```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To prevent unnecessary BGP session flaps:

1. Add a passive EBGP session with a neighbor address that does not exist in the peer autonomous system (AS).

```
[edit protocols bgp]
user@R1# set group Fake type external
user@R1# set group Fake passive
user@R1# set neighbor 100.100.100.100 peer-as 500
```

2. Run the **show bgp summary** command to verify that the real sessions have been established and the passive session is idle.

```
user@R1> show bgp summary

### Verification

Confirm that the configuration is working properly.

- [Bringing Down the EBGP Session on page 3735](#)
- [Verifying That the IBGP Sessions Remain Up on page 3735](#)

### Bringing Down the EBGP Session

**Purpose** Try to cause the flap issue after the workaround is configured.

**Action** user@R1# deactivate group R1-R4  
user@R1# commit

### Verifying That the IBGP Sessions Remain Up

**Purpose** Make sure that the IBGP sessions do not flap after the EBGP session is deactivated.

**Action** user@R1> show bgp summary

```

### Understanding BGP Route Flap Damping Parameters

BGP *route flapping* describes the situation in which BGP systems send an excessive number of update messages to advertise network reachability information. BGP *flap damping* is a method of reducing the number of update messages sent between BGP peers, thereby reducing the load on these peers, without adversely affecting the route convergence time for stable routes.

Flap damping reduces the number of update messages by marking routes as ineligible for selection as the active or preferable route. Marking routes in this way leads to some delay, or *suppression*, in the propagation of route information, but the result is increased network stability. You typically apply flap damping to external BGP (EBGP) routes (routes in different ASs). You can also apply flap damping within a confederation, between confederation member ASs. Because routing consistency within an AS is important, do

not apply flap damping to internal BGP (IBGP) routes. (If you do, it is ignored.) The exception to this rule is when flap damping is applied at the address family level, which is supported in Junos OS Release 12.2 and later. When you apply flap damping at the address family level, it works for both IBGP and EBGP.

By default, route flap damping is not enabled. Damping is applied to external peers and to peers at confederation boundaries.

When you enable damping, default parameters are applied, as summarized in [Table 272 on page 3737](#).

**Table 272: Damping Parameters**

Damping Parameter	Description	Default Value	Possible Values
<b>half-life <i>minutes</i></b>	Decay half-life—Number of minutes after which an arbitrary value is halved if a route stays stable.	15 (minutes)	1 through 45
<b>max-suppress <i>minutes</i></b>	Maximum hold-down time for a route, in minutes.	60 (minutes)	1 through 720
<b>reuse</b>	Reuse threshold—Arbitrary value below which a suppressed route can be used again.	750	1 through 20,000
<b>suppress</b>	Cutoff (suppression) threshold—Arbitrary value above which a route can no longer be used or included in advertisements.	3000	1 through 20,000

To change the default BGP flap damping values, you define actions by creating a named set of damping parameters and including it in a routing policy with the damping action. For the damping routing policy to work, you also must enable BGP route flap damping.

#### **Example: Configuring BGP Route Flap Damping Parameters**

This example shows how to configure damping parameters.

- [Requirements on page 3737](#)
- [Overview on page 3737](#)
- [Configuration on page 3738](#)
- [Verification on page 3742](#)

#### **Requirements**

Before you begin, configure router interfaces and configure routing protocols.

#### **Overview**

This example has three routing devices. Device R2 has external BGP (EBGP) connections with Device R1 and Device R3.

Device R1 and Device R3 have some static routes configured for testing purposes, and these static routes are advertised through BGP to Device R2.

Device R2 damps routes received from Device R1 and Device R3 according to these criteria:

- Damp all prefixes with a mask length equal to or greater than 17 more aggressively than routes with a mask length between 9 and 16.
- Damp routes with a mask length between 0 and 8, inclusive, less than routes with a mask length greater than 8.
- Do not damp the 10.128.0.0/9 prefix at all.

The routing policy is evaluated when routes are being exported from the routing table into the forwarding table. Only the active routes are exported from the routing table.

Figure 125 on page 3738 shows the sample network.

**Figure 125: BGP Flap Damping Topology**

“CLI Quick Configuration” on page 3738 shows the configuration for all of the devices in Figure 125 on page 3738.

The section “Step-by-Step Procedure” on page 3739 describes the steps on Device R2.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.1/30
set interfaces lo0 unit 0 family inet address 192.168.0.1/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct-and-static
set protocols bgp group ext peer-as 200
set protocols bgp group ext neighbor 10.0.0.2
set policy-options policy-statement send-direct-and-static term 1 from protocol direct
set policy-options policy-statement send-direct-and-static term 1 from protocol static
set policy-options policy-statement send-direct-and-static term 1 then accept
set routing-options static route 172.16.0.0/16 reject
set routing-options static route 172.16.128.0/17 reject
set routing-options static route 172.16.192.0/20 reject
set routing-options static route 10.0.0.0/9 reject
set routing-options static route 224.0.0.0/7 reject
set routing-options static route 10.224.0.0/11 reject
set routing-options static route 0.0.0.0/0 reject
set routing-options autonomous-system 100
  
```

**Device R2**

```

set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 0 family inet address 10.1.0.1/30
set interfaces lo0 unit 0 family inet address 192.168.0.2/32
  
```

```

set protocols bgp damping
set protocols bgp group ext type external
set protocols bgp group ext import damp
set protocols bgp group ext export send-direct
set protocols bgp group ext neighbor 10.0.0.1 peer-as 100
set protocols bgp group ext neighbor 10.1.0.2 peer-as 300
set policy-options policy-statement damp term 1 from route-filter 10.128.0.0/9 exact
damping dry
set policy-options policy-statement damp term 1 from route-filter 0.0.0.0/0
prefix-length-range /0-/8 damping timid
set policy-options policy-statement damp term 1 from route-filter 0.0.0.0/0
prefix-length-range /17-/32 damping aggressive
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options damping aggressive half-life 30
set policy-options damping aggressive suppress 2500
set policy-options damping timid half-life 5
set policy-options damping dry disable
set routing-options autonomous-system 200

```

**Device R3**

```

set interfaces fe-1/2/1 unit 0 family inet address 10.1.0.2/30
set interfaces lo0 unit 0 family inet address 192.168.0.3/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct-and-static
set protocols bgp group ext peer-as 200
set protocols bgp group ext neighbor 10.1.0.1
set policy-options policy-statement send-direct-and-static term 1 from protocol direct
set policy-options policy-statement send-direct-and-static term 1 from protocol static
set policy-options policy-statement send-direct-and-static term 1 then accept
set routing-options static route 10.128.0.0/9 reject
set routing-options autonomous-system 300

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure damping parameters:

1. Configure the interfaces.

```

[edit interfaces]
user@R2# set fe-1/2/0 unit 0 family inet address 10.0.0.2/30

user@R2# set fe-1/2/1 unit 0 family inet address 10.1.0.1/30

user@R2# set lo0 unit 0 family inet address 192.168.0.2/32

```

2. Configure the BGP neighbors.

```

[edit protocols bgp group ext]
user@R2# set type external
user@R2# set neighbor 10.0.0.1 peer-as 100
user@R2# set neighbor 10.1.0.2 peer-as 300

```

3. Create and configure the damping parameter groups.

```
[edit policy-options]
user@R2# set damping aggressive half-life 30
user@R2# set damping aggressive suppress 2500
user@R2# set damping timid half-life 5
user@R2# set damping dry disable
```

4. Configure the damping policy.

```
[edit policy-options policy-statement damp term 1]
user@R2# set from route-filter 10.128.0.0/9 exact damping dry
user@R2# set from route-filter 0.0.0.0/0 prefix-length-range /0-/8 damping timid
user@R2# set from route-filter 0.0.0.0/0 prefix-length-range /17-/32 damping
    aggressive
```

5. Enable damping for BGP.

```
[edit protocols bgp]
user@R2# set damping
```

6. Apply the policy as an import policy for the BGP neighbor.

```
[edit protocols bgp group ext]
user@R2# set import damp
```

**NOTE:** You can refer to the same routing policy one or more times in the same or different import statements.

---

7. Configure an export policy.

```
[edit policy-options policy-statement send-direct term 1]
user@R2# set from protocol direct
user@R2# set then accept
```

8. Apply the export policy.

```
[edit protocols bgp group ext]
user@R2# set export send-direct
```

9. Configure the autonomous system (AS) number.

```
[edit routing-options]
user@R2# set autonomous-system 200
```

**Results** From configuration mode, confirm your configuration by issuing the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 0 {
    family inet {
      address 10.0.0.2/30;
    }
  }
}
```

```

    }
  }
  fe-1/2/1 {
    unit 0 {
      family inet {
        address 10.1.0.1/30;
      }
    }
  }
  lo0 {
    unit 0 {
      family inet {
        address 192.168.0.2/32;
      }
    }
  }
}

user@R2# show protocols
bgp {
  damping;
  group ext {
    type external;
    import damp;
    export send-direct;
    neighbor 10.0.0.1 {
      peer-as 100;
    }
    neighbor 10.1.0.2 {
      peer-as 300;
    }
  }
}

user@R2# show policy-options
policy-statement damp {
  term 1 {
    from {
      route-filter 10.128.0.0/9 exact damping dry;
      route-filter 0.0.0.0/0 prefix-length-range /0-/8 damping timid;
      route-filter 0.0.0.0/0 prefix-length-range /17-/32 damping aggressive;
    }
  }
}
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}
damping aggressive {
  half-life 30;
  suppress 2500;
}
damping timid {
  half-life 5;
}
damping dry {

```

```
disable;  
}  
  
user@R2# show routing-options  
autonomous-system 200;
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Causing Some Routes to Flap on page 3742](#)
- [Checking the Route Flaps on page 3742](#)
- [Verifying Route Flap Damping on page 3743](#)
- [Displaying the Details of a Damped Route on page 3744](#)
- [Verifying That Default Damping Parameters Are in Effect on page 3744](#)
- [Filtering the Damping Information on page 3745](#)

### **Causing Some Routes to Flap**

**Purpose** To verify your route flap damping policy, some routes must flap. Having a live Internet feed almost guarantees that a certain number of route flaps will be present. If you have control over a remote system that is advertising the routes, you can modify the advertising router's policy to effect the advertisement and withdrawal of all routes or of a given prefix. In a test environment, you can cause routes to flap by clearing the BGP neighbors or by restarting the routing process on the BGP neighbors, as shown here.

**Action** From operational mode on Device R1 and Device R3, enter the **restart routing** command.

**CAUTION:** Use this command cautiously in a production network.

```
user@R1> restart routing
```

```
R1 started, pid 10474
```

```
user@R3> restart routing
```

```
R3 started, pid 10478
```

**Meaning** On Device R2, all of the routes from the neighbors are withdrawn and re-advertised.

### **Checking the Route Flaps**

**Purpose** View the number of neighbor flaps.

**Action** From operational mode, enter the **show bgp summary** command.

```
user@R2> show bgp summary
```

```

Groups: 1 Peers: 2 Down peers: 0
Table      Tot Paths  Act Paths Suppressed  History Damp State  Pending

State|#Active/Received/Accepted/Damped...
10.0.0.1   100         10         10         0         4        2:50
0/9/0/9    0/0/0/0
10.1.0.2   300         10         10         0         4        2:53
1/3/1/2    0/0/0/0

```

**Meaning** This output was captured after the routing process was restarted on Device R2's neighbors four times.

### *Verifying Route Flap Damping*

**Purpose** Verify that routes are being hidden due to damping.

**Action** From operational mode, enter the **show route damping suppressed** command.

```
user@R2> show route damping suppressed
```

```
inet.0: 15 destinations, 17 routes (6 active, 0 holddown, 11 hidden)
+ = Active Route, - = Last Active, * = Both
```

```

        damping-parameters: aggressive
        Last update: 00:00:52 First update: 01:01:55
        Flaps: 8
        Suppressed. Reusable in: 01:14:40
        Preference will be: 170
```

**Meaning** This output indicates that the displayed route has a mask length that is equal to or greater than /17, and confirms that it has been correctly mapped to the aggressive damping profile. You can also see the route's current (and last) figure of merit value, and when the route is expected to become active if it remains stable.

#### *Verifying That Default Damping Parameters Are in Effect*

**Purpose** Locating a damped route with a /16 mask confirms that the default parameters are in effect.

**Action** From operational mode, enter the **show route damping suppressed detail | match 0/16** command.

```
user@R2> show route damping suppressed detail | match 0/16

172.16.0.0/16 (1 entry, 0 announced)

user@R2> show route damping suppressed 172.16.0.0/16 detail

inet.0: 15 destinations, 17 routes (6 active, 0 holddown, 11 hidden)
172.16.0.0/16 (1 entry, 0 announced)
```

```

BGP                               /-101
Next hop type: Router, Next hop index: 758

Suppressed. Reusable in: 00:31:40
Preference will be: 170

```

**Meaning** Routes with a /16 mask are not impacted by the custom damping rules. Therefore, the default damping rules are in effect.

To repeat, the custom rules are as follows:

- Damp all prefixes with a mask length equal to or greater than 17 more aggressively than routes with a mask length between 9 and 16.
- Damp routes with a mask length between 0 and 8, inclusive, less than routes with a mask length greater than 8.
- Do not damp the 10.128.0.0/9 prefix at all.

### *Filtering the Damping Information*

**Purpose** Use OR groupings or cascaded piping to simplify the determination of what damping profile is being used for routes with a given mask length.

**Action** From operational mode, enter the **show route damping suppressed** command.

```
user@R2> show route damping suppressed detail | match "0 announced | damp"
```

```

0.0.0.0/0 (1 entry, 0 announced)
    damping-parameters: timid
10.0.0.0/9 (1 entry, 0 announced)
    Default damping parameters used
    damping-parameters: aggressive
    damping-parameters: aggressive
10.224.0.0/11 (1 entry, 0 announced)
    Default damping parameters used
172.16.0.0/16 (1 entry, 0 announced)
    Default damping parameters used
172.16.128.0/17 (1 entry, 0 announced)
    damping-parameters: aggressive
172.16.192.0/20 (1 entry, 0 announced)
    damping-parameters: aggressive
192.168.0.1/32 (1 entry, 0 announced)

```

```

                                damping-parameters: aggressive
192.168.0.3/32 (1 entry, 0 announced)
                                damping-parameters: aggressive
224.0.0.0/7 (1 entry, 0 announced)
                                damping-parameters: timid

```

**Meaning** When you are satisfied that your EBGp routes are correctly associated with a damping profile, you can issue the **clear bgp damping** operational mode command to restore an active status to your damped routes, which will return your connectivity to normal operation.

### Example: Configuring BGP Route Flap Damping Based on the MBGP MVPN Address Family

This example shows how to configure an multiprotocol BGP multicast VPN (also called Next-Generation MVPN) with BGP route flap damping.

- [Requirements on page 3746](#)
- [Overview on page 3746](#)
- [Configuration on page 3747](#)
- [Verification on page 3754](#)

#### Requirements

This example uses Junos OS Release 12.2. BGP route flap damping support for MBGP MVPN, specifically, and on an address family basis, in general, is introduced in Junos OS Release 12.2.

#### Overview

BGP route flap damping helps to diminish route instability caused by routes being repeatedly withdrawn and readvertised when a link is intermittently failing.

This example uses the default damping parameters and demonstrates an MBGP MVPN scenario with three provider edge (PE) routing devices, three customer edge (CE) routing devices, and one provider (P) routing device.

[Figure 126 on page 3746](#) shows the topology used in this example.

**Figure 126: MBGP MVPN with BGP Route Flap Damping**

On PE Device R4, BGP route flap damping is configured for address family **inet-mvpn**. A routing policy called **dampPolicy** uses the **nlri-route-type** match condition to damp only MVPN route types 3, 4, and 5. All other MVPN route types are not damped.

This example shows the full configuration on all devices in the “[CLI Quick Configuration](#)” on page 3747 section. The “[Configuring Device R4](#)” on page 3750 section shows the step-by-step configuration for PE Device R4.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

Device R1  set interfaces ge-1/2/0 unit 1 family inet address 10.1.1.1/30
            set interfaces ge-1/2/0 unit 1 family mpls
            set interfaces lo0 unit 1 family inet address 1.1.1.1/32
            set protocols ospf area 0.0.0.0 interface lo0.1 passive
            set protocols ospf area 0.0.0.0 interface ge-1/2/0.1
            set protocols pim rp static address 100.1.1.2
            set protocols pim interface all
            set routing-options router-id 1.1.1.1

Device R2  set interfaces ge-1/2/0 unit 2 family inet address 10.1.1.2/30
            set interfaces ge-1/2/0 unit 2 family mpls
            set interfaces ge-1/2/1 unit 5 family inet address 10.1.1.5/30
            set interfaces ge-1/2/1 unit 5 family mpls
            set interfaces vt-1/2/0 unit 2 family inet
            set interfaces lo0 unit 2 family inet address 1.1.1.2/32

set protocols pim rp static address 100.1.1.2
set protocols pim interface all
set routing-options router-id 1.1.1.7
```

### *Configuring Device R4*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R4:

1. Configure the interfaces.

```
[edit interfaces]
user@R4# set ge-1/2/0 unit 10 family inet address 10.1.1.10/30
user@R4# set ge-1/2/0 unit 10 family mpls

user@R4# set ge-1/2/1 unit 17 family inet address 10.1.1.17/30
user@R4# set ge-1/2/1 unit 17 family mpls

user@R4# set vt-1/2/0 unit 4 family inet

user@R4# set lo0 unit 4 family inet address 1.1.1.4/32
user@R4# set lo0 unit 104 family inet address 100.1.1.4/32
```

2. Configure MPLS and the signaling protocols on the interfaces.

```
[edit protocols]
user@R4# set mpls interface all
user@R4# set mpls interface ge-1/2/0.10
user@R4# set rsvp interface all aggregate
user@R4# set ldp interface ge-1/2/0.10
user@R4# set ldp p2mp
```

3. Configure BGP.

The BGP configuration enables BGP route flap damping for the **inet-mvpn** address family. The BGP configuration also imports into the routing table the routing policy called **dampPolicy**. This policy is applied to neighbor PE Device R2.

```
[edit protocols bgp group ibgp]
user@R4# set type internal
```

```

user@R4# set local-address 1.1.1.4
user@R4# set family inet-vpn unicast
user@R4# set family inet-vpn any
user@R4# set family inet-mvpn signaling damping
user@R4# set neighbor 1.1.1.2 import dampPolicy
user@R4# set neighbor 1.1.1.5

```

4. Configure an interior gateway protocol.

```

[edit protocols ospf]
user@R4# set traffic-engineering

[edit protocols ospf area 0.0.0.0]
user@R4# set interface all
user@R4# set interface lo0.4 passive
user@R4# set interface ge-1/2/0.10

```

5. Configure a damping policy that uses the **nlri-route-type** match condition to damp only MVPN route types 3, 4, and 5.

```

[edit policy-options policy-statement dampPolicy term term1]
user@R4# set from family inet-mvpn
user@R4# set from nlri-route-type 3
user@R4# set from nlri-route-type 4
user@R4# set from nlri-route-type 5
user@R4# set then accept

```

6. Configure the **damping** policy to disable BGP route flap damping.

The **no-damp** policy (**damping no-damp disable**) causes any damping state that is present in the routing table to be deleted. The **then damping no-damp** statement applies the **no-damp** policy as an action and has no **from** match conditions. Therefore, all routes that are not matched by **term1** are matched by this term, with the result that all other MVPN route types are not damped.

```

[edit policy-options policy-statement dampPolicy]
user@R4# set then damping no-damp
user@R4# set then accept

```

```

[edit policy-options]
user@R4# set damping no-damp disable

```

7. Configure the **parent\_vpn\_routes** to accept all other BGP routes that are not from the **inet-mvpn** address family.

This policy is applied as an OSPF export policy in the routing instance.

```

[edit policy-options policy-statement parent_vpn_routes]
user@R4# set from protocol bgp
user@R4# set then accept

```

8. Configure the VPN routing and forwarding (VRF) instance.

```

[edit routing-instances vpn-1]
user@R4# set instance-type vrf
user@R4# set interface vt-1/2/0.4
user@R4# set interface ge-1/2/1.17
user@R4# set interface lo0.104

```

```
user@R4# set route-distinguisher 100:100
user@R4# set vrf-target target:1:1
user@R4# set protocols ospf export parent_vpn_routes
user@R4# set protocols ospf area 0.0.0.0 interface lo0.104 passive
user@R4# set protocols ospf area 0.0.0.0 interface ge-1/2/1.17
user@R4# set protocols pim rp static address 100.1.1.2
user@R4# set protocols pim interface ge-1/2/1.17 mode sparse
user@R4# set protocols mvpn
```

9. Configure the router ID and the autonomous system (AS) number.

```
[edit routing-options]
user@R4# set router-id 1.1.1.4
user@R4# set autonomous-system 1001
```

10. If you are done configuring the device, commit the configuration.

```
user@R4# commit
```

### Results

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, **show routing-instances**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R4# show interfaces
ge-1/2/0 {
  unit 10 {
    family inet {
      address 10.1.1.10/30;
    }
    family mpls;
  }
}

                interface lo0.104 {
                    passive;
                }
                interface ge-1/2/1.17;
            }
        }
        pim {
            rp {
                static {
                    address 100.1.1.2;
                }
            }
            interface ge-1/2/1.17 {
                mode sparse;
            }
        }
        mvpn;
    }
}
```

user@R4# show routing-options

```
router-id 1.1.1.4;
autonomous-system 1001;
```

### **Verification**

Confirm that the configuration is working properly.

- [Verifying That Route Flap Damping Is Disabled on page 3755](#)
- [Verifying Route Flap Damping on page 3755](#)

**Verifying That Route Flap Damping Is Disabled**

**Purpose** Verify the presence of the **no-damp** policy, which disables damping for MVPN route types other than 3, 4, and 5.

**Action** From operational mode, enter the **show policy damping** command.

```
user@R4> show policy damping
Default damping information:
  Halflife: 15 minutes
  Reuse merit: 750 Suppress/cutoff merit: 3000
  Maximum suppress time: 60 minutes
  Computed values:
    Merit ceiling: 12110
    Maximum decay: 6193
Damping information for "no-damp":
  Damping disabled
```

**Meaning** The output shows that the default damping parameters are in effect and that the **no-damp** policy is also in effect for the specified route types.

**Verifying Route Flap Damping**

**Purpose** Check whether BGP routes have been damped.

**Action** From operational mode, enter the **show bgp summary** command.

```
user@R4> show bgp summary
Groups: 1 Peers: 2 Down peers: 0
Table Tot Paths Act Paths Suppressed History Damp State Pending
bgp.l3vpn.0
      6      6      0      0      0      0
bgp.l3vpn.2
      0      0      0      0      0      0
bgp.mvpn.0
      2      2      0      0      0      0
Peer AS InPkt OutPkt OutQ Flaps Last Up/Dwn
State|#Active/Received/Accepted/Damped...
1.1.1.2 1001 3159 3155 0 0 23:43:47
Establ
  bgp.l3vpn.0: 3/3/3/0
  bgp.l3vpn.2: 0/0/0/0
  bgp.mvpn.0: 1/1/1/0
  vpn-1.inet.0: 3/3/3/0
  vpn-1.mvpn.0: 1/1/1/0
1.1.1.5 1001 3157 3154 0 0 23:43:40
Establ
  bgp.l3vpn.0: 3/3/3/0
  bgp.l3vpn.2: 0/0/0/0
  bgp.mvpn.0: 1/1/1/0
  vpn-1.inet.0: 3/3/3/0
  vpn-1.mvpn.0: 1/1/1/0
```

**Meaning** The Damp State field shows that zero routes in the bgp.mvpn.0 routing table have been damped. Further down, the last number in the State field shows that zero routes have been damped for BGP peer 1.1.1.2.

### Example: Configuring BGP Trace Operations

- [Understanding Trace Operations for BGP Protocol Traffic on page 3756](#)
- [Example: Viewing BGP Trace Files on Logical Systems on page 3758](#)

---

#### Understanding Trace Operations for BGP Protocol Traffic

---

You can trace various BGP protocol traffic to help you debug BGP protocol issues. To trace BGP protocol traffic, include the **traceoptions** statement at the **[edit protocols bgp]** hierarchy level. For routing instances, include the **traceoptions** statement at the **[edit routing-instances routing-instance-name protocols bgp]** hierarchy level.

```
traceoptions {  
  file filename <files number> <size size> <world-readable | no-world-readable>;  
  flag flag <flag-modifier> <disable>;  
}
```

You can specify the following BGP protocol-specific trace options using the **flag** statement:

- **4byte-as**—4-byte AS events.
- **bfd**—BFD protocol events.
- **damping**—Damping operations.
- **graceful-restart**—Graceful restart events.
- **keepalive**—BGP keepalive messages.
- **nsr-synchronization**—Nonstop active routing synchronization events.
- **open**—BGP open packets. These packets are sent between peers when they are establishing a connection.
- **packets**—All BGP protocol packets.
- **refresh**—BGP refresh packets.
- **update**—BGP update packets. These packets provide routing updates to BGP systems.

Global tracing options are inherited from the configuration set by the **traceoptions** statement at the **[edit routing-options]** hierarchy level. You can override the following global trace options for the BGP protocol using the **traceoptions flag** statement included at the **[edit protocols bgp]** hierarchy level:

- **all**—All tracing operations
- **general**—All normal operations and routing table changes (a combination of the normal and route trace operations)
- **normal**—Normal events
- **policy**—Policy processing
- **route**—Routing information
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

You can optionally specify one or more of the following flag modifiers:

- **detail**—Detailed trace information.
- **filter**—Filter trace information. Applies only to **route** and **damping** tracing flags.
- **receive**—Packets being received.
- **send**—Packets being transmitted.

**NOTE:** Use the **all** trace flag and the **detail** flag modifier with caution because these might cause the CPU to become very busy.

**NOTE:** If you only enable the **update** flag, received keepalive messages do not generate a trace message.

You can filter trace statements and display only the statement information that passes through the filter by specifying the **filter** flag modifier. The **filter** modifier is only supported for the **route** and **damping** tracing flags.

The **match-on** statement specifies filter matches based on prefixes. It is used to match on route filters.

**NOTE:** Per-neighbor trace filtering is not supported on a BGP per-neighbor level for **route** and **damping** flags. Trace option filtering support is on a peer group level.

### Example: Viewing BGP Trace Files on Logical Systems

---

This example shows how to list and view files that are stored on a logical system.

- [Requirements on page 3758](#)
- [Overview on page 3758](#)
- [Configuration on page 3759](#)
- [Verification on page 3762](#)

#### Requirements

- You must have the **view** privilege for the logical system.
- Configure a network, such as the BGP network shown in “[Example: Configuring Internal BGP Peering Sessions on Logical Systems](#)” on page 3464.

#### Overview

Logical systems have their individual directory structure created in the **/var/logical-systems/logical-system-name** directory. It contains the following subdirectories:

- **/config**—Contains the active configuration specific to the logical system.
- **/log**—Contains system log and tracing files specific to the logical system.

To maintain backward compatibility for the log files with previous versions of Junos OS, a symbolic link (symlink) from the **/var/logs/logical-system-name** directory to the **/var/logical-systems/logical-system-name** directory is created when a logical system is configured.

- **/tmp**—Contains temporary files specific to the logical system.

The file system for each logical system enables logical system users to view trace logs and modify logical system files. Logical system administrators have full access to view and modify all files specific to the logical system.

Logical system users and administrators can save and load configuration files at the logical-system level using the **save** and **load** configuration mode commands. In addition, they can also issue the **show log**, **monitor**, and **file** operational mode commands at the logical-system level.

This example shows how to configure and view a BGP trace file on a logical system. The steps can be adapted to apply to trace operations for any Junos OS hierarchy level that supports trace operations.

**TIP:** To view a list of hierarchy levels that support tracing operations, enter the **help apropos traceoptions** command in configuration mode.

---

**Configuration**

- [Configuring Trace Operations on page 3759](#)
- [Viewing the Trace File on page 3759](#)
- [Deactivating and Reactivating Trace Logging on page 3761](#)
- [Results on page 3762](#)

**CLI Quick Configuration**

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set logical-systems A protocols bgp group internal-peers traceoptions file bgp-log
set logical-systems A protocols bgp group internal-peers traceoptions file size 10k
set logical-systems A protocols bgp group internal-peers traceoptions file files 2
set logical-systems A protocols bgp group internal-peers traceoptions flag update detail
```

**Configuring Trace Operations****Step-by-Step Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the trace operations:

1. Configure trace operations on the logical system.

```
[edit logical-systems A protocols bgp group internal-peers]
user@host# set traceoptions file bgp-log
user@host# set traceoptions file size 10k
user@host# set traceoptions file files 2
user@host# set traceoptions flag update detail
```

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**Viewing the Trace File****Step-by-Step Procedure**

To view the trace file:

1. In operational mode on the main router, list the directories on the logical system.

```
user@host> file list /var/logical-systems/A
/var/logical-systems/A:
config/
log/
tmp/
```

2. In operational mode on the main router, list the log files on the logical system.

```
user@host> file list /var/logical-systems/A/log/
/var/logical-systems/A/log:
bgp-log
```

3. View the contents of the **bgp-log** file.

```

user@host> file show /var/logical-systems/A/log/bgp-log
Aug 10 17:12:01 trace_on: Tracing to "/var/log/A/bgp-log" started
Aug 10 17:14:22.826182 bgp_peer_mgmt_clear:5829: NOTIFICATION sent to

Aug 10 17:14:54.920348 BGP RECV flags 0x40 code ASPath(2) length 0: <null>
Aug 10 17:14:54.920393 BGP RECV flags 0x40 code NextHop(3): 10.0.0.10
Aug 10 17:14:54.920434 BGP RECV flags 0x40 code LocalPref(5): 100

```

5. View the tracing operations in real time.

```

user@host> clear bgp neighbor logical-system A
Cleared 2 connections

```

**CAUTION:** Clearing the BGP neighbor table is disruptive in a production environment.

6. Run the **monitor start** command with an optional **match** condition.

```

user@host> monitor start A/bgp-log | match 0.0.0.0/0

```

```

Aug 10 19:21:40.773467 BGP RECV      0.0.0.0/0
Aug 10 19:21:40.773685 bgp_rcv_nlri: 0.0.0.0/0
Aug 10 19:21:40.773778 bgp_rcv_nlri: 0.0.0.0/0 belongs to meshgroup
Aug 10 19:21:40.773832 bgp_rcv_nlri: 0.0.0.0/0 qualified bnp->ribact 0x0
12afcb 0x0

```

7. Pause the **monitor** command by pressing Esc-Q.  
To unpause the output, press Esc-Q again.
8. Halt the **monitor** command by pressing Enter and typing **monitor stop**.  
[Enter]  
user@host> **monitor stop**
9. When you are finished troubleshooting, consider deactivating trace logging to avoid any unnecessary impact to system resources.

```

[edit protocols bgp group internal-peers]
user@host:A# deactivate traceoptions
user@host:A# commit

```

When configuration is deactivated, it appears in the configuration with the **inactive** tag. To reactivate trace operations, use the **activate** configuration-mode statement.

```

[edit protocols bgp group internal-peers]
user@host:A# show

```

```

type internal;
inactive: traceoptions {
    file bgp-log size 10k files 2;
    flag update detail;
    flag all;
}
local-address 192.168.6.5;
export send-direct;
neighbor 192.163.6.4;
neighbor 192.168.40.4;

```

10. To reactivate trace operations, use the **activate** configuration-mode statement.  
[edit protocols bgp group internal-peers]  
user@host:A# **activate traceoptions**  
user@host:A# **commit**

### ***Deactivating and Reactivating Trace Logging***

#### **Step-by-Step Procedure**

To deactivate and reactivate the trace file:

1. When you are finished troubleshooting, consider deactivating trace logging to avoid an unnecessary impact to system resources.

```

[edit protocols bgp group internal-peers]
user@host:A# deactivate traceoptions
user@host:A# commit

```

When configuration is deactivated, the statement appears in the configuration with the **inactive** tag.

```

[edit protocols bgp group internal-peers]
user@host:A# show

```

```
type internal;
inactive: traceoptions {
  file bgp-log size 10k files 2;
  flag update detail;
  flag all;
}
local-address 192.168.6.5;
export send-direct;
neighbor 192.163.6.4;
neighbor 192.168.40.4;
```

2. To reactivate logging, use the **activate** configuration-mode statement.

```
[edit protocols bgp group internal-peers]
user@host:A# activate traceoptions
user@host:A# commit
```

### Results

From configuration mode, confirm your configuration by entering the **show logical-systems A protocols bgp group internal-peers** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show logical-systems A protocols bgp group internal-peers
traceoptions {
  file bgp-log size 10k files 2;
  flag update detail;
}
```

### Verification

Confirm that the configuration is working properly.

#### Verifying That the Trace Log File Is Operating

**Purpose** Make sure that events are being written to the log file.

**Action** user@host:A> **show log bgp-log**  
Aug 12 11:20:57 trace\_on: Tracing to "/var/log/A/bgp-log" started

<b>Syntax</b>	<code>advertise-external {<i>conditional</i>};</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>    bgp group <i>group-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>    bgp group <i>group-name</i> neighbor <i>address</i>],</code> <code>[edit protocols bgp group <i>group-name</i>],</code> <code>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor</code> <code>    <i>neighbor-address</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3. Statement introduced in Junos OS Release 9.3 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	<p>Specify BGP to advertise the best external route into an IBGP mesh group, a route reflector cluster, or an AS confederation even if the best route is an internal route.</p> <p>In general, deployed BGP implementations do not advertise the external route with the highest local preference value to internal peers unless it is the best route. Although this behavior was required by an earlier version of the BGP version 4 specification, RFC 1771, it was typically not followed in order to minimize the amount of advertised information and to prevent routing loops. However, there are scenarios in which advertising the best external route is beneficial, in particular, situations that can result in IBGP route oscillation.</p> <p>The <b>advertise-external</b> statement is supported at both the group and neighbor level. If you configure the statement at the neighbor level, you must configure it for all neighbors in a group. Otherwise, the group is automatically split into different groups.</p> <p>In a confederation, when advertising a route to a confederation border router, any route from a different confederation sub-AS is considered external. When configuring the <b>advertise-external</b> statement for an AS confederation, it is recommended that EBGp peers belonging to different autonomous systems are configured in a separate EBGp peer group. This ensures consistency while BGP sends the best external route to peers in the configured peer group.</p> <p>To configure the <b>advertise-external</b> statement on a route reflector, you must disable intracluster reflection with the <b>no-client-reflect</b> statement.</p> <p>When a routing device is configured as a route reflector for a cluster, a route advertised by the route reflector is considered internal if it is received from an internal peer with the same cluster identifier or if both peers have no cluster identifier configured. A route received from an internal peer that belongs to another cluster, that is, with a different cluster identifier, is considered external.</p> <p>The <b>conditional</b> option causes BGP to advertise the external route only if the route selection process reaches the point where the multiple exit discriminator (MED) metric</p>

is evaluated. As a result, an external route with an AS path longer than that of the active path is not advertised.

Junos OS also provides support for configuring a BGP export policy that matches on the state of an advertised route. You can match on either active or inactive routes.

**Default** BGP does not advertise the external route with the highest local preference value to internal peers unless it is the best route.

**Options** **conditional**—(Optional) Advertise the best external path only if the route selection process reaches the point at which the multiple exit discriminator (MED) metric is evaluated. The **conditional** option restricts advertisement to when the best external path and the active path are equal until the MED step of the route selection process. This implies that external routes with a longer AS path length than the active path, for instance, are not advertised. The criteria used for selecting the best external path is the same whether or not the **conditional** option is configured.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## advertise-inactive

<b>Syntax</b>	advertise-inactive;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> neighbor <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Configure the routing table to export to BGP the best route learned by BGP even if Junos OS did not select this route to be an active route.</p> <p>One way to achieve multivendor compatibility is to include the <b>advertise-inactive</b> statement in the external BGP (EBGP) configuration. By default, BGP stores the route information it receives from update messages in the Junos OS routing table, and the routing table exports only active routes into BGP, which BGP then advertises to its peers. The <b>advertise-inactive</b> statement causes Junos OS to advertise the best BGP route that is inactive because of IGP preference. When you use the <b>advertise-inactive</b> statement, the Junos OS device uses, for example, the OSPF route for forwarding, and the other vendor's device uses the EBGP route for forwarding. However, from the perspective of an EBGP peer in a neighboring AS, both vendors' devices appear to behave the same way.</p>
<b>Default</b>	By default, BGP stores the route information it receives from update messages in the Junos OS routing table, and the routing table exports only active routes into BGP, which BGP then advertises to its peers.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

## advertise-peer-as

<b>Syntax</b>	advertise-peer-as;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],          [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],          [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> neighbor <i>address</i>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>],          [edit protocols bgp],          [edit protocols bgp <b>group</b> <i>group-name</i>],          [edit protocols bgp group <i>group-name</i> neighbor <i>address</i>],          [edit routing-instances <i>routing-instance-name</i> protocols bgp],          [edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],          [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Disable the default behavior of suppressing AS routes.</p> <p>If you include the <b>advertise-peer-as</b> statement in the configuration, BGP advertises routes learned from one external BGP (EBGP) peer back to another EBGP peer in the same autonomous system (AS) but not back to the originating peer.</p> <p>Another way to disable the route suppression default behavior is with the <b>as-override</b> statement. If you include both the <b>as-override</b> and <b>no-advertise-peer-as</b> statements in the configuration, the <b>no-advertise-peer-as</b> statement is ignored.</p>
<b>Default</b>	By default, Junos OS does not advertise the routes learned from one EBGP peer back to the same external BGP (EBGP) peer. In addition, the software does not advertise those routes back to any EBGP peers that are in the same AS as the originating peer, regardless of the routing instance.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Disabling Suppression of Route Advertisements</i></li> <li>• <i>Example: Configuring a Layer 3 VPN with Route Reflection and AS Override</i></li> <li>• <a href="#">no-advertise-peer-as on page 3841</a></li> </ul>

## algorithm (BGP BFD Authentication)

---

<b>Syntax</b>	<code>algorithm <i>algorithm-name</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection authentication],</p> <p>[edit protocols bgp bgp bfd-liveness-detection authentication],</p> <p>[edit protocols bgp group <i>group-name</i> bfd-liveness-detection authentication],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection authentication],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp bgp bfd-liveness-detection authentication],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection authentication],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection authentication]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for BFD authentication introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Configure the algorithm used to authenticate the specified BFD session.
<b>Options</b>	<p><b><i>algorithm-name</i></b>—Authentication algorithm name: <b>simple-password</b>, <b>keyed-md5</b>, <b>keyed-sha-1</b>, <b>meticulous-keyed-md5</b>, <b>meticulous-keyed-sha-1</b>.</p> <p><b>simple-password</b>—Plain-text password. One to 16 bytes of plain text are used to authenticate the BFD session. One or more passwords can be configured. This method is the least secure and should be used only when BFD sessions are not subject to packet interception.</p> <p><b>keyed-md5</b>—Keyed Message Digest 5 hash algorithm for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed MD5 uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than or equal to the last sequence number received. Although more secure than a simple password, this method is vulnerable to replay attacks. Increasing the rate at which the sequence number is updated can reduce this risk.</p>

**meticulous-keyed-md5**—Meticulous keyed Message Digest 5 hash algorithm. This method works in the same manner as keyed MD5, but the sequence number is updated with every packet. Although more secure than keyed MD5 and simple passwords, this method can take additional time to authenticate the session.

**keyed-sha-1**—Keyed Secure Hash Algorithm I for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed SHA uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. The key is not carried within the packets. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than the last sequence number received.

**meticulous-keyed-sha-1**—Meticulous keyed Secure Hash Algorithm I. This method works in the same manner as keyed SHA, but the sequence number is updated with every packet. Although more secure than keyed SHA and simple passwords, this method can take additional time to authenticate the session.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## apply-groups

---

<b>Syntax</b>	<code>apply-groups [ <i>group-names</i> ];</code>
<b>Hierarchy Level</b>	All hierarchy levels
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	<p>Apply a configuration group to a specific hierarchy level in a configuration, to have a configuration inherit the statements in the configuration group.</p> <p>You can specify more than one group name. You must list them in order of inheritance priority. The configuration data in the first group takes priority over the data in subsequent groups.</p>
<b>Options</b>	<i>group-names</i> —One or more names specified in the <b>groups</b> statement.
<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Applying a Junos OS Configuration Group</i></li><li>• <i>groups</i></li></ul>

## apply-groups-except

---

<b>Syntax</b>	<code>apply-groups-except [ <i>group-names</i> ];</code>
<b>Hierarchy Level</b>	All hierarchy levels except the top level
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Disable inheritance of a configuration group.
<b>Options</b>	<i>group-names</i> —One or more names specified in the <b>groups</b> statement.
<b>Required Privilege Level</b>	configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>groups</i></li><li>• <i>Disabling Inheritance of a Junos OS Configuration Group</i></li></ul>

## authentication (BGP BFD Liveness Detection)

<b>Syntax</b>	<pre> authentication {   algorithm <i>algorithm-name</i>;   key-chain <i>key-chain-name</i>;   loose-check ; } </pre>
<b>Hierarchy Level</b>	<pre> [edit logical-systems <i>logical-system-name</i> protocols bgp bfd-liveness-detection], [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i>   bfd-liveness-detection], [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>   bfd-liveness-detection], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp bfd-liveness-detection], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp group <i>group-name</i> bfd-liveness-detection], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection], [edit protocols bgp bgp bfd-liveness-detection], [edit protocols bgp group <i>group-name</i> bfd-liveness-detection], [edit protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>   bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor   <i>address</i> bfd-liveness-detection] </pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for BFD authentication introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Specify the router and route authentication to mitigate the risk of being attacked by a machine or router that has been configured to share incorrect routing information with another router. Router and route authentication enables routers to share information only if they can verify that they are talking to a trusted source, based on a password (key). In this method, a hashed key is sent along with the route being sent to another router. The receiving router compares the sent key to its own configured key. If they are the same, the receiving router accepts the route.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

**Release Information**    Statement introduced in Junos OS Release 8.1.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
**detection-time threshold** and **transmit-interval threshold** options introduced in Junos OS Release 8.2  
Support for logical routers introduced in Junos OS Release 8.3.  
Support for IBGP and multihop EBGP sessions introduced in Junos OS Release 8.3.  
**holddown-interval** statement introduced in Junos OS Release 8.5. You can configure this statement only for EBGP peers at the **[edit protocols bgp group *group-name* neighbor *address*]** hierarchy level.  
**no-adaptation** statement introduced in Junos OS Release 9.0.  
Support for BFD authentication introduced in Junos OS Release 9.6.

Support for BFD on IPv6 interfaces with BGP introduced in Junos OS Release 11.2.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description** Configure bidirectional failure detection (BFD) timers and authentication for BGP.

For IBGP and multihop EBGP support, configure the **bfd-liveness-detection** statement at the global **[edit bgp protocols]** hierarchy level. You can also configure IBGP and multihop support for a routing instance or a logical system.

**Options**    **authentication algorithm** *algorithm-name* (Optional)—Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**.

**authentication key-chain** *key-chain-name* (Optional)—Associate a security key with the specified BFD session using the name of the security keychain. The keychain name must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

**authentication loose-check**—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

**detection-time threshold** *milliseconds* (Optional)—Configure a threshold. When the BFD session detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**holddown-interval** *milliseconds* (Optional)—Configure an interval specifying how long a BFD session must remain up before a state change notification is sent. When you configure the hold-down interval for the BFD protocol for EBGp, the BFD session is unaware of the BGP session during this time. In this case, if the BGP session goes down during the configured hold-down interval, BFD already assumes it is down and does not send a state change notification. The **holddown-interval** statement is supported only for EBGp peers at the **[edit protocols bgp group group-name neighbor address]** hierarchy level. If the BFD session goes down and then comes back up during the configured hold-down interval, the timer is restarted. You must configure the hold-down interval on both EBGp peers. If you configure the hold-down interval for a multihop EBGp session, you must also configure a local IP address by including the **local-address** statement at the **[edit protocols bgp group group-name]** hierarchy level.

**Range:** 0 through 255,000

**Default:** 0

**minimum-interval** *milliseconds* (Required)—Configure the minimum intervals at which the local routing device transmits hello packets and then expects to receive a reply from a neighbor with which it has established a BFD session. This value represents the minimum interval at which the local routing device transmits hello packets as well as the minimum interval that the routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a value in the range from 1 through 255,000 milliseconds. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately (using the **minimum-receive-interval** and **transmit-interval** statements).

**Range:** 1 through 255,000

**minimum-receive-interval** *milliseconds* (Optional)—Configure only the minimum interval at which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session.

**Range:** 1 through 255,000

**multiplier *number*** (Optional)—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255

**Default:** 3

**no-adaptation** (Optional)—Configure BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable to not to have BFD adaptation enabled in your network.

**transmit-interval threshold *milliseconds*** (Optional)—Configure a threshold. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**transmit-interval minimum-interval *milliseconds*** (Optional)—Configure only the minimum interval at which the local routing device transmits hello packets to a neighbor with which it has established a BFD session.

**Range:** 1 through 255,000

**version** (Optional)—Configure the BFD version to detect.

**Range:** 1 or **automatic** (autodetect the BFD version)

**Default:** **automatic**

The remaining statements are explained separately.

## cluster

<b>Syntax</b>	<code>cluster <i>cluster-identifier</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Specify the cluster identifier to be used by the route reflector cluster in an internal BGP group.

### CAUTION:

If you configure both route reflection and VPNs on the same routing device, the following modifications to the route reflection configuration cause current BGP sessions to be reset:

- Adding a cluster ID—If a BGP session shares the same AS number with the group where you add the cluster ID, all BGP sessions are reset regardless of whether the BGP sessions are contained in the same group.
- Creating a new route reflector—If you have an IBGP group with an AS number and create a new route reflector group with the same AS number, all BGP sessions in the IBGP group and the new route reflector group are reset.

**NOTE:** If you change the address family specified in the [edit protocols bgp family] hierarchy level, all current BGP sessions on the routing device are dropped and then reestablished.

<b>Options</b>	<i>cluster-identifier</i> —4-byte identifier (such as an IPv4 address).
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring BGP Route Reflectors on page 3684</a></li><li>• <a href="#">Understanding External BGP Peering Sessions on page 3429</a></li><li>• <a href="#">no-client-reflect on page 3843</a></li></ul>

## damping (Protocols BGP)

<b>Syntax</b>	damping;
<b>Hierarchy Level</b>	<pre> [edit logical-systems <i>logical-system-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> protocols bgp family <i>family</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp family <i>family</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> family <i>family</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>   <b>neighbor</b> <i>address</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>   family <i>family</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>   family <i>family</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp family <i>family</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp family <i>family</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp <b>group</b> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp <b>group</b> <i>group-name</i> family <i>family</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp <b>group</b> <i>group-name</i> family <i>family</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i> family <i>family</i>], [edit protocols bgp], [edit protocols bgp], [edit protocols bgp <b>group</b> <i>group-name</i>], [edit protocols bgp <b>group</b> <i>group-name</i> family <i>family</i>], [edit protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>], [edit protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i> family <i>family</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp], [edit routing-instances <i>routing-instance-name</i> protocols bgp family <i>family</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> family <i>family</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>   <b>neighbor</b> <i>address</i>] [edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>   <b>neighbor</b> <i>address</i> family <i>family</i>] </pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Support for flap damping at the address family level introduced in Junos OS Release 12.2.</p>
<b>Description</b>	<p>Enable route flap damping. BGP route flapping describes the situation in which BGP systems send an excessive number of update messages to advertise network reachability information. Flap damping reduces the number of update messages sent between BGP</p>

peers, thereby reducing the load on these peers, without adversely affecting the route convergence time for stable routes.

You typically apply flap damping to external BGP (EBGP) routes (that is, to routes in different ASs). You can also apply it within a confederation, between confederation member ASs. Because routing consistency within an AS is important, do not apply flap damping to internal BGP (IBGP) routes. (If you do, it is ignored.) The exception to this rule is when flap damping is applied at the address family level. When you apply flap damping at the address family level, it works for both IBGP and EBGP.

**Default** Flap damping is disabled on the routing device.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## detection-time (BFD Liveness Detection)

<b>Syntax</b>	<pre> detection-time {     threshold milliseconds; } </pre>
<b>Hierarchy Level</b>	<pre> [edit logical-systems <i>logical-system-name</i> protocols bgp bfd-liveness-detection], [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i>   bfd-liveness-detection], [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>   bfd-liveness-detection], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp bfd-liveness-detection], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp group <i>group-name</i> bfd-liveness-detection], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection], [edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   l2vpn oam bfd-liveness-detection], [edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   vpls neighbor <i>neighbor-id</i> oam bfd-liveness-detection], [edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   vpls mesh-group <i>mesh-group-name</i> neighbor <i>neighbor-id</i> oam bfd-liveness-detection], [edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   vpls oam bfd-liveness-detection], [edit protocols bgp bfd-liveness-detection], [edit protocols bgp group <i>group-name</i> bfd-liveness-detection], [edit protocols bgp group <i>group-name</i> neighbor <i>address</i> bgp bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>   bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor   <i>address</i> bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols l2vpn oam bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols vpls neighbor <i>neighbor-id</i> oam   bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols vpls mesh-group <i>mesh-group-name</i>   neighbor <i>neighbor-id</i> oam bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols vpls oam bfd-liveness-detection] </pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.2.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for BFD authentication introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2 for Layer 2 VPNs and VPLS.</p>
<b>Description</b>	<p>Enable BFD failure detection. The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance</p>

is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the **clear bfd adaptation** command to return BFD interval timers to their configured values. The **clear bfd adaptation** command is hitless, meaning that the command does not affect traffic flow on the routing device.

The remaining statement is explained separately.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## disable (Protocols BGP)

<b>Syntax</b>	disable;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp], [edit protocols bgp], [edit routing-instances <i>routing-instance-name</i> protocols bgp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Disable BGP on the system.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## disable (BGP Graceful Restart)

<b>Syntax</b>	disable;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp graceful-restart],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> graceful-restart],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i> graceful-restart],</p> <p>[edit protocols bgp graceful-restart],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i> graceful-restart],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i> graceful-restart]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Disable graceful restart for BGP. Graceful restart allows a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition.
<div>  <p><b>NOTE:</b> When you disable graceful restart at one level in the configuration statement hierarchy, it is also disabled at lower levels in the same hierarchy. For example, if you disable graceful restart at the [edit protocols bgp group <i>group-name</i>] hierarchy level, it is disabled for all the peers in the group. Therefore, if you want to enable graceful restart for some peers in a group and disable it for others, enable graceful restart at the [edit protocols bgp group <i>group-name</i>] hierarchy level and disable graceful restart for each peer at the [edit protocols bgp group <i>group-name</i> neighbor <i>address</i>] hierarchy level.</p> </div>	
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Graceful Restart Options for BGP on page 2457</a></li> <li>• <a href="#">Configuring Graceful Restart for QFabric Systems on page 1512</a></li> <li>• <a href="#">graceful-restart on page 1528</a></li> </ul>

## export (Protocols BGP)

<b>Syntax</b>	<code>export [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Apply one or more policies to routes being exported from the routing table into BGP.</p> <p>If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no routes match the filters, the routing table exports into BGP only the routes that it learned from BGP. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route's metric to 500, this route matches the criterion of <b>metric 500</b> defined in the next policy.</p>
<b>Options</b>	<b><i>policy-names</i></b> —Name of one or more policies.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Route Advertisement on page 3589</a></li> <li>• <a href="#">Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices</a></li> <li>• <a href="#">import on page 3806</a></li> </ul>

## family (Protocols BGP)

---

