet address 34.34.34.3/24
```

```
[edit interfaces lo0 unit 3]  
user@R3# set family inet address 192.168.3.1/32
```

2. Configure BGP.

```
[edit protocols bgp group internal]  
user@R3# set type internal  
user@R3# set local-address 192.168.3.1  
user@R3# set export send-direct  
user@R3# set neighbor 192.168.1.1  
user@R3# set neighbor 192.168.2.1
```

```
[edit protocols bgp group external]  
user@R3# set type external  
user@R3# set export send-direct  
user@R3# set peer-as 4  
user@R3# set neighbor 34.34.34.4
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]  
user@R3# set interface lo0.3 passive  
user@R3# set interface fe-1/2/0.5  
user@R3# set interface fe-1/2/1.6
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R3# set from protocol direct
user@R3# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R3# set autonomous-system 123
user@R3# set router-id 192.168.3.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
fe-1/2/0 {
  unit 5 {
    family inet {
      address 13.13.13.3/24;
    }
  }
}
fe-1/2/1 {
  unit 6 {
    family inet {
      address 34.34.34.3/24;
    }
  }
}
lo0 {
  unit 3 {
    family inet {
      address 192.168.3.1/32;
    }
  }
}

user@R3# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.3.1;
    export send-direct;
    neighbor 192.168.1.1;
    neighbor 192.168.2.1;
  }
  group external {
    type external;
    export send-direct;
    peer-as 4;
    neighbor 34.34.34.4;
  }
}
ospf {
  area 0.0.0.0 {
```

```
interface lo0.3 {
    passive;
}
interface fe-1/2/0.5;
interface fe-1/2/1.6;
}
}

user@R3# show policy-options
policy-statement send-direct {
    term 1 {
        from protocol direct;
        then accept;
    }
}

user@R3# show routing-options
autonomous-system 123;
router-id 192.168.3.1;
```

If you are done configuring the device, enter **commit** from configuration mode.

#### **Configuring Device R4**

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R4:

1. Configure the device interfaces.

```
[edit interfaces fe-1/2/0 unit 7]
user@R4# set family inet address 24.24.24.4/24
```

```
[edit interfaces fe-1/2/1 unit 8]
user@R4# set family inet address 34.34.34.4/24
```

```
[edit interfaces lo0 unit 4]
user@R4# set family inet address 192.168.4.1/32
user@R4# set family inet address 44.44.44.44/32
user@R4# set family inet address 144.144.144.144/32
```

Device R4 has multiple loopback interface addresses to simulate advertised prefixes.

2. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R4# set from protocol direct
user@R4# set then accept
```

3. Configure BGP.

```
[edit protocols bgp group external]
user@R4# set type external
```

```
user@R4# set export send-direct
user@R4# set peer-as 123
```

4. Configure the two MED policies.

```
[edit policy-options]
set policy-statement med-10 from route-filter 144.144.144.144/32 exact
set policy-statement med-10 then metric 10
set policy-statement med-10 then accept
```

```
set policy-statement med-30 from route-filter 0.0.0.0/0 longer
set policy-statement med-30 then metric 30
set policy-statement med-30 then accept
```

5. Configure the two EBGP neighbors, applying the two MED policies to Device R3, and a MED value of 20 to Device R2.

```
[edit protocols bgp group external]
user@R4# set neighbor 34.34.34.3 export med-10
user@R4# set neighbor 34.34.34.3 export med-30
user@R4# set neighbor 24.24.24.2 metric-out 20
```

6. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R4# set autonomous-system 4
user@R4# set router-id 192.168.4.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R4# show interfaces
fe-1/2/0 {
  unit 7 {
    family inet {
      address 24.24.24.4/24;
    }
  }
}
fe-1/2/1 {
  unit 8 {
    family inet {
      address 34.34.34.4/24;
    }
  }
}
lo0 {
  unit 4 {
    family inet {

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Checking the Active Path from Device R1 to Device R4 on page 3514](#)
- [Verifying That Device R4 Is Sending Its Routes Correctly on page 3515](#)

### **Checking the Active Path from Device R1 to Device R4**

**Purpose** Verify that the active path goes through Device R2.

**Action** From operational mode, enter the **show route protocol bgp** command.

```

user@R1> show route protocol bgp
inet.0: 13 destinations, 19 routes (13 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

12.12.12.0/24      [BGP/170] 4d 01:13:32, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
13.13.13.0/24      [BGP/170] 3d 05:36:10, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
24.24.24.0/24      [BGP/170] 4d 01:13:32, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
34.34.34.0/24      [BGP/170] 3d 05:36:10, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
44.44.44.44/32     *[BGP/170] 00:06:03, MED 20, localpref 100, from 192.168.2.1
                  AS path: 4 I
                  > to 12.12.12.2 via fe-1/2/0.1
144.144.144.144/32 *[BGP/170] 00:06:03, MED 10, localpref 100, from 192.168.3.1
                  AS path: 4 I
                  > to 13.13.13.3 via fe-1/2/1.2
192.168.2.1/32      [BGP/170] 4d 01:13:32, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
192.168.3.1/32      [BGP/170] 3d 05:36:10, localpref 100, from 192.168.3.1
                  AS path: I

192.168.4.1/32     *[BGP/170] 00:06:03, MED 20, localpref 100, from 192.168.2.1
                  AS path: 4 I
                  > to 12.12.12.2 via fe-1/2/0.1

```

**Meaning** The output shows that the preferred path to the routes advertised by Device R4 is through Device R2 for all routes except 144.144.144.144/32. For 144.144.144.144/32, the preferred path is through Device R3.

### *Verifying That Device R4 Is Sending Its Routes Correctly*

**Purpose** Make sure that Device R4 is sending update messages with a value of 20 to Device R2 and a value of 30 to Device R3.

**Action** From operational mode, enter the **show route advertising-protocol bgp** command.

```

user@R4> show route advertising-protocol bgp 24.24.24.2
inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
  Prefix                Nexthop      MED      Lclpref    AS path
* 24.24.24.0/24          Self         20             I
* 34.34.34.0/24          Self         20             I
* 44.44.44.44/32         Self         20             I
* 144.144.144.144/32     Self         20             I
* 192.168.4.1/32         Self         20             I

user@R4> show route advertising-protocol bgp 34.34.34.3
inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
  Prefix                Nexthop      MED      Lclpref    AS path
* 24.24.24.0/24          Self         30             I
* 34.34.34.0/24          Self         30             I

```

|                      |      |    |   |
|----------------------|------|----|---|
| * 44.44.44.44/32     | Self | 30 | I |
| * 144.144.144.144/32 | Self | 10 | I |
| * 192.168.4.1/32     | Self | 30 | I |

**Meaning** The MED column shows that Device R4 is sending the correct MED values to its two EBGp neighbors.

---

### Example: Configuring the MED Using Communities

Set the multiple exit discriminator (MED) metric to 20 for all routes from a particular community.

```
[edit]
routing-options {
  router-id 10.0.0.1;
  autonomous-system 23;
}
policy-options {
  policy-statement from-otago {
    from community otago;
    then metric 20;
  }
  community otago members [56:2379 23:46944];
}
protocols {
  bgp {
    import from-otago;
    group 23 {
      type external;
      peer-as 56;
      neighbor 192.168.0.1 {
        traceoptions {
          file bgp-log-peer;
          flag packets;
        }
        log-updown;
      }
    }
  }
}
```

---

### Example: Associating the MED Path Attribute with the IGP Metric and Delaying MED Updates

This example shows how to associate the multiple exit discriminator (MED) path attribute with the interior gateway protocol (IGP) metric, and configure a timer to delay update of the MED attribute.

- [Requirements on page 3517](#)
- [Overview on page 3517](#)
- [Configuration on page 3518](#)
- [Verification on page 3524](#)

### Requirements

No special configuration beyond device initialization is required before you configure this example.

### Overview

BGP can be configured to advertise the MED attribute for a route based on the IGP distance of its internal BGP (IBGP) route next-hop. The IGP metric enables internal routing to follow the shortest path according to the administrative setup. In some deployments, it might be ideal to communicate IGP shortest-path knowledge to external BGP (EBGP) peers in a neighboring autonomous system (AS). This allows those EBGP peers to forward traffic into your AS using the shortest paths possible.

Routes learned from an EBGP peer usually have a next hop on a directly connected interface, and thus the IGP value is equal to zero. Zero is the value advertised. The IGP metric is a nonzero value when a BGP peer sends third-party next hops that require the local system to perform next-hop resolution—IBGP configurations, configurations within confederation peers, or EBGP configurations that include the **multihop** command. In these scenarios, it might make sense to associate the MED value with the IGP metric by including the **metric-out minimum-igp** or **metric-out igp** option.

The drawback of associating the MED with the IGP metric is the risk of excessive route advertisements when there are IGP instabilities in the network. Configuring a delay for the MED update provides a mechanism to reduce route advertisements in such scenarios. The delay works by slowing down MED updates when the IGP metric for the next hop changes. The approach uses a timer to periodically advertise MED updates. When the timer expires, the MED attribute for routes with **metric-out igp delay-updates** configured is updated to the current IGP metric of the next hop. The BGP-enabled device sends out advertisements for routes for which the MED attribute has changed.

The **delay-updates** option identifies the BGP groups (or peers) for which the MED updates must be suppressed. The time for advertising MED updates is set to 10 minutes by default. You can increase the interval up to 600 minutes by including the **med-igp-update-interval** statement in the **routing-options** configuration.

**NOTE:** If you have nonstop active routing (NSR) enabled and a switchover occurs, the delayed MED updates might be advertised as soon as the switchover occurs.

When you configure the **metric-out igp** option, the IGP metric directly tracks the IGP cost to the IBGP peer. When the IGP cost goes down, so does the advertised MED value. Conversely, when the IGP cost goes up, the MED value goes up as well.

When you configure the **metric-out minimum-igp** option, the advertised MED value changes only when the IGP cost to the IBGP peer goes down. An increase in the IGP cost does not affect the MED value. The router monitors and remembers the lowest IGP cost until the routing process (rpd) is restarted. The BGP peer sends an update only if the MED is lower than the previously advertised value or another attribute associated with the route has changed, or if the BGP peer is responding to a refresh route request.

This example uses the **metric** statement in the OSPF configuration to demonstrate that when the IGP metric changes, the MED also changes after the configured delay interval. The OSPF metric can range from 1 through 65,535.

Figure 100 on page 3518 shows the sample topology.

**Figure 100: Topology for Delaying the MED Update**

In this example, the MED value advertised by Device R1 is associated with the IGP running in AS 1. The MED value advertised by Device R1 impacts the decisions of the neighboring AS (AS 2) when AS 2 is forwarding traffic into AS 1.

#### Configuration

- [Configuring Device R1 on page 3522](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

Device R1    set interfaces fe-1/2/0 unit 2 description R1->R2
              set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.1/30

### Configuring Device R1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.

```
[edit interfaces fe-1/2/0 unit 2]
user@R1# set description R1->R2
user@R1# set family inet address 10.0.0.1/30
```

```
[edit interfaces fe-1/2/1 unit 7]
user@R1# set description R1->R4
user@R1# set family inet address 172.16.0.1/30
```

```
[edit interfaces lo0 unit 1]
user@R1# set family inet address 192.168.0.1/32
```

2. Configure IBGP.

```
[edit protocols bgp group internal]
user@R1# set type internal
user@R1# set local-address 192.168.0.1
user@R1# set export send-direct
user@R1# set neighbor 192.168.0.2
user@R1# set neighbor 192.168.0.3
```

3. Configure EBGp.

```
[edit protocols bgp group external]
user@R1# set type external
user@R1# set export send-direct
user@R1# set peer-as 2
user@R1# set neighbor 172.16.0.2
```

4. Associate the MED value with the IGP metric.

```
[edit protocols bgp group external]
user@R1# set metric-out igp delay-med-update
```

The default for the MED update is 10 minutes when you include the **delay-med-update** option. When you exclude the **delay-med-update** option, the MED update occurs immediately after the IGP metric changes.

5. (Optional) Configure the update interval for the MED update.

```
[edit routing-options]
user@R1# set med-igp-update-interval 12
```

You can configure the interval from 10 minutes through 600 minutes.

6. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R1# set interface fe-1/2/0.2 metric 600
user@R1# set interface lo0.1 passive
```

The **metric** statement is used here to demonstrate what happens when the IGP metric changes.

7. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct
user@R1# set then accept
```

8. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R1# set router-id 192.168.0.1
user@R1# set autonomous-system 1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 2 {
    description R1->R2;
    family inet {
      address 10.0.0.1/30;
    }
  }
}
fe-1/2/1 {
  unit 7 {
    description R1->R4;
    family inet {
      address 172.16.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.0.1/32;
    }
  }
}

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R1# show protocols
```

```
bgp {
  group internal {
    type internal;
    local-address 192.168.0.1;
    export send-direct;
    neighbor 192.168.0.2;
    neighbor 192.168.0.3;
  }
  group external {
    type external;
    metric-out igp delay-med-update;
    export send-direct;
    peer-as 2;
    neighbor 172.16.0.2;
  }
}
ospf {
  area 0.0.0.0 {
    interface fe-1/2/0.2 {
      metric 600;
    }
    interface lo0.1 {
      passive;
    }
  }
}
```

```
user@R1# show routing-options
med-igp-update-interval 12;
router-id 192.168.0.1;
autonomous-system 1;
```

If you are done configuring the device, enter **commit** from configuration mode. Repeat the configuration steps on the other devices in the topology, as needed for your network.

### **Verification**

Confirm that the configuration is working properly.

- [Checking the BGP Advertisements on page 3524](#)
- [Verifying That the MED Value Changes When the OSPF Metric Changes on page 3525](#)
- [Testing the minimum-igp Setting on page 3525](#)

### **Checking the BGP Advertisements**

**Purpose** Verify that Device R1 is advertising to Device R4 a BGP MED value that reflects the IGP metric.

**Action** From operational mode, enter the **show route advertising-protocol bgp** command.

```
user@R1> show route advertising-protocol bgp 172.16.0.2
inet.0: 19 destinations, 33 routes (19 active, 0 holddown, 0 hidden)
  Prefix                Nexthop      MED      Lc1pref  AS path
* 10.0.0.0/30           Self         0         I         I
* 172.16.0.0/30         Self         0         I         I
```

|                  |      |     |   |
|------------------|------|-----|---|
| * 172.16.0.4/30  | Self | 601 | I |
| * 192.168.0.1/32 | Self | 0   | I |

**Meaning** The 601 value in the MED column shows that the MED value has been updated to reflect the configured OSPF metric.

#### *Verifying That the MED Value Changes When the OSPF Metric Changes*

**Purpose** Make sure that when you raise the OSPF metric to 700, the MED value is updated to reflect this change.

**Action** From configuration mode, enter the **set protocols ospf area 0 interface fe-1/2/0.2 metric 700** command.

```
user@R1# set protocols ospf area 0 interface fe-1/2/0.2 metric 700
user@R1# commit
```

After waiting 12 minutes (the configured delay period), enter the **show route advertising-protocol bgp** command from operational mode.

```
user@R1> show route advertising-protocol bgp 172.16.0.2
inet.0: 19 destinations, 33 routes (19 active, 0 holddown, 0 hidden)
  Prefix            Nexthop      MED      Lclpref  AS path
* 10.0.0.0/30       Self         0         I
* 172.16.0.0/30     Self         0         I
* 172.16.0.4/30     Self         701        I
* 192.168.0.1/32    Self         0         I
```

**Meaning** The 701 value in the MED column shows that the MED value has been updated to reflect the configured OSPF metric.

#### *Testing the minimum-igp Setting*

**Purpose** Change the configuration to use the **minimum-igp** statement instead of the **igp** statement. When you increase the OSPF metric, the MED value remains unchanged, but when you decrease the OSPF metric, the MED value reflects the new OSPF metric.

**Action** From configuration mode, delete the **igp** statement, add the **minimum-igp** statement, and increase the OSPF metric.

```
user@R1# delete protocols bgp group external metric-out igp
user@R1# set protocols bgp group external metric-out minimum-igp
user@R1# set protocols ospf area 0 interface fe-1/2/0.2 metric 800
user@R1# commit
```

From operational mode, enter the **show route advertising-protocol bgp** command to make sure that the MED value does not change.

```
user@R1> show route advertising-protocol bgp 172.16.0.2
inet.0: 19 destinations, 33 routes (19 active, 0 holddown, 0 hidden)
  Prefix            Nexthop      MED      Lclpref  AS path
* 10.0.0.0/30       Self         0         I
* 172.16.0.0/30     Self         0         I
* 172.16.0.4/30     Self         701        I
* 192.168.0.1/32    Self         0         I
```

From configuration mode, decrease the OSPF metric.

```
user@R1# set protocols ospf area 0 interface fe-1/2/0.2 metric 20
user@R1# commit
```

From operational mode, enter the **show route advertising-protocol bgp** command to make sure that the MED value does change.

```
user@R1> show route advertising-protocol bgp 172.16.0.2
inet.0: 19 destinations, 33 routes (19 active, 0 holddown, 0 hidden)
  Prefix                Nexthop          MED      Lclpref    AS path
* 10.0.0.0/30           Self             0         I           I
* 172.16.0.0/30         Self             0         I           I
* 172.16.0.4/30         Self             21        I           I
* 192.168.0.1/32        Self             0         I           I
```

**Meaning** When the **minimum-igp** statement is configured, the MED value changes only when a shorter path is available.

### Understanding the BGP Local AS Attribute

When an Internet service provider (ISP) acquires a network that belongs to a different autonomous system (AS), there is no seamless method for moving the BGP peers of the acquired network to the AS of the acquiring ISP. The process of configuring the BGP peers with the new AS number can be time-consuming and cumbersome. Sometimes customers do not want to or are not immediately able to modify their peer arrangements or configuration. During this kind of transition period, it can be useful to configure BGP-enabled devices in the new AS to use the former AS number in BGP updates. This former AS number is called a *local AS*.

Using a local AS number permits the routing devices in an acquired network to appear to belong to the former AS.

For example, ISP A, with an AS of 200, acquires ISP B, with an AS of 250. ISP B has a customer, ISP C, that does not want to change its configuration. After ISP B becomes part of ISP A, a local AS number of 250 is configured for use in EBGp peer sessions with ISP C. Consequently, the local AS number of 250 is either prepended before or used instead of the global AS number of 200 in the AS path used to export routes to direct external peers in ISP C.

If the route is received from an internal BGP (IBGP) peer, the AS path includes the local AS number prepended before the global AS number.

The local AS number is used instead of the global AS number if the route is an external route, such as a static route or an interior gateway protocol (IGP) route that is imported into BGP. If the route is external and you want the global AS number to be included in the AS path, you can apply a routing policy that uses **as-path-expand** or **as-path-prepend**. Use the **as-path-expand** policy action to place the global AS number behind the local AS number. Use the **as-path-prepend** policy action to place the global AS number in front of the local AS number.

For example:

```

user@R2# show policy-options
policy-statement prepend-global {
  term 1 {
    from protocol static;
    then {
      as-path-prepend 200; # or use as-path-expand
      accept;
    }
  }
}

user@R2# show protocols bgp
group ext {
  export prepend-global;
  type external;
  local-as 250;
  neighbor 10.0.0.1 {
    peer-as 100;
  }
  neighbor 10.1.0.2 {
    peer-as 300;
  }
}

user@R2# show routing-options
static {
  route 1.1.1.1/32 next-hop 10.0.0.1;
}
autonomous-system 200;

user@R3# run show route 1.1.1.1 protocol bgp
inet.0: 6 destinations, 6 routes (6 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

1.1.1.1/32          *[BGP/170] 00:05:11, localpref 100
                   AS path: 200 250 I, validation-state: unverified
                   > to 10.1.0.1 via lt-1/2/0.4

```

In a Layer 3 VPN scenario, in which a provider edge (PE) device uses external BGP (EBGP) to peer with a customer edge (CE) device, the **local-as** statement behaves differently than in the non-VPN scenario. In the VPN scenario, the global AS number defined in the master instance is prepended to the AS path by default. To override this behavior, you can configure the **no-prepend-global-as** in the routing-instance BGP configuration on the PE device, as shown here:

```

user@R2# show routing-instances

```

```
red {  
  instance-type vrf;  
  interface fe-1/2/0.2;  
  route-distinguisher 2:1;  
  vrf-target target:2:1;  
  protocols {  
    bgp {  
      group toR1 {  
        type external;  
        peer-as 1;  
        local-as 200 no-prepend-global-as;  
        neighbor 10.1.1.1;  
      }  
    }  
  }  
}
```

The Junos operating system (Junos OS) implementation of the local AS attribute supports the following options:

- **Local AS with private option**—When you use the **private** option, the local AS is used during the establishment of the BGP session with an EBGP neighbor but is hidden in the AS path sent to other EBGP peers. Only the global AS is included in the AS path sent to external peers.

The **private** option is useful for establishing local peering with routing devices that remain configured with their former AS or with a specific customer that has not yet modified its peer arrangements. The local AS is used to establish the BGP session with the EBGP neighbor but is hidden in the AS path sent to external peers in another AS.

Include the **private** option so that the local AS is not prepended before the global AS in the AS path sent to external peers. When you specify the **private** option, the local AS is prepended only in the AS path sent to the EBGP neighbor.

For example, in [Figure 101 on page 3529](#), Router 1 and Router 2 are in AS 64496, Router 4 is in AS 64511, and Router 3 is in AS 64510. Router 2 formerly belonged to AS 64497, which has merged with another network and now belongs to AS 64496. Because Router 3 still peers with Router 2 using its former AS (64497), Router 2 needs to be configured with a local AS of 64497 in order to maintain peering with Router 3. Configuring a local AS of 64497 permits Router 2 to add AS 64497 when advertising routes to Router 3. Router 3 sees an AS path of 64497 64496 for the prefix 10/8.

**Figure 101: Local AS Configuration**

To prevent Router 2 from adding the local AS number in its announcements to other peers, use the **local-as 64497 private** statement. This statement configures Router 2 to not include local AS 64497 when announcing routes to Router 1 and to Router 4. In this case, Router 4 sees an AS path of 64496 64510 for the prefix 10.222/16.

- **Local AS with alias option**—In Junos OS Release 9.5 and later, you can configure a local AS as an alias. During the establishment of the BGP open session, the AS used in the open message alternates between the local AS and the global AS. If the local AS is used to connect with the EBGP neighbor, then only the local AS is prepended to the AS path when the BGP peer session is established. If the global AS is used to connect with the EBGP neighbor, then only the global AS is prepended to the AS path when the BGP peer session is established. The use of the **alias** option also means that

the local AS is not prepended to the AS path for any routes learned from that EBGp neighbor. Therefore, the local AS remains hidden from other external peers.

Configuring a local AS with the **alias** option is especially useful when you are migrating the routing devices in an acquired network to the new AS. During the migration process, some routing devices might be configured with the new AS while others remain configured with the former AS. For example, it is good practice to start by first migrating to the new AS any routing devices that function as route reflectors. However, as you migrate the route reflector clients incrementally, each route reflector has to peer with routing devices configured with the former AS, as well as peer with routing devices configured with the new AS. To establish local peer sessions, it can be useful for the BGP peers in the network to use both the local AS and the global AS. At the same time, you want to hide this local AS from external peers and use only the global AS in the AS path when exporting routes to another AS. In this kind of situation, configure the **alias** option.

Include the **alias** option to configure the local AS as an alias to the global AS configured at the **[edit routing-options]** hierarchy level. When you configure a local AS as an alias, during the establishment of the BGP open session, the AS used in the open message alternates between the local AS and the global AS. The local AS is prepended to the AS path only when the peer session with an EBGp neighbor is established using that local AS. The local AS is hidden in the AS path sent to any other external peers. Only the global AS is prepended to the AS path when the BGP session is established using the global AS.

**NOTE:** The **private** and **alias** options are mutually exclusive. You cannot configure both options with the same **local-as** statement.

---

- **Local AS with option not to prepend the global AS**—In Junos OS Release 9.6 and later, you can configure a local AS with the option not to prepend the global AS. Only the local AS is included in the AS path sent to external peers.

Use the **no-prepend-global-as** option when you want to strip the global AS number from outbound BGP updates in a virtual private network (VPN) scenario. This option is useful in a VPN scenario in which you want to hide the global AS from the VPN.

Include the **no-prepend-global-as** option to have the global AS configured at the **[edit routing-options]** hierarchy level removed from the AS path sent to external peers. When you use this option, only the local AS is included in the AS path for the routes sent to a customer edge (CE) device.

- **Number of loops option**—The local AS feature also supports specifying the number of times that detection of the AS number in the AS\_PATH attribute causes the route to be discarded or hidden. For example, if you configure **loops 1**, the route is hidden if the AS number is detected in the path one or more times. This is the default behavior. If you configure **loops 2**, the route is hidden if the AS number is detected in the path two or more times.

For the **loops number** statement, you can configure 1 through 10.

**NOTE:** If you configure the local AS values for any BGP group, the detection of routing loops is performed using both the AS and the local AS values for all BGP groups.

If the local AS for the EBGP or IBGP peer is the same as the current AS, do not use the `local-as` statement to specify the local AS number.

When you configure the local AS within a VRF, this impacts the AS path loop-detection mechanism. All of the `local-as` statements configured on the device are part of a single AS domain. The AS path loop-detection mechanism is based on looking for a matching AS present in the domain.

### Example: Configuring a Local AS for EBGP Sessions

This example shows how to configure a local autonomous system (AS) for a BGP peer so that both the global AS and the local AS are used in BGP inbound and outbound updates.

- [Requirements on page 3531](#)
- [Overview on page 3531](#)
- [Configuration on page 3532](#)
- [Verification on page 3538](#)

#### Requirements

No special configuration beyond device initialization is required before you configure this example.

#### Overview

Use the `local-as` statement when ISPs merge and want to preserve a customer's configuration, particularly the AS with which the customer is configured to establish a peer relationship. The `local-as` statement simulates the AS number already in place in customer routers, even if the ISP's router has moved to a different AS.

This example shows how to use the `local-as` statement to configure a local AS. The `local-as` statement is supported for BGP at the global, group, and neighbor hierarchy levels.

When you configure the `local-as` statement, you must specify an AS number. You can specify a number from 1 through 4,294,967,295 in plain-number format. In Junos OS Release 9.1 and later, the range for AS numbers is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*. In Junos OS Release 9.3 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format. You can specify a value from 0.0 through 65535.65535 in AS-dot notation format. Junos

OS continues to support 2-byte AS numbers. The 2-byte AS number range is 1 through 65,535 (this is a subset of the 4-byte range).

Figure 102 on page 3532 shows the sample topology.

**Figure 102: Topology for Configuring the Local AS**

In this example, Device R2 formerly belonged to AS 250 and now is in AS 200. Device R1 and Device R3 are configured to peer with AS 250 instead of with the new AS number (AS 200). Device R2 has the new AS number configured with the **autonomous-system 200** statement. To enable the peering sessions to work, the **local-as 250** statement is added in the BGP configuration. Because **local-as 250** is configured, Device R2 includes both the global AS (200) and the local AS (250) in its BGP inbound and outbound updates.

#### Configuration

- [Configuring Device R1 on page 3533](#)
- [Configuring Device R2 on page 3535](#)
- [Configuring Device R3 on page 3537](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```
set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 192.168.0.1/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct
set protocols bgp group ext export send-static
set protocols bgp group ext peer-as 250
set protocols bgp group ext neighbor 10.0.0.2
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 10.1.0.0/30 next-hop 10.0.0.2
set routing-options autonomous-system 100
```

**Device R2**

```
set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 3 family inet address 10.1.0.1/30
set interfaces lo0 unit 2 family inet address 192.168.0.2/32
set protocols bgp group ext type external
```

```

set protocols bgp group ext export send-direct
set protocols bgp group ext export send-static
set protocols bgp group ext local-as 250
set protocols bgp group ext neighbor 10.0.0.1 peer-as 100
set protocols bgp group ext neighbor 10.1.0.2 peer-as 300
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options autonomous-system 200

```

**Device R3**

```

set interfaces fe-1/2/0 unit 4 family inet address 10.1.0.2/30
set interfaces lo0 unit 3 family inet address 192.168.0.3/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct
set protocols bgp group ext export send-static
set protocols bgp group ext peer-as 250
set protocols bgp group ext neighbor 10.1.0.1
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 10.0.0.0/30 next-hop 10.1.0.1
set routing-options autonomous-system 300

```

### Configuring Device R1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.  

```

[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30

user@R1# set lo0 unit 1 family inet address 192.168.0.1/32

```
2. Configure external BGP (EBGP).  

```

[edit protocols bgp group ext]
user@R1# set type external
user@R1# set export send-direct
user@R1# set export send-static
user@R1# set peer-as 250
user@R1# set neighbor 10.0.0.2

```
3. Configure the routing policy.  

```

[edit policy-options]
user@R1# set policy-statement send-direct term 1 from protocol direct
user@R1# set policy-statement send-direct term 1 then accept
user@R1# set policy-statement send-static term 1 from protocol static
user@R1# set policy-statement send-static term 1 then accept

```

4. Configure a static route to the remote network between Device R2 and Device R3.

```
[edit routing-options]
user@R1# set static route 10.1.0.0/30 next-hop 10.0.0.2
```

5. Configure the global AS number.

```
[edit routing-options]
user@R1# set autonomous-system 100
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.0.1/32;
    }
  }
}

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}
policy-statement send-static {
  term 1 {
    from protocol static;
    then accept;
  }
}

user@R1# show protocols
bgp {
  group ext {
    type external;
    export [ send-direct send-static ];
    peer-as 250;
    neighbor 10.0.0.2;
  }
}

user@R1# show routing-options
static {
```

```

    route 10.1.0.0/30 next-hop 10.0.0.2;
}
autonomous-system 100;

```

When you are done configuring the device, enter **commit** from configuration mode.

### Configuring Device R2

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.
 

```

[edit interfaces]
user@R2# set fe-1/2/0 unit 2 family inet address 10.0.0.2/30

user@R2# set fe-1/2/1 unit 3 family inet address 10.1.0.1/30

user@R2# set lo0 unit 2 family inet address 192.168.0.2/32

```
2. Configure EBGP.
 

```

[edit protocols bgp group ext]
user@R2# set type external
user@R2# set export send-direct
user@R2# set export send-static
user@R2# set neighbor 10.0.0.1 peer-as 100
user@R2# set neighbor 10.1.0.2 peer-as 300

```
3. Configure the local autonomous system (AS) number.
 

```

[edit protocols bgp group ext]
user@R2# set local-as 250

```
4. Configure the global AS number.
 

```

[edit routing-options]
user@R2# set autonomous-system 200

```
5. Configure the routing policy.
 

```

[edit policy-options]
user@R2# set policy-statement send-direct term 1 from protocol direct
user@R2# set policy-statement send-direct term 1 then accept
user@R2# set policy-statement send-static term 1 from protocol static
user@R2# set policy-statement send-static term 1 then accept

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R2# show interfaces
fe-1/2/0 {
  unit 2 {

```

```
        family inet {
            address 10.0.0.2/30;
        }
    }
}
fe-1/2/1 {
    unit 3 {
        family inet {
            address 10.1.0.1/30;
        }
    }
}
lo0 {
    unit 2 {
        family inet {
            address 192.168.0.2/32;
        }
    }
}

user@R2# show policy-options
policy-statement send-direct {
    term 1 {
        from protocol direct;
        then accept;
    }
}
policy-statement send-static {
    term 1 {
        from protocol static;
        then accept;
    }
}

user@R2# show protocols
bgp {
    group ext {
        type external;
        export [ send-direct send-static ];
        local-as 250;
        neighbor 10.0.0.1 {
            peer-as 100;
        }
        neighbor 10.1.0.2 {
            peer-as 300;
        }
    }
}

user@R2# show routing-options
autonomous-system 200;
```

When you are done configuring the device, enter **commit** from configuration mode.

### Configuring Device R3

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R3:

1. Configure the interfaces.  

```
[edit interfaces]
user@R3# set fe-1/2/0 unit 4 family inet address 10.1.0.2/30

user@R3# set lo0 unit 3 family inet address 192.168.0.3/32
```
2. Configure EBGP.  

```
[edit protocols bgp group ext]
user@R3# set type external
user@R3# set export send-direct
user@R3# set export send-static
user@R3# set peer-as 250
user@R3# set neighbor 10.1.0.1
```
3. Configure the global autonomous system (AS) number.  

```
[edit routing-options]
user@R3# set autonomous-system 300
```
4. Configure a static route to the remote network between Device R1 and Device R2.  

```
[edit routing-options]
user@R3# set static route 10.0.0.0/30 next-hop 10.1.0.1
```
5. Configure the routing policy.  

```
[edit policy-options]
user@R3# set policy-statement send-direct term 1 from protocol direct
user@R3# set policy-statement send-direct term 1 then accept
user@R3# set policy-statement send-static term 1 from protocol static
user@R3# set policy-statement send-static term 1 then accept
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
fe-1/2/0 {
  unit 4 {
    family inet {
      address 10.1.0.2/30;
    }
  }
}
lo0 {
  unit 3 {
```

```
family inet {
    address 192.168.0.3/32;
}
}

user@R3# show policy-options
policy-statement send-direct {
    term 1 {
        from protocol direct;
        then accept;
    }
}
policy-statement send-static {
    term 1 {
        from protocol static;
        then accept;
    }
}

user@R3# show protocols
bgp {
    group ext {
        type external;
        export [ send-direct send-static ];
        peer-as 250;
        neighbor 10.1.0.1;
    }
}

user@R3# show routing-options
static {
    route 10.0.0.0/30 next-hop 10.1.0.1;
}
autonomous-system 300;
```

When you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Checking the Local and Global AS Settings on page 3538](#)
- [Checking the BGP Peering Sessions on page 3540](#)
- [Verifying the BGP AS Paths on page 3540](#)

### **Checking the Local and Global AS Settings**

**Purpose** Make sure that Device R2 has the local and global AS settings configured.

**Action** From operational mode, enter the **show bgp neighbors** command.

```
user@R2> show bgp neighbors
Peer: 10.0.0.1+179 AS 100      Local: 10.0.0.2+61036 AS 250
Type: External    State: Established    Flags: <Sync>
Last State: OpenConfirm    Last Event: RecvKeepAlive
Last Error: None
```

```

Export: [ send-direct send-static ]

Output messages: Total 256 Updates 2 Refreshes 0 Octets 4999
Output Queue[0]: 0

```

**Meaning** The Local AS: 250 and Local System AS: 200 output shows that Device R2 has the expected settings. Additionally, the output shows that the options list includes LocalAS.