```
Syntax  family {

}
}

```

<b>Hierarchy Level</b>	<pre>[edit logical-systems <i>logical-system-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>], [edit protocols bgp], [edit protocols bgp <b>group</b> <i>group-name</i>], [edit protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p><b>inet-mvpn</b> and <b>inet6-mvpn</b> statements introduced in Junos OS Release 8.4.</p> <p><b>inet-mdt</b> statement introduced in Junos OS Release 9.4.</p> <p>Support for the <b>loops</b> statement introduced in Junos OS Release 9.6.</p> <p><b>evpn</b> statement introduced in Junos OS Release 13.2.</p>
<b>Description</b>	<p>Enable multiprotocol BGP (MP-BGP) by configuring BGP to carry network layer reachability information (NLRI) for address families other than unicast IPv4, to specify MP-BGP to carry NLRI for the IPv6 address family, or to carry NLRI for VPNs.</p>

- Options**
- any**—Configure the family type to be both unicast and multicast.
  - evpn**—Configure NLRI parameters for Ethernet VPNs (EVPNs).
  - inet**—Configure NLRI parameters for IPv4.
  - inet6**—Configure NLRI parameters for IPv6.
  - inet-mdt**—Configure NLRI parameters for the multicast distribution tree (MDT) subaddress family identifier (SAFI) for IPv4 traffic in Layer 3 VPNs.
  - inet-mvpn**—Configure NLRI parameters for IPv4 for multicast VPNs.
  - inet6-mvpn**—Configure NLRI parameters for IPv6 for multicast VPNs.
  - inet-vpn**—Configure NLRI parameters for IPv4 for Layer 3 VPNs.
  - inet6-vpn**—Configure NLRI parameters for IPv6 for Layer 3 VPNs.
  - iso-vpn**—Configure NLRI parameters for IS-IS for Layer 3 VPNs.
  - l2vpn**—Configure NLRI parameters for IPv4 for MPLS-based Layer 2 VPNs and VPLS.
  - labeled-unicast**—Configure the family type to be labeled-unicast. This means that the BGP peers are being used only to carry the unicast routes that are being used by labeled-unicast for resolving the labeled-unicast routes. This statement is supported only with **inet** and **inet6**.
  - multicast**—Configure the family type to be multicast. This means that the BGP peers are being used only to carry the unicast routes that are being used by multicast for resolving the multicast routes.
  - unicast**—Configure the family type to be unicast. This means that the BGP peers only carry the unicast routes that are being used for unicast forwarding purposes. The default family type is **unicast**.

The remaining statements are explained separately.

- Required Privilege Level**
- routing—To view this statement in the configuration.
  - routing-control—To add this statement to the configuration.

## graceful-restart (Protocols BGP)

---

Syntax	<pre>graceful-restart {     disable;     restart-time seconds;     stale-routes-time seconds; }</pre>
Hierarchy Level	<pre>[edit logical-systems logical-system-name protocols bgp], [edit logical-systems logical-system-name protocols bgp group group-name], [edit logical-systems logical-system-name protocols bgp group group-name     neighbor address], [edit protocols bgp], [edit protocols bgp group group-name], [edit protocols bgp group group-name neighbor address]</pre>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
Description	<p>Configure graceful restart for BGP. Graceful restart allows a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition. Graceful restart is disabled by default.</p> <p>To configure the duration of the BGP graceful restart period, include the <b>restart-time</b> statement at the <b>[edit protocols bgp graceful-restart]</b> hierarchy level. To set the length of time the router waits to receive messages from restarting neighbors before declaring them down, include the <b>stale-routes-time</b> statement at the <b>[edit protocols bgp graceful-restart]</b> hierarchy level.</p> <div> <b>NOTE:</b> If you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.</div> <p>Configure graceful restart globally at the <b>[edit routing-options]</b> or <b>[edit routing-instances instance-name routing-options]</b> hierarchy level to enable the feature. You cannot enable graceful restart for specific protocols unless graceful restart is also enabled globally. You can, optionally, modify the global settings at the individual protocol level.</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	<p>Define a BGP peer group. BGP peer groups share a common type, peer autonomous system (AS) number, and cluster ID, if present. To configure multiple BGP groups, include multiple <b>group</b> statements.</p> <p>By default, the group's options are identical to the global BGP options. To override the global options, include group-specific options within the <b>group</b> statement.</p> <p>The <b>group</b> statement is one of the statements you must include in the configuration to run BGP on the routing device.</p> <p>Each group must contain at least one peer.</p>
<b>Options</b>	<p><b>group-name</b>—Name of the BGP group.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>BGP Feature Guide for Routing Devices</i></li></ul>

## hold-down-interval (BGP BFD Liveness Detection)

---

<b>Syntax</b>	<code>holddown-interval milliseconds;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols bgp bfd-liveness-detection],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i></code> <code>    bfd-liveness-detection],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i></code> <code>    bfd-liveness-detection],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>    bgp bfd-liveness-detection],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>    bgp group <i>group-name</i> bfd-liveness-detection],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>    bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection],</code> <code>[edit protocols bgp bfd-liveness-detection],</code> <code>[edit protocols bgp group <i>group-name</i> bfd-liveness-detection],</code> <code>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i> bgp bfd-liveness-detection],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i></code> <code>    bfd-liveness-detection],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor</code> <code>    <i>address</i> bfd-liveness-detection]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 9.0 for EX Series switches. Support for BFD authentication introduced in Junos OS Release 9.6. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Configure an interval specifying how long a BFD session must remain up before a state change notification is sent.</p> <p>When you configure the hold-down interval for the BFD protocol for EBGp, the BFD session is unaware of the BGP session during this time. In this case, if the BGP session goes down during the configured hold-down interval, BFD already assumes the BGP session is down and does not send a state change notification. The <b>holddown-interval</b> statement is supported only for EBGp peers at the <b>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i>]</b> hierarchy level. If the BFD session goes down and then comes back up during the configured hold-down interval, the timer is restarted. You must configure the hold-down interval on both EBGp peers. If you configure the hold-down interval for a multihop EBGp session, you must also configure a local IP address by including the <b>local-address</b> statement at the <b>[edit protocols bgp group <i>group-name</i>]</b> hierarchy level.</p>
<b>Options</b>	<b>milliseconds</b> —Specify the hold-down interval value. <b>Range:</b> 0 through 255,000 <b>Default:</b> 0
<b>Required Privilege Level</b>	<b>routing</b> —To view this statement in the configuration. <b>routing-control</b> —To add this statement to the configuration.

## hold-time (Protocols BGP)

---

<b>Syntax</b>	<code>hold-time seconds;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols bgp],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols bgp <i>group group-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols bgp <i>group group-name</i></code> <code>  <i>neighbor address</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>  bgp],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>  bgp <i>group group-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>  bgp <i>group group-name neighbor address</i>],</code> <code>[edit protocols bgp],</code> <code>[edit protocols bgp <i>group group-name</i>],</code> <code>[edit protocols bgp <i>group group-name neighbor address</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i></code> <code>  <i>neighbor address</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	<p>Specify the hold-time value to use when negotiating a connection with the peer. The hold-time value is advertised in open packets and indicates to the peer the length of time that it should consider the sender valid. If the peer does not receive a keepalive, update, or notification message within the specified hold time, the BGP connection to the peer is closed and routing devices through that peer become unavailable.</p> <p>The hold time is three times the interval at which keepalive messages are sent.</p> <p>BGP on the local routing device uses the smaller of either the local hold-time value or the peer's hold-time value received in the open message as the hold time for the BGP connection between the two peers.</p> <p>Starting in Junos OS Release 12.3, the BGP hold-time value can be zero (0). This implies that the speaker does not expect keepalive messages from its peer to maintain the BGP session. When negotiating between two peers, if one side requests a nonzero hold time and the other requests a zero hold time, the negotiation settles on the nonzero value and keepalive intervals are determined accordingly. Both sides must be set to zero for keepalive messages to stop being sent.</p>
<b>Options</b>	<b>seconds</b> —Hold time. <b>Range:</b> 10 through 65,535 seconds (or 0 for infinite hold time) <b>Default:</b> 90 seconds

**TIP:** When you set a hold-time value of 1 through 19 seconds, we recommend that you also configure the BGP `precision-timers` statement. The `precision-timers` statement ensures that if scheduler slip messages occur, the routing device continues to send keepalive messages. When the `precision-timers` statement is included, keepalive message generation is performed in a dedicated kernel thread, which helps to prevent BGP session flaps.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration.
	routing-control—To add this statement to the configuration.

## import (Protocols BGP)

---

<b>Syntax</b>	<code>import [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols bgp],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols bgp <i>group group-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols bgp <i>group group-name</i></code> <code>    <i>neighbor address</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>    bgp],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>    bgp <i>group group-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>    bgp <i>group group-name</i> <i>neighbor address</i>],</code> <code>[edit protocols bgp],</code> <code>[edit protocols bgp <i>group group-name</i>],</code> <code>[edit protocols bgp <i>group group-name</i> <i>neighbor address</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i></code> <code>    <i>neighbor address</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	<p>Apply one or more routing policies to routes being imported into the Junos OS routing table from BGP.</p> <p>If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no match is found, BGP places into the routing table only those routes that were learned from BGP routing devices. The policy framework software evaluates the routing policies in a chain sequentially. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route's metric to 500, this route matches the criterion of <b>metric 500</b> defined in the next policy.</p> <p>It is also important to understand that in Junos OS, although an import policy (inbound route filter) might reject a route, not use it for traffic forwarding, and not include it in an advertisement to other peers, the router retains these routes as hidden routes. These hidden routes are not available for policy or routing purposes. However, they do occupy memory space on the router. A service provider filtering routes to control the amount of information being kept in memory and processed by a router might want the router to entirely drop the routes being rejected by the import policy.</p> <p>Hidden routes can be viewed by using the <b>show route receive-protocol bgp <i>neighbor-address</i> hidden</b> command. The hidden routes can then be retained or dropped from the routing table by configuring the <b>keep all   none</b> statement at the <b>[edit protocols bgp]</b> or <b>[edit protocols bgp <i>group group-name</i>]</b> hierarchy level.</p>

The rules of BGP route retention are as follows:

- By default, all routes learned from BGP are retained, except those where the AS path is looped. (The AS path includes the local AS.)
- By configuring the **keep all** statement, all routes learned from BGP are retained, even those with the local AS in the AS path.
- By configuring the **keep none** statement, all routes received are discarded. When this statement is configured and the inbound policy changes, Junos OS re-advertises all the routes advertised by the peer.

**Options**    *policy-names*—Name of one or more policies.

**Required Privilege**    routing—To view this statement in the configuration.  
**Level**    routing-control—To add this statement to the configuration.

## keep

<b>Syntax</b>	keep (all   none);
<b>Hierarchy Level</b>	<pre>[edit logical-systems <i>logical-system-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> protocols bgp <i>group group-name</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp <i>group group-name</i> <i>neighbor address</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name neighbor address</i>], [edit protocols bgp], [edit protocols bgp <i>group group-name</i>], [edit protocols bgp <i>group group-name neighbor address</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp], [edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i> <i>neighbor address</i>]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Control whether or not Junos OS keeps in memory and hides certain routes.</p> <p>If the <b>keep none</b> statement is used, Junos OS does not retain in memory and hide routes that are rejected because of a BGP import policy. Nor does BGP keep in memory and hide routes that are declared unfeasible due to BGP sanity checks. The <b>keep none</b> statement causes Junos OS to discard from memory the routes that are rejected due to BGP-specific logic or BGP evaluation. When a route is rejected because of some non-BGP-specific reason, the <b>keep none</b> statement has no effect on this route. This rejected route is retained in memory and hidden even though <b>keep none</b> is configured. An example of this type of hidden route is a route for which the protocol nexthop is unresolved.</p> <p>The routing table can retain the route information learned from BGP in one of the following ways:</p> <ul style="list-style-type: none"> <li>• Default (omit the <b>keep</b> statement)—Keep all route information that was learned from BGP, except for routes whose AS path is looped and whose loop includes the local AS.</li> <li>• <b>keep all</b>—Keep all route information that was learned from BGP.</li> <li>• <b>keep none</b>—Discard routes that were received from a peer and that were rejected by import policy or other sanity checking, such as AS path or next hop. When you configure <b>keep none</b> for the BGP session and the inbound policy changes, Junos OS forces readvertisement of the full set of routes advertised by the peer.</li> </ul>

In an AS path healing situation, routes with looped paths theoretically could become usable during a soft reconfiguration when the AS path loop limit is changed. However, there is a significant memory usage difference between the default and **keep all**.

Consider the following scenarios:

- A peer readvertises routes back to the peer from which it learned them.

This can happen in the following cases:

- Another vendor's routing device advertises the routes back to the sending peer.
- The Junos OS peer's default behavior of not readvertising routes back to the sending peer is overridden by configuring **advertise-peer-as**.
- A provider edge (PE) routing device discards any VPN route that does not have any of the expected route targets.

When **keep all** is configured, the behavior of discarding routes received in the above scenarios is overridden.

**CAUTION:** If you add or remove **keep all** or **keep none** and the peer does not support session restart, the associated BGP sessions are restarted (flapped). To determine if a peer supports refresh, check for **Peer supports Refresh capability** in the output of the **show bgp neighbor** command.

<b>Default</b>	By default, BGP retains incoming rejected routes in memory and hides them. If you do not include the <b>keep</b> statement, most routes are retained in the routing table. BGP keeps all route information that was learned from BGP, except for routes whose AS path is looped and whose loop includes the local AS.
<b>Options</b>	<b>all</b> —Retain all routes.  <b>none</b> —Discard routes that were received from a peer and that were rejected by import policy or other sanity checking. When <b>keep none</b> is configured for the BGP session and the inbound policy changes, Junos OS forces readvertisement of the full set of routes advertised by the peer.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## key-chain (BGP BFD Authentication)

<b>Syntax</b>	<code>key-chain <i>key-chain-name</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection authentication],</p> <p>[edit protocols bgp bgp bfd-liveness-detection authentication],</p> <p>[edit protocols bgp group <i>group-name</i> bgp bfd-liveness-detection authentication],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection authentication],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection authentication],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection authentication],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection authentication]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for BFD authentication introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Associate a security key with the specified BFD session using the name of the security keychain. Each key has a unique start time within the keychain. Keychain authentication allows you to change the password information periodically without bringing down peering sessions. This keychain authentication method is referred to as <i>hitless</i> because the keys roll over from one to the next without resetting any peering sessions or interrupting the routing protocol.
<b>Options</b>	<b><i>key-chain-name</i></b> —Name of the authentication keychain. The keychain name must match one of the keychains configured with the <b>key-chain <i>key-chain-name</i></b> statement at the [edit security authentication-key-chain] hierarchy level.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring BFD for Static Routes on page 3095</a></li> <li>• <a href="#">Example: Configuring BFD Authentication for Static Routes on page 3109</a></li> <li>• <a href="#">Example: Configuring BFD on Internal BGP Peer Sessions on page 3627</a></li> <li>• <a href="#">Example: Configuring BGP Route Authentication on page 3708</a></li> </ul>

## local-address (Protocols BGP)

<b>Syntax</b>	<code>local-address address;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],          [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],          [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],          [edit protocols bgp],          [edit protocols bgp <b>group</b> <i>group-name</i>],          [edit protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],          [edit routing-instances <i>routing-instance-name</i> protocols bgp],          [edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],          [edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Specify the address of the local end of a BGP session. This address is used to accept incoming connections to the peer and to establish connections to the remote peer. When none of the operational interfaces are configured with the specified local address, a session with a BGP peer is placed in the idle state.</p> <p>You generally configure a local address to explicitly configure the system's IP address from BGP's point of view. This IP address can be either an IPv6 or IPv4 address. Typically, an IP address is assigned to a loopback interface, and that IP address is configured here.</p> <p>For internal BGP (IBGP) peering sessions, generally the loopback interface (lo0) is used to establish connections between the IBGP peers. The loopback interface is always up as long as the device is operating. If there is a route to the loopback address, the IBGP peering session stays up. If a physical interface address is used instead and that interface goes up and down, the IBGP peering session also goes up and down. Thus, the loopback interface provides fault tolerance in case the physical interface or the link goes down, if the device has link redundancy.</p> <p>When a device peers with a remote device's loopback interface address, the local device expects BGP update messages to come from (be sourced by) the remote device's loopback interface address. The <b>local-address</b> statement enables you to specify the source information in BGP update messages. If you omit the <b>local-address</b> statement, the expected source of BGP update messages is based on the device's source address selection rules, which normally result in the egress interface address being the expected source of update messages. When this happens, the peering session is not established because a mismatch exists between the expected source address (the egress interface</p>

of the peer) and the actual source (the loopback interface of the peer). To ensure that the expected source address matches the actual source address, specify the loopback interface address in the **local-address** statement.

**NOTE:** Although a BGP session can be established when only one of the paired routing devices has **local-address** configured, we strongly recommend that you configure **local-address** on both paired routing devices for IBGP and multihop EBGP sessions. The **local-address** statement ensures that deterministic fixed addresses are used for the BGP session end-points.

If you include the **default-address-selection** statement in the configuration, the software chooses the system default address as the source for most locally generated IP packets. For protocols in which the local address is unconstrained by the protocol specification, for example IBGP and multihop EBGP, if you do not configure a specific local address when configuring the protocol, the local address is chosen using the same methods as other locally generated IP packets.

**Default** If you do not configure a local address, BGP uses the routing device's source address selection rules to set the local address.

**Options** **address**—IPv6 or IPv4 address of the local end of the connection.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## local-as

<b>Syntax</b>	<code>local-as <i>autonomous-system</i> &lt;loops number&gt; &lt;private   alias&gt; &lt;no-prepend-global-as&gt;;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p><b>alias</b> option introduced in Junos OS Release 9.5.</p> <p><b>no-prepend-global-as</b> option introduced in Junos OS Release 9.6.</p>
<b>Description</b>	<p>Specify the local autonomous system (AS) number. An AS is a set of routing devices that are under a single technical administration and generally use a single interior gateway protocol (IGP) and metrics to propagate routing information within the set of routing devices.</p> <p>Internet service providers (ISPs) sometimes acquire networks that belong to a different AS. When this occur, there is no seamless method for moving the BGP peers of the acquired network to the AS of the acquiring ISP. The process of configuring the BGP peers with the new AS number can be time-consuming and cumbersome. In this case, it might not be desirable to modify peer arrangements or configuration. During this kind of transition period, it can be useful to configure BGP-enabled devices in the new AS to use the former AS number in BGP updates. This former AS number is called a <i>local</i> AS.</p>

**NOTE:** If you are using BGP on the routing device, you must configure an AS number before you specify the local as number.

In Junos OS Release 9.1 and later, the AS numeric range in plain-number format is extended to provide BGP support for 4-byte AS numbers, as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*.

In Junos OS Release 9.3 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For

example, the 4-byte AS number of 65546 in plain-number format is represented as 1.10 in the AS-dot notation format.

**Options** **alias**—(Optional) Configure the local AS as an alias of the global AS number configured for the router at the **[edit routing-options]** hierarchy level. As a result, a BGP peer considers any local AS to which it is assigned as equivalent to the primary AS number configured for the routing device. When you use the **alias** option, only the AS (global or local) used to establish the BGP session is prepended in the AS path sent to the BGP neighbor.

**autonomous-system**—AS number.

**Range:** 1 through 4,294,967,295 ( $2^{32} - 1$ ) in plain-number format

**Range:** 0.0 through 65535.65535 in AS-dot notation format

**loops number**—(Optional) Specify the number of times detection of the AS number in the AS\_PATH attribute causes the route to be discarded or hidden. For example, if you configure **loops 1**, the route is hidden if the AS number is detected in the path one or more times. This is the default behavior. If you configure **loops 2**, the route is hidden if the AS number is detected in the path two or more times.

**NOTE:** If you configure the local AS values for any BGP group, the detection of routing loops is performed using both the AS and the local AS values for all BGP groups.

If the local AS for the EBGp or IBGP peer is the same as the current AS, do not use the **local-as** statement to specify the local AS number.

When you configure the local AS within a VRF, this impacts the AS path loop-detection mechanism. All of the **local-as** statements configured on the device are part of a single AS domain. The AS path loop-detection mechanism is based on looking for a matching AS present in the domain.

**Range:** 1 through 10

**Default:** 1

**no-prepend-global-as**—(Optional) Specify to strip the global AS and to prepend only the local AS in AS paths sent to external peers.

**private**—(Optional) Configure to use the local AS only during the establishment of the BGP session with a BGP neighbor but to hide it in the AS path sent to external BGP peers. Only the global AS is included in the AS path sent to external peers.

**NOTE:** The **private** and **alias** options are mutually exclusive. You cannot configure both options with the same **local-as** statement.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Examples: Configuring BGP Local AS on page 3526</a></li><li>• <a href="#">Example: Configuring a Local AS for EBGp Sessions on page 3531</a></li><li>• <a href="#">autonomous-system on page 3123</a></li><li>• <a href="#">family on page 3794</a></li></ul>

## local-preference

<b>Syntax</b>	<code>local-preference local-preference;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],  [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],  [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],  [edit protocols bgp],  [edit protocols bgp <b>group</b> <i>group-name</i>],  [edit protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],  [edit routing-instances <i>routing-instance-name</i> protocols bgp],  [edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],  [edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Modify the value of the <b>LOCAL_PREF</b> path attribute, which is a metric used by BGP sessions to indicate the degree of preference for an external route. The route with the highest local preference value is preferred.</p> <p>The <b>LOCAL_PREF</b> path attribute always is used in inbound routing policy and is advertised to internal BGP peers and to neighboring confederations. It is never advertised to external BGP peers.</p>
<b>Default</b>	If you omit this statement, the <b>LOCAL_PREF</b> path attribute, if present, is not modified.
<b>Options</b>	<p><b>local-preference</b>—Preference to assign to routes learned from BGP or from the group or peer.</p> <p><b>Range:</b> 0 through 4,294,967,295 (<math>2^{32} - 1</math>)</p> <p><b>Default:</b> If the <b>LOCAL_PREF</b> path attribute is present, do not modify its value. If a BGP route is received without a <b>LOCAL_PREF</b> attribute, the route is handled locally (it is stored in the routing table and advertised by BGP) as if it were received with a <b>LOCAL_PREF</b> value of 100. By default, non-BGP routes that are advertised by BGP are advertised with a <b>LOCAL_PREF</b> value of 100.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring the Local Preference Value for BGP Routes on page 3475</a></li> <li>• <a href="#">Understanding Internal BGP Peering Sessions on page 3452</a></li> </ul>

## log-updown (Protocols BGP)

<b>Syntax</b>	log-updown;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],          [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],          [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <i>group</i> <i>group-name</i> <b>neighbor</b> <i>address</i>],          [edit protocols bgp],          [edit protocols bgp <b>group</b> <i>group-name</i>],          [edit protocols bgp <i>group</i> <i>group-name</i> <b>neighbor</b> <i>address</i>],          [edit routing-instances <i>routing-instance-name</i> protocols bgp],          [edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],          [edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group</i> <i>group-name</i> <b>neighbor</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.          Statement introduced in Junos OS Release 9.0 for EX Series switches.          Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Specify to generate a log a message whenever a BGP peer makes a state transition. Messages are logged using the system logging mechanism located at the <b>[edit system syslog]</b> hierarchy level.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.          routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Preventing BGP Session Resets on page 3728</a></li> <li>• <a href="#">Junos OS Administration Library for Routing Devices</a></li> <li>• <a href="#">traceoptions on page 3863</a></li> </ul>

## loops

<b>Syntax</b>	<code>loops <i>number</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp family <i>address-family</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> family <i>address-family</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> local-as],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> family <i>address-family</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> local-as]</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp local-as],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options autonomous-system <i>as-number</i>],</p> <p>[edit protocols bgp family <i>address-family</i>],</p> <p>[edit protocols bgp group <i>group-name</i> family <i>address-family</i>],</p> <p>[edit protocols bgp group <i>group-name</i> local-as],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i> family <i>address-family</i>],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i> local-as]</p> <p>[edit protocols bgp local-as],</p> <p>[edit routing-options autonomous-system <i>as-number</i>]</p>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6.
<b>Description</b>	<p>Globally, for the local-AS BGP attribute, or the specified address family, allow the local device's AS number to be in the received AS paths, and specify the number of times detection of the local device's AS number in the AS_PATH attribute causes the route to be discarded or hidden. For example, if you configure <b>loops 1</b>, the route is hidden if the local device's AS number is detected in the path one or more times. This prevents routing loops and is the default behavior. If you configure <b>loops 2</b>, the route is hidden if the local device's AS number is detected in the path two or more times.</p> <p>Some examples of BGP address families are as follows:</p> <ul style="list-style-type: none"> <li>• <b>inet unicast</b></li> <li>• <b>inet-vpn multicast</b></li> <li>• <b>inet6 any</b></li> <li>• <b>l2vpn auto-discovery-only</b></li> <li>• ...</li> </ul> <p>This list is truncated for brevity. For a complete list of protocol families for which you can specify the <b>loops</b> statement, enter the <b>help apropos loops</b> configuration command at the <b>[edit protocols bgp]</b> hierarchy level on your device.</p> <pre>[edit protocols bgp] user@host# help apropos loops set family inet unicast loops     Allow local AS in received AS paths set family inet unicast loops &lt;loops&gt;     AS-Path loop count set family inet multicast loops</pre>