### *Checking the BGP Peering Sessions*

**Purpose** Ensure that the sessions are established and that the local AS number 250 is displayed.

**Action** From operational mode, enter the **show bgp summary** command.

```

user@R1> show bgp summary
Groups: 1 Peers: 1 Down peers: 0
Table Tot Paths Act Paths Suppressed History Damp State Pending
inet.0 4 2 0 0 0 0 0
Peer AS InPkt OutPkt OutQ Flaps Last Up/Dwn
State|#Active/Received/Accepted/Damped...
10.0.0.2 250 232 233 0 4 1:42:37
2/4/4/0 0/0/0/0

```

```

user@R3> show bgp summary
Groups: 1 Peers: 1 Down peers: 0
Table Tot Paths Act Paths Suppressed History Damp State Pending
inet.0 4 2 0 0 0 0 0
Peer AS InPkt OutPkt OutQ Flaps Last Up/Dwn
State|#Active/Received/Accepted/Damped...
10.1.0.1 250 235 236 0 4 1:44:25
2/4/4/0 0/0/0/0

```

**Meaning** Device R1 and Device R3 appear to be peering with a device in AS 250, even though Device R2 is actually in AS 200.

### *Verifying the BGP AS Paths*

**Purpose** Make sure that the routes are in the routing tables and that the AS paths show the local AS number 250.

**Action** From configuration mode, enter the **set route protocol bgp** command.

```

user@R1> show route protocol bgp
inet.0: 6 destinations, 8 routes (6 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.0/30 [BGP/170] 01:46:44, localpref 100
AS path: 250 I
> to 10.0.0.2 via fe-1/2/0.1
10.1.0.0/30 [BGP/170] 01:46:44, localpref 100
AS path: 250 I
> to 10.0.0.2 via fe-1/2/0.1
192.168.0.2/32 *[BGP/170] 01:46:44, localpref 100
AS path: 250 I
> to 10.0.0.2 via fe-1/2/0.1

```

```

192.168.0.3/32      *[BGP/170] 01:46:40, localpref 100
                   AS path: 250 300 I
                   > to 10.0.0.2 via fe-1/2/0.1

user@R3> show route protocol bgp

inet.0: 6 destinations, 8 routes (6 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.0/30        [BGP/170] 01:47:10, localpref 100
                   AS path: 250 I
                   > to 10.1.0.1 via fe-1/2/0.4
10.1.0.0/30        [BGP/170] 01:47:10, localpref 100
                   AS path: 250 I
                   > to 10.1.0.1 via fe-1/2/0.4
192.168.0.1/32     *[BGP/170] 01:47:10, localpref 100
                   AS path: 250 100 I
                   > to 10.1.0.1 via fe-1/2/0.4
192.168.0.2/32     *[BGP/170] 01:47:10, localpref 100
                   AS path: 250 I
                   > to 10.1.0.1 via fe-1/2/0.4

```

**Meaning** The output shows that Device R1 and Device R3 appear to have routes with AS paths that include AS 250, even though Device R2 is actually in AS 200.

### Example: Configuring a Private Local AS for EBGp Sessions

This example shows how to configure a private local autonomous system (AS) number. The local AS is considered to be private because it is advertised to peers that use the local AS number for peering, but is hidden in the announcements to peers that can use the global AS number for peering.

- [Requirements on page 3541](#)
- [Overview on page 3541](#)
- [Configuration on page 3542](#)
- [Verification on page 3545](#)

#### Requirements

No special configuration beyond device initialization is required before you configure this example.

#### Overview

Use the **local-as** statement when ISPs merge and want to preserve a customer's configuration, particularly the AS with which the customer is configured to establish a peer relationship. The **local-as** statement simulates the AS number already in place in customer routers, even if the ISP's router has moved to a different AS.

When you use the **private** option, the local AS is used during the establishment of the BGP session with an external BGP (EBGP) neighbor, but is hidden in the AS path sent to other EBGp peers. Only the global AS is included in the AS path sent to external peers.

The **private** option is useful for establishing local peering with routing devices that remain configured with their former AS or with a specific customer that has not yet modified its

peer arrangements. The local AS is used to establish the BGP session with the EBGP neighbor, but is hidden in the AS path sent to external peers in another AS.

Include the **private** option so that the local AS is not prepended before the global AS in the AS path sent to external peers. When you specify the **private** option, the local AS is prepended only in the AS path sent to the EBGP neighbor.

Figure 103 on page 3542 shows the sample topology.

**Figure 103: Topology for Configuring a Private Local AS**

Device R1 is in AS 64496. Device R2 is in AS 64510. Device R3 is in AS 64511. Device R4 is in AS 64512. Device R1 formerly belonged to AS 64497, which has merged with another network and now belongs to AS 64496. Because Device R3 still peers with Device R1, using its former AS, 64497, Device R1 needs to be configured with a local AS of 64497 in order to maintain peering with Device R3. Configuring a local AS of 64497 permits Device R1 to add AS 64497 when advertising routes to Device R3. Device R3 sees an AS path of 64497 64496 for the prefix 10.1.1.2/32, which is Device R2's loopback interface. Device R4, which is behind Device R3, sees an AS path of 64511 64497 64496 64510 to Device R2's loopback interface. To prevent Device R1 from adding the local AS number in its announcements to other peers, this example includes the **local-as 64497 private** statement. The **private** option configures Device R1 to not include the local AS 64497 when announcing routes to Device R2. Device R2 sees an AS path of 64496 64511 to Device R3 and an AS path of 64496 64511 64512 to Device R4. The **private** option in Device R1's configuration causes the AS number 64497 to be missing from the AS paths that Device R1 readvertises to Device R2.

Device R2 is hiding the private local AS from all the routers, except Device R3. The **private** option applies to the routes that Device R1 receives (learns) from Device R3 and that Device R1, in turn, readvertises to other routers. When these routes learned from Device R3 are readvertised by Device R1 to Device R2, the private local AS is missing from the AS path advertised to Device R2.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Configuring Device R1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.

```
[edit interfaces fe-1/2/0 unit 3]
user@R1# set family inet address 192.168.1.1/24
```

```
[edit interfaces fe-1/2/1 unit 5]
user@R1# set family inet address 192.168.10.1/24
```

```
[edit interfaces lo0 unit 2]
user@R1# set family inet address 10.1.1.1/32
```

2. Configure the EBGP peering session with Device R2.

```
[edit protocols bgp group external-AS64510]
user@R1# set type external
user@R1# set peer-as 64510
user@R1# set neighbor 192.168.10.2
```

3. Configure the EBGP peering session with Device R3.

```
[edit protocols bgp group external-AS64511]
user@R1# set type external
user@R1# set peer-as 64511
user@R1# set local-as 64497
user@R1# set local-as private
user@R1# set neighbor 192.168.1.2
```

4. Configure the routing policy.

```
[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct
user@R1# set then accept
```

5. Configure the global autonomous system (AS) number.

```
[edit routing-options]
user@R1# set autonomous-system 64496
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 3 {
    family inet {
      address 192.168.1.1/24;
    }
  }
}
```

```

    }
  }
  fe-1/2/1 {
    unit 5 {
      family inet {
        address 192.168.10.1/24;
      }
    }
  }
  lo0 {
    unit 2 {
      family inet {
        address 10.1.1.1/32;
      }
    }
  }
}

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R1# show protocols
bgp {
  group external-AS64511 {
    type external;
    peer-as 64511;
    local-as 64497 private;
    neighbor 192.168.1.2;
  }
  group external-AS64510 {
    type external;
    peer-as 64510;
    neighbor 192.168.10.2;
  }
}

user@R1# show routing-options
autonomous-system 64496;

```

If you are done configuring the device, enter **commit** from configuration mode.

Repeat the configuration as needed for the other devices in the topology.

### Verification

Confirm that the configuration is working properly.

- [Checking Device R2's AS Paths on page 3546](#)
- [Checking Device R3's AS Paths on page 3546](#)

### ***Checking Device R2's AS Paths***

**Purpose** Make sure that Device R2 does not have AS 64497 in its AS paths to Device R3 and Device R4.

**Action** From operational mode, enter the **show route protocol bgp** command.

```
user@R2> show route protocol bgp
inet.0: 6 destinations, 6 routes (6 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.1.1.3/32      *[BGP/170] 01:33:11, localpref 100
                 AS path: 64496 64511 I
                 > to 192.168.10.1 via fe-1/2/0.6
10.1.1.4/32      *[BGP/170] 01:33:11, localpref 100
                 AS path: 64496 64511 64512 I
                 > to 192.168.10.1 via fe-1/2/0.6
192.168.5.0/24  *[BGP/170] 01:49:15, localpref 100
                 AS path: 64496 64511 I
                 > to 192.168.10.1 via fe-1/2/0.6
```

**Meaning** Device R2's AS paths do not include AS 64497.

### ***Checking Device R3's AS Paths***

**Purpose** Make sure that Device R3 does not have AS 64497 in its AS path to Device R4.

**Action** From operational mode, enter the **show route protocol bgp** command.

```
user@R3> show route protocol bgp
inet.0: 7 destinations, 8 routes (7 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.1.1.2/32      *[BGP/170] 01:35:11, localpref 100
                 AS path: 64497 64496 64510 I
                 > to 192.168.1.1 via fe-1/2/0.4
10.1.1.4/32      *[BGP/170] 01:35:11, localpref 100
                 AS path: 64512 I
                 > to 192.168.5.2 via fe-1/2/1.7
192.168.5.0/24  [BGP/170] 01:51:15, localpref 100
                 AS path: 64512 I
                 > to 192.168.5.2 via fe-1/2/1.7
```

**Meaning** Device R3's route to Device R2 (prefix 10.1.1.2) includes both the local and the global AS configured on Device R1 (64497 and 64496, respectively).

### Understanding the Accumulated IGP Attribute for BGP

---

The interior gateway protocols (IGPs) are designed to handle routing within a single domain or an autonomous system (AS). Each link is assigned a particular value called a metric. The distance between the two nodes is calculated as a sum of all the metric values of links along the path. The IGP selects the shortest path between two nodes based on distance.

BGP is designed to provide routing over a large number of independent ASs with limited or no coordination among respective administrations. BGP does not use metrics in the path selection decisions.

The accumulated IGP (AIGP) metric attribute for BGP enables deployment in which a single administration can run several contiguous BGP ASs. Such deployments allow BGP to make routing decisions based on the IGP metric. In such networks, it is possible for BGP to select paths based on metrics as is done by IGPs. In this case, BGP chooses the shortest path between two nodes, even though the nodes might be in two different ASs.

The AIGP attribute is particularly useful in networks that use tunneling to deliver a packet to its BGP next hop. The Juniper Networks® Junos® operating system (Junos OS) currently supports the AIGP attribute for two BGP address families, **family inet labeled-unicast** and **family inet6 labeled-unicast**.

AIGP impacts the BGP best-route decision process. The AIGP attribute preference rule is applied after the local-preference rule. The AIGP distance is compared to break a tie. The BGP best-route decision process also impacts the way the interior cost rule is applied if the resolving next hop has an AIGP attribute. Without AIGP enabled, the interior cost of a route is based on the calculation of the metric to the next hop for the route. With AIGP enabled, the resolving AIGP distance is added to the interior cost.

The AIGP attribute is an optional non-transitive BGP path attribute and is specified in Internet draft draft-ietf-idr-aigp-06, *The Accumulated IGP Metric Attribute for BGP*.

---

### Example: Configuring the Accumulated IGP Attribute for BGP

---

This example shows how to configure the accumulated IGP (AIGP) metric attribute for BGP.

- [Requirements on page 3547](#)
- [Overview on page 3548](#)
- [Configuration on page 3549](#)
- [Verification on page 3579](#)

#### **Requirements**

This example uses the following hardware and software components:

- Seven BGP-speaking devices.
- Junos OS Release 12.1 or later.

### Overview

The AIGP attribute enables deployments in which a single administration can run several contiguous BGP autonomous systems (ASs). Such deployments allow BGP to make routing decisions based on the IGP metric. With AIGP enabled, BGP can select paths based on IGP metrics. This enables BGP to choose the shortest path between two nodes, even though the nodes might be in different ASs. The AIGP attribute is particularly useful in networks that use tunneling to deliver a packet to its BGP next hop. This example shows AIGP configured with MPLS label-switched paths.

To enable AIGP, you include the **aigp** statement in the BGP configuration on a protocol family basis. Configuring AIGP on a particular family enables sending and receiving of the AIGP attribute on that family. By default, AIGP is disabled. An AIGP-disabled neighbor does not send an AIGP attribute and silently discards a received AIGP attribute.

Junos OS supports AIGP for **family inet labeled-unicast** and **family inet6 labeled-unicast**. The **aigp** statement can be configured for a given family at the global BGP, group, or neighbor level.

By default, the value of the AIGP attribute for a local prefix is zero. An AIGP-enabled neighbor can originate an AIGP attribute for a given prefix by export policy, using the **aigp-originate** policy action. The value of the AIGP attribute reflects the IGP distance to the prefix. Alternatively, you can specify a value, by using the **aigp-originate distance distance** policy action. The configurable range is 0 through 4,294,967,295. Only one node needs to originate an AIGP attribute. The AIGP attribute is retained and readvertised if the neighbors are AIGP enabled with the **aigp** statement in the BGP configuration.

The policy action to originate the AIGP attribute has the following requirements:

- Neighbor must be AIGP enabled.
- Policy must be applied as an export policy.
- Prefix must have no current AIGP attribute.
- Prefix must export with next-hop self.
- Prefix must reside within the AIGP domain. Typically, a loopback IP address is the prefix to originate.

The policy is ignored if these requirements are not met.

### Topology Diagram

Figure 104 on page 3549 shows the topology used in this example. OSPF is used as the interior gateway protocol (IGP). Internal BGP (IBGP) is configured between Device PE1 and Device PE4. External BGP (EBGP) is configured between Device PE7 and Device PE1, between Device PE4 and Device PE3, and between Device PE4 and Device PE2. Devices PE4, PE2, and PE3 are configured for multihop. Device PE4 selects a path based on the AIGP value and then readvertises the AIGP value based on the AIGP and policy configuration. Device PE1 readvertises the AIGP value to Device PE7, which is in another administrative domain. Every device has two loopback interface addresses: 10.9.9.x is used for BGP peering and the router ID, and 10.100.1.x is used for the BGP next hop.

The network between Device PE1 and PE3 has IBGP peering and multiple OSPF areas. The external link to Device PE7 is configured to show that the AIGP attribute is readadvertised to a neighbor outside of the administrative domain, if that neighbor is AIGP enabled.

**Figure 104: Advertisement of Multiple Paths in BGP**

For origination of an AIGP attribute, the BGP next hop is required to be itself. If the BGP next hop remains unchanged, the received AIGP attribute is readadvertised, as is, to another AIGP neighbor. If the next hop changes, the received AIGP attribute is readadvertised with an increased value to another AIGP neighbor. The increase in value reflects the IGP distance to the previous BGP next hop. To demonstrate, this example uses loopback interface addresses for Device PE4's EBGP peering sessions with Device PE2 and Device PE3. Multihop is enabled on these sessions so that a recursive lookup is performed to determine the point-to-point interface. Because the next hop changes, the IGP distance is added to the AIGP distance.

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
Device P1 set interfaces fe-1/2/0 unit 1 description P1-to-PE1
set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.2/30
set interfaces fe-1/2/0 unit 1 family mpls
set interfaces fe-1/2/1 unit 4 description P1-to-P2
```

```
set interfaces fe-1/2/1 unit 4 family inet address 10.0.0.29/30
set interfaces fe-1/2/1 unit 4 family mpls
set interfaces fe-1/2/2 unit 8 description P1-to-PE4
set interfaces fe-1/2/2 unit 8 family inet address 10.0.0.17/30
set interfaces fe-1/2/2 unit 8 family mpls
set interfaces lo0 unit 3 family inet address 10.9.9.2/32
set interfaces lo0 unit 3 family inet address 10.100.1.2/32
set protocols rsvp interface fe-1/2/0.1
set protocols rsvp interface fe-1/2/2.8
set protocols rsvp interface fe-1/2/1.4
set protocols mpls label-switched-path P1-to-P2 to 10.9.9.3
set protocols mpls label-switched-path P1-to-PE1 to 10.9.9.1
set protocols mpls label-switched-path P1-to-PE4 to 10.9.9.4
set protocols mpls interface fe-1/2/0.1

### Configuring Device P1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device P1:

1. Configure the interfaces.

```

[edit interfaces]
user@P1# set fe-1/2/0 unit 1 description P1-to-PE1
user@P1# set fe-1/2/0 unit 1 family inet address 10.0.0.2/30
user@P1# set fe-1/2/0 unit 1 family mpls
user@P1# set fe-1/2/1 unit 4 description P1-to-P2
user@P1# set fe-1/2/1 unit 4 family inet address 10.0.0.29/30
user@P1# set fe-1/2/1 unit 4 family mpls
user@P1# set fe-1/2/2 unit 8 description P1-to-PE4
user@P1# set fe-1/2/2 unit 8 family inet address 10.0.0.17/30
user@P1# set fe-1/2/2 unit 8 family mpls
user@P1# set lo0 unit 3 family inet address 10.9.9.2/32
user@P1# set lo0 unit 3 family inet address 10.100.1.2/32

```

2. Configure MPLS and a signaling protocol, such as RSVP or LDP.

```

[edit protocols]
user@P1# set rsvp interface fe-1/2/0.1
user@P1# set rsvp interface fe-1/2/2.8
user@P1# set rsvp interface fe-1/2/1.4
user@P1# set mpls label-switched-path P1-to-P2 to 10.9.9.3
user@P1# set mpls label-switched-path P1-to-PE1 to 10.9.9.1
user@P1# set mpls label-switched-path P1-to-PE4 to 10.9.9.4
user@P1# set mpls interface fe-1/2/0.1
user@P1# set mpls interface fe-1/2/2.8
user@P1# set mpls interface fe-1/2/1.4

```

3. Configure BGP.

```

[edit protocols bgp group internal]
user@P1# set type internal
user@P1# set local-address 10.9.9.2
user@P1# set neighbor 10.9.9.1
user@P1# set neighbor 10.9.9.3
user@P1# set neighbor 10.9.9.4

```

4. Enable AIGP.

```

[edit protocols bgp group internal]
user@P1# set family inet labeled-unicast aigp

```

5. Configure an IGP, such as OSPF, RIP, or IS-IS.

```
[edit protocols ospf]
user@P1# set area 0.0.0.1 interface fe-1/2/0.1 metric 1
user@P1# set area 0.0.0.1 interface fe-1/2/1.4 metric 1
user@P1# set area 0.0.0.0 interface fe-1/2/2.8 metric 1
user@P1# set area 0.0.0.0 interface 10.9.9.2 passive
user@P1# set area 0.0.0.0 interface 10.9.9.2 metric 1
user@P1# set area 0.0.0.0 interface 10.100.1.2 passive
user@P1# set area 0.0.0.0 interface 10.100.1.2 metric 1
```

6. Configure the router ID and the autonomous system number.

```
[edit routing-options]
user@P1# set router-id 10.9.9.2
user@P1# set autonomous-system 13979
```

7. If you are done configuring the device, commit the configuration.

```
user@P1# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@P1# show interfaces

### **Configuring Device P2**

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device P2:

1. Configure the interfaces.

```
[edit interfaces]  
user@P2# set fe-1/2/0 unit 3 description P2-to-PE1  
user@P2# set fe-1/2/0 unit 3 family inet address 10.0.0.6/30  
user@P2# set fe-1/2/0 unit 3 family mpls  
user@P2# set fe-1/2/1 unit 5 description P2-to-P1  
user@P2# set fe-1/2/1 unit 5 family inet address 10.0.0.30/30  
user@P2# set fe-1/2/1 unit 5 family mpls  
user@P2# set fe-1/2/2 unit 6 description P2-to-PE4  
user@P2# set fe-1/2/2 unit 6 family inet address 10.0.0.13/30  
user@P2# set fe-1/2/2 unit 6 family mpls  
user@P2# set lo0 unit 5 family inet address 10.9.9.3/32  
user@P2# set lo0 unit 5 family inet address 10.100.1.3/32
```

2. Configure MPLS and a signaling protocol, such as RSVP or LDP.

```
[edit protocols]  
user@P2# set rsvp interface fe-1/2/1.5  
user@P2# set rsvp interface fe-1/2/2.6  
user@P2# set rsvp interface fe-1/2/0.3  
user@P2# set mpls label-switched-path P2-to-PE1 to 10.9.9.1  
user@P2# set mpls label-switched-path P2-to-P1 to 10.9.9.2  
user@P2# set mpls label-switched-path P2-to-PE4 to 10.9.9.4  
user@P2# set mpls interface fe-1/2/1.5  
user@P2# set mpls interface fe-1/2/2.6  
user@P2# set mpls interface fe-1/2/0.3
```

3. Configure BGP.

```
[edit protocols bgp group internal]  
user@P2# set type internal  
user@P2# set local-address 10.9.9.3  
user@P2# set neighbor 10.9.9.1  
user@P2# set neighbor 10.9.9.2  
user@P2# set neighbor 10.9.9.4
```

4. Enable AIGP.

```
[edit protocols bgp group internal]
user@P2# set family inet labeled-unicast aigp
```

5. Configure an IGP, such as OSPF, RIP, or IS-IS.

```
[edit protocols ospf]
user@P2# set area 0.0.0.0 interface fe-1/2/2.6 metric 1
user@P2# set area 0.0.0.0 interface 10.9.9.3 passive
user@P2# set area 0.0.0.0 interface 10.9.9.3 metric 1
user@P2# set area 0.0.0.0 interface 10.100.1.3 passive
user@P2# set area 0.0.0.0 interface 10.100.1.3 metric 1
```

6. Configure the router ID and the autonomous system number.

```
[edit routing-options]
user@P2# set router-id 10.9.9.3
user@P2# set autonomous-system 13979
```

7. If you are done configuring the device, commit the configuration.

```
user@P2# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

    }
    interface 10.100.1.3 {
      passive;
      metric 1;
    }
  }
}
```

```

}
user@P2# show routing-options
router-id 10.9.9.3;
autonomous-system 13979;

```

### Configuring Device PE4

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device PE4:

1. Configure the interfaces.

```

[edit interfaces]
user@PE4# set fe-1/2/0 unit 7 description PE4-to-P2
user@PE4# set fe-1/2/0 unit 7 family inet address 10.0.0.14/30
user@PE4# set fe-1/2/0 unit 7 family mpls
user@PE4# set fe-1/2/1 unit 9 description PE4-to-P1
user@PE4# set fe-1/2/1 unit 9 family inet address 10.0.0.18/30
user@PE4# set fe-1/2/1 unit 9 family mpls
user@PE4# set fe-1/2/2 unit 10 description PE4-to-PE2
user@PE4# set fe-1/2/2 unit 10 family inet address 10.0.0.21/30
user@PE4# set fe-1/2/2 unit 10 family mpls
user@PE4# set fe-1/0/2 unit 12 description PE4-to-PE3
user@PE4# set fe-1/0/2 unit 12 family inet address 10.0.0.25/30
user@PE4# set fe-1/0/2 unit 12 family mpls
user@PE4# set lo0 unit 7 family inet address 10.9.9.4/32
user@PE4# set lo0 unit 7 family inet address 10.100.1.4/32

```

2. Configure MPLS and a signaling protocol, such as RSVP or LDP.

```

[edit protocols]
user@PE4# set rsvp interface fe-1/2/0.7
user@PE4# set rsvp interface fe-1/2/1.9
user@PE4# set rsvp interface fe-1/2/2.10
user@PE4# set rsvp interface fe-1/0/2.12
user@PE4# set mpls label-switched-path PE4-to-PE2 to 10.9.9.5
user@PE4# set mpls label-switched-path PE4-to-PE3 to 10.9.9.6
user@PE4# set mpls label-switched-path PE4-to-P1 to 10.9.9.2
user@PE4# set mpls label-switched-path PE4-to-P2 to 10.9.9.3
user@PE4# set mpls interface fe-1/2/0.7
user@PE4# set mpls interface fe-1/2/1.9
user@PE4# set mpls interface fe-1/2/2.10
user@PE4# set mpls interface fe-1/0/2.12

```

3. Configure BGP.

```

[edit protocols bgp]
user@PE4# set export next-hop
user@PE4# set export aigp
user@PE4# set group internal type internal
user@PE4# set group internal local-address 10.9.9.4
user@PE4# set group internal neighbor 10.9.9.1
user@PE4# set group internal neighbor 10.9.9.3

```

```
user@PE4# set group internal neighbor 10.9.9.2
user@PE4# set group external type external
user@PE4# set group external multihop ttl 2
user@PE4# set group external local-address 10.9.9.4
user@PE4# set group external peer-as 7018
user@PE4# set group external neighbor 10.9.9.5
user@PE4# set group external neighbor 10.9.9.6
```

4. Enable AIGP.

```
[edit protocols bgp]
user@PE4# set group external family inet labeled-unicast aigp
user@PE4# set group internal family inet labeled-unicast aigp
```

5. Originate a prefix, and configure an AIGP distance.

By default, a prefix is originated using the current IGP distance. Optionally, you can configure a distance for the AIGP attribute, using the **distance** option, as shown here.

```
[edit policy-options policy-statement aigp term 10]
user@PE4# set from protocol static
user@PE4# set from route-filter 44.0.0.0/24 exact
user@PE4# set then aigp-originate distance 200
user@PE4# set then next-hop 10.100.1.4
user@PE4# set then accept
```

6. Enable the policies.

```
[edit policy-options policy-statement next-hop]
user@PE4# set term 10 from protocol bgp
user@PE4# set term 10 then next-hop 10.100.1.4
user@PE4# set term 10 then accept
user@PE4# set term 20 from protocol direct
user@PE4# set term 20 from route-filter 10.9.9.4/32 exact
user@PE4# set term 20 from route-filter 10.100.1.4/32 exact
user@PE4# set term 20 then next-hop 10.100.1.4
user@PE4# set term 20 then accept
```

7. Configure a static route.

```
[edit routing-options]
user@PE4# set static route 44.0.0.0/24 discard
```

8. Configure an IGP, such as OSPF, RIP, or IS-IS.

```
[edit protocols ospf]
user@PE4# set area 0.0.0.0 interface fe-1/2/1.9 metric 1
user@PE4# set area 0.0.0.0 interface fe-1/2/0.7 metric 1
user@PE4# set area 0.0.0.0 interface 10.9.9.4 passive
user@PE4# set area 0.0.0.0 interface 10.9.9.4 metric 1
user@PE4# set area 0.0.0.0 interface 10.100.1.4 passive
user@PE4# set area 0.0.0.0 interface 10.100.1.4 metric 1
user@PE4# set area 0.0.0.2 interface fe-1/2/2.10 metric 1
user@PE4# set area 0.0.0.3 interface fe-1/0/2.12 metric 1
```

9. Configure the router ID and the autonomous system number.

```
[edit routing-options]
```

```

user@PE4# set router-id 10.9.9.4
user@PE4# set autonomous-system 13979

```

10. If you are done configuring the device, commit the configuration.

```

user@PE4# commit

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@PE4# show interfaces

### *Configuring Device PE1*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device PE1:

1. Configure the interfaces.

```
[edit interfaces]  
user@PE1# set fe-1/2/0 unit 0 description PE1-to-P1  
user@PE1# set fe-1/2/0 unit 0 family inet address 10.0.0.1/30  
user@PE1# set fe-1/2/0 unit 0 family mpls  
user@PE1# set fe-1/2/1 unit 2 description PE1-to-P2  
user@PE1# set fe-1/2/1 unit 2 family inet address 10.0.0.5/30  
user@PE1# set fe-1/2/1 unit 2 family mpls  
user@PE1# set fe-1/2/2 unit 14 description PE1-to-PE7  
user@PE1# set fe-1/2/2 unit 14 family inet address 10.0.0.9/30  
user@PE1# set lo0 unit 1 family inet address 10.9.9.1/32  
user@PE1# set lo0 unit 1 family inet address 10.100.1.1/32
```

2. Configure MPLS and a signaling protocol, such as RSVP or LDP.

```
[edit protocols]  
user@PE1# set rsvp interface fe-1/2/0.0  
user@PE1# set rsvp interface fe-1/2/1.2  
user@PE1# set rsvp interface fe-1/2/2.14  
user@PE1# set mpls label-switched-path PE1-to-P1 to 10.9.9.2  
user@PE1# set mpls label-switched-path PE1-to-P2 to 10.9.9.3  
user@PE1# set mpls interface fe-1/2/0.0  
user@PE1# set mpls interface fe-1/2/1.2  
user@PE1# set mpls interface fe-1/2/2.14
```

3. Configure BGP.

```
[edit protocols bgp]  
user@PE1# set group internal type internal  
user@PE1# set group internal local-address 10.9.9.1  
user@PE1# set group internal export SET_EXPORT_ROUTES  
user@PE1# set group internal vpn-apply-export
```

```

user@PE1# set group internal neighbor 10.9.9.4
user@PE1# set group internal neighbor 10.9.9.2
user@PE1# set group internal neighbor 10.9.9.3
user@PE1# set group external type external
user@PE1# set group external export SET_EXPORT_ROUTES
user@PE1# set group external peer-as 7019
user@PE1# set group external neighbor 10.0.0.10

```

4. Enable AIGP.

```

[edit protocols bgp]
user@PE1# set group internal family inet labeled-unicast aigp
user@PE1# set group external family inet labeled-unicast aigp

```

5. Enable the policies.

```

[edit policy-options policy-statement SET_EXPORT_ROUTES term 10]
user@PE1# set from protocol direct
user@PE1# set from protocol bgp
user@PE1# set then next-hop 10.100.1.1
user@PE1# set then accept

```

6. Configure an IGP, such as OSPF, RIP, or IS-IS.

```

[edit protocols ospf area 0.0.0.1]
user@PE1# set interface fe-1/2/0.0 metric 1
user@PE1# set interface fe-1/2/1.2 metric 1
user@PE1# set interface 10.9.9.1 passive
user@PE1# set interface 10.9.9.1 metric 1
user@PE1# set interface 10.100.1.1 passive
user@PE1# set interface 10.100.1.1 metric 1

```

7. Configure the router ID and the autonomous system number.

```

[edit routing-options]
user@PE1# set router-id 10.9.9.1
user@PE1# set autonomous-system 13979

```

8. If you are done configuring the device, commit the configuration.

```

user@PE1# commit

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@PE1# show interfaces

### Configuring Device PE2

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device PE2:

1. Configure the interfaces.

```
[edit interfaces]
user@PE2# set fe-1/2/0 unit 11 description PE2-to-PE4
user@PE2# set fe-1/2/0 unit 11 family inet address 10.0.0.22/30
user@PE2# set fe-1/2/0 unit 11 family mpls
user@PE2# set lo0 unit 9 family inet address 10.9.9.5/32 primary
user@PE2# set lo0 unit 9 family inet address 10.100.1.5/32
```

2. Configure MPLS and a signaling protocol, such as RSVP or LDP.

```
[edit protocols]
user@PE2# set rsvp interface fe-1/2/0.11
user@PE2# set mpls label-switched-path PE2-to-PE4 to 10.9.9.4
user@PE2# set mpls interface fe-1/2/0.11
```

3. Configure BGP.

```
[edit protocols bgp]
user@PE2# set group external type external
user@PE2# set group external multihop ttl 2
user@PE2# set group external local-address 10.9.9.5
user@PE2# set group external export next-hop
user@PE2# set group external export aigp
user@PE2# set group external export SET_EXPORT_ROUTES
user@PE2# set group external vpn-apply-export
user@PE2# set group external peer-as 13979
user@PE2# set group external neighbor 10.9.9.4
```

4. Enable AIGP.

```
[edit protocols bgp]
user@PE2# set group external family inet labeled-unicast aigp
```

5. Originate a prefix, and configure an AIGP distance.

By default, a prefix is originated using the current IGP distance. Optionally, you can configure a distance for the AIGP attribute, using the **distance** option, as shown here.

```
[edit policy-options policy-statement aigp]
user@PE2# set term 10 from route-filter 55.0.0.0/24 exact
user@PE2# set term 10 then aigp-originate distance 20
user@PE2# set term 10 then next-hop 10.100.1.5
user@PE2# set term 10 then accept
user@PE2# set term 20 from route-filter 99.0.0.0/24 exact
user@PE2# set term 20 then aigp-originate distance 30
user@PE2# set term 20 then next-hop 10.100.1.5
user@PE2# set term 20 then accept
```

6. Enable the policies.

```
[edit policy-options]
user@PE2# set policy-statement SET_EXPORT_ROUTES term 10 from protocol
direct
user@PE2# set policy-statement SET_EXPORT_ROUTES term 10 from protocol
static
user@PE2# set policy-statement SET_EXPORT_ROUTES term 10 from protocol
bgp
user@PE2# set policy-statement SET_EXPORT_ROUTES term 10 then next-hop
10.100.1.5
user@PE2# set policy-statement SET_EXPORT_ROUTES term 10 then accept
user@PE2# set policy-statement next-hop term 10 from protocol bgp
user@PE2# set policy-statement next-hop term 10 then next-hop 10.100.1.5
user@PE2# set policy-statement next-hop term 10 then accept
user@PE2# set policy-statement next-hop term 20 from protocol direct
user@PE2# set policy-statement next-hop term 20 from route-filter 10.9.9.5/32
exact
user@PE2# set policy-statement next-hop term 20 from route-filter 10.100.1.5/32
exact
user@PE2# set policy-statement next-hop term 20 then next-hop 10.100.1.5
user@PE2# set policy-statement next-hop term 20 then accept
```

7. Enable some static routes.

```
[edit routing-options]
user@PE2# set static route 99.0.0.0/24 discard
user@PE2# set static route 55.0.0.0/24 discard
```

8. Configure an IGP, such as OSPF, RIP, or IS-IS.

```
[edit protocols ospf area 0.0.0.2]
user@PE2# set interface 10.9.9.5 passive
user@PE2# set interface 10.9.9.5 metric 1
user@PE2# set interface 10.100.1.5 passive
user@PE2# set interface 10.100.1.5 metric 1
user@PE2# set interface fe-1/2/0.11 metric 1
```

9. Configure the router ID and the autonomous system number.

```
[edit routing-options]
user@PE2# set router-id 10.9.9.5
user@PE2# set autonomous-system 7018
```

10. If you are done configuring the device, commit the configuration.

```
user@PE2# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@PE2# show interfaces
fe-1/2/0 {
  unit 11 {

### **Configuring Device PE3**

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device PE3:

1. Configure the interfaces.

```
[edit interfaces]
user@PE3# set fe-1/2/0 unit 13 description PE3-to-PE4
user@PE3# set fe-1/2/0 unit 13 family inet address 10.0.0.26/30
user@PE3# set fe-1/2/0 unit 13 family mpls
user@PE3# set lo0 unit 11 family inet address 10.9.9.6/32
user@PE3# set lo0 unit 11 family inet address 10.100.1.6/32
```

2. Configure MPLS and a signaling protocol, such as RSVP or LDP.

```
[edit protocols]
user@PE3# set rsvp interface fe-1/2/0.13
user@PE3# set mpls label-switched-path PE3-to-PE4 to 10.9.9.4
user@PE3# set mpls interface fe-1/2/0.13
```

3. Configure BGP.

```
[edit protocols bgp group external]
user@PE3# set type external
user@PE3# set multihop ttl 2
user@PE3# set local-address 10.9.9.6
user@PE3# set export next-hop
user@PE3# set export SET_EXPORT_ROUTES
user@PE3# set vpn-apply-export
user@PE3# set peer-as 13979
user@PE3# set neighbor 10.9.9.4
```

4. Enable AIGP.

```
[edit protocols bgp group external]
user@PE3# set family inet labeled-unicast aigp
```

5. Enable the policies.

```
[edit policy-options]
user@PE3# set policy-statement SET_EXPORT_ROUTES term 10 from protocol
    direct
user@PE3# set policy-statement SET_EXPORT_ROUTES term 10 from protocol
    static
```

```

user@PE3# set policy-statement SET_EXPORT_ROUTES term 10 from protocol
bgp
user@PE3# set policy-statement SET_EXPORT_ROUTES term 10 then next-hop
10.100.1.6
user@PE3# set policy-statement SET_EXPORT_ROUTES term 10 then accept
user@PE3# set policy-statement next-hop term 10 from protocol bgp
user@PE3# set policy-statement next-hop term 10 then next-hop 10.100.1.6
user@PE3# set policy-statement next-hop term 10 then accept
user@PE3# set policy-statement next-hop term 20 from protocol direct
user@PE3# set policy-statement next-hop term 20 from route-filter 10.9.9.6/32
exact
user@PE3# set policy-statement next-hop term 20 from route-filter 10.100.1.6/32
exact
user@PE3# set policy-statement next-hop term 20 then next-hop 10.100.1.6
user@PE3# set policy-statement next-hop term 20 then accept

```

6. Configure an IGP, such as OSPF, RIP, or IS-IS.

```

[edit protocols ospf area 0.0.0.3]
user@PE3# set interface 10.9.9.6 passive
user@PE3# set interface 10.9.9.6 metric 1
user@PE3# set interface 10.100.1.6 passive
user@PE3# set interface 10.100.1.6 metric 1
user@PE3# set interface fe-1/2/0.13 metric 1

```

7. Configure the router ID and the autonomous system number.

```

[edit routing-options]
user@PE3# set router-id 10.9.9.6
user@PE3# set autonomous-system 7018

```

8. If you are done configuring the device, commit the configuration.

```

user@PE3# commit

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@PE3# show interfaces

### Configuring Device PE7

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device PE7:

1. Configure the interfaces.

```

[edit interfaces]
user@PE7# set fe-1/2/0 unit 15 description PE7-to-PE1
user@PE7# set fe-1/2/0 unit 15 family inet address 10.0.0.10/30
user@PE7# set lo0 unit 13 family inet address 10.9.9.7/32
user@PE7# set lo0 unit 13 family inet address 10.100.1.7/32

```

2. Configure BGP.

```

[edit protocols bgp group external]
user@PE7# set type external
user@PE7# set export SET_EXPORT_ROUTES
user@PE7# set peer-as 13979
user@PE7# set neighbor 10.0.0.9

```

3. Enable AIGP.

```

[edit protocols bgp group external]
user@PE7# set family inet labeled-unicast aigp

```

4. Configure the routing policy.

```

[edit policy-options policy-statement SET_EXPORT_ROUTES term 10]
user@PE7# set from protocol direct

```

```
user@PE7# set from protocol bgp
user@PE7# set then next-hop 10.100.1.7
user@PE7# set then accept
```

5. Configure the router ID and the autonomous system number.

```
[edit routing-options]
user@PE7# set router-id 10.9.9.7
user@PE7# set autonomous-system 7019
```

6. If you are done configuring the device, commit the configuration.

```
user@PE7# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@PE7# show interfaces
interfaces {
  fe-1/2/0 {
    unit 15 {
      description PE7-to-PE1;
      family inet {
        address 10.0.0.10/30;
      }
    }
  }
  lo0 {
    unit 13 {
      family inet {
        address 10.9.9.7/32;
        address 10.100.1.7/32;
      }
    }
  }
}

user@PE7# show policy-options
policy-statement SET_EXPORT_ROUTES {
  term 10 {
    from protocol [ direct bgp ];
    then {
      next-hop 10.100.1.7;
      accept;
    }
  }
}

user@PE7# show protocols
bgp {
  group external {
    type external;
    family inet {
      labeled-unicast {
        aigp;
      }
    }
  }
}
```

```

    }
  }
  export SET_EXPORT_ROUTES;
  peer-as 13979;
  neighbor 10.0.0.9;
}
}

user@PE7# show routing-options
router-id 10.9.9.7;
autonomous-system 7019;

```

### Verification

Confirm that the configuration is working properly.

- [Verifying That Device PE4 Is Receiving the AIGP Attribute from Its EBGp Neighbor PE2 on page 3579](#)
- [Checking the IGP Metric on page 3579](#)
- [Verifying That Device PE4 Adds the IGP Metric to the AIGP Attribute on page 3580](#)
- [Verifying That Device PE7 Is Receiving the AIGP Attribute from Its EBGp Neighbor PE1 on page 3580](#)
- [Verifying the Resolving AIGP Metric on page 3581](#)
- [Verifying the Presence of AIGP Attributes in BGP Updates on page 3584](#)

### *Verifying That Device PE4 Is Receiving the AIGP Attribute from Its EBGp Neighbor PE2*

**Purpose** Make sure that the AIGP policy on Device PE2 is working.

**Action**

```

user@PE4> show route receive-protocol bgp 10.9.9.5 extensive
* 55.0.0.0/24 (1 entry, 1 announced)
  Accepted
  Route Label: 299888
  Nexthop: 10.100.1.5
  AS path: 7018 I
  AIGP: 20

* 99.0.0.0/24 (1 entry, 1 announced)
  Accepted
  Route Label: 299888
  Nexthop: 10.100.1.5
  AS path: 7018 I
  AIGP: 30

```

**Meaning** On Device PE2, the **aigp-originate** statement is configured with a distance of 20 (**aigp-originate distance 20**). This statement is applied to route 55.0.0.0/24. Likewise, the **aigp-originate distance 30** statement is applied to route 99.0.0.0/24. Thus, when Device PE4 receives these routes, the AIGP attribute is attached with the configured metrics.

### *Checking the IGP Metric*

**Purpose** From Device PE4, check the IGP metric to the BGP next hop 10.100.1.5.

**Action** user@PE4> show route 10.100.1.5  
inet.0: 30 destinations, 40 routes (30 active, 0 holddown, 0 hidden)  
+ = Active Route, - = Last Active, \* = Both

10.100.1.5/32      \* [OSPF/10] 05:35:50, metric 2  
                    > to 10.0.0.22 via fe-1/2/2.10  
                    [BGP/170] 03:45:07, localpref 100, from 10.9.9.5  
                    AS path: 7018 I  
                    > to 10.0.0.22 via fe-1/2/2.10

**Meaning** The IGP metric for this route is 2.

***Verifying That Device PE4 Adds the IGP Metric to the AIGP Attribute***

**Purpose** Make sure that Device PE4 adds the IGP metric to the AIGP attribute when it readvertises routes to its IBGP neighbor, Device PE1.

**Action** user@PE4> show route advertising-protocol bgp 10.9.9.1 extensive

\* 55.0.0.0/24 (1 entry, 1 announced)  
BGP group internal type Internal  
Route Label: 300544  
Nexthop: 10.100.1.4  
Flags: Nexthop Change  
Localpref: 100  
AS path: [13979] 7018 I  
AIGP: 22

\* 99.0.0.0/24 (1 entry, 1 announced)  
BGP group internal type Internal  
Route Label: 300544  
Nexthop: 10.100.1.4  
Flags: Nexthop Change  
Localpref: 100  
AS path: [13979] 7018 I  
AIGP: 32

**Meaning** The IGP metric is added to the AIGP metric ( $20 + 2 = 22$  and  $30 + 2 = 32$ ), because the next hop is changed for these routes.

***Verifying That Device PE7 Is Receiving the AIGP Attribute from Its EBGp Neighbor PE1***

**Purpose** Make sure that the AIGP policy on Device PE1 is working.

**Action** user@PE7> show route receive-protocol bgp 10.0.0.9 extensive

\* 44.0.0.0/24 (1 entry, 1 announced)

Accepted  
Route Label: 300096  
Nexthop: 10.0.0.9  
AS path: 13979 I  
AIGP: 203

\* 55.0.0.0/24 (1 entry, 1 announced)

Accepted  
Route Label: 300112  
Nexthop: 10.0.0.9  
AS path: 13979 7018 I  
AIGP: 25

\* 99.0.0.0/24 (1 entry, 1 announced)

Accepted  
Route Label: 300112  
Nexthop: 10.0.0.9  
AS path: 13979 7018 I  
AIGP: 35

**Meaning** The 44.0.0.0/24 route is originated at Device PE4. The 55.0.0.0/24 and 99.0.0.0/24 routes are originated at Device PE2. The IGP distances are added to the configured AIGP distances.

#### *Verifying the Resolving AIGP Metric*

**Purpose** Confirm that if the prefix is resolved through recursion and the recursive next hops have AIGP metrics, the prefix has the sum of the AIGP values that are on the recursive BGP next hops.

**Action** 1. Add a static route to 66.0.0.0/24.

```
[edit routing-options]
user@PE2# set static route 66.0.0.0/24 discard
```

2. Delete the existing terms in the **aigp** policy statement on Device PE2.

```
[edit policy-options policy-statement aigp]
user@PE2# delete term 10
user@PE2# delete term 20
```

3. Configure a recursive route lookup for the route to 66.0.0.0.

The policy shows the AIGP metric for prefix 66.0.0.0/24 (none) and its recursive next hop. Prefix 66.0.0.0/24 is resolved by 55.0.0.1. Prefix 66.0.0.0/24 does not have its own AIGP metric being originated, but its recursive next hop, 55.0.0.1, has an AIGP value.

```
[edit policy-options policy-statement aigp]
user@PE2# set term 10 from route-filter 55.0.0.1/24 exact
user@PE2# set term 10 then aigp-originate distance 20
user@PE2# set term 10 then next-hop 10.100.1.5
user@PE2# set term 10 then accept
user@PE2# set term 20 from route-filter 66.0.0.0/24 exact
user@PE2# set term 20 then next-hop 55.0.0.1
```

user@PE2# set term 20 then accept

4. On Device PE4, run the **show route 55.0.0.0 extensive** command.

The value of Metric2 is the IGP metric to the BGP next hop. When Device PE4 readvertises these routes to its IBGP peer, Device PE1, the AIGP metric is the sum of AIGP + its Resolving AIGP metric + Metric2.

Prefix 55.0.0.0 shows its own IGP metric 20, as defined and advertised by Device PE2. It does not show a resolving AIGP value because it does not have a recursive BGP next hop. The value of Metric2 is 2.

```
user@PE4> show route 55.0.0.0 extensive
inet.0: 31 destinations, 41 routes (31 active, 0 holddown, 0 hidden)
55.0.0.0/24 (1 entry, 1 announced)

### *Verifying the Presence of AIGP Attributes in BGP Updates*

**Purpose** If the AIGP attribute is not enabled under BGP (or the **group** or **neighbor** hierarchies), the AIGP attribute is silently discarded. Enable **traceoptions** and include the **packets** flag in the **detail** option in the configuration to confirm the presence of the AIGP attribute in transmitted or received BGP updates. This is useful when debugging AIGP issues.

**Action** 1. Configure Device PE2 and Device PE4 for **traceoptions**.

```
user@host> show protocols bgp
traceoptions {
  file bgp size 1m files 5;
  flag packets detail;
}
```

2. Check the **traceoptions** file on Device PE2.

The following sample shows Device PE2 advertising prefix 99.0.0.0/24 to Device PE4 (10.9.9.4) with an AIGP metric of 20:

```
user@PE2> show log bgp
Mar 22 09:27:18.982150 BGP SEND 10.9.9.5+49652 -> 10.9.9.4+179
Mar 22 09:27:18.982178 BGP SEND message type 2 (Update) length 70
Mar 22 09:27:18.982198 BGP SEND Update PDU length 70
Mar 22 09:27:18.982248 BGP SEND flags 0x40 code Origin(1): IGP
Mar 22 09:27:18.982273 BGP SEND flags 0x40 code ASPath(2) length 6: 7018
Mar 22 09:27:18.982295 BGP SEND flags 0x80 code AIGP(26): AIGP: 20
Mar 22 09:27:18.982316 BGP SEND flags 0x90 code MP_reach(14): AFI/SAFI 1/4
Mar 22 09:27:18.982341 BGP SEND      nhop 10.100.1.5 len 4
Mar 22 09:27:18.982372 BGP SEND    99.0.0.0/24 (label 301664)
Mar 22 09:27:33.665412 bgp_send: sending 19 bytes to abcd::10:255:170:84
(External AS 13979)
```

3. Verify that the route was received on Device PE4 using the **show route receive-protocol** command.

AIGP is not enabled on Device PE4, so the AIGP attribute is silently discarded for prefix 99.0.0.0/24 and does not appear in the following output:

```
user@PE4> show route receive-protocol bgp 10.9.9.5 extensive | find 55.0.0.0
* 99.0.0.0/24 (2 entries, 1 announced)
  Accepted
  Route Label: 301728
  Nexthop: 10.100.1.5
  AS path: 7018 I
```

4. Check the **traceoptions** file on Device PE4.

The following output from the **traceoptions** log shows that the 99.0.0.0/24 prefix was received with the AIGP attribute attached:

```
user@PE4> show log bgp
Mar 22 09:41:39.650295 BGP RECV 10.9.9.5+64690 -> 10.9.9.4+179
Mar 22 09:41:39.650331 BGP RECV message type 2 (Update) length 70
Mar 22 09:41:39.650350 BGP RECV Update PDU length 70
Mar 22 09:41:39.650370 BGP RECV flags 0x40 code Origin(1): IGP
Mar 22 09:41:39.650394 BGP RECV flags 0x40 code ASPath(2) length 6: 7018
Mar 22 09:41:39.650415 BGP RECV flags 0x80 code AIGP(26): AIGP: 20
Mar 22 09:41:39.650436 BGP RECV flags 0x90 code MP_reach(14): AFI/SAFI 1/4
Mar 22 09:41:39.650459 BGP RECV      nhop 10.100.1.5 len 4
```

```

Mar 22 09:41:39.650495 BGP RECV    99.0.0.0/24 (label 301728)
Mar 22 09:41:39.650574 bgp_rcv_nlri: 99.0.0.0/24
Mar 22 09:41:39.650607 bgp_rcv_nlri: 99.0.0.0/24 belongs to meshgroup
Mar 22 09:41:39.650629 bgp_rcv_nlri: 99.0.0.0/24 qualified bnp->ribact 0x0
12afcb 0x0

```

**Meaning** Performing this verification helps with AIGP troubleshooting and debugging issues. It enables you to verify which devices in your network send and receive AIGP attributes.

- [Example: Injecting OSPF Routes into the BGP Routing Table on page 3586](#)

#### Understanding Routing Policies

Each routing policy is identified by a policy name. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks. Each routing policy name must be unique within a configuration.

Once a policy is created and named, it must be applied before it is active. You apply routing policies using the **import** and **export** statements at the **protocols>protocol-name** level in the configuration hierarchy.

In the **import** statement, you list the name of the routing policy to be evaluated when routes are imported into the routing table from the routing protocol.

In the **export** statement, you list the name of the routing policy to be evaluated when routes are being exported from the routing table into a dynamic routing protocol. Only active routes are exported from the routing table.

To specify more than one policy and create a policy chain, you list the policies using a space as a separator. If multiple policies are specified, the policies are evaluated in the order in which they are specified. As soon as an accept or reject action is executed, the policy chain evaluation ends.

### Example: Injecting OSPF Routes into the BGP Routing Table

---

This example shows how to create a policy that injects OSPF routes into the BGP routing table.

- [Requirements on page 3586](#)
- [Overview on page 3586](#)
- [Configuration on page 3586](#)
- [Verification on page 3588](#)
- [Troubleshooting on page 3588](#)

#### Requirements

Before you begin:

- Configure network interfaces.
- Configure external peer sessions. See [“Example: Configuring External BGP Point-to-Point Peer Sessions” on page 3430](#).
- Configure interior gateway protocol (IGP) sessions between peers.

#### Overview

In this example, you create a routing policy called **injectpolicy1** and a routing term called **injectterm1**. The policy injects OSPF routes into the BGP routing table.

#### Configuration

- [Configuring the Routing Policy on page 3586](#)
- [Configuring Tracing for the Routing Policy on page 3587](#)

#### Configuring the Routing Policy

##### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set policy-options policy-statement injectpolicy1 term injectterm1 from protocol ospf
set policy-options policy-statement injectpolicy1 term injectterm1 from area 0.0.0.1
set policy-options policy-statement injectpolicy1 term injectterm1 then accept
set protocols bgp export injectpolicy1
```

##### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To inject OSPF routes into a BGP routing table:

1. Create the policy term.

```
[edit policy-options policy-statement injectpolicy1]
user@host# set term injectterm1
```

- Specify OSPF as a match condition.

```
[edit policy-options policy-statement injectpolicy1 term injectterm1]
user@host# set from protocol ospf
```

- Specify the routes from an OSPF area as a match condition.

```
[edit policy-options policy-statement injectpolicy1 term injectterm1]
user@host# set from area 0.0.0.1
```

- Specify that the route is to be accepted if the previous conditions are matched.

```
[edit policy-options policy-statement injectpolicy1 term injectterm1]
user@host# set then accept
```

- Apply the routing policy to BGP.

```
[edit]
user@host# set protocols bgp export injectpolicy1
```

**Results** Confirm your configuration by entering the **show policy-options** and **show protocols bgp** commands from configuration mode. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show policy-options
policy-statement injectpolicy1 {
  term injectterm1 {
    from {
      protocol ospf;
      area 0.0.0.1;
    }
    then accept;
  }
}

user@host# show protocols bgp
export injectpolicy1;
```

If you are done configuring the device, enter **commit** from configuration mode.

### *Configuring Tracing for the Routing Policy*

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set policy-options policy-statement injectpolicy1 term injectterm1 then trace
set routing-options traceoptions file ospf-bgp-policy-log
set routing-options traceoptions file size 5m
set routing-options traceoptions file files 5
set routing-options traceoptions flag policy
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Include a trace action in the policy.

```
[edit policy-options policy-statement injectpolicy] term injectterm1]
user@host# then trace
```

2. Configure the tracing file for the output.

```
[edit routing-options traceoptions]
user@host# set file ospf-bgp-policy-log
user@host# set file size 5m
user@host# set file files 5
user@host# set flag policy
```

**Results** Confirm your configuration by entering the **show policy-options** and **show routing-options** commands from configuration mode. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show policy-options
policy-statement injectpolicy1 {
  term injectterm1 {
    then {
      trace;
    }
  }
}

user@host# show routing-options
traceoptions {
  file ospf-bgp-policy-log size 5m files 5;
  flag policy;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

### **Verifying That the Expected BGP Routes Are Present**

**Purpose** Verify the effect of the export policy.

**Action** From operational mode, enter the **show route** command.

### **Troubleshooting**

- [Using the show log Command to Examine the Actions of the Routing Policy on page 3588](#)

### **Using the show log Command to Examine the Actions of the Routing Policy**

**Problem** The routing table contains unexpected routes, or routes are missing from the routing table.

**Solution** If you configure policy tracing as shown in this example, you can run the **show log ospf-bgp-policy-log** command to diagnose problems with the routing policy. The **show log ospf-bgp-policy-log** command displays information about the routes that the **injectpolicy1** policy term analyzes and acts upon.

## Example: Configuring BGP Route Advertisement

- [Understanding Route Advertisement on page 3589](#)
- [Example: Configuring BGP Prefix-Based Outbound Route Filtering on page 3593](#)

### Understanding Route Advertisement

All routing protocols use the Junos OS routing table to store the routes that they learn and to determine which routes they should advertise in their protocol packets. Routing policy allows you to control which routes the routing protocols store in and retrieve from the routing table. For information about routing policy, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

When configuring BGP routing policy, you can perform the following tasks:

- [Applying Routing Policy on page 3589](#)
- [Setting BGP to Advertise Inactive Routes on page 3590](#)
- [Configuring BGP to Advertise the Best External Route to Internal Peers on page 3590](#)
- [Configuring How Often BGP Exchanges Routes with the Routing Table on page 3592](#)
- [Disabling Suppression of Route Advertisements on page 3593](#)

### Applying Routing Policy

You define routing policy at the **[edit policy-options]** hierarchy level. To apply policies you have defined for BGP, include the **import** and **export** statements within the BGP configuration.

You can apply policies as follows:

- BGP global **import** and **export** statements—Include these statements at the **[edit protocols bgp]** hierarchy level (for routing instances, include these statements at the **[edit routing-instances routing-instance-name protocols bgp]** hierarchy level).
- Group **import** and **export** statements—Include these statements at the **[edit protocols bgp group group-name]** hierarchy level (for routing instances, include these statements at the **[edit routing-instances routing-instance-name protocols bgp group group-name]** hierarchy level).
- Peer **import** and **export** statements—Include these statements at the **[edit protocols bgp group group-name neighbor address]** hierarchy level (for routing instances, include these statements at the **[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address]** hierarchy level).

A peer-level **import** or **export** statement overrides a group **import** or **export** statement. A group-level **import** or **export** statement overrides a global BGP **import** or **export** statement.

To apply policies, see the following sections:

- [Applying Policies to Routes Being Imported into the Routing Table from BGP on page 3590](#)
- [Applying Policies to Routes Being Exported from the Routing Table into BGP on page 3590](#)

#### ***Applying Policies to Routes Being Imported into the Routing Table from BGP***

To apply policy to routes being imported into the routing table from BGP, include the **import** statement, listing the names of one or more policies to be evaluated:

```
import [ policy-names ];
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

If you specify more than one policy, they are evaluated in the order specified, from first to last, and the first matching filter is applied to the route. If no match is found, BGP places into the routing table only those routes that were learned from BGP routing devices.

#### ***Applying Policies to Routes Being Exported from the Routing Table into BGP***

To apply policy to routes being exported from the routing table into BGP, include the **export** statement, listing the names of one or more policies to be evaluated:

```
export [ policy-names ];
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

If you specify more than one policy, they are evaluated in the order specified, from first to last, and the first matching filter is applied to the route. If no routes match the filters, the routing table exports into BGP only the routes that it learned from BGP.

#### ***Setting BGP to Advertise Inactive Routes***

By default, BGP stores the route information it receives from update messages in the Junos OS routing table, and the routing table exports only active routes into BGP, which BGP then advertises to its peers. To have the routing table export to BGP the best route learned by BGP even if Junos OS did not select it to be an active route, include the **advertise-inactive** statement:

```
advertise-inactive;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

#### ***Configuring BGP to Advertise the Best External Route to Internal Peers***

In general, deployed BGP implementations do not advertise the external route with the highest local preference value to internal peers unless it is the best route. Although this behavior was required by an earlier version of the BGP version 4 specification, RFC 1771, it was typically not followed in order to minimize the amount of advertised information

and to prevent routing loops. However, there are scenarios in which advertising the best external route is beneficial, in particular, situations that can result in IBGP route oscillation.

In Junos OS Release 9.3 and later, you can configure BGP to advertise the best external route into an internal BGP (IBGP) mesh group, a route reflector cluster, or an autonomous system (AS) confederation, even when the best route is an internal route.

**NOTE:** In order to configure the `advertise-external` statement on a route reflector, you must disable intracluster reflection with the `no-client-reflect` statement.

When a routing device is configured as a route reflector for a cluster, a route advertised by the route reflector is considered internal if it is received from an internal peer with the same cluster identifier or if both peers have no cluster identifier configured. A route received from an internal peer that belongs to another cluster, that is, with a different cluster identifier, is considered external.

In a confederation, when advertising a route to a confederation border router, any route from a different confederation sub-AS is considered external.

You can also configure BGP to advertise the external route only if the route selection process reaches the point where the multiple exit discriminator (MED) metric is evaluated. As a result, an external route with an AS path worse (that is, longer) than that of the active path is not advertised.

Junos OS also provides support for configuring a BGP export policy that matches on the state of an advertised route. You can match on either active or inactive routes. For more information, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

To configure BGP to advertise the best external path to internal peers, include the `advertise-external` statement:

```
advertise-external;
```

**NOTE:** The `advertise-external` statement is supported at both the group and neighbor level. If you configure the statement at the neighbor level, you must configure it for all neighbors in a group. Otherwise, the group is automatically split into different groups.

For a complete list of hierarchy levels at which you can configure this statement, see the statement summary section for this statement.

To configure BGP to advertise the best external path only if the route selection process reaches the point where the MED value is evaluated, include the `conditional` statement:

```
advertise-external {
  conditional;
}
```

### *Configuring How Often BGP Exchanges Routes with the Routing Table*

BGP stores the route information it receives from update messages in the routing table, and the routing table exports active routes from the routing table into BGP. BGP then advertises the exported routes to its peers. By default, the exchange of route information between BGP and the routing table occurs immediately after the routes are received. This immediate exchange of route information might cause instabilities in the network reachability information. To guard against this, you can delay the time between when BGP and the routing table exchange route information.

To configure how often BGP and the routing table exchange route information, include the **out-delay** statement:

**out-delay** *seconds*;

By default, the routing table retains some of the route information learned from BGP. To have the routing table retain all or none of this information, include the **keep** statement:

**keep** (all | none);

For a list of hierarchy levels at which you can include these statements, see the statement summary sections for these statements.

The routing table can retain the route information learned from BGP in one of the following ways:

- Default (omit the **keep** statement)—Keep all route information that was learned from BGP, except for routes whose AS path is looped and whose loop includes the local AS.
- **keep all**—Keep all route information that was learned from BGP.
- **keep none**—Discard routes that were received from a peer and that were rejected by import policy or other sanity checking, such as AS path or next hop. When you configure **keep none** for the BGP session and the inbound policy changes, Junos OS forces readvertisement of the full set of routes advertised by the peer.

In an AS path healing situation, routes with looped paths theoretically could become usable during a soft reconfiguration when the AS path loop limit is changed. However, there is a significant memory usage difference between the default and **keep all**.

Consider the following scenarios:

- A peer readvertises routes back to the peer from which it learned them.

This can happen in the following cases:

- Another vendor's routing device advertises the routes back to the sending peer.
- The Junos OS peer's default behavior of not readvertising routes back to the sending peer is overridden by configuring **advertise-peer-as**.
- A provider edge (PE) routing device discards any VPN route that does not have any of the expected route targets.

When **keep all** is configured, the behavior of discarding routes received in the above scenarios is overridden.

### *Disabling Suppression of Route Advertisements*

Junos OS does not advertise the routes learned from one EBGp peer back to the same external BGP (EBGP) peer. In addition, the software does not advertise those routes back to any EBGp peers that are in the same AS as the originating peer, regardless of the routing instance. You can modify this behavior by including the **advertise-peer-as** statement in the configuration. To disable the default advertisement suppression, include the **advertise-peer-as** statement:

```
advertise-peer-as;
```

**NOTE:** The route suppression default behavior is disabled if the **as-override** statement is included in the configuration.

If you include the **advertise-peer-as** statement in the configuration, BGP advertises the route regardless of this check.

To restore the default behavior, include the **no-advertise-peer-as** statement in the configuration:

```
no-advertise-peer-as;
```

If you include both the **as-override** and **no-advertise-peer-as** statements in the configuration, the **no-advertise-peer-as** statement is ignored. You can include these statements at multiple hierarchy levels.

For a list of hierarchy levels at which you can include these statements, see the statement summary section for these statements.

### Example: Configuring BGP Prefix-Based Outbound Route Filtering

This example shows how to configure a Juniper Networks router to accept route filters from remote peers and perform outbound route filtering using the received filters.

- [Requirements on page 3593](#)
- [Overview on page 3594](#)
- [Configuration on page 3594](#)
- [Verification on page 3596](#)

#### **Requirements**

Before you begin:

- Configure the router interfaces.
- Configure an interior gateway protocol (IGP).

### Overview

You can configure a BGP peer to accept route filters from remote peers and perform outbound route filtering using the received filters. By filtering out unwanted updates, the sending peer saves resources needed to generate and transmit updates, and the receiving peer saves resources needed to process updates. This feature can be useful, for example, in a virtual private network (VPN) in which subsets of customer edge (CE) devices are not capable of processing all the routes in the VPN. The CE devices can use prefix-based outbound route filtering to communicate to the provider edge (PE) routing device to transmit only a subset of routes, such as routes to the main data centers only.

The maximum number of prefix-based outbound route filters that a BGP peer can accept is 5000. If a remote peer sends more than 5000 outbound route filters to a peer address, the additional filters are discarded, and a system log message is generated.

You can configure interoperability for the routing device as a whole or for specific BGP groups or peers only.

### Topology

In the sample network, Device CE1 is a router from another vendor. The configuration shown in this example is on Juniper Networks Router PE1.

Figure 105 on page 3594 shows the sample network.

Figure 105: BGP Prefix-Based Outbound Route Filtering

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
PE1 set protocols bgp group cisco-peers type external
    set protocols bgp group cisco-peers description "to CE1"
    set protocols bgp group cisco-peers local-address 192.168.165.58
    set protocols bgp group cisco-peers peer-as 35
    set protocols bgp group cisco-peers outbound-route-filter bgp-orf-cisco-mode
    set protocols bgp group cisco-peers outbound-route-filter prefix-based accept inet
    set protocols bgp group cisco-peers neighbor 192.168.165.56
    set routing-options autonomous-system 65500
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Router PE1 to accept route filters from Device CE1 and perform outbound route filtering using the received filters:

1. Configure the local autonomous system.

```
[edit routing-options]
user@PE1# set autonomous-system 65500
```

2. Configure external peering with Device CE1.

```
[edit protocols bgp group cisco-peers]
user@PE1# set type external
user@PE1# set description "to CE1"
user@PE1# set local-address 192.168.165.58
user@PE1# set peer-as 35
user@PE1# set neighbor 192.168.165.56
```

3. Configure Router PE1 to accept IPv4 route filters from Device CE1 and perform outbound route filtering using the received filters.

```
[edit protocols bgp group cisco-peers]
user@PE1# set outbound-route-filter prefix-based accept inet
```

4. (Optional) Enable interoperability with routing devices that use the vendor-specific compatibility code of 130 for outbound route filters and the code type of 128.

The IANA standard code is 3, and the standard code type is 64.

```
[edit protocols bgp group cisco-peers]
user@PE1# set outbound-route-filter bgp-orf-cisco-mode
```

**Results** From configuration mode, confirm your configuration by entering the **show protocols** and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@PE1# show protocols
group cisco-peers {
  type external;
  description "to CE1";
  local-address 192.168.165.58;
  peer-as 35;
  outbound-route-filter {
    bgp-orf-cisco-mode;
    prefix-based {
      accept {
        inet;
      }
    }
  }
  neighbor 192.168.165.56;
}

user@PE1# show routing-options
autonomous-system 65500;
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying the Outbound Route Filter on page 3596](#)
- [Verifying the BGP Neighbor Mode on page 3596](#)

### **Verifying the Outbound Route Filter**

**Purpose** Display information about the prefix-based outbound route filter received from Device CE1.

**Action** From operational mode, enter the [show bgp neighbor orf detail](#) command.

```
user@PE1> show bgp neighbor orf 192.168.165.56 detail
Peer: 192.168.165.56 Type: External
Group: cisco-peers

inet-unicast
Filter updates rcv:          4 Immediate:          0
Filter: prefix-based         receive
Updates rcv:                4
Received filter entries:
  seq 10 2.2.0.0/16 deny minlen 0 maxlen 0
  seq 20 3.3.0.0/16 deny minlen 24 maxlen 0
  seq 30 4.4.0.0/16 deny minlen 0 maxlen 28
  seq 40 5.5.0.0/16 deny minlen 24 maxlen 28
```

### **Verifying the BGP Neighbor Mode**

**Purpose** Verify that the **bgp-orf-cisco-mode** setting is enabled for the peer by making sure that the **ORFCiscoMode** option is displayed in the **show bgp neighbor** command output.

**Action** From operational mode, enter the [show bgp neighbor](#) command.

```
user@PE1> show bgp neighbor
Peer: 192.168.165.56 AS 35           Local: 192.168.165.58 AS 65500

## Example: Configuring EBGP Multihop

- [Understanding BGP Multihop on page 3597](#)
- [Example: Configuring EBGP Multihop Sessions on page 3597](#)

### Understanding BGP Multihop

When external BGP (EBGP) peers are not directly connected to each other, they must cross one or more non-BGP routers to reach each other. Configuring multihop EBGP enables the peers to pass through the other routers to form peer relationships and exchange update messages. This type of configuration is typically used when a Juniper Networks routing device needs to run EBGP with a third-party router that does not allow direct connection of the two EBGP peers. EBGP multihop enables a neighbor connection between two EBGP peers that do not have a direct connection.

### Example: Configuring EBGP Multihop Sessions

This example shows how to configure an external BGP (EBGP) peer that is more than one hop away from the local router. This type of session is called a *multihop* BGP session.

- [Requirements on page 3597](#)
- [Overview on page 3597](#)
- [Configuration on page 3598](#)
- [Verification on page 3604](#)

#### Requirements

No special configuration beyond device initialization is required before you configure this example.

#### Overview

The configuration to enable multihop EBGP sessions requires connectivity between the two EBGP peers. This example uses static routes to provide connectivity between the devices.

Unlike directly connected EBGP sessions in which physical address are typically used in the **neighbor** statements, you must use loopback interface addresses for multihop EBGP by specifying the loopback interface address of the indirectly connected peer. In this way, EBGP multihop is similar to internal BGP (IBGP).

Finally, you must add the **multihop** statement. Optionally, you can set a maximum time-to-live (TTL) value with the **ttl** statement. The TTL is carried in the IP header of BGP packets. If you do not specify a TTL value, the system's default maximum TTL value is used. The default TTL value is 64 for multihop EBGP sessions. Another option is to retain the BGP next-hop value for route advertisements by including the **no-nexthop-change** statement.

[Figure 106 on page 3598](#) shows a typical EBGP multihop network.

Device C and Device E have an established EBGP session. Device D is not a BGP-enabled device. All of the devices have connectivity via static routes.