```

    Allow local AS in received AS paths
set family inet multicast loops <loops>
    AS-Path loop count
set family inet flow loops
    Allow local AS in received AS paths
set family inet flow loops <loops>
    AS-Path loop count
set family inet any loops
    Allow local AS in received AS paths
set family inet any loops <loops>
    AS-Path loop count
set family inet labeled-unicast loops
    Allow local AS in received AS paths
...

```

**NOTE:** When you configure the `loops` statement for a specific BGP address family, that value is used to evaluate the AS path for routes received by a BGP peer for the specified address family, rather than the `loops` value configured for the global AS number with the `loops` statement at the `[edit routing-options autonomous-system as-number]` hierarchy level.

**Options** *number*—Number of times detection of the AS number in the AS\_PATH attribute causes the route to be discarded or hidden.

**Range:** 1 through 10

**Default:** 1

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## loose-check (BGP BFD Authentication)

---

<b>Syntax</b>	loose-check ;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection authentication],</p> <p>[edit protocols bgp bgp bfd-liveness-detection authentication],</p> <p>[edit protocols bgp group <i>group-name</i> bfd-liveness-detection authentication],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection authentication],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection authentication],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection authentication],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection authentication]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for BFD authentication introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Specify loose authentication checking on the BFD session. Use loose authentication for transitional periods only when authentication might not be configured at both ends of the BFD session.</p> <p>By default, strict authentication is enabled and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure <i>loose checking</i>. When loose checking is configured, packets are accepted without authentication being checked at each end of the session.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring BFD for Static Routes on page 3095</a></li><li>• <a href="#">Example: Configuring BFD Authentication for Static Routes on page 3109</a></li><li>• <a href="#">Example: Configuring BFD on Internal BGP Peer Sessions on page 3627</a></li><li>• <a href="#">Example: Configuring BGP Route Authentication on page 3708</a></li><li>• <a href="#">Example: Configuring EBGp Multihop Sessions on page 3597</a></li></ul>

## metric-out (Protocols BGP)

<b>Syntax</b>	<code>metric-out (<i>metric</i>   minimum-igp <i>offset</i>   igp (delay-med-update   <i>offset</i>);</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <i>group group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <i>group group-name neighbor address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name neighbor address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <i>group group-name</i>],</p> <p>[edit protocols bgp <i>group group-name neighbor address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name neighbor address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Option <b>delay-med-update</b> introduced in Junos OS Release 9.0.</p>
<b>Description</b>	<p>Specify the metric for all routes sent using the multiple exit discriminator (MED, or <b>MULTI_EXIT_DISC</b>) path attribute in update messages. This path attribute is used to discriminate among multiple exit points to a neighboring AS. If all other factors are equal, the exit point with the lowest metric is preferred.</p> <p>You can specify a constant metric value by including the <b>metric</b> option. For configurations in which a BGP peer sends third-party next hops that require the local system to perform next-hop resolution—IBGP configurations, configurations within confederation peers, or EBGP configurations that include the <b>multihop</b> command—you can specify a variable metric by including the <b>minimum-igp</b> or <b>igp</b> option.</p> <p>You can increase or decrease the variable metric calculated from the IGP metric (either from the <b>igp</b> or <b>minimum-igp</b> statement) by specifying a value for <b>offset</b>. The metric is increased by specifying a positive value for <b>offset</b>, and decreased by specifying a negative value for <b>offset</b>.</p> <p>In Junos OS Release 9.0 and later, you can specify that a BGP group or peer not advertise updates for the MED path attributes used to calculate IGP costs for BGP next hops unless the MED is lower. You can also configure an interval to delay when MED updates are sent by including the <b>med-igp-update-interval minutes</b> statement at the [edit routing-options] hierarchy level.</p>
<b>Options</b>	<p><b>delay-med-update</b>—Specify that a BGP group or peer configured with the <b>metric-out igp</b> statement not advertise MED updates unless the current MED value is lower than</p>

the previously advertised MED value, or another attribute associated with the route has changed, or the BGP peer is responding to a refresh route request.

**NOTE:** You cannot configure the `delay-med-update` statement at the global BGP level.

**igp**—Set the metric to the most recent metric value calculated in the IGP to get to the BGP next hop. Routes learned from an EBGP peer usually have a next hop on a directly connected interface and thus the IGP value is equal to zero. This is the value advertised.

**metric**—Primary metric on all routes sent to peers.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**Default:** No metric is sent.

**minimum-igp**—Set the metric to the minimum metric value calculated in the IGP to get to the BGP next hop. If a newly calculated metric is greater than the minimum metric value, the metric value remains unchanged. If a newly calculated metric is lower, the metric value is lowered to that value. When you change a neighbor's export policy from any configuration to a configuration that sets the minimum IGP offset on an exported route, the advertised MED is not updated if the value would increase as a result, even if the previous configuration does not use a minimum IGP-based MED value. This behavior helps to prevent unnecessary route flapping when an IGP cost changes, by not forcing a route update if the metric value increases past the previous lowest known value.

**offset**—Increases or decreases the metric by this value.

**Range:**  $-2^{31}$  through  $2^{31} - 1$

**Default:** None

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## mtu-discovery

<b>Syntax</b>	mtu-discovery;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Configure TCP path maximum transmission unit (MTU) discovery.</p> <p>TCP path MTU discovery enables BGP to automatically discover the best TCP path MTU for each BGP session. In Junos OS, TCP path MTU discovery is disabled by default for all BGP neighbor sessions.</p> <p>When MTU discovery is disabled, TCP sessions that are not directly connected transmit packets of 512-byte maximum segment size (MSS). These small packets minimize the chances of packet fragmentation at a device along the path to the destination. However, because most links use an MTU of at least 1500 bytes, 512-byte packets do not result in the most efficient use of link bandwidth. For directly connected EBGP sessions, MTU mismatches prevent the BGP session from being established. As a workaround, enable path MTU discovery within the EBGP group.</p> <p>Path MTU discovery dynamically determines the MTU size on the network path between the source and the destination, with the goal of avoiding IP fragmentation. Path MTU discovery works by setting the Don't Fragment (DF) bit in the IP headers of outgoing packets. When a device along the path has an MTU that is smaller than the packet, the device drops the packet. The device also sends back an ICMP Fragmentation Needed (Type 3, Code 4) message that contains the device's MTU, thus allowing the source to reduce its path MTU appropriately. The process repeats until the MTU is small enough to traverse the entire path without fragmentation.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

- *Configuring Junos OS for Path MTU Discovery on Outgoing GRE Tunnel Connections*

## multihop

<b>Syntax</b>	<pre>multihop {     no-nexthop-change;     ttl <i>ttl-value</i>; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],          [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],          [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>],          [edit protocols bgp],          [edit protocols bgp <b>group</b> <i>group-name</i>],          [edit protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>],          [edit routing-instances <i>routing-instance-name</i> protocols bgp],          [edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],          [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.          Statement introduced in Junos OS Release 9.0 for EX Series switches.          Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Configure an EBGp multihop session.</p> <p>For Layer 3 VPNs, you configure the EBGp multihop session between the PE and CE routing devices. This allows you to configure one or more routing devices between the PE and CE routing devices.</p> <p>An external confederation peer is a special case that allows unconnected third-party next hops. You do not need to configure multihop sessions explicitly in this particular case because multihop behavior is implied.</p> <p>If you have external BGP confederation peer-to-loopback addresses, you still need the multihop configuration.</p>
	<div>  <p><b>NOTE:</b> You cannot configure the <code>accept-remote-nexthop</code> statement at the same time.</p> </div>
<b>Default</b>	<p>If you omit this statement, all EBGp peers are assumed to be directly connected (that is, you are establishing a nonmultihop, or “regular,” BGP session), and the default time-to-live (TTL) value is 1.</p>

The remaining statements are explained separately.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring EBGp Multihop Sessions on page 3597</a></li><li>• <i>Configuring EBGp Multihop Sessions Between PE and CE Routers in Layer 3 VPNs</i></li><li>• <a href="#">accept-remote-nextthop on page 3765</a></li><li>• <i>no-nextthop-change</i></li><li>• <i>tth</i></li></ul>

## multiplier (BFD Liveness Detection)

<b>Syntax</b>	<code>multiplier <i>number</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp bfd-liveness-detection],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection],</p> <p>[edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols l2vpn oam bfd-liveness-detection],</p> <p>[edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols vpls neighbor <i>neighbor-id</i> oam bfd-liveness-detection],</p> <p>[edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols vpls mesh-group <i>mesh-group-name</i> neighbor <i>neighbor-id</i> oam bfd-liveness-detection],</p> <p>[edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols vpls oam bfd-liveness-detection],</p> <p>[edit protocols bgp bfd-liveness-detection],</p> <p>[edit protocols bgp group <i>group-name</i> bfd-liveness-detection],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i> bgp bfd-liveness-detection],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols l2vpn oam bfd-liveness-detection],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols vpls neighbor <i>neighbor-id</i> oam bfd-liveness-detection],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols vpls mesh-group <i>mesh-group-name</i> neighbor <i>neighbor-id</i> oam bfd-liveness-detection],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols vpls oam bfd-liveness-detection]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.5.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for BFD authentication introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2 for Layer 2 VPN and VPLS.</p>
<b>Description</b>	Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.
<b>Options</b>	<p><i>number</i>—Number of hello packets.</p> <p><b>Range:</b> 1 through 255</p> <p><b>Default:</b> 3</p>

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> ], [edit protocols bgp <b>group</b> <i>group-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> ]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
Description	<p>Explicitly configure a neighbor (peer). To configure multiple BGP peers, include multiple <b>neighbor</b> statements.</p> <p>By default, the peer's options are identical to those of the group. You can override these options by including peer-specific option statements within the <b>neighbor</b> statement.</p> <p>The <b>neighbor</b> statement is one of the statements you can include in the configuration to define a minimal BGP configuration on the routing device. (You can include an <b>allow all</b> statement in place of a <b>neighbor</b> statement.)</p>
Options	<p><b>address</b>—IPv6 or IPv4 address of a single peer.</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

## no advertise-peer-as

<b>Syntax</b>	no-advertise-peer-as;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Enable the default behavior of suppressing AS routes.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring BGP Route Advertisement on page 3589</a></li> <li>• <a href="#">Understanding Route Advertisement on page 3589</a></li> <li>• <a href="#">advertise-peer-as on page 3769</a></li> </ul>

## no-aggregator-id

---

<b>Syntax</b>	no-aggregator-id;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> neighbor <i>address</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>], [edit protocols bgp], [edit protocols bgp <b>group</b> <i>group-name</i>], [edit protocols bgp group <i>group-name</i> neighbor <i>address</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Prevent different routing devices within an AS from creating aggregate routes that contain different AS paths.</p> <p>Junos OS performs route aggregation, which is the process of combining the characteristics of different routes so that only a single route is advertised. Aggregation reduces the amount of information that BGP must store and exchange with other BGP systems. When aggregation occurs, the local routing device adds the local AS number and the router ID to the aggregator path attribute. The <b>no-aggregator-id</b> statement causes Junos OS to place a 0 in the router ID field and thus eliminate the possibility of having multiple aggregate advertisements in the network, each with different path information.</p>
<b>Default</b>	If you omit this statement, the router ID is included in the BGP aggregator path attribute.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Update Messages on page 3428</a></li></ul>

## no-client-reflect

<b>Syntax</b>	no-client-reflect;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],  [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],  [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],  [edit protocols bgp],  [edit protocols bgp <b>group</b> <i>group-name</i>],  [edit protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],  [edit routing-instances <i>routing-instance-name</i> protocols bgp],  [edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],  [edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Disable intracluster route redistribution by the system acting as the route reflector. Include this statement when the client cluster is fully meshed to prevent the sending of redundant route advertisements. Route reflection provides a way to decrease BGP control traffic and minimizing the number of update messages sent within the AS.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring BGP Route Reflectors on page 3684</a></li> <li>• <a href="#">cluster on page 3785</a></li> </ul>

## out-delay

<b>Syntax</b>	<code>out-delay seconds;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Control how often BGP and the routing table exchange route information by specifying how long a route must be present in the Junos OS routing table before it is exported to BGP. Use this time delay to help bundle routing updates and to avoid sending updates too often.</p> <p>Alternatively or in addition, external BGP (EBGP) sessions can also use the route-flap damping mechanism upon the reception of BGP messages coming from an external neighbor.</p> <p>BGP stores the route information it receives from update messages in the routing table, and the routing table exports active routes from the routing table into BGP. BGP then advertises the exported routes to its peers. The <b>out-delay</b> statement enables a form of rate limiting. The delay is added to each update for each prefix individually. When a routing device changes its best path to a destination prefix, the device does not inform its peer about the change unless the route has been present in its routing table for the specified <b>out-delay</b>. If you use <b>out-delay</b> to perform rate-limiting, you can expect a less bursty pattern of updates. You will see a pattern in which updates arrive in a steady flow, and two updates for the same prefix are always spaced by at least the <b>out-delay</b> timer value (for example, 30 seconds). Thus, the <b>out-delay</b> setting is useful for limiting oscillation (sometimes called <i>churn</i>) in a network. Keep in mind that, regardless of the <b>out-delay</b> setting, BGP peers exchange routes immediately after neighbor establishment. The <b>out-delay</b> setting is only designed to delay the exchange of routes between BGP and the local routing table.</p>

Caution is warranted because an **out-delay** can delay convergence. If your network is configured in a way that avoids oscillation, setting an **out-delay** is not necessary.

When configured, the **out-delay** value displays as **Outbound Timer** when using **show bgp group** or **show bgp group neighbor** commands.

**Default** By default, the exchange of route information between BGP and the routing table occurs immediately after the routes are received. This immediate exchange of route information might cause instabilities in the network reachability information. If you omit this statement, routes are exported to BGP immediately after they have been added to the routing table.

**Options** *seconds*—Output delay time.  
**Range:** 0 through 65,535 seconds  
**Default:** 0 seconds

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## outbound-route-filter

<b>Syntax</b>	<pre> outbound-route-filter {     <b>bgp-orf-cisco-mode</b>;     prefix-based {         accept {             (inet   inet6);         }     } } </pre>
<b>Hierarchy Level</b>	<pre> [edit logical-systems <i>logical-system-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>], [edit protocols bgp], [edit protocols bgp group <i>group-name</i>], [edit protocols bgp group <i>group-name</i> neighbor <i>address</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp], [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>] </pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.2.</p> <p>Statement introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Configure a BGP peer to accept outbound route filters from a remote peer.
<b>Options</b>	<p><b>accept</b>—Specify that outbound route filters from a BGP peer be accepted.</p> <p><b>inet</b>—Specify that IPv4 prefix-based outbound route filters be accepted.</p> <p><b>inet6</b>—Specify that IPv6 prefix-based outbound route filters be accepted.</p>
	<p> <b>NOTE:</b> You can specify that both IPv4 and IPv6 outbound route filters be accepted.</p>
	<p><b>prefix-based</b>—Specify that prefix-based filters be accepted.</p> <p>The <b>bgp-orf-cisco-mode</b> statement is explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

## passive (Protocols BGP)

<b>Syntax</b>	passive;
<b>Hierarchy Level</b>	<pre>[edit logical-systems <i>logical-system-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> protocols bgp <i>group</i> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp <i>group</i> <i>group-name</i> <i>neighbor</i> <i>address</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <i>group</i> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <i>group</i> <i>group-name</i> <i>neighbor</i> <i>address</i>], [edit protocols bgp], [edit protocols bgp <i>group</i> <i>group-name</i>], [edit protocols bgp <i>group</i> <i>group-name</i> <i>neighbor</i> <i>address</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp], [edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group</i> <i>group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group</i> <i>group-name</i> <i>neighbor</i> <i>address</i>]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Configure the routing device so that active open messages are not sent to the peer. Once you configure the routing device to be passive, the routing device will wait for the peer to issue an open request before a message is sent.
<b>Default</b>	If you omit this statement, all explicitly configured peers are active, and each peer periodically sends open requests until its peer responds.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Preventing BGP Session Flaps When VPN Families Are Configured on page 3728</a></li> </ul>

## path-selection

---

<b>Syntax</b>	<pre>path-selection {   (always-compare-med   cisco-non-deterministic   external-router-id);   as-path-ignore;   l2vpn-use-bgp-rules;   med-plus-igp {     igp-multiplier <i>number</i>;     med-multiplier <i>number</i>;   } }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp], [edit protocols bgp], [edit routing-instances <i>routing-instance-name</i> protocols bgp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series. <b>med-plus-igp</b> option introduced in Junos OS Release 8.1. <b>as-path-ignore</b> and <b>l2vpn-use-bgp-rules</b> options introduced in Junos OS Release 10.2.
<b>Description</b>	Configure BGP path selection.
<b>Default</b>	If the <b>path-selection</b> statement is not included in the configuration, only the multiple exit discriminators (MEDs) of routes that have the same peer ASs are compared.
<b>Options</b>	<b>always-compare-med</b> —Always compare MEDs whether or not the peer ASs of the compared routes are the same.

**NOTE:** We recommend that you configure the **always-compare-med** option.

---

**as-path-ignore**—In the best-path algorithm, skip the step that compares the autonomous system (AS) path lengths. By default, the best-path algorithm evaluates the length of the AS paths and prefers the route with the shortest AS path length.

---

**NOTE:** The **as-path-ignore** statement is not supported with routing instances.

---

**cisco-non-deterministic**—Emulate the Cisco IOS default behavior. This mode evaluates routes in the order that they are received and does not group them according to their neighboring AS. With **cisco-non-deterministic** mode, the active path is always first. All inactive, but eligible, paths follow the active path and are maintained in the order

in which they were received, with the most recent path first. Ineligible paths remain at the end of the list.

As an example, suppose you have three path advertisements for the 192.168.1.0 /24 route:

- Path 1—learned through EBGP; AS Path of 65010; MED of 200
- Path 2—learned through IBGP; AS Path of 65020; MED of 150; IGP cost of 5
- Path 3—learned through IBGP; AS Path of 65010; MED of 100; IGP cost of 10

These advertisements are received in quick succession, within a second, in the order listed. Path 3 is received most recently, so the routing device compares it against path 2, the next most recent advertisement. The cost to the IBGP peer is better for path 2, so the routing device eliminates path 3 from contention. When comparing paths 1 and 2, the routing device prefers path 1 because it is received from an EBGP peer. This allows the routing device to install path 1 as the active path for the route.

**NOTE:** We do not recommend using this configuration option in your network. It is provided solely for interoperability to allow all routing devices in the network to make consistent route selections.

**external-router-id**—Compare the router ID between external BGP paths to determine the active path.

**igp-multiplier *number***—The multiplier value for the IGP cost to a next-hop address. This option is useful for making the MED and IGP cost comparable.

**Range:** 1 through 1000

**Default:** 1

**med-multiplier *number***—The multiplier value for the MED calculation. This option is useful for making the MED and IGP cost comparable.

**Range:** 1 through 1000

**Default:** 1

**med-plus-igp**—Add the IGP cost to the indirect next-hop destination to the MED before comparing MED values for path selection. This statement only affects best-path selection. It does not affect the advertised MED.

The other option is explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## peer-as (Protocols BGP)

<b>Syntax</b>	<code>peer-as <i>autonomous-system</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Specify the neighbor (peer) autonomous system (AS) number.</p> <p>For EBGP, the peer is in another AS, so the AS number you specify in the <b>peer-as</b> statement must be different from the local router's AS number, which you specify in the <b>autonomous-system</b> statement. For IBGP, the peer is in the same AS, so the two AS numbers that you specify in the <b>autonomous-system</b> and <b>peer-as</b> statements must be the same.</p> <p>The AS numeric range in plain-number format has been extended in Junos OS Release 9.1 to provide BGP support for 4-byte AS numbers, as defined in RFC 4893, <i>BGP Support for Four-octet AS Number Space</i>. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of the Junos OS support 2-byte AS numbers.</p> <p>In Junos OS Release 9.2 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: <i>&lt;16-bit high-order value in decimal&gt;.&lt;16-bit low-order value in decimal&gt;</i>. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.</p> <p>With the introduction of 4-byte AS numbers, you might have a combination of routers that support 4-byte AS numbers and 2-byte AS numbers. For more information about what happens when establishing BGP peer relationships between 4-byte and 2-byte capable routers, see the following topics:</p>

- *Using 4-Byte Autonomous System Numbers in BGP Networks Technology Overview.*

**Options**    *autonomous-system*—AS number.  
**Range:** 1 through 4,294,967,295 ( $2^{32} - 1$ ) in plain-number format for 4-byte AS numbers  
**Range:** 1 through 65,535 in plain-number format for 2-byte AS numbers (this is a subset of the 4-byte range)  
**Range:** 0.0 through 65535.65535 in AS-dot notation format for 4-byte AS numbers

**Required Privilege**    routing—To view this statement in the configuration.  
**Level**    routing-control—To add this statement to the configuration.

Documentation**

## preference (Protocols BGP)

<b>Syntax</b>	<code>preference preference;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Specify the preference for routes learned from BGP.</p> <p>At the BGP global level, the preference statement sets the preference for routes learned from BGP. You can override this preference in a BGP group or peer preference statement.</p> <p>At the group or peer level, the preference statement sets the preference for routes learned from the group or peer. Use this statement to override the preference set in the BGP global preference statement when you want to favor routes from one group or peer over those of another.</p>
<div>  <b>NOTE:</b> Do not set preference2 for BGP route-policy.         </div>	
<b>Options</b>	<p><b>preference</b>—Preference to assign to routes learned from BGP or from the group or peer.</p> <p><b>Range:</b> 0 through 4,294,967,295 (<math>2^{32} - 1</math>)</p> <p><b>Default:</b> 170 for the primary preference</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">local-preference on page 3818</a></li> <li>• <a href="#">Example: Configuring the Preference Value for BGP Routes on page 3607</a></li> </ul>

## remove-private

<b>Syntax</b>	remove-private all replace nearest;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>When advertising AS paths to remote systems, have the local system strip private AS numbers from the AS path. The numbers are stripped from the AS path starting at the left end of the AS path (the end where AS paths have been most recently added). The routing device stops searching for private ASs when it finds the first nonprivate AS or a peer's private AS. If the AS path contains the AS number of the external BGP (EBGP) neighbor, BGP does not remove the private AS number.</p>
<div>  <p><b>NOTE:</b> As of Junos OS 10.0R2 and higher, if there is a need to send prefixes to an EBGP peer that has an AS number that matches an AS number in the AS path, consider using the <code>as-override</code> statement instead of the <code>remove-private</code> statement.</p> </div>	
<p>The operation takes place after any confederation member ASs have already been removed from the AS path, if applicable.</p> <p>The Junos OS recognizes the set of AS numbers that is considered private, a range that is defined in the Internet Assigned Numbers Authority (IANA) assigned numbers document.</p> <p>The set of reserved AS numbers is in the range from 64,512 through 65,535.</p>	
<b>Options</b>	<p><b>all</b>—Remove all private AS numbers from the original path. Do not stop the process of removing private AS numbers, even if a public AS number is encountered.</p>

**nearest**—When you use the **all** and **replace** options, choose the last (right-most) public AS number encountered in the original AS path for the replacement value, as the AS path is processed from left to right. If no public AS number is encountered, the default replacement value is used. (See the **replace** option for information about the default replacement value.)

**replace**—When you use the **all** option, instead of removing private AS numbers, perform a replace operation. The default replacement value for the private AS number is the local AS number at the BGP group level for the BGP peer. If you are unsure about the replacement value, check the local AS value displayed in the output of the **show bgp group group-name** command.

<b>Required Privilege</b>	routing—To view this statement in the configuration.
<b>Level</b>	routing-control—To add this statement to the configuration.

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Removing Private AS Numbers from AS Paths on page 3621</a></li></ul>
------------------------------	---

## restart-time (BGP Graceful Restart)

<b>Syntax</b>	<code>restart-time seconds;</code>
<b>Hierarchy Level</b>	<p>[edit protocols (bgp   rip   ripng) <a href="#">graceful-restart</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols (bgp   rip   ripng) <a href="#">graceful-restart (Enabling Globally)</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <a href="#">graceful-restart</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <a href="#">graceful-restart</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.3.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Configure the duration of the BGP, RIP, or next-generation RIP (RIPng) graceful restart period.
<b>Options</b>	<p><b>seconds</b>—Length of time for the graceful restart period.</p> <p><b>Range:</b> 1 through 600 seconds</p> <p><b>Default:</b> Varies by protocol:</p> <ul style="list-style-type: none"> <li>• BGP—120 seconds</li> <li>• RIP and RIPng—60 seconds</li> </ul>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Graceful Restart Options for BGP on page 2457</a></li> <li>• <a href="#">Configuring Graceful Restart Options for RIP and RIPng on page 2461</a></li> <li>• <a href="#">Configuring Graceful Restart for QFabric Systems on page 1512</a></li> <li>• <a href="#">stale-routes-time on page 2501</a></li> </ul>

## session-mode

<b>Syntax</b>	session-mode (automatic   multihop   single-hop);
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp bfd-liveness-detection],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection],</p> <p>[edit protocols bgp group <i>group-name</i> bfd-liveness-detection],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 11.1.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure BFD session mode to be single-hop or multihop. By default, BGP uses single-hop BFD sessions if the peer is directly connected to the router's interface. BGP uses multihop BFD sessions if the peer is not directly connected to the router's interface. If the peer session's <b>local-address</b> option is configured, the directly connected check is based partly on the source address that would be used for BGP and BFD.</p> <p>For backward compatibility, you can override the default behavior by configuring the <b>single-hop</b> or <b>multihop</b> option. Before Junos OS Release 11.1, the behavior was to assume that IBGP peer sessions were multihop.</p>
<b>Options</b>	<p><b>automatic</b>—Configure BGP to use single-hop BFD sessions if the peer is directly connected to the router's interface, and multihop BFD sessions if the peer is not directly connected to the router's interface</p> <p><b>multihop</b>—Configure BGP to use multihop BFD sessions.</p> <p><b>single-hop</b>—Configure BGP to use single-hop BFD sessions.</p> <p><b>Default:</b> automatic</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring BFD Authentication for BGP on page 3637</a></li> <li>• <a href="#">Example: Configuring BFD on Internal BGP Peer Sessions on page 3627</a></li> </ul>

## stale-routes-time

---

<b>Syntax</b>	<code>stale-routes-time <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-routing-name</i> protocols bgp <a href="#">graceful-restart</a> ], [edit logical-systems <i>logical-routing-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <a href="#">graceful-restart</a> ], [edit protocols bgp <a href="#">graceful-restart</a> ], [edit routing-instances <i>routing-instance-name</i> protocols bgp <a href="#">graceful-restart</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify the maximum time that stale routes are kept during a restart. The <b>stale-routes-time</b> statement allows you to set the length of time the routing device waits to receive messages from restarting neighbors before declaring them down.
<b>Options</b>	<b>seconds</b> —Time the router device waits to receive messages from restarting neighbors before declaring them down. <b>Range:</b> 1 through 600 seconds <b>Default:</b> 300 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Graceful Restart Options for BGP on page 2457</a></li> <li>• <a href="#">Configuring Graceful Restart for QFabric Systems on page 1512</a></li> <li>• <a href="#">restart-time (BGP Graceful Restart) on page 2500</a></li> </ul>

## tcp-mss (Protocols BGP)

---

<b>Syntax</b>	<code>tcp-mss <i>segment-size</i>;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols bgp],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor</code> <code>    <i>neighbor-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>    bgp],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>    bgp group <i>group-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>    bgp group <i>group-name</i> neighbor <i>neighbor-name</i>],</code> <code>[edit protocols bgp],</code> <code>[edit protocol bgp group <i>group-name</i>],</code> <code>[edit protocols bgp group <i>group-name</i> neighbor <i>neighbor-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor</code> <code>    <i>neighbor-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.1. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Configure the maximum segment size (MSS) for the TCP connection for BGP neighbors.  The MSS is only valid in increments of 2 KB. The value used is based on the value set, but is rounded down to the nearest multiple of 2048.
<b>Options</b>	<b><i>segment-size</i></b> —MSS for the TCP connection. <b>Range:</b> 1 through 4096
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## threshold (detection-time)

<b>Syntax</b>	<code>threshold <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp bfd-liveness-detection detection-time],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection detection-time],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection detection-time],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection detection-time],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection detection-time],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection detection-time],</p> <p>[edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols l2vpn oam bfd-liveness-detection detection-time],</p> <p>[edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols vpls neighbor <i>neighbor-id</i> oam bfd-liveness-detection detection-time],</p> <p>[edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols vpls mesh-group <i>mesh-group-name</i> neighbor <i>neighbor-id</i> oam bfd-liveness-detection detection-time],</p> <p>[edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols vpls oam bfd-liveness-detection detection-time],</p> <p>[edit protocols bgp bfd-liveness-detection detection-time],</p> <p>[edit protocols bgp group <i>group-name</i> bfd-liveness-detection detection-time],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i> bgp bfd-liveness-detection detection-time],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection detection-time],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection detection-time],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection detection-time],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols l2vpn oam bfd-liveness-detection detection-time],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols vpls neighbor <i>neighbor-id</i> oam bfd-liveness-detection detection-time],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols vpls mesh-group <i>mesh-group-name</i> neighbor <i>neighbor-id</i> oam bfd-liveness-detection detection-time],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols vpls oam bfd-liveness-detection detection-time]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.2.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for BFD authentication introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2 for Layer 2 VPNs and VPLS.</p>
<b>Description</b>	Specify the threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**NOTE:** The threshold value must be equal to or greater than the transmit interval.

The threshold time must be equal to or greater than the value specified in the `minimum-interval` or the `minimum-receive-interval` statement.

---

<b>Options</b>	<b><i>milliseconds</i></b> —Value for the detection time adaptation threshold. <b>Range:</b> 1 through 255,000
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring BFD for Layer 2 VPN and VPLS</a></li><li>• <a href="#">Example: Configuring BFD for Static Routes on page 3095</a></li></ul>

## threshold (transmit-interval)

<b>Syntax</b>	threshold <i>milliseconds</i> ;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp bfd-liveness-detection transmit-interval],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection transmit-interval],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection transmit-interval],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection transmit-interval],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection transmit-interval],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection transmit-interval],</p> <p>[edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols l2vpn oam bfd-liveness-detection transmit-interval],</p> <p>[edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols vpls neighbor <i>neighbor-id</i> oam bfd-liveness-detection transmit-interval],</p> <p>[edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols vpls mesh-group <i>mesh-group-name</i> neighbor <i>neighbor-id</i> oam bfd-liveness-detection transmit-interval],</p> <p>[edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols vpls oam bfd-liveness-detection transmit-interval],</p> <p>[edit protocols bgp bfd-liveness-detection transmit-interval],</p> <p>[edit protocols bgp group <i>group-name</i> bfd-liveness-detection transmit-interval],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i> bgp bfd-liveness-detection transmit-interval],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection transmit-interval],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection transmit-interval],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection transmit-interval],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols l2vpn oam bfd-liveness-detection transmit-interval],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols vpls neighbor <i>neighbor-id</i> oam bfd-liveness-detection transmit-interval],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols vpls mesh-group <i>mesh-group-name</i> neighbor <i>neighbor-id</i> oam bfd-liveness-detection transmit-interval],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols vpls oam bfd-liveness-detection transmit-interval]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.2.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2 for Layer 2 VPN and VPLS.</p>
<b>Description</b>	Specify the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent.

**Options**    *milliseconds*—Value for the transmit interval adaptation threshold.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**NOTE:** The threshold value specified in the `threshold` statement must be greater than the value specified in the `minimum-interval` statement for the `transmit-interval` statement.

---

**Required Privilege Level**    routing—To view this statement in the configuration.  
   routing-control—To add this statement to the configuration.

## traceoptions (Protocols BGP)

<b>Syntax</b>	<pre> traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;flag-modifier&gt; &lt;disable&gt;; } </pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p><b>4byte-as</b> statement introduced in Junos OS Release 9.2.</p> <p><b>4byte-as</b> statement introduced in Junos OS Release 9.2 for EX Series switches.</p>
<b>Description</b>	Configure BGP protocol-level tracing options. To specify more than one tracing operation, include multiple flag statements.
<div>  <b>NOTE:</b> The <b>traceoptions</b> statement is not supported on QFabric systems. </div>	
<b>Default</b>	<p>The default BGP protocol-level tracing options are inherited from the routing protocols <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level. The default group-level trace options are inherited from the BGP protocol-level <b>traceoptions</b> statement. The default peer-level trace options are inherited from the group-level <b>traceoptions</b> statement.</p>
<b>Options</b>	<p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>name</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place BGP tracing output in the file <b>bgp-log</b>.</p>

**files number**—(Optional) Maximum number of trace files. When a trace file named **trace-file.0** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 10 files

**flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

#### BGP Tracing Flags

- **4byte-as**—4-byte AS events.
- **bfd**—BFD protocol events.
- **damping**—Damping operations.
- **graceful-restart**—Graceful restart events.
- **keepalive**—BGP keepalive messages. If you enable the the BGP **update** flag only, received keepalive messages do not generate a trace message.
- **nsr-synchronization**—Nonstop routing synchronization events.
- **open**—Open packets. These packets are sent between peers when they are establishing a connection.
- **packets**—All BGP protocol packets.
- **refresh**—BGP refresh packets.
- **update**—Update packets. These packets provide routing updates to BGP systems. If you enable only this flag, received keepalive messages do not generate a trace message. Use the **keepalive** flag to generate a trace message for keepalive messages.

#### Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **filter**—Provide filter trace information. Applies only to **route**, **damping**, and **update** tracing flags.
- **receive**—Trace the packets being received.
- **send**—Trace the packets being transmitted.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

<b>Required Privilege Level</b>	<p>routing and trace—To view this statement in the configuration.</p> <p>routing-control and trace-control—To add this statement to the configuration.</p>

**Release Information**    Statement introduced in Junos OS Release 8.2.  
                              Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                              Support for BFD authentication introduced in Junos OS Release 9.6.  
                              Statement introduced in Junos OS Release 12.1 for the QFX Series.  
                              Statement introduced in Junos OS Release 13.2 for Layer 2 VPN and VPLS.

**Description**    Specify the transmit interval for the **bfd-liveness-detection** statement. The negotiated transmit interval for a peer is the interval between the sending of BFD packets to peers. The receive interval for a peer is the minimum time that it requires between packets sent from its peer; the receive interval is not negotiated between peers. To determine the transmit interval, each peer compares its configured minimum transmit interval with its

peer's minimum receive interval. The larger of the two numbers is accepted as the transmit interval for that peer.

The remaining statements are explained separately.

<b>Required Privilege</b>	routing—To view this statement in the configuration.
<b>Level</b>	routing-control—To add this statement to the configuration.

# Administration

- [Routine Monitoring on page 3871](#)
- [Operational Commands on page 3871](#)

## Routine Monitoring

---

- [Monitoring BGP Routing Information on page 3871](#)

### Monitoring BGP Routing Information

**Purpose** Use the monitoring functionality to monitor BGP routing information on the routing device.

**Action** To view BGP routing information in the CLI, enter the following commands:

- `show bgp summary`
- `show bgp neighbor`

**Related Documentation**

- [show bgp neighbor on page 2550](#)
- [show bgp summary on page 3898](#)

## Operational Commands

---

- `clear bgp damping`
- `clear bgp neighbor`
- `clear bgp table`
- `show bgp group`
- `show bgp neighbor`
- `show bgp summary`
- `show policy damping`
- `show route damping`

## clear bgp damping

---

<b>List of Syntax</b>	<a href="#">Syntax on page 3872</a> <a href="#">Syntax (EX Series Switch and QFX Series) on page 3872</a>
<b>Syntax</b>	<code>clear bgp damping</code> <code>&lt;logical-system (all   <i>logical-system-name</i>)&gt;</code> <code>&lt;<i>prefix</i>&gt;</code>
<b>Syntax (EX Series Switch and QFX Series)</b>	<code>clear bgp damping</code> <code>&lt;<i>prefix</i>&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Clear BGP route flap damping information.
<b>Options</b>	<b>none</b> —Clear all BGP route flap damping information.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.  <b><i>prefix</i></b> —(Optional) Clear route flap damping information for only the specified destination prefix.
<b>Required Privilege Level</b>	clear

<b>Syntax (EX Series Switch and QFX Series)</b>	<pre>clear bgp neighbor &lt;as <i>as-number</i>&gt; &lt;instance <i>instance-name</i>&gt; &lt;malformed-route&gt; &lt;neighbor&gt; &lt;soft   soft-inbound&gt; &lt;soft-minimum-igp&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p> <p><b>malformed-route</b> option introduced in Junos OS Release 13.2.</p>
<b>Description</b>	<p>Perform one of the following tasks:</p> <ul style="list-style-type: none"> <li>• Change the state of one or more BGP neighbors to <b>IDLE</b>. For neighbors in the <b>ESTABLISHED</b> state, this command drops the TCP connection to the neighbors and then reestablishes the connection.</li> <li>• (<b>soft</b> keyword only) Reapply export policies or import policies, respectively, to one or more BGP neighbors without changing their state.</li> <li>• (<b>soft-inbound</b> keyword only) Reapply export policies or import policies, respectively, and send refresh updates to one or more BGP neighbors without changing their state.</li> </ul>
<b>Options</b>	<p><b>none</b>—Change the state of all BGP neighbors to <b>IDLE</b>.</p> <p><b>as <i>as-number</i></b>—(Optional) Apply this command only to neighbors in the specified autonomous system (AS).</p> <p><b>instance <i>instance-name</i></b>—(Optional) Apply this command only to neighbors for the specified routing instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>malformed-route</b>—(Optional) Remove malformed routes. If a specific neighbor is provided, Junos OS removes malformed routes for that particular neighbor. Otherwise, Junos OS removes malformed routes for all BGP neighbors. To find routes that have</p>

malformed attributes, run the **show route hidden** command, and look for routes marked with **MalformedAttr** in the AS path field.

**neighbor**—(Optional) IP address of a BGP peer. Apply this command only to the specified neighbor.

**soft**—(Optional) Reapply any export policies and send refresh updates to neighbors without clearing the state.

**soft-inbound**—(Optional) Reapply any import policies and send refresh updates to neighbors without clearing the state.

**soft-minimum-igp**—(Optional) Provides soft refresh of the outbound state when the interior gateway protocol (IGP) metric is reset.

**Output Fields**

When you enter this command, you are provided feedback on the status of your request.

## Sample Output

**clear bgp neighbor**

```
user@host> clear bgp neighbor
```

## clear bgp table

<b>Syntax</b>	<code>clear bgp table <i>table-name</i></code> <code>&lt;logical-system (all   <i>logical-system-name</i>)&gt;</code>
<b>Syntax (EX Series Switch and QFX Series)</b>	<code>clear bgp table <i>table-name</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.0. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Request that BGP refresh routes in a specified routing table.
<b>Options</b>	<b><code>logical-system (all   <i>logical-system-name</i>)</code></b> —(Optional) Perform this operation on all logical systems or on a particular logical system.  <b><code>table-name</code></b> —Request that BGP refresh routes in the specified table.
<b>Additional Information</b>	In some cases, a prefix limit is associated with a routing table for a VPN instance. When this limit is exceeded (for example, because of a network misconfiguration), some routes might not be inserted in the table. Such routes need to be added to the table after the network issue is resolved. Use the <b>clear bgp table</b> command to request that BGP refresh routes in a VPN instance table.
<b>Required Privilege Level</b>	clear
<b>List of Sample Output</b>	<a href="#">clear bgp table private.inet.0 on page 3875</a> <a href="#">clear bgp table inet.6 logical-system all on page 3875</a> <a href="#">clear bgp table private.inet.6 logical-system ls1 on page 3875</a> <a href="#">clear bgp table logical-system all inet.0 on page 3875</a> <a href="#">clear bgp table logical-system ls2 private.inet.0 on page 3876</a>
<b>Output Fields</b>	This command produces no output.

## Sample Output

`clear bgp table private.inet.0`

```
user@host> clear bgp table private.inet.0
```

`clear bgp table inet.6 logical-system all`

```
user@host> clear bgp table inet.6 logical-system all
```

**Output Fields** [Table 273 on page 3878](#) describes the output fields for the **show bgp group** command. Output fields are listed in the approximate order in which they appear.

**Table 273: show bgp group Output Fields**

Field Name	Field Description	Level of Output
<b>Group Type or Group</b>	Type of BGP group: <b>Internal</b> or <b>External</b> .	All levels
<b>group-index</b>	Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels.	<b>rtf detail</b>
<b>AS</b>	AS number of the peer. For internal BGP (IBGP), this number is the same as <b>Local AS</b> .	<b>brief detail</b> none
<b>Local AS</b>	AS number of the local routing device.	<b>brief detail</b> none
<b>Name</b>	Name of a specific BGP group.	<b>brief detail</b> none
<b>Index</b>	Unique index number of a BGP group.	<b>brief detail</b> none
<b>Flags</b>	Flags associated with the BGP group. This field is used by Juniper Networks customer support.	<b>brief detail</b> none
<b>Remove-private options</b>	Options associated with the <a href="#">remove-private</a> statement.	<b>brief detail</b> none
<b>Holdtime</b>	Maximum number of seconds allowed to elapse between successive keepalive or update messages that BGP receives from a peer in the BGP group, after which the connection to the peer is closed and routing devices through that peer become unavailable.	<b>brief detail</b> none
<b>Export</b>	Export policies configured for the BGP group with the <b>export</b> statement.	<b>brief detail</b> none
<b>MED tracks IGP metric update delay</b>	Time, in seconds, that updates to multiple exit discriminator (MED) are delayed. Also displays the time remaining before the interval is set to expire	All levels
<b>Traffic Statistics Interval</b>	Time between sample periods for labeled-unicast traffic statistics, in seconds.	<b>brief detail</b> none
<b>Total peers</b>	Total number of peers in the group.	<b>brief detail</b> none

Table 273: show bgp group Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Established</b>	Number of peers in the group that are in the established state.	All levels
<b>Active/Received/Accepted/Damped</b>	<p>Multipurpose field that displays information about BGP peer sessions. The field's contents depend upon whether a session is established and whether it was established in the main routing device or in a routing instance.</p> <ul style="list-style-type: none"> <li>If a peer is not established, the field shows the state of the peer session: <b>Active</b>, <b>Connect</b>, or <b>Idle</b>.</li> <li>If a BGP session is established in the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the <b>inet.0</b> (main) and <b>inet.2</b> (multicast) routing tables. For example, <b>8/10/10/2</b> and <b>2/4/4/0</b> indicate the following: <ul style="list-style-type: none"> <li>8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the <b>inet.0</b> routing table.</li> <li>2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the <b>inet.2</b> routing table.</li> </ul> </li> </ul>	<b>summary</b>
<b>ip-addresses</b>	List of peers who are members of the group. The address is followed by the peer's port number.	All levels
<b>Route Queue Timer</b>	Number of seconds until queued routes are sent. If this time has already elapsed, this field displays the number of seconds by which the updates are delayed.	<b>detail</b>
<b>Route Queue</b>	Number of prefixes that are queued up for sending to the peers in the group.	<b>detail</b>
<b>inet.number</b>	<p>Number of active, received, accepted, and damped routes in the routing table. For example, <b>inet.0: 7/10/9/0</b> indicates the following:</p> <ul style="list-style-type: none"> <li>7 active routes, 10 received routes, 9 accepted routes, and no damped routes from a BGP peer appear in the <b>inet.0</b> routing table.</li> </ul>	none

Table 273: show bgp group Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Table inet.number</b>	Information about the routing table. <ul style="list-style-type: none"> <li>• <b>Received prefixes</b>—Total number of prefixes from the peer, both active and inactive, that are in the routing table.</li> <li>• <b>Active prefixes</b>—Number of prefixes received from the peer that are active in the routing table.</li> <li>• <b>Suppressed due to damping</b>—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.</li> <li>• <b>Advertised prefixes</b>—Number of prefixes advertised to a peer.</li> <li>• <b>Received external prefixes</b>—Total number of prefixes from the external BGP (EBGP) peers, both active and inactive, that are in the routing table.</li> <li>• <b>Active external prefixes</b>—Number of prefixes received from the EBGP peers that are active in the routing table.</li> <li>• <b>Externals suppressed</b>—Number of routes received from EBGP peers currently inactive because of damping or other reasons.</li> <li>• <b>Received internal prefixes</b>—Total number of prefixes from the IBGP peers, both active and inactive, that are in the routing table.</li> <li>• <b>Active internal prefixes</b>—Number of prefixes received from the IBGP peers that are active in the routing table.</li> <li>• <b>Internals suppressed</b>—Number of routes received from IBGP peers currently inactive because of damping or other reasons.</li> <li>• <b>RIB State</b>—Status of the graceful restart process for this routing table: <b>BGP restart is complete</b>, <b>BGP restart in progress</b>, <b>VPN restart in progress</b>, or <b>VPN restart is complete</b>.</li> </ul>	<b>detail</b>
<b>Groups</b>	Total number of groups.	All levels
<b>Peers</b>	Total number of peers.	All levels
<b>External</b>	Total number of external peers.	All levels
<b>Internal</b>	Total number of internal peers.	All levels
<b>Down peers</b>	Total number of unavailable peers.	All levels
<b>Flaps</b>	Total number of flaps that occurred.	All levels
<b>Table</b>	Name of a routing table.	<b>brief</b> , none
<b>Tot Paths</b>	Total number of routes.	<b>brief</b> , none
<b>Act Paths</b>	Number of active routes.	<b>brief</b> , none
<b>Suppressed</b>	Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.	<b>brief</b> , none

Table 273: show bgp group Output Fields (*continued*)

Field Name	Field Description	Level of Output
History	Number of withdrawn routes stored locally to keep track of damping history.	<b>brief, none</b>
Damp State	Number of active routes with a figure of merit greater than zero, but lower than the threshold at which suppression occurs.	<b>brief, none</b>
Pending	Routes being processed by the BGP import policy.	<b>brief, none</b>
Group	Group the peer belongs to in the BGP configuration.	<b>detail</b>
Receive mask	Mask of the received target included in the advertised route.	<b>detail</b>
Entries	Number of route entries received.	<b>detail</b>
Target	Route target that is to be passed by route-target filtering. If a route advertised from the provider edge (PE) routing device matches an entry in the route-target filter, the route is passed to the peer.	<b>detail</b>
Mask	Mask which specifies that the peer receive routes with the given route target.	<b>detail</b>

**Table 274: show bgp neighbor Output Fields**

Field Name	Field Description
<b>Peer</b>	Address of the BGP neighbor. The address is followed by the neighbor port number.
<b>AS</b>	AS number of the peer.
<b>Local</b>	Address of the local routing device. The address is followed by the peer port number.
<b>Type</b>	Type of peer: <b>Internal</b> or <b>External</b> .
<b>State</b>	<p>Current state of the BGP session:</p> <ul style="list-style-type: none"> <li>• <b>Active</b>—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message.</li> <li>• <b>Connect</b>—BGP is waiting for the transport protocol connection to be completed.</li> <li>• <b>Established</b>—The BGP session has been established, and the peers are exchanging update messages.</li> <li>• <b>Idle</b>—This is the first stage of a connection. BGP is waiting for a Start event.</li> <li>• <b>OpenConfirm</b>—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message.</li> <li>• <b>OpenSent</b>—BGP has sent an open message and is waiting to receive an open message from the peer.</li> </ul>

Table 274: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
<b>Flags</b>	<p>Internal BGP flags:</p> <ul style="list-style-type: none"> <li>• <b>Aggregate Label</b>—BGP has aggregated a set of incoming labels (labels received from the peer) into a single forwarding label.</li> <li>• <b>CleanUp</b>—The peer session is being shut down.</li> <li>• <b>Delete</b>—This peer has been deleted.</li> <li>• <b>Idled</b>—This peer has been permanently idled.</li> <li>• <b>ImportEval</b>—At the last commit operation, this peer was identified as needing to reevaluate all received routes.</li> <li>• <b>Initializing</b>—The peer session is initializing.</li> <li>• <b>SendRtn</b>—Messages are being sent to the peer.</li> <li>• <b>Sync</b>—This peer is synchronized with the rest of the peer group.</li> <li>• <b>TryConnect</b>—Another attempt is being made to connect to the peer.</li> <li>• <b>Unconfigured</b>—This peer is not configured.</li> <li>• <b>WriteFailed</b>—An attempt to write to this peer failed.</li> </ul>
<b>Last state</b>	<p>Previous state of the BGP session:</p> <ul style="list-style-type: none"> <li>• <b>Active</b>—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message.</li> <li>• <b>Connect</b>—BGP is waiting for the transport protocol connection to be completed.</li> <li>• <b>Established</b>—The BGP session has been established, and the peers are exchanging update messages.</li> <li>• <b>Idle</b>—This is the first stage of a connection. BGP is waiting for a Start event.</li> <li>• <b>OpenConfirm</b>—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message.</li> <li>• <b>OpenSent</b>—BGP has sent an open message and is waiting to receive an open message from the peer.</li> </ul>
<b>Last event</b>	<p>Last activity that occurred in the BGP session:</p> <ul style="list-style-type: none"> <li>• <b>Closed</b>—The BGP session closed.</li> <li>• <b>ConnectRetry</b>—The transport protocol connection failed, and BGP is trying again to connect.</li> <li>• <b>HoldTime</b>—The session ended because the hold timer expired.</li> <li>• <b>KeepAlive</b>—The local routing device sent a BGP keepalive message to the peer.</li> <li>• <b>Open</b>—The local routing device sent a BGP open message to the peer.</li> <li>• <b>OpenFail</b>—The local routing device did not receive an acknowledgment of a BGP open message from the peer.</li> <li>• <b>RecvKeepAlive</b>—The local routing device received a BGP keepalive message from the peer.</li> <li>• <b>RecvNotify</b>—The local routing device received a BGP notification message from the peer.</li> <li>• <b>RecvOpen</b>—The local routing device received a BGP open message from the peer.</li> <li>• <b>RecvUpdate</b>—The local routing device received a BGP update message from the peer.</li> <li>• <b>Start</b>—The peering session started.</li> <li>• <b>Stop</b>—The peering session stopped.</li> <li>• <b>TransportError</b>—A TCP error occurred.</li> </ul>

Table 274: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
Last error	<p>Last error that occurred in the BGP session:</p> <ul style="list-style-type: none"> <li>• <b>Cease</b>—An error occurred, such as a version mismatch, that caused the session to close.</li> <li>• <b>Finite State Machine Error</b>—In setting up the session, BGP received a message that it did not understand.</li> <li>• <b>Hold Time Expired</b>—The session's hold time expired.</li> <li>• <b>Message Header Error</b>—The header of a BGP message was malformed.</li> <li>• <b>Open Message Error</b>—A BGP open message contained an error.</li> <li>• <b>None</b>—No errors occurred in the BGP session.</li> <li>• <b>Update Message Error</b>—A BGP update message contained an error.</li> </ul>
Export	Name of the export policy that is configured on the peer.
Import	Name of the import policy that is configured on the peer.
Options	<p>Configured BGP options:</p> <ul style="list-style-type: none"> <li>• <b>AddressFamily</b>—Configured address family: <b>inet</b> or <b>inet-vpn</b>.</li> <li>• <b>AuthKeyChain</b>—Authentication key change is enabled.</li> <li>• <b>DropPathAttributes</b>—Certain path attributes are configured to be dropped from neighbor updates during inbound processing.</li> <li>• <b>GracefulRestart</b>—Graceful restart is configured.</li> <li>• <b>HoldTime</b>—Hold time configured with the <b>hold-time</b> statement. The hold time is three times the interval at which keepalive messages are sent.</li> <li>• <b>IgnorePathAttributes</b>—Certain path attributes are configured to be ignored in neighbor updates during inbound processing.</li> <li>• <b>Local Address</b>—Address configured with the <b>local-address</b> statement.</li> <li>• <b>Multihop</b>—Allow BGP connections to external peers that are not on a directly connected network.</li> <li>• <b>NLRI</b>—Configured MBGP state for the BGP group: <b>multicast</b>, <b>unicast</b>, or both if you have configured <b>nlri any</b>.</li> <li>• <b>Peer AS</b>—Configured peer autonomous system (AS).</li> <li>• <b>Preference</b>—Preference value configured with the <b>preference</b> statement.</li> <li>• <b>Refresh</b>—Configured to refresh automatically when the policy changes.</li> <li>• <b>Rib-group</b>—Configured routing table group.</li> </ul>
Path-attributes dropped	Path attribute codes that are dropped from neighbor updates.
Path-attributes ignored	Path attribute codes that are ignored during neighbor updates.
Authentication key change	(appears only if the <b>authentication-keychain</b> statement has been configured) Name of the authentication keychain enabled.
Authentication algorithm	(appears only if the <b>authentication-algorithm</b> statement has been configured) Type of authentication algorithm enabled: <b>hmac</b> or <b>md5</b> .
Address families configured	Names of configured address families for the VPN.

Table 274: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
Local Address	Address of the local routing device.
Remove-private options	Options associated with the <code>remove-private</code> statement.
Holdtime	Hold time configured with the <code>hold-time</code> statement. The hold time is three times the interval at which keepalive messages are sent.
Flags for NLRI inet-label-unicast	Flags related to labeled-unicast: <ul style="list-style-type: none"> <li>• <b>TrafficStatistics</b>—Collection of statistics for labeled-unicast traffic is enabled.</li> </ul>
Traffic statistics	Information about labeled-unicast traffic statistics: <ul style="list-style-type: none"> <li>• <b>Options</b>—Options configured for collecting statistics about labeled-unicast traffic.</li> <li>• <b>File</b>—Name and location of statistics log files.</li> <li>• <b>size</b>—Size of all the log files, in bytes.</li> <li>• <b>files</b>—Number of log files.</li> </ul>
Traffic Statistics Interval	Time between sample periods for labeled-unicast traffic statistics, in seconds.
Preference	Preference value configured with the <code>preference</code> statement.
Outbound Timer	Time for which the route is available in Junos OS routing table before it is exported to BGP. This field is displayed in the output only if the <code>out-delay</code> parameter is configured to a non-zero value.
Number of flaps	Number of times the BGP session has gone down and then come back up.
Peer ID	Router identifier of the peer.
Group index	Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels.
Peer index	Index that is unique within the BGP group to which the peer belongs.
Local ID	Router identifier of the local routing device.
Local Interface	Name of the interface on the local routing device.
Active holdtime	Hold time that the local routing device negotiated with the peer.
Keepalive Interval	Keepalive interval, in seconds.
BFD	Status of BFD failure detection.
Local Address	Name of directly connected interface over which direct EBGP peering is established.
NLRI for restart configured on peer	Names of address families configured for restart.

Table 274: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
NLRI advertised by peer	Address families supported by the peer: <b>unicast</b> or <b>multicast</b> .
NLRI for this session	Address families being used for this session.
Peer supports Refresh capability	Remote peer's ability to send and request full route table readvertisement (route refresh capability). For more information, see RFC 2918, <i>Route Refresh Capability for BGP-4</i> .
Restart time configured on peer	Configured time allowed for restart on the neighbor.
Stale routes from peer are kept for	When graceful restart is negotiated, the maximum time allowed to hold routes from neighbors after the BGP session has gone down.
Peer does not support Restarter functionality	Graceful restart restarter-mode is disabled on the peer.
Peer does not support Receiver functionality	Graceful restart helper-mode is disabled on the peer.
Restart time requested by this peer	Restart time requested by this neighbor during capability negotiation.
Restart flag received from the peer	When this field appears, the BGP speaker has restarted (Restarting), and this peer should not wait for the <b>end-of-rib</b> marker from the speaker before advertising routing information to the speaker.
NLRI that peer supports restart for	Neighbor supports graceful restart for this address family.
NLRI peer can save forwarding state	Neighbor supporting this address family saves all forwarding states.
NLRI that peer saved forwarding for	Neighbor saves all forwarding states for this address family.
NLRI that restart is negotiated for	Router supports graceful restart for this address family.
NLRI of received end-of-rib markers	Address families for which end-of-routing-table markers are received from the neighbor.
NLRI of all end-of-rib markers sent	Address families for which end-of-routing-table markers are sent to the neighbor.
Peer supports 4 byte AS extension (peer-as1)	Peer understands 4-byte AS numbers in BGP messages. The peer is running Junos OS Release 9.1 or later.
NLRIs for which peer can receive multiple paths	Appears in the command output of the local router if the downstream peer is configured to receive multiple BGP routes to a single destination, instead of only receiving the active route.  Possible value is <b>inet-unicast</b> .

Table 274: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
NLRIs for which peer can send multiple paths: inet-unicast	Appears in the command output of the local router if the upstream peer is configured to send multiple BGP routes to a single destination, instead of only sending the active route.  Possible value is <b>inet-unicast</b> .
Table inet.number	Information about the routing table: <ul style="list-style-type: none"> <li>• <b>RIB State</b>—BGP is in the graceful restart process for this routing table: <b>restart is complete</b> or <b>restart in progress</b>.</li> <li>• <b>Bit</b>—Number that represents the entry in the routing table for this peer.</li> <li>• <b>Send state</b>—State of the BGP group: <b>in sync</b>, <b>not in sync</b>, or <b>not advertising</b>.</li> <li>• <b>Active prefixes</b>—Number of prefixes received from the peer that are active in the routing table.</li> <li>• <b>Received prefixes</b>—Total number of prefixes from the peer, both active and inactive, that are in the routing table.</li> <li>• <b>Accepted prefixes</b>—Total number of prefixes from the peer that have been accepted by a routing policy.</li> <li>• <b>Suppressed due to damping</b>—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.</li> </ul>
Last traffic (seconds)	Last time any traffic was received from the peer or sent to the peer, and the last time the local routing device checked.
Input messages	Messages that BGP has received from the receive socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.
Output messages	Messages that BGP has written to the transmit socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.
Input dropped path attributes	Information about dropped path attributes: <ul style="list-style-type: none"> <li>• <b>Code</b>—Path attribute code.</li> <li>• <b>Count</b>—Path attribute count.</li> </ul>
Input ignored path attributes	Information about ignored path attributes: <ul style="list-style-type: none"> <li>• <b>Code</b>—Path attribute code.</li> <li>• <b>Count</b>—Path attribute count.</li> </ul>
Output queue	Number of BGP packets that are queued to be transmitted to a particular neighbor for a particular routing table. Output queue 0 is for unicast NLRIs, and queue 1 is for multicast NLRIs.  It also specifies the routing table name and the NLRI they represent in the format ( <b>routing table name, NLRI</b> ).  <b>NOTE:</b> The output queues of routing tables that are not advertised, will only show up at <b>extensive</b> output level.
Trace options	Configured tracing of BGP protocol packets and operations.

Table 274: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
Trace file	Name of the file to receive the output of the tracing operation.
Filter Updates rcv	(orf option only) Number of outbound-route filters received for each configured address family.  <b>NOTE:</b> The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.
Immediate	(orf option only) Number of route updates received with the immediate flag set. The immediate flag indicates that the BGP peer should readvertise the updated routes.  <b>NOTE:</b> The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.
Filter	(orf option only) Type of prefix filter received: <b>prefix-based</b> or <b>extended-community</b> .
Received filter entries	(orf option only) List of received filters displayed.
seq	(orf option only) Numerical order assigned to this prefix entry among all the received outbound route filter prefix entries.
prefix	(orf option only) Address for the prefix entry that matches the filter.
minlength	(orf option only) Minimum prefix length, in bits, required to match this prefix.
maxlength	(orf option only) Maximum prefix length, in bits, required to match this prefix.
match	(orf option only) For this prefix match, whether to <b>permit</b> or <b>deny</b> route updates.

## Sample Output

### show bgp neighbor

```

List of Syntax	<a href="#">Syntax on page 3898</a> <a href="#">Syntax (EX Series Switch and QFX Series) on page 3898</a>
Syntax	<pre>show bgp summary &lt;exact-instance <i>instance-name</i>&gt; &lt;group <i>group-name</i>&gt; &lt;instance <i>instance-name</i>&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt;</pre>
Syntax (EX Series Switch and QFX Series)	<pre>show bgp summary &lt;exact-instance <i>instance-name</i>&gt; &lt;instance <i>instance-name</i>&gt;</pre>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series. <b>exact-instance</b> option introduced in Junos OS Release 11.4. <b>group</b> option introduced in Junos OS Release 13.3.
Description	Display BGP summary information.
Options	<b>none</b> —Display BGP summary information for all routing instances.  <b>exact-instance <i>instance-name</i></b> —(Optional) Display information for the specified instance only.  <b>group</b> —Display overview of bgp information for a particular group  <b>instance <i>instance-name</i></b> —(Optional) Display information for all routing instances whose name begins with this string (for example, <b>cust1</b> , <b>cust11</b> , and <b>cust111</b> are all displayed when you run the <b>show bgp summary instance cust1</b> command). The instance name can be master for the main instance, or any valid configured instance name or its prefix.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
Required Privilege Level	view
List of Sample Output	<a href="#">show bgp summary (When a Peer Is Not Established) on page 3901</a> <a href="#">show bgp summary (When a Peer Is Established) on page 3901</a> <a href="#">show bgp summary (CLNS) on page 3901</a> <a href="#">show bgp summary (Layer 2 VPN) on page 3902</a> <a href="#">show bgp summary (Layer 3 VPN) on page 3902</a> <a href="#">show bgp summary group on page 3902</a>
Output Fields	<a href="#">Table 275 on page 3899</a> describes the output fields for the <b>show bgp summary</b> command. Output fields are listed in the approximate order in which they appear.

Table 275: show bgp summary Output Fields

Field Name	Field Description
<b>Groups</b>	Number of BGP groups.
<b>Peers</b>	Number of BGP peers.
<b>Down peers</b>	Number of down BGP peers.
<b>Table</b>	Name of routing table.
<b>Tot Paths</b>	Total number of paths.
<b>Act Paths</b>	Number of active routes.
<b>Suppressed</b>	Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.
<b>History</b>	Number of withdrawn routes stored locally to keep track of damping history.
<b>Damp State</b>	Number of routes with a figure of merit greater than zero, but still active because the value has not reached the threshold at which suppression occurs.
<b>Pending</b>	Routes in process by BGP import policy.
<b>Peer</b>	Address of each BGP peer. Each peer has one line of output.
<b>AS</b>	Peer's AS number.
<b>InPkt</b>	Number of packets received from the peer.
<b>OutPkt</b>	Number of packets sent to the peer.
<b>OutQ</b>	Number of BGP packets that are queued to be transmitted to a particular neighbor. It normally is 0 because the queue usually is emptied quickly.
<b>Flaps</b>	Number of times the BGP session has gone down and then come back up.
<b>Last Up/Down</b>	Last time since the neighbor transitioned to or from the established state.

Table 275: show bgp summary Output Fields (*continued*)

Field Name	Field Description
<b>State #Active /Received/Accepted /Damped</b>	<p>Multipurpose field that displays information about BGP peer sessions. The field's contents depend upon whether a session is established and whether it was established on the main routing device or in a routing instance.</p> <ul style="list-style-type: none"> <li>If a peer is not established, the field shows the state of the peer session: <b>Active</b>, <b>Connect</b>, or <b>Idle</b>. In general, the Idle state is the first stage of a connection. BGP is waiting for a Start event. A session can be idle for other reasons as well. The reason that a session is idle is sometimes displayed. For example: <b>Idle (Removal in progress)</b> or <b>Idle (LicenseFailure)</b>.</li> <li>If a BGP session is established on the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the <b>inet.0</b> (main) and <b>inet.2</b> (multicast) routing tables. For example, <b>8/10/10/2</b> and <b>2/4/4/0</b> indicate the following: <ul style="list-style-type: none"> <li>8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the <b>inet.0</b> routing table.</li> <li>2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the <b>inet.2</b> routing table.</li> </ul> </li> <li>If a BGP session is established in a routing instance, the field indicates the established (<b>Establ</b>) state, identifies the specific routing table that receives BGP updates, and shows the number of active, received, and damped routes that are received from a neighbor. For example, <b>Establ VPN-AB.inet.0: 2/4/0</b> indicates the following: <ul style="list-style-type: none"> <li>The BGP session is established.</li> <li>Routes are received in the <b>VPN-AB.inet.0</b> routing table.</li> <li>The local routing device has two active routes, four received routes, and no damped routes from a BGP peer.</li> </ul> </li> </ul> <p>When a BGP session is established, the peers are exchanging update messages.</p>

## Sample Output

## show policy damping

---

<b>List of Syntax</b>	<a href="#">Syntax on page 3904</a> <a href="#">Syntax (EX Series Switch and QFX Series) on page 3904</a>
<b>Syntax</b>	show policy damping <logical-system (all   <i>logical-system-name</i> )>
<b>Syntax (EX Series Switch and QFX Series)</b>	show policy damping
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Display information about BGP route flap damping parameters.
<b>Options</b>	<b>none</b> —Display information about BGP route flap damping parameters.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Additional Information</b>	In the output from this command, figure-of-merit values correlate with the probability of future instability of a routing device. Routes with higher figure-of-merit values are suppressed for longer periods of time. The figure-of-merit value decays exponentially over time. A figure-of-merit value of zero is assigned to each new route. The value is increased each time the route is withdrawn or readvertised, or when one of its path attributes changes.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• “Configuring BGP Flap Damping Parameters” in the <i>Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices</i></li><li>• <a href="#">clear bgp damping on page 3872</a></li><li>• <a href="#">show route damping on page 3266</a></li></ul>
<b>List of Sample Output</b>	<a href="#">show policy damping on page 3905</a>
<b>Output Fields</b>	<a href="#">Table 276 on page 3905</a> describes the output fields for the <b>show policy damping</b> command. Output fields are listed in the approximate order in which they appear.

Table 276: show policy damping Output Fields

Field Name	Field Description
<b>Halflife</b>	Decay half-life, in minutes. The value represents the period during which the accumulated figure-of-merit value is reduced by half if the route remains stable. If a route has flapped, but then becomes stable, the figure-of-merit value for the route decays exponentially. For example, for a route with a figure-of-merit value of 1500, if no incidents occur, its figure-of-merit value is reduced to 750 after 15 minutes and to 375 after another 15 minutes.
<b>Reuse merit</b>	Figure-of-merit value below which a suppressed route can be used again. A suppressed route becomes reusable when its figure-of-merit value decays to a value below a reuse threshold, and the route once again is considered usable and can be installed in the forwarding table and exported from the routing table.
<b>Suppress/cutoff merit</b>	Figure-of-merit value above which a route is suppressed for use or inclusion in advertisements. When a route's figure-of-merit value reaches a particular level, called the cutoff or suppression threshold, the route is suppressed. When a route is suppressed, the routing table no longer installs the route into the forwarding table and no longer exports this route to any of the routing protocols.
<b>Maximum suppress time</b>	Maximum hold-down time, in minutes. The value represents the maximum time that a route can be suppressed no matter how unstable it has been before this period of stability.
<b>Computed values</b>	<ul style="list-style-type: none"> <li>• <b>Merit ceiling</b>—Maximum merit that a flapping route can collect.</li> <li>• <b>Maximum decay</b>—Maximum decay half-life, in minutes.</li> </ul>

## Sample Output

### show policy damping

```

user@host> show policy damping
Default damping information:
  Halflife: 15 minutes
  Reuse merit: 750 Suppress/cutoff merit: 3000
  Maximum suppress time: 60 minutes
  Computed values:
    Merit ceiling: 12110
    Maximum decay: 6193
Damping information for "standard-damping":
  Halflife: 10 minutes
  Reuse merit: 4000 Suppress/cutoff merit: 8000
  Maximum suppress time: 30 minutes
  Computed values:
    Merit ceiling: 32120
    Maximum decay: 12453

Output Fields	<a href="#">Table 255 on page 3267</a> lists the output fields for the <b>show route damping</b> command. Output fields are listed in the approximate order in which they appear.

Table 277: show route damping Output Fields

Field Name	Field Description	Level of Output
<i>routing-table-name</i>	Name of the routing table—for example, <b>inet.0</b> .	All levels
<b>destinations</b>	Number of destinations for which there are routes in the routing table.	All levels
<b>number routes</b>	Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b></li> <li>• <b>holdddown</b> (routes that are in a pending state before being declared inactive)</li> <li>• <b>hidden</b> (the routes are not used because of a routing policy)</li> </ul>	All levels
<b>destination-prefix (entry, announced)</b>	Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.	<b>detail extensive</b>
<b>[protocol, preference]</b>	Protocol from which the route was learned and the preference value for the route. <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>	All levels
<b>Next-hop reference count</b>	Number of references made to the next hop.	<b>detail extensive</b>
<b>Source</b>	IP address of the route source.	<b>detail extensive</b>
<b>Next hop</b>	Network layer address of the directly reachable neighboring system.	<b>detail extensive</b>
<b>via</b>	Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b> .	<b>detail extensive</b>
<b>Protocol next hop</b>	Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.	<b>detail extensive</b>
<b>Indirect next hop</b>	Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.	<b>detail extensive</b>
<b>State</b>	Flags for this route. For a description of possible values for this field, see the output field table for the <a href="#">show route detail</a> command.	<b>detail extensive</b>

Table 277: show route damping Output Fields (*continued*)

Field Name	Field Description	Level of Output
Local AS	AS number of the local routing device.	detail extensive
Peer AS	AS number of the peer routing device.	detail extensive
Age	How long the route has been known.	detail extensive
Metric	Metric for the route.	detail extensive
Task	Name of the protocol that has added the route.	detail extensive
Announcement bits	List of protocols that announce this route. <i>n-Resolve inet</i> indicates that the route is used for route resolution for next hops found in the routing table. <i>n</i> is an index used by Juniper Networks customer support only.	detail extensive
AS path	<p>AS path through which the route was learned. ## IS-IS Overview

The IS-IS protocol is an interior gateway protocol (IGP) that uses link-state information to make routing decisions.

IS-IS is a link-state IGP that uses the shortest-path-first (SPF) algorithm to determine routes. IS-IS evaluates the topology changes and determines whether to perform a full SPF recalculation or a partial route calculation (PRC). This protocol originally was developed for routing International Organization for Standardization (ISO) Connectionless Network Protocol (CLNP) packets.

Like OSPF routing, IS-IS uses hello packets that allow network convergence to occur quickly when network changes are detected. IS-IS uses the SPF algorithm to determine routes. Using SPF, IS-IS evaluates network topology changes and determines if a full or partial route calculation is required.

**NOTE:** Because IS-IS uses ISO addresses, the configuration of IP version 6 (IPv6) and IP version 4 (IPv4) implementations of IS-IS is identical.

**NOTE:** See *Platforms/FPCs That Cannot Forward TCC Encapsulated ISO Traffic* to find a list of those devices and FPC configurations that cannot pass ISO traffic when encapsulated in TCC format.

This section discusses the following topics:

- [IS-IS Terminology on page 3914](#)
- [ISO Network Addresses on page 3915](#)
- [IS-IS Packets on page 3916](#)
- [Persistent Route Reachability on page 3917](#)
- [IS-IS Support for Multipoint Network Clouds on page 3917](#)
- [Installing a Default Route to the Nearest Routing Device That Operates at Both IS-IS Levels on page 3918](#)

---

### IS-IS Terminology

An IS-IS network is a single autonomous system (AS), also called a *routing domain*, that consists of *end systems* and *intermediate systems*. End systems are network entities that send and receive packets. Intermediate systems send and receive packets and relay (forward) packets. (Intermediate system is the Open System Interconnection [OSI] term for a router.) ISO packets are called network PDUs.

In IS-IS, a single AS can be divided into smaller groups called *areas*. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring *Level 1* and *Level 2* intermediate systems. Level 1 systems route within an area; when the destination is

outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs. No IS-IS area functions strictly as a backbone.

Level 1 routers share intra-area routing information, and Level 2 routers share interarea information about IP addresses available within each area. Uniquely, IS-IS routers can act as both Level 1 and Level 2 routers, sharing intra-area routes with other Level 1 routers and interarea routes with other Level 2 routers.

The propagation of link-state updates is determined by the level boundaries. All routers within a level maintain a complete link-state database of all other routers in the same level. Each router then uses the Dijkstra algorithm to determine the shortest path from the local router to other routers in the link-state database.

### ISO Network Addresses

IS-IS uses ISO network addresses. Each address identifies a point of connection to the network, such as a router interface, and is called a *network service access point (NSAP)*.

IS-IS supports multiple NSAP addresses on the loopback lo0 interface.

An end system can have multiple NSAP addresses, in which case the addresses differ only by the last byte (called the *n-selector*). Each NSAP represents a service that is available at that node. In addition to having multiple services, a single node can belong to multiple areas.

Each network entity also has a special network address called a *network entity title (NET)*. Structurally, an NET is identical to an NSAP address but has an n-selector of 00. Most end systems and intermediate systems have one NET. Intermediate systems that participate in multiple areas can have multiple NETs.

The following ISO addresses illustrate the IS-IS address format:

```
49.0001.00a0.c96b.c490.00
49.0001.2081.9716.9018.00
```

NETs take several forms, depending on your network requirements. NET addresses are hexadecimal and range from 8 octets to 20 octets in length. Generally, the format consists of an authority and format Identifier (AFI), a domain ID, an area ID, a system identifier, and a selector. The simplest format omits the domain ID and is 10 octets long. For example, the NET address 49.0001.1921.6800.1001.00 consists of the following parts:

- 49—AFI
- 0001—Area ID
- 1921.6800.1001—System identifier
- 00—Selector

The system identifier must be unique within the network. For an IP-only network, we recommend using the IP address of an interface on the router. Configuring a loopback NET address with the IP address is helpful when troubleshooting is required on the network.

The first portion of the address is the area number, which is a variable number from 1 through 13 bytes. The first byte of the area number (49) is the authority and format indicator (AFI). The next bytes are the assigned domain (area) identifier, which can be from 0 through 12 bytes. In the examples above, the area identifier is 0001.

The next six bytes form the system identifier. The system identifier can be any six bytes that are unique throughout the entire domain. The system identifier commonly is the media access control (MAC) address (as in the first example, 00a0.c96b.c490) or the IP address expressed in binary-coded decimal (BCD) (as in the second example, 2081.9716.9018, which corresponds to IP address 208.197.169.18). The last byte (00) is the n-selector.

**NOTE:** The system identifier cannot be 0000.0000.0000. All 0s is an illegal setting, and the adjacency is not formed with this setting.

To provide help with IS-IS debugging, the Junos® operating system (Junos OS) supports dynamic mapping of ISO system identifiers to the hostname. Each system can be configured with a hostname, which allows the system identifier-to-hostname mapping to be carried in a dynamic hostname type, length, and value (TLV) tuple in IS-IS link-state PDUs. This enables intermediate systems in the routing domain to learn about the ISO system identifier of a particular intermediate system.

---

### IS-IS Packets

---

Each IS-IS PDU shares a common header. IS-IS uses the following PDUs to exchange protocol information:

- IS-IS hello (IIH) PDUs—Broadcast to discover the identity of neighboring IS-IS systems and to determine whether the neighbors are Level 1 or Level 2 intermediate systems.

IS-IS hello PDUs establish adjacencies with other routers and have three different formats: one for point-to-point hello packets, one for Level 1 broadcast links, and one for Level 2 broadcast links. Level 1 routers must share the same area address to form an adjacency, while Level 2 routers do not have this limitation. The request for adjacency is encoded in the Circuit type field of the PDU.

Hello PDUs have a preset length assigned to them. The IS-IS router does not resize any PDU to match the maximum transmission unit (MTU) on a router interface. Each interface supports the maximum IS-IS PDU of 1492 bytes, and hello PDUs are padded to meet the maximum value. When the hello is sent to a neighboring router, the connecting interface supports the maximum PDU size.

- Link-state PDUs—Contain information about the state of adjacencies to neighboring IS-IS systems. Link-state PDUs are flooded periodically throughout an area.

Also included is metric and IS-IS neighbor information. Each link-state PDU must be refreshed periodically on the network and is acknowledged by information within a sequence number PDU.

On point-to-point links, each link-state PDU is acknowledged by a partial sequence number PDU (PSNP), but on broadcast links, a complete sequence number PDU

(CSNP) is sent out over the network. Any router that finds newer link-state PDU information in the CSNP then purges the out-of-date entry and updates the link-state database.

Link-state PDUs support variable-length subnet mask addressing.

- Complete sequence number PDUs (CSNPs)—Contain a complete list of all link-state PDUs in the IS-IS database. CSNPs are sent periodically on all links, and the receiving systems use the information in the CSNP to update and synchronize their link-state PDU databases. The designated router multicasts CSNPs on broadcast links in place of sending explicit acknowledgments for each link-state PDU.

Contained within the CSNP is a link-state PDU identifier, a lifetime, a sequence number, and a checksum for each entry in the database. Periodically, a CSNP is sent on both broadcast and point-to-point links to maintain a correct database. Also, the advertisement of CSNPs occurs when an adjacency is formed with another router. Like IS-IS hello PDUs, CSNPs come in two types: Level 1 and Level 2.

When a device receives a CSNP, it checks the database entries against its own local link-state database. If it detects missing information, the device requests specific link-state PDU details using a partial sequence number PDU (PSNP).

- Partial sequence number PDUs (PSNPs)—Sent multicast by a receiver when it detects that it is missing a link-state PDU (when its link-state PDU database is out of date). The receiver sends a PSNP to the system that transmitted the CSNP, effectively requesting that the missing link-state PDU be transmitted. That routing device, in turn, forwards the missing link-state PDU to the requesting routing device.

A PSNP is used by an IS-IS router to request link-state PDU information from a neighboring router. A PSNP can also explicitly acknowledge the receipt of a link-state PDU on a point-to-point link. On a broadcast link, a CSNP is used as implicit knowledge. Like hello PDUs and CSNPs, the PSNP also has two types: Level 1 and Level 2.

When a device compares a CSNP to its local database and determines that a link-state PDU is missing, the router issues a PSNP for the missing link-state PDU, which is returned in a link-state PDU from the router sending the CSNP. The received link-state PDU is then stored in the local database, and an acknowledgment is sent back to the originating router.

### Persistent Route Reachability

IPv4 and IPv6 route reachability information in IS-IS link-state PDUs is preserved when you commit a configuration. IP prefixes are preserved with their original packet fragment upon link-state PDU regeneration.

### IS-IS Support for Multipoint Network Clouds

IS-IS does not support multipoint configurations. Therefore, when configuring Frame Relay or Asynchronous Transfer Mode (ATM) networks, you must configure them as collections of point-to-point links, not as multipoint clouds.

### Installing a Default Route to the Nearest Routing Device That Operates at Both IS-IS Levels

When a routing device that operates as both a Level 1 and Level 2 router (Router B) determines that it can reach at least one area other than its own (for example, in Area Y), it sets the ATTACHED bit in its Level 1 link-state PDU. Thereafter, the Level 1 router (Router A) introduces a default route pointing to the nearest attached routing device that operates as both a Level 1 and Level 2 router (Router B). See [Figure 127 on page 3918](#).

**Figure 127: Install Default Route to Nearest Routing Device That Operates at Both Level 1 and Level 2**

### Understanding BFD Authentication for IS-IS

Bidirectional Forwarding Detection (BFD) enables rapid detection of communication failures between adjacent systems. By default, authentication for BFD sessions is disabled. However, when running BFD over Network Layer protocols, the risk of service attacks can be significant. We strongly recommend using authentication if you are running BFD over multiple hops or through insecure tunnels. Beginning with Junos OS Release 9.6, Junos OS supports authentication for BFD sessions running over IS-IS. BFD authentication is only supported in the domestic image and is not available in the export image.

You authenticate BFD sessions by specifying an authentication algorithm and keychain, and then associating that configuration information with a security authentication keychain using the keychain name.

The following sections describe the supported authentication algorithms, security keychains, and level of authentication that can be configured:

- [BFD Authentication Algorithms on page 3919](#)
- [Security Authentication Keychains on page 3919](#)
- [Strict Versus Loose Authentication on page 3920](#)

## BFD Authentication Algorithms

Junos OS supports the following algorithms for BFD authentication:

- **simple-password**—Plain-text password. One to 16 bytes of plain text are used to authenticate the BFD session. One or more passwords might be configured. This method is the least secure and should be used only when BFD sessions are not subject to packet interception.
- **keyed-md5**—Keyed Message Digest 5 hash algorithm for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed MD5 uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than or equal to the last sequence number received. Although more secure than a simple password, this method is vulnerable to replay attacks. Increasing the rate at which the sequence number is updated can reduce this risk.
- **meticulous-keyed-md5**—Meticulous keyed Message Digest 5 hash algorithm. This method works in the same manner as keyed MD5, but the sequence number is updated with every packet. Although more secure than keyed MD5 and simple passwords, this method might take additional time to authenticate the session.
- **keyed-sha-1**—Keyed Secure Hash Algorithm 1 for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed SHA uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. The key is not carried within the packets. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than the last sequence number received.
- **meticulous-keyed-sha-1**—Meticulous keyed Secure Hash Algorithm 1. This method works in the same manner as keyed SHA, but the sequence number is updated with every packet. Although more secure than keyed SHA and simple passwords, this method might take additional time to authenticate the session.

**NOTE:** Nonstop active routing (NSR) is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

## Security Authentication Keychains

The security authentication keychain defines the authentication attributes used for authentication key updates. When the security authentication keychain is configured and associated with a protocol through the keychain name, authentication key updates can occur without interrupting routing and signaling protocols.

The authentication keychain contains one or more keychains. Each keychain contains one or more keys. Each key holds the secret data and the time at which the key becomes valid. The algorithm and keychain must be configured on both ends of the BFD session,

and they must match. Any mismatch in configuration prevents the BFD session from being created.

BFD allows multiple clients per session, and each client can have its own keychain and algorithm defined. To avoid confusion, we recommend specifying only one security authentication keychain.

### Strict Versus Loose Authentication

---

By default, strict authentication is enabled and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure *loose checking*. When loose checking is configured, packets are accepted without authentication being checked at each end of the session. This feature is intended for transitional periods only.

**Related Documentation** • [Example: Configuring BFD Authentication for IS-IS on page 3953](#)

## Understanding Hitless Authentication Key Rollover for IS-IS

IS-IS protocol exchanges can be authenticated to guarantee that only trusted routing devices participate in routing. By default, authentication is disabled. The authentication algorithm creates an encoded checksum that is included in the transmitted packet. The receiving routing device uses an authentication key (password) to verify the packet's checksum.

If you configure authentication for all peers, each peer in that group inherits the group's authentication.

You can update authentication keys without resetting any IS-IS neighbor sessions. This is referred to as *hitless authentication key rollover*.

Hitless authentication key rollover uses authentication keychains, which consist of the authentication keys that are being updated. The keychain includes multiple keys. Each key in the keychain has a unique start time. At the next key's start time, a rollover occurs from the current key to the next key, and the next key becomes the current key.

You can choose the algorithm through which authentication is established. You can configure MD5 or SHA-1 authentication. You associate a keychain and the authentication algorithm with an IS-IS neighboring session. Each key contains an identifier and a secret password.

The sending peer chooses the active key based on the system time and the start times of the keys in the keychain. The receiving peer determines the key with which it authenticates based on the incoming key identifier.

You can configure either RFC 5304-based encoding or RFC 5310-based encoding for the IS-IS protocol transmission encoding format.

# Configuration

- [Configuration Guidelines on page 3921](#)
- [Configuration Examples on page 3926](#)
- [Configuration Tasks on page 3978](#)
- [Configuration Statements on page 3980](#)

### Configuration Guidelines

---

- [Example: Configuring IS-IS on page 3921](#)

### Example: Configuring IS-IS

This example shows how to configure IS-IS.

- [Requirements on page 3921](#)
- [Overview on page 3921](#)
- [Configuration on page 3922](#)
- [Verification on page 3924](#)

#### Requirements

---

No special configuration beyond device initialization is required before configuring this example.

#### Overview

---

In this example, you configure the two IS-IS routing devices in a single area. The devices have NET addresses 49.0002.0192.0168.0001.00 and 49.0002.0192.0168.0002.00 on the lo0 interfaces. Additionally, you configure the ISO family on the IS-IS interfaces.

For Junos OS security devices only, you configure the **mode packet-based** statement at the **[edit security forwarding-options family iso]** hierarchy level.

[Figure 128 on page 3922](#) shows the topology used in this example.

Figure 128: Simple IS-IS Topology

“CLI Quick Configuration” on page 3922 shows the configuration for both of the devices in Figure 128 on page 3922. The section “Step-by-Step Procedure” on page 3922 describes the steps on Device R1.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```
set security forwarding-options family iso mode packet-based
set interfaces ge-1/2/0 unit 0 description to-R2
set interfaces ge-1/2/0 unit 0 family inet address 10.0.0.1/30
set interfaces ge-1/2/0 unit 0 family iso
set interfaces lo0 unit 0 family inet address 192.168.0.1/32
set interfaces lo0 unit 0 family iso address 49.0002.0192.0168.0001.00
set protocols isis interface ge-1/2/0.0
set protocols isis interface lo0.0
```

**Device R2**

```
set security forwarding-options family iso mode packet-based
set interfaces ge-1/2/0 unit 0 description to-R1
set interfaces ge-1/2/0 unit 0 family inet address 10.0.0.2/30
set interfaces ge-1/2/0 unit 0 family iso
set interfaces lo0 unit 0 family inet address 192.168.0.2/32
set interfaces lo0 unit 0 family iso address 49.0002.0192.0168.0002.00
set protocols isis interface ge-1/2/0.0
set protocols isis interface lo0.0
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IS-IS:

1. Enable IS-IS if your router is in secure context.
 

```
[edit security forwarding-options family iso]
user@R1# set mode packet-based
```
2. Create the interface that connects to Device R2, and configure the ISO family on the interface.
 

```
[edit interfaces ge-1/2/0 unit 0]
user@R1# set description to-R2
user@R1# set family inet address 10.0.0.1/30
user@R1# set family iso
```

3. Create the loopback interface, set the IP address, and set the NET address.

```
[edit interfaces lo0 unit 0]
user@R1# set family inet address 192.168.0.1/32
user@R1# set family iso address 49.0002.0192.0168.0001.00
```

4. Enable IS-IS on the interfaces.

```
[edit protocols isis]
user@R1# set interface ge-1/2/0.0
user@R1# set interface lo0.0
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show security** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show security
forwarding-options {
  family iso {
    mode packet-based;
  }
}

user@R1# show interfaces
ge-1/2/0 {
  unit 0 {
    description to-R2;
    family inet {
      address 10.0.0.1/30;
    }
    family iso;
  }
}
lo0 {
  unit 0 {
    family inet {
      address 192.168.0.1/32;
    }
    family iso {
      address 49.0002.0192.0168.0001.00;
    }
  }
}

user@R1# show protocols
isis {
  interface ge-1/2/0.0;
  interface lo0.0;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying IS-IS Interface Configuration on page 3924](#)
- [Verifying IS-IS Interface Configuration in Detail on page 3924](#)
- [Verifying IS-IS Adjacencies on page 3925](#)
- [Verifying IS-IS Adjacencies in Detail on page 3925](#)

### Verifying IS-IS Interface Configuration

**Purpose** Verify the status of the IS-IS-enabled interfaces.

**Action** From operational mode, enter the **show isis interface brief** command.

```
user@R1> show isis interface brief
IS-IS interface database:
Interface          L CirID Level 1 DR          Level 2 DR          L1/L2 Metric
lo0.0              3  0x1 Passive                Passive              0/0
ge-1/2/0.0         3  0x1 R2.02                  R2.02                10/10
```

**Meaning** Verify that the output shows the intended configuration of the interfaces on which IS-IS is enabled.

### Verifying IS-IS Interface Configuration in Detail

**Purpose** Verify the details of IS-IS-enabled interfaces.

**Action** From operational mode, enter the **show isis interface detail** command.

```
user@R1> show isis interface detail
IS-IS interface database:
lo0.0
  Index: 75, State: 0x6, Circuit id: 0x1, Circuit type: 0
  LSP interval: 100 ms, CSNP interval: disabled
  Adjacency advertisement: Advertise
  Level Adjacencies Priority Metric Hello (s) Hold (s) Designated Router
    1          0          64          0 Passive
    2          0          64          0 Passive
ge-1/2/0.0
  Index: 77, State: 0x6, Circuit id: 0x1, Circuit type: 3
  LSP interval: 100 ms, CSNP interval: 10 s
  Adjacency advertisement: Advertise
  Level Adjacencies Priority Metric Hello (s) Hold (s) Designated Router
    1          1          64         10    9.000        27 R2.02 (not us)
    2          1          64         10    9.000        27 R2.02 (not us)
```

**Meaning** Check the following output fields and verify that the output shows the intended configuration of IS-IS-enabled interfaces:

- Interface—Interface configured for IS-IS.
- State—Internal implementation information.
- Circuit id—Circuit identifier.

- Circuit type—Configured level of IS-IS:
  - 1—Level 1 only
  - 2—Level 2 only
  - 3—Level 1 and Level 2
- link-state PDU interval—Time between IS-IS information messages.
- L or Level—Type of adjacency:
  - 1—Level 1 only
  - 2—Level 2 only
  - 3—Level 1 and Level 2
- Adjacencies—Adjacencies established on the interface.
- Priority—Priority value established on the interface.
- Metric—Metric value for the interface.
- Hello(s)—Intervals between hello PDUs.
- Hold(s)—Hold time on the interface.

### *Verifying IS-IS Adjacencies*

**Purpose** Display brief information about IS-IS neighbors.

**Action** From operational mode, enter the **show isis adjacency brief** command.

```
user@R1> show isis adjacency brief
Interface      System      L State      Hold (secs) SNPA
ge-1/2/0.0     R2          1 Up          6  0:5:85:8f:c8:bd
ge-1/2/0.0     R2          2 Up          6  0:5:85:8f:c8:bd
```

**Meaning** Verify the adjacent routers in the IS-IS database.

### *Verifying IS-IS Adjacencies in Detail*

**Purpose** Display extensive information about IS-IS neighbors.

**Action** From operational mode, enter the **show isis adjacency extensive** command.

```
user@R1> show isis adjacency extensive
R2
Interface: ge-1/2/0.0, Level: 1, State: Up, Expires in 6 secs
Priority: 64, Up/Down transitions: 1, Last transition: 00:40:28 ago
Circuit type: 3, Speaks: IP, IPv6, MAC address: 0:5:85:8f:c8:bd
Topologies: Unicast
Restart capable: Yes, Adjacency advertisement: Advertise
LAN id: R2.02, IP addresses: 10.0.0.2
Transition log:
When              State      Event          Down reason
Thu May 31 11:18:48 Up          Seenself
```

R2

```
Interface: ge-1/2/0.0, Level: 2, State: Up, Expires in 8 secs
Priority: 64, Up/Down transitions: 1, Last transition: 00:40:28 ago
Circuit type: 3, Speaks: IP, IPv6, MAC address: 0:5:85:8f:c8:bd
Topologies: Unicast
Restart capable: Yes, Adjacency advertisement: Advertise
LAN id: R2.02, IP addresses: 10.0.0.2
Transition log:
When                State      Event      Down reason
Thu May 31 11:18:48  Up        SeenseIf
```

**Meaning** Check the following fields and verify the adjacency information about IS-IS neighbors:

- Interface—Interface through which the neighbor is reachable.
- L or Level—Configured level of IS-IS:
  - 1—Level 1 only
  - 2—Level 2 only
  - 3—Level 1 and Level 2

An exclamation point before the level number indicates that the adjacency is missing an IP address.

- State—Status of the adjacency: **Up**, **Down**, **New**, **One-way**, **Initializing**, or **Rejected**.
- Event—Message that identifies the cause of a state.
- Down reason—Reason the adjacency is down.
- Restart capable—A neighbor is configured for graceful restart.
- Transition log—List of transitions including **When**, **State**, and **Reason**.

## Example: Configuring Multi-Level IS-IS

This example shows how to configure a multi-level IS-IS topology.

- [Requirements on page 3927](#)
- [Overview on page 3927](#)
- [Configuration on page 3928](#)
- [Verification on page 3932](#)

### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

Like OSPF, the IS-IS protocol supports the partitioning of a routing domain into multiple areas with levels that control interarea flooding. The use of multiple levels improves protocol scalability, as Level 2 (backbone) link-state PDUs are normally not flooded into a Level 1 area.

An IS-IS Level 2 area is analogous to the OSPF backbone area (0), while a Level 1 area operates much like an OSPF totally stubby area, in that a default route is normally used to reach both inter-level and AS external routes.

Unlike OSPF, IS-IS area boundaries occur between routers, such that a given routing device is always wholly contained within a particular area. Level 1 adjacencies can be formed between routers that share a common area number, while a Level 2 adjacency can be formed between routers that might or might not share an area number.

[Figure 129 on page 3927](#) shows the topology used in this example.

**Figure 129: IS-IS Multi-Level Topology**

[“CLI Quick Configuration” on page 3928](#) shows the configuration for all of the devices in [Figure 129 on page 3927](#). The section [“Step-by-Step Procedure” on page 3929](#) describes the steps on Device R5.

This example has the following characteristics:

- Device R5 functions as a Level 1/Level 2 router to interconnect the Level 2 backbone area 49.001 and the Level 1 area 49.002 containing Device R6 and Device R7.
- The system ID is based on the devices' IPv4 lo0 addresses.
- Loss of any individual interface does not totally disrupt the IS-IS operation.
- The IPv4 lo0 addresses of all routers are reachable through IS-IS.
- The link between Device R3 and Device S1 appears in area 49.001 as an intra-area route. No IS-IS adjacencies can be established on this interface. This is accomplished by configuring the [passive](#) statement on Device R3's interface to Device S1.
- The loopback addresses of Level 2 devices do not appear in a Level 1 area.
- There is only one adjacency for each device pairing.

### Configuration

---

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R3**

```
set interfaces fe-1/2/0 unit 0 description to-R4
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.17/30
set interfaces fe-1/2/0 unit 0 family iso
set interfaces fe-1/2/1 unit 0 description to-R5
set interfaces fe-1/2/1 unit 0 family inet address 10.0.0.21/30
set interfaces fe-1/2/1 unit 0 family iso
set interfaces fe-1/2/2 unit 0 family inet address 10.0.0.41/30
set interfaces fe-1/2/2 unit 0 description to-S1
set interfaces lo0 unit 0 family inet address 192.168.0.3/32
set interfaces lo0 unit 0 family iso address 49.001.0192.0168.0003.00
set protocols isis interface fe-1/2/0.0 level 1 disable
set protocols isis interface fe-1/2/1.0 level 1 disable
set protocols isis interface lo0.0 level 1 disable
set protocols isis interface fe-1/2/2.0 passive
```

**Device R4**

```
set interfaces fe-1/2/0 unit 0 description to-R3
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.18/30
set interfaces fe-1/2/0 unit 0 family iso
set interfaces fe-1/2/1 unit 0 description to-R5
set interfaces fe-1/2/1 unit 0 family inet address 10.0.0.25/30
set interfaces fe-1/2/1 unit 0 family iso
set interfaces lo0 unit 0 family inet address 192.168.0.4/32
set interfaces lo0 unit 0 family iso address 49.001.0192.0168.0004.00
set protocols isis interface fe-1/2/0.0 level 1 disable
set protocols isis interface fe-1/2/1.0 level 1 disable
set protocols isis interface lo0.0 level 1 disable
```

Device R5	<pre> set interfaces fe-1/2/0 unit 0 description to-R3 set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.22/30 set interfaces fe-1/2/0 unit 0 family iso set interfaces fe-1/2/1 unit 0 description to-R4 set interfaces fe-1/2/1 unit 0 family inet address 10.0.0.26/30 set interfaces fe-1/2/1 unit 0 family iso set interfaces fe-1/2/2 unit 0 description to-R6 set interfaces fe-1/2/2 unit 0 family inet address 10.0.0.29/30 set interfaces fe-1/2/2 unit 0 family iso set interfaces fe-1/2/3 unit 0 description to-R7 set interfaces fe-1/2/3 unit 0 family inet address 10.0.0.38/30 set interfaces fe-1/2/3 unit 0 family iso set interfaces lo0 unit 0 family inet address 192.168.0.5/32 set interfaces lo0 unit 0 family iso address 49.002.0192.0168.0005.00 set protocols isis interface fe-1/2/0.0 level 1 disable set protocols isis interface fe-1/2/1.0 level 1 disable set protocols isis interface fe-1/2/2.0 level 2 disable set protocols isis interface fe-1/2/3.0 level 2 disable set protocols isis interface lo0.0 level 1 disable </pre>
Device R6	<pre> set interfaces fe-1/2/0 unit 0 description to-R5 set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.30/30 set interfaces fe-1/2/0 unit 0 family iso set interfaces fe-1/2/1 unit 0 description to-R7 set interfaces fe-1/2/1 unit 0 family inet address 10.0.0.33/30 set interfaces fe-1/2/1 unit 0 family iso set interfaces lo0 unit 0 family inet address 192.168.0.6/32 set interfaces lo0 unit 0 family iso address 49.002.0192.0168.0006.00 set protocols isis interface fe-1/2/0.0 level 2 disable set protocols isis interface fe-1/2/1.0 level 2 disable set protocols isis interface lo0.0 level 2 disable </pre>
Device R7	<pre> set interfaces fe-1/2/0 unit 0 description to-R6 set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.34/30 set interfaces fe-1/2/0 unit 0 family iso set interfaces fe-1/2/1 unit 0 description to-R5 set interfaces fe-1/2/1 unit 0 family inet address 10.0.0.37/30 set interfaces fe-1/2/1 unit 0 family iso set interfaces lo0 unit 0 family inet address 192.168.0.7/32 set interfaces lo0 unit 0 family iso address 49.002.0192.0168.0007.00 set protocols isis interface fe-1/2/0.0 level 2 disable set protocols isis interface fe-1/2/1.0 level 2 disable set protocols isis interface lo0.0 level 2 disable </pre>
Device S1	<pre> set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.42/30 set interfaces fe-1/2/0 unit 0 description to-R3 </pre>
<b>Step-by-Step Procedure</b>	<p>The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see <i>Using the CLI Editor in Configuration Mode</i> in the <i>CLI User Guide</i>.</p> <p>To configure multi-level IS-IS:</p> <ol style="list-style-type: none"> <li>1. Configure the network interfaces.</li> </ol>

Enable IS-IS on the interfaces by including the ISO address family on each interface.

```
[edit interfaces]
user@R5# set fe-1/2/0 unit 0 description to-R3
user@R5# set fe-1/2/0 unit 0 family inet address 10.0.0.22/30
user@R5# set fe-1/2/0 unit 0 family iso
user@R5# set fe-1/2/1 unit 0 description to-R4
user@R5# set fe-1/2/1 unit 0 family inet address 10.0.0.26/30
user@R5# set fe-1/2/1 unit 0 family iso
user@R5# set fe-1/2/2 unit 0 description to-R6
user@R5# set fe-1/2/2 unit 0 family inet address 10.0.0.29/30
user@R5# set fe-1/2/2 unit 0 family iso
user@R5# set fe-1/2/3 unit 0 description to-R7
user@R5# set fe-1/2/3 unit 0 family inet address 10.0.0.38/30
user@R5# set fe-1/2/3 unit 0 family iso
```

2. Configure two loopback interface addresses.

One address is for IPv4.

The other is for the IS-IS area 49.002 so that Device R5 can form adjacencies with the other Level 1 devices in area 49.002. Even though Device R5's NET identifies itself as belonging to the Level 1 area 49.002, its loopback interface is not configured as a Level 1 interface. Doing so would cause the route to Device R5's loopback to be injected into the Level 1 area.

```
[edit interfaces lo0 unit 0]
user@R5# set family inet address 192.168.0.5/32
user@R5# set family iso address 49.002.0192.0168.0005.00
```

3. Specify the IS-IS level on a per-interface basis.

Device R5 becomes adjacent to the other routing devices on the same level on each link.

By default, IS-IS is enabled for IS-IS areas on all interfaces on which the ISO protocol family is enabled (at the **[edit interfaces *interface-name* unit *logical-unit-number*]** hierarchy level). To disable IS-IS at any particular level on an interface, include the **disable** statement.

Device R5's loopback interface is configured to run Level 2 only. If Level 1 operation were enabled on lo0.0, Device R5 would include its loopback address in its Level 1 link-state PDU, which is incorrect for this example in which the loopback addresses of Level 2 devices must not appear in a Level 1 area.

Unlike OSPF, you must explicitly list the router's lo0 interface at the **[edit protocols isis]** hierarchy level, because this interface is the source of the router's NET, and therefore must be configured as an IS-IS interface. In IS-IS, the lo0 interface operates in the passive mode by default, which is ideal because adjacency formation can never occur on a virtual interface.

```
[edit protocols isis]
user@R5# set interface fe-1/2/0.0 level 1 disable
user@R5# set interface fe-1/2/1.0 level 1 disable
user@R5# set interface fe-1/2/0.0 level 2 disable
user@R5# set interface fe-1/2/3.0 level 2 disable
user@R5# set interface lo0.0 level 1 disable
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces** and **show protocols** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R5# show interfaces
fe-1/2/0 {
  unit 0 {
    description to-R3;
    family inet {
      address 10.0.0.22/30;
    }
    family iso;
  }
}
fe-1/2/1 {
  unit 0 {
    description to-R4;
    family inet {
      address 10.0.0.26/30;
    }
    family iso;
  }
}
fe-1/2/2 {
  unit 0 {
    description to-R6;
    family inet {
      address 10.0.0.29/30;
    }
    family iso;
  }
}
fe-1/2/3 {
  unit 0 {
    description to-R7;
    family inet {
      address 10.0.0.38/30;
    }
    family iso;
  }
}
lo0 {
  unit 0 {
    family inet {
      address 192.168.0.5/32;
    }
    family iso {
      address 49.002.0192.0168.0005.00;
    }
  }
}
user@R5# show protocols
isis {
  interface fe-1/2/0.0 {
    level 1 disable;
  }
}

```

```
}
interface fe-1/2/1.0 {
  level 1 disable;
}
interface fe-1/2/0.0 {
  level 2 disable;
}
interface fe-1/2/3.0 {
  level 2 disable;
}
interface lo0.0 {
  level 1 disable;
}
}
```

If you are done configuring the device, enter **commit** from configuration mode.

---

### Verification

Confirm that the configuration is working properly.

- [Checking Interface-to-Area Associations on page 3932](#)
- [Verifying IS-IS Adjacencies on page 3932](#)
- [Examining the IS-IS Database on page 3933](#)

#### *Checking Interface-to-Area Associations*

**Purpose** Make sure that the interface-to-area associations are configured as expected.

**Action** From operational mode, enter the **show isis interface** command.

```
user@R5> show isis interface
IS-IS interface database:
Interface          L CirID Level 1 DR      Level 2 DR      L1/L2 Metric
lo0.0              3  0x1 Disabled           Passive         0/0
fe-1/2/0.0         2  0x3 Disabled          R5.03           10/10
fe-1/2/1.0         2  0x2 Disabled          R5.02           10/10
fe-1/2/0.0         1  0x1 R6.02             Disabled        10/10
fe-1/2/3.0         1  0x4 R5.04             Disabled        10/10
```

**Meaning** The output shows that Device R5's interfaces have been correctly configured with the ISO family, and that the interfaces have been placed into the correct levels.