Figure 106: Typical Network with EBGP Multihop Sessions

**Configuration**

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device C**

```

set interfaces fe-1/2/0 unit 9 description to-D
set interfaces fe-1/2/0 unit 9 family inet address 10.10.10.9/30
set interfaces lo0 unit 3 family inet address 192.168.40.4/32
set protocols bgp group external-peers type external
set protocols bgp group external-peers multihop ttl 2
set protocols bgp group external-peers local-address 192.168.40.4
set protocols bgp group external-peers export send-static
set protocols bgp group external-peers peer-as 18
set protocols bgp group external-peers neighbor 192.168.6.7
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 10.10.10.14/32 next-hop 10.10.10.10
set routing-options static route 192.168.6.7/32 next-hop 10.10.10.10
set routing-options router-id 192.168.40.4
set routing-options autonomous-system 17

```

**Device D**

```

set interfaces fe-1/2/0 unit 10 description to-C
set interfaces fe-1/2/0 unit 10 family inet address 10.10.10.10/30
set interfaces fe-1/2/1 unit 13 description to-E
set interfaces fe-1/2/1 unit 13 family inet address 10.10.10.13/30
set interfaces lo0 unit 4 family inet address 192.168.6.6/32
set routing-options static route 192.168.40.4/32 next-hop 10.10.10.9
set routing-options static route 192.168.6.7/32 next-hop 10.10.10.14
set routing-options router-id 192.168.6.6

```

**Device E**

```

set interfaces fe-1/2/0 unit 14 description to-D
set interfaces fe-1/2/0 unit 14 family inet address 10.10.10.14/30
set interfaces lo0 unit 5 family inet address 192.168.6.7/32
set protocols bgp group external-peers multihop ttl 2
set protocols bgp group external-peers local-address 192.168.6.7
set protocols bgp group external-peers export send-static
set protocols bgp group external-peers peer-as 17
set protocols bgp group external-peers neighbor 192.168.40.4
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept

```

```

set routing-options static route 10.10.10.8/30 next-hop 10.10.10.13
set routing-options static route 192.168.40.4/32 next-hop 10.10.10.13
set routing-options router-id 192.168.6.7
set routing-options autonomous-system 18

```

### Device C

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device C:

1. Configure the interface to the directly connected device (to-D), and configure the loopback interface.

```

[edit interfaces fe-1/2/0 unit 9]
user@C# set description to-D
user@C# set family inet address 10.10.10.9/30

```

```

[edit interfaces lo0 unit 3]
user@C# set family inet address 192.168.40.4/32

```

2. Configure an EBGP session with Device E.

The **neighbor** statement points to the loopback interface on Device E.

```

[edit protocols bgp group external-peers]
user@C# set type external
user@C# set local-address 192.168.40.4
user@C# set export send-static
user@C# set peer-as 18
user@C# set neighbor 192.168.6.7

```

3. Configure the multihop statement to enable Device C and Device E to become EBGP peers.

Because the peers are two hops away from each other, the example uses the **ttl 2** statement.

```

[edit protocols bgp group external-peers]
user@C# set multihop ttl 2

```

4. Configure connectivity to Device E, using static routes.

You must configure a route to both the loopback interface address and to the address on the physical interface.

```

[edit routing-options]
user@C# set static route 10.10.10.14/32 next-hop 10.10.10.10
user@C# set static route 192.168.6.7/32 next-hop 10.10.10.10

```

5. Configure the local router ID and the autonomous system (AS) number.

```

[edit routing-options]
user@C# set router-id 192.168.40.4
user@C# set autonomous-system 17

```

6. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-static term 1]
user@C# set from protocol static
user@C# set then accept
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@C# show interfaces
fe-1/2/0 {
  unit 9 {
    description to-D;
    family inet {
      address 10.10.10.9/30;
    }
  }
}
lo0 {
  unit 3 {
    family inet {
      address 192.168.40.4/32;
    }
  }
}

user@C# show protocols
bgp {
  group external-peers {
    type external;
    multihop {
      ttl 2;
    }
    local-address 192.168.40.4;
    export send-static;
    peer-as 18;
    neighbor 192.168.6.7;
  }
}

user@C# show policy-options
policy-statement send-static {
  term 1 {
    from protocol static;
    then accept;
  }
}

user@C# show routing-options
static {
  route 10.10.10.14/32 next-hop 10.10.10.10;
  route 192.168.6.7/32 next-hop 10.10.10.10;
}
```

```
router-id 192.168.40.4;
autonomous-system 17;
```

If you are done configuring the device, enter **commit** from configuration mode.  
Repeat these steps for all BFD sessions in the topology.

### Configuring Device D

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device D:

1. Set the CLI to Device D.

```
user@host> set cli logical-system D
```

2. Configure the interfaces to the directly connected devices, and configure a loopback interface.

```
[edit interfaces fe-1/2/0 unit 10]
user@D# set description to-C
user@D# set family inet address 10.10.10.10/30
```

```
[edit interfaces fe-1/2/1 unit 13]
user@D# set description to-E
user@D# set family inet address 10.10.10.13/30
```

```
[edit interfaces lo0 unit 4]
user@D# set family inet address 192.168.6.6/32
```

3. Configure connectivity to the other devices using static routes to the loopback interface addresses.

On Device D, you do not need static routes to the physical addresses because Device D is directly connected to Device C and Device E.

```
[edit routing-options]
user@D# set static route 192.168.40.4/32 next-hop 10.10.10.9
user@D# set static route 192.168.6.7/32 next-hop 10.10.10.14
```

4. Configure the local router ID.

```
[edit routing-options]
user@D# set router-id 192.168.6.6
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces** and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@D# show interfaces
fe-1/2/0 {
  unit 10 {
    description to-C;
    family inet {
      address 10.10.10.10/30;
```

```
    }  
  }  
}  
fe-1/2/1 {  
  unit 13 {  
    description to-E;  
    family inet {  
      address 10.10.10.13/30;  
    }  
  }  
}  
lo0 {  
  unit 4 {  
    family inet {  
      address 192.168.6.6/32;  
    }  
  }  
}  
  
user@D# show protocols  
  
user@D# show routing-options  
static {  
  route 192.168.40.4/32 next-hop 10.10.10.9;  
  route 192.168.6.7/32 next-hop 10.10.10.14;  
}  
router-id 192.168.6.6;
```

If you are done configuring the device, enter **commit** from configuration mode.  
Repeat these steps for all BFD sessions in the topology.

### **Configuring Device E**

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device E:

1. Set the CLI to Device E.
2. Configure the interface to the directly connected device (to-D), and configure the loopback interface.

```
[edit interfaces fe-1/2/0 unit 14]  
user@E# set description to-D  
user@E# set family inet address 10.10.10.14/30
```

```
[edit interfaces lo0 unit 5]  
user@E# set family inet address 192.168.6.7/32
```

3. Configure an EBGP session with Device E.

The **neighbor** statement points to the loopback interface on Device C.

```
[edit protocols bgp group external-peers]
```

```

user@E# set local-address 192.168.6.7
user@E# set export send-static
user@E# set peer-as 17
user@E# set neighbor 192.168.40.4

```

4. Configure the **multihop** statement to enable Device C and Device E to become EBGp peers.

Because the peers are two hops away from each other, the example uses the **ttl 2** statement.

```

[edit protocols bgp group external-peers]
user@E# set multihop ttl 2

```

5. Configure connectivity to Device E, using static routes.

You must configure a route to both the loopback interface address and to the address on the physical interface.

```

[edit routing-options]
user@E# set static route 10.10.10.8/30 next-hop 10.10.10.13
user@E# set static route 192.168.40.4/32 next-hop 10.10.10.13

```

6. Configure the local router ID and the autonomous system (AS) number.

```

[edit routing-options]
user@E# set router-id 192.168.6.7
user@E# set autonomous-system 18

```

7. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```

[edit policy-options policy-statement send-static term 1]
user@E# set from protocol static
user@E# set then accept

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@E# show interfaces
fe-1/2/0 {
  unit 14 {
    description to-D;
    family inet {
      address 10.10.10.14/30;
    }
  }
}
lo0 {
  unit 5 {
    family inet {
      address 192.168.6.7/32;
    }
  }
}

```

```
}
user@E# show protocols
bgp {
  group external-peers {
    multihop {
      ttl 2;
    }
    local-address 192.168.6.7;
    export send-static;
    peer-as 17;
    neighbor 192.168.40.4;
  }
}

user@E# show policy-options
policy-statement send-static {
  term 1 {
    from protocol static;
    then accept;
  }
}

user@E# show routing-options
static {
  route 10.10.10.8/30 next-hop 10.10.10.13;
  route 192.168.40.4/32 next-hop 10.10.10.13;
}
router-id 192.168.6.7;
autonomous-system 18;
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying Connectivity on page 3604](#)
- [Verifying That BGP Sessions Are Established on page 3605](#)
- [Viewing Advertised Routes on page 3605](#)

### **Verifying Connectivity**

**Purpose** Make sure that Device C can ping Device E, specifying the loopback interface address as the source of the ping request.

The loopback interface address is the source address that BGP will use.

**Action** From operational mode, enter the **ping 10.10.10.14 source 192.168.40.4** command from Device C, and enter the **ping 10.10.10.9 source 192.168.6.7** command from Device E.

```
user@C> ping 10.10.10.14 source 192.168.40.4
```

```
PING 10.10.10.14 (10.10.10.14): 56 data bytes
64 bytes from 10.10.10.14: icmp_seq=0 ttl=63 time=1.262 ms
64 bytes from 10.10.10.14: icmp_seq=1 ttl=63 time=1.202 ms
^C
```

```

--- 10.10.10.14 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.202/1.232/1.262/0.030 ms

```

```
user@E> ping 10.10.10.9 source 192.168.6.7
```

```

PING 10.10.10.9 (10.10.10.9): 56 data bytes
64 bytes from 10.10.10.9: icmp_seq=0 ttl=63 time=1.255 ms
64 bytes from 10.10.10.9: icmp_seq=1 ttl=63 time=1.158 ms
^C
--- 10.10.10.9 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.158/1.206/1.255/0.049 ms

```

**Meaning** The static routes are working if the pings work.

### *Verifying That BGP Sessions Are Established*

**Purpose** Verify that the BGP sessions are up.

**Action** From operational mode, enter the `show bgp summary` command.

```
user@C> show bgp summary
```

```

Groups: 1 Peers: 1 Down peers: 0
Table      Tot Paths  Act Paths Suppressed  History  Damp State  Pending
inet.0          2          0          0          0          0          0          0
Peer        AS      InPkt    OutPkt    OutQ   Flaps  Last Up/Dwn
State|#Active/Received/Accepted/Damped...
192.168.6.7      18      147      147        0        1    1:04:27
0/2/2/0          0/0/0/0

```

```
user@E> show bgp summary
```

```

Groups: 1 Peers: 1 Down peers: 0
Table      Tot Paths  Act Paths Suppressed  History  Damp State  Pending
inet.0          2          0          0          0          0          0          0
Peer        AS      InPkt    OutPkt    OutQ   Flaps  Last Up/Dwn
State|#Active/Received/Accepted/Damped...
192.168.40.4     17      202      202        0        1    1:02:18
0/2/2/0          0/0/0/0

```

**Meaning** The output shows that both devices have one peer each. No peers are down.

### *Viewing Advertised Routes*

**Purpose** Check to make sure that routes are being advertised by BGP.

**Action** From operational mode, enter the `show route advertising-protocol bgp neighbor` command.

```
user@C> show route advertising-protocol bgp 192.168.6.7
```

```

inet.0: 5 destinations, 7 routes (5 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED    Lclpref  AS path
* 10.10.10.14/32    Self              0
* 192.168.6.7/32    Self              0

```

```
user@E> show route advertising-protocol bgp 192.168.40.4
```

```
inet.0: 5 destinations, 7 routes (5 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lclpref    AS path
* 10.10.10.8/30      Self              0         0          I
* 192.168.40.4/32    Self              0         0          I
```

**Meaning** The **send-static** routing policy is exporting the static routes from the routing table into BGP. BGP is advertising these routes between the peers because the BGP peer session is established.

## Example: Configuring BGP Route Preference (Administrative Distance)

- [Understanding Route Preference Values on page 3606](#)
- [Example: Configuring the Preference Value for BGP Routes on page 3607](#)

### Understanding Route Preference Values

The Junos OS routing protocol process assigns a default preference value (also known as an *administrative distance*) to each route that the routing table receives. The default value depends on the source of the route. The preference value is a value from 0 through 4,294,967,295 ( $2^{32} - 1$ ), with a lower value indicating a more preferred route.

[Table 271 on page 3606](#) lists the default preference values.

**Table 271: Default Route Preference Values**

| How Route Is Learned         | Default Preference | Statement to Modify Default Preference                                                                    |
|------------------------------|--------------------|-----------------------------------------------------------------------------------------------------------|
| Directly connected network   | 0                  | —                                                                                                         |
| System routes                | 4                  | —                                                                                                         |

In general, the narrower the scope of the statement, the higher precedence its preference value is given, but the smaller the set of routes it affects. To modify the default preference value for routes learned by routing protocols, you generally apply routing policy when configuring the individual routing protocols. You also can modify some preferences with other configuration statements, which are indicated in the table.

#### Example: Configuring the Preference Value for BGP Routes

This example shows how to specify the preference for routes learned from BGP. Routing information can be learned from multiple sources. To break ties among equally specific routes learned from multiple sources, each source has a preference value. Routes that are learned through explicit administrative action, such as static routes, are preferred over routes learned from a routing protocol, such as BGP or OSPF. This concept is called *administrative distance* by some vendors.

- [Overview on page 3608](#)

- [Configuration on page 3609](#)
- [Verification on page 3611](#)

### **Requirements**

No special configuration beyond device initialization is required before you configure this example.

### **Overview**

Routing information can be learned from multiple sources, such as through static configuration, BGP, or an interior gateway protocol (IGP). When Junos OS determines a route's preference to become the active route, it selects the route with the lowest preference as the active route and installs this route into the forwarding table. By default, the routing software assigns a preference of 170 to routes that originated from BGP. Of all the routing protocols, BGP has the highest default preference value, which means that routes learned by BGP are the least likely to become the active route.

Some vendors have a preference (distance) of 20 for external BGP (EBGP) and a distance of 200 for internal BGP (IBGP). Junos OS uses the same value (170) for both EBGP and IBGP. However, this difference between vendors has no operational impact because Junos OS always prefers EBGP routes over IBGP routes.

Another area in which vendors differ is in regard to IGP distance compared to BGP distance. For example, some vendors assign a distance of 110 to OSPF routes. This is higher than the EBGP distance of 20, and results in the selection of an EBGP route over an equivalent OSPF route. In the same scenario, Junos OS chooses the OSPF route, because of the default preference 10 for an internal OSPF route and 150 for an external OSPF route, which are both lower than the 170 preference assigned to all BGP routes.

In a multivendor environment, you might want to change the preference value for BGP routes so that Junos OS chooses an EBGP route instead of an OSPF route. To accomplish this goal, one option is to include the [preference](#) statement in the EBGP configuration. To modify the default BGP preference value, include the **preference** statement, specifying a value from 0 through 4,294,967,295 ( $2^{32} - 1$ ).

**TIP:** Another way to achieve multivendor compatibility is to include the [advertise-inactive](#) statement in the EBGP configuration. This causes the routing table to export to BGP the best route learned by BGP even if Junos OS did not select it to be an active route. By default, BGP stores the route information it receives from update messages in the Junos OS routing table, and the routing table exports only active routes into BGP, which BGP then advertises to its peers. The `advertise-inactive` statement causes Junos OS to advertise the best BGP route that is inactive because of IGP preference. When you use the `advertise-inactive` statement, the Junos OS device uses the OSPF route for forwarding, and the other vendor's device uses the EBGP route for forwarding. However, from the perspective of an EBGP peer in a neighboring AS, both vendors' devices appear to behave the same way.

---

### Topology

In the sample network, Device R1 and Device R2 have EBGP routes to each other and also OSPF routes to each other.

This example shows the routing tables in the following cases:

- Accept the default preference values of 170 for BGP and 10 for OSPF.
- Change the BGP preference to 8.

Figure 107 on page 3609 shows the sample network.

**Figure 107: BGP Preference Value Topology**

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

Device R1  set interfaces fe-1/2/0 unit 4 family inet address 1.12.0.1/30
            set interfaces lo0 unit 2 family inet address 10.255.71.24/32
            set protocols bgp export send-direct
            set protocols bgp group ext type external
            set protocols bgp group ext preference 8
            set protocols bgp group ext peer-as 65000
            set protocols bgp group ext neighbor 1.12.0.2
            set protocols ospf area 0.0.0.0 interface fe-1/2/0.4
            set protocols ospf area 0.0.0.0 interface 10.255.71.24
            set policy-options policy-statement send-direct term 1 from protocol direct
  
```

```
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 65500
```

**Device R2**

```
set interfaces fe-1/2/0 unit 6 family inet address 1.12.0.2/30
set interfaces lo0 unit 3 family inet address 10.255.14.177/32
set protocols bgp export send-direct
set protocols bgp group ext type external
set protocols bgp group ext peer-as 65500
set protocols bgp group ext neighbor 1.12.0.1
set protocols ospf area 0.0.0.0 interface fe-1/2/0.6
set protocols ospf area 0.0.0.0 interface 10.255.14.177
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 65000
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.  

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 4 family inet address 1.12.0.1/30
user@R1# set lo0 unit 2 family inet address 10.255.71.24/32
```
2. Configure the local autonomous system.  

```
[edit routing-options]
user@R1# set autonomous-system 65500
```
3. Configure the external peering with Device R2.  

```
[edit protocols bgp]
user@R1# set export send-direct
user@R1# set group ext type external
user@R1# set group ext preference 8
user@R1# set group ext peer-as 65000
user@R1# set group ext neighbor 1.12.0.2
```
4. Configure OSPF.  

```
[edit protocols ospf area 0.0.0.0]
user@R1# set interface fe-1/2/0.4
user@R1# set interface 10.255.71.24
```
5. Configure the routing policy.  

```
[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct
user@R1# set then accept
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R1# show interfaces
fe-1/2/0 {
  unit 4 {
    family inet {
      address 1.12.0.1/30;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 10.255.71.24/32;
    }
  }
}

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R1# show protocols
protocols {
  bgp {
    export send-direct;
    group ext {
      type external;
      preference 8;
      peer-as 65000;
      neighbor 1.12.0.2;
    }
  }
  ospf {
    area 0.0.0.0 {
      interface fe-1/2/0.4;
      interface 10.255.71.24;
    }
  }
}

user@R1# show routing-options
autonomous-system 65500;

```

If you are done configuring the device, enter **commit** from configuration mode. Repeat these steps on Device R2.

### Verification

Confirm that the configuration is working properly.

### *Verifying the Preference*

**Purpose** Make sure that the routing tables on Device R1 and Device R2 reflect the fact that Device R1 is using the configured EBGp preference of 8, and Device R2 is using the default EBGp preference of 170.

**Action** From operational mode, enter the **show route** command.

```
user@R1> show route
inet.0: 5 destinations, 7 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
1.12.0.0/30      *[Direct/0] 3d 07:03:01
                  > via fe-1/2/0.4
                  [BGP/8] 01:04:49, localpref 100
                  AS path: 65000 I
                  > to 1.12.0.2 via fe-1/2/0.4
1.12.0.1/32      *[Local/0] 3d 07:03:01
                  Local via fe-1/2/0.4
10.255.14.177/32 *[BGP/8] 01:04:49, localpref 100
                  AS path: 65000 I
                  > to 1.12.0.2 via fe-1/2/0.4
                  [OSPF/10] 3d 07:02:16, metric 1
                  > to 1.12.0.2 via fe-1/2/0.4
10.255.71.24/32  *[Direct/0] 3d 07:03:01
                  > via lo0.2
224.0.0.5/32     *[OSPF/10] 5d 03:42:16, metric 1
                  MultiRecv
```

```
user@R2> show route
inet.0: 5 destinations, 7 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
1.12.0.0/30      *[Direct/0] 3d 07:03:30
                  > via fe-1/2/0.6
                  [BGP/170] 00:45:36, localpref 100
                  AS path: 65500 I
                  > to 1.12.0.1 via fe-1/2/0.6
1.12.0.2/32      *[Local/0] 3d 07:03:30
                  Local via fe-1/2/0.6
10.255.14.177/32 *[Direct/0] 3d 07:03:30
                  > via lo0.3
10.255.71.24/32  *[OSPF/10] 3d 07:02:45, metric 1
                  > to 1.12.0.1 via fe-1/2/0.6
                  [BGP/170] 00:45:36, localpref 100
                  AS path: 65500 I
                  > to 1.12.0.1 via fe-1/2/0.6
224.0.0.5/32     *[OSPF/10] 5d 03:42:45, metric 1
                  MultiRecv
```

**Meaning** The output shows that on Device R1, the active path to Device R2's loopback interface (10.255.14.177/32) is a BGP route. The output also shows that on Device R2, the active path to Device R1's loopback interface (10.255.71.24/32) is an OSPF route.

## Example: Configuring BGP Path Selection

- [Example: Ignoring the AS Path Attribute When Selecting the Best Path on page 3613](#)

### Example: Ignoring the AS Path Attribute When Selecting the Best Path

If multiple BGP routes to the same destination exist, BGP selects the best path based on the route attributes of the paths. One of the route attributes that affects the best-path decision is the length of the AS paths of each route. Routes with shorter AS paths are preferred over those with longer AS paths. Although not typically practical, some scenarios might require that the AS path length be ignored in the route selection process. This example shows how to configure a routing device to ignore the AS path attribute.

- [Requirements on page 3613](#)
- [Overview on page 3613](#)
- [Configuration on page 3614](#)
- [Verification on page 3619](#)

#### Requirements

No special configuration beyond device initialization is required before you configure this example.

#### Overview

On externally connected routing devices, the purpose of skipping the AS path comparison might be to force an external BGP (EBGP) versus internal BGP (IBGP) decision to remove traffic from your network as soon as possible. On internally connected routing devices, you might want your IBGP-only routers to default to the local externally connected gateway. The local IBGP-only (internal) routers skip the AS path comparison and move down the decision tree to use the closest interior gateway protocol (IGP) gateway (lowest IGP metric). Doing this might be an effective way to force these routers to use a LAN connection instead of their WAN connection.

**CAUTION:** When you include the `as-path-ignore` statement on a routing device in your network, you might need to include it on all other BGP-enabled devices in your network to prevent routing loops and convergence issues. This is especially true for IBGP path comparisons.

In this example, Device R2 is learning about the loopback interface address on Device R4 (4.4.4.4/32) from Device R1 and Device R3. Device R1 is advertising 4.4.4.4/32 with an AS-path of 1 5 4, and Device R3 is advertising 4.4.4.4/32 with an AS-path of 3 4. Device R2 selects the path for 4.4.4.4/32 from Device R3 as the best path because the AS path is shorter than the AS path from Device R1.

This example modifies the BGP configuration on Device R2 so that the AS-path length is not used in the best-path selection.

Device R1 has a lower router ID (1.1.1.1) than Device R3 (1.1.1.1). If all other path selection criteria are equal (or, as in this case, ignored), the route learned from Device R1 is used. Because the AS-path attribute is being ignored, the best path is toward Device R1 because of its lower router ID value.

Figure 108 on page 3614 shows the sample topology.

**Figure 108: Topology for Ignoring the AS-Path Length**

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 1 family inet address 192.168.10.1/24
set interfaces fe-1/2/1 unit 10 family inet address 192.168.50.2/24
set interfaces lo0 unit 1 family inet address 1.1.1.1/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct

```

```

set protocols bgp group ext export send-static
set protocols bgp group ext export send-local
set protocols bgp group ext neighbor 192.168.10.2 peer-as 2
set protocols bgp group ext neighbor 192.168.50.1 peer-as 5
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options policy-statement send-local term 1 from protocol local
set policy-options policy-statement send-local term 1 then accept
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept

```

### *Configuring Device R2*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.

```
[edit interfaces]
user@R2# set fe-1/2/0 unit 2 family inet address 192.168.10.2/24
user@R2# set fe-1/2/1 unit 3 family inet address 192.168.20.2/24
user@R2# set lo0 unit 2 family inet address 2.2.2.2/32
```

2. Configure EBGp.

```
[edit protocols bgp group ext]
user@R2# set type external
user@R2# set export send-direct
user@R2# set export send-static
user@R2# set export send-local
user@R2# set neighbor 192.168.10.1 peer-as 1
user@R2# set neighbor 192.168.20.1 peer-as 3
```

3. Configure the autonomous system (AS) path attribute to be ignored in the Junos OS path selection algorithm.

```
[edit protocols bgp]
user@R2# set path-selection as-path-ignore
```

4. Configure the routing policy.

```
[edit policy-options]
user@R2# set policy-statement send-direct term 1 from protocol direct
user@R2# set policy-statement send-direct term 1 then accept
user@R2# set policy-statement send-local term 1 from protocol local
user@R2# set policy-statement send-local term 1 then accept
user@R2# set policy-statement send-static term 1 from protocol static
user@R2# set policy-statement send-static term 1 then accept
```

5. Configure some static routes.

```
[edit routing-options static]
user@R2# set route 192.168.50.0/24 next-hop 192.168.10.1
user@R2# set route 192.168.40.0/24 next-hop 192.168.10.1
user@R2# set route 192.168.30.0/24 next-hop 192.168.20.1
```

6. Configure the autonomous system (AS) number and the router ID.

```
[edit routing-options]
user@R2# set router-id 2.2.2.2
user@R2# set autonomous-system 2
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 2 {
    family inet {
      address 192.168.10.2/24;
    }
  }
}
fe-1/2/1 {
```

```
    unit 3 {
      family inet {
        address 192.168.20.2/24;
      }
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 2.2.2.2/32;
    }
  }
}

user@R2# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}
policy-statement send-local {
  term 1 {
    from protocol local;
    then accept;
  }
}
policy-statement send-static {
  term 1 {
    from protocol static;
    then accept;
  }
}

user@R2# show protocols
bgp {
  path-selection as-path-ignore;
  group ext {
    type external;
    export [ send-direct send-static send-local ];
    neighbor 192.168.10.1 {
      peer-as 1;
    }
    neighbor 192.168.20.1 {
      peer-as 3;
    }
  }
}

user@R2# show routing-options
static {
  route 192.168.50.0/24 next-hop 192.168.10.1;
  route 192.168.40.0/24 next-hop 192.168.10.1;
  route 192.168.30.0/24 next-hop 192.168.20.1;
}
router-id 2.2.2.2;
autonomous-system 2;
```

If you are done configuring the device, enter **commit** from configuration mode. Repeat the configuration on the other devices in the network, changing the interface names and IP addresses, as needed.

### Verification

Confirm that the configuration is working properly.

- [Checking the Neighbor Status on page 3619](#)

### Checking the Neighbor Status

**Purpose** Make sure that from Device R2, the active path to get to AS 4 is through AS 1 and AS 5, not through AS 3.

**NOTE:** To verify the functionality of the `as-path-ignore` statement, you might need to run the `restart routing` command to force reevaluation of the active path. This is because for BGP, if both paths are external, the Junos OS behavior is to prefer the currently active path. This behavior helps to minimize route-flapping. Use caution when restarting the routing protocol process in a production network.

**Action** From operational mode, enter the `restart routing` command.

```
user@R2> restart routing
Routing protocols process started, pid 49396
```

From operational mode, enter the `show route 4.4.4.4 protocol bgp` command.

```
user@R2> show route 4.4.4.4 protocol bgp
inet.0: 12 destinations, 25 routes (12 active, 0 holddown, 4 hidden)
+ = Active Route, - = Last Active, * = Both

4.4.4.4/32          *[BGP/170] 00:00:12, localpref 100
                   AS path: 1 5 4 I
                   > to 192.168.10.1 via fe-1/2/0.2
                   [BGP/170] 00:00:08, localpref 100
                   AS path: 3 4 I
                   > to 192.168.20.1 via fe-1/2/1.3
```

**Meaning** The asterisk (\*) is next to the path learned from R1, meaning that this is the active path. The AS path for the active path is 1 5 4, which is longer than the AS path (3 4) for the nonactive path learned from Router R3.

## Example: Removing Private AS Numbers

- [Understanding Private AS Number Removal from AS Paths on page 3620](#)
- [Example: Removing Private AS Numbers from AS Paths on page 3621](#)

### Understanding Private AS Number Removal from AS Paths

---

By default, when BGP advertises AS paths to remote systems, it includes all AS numbers, including private AS numbers. You can configure the software so that it removes private AS numbers from AS paths. Doing this is useful when any of the following circumstances are true:

- A remote AS for which you provide connectivity is multihomed, but only to the local AS.
- The remote AS does not have an officially allocated AS number.
- It is not appropriate to make the remote AS a confederation member AS of the local AS.

Most companies acquire their own AS number. Some companies also use private AS numbers to connect to their public AS network. These companies might use a different private AS number for each region in which their company does business. In any implementation, announcing a private AS number to the Internet must be avoided. Service providers can use the **remove-private** statement to prevent advertising private AS numbers to the Internet.

In an enterprise scenario, suppose that you have multiple AS numbers in your company, some of which are private AS numbers, and one with a public AS number. The one with a public AS number has a direct connection to the service provider. In the AS that connects directly to the service provider, you can use the **remove-private** statement to filter out any private AS numbers in the advertisements that are sent to the service provider.

**CAUTION:** Changing configuration statements that affect BGP peers, such as enabling or disabling **remove-private** or renaming a BGP group, resets the BGP sessions. Changes that affect BGP peers should only be made when resetting a BGP session is acceptable.

The AS numbers are stripped from the AS path starting at the left end of the AS path (the end where AS paths have been most recently added). The routing device stops searching for private ASs when it finds the first nonprivate AS or a peer's private AS. If the AS path contains the AS number of the external BGP (EBGP) neighbor, BGP does not remove the private AS number.

**NOTE:** As of Junos OS 10.0R2 and later, if there is a need to send prefixes to an EBGP peer that has an AS number that matches an AS number in the AS path, consider using the **as-override** statement instead of the **remove-private** statement.

The operation takes place after any confederation member ASs have already been removed from the AS path, if applicable.

The software is preconfigured with knowledge of the set of AS numbers that is considered private, a range that is defined in the Internet Assigned Numbers Authority (IANA) assigned numbers document. The set of AS numbers reserved as private are in the range from 64,512 through 65,534, inclusive.

### Example: Removing Private AS Numbers from AS Paths

This example demonstrates the removal of a private AS number from the advertised AS path to avoid announcing the private AS number to the Internet.

- [Requirements on page 3621](#)
- [Overview on page 3621](#)
- [Configuration on page 3622](#)
- [Verification on page 3624](#)

#### Requirements

No special configuration beyond device initialization is required before you configure this example.

#### Overview

Service providers and enterprise networks use the **remove-private** statement to prevent advertising private AS numbers to the Internet. The **remove-private** statement works in the outbound direction. You configure the **remove-private** statement on a device that has a public AS number and that is connected to one or more devices that have private AS numbers. Generally, you would not configure this statement on a device that has a private AS number.

[Figure 109 on page 3621](#) shows the sample topology.

**Figure 109: Topology for Removing a Private AS from the Advertised AS Path**

In this example, Device R1 is connected to its service provider using private AS number 65535. The example shows the **remove-private** statement configured on Device ISP to prevent Device R1's private AS number from being announced to Device R2. Device R2 sees only the AS number of the service provider.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```
set interfaces fe-1/2/0 unit 1 family inet address 192.168.10.1/24
set interfaces lo0 unit 1 family inet address 10.10.10.1/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct
set protocols bgp group ext export send-static
set protocols bgp group ext peer-as 100
set protocols bgp group ext neighbor 192.168.10.10
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 192.168.20.0/24 next-hop 192.168.10.10
set routing-options autonomous-system 65535
```

**Device ISP**

```
set interfaces fe-1/2/0 unit 2 family inet address 192.168.10.10/24
set interfaces fe-1/2/1 unit 3 family inet address 192.168.20.20/24
set interfaces lo0 unit 2 family inet address 10.10.0.1/32
set protocols bgp group ext type external
set protocols bgp group ext neighbor 192.168.10.1 peer-as 65535
set protocols bgp group ext neighbor 192.168.20.1 remove-private
set protocols bgp group ext neighbor 192.168.20.1 peer-as 200
set routing-options autonomous-system 100
```

**Device R2**

```
set interfaces fe-1/2/0 unit 4 family inet address 192.168.20.1/24
set interfaces lo0 unit 3 family inet address 10.10.20.1/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct
set protocols bgp group ext export send-static
set protocols bgp group ext peer-as 100
set protocols bgp group ext neighbor 192.168.20.20
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 192.168.10.0/24 next-hop 192.168.20.20
set routing-options autonomous-system 200
```

### Device ISP

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device ISP:

1. Configure the interfaces.  
[edit interfaces]

```

user@ISP# set fe-1/2/0 unit 2 family inet address 192.168.10.10/24
user@ISP# set fe-1/2/1 unit 3 family inet address 192.168.20.20/24
user@ISP# set lo0 unit 2 family inet address 10.10.0.1/32

```

2. Configure EBGP.

```

[edit protocols bgp group ext]
user@ISP# set type external
user@ISP# set neighbor 192.168.10.1 peer-as 65535
user@ISP# set neighbor 192.168.20.1 peer-as 200

```

3. For the neighbor in autonomous system (AS) 200 (Device R2), remove private AS numbers from the advertised AS paths.

```

[edit protocols bgp group ext]
user@ISP# set neighbor 192.168.20.1 remove-private

```

4. Configure the AS number.

```

[edit routing-options]
user@ISP# set autonomous-system 100

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@ISP# show interfaces
fe-1/2/0 {
  unit 2 {
    family inet {
      address 192.168.10.10/24;
    }
  }
}
fe-1/2/1 {
  unit 3 {
    family inet {
      address 192.168.20.20/24;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 10.10.0.1/32;
    }
  }
}
}

user@ISP# show protocols
bgp {
  group ext {
    type external;
    neighbor 192.168.10.1 {
      peer-as 65535;
    }
    neighbor 192.168.20.1 {
      remove-private;
    }
  }
}

```

```
        peer-as 200;
    }
}
}
```

```
user@ISP# show routing-options
autonomous-system 100;
```

If you are done configuring the device, enter **commit** from configuration mode. Repeat the configuration on Device R1 and Device R2, changing the interface names and IP address, as needed, and adding the routing policy configuration.

### **Verification**

Confirm that the configuration is working properly.