You can also see that Device R5 has elected itself as the designated intermediate system (DIS) on its broadcast-capable IS-IS interfaces.

#### *Verifying IS-IS Adjacencies*

**Purpose** Verify that the expected adjacencies have formed between Device R5 and its IS-IS neighbors.

**Action** From operational mode, enter the **show isis adjacency detail** command.

```
user@R5> show isis adjacency detail
```

```

R3
Interface: fe-1/2/0.0, Level: 2, State: Up, Expires in 25 secs
Priority: 64, Up/Down transitions: 1, Last transition: 03:19:31 ago
Circuit type: 2, Speaks: IP, IPv6, MAC address: 0:5:85:8f:c8:bc
Topologies: Unicast
Restart capable: Yes, Adjacency advertisement: Advertise
LAN id: R5.03, IP addresses: 10.0.0.21

R4
Interface: fe-1/2/1.0, Level: 2, State: Up, Expires in 24 secs
Priority: 64, Up/Down transitions: 1, Last transition: 03:19:36 ago
Circuit type: 2, Speaks: IP, IPv6, MAC address: 0:5:85:8f:c8:bc
Topologies: Unicast
Restart capable: Yes, Adjacency advertisement: Advertise
LAN id: R5.02, IP addresses: 10.0.0.25

R6
Interface: fe-1/2/0.0, Level: 1, State: Up, Expires in 6 secs
Priority: 64, Up/Down transitions: 1, Last transition: 03:20:24 ago
Circuit type: 1, Speaks: IP, IPv6, MAC address: 0:5:85:8f:c8:bd
Topologies: Unicast
Restart capable: Yes, Adjacency advertisement: Advertise
LAN id: R6.02, IP addresses: 10.0.0.30

R7
Interface: fe-1/2/3.0, Level: 1, State: Up, Expires in 21 secs
Priority: 64, Up/Down transitions: 1, Last transition: 03:19:29 ago
Circuit type: 1, Speaks: IP, IPv6, MAC address: 0:5:85:8f:c8:bc
Topologies: Unicast
Restart capable: Yes, Adjacency advertisement: Advertise
LAN id: R5.04, IP addresses: 10.0.0.37

```

**Meaning** These results confirm that Device R5 has two Level 2 adjacencies and two Level 1 adjacencies.

### *Examining the IS-IS Database*

**Purpose** Because Device R5 is a L1/L2 attached router, examine the Level 1 link-state database associated with area 49.002 to confirm that loopback addresses from backbone routers are not being advertised into the Level 1 area.

**Action** From operational mode, enter the **show isis database detail** command.

```

user@R5> show isis database detail
IS-IS level 1 link-state database:

R5.00-00 Sequence: 0x19, Checksum: 0x7488, Lifetime: 727 secs

```

**Meaning** This display indicates that Device R5's loopback interface is correctly configured to run Level 2 only. Had Level 1 operation been enabled on lo0.0, Device R5 would have then included its loopback address in its Level 1 link-state PDU.

You can also see that Device R5 has Level 2 link-state PDUs, received from its adjacent neighbors.

Like an OSPF totally stubby area, no backbone (Level 2) or external prefixes are leaked into a Level 1 area, by default. Level 1 prefixes are leaked up into the IS-IS backbone, however, as can be seen in Device R5's Level 2 link-state PDU.

## Example: Configuring Hitless Authentication Key Rollover for IS-IS

This example shows how to configure hitless authentication key rollover for IS-IS.

- [Requirements on page 3935](#)
- [Overview on page 3935](#)
- [Configuration on page 3936](#)
- [Verification on page 3939](#)

### Requirements

No special configuration beyond device initialization is required before configuring hitless authentication key rollover for IS-IS.

### Overview

Authentication guarantees that only trusted routers participate in routing updates. This keychain authentication method is referred to as hitless because the keys roll over from one to the next without resetting any peering sessions or interrupting the routing protocol. Junos OS supports both RFC 5304, *IS-IS Cryptographic Authentication* and RFC 5310, *IS-IS Generic Cryptographic Authentication*.

This example includes the following statements for configuring the keychain:

- **algorithm**—For each key in the keychain, you can specify an encryption algorithm. The algorithm can be SHA-1 or MD-5.
- **key**—A keychain can have multiple keys. Each key within a keychain must be identified by a unique integer value. The range of valid identifier values is from 0 through 63.
- **key-chain**—For each keychain, you must specify a name. This example defines two keychains: **base-key-global** and **base-key-inter**.
- **options**—For each key in the keychain, you can specify the encoding for the message authentication code: **isis-enhanced** or **basic**. The basic (RFC 5304) operation is enabled by default.

When you configure the **isis-enhanced** option, Junos OS sends RFC 5310-encoded routing protocol packets and accepts both RFC 5304-encoded and RFC 5310-encoded routing protocol packets that are received from other devices.

When you configure **basic** (or do not include the **options** statement in the key configuration), Junos OS sends and receives RFC 5304-encoded routing protocols packets, and drops 5310-encoded routing protocol packets that are received from other devices.

Because this setting is for IS-IS only, the TCP and the BFD protocols ignore the encoding option configured in the key.

- **secret**—For each key in the keychain, you must set a secret password. This password can be entered in either encrypted or plain text format in the **secret** statement. It is always displayed in encrypted format.
- **start-time**—Each key must specify a start time in UTC format. Control gets passed from one key to the next. When a configured start time arrives (based on the routing device's clock), the key with that start time becomes active. Start times are specified in the local time zone for a routing device and must be unique within the key chain.

You can apply a keychain globally to all interfaces or more granularly to specific interfaces.

This example includes the following statements for applying the keychain to all interfaces or to particular interfaces:

- **authentication-key-chain**—Enables you to apply a keychain at the global IS-IS level for all Level 1 or all Level 2 interfaces.
- **hello-authentication-key-chain**—Enables you to apply a keychain at the individual IS-IS interface level. The interface configuration overrides the global configuration.

Figure 130 on page 3936 shows the topology used in the example.

**Figure 130: Hitless Authentication Key Rollover for IS-IS**

This example shows the configuration for Router R0.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

set interfaces ge-0/0/0 unit 0 description "interface A"
set interfaces ge-0/0/0 unit 0 family inet address 10.0.0.1/30
set interfaces ge-0/0/0 unit 0 family iso
set interfaces ge-0/0/0 unit 0 family inet6 address fe80::200:f8ff:fe21:67cf/128
set interfaces ge-0/0/1 unit 0 description "interface B"
set interfaces ge-0/0/1 unit 0 family inet address 10.0.0.5/30
set interfaces ge-0/0/1 unit 0 family iso
set interfaces ge-0/0/1 unit 0 family inet6 address 10FB::C:ABC:1FOC:44DA/128
set interfaces ge-0/0/2 unit 0 description "interface C"
set interfaces ge-0/0/2 unit 0 family inet address 10.0.0.9/30
set interfaces ge-0/0/2 unit 0 family iso
set interfaces ge-0/0/2 unit 0 family inet6 address ff06::c3/128
set security authentication-key-chains key-chain base-key-global key 63 secret
"$9$jfkgfTQnCpBDiCt"
set security authentication-key-chains key-chain base-key-global key 63 start-time
"2011-8-6.06:54:00-0700"
set security authentication-key-chains key-chain base-key-global key 63 algorithm
hmac-sha-1
set security authentication-key-chains key-chain base-key-global key 63 options
isis-enhanced
set security authentication-key-chains key-chain base-key-inter key 0 secret
"$9$8sgx7Vws4ZDkWLGD"
set security authentication-key-chains key-chain base-key-inter key 0 start-time
"2011-8-6.06:54:00-0700"
set security authentication-key-chains key-chain base-key-inter key 0 algorithm md5
set security authentication-key-chains key-chain base-key-inter key 0 options basic
set protocols isis level 1 authentication-key-chain base-key-global
set protocols isis interface ge-0/0/0.0 level 1 hello-authentication-key-chain
base-key-inter

```

#### Step-by-Step Procedure

To configure hitless authentication key rollover for IS-IS:

1. Configure the Router R0 interfaces.

```

[edit interfaces ge-0/0/0 unit 0]
user@R0# set description "interface A"
user@R0# set family inet address 10.0.0.1/30
user@R0# set family iso
user@R0# set family inet6 address fe80::200:f8ff:fe21:67cf/128
[edit interfaces ge-0/0/1 unit 0]
user@R0# set interfaces ge-0/0/1 unit 0 description "interface B"
user@R0# set interfaces ge-0/0/1 unit 0 family inet address 10.0.0.5/30
user@R0# set interfaces ge-0/0/1 unit 0 family iso
user@R0# set interfaces ge-0/0/1 unit 0 family inet6 address
10FB::C:ABC:1FOC:44DA/128
[edit interfaces ge-0/0/2 unit 0]
user@R0# set description "interface C"
user@R0# set family inet address 10.0.0.9/30
user@R0# set interfaces ge-0/0/2 unit 0 family iso
user@R0# set interfaces ge-0/0/2 unit 0 family inet6 address ff06::c3/128

```

2. Configure one or more authentication keys.

```

[edit security authentication-key-chains key-chain base-key-global]
user@R0# set key 63 secret "$9$jfkgfTQnCpBDiCt"
user@R0# set key 63 start-time "2011-8-6.06:54:00-0700"

```

```
user@R0# set key 63 algorithm hmac-sha-1
user@R0# set key 63 options isis-enhanced
[edit security authentication-key-chains key-chain base-key-inter]
user@R0# set key 0 secret "$9$8sgx7Vws4ZDkWLGD"
user@R0# set key 0 start-time "2011-8-6.06:54:00-0700"
user@R0# set key 0 algorithm md5
user@R0# set key 0 options basic
```

3. Apply the base-key-global keychain to all Level 1 IS-IS interfaces on Router R0.

```
[edit protocols isis level 1]
user@R0# set authentication-key-chain base-key-global
```

4. Apply the base-key-inter keychain to the ge-0/0/0.0 interface on Router R0.

```
[edit protocols isis interface ge-0/0/0.0 level 1]
user@R0# set hello-authentication-key-chain base-key-inter
```

5. If you are done configuring the device, commit the configuration.

```
user@R0# commit
```

### Results

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show security** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R0# show interfaces
ge-0/0/0 {
  unit 0 {
    description "interface A";
    family inet {
      address 10.0.0.1/30;
    }
    family iso;
    family inet6 {
      address fe80::200:f8ff:fe21:67cf/128;
    }
  }
}
ge-0/0/1 {
  unit 0 {
    description "interface B";
    family inet {
      address 10.0.0.5/30;
    }
    family iso;
    family inet6 {
      address 10fb::c:abc:1f0c:44da/128;
    }
  }
}
ge-0/0/2 {
  unit 0 {
    description "interface C";
    family inet {
```

```

        address 10.0.0.9/30;
    }
    family iso;
    family inet6 {
        address ff06::c3/128;
    }
}

user@R0# show protocols
isis {
    level 1 authentication-key-chain base-key-global;
    interface ge-0/0/0.0 {
        level 1 hello-authentication-key-chain base-key-inter;
    }
}

user@R0# show security
authentication-key-chains {
    key-chain base-key-global {
        key 63 {
            secret "$9$jfkqfTQnCpBDiCt"; ## SECRET-DATA
            start-time "2011-8-6.06:54:00-0700";
            algorithm hmac-sha-1;
            options isis-enhanced;
        }
    }
    key-chain base-key-inter {
        key 0 {
            secret "$9$8sgx7Vws4ZDkWLGD"; ## SECRET-DATA
            start-time "2011-8-6.06:54:00-0700";
            algorithm md5;
            options basic;
        }
    }
}

```

### Verification

To verify the configuration, run the following commands:

- [show isis authentication](#)
- [show security keychain](#)

### Related Documentation

- [Understanding Hitless Authentication Key Rollover for IS-IS on page 3920](#)

### Example: Redistributing OSPF Routes into IS-IS

This example shows how to redistribute OSPF routes into an IS-IS network.

- [Requirements on page 3940](#)
- [Overview on page 3940](#)

- [Configuration on page 3941](#)
- [Verification on page 3946](#)

## Requirements

No special configuration beyond device initialization is required before configuring this example.

## Overview

Export policy can be applied to IS-IS to facilitate route redistribution.

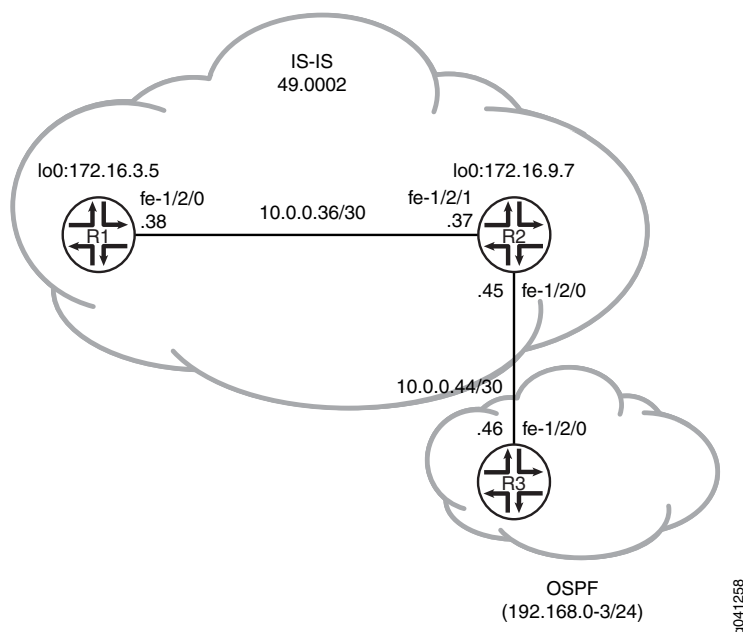

Junos OS does not support the application of import policy for link-state routing protocols like IS-IS because such policies can lead to inconsistent link-state database (LSDB) entries, which in turn can result in routing inconsistencies.

In this example, OSPF routes 192.168.0/24 through 192.168.3/24 are redistributed into IS-IS area 49.0002 from Device R2.

In addition, policies are configured to ensure that Device R1 can reach destinations on the 10.0.0.44/30 network, and that Device R3 can reach destinations on the 10.0.0.36/30 network. This enables end-to-end reachability.

[Figure 131 on page 3940](#) shows the topology used in this example.

**Figure 131: IS-IS Route Redistribution Topology**

“CLI Quick Configuration” on [page 3941](#) shows the configuration for all of the devices in [Figure 131 on page 3940](#). The section “[Step-by-Step Procedure](#)” on [page 3942](#) describes the steps on Device R2. “[Step-by-Step Procedure](#)” on [page 3943](#) describes the steps on Device R3.

## Configuration

<b>CLI Quick Configuration</b>	To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the <b>[edit]</b> hierarchy level.
<b>Device R1</b>	<pre> set interfaces fe-1/2/0 unit 0 description to-R7 set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.38/30 set interfaces fe-1/2/0 unit 0 family iso set interfaces lo0 unit 0 family inet address 172.16.3.5/32 set interfaces lo0 unit 0 family iso address 49.0002.0172.0016.0305.00 set protocols isis interface fe-1/2/0.0 set protocols isis interface lo0.0 </pre>
<b>Device R2</b>	<pre> set interfaces fe-1/2/1 unit 0 description to-R5 set interfaces fe-1/2/1 unit 0 family inet address 10.0.0.37/30 set interfaces fe-1/2/1 unit 0 family iso set interfaces fe-1/2/0 unit 0 description to-OSPF-network set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.45/30 set interfaces lo0 unit 0 family inet address 172.16.9.7/32 set interfaces lo0 unit 0 family iso address 49.0002.0172.0016.0907.00 set protocols isis export ospf-isis set protocols isis export send-direct-to-isis-neighbors set protocols isis interface fe-1/2/1.0 set protocols isis interface lo0.0 set protocols ospf export send-direct-to-ospf-neighbors set protocols ospf area 0.0.0.1 interface fe-1/2/0.0 set protocols ospf area 0.0.0.1 interface lo0.0 passive set policy-options policy-statement ospf-isis term 1 from protocol ospf set policy-options policy-statement ospf-isis term 1 from route-filter 192.168.0.0/22   longer set policy-options policy-statement ospf-isis term 1 then accept set policy-options policy-statement send-direct-to-isis-neighbors from protocol direct set policy-options policy-statement send-direct-to-isis-neighbors from route-filter   10.0.0.44/30 exact set policy-options policy-statement send-direct-to-isis-neighbors then accept set policy-options policy-statement send-direct-to-ospf-neighbors from protocol direct set policy-options policy-statement send-direct-to-ospf-neighbors from route-filter   10.0.0.36/30 exact set policy-options policy-statement send-direct-to-ospf-neighbors then accept </pre>
<b>Device R3</b>	<pre> set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.46/30 set interfaces lo0 unit 0 family inet address 192.168.1.1/32 set interfaces lo0 unit 0 family inet address 192.168.2.1/32 set interfaces lo0 unit 0 family inet address 192.168.3.1/32 set interfaces lo0 unit 0 family inet address 192.168.0.1/32 set protocols ospf export ospf set protocols ospf area 0.0.0.1 interface fe-1/2/0.0 set protocols ospf area 0.0.0.1 interface lo0.0 passive set policy-options policy-statement ospf term 1 from protocol static set policy-options policy-statement ospf term 1 then accept set routing-options static route 192.168.0.0/24 discard set routing-options static route 192.168.1.0/24 discard set routing-options static route 192.168.3.0/24 discard </pre>

```
set routing-options static route 192.168.2.0/24 discard
```

**Step-by-Step  
Procedure**

To configure Device R2:

1. Configure the network interfaces.  

```
[edit interfaces]
user@R2# set fe-1/2/1 unit 0 description to-R5
user@R2# set fe-1/2/1 unit 0 family inet address 10.0.0.37/30
user@R2# set fe-1/2/1 unit 0 family iso
user@R2# set fe-1/2/0 unit 0 description to-OSPF-network
user@R2# set fe-1/2/0 unit 0 family inet address 10.0.0.45/30
user@R2# set lo0 unit 0 family inet address 172.16.9.7/32
user@R2# set lo0 unit 0 family iso address 49.0002.0172.0016.0907.00
```
2. Configure IS-IS on the interface facing Device R1 and the loopback interface.  

```
[edit protocols isis]
user@R2# set interface fe-1/2/1.0
user@R2# set interface lo0.0
```
3. Configure the policy that enables Device R1 to reach the 10.0.0.44/30 network.  

```
[edit policy-options policy-statement send-direct-to-isis-neighbors]
user@R2# set from protocol direct
user@R2# set from route-filter 10.0.0.44/30 exact
user@R2# set then accept
```
4. Apply the policy that enables Device R1 to reach the 10.0.0.44/30 network.  

```
[edit protocols isis]
user@R2# set export send-direct-to-isis-neighbors
```
5. Configure OSPF on the interfaces.  

```
[edit protocols ospf]
user@R2# set area 0.0.0.1 interface fe-1/2/0.0
user@R2# set area 0.0.0.1 interface lo0.0 passive
```
6. Configure the OSPF route redistribution policy.  

```
[edit policy-options policy-statement ospf-isis term 1]
user@R2# set from protocol ospf
user@R2# set from route-filter 192.168.0.0/22 longer
user@R2# set then accept
```
7. Apply the OSPF route redistribution policy to the IS-IS instance.  

```
[edit protocols isis]
user@R2# set export ospf-isis
```
8. Configure the policy that enables Device R3 to reach the 10.0.0.36/30 network.  

```
[edit policy-options policy-statement send-direct-to-ospf-neighbors]
user@R2# set from protocol direct
user@R2# set from route-filter 10.0.0.36/30 exact
user@R2# set then accept
```
9. Apply the policy that enables Device R3 to reach the 10.0.0.36/30 network.  

```
[edit protocols ospf]
user@R2# set export send-direct-to-ospf-neighbors
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure multi-level IS-IS:

1. Configure the network interfaces.

Multiple addresses are configured on the loopback interface to simulate multiple route destinations.

```
[edit interfaces]
user@R3# set fe-1/2/0 unit 0 family inet address 10.0.0.46/30
user@R3# set lo0 unit 0 family inet address 192.168.1.1/32
user@R3# set lo0 unit 0 family inet address 192.168.2.1/32
user@R3# set lo0 unit 0 family inet address 192.168.3.1/32
user@R3# set lo0 unit 0 family inet address 192.168.0.1/32
```

2. Configure static routes to the loopback interface addresses.

These are the routes that are redistributed into IS-IS.

```
[edit routing-options static]
user@R3# set route 192.168.0.0/24 discard
user@R3# set route 192.168.1.0/24 discard
user@R3# set route 192.168.3.0/24 discard
user@R3# set route 192.168.2.0/24 discard
```

3. Configure OSPF on the interfaces.

```
[edit protocols ospf area 0.0.0.1]
user@R3# set interface fe-1/2/0.0
user@R3# set interface lo0.0 passive
```

4. Configure the OSPF policy to export the static routes.

```
[edit policy-options policy-statement ospf term 1]
user@R3# set from protocol static
user@R3# set then accept
```

5. Apply the OSPF export policy.

```
[edit protocols ospf]
user@R3# set export ospf
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
Device R2 user@R2# show interfaces
fe-1/2/1 {
  unit 0 {

}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

---

Confirm that the configuration is working properly.

- [Verifying OSPF Route Advertisement on page 3946](#)
- [Verifying Route Redistribution on page 3946](#)
- [Verifying Connectivity on page 3947](#)

### *Verifying OSPF Route Advertisement*

**Purpose** Make sure that the expected routes are advertised by OSPF.

**Action** From operational mode on Device R2, enter the **show route protocol ospf** command.

```
user@R2> show route protocol ospf
```

```
inet.0: 15 destinations, 15 routes (15 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
192.168.0.0/24    *[OSPF/150] 03:54:21, metric 0, tag 0
                  > to 10.0.0.46 via fe-1/2/0.0
192.168.0.1/32    *[OSPF/10] 03:54:21, metric 1
                  > to 10.0.0.46 via fe-1/2/0.0
192.168.1.0/24    *[OSPF/150] 03:54:21, metric 0, tag 0
                  > to 10.0.0.46 via fe-1/2/0.0
192.168.1.1/32    *[OSPF/10] 03:54:21, metric 1
                  > to 10.0.0.46 via fe-1/2/0.0
192.168.2.0/24    *[OSPF/150] 03:54:21, metric 0, tag 0
                  > to 10.0.0.46 via fe-1/2/0.0
192.168.2.1/32    *[OSPF/10] 03:54:21, metric 1
                  > to 10.0.0.46 via fe-1/2/0.0
192.168.3.0/24    *[OSPF/150] 03:54:21, metric 0, tag 0
                  > to 10.0.0.46 via fe-1/2/0.0
192.168.3.1/32    *[OSPF/10] 03:54:21, metric 1
                  > to 10.0.0.46 via fe-1/2/0.0
224.0.0.5/32     *[OSPF/10] 03:56:03, metric 1
                  MultiRecv
```

```
iso.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
```

**Meaning** The 192.168/16 routes are advertised by OSPF.

### *Verifying Route Redistribution*

**Purpose** Make sure that the expected routes are redistributed from OSPF into IS-IS.

**Action** From operational mode on Device R1, enter the **show route protocol isis** command.

```
user@R1> show route protocol isis
```

```
inet.0: 13 destinations, 13 routes (13 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
10.0.0.44/30     *[IS-IS/160] 03:45:24, metric 20
                  > to 10.0.0.37 via fe-1/2/0.0
```

```

172.16.9.7/32      *[IS-IS/15] 03:49:46, metric 10
                  > to 10.0.0.37 via fe-1/2/0.0
192.168.0.0/24    *[IS-IS/160] 03:49:46, metric 10
                  > to 10.0.0.37 via fe-1/2/0.0
192.168.0.1/32    *[IS-IS/160] 03:49:46, metric 11, tag2 1
                  > to 10.0.0.37 via fe-1/2/0.0
192.168.1.0/24    *[IS-IS/160] 03:49:46, metric 10
                  > to 10.0.0.37 via fe-1/2/0.0
192.168.1.1/32    *[IS-IS/160] 03:49:46, metric 11, tag2 1
                  > to 10.0.0.37 via fe-1/2/0.0
192.168.2.0/24    *[IS-IS/160] 03:49:46, metric 10
                  > to 10.0.0.37 via fe-1/2/0.0
192.168.2.1/32    *[IS-IS/160] 03:49:46, metric 11, tag2 1
                  > to 10.0.0.37 via fe-1/2/0.0
192.168.3.0/24    *[IS-IS/160] 03:49:46, metric 10
                  > to 10.0.0.37 via fe-1/2/0.0
192.168.3.1/32    *[IS-IS/160] 03:49:46, metric 11, tag2 1
                  > to 10.0.0.37 via fe-1/2/0.0

iso.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)

```

**Meaning** The 192.168/16 routes are redistributed into IS-IS.

#### *Verifying Connectivity*

**Purpose** Check that Device R1 can reach the destinations on Device R3.

**Action** From operational mode, enter the **ping** command.

```

user@R1> ping 192.168.1.1
PING 192.168.1.1 (192.168.1.1): 56 data bytes
64 bytes from 192.168.1.1: icmp_seq=0 ttl=63 time=2.089 ms
64 bytes from 192.168.1.1: icmp_seq=1 ttl=63 time=1.270 ms
64 bytes from 192.168.1.1: icmp_seq=2 ttl=63 time=2.135 ms

```

**Meaning** These results confirm that Device R1 can reach the destinations in the OSPF network.

## Example: Configuring BFD for IS-IS

This example describes how to configure the Bidirectional Forwarding Detection (BFD) protocol to detect failures in an IS-IS network.

- [Requirements on page 3947](#)
- [Overview on page 3948](#)
- [Configuration on page 3948](#)
- [Verification on page 3951](#)

### Requirements

Before you begin, configure IS-IS on both routers. See [“Example: Configuring IS-IS” on page 3921](#) for information about the required IS-IS configuration.

This example uses the following hardware and software components:

- Junos OS Release 7.3 or later
- M Series, MX Series, and T Series routers

### Overview

This example shows two routers connected to each other. A loopback interface is configured on each router. IS-IS and BFD protocols are configured on both routers.

Figure 132 on page 3948 shows the sample network.

Figure 132: Configuring BFD for IS-IS

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

#### Router R1

```
set protocols isis interface so-0/0/0 bfd-liveness-detection detection-time threshold 5
set protocols isis interface so-0/0/0 bfd-liveness-detection minimum-interval 2
set protocols isis interface so-0/0/0 bfd-liveness-detection minimum-receive-interval 1
set protocols isis interface so-0/0/0 bfd-liveness-detection no-adaptation
set protocols isis interface so-0/0/0 bfd-liveness-detection transmit-interval threshold 3
set protocols isis interface so-0/0/0 bfd-liveness-detection transmit-interval
  minimum-interval 1
set protocols isis interface so-0/0/0 bfd-liveness-detection multiplier 2
set protocols isis interface so-0/0/0 bfd-liveness-detection version automatic
```

#### Router R2

```
set protocols isis interface so-0/0/0 bfd-liveness-detection detection-time threshold 6
set protocols isis interface so-0/0/0 bfd-liveness-detection minimum-interval 3
set protocols isis interface so-0/0/0 bfd-liveness-detection minimum-receive-interval 1
set protocols isis interface so-0/0/0 bfd-liveness-detection no-adaptation
set protocols isis interface so-0/0/0 bfd-liveness-detection transmit-interval threshold 4
set protocols isis interface so-0/0/0 bfd-liveness-detection transmit-interval
  minimum-interval 1
set protocols isis interface so-0/0/0 bfd-liveness-detection multiplier 2
set protocols isis interface so-0/0/0 bfd-liveness-detection version automatic
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

**NOTE:** To simply configure BFD for IS-IS, only the `minimum-interval` statement is required. The BFD protocol selects default parameters for all the other configuration statements when you use the `bfd-liveness-detection` statement without specifying any parameters.

**NOTE:** You can change parameters at any time without stopping or restarting the existing session. BFD automatically adjusts to the new parameter value. However, no changes to BFD parameters take place until the values resynchronize with each BFD peer.

To configure BFD for IS-IS on Routers R1 and R2:

1. Enable BFD failure detection for IS-IS.
 

```
[edit protocols isis]
user@R1# set interface so-0/0/0 bfd-liveness-detection

[edit protocols isis]
user@R2# set interface so-0/0/0 bfd-liveness-detection
```
2. Configure the threshold for the adaptation of the detection time, which must be greater than the multiplier number multiplied by the minimum interval.
 

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R1# set detection-time threshold 5

[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R2# set detection-time threshold 6
```
3. Configure the minimum transmit and receive intervals for failure detection.
 

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R1# set minimum-interval 2

[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R2# set minimum-interval 3
```
4. Configure only the minimum receive interval for failure detection.
 

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R1# set minimum-receive-interval 1

[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R2# set minimum-receive-interval 1
```
5. Disable BFD adaptation.
 

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R1# set no-adaptation
```

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R2# set no-adaptation
```

6. Configure the threshold for the transmit interval, which must be greater than the minimum transmit interval.

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R1# set transmit-interval threshold 3
```

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R2# set transmit-interval threshold 4
```

7. Configure the minimum transmit interval for failure detection.

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R1# set transmit-interval minimum-interval 1
```

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R2# set transmit-interval minimum-interval 1
```

8. Configure the multiplier number, which is the number of hello packets not received by the neighbor that causes the originating interface to be declared down.

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R1# set multiplier 2
```

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R2# set multiplier 2
```

9. Configure the BFD version used for detection.

The default is to have the version detected automatically.

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R1# set version automatic
```

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R2# set version automatic
```

### Results

From configuration mode, confirm your configuration by issuing the **show protocols isis interface** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show protocols isis interface so-0/0/0
```

```
    bfd-liveness-detection {
      version automatic;
      minimum-interval 2;
      minimum-receive-interval 1;
      multiplier 2;
      no-adaptation;
      transmit-interval {
        minimum-interval 1;
        threshold 3;
      }
      detection-time {
        threshold 5;
      }
    }
...
```

```
user@R2# show protocols isis interface so-0/0/0
```

```
    bfd-liveness-detection {
      version automatic;
      minimum-interval 3;
      minimum-receive-interval 1;
      multiplier 2;
      no-adaptation;
      transmit-interval {
        minimum-interval 1;
        threshold 4;
      }
      detection-time {
        threshold 6;
      }
    }
  ...
```

### Verification

Confirm that the configuration is working properly.

- [Verifying the Connection Between Routers R1 and R2 on page 3951](#)
- [Verifying That IS-IS Is Configured on page 3952](#)
- [Verifying That BFD Is configured on page 3952](#)

#### *Verifying the Connection Between Routers R1 and R2*

**Purpose** Make sure that Routers R1 and R2 are connected to each other.

**Action** Ping the other router to check the connectivity between the two routers as per the network topology.

```
user@R1> ping 10.0.0.2
```

```
PING 10.0.0.2 (10.0.0.2): 56 data bytes
64 bytes from 10.0.0.2: icmp_seq=0 ttl=64 time=1.367 ms
64 bytes from 10.0.0.2: icmp_seq=1 ttl=64 time=1.662 ms
64 bytes from 10.0.0.2: icmp_seq=2 ttl=64 time=1.291 ms
^C
--- 10.0.0.2 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.291/1.440/1.662/0.160 ms
```

```
user@R2> ping 10.0.0.1
```

```
PING 10.0.0.1 (10.0.0.1): 56 data bytes
64 bytes from 10.0.0.1: icmp_seq=0 ttl=64 time=1.287 ms
64 bytes from 10.0.0.1: icmp_seq=1 ttl=64 time=1.310 ms
64 bytes from 10.0.0.1: icmp_seq=2 ttl=64 time=1.289 ms
^C
--- 10.0.0.1 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.287/1.295/1.310/0.010 ms
```

**Meaning** Routers R1 and R2 are connected to each other.

**Verifying That IS-IS Is Configured**

**Purpose** Make sure that the IS-IS instance is running on both routers.

**Action** Use the **show isis database** statement to check if the IS-IS instance is running on both routers, R1 and R2.

```
user@R1> show isis database
```

```
IS-IS level 1 link-state database:
LSP ID      Sequence Checksum Lifetime Attributes
R1.00-00    0x4a571  0x30c5    1195 L1 L2
R2.00-00    0x4a586  0x4b7e    1195 L1 L2
R2.02-00    0x330ca1 0x3492    1196 L1 L2
  3 LSPs
```

```
IS-IS level 2 link-state database:
LSP ID      Sequence Checksum Lifetime Attributes
R1.00-00    0x4a856  0x5db0    1194 L1 L2
R2.00-00    0x4a89d  0x149b    1194 L1 L2
R2.02-00    0x1fb2ff 0xd302    1194 L1 L2
  3 LSPs
```

```
user@R2> show isis database
```

```
IS-IS level 1 link-state database:
LSP ID      Sequence Checksum Lifetime Attributes
R1.00-00    0x4b707  0xcc80    1195 L1 L2
R2.00-00    0x4b71b  0xeb37    1198 L1 L2
R2.02-00    0x33c2ce 0xb52d    1198 L1 L2
  3 LSPs
```

```
IS-IS level 2 link-state database:
LSP ID      Sequence Checksum Lifetime Attributes
R1.00-00    0x4b9f2  0xee70    1192 L1 L2
R2.00-00    0x4ba41  0x9862    1197 L1 L2
R2.02-00    0x3      0x6242    1198 L1 L2
  3 LSPs
```

**Meaning** IS-IS is configured on both routers, R1 and R2.

**Verifying That BFD Is configured**

**Purpose** Make sure that the BFD instance is running on both routers, R1 and R2.

**Action** Use the **show bfd session detail** statement to check if BFD instance is running on the routers.

```
user@R1> show bfd session detail
```

```
Address      State      Interface      Detect   Transmit
10.0.0.2     Up         so-0/0/0       Time    Interval  Multiplier
                2.000      1.000          2
Client ISIS R2, TX interval 0.001, RX interval 0.001
Client ISIS R1, TX interval 0.001, RX interval 0.001
Session down time 00:00:00, previous up time 00:00:15
Local diagnostic NbrSignal, remote diagnostic NbrSignal
Remote state AdminDown, version 1
Router 3, routing table index 17
```

```
1 sessions, 2 clients
Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps
```

```
user@R2> show bfd session detail
```

Address	State	Interface	Detect Time	Transmit Interval	Multiplier
10.0.0.1	Up	so-0/0/0	2.000	1.000	2

```
Client ISIS R2, TX interval 0.001, RX interval 0.001
Session down time 00:00:00, previous up time 00:00:05
Local diagnostic NbrSignal, remote diagnostic NbrSignal
Remote state AdminDown, version 1
Router 2, routing table index 15
```

```
1 sessions, 1 clients
Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps
```

**Meaning** BFD is configured on Routers R1 and R2 for detecting failures in the IS-IS network.

## Example: Configuring BFD Authentication for IS-IS

This example shows how to configure BFD authentication for IS-IS.

- [Requirements on page 3953](#)
- [Overview on page 3953](#)
- [Configuration on page 3954](#)
- [Verification on page 3955](#)

### Requirements

Before you begin, configure IS-IS on both routers. See [“Example: Configuring IS-IS” on page 3921](#) for information about the required IS-IS configuration.

### Overview

In this example, a BFD authentication keychain is configured with meticulous keyed MD5 authentication.

[Figure 133 on page 3953](#) shows the topology used in this example.

**Figure 133: IS-IS BFD Authentication Topology**

[“CLI Quick Configuration” on page 3954](#) shows the configuration for both of the devices in [Figure 133 on page 3953](#). The section [“Step-by-Step Procedure” on page 3954](#) describes the steps on Device R1.

## Configuration

---

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```
set security authentication-key-chains key-chain secret123 description for-isis-bfd
set security authentication-key-chains key-chain secret123 key 1 secret "$9$cW-yrv"
set security authentication-key-chains key-chain secret123 key 1 start-time

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IS-IS BFD authentication:

1. Configure the authentication keychain.

```
[edit security authentication-key-chains key-chain secret123]
user@R1# set description for-isis-bfd
user@R1# set key 1 secret "$9$cW-yrv"
user@R1# set key 1 start-time "2012-5-31.13:00:00 -0700"
user@R1# set key 2 secret "$9$m5T3"
user@R1# set key 2 start-time "2013-5-31.13:00:00 -0700"
user@R1# set key 3 secret "$9$mTQn"
user@R1# set key 3 start-time "2014-5-31.13:00:00 -0700"
```

2. Enable BFD.
 

```
[edit protocols isis interface ge-1/2/0.0 bfd-liveness-detection]
user@R1# set minimum-interval 100
```
3. Apply the authentication keychain.
 

```
[edit protocols isis interface ge-1/2/0.0 bfd-liveness-detection]
user@R1# set authentication key-chain secret123
```
4. Set the authentication type.
 

```
[edit protocols isis interface ge-1/2/0.0 bfd-liveness-detection]
user@R1# set authentication algorithm meticulous-keyed-md5
```

**Results** From configuration mode, confirm your configuration by entering the **show protocols** and **show security** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show protocols
isis {
  interface ge-1/2/0.0 {
    bfd-liveness-detection {
      minimum-interval 100;
      authentication {
        key-chain secret123;
        algorithm meticulous-keyed-md5;
      }
    }
  }
}

user@R1# show security
authentication-key-chains {
  key-chain secret123 {
    description for-isis-bfd;
    key 1 {
      secret "$9$cW-yrv"; ## SECRET-DATA
      start-time "2012-5-31.13:00:00 -0700";
    }
    key 2 {
      secret "$9$m5T3"; ## SECRET-DATA
      start-time "2013-5-31.13:00:00 -0700";
    }
    key 3 {
      secret "$9$mTQn"; ## SECRET-DATA
      start-time "2014-5-31.13:00:00 -0700";
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

### Verifying IS-IS BFD Authentication

**Purpose** Verify the status of IS-IS BFD authentication.

**Action** From operational mode, enter the **show bfd session extensive** command.

```
user@R1> show bfd session extensive
```

Address	State	Interface	Detect Time	Transmit Interval	Multiplier
10.0.0.2	Down	ge-1/2/0.0	0.300	1.000	3

Client ISIS L1, TX interval 0.100, RX interval 0.100, Authenticate  
**keychain secret123, algo meticulous-keyed-md5, mode strict**  
Client ISIS L2, TX interval 0.100, RX interval 0.100, Authenticate  
**keychain secret123, algo meticulous-keyed-md5, mode strict**  
Session down time 00:35:13, previous up time 00:12:17  
Local diagnostic None, remote diagnostic None  
Remote state Up, version 1  
Logical system 2, routing table index 85  
Min async interval 0.100, min slow interval 1.000  
Adaptive async TX interval 0.100, RX interval 0.100  
Local min TX interval 1.000, minimum RX interval 0.100, multiplier 3  
Remote min TX interval 0.100, min RX interval 0.100, multiplier 3  
Local discriminator 2, remote discriminator 1  
Echo mode disabled/inactive, no-absorb, no-refresh  
**Authentication enabled/active, keychain secret123, algo meticulous-keyed-md5,  
mode strict**  
Session ID: 0x100101

1 sessions, 2 clients  
Cumulative transmit rate 1.0 pps, cumulative receive rate 10.0 pps

**Meaning** The output shows that BFD authentication is enabled on IS-IS Level 1 and Level 2.

### IS-IS Multicast Topologies Overview

Most multicast routing protocols perform a reverse-path forwarding (RPF) check on the source of multicast data packets. If a packet comes in on the interface that is used to send data to the source, the packet is accepted and forwarded to one or more downstream interfaces. Otherwise, the packet is discarded and a notification is sent to the multicast routing protocol running on the interface.

In certain instances, the unicast routing table used for the RPF check is also the table used for forwarding unicast data packets. Thus, unicast and multicast routing are congruent. In other cases, where it is preferred that multicast routing be independent of unicast routing, the multicast routing protocols are configured to perform the RPF check using an alternate unicast routing table `inet.2`.

You can configure IS-IS to calculate an alternate IPv4 multicast topology, in addition to the normal IPv4 unicast topology, and add the corresponding routes to `inet.2`. The IS-IS interface metrics for the multicast topology can be configured independently of the unicast metrics. You can also selectively disable interfaces from participating in the multicast topology while continuing to participate in the regular unicast topology. This enables you to exercise control over the paths that multicast data takes through a network so that it is independent of unicast data paths. You can also configure IS-IS to calculate an alternate IPv6 multicast topology, in addition to the normal IPv6 unicast topology.

**NOTE:** IS-IS only starts advertising the routes when the interface routes are in `inet.2`.

Table 278 on page 3957 lists the various IPv4 statements you can use to configure IS-IS topologies.

**Table 278: IPv4 Statements**

Statement	Description
<code>ipv4-multicast</code>	Enables an alternate IPv4 multicast topology.
<code>ipv4-multicast-metric</code> <i>number</i>	Configures the multicast metric for an alternate IPv4 multicast topology.
<code>no-ipv4-multicast</code>	Excludes an interface from the IPv4 multicast topology.
<code>no-unicast-topology</code>	Excludes an interface from the IPv4 unicast topologies.

Table 279 on page 3957 lists the various IPv6 statements you can use to configure IS-IS topologies.

**Table 279: IPv6 Statements**

Statement	Description
<code>ipv6-multicast</code>	Enables an alternate IPv6 multicast topology.

Table 279: IPv6 Statements (*continued*)

Statement	Description
<code>ipv6-multicast-metric <i>number</i></code>	Configures the multicast metric for an alternate IPv6 multicast topology.
<code>ipv6-unicast-metric <i>number</i></code>	Configures the unicast metric for an alternate IPv6 multicast topology.
<code>no-ipv6-multicast</code>	Excludes an interface from the IPv6 multicast topology.
<code>no-ipv6-unicast</code>	Excludes an interface from the IPv6 unicast topologies.

For a list of hierarchy levels at which you can include these statements, see the statement summary sections for these statements.

#### Example: Configuring IS-IS Multicast Topology

This example shows how to configure a multicast topology for an IS-IS network.

- [Requirements on page 3958](#)
- [Overview on page 3958](#)
- [Configuration on page 3959](#)
- [Verification on page 3963](#)

#### **Requirements**

Before you begin, configure IS-IS on all routers. See [“Example: Configuring IS-IS” on page 3921](#) for information about the required IS-IS configuration.

This example uses the following hardware and software components:

- Junos OS Release 7.3 or later
- M Series, MX Series, and T Series routers

#### **Overview**

This example shows an IS-IS multicast topology configuration. Three routers are connected to each other. A loopback interface is configured on each router.

[Figure 134 on page 3959](#) shows the sample network.

Figure 134: Configuring IS-IS Multicast Topology

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

#### Router R1

```
set protocols isis traceoptions file isis size 5m world-readable
set protocols isis traceoptions flag error
set protocols isis topologies ipv4-multicast
set protocols isis interface so-0/0/0 level 1 metric 15
set protocols isis interface so-0/0/0 level 1 ipv4-multicast-metric 18
set protocols isis interface so-0/0/0 level 2 metric 20
set protocols isis interface so-0/0/0 level 2 ipv4-multicast-metric 14
set protocols isis interface so-1/0/0 level 1 metric 13
set protocols isis interface so-1/0/0 level 1 ipv4-multicast-metric 12
set protocols isis interface so-1/0/0 level 2 metric 29
set protocols isis interface so-1/0/0 level 2 ipv4-multicast-metric 23
set protocols isis interface fxp0.0 disable
```

#### Router R2

```
set protocols isis traceoptions file isis size 5m world-readable
set protocols isis traceoptions flag error
set protocols isis topologies ipv4-multicast
set protocols isis interface so-0/0/0 level 1 metric 13
set protocols isis interface so-0/0/0 level 1 ipv4-multicast-metric 12
set protocols isis interface so-0/0/0 level 2 metric 29
```

```
set protocols isis interface so-0/0/0 level 2 ipv4-multicast-metric 23
set protocols isis interface so-1/0/0 level 1 metric 14
set protocols isis interface so-1/0/0 level 1 ipv4-multicast-metric 18
set protocols isis interface so-1/0/0 level 2 metric 32
set protocols isis interface so-1/0/0 level 2 ipv4-multicast-metric 26
set protocols isis interface fxp0.0 disable
```

#### Router R3

```
set protocols isis traceoptions file isis size 5m world-readable
set protocols isis traceoptions flag error
set protocols isis topologies ipv4-multicast
set protocols isis interface so-0/0/0 level 1 metric 19
set protocols isis interface so-0/0/0 level 1 ipv4-multicast-metric 11
set protocols isis interface so-0/0/0 level 2 metric 27
set protocols isis interface so-0/0/0 level 2 ipv4-multicast-metric 21
set protocols isis interface so-1/0/0 level 1 metric 16
set protocols isis interface so-1/0/0 level 1 ipv4-multicast-metric 26
set protocols isis interface so-1/0/0 level 2 metric 30
set protocols isis interface so-1/0/0 level 2 ipv4-multicast-metric 20
set protocols isis interface fxp0.0 disable
```

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IS-IS multicast topologies:

1. Enable the multicast topology for IS-IS by using the **ipv4-multicast** statement.

#### Routers R1, R2, and R3

```
[edit protocols isis]
user@host# set traceoptions file isis size 5m world-readable
user@host# set traceoptions flag error
user@host# set topologies ipv4-multicast
```

2. Enable multicast metrics on the first SONET/SDH Interface by using the **ipv4-multicast-metric** statement.

#### Router R1

```
[edit protocols isis interface so-0/0/0 ]
user@R1# set level 1 metric 15
user@R1# set level 1 ipv4-multicast-metric 18
user@R1# set level 2 metric 20
user@R1# set level 2 ipv4-multicast-metric 14
```

#### Router R2

```
[edit protocols isis interface so-0/0/0]
user@R2# set level 1 metric 13
user@R2# set level 1 ipv4-multicast-metric 12
user@R2# set level 2 metric 29
user@R2# set level 2 ipv4-multicast-metric 23
```

#### Router R3

```
[edit protocols isis interface so-0/0/0]
```

```

user@R3# set level 1 metric 19
user@R3# set level 1 ipv4-multicast-metric 11
user@R3# set level 2 metric 27
user@R3# set level 2 ipv4-multicast-metric 21

```

3. Enable multicast metrics on a second sonet Interface by using the **ipv4-multicast-metric** statement.

#### Router R1

```

[edit protocols isis interface so-1/0/0]
user@R1# set level 1 metric 13
user@R1# set level 1 ipv4-multicast-metric 12
user@R1# set level 2 metric 29
user@R1# set level 2 ipv4-multicast-metric 23

```

#### Router R2

```

[edit protocols isis interface so-1/0/0]
user@R2# set level 1 metric 14
user@R2# set level 1 ipv4-multicast-metric 18
user@R2# set level 2 metric 32
user@R2# set level 2 ipv4-multicast-metric 26

```

#### Router R3

```

[edit protocols isis interface so-1/0/0]
user@R3# set level 1 metric 16
user@R3# set level 1 ipv4-multicast-metric 26
user@R3# set level 2 metric 30
user@R3# set level 2 ipv4-multicast-metric 20

```

4. Disable the out-of-band management port, fxp0.

#### Routers R1, R2, and R3

```

[edit protocols isis]
user@host# set interface fxp0.0 disable

```

5. If you are done configuring the routers, commit the configuration.

#### Routers R1, R2, and R3

```

[edit]
user@host# commit

```

**Results** From configuration mode, confirm your configuration by using the **show protocols isis** statement. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

#### Router R1

```

user@R1# show protocols isis

traceoptions {
  file isis size 5m world-readable;
  flag error;
}
topologies ipv4-multicast;
interface so-0/0/0 {
  level 1 {

```

```
        metric 15;
        ipv4-multicast-metric 18;
    }
    level 2 {
        metric 20;
        ipv4-multicast-metric 14;
    }
}
interface so-1/0/0 {
    level 1 {
        metric 13;
        ipv4-multicast-metric 12;
    }
    level 2 {
        metric 29;
        ipv4-multicast-metric 23;
    }
}
interface fxp0.0 {
    disable;
}
```

#### Router R2

user@R2# show protocols isis

```
traceoptions {
    file isis size 5m world-readable;
    flag error;
}
topologies ipv4-multicast;
interface so-0/0/0 {
    level 1 {
        metric 13;
        ipv4-multicast-metric 12;
    }
    level 2 {
        metric 29;
        ipv4-multicast-metric 23;
    }
}
interface so-1/0/0 {
    level 1 {
        metric 14;
        ipv4-multicast-metric 18;
    }
    level 2 {
        metric 32;
        ipv4-multicast-metric 26;
    }
}
interface fxp0.0 {
    disable;
}
```

#### Router R3

user@R3# show protocols isis

```
traceoptions {
    file isis size 5m world-readable;
    flag error;
```

```

}
topologies ipv4-multicast;
interface so-0/0/0 {
    level 1 {
        metric 19;
        ipv4-multicast-metric 11;
    }
    level 2 {
        metric 27;
        ipv4-multicast-metric 21;
    }
}
interface so-1/0/0 {
    level 1 {
        metric 16;
        ipv4-multicast-metric 26;
    }
    level 2 {
        metric 30;
        ipv4-multicast-metric 20;
    }
}
interface fxp0.0 {
    disable;
}

```

### Verification

Confirm that the configuration is working properly.

- [Verifying the Connection Between Routers R1, R2, and R3 on page 3963](#)
- [Verifying That IS-IS Is Configured on page 3965](#)
- [Verifying the Configured Multicast Metric Values on page 3967](#)
- [Verifying the Configuration of the Multicast Topology on page 3968](#)

### Verifying the Connection Between Routers R1, R2, and R3

**Purpose** Make sure that Routers R1, R2, and R3 are connected to each other.

**Action** Ping the other two routers from any router, to check the connectivity between the three routers as per the network topology.

```
user@R1> ping 10.0.3.9
```

```

PING 10.0.3.9 (10.0.3.9): 56 data bytes
64 bytes from 10.0.3.9: icmp_seq=0 ttl=64 time=1.299 ms

64 bytes from 10.0.1.9: icmp_seq=2 ttl=64 time=1.300 ms
64 bytes from 10.0.1.9: icmp_seq=3 ttl=64 time=1.397 ms
^C
--- 10.0.1.9 ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.300/1.394/1.499/0.071 ms
```

**Meaning** Routers R1, R2, and R3 have a peer relationship with each other.

**Verifying That IS-IS Is Configured**

**Purpose** Make sure that the IS-IS instance is running on Routers R1, R2, and R3, and that they are adjacent to each other.

**Action** Use the `show isis adjacency detail` command to check the adjacency between the routers.

**Router R1**

```
user@R1> show isis adjacency detail
```

R2

```

**Meaning** IS-IS is configured on Routers R1, R2, and R3, and they are adjacent to each other.

**Verifying the Configured Multicast Metric Values**

**Purpose** Make sure that the SPF calculations are accurate as per the configured multicast metric values on Routers R1, R2, and R3.

**Action** Use the **show isis spf results** command to check the SPF calculations for the network.

**Router R1**

```
user@R1> show isis spf results
```

```
...
IPv4 Multicast IS-IS level 1 SPF results:

## Example: Configuring IS-IS for CLNS

- [Understanding IS-IS for CLNS on page 3972](#)
- [Example: Configuring IS-IS for CLNS on page 3972](#)

### Understanding IS-IS for CLNS

---

IS-IS extensions provide the basic interior gateway protocol (IGP) support for collecting intradomain routing information for Connectionless Network Service (CLNS) destinations within a CLNS network. Routers that learn host addresses through End System-to-Intermediate System (ES-IS) can advertise the addresses to other routers (intermediate systems) by using IS-IS.

For more information about IS-IS, see the ISO 10589 standard.

### Example: Configuring IS-IS for CLNS

---

This example shows how to create a routing instance and enable the IS-IS protocol on all interfaces.

- [Requirements on page 3973](#)
- [Overview on page 3973](#)

- [Configuration on page 3973](#)
- [Verification on page 3974](#)

### Requirements

Before you begin, configure the network interfaces. See the *Junos OS Interfaces Configuration Guide for Security Devices*.

### Overview

The configuration instructions in this topic describe how to create a routing instance called `aaaa`, enable IS-IS on all interfaces, define the BGP export policy name (`dist-bgp`), family (`ISO`), and protocol (`BGP`), and apply the export policy to IS-IS.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set routing-instances aaaa protocols isis clns-routing
set routing-instances aaaa protocols isis interface all
set routing-instances aaaa protocols isis no-ipv4-routing no-ipv6-routing
set policy-options policy-statement dist-bgp from family iso protocol bgp
set policy-options policy-statement dist-bgp then accept
set routing-instances aaaa protocols isis export dist-bgp
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IS-IS for CLNS:

1. Enable CLNS routing.  

```
[edit routing-instances aaaa]
user@host# set protocols isis clns-routing
```
2. Enable IS-IS on all interfaces.  

```
[edit routing-instances aaaa]
user@host# set protocols isis interface all
```
3. (Optional) Disable IPv4 and IPv6 routing to configure a pure CLNS network.  

```
[edit routing-instances aaaa]
user@host# set protocols isis no-ipv4-routing no-ipv6-routing
```
4. Define the BGP export policy name, family, and protocol.  

```
[edit policy-options]
user@host# set policy-statement dist-bgp from family iso protocol bgp
```
5. Define the action for the export policy.  

```
[edit policy-options]
user@host# set policy-statement dist-bgp then accept
```

6. Apply the export policy to IS-IS.

```
[edit routing-instances aaaa]  
user@host# set protocols isis export dist-bgp
```

**Results** From configuration mode, confirm your configuration by entering the **show routing-instances** and **show policy-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show routing-instances  
aaaa {  
  protocols {  
    isis {  
      export dist-bgp;  
      no-ipv4-routing;  
      no-ipv6-routing;  
      clns-routing;  
      interface all;  
    }  
  }  
}  
  
user@host# show policy-options  
policy-statement dist-bgp {  
  from {  
    family iso;  
    protocol bgp;  
  }  
  then accept;  
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying the ISO Routes on page 3974](#)
- [Checking the SPF Calculations on page 3974](#)

### **Verifying the ISO Routes**

**Purpose** Verify that the expected ISO routes are displayed in the IS-IS routing table.

**Action** From operational mode, enter the [show isis route](#) command.

### **Checking the SPF Calculations**

**Purpose** Display information about IS-IS shortest-path-first (SPF) calculations.

**Action** From operational mode, enter the **show isis spf** command.

## **Example: Configuring IS-IS Designated Routers**

- [Understanding IS-IS Designated Routers on page 3975](#)
- [Example: Configuring Designated Router Election Priority for IS-IS on page 3975](#)

## Understanding IS-IS Designated Routers

A router advertises its priority to become a designated router in its hello packets. On all multiaccess networks (physical networks that support the attachment of more than two routers, such as Ethernet networks), IS-IS uses the advertised priorities to elect a designated router for the network. This router is responsible for sending network link-state advertisements, which describe all the routers attached to the network. These advertisements are flooded throughout a single area. The priority value is meaningful only on a multiaccess network. It has no meaning on a point-to-point interface.

A router's priority for becoming the designated router is indicated by an arbitrary number from 0 through 127, which you configure on the IS-IS interface. The router with the highest priority becomes the designated router for the area (Level 1, Level 2, or both), also configured on the IS-IS interface. If routers in the network have the same priority, then the router with the highest MAC address is elected as the designated router. By default, routers have a priority value of 64.

## Example: Configuring Designated Router Election Priority for IS-IS

This example shows how to configure the designated router election priority for IS-IS.

Before you begin:

- Configure network interfaces. See the *Junos OS Interfaces Configuration Guide for Security Devices*.
- Enable IS-IS on the interfaces. See [“Example: Configuring IS-IS” on page 3921](#).

In this example, you configure the priority for logical interface ge-0/0/1.0 to be 100 and the level number to be 1. If this interface has the highest priority value, the router becomes the designated router for the Level 1 area.

To configure a designated router election priority for IS-IS:

```
[edit]
user@host# set protocols isis interface ge-0/0/1.0 level 1 priority 100
```

**Related Documentation**

- [Example: Configuring IS-IS](#)

## Example: Enabling Packet Checksums on IS-IS Interfaces

This example shows how to enable packet checksums for IS-IS interfaces.

- [Requirements on page 3975](#)
- [Overview on page 3976](#)
- [Configuration on page 3976](#)
- [Verification on page 3977](#)

## Requirements

Before you begin, configure IS-IS on both routers. See [“Example: Configuring IS-IS” on page 3921](#) for information about the sample IS-IS configuration.

## Overview

Junos OS supports IS-IS checksums as documented in RFC 3358, *Optional Checksums in Intermediate System to Intermediate System (ISIS)*.

IS-IS protocol data units (PDUs) include link-state PDUs, complete sequence number PDUs (CSNPs), partial sequence number PDUs (PSNPs), and IS-IS hello (IIH) packets. These PDUs can be corrupt due to faulty implementations of Layer 2 hardware or lack of checksums on a specific network technology. Corruption of length or type, length, and value (TLV) fields can lead to the generation of extensive numbers of empty link-state PDUs in the receiving node. Because authentication is not a replacement for a checksum mechanism, you might want to enable the optional checksum TLV on your IS-IS interfaces.

The checksum cannot be enabled with MD5 hello authentication on the same interface.

Figure 135 on page 3976 shows the topology used in this example.

Figure 135: IS-IS Checksum Topology

This example describes the steps on Device R1.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

Device R1  set protocols isis traceoptions file isis
            set protocols isis traceoptions flag all
            set protocols isis interface fe-1/2/0.1 checksum
  
```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IS-IS checksums:

1. Enable checksums.
 

```

[edit protocols isis interface fe-1/2/0.1]
user@R1# set checksum
      
```
2. (Optional) Enable tracing for tracking checksum operations.
 

```

[edit protocols isis traceoptions]
user@R1# set file isis
user@R1# set flag all
      
```

**Results** From configuration mode, confirm your configuration by entering the **show protocols** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show protocols
isis {
  traceoptions {
    file isis;
    flag all;
  }
  interface fe-1/2/0.1 {
    checksum;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

#### Verifying Checksums

**Purpose** Verify that checksums are performed.

**Action** From operational mode, enter the **show log isis | match checksum** command.

```
user@R1> show log isis | match checksum
```

```
May 31 16:47:39.513267      sequence 0x49 checksum 0x8e64
May 31 16:47:39.513394      sequence 0x4e checksum 0x34b3
May 31 16:47:39.513517      sequence 0x50 checksum 0x9dcb
May 31 16:47:46.563781      sequence 0x45 checksum 0x7e1a
May 31 16:47:46.563970      sequence 0x46 checksum 0x226d
May 31 16:47:46.564104      sequence 0x52 checksum 0x99cd
May 31 16:47:46.581087      sequence 0x49 checksum 0x8e64
May 31 16:47:46.581222      sequence 0x4e checksum 0x34b3
May 31 16:47:46.581353      sequence 0x50 checksum 0x9dcb
May 31 16:47:55.799090      sequence 0x45 checksum 0x7e1a
May 31 16:47:55.799223      sequence 0x46 checksum 0x226d
May 31 16:47:55.799347      sequence 0x52 checksum 0x99cd
May 31 16:47:55.818255      sequence 0x49 checksum 0x8e64
May 31 16:47:55.818473      sequence 0x4e checksum 0x34b3
May 31 16:47:55.818606      sequence 0x50 checksum 0x9dcb
May 31 16:48:03.455816      sequence 0x49 checksum 0x8e64
May 31 16:48:03.455973      sequence 0x4e checksum 0x34b3
```

**Meaning** The output shows that checksum information is captured in the IS-IS trace log file.

## Configuration Tasks

---

- [Configuring IS-IS Authentication on page 3978](#)
- [Configuring Authentication Without Network-Wide Deployment on page 3979](#)

### Configuring IS-IS Authentication

All IS-IS protocol exchanges can be authenticated to guarantee that only trusted routing devices participate in the autonomous system (AS) routing. By default, IS-IS authentication is disabled on the routing device.

To configure IS-IS authentication, you must define an authentication password and specify the authentication type.

You can configure one of the following authentication methods:

- Simple authentication—Uses a text password that is included in the transmitted packet. The receiving routing device uses an authentication key (password) to verify the packet. Simple authentication is included for compatibility with existing IS-IS implementations. However, we recommend that you do *not* use this authentication method because it is insecure (the text can be “sniffed”).

**CAUTION:** A simple password that exceeds 254 characters is truncated.

- HMAC-MD5 authentication—Uses an iterated cryptographic hash function. The receiving routing device uses an authentication key (password) to verify the packet.

You can also configure more fine-grained interface-level authentication for hello packets.

To enable authentication and specify an authentication method, include the **authentication-type** statement, specifying the **simple** or **md5** authentication type:

**authentication-type** *authentication*;

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

To configure a password, include the **authentication-key** statement. The authentication password for all routing devices in a domain must be the same.

**authentication-key** *key*;

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

To configure hitless authentication key rollover, include the **authentication-key-chain (Protocols IS-IS)** statement.

The password can contain up to 255 characters. If you include spaces, enclose all characters in quotation marks (" ").

If you are using the Junos OS IS-IS software with another implementation of IS-IS, the other implementation must be configured to use the same password for the domain, the area, and all interfaces that are shared with a Junos OS implementation.

Authentication of hello packets, partial sequence number PDU (PSNP), and complete sequence number PDU (CSNP) can be suppressed to enable interoperability with the routing software of different vendors. Different vendors handle authentication in various ways, and suppressing authentication for different PDU types might be the simplest way to allow compatibility within the same network.

To configure IS-IS to generate authenticated packets, but not to check the authentication on received packets, include the **no-authentication-check** statement:

```
no-authentication-check;
```

To suppress authentication of IS-IS hello packets, include the **no-hello-authentication** statement:

```
no-hello-authentication;
```

To suppress authentication of PSNPs, include the **no-psnp-authentication** statement:

```
no-psnp-authentication;
```

To suppress authentication of CSNPs, include the **no-csnp-authentication** statement:

```
no-csnp-authentication;
```

For a list of hierarchy levels at which you can include these statements, see the statement summary sections for these statements.

**NOTE:** The **authentication** and the **no-authentication** statements must be configured at the same hierarchy level. Configuring authentication at the [edit protocols isis interface *interface-name*] hierarchy level and configuring **no-authentication** at the [edit protocols isis] hierarchy level has no effect.

#### Related Documentation

- [Configuring Authentication Without Network-Wide Deployment on page 3979](#)

## Configuring Authentication Without Network-Wide Deployment

To allow the use of authentication without requiring network-wide deployment, include the **loose-authentication-check** statement:

```
loose-authentication-check;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

## bfd-liveness-detection (Protocols IS-IS)

<b>Syntax</b>	<pre> bfd-liveness-detection {   authentication {     algorithm <i>algorithm-name</i>;     key-chain <i>key-chain-name</i>;     loose-check;   }   detection-time {     threshold <i>milliseconds</i>;   }   minimum-interval <i>milliseconds</i>;   minimum-receive-interval <i>milliseconds</i>;   multiplier <i>number</i>;   no-adaptation;   transmit-interval {     minimum-interval <i>milliseconds</i>;     threshold <i>milliseconds</i>;   }   version (1   automatic); } </pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols isis <a href="#">interface interface-name</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <a href="#">interface interface-name</a>],</p> <p>[edit protocols isis <a href="#">interface interface-name</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis <a href="#">interface interface-name</a>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>detection-time threshold</b> and <b>transmit-interval threshold</b> options added in Junos OS Release 8.2.</p> <p>Support for logical systems introduced in Junos OS Release 8.3.</p> <p><b>no-adaptation</b> statement introduced in Junos OS Release 9.0.</p> <p><b>authentication algorithm</b>, <b>authentication key-chain</b>, and <b>authentication loose-check</b> options introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Configure bidirectional failure detection timers and authentication.
<b>Options</b>	<p><b>authentication algorithm <i>algorithm-name</i></b>—Configure the algorithm used to authenticate the specified BFD session: <b>simple-password</b>, <b>keyed-md5</b>, <b>keyed-sha-1</b>, <b>meticulous-keyed-md5</b>, <b>meticulous-keyed-sha-1</b>.</p> <p><b>authentication key-chain <i>key-chain-name</i></b>—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the <b>authentication-key-chains key-chain</b> statement at the <b>[edit security]</b> hierarchy level.</p> <p><b>authentication loose-check</b>—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication might not be configured at both ends of the BFD session.</p>

**detection-time threshold *milliseconds***—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**minimum-interval *milliseconds***—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the **transmit-interval**, **minimum-interval**, and **minimum-receive-interval** statements.

**Range:** 1 through 255,000

**minimum-receive-interval *milliseconds***—Configure the minimum interval after which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the **minimum-interval** statement.

**Range:** 1 through 255,000

**multiplier *number***—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255

**Default:** 3

**no-adaptation**—Specify that BFD sessions not adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

**transmit-interval threshold *milliseconds***—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**transmit-interval minimum-interval *milliseconds***—Configure a minimum interval after which the local routing device transmits hello packets to a neighbor. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement.

**Range:** 1 through 255,000

**version**—Configure the BFD version to detect: **1** (BFD version 1) or **automatic** (autodetect the BFD version)

**Default:** automatic

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

------------------------------	--

## checksum (Protocols IS-IS)

<b>Syntax</b>	checksum;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols isis <a href="#">interface interface-name</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <a href="#">interface interface-name</a> ], [edit protocols isis <a href="#">interface interface-name</a> ], [edit routing-instances <i>routing-instance-name</i> protocols isis <a href="#">interface interface-name</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Enable checksums for packets on this interface.  Junos OS supports IS-IS checksums as documented in RFC 3358, <i>Optional Checksums in Intermediate System to Intermediate System (ISIS)</i> .  The checksum cannot be enabled with MD5 hello authentication on the same interface.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Enabling Packet Checksums on IS-IS Interfaces</i></li> </ul>

## csnp-interval

---

<b>Syntax</b>	csnp-interval (seconds   disable);
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols isis <b>interface</b> <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <b>interface</b> <i>interface-name</i> ], [edit protocols isis <b>interface</b> <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols isis <b>interface</b> <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Configure the interval between complete sequence number PDUs (CSNPs) on a LAN interface.</p> <p>If the routing device is the designated router on a LAN, IS-IS sends CSN packets every 10 seconds. If the routing device is on a point-to-point interface, it sends CSN packets every 5 seconds multiplied by the number of IS-IS adjacencies over point-to-point links, which are in UP state.</p> <p>To configure the interface not to send any CSNPs, specify the <b>disable</b> option.</p>
<b>Default</b>	By default, IS-IS sends CSNPs periodically. If the routing device is the designated router on a LAN, IS-IS sends CSNPs every 10 seconds. If the routing device is on a point-to-point interface, it sends CSNPs every 5 seconds multiplied by the number of IS-IS adjacencies over point-to-point links, which are in UP state.
<b>Options</b>	<p><b>disable</b>—Do not send CSNPs on this interface.</p> <p><b>seconds</b>—Number of seconds between the sending of CSNPs.</p> <p><b>Range:</b> 1 through 65,535 seconds</p> <p><b>Default:</b> 10 seconds on LAN broadcast links. 5 seconds on point-to-point links.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Configuring the Transmission Frequency for CSNP Packets on IS-IS Interfaces</i></li></ul>

## disable (Protocols IS-IS)

<b>Syntax</b>	disable;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols <b>isis</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols isis <b>interface</b> <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols isis <b>traffic-engineering</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>isis</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <b>interface</b> <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <b>traffic-engineering</b>],</p> <p>[edit protocols <b>isis</b>],</p> <p>[edit protocols isis <b>interface</b> <i>interface-name</i>],</p> <p>[edit protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit protocols isis <b>traffic-engineering</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <b>isis</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis <b>interface</b> <i>interface-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis <b>traffic-engineering</b>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Disable IS-IS on the routing device, on an interface, or on a level.</p> <p>At the <b>[edit protocols isis traffic-engineering]</b> hierarchy level, disable IS-IS support for traffic engineering.</p> <p>Enabling IS-IS on an interface (by including the <b>interface</b> statement at the <b>[edit protocols isis]</b> or the <b>[edit routing-instances routing-instance-name protocols isis]</b> hierarchy level), disabling it (by including the <b>disable</b> statement), and not actually having IS-IS run on an interface (by including the <b>passive</b> statement) are mutually exclusive states.</p>
<b>Default</b>	<p>IS-IS is enabled for Level 1 and Level 2 routers on all interfaces on which <b>family iso</b> is enabled.</p> <p>IS-IS support for traffic engineering is enabled.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Multi-Level IS-IS on page 3927</a></li> <li>• <a href="#">IS-IS Overview on page 3914</a></li> </ul>

## export (Protocols IS-IS)

---

<b>Syntax</b>	<code>export [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <a href="#">isis</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ], [edit protocols <a href="#">isis</a> ], [edit routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Apply one or more policies to routes being exported from the routing table into IS-IS.</p> <p>All routing protocols store the routes that they learn in the routing table. The routing table uses this collected route information to determine the active routes to destinations. The routing table then installs the active routes into its forwarding table and exports them into the routing protocols. It is these exported routes that the protocols advertise.</p> <p>For each protocol, you control which routes the protocol stores in the routing table and which routes the routing table exports into the protocol from the routing table by defining a <i>routing policy</i> for that protocol.</p>
<div> <b>NOTE:</b> For IS-IS, you cannot apply routing policies that affect how routes are imported into the routing table; doing so with a link-state protocol can easily lead to an inconsistent topology database.</div>	
<b>Options</b>	<i>policy-names</i> —Name of one or more policies.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Redistributing OSPF Routes into IS-IS</i></li><li>• <i>Example: Configuring an IS-IS Default Route Policy on Logical Systems</i></li></ul>

## external-preference (Protocols IS-IS)

<b>Syntax</b>	<code>external-preference <i>preference</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols isis <a href="#">level level-number</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <a href="#">level level-number</a>],</p> <p>[edit protocols isis <a href="#">level level-number</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis <a href="#">level level-number</a>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Configure the preference of external routes.
<b>Options</b>	<p><i>preference</i>—Preference value.</p> <p><b>Range:</b> 0 through 4,294,967,295 (<math>2^{32} - 1</math>)</p> <p><b>Default:</b> 15 (for Level 1 internal routes), 18 (for Level 2 internal routes), 160 (for Level 1 external routes), 165 (for Level 2 external routes)</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Route Preferences Overview</i></li> <li>• <i>Example: Redistributing OSPF Routes into IS-IS</i></li> <li>• <i>Example: Redistributing BGP Routes with a Specific Community Tag into IS-IS</i></li> <li>• <a href="#">preference on page 4029</a></li> </ul>

## family (Protocols IS-IS)

---

<b>Syntax</b>	<pre>family inet {     shortcuts {         multicast-rpf-routes;     } } family inet6 {     shortcuts; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols isis traffic-engineering], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis traffic-engineering], [edit protocols isis traffic-engineering], [edit routing-instances <i>routing-instance-name</i> protocols isis traffic-engineering]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3. Support for IPv6 for IGP shortcuts introduced in Junos OS Release 9.3. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure the address family for traffic engineering IS-IS interior gateway protocol (IGP) shortcuts.
<b>Options</b>	inet—IPv4 address family  inet6—IPv6 address family  The remaining statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	•

## hello-authentication-key

<b>Syntax</b>	<code>hello-authentication-key password;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i> level <i>number</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>number</i>],</p> <p>[edit protocols isis interface <i>interface-name</i> level <i>number</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>number</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Configure an authentication key (password) for hello packets. Neighboring routing devices use the password to verify the authenticity of packets sent from an interface. For the key to work, you also must include the <b>hello-authentication-type</b> statement.
<b>Default</b>	By default, hello authentication is not configured on an interface. However, if IS-IS authentication is configured, the hello packets are authenticated using the IS-IS authentication type and password.
<b>Options</b>	<p><b>password</b>—Authentication password. The password can be up to 255 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">authentication-key on page 3982</a></li> <li>• <a href="#">authentication-type on page 3984</a></li> <li>• <a href="#">hello-authentication-type on page 3995</a></li> </ul>

## hello-authentication-key-chain

---

<b>Syntax</b>	hello-authentication-key-chain <i>key-chain-name</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i> ], [edit logical-systems <i>name</i> routing-instances <i>instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i> ], [edit protocols isis interface <i>interface-name</i> level <i>level-number</i> ], [edit routing-instances <i>instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Apply an authentication keychain to the IS-IS interface.
<b>Options</b>	<i>key-chain-name</i> —Authentication keychain name. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Configuring Hitless Authentication Key Rollover for IS-IS</i></li></ul>

## hello-authentication-type

<b>Syntax</b>	hello-authentication-type (md5   simple);
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i> level <i>number</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>number</i>],</p> <p>[edit protocols isis interface <i>interface-name</i> level <i>number</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>number</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Enable authentication on an interface for hello packets. If you enable authentication on hello packets, you must specify a password by including the <b>hello-authentication-key</b> statement.</p> <p>You can configure authentication for a given IS-IS level on an interface. On a point-to-point link, if you enable hello authentication for both IS-IS levels, the password configured for Level 1 is used for both levels.</p>
<div style="display: flex; align-items: center;">  <div style="margin-left: 10px;"> <p><b>CAUTION:</b> If no authentication is configured for Level 1 on a point-to-point link with both levels enabled, the hello packets are sent without any password, regardless of the Level 2 authentication configurations.</p> </div> </div>	
<b>Default</b>	By default, hello authentication is not configured on an interface. However, if IS-IS authentication is configured, the hello packets are authenticated using the IS-IS authentication type and password.
<b>Options</b>	<p><b>md5</b>—Specifies Message Digest 5 as the packet verification type.</p> <p><b>simple</b>—Specifies simple authentication as the packet verification type.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">authentication-key on page 3982</a></li> <li>• <a href="#">authentication-type on page 3984</a></li> <li>• <a href="#">hello-authentication-key on page 3993</a></li> </ul>

## hello-interval (Protocols IS-IS)

---

<b>Syntax</b>	<code>hello-interval <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i> ], [edit protocols isis interface <i>interface-name</i> level <i>level-number</i> ], [edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Modify the frequency with which the routing device sends hello packets out of an interface, in seconds.</p> <p>Routing devices send hello packets at a fixed interval on all interfaces to establish and maintain neighbor relationships. This interval is advertised in the hello interval field in the hello packet.</p> <p>You can send out hello packets in subsecond intervals. To send out hello packets every 333 milliseconds, set the <b>hello-interval</b> value to 1.</p>
<b>Options</b>	<b><i>seconds</i></b> —Frequency of transmission for hello packets. <b>Range:</b> 1 through 20,000 seconds <b>Default:</b> 3 seconds (for designated intermediate system [DIS] routers), 9 seconds (for non-DIS routers)
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li><i>hold-time</i></li></ul>

## hello-padding

<b>Syntax</b>	hello-padding (adaptive   disable   loose   strict);
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols isis <b>interface</b> <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <b>interface</b> <i>interface-name</i> ], [edit protocols isis <b>interface</b> <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols isis <b>interface</b> <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Configure padding on hello packets to accommodate asymmetrical maximum transfer units (MTUs) from different hosts.</p> <p>This helps to prevent a premature adjacency Up state when one routing device's MTU does not meet the requirements to establish the adjacency.</p> <p>As an OSI Layer 2 protocol, IS-IS does not support data fragmentation. Therefore, maximum packet sizes must be established and supported between two routers. During adjacency establishment, the IS-IS protocol makes sure that the link supports a packet size of 1492 bytes by padding outgoing hello packets up to the maximum packet size of 1492 bytes.</p> <p>This is the default behavior of the Junos OS IS-IS implementation. However, Junos OS provides an option to disable hello padding that can override this behavior.</p> <p>There are four types of hello padding:</p> <ul style="list-style-type: none"> <li>Adaptive padding—On point-to-point connections, the hello packets are padded from the initial detection of a new neighbor until the neighbor verifies the adjacency as Up in the adjacency state type, length, and value (TLV) tuple. If the neighbor does not support the adjacency state TLV, then padding continues. On LAN connections, padding starts from the initial detection of a new neighbor until there is at least one active adjacency on the interface. Adaptive padding has more overhead than loose padding and is able to detect MTU asymmetry from one side of the connection. This one-sided detection can result in generation of extra link-state PDUs that are flooded throughout the network. Specify the <b>adaptive</b> option to configure enough padding to establish an adjacency to neighbors.</li> <li>Disabled padding—Padding is disabled on all types of interfaces for all adjacency states. Specify the <b>disable</b> option to accommodate interfaces that support less than the default packet size of 1492 bytes.</li> <li>Loose padding (the default)—The hello packet is padded from the initial detection of a new neighbor until the adjacency transitions to the Up state. Loose padding might not be able to detect certain situations such as asymmetrical MTUs between the routing devices. Specify the <b>loose</b> option to configure enough padding to initialize an adjacency to neighbors.</li> </ul>

- **Strict padding**—Padding is done on all interface types and for all adjacency states, and is continuous. Strict padding has the most overhead. The advantage is that strict padding detects MTU issues on both sides of a link. Specify the **strict** option to configure padding to allow all adjacency states with neighbors.

**Options**    **adaptive**—Configure padding until the neighbor adjacency is established and active.

**disable**—Disable padding on all types of interfaces for all adjacency states.

**loose**—Configure padding until the state of the adjacency is initialized.

**strict**—Configure padding for all adjacency states.

**Required Privilege Level**    routing—To view this statement in the configuration.  
   routing-control—To add this statement to the configuration.

**Related Documentation**    • *Example: Configuring IS-IS*

## hold-time (Protocols IS-IS)

<b>Syntax</b>	<code>hold-time seconds;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Set the length of time a neighbor considers this router to be operative (up) after receiving a hello packet. If the neighbor does not receive another hello packet within the specified time, it marks this routing device as inoperative (down). The hold time itself is advertised in the hello packets.</p> <p>The hold time specifies how long a neighbor should consider this routing device to be operative without receiving another hello packet. If the neighbor does not receive a hello packet from this routing device within the hold time, it marks the routing device as being unavailable.</p> <p>For systems configured with graceful routing switchover (GRES) with Graceful Restart, the hold time for Master and Backup Routing Engines should be set to a value higher than 40 seconds. This ensures that adjacencies between the Routing Engine and the neighboring peer 'helper' routers do not time out, stopping graceful restart, and all traffic.</p>
<b>Options</b>	<p><b>seconds</b>—Hold-time value, in seconds.</p> <p><b>Range:</b> 3 through 65,535 seconds, or 1 to send out hello packets every 333 milliseconds</p> <p><b>Default:</b> 9 seconds (for designated intermediate system [DIS] routers), 27 seconds (for non-DIS routers; three times the default hello interval)</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Graceful Routing Engine Switchover on page 2463</a></li> <li>• <a href="#">Example: Configuring IS-IS</a></li> <li>• <a href="#">Example: Configuring IS-IS for GRES with Graceful Restart</a></li> <li>• <a href="#">hello-interval on page 3996</a></li> </ul>

## ignore-attached-bit

---

<b>Syntax</b>	ignore-attached-bit;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <a href="#">isis</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ], [edit protocols <a href="#">isis</a> ], [edit routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Ignore the attached bit on IS-IS Level 1 routers. Configuring this statement enables the routing device to ignore the attached bit on incoming Level 1 link-state PDUs. If the attached bit is ignored, no default route, which points to the routing device which has set the attached bit, is installed.</p> <p>There might be times, such as during a denial-of-service (DoS) attack, that you do not want a Level 1 router to be able to forward traffic based on a default route.</p> <p>To prevent a routing device from being able to reach interarea destinations, you can prevent the routing device from installing the default route without affecting the status of its IS-IS adjacencies. The <b>ignore-attached-bit</b> statement is used to tell the routing device to ignore the presence of the attached bit in Level 1 link-state PDUs, which blocks the installation of the IS-IS default route.</p>
<b>Default</b>	The <b>ignore-attached-bit</b> statement is disabled by default.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## ipv4-multicast

<b>Syntax</b>	ipv4-multicast;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols isis <a href="#">topologies</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <a href="#">topologies</a> ], [edit protocols isis <a href="#">topologies</a> ], [edit routing-instances <i>routing-instance-name</i> protocols isis <a href="#">topologies</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure alternate IPv4 multicast topologies.

**NOTE:** The IS-IS interface metrics for the IPv4 topology can be configured independently of the IPv6 metrics. You can also selectively disable interfaces from participating in the IPv6 topology while continuing to participate in the IPv4 topology. This lets you exercise control over the paths that unicast data takes through a network.

<b>Default</b>	Multicast topologies are disabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## isis

---

<b>Syntax</b>	isis { ... }
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols], [edit protocols], [edit routing-instances <i>routing-instance-name</i> protocols]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Enable IS-IS routing on the routing device or for a routing instance.  The <b>isis</b> statement is the one statement you must include in the configuration to run IS-IS on the routing device or in a routing instance.
<b>Default</b>	IS-IS is disabled on the routing device.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring IS-IS on page 3921</a></li><li>• <a href="#">Example: Configuring Multi-Level IS-IS on page 3927</a></li></ul>

## level (Global IS-IS)

<b>Syntax</b>	<pre> level <i>level-number</i> {     authentication-key <i>key</i>;     authentication-key-chain (Protocols IS-IS) <i>key-chain-name</i>;     authentication-type <i>type</i>;     disable;     external-preference <i>preference</i>;     no-csnp-authentication;     no-hello-authentication;     no-psnp-authentication;     preference <i>preference</i>;     wide-metrics-only; } </pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols <b>isis</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>isis</b>],</p> <p>[edit protocols <b>isis</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <b>isis</b>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure the global-level properties.</p> <p>You can administratively divide a single AS into smaller groups called areas. You configure each routing device interface to be in an area. Any interface can be in any area. The area address applies to the entire routing device. You cannot specify one interface to be in one area and another interface in a different area. To route between areas, you must have two adjacent Level 2 routers that communicate with each other.</p> <p>Level 1 routers can only route within their IS-IS area. To send traffic outside their area, Level 1 routers must send packets to the nearest intra-area Level 2 router. A routing device can be a Level 1 router, a Level 2 router, or both. You specify the router level on a per-interface basis, and a routing device becomes adjacent to other routing devices on the same level on that link only.</p> <p>You can configure one Level 1 routing process and one Level 2 routing process on each interface, and you can configure the two levels differently.</p>
<b>Options</b>	<p><b>level-number</b>—IS-IS level number.</p> <p><b>Values:</b> 1 or 2</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

## loose-authentication-check

---

<b>Syntax</b>	loose-authentication-check;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <a href="#">isis</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ], [edit protocols <a href="#">isis</a> ], [edit routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Allow the use of MD5 authentication without requiring network-wide deployment.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Configuring Hitless Authentication Key Rollover for IS-IS</i></li></ul>

## lsp-interval

<b>Syntax</b>	<code>lsp-interval <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols isis <b>interface</b> <i>interface-name</i>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <b>interface</b> <i>interface-name</i>],          [edit protocols isis <b>interface</b> <i>interface-name</i>],          [edit routing-instances <i>routing-instance-name</i> protocols isis <b>interface</b> <i>interface-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure the link-state PDU interval time.</p> <p>By default, the routing device sends one link-state PDU packet out an interface every 100 milliseconds. To disable the transmission of all link-state PDUs, set the interval to 0.</p> <p>Link-state PDU throttling by use of the <b>lsp-interval</b> statement controls the flooding pace to neighboring routing devices in order to not overload them.</p> <p>Also, consider that control traffic (such as link-state PDUs and related packets) might delay user traffic (information packets) because control traffic always has precedence in terms of scheduling on the routing device interface cards. Unfortunately, the control traffic transmission rate is not decreased on low-bandwidth interfaces, such as DS-0 or fractional T1 and E1 interface. Line control traffic stays the same. On a low-bandwidth circuit that is transmitting 30 full-MTU-sized packets, there is not much bandwidth left over for other types of packets.</p>
<b>Default</b>	By default, the routing device sends one link-state PDU out an interface every 100 milliseconds.
<b>Options</b>	<p><b>milliseconds</b>—Number of milliseconds between the sending of link-state PDUs. Specifying a value of 0 blocks all link-state PDU transmission.</p> <p><b>Range:</b> 0 through 1000 milliseconds</p> <p><b>Default:</b> 100 milliseconds</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Example: Configuring the Transmission Frequency for Link-State PDUs on IS-IS Interfaces</i></li> </ul>

## **lsp-lifetime**

---

<b>Syntax</b>	<code>lsp-lifetime seconds;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">isis</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>    <a href="#">isis</a>],</code> <code>[edit protocols <a href="#">isis</a>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Specify how long a link-state PDU originating from the routing device should persist in the network. The routing device sends link-state PDUs often enough so that the link-state PDU lifetime never expires.</p> <p>Because link-state PDUs have a maximum lifetime, they need to be refreshed. Refreshing means that a routing device needs to re-originate its link-state PDUs periodically. The re-origination interval must be less than the link-state PDU's lifetime. For example, if the link-state PDU is valid for 1200 seconds, the routing device needs to refresh the link-state PDU in less than 1200 seconds to avoid removal of the link-state PDU from the link-state database by other routing devices. The recommended maximum link-state PDU origination interval is the lifetime minus 300 seconds. So, in a default environment this would be 900 seconds. In Junos OS, the refresh interval is derived from the lifetime and is equal to the lifetime minus 317 seconds. You can change the lifetime to a higher value to reduce the number of refreshes in the network. (You would rarely want to increase the number of refreshes.) Often these periodic link-state PDU refreshes are referred to as refresh noise, and network administrators want to reduce this noise as much as possible.</p> <p>The <a href="#">show isis overview</a> command displays the link-state PDU lifetime.</p>
<b>Default</b>	By default, link-state PDUs are maintained in network databases for 1200 seconds (20 minutes) before being considered invalid. This length of time, called the <i>LSP lifetime</i> , normally is sufficient to guarantee that link-state PDUs never expire.
<b>Options</b>	<b>seconds</b> —link-state PDU lifetime, in seconds. <b>Range:</b> 350 through 65,535 seconds <b>Default:</b> 1200 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Configuring the Transmission Frequency for Link-State PDUs on IS-IS Interfaces</i></li><li>• <a href="http://www.juniper.net/us/en/training/certification/JNCIP_studyguide.pdf">http://www.juniper.net/us/en/training/certification/JNCIP_studyguide.pdf</a></li></ul>

## max-areas

<b>Syntax</b>	<code>max-areas <i>number</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">isis</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a>]</p> <p>[edit protocols <a href="#">isis</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Modify the maximum number of IS-IS areas advertised.</p> <p>This value is included in the Maximum Address Area field of the IS-IS common PDU header included in all outgoing PDUs.</p> <p>The maximum number of areas you can advertise is restricted to 36 to ensure that the IIH PDUs have enough space to include other type, length, and value (TLV) fields, such as the Authentication and IPv4 and IPv6 Interface Address TLVs.</p>
<b>Options</b>	<p><b><i>number</i></b>—Maximum number of areas to include in the IS-IS hello (IIH) PDUs and link-state PDUs.</p> <p><b>Range:</b> 3 through 36</p> <p><b>Default:</b> 3</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Example: Configuring Multi-Level IS-IS</i></li> </ul>

## mesh-group (Protocols IS-IS)

---

<b>Syntax</b>	mesh-group (blocked   <i>value</i> );
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols isis <b>interface</b> <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <b>interface</b> <i>interface-name</i> ], [edit protocols isis <b>interface</b> <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols isis <b>interface</b> <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Configure an interface to be part of a mesh group, which is a set of fully connected nodes.</p> <p>A <i>mesh group</i> is a set of routing devices that are fully connected. That is, they have a fully meshed topology. When link-state PDUs are being flooded throughout an area, each router within a mesh group receives only a single copy of a link-state PDU instead of receiving one copy from each neighbor, thus minimizing the overhead associated with the flooding of link-state PDUs.</p> <p>To create a mesh group and designate that an interface be part of the group, assign a mesh-group number to all the routing device interfaces in the group. To prevent an interface in the mesh group from flooding link-state PDUs, configure blocking on that interface.</p>
<b>Options</b>	<p><b>blocked</b>—Configure the interface so that it does not flood link-state PDUs.</p> <p><b>value</b>—Number that identifies the mesh group.</p> <p><b>Range:</b> 1 through 4,294,967,295 (<math>2^{32} - 1</math>; 32 bits are allocated to identify a mesh group)</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Configuring Mesh Groups of IS-IS Interfaces</i></li></ul>

## metric (Protocols IS-IS)

<b>Syntax</b>	<code>metric <i>metric</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i> ], [edit protocols isis interface <i>interface-name</i> level <i>level-number</i> ], [edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify the metric value for the level.

All IS-IS routes have a cost, which is a routing metric that is used in the IS-IS link-state calculation. The cost is an arbitrary, dimensionless integer that can be from 1 through 63, or from 1 through 16,777,215 ( $2^{24} - 1$ ) if you are using wide metrics.

Similar to other routing protocols, IS-IS provides a way of exporting routes from the routing table into the IS-IS network. When a route is exported into the IS-IS network without a specified metric, IS-IS uses default metric values for the route, depending on the protocol that was used to learn the route.

Table 280 on page 4015 depicts IS-IS route export metric default values.

**Table 280: Default Metric Values for Routes Exported into IS-IS**

Protocol Used for Learning the Route	Default Metric Value
Direct	10
Static	Same as reported by the protocol used for exporting the route
Aggregate	10
Generate	10
RIP	Same as reported by the protocol used for exporting the route
OSPF	Same as reported by the protocol used for exporting the route
BGP	10

The default metric values behavior can be customized by using routing policies.

<b>Options</b>	<b><i>metric</i></b> —Metric value. <b>Range:</b> 1 through 63, or 1 through 16,777,215 (if you have configured wide metrics)
----------------	--

**Default:** 10 (for all interfaces except lo0), 0 (for the lo0 interface)

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## no-adjacency-holddown

---

<b>Syntax</b>	no-adjacency-holddown;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <a href="#">isis</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ], [edit protocols <a href="#">isis</a> ], [edit routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Disable the hold-down timer for IS-IS adjacencies.</p> <p>A hold-down timer delays the advertising of adjacencies by waiting until a time period has elapsed before labeling adjacencies in the up state. You can disable this hold-down timer, which labels adjacencies up faster. However, disabling the hold-down timer creates more frequent link-state PDU updates and SPF computation.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">hold-time on page 3999</a></li></ul>

## no-authentication-check

<b>Syntax</b>	no-authentication-check;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <a href="#">isis</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ], [edit protocols <a href="#">isis</a> ], [edit routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Generate authenticated packets and check the authentication on received packets, but do not reject packets that cannot be authenticated.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## overload (Protocols IS-IS)

---

<b>Syntax</b>	<pre>overload {     advertise-high-metrics;     allow-route-leaking;     timeout <i>seconds</i>; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <i>isis</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <i>isis</i> ], [edit protocols <i>isis</i> ], [edit routing-instances <i>routing-instance-name</i> protocols <i>isis</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Configure the local routing device so that it appears to be overloaded. This statement causes the routing device to continue participating in IS-IS routing, but prevents it from being used for transit traffic. Traffic destined to immediately attached subnets continues to transit the routing device.</p> <p>You can also advertise maximum link metrics in network layer reachability information (NLRI) instead of setting the overload bit.</p> <p>You configure or disable overload mode in IS-IS with or without a timeout. Without a timeout, overload mode is set until it is explicitly deleted from the configuration. With a timeout, overload mode is set if the time elapsed since the IS-IS instance started is less than the specified timeout.</p> <p>A timer is started for the difference between the timeout and the time elapsed since the instance started. If the time elapsed after the IS-IS instance is enabled is less than the specified timeout, overload mode is set. When the timer expires, overload mode is cleared. In overload mode, the routing device IS-IS advertisements are originated with the overload bit set. This causes the transit traffic to take paths around the routing device. However, the overloaded routing device's own links are still accessible.</p> <p>The value of the overload bit depends on these three scenarios:</p> <ol style="list-style-type: none"><li>1. When the overload bit has already been set to a given value and the routing process is restarted: Link-state PDUs are regenerated with the overload bit cleared.</li><li>2. When the overload bit is reset to a lesser value while the routing process is running: Link-state PDUs are regenerated with the overload bit cleared.</li><li>3. When the overload bit is reset to a greater value while the routing process is running: Link-state PDUs are regenerated with the overload bit set to the difference between the old and new value.</li></ol> <p>In overload mode, the routing device advertisement is originated with all the transit routing device links (except stub) set to a metric of 0xFFFF. The stub routing device links are</p>

advertised with the actual cost of the interfaces corresponding to the stub. This causes the transit traffic to avoid the overloaded routing device and take paths around the routing device.

To understand the reason for setting the overload bit, consider that BGP converges slowly. It is not very good at detecting that a neighbor is down because it has slow-paced keepalive timers. Once the BGP neighbor is determined to be down, it can take up to 2 minutes for a BGP router to declare the neighbor down. IS-IS is much quicker. IS-IS only takes 10-30 seconds to detect absent peers. It is the slowness of BGP, more precisely the slowness of internal BGP (IBGP), that necessitates the use of the overload bit. IS-IS and BGP routing are mutually dependent on each other. If both do not converge at the same time, traffic is dropped without notification (black holed).

You might want to configure the routing device so that it appears to be overloaded when you are restarting routing on the device. Setting the overload bit for a fixed amount of time right after a restart of the routing protocol process (rpd) ensures that the router does not receive transit traffic while the routing protocols (especially IBGP) are still converging.

Setting the overload bit is useful when performing hardware or software maintenance work on a routing device. After the maintenance work, clear the overload bit to carry on forwarding transit traffic. Manual clearing of the overload bit is not always possible. What is needed is an automated way of clearing the overload bit after some amount of time. Most networks use a time value of 300 seconds. This 5-minute value provides a good balance, allowing time to bring up even large internal IBGP meshes, while still relatively quick.

Another appropriate application for setting for the overload bit is on dedicated devices such as BGP route reflectors, which are intentionally not meant to carry any transit traffic. In this case, you would not use the timer.

You can verify that the overload bit is set by running the **show isis database** command.

**Options**    **advertise-high-metrics**—Advertise maximum link metrics in NLRIs instead of setting the overload bit.

The **advertise-high-metric** setting is only valid while the routing device is in overload mode.

When **advertise-high-metric** is configured, IS-IS does not set the overload bit. Rather, it sets the metric to 63 or 16,777,214, depending whether wide metrics are enabled. This allows the overloaded routing device to be used for transit as a last resort.

An L1-L2 router in overload mode stops leaking route information between L1 and L2 levels and clears its attached bit. This is also true when **advertise-high-metrics** is configured.

**allow-route-leaking**—Enable leaking of route information into the network even if the overload bit is set.

**NOTE:** The **allow-route-leaking** option does not work if the routing device is in dynamic overload mode. Dynamic overload can occur if the device has exceeded its resource limits, such as the prefix limit.

---

**timeout seconds**—Number of seconds at which the overloading is reset.

**Range:** 60 through 1800 seconds

**Default:** 0 seconds

**Required Privilege Level**    routing—To view this statement in the configuration.  
   routing-control—To add this statement to the configuration.

**Related Documentation**    • *Example: Configuring IS-IS*

## passive (Protocols IS-IS)

<b>Syntax</b>	<code>passive;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols isis <b>interface</b> <i>interface-name</i>],          [edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <b>interface</b> <i>interface-name</i>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],          [edit protocols isis <b>interface</b> <i>interface-name</i>],          [edit protocols isis interface <i>interface-name</i> level <i>level-number</i>],          [edit routing-instances <i>routing-instance-name</i> protocols isis <b>interface</b> <i>interface-name</i>],          [edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.          Statement introduced in Junos OS Release 9.0 for EX Series switches.          Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Advertise the direct interface addresses on an interface or into a level on the interface without actually running IS-IS on that interface or level.</p> <p>This statement effectively prevents IS-IS from running on the interface. To enable IS-IS on an interface, include the <b>interface</b> statement at the [edit protocols isis] or the [edit routing-instances <i>routing-instance-name</i> protocols isis] hierarchy level. To disable it, include the <b>disable</b> statement at those hierarchy levels. The three states—enabling, disabling, or not running IS-IS on an interface—are mutually exclusive.</p>
<div>  <p><b>NOTE:</b> Configuring IS-IS on a loopback interface automatically renders it as a passive interface, irrespective of whether the <b>passive</b> statement was used in the configuration of the interface.</p> </div>	
<p>If neither passive mode nor the <b>family iso</b> option is configured on the IS-IS interface, then the routing device treats the interface as not being operational, and no direct IPv4/IPv6 routes are exported into IS-IS. (You configure the <b>family iso</b> option at the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>] hierarchy level.)</p>	
<b>Default</b>	By default, IS-IS must be configured on an interface or a level for direct interface addresses to be advertised into that level.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.          routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Multi-Level IS-IS on page 3927</a></li> <li>• <code>disable</code></li> </ul>

## point-to-point

---

<b>Syntax</b>	point-to-point;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols isis <a href="#">interface interface-name</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <a href="#">interface interface-name</a> ], [edit protocols isis <a href="#">interface interface-name</a> ], [edit routing-instances <i>routing-instance-name</i> protocols isis <a href="#">interface interface-name</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Configure an IS-IS interface to behave like a point-to-point connection.</p> <p>You can use the <b>point-to-point</b> statement to configure a LAN interface to act like a point-to-point interface for IS-IS. You do not need an unnumbered LAN interface, and it has no effect if configured on an interface that is already point-to-point.</p> <p>The <b>point-to-point</b> statement affects only IS-IS protocol procedures on that interface. All other protocols continue to treat the interface as a LAN interface. Only two IS-IS routing devices can be connected to the LAN interface, and both must be configured as point-to-point.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">IS-IS Overview on page 3914</a></li><li>• <a href="#">Understanding IS-IS Designated Routers on page 3975</a></li><li>• <i>Example: Configuring Synchronization Between IS-IS and LDP</i></li></ul>

## preference (Protocols IS-IS)

<b>Syntax</b>	<code>preference <i>preference</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols isis <a href="#">level level-number</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <a href="#">level level-number</a>],</p> <p>[edit protocols isis <a href="#">level level-number</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis <a href="#">level level-number</a>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure the preference of internal routes.</p> <p>Route preferences (also known as administrative distances) are used to select which route is installed in the forwarding table when several protocols calculate routes to the same destination. The route with the lowest preference value is selected.</p> <p>To change the preference values, include the <b>preference</b> statement (for internal routes) or the <b>external-preference</b> statement.</p>
<b>Options</b>	<p><b><i>preference</i></b>—Preference value.</p> <p><b>Range:</b> 0 through 4,294,967,295 (<math>2^{32} - 1</math>)</p> <p><b>Default:</b> 15 (for Level 1 internal routes), 18 (for Level 2 internal routes), 160 (for Level 1 external routes), 165 (for Level 2 external routes)</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Route Preferences Overview</i></li> <li>• <i>Example: Redistributing OSPF Routes into IS-IS</i></li> <li>• <i>Example: Redistributing BGP Routes with a Specific Community Tag into IS-IS</i></li> <li>• <a href="#">external-preference on page 3991</a></li> </ul>

## prefix-export-limit (Protocols IS-IS)

---

<b>Syntax</b>	<code>prefix-export-limit <i>number</i>;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols isis <a href="#">level level-number</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>isis <a href="#">level level-number</a>],</code> <code>[edit protocols isis <a href="#">level level-number</a>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols isis <a href="#">level level-number</a>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Configure a limit to the number of prefixes exported into IS-IS.</p> <p>By default, there is no limit to the number of prefixes that can be exported into IS-IS. To configure a limit to the number of prefixes that can be exported into IS-IS, include the <b>prefix-export-limit</b> statement. The <b>prefix-export-limit</b> statement protects the rest of the network from a malicious policy by applying a threshold filter for exported routes.</p> <p>The number of prefixes depends on the size of your network. Good design advice is to set it to double the total number of IS-IS Level 1 and Level 2 routing devices in your network.</p> <p>If the number of prefixes exported into IS-IS exceeds the configured limit, the overload bit is set and the overload state is reached. When other routers detect that this bit is set, they do not use this routing device for transit traffic, but they do use it for packets destined to the overloaded routing device's directly connected networks and IP prefixes. The overload state can be cleared by using the <a href="#">clear isis overload</a> command.</p> <p>The <a href="#">show isis overview</a> command displays the prefix export limit when it is configured.</p>
<b>Options</b>	<p><b><i>number</i></b>—Prefix limit.</p> <p><b>Range:</b> 0 through 4,294,967,295 (<math>2^{32} - 1</math>)</p> <p><b>Default:</b> None</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Redistributing BGP Routes with a Specific Community Tag into IS-IS</i></li><li>• <i>Example: Redistributing OSPF Routes into IS-IS</i></li></ul>

## priority (Protocols IS-IS)

<b>Syntax</b>	<code>priority <i>number</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure the interface's priority for becoming the designated router. The interface with the highest priority value becomes that level's designated router.</p> <p>The priority value is meaningful only on a multiaccess network. It has no meaning on a point-to-point interface.</p> <p>A routing device advertises its priority to become a designated router in its hello packets. On all multiaccess networks, IS-IS uses the advertised priorities to elect a designated router for the network. This routing device is responsible for sending network link-state advertisements, which describe all the routing devices attached to the network. These advertisements are flooded throughout a single area.</p> <p>A routing device's priority for becoming the designated router is indicated by an arbitrary number from 0 through 127. Routing devices with a higher value are more likely to become the designated router.</p>
<b>Options</b>	<p><i>number</i>—Priority value.</p> <p><b>Range:</b> 0 through 127</p> <p><b>Default:</b> 64</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

## topologies (Protocols IS-IS)

---

<b>Syntax</b>	<pre>topologies {     ipv4-multicast;     ipv6-multicast;     ipv6-unicast; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <a href="#">isis</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ], [edit protocols <a href="#">isis</a> ], [edit routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure alternate IS-IS topologies.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Configuring IS-IS IPv4 and IPv6 Unicast Topologies</i></li><li>• <a href="#">Example: Configuring IS-IS Multicast Topology on page 3956</a></li></ul>

## traceoptions (Protocols IS-IS)

<b>Syntax</b>	<pre>traceoptions {     file <i>name</i> &lt;size <i>size</i>&gt; &lt;files <i>number</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;<i>flag-modifier</i>&gt; &lt;disable&gt;; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <a href="#">isis</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ], [edit protocols <a href="#">isis</a> ], [edit routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure IS-IS protocol-level tracing options. To specify more than one tracing operation, include multiple <b>flag</b> statements.

**NOTE:** The **traceoptions** statement is not supported on QFabric systems.

<b>Default</b>	The default IS-IS protocol-level tracing options are those inherited from the routing protocols <b>traceoptions</b> statement included at the <b>[edit routing-options]</b> hierarchy level.
<b>Options</b>	<p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>name</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks (" "). All files are placed in the directory <b>/var/log</b>. We recommend that you place IS-IS tracing output in the file <b>isis-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 10 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one flag, include multiple <b>flag</b> statements.</p>

### IS-IS Protocol-Specific Tracing Flags

- **csn**—Complete sequence number PDU (CSNP) packets
- **error**—Errored IS-IS packets
- **graceful-restart**—Graceful restart operation
- **hello**—Hello packets
- **ldp-synchronization**—Synchronization between IS-IS and LDP
- **lsp**—Link-state PDUs
- **lsp-generation**—Link-state PDU generation packets
- **packets**—All IS-IS protocol packets
- **psn**—Partial sequence number PDU (PSNP) packets
- **spf**—Shortest-path-first calculations

#### Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations, including adjacency changes

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

***flag-modifier***—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **receive**—Trace the packets being received.
- **send**—Trace the packets being transmitted.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

<b>Required Privilege</b>	routing and trace—To view this statement in the configuration.
<b>Level</b>	routing-control and trace-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring the Transmission Frequency for CSNPs on IS-IS Interfaces</i></li> <li>• <i>Example: Configuring the Transmission Frequency for Link-State PDUs on IS-IS Interfaces</i></li> <li>• <i>Example: Enabling Packet Checksums on IS-IS Interfaces</i></li> </ul>

## traffic-engineering (Protocols IS-IS)

---

**Syntax**