- [Checking the Neighbor Status on page 3624](#)
- [Checking the Routing Tables on page 3625](#)
- [Checking the AS Path When the remove-private Statement Is Deactivated on page 3625](#)

### **Checking the Neighbor Status**

**Purpose** Make sure that Device ISP has the **remove-private** setting enabled in its neighbor session with Device R2.

**Action** From operational mode, enter the **show bgp neighbor 192.168.20.1** command.

```
user@ISP> show bgp neighbor 192.168.20.1
Peer: 192.168.20.1+179 AS 200 Local: 192.168.20.20+60216 AS 100
  Type: External State: Established Flags: <ImportEval Sync>
  Last State: OpenConfirm Last Event: RecvKeepAlive
  Last Error: None
  Options: <Preference RemovePrivateAS PeerAS Refresh>
  Holdtime: 90 Preference: 170
  Number of flaps: 0
  Peer ID: 10.10.20.1 Local ID: 10.10.0.1 Active Holdtime: 90
  Keepalive Interval: 30 Peer index: 0
  BFD: disabled, down
  Local Interface: fe-1/2/1.3
  NLRI for restart configured on peer: inet-unicast
  NLRI advertised by peer: inet-unicast
  NLRI for this session: inet-unicast
  Peer supports Refresh capability (2)
  Stale routes from peer are kept for: 300
  Peer does not support Restarter functionality
  NLRI that restart is negotiated for: inet-unicast
  NLRI of received end-of-rib markers: inet-unicast
  NLRI of all end-of-rib markers sent: inet-unicast
  Peer supports 4 byte AS extension (peer-as 200)
  Peer does not support Addpath
  Table inet.0 Bit: 10001
    RIB State: BGP restart is complete
    Send state: in sync
    Active prefixes: 1
    Received prefixes: 3
    Accepted prefixes: 2
    Suppressed due to damping: 0
    Advertised prefixes: 1
```

```

Last traffic (seconds): Received 10    Sent 16    Checked 55
Input messages: Total 54    Updates 3    Refreshes 0    Octets 1091
Output messages: Total 54    Updates 1    Refreshes 0    Octets 1118
Output Queue[0]: 0

```

**Meaning** The `RemovePrivateAS` option shows that Device ISP has the expected setting.

### *Checking the Routing Tables*

**Purpose** Make sure that the devices have the expected routes and AS paths.

**Action** From operational mode, enter the `show route protocol bgp` command.

```

user@R1> show route protocol bgp
inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.10.20.1/32    *[BGP/170] 00:28:57, localpref 100
                 AS path: 100 200 I
                 > to 192.168.10.10 via fe-1/2/0.1

user@ISP> show route protocol bgp

inet.0: 7 destinations, 11 routes (7 active, 0 holddown, 2 hidden)
+ = Active Route, - = Last Active, * = Both

10.10.10.1/32    *[BGP/170] 00:29:40, localpref 100
                 AS path: 65535 I
                 > to 192.168.10.1 via fe-1/2/0.2
10.10.20.1/32    *[BGP/170] 00:29:36, localpref 100
                 AS path: 200 I
                 > to 192.168.20.1 via fe-1/2/1.3
192.168.10.0/24  [BGP/170] 00:29:40, localpref 100
                 AS path: 65535 I
                 > to 192.168.10.1 via fe-1/2/0.2
192.168.20.0/24  [BGP/170] 00:29:36, localpref 100
                 AS path: 200 I
                 > to 192.168.20.1 via fe-1/2/1.3

user@R2> show route protocol bgp
inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.10.10.1/32    *[BGP/170] 00:29:53, localpref 100
                 AS path: 100 I
                 > to 192.168.20.20 via fe-1/2/0.4

```

**Meaning** Device ISP has the private AS number 65535 in its AS path to Device R1. However, Device ISP does not advertise this private AS number to Device R2. This is shown in the routing table of Device R2. Device R2's path to Device R1 contains only the AS number for Device ISP.

### *Checking the AS Path When the remove-private Statement Is Deactivated*

**Purpose** Verify that without the `remove-private` statement, the private AS number appears in Device R2's routing table.

**Action** From configuration mode on Device ISP, enter the **deactivate remove-private** command and then recheck the routing table on Device R2.

```
[protocols bgp group ext neighbor 192.168.20.1]
user@ISP# deactivate remove-private
user@ISP# commit

user@R2> show route protocol bgp
inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.10.10.1/32      *[BGP/170] 00:00:54, localpref 100
                  AS path: 100 65535 I
                  > to 192.168.20.20 via fe-1/2/0.4
```

**Meaning** Private AS number 65535 appears in Device R2's AS path to Device R1.

#### Understanding BFD for BGP

The Bidirectional Forwarding Detection (BFD) protocol is a simple hello mechanism that detects failures in a network. Hello packets are sent at a specified, regular interval. A neighbor failure is detected when the routing device stops receiving a reply after a specified interval. BFD works with a wide variety of network environments and topologies. The failure detection timers for BFD have shorter time limits than default failure detection mechanisms for BGP, so they provide faster detection.

The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the **clear bfd adaptation** command to return BFD interval timers to their configured values. The **clear bfd adaptation** command is hitless, meaning that the command does not affect traffic flow on the routing device.

In Junos OS Release 8.3 and later, BFD is supported on internal BGP (IBGP) and multihop external BGP (EBGP) sessions as well as on single-hop EBGp sessions. In Junos OS Release 9.1 through Junos OS Release 11.1, BFD supports IPv6 interfaces in static routes only. In Junos OS Release 11.2 and later, BFD supports IPv6 interfaces with BGP.

---

### Example: Configuring BFD on Internal BGP Peer Sessions

---

This example shows how to configure internal BGP (IBGP) peer sessions with the Bidirectional Forwarding Detection (BFD) protocol to detect failures in a network.

- [Requirements on page 3627](#)
- [Overview on page 3627](#)
- [Configuration on page 3628](#)
- [Verification on page 3632](#)

#### **Requirements**

No special configuration beyond device initialization is required before you configure this example.

#### **Overview**

The minimum configuration to enable BFD on IBGP sessions is to include the **bfd-liveness-detection minimum-interval** statement in the BGP configuration of all neighbors participating in the BFD session. The **minimum-interval** statement specifies the minimum transmit and receive intervals for failure detection. Specifically, this value represents the minimum interval after which the local routing device transmits hello packets as well as the minimum interval that the routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a value from 1 through 255,000 milliseconds.

Optionally, you can specify the minimum transmit and receive intervals separately using the **transmit-interval minimum-interval** and **minimum-receive-interval** statements. For information about these and other optional BFD configuration statements, see [bfd-liveness-detection](#).

**NOTE:** BFD is an intensive protocol that consumes system resources. Specifying a minimum interval for BFD less than 100 ms for Routing Engine-based sessions and less than 10 ms for distributed BFD sessions can cause undesired BFD flapping.

Depending on your network environment, these additional recommendations might apply:

- For large-scale network deployments with a large number of BFD sessions, specify a minimum interval of 300 ms for Routing Engine-based sessions and 100 ms for distributed BFD sessions.
- For very large-scale network deployments with a large number of BFD sessions, contact Juniper Networks customer support for more information.
- For BFD sessions to remain up during a Routing Engine switchover event when nonstop active routing (NSR) is configured, specify a minimum interval of 2500 ms for Routing Engine-based sessions. For distributed BFD sessions with NSR configured, the minimum interval recommendations are unchanged and depend only on your network deployment.

BFD is supported on the default routing instance (the main router), routing instances, and logical systems. This example shows BFD on logical systems.

Figure 110 on page 3628 shows a typical network with internal peer sessions.

**Figure 110: Typical Network with IBGP Sessions**

#### Configuration

##### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

##### Device A

```
set logical-systems A interfaces lt-1/2/0 unit 1 description to-B
set logical-systems A interfaces lt-1/2/0 unit 1 encapsulation ethernet
set logical-systems A interfaces lt-1/2/0 unit 1 peer-unit 2
```

```

set logical-systems A interfaces lt-1/2/0 unit 1 family inet address 10.10.10.1/30
set logical-systems A interfaces lo0 unit 1 family inet address 192.168.6.5/32
set logical-systems A protocols bgp group internal-peers type internal
set logical-systems A protocols bgp group internal-peers traceoptions file bgp-bfd
set logical-systems A protocols bgp group internal-peers traceoptions flag bfd detail
set logical-systems A protocols bgp group internal-peers local-address 192.168.6.5
set logical-systems A protocols bgp group internal-peers export send-direct
set logical-systems A protocols bgp group internal-peers bfd-liveness-detection
    minimum-interval 1000
set logical-systems A protocols bgp group internal-peers neighbor 192.163.6.4
set logical-systems A protocols bgp group internal-peers neighbor 192.168.40.4
set logical-systems A protocols ospf area 0.0.0.0 interface lo0.1 passive
set logical-systems A protocols ospf area 0.0.0.0 interface lt-1/2/0.1
set logical-systems A policy-options policy-statement send-direct term 2 from protocol
    direct
set logical-systems A policy-options policy-statement send-direct term 2 then accept
set logical-systems A routing-options router-id 192.168.6.5
set logical-systems A routing-options autonomous-system 17

```

**Device B**

```

set logical-systems B interfaces lt-1/2/0 unit 2 description to-A
set logical-systems B interfaces lt-1/2/0 unit 2 encapsulation ethernet
set logical-systems B interfaces lt-1/2/0 unit 2 peer-unit 1
set logical-systems B interfaces lt-1/2/0 unit 2 family inet address 10.10.10.2/30
set logical-systems B interfaces lt-1/2/0 unit 5 description to-C
set logical-systems B interfaces lt-1/2/0 unit 5 encapsulation ethernet
set logical-systems B interfaces lt-1/2/0 unit 5 peer-unit 6
set logical-systems B interfaces lt-1/2/0 unit 5 family inet address 10.10.10.5/30
set logical-systems B interfaces lo0 unit 2 family inet address 192.163.6.4/32
set logical-systems B protocols bgp group internal-peers type internal
set logical-systems B protocols bgp group internal-peers local-address 192.163.6.4
set logical-systems B protocols bgp group internal-peers export send-direct
set logical-systems B protocols bgp group internal-peers bfd-liveness-detection
    minimum-interval 1000
set logical-systems B protocols bgp group internal-peers neighbor 192.168.40.4
set logical-systems B protocols bgp group internal-peers neighbor 192.168.6.5
set logical-systems B protocols ospf area 0.0.0.0 interface lo0.2 passive
set logical-systems B protocols ospf area 0.0.0.0 interface lt-1/2/0.2
set logical-systems B protocols ospf area 0.0.0.0 interface lt-1/2/0.5
set logical-systems B policy-options policy-statement send-direct term 2 from protocol
    direct
set logical-systems B policy-options policy-statement send-direct term 2 then accept
set logical-systems B routing-options router-id 192.163.6.4
set logical-systems B routing-options autonomous-system 17

```

**Device C**

```

set logical-systems C interfaces lt-1/2/0 unit 6 description to-B
set logical-systems C interfaces lt-1/2/0 unit 6 encapsulation ethernet
set logical-systems C interfaces lt-1/2/0 unit 6 peer-unit 5
set logical-systems C interfaces lt-1/2/0 unit 6 family inet address 10.10.10.6/30
set logical-systems C interfaces lo0 unit 3 family inet address 192.168.40.4/32
set logical-systems C protocols bgp group internal-peers type internal
set logical-systems C protocols bgp group internal-peers local-address 192.168.40.4
set logical-systems C protocols bgp group internal-peers export send-direct
set logical-systems C protocols bgp group internal-peers bfd-liveness-detection
    minimum-interval 1000
set logical-systems C protocols bgp group internal-peers neighbor 192.163.6.4

```

```
set logical-systems C protocols bgp group internal-peers neighbor 192.168.6.5
set logical-systems C protocols ospf area 0.0.0.0 interface lo0.3 passive
set logical-systems C protocols ospf area 0.0.0.0 interface lt-1/2/0.6
set logical-systems C policy-options policy-statement send-direct term 2 from protocol
  direct
set logical-systems C policy-options policy-statement send-direct term 2 then accept
set logical-systems C routing-options router-id 192.168.40.4
set logical-systems C routing-options autonomous-system 17
```

### *Configuring Device A*

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device A:

1. Set the CLI to Logical System A.

```
user@host> set cli logical-system A
```

2. Configure the interfaces.

```
[edit interfaces lt-1/2/0 unit 1]
user@host:A# set description to-B
user@host:A# set encapsulation ethernet
user@host:A# set peer-unit 2
user@host:A# set family inet address 10.10.10.1/30
```

```
[edit interfaces lo0 unit 1]
user@host:A# set family inet address 192.168.6.5/32
```

3. Configure BGP.

The **neighbor** statements are included for both Device B and Device C, even though Device A is not directly connected to Device C.

```
[edit protocols bgp group internal-peers]
user@host:A# set type internal
user@host:A# set local-address 192.168.6.5
user@host:A# set export send-direct
user@host:A# set neighbor 192.163.6.4
user@host:A# set neighbor 192.168.40.4
```

4. Configure BFD.

```
[edit protocols bgp group internal-peers]
user@host:A# set bfd-liveness-detection minimum-interval 1000
```

You must configure the same minimum interval on the connecting peer.

5. (Optional) Configure BFD tracing.

```
[edit protocols bgp group internal-peers]
user@host:A# set traceoptions file bgp-bfd
user@host:A# set traceoptions flag bfd detail
```

6. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
```

```
user@host:A# set interface lo0.1 passive
user@host:A# set interface lt-1/2/0.1
```

7. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 2]
user@host:A# set from protocol direct
user@host:A# set then accept
```

8. Configure the router ID and the autonomous system (AS) number.

```
[edit routing-options]
user@host:A# set router-id 192.168.6.5
user@host:A# set autonomous-system 17
```

9. If you are done configuring the device, enter **commit** from configuration mode. Repeat these steps to configure Device B and Device C.

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host:A# show interfaces
lt-1/2/0 {
  unit 1 {
    description to-B;
    encapsulation ethernet;
    peer-unit 2;
    family inet {
      address 10.10.10.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.6.5/32;
    }
  }
}

user@host:A# show policy-options
policy-statement send-direct {
  term 2 {
    from protocol direct;
    then accept;
  }
}

user@host:A# show protocols
bgp {
  group internal-peers {
    type internal;
    traceoptions {
```

```
file bgp-bfd;
flag bfd detail;
}
local-address 192.168.6.5;
export send-direct;
bfd-liveness-detection {
  minimum-interval 1000;
}
neighbor 192.163.6.4;
neighbor 192.168.40.4;
}
}
ospf {
  area 0.0.0.0 {
    interface lo0.1 {
      passive;
    }
    interface lt-1/2/0.1;
  }
}

user@host:A# show routing-options
router-id 192.168.6.5;
autonomous-system 17;
```

### **Verification**

Confirm that the configuration is working properly.

- [Verifying That BFD Is Enabled on page 3632](#)
- [Verifying That BFD Sessions Are Up on page 3633](#)
- [Viewing Detailed BFD Events on page 3633](#)
- [Viewing Detailed BFD Events After Deactivating and Reactivating a Loopback Interface on page 3634](#)

### **Verifying That BFD Is Enabled**

**Purpose** Verify that BFD is enabled between the IBGP peers.

**Action** From operational mode, enter the **show bgp neighbor** command. You can use the **| match bfd** filter to narrow the output.

```
user@host:A> show bgp neighbor | match bfd
Options: <BfdEnabled>
  BFD: enabled, up
  Trace file: /var/log/A/bgp-bfd size 131072 files 10
Options: <BfdEnabled>
  BFD: enabled, up
  Trace file: /var/log/A/bgp-bfd size 131072 files 10
```

**Meaning** The output shows that Logical System A has two neighbors with BFD enabled. When BFD is not enabled, the output displays **BFD: disabled, down**, and the **<BfdEnabled>** option is absent. If BFD is enabled and the session is down, the output displays **BFD: enabled, down**. The output also shows that BFD-related events are being written to a log file because trace operations are configured.

**Verifying That BFD Sessions Are Up**

**Purpose** Verify that the BFD sessions are up, and view details about the BFD sessions.

**Action** From operational mode, enter the **show bfd session extensive** command.

```
user@host:A> show bfd session extensive
```

| Address     | State | Interface | Detect Time | Transmit Interval | Multiplier |
|-------------|-------|-----------|-------------|-------------------|------------|
| 192.163.6.4 | Up    |           | 3.000       | 1.000             | 3          |

Client BGP, TX interval 1.000, RX interval 1.000  
Session up time 00:54:40  
Local diagnostic None, remote diagnostic None  
Remote state Up, version 1  
Logical system 12, routing table index 25  
Min async interval 1.000, min slow interval 1.000  
Adaptive async TX interval 1.000, RX interval 1.000  
Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3  
Remote min TX interval 1.000, min RX interval 1.000, multiplier 3  
Local discriminator 10, remote discriminator 9  
Echo mode disabled/inactive  
Multi-hop route table 25, local-address 192.168.6.5

| Address      | State | Interface | Detect Time | Transmit Interval | Multiplier |
|--------------|-------|-----------|-------------|-------------------|------------|
| 192.168.40.4 | Up    |           | 3.000       | 1.000             | 3          |

Client BGP, TX interval 1.000, RX interval 1.000  
Session up time 00:48:03  
Local diagnostic None, remote diagnostic None  
Remote state Up, version 1  
Logical system 12, routing table index 25  
Min async interval 1.000, min slow interval 1.000  
Adaptive async TX interval 1.000, RX interval 1.000  
Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3  
Remote min TX interval 1.000, min RX interval 1.000, multiplier 3  
Local discriminator 14, remote discriminator 13  
Echo mode disabled/inactive  
Multi-hop route table 25, local-address 192.168.6.5

2 sessions, 2 clients  
Cumulative transmit rate 2.0 pps, cumulative receive rate 2.0 pps

**Meaning** The TX interval 1.000, RX interval 1.000 output represents the setting configured with the **minimum-interval** statement. All of the other output represents the default settings for BFD. To modify the default settings, include the optional statements under the **bfd-liveness-detection** statement.

**Viewing Detailed BFD Events**

**Purpose** View the contents of the BFD trace file to assist in troubleshooting, if needed.

**Action** From operational mode, enter the **file show /var/log/A/bgp-bfd** command.

```
user@host:A> file show /var/log/A/bgp-bfd
Aug 15 17:07:25 trace_on: Tracing to "/var/log/A/bgp-bfd" started
Aug 15 17:07:26.492190 bgp_peer_init: BGP peer 192.163.6.4 (Internal AS 17) local
address 192.168.6.5 not found. Leaving peer idled
Aug 15 17:07:26.493176 bgp_peer_init: BGP peer 192.168.40.4 (Internal AS 17) local
```

```

address 192.168.6.5 not found. Leaving peer idled
Aug 15 17:07:32.597979 task_connect: task BGP_17.192.163.6.4+179 addr
192.163.6.4+179: No route to host
Aug 15 17:07:32.599623 bgp_connect_start: connect 192.163.6.4 (Internal AS 17):

### Example: Configuring BFD Authentication for BGP

- [Understanding BFD Authentication for BGP on page 3635](#)
- [Example: Configuring BFD Authentication for BGP on page 3637](#)

#### Understanding BFD Authentication for BGP

Bidirectional Forwarding Detection protocol (BFD) enables rapid detection of communication failures between adjacent systems. By default, authentication for BFD sessions is disabled. However, when you run BFD over Network Layer protocols, the risk of service attacks can be significant. We strongly recommend using authentication if you are running BFD over multiple hops or through insecure tunnels. Beginning with Junos OS Release 9.6, Junos OS supports authentication for BFD sessions running over BGP. BFD authentication is not supported on MPLS OAM sessions. BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

You authenticate BFD sessions by specifying an authentication algorithm and keychain, and then associating that configuration information with a security authentication keychain using the keychain name.

The following sections describe the supported authentication algorithms, security keychains, and level of authentication that can be configured:

- [BFD Authentication Algorithms on page 3636](#)
- [Security Authentication Keychains on page 3636](#)
- [Strict Versus Loose Authentication on page 3637](#)

### **BFD Authentication Algorithms**

Junos OS supports the following algorithms for BFD authentication:

- **simple-password**—Plain-text password. One to 16 bytes of plain text are used to authenticate the BFD session. One or more passwords can be configured. This method is the least secure and should be used only when BFD sessions are not subject to packet interception.
- **keyed-md5**—Keyed Message Digest 5 hash algorithm for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed MD5 uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than or equal to the last sequence number received. Although more secure than a simple password, this method is vulnerable to replay attacks. Increasing the rate at which the sequence number is updated can reduce this risk.
- **meticulous-keyed-md5**—Meticulous keyed Message Digest 5 hash algorithm. This method works in the same manner as keyed MD5, but the sequence number is updated with every packet. Although more secure than keyed MD5 and simple passwords, this method might take additional time to authenticate the session.
- **keyed-sha-1**—Keyed Secure Hash Algorithm I for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed SHA uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. The key is not carried within the packets. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than the last sequence number received.
- **meticulous-keyed-sha-1**—Meticulous keyed Secure Hash Algorithm I. This method works in the same manner as keyed SHA, but the sequence number is updated with every packet. Although more secure than keyed SHA and simple passwords, this method might take additional time to authenticate the session.

**NOTE:** Nonstop active routing (NSR) is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

---

### **Security Authentication Keychains**

The security authentication keychain defines the authentication attributes used for authentication key updates. When the security authentication keychain is configured and associated with a protocol through the keychain name, authentication key updates can occur without interrupting routing and signaling protocols.

The authentication keychain contains one or more keychains. Each keychain contains one or more keys. Each key holds the secret data and the time at which the key becomes valid. The algorithm and keychain must be configured on both ends of the BFD session,

and they must match. Any mismatch in configuration prevents the BFD session from being created.

BFD allows multiple clients per session, and each client can have its own keychain and algorithm defined. To avoid confusion, we recommend specifying only one security authentication keychain.

### ***Strict Versus Loose Authentication***

By default, strict authentication is enabled and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure *loose checking*. When loose checking is configured, packets are accepted without authentication being checked at each end of the session. This feature is intended for transitional periods only.

### **Example: Configuring BFD Authentication for BGP**

Beginning with Junos OS Release 9.6, you can configure authentication for BFD sessions running over BGP. Only three steps are needed to configure authentication on a BFD session:

1. Specify the BFD authentication algorithm for the BGP protocol.
2. Associate the authentication keychain with the BGP protocol.
3. Configure the related security authentication keychain.

The following sections provide instructions for configuring and viewing BFD authentication on BGP:

- [Configuring BFD Authentication Parameters on page 3637](#)
- [Viewing Authentication Information for BFD Sessions on page 3639](#)

### ***Configuring BFD Authentication Parameters***

BFD authentication can be configured for the entire BGP protocol, or a specific BGP group, neighbor, or routing instance.

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure BFD authentication:

1. Specify the algorithm (**keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**, or **simple-password**) to use.

[edit]

```
user@host# set protocols bgp bfd-liveness-detection authentication algorithm
keyed-sha-1
```

```
user@host# set protocols bgp group bgp-gr1 bfd-liveness-detection authentication
algorithm keyed-sha-1
```

```
user@host# set protocols bgp group bgp-gr1 neighbor 10.10.10.7 bfd-liveness-detection
authentication algorithm keyed-sha-1
```

**NOTE:** Nonstop active routing is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

2. Specify the keychain to be used to associate BFD sessions on BGP with the unique security authentication keychain attributes.

The keychain name you specify must match a keychain name configured at the **[edit security authentication key-chains]** hierarchy level.

```
[edit]
user@host# set protocols bgp bfd-liveness-detection authentication keychain bfd-bgp
user@host# set protocols bgp group bgp-gr1 bfd-liveness-detection authentication
keychain bfd-bgp
user@host# set protocols bgp group bgp-gr1 neighbor 10.10.10.7 bfd-liveness-detection
authentication keychain bfd-bgp
```

**NOTE:** The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

3. Specify the unique security authentication information for BFD sessions:

- The matching keychain name as specified in Step 2.
- At least one key, a unique integer between 0 and 63. Creating multiple keys allows multiple clients to use the BFD session.
- The secret data used to allow access to the session.
- The time at which the authentication key becomes active, in the format *yyyy-mm-dd.hh:mm:ss*.

```
[edit security]
user@host# set authentication-key-chains key-chain bfd-bgp key 53 secret
$9$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHm start-time 2009-06-14.10:00:00
```

4. (Optional) Specify loose authentication checking if you are transitioning from nonauthenticated sessions to authenticated sessions.

```
[edit]
user@host# set protocols bgp bfd-liveness-detection authentication loose-check
user@host# set protocols bgp group bgp-gr1 bfd-liveness-detection authentication
loose-check
user@host# set protocols bgp group bgp-gr1 neighbor 10.10.10.7 bfd-liveness-detection
authentication loose-check
```

5. (Optional) View your configuration using the **show bfd session detail** or **show bfd session extensive** command.
6. Repeat these steps to configure the other end of the BFD session.

**NOTE:** BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

### Viewing Authentication Information for BFD Sessions

You can view the existing BFD authentication configuration using the **show bfd session detail** and **show bfd session extensive** commands.

The following example shows BFD authentication configured for the **bgp-gr1** BGP group. It specifies the keyed SHA-1 authentication algorithm and a keychain name of **bfd-bgp**. The authentication keychain is configured with two keys. Key 1 contains the secret data “\$9\$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHM” and a start time of June 1, 2009, at 9:46:02 AM PST. Key 2 contains the secret data “\$9\$a5jiKW9L.reP38ny.TszF2/9” and a start time of June 1, 2009, at 3:29:20 PM PST.

```
[edit protocols bgp]
group bgp-gr1 {
  bfd-liveness-detection {
    authentication {
      algorithm keyed-sha-1;
      key-chain bfd-bgp;
    }
  }
}
[edit security]
authentication key-chains {
  key-chain bfd-bgp {
    key 1 {
      secret "$9$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHM";
      start-time "2009-6-1.09:46:02 -0700";
    }
    key 2 {
      secret "$9$a5jiKW9L.reP38ny.TszF2/9";
      start-time "2009-6-1.15:29:20 -0700";
    }
  }
}
```

If you commit these updates to your configuration, you see output similar to the following. In the output for the **show bfd session detail** command, **Authenticate** is displayed to indicate that BFD authentication is configured. For more information about the configuration, use the **show bfd session extensive** command. The output for this command provides the keychain name, the authentication algorithm and mode for each client in the session, and the overall BFD authentication configuration status, keychain name, and authentication algorithm and mode.

### show bfd session detail

```
user@host# show bfd session detail
```

#### Understanding BGP Multipath

BGP multipath allows you to select multiple internal or external BGP peers as active paths. Selecting multiple paths enables BGP peering to load-balance traffic across an Autonomous System (AS) confederation boundary.

A path is considered a BGP equal-cost path (and is used for forwarding) if a tie-break is performed. The tie-break is performed after the BGP route path selection step that chooses the next-hop path that is resolved through the IGP route with the lowest metric. All paths with the same neighboring AS, learned by a multipath-enabled BGP neighbor are considered in the path selection process.

BGP, typically selects only one best path for each prefix and installs that route in the routing table. When BGP multipath is enabled, the device selects multiple equal-cost

EBGP paths as the best paths to reach a given destination, and all these paths are installed in the routing table. BGP advertises only the active path to its neighbors. However, you can configure BGP to advertise multiple paths to the same destination for redundancy and load balancing.

The Junos OS BGP multipath feature supports the following applications:

- Load balancing across multiple links between two routing devices belonging to different autonomous systems (ASs)
- Load balancing across a common subnet or multiple subnets to different routing devices belonging to the same peer AS
- Load balancing across multiple links between two routing devices belonging to different external confederation peers
- Load balancing across a common subnet or multiple subnets to different routing devices belonging to external confederation peers

In a common scenario for load balancing, a customer is multihomed to multiple routers in a point of presence (POP). The default behavior is to send all traffic across only one of the available links. Load balancing causes traffic to use two or more of the links.

**NOTE:** BGP multipath does not apply to paths that share the same MED-plus-IGP cost, yet differ in IGP cost. Multipath path selection is based on the IGP cost metric, even if two paths have the same MED-plus-IGP cost.

### Example: Load Balancing BGP Traffic

This example shows how to configure BGP to select multiple equal-cost external BGP (EBGP) or internal BGP (IBGP) paths as active paths.

- [Requirements on page 3641](#)
- [Overview on page 3641](#)
- [Configuration on page 3643](#)
- [Verification on page 3645](#)

#### Requirements

Before you begin:

- Configure the device interfaces.
- Configure an interior gateway protocol (IGP).
- Configure BGP.
- Configure a routing policy that exports routes (such as direct routes or IGP routes) from the routing table into BGP.

#### Overview

The following steps show how to configure per-packet load balancing:

1. Define a load-balancing routing policy by including one or more **policy-statement** statements at the **[edit policy-options]** hierarchy level, defining an action of **load-balance per-packet**:

```
policy-statement policy-name {  
  from {  
    match-conditions;  
    route-filter destination-prefix match-type <actions>;  
    prefix-list name;  
  }  
  then {  
    load-balance per-packet;  
  }  
}
```

2. Apply the policy to routes exported from the routing table to the forwarding table. To do this, include the **forwarding-table** and **export** statements:

```
forwarding-table {  
  export policy-name;  
}
```

You cannot apply the export policy to VRF routing instances.

3. Specify all next hops of that route, if more than one exists, when allocating a label corresponding to a route that is being advertised.
4. Configure the forwarding-options hash key for MPLS to include the IP payload.

**NOTE:** On some platforms, you can increase the number of paths that are load balanced by using the **chassis maximum-ecmp** statement. With this statement, you can change the maximum number of equal-cost load-balanced paths to 32 or 64.

---

In this example, Device R1 is in AS 65000 and is connected to both Device R2 and Device R3, which are in AS 65001. This example shows the configuration on Device R1.

### **Topology**

[Figure 111 on page 3643](#) shows the topology used in this example.

Figure 111: BGP Load Balancing

**Configuration****CLI Quick Configuration**

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set protocols bgp group external type external
set protocols bgp group external peer-as 65001
set protocols bgp group external multipath
set protocols bgp group external neighbor 10.0.1.1
set protocols bgp group external neighbor 10.0.0.2
set policy-options policy-statement loadbal from route-filter 10.0.0.0/16 orlonger
set policy-options policy-statement loadbal then load-balance per-packet
set routing-options forwarding-table export loadbal
set routing-options autonomous-system 65000
```

**Step-by-Step Procedure**

The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the BGP peer sessions:

1. Configure the BGP group.
 

```
[edit protocols bgp group external]
user@R1# set type external
user@R1# set peer-as 65001
user@R1# set neighbor 10.0.1.1
user@R1# set neighbor 10.0.0.2
```
2. Enable the BGP group to use multiple paths.

**NOTE:** To disable the default check requiring that paths accepted by BGP multipath must have the same neighboring autonomous system (AS), include the `multiple-as` option.

```
[edit protocols bgp group external]
user@R1# set multipath
```

3. Configure the load-balancing policy.

```
[edit policy-options policy-statement loadbal]
user@R1# set from route-filter 10.0.0.0/16 orlonger
user@R1# set then load-balance per-packet
```

4. Apply the load-balancing policy.

```
[edit routing-options]
user@R1# set forwarding-table export loadbal
```

5. Configure the local autonomous system (AS) number.

```
[edit routing-options]
user@R1# set autonomous-system 65000
```

**Results** From configuration mode, confirm your configuration by entering the **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@R1# show protocols
bgp {
  group external {
    type external;
    peer-as 65001;
    multipath;
    neighbor 10.0.1.1;
    neighbor 10.0.0.2;
  }
}
```

```
[edit]
user@R1# show policy-options
policy-statement loadbal {
  from {
    route-filter 10.0.0.0/16 orlonger;
  }
  then {
    load-balance per-packet;
  }
}
```

```
[edit]
user@R1# show routing-options
autonomous-system 65000;
forwarding-table {
```

```
export loadbal;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly:

- [Verifying Routes on page 3645](#)
- [Verifying Forwarding on page 3646](#)

### Verifying Routes

**Purpose** Verify that routes are learned from both routers in the neighboring AS.

**Action** From operational mode, run the **show route** command.

```
user@R1> show route 10.0.2.0
inet.0: 12 destinations, 15 routes (12 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.2.0/30          *[BGP/170] 03:12:32, localpref 100
                    AS path: 65001 I
                    to 10.0.1.1 via ge-1/2/0.0
                    > to 10.0.0.2 via ge-1/2/1.0
                    [BGP/170] 03:12:32, localpref 100
                    AS path: 65001 I
                    > to 10.0.1.1 via ge-1/2/0.0

user@R1> show route 10.0.2.0 detail

             Next-hop reference count: 3
             Source: 10.0.0.2
             Next hop: 10.0.1.1 via ge-1/2/0.0
             Next hop: 10.0.0.2 via ge-1/2/1.0, selected
             State: <Active Ext>
             Local AS: 65000 Peer AS: 65001
             Age: 3:18:30
             Task: BGP_65001.10.0.0.2+55402
             Announcement bits (1): 2-KRT
             AS path: 65001 I
             Accepted Multipath
             Localpref: 100
             Router ID: 192.168.2.1
   BGP      Preference: 170/-101
             Next hop type: Router, Next hop index: 602
             Next-hop reference count: 5
             Source: 10.0.1.1
             Next hop: 10.0.1.1 via ge-1/2/0.0, selected
             State: <NotBest Ext>
             Inactive reason: Not Best in its group - Active preferred
             Local AS: 65000 Peer AS: 65001
             Age: 3:18:30
             Task: BGP_65001.10.0.1.1+53135
             AS path: 65001 I
```

Accepted  
Localpref: 100  
Router ID: 192.168.3.1

**Meaning** The active path, denoted with an asterisk (\*), has two next hops: 10.0.1.1 and 10.0.0.2 to the 10.0.2.0 destination. The 10.0.1.1 next hop is copied from the inactive path to the active path.

**NOTE:** The `show route detail` command output designates one gateway as selected. This output is potentially confusing in the context of load balancing. The selected gateway is used for many purposes in addition to deciding which gateway to install into the kernel when Junos OS is not performing per-packet load-balancing. For instance, the `ping mpls` command uses the selected gateway when sending packets. Multicast protocols use the selected gateway in some cases to determine the upstream interface. Therefore, even when Junos OS is performing per-packet load-balancing by way of a forwarding-table policy, the selected gateway information is still required for other purposes. It is useful to display the selected gateway for troubleshooting purposes. Additionally, it is possible to use forwarding-table policy to override what is installed into the kernel (for example, by using the `install-nexthop` action). In this case, the next-hop gateway installed in the forwarding table might be a subset of the total gateways displayed in the `show route` command.

---

### Verifying Forwarding

**Purpose** Verify that both next hops are installed in the forwarding table.

**Action** From operational mode, run the `show route forwarding-table` command.

```
user@R1> show route forwarding-table destination 10.0.2.0
Routing table: default.inet
Internet:
Destination      Type RtRef Next hop          Type Index NhRef Netif
10.0.2.0/30      user   0          10.0.1.1          ucst  602    5 ge-1/2/0.0
                  10.0.0.2          ucst  522    6 ge-1/2/1.0
```

### Example: Configuring Single-Hop EBGPeers to Accept Remote Next Hops

---

This example shows how to configure a single-hop external BGP (EBGP) peer to accept a remote next hop with which it does not share a common subnet.

- [Requirements on page 3647](#)
- [Overview on page 3647](#)
- [Configuration on page 3648](#)
- [Verification on page 3655](#)

### Requirements

No special configuration beyond device initialization is required before you configure this example.

### Overview

In some situations, it is necessary to configure a single-hop EBGP peer to accept a remote next hop with which it does not share a common subnet. The default behavior is for any next-hop address received from a single-hop EBGP peer that is not recognized as sharing a common subnet to be discarded. The ability to have a single-hop EBGP peer accept a remote next hop to which it is not directly connected also prevents you from having to configure the single-hop EBGP neighbor as a multihop session. When you configure a multihop session in this situation, all next-hop routes learned through this EBGP peer are labeled indirect even when they do share a common subnet. This situation breaks multipath functionality for routes that are recursively resolved over routes that include these next-hop addresses. Configuring the `accept-remote-nexthop` statement allows a single-hop EBGP peer to accept a remote next hop, which restores multipath functionality for routes that are resolved over these next-hop addresses. You can configure this statement at the global, group, and neighbor hierarchy levels for BGP. The statement is also supported on logical systems and the VPN routing and forwarding (VRF) routing instance type. Both the remote next-hop and the EBGP peer must support BGP route refresh as defined in RFC 2918, *Route Refresh Capability in BGP-4*. If the remote peer does not support BGP route refresh, the session is reset.

**NOTE:** You cannot configure both the `multihop` and `accept-remote-nexthop` statements for the same EBGP peer.

When you enable a single-hop EBGP peer to accept a remote next hop, you must also configure an import routing policy on the EBGP peer that specifies the remote next-hop address.

This example includes an import routing policy, `agg_route`, that enables a single-hop external BGP peer (Device R1) to accept the remote next-hop 1.1.10.10 for the route to the 1.1.230.0/23 network. At the `[edit protocols bgp]` hierarchy level, the example includes the `import agg_route` statement to apply the policy to the external BGP peer and includes the `accept-remote-nexthop` statement to enable the single-hop EBGP peer to accept the remote next hop.

Figure 112 on page 3648 shows the sample topology.

Figure 112: Topology for Accepting a Remote Next Hop

**Configuration**

- [Device R0 on page 3649](#)
- [Configuring Device R1 on page 3651](#)
- [Configuring Device R2 on page 3654](#)

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R0**

```

set interfaces fe-1/2/0 unit 1 family inet address 1.1.0.1/30
set interfaces fe-1/2/1 unit 2 family inet address 1.1.1.1/30
set interfaces lo0 unit 1 family inet address 10.255.14.179/32
set protocols bgp group ext type external
set protocols bgp group ext export test_route
set protocols bgp group ext export agg_route
set protocols bgp group ext peer-as 65000
set protocols bgp group ext multipath
set protocols bgp group ext neighbor 1.1.0.2
set protocols bgp group ext neighbor 1.1.1.2
set policy-options policy-statement agg_route term 1 from protocol static
set policy-options policy-statement agg_route term 1 from route-filter 1.1.230.0/23 exact
set policy-options policy-statement agg_route term 1 then accept
set policy-options policy-statement test_route term 1 from protocol static
set policy-options policy-statement test_route term 1 from route-filter 1.1.10.10/32 exact
set policy-options policy-statement test_route term 1 then accept
set routing-options static route 1.1.10.10/32 reject
set routing-options static route 1.1.230.0/23 reject
set routing-options autonomous-system 65500

```

**Device R1**

```

set interfaces fe-1/2/0 unit 3 family inet address 1.1.0.2/30
set interfaces fe-1/2/1 unit 4 family inet address 1.1.2.1/30
set interfaces fe-1/2/2 unit 5 family inet address 1.1.1.2/30
set interfaces lo0 unit 2 family inet address 10.255.71.24/32
set protocols bgp accept-remote-nexthop

```

```

set protocols bgp group ext type external
set protocols bgp group ext import agg_route
set protocols bgp group ext peer-as 65500
set protocols bgp group ext multipath
set protocols bgp group ext neighbor 1.1.0.1
set protocols bgp group ext neighbor 1.1.1.1
set protocols bgp group int type internal
set protocols bgp group int local-address 10.255.71.24
set protocols bgp group int neighbor 10.255.14.177
set protocols ospf area 0.0.0.0 interface fe-1/2/1.4
set protocols ospf area 0.0.0.0 interface 10.255.71.24
set policy-options policy-statement agg_route term 1 from protocol bgp
set policy-options policy-statement agg_route term 1 from route-filter 1.1.230.0/23 exact
set policy-options policy-statement agg_route term 1 then next-hop 1.1.10.10
set policy-options policy-statement agg_route term 1 then accept
set routing-options autonomous-system 65000

```

**Device R2**

```

set interfaces fe-1/2/0 unit 6 family inet address 1.12.0.2/30
set interfaces lo0 unit 3 family inet address 10.255.14.177/32
set protocols bgp group int type internal
set protocols bgp group int local-address 10.255.14.177
set protocols bgp group int neighbor 10.255.71.24
set protocols ospf area 0.0.0.0 interface fe-1/2/0.6
set protocols ospf area 0.0.0.0 interface 10.255.14.177
set routing-options autonomous-system 65000

```

#### *Device R0*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R0:

1. Configure the interfaces.
 

```

[edit interfaces fe-1/2/0 unit 1]
user@R0# set family inet address 1.1.0.1/30

[edit interfaces fe-1/2/1 unit 2]
user@R0# set family inet address 1.1.1.1/30

[edit interfaces lo0 unit 1]
user@R0# set family inet address 10.255.14.179/32

```
2. Configure EBGp.
 

```

[edit protocols bgp group ext]
user@R0# set type external
user@R0# set peer-as 65000
user@R0# set neighbor 1.1.0.2
user@R0# set neighbor 1.1.1.2

```
3. Enable multipath BGP between Device R0 and Device R1.
 

```

[edit protocols bgp group ext]
user@R0# set multipath

```

4. Configure static routes to remote networks.  
These routes are not part of the topology. The purpose of these routes is to demonstrate the functionality in this example.

```
[edit routing-options]
user@R0# set static route 1.1.10.10/32 reject
user@R0# set static route 1.1.230.0/23 reject
```

5. Configure routing policies that accept the static routes.

```
[edit policy-options policy-statement agg_route term 1]
user@R0# set from protocol static
user@R0# set from route-filter 1.1.230.0/23 exact
user@R0# set then accept
```

```
[edit policy-options policy-statement test_route term 1]
user@R0# set from protocol static
user@R0# set from route-filter 1.1.10.10/32 exact
user@R0# set then accept
```

6. Export the **agg\_route** and **test\_route** policies from the routing table into BGP.

```
[edit protocols bgp group ext]
user@R0# set export test_route
user@R0# set export agg_route
```

7. Configure the autonomous system (AS) number.

```
[edit routing-options]
user@R0# set autonomous-system 65500
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R0# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 1.1.0.1/30;
    }
  }
}
fe-1/2/1 {
  unit 2 {
    family inet {
      address 1.1.1.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 10.255.14.179/32;
    }
  }
}
```

```

}

user@R0# show policy-options
policy-statement agg_route {
  term 1 {
    from {
      protocol static;
      route-filter 1.1.230.0/23 exact;
    }
    then accept;
  }
}
policy-statement test_route {
  term 1 {
    from {
      protocol static;
      route-filter 1.1.10.10/32 exact;
    }
    then accept;
  }
}

user@R0# show protocols
bgp {
  group ext {
    type external;
    export [ test_route agg_route ];
    peer-as 65000;
    multipath;
    neighbor 1.1.0.2;
    neighbor 1.1.1.2;
  }
}

user@R0# show routing-options
static {
  route 1.1.10.10/32 reject;
  route 1.1.230.0/23 reject;
}
autonomous-system 65500;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Device R1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.
 

```

[edit interfaces fe-1/2/0 unit 3]
user@R1# set family inet address 1.1.0.2/30

[edit interfaces fe-1/2/1 unit 4]

```

```
user@R1# set family inet address 1.12.0.1/30
```

```
[edit interfaces fe-1/2/2 unit 5]
```

```
user@R1# set family inet address 1.1.1.2/30
```

```
[edit interfaces lo0 unit 2]
```

```
user@R1# set family inet address 10.255.71.24/32
```

2. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
```

```
user@R1# set interface fe-1/2/1.4
```

```
user@R1# set interface 10.255.71.24
```

3. Enable Device R1 to accept the remote next hop.

```
[edit protocols bgp]
```

```
user@R1# set accept-remote-nexthop
```

4. Configure IBGP.

```
[edit protocols bgp group int]
```

```
user@R1# set type internal
```

```
user@R1# set local-address 10.255.71.24
```

```
user@R1# set neighbor 10.255.14.177
```

5. Configure EBGP.

```
[edit protocols bgp group ext]
```

```
user@R1# set type external
```

```
user@R1# set peer-as 65500
```

```
user@R1# set neighbor 1.1.0.1
```

```
user@R1# set neighbor 1.1.1.1
```

6. Enable multipath BGP between Device R0 and Device R1.

```
[edit protocols bgp group ext]
```

```
user@R1# set multipath
```

7. Configure a routing policy that enables a single-hop external BGP peer (Device R1) to accept the remote next-hop 1.1.10.10 for the route to the 1.1.230.0/23 network.

```
[edit policy-options policy-statement agg_route term 1]
```

```
user@R1# set from protocol bgp
```

```
user@R1# set from route-filter 1.1.230.0/23 exact
```

```
user@R1# set then next-hop 1.1.10.10
```

```
user@R1# set then accept
```

8. Import the **agg\_route** policy into the routing table on Device R1.

```
[edit protocols bgp group ext]
```

```
user@R1# set import agg_route
```

9. Configure the autonomous system (AS) number.

```
[edit routing-options]
```

```
user@R1# set autonomous-system 65000
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output

does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R1# show interfaces
fe-1/2/0 {
  unit 3 {
    family inet {
      address 1.1.0.2/30;
    }
  }
}
fe-1/2/1 {
  unit 4 {
    family inet {
      address 1.12.0.1/30;
    }
  }
}
fe-1/2/2 {
  unit 5 {
    family inet {
      address 1.1.1.2/30;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 10.255.71.24/32;
    }
  }
}

user@R1# show policy-options
policy-statement agg_route {
  term 1 {
    from {
      protocol bgp;
      route-filter 1.1.230.0/23 exact;
    }
    then {
      next-hop 1.1.10.10;
      accept;
    }
  }
}

user@R1# show protocols
bgp {
  accept-remote-nexthop;
  group ext {
    type external;
    import agg_route;
    peer-as 65500;
    multipath;
    neighbor 1.1.0.1;
  }
}

```

```
        neighbor 1.1.1.1;
    }
    group int {
        type internal;
        local-address 10.255.71.24;
        neighbor 10.255.14.177;
    }
}
ospf {
    area 0.0.0.0 {
        interface fe-1/2/1.4;
        interface 10.255.71.24;
    }
}
```

```
user@R1# show routing-options
autonomous-system 65000;
```

If you are done configuring the device, enter **commit** from configuration mode.

### *Configuring Device R2*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.  

```
[edit interfaces fe-1/2/0 unit 6]
user@R2# set family inet address 1.12.0.2/30

[edit interfaces lo0 unit 3]
user@R2# set family inet address 10.255.14.177/32
```
2. Configure OSPF.  

```
[edit protocols ospf area 0.0.0.0]
user@R2# set interface fe-1/2/0.6
user@R2# set interface 10.255.14.177
```
3. Configure IBGP.  

```
[edit protocols bgp group int]
user@R2# set type internal
user@R2# set local-address 10.255.14.177
user@R2# set neighbor 10.255.71.24
```
4. Configure the autonomous system (AS) number.  

```
[edit routing-options]
user@R1# set autonomous-system 65000
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R2# show interfaces
fe-1/2/0 {
  unit 6 {
    family inet {
      address 1.12.0.2/30;
    }
  }
}
lo0 {
  unit 3 {
    family inet {
      address 10.255.14.177/32;
    }
  }
}

user@R2# show protocols
bgp {
  group int {
    type internal;
    local-address 10.255.14.177;
    neighbor 10.255.71.24;
  }
}
ospf {
  area 0.0.0.0 {
    interface fe-1/2/0.6;
    interface 10.255.14.177;
  }
}

user@R2# show routing-options
autonomous-system 65000;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying That the Multipath Route with the Indirect Next Hop Is in the Routing Table on page 3655](#)
- [Deactivating and Reactivating the accept-remote-nexthop Statement on page 3657](#)

### Verifying That the Multipath Route with the Indirect Next Hop Is in the Routing Table

**Purpose** Verify that Device R1 has a route to the 1.1.230.0/23 network.

**Action** From operational mode, enter the **show route 1.1.230.0 extensive** command.

```

user@R1> show route 1.1.230.0 extensive
inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
Restart Complete
1.1.230.0/23 (2 entries, 1 announced)
TSI:

        Indirect next hops: 1
            Protocol next hop: 1.1.10.10
            Indirect next hop: 91c0000 262142
            Indirect path forwarding next hops: 2
                Next hop type: Router

```

```

Next hop: 1.1.0.1 via fe-1/2/0.3
Next hop: 1.1.1.1 via fe-1/2/2.5
1.1.10.10/32 Originating RIB: inet.0
Node path count: 1
Forwarding nexthops: 2
  Nexthop: 1.1.0.1 via fe-1/2/0.3
  Nexthop: 1.1.1.1 via fe-1/2/2.5

```

**Meaning** The output shows that Device R1 has a route to the 1.1.230.0 network with the multipath feature enabled (**Accepted Multipath**). The output also shows that the route has an indirect next hop of 1.1.10.10.

#### *Deactivating and Reactivating the accept-remote-nexthop Statement*

**Purpose** Make sure that the multipath route with the indirect next hop is removed from the routing table when you deactivate the **accept-remote-nexthop** statement.

**Action** 1. From configuration mode, enter the **deactivate protocols bgp accept-remote-nexthop** command.

```

user@R1# deactivate protocols bgp accept-remote-nexthop
user@R1# commit

```

2. From operational mode, enter the **show route 1.1.230.0** command.

```

user@R1> show route 1.1.230.0

```

3. From configuration mode, reactivate the statement by entering the **activate protocols bgp accept-remote-nexthop** command.

```

user@R1# activate protocols bgp accept-remote-nexthop
user@R1# commit

```

4. From operational mode, reenter the **show route 1.1.230.0** command.

```

user@R1> show route 1.1.230.0

```

```

inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both

```

```

1.1.230.0/23      *[BGP/170] 03:13:19, localpref 100
                  AS path: 65500 I
                  > to 1.1.0.1 via fe-1/2/0.3
                  to 1.1.1.1 via fe-1/2/2.5
                  [BGP/170] 03:13:15, localpref 100, from 1.1.1.1
                  AS path: 65500 I
                  > to 1.1.0.1 via fe-1/2/0.3
                  to 1.1.1.1 via fe-1/2/2.5

```

**Meaning** When the **accept-remote-nexthop** statement is deactivated, the multipath route to the 1.1.230.0 network is removed from the routing table .

### Understanding the Advertisement of Multiple Paths to a Single Destination in BGP

---

BGP peers advertise routes to each other in update messages. BGP stores its routes in the Junos OS routing table (**inet.0**). For each prefix in the routing table, the routing protocol process selects a single best path, called the active path. Unless you configure BGP to advertise multiple paths to the same destination, BGP advertises only the active path.

Instead of advertising only the active path to a destination, you can configure BGP to advertise multiple paths to the destination. Within an autonomous system (AS), the availability of multiple exit points to reach a destination provides the following benefits:

- **Fault tolerance**—Path diversity leads to reduction in restoration time after failure. For instance, a border after receiving multiple paths to the same destination can precompute a backup path and have it ready so that when the primary path becomes invalid, the border routing device can use the backup to quickly restore connectivity. Without a backup path, the restoration time depends on BGP reconvergence, which includes withdraw and advertisement messages in the network before a new best path can be learned.
- **Load balancing**—The availability of multiple paths to reach the same destination enables load balancing of traffic, if the routing within the AS meets certain constraints.
- **Maintenance**—The availability of alternate exit points allows for graceful maintenance operation of routers.

The following limitations apply to advertising multiple routes in BGP:

- Address families supported:
  - IPv4 unicast (**family inet unicast**)
  - IPv6 unicast (**family inet6 unicast**)
  - IPv4 labeled unicast (**family inet labeled-unicast**)
  - IPv6 labeled unicast (**family inet6 labeled-unicast**)
- Internal BGP (IBGP) peers only. No support on external BGP (EBGP) peers.
- Master instance only. No support for routing instances.
- Graceful restart and nonstop active routing (NSR) are supported.
- No BGP Monitoring Protocol (BMP) support.

- No support for EBGp sessions between confederations.
- Prefix policies enable you to filter routes on a router that is configured to advertise multiple paths to a destination. Prefix policies can only match prefixes. They cannot match route attributes, and they cannot change the attributes of routes.

### Example: Advertising Multiple Paths in BGP

In this example, BGP routers are configured to advertise multiple paths instead of advertising only the active path. Advertising multiple paths in BGP is specified in Internet draft draft-ietf-idr-add-paths-04, *Advertisement of Multiple Paths in BGP*.

- [Verification on page 3679](#)

#### Requirements

This example uses the following hardware and software components:

- Eight BGP-enabled devices.
- Five of the BGP-enabled devices do not necessarily need to be routers. For example, they can be EX Series Ethernet Switches.
- Three of the BGP-enabled devices are configured to send multiple paths or receive multiple paths (or both send and receive multiple paths). These three BGP-enabled devices must be M Series Multiservice Edge Routers, MX Series 3D Universal Edge Routers, or T Series Core Routers.
- The three routers must be running Junos OS Release 11.4 or later.

#### Overview

The following statements are used for configuring multiple paths to a destination:

```
[edit protocols bgp group group-name family family]
add-path {
  receive;
  send {
    path-count number;
    prefix-policy [ policy-names ];
  }
}
```

In this example, Router R5, Router R6, and Router R7 redistribute static routes into BGP. Router R1 and Router R4 are route reflectors. Router R2 and Router R3 are clients to Route Reflector R1. Router R8 is a client to Route Reflector R4.

Route reflection is optional when multiple-path advertisement is enabled in BGP.

With the **add-path send path-count 6** configuration, Router R1 is configured to send up to six paths (per destination) to Router R4.

With the **add-path receive** configuration, Router R4 is configured to receive multiple paths from Router R1.

With the **add-path send path-count 6** configuration, Router R4 is configured to send up to six paths to Router R8.

With the **add-path receive** configuration, Router R8 is configured to receive multiple paths from Router R4.

The **add-path send prefix-policy allow\_199** policy configuration (along with the corresponding route filter) limits Router R4 to sending multiple paths for only the 199.1.1.1/32 route.

### Topology Diagram

Figure 113 on page 3660 shows the topology used in this example.

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Router R1**

```
set interfaces fe-0/0/0 unit 12 family inet address 10.0.12.1/24
set interfaces fe-0/0/1 unit 13 family inet address 10.0.13.1/24
set interfaces fe-1/0/0 unit 14 family inet address 10.0.14.1/24
```

```

set interfaces fe-1/2/0 unit 15 family inet address 10.0.15.1/24
set interfaces lo0 unit 10 family inet address 10.0.0.10/32
set protocols bgp group rr type internal
set protocols bgp group rr local-address 10.0.0.10
set protocols bgp group rr cluster 10.0.0.10

set protocols ospf area 0.0.0.0 interface lo0.80 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.84
set routing-options autonomous-system 1

```

### Configuring Router R1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Router R1:

1. Configure the interfaces to Router R2, Router R3, Router R4, and Router R5, and configure the loopback (lo0) interface.

```

[edit interfaces]
user@R1# set fe-0/0/0 unit 12 family inet address 10.0.12.1/24

user@R1# set fe-0/0/1 unit 13 family inet address 10.0.13.1/24

user@R1# set fe-1/0/0 unit 14 family inet address 10.0.14.1/24

user@R1# set fe-1/2/0 unit 15 family inet address 10.0.15.1/24

user@R1# set lo0 unit 10 family inet address 10.0.0.10/32

```

2. Configure BGP on the interfaces, and configure IBGP route reflection.

```

[edit protocols bgp]
user@R1# set group rr type internal
user@R1# set group rr local-address 10.0.0.10
user@R1# set group rr cluster 10.0.0.10
user@R1# set group rr neighbor 10.0.0.20
user@R1# set group rr neighbor 10.0.0.30

user@R1# set group rr_rr type internal
user@R1# set group rr_rr local-address 10.0.0.10

user@R1# set group e1 type external
user@R1# set group e1 neighbor 10.0.15.2 local-address 10.0.15.1
user@R1# set group e1 neighbor 10.0.15.2 peer-as 2

```

3. Configure Router R1 to send up to six paths to its neighbor, Router R4.

The destination of the paths can be any destination that Router R1 can reach through multiple paths.

```

[edit protocols bgp]
user@R1# set group rr_rr neighbor 10.0.0.40 family inet unicast add-path send
path-count 6

```

4. Configure OSPF on the interfaces.

```
[edit protocols ospf]
user@R1# set area 0.0.0.0 interface lo0.10 passive
user@R1# set area 0.0.0.0 interface fe-0/0/0.12
user@R1# set area 0.0.0.0 interface fe-0/0/1.13
user@R1# set area 0.0.0.0 interface fe-1/0/0.14
user@R1# set area 0.0.0.0 interface fe-1/2/0.15
```

5. Configure the router ID and the autonomous system number.

```
[edit routing-options]
user@R1# set router-id 10.0.0.10
user@R1# set autonomous-system 1
```

6. If you are done configuring the device, commit the configuration.

```
user@R1# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-0/0/0 {
  unit 12 {
    family inet {
      address 10.0.12.1/24;
    }
  }
}
fe-0/0/1 {
  unit 13 {
    family inet {
      address 10.0.13.1/24;
    }
  }
}
fe-1/0/0 {
  unit 14 {
    family inet {
      address 10.0.14.1/24;
    }
  }
}
fe-1/2/0 {
  unit 15 {
    family inet {
      address 10.0.15.1/24;
    }
  }
}
lo0 {
  unit 10 {
    family inet {
```

```

        address 10.0.0.10/32;
    }
}
}
user@R1# show protocols
bgp {
    group rr {
        type internal;
        local-address 10.0.0.10;
        cluster 10.0.0.10;
        neighbor 10.0.0.20;
        neighbor 10.0.0.30;
    }
    group e1 {
        type external;
        neighbor 10.0.15.2 {
            local-address 10.0.15.1;
            peer-as 2;
        }
    }
    group rr_rr {
        type internal;
        local-address 10.0.0.10;
        neighbor 10.0.0.40 {
            family inet {
                unicast {
                    add-path {
                        send {
                            path-count 6;
                        }
                    }
                }
            }
        }
    }
}
ospf {
    area 0.0.0.0 {
        interface lo0.10 {
            passive;
        }
        interface fe-0/0/0.12;
        interface fe-0/0/1.13;
        interface fe-1/0/0.14;
        interface fe-1/2/0.15;
    }
}

user@R1# show routing-options
router-id 10.0.0.10;
autonomous-system 1;

```

### *Configuring Router R2*

#### **Step-by-Step Procedure**

To configure Router R2:

1. Configure the loopback (lo0) interface and the interfaces to Router R6 and Router R1.

```
[edit interfaces]
```

```
user@R2# set fe-1/2/0 unit 21 family inet address 10.0.12.2/24
```

```
user@R2# set fe-1/2/1 unit 26 family inet address 10.0.26.1/24
```

```
user@R2# set lo0 unit 20 family inet address 10.0.0.20/32
```

2. Configure BGP and OSPF on Router R2's interfaces.

```
[edit protocols]
```

```
user@R2# set bgp group rr type internal
```

```
user@R2# set bgp group rr local-address 10.0.0.20
```

```
user@R2# set bgp group e1 type external
```

```
user@R2# set bgp group e1 neighbor 10.0.26.2 peer-as 2
```

```
user@R2# set ospf area 0.0.0.0 interface lo0.20 passive
```

```
user@R2# set ospf area 0.0.0.0 interface fe-1/2/0.21
```

```
user@R2# set ospf area 0.0.0.0 interface fe-1/2/1.28
```

3. For routes sent from Router R2 to Router R1, advertise Router R2 as the next hop, because Router R1 does not have a route to Router R6's address on the 10.0.26.0/24 network.

```
[edit]
```

```
user@R2# set policy-options policy-statement set_nh_self then next-hop self
```

```
user@R2# set protocols bgp group rr neighbor 10.0.0.10 export set_nh_self
```

4. Configure the autonomous system number.

```
[edit]
```

```
user@R2# set routing-options autonomous-system 1
```

5. If you are done configuring the device, commit the configuration.

```
user@R2# commit
```

#### **Results**

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 21 {
    family inet {
      address 10.0.12.2/24;
```

```

    }
  }
}
fe-1/2/1 {
  unit 26 {
    family inet {
      address 10.0.26.1/24;
    }
  }
}
lo0 {
  unit 20 {
    family inet {
      address 10.0.0.20/32;
    }
  }
}
}

user@R2# show protocols
bgp {
  group rr {
    type internal;
    local-address 10.0.0.20;
    neighbor 10.0.0.10 {
      export set_nh_self;
    }
  }
  group e1 {
    type external;
    neighbor 10.0.26.2 {
      peer-as 2;
    }
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.20 {
      passive;
    }
    interface fe-1/2/0.21;
    interface fe-1/2/1.28;
  }
}

user@R2# show policy-options
policy-statement set_nh_self {
  then {
    next-hop self;
  }
}

user@R2# show routing-options
autonomous-system 1;

```

### *Configuring Router R3*

#### **Step-by-Step Procedure**

To configure Router R3:

1. Configure the loopback (lo0) interface and the interfaces to Router R7 and Router R1.

```
[edit interfaces]
```

```
user@R3# set fe-1/0/1 unit 31 family inet address 10.0.13.2/24
```

```
user@R3# set fe-1/0/2 unit 37 family inet address 10.0.37.1/24
```

```
user@R3# set lo0 unit 30 family inet address 10.0.0.30/32
```

2. Configure BGP and OSPF on Router R3's interfaces.

```
[edit protocols]
```

```
user@R3# set bgp group rr type internal
```

```
user@R3# set bgp group rr local-address 10.0.0.30
```

```
user@R3# set bgp group e1 type external
```

```
user@R3# set bgp group e1 neighbor 10.0.37.2 peer-as 2
```

```
user@R3# set ospf area 0.0.0.0 interface lo0.30 passive
```

```
user@R3# set ospf area 0.0.0.0 interface fe-1/0/1.31
```

```
user@R3# set ospf area 0.0.0.0 interface fe-1/0/2.37
```

3. For routes sent from Router R3 to Router R1, advertise Router R3 as the next hop, because Router R1 does not have a route to Router R7's address on the 10.0.37.0/24 network.

```
[edit]
```

```
user@R3# set policy-options policy-statement set_nh_self then next-hop self
```

```
user@R3# set protocols bgp group rr neighbor 10.0.0.10 export set_nh_self
```

4. Configure the autonomous system number.

```
[edit]
```

```
user@R3# set routing-options autonomous-system 1
```

5. If you are done configuring the device, commit the configuration.

```
user@R3# commit
```

#### **Results**

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
fe-1/0/1 {
  unit 31 {
    family inet {
      address 10.0.13.2/24;
```

```

    }
  }
}
fe-1/0/2 {
  unit 37 {
    family inet {
      address 10.0.37.1/24;
    }
  }
}
lo0 {
  unit 30 {
    family inet {
      address 10.0.0.30/32;
    }
  }
}
user@R3# show protocols
bgp {
  group rr {
    type internal;
    local-address 10.0.0.30;
    neighbor 10.0.0.10 {
      export set_nh_self;
    }
  }
  group e1 {
    type external;
    neighbor 10.0.37.2 {
      peer-as 2;
    }
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.30 {
      passive;
    }
    interface fe-1/0/1.31;
    interface fe-1/0/2.37;
  }
}
user@R3# show policy-options
policy-statement set_nh_self {
  then {
    next-hop self;
  }
}
user@R3# show routing-options
autonomous-system 1;

```

### ***Configuring Router R4***

#### **Step-by-Step Procedure**

To configure Router R4:

1. Configure the interfaces to Router R1 and Router R8, and configure the loopback (lo0) interface.

```
[edit interfaces]
```

```
user@R4# set fe-1/2/0 unit 41 family inet address 10.0.14.2/24
```

```
user@R4# set fe-1/2/1 unit 48 family inet address 10.0.48.1/24
```

```
user@R4# set lo0 unit 40 family inet address 10.0.0.40/32
```

2. Configure BGP on the interfaces, and configure IBGP route reflection.

```
[edit protocols bgp]
```

```
user@R4# set group rr type internal
```

```
user@R4# set group rr local-address 10.0.0.40
```

```
user@R4# set group rr neighbor 10.0.0.10
```

```
user@R4# set group rr_client type internal
```

```
user@R4# set group rr_client local-address 10.0.0.40
```

```
user@R4# set group rr_client cluster 10.0.0.40
```

3. Configure Router R4 to send up to six paths to its neighbor, Router R8.

The destination of the paths can be any destination that Router R4 can reach through multiple paths.

```
[edit protocols bgp]
```

```
user@R4# set group rr_client neighbor 10.0.0.80 family inet unicast add-path send  
path-count 6
```

4. Configure Router R4 to receive multiple paths from its neighbor, Router R1.

The destination of the paths can be any destination that Router R1 can reach through multiple paths.

```
[edit protocols bgp group rr family inet unicast]
```

```
user@R4# set add-path receive
```

5. Configure OSPF on the interfaces.

```
[edit protocols ospf area 0.0.0.0]
```

```
user@R4# set interface fe-1/2/0.41
```

```
user@R4# set interface lo0.40 passive
```

```
user@R4# set interface fe-1/2/1.48
```

6. Configure a policy that allows Router R4 to send Router R8 multiple paths to the 199.1.1.1/32 route.

- Router R4 receives multiple paths for the 198.1.1.1/32 route and the 199.1.1.1/32 route. However, because of this policy, Router R4 only sends multiple paths for the 199.1.1.1/32 route.

```
[edit protocols bgp group rr_client neighbor 10.0.0.80 family inet unicast]
```

```
user@R4# set add-path send prefix-policy allow_199
```

```
[edit policy-options policy-statement allow_199]
user@R4# set from route-filter 199.1.1/32 exact
user@R4# set then accept
```

- Router R4 can also be configured to send up-to 20 BGP **add-path** routes for a subset of *add-path advertised prefixes*.

```
[edit policy-options policy-statement allow_199]
user@R4# set term match_199 from prefix-list match_199
user@R4# set then add-path send-count 20
```

7. Configure the autonomous system number.

```
[edit routing-options]
user@R4# set autonomous-system 1
```

8. If you are done configuring the device, commit the configuration.

```
user@R4# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R4# show interfaces
fe-1/2/0 {
  unit 41 {
    family inet {
      address 10.0.14.2/24;
    }
  }
}
fe-1/2/1 {
  unit 48 {
    family inet {
      address 10.0.48.1/24;
    }
  }
}
lo0 {
  unit 40 {
    family inet {
      address 10.0.0.40/32;
    }
  }
}
```

```
user@R4# show protocols
bgp {
  group rr {
    type internal;
    local-address 10.0.0.40;
    family inet {
      unicast {
        add-path {
          receive;
        }
      }
    }
  }
}
```

```
user@R5# set lo0 unit 50 family inet address 10.0.0.50/32
```

2. Configure BGP on Router R5's interface.

```
[edit protocols bgp group e1]
user@R5# set type external
user@R5# set neighbor 10.0.15.1 peer-as 1
```

3. Create static routes for redistribution into BGP.

```
[edit routing-options]
user@R5# set static route 199.1.1.1/32 reject
user@R5# set static route 198.1.1.1/32 reject
```

4. Redistribute static and direct routes into BGP.

```
[edit protocols bgp group e1 neighbor 10.0.15.1]
user@R5# set export s2b
```

```
[edit policy-options policy-statement s2b]
user@R5# set from protocol static
user@R5# set from protocol direct
user@R5# set then as-path-expand 2
user@R5# set then accept
```

5. Configure the autonomous system number.

```
[edit routing-options]
user@R5# set autonomous-system 2
```

6. If you are done configuring the device, commit the configuration.

```
user@R5# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R5# show interfaces
fe-1/2/0 {
  unit 51 {
    family inet {
      address 10.0.15.2/24;
    }
  }
}
lo0 {
  unit 50 {

    peer-as 1;
}
}

user@R5# show policy-options
policy-statement s2b {
    from protocol [ static direct ];
    then {
        as-path-expand 2;
        accept;
    }
}

user@R5# show routing-options
static {
    route 198.1.1.1/32 reject;
    route 199.1.1.1/32 reject;
}
autonomous-system 2;
```

### ***Configuring Router R6***

#### **Step-by-Step Procedure**

To configure Router R6:

1. Configure the loopback (lo0) interface and the interface to Router R2.  
  
[edit interfaces]  
user@R6# set fe-1/2/0 unit 62 family inet address 10.0.26.2/24  
  
user@R6# set lo0 unit 60 family inet address 10.0.0.60/32
2. Configure BGP on Router R6's interface.  
  
[edit protocols]  
user@R6# set bgp group e1 type external  
user@R6# set bgp group e1 neighbor 10.0.26.1 peer-as 1
3. Create static routes for redistribution into BGP.  
  
[edit]  
user@R6# set routing-options static route 199.1.1.1/32 reject  
user@R6# set routing-options static route 198.1.1.1/32 reject
4. Redistribute static and direct routes from Router R6's routing table into BGP.  
  
[edit protocols bgp group e1 neighbor 10.0.26.1]  
user@R6# set export s2b  
  
[edit policy-options policy-statement s2b]  
user@R6# set from protocol static  
user@R6# set from protocol direct  
user@R6# set then accept

5. Configure the autonomous system number.

```
[edit routing-options]
user@R6# set autonomous-system 2
```

6. If you are done configuring the device, commit the configuration.

```
user@R6# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R6# show interfaces
fe-1/2/0 {
  unit 62 {
    family inet {
      address 10.0.26.2/24;
    }
  }
}
lo0 {
  unit 60 {
    family inet {
      address 10.0.0.60/32;
    }
  }
}

user@R6# show protocols
bgp {
  group e1 {
    type external;
    neighbor 10.0.26.1 {
      export s2b;
      peer-as 1;
    }
  }
}

user@R6# show policy-options
policy-statement s2b {
  from protocol [ static direct ];
  then accept;
}

user@R6# show routing-options
static {
  route 198.1.1.1/32 reject;
  route 199.1.1.1/32 reject;
}
autonomous-system 2;
```

### *Configuring Router R7*

#### **Step-by-Step Procedure**

To configure Router R7:

1. Configure the loopback (lo0) interface and the interface to Router R3.  
  
[edit interfaces]  
user@R7# set fe-1/2/0 unit 73 family inet address 10.0.37.2/24  
  
user@R7# set lo0 unit 70 family inet address 10.0.0.70/32
2. Configure BGP on Router R7's interface.  
  