```
traffic-engineering {
  disable;
  credibility-protocol-preference;
  family inet {
    shortcuts {
      multicast-rpf-routes;
    }
  }
  family inet6 {
    shortcuts;
  }
  multipath {
    lsp-equal-cost;
  }
}
```

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols [isis](#)],  
[edit protocols [isis](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Support for the **family** statement introduced in Junos OS Release 9.3.  
Support for the **credibility-protocol-preference** statement introduced in Junos OS Release 9.4.  
Support for the **multipath** statement introduced in Junos OS Release 9.6.  
Support for the **lsp-equal-cost** statement introduced in Junos OS Release 9.6.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description** Configure traffic engineering properties for IS-IS.

IS-IS always performs shortest-path-first (SPF) calculations to determine next hops. For prefixes reachable through a particular next hop, IS-IS places that next hop for that prefix in the inet.0 routing table. In addition, for routers running MPLS, IS-IS installs the prefix for IPv4 routes in the inet.3 routing table as well. The inet.3 table, which is present on the ingress router, contains the host address of each MPLS label-switched path (LSP) egress router. BGP uses this routing table to resolve next-hop addresses.

If you enable IS-IS traffic engineering shortcuts and if there is a label-switched path to a point along the path to that prefix, IS-IS installs the prefix in the inet.3 routing table and uses the LSP as a next hop. The net result is that for BGP egress routers for which there is no LSP, BGP automatically uses an LSP along the path to reach the egress router.

In Junos OS Release 9.3 and later, IS-IS traffic engineering shortcuts support IPv6 routes. LSPs to be used for shortcuts continue to be signaled using IPv4. However, by default, shortcut routes calculated through IPv6 routes are added to the inet6.3 routing table. The default behavior is for only BGP to use LSPs in its calculations. If you configure MPLS so that both BGP and interior gateway protocols use LSPs for forwarding traffic, shortcut routes calculated through IPv6 are added to the inet6.0 routing table. IS-IS ensures that the IPv6 routes running over the IPv4 MPLS LSP are correctly de-encapsulated at the

tunnel egress by pushing an extra IPv6 explicit null label between the IPv6 payload and the IPv4 transport label.

RSVP LSPs with a higher preference than IS-IS routes are not considered during the computation of traffic engineering shortcuts.

To configure IS-IS so that it uses LSPs as shortcuts when installing information in the inet.3 or inet6.3 routing table, include the following statements:

```
family inet {
  shortcuts {
    multicast-rpf-routes;
  }
}
family inet6 {
  shortcuts;
}
```

For IPv4 traffic, include the **inet** statement. For IPv6 traffic, include the **inet6** statement.

To configure load balancing across multiple LSPs, include the **multipath** statement.

When traffic engineering shortcuts are used, RSVP first looks at the **metric2** value, which is derived from the IGP cost. After this, RSVP considers the LSP metric value. So, if a certain path changes for an LSP and the cost changes, not all LSPs are used to load-balance the network.

When a route with an improved metric is added to the IS-IS internal routing table, IS-IS flushes all next-hop information (including LSP next-hop information) for a route. This is undesirable, because certain equal-cost multipath (ECMP) combinations can be lost during route calculation. To override this default behavior for load balancing, include the **lsp-equal-cost** statement to retain the equal cost path information in the routing table.

```
multipath {
  lsp-equal-cost;
}
```

Because the inet.3 routing table is present only on ingress routers, you can configure LSP shortcuts only on these routers.

**Default** IS-IS traffic engineering support is enabled.

By default, IS-IS supports traffic engineering by exchanging basic information with the traffic engineering database. To disable this support, and to disable IS-IS shortcuts if they are configured, include the **disable** statement.

**Options**    **credibility-protocol-preference**—Specify that IS-IS should use the configured protocol preference for IGP routes to determine the traffic engineering database credibility value. By default, the traffic engineering database prefers IS-IS routes even when the routes of another IGP are configured with a lower, that is, more preferred value. Use this statement to override this default behavior.

The traffic engineering database assigns a credibility value to each IGP and prefers the routes of the IGP with the highest credibility value. In Junos OS Release 9.4 and later, you can configure IS-IS to take protocol preference into account to determine the traffic engineering database credibility value. When protocol preference is used to determine the credibility value, IS-IS routes are not automatically preferred by the traffic engineering database, depending on your configuration. For example, OSPF routes have a default preference value of 10, whereas IS-IS Level 1 routes have a default preference value of 15. When protocol preference is enabled, the credibility value is determined by deducting the protocol preference value from a base value of 512. Using default protocol preference values, OSPF has a credibility value of 502, whereas IS-IS has a credibility value of 497. Because the traffic engineering database prefers IGP routes with the highest credibility value, OSPF routes are now preferred.

**NOTE:** This feature is also supported for OSPFv2.

---

**lsp-equal-cost**—Configure LSPs to be retained as equal cost paths for load balancing when a better path metric is found during the IS-IS internal routing table calculation. When a route with an improved metric is added to the IS-IS internal routing table, IS-IS flushes all next-hop information (including LSP next-hop information) for a route. This is undesirable, because certain equal-cost multipath (ECMP) combinations can be lost during route calculation. To override this default IS-IS behavior, include the **lsp-equal-cost** statement for load balancing, so that the equal cost path information is retained in the routing table.

**multipath**—Enable load balancing for multiple LSPs.

The remaining statements are explained separately.

**Required Privilege Level**    routing—To view this statement in the configuration.  
   routing-control—To add this statement to the configuration.

## wide-metrics-only

<b>Syntax</b>	wide-metrics-only;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols isis <b>level</b> <i>level-number</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <b>level</b> <i>level-number</i> ], [edit protocols isis <b>level</b> <i>level-number</i> ], [edit routing-instances <i>routing-instance-name</i> protocols isis <b>level</b> <i>level-number</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure IS-IS to generate metric values greater than 63 on a per IS-IS level basis.  Normally, IS-IS metrics can have values up to 63, and IS-IS generates two type, length, and value (TLV) tuples, one for an IS-IS adjacency and the second for an IP prefix. To allow IS-IS to support traffic engineering, a second pair of TLVs has been added to IS-IS, one for IP prefixes and the second for IS-IS adjacency and traffic engineering information. With these TLVs, IS-IS metrics can have values up to 16,777,215 ( $2^{24} - 1$ ).  To configure IS-IS to generate only the new pair of TLVs and thus to allow the wider range of metric values, include the <b>wide-metrics-only</b> statement.
<b>Default</b>	By default, Junos OS supports the sending and receiving of wide metrics. Junos OS allows a maximum metric value of 63 and generates both pairs of TLVs.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Enabling Wide IS-IS Metrics for Traffic Engineering</i></li> <li>• <i>te-metric</i></li> </ul>

## clear isis overload

---

<b>List of Syntax</b>	<a href="#">Syntax on page 4048</a> <a href="#">Syntax (EX Series Switches and QFX Series) on page 4048</a>
<b>Syntax</b>	<code>clear isis overload</code> <code>&lt;instance <i>instance-name</i>&gt;</code> <code>&lt;logical-system (all   <i>logical-system-name</i>)&gt;</code>
<b>Syntax (EX Series Switches and QFX Series)</b>	<code>clear isis overload</code> <code>&lt;instance <i>instance-name</i>&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Reset the IS-IS dynamic overload bit. This command can appear to not work, continuing to display <b>overload</b> after execution. The bit is reset only if the root cause is corrected by configuration remotely or locally.</p> <p>When other routers detect that the overload bit is set, they do not use this routing device for transit traffic, but they do use it for packets destined to the overloaded routing device's directly connected networks and IP prefixes.</p>
<b>Options</b>	<p><b>none</b>—Reset the IS-IS dynamic overload bit.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Reset the IS-IS dynamic overload bit for the specified routing instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	clear

<b>Output Fields</b>	<a href="#">Table 281 on page 4053</a> describes the output fields for the <b>show isis adjacency</b> command. Output fields are listed in the approximate order in which they appear.

Table 281: show isis adjacency Output Fields

Field Name	Field Description	Level of Output
<b>Interface</b>	Interface through which the neighbor is reachable.	All levels
<b>System</b>	System identifier ( <b>sysid</b> ), displayed as a name, if possible.	<b>brief</b>
<b>L or Level</b>	Level: <ul style="list-style-type: none"> <li>• 1—Level 1 only</li> <li>• 2—Level 2 only</li> <li>• 3—Level 1 and Level 2</li> </ul> An exclamation point (!) preceding the level number indicates that the adjacency is missing an IP address.	All levels
<b>State</b>	State of the adjacency: <b>Up</b> , <b>Down</b> , <b>New</b> , <b>One-way</b> , <b>Initializing</b> , or <b>Rejected</b> .	All levels
<b>Hold (secs)</b>	Remaining hold time of the adjacency.	<b>brief</b>
<b>SNPA</b>	Subnetwork point of attachment (MAC address of the next hop).	<b>brief</b>
<b>Expires in</b>	How long until the adjacency expires, in seconds.	<b>detail</b>
<b>Priority</b>	Priority to become the designated intermediate system.	<b>detail extensive</b>
<b>Up/Down transitions</b>	Count of adjacency status changes from <b>Up</b> to <b>Down</b> or from <b>Down</b> to <b>Up</b> .	<b>detail</b>
<b>Last transition</b>	Time of the last <b>Up/Down</b> transition.	<b>detail</b>
<b>Circuit type</b>	Bit mask of levels on this interface: 1=Level 1 router; 2=Level 2 router; 3=both Level 1 and Level 2 router.	<b>detail</b>
<b>Speaks</b>	Protocols supported by this neighbor.	<b>detail extensive</b>
<b>MAC address</b>	MAC address of the interface.	<b>detail extensive</b>
<b>Topologies</b>	Supported topologies.	<b>detail extensive</b>
<b>Restart capable</b>	Whether a neighbor is capable of graceful restart: <b>Yes</b> or <b>No</b> .	<b>detail extensive</b>
<b>Adjacency advertisement: Advertise</b>	This routing device has signaled to advertise this interface to its neighbors in their link-state PDUs.	<b>detail extensive</b>
<b>Adjacency advertisement: Suppress</b>	This neighbor has signaled not to advertise the interface in the routing device's outbound link-state PDUs.	<b>detail extensive</b>
<b>IP addresses</b>	IP address of this neighbor.	<b>detail extensive</b>

Table 281: show isis adjacency Output Fields (*continued*)

Field Name	Field Description	Level of Output
Transition log	<p>List of recent transitions, including:</p> <ul style="list-style-type: none"> <li>• <b>When</b>—Time at which an IS-IS adjacency transition occurred.</li> <li>• <b>State</b>—Current state of the IS-IS adjacency (<b>up</b>, <b>down</b>, or <b>rejected</b>). <ul style="list-style-type: none"> <li>• <b>Up</b>—Adjacency is up and operational.</li> <li>• <b>Down</b>—Adjacency is down and not available.</li> <li>• <b>Rejected</b>—Adjacency has been rejected.</li> </ul> </li> <li>• <b>Event</b>—Type of transition that occurred. <ul style="list-style-type: none"> <li>• <b>Seenself</b>—Possible routing loop has been detected.</li> <li>• <b>Interface down</b>—IS-IS interface has gone down and is no longer available.</li> <li>• <b>Error</b>—Adjacency error.</li> </ul> </li> <li>• <b>Down reason</b>—Reason that an IS-IS adjacency is down: <ul style="list-style-type: none"> <li>• <b>3-Way Handshake Failed</b>—Connection establishment failed.</li> <li>• <b>Address Mismatch</b>—Address mismatch caused link failure.</li> <li>• <b>Aged Out</b>—Link expired.</li> <li>• <b>ISO Area Mismatch</b>—IS-IS area mismatch caused link failure.</li> <li>• <b>Bad Hello</b>—Unacceptable hello message caused link failure.</li> <li>• <b>BFD Session Down</b>—Bidirectional failure detection caused link failure.</li> <li>• <b>Interface Disabled</b>—IS-IS interface is disabled.</li> <li>• <b>Interface Down</b>—IS-IS interface is unavailable.</li> <li>• <b>Interface Level Disabled</b>—IS-IS level is disabled.</li> <li>• <b>Level Changed</b>—IS-IS level has changed on the adjacency.</li> <li>• <b>Level Mismatch</b>—Levels on adjacency are not compatible.</li> <li>• <b>MPLS LSP Down</b>—Label-switched path (LSP) is unavailable.</li> <li>• <b>MT Topology Changed</b>—IS-IS topology has changed.</li> <li>• <b>MT Topology Mismatch</b>—IS-IS topology is mismatched.</li> <li>• <b>Remote System ID Changed</b>—Adjacency peer system ID changed.</li> <li>• <b>Protocol Shutdown</b>—IS-IS protocol is disabled.</li> <li>• <b>CLI Command</b>—Adjacency brought down by user.</li> <li>• <b>Unknown</b>—Unknown.</li> </ul> </li> </ul>	extensive

## Sample Output

### show isis adjacency

```

user@host> show isis adjacency

**Output Fields** [Table 283 on page 4059](#) describes the output fields for the **show isis database** command. Output fields are listed in the approximate order in which they appear. Fields that contain internal IS-IS information useful only in troubleshooting obscure problems are not described in the table. For more details about these fields, contact your customer support representative.

**Table 283: show isis database Output Fields**

Field Name	Field Description	Level of Output
<b>Interface name</b>	Name of the interface on which the link-state PDU has been received; always <b>IS-IS</b> for this command.	All levels
level	Level of intermediate system: <ul style="list-style-type: none"> <li>• <b>1</b>—Intermediate system routes within an area; when the destination is outside an area, it routes toward a Level 2 system.</li> <li>• <b>2</b>—Intermediate system routes between areas and toward other ASs.</li> </ul>	All levels
LSP ID	Link-state PDU identifier.	All levels
Sequence	Sequence number of the link-state PDU.	All levels
Checksum	Checksum value of the link-state PDU.	All levels
Lifetime (secs)	Remaining lifetime of the link-state PDU, in seconds.	All levels
Attributes	Attributes of the specified database: <b>L1</b> , <b>L2</b> , <b>Overload</b> , or <b>Attached</b> (L1 only).	none <b>brief</b>
# LSPs	Total number of link-state PDUs in the specified link-state database.	none <b>brief</b>
IP prefix	Prefix advertised by this link-state PDU.	<b>detail extensive</b>
IS neighbor	IS-IS neighbor of the advertising system.	<b>detail extensive</b>
ES neighbor	(J Series routers only) An ES-IS neighbor of the advertising system.	<b>detail extensive</b>
IP prefix	IPv4 prefix advertised by this link-state PDU.	<b>detail extensive</b>
V6 prefix	IPv6 prefix advertised by this link-state PDU.	<b>detail extensive</b>
Metric	Metric of the prefix or neighbor.	<b>detail extensive</b>
Header	<ul style="list-style-type: none"> <li>• <b>LSP ID</b>—Link state PDU identifier of the header.</li> <li>• <b>Length</b>—Header length.</li> <li>• <b>Allocated Length</b>—Amount of length available for the header.</li> <li>• <b>Router ID</b>—Address of the local routing device.</li> <li>• <b>Remaining Lifetime</b>—Remaining lifetime of the link-state PDU, in seconds.</li> </ul>	<b>extensive</b>

Table 283: show isis database Output Fields (*continued*)

Field Name	Field Description	Level of Output
Packet	<ul style="list-style-type: none"> <li>• <b>LSP ID</b>—The identifier for the link-state PDU.</li> <li>• <b>Length</b>—Packet length.</li> <li>• <b>Lifetime</b>—Remaining lifetime, in seconds.</li> <li>• <b>Checksum</b>—The checksum of the link-state PDU.</li> <li>• <b>Sequence</b>—The sequence number of the link-state PDU. Every time the link-state PDU is updated, this number increments.</li> <li>• <b>Attributes</b>—Packet attributes.</li> <li>• <b>NLPID</b>—Network layer protocol identifier.</li> <li>• <b>Fixed length</b>—Specifies the set length for the packet.</li> </ul>	extensive
TLVs	<ul style="list-style-type: none"> <li>• <b>Area Address</b>—Area addresses that the routing device can reach.</li> <li>• <b>Speaks</b>—Supported routing protocols.</li> <li>• <b>IP router id</b>—ID of the routing device (usually the IP address).</li> <li>• <b>IP address</b>—IPv4 address.</li> <li>• <b>Hostname</b>—Assigned name of the routing device.</li> <li>• <b>IP prefix</b>—IP prefix of the routing device.</li> <li>• <b>Metric</b>—IS-IS metric that measures the cost of the adjacency between the originating routing device and the advertised routing device.</li> <li>• <b>IP extended prefix</b>—Extended IP prefix of the routing device.</li> <li>• <b>IS neighbor</b>—Directly attached neighbor's name and metric.</li> <li>• <b>IS extended neighbor</b>—Directly attached neighbor's name, metric, IP address, local interface index, and remote interface index.</li> </ul> <p>The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205.</p>	extensive

## Sample Output

## show isis hostname

<b>List of Syntax</b>	<a href="#">Syntax on page 4070</a> <a href="#">Syntax (EX Series Switches and QFX Series) on page 4070</a>
<b>Syntax</b>	<pre>show isis hostname &lt;logical-system (all   <i>logical-system-name</i>)&gt;</pre>
<b>Syntax (EX Series Switches and QFX Series)</b>	show isis hostname
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Display IS-IS hostname database information.</p> <p>This command displays the system ID-to-name cache. The output shows if the mapping has been learned by receipt of a Hostname TLV #137 (type dynamic) configured in Junos OS with the <b>set system host-name</b> command, or a static mapping defined in Junos OS with the <b>set system static-host-mapping <i>hostname</i> sysid</b> command (type static). The local router always has its type set to static even if <b>static-host-mapping</b> is not configured.</p>
<b>Options</b>	<p><b>none</b>—Display IS-IS hostname database information.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show isis hostname on page 4071</a>
<b>Output Fields</b>	<p><a href="#">Table 284 on page 4070</a> describes the output fields for the <b>show isis hostname</b> command. Output fields are listed in the approximate order in which they appear.</p>

**Table 284: show isis hostname Output Fields**

Field Name	Field Description
<b>System Id</b>	System identifier mapped to the hostname.
<b>Hostname</b>	Hostname mapped to the system identifier.
<b>Type</b>	<p>Type of mapping between system identifier and hostname.</p> <ul style="list-style-type: none"> <li><b>Dynamic</b>—Hostname mapping determined as described in RFC 2763, <i>Dynamic Hostname Exchange Mechanism for IS-IS</i>.</li> <li><b>Static</b>—Hostname mapping configured by user.</li> </ul>

## Sample Output

show isis hostname

```
user@host> show isis hostname
IS-IS hostname database:
System Id      Hostname
1921.6800.4201 isis1
1921.6800.4202 isis2
1921.6800.4203 isis3
```

	Type
1921.6800.4201 isis1	Dynamic
1921.6800.4202 isis2	Static
1921.6800.4203 isis3	Dynamic

```
show isis interface

**Output Fields** [Table 285 on page 4073](#) describes the output fields for the **show isis interface** command. Output fields are listed in the approximate order in which they appear.

**Table 285: show isis interface Output Fields**

Field Name	Field Description	Level of Output
<i>interface-name</i>	Name of the interface.	<b>detail</b>
<b>Designated router</b>	Routing device selected by other routers that is responsible for sending link-state advertisements that describe the network. Used only on broadcast networks.	<b>detail</b>
<b>Index</b>	Interface index assigned by the Junos OS kernel.	<b>detail</b>
<b>State</b>	Internal implementation information.	<b>detail</b>
<b>Circuit id</b>	Circuit identifier.	<b>detail</b>
<b>Circuit type</b>	Circuit type: <ul style="list-style-type: none"> <li>• 1—Level 1 only</li> <li>• 2—Level 2 only</li> <li>• 3—Level 1 and Level 2</li> </ul>	<b>detail</b>
<b>LSP interval</b>	Interval between link-state PDUs sent from the interface.	<b>detail</b>
<b>CSNP interval</b>	Interval between complete sequence number PDUs sent from the interface.	<b>detail extensive</b>
<b>Sysid</b>	System identifier.	<b>detail</b>
<b>Interface</b>	Interface through which the adjacency is made.	<b>none brief</b>
<b>L or Level</b>	Level: <ul style="list-style-type: none"> <li>• 1—Level 1 only</li> <li>• 2—Level 2 only</li> <li>• 3—Level 1 and Level 2</li> </ul> <p><b>NOTE:</b> The default IS-IS level on loopback interfaces are always same as the IS-IS level configured on other IS-IS interfaces in a router. You can also configure IS-IS level on loopback interfaces per your requirement.</p>	All levels
<b>CirID</b>	Circuit identifier.	<b>none brief</b>
<b>Level 1 DR</b>	Level 1 designated intermediate system.	<b>none brief</b>
<b>Level 2 DR</b>	Level 2 designated intermediate system.	<b>none brief</b>
<b>L1/L2 Metric</b>	Interface's metric for Level 1 and Level 2. If there is no information, the metric is 0.	<b>none brief</b>

Table 285: show isis interface Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Adjacency advertisement: Advertise</b>	This routing device has signaled to advertise this interface to its neighbors in their label-switched paths (LSPs).	<b>detail extensive</b>
<b>Adjacency advertisement: Suppress</b>	This neighbor has signaled not to advertise this interface in the routing device's outbound LSPs.	<b>detail extensive</b>
<b>Adjacencies</b>	Number of adjacencies established on this interface.	<b>detail</b>
<b>Priority</b>	Priority value for this interface.	<b>detail</b>
<b>Metric</b>	Metric value for this interface.	<b>detail</b>
<b>Hello(s) / Hello Interval</b>	Interface's hello interval.	<b>detail extensive</b>
<b>Hold(s) / Hold Time</b>	Interface's hold time.	<b>detail extensive</b>
<b>Designated Router</b>	Router responsible for sending network link-state advertisements, which describe all the routing devices attached to the network.	<b>detail</b>
<b>Hello padding</b>	Type of hello padding: <ul style="list-style-type: none"> <li>• <b>Adaptive</b>—On point-to-point connections, the hello packets are padded from the initial detection of a new neighbor until the neighbor verifies the adjacency as Up in the adjacency state TLV. If the neighbor does not support the adjacency state TLV, then padding continues. On LAN connections, padding starts from the initial detection of a new neighbor until there is at least one active adjacency on the interface.</li> <li>• <b>Loose</b>—(Default) The hello packet is padded from the initial detection of a new neighbor until the adjacency transitions to the Up state.</li> <li>• <b>Strict</b>—Padding is performed on all interface types and for all adjacency states, and is continuous.</li> </ul>	<b>extensive</b>
<b>LDP sync state</b>	Current LDP synchronization state: <b>in sync</b> , <b>in holddown</b> , or <b>not supported</b> .	<b>extensive</b>
<b>reason</b>	Reason for being in the LDP sync state.	<b>extensive</b>
<b>config holdtime</b>	Configured value of the hold timer.	<b>extensive</b>
<b>remaining</b>	If the state is not in sync and the hold time is not infinity, then this field displays the remaining hold time in seconds.	<b>extensive</b>

## Sample Output

### show isis interface

```
user@host> show isis interface
```

## IS-IS interface database:

Interface	L	CirID	Level 1 DR	Level 2 DR	L1/L2 Metric
at-2/3/0.0	3	0x1	Point to Point	Point to Point	10/10
lo0.0	3	0x1	Passive	Passive	0/0

## show isis overview

<b>Syntax</b>	<b>show isis overview</b> <instance <i>instance-name</i> > <logical-system (all   <i>logical-system-name</i> )>
<b>Syntax (EX Series Switches and QFX Series)</b>	<b>show isis overview</b> <instance <i>instance-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 8.5. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Display IS-IS overview information.
<b>Options</b>	<b>none</b> —Display standard overview information about IS-IS for all routing instances.  <b>instance <i>instance-name</i></b> —(Optional) Display overview information for the specified routing instance.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show isis overview on page 4078</a>
<b>Output Fields</b>	<a href="#">Table 286 on page 4076</a> lists the output fields for the <b>show isis overview</b> command. Output fields are listed in the approximate order in which they appear.

**Table 286: show isis overview Output Fields**

Field Name	Field Description
Instance	IS-IS routing instance.
Router ID	Router ID of the routing device.
Adjacency holddown	Adjacency holddown capability: <b>enabled</b> or <b>disabled</b> .
Maximum Areas	Maximum number of IS-IS areas advertised by the routing device.
LSP life time	Lifetime of the link-state PDU, in seconds.
Attached bit evaluation	Attached bit capability: <b>enabled</b> or <b>disabled</b> .
SPF delay	Delay before performing consecutive shortest-path-first (SPF) calculations.
SPF holddown	Delay before performing additional SPF calculations after the maximum number of consecutive SPF calculations is reached.

Table 286: show isis overview Output Fields (*continued*)

Field Name	Field Description
SPF rapid runs	Maximum number of SPF calculations that can be performed in succession before the holddown timer begins.
Overload bit at startup is set	Overload bit capability is enabled.
Overload high metrics	Overload high metrics capability: <b>enabled</b> or <b>disabled</b> .
Overload timeout	Time period after which overload is reset and the time that remains before the timer is set to expire.
Traffic engineering	Traffic engineering capability: <b>enabled</b> or <b>disabled</b> .
Restart	Graceful restart capability: <b>enabled</b> or <b>disabled</b> .
Restart duration	Time period for complete reacquisition of IS-IS neighbors.
Helper mode	Graceful restart helper capability: <b>enabled</b> or <b>disabled</b> .
Level	IS-IS level: <ul style="list-style-type: none"> <li>• 1—Level 1 information</li> <li>• 2—Level 2 information</li> </ul>
IPv4 is enabled	IP Protocol version 4 capability is enabled.
IPv6 is enabled	IP Protocol version 6 capability is enabled.
CLNS is enabled	(J Series routers only) OSI CLNP capability is enabled.
Internal route preference	Preference value of internal routes.
External route preference	Preference value of external routes.
Prefix export limit	Number of prefixes allowed to be exported, as configured by the <a href="#">prefix-export-limit</a> statement.
Prefix export count	Number of prefixes exported.
Wide area metrics are enabled	Wide area metrics capability is enabled.
Narrow metrics are enabled	Narrow metrics capability is enabled.

## Sample Output

### show isis overview