[edit protocols bgp group e1]  
user@R7# set type external  
user@R7# set neighbor 10.0.37.1 peer-as 1
3. Create a static route for redistribution into BGP.  
  
[edit]  
user@R7# set routing-options static route 199.1.1.1/32 reject
4. Redistribute static and direct routes from Router R7's routing table into BGP.  
  
[edit protocols bgp group e1 neighbor 10.0.37.1]  
user@R7# set export s2b  
  
[edit policy-options policy-statement s2b]  
user@R7# set from protocol static  
user@R7# set from protocol direct  
user@R7# set then accept
5. Configure the autonomous system number.  
  
[edit routing-options]  
user@R7# set autonomous-system 2
6. If you are done configuring the device, commit the configuration.  
  
user@R7# commit

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R7# show interfaces
fe-1/2/0 {
  unit 73 {
    family inet {
      address 10.0.37.2/24;
    }
  }
}
lo0 {
  unit 70 {
    family inet {
```

```

        address 10.0.0.70/32;
    }
}
}

user@R7# show protocols
bgp {
    group e1 {
        type external;
        neighbor 10.0.37.1 {
            export s2b;
            peer-as 1;
        }
    }
}

user@R7# show policy-options
policy-statement s2b {
    from protocol [ static direct ];
    then accept;
}

user@R7# show routing-options
static {
    route 199.1.1.1/32 reject;
}
autonomous-system 2;

```

### Configuring Router R8

#### Step-by-Step Procedure

To configure Router R8:

1. Configure the loopback (lo0) interface and the interface to Router R4.

[edit interfaces]

```
user@R8# set fe-1/2/0 unit 84 family inet address 10.0.48.2/24
```

```
user@R8# set lo0 unit 80 family inet address 10.0.0.80/32
```

2. Configure BGP and OSPF on Router R8's interface.

[edit protocols]

```
user@R8# set bgp group rr type internal
```

```
user@R8# set bgp group rr local-address 10.0.0.80
```

```
user@R8# set ospf area 0.0.0.0 interface lo0.80 passive
```

```
user@R8# set ospf area 0.0.0.0 interface fe-1/2/0.84
```

3. Configure Router R8 to receive multiple paths from its neighbor, Router R4.

The destination of the paths can be any destination that Router R4 can reach through multiple paths.

[edit protocols]

```
user@R8# set bgp group rr neighbor 10.0.0.40 family inet unicast add-path receive
```

4. Configure the autonomous system number.

[edit]

```
user@R8# set routing-options autonomous-system 1
```

5. If you are done configuring the device, commit the configuration.

```
user@R8# commit
```

### Results

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R8# show interfaces
fe-1/2/0 {
  unit 84 {
    family inet {
      address 10.0.48.2/24;
    }
  }
}
lo0 {
  unit 80 {
    family inet {
      address 10.0.0.80/32;
    }
  }
}

user@R8# show protocols
bgp {
  group rr {
    type internal;
    local-address 10.0.0.80;
    neighbor 10.0.0.40 {
      family inet {
        unicast {
          add-path {
            receive;
          }
        }
      }
    }
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.80 {
      passive;
    }
    interface fe-1/2/0.84;
  }
}

user@R8# show routing-options
autonomous-system 1;
```

**Verification**

Confirm that the configuration is working properly.

- [Verifying That the BGP Peers Have the Ability to Send and Receive Multiple Paths on page 3679](#)
- [Verifying That Router R1 Is Advertising Multiple Paths on page 3679](#)
- [Verifying That Router R4 Is Receiving and Advertising Multiple Paths on page 3680](#)
- [Verifying That Router R8 Is Receiving Multiple Paths on page 3681](#)
- [Checking the Path ID on page 3681](#)

**Verifying That the BGP Peers Have the Ability to Send and Receive Multiple Paths**

**Purpose** Make sure that one or both of the following strings appear in the output of the **show bgp neighbor** command:

- NLRI's for which peer can receive multiple paths: inet-unicast
- NLRI's for which peer can send multiple paths: inet-unicast

**Action**

```

user@R1> show bgp neighbor 10.0.0.40
Peer: 10.0.0.40+179 AS 1      Local: 10.0.0.10+65237 AS 1
  Type: Internal    State: Established    Flags: <Sync>
...  NLRI's for which peer can receive multiple paths: inet-unicast
...

user@R4> show bgp neighbor 10.0.0.10
Peer: 10.0.0.10+65237 AS 1      Local: 10.0.0.40+179 AS 1
  Type: Internal    State: Established    Flags: <Sync>
...
  NLRI's for which peer can send multiple paths: inet-unicast
...

user@R4> show bgp neighbor 10.0.0.80
Peer: 10.0.0.80+55416 AS 1      Local: 10.0.0.40+179 AS 1
  Type: Internal    State: Established (route reflector client)Flags: <Sync>
...
  NLRI's for which peer can receive multiple paths: inet-unicast
...

user@R8> show bgp neighbor 10.0.0.40
Peer: 10.0.0.40+179 AS 1      Local: 10.0.0.80+55416 AS 1
  Type: Internal    State: Established    Flags: <Sync>
...
  NLRI's for which peer can send multiple paths: inet-unicast
...

```

**Verifying That Router R1 Is Advertising Multiple Paths**

**Purpose** Make sure that multiple paths to the 198.1.1/32 destination and multiple paths to the 199.1.1/32 destination are advertised to Router R4.

**Action** user@R1> show route advertising-protocol bgp 10.0.0.40  
 inet.0: 21 destinations, 25 routes (21 active, 0 holddown, 0 hidden)

| Prefix         | Nexthop   | MED | Lc1pref | AS path |
|----------------|-----------|-----|---------|---------|
| * 10.0.0.50/32 | 10.0.15.2 |     | 100     | 2 2 I   |
| * 10.0.0.60/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 10.0.0.70/32 | 10.0.0.30 |     | 100     | 2 I     |
| * 198.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 199.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.0.30 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 200.1.1.0/30 | 10.0.0.20 |     | 100     | 2 I     |

**Meaning** When you see one prefix and more than one next hop, it means that multiple paths are advertised to Router R4.

#### *Verifying That Router R4 Is Receiving and Advertising Multiple Paths*

**Purpose** Make sure that multiple paths to the 199.1.1.1/32 destination are received from Router R1 and advertised to Router R8. Make sure that multiple paths to the 198.1.1.1/32 destination are received from Router R1, but only one path to this destination is advertised to Router R8.

**Action** user@R4> show route receive-protocol bgp 10.0.0.10  
 inet.0: 19 destinations, 22 routes (19 active, 0 holddown, 0 hidden)

| Prefix         | Nexthop   | MED | Lc1pref | AS path |
|----------------|-----------|-----|---------|---------|
| * 10.0.0.50/32 | 10.0.15.2 |     | 100     | 2 2 I   |
| * 10.0.0.60/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 10.0.0.70/32 | 10.0.0.30 |     | 100     | 2 I     |
| * 198.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 199.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.0.30 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 200.1.1.0/30 | 10.0.0.20 |     | 100     | 2 I     |

user@R4> show route advertising-protocol bgp 10.0.0.80  
 inet.0: 19 destinations, 22 routes (19 active, 0 holddown, 0 hidden)

| Prefix         | Nexthop   | MED | Lc1pref | AS path |
|----------------|-----------|-----|---------|---------|
| * 10.0.0.50/32 | 10.0.15.2 |     | 100     | 2 2 I   |
| * 10.0.0.60/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 10.0.0.70/32 | 10.0.0.30 |     | 100     | 2 I     |
| * 198.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 199.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.0.30 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 200.1.1.0/30 | 10.0.0.20 |     | 100     | 2 I     |

**Meaning** The **show route receive-protocol** command shows that Router R4 receives two paths to the 198.1.1.1/32 destination and three paths to the 199.1.1.1/32 destination. The **show route advertising-protocol** command shows that Router R4 advertises only one path to the 198.1.1.1/32 destination and advertises all three paths to the 199.1.1.1/32 destination.

Because of the prefix policy that is applied to Router R4, Router R4 does not advertise multiple paths to the 198.1.1.1/32 destination. Router R4 advertises only one path to the 198.1.1.1/32 destination even though it receives multiple paths to this destination.

### *Verifying That Router R8 Is Receiving Multiple Paths*

**Purpose** Make sure that Router R8 receives multiple paths to the 199.1.1.1/32 destination through Router R4. Make sure that Router R8 receives only one path to the 198.1.1.1/32 destination through Router R4.

**Action** user@R8> `show route receive-protocol bgp 10.0.0.40`  
 inet.0: 18 destinations, 20 routes (18 active, 0 holddown, 0 hidden)

| Prefix         | Nexthop   | MED | Lc1pref | AS path |
|----------------|-----------|-----|---------|---------|
| * 10.0.0.50/32 | 10.0.15.2 |     | 100     | 2 2 I   |
| * 10.0.0.60/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 10.0.0.70/32 | 10.0.0.30 |     | 100     | 2 I     |
| * 198.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 199.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.0.30 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 200.1.1.0/30 | 10.0.0.20 |     | 100     | 2 I     |

### *Checking the Path ID*

**Purpose** On the downstream devices, Router R4 and Router R8, verify that a path ID uniquely identifies the path. Look for the **Addpath Path ID:** string.

**Action** user@R4> show route 199.1.1.1/32 detail

```
inet.0: 18 destinations, 20 routes (18 active, 0 holddown, 0 hidden)

#### Understanding BGP Route Reflectors

---

Because of the internal BGP (IBGP) full-mesh requirement, most networks use route reflectors to simplify configuration. The formula to compute the number of sessions required for a full mesh is  $v * (v - 1) / 2$ , where  $v$  is the number of BGP-enabled devices. The full-mesh model does not scale well. Using a route reflector, you group routers into clusters, which are identified by numeric identifiers unique to the autonomous system (AS). Within the cluster, you must configure a BGP session from a single router (the route reflector) to each internal peer. With this configuration, the IBGP full-mesh requirement is met.

To use route reflection in an AS, you designate one or more routers as a route reflector—typically, one per point of presence (POP). Route reflectors have the special BGP ability to readvertise routes learned from an internal peer to other internal peers. So rather than requiring all internal peers to be fully meshed with each other, route reflection requires only that the route reflector be fully meshed with all internal peers. The route reflector and all of its internal peers form a cluster, as shown in [Figure 114 on page 3685](#).

**NOTE:** For some Juniper Networks devices, you must have an Advanced BGP Feature license installed on each device that uses a route reflector. For license details, see the *Junos OS Initial Configuration Guide for Security Devices*.

---

Figure 114: Simple Route Reflector Topology (One Cluster)

Figure 114 on page 3685 shows Router RR configured as the route reflector for Cluster 127. The other routers are designated internal peers within the cluster. BGP routes are advertised to Router RR by any of the internal peers. RR then readvertises those routes to all other peers within the cluster.

You can configure multiple clusters and link them by configuring a full mesh of route reflectors (see Figure 115 on page 3685).

Figure 115: Basic Route Reflection (Multiple Clusters)

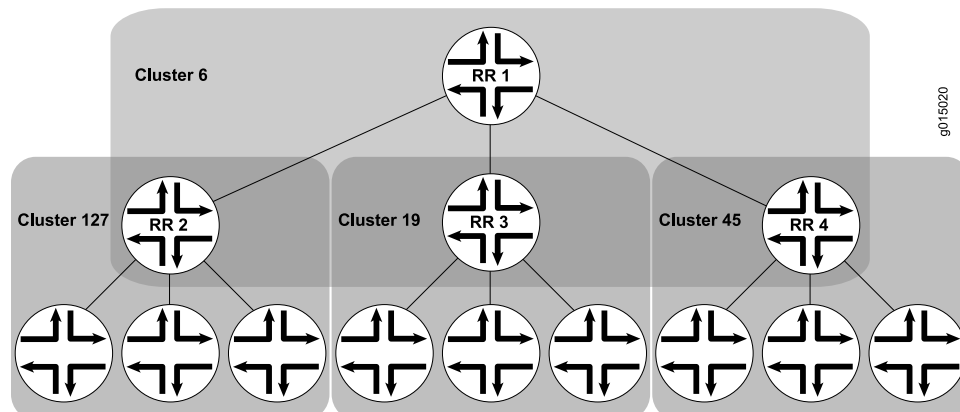

Figure 115 on page 3685 shows Route Reflectors RR 1, RR 2, RR 3, and RR 4 as fully meshed internal peers. When a router advertises a route to RR 1, RR 1 readvertises the route to the other route reflectors, which, in turn, readvertise the route to the remaining routers within the AS. Route reflection allows the route to be propagated throughout the AS without the scaling problems created by the full mesh requirement.

However, as clusters become large, a full mesh with a route reflector becomes difficult to scale, as does a full mesh between route reflectors. To help offset this problem, you can group clusters of routers together into clusters of clusters for hierarchical route reflection (see [Figure 116 on page 3686](#)).

**Figure 116: Hierarchical Route Reflection (Clusters of Clusters)**

[Figure 116 on page 3686](#) shows RR 2, RR 3, and RR 4 as the route reflectors for Clusters 127, 19, and 45, respectively. Rather than fully mesh those route reflectors, the network administrator has configured them as part of another cluster (Cluster 6) for which RR 1 is the route reflector. When a router advertises a route to RR 2, RR 2 readvertises the route to all the routers within its own cluster, and then readvertises the route to RR 1. RR 1 readvertises the route to the routers in its cluster, and those routers propagate the route down through their clusters.

### Example: Configuring a Route Reflector

This example shows how to configure a route reflector.

- [Requirements on page 3686](#)
- [Overview on page 3686](#)
- [Configuration on page 3688](#)
- [Verification on page 3696](#)

#### Requirements

No special configuration beyond device initialization is required before you configure this example.

#### Overview

Generally, internal BGP (IBGP)-enabled devices need to be fully meshed, because IBGP does not readvertise updates to other IBGP-enabled devices. The full mesh is a logical mesh achieved through configuration of multiple **neighbor** statements on each IBGP-enabled device. The full mesh is not necessarily a physical full mesh. Maintaining a full mesh (logical or physical) does not scale well in large deployments.

Figure 117 on page 3688 shows an IBGP network with Device A acting as a route reflector. Device B and Device C are clients of the route reflector. Device D and Device E are outside the cluster, so they are nonclients of the route reflector.

On Device A (the route reflector), you must form peer relationships with all of the IBGP-enabled devices by including the **neighbor** statement for the clients (Device B and Device C) and the nonclients (Device D and Device E). You must also include the **cluster** statement and a cluster identifier. The cluster identifier can be any 32-bit value. This example uses the loopback interface IP address of the route reflector.

On Device B and Device C, the route reflector clients, you only need one **neighbor** statement that forms a peer relationship with the route reflector, Device A.

On Device D and Device E, the nonclients, you need a **neighbor** statement for each nonclient device (D-to-E and E-to-D). You also need a **neighbor** statement for the route reflector (D-to-A and E-to-A). Device D and Device E do not need **neighbor** statements for the client devices (Device B and Device C).

**TIP:** Device D and Device E are considered to be nonclients because they have explicitly configured peer relationships with each other. To make them RRroute reflector clients, remove the **neighbor 192.168.5.5** statement from the configuration on Device D, and remove the **neighbor 192.168.0.1** statement from the configuration on Device E.

Figure 117: IBGP Network Using a Route Reflector

**Configuration**

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device A**

```

### *Configuring the Route Reflector*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IBGP in the network using Juniper Networks Device A as a route reflector:

1. Configure the interfaces.

```
[edit interfaces]
user@A# set fe-0/0/0 unit 1 description to-B
user@A# set fe-0/0/0 unit 1 family inet address 10.10.1/30
user@A# set fe-0/0/1 unit 3 description to-D
user@A# set fe-0/0/1 unit 3 family inet address 10.10.9/30
user@A# set lo0 unit 1 family inet address 192.168.6.5/32
```

2. Configure BGP, including the cluster identifier and neighbor relationships with all IBGP-enabled devices in the autonomous system (AS).

Also apply the policy that redistributes OSPF routes into BGP.

```
[edit protocols bgp group internal-peers]
user@A# set type internal
user@A# set local-address 192.168.6.5
user@A# set export send-ospf
user@A# set cluster 192.168.6.5
user@A# set neighbor 192.163.6.4
user@A# set neighbor 192.168.40.4
user@A# set neighbor 192.168.0.1
user@A# set neighbor 192.168.5.5
```

3. Configure static routing or an interior gateway protocol (IGP).

This example uses OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@A# set interface lo0.1 passive
user@A# set interface fe-0/0/0.1
user@A# set interface fe-0/0/1.3
```

4. Configure the policy that redistributes OSPF routes into BGP.

```
[edit policy-options policy-statement send-ospf term 2]
user@A# set from protocol ospf
user@A# set then accept
```

5. Configure the router ID and the autonomous system (AS) number.

```
[edit routing-options]
user@A# set router-id 192.168.6.5
user@A# set autonomous-system 17
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@A# show interfaces
fe-0/0/0 {
  unit 1 {
    description to-B;
    family inet {
      address 10.10.10.1/30;
    }
  }
}
fe-0/0/1 {
  unit 3 {
    description to-D;
    family inet {
      address 10.10.10.9/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.6.5/32;
    }
  }
}

user@A# show protocols
bgp {
  group internal-peers {
    type internal;
    local-address 192.168.6.5;
    export send-ospf;
    cluster 192.168.6.5;
    neighbor 192.163.6.4;
    neighbor 192.168.40.4;
    neighbor 192.168.0.1;
    neighbor 192.168.5.5;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.1 {
      passive;
    }
    interface fe-0/0/0.1;
    interface fe-0/0/1.3;
```

```
}  
}  
  
user@A# show policy-options  
policy-statement send-ospf {  
  term 2 {  
    from protocol ospf;  
    then accept;  
  }  
}  
  
user@A# show routing-options  
router-id 192.168.6.5;  
autonomous-system 17;
```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** Repeat these steps for each nonclient BGP peer within the cluster that you are configuring, if the other nonclient devices are from Juniper Networks. Otherwise, consult the device's documentation for instructions.

### **Configuring Client Peers**

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure client peers:

1. Configure the interfaces.  

```
[edit interfaces]  
user@B# set fe-0/0/0 unit 2 description to-A  
user@B# set fe-0/0/0 unit 2 family inet address 10.10.10.2/30  
user@B# set fe-0/0/1 unit 5 description to-C  
user@B# set fe-0/0/1 unit 5 family inet address 10.10.10.5/30  
user@B# set lo0 unit 2 family inet address 192.163.6.4/32
```
2. Configure the BGP neighbor relationship with the route reflector.

Also apply the policy that redistributes OSPF routes into BGP.

- ```
[edit protocols bgp group internal-peers]  
user@B# set type internal  
user@B# set local-address 192.163.6.4  
user@B# set export send-ospf  
user@B# set neighbor 192.168.6.5
```
3. Configure OSPF.  

```
[edit protocols ospf area 0.0.0.0]  
user@B# set interface lo0.2 passive  
user@B# set interface fe-0/0/0.2  
user@B# set interface fe-0/0/1.5
```
  4. Configure the policy that redistributes OSPF routes into BGP.

```
[edit policy-options policy-statement send-ospf term 2]
user@B# set from protocol ospf
user@B# set then accept
```

5. Configure the router ID and the AS number.

```
[edit routing-options]
user@B# set router-id 192.163.6.4
user@B# set autonomous-system 17
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@B# show interfaces
fe-0/0/0 {
  unit 2 {
    description to-A;
    family inet {
      address 10.10.10.2/30;
    }
  }
}
fe-0/0/1 {
  unit 5 {
    description to-C;
    family inet {
      address 10.10.10.5/30;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 192.163.6.4/32;
    }
  }
}

user@B# show protocols
bgp {
  group internal-peers {
    type internal;
    local-address 192.163.6.4;
    export send-ospf;
    neighbor 192.168.6.5;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.2 {
      passive;
    }
    interface fe-0/0/0.2;
    interface fe-0/0/1.5;
```

```
}  
}  
  
user@B# show policy-options  
policy-statement send-ospf {  
  term 2 {  
    from protocol ospf;  
    then accept;  
  }  
}  
  
user@B# show routing-options  
router-id 192.163.6.4;  
autonomous-system 17;
```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** Repeat these steps for each client BGP peer within the cluster that you are configuring if the other client devices are from Juniper Networks. Otherwise, consult the device's documentation for instructions.

### **Configuring Nonclient Peers**

#### **Step-by-Step Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure nonclient peers:

1. Configure the interfaces.

```
[edit interfaces]  
user@D# set fe-0/0/0 unit 4 description to-A  
user@D# set fe-0/0/0 unit 4 family inet address 10.10.10.10/30  
user@D# set fe-0/0/1 unit 7 description to-E  
user@D# set fe-0/0/1 unit 7 family inet address 10.10.10.13/30  
user@D# set lo0 unit 4 family inet address 192.168.0.1/32
```

2. Configure the BGP neighbor relationships with the RRroute reflector and with the other nonclient peers.

Also apply the policy that redistributes OSPF routes into BGP.

```
[edit protocols bgp group internal-peers]  
user@D# set type internal  
user@D# set local-address 192.168.0.1  
user@D# set export send-ospf  
user@D# set neighbor 192.168.6.5  
user@D# set neighbor 192.168.5.5
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]  
user@D# set interface lo0.4 passive  
user@D# set interface fe-0/0/0.4
```

```
user@D# set interface fe-0/0/1.7
```

4. Configure the policy that redistributes OSPF routes into BGP.

```
[edit policy-options policy-statement send-ospf term 2]
user@D# set from protocol ospf
user@D# set then accept
```

5. Configure the router ID and the AS number.

```
[edit routing-options]
user@D# set router-id 192.168.0.1
user@D# set autonomous-system 17
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@D# show interfaces
fe-0/0/0 {
  unit 4 {
    description to-A;
    family inet {
      address 10.10.10.10/30;
    }
  }
}
fe-0/0/1 {
  unit 7 {
    description to-E;
    family inet {
      address 10.10.10.13/30;
    }
  }
}
lo0 {
  unit 4 {
    family inet {
      address 192.168.0.1/32;
    }
  }
}
```

```
user@D# show protocols
bgp {
  group internal-peers {
    type internal;
    local-address 192.168.0.1;
    export send-ospf;
    neighbor 192.168.6.5;
    neighbor 192.168.5.5;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.4 {
```

```
        passive;
    }
    interface fe-0/0/0.4;
    interface fe-0/0/1.7;
}
}

user@D# show policy-options
policy-statement send-ospf {
    term 2 {
        from protocol ospf;
        then accept;
    }
}

user@D# show routing-options
router-id 192.168.0.1;
autonomous-system 17;
```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** Repeat these steps for each nonclient BGP peer within the cluster that you are configuring if the other nonclient devices are from Juniper Networks. Otherwise, consult the device's documentation for instructions.

---

### **Verification**

Confirm that the configuration is working properly.

- [Verifying BGP Neighbors on page 3696](#)
- [Verifying BGP Groups on page 3699](#)
- [Verifying BGP Summary Information on page 3699](#)
- [Verifying Routing Table Information on page 3699](#)

### **Verifying BGP Neighbors**

**Purpose** Verify that BGP is running on configured interfaces and that the BGP session is established for each neighbor address.

**Action** From operational mode, enter the **show bgp neighbor** command.

```
user@A> show bgp neighbor
Peer: 192.163.6.4+179 AS 17    Local: 192.168.6.5+62857 AS 17

## Example: Configuring BGP Confederations

- [Understanding BGP Confederations on page 3701](#)
- [Example: Configuring BGP Confederations on page 3702](#)

### Understanding BGP Confederations

BGP confederations are another way to solve the scaling problems created by the BGP full mesh requirement. BGP confederations effectively break up a large autonomous system (AS) into subautonomous systems (sub-ASs). Each sub-AS must be uniquely identified within the confederation AS by a sub-AS number. Typically, sub-AS numbers are taken from the private AS numbers between 64,512 and 65,535.

Within a sub-AS, the same internal BGP (IBGP) full mesh requirement exists. Connections to other confederations are made with standard external BGP (EBGP), and peers outside the sub-AS are treated as external. To avoid routing loops, a sub-AS uses a confederation sequence, which operates like an AS path but uses only the privately assigned sub-AS numbers.

The confederation AS appears whole to other confederation ASs. The AS path received by other ASs shows only the globally assigned AS number. It does not include the confederation sequence or the privately assigned sub-AS numbers. The sub-AS numbers are removed when the route is advertised out of the confederation AS.

[Figure 118 on page 3702](#) shows an AS divided into four confederations.

Figure 118: BGP Confederations

Figure 118 on page 3702 shows AS 3 divided into four sub-ASs, 64517, 64550, 65300, and 65410, which are linked through EBGP sessions. Because the confederations are connected by EBGP, they do not need to be fully meshed. EBGP routes are readvertised to other sub-ASs.

### Example: Configuring BGP Confederations

This example shows how to configure BGP confederations.

- [Requirements on page 3702](#)
- [Overview on page 3702](#)
- [Configuration on page 3703](#)
- [Verification on page 3705](#)

#### Requirements

- Configure network interfaces.
- Configure external peer sessions. See [“Example: Configuring External BGP Point-to-Point Peer Sessions” on page 3430](#).
- Configure interior gateway protocol (IGP) sessions between peers.
- Configure a routing policy to advertise the BGP routes.

#### Overview

Within a BGP confederation, the links between the confederation member autonomous systems (ASs) must be external BGP (EBGP) links, not internal BGP (IBGP) links.

Similar to route reflectors, BGP confederations reduce the number of peer sessions and TCP sessions to maintain connections between IBGP routing devices. BGP confederation is one method used to solve the scaling problems created by the IBGP full mesh requirement. BGP confederations effectively break up a large AS into subautonomous

systems. Each sub-AS must be uniquely identified within the confederation AS by a sub-AS number. Typically, sub-AS numbers are taken from the private AS numbers between 64512 and 65535. Within a sub-AS, the same IBGP full mesh requirement exists. Connections to other confederations are made with standard EBGP, and peers outside the sub-AS are treated as external. To avoid routing loops, a sub-AS uses a confederation sequence, which operates like an AS path but uses only the privately assigned sub-AS numbers.

Figure 119 on page 3703 shows a sample network in which AS 17 has two separate confederations: sub-AS 64512 and sub-AS 64513, each of which has multiple routers. Within a sub-AS, an IGP is used to establish network connectivity with internal peers. Between sub-ASs, an EBGP peer session is established.

Figure 119: Typical Network Using BGP Confederations

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

All Devices in Sub-AS 64512	<pre> set routing-options autonomous-system 64512 set routing-options confederation 17 members 64512 set routing-options confederation 17 members 64513 set protocols bgp group sub-AS-64512 type internal set protocols bgp group sub-AS-64512 local-address 192.168.5.1 set protocols bgp group sub-AS-64512 neighbor 192.168.8.1 set protocols bgp group sub-AS-64512 neighbor 192.168.15.1 </pre>
Border Device in Sub-AS 64512	<pre> set protocols bgp group to-sub-AS-64513 type external set protocols bgp group to-sub-AS-64513 peer-as 64513 set protocols bgp group to-sub-AS-64513 neighbor 192.168.5.2 </pre>
All Devices in Sub-AS 64513	<pre> set routing-options autonomous-system 64513 set routing-options confederation 17 members 64512 set routing-options confederation 17 members 64513 set protocols bgp group sub-AS-64513 type internal set protocols bgp group sub-AS-64513 local-address 192.168.5.2 set protocols bgp group sub-AS-64513 neighbor 192.168.9.1 </pre>

	<pre>set protocols bgp group sub-AS-64513 neighbor 192.168.16.1</pre>
Border Device in Sub-AS 64513	<pre>set protocols bgp group to-sub-AS-64512 type external set protocols bgp group to-sub-AS-64512 peer-as 64512 set protocols bgp group to-sub-AS-64512 neighbor 192.168.5.1</pre>
Step-by-Step Procedure	<p>This procedure shows the steps for the devices that are in sub-AS 64512.</p> <p>The <b>autonomous-system</b> statement sets the sub-AS number of the device.</p> <p>The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see <i>Using the CLI Editor in Configuration Mode</i> in the <i>CLI User Guide</i>.</p> <p>To configure BGP confederations:</p> <ol style="list-style-type: none"><li>1. Set the sub-AS number for the device. <pre>[edit routing-options] user@host# set autonomous-system 64512</pre></li><li>2. In the confederation, include all sub-ASs in the main AS. <p>The number 17 represents the main AS. The <b>members</b> statement lists all the sub-ASs in the main AS.</p><pre>[edit routing-options confederation] user@host# set 17 members 64512 user@host# set 17 members 64513</pre></li><li>3. On the border device in sub-AS 64512, configure an EBGP connection to the border device in AS 64513. <pre>[edit protocols bgp group to-sub-AS-64513] user@host# set type external user@host# set neighbor 192.168.5.2 user@host# set peer-as 64513</pre></li><li>4. Configure an IBGP group for peering with the devices within sub-AS 64512. <pre>[edit protocols bgp group sub-AS-64512] user@host# set type internal user@host# set local-address 192.168.5.1 user@host# neighbor 192.168.8.1 user@host# neighbor 192.168.15.1</pre></li></ol>
Results	<p>From configuration mode, confirm your configuration by entering the <b>show routing-options</b> and <b>show protocols</b> commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.</p> <pre>user@host# show routing-options autonomous-system 64512; confederation 17 members [ 64512 64513 ];  user@host# show protocols bgp {   group to-sub-AS-64513 { # On the border devices only     type external;</pre>

```

    peer-as 64513;
    neighbor 192.168.5.2;
  }
  group sub-AS-64512 {
    type internal;
    local-address 192.168.5.1;
    neighbor 192.168.8.1;
    neighbor 192.168.15.1;
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode. Repeat these steps for sSub-AS 64513.

### Verification

Confirm that the configuration is working properly.

- [Verifying BGP Neighbors on page 3705](#)
- [Verifying BGP Groups on page 3706](#)
- [Verifying BGP Summary Information on page 3707](#)

### Verifying BGP Neighbors

**Purpose** Verify that BGP is running on configured interfaces and that the BGP session is active for each neighbor address.

**Action** From the CLI, enter the **show bgp neighbor** command.

### Sample Output

```

user@host> show bgp neighbor
Peer: 10.255.245.12+179 AS 35 Local: 10.255.245.13+2884 AS 35

```

**Meaning** The output shows a list of the BGP neighbors with detailed session information. Verify the following information:

- Each configured peering neighbor is listed.
- For **State**, each BGP session is **Established**.
- For **Type**, each peer is configured as the correct type (either internal or external).
- For **AS**, the AS number of the BGP neighbor is correct.

#### *Verifying BGP Groups*

**Purpose** Verify that the BGP groups are configured correctly.

**Action** From the CLI, enter the **show bgp group** command.

### Sample Output

```

user@host> show bgp group
Group Type: Internal  AS: 10045      Local AS: 10045
Name: pe-to-asbr2
Export: [ match-all ]
Total peers: 1      Established: 1
10.0.0.4+179
bgp.l3vpn.0: 1/1/0

```

**Meaning** The output shows a list of the BGP groups with detailed group information. Verify the following information:

- Each configured group is listed.
- For **AS**, each group's remote AS is configured correctly.
- For **Local AS**, each group's local AS is configured correctly.
- For **Group Type**, each group has the correct type (either internal or external).

- For **Total peers**, the expected number of peers within the group is shown.
- For **Established**, the expected number of peers within the group have BGP sessions in the **Established** state.
- The IP addresses of all the peers within the group are present.

### Verifying BGP Summary Information

**Purpose** Verify that the BGP configuration is correct.

**Action** From the CLI, enter the **show bgp summary** command.

### Sample Output

```
user@host> show bgp summary
Groups: 1 Peers: 3 Down peers: 0
Table          Tot Paths  Act Paths Suppressed    History Damp State   Pending
inet.0         6         4         0         0         0         0         0
Peer           AS      InPkt   OutPkt   OutQ    Flaps  Last Up/Dwn
State|#Active/Received/Damped...
10.0.0.2       65002   88675   88652     0        2      42:38 2/4/0
              0/0/0
10.0.0.3       65002   54528   54532     0        1     2w4d22h 0/0/0
              0/0/0
10.0.0.4       65002   51597   51584     0        0     2w3d22h 2/2/0
              0/0/0
```

**Meaning** The output shows a summary of BGP session information. Verify the following information:

- For **Groups**, the total number of configured groups is shown.
- For **Peers**, the total number of BGP peers is shown.
- For **Down Peers**, the total number of unestablished peers is 0. If this value is not zero, one or more peering sessions are not yet established.
- Under **Peer**, the IP address for each configured peer is shown.
- Under **AS**, the peer AS for each configured peer is correct.
- Under **Up/Dwn State**, the BGP state reflects the number of paths received from the neighbor, the number of these paths that have been accepted, and the number of routes being damped (such as 0/0/0). If the field is **Active**, it indicates a problem in the establishment of the BGP session.

### Understanding Route Authentication

---

The use of router and route authentication and route integrity greatly mitigates the risk of being attacked by a machine or router that has been configured to share incorrect routing information with another router. In this kind of attack, the attacked router can be tricked into creating a routing loop, or the attacked router's routing table can be greatly increased thus impacting performance, or routing information can be redirected to a place in the network for the attacker to analyze it. Bogus route advertisements can be sent out on a segment. These updates can be accepted into the routing tables of neighbor routers unless an authentication mechanism is in place to verify the source of the routes.

Router and route authentication enables routers to share information only if they can verify that they are talking to a trusted source, based on a password (key). In this method, a hashed key is sent along with the route being sent to another router. The receiving router compares the sent key to its own configured key. If they are the same, it accepts the route. By using a hashing algorithm, the key is not sent over the wire in plain text. Instead, a hash is calculated using the configured key. The routing update is used as the input text, along with the key, into the hashing function. This hash is sent along with the route update to the receiving router. The receiving router compares the received hash with a hash it generates on the route update using the preshared key configured on it. If the two hashes are the same, the route is assumed to be from a trusted source. The key is known only to the sending and receiving routers.

To further strengthen security, you can configure a series of authentication keys (a *keychain*). Each key has a unique start time within the keychain. Keychain authentication allows you to change the password information periodically without bringing down peering sessions. This keychain authentication method is referred to as *hitless* because the keys roll over from one to the next without resetting any peering sessions or interrupting the routing protocol.

The sending peer uses the following rules to identify the active authentication key:

- The start time is less than or equal to the current time (in other words, not in the future).
- The start time is greater than that of all other keys in the chain whose start time is less than the current time (in other words, closest to the current time).

The receiving peer determines the key with which it authenticates based on the incoming key identifier.

The sending peer identifies the current authentication key based on a configured start time and then generates a hash value using the current key. The sending peer then inserts a TCP-enhanced authentication option object into the BGP update message. The object contains an object ID (assigned by IANA), the object length, the current key, and a hash value.

The receiving peer examines the incoming TCP-enhanced authentication option, looks up the received authentication key, and determines whether the key is acceptable based on the start time, the system time, and the tolerance parameter. If the key is accepted, the receiving peer calculates a hash and authenticates the update message.

Initial application of a keychain to a TCP session causes the session to reset. However, once the keychain is applied, the addition or removal of a password from the keychain does not cause the TCP session to reset. Also, the TCP session does not reset when the keychain changes from one authentication algorithm to another.

### Example: Configuring Route Authentication for BGP

All BGP protocol exchanges can be authenticated to guarantee that only trusted routing devices participate in autonomous system (AS) routing updates. By default, authentication is disabled.

- [Requirements on page 3709](#)
- [Overview on page 3709](#)
- [Configuration on page 3710](#)
- [Verification on page 3712](#)

#### Requirements

Before you begin:

- Configure the router interfaces.
- Configure an interior gateway protocol (IGP).

#### Overview

When you configure authentication, the algorithm creates an encoded checksum that is included in the transmitted packet. The receiving routing device uses an authentication key (password) to verify the packet's checksum.

This example includes the following statements for configuring and applying the keychain:

- **key**—A keychain can have multiple keys. Each key within a keychain must be identified by a unique integer value. The range of valid identifier values is from 0 through 63.  
The key can be up to 126 characters long. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").
- **tolerance**—(Optional) For each keychain, you can configure a clock-skew tolerance value in seconds. The clock-skew tolerance is applicable to the receiver accepting keys for BGP updates. The configurable range is 0 through 999,999,999 seconds. During the tolerance period, either the current or previous password is acceptable.
- **key-chain**—For each keychain, you must specify a name. This example defines one keychain: **bgp-auth**. You can have multiple keychains on a routing device. For example, you can have a keychain for BGP, a keychain for OSPF, and a keychain for LDP.

- **secret**—For each key in the keychain, you must set a secret password. This password can be entered in either encrypted or plain text format in the **secret** statement. It is always displayed in encrypted format.
- **start-time**—Each key must specify a start time in UTC format. Control gets passed from one key to the next. When a configured start time arrives (based on the routing device's clock), the key with that start time becomes active. Start times are specified in the local time zone for a routing device and must be unique within the keychain.
- **authentication-key-chain**—Enables you to apply a keychain at the global BGP level for all peers, for a group, or for a neighbor. This example applies the keychain to the peers defined in the external BGP (EBGP) group called **ext**.
- **authentication-algorithm**—For each keychain, you can specify a hashing algorithm. The algorithm can be AES-128, MD5, or SHA-1.

You associate a keychain and an authentication algorithm with a BGP neighboring session.

This example configures a keychain named **bgp-auth**. Key 0 will be sent and accepted starting at 2011-6-23.20:19:33 -0700, and will stop being sent and accepted when the next key in the keychain (key 1) becomes active. Key 1 becomes active one year later at 2012-6-23.20:19:33 -0700, and will not stop being sent and accepted unless another key is configured with a start time that is later than the start time of key 1. A clock-skew tolerance of 30 seconds applies to the receiver accepting the keys. During the tolerance period, either the current or previous key is acceptable. The keys are shared-secret passwords. This means that the neighbors receiving the authenticated routing updates must have the same authentication keychain configuration, including the same keys (passwords). So Router R0 and Router R1 must have the same authentication-key-chain configuration if they are configured as peers. This example shows the configuration on only one of the routing devices.

### Topology Diagram

Figure 120 on page 3710 shows the topology used in this example.

Figure 120: Authentication for BGP

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set protocols bgp group ext type external
set protocols bgp group ext peer-as 65530
set protocols bgp group ext neighbor 172.16.2.1
set routing-options autonomous-system 65533
```

```

set protocols bgp group ext authentication-key-chain bgp-auth
set protocols bgp group ext authentication-algorithm md5
set security authentication-key-chains key-chain bgp-auth tolerance 30
set security authentication-key-chains key-chain bgp-auth key 0 secret
  this-is-the-secret-password
set security authentication-key-chains key-chain bgp-auth key 0 start-time
  2011-6-23.20:19:33-0700
set security authentication-key-chains key-chain bgp-auth key 1 secret
  this-is-another-secret-password
set security authentication-key-chains key-chain bgp-auth key 1 start-time
  2012-6-23.20:19:33-0700

```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Router R1 to accept route filters from Device CE1 and perform outbound route filtering using the received filters:

1. Configure the local autonomous system.

```

[edit routing-options]
user@R1# set autonomous-system 65533

```

2. Configure one or more BGP groups.

```

[edit protocols bgp group ext]
user@R1# set type external
user@R1# set peer-as 65530
user@R1# set neighbor 172.16.2.1

```

3. Configure authentication with multiple keys.

```

[edit security authentication-key-chains key-chain bgp-auth]
user@R1# set key 0 secret this-is-the-secret-password
user@R1# set key 0 start-time 2011-6-23.20:19:33-0700
user@R1# set key 1 secret this-is-another-secret-password
user@R1# set key 1 start-time 2012-6-23.20:19:33-0700

```

The start time of each key must be unique within the keychain.

4. Apply the authentication keychain to BGP, and set the hashing algorithm.

```

[edit protocols bgp group ext]
user@R1# set authentication-key-chain bgp-auth
user@R1# set authentication-algorithm md5

```

5. (Optional) Apply a clock-skew tolerance value in seconds.

```

[edit security authentication-key-chains key-chain bgp-auth]
user@R1# set tolerance 30

```

**Results** From configuration mode, confirm your configuration by entering the **show protocols**, **show routing-options**, and **show security** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R1# show protocols
bgp {

```

```
group ext {
  type external;
  peer-as 65530;
  neighbor 172.16.2.1;
  authentication-key-chain bgp-auth;
  authentication-algorithm md5;
}
}

user@R1# show routing-options
autonomous-system 65533;

user@R1# show security
authentication-key-chains {
  key-chain bgp-auth {
    tolerance 30;
    key 0 {
      secret
      "$9$ST6AREyK8RhXNdwaJn/CtO1cykWwX9AylMWdVgoJDqP5FCA0z3IEhcMWLxNbgJDiF6A";
      ## SECRET-DATA
      start-time "2011-6-23.20:19:33 -0700";
    }
    key 1 {
      secret "$9$UyD.59CuO1h9AylKW-dqmfT369CuRhSP5hrvMN-JGDiqfuOlleWpuh.";
      ## SECRET-DATA
      start-time "2012-6-23.20:19:33 -0700";
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Repeat the procedure for every BGP-enabled device in the network, using the appropriate interface names and addresses for each BGP-enabled device.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying Authentication for the Neighbor on page 3712](#)
- [Verifying That Authorization Messages Are Sent on page 3713](#)
- [Checking Authentication Errors on page 3714](#)
- [Verifying the Operation of the Keychain on page 3714](#)

### **Verifying Authentication for the Neighbor**

**Purpose** Make sure that the **AuthKeyChain** option appears in the output of the **show bgp neighbor** command.

**Action** From operational mode, enter the **show bgp neighbor** command.

```
user@R1> show bgp neighbor
Peer: 172.16.2.1+179 AS 65530  Local: 172.16.2.2+1222 AS 65533

Output messages: Total 22   Updates 1   Refreshes 0   Octets 471
Output Queue[0]: 0

```

### *Verifying That Authorization Messages Are Sent*

**Purpose** Confirm that BGP has the enhanced authorization option.

**Action** From operational mode, enter the `monitor traffic interface fe-0/0/1` command.

```

user@R1> monitor traffic interface fe-0/0/1
verbose output suppressed, use <detail> or <extensive> for full protocol decode
Listening on fe-0/0/1, capture size 96 bytes

### **Understanding Security Options for BGP with TCP**

Among routing protocols, BGP is unique in using TCP as its transport protocol. BGP peers are established by manual configuration between routing devices to create a TCP session on port 179. A BGP-enabled device periodically sends keepalive messages to maintain the connection.

Over time, BGP has become the dominant interdomain routing protocol on the Internet. However, it has limited guarantees of stability and security. Configuring security options for BGP must balance suitable security measures with acceptable costs. No one method

has emerged as superior to other methods. Each network administrator must configure security measures that meet the needs of the network being used.

For detailed information about the security issues associated with BGP's use of TCP as a transport protocol, see RFC 4272, *BGP Security Vulnerabilities Analysis*.

### Example: Configuring a Filter to Block TCP Access to a Port Except from Specified BGP Peers

This example shows how to configure a standard stateless firewall filter that blocks all TCP connection attempts to port 179 from all requesters except from specified BGP peers.

- [Requirements on page 3715](#)

#### Requirements

No special configuration beyond device initialization is required before you configure this example.

#### Overview

In this example, you create a stateless firewall filter that blocks all TCP connection attempts to port 179 from all requesters except the specified BGP peers.

The stateless firewall filter **filter\_bgp179** matches all packets from the directly connected interfaces on Device A and Device B to the destination port number 179.

Figure 121 on page 3715 shows the topology used in this example. Device C attempts to make a TCP connection to Device E. Device E blocks the connection attempt. This example shows the configuration on Device E.

Figure 121: Typical Network with BGP Peer Sessions

#### Configuration

##### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device C**

```
set interfaces ge-1/2/0 unit 10 description to-E
set interfaces ge-1/2/0 unit 10 family inet address 10.10.10.10/30
set protocols bgp group external-peers type external
set protocols bgp group external-peers peer-as 17
set protocols bgp group external-peers neighbor 10.10.10.9
set routing-options autonomous-system 22
```

**Device E**

```
set interfaces ge-1/2/0 unit 0 description to-A
set interfaces ge-1/2/0 unit 0 family inet address 10.10.10.1/30
set interfaces ge-1/2/1 unit 5 description to-B
set interfaces ge-1/2/1 unit 5 family inet address 10.10.10.5/30
set interfaces ge-1/0/0 unit 9 description to-C
set interfaces ge-1/0/0 unit 9 family inet address 10.10.10.9/30
set interfaces lo0 unit 2 family inet filter input filter_bgp179
set interfaces lo0 unit 2 family inet address 192.168.0.1/32
set protocols bgp group external-peers type external
set protocols bgp group external-peers peer-as 22
set protocols bgp group external-peers neighbor 10.10.10.2
set protocols bgp group external-peers neighbor 10.10.10.6
set protocols bgp group external-peers neighbor 10.10.10.10
set routing-options autonomous-system 17
set firewall family inet filter filter_bgp179 term 1 from source-address 10.10.10.2/32
set firewall family inet filter filter_bgp179 term 1 from source-address 10.10.10.6/32
set firewall family inet filter filter_bgp179 term 1 from destination-port bgp
set firewall family inet filter filter_bgp179 term 1 then accept
set firewall family inet filter filter_bgp179 term 2 then reject
```

### *Configuring Device E*

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device E with a stateless firewall filter that blocks all TCP connection attempts to port 179 from all requestors except specified BGP peers:

1. Configure the interfaces.

```
user@E# set interfaces ge-1/2/0 unit 0 description to-A
user@E# set interfaces ge-1/2/0 unit 0 family inet address 10.10.10.1/30
```

```
user@E# set interfaces ge-1/2/1 unit 5 description to-B
user@E# set interfaces ge-1/2/1 unit 5 family inet address 10.10.10.5/30
```

```
user@E# set interfaces ge-1/0/0 unit 9 description to-C
user@E# set interfaces ge-1/0/0 unit 9 family inet address 10.10.10.9/30
```

2. Configure BGP.

```
[edit protocols bgp group external-peers]
user@E# set type external
user@E# set peer-as 22
user@E# set neighbor 10.10.10.2
user@E# set neighbor 10.10.10.6
user@E# set neighbor 10.10.10.10
```

3. Configure the autonomous system number.

```
[edit routing-options]
user@E# set autonomous-system 17
```

4. Define the filter term that accepts TCP connection attempts to port 179 from the specified BGP peers.

```
[edit firewall family inet filter filter_bgp179]
user@E# set term 1 from source-address 10.10.10.2/32
user@E# set term 1 from source-address 10.10.10.6/32
user@E# set term 1 from destination-port bgp
user@E# set term 1 then accept
```

5. Define the other filter term to reject packets from other sources.

```
[edit firewall family inet filter filter_bgp179]
user@E# set term 2 then reject
```

6. Apply the firewall filter to the loopback interface.

```
[edit interfaces lo0 unit 2 family inet]
user@E# set filter input filter_bgp179
user@E# set address 192.168.0.1/32
```

**Results** From configuration mode, confirm your configuration by entering the **show firewall**, **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@E# show firewall
family inet {
  filter filter_bgp179 {
    term 1 {
      from {
        source-address {
          10.10.10.2/32;
          10.10.10.6/32;
        }
        destination-port bgp;
      }
      then accept;
    }
    term 2 {
      then {
        reject;
      }
    }
  }
}

user@E# show interfaces
lo0 {
  unit 2 {
    family inet {
      filter {
        input filter_bgp179;
```

```
        }
        address 192.168.0.1/32;
    }
}
ge-1/2/0 {
    unit 0 {
        description to-A;
        family inet {
            address 10.10.10.1/30;
        }
    }
}
ge-1/2/1 {
    unit 5 {
        description to-B;
        family inet {
            address 10.10.10.5/30;
        }
    }
}
ge-1/0/0 {
    unit 9 {
        description to-C;
        family inet {
            address 10.10.10.9/30;
        }
    }
}
}

user@E# show protocols
bgp {
    group external-peers {
        type external;
        peer-as 22;
        neighbor 10.10.10.2;
        neighbor 10.10.10.6;
        neighbor 10.10.10.10;
    }
}
```

```
user@E# show routing-options
autonomous-system 17;
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying That the Filter Is Configured on page 3719](#)
- [Verifying the TCP Connections on page 3719](#)
- [Monitoring Traffic on the Interfaces on page 3719](#)

*Verifying That the Filter Is Configured*

**Purpose** Make sure that the filter is listed in output of the **show firewall filter** command.

**Action** user@E> show firewall filter filter\_bgp179  
Filter: filter\_bgp179

*Verifying the TCP Connections*

**Purpose** Verify the TCP connections.

**Action** From operational mode, run the **show system connections extensive** command on Device C and Device E.

The output on Device C shows the attempt to establish a TCP connection. The output on Device E shows that connections are established with Device A and Device B only.

user@C> show system connections extensive | match 10.10.10

tcp4	0	0	10.10.10.9.51872	10.10.10.10.179	SYN_SENT
------	---	---	------------------	-----------------	----------

user@E> show system connections extensive | match 10.10.10

tcp4	0	0	10.10.10.5.179	10.10.10.6.62096	ESTABLISHED
tcp4	0	0	10.10.10.6.62096	10.10.10.5.179	ESTABLISHED
tcp4	0	0	10.10.10.1.179	10.10.10.2.61506	ESTABLISHED
tcp4	0	0	10.10.10.2.61506	10.10.10.1.179	ESTABLISHED

*Monitoring Traffic on the Interfaces*

**Purpose** Use the **monitor traffic** command to compare the traffic on an interface that establishes a TCP connection with the traffic on an interface that does not establish a TCP connection.

**Action** From operational mode, run the **monitor traffic** command on the Device E interface to Device B and on the Device E interface to Device C. The following sample output verifies that in the first example, acknowledgment (**ack**) messages are received. In the second example, **ack** messages are not received.

user@E> monitor traffic size 1500 interface ge-1/2/1.5

```

### **Example: Configuring a Filter to Limit TCP Access to a Port Based On a Prefix List**

This example shows how to configure a standard stateless firewall filter that limits certain TCP and Internet Control Message Protocol (ICMP) traffic destined for the Routing Engine by specifying a list of prefix sources that contain allowed BGP peers.

- [Requirements on page 3720](#)
- [Overview on page 3720](#)
- [Configuration on page 3720](#)
- [Verification on page 3722](#)

#### **Requirements**

No special configuration beyond device initialization is required before configuring this example.

#### **Overview**

In this example, you create a stateless firewall filter that blocks all TCP connection attempts to port 179 from all requesters except BGP peers that have a specified prefix.

A source prefix list, **plist\_bgp179**, is created that specifies the list of source prefixes that contain allowed BGP peers.

The stateless firewall filter **filter\_bgp179** matches all packets from the source prefix list **plist\_bgp179** to the destination port number 179.

#### **Configuration**

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

- [Configure the Filter on page 3721](#)
- [Results on page 3721](#)

#### **CLI Quick Configuration**

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set policy-options prefix-list plist_bgp179 apply-path "protocols bgp group <*> neighbor <*>"
set firewall family inet filter filter_bgp179 term 1 from source-address 0.0.0.0/0
```

```

set firewall family inet filter filter_bgp179 term 1 from source-prefix-list plist_bgp179 except
set firewall family inet filter filter_bgp179 term 1 from destination-port bgp
set firewall family inet filter filter_bgp179 term 1 then reject
set firewall family inet filter filter_bgp179 term 2 then accept
set interfaces lo0 unit 0 family inet filter input filter_bgp179
set interfaces lo0 unit 0 family inet address 127.0.0.1/32

```

### Configure the Filter

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the filter:

1. Expand the prefix list **bgp179** to include all prefixes pointed to by the BGP peer group defined by **protocols bgp group <\*> neighbor <\*>**.

```

[edit policy-options prefix-list plist_bgp179]
user@host# set apply-path "protocols bgp group <*> neighbor <*>"

```

2. Define the filter term that rejects TCP connection attempts to port 179 from all requesters except the specified BGP peers.

```

[edit firewall family inet filter filter_bgp179]
user@host# set term term1 from source-address 0.0.0.0/0
user@host# set term term1 from source-prefix-list bgp179 except
user@host# set term term1 from destination-port bgp
user@host# set term term1 then reject

```

3. Define the other filter term to accept all packets.

```

[edit firewall family inet filter filter_bgp179]
user@host# set term term2 then accept

```

4. Apply the firewall filter to the loopback interface.

```

[edit interfaces lo0 unit 0 family inet]
user@host# set filter input filter_bgp179
user@host# set address 127.0.0.1/32

```

### Results

From configuration mode, confirm your configuration by entering the **show firewall**, **show interfaces**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@host# show firewall
family inet {
  filter filter_bgp179 {
    term 1 {
      from {
        source-address {
          0.0.0.0/0;
        }
        source-prefix-list {
          plist_bgp179 except;

```

```
    }
    destination-port bgp;
  }
  then {
    reject;
  }
}
term 2 {
  then {
    accept;
  }
}
}
}

user@host# show interfaces
lo0 {
  unit 0 {
    family inet {
      filter {
        input filter_bgp179;
      }
      address 127.0.0.1/32;
    }
  }
}

user@host# show policy-options
prefix-list plist_bgp179 {
  apply-path "protocols bgp group <*> neighbor <*>";
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Repeat the procedure, where appropriate, for every BGP-enabled device in the network, using the appropriate interface names and addresses for each BGP-enabled device.

### **Verification**

Confirm that the configuration is working properly.

### **Displaying the Firewall Filter Applied to the Loopback Interface**

**Purpose** Verify that the firewall filter **filter\_bgp179** is applied to the IPv4 input traffic at logical interface **lo0.0**.

**Action** Use the **show interfaces statistics** operational mode command for logical interface **lo0.0**, and include the **detail** option. Under the **Protocol inet** section of the command output section, the **Input Filters** field displays the name of the stateless firewall filter applied to the logical interface in the input direction:

```
[edit]
user@host> show interfaces statistics lo0.0 detail
Logical interface lo0.0 (Index 321) (SNMP ifIndex 16) (Generation 130)
Flags: SNMP-Traps Encapsulation: Unspecified
Traffic statistics:
Input bytes : 0
```

```

Output bytes : 0
Input packets: 0
Output packets: 0
Local statistics:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0
Transit statistics:
Input bytes : 0 0 bps
Output bytes : 0 0 bps
Input packets: 0 0 pps
Output packets: 0 0 pps
Protocol inet, MTU: Unlimited, Generation: 145, Route table: 0
Flags: Sendbcst-pkt-to-re
Input Filters: filter_bgp179
Addresses, Flags: Primary
Destination: Unspecified, Local: 127.0.0.1, Broadcast: Unspecified,
Generation: 138

```

### Example: Limiting TCP Segment Size for BGP

This example shows how to avoid Internet Control Message Protocol (ICMP) vulnerability issues by limiting TCP segment size when you are using maximum transmission unit (MTU) discovery. Using MTU discovery on TCP paths is one method of avoiding BGP packet fragmentation.

- [Requirements on page 3723](#)
- [Overview on page 3723](#)
- [Configuration on page 3724](#)
- [Verification on page 3726](#)
- [Troubleshooting on page 3726](#)

#### Requirements

No special configuration beyond device initialization is required before you configure this example.

#### Overview

TCP negotiates a maximum segment size (MSS) value during session connection establishment between two peers. The MSS value negotiated is primarily based on the maximum transmission unit (MTU) of the interfaces to which the communicating peers are directly connected. However, due to variations in link MTU on the path taken by the TCP packets, some packets in the network that are well within the MSS value might be fragmented when the packet size exceeds the link's MTU.

To configure the TCP MSS value, include the **tcp-mss** statement with a segment size from 1 through 4096.

If the router receives a TCP packet with the SYN bit and the MSS option set, and the MSS option specified in the packet is larger than the MSS value specified by the **tcp-mss** statement, the router replaces the MSS value in the packet with the lower value specified by the **tcp-mss** statement.

The configured MSS value is used as the maximum segment size for the sender. The assumption is that the TCP MSS value used by the sender to communicate with the BGP neighbor is the same as the TCP MSS value that the sender can accept from the BGP neighbor. If the MSS value from the BGP neighbor is less than the MSS value configured, the MSS value from the BGP neighbor is used as the maximum segment size for the sender.

This feature is supported with TCP over IPv4 and TCP over IPv6.

### Topology Diagram

Figure 122 on page 3724 shows the topology used in this example.

**Figure 122: TCP Maximum Segment Size for BGP**

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
R0
set interfaces fe-1/2/0 unit 1 family inet address 1.1.0.1/30
set interfaces lo0 unit 1 family inet address 10.255.14.179/32
set protocols bgp group-int tcp-mss 2020
set protocols bgp group int type internal
set protocols bgp group int local-address 10.255.14.179
set protocols bgp group int mtu-discovery
set protocols bgp group int neighbor 10.255.71.24 tcp-mss 2000
set protocols bgp group int neighbor 10.255.14.177
set protocols bgp group int neighbor 10.0.14.4 tcp-mss 4000
set protocols ospf area 0.0.0.0 interface fe-1/2/0.1
set protocols ospf area 0.0.0.0 interface 10.255.14.179
set routing-options autonomous-system 65000
```

#### Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Router R0:

1. Configure the interfaces.  

```
[edit interfaces]
user@R0# set fe-1/2/0 unit 1 family inet address 1.1.0.1/30
user@R0# set lo0 unit 1 family inet address 10.255.14.179/32
```
2. Configure an interior gateway protocol (IGP), OSPF in this example.  

```
[edit protocols ospf area 0.0.0.0]
```

```
user@R0# set interface fe-1/2/0.1
user@R0# set interface 10.255.14.179
```

3. Configure one or more BGP groups.

```
[edit protocols bgp group int]
user@R0# set type internal
user@R0# set local-address 10.255.14.179
```

4. Configure MTU discovery to prevent packet fragmentation.

```
[edit protocols bgp group int]
user@R0# set mtu-discovery
```

5. Configure the BGP neighbors, with the TCP MSS set globally for the group or specifically for the various neighbors.

```
[edit protocols bgo group int]
user@R0# set tcp-mss 2020
user@R0# set neighbor 10.255.14.177
user@R0# set neighbor 10.255.71.24 tcp-mss 2000
user@R0# set neighbor 10.0.14.4 tcp-mss 4000
```

**NOTE:** The TCP MSS neighbor setting overrides the group setting.

6. Configure the local autonomous system.

```
[edit routing-options]
user@R0# set autonomous-system 65000
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R0# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 1.1.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 10.255.14.179/32;
    }
  }
}

user@R0# show protocols
bgp {
  group int {
    type internal;
    local-address 10.255.14.179;
```

```
mtu-discovery;
tcp-mss 2020;
neighbor 10.255.71.24 {
    tcp-mss 2000;
}
neighbor 10.255.14.177;
neighbor 10.0.14.4 {
    tcp-mss 4000;
}
}
}
ospf {
    area 0.0.0.0 {
        interface fe-1/2/0.1;
        interface 10.255.14.179;
    }
}
}

user@R0# show routing-options
autonomous-system 65000;
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

To confirm that the configuration is working properly, run the following commands:

- **show system connections extensive | find <neighbor-address>**, to check the negotiated TCP MSS value.
- **monitor traffic interface**, to monitor BGP traffic and to make sure that the configured TCP MSS value is used as the MSS option in the TCP SYN packet.

### Troubleshooting

- [MSS Calculation with MTU Discovery on page 3726](#)

### MSS Calculation with MTU Discovery

**Problem** Consider an example in which two routing devices (R1 and R2) have an internal BGP (IBGP) connection. On both of the routers, the connected interfaces have 4034 as the IPv4 MTU.

```
user@R1# show protocols bgp | display set
[edit]
set protocols bgp group ibgp type internal
set protocols bgp group ibgp local-address 45.45.45.2
set protocols bgp group ibgp mtu-discovery
set protocols bgp group ibgp neighbor 45.45.45.1
```

```
user@R1# run show interfaces xe-0/0/3 extensive | match mtu
```

```
Link-level type: Ethernet, MTU: 4048, LAN-PHY mode, Speed: 10Gbps,
FIFO errors: 0, HS link CRC errors: 0, MTU errors: 0, Resource errors: 0
Protocol inet, MTU: 4034, Generation: 180, Route table: 0
Protocol multiservice, MTU: Unlimited, Generation: 181, Route table: 0
```

In the following packet capture on Device R1, the negotiated MSS is 3994. In the **show system connections extensive** information for MSS, it is set to 2048.

```

```

**Solution** This is expected behavior with Junos OS. The MSS value is equal to the MTU value minus the IP or IPv6 and TCP headers. This means that the MSS value is generally 40 bytes less than the MTU (for IPv4) and 60 bytes less than the MTU (for IPv6). This value is negotiated between the peers. In this example, it is  $4034 - 40 = 3994$ . Junos OS then rounds this value to a multiple of 2 KB. The value is  $3994 / 2048 * 2048 = 2048$ . So it is not necessary to see same MSS value with in the **show system connections** output.

$3994 / 2048 = 1.95$

1.95 is rounded to 1.

$1 * 2048 = 2048$

### Example: Preventing BGP Session Resets

- [Understanding BGP Session Resets on page 3728](#)
- [Example: Preventing BGP Session Flaps When VPN Families Are Configured on page 3728](#)

#### Understanding BGP Session Resets

---

Certain configuration actions and events cause BGP sessions to be reset (dropped and then reestablished).

If you configure both route reflection and VPNs on the same routing device, the following modifications to the route reflection configuration cause current BGP sessions to be reset:

- Adding a cluster ID—If a BGP session shares the same autonomous system (AS) number with the group where you add the cluster ID, all BGP sessions are reset regardless of whether the BGP sessions are contained in the same group.
- Creating a new route reflector—If you have an internal BGP (IBGP) group with an AS number and create a new route reflector group with the same AS number, all BGP sessions in the IBGP group and the new route reflector group are reset.
- Changing configuration statements that affect BGP peers, such as renaming a BGP group, resets the BGP sessions.
- If you change the address family specified in the **[edit protocols bgp family]** hierarchy level, all current BGP sessions on the routing device are dropped and then reestablished.

#### Example: Preventing BGP Session Flaps When VPN Families Are Configured

---

This example shows a workaround for a known issue in which BGP sessions sometimes go down and then come back up (in other words, flap) when virtual private network (VPN) families are configured. If any VPN family (for example, **inet-vpn**, **inet6-vpn**, **inet-mpvn**, **inet-mdt**, **inet6-mpvn**, **l2vpn**, **iso-vpn**, and so on) is configured on a BGP master instance, a flap of either a route reflector (RR) internal BGP (IBGP) session or an external BGP (EBGP) session causes flaps of other BGP sessions configured with the same VPN family.

- [Requirements on page 3729](#)
- [Overview on page 3730](#)
- [Configuration on page 3732](#)
- [Verification on page 3735](#)

***Requirements***

Before you begin:

- Configure router interfaces.
- Configure an interior gateway protocol (IGP).
- Configure BGP.
- Configure VPNs.

## *Overview*

When a router or switch is configured as either a route reflector (RR) or an AS boundary router (an external BGP peer) and a VPN family (for example, the **family inet-vpn unicast** statement) is configured, a flap of either the RR IBGP session or the EBGP session causes flaps of all other BGP sessions that are configured with the **family inet-vpn unicast** statement. This example shows how to prevent these unnecessary session flaps.

The reason for the flapping behavior is related to BGP operation in Junos OS when originating VPN routes.

BGP has the following two modes of operation with respect to originating VPN routes:

- If BGP does not need to propagate VPN routes because the session has no EBGP peer and no RR clients, BGP exports VPN routes directly from the *instance.inet.0* routing table to other PE routers. This behavior is efficient in that it avoids the creation of two copies of many routes (one in the *instance.inet.0* table and one in the *bgp.l3vpn.0* table).
- If BGP does need to propagate VPN routes because the session has an EBGP peer or RR clients, BGP first exports the VPN routes from the *instance.inet.0* table to the *bgp.l3vpn.0* table. Then BGP exports the routes to other PE routers. In this scenario, two copies of the route are needed to enable best-route selection. A PE router might receive the same VPN route from a CE device and also from an RR client or EBGP peer.

**NOTE:** The route export is not performed if the route in *instance.inet.0* is a secondary route. In Junos OS, a route is only exported one time from one routing table as a primary route to another routing table as a secondary route. Because the route in *instance.inet.0* is already a secondary route, it is not allowed to be moved again to the *bgp.l3vpn.0* table, as needed to be advertised. The route does not reach the *bgp.l3vpn.0* table and thus is not advertised. One workaround is to send the routes that should be advertised to *inet.0* so that they are advertised.

When, because of a configuration change, BGP transitions from needing two copies of a route to not needing two copies of a route (or the reverse), all sessions over which VPN routes are exchanged go down and then come back up. Although this example focuses on the **family inet-vpn unicast** statement, the concept applies to all VPN network layer reachability information (NLRI) families. This issue impacts logical systems as well. All BGP sessions in the master instance related to the VPN NLRI family are brought down to implement the table advertisement change for the VPN NLRI family. Changing an RR to a non-RR or the reverse (by adding or removing the **cluster** statement) causes the table advertisement change. Also, configuring the first EBGP session or removing the EBGP session from the configuration in the master instance for a VPN NLRI family causes the table advertisement change.

The way to prevent these unnecessary session flaps is to configure an extra RR client or EBGP session as a passive session with a neighbor address that does not exist. This example focuses on the EBGP case, but the same workaround works for the RR case.

When a session is passive, the routing device does not send Open requests to a peer. Once you configure the routing device to be passive, the routing device does not originate the TCP connection. However, when the routing device receives a connection from the peer and an Open message, it replies with another BGP Open message. Each routing device declares its own capabilities.

Figure 123 on page 3732 shows the topology for the EBGp case. Router R1 has an IBGP session with Routers R2 and R3 and an EBGp session with Router R4. All sessions have the **family inet-vpn unicast** statement configured. If the R1-R4 EBGp session flaps, the R1-R2 and R1-R3 BGP sessions flap also.

Figure 123: Topology for the EBGp Case

Figure 124 on page 3732 shows the topology for the RR case. Router R1 is the RR, and Router R3 is the client. Router R1 has IBGP sessions with Routers R2 and R3. All sessions have the **family inet-vpn unicast** statement configured. If the R1-R3 session flaps, the R1-R2 and R1-R4 sessions flap also.

Figure 124: Topology for the RR Case

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

set protocols bgp family inet-vpn unicast
set protocols bgp family l2vpn signaling
set protocols bgp group R1-R4 type external
set protocols bgp group R1-R4 local-address 4.4.4.2
set protocols bgp group R1-R4 neighbor 4.4.4.1 peer-as 200
set protocols bgp group R1-R2-R3 type internal
set protocols bgp group R1-R2-R3 log-updown
set protocols bgp group R1-R2-R3 local-address 15.15.15.15
set protocols bgp group R1-R2-R3 neighbor 12.12.12.12
set protocols bgp group R1-R2-R3 neighbor 13.13.13.13
set protocols bgp group Fake type external
set protocols bgp group Fake passive
set protocols bgp group Fake neighbor 100.100.100.100 peer-as 500

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the EBGp scenario:

1. Configure one or more VPN families.

```

[edit protocols bgp]
user@R1# set family inet-vpn unicast
user@R1# set family l2vpn signaling

```

2. Configure the EBGp session.

```

[edit protocols bgp]
user@R1# set group R1-R4 type external
user@R1# set group R1-R4 local-address 4.4.4.2
user@R1# set group R1-R4 neighbor 4.4.4.1 peer-as 200

```

3. Configure the IBGP sessions.

```

[edit protocols bgp]
user@R1# set group R1-R2-R3 type internal
user@R1# set group R1-R2-R3 local-address 15.15.15.15
user@R1# set group R1-R2-R3 neighbor 12.12.12.12
user@R1# set group R1-R2-R3 neighbor 13.13.13.13

```

4. (Optional) Configure BGP so that it generates a **syslog** message whenever a BGP peer makes a state transition.

```

[edit protocols bgp]
user@R1# set group R1-R2-R3 log-updown

```

Enabling the **log-updown** statement causes BGP state transitions to be logged at **warning** level.

**Step-by-Step Procedure** To verify that unnecessary session flaps are occurring:

1. Run the **show bgp summary** command to verify that the sessions have been established.

```

user@R1> show bgp summary
Groups: 2 Peers: 3 Down peers: 0
Table      Tot Paths Act Paths Suppressed History Damp State Pending

```

```

bgp.13vpn.0 0      0      0      0      0      0
bgp.12vpn.0 0      0      0      0      0      0
inet.0      0      0      0      0      0      0
Peer        AS  InPkt OutPkt OutQ Flaps Last Up/Dwn
State|#Active/Received/Accepted/Damped...
4.4.4.1     200 6      5      0      0      1:08 Establ
bgp.13vpn.0: 0/0/0/0
bgp.12vpn.0: 0/0/0/0
12.12.12.12 100 3      7      0      0      1:18 Establ
bgp.13vpn.0: 0/0/0/0
bgp.12vpn.0: 0/0/0/0
13.13.13.13 100 3      6      0      0      1:14 Establ
bgp.13vpn.0: 0/0/0/0
bgp.12vpn.0: 0/0/0/0

```

2. Deactivate the EBGp session.

```

user@R1# deactivate group R1-R4
user@R1# commit

```

```

Mar 10 18:27:40 R1: rpd[1464]: bgp_peer_delete:6589: NOTIFICATION sent to 4.4.4.1 (External AS 200): code