```
user@host> show isis overview
Instance: master
  Router ID: 10.255.107.183
  Adjacency holddown: disabled
  Maximum Areas: 3
  LSP life time: 1200
  Attached bit evaluation: enabled
  SPF delay: 200 msec, SPF holddown: 5000 msec, SPF rapid runs: 3
  IPv4 is enabled, IPv6 is enabled
  Traffic engineering: enabled
  Restart: Disabled
    Helper mode: Enabled
Level 1
  Internal route preference: 15
  External route preference: 160
  Wide metrics are enabled, Narrow metrics are enabled
Level 2
  Internal route preference: 18
  External route preference: 165
  Prefix export limit: 5, Prefix export count: 5
  Wide metrics are enabled
```

## show isis route

<b>List of Syntax</b>	<a href="#">Syntax on page 4079</a> <a href="#">Syntax (EX Series Switches and QFX Series) on page 4079</a>

Field Name	Field Description
PDU type	<p>PDU type:</p> <ul style="list-style-type: none"> <li>• <b>CSNP</b>—Complete sequence number PDUs contain a complete list of all link-state PDUs in the IS-IS database. CSNPs are sent periodically on all links, and the receiving systems use the information in the CSNP to update and synchronize their link-state PDU databases. The designated router multicasts CSNPs on broadcast links in place of sending explicit acknowledgments for each link-state PDU.</li> <li>• <b>IIH</b>—IS-IS hello packets are broadcast to discover the identity of neighboring IS-IS systems and to determine whether the neighbors are Level 1 or Level 2 intermediate systems.</li> <li>• <b>LSP</b>—Link-state PDUs contain information about the state of adjacencies to neighboring IS-IS systems. Link-state PDUs are flooded periodically throughout an area.</li> <li>• <b>PSNP</b>—Partial sequence number PDUs are sent multicast by a receiver when it detects that it is missing a link-state PDU (when its link-state PDU database is out of date). The receiver sends a PSNP to the system that transmitted the CSNP, effectively requesting that the missing link-state PDU be transmitted. That routing device, in turn, forwards the missing link-state PDU to the requesting routing device.</li> <li>• <b>Unknown</b>—The PDU type is unknown.</li> </ul>
Received	Number of PDUs received since IS-IS started or since the statistics were set to zero.
Processed	Number of PDUs received less the number dropped.
Drops	Number of PDUs dropped.
Sent	Number of PDUs transmitted since IS-IS started or since the statistics were set to zero.
Rexmit	Number of PDUs retransmitted since IS-IS started or since the statistics were set to zero.
Total packets received/sent	Total number of PDUs received and transmitted since IS-IS started or since the statistics were set to zero.
SNP queue length	Number of CSPN and PSNP packets currently waiting in the queue for processing. This value is almost always 0.
LSP queue length	Number of link-state PDUs waiting in the queue for processing. This value is almost always 0.
SPF runs	Number of shortest-path-first (SPF) calculations that have been performed. If this number is incrementing rapidly, it indicates that the network is unstable.
Fragments rebuilt	Number of link-state PDU fragments that the local system has computed.
LSP regenerations	Number of link-state PDUs that have been regenerated. A link-state PDU is regenerated when it is nearing the end of its lifetime and it has not changed.
Purges initiated	Number of purges that the system initiated. A purge is initiated if the software decides that a link-state PDU must be removed from the network.

## OSPF Overview

OSPF is an interior gateway protocol (IGP) that routes packets within a single autonomous system (AS). OSPF uses link-state information to make routing decisions, making route calculations using the shortest-path-first (SPF) algorithm (also referred to as the Dijkstra algorithm). Each router running OSPF floods link-state advertisements throughout the AS or area that contain information about that router's attached interfaces and routing metrics. Each router uses the information in these link-state advertisements to calculate the least cost path to each network and create a routing table for the protocol.

Junos OS supports OSPF version 2 (OSPFv2) and OSPF version 3 (OSPFv3), including virtual links, stub areas, and for OSPFv2, authentication. Junos OS does not support type-of-service (ToS) routing.

OSPF was designed for the Transmission Control Protocol/Internet Protocol (TCP/IP) environment and as a result explicitly supports IP subnetting and the tagging of externally derived routing information. OSPF also provides for the authentication of routing updates.

OSPF routes IP packets based solely on the destination IP address contained in the IP packet header. OSPF quickly detects topological changes, such as when router interfaces become unavailable, and calculates new loop-free routes quickly and with a minimum of routing overhead traffic.

**NOTE:** On SRX Series devices, when only one link-protection is configured under the OSPF interface, the device does not install an alternative route in the forwarding table. When the per-packet load-balancing is enabled as a workaround, the device does not observe both the OSPF metric and sending the traffic through both the interfaces.

An OSPF AS can consist of a single area, or it can be subdivided into multiple areas. In a single-area OSPF network topology, each router maintains a database that describes the topology of the AS. Link-state information for each router is flooded throughout the AS. In a multiarea OSPF topology, each router maintains a database that describes the topology of its area, and link-state information for each router is flooded throughout that area. All routers maintain summarized topologies of other areas within an AS. Within each area, OSPF routers have identical topological databases. When the AS or area topology changes, OSPF ensures that the contents of all routers' topological databases converge quickly.

All OSPFv2 protocol exchanges can be authenticated. OSPFv3 relies on IPsec to provide this functionality. This means that only trusted routers can participate in the AS's routing. A variety of authentication schemes can be used. A single authentication scheme is configured for each area, which enables some areas to use stricter authentication than others.

Externally derived routing data (for example, routes learned from BGP) is passed transparently throughout the AS. This externally derived data is kept separate from the OSPF link-state data. Each external route can be tagged by the advertising router, enabling the passing of additional information between routers on the boundaries of the AS.

**NOTE:** By default, Junos OS is compatible with RFC 1583, *OSPF Version 2*. In Junos OS Release 8.5 and later, you can disable compatibility with RFC 1583 by including the `no-rfc-1583` statement. For more information, see “[Example: Disabling OSPFv2 Compatibility with RFC 1583](#)” on page 4128.

This topic describes the following information:

- [OSPF Default Route Preference Values on page 4092](#)
- [OSPF Routing Algorithm on page 4092](#)
- [OSPF Three-Way Handshake on page 4093](#)
- [OSPF Version 3 on page 4094](#)

### OSPF Default Route Preference Values

The Junos OS routing protocol process assigns a default preference value to each route that the routing table receives. The default value depends on the source of the route. The preference value is from 0 through 4,294,967,295 ( $2^{32} - 1$ ), with a lower value indicating a more preferred route. [Table 289 on page 4092](#) lists the default preference values for OSPF.

**Table 289: Default Route Preference Values for OSPF**

How Route Is Learned	Default Preference	Statement to Modify Default Preference
OSPF internal route	10	OSPF <code>preference</code>
OSPF AS external routes	150	OSPF <code>external-preference</code>

### OSPF Routing Algorithm

OSPF uses the shortest-path-first (SPF) algorithm, also referred to as the Dijkstra algorithm, to determine the route to each destination. All routing devices in an area run this algorithm in parallel, storing the results in their individual topological databases. Routing devices with interfaces to multiple areas run multiple copies of the algorithm. This section provides a brief summary of how the SPF algorithm works.

When a routing device starts, it initializes OSPF and waits for indications from lower-level protocols that the router interfaces are functional. The routing device then uses the OSPF hello protocol to acquire neighbors, by sending hello packets to its neighbors and receiving their hello packets.

On broadcast or nonbroadcast multiaccess networks (physical networks that support the attachment of more than two routing devices), the OSPF hello protocol elects a designated router for the network. This routing device is responsible for sending *link-state advertisements* (LSAs) that describe the network, which reduces the amount of network traffic and the size of the routing devices' topological databases.

The routing device then attempts to form *adjacencies* with some of its newly acquired neighbors. (On multiaccess networks, only the designated router and backup designated

router form adjacencies with other routing devices.) Adjacencies determine the distribution of routing protocol packets. Routing protocol packets are sent and received only on adjacencies, and topological database updates are sent only along adjacencies. When adjacencies have been established, pairs of adjacent routers synchronize their topological databases.

A routing device sends LSA packets to advertise its state periodically and when its state changes. These packets include information about the routing device's adjacencies, which allows detection of nonoperational routing devices.

Using a reliable algorithm, the routing device floods LSAs throughout the area, which ensures that all routing devices in an area have exactly the same topological database. Each routing device uses the information in its topological database to calculate a shortest-path tree, with itself as the root. The routing device then uses this tree to route network traffic.

The description of the SPF algorithm up to this point has explained how the algorithm works within a single area (*intra-area routing*). For internal routers to be able to route to destinations outside the area (*interarea routing*), the area border routers must inject additional routing information into the area. Because the area border routers are connected to the backbone, they have access to complete topological data about the backbone. The area border routers use this information to calculate paths to all destinations outside its area and then advertise these paths to the area's internal routers.

Autonomous system (AS) boundary routers flood information about external autonomous systems throughout the AS, except to stub areas. Area border routers are responsible for advertising the paths to all AS boundary routers.

### OSPF Three-Way Handshake

OSPF creates a topology map by flooding LSAs across OSPF-enabled links. LSAs announce the presence of OSPF-enabled interfaces to adjacent OSPF interfaces. The exchange of LSAs establishes bidirectional connectivity between all adjacent OSPF interfaces (neighbors) using a three-way handshake, as shown in [Figure 136 on page 4093](#).

**Figure 136: OSPF Three-Way Handshake**

In [Figure 136 on page 4093](#), Router A sends hello packets out all its OSPF-enabled interfaces when it comes online. Router B receives the packet, which establishes that Router B can receive traffic from Router A. Router B generates a response to Router A to acknowledge receipt of the hello packet. When Router A receives the response, it establishes that Router B can receive traffic from Router A. Router A then generates a final response packet to inform Router B that Router A can receive traffic from Router B. This three-way handshake ensures bidirectional connectivity.

As new neighbors are added to the network or existing neighbors lose connectivity, the adjacencies in the topology map are modified accordingly through the exchange (or absence) of LSAs. These LSAs advertise only the incremental changes in the network, which helps minimize the amount of OSPF traffic on the network. The adjacencies are shared and used to create the network topology in the topological database.

### OSPF Version 3

---

OSPFv3 is a modified version of OSPF that supports IP version 6 (IPv6) addressing. OSPFv3 differs from OSPFv2 in the following ways:

- All neighbor ID information is based on a 32-bit router ID.
- The protocol runs per link rather than per subnet.
- Router and network link-state advertisements (LSAs) do not carry prefix information.
- Two new LSA types are included: link-LSA and intra-area-prefix-LSA.
- Flooding scopes are as follows:
  - Link-local
  - Area
  - AS
- Link-local addresses are used for all neighbor exchanges except virtual links.
- Authentication is removed. The IPv6 authentication header relies on the IP layer.
- The packet format has changed as follows:
  - Version number 2 is now version number 3.
  - The **db** option field has been expanded to 24 bits.
  - Authentication information has been removed.
  - Hello messages do not have address information.
  - Two new option bits are included: **R** and **V6**.
- Type 3 summary LSAs have been renamed *inter-area-prefix-LSAs*.
- Type 4 summary LSAs have been renamed *inter-area-router-LSAs*.

## OSPF Areas and Router Functionality Overview

In OSPF, a single autonomous system (AS) can be divided into smaller groups called *areas*. This reduces the number of link-state advertisements (LSAs) and other OSPF overhead traffic sent on the network, and it reduces the size of the topology database that each router must maintain. The routing devices that participate in OSPF routing perform one or more functions based on their location in the network.

This topic describes the following OSPF area types and routing device functions:

- [Areas on page 4095](#)
- [Area Border Routers on page 4095](#)
- [Backbone Areas on page 4095](#)
- [AS Boundary Routers on page 4096](#)
- [Backbone Router on page 4096](#)
- [Internal Router on page 4096](#)
- [Stub Areas on page 4096](#)
- [Not-So-Stubby Areas on page 4096](#)
- [Transit Areas on page 4097](#)

---

### Areas

An *area* is a set of networks and hosts within an AS that have been administratively grouped together. We recommend that you configure an area as a collection of contiguous IP subnetted networks. Routing devices that are wholly within an area are called *internal routers*. All interfaces on internal routers are directly connected to networks within the area.

The topology of an area is hidden from the rest of the AS, thus significantly reducing routing traffic in the AS. Also, routing within the area is determined only by the area's topology, providing the area with some protection from bad routing data.

All routing devices within an area have identical topology databases.

---

### Area Border Routers

Routing devices that belong to more than one area and connect one or more OSPF areas to the backbone area are called *area border routers* (ABRs). At least one interface is within the backbone while another interface is in another area. ABRs also maintain a separate topological database for each area to which they are connected.

---

### Backbone Areas

An OSPF *backbone area* consists of all networks in area ID 0.0.0.0, their attached routing devices, and all ABRs. The backbone itself does not have any ABRs. The backbone distributes routing information between areas. The backbone is simply another area, so the terminology and rules of areas apply: a routing device that is directly connected to the backbone is an internal router on the backbone, and the backbone's topology is hidden from the other areas in the AS.

The routing devices that make up the backbone must be physically contiguous. If they are not, you must configure *virtual links* to create the appearance of backbone connectivity. You can create virtual links between any two ABRs that have an interface to a common nonbackbone area. OSPF treats two routing devices joined by a virtual link as if they were connected to an unnumbered point-to-point network.

---

### AS Boundary Routers

Routing devices that exchange routing information with routing devices in non-OSPF networks are called *AS boundary routers*. They advertise externally learned routes throughout the OSPF AS. Depending on the location of the AS boundary router in the network, it can be an ABR, a backbone router, or an internal router (with the exception of stub areas). Internal routers within a stub area cannot be an AS boundary router because stub areas cannot contain any Type 5 LSAs.

Routing devices within the area where the AS boundary router resides know the path to that AS boundary router. Any routing device outside the area only knows the path to the nearest ABR that is in the same area where the AS boundary router resides.

---

### Backbone Router

*Backbone routers* are routing devices that have one or more interfaces connected to the OSPF backbone area (area ID 0.0.0.0).

---

### Internal Router

Routing devices that connect to only one OSPF area are called *internal routers*. All interfaces on internal routers are directly connected to networks within a single area.

---

### Stub Areas

*Stub areas* are areas through which or into which AS external advertisements are not flooded. You might want to create stub areas when much of the topological database consists of AS external advertisements. Doing so reduces the size of the topological databases and therefore the amount of memory required on the internal routers in the stub area.

Routing devices within a stub area rely on the default routes originated by the area's ABR to reach external AS destinations. You must configure the **default-metric** option on the ABR before it advertises a default route. Once configured, the ABR advertises a default route in place of the external routes that are not being advertised within the stub area, so that routing devices in the stub area can reach destinations outside the area.

The following restrictions apply to stub areas: you cannot create a virtual link through a stub area, a stub area cannot contain an AS boundary router, the backbone cannot be a stub area, and you cannot configure an area as both a stub area and a not-so-stubby area.

---

### Not-So-Stubby Areas

An OSPF stub area has no external routes in it, so you cannot redistribute from another protocol into a stub area. A *not-so-stubby area* (NSSA) allows external routes to be

flooded within the area. These routes are then leaked into other areas. However, external routes from other areas still do not enter the NSSA.

The following restriction applies to NSSAs: you cannot configure an area as both a stub area and an NSSA.

### Transit Areas

*Transit areas* are used to pass traffic from one adjacent area to the backbone (or to another area if the backbone is more than two hops away from an area). The traffic does not originate in, nor is it destined for, the transit area.

## Packets Overview

There are several types of link-state advertisement (LSA) packets.

This topic describes the following information:

- [OSPF Packet Header on page 4097](#)
- [Hello Packets on page 4098](#)
- [Database Description Packets on page 4098](#)
- [Link-State Request Packets on page 4098](#)
- [Link-State Update Packets on page 4098](#)
- [Link-State Acknowledgment Packets on page 4099](#)
- [Link-State Advertisement Packet Types on page 4099](#)

### OSPF Packet Header

All OSPFv2 packets have a common 24-byte header, and OSPFv3 packets have a common 16-byte header, that contains all information necessary to determine whether OSPF should accept the packet. The header consists of the following fields:

- Version number—The current OSPF version number. This can be either **2** or **3**.
- Type—Type of OSPF packet.
- Packet length—Length of the packet, in bytes, including the header.
- Router ID—IP address of the router from which the packet originated.
- Area ID—Identifier of the area in which the packet is traveling. Each OSPF packet is associated with a single area. Packets traveling over a virtual link are labeled with the backbone area ID, 0.0.0.0.

- Checksum—Fletcher checksum.
- Authentication—(OSPFv2 only) Authentication scheme and authentication information.
- Instance ID—(OSPFv3 only) Identifier used when there are multiple OSPFv3 realms configured on a link.

---

### Hello Packets

Routers periodically send hello packets on all interfaces, including virtual links, to establish and maintain neighbor relationships. Hello packets are multicast on physical networks that have a multicast or broadcast capability, which enables dynamic discovery of neighboring routers. (On nonbroadcast networks, dynamic neighbor discovery is not possible, so you must configure all neighbors statically as described in [“Example: Configuring an OSPFv2 Interface on a Nonbroadcast Multiaccess Network” on page 4133.](#))

Hello packets consist of the OSPF header plus the following fields:

- Network mask—(OSPFv2 only) Network mask associated with the interface.
- Hello interval—How often the router sends hello packets. All routers on a shared network must use the same hello interval.
- Options—Optional capabilities of the router.
- Router priority—The router’s priority to become the designated router.
- Router dead interval—How long the router waits without receiving any OSPF packets from a router before declaring that router to be down. All routers on a shared network must use the same router dead interval.
- Designated router—IP address of the designated router.
- Backup designated router—IP address of the backup designated router.
- Neighbor—IP addresses of the routers from which valid hello packets have been received within the time specified by the router dead interval.

---

### Database Description Packets

When initializing an adjacency, OSPF exchanges database description packets, which describe the contents of the topological database. These packets consist of the OSPF header, packet sequence number, and the link-state advertisement’s header.

---

### Link-State Request Packets

When a router detects that portions of its topological database are out of date, it sends a link-state request packet to a neighbor requesting a precise instance of the database. These packets consist of the OSPF header plus fields that uniquely identify the database information that the router is seeking.

---

### Link-State Update Packets

Link-state update packets carry one or more link-state advertisements one hop farther from their origin. The router multicasts (floods) these packets on physical networks that support multicast or broadcast mode. The router acknowledges all link-state update

packets and, if retransmission is necessary, sends the retransmitted advertisements unicast.

Link-state update packets consist of the OSPF header plus the following fields:

- Number of advertisements—Number of link-state advertisements included in this packet.
- Link-state advertisements—The link-state advertisements themselves.

### Link-State Acknowledgment Packets

The router sends link-state acknowledgment packets in response to link-state update packets to verify that the update packets have been received successfully. A single acknowledgment packet can include responses to multiple update packets.

Link-state acknowledgment packets consist of the OSPF header plus the link-state advertisement header.

### Link-State Advertisement Packet Types

Link-state request, link-state update, and link-state acknowledgment packets are used to reliably flood link-state advertisement packets. OSPF sends the following types of link-state advertisements:

- Router link advertisements—Are sent by all routers to describe the state and cost of the router's links to the area. These link-state advertisements are flooded throughout a single area only.
- Network link advertisements—Are sent by designated routers to describe all the routers attached to the network. These link-state advertisements are flooded throughout a single area only.
- Summary link advertisements—Are sent by area border routers to describe the routes that they know about in other areas. There are two types of summary link advertisements: those used when the destination is an IP network, and those used when the destination is an AS boundary router. Summary link advertisements describe interarea routes, that is, routes to destinations outside the area but within the AS. These link-state advertisements are flooded throughout the advertisement's associated areas.
- AS external link advertisement—Are sent by AS boundary routers to describe external routes that they know about. These link-state advertisements are flooded throughout the AS (except for stub areas).

Each link-state advertisement type describes a portion of the OSPF routing domain. All link-state advertisements are flooded throughout the AS.

Each link-state advertisement packet begins with a common 20-byte header.

## OSPF External Metrics Overview

When OSPF exports route information from external autonomous systems (ASs), it includes a cost, or *external metric*, in the route. OSPF supports two types of external metrics: Type 1 and Type 2. The difference between the two metrics is how OSPF calculates the cost of the route. Type 1 external metrics are equivalent to the link-state metric, where the cost is equal to the sum of the internal costs plus the external cost. This means that Type 1 external metrics include the external cost to the destination as well as the cost (metric) to reach the AS boundary router. Type 2 external metrics are greater than the cost of any path internal to the AS. Type 2 external metrics use only the external cost to the destination and ignore the cost (metric) to reach the AS boundary router. By default, OSPF uses the Type 2 external metric.

#### OSPF Designated Router Overview

---

Large LANs that have many routing devices and therefore many OSPF adjacencies can produce heavy control-packet traffic as link-state advertisements (LSAs) are flooded across the network. To alleviate the potential traffic problem, OSPF uses designated routers on all multiaccess networks (broadcast and nonbroadcast multiaccess [NBMA] networks types). Rather than broadcasting LSAs to all their OSPF neighbors, the routing devices send their LSAs to the designated router. Each multiaccess network has a designated router, which performs two main functions:

- Originate network link advertisements on behalf of the network.

- Establish adjacencies with all routing devices on the network, thus participating in the synchronizing of the link-state databases.

In LANs, the election of the designated router takes place when the OSPF network is initially established. When the first OSPF links are active, the routing device with the highest router identifier (defined by the **router-id** configuration value, which is typically the IP address of the routing device, or the loopback address) is elected the designated router. The routing device with the second highest router identifier is elected the backup designated router. If the designated router fails or loses connectivity, the backup designated router assumes its role and a new backup designated router election takes place between all the routers in the OSPF network.

OSPF uses the router identifier for two main purposes: to elect a designated router, unless you manually specify a priority value, and to identify the routing device from which a packet is originated. At designated router election, the router priorities are evaluated first, and the routing device with the highest priority is elected designated router. If router priorities tie, the routing device with the highest router identifier, which is typically the routing device's IP address, is chosen as the designated router. If you do not configure a router identifier, the IP address of the first interface to come online is used. This is usually the loopback interface. Otherwise, the first hardware interface with an IP address is used.

At least one routing device on each logical IP network or subnet must be eligible to be the designated router for OSPFv2. At least one routing device on each logical link must be eligible to be the designated router for OSPFv3.

By default, routing devices have a priority of 128. A priority of 0 marks the routing device as ineligible to become the designated router. A priority of 1 means the routing device has the least chance of becoming a designated router. A priority of 255 means the routing device is always the designated router.

---

### Example: Configuring an OSPF Router Identifier

---

This example shows how to configure an OSPF router identifier.

- [Requirements on page 4102](#)
- [Overview on page 4103](#)
- [Configuration on page 4103](#)
- [Verification on page 4104](#)

#### **Requirements**

Before you begin:

- Identify the interfaces on the routing device that will participate in OSPF. You must enable OSPF on all interfaces within the network on which OSPF traffic is to travel.
- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices* or the *Junos OS Interfaces Configuration Guide for Security Devices*.

### Overview

The router identifier is used by OSPF to identify the routing device from which a packet originated. Junos OS selects a router identifier according to the following set of rules:

1. By default, Junos OS selects the lowest configured physical IP address of an interface as the router identifier.
2. If a loopback interface is configured, the IP address of the loopback interface becomes the router identifier.
3. If multiple loopback interfaces are configured, the lowest loopback address becomes the router identifier.
4. If a router identifier is explicitly configured using the **router-id address** statement under the **[edit routing-options]** hierarchy level, the above three rules are ignored.

**NOTE:** If the router identifier is modified in a network, the link-state advertisements (LSAs) advertised by the previous router identifier are retained in the OSPF database until the LSA retransmit interval has timed out.

If the router identifier is not configured explicitly and an interface IP address is used as the router identifier, the established OSPF adjacency flaps when the interface goes down, or when it is brought back into the network. When the interface is brought back into the network, or a new interface is introduced into the network, the router identifier is selected again based on the rules stated above. Hence, it is strongly recommended that you explicitly configure the router identifier under the **[edit routing-options]** hierarchy level to avoid unpredictable behavior if the interface address on a loopback interface changes.

**NOTE:** The router identifier behavior described here holds good even when configured under **[edit routing-instances routing-instance-name routing-options]** and **[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options]** hierarchy levels.

In this example, you configure the OSPF router identifier by setting its router ID value to the IP address of the device, which is 177.162.4.24.

### Configuration

**CLI Quick Configuration** To quickly configure an OSPF router identifier, copy the following command and paste it into the CLI.

```
[edit]
set routing-options router-id 177.162.4.24
```

**Step-by-Step Procedure** To configure an OSPF router identifier:

1. Configure the OSPF router identifier by entering the **[router-id]** configuration value.
- ```
[edit]
```

```
user@host# set routing-options router-id 177.162.4.24
```

2. If you are done configuring the device, commit the configuration.

```
[edit]  
user@host# commit
```

### Results

Confirm your configuration by entering the **show routing-options router-id** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show routing-options router-id  
router-id 177.162.4.24;
```

### Verification

After you configure the router ID and activate OSPF on the routing device, the router ID is referenced by multiple OSPF operational mode commands that you can use to monitor and troubleshoot the OSPF protocol. The router ID fields are clearly marked in the output.

### Example: Controlling OSPF Designated Router Election

---

This example shows how to control OSPF designated router election.

- [Requirements on page 4104](#)
- [Overview on page 4104](#)
- [Configuration on page 4104](#)
- [Verification on page 4105](#)

### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices* or the *Junos OS Interfaces Configuration Guide for Security Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4102.

### Overview

This example shows how to control OSPF designated router election. Within the example, you set the OSPF interface to **ge-/0/0/1** and the device priority to 200. The higher the priority value, the greater likelihood the routing device will become the designated router.

By default, routing devices have a priority of 128. A priority of 0 marks the routing device as ineligible to become the designated router. A priority of 1 means the routing device has the least chance of becoming a designated router.

### Configuration

#### CLI Quick Configuration

To quickly configure an OSPF designated router election, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf area 0.0.0.3 interface ge-0/0/1 priority 200
```

**Step-by-Step Procedure** To control OSPF designated router election:

1. Configure an OSPF interface and specify the device priority.

**NOTE:** To specify an OSPFv3 interface, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@host# set protocols ospf area 0.0.0.3 interface ge-0/0/1 priority 200
```

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

### Results

Confirm your configuration by entering the `show protocols ospf` command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.3 {
  interface ge-0/0/1.0 {
    priority 200;
  }
}
```

To confirm your OSPFv3 configuration, enter the `show protocols ospf3` command.

### Verification

Confirm that the configuration is working properly.

- [Verifying the Designated Router Election on page 4105](#)

### Verifying the Designated Router Election

**Purpose** Based on the priority you configured for a specific OSPF interface, you can confirm the address of the area's designated router. The DR ID, DR, or DR-ID field displays the address of the area's designated router. The BDR ID, BDR, or BDR-ID field displays the address of the backup designated router.

**Action** From operational mode, enter the `show ospf interface` and the `show ospf neighbor` commands for OSPFv2, and enter the `show ospf3 interface` and the `show ospf3 neighbor` commands for OSPFv3.

- [Example: Configuring a Single-Area OSPF Network on page 4107](#)
- [Example: Configuring a Multiarea OSPF Network on page 4109](#)

### Understanding OSPF Areas and Backbone Areas

OSPF networks in an autonomous system (AS) are administratively grouped into *areas*. Each area within an AS operates like an independent network and has a unique 32-bit area ID, which functions similar to a network address. Within an area, the topology database contains only information about the area, link-state advertisements (LSAs) are flooded only to nodes within the area, and routes are computed only within the area. The topology of an area is hidden from the rest of the AS, thus significantly reducing routing traffic in the AS. Subnetworks are divided into other areas, which are connected to form the whole of the main network. Routing devices that are wholly within an area are called *internal routers*. All interfaces on internal routers are directly connected to networks within the area.

The central area of an AS, called the *backbone area*, has a special function and is always assigned the area ID 0.0.0.0. (Within a simple, single-area network, this is also the ID of the area.) Area IDs are unique numeric identifiers, in dotted decimal notation, but they are not IP addresses. Area IDs need only be unique within an AS. All other networks or areas in the AS must be directly connected to the backbone area by a routing device that has interfaces in more than one area. These connecting routing devices are called *area border routers* (ABRs). [Figure 137 on page 4106](#) shows an OSPF topology of three areas connected by two ABRs.

Figure 137: Multiarea OSPF Topology

Because all areas are adjacent to the backbone area, OSPF routers send all traffic not destined for their own area through the backbone area. The ABRs in the backbone area are then responsible for transmitting the traffic through the appropriate ABR to the destination area. The ABRs summarize the link-state records of each area and advertise destination address summaries to neighboring areas. The advertisements contain the ID of the area in which each destination lies, so that packets are routed to the appropriate ABR. For example, in the OSPF areas shown in [Figure 137 on page 4106](#), packets sent from Router A to Router C are automatically routed through ABR B.

Junos OS supports active backbone detection. Active backbone detection is implemented to verify that ABRs are connected to the backbone. If the connection to the backbone area is lost, then the routing device's default metric is not advertised, effectively rerouting traffic through another ABR with a valid connection to the backbone. Active backbone detection enables transit through an ABR with no active backbone connection. An ABR advertises to other routing devices that it is an ABR even if the connection to the backbone is down, so that the neighbors can consider it for interarea routes.

An OSPF restriction requires all areas to be directly connected to the backbone area so that packets can be properly routed. All packets are routed first to the backbone area by default. Packets that are destined for an area other than the backbone area are then routed to the appropriate ABR and on to the remote host within the destination area.

### Example: Configuring a Single-Area OSPF Network

This example shows how to configure a single-area OSPF network.

- [Requirements on page 4107](#)
- [Overview on page 4107](#)
- [Configuration on page 4108](#)
- [Verification on page 4109](#)

#### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices* or the *Junos OS Interfaces Configuration Guide for Security Devices*.
- Configure the router identifiers for the devices in your OSPF network. See "[Example: Configuring an OSPF Router Identifier](#)" on page 4102.

#### Overview

To activate OSPF on a network, you must enable the OSPF protocol on all interfaces within the network on which OSPF traffic is to travel. To enable OSPF, you must configure one or more interfaces on the device within an OSPF area. Once the interfaces are configured, OSPF LSAs are transmitted on all OSPF-enabled interfaces, and the network topology is shared throughout the network.

In an autonomous system (AS), the backbone area is always assigned area ID 0.0.0.0 (within a simple, single-area network, this is also the ID of the area). Area IDs are unique numeric identifiers, in dotted decimal notation. Area IDs need only be unique within an

AS. All other networks or areas in the AS must be directly connected to the backbone area by area border routers that have interfaces in more than one area. You must also create a backbone area if your network consists of multiple areas. In this example, you create the backbone area and add interfaces, such as **ge-0/0/0**, as needed to the OSPF area.

To use OSPF on the device, you must configure at least one OSPF area, such as the one shown in [Figure 138 on page 4108](#).

**Figure 138: Typical Single-Area OSPF Network Topology**

#### Configuration

##### CLI Quick Configuration

To quickly configure a single-area OSPF network, copy the following command and paste it into the CLI. You repeat this configuration for all interfaces that are part of the OSPF area.

```
[edit]
set protocols ospf area 0.0.0.0 interface ge-0/0/0
```

##### Step-by-Step Procedure

To configure a single-area OSPF network:

1. Configure the single-area OSPF network by specifying the area ID and associated interface.

**NOTE:** For a single-area OSPFv3 network, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# set protocols ospf area 0.0.0.0 interface ge-0/0/0
```

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

### Results

Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.0 {
  interface ge-0/0/0.0;
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### Verification

Confirm that the configuration is working properly.

#### Verifying the Interfaces in the Area

### Example: Configuring a Multiarea OSPF Network

This example shows how to configure a multiarea OSPF network. To reduce traffic and topology maintenance for the devices in an OSPF autonomous system (AS), you can group the OSPF-enabled routing devices into multiple areas.

- [Requirements on page 4109](#)
- [Overview on page 4110](#)
- [Configuration on page 4110](#)
- [Verification on page 4112](#)

#### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices* or the *Junos OS Interfaces Configuration Guide for Security Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4102.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4104.
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4107.

### Overview

To activate OSPF on a network, you must enable the OSPF protocol on all interfaces within the network on which OSPF traffic is to travel. To enable OSPF, you must configure one or more interfaces on the device within an OSPF area. Once the interfaces are configured, OSPF LSAs are transmitted on all OSPF-enabled interfaces, and the network topology is shared throughout the network.

Each OSPF area consists of routing devices configured with the same area number. The backbone area is always assigned area ID 0.0.0.0. (All area identifiers (IDs) must be unique within an AS.) All other networks or areas in the AS must be directly connected to the backbone area by a router that has interfaces in more than one area. In [Figure 139 on page 4110](#), Devices A and C are in the backbone area (area 0), and Devices D and E are in area 2. Device B has a special role. This is the area border router that connects area 0 and area 2. The area border router maintains a separate topological database for each area to which it is connected.

To reduce traffic and topology maintenance for the devices in an OSPF AS, you can group them into multiple areas as shown in [Figure 139 on page 4110](#). In this example, you create the backbone area, create an additional area (area 2) and assign it unique area ID 0.0.0.2, and you configure Device B as the area border router, where interface **ge-0/0/0** participates in OSPF area 0 and interface **ge-0/0/2** participates in OSPF area 2.

**Figure 139: Typical Multiarea OSPF Network Topology**

### Configuration

**CLI Quick Configuration** To quickly configure a multiarea OSPF network, copy the following commands and paste them into the CLI. You repeat this configuration for all interfaces that are part of the OSPF area.

**Device A** [edit]  
 set protocols ospf area 0.0.0.0 interface ge-0/0/0  
 set protocols ospf area 0.0.0.0 interface ge-0/0/1

**Device C** [edit]  
 set protocols ospf area 0.0.0.0 interface ge-0/0/0

**Device B** [edit]

```
set protocols ospf area 0.0.0.0 interface ge-0/0/0
set protocols ospf area 0.0.0.2 interface ge-0/0/2
```

**Device D**      [edit]  
 set protocols ospf area 0.0.0.2 interface ge-0/0/0  
 set protocols ospf area 0.0.0.2 interface ge-0/0/2

**Device E**      [edit]  
 set protocols ospf area 0.0.0.2 interface ge-0/0/2

**Step-by-Step Procedure**      To configure a multiarea OSPF network:

1.      Configure the backbone area.

**NOTE:** For an OSPFv3 network, include the `ospf3` statement at the [edit protocols] hierarchy level.

```
[edit]
user@A# set protocols ospf area 0.0.0.0 interface ge-0/0/0
user@A# set protocols ospf area 0.0.0.0 interface ge-0/0/1
```

```
[edit]
user@C# set protocols ospf area 0.0.0.0 interface ge-0/0/0
```

```
[edit]
user@B# set protocols ospf area 0.0.0.0 interface ge-0/0/0
```

2.      Configure an additional area for your OSPF network.

```
[edit]
user@B# set protocols ospf area 0.0.0.2 interface ge-0/0/2
```

```
[edit]
user@D# set protocols ospf area 0.0.0.2 interface ge-0/0/0
user@D# set protocols ospf area 0.0.0.2 interface ge-0/0/2
```

```
[edit]
user@E# set protocols ospf area 0.0.0.2 interface ge-0/0/2
```

3.      If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

### Results

Confirm your configuration by entering the `show protocols ospf` command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@A# show protocols ospf
area 0.0.0.0 {
  interface ge-0/0/0.0;
  interface ge-0/0/1.0;
}
```

```
user@C# show protocols ospf
area 0.0.0.0 {
  interface ge-0/0/0.0;
}

user@B# show protocols ospf
area 0.0.0.0 {
  interface ge-0/0/0.0;
}
area 0.0.0.2 {
  interface ge-0/0/2.0;
}

user@D# show protocols ospf
area 0.0.0.2 {
  interface ge-0/0/0.0;
  interface ge-0/0/2.0;
}

user@E# show protocols ospf
area 0.0.0.2 {
  interface ge-0/0/2.0;
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying the Interfaces in the Area on page 4112](#)

### **Verifying the Interfaces in the Area**

**Purpose** Verify that the interface for OSPF or OSPFv3 has been configured for the appropriate area. Confirm that the Area field displays the value that you configured.

**Action** From operational mode, enter the **show ospf interface** command for OSPFv2, and enter the **show ospf3 interface** command for OSPFv3.

### Understanding OSPF Stub Areas, Totally Stubby Areas, and Not-So-Stubby Areas

Figure 140 on page 4113 shows an autonomous system (AS) across which many external routes are advertised. If external routes make up a significant portion of a topology database, you can suppress the advertisements in areas that do not have links outside the network. By doing so, you can reduce the amount of memory the nodes use to maintain the topology database and free it for other uses.

Figure 140: OSPF AS Network with Stub Areas and NSSAs

To control the advertisement of external routes into an area, OSPF uses stub areas. By designating an area border router (ABR) interface to the area as a stub interface, you suppress external route advertisements through the ABR. Instead, the ABR advertises a default route (through itself) in place of the external routes and generates network summary (Type 3) link-state advertisements (LSAs). Packets destined for external routes are automatically sent to the ABR, which acts as a gateway for outbound traffic and routes the traffic appropriately.

**NOTE:** You must explicitly configure the ABR to generate a default route when attached to a stub or not-so-stubby-area (NSSA). To inject a default route with a specified metric value into the area, you must configure the `default-metric` option and specify a metric value.

For example, area 0.0.0.3 in Figure 140 on page 4113 is not directly connected to the outside network. All outbound traffic is routed through the ABR to the backbone and then to the

destination addresses. By designating area 0.0.0.3 as a stub area, you reduce the size of the topology database for that area by limiting the route entries to only those routes internal to the area.

A stub area that only allows routes internal to the area and restricts Type 3 LSAs from entering the stub area is often called a *totally stubby area*. You can convert area 0.0.0.3 to a totally stubby area by configuring the ABR to only advertise and allow the default route to enter into the area. External routes and destinations to other areas are no longer summarized or allowed into a totally stubby area.

**NOTE:** If you incorrectly configure a totally stubby area, you might encounter network connectivity issues. You should have advanced knowledge of OSPF and understand your network environment before configuring totally stubby areas.

Similar to area 0.0.0.3 in [Figure 14-0 on page 4113](#), area 0.0.0.4 has no external connections. However, area 0.0.0.4 has static customer routes that are not internal OSPF routes. You can limit the external route advertisements to the area and advertise the static customer routes by designating the area an NSSA. In an NSSA, the AS boundary router generates NSSA external (Type 7) LSAs and floods them into the NSSA, where they are contained. Type 7 LSAs allow an NSSA to support the presence of AS boundary routers and their corresponding external routing information. The ABR converts Type 7 LSAs into AS external (Type 5) LSAs and leaks them to the other areas, but external routes from other areas are not advertised within the NSSA.

---

### Example: Configuring OSPF Stub and Totally Stubby Areas

---

This example shows how to configure an OSPF stub area and a totally stubby area to control the advertisement of external routes into an area.

- [Requirements on page 4114](#)
- [Overview on page 4115](#)
- [Configuration on page 4116](#)
- [Verification on page 4117](#)

#### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices* or the *Junos OS Interfaces Configuration Guide for Security Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4102.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4104.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4109.

### Overview

The backbone area, which is 0 in [Figure 141 on page 4116](#), has a special function and is always assigned the area ID 0.0.0.0. Area IDs are unique numeric identifiers, in dotted decimal notation. Area IDs need only be unique within an autonomous system (AS). All other networks or areas (such as 3, 7, and 9) in the AS must be directly connected to the backbone area by area border routers (ABRs) that have interfaces in more than one area.

Stub areas are areas through which or into which OSPF does not flood AS external link-state advertisements (Type 5 LSAs). You might create stub areas when much of the topology database consists of AS external advertisements and you want to minimize the size of the topology databases on the internal routers in the stub area.

The following restrictions apply to stub areas:

- You cannot create a virtual link through a stub area.
- A stub area cannot contain an AS boundary router.
- You cannot configure the backbone as a stub area.
- You cannot configure an area as both a stub area and a not-so-stubby area (NSSA).

In this example, you configure each routing device in area 7 (area ID 0.0.0.7) as a stub router and some additional settings on the ABR:

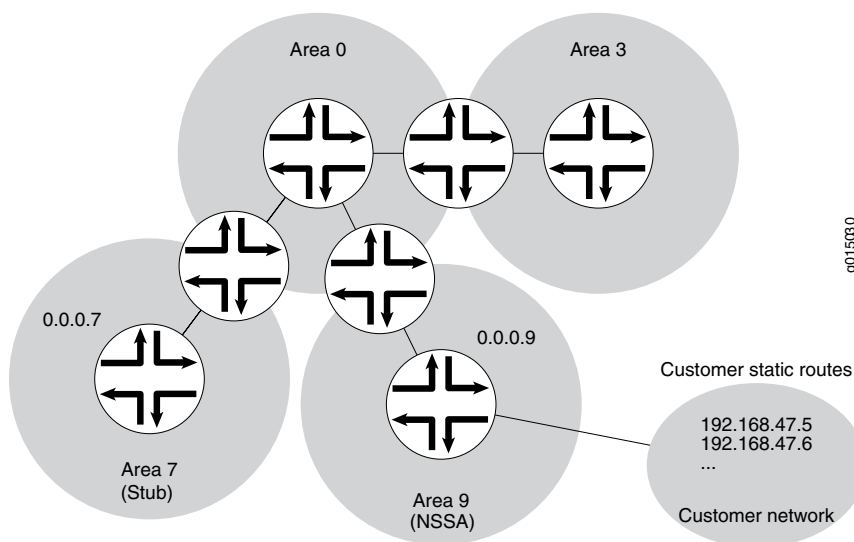

- **stub**—Specifies that this area become a stub area and not be flooded with Type 5 LSAs. You must include the **stub** statement on all routing devices that are in area 7 because this area has no external connections.
- **default-metric**—Configures the ABR to generate a default route with a specified metric into the stub area. This default route enables packet forwarding from the stub area to external destinations. You configure this option only on the ABR. The ABR does not automatically generate a default route when attached to a stub. You must explicitly configure this option to generate a default route.
- **no-summaries**—(Optional) Prevents the ABR from advertising summary routes into the stub area by converting the stub area into a totally stubby area. If configured in combination with the **default-metric** statement, a totally stubby area only allows routes internal to the area and advertises the default route into the area. External routes and destinations to other areas are no longer summarized or allowed into a totally stubby area. Only the ABR requires this additional configuration because it is the only routing device within the totally stubby area that creates Type 3 LSAs used to receive and send traffic from outside of the area.

**NOTE:**

In Junos OS Release 8.5 and later, the following applies:

- A router-identifier interface that is not configured to run OSPF is no longer advertised as a stub network in OSPF LSAs.
- OSPF advertises a local route with a prefix length of 32 as a stub link if the loopback interface is configured with a prefix length other than 32. OSPF also advertises the direct route with the configured mask length, as in earlier releases.

Figure 141: OSPF Network Topology with Stub Areas and NSSAs

**Configuration****CLI Quick Configuration**

- To quickly configure an OSPF stub area, copy the following command and paste it into the CLI. You must configure all routing devices that are part of the stub area.

[edit]

```
set protocols ospf area 0.0.0.7 stub
```

- To quickly configure the ABR to inject a default route into the area, copy the following command and paste it into the CLI. You apply this configuration only on the ABR.

[edit]

```
set protocols ospf area 0.0.0.7 stub default-metric 10
```

- (Optional) To quickly configure the ABR to restrict all summary advertisements and allow only internal routes and default route advertisements into the area, copy the following command and paste it into the CLI. You apply this configuration only on the ABR.

[edit]

```
set protocols ospf area 0.0.0.7 stub no-summaries
```

**Step-by-Step  
Procedure**

To configure OSPF stub areas:

1. On all routing devices in the area, configure an OSPF stub area.

**NOTE:** To specify an OSPFv3 stub area, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@host# set protocols ospf area 0.0.0.7 stub
```

2. On the ABR, inject a default route into the area.

```
[edit]
user@host# set protocols ospf area 0.0.0.7 stub default-metric 10
```

3. (Optional) On the ABR, restrict summary LSAs from entering the area. This step converts the stub area into a totally stubby area.

```
[edit]
user@host# set protocols ospf area 0.0.0.7 stub no-summaries
```

4. If you are done configuring the devices, commit the configuration.

```
[edit]
user@host# commit
```

**Results**

Confirm your configuration by entering the `show protocols ospf` command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

Configuration on all routing devices:

```
user@host# show protocols ospf
area 0.0.0.7 {
  stub;
}
```

Configuration on the ABR (the output also includes the optional setting):

```
user@host# show protocols ospf
area 0.0.0.7 {
  stub default-metric 10 no-summaries;
}
```

To confirm your OSPFv3 configuration, enter the `show protocols ospf3` command.

**Verification**

Confirm that the configuration is working properly.

- [Verifying the Interfaces in the Area on page 4118](#)
- [Verifying the Type of OSPF Area on page 4118](#)

### ***Verifying the Interfaces in the Area***

**Purpose** Verify that the interface for OSPF has been configured for the appropriate area. Confirm that the output includes Stub as the type of OSPF area.

**Action** From operational mode, enter the **show ospf interface detail** command for OSPFv2, and enter the **show ospf3 interface detail** command for OSPFv3.

### ***Verifying the Type of OSPF Area***

**Purpose** Verify that the OSPF area is a stub area. Confirm that the output displays Normal Stub as the Stub type.

**Action** From operational mode, enter the **show ospf overview** command for OSPFv2, and enter the **show ospf3 overview** command for OSPFv3.

---

### **Example: Configuring OSPF Not-So-Stubby Areas**

This example shows how to configure an OSPF not-so-stubby area (NSSA) to control the advertisement of external routes into an area.

- [Requirements on page 4118](#)
- [Overview on page 4118](#)
- [Configuration on page 4120](#)
- [Verification on page 4122](#)

#### ***Requirements***

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices* or the *Junos OS Interfaces Configuration Guide for Security Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4102.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4104
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4109.

#### ***Overview***

The backbone area, which is 0 in [Figure 142 on page 4120](#), has a special function and is always assigned the area ID 0.0.0.0. Area IDs are unique numeric identifiers, in dotted decimal notation. Area IDs need only be unique within an AS. All other networks or areas (such as 3, 7, and 9) in the AS must be directly connected to the backbone area by ABRs that have interfaces in more than one area.

An OSPF stub area has no external routes, so you cannot redistribute routes from another protocol into a stub area. OSPF NSSAs allow external routes to be flooded within the area.

In addition, you might have a situation when exporting Type 7 LSAs into the NSSA is unnecessary. When an AS boundary router is also an ABR with an NSSA attached, Type 7 LSAs are exported into the NSSA by default. If the ABR is attached to multiple NSSAs, a separate Type 7 LSA is exported into each NSSA by default. During route redistribution, this routing device generates both Type 5 LSAs and Type 7 LSAs. You can disable exporting Type 7 LSAs into the NSSA.

**NOTE:** The following restriction applies to NSSAs: You cannot configure an area as both a stub area and an NSSA.

You configure each routing device in area 9 (area ID 0.0.0.9) with the following setting:

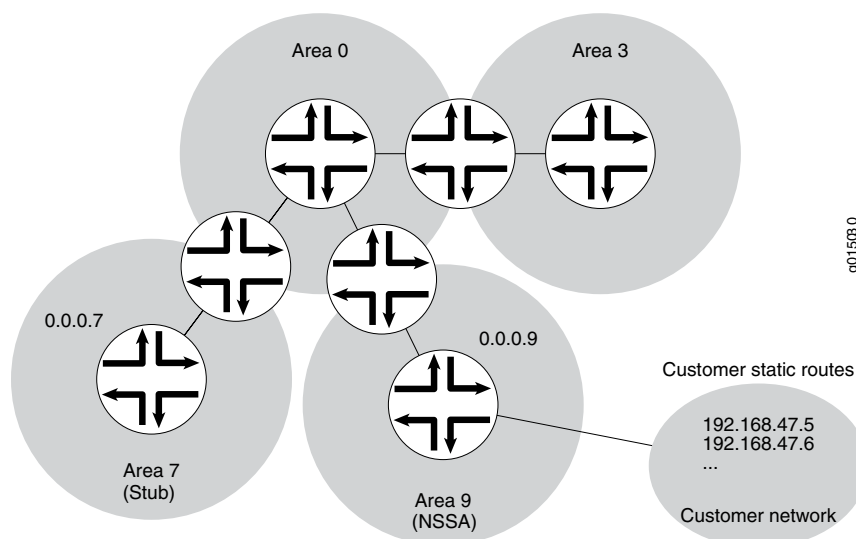

- **nssa**—Specifies an OSPF NSSA. You must include the **nssa** statement on all routing devices in area 9 because this area only has external connections to static routes.

You also configure the ABR in area 9 with the following additional settings:

- **no-summaries**—Prevents the ABR from advertising summary routes into the NSSA. If configured in combination with the **default-metric** statement, the NSSA only allows routes internal to the area and advertises the default route into the area. External routes and destinations to other areas are no longer summarized or allowed into the NSSA. Only the ABR requires this additional configuration because it is the only routing device within the NSSA that creates Type 3 LSAs used to receive and send traffic from outside the area.
- **default-lsa**—Configures the ABR to generate a default route into the NSSA. In this example, you configure the following:
  - **default-metric**—Specifies that the ABR generate a default route with a specified metric into the NSSA. This default route enables packet forwarding from the NSSA to external destinations. You configure this option only on the ABR. The ABR does not automatically generate a default route when attached to an NSSA. You must explicitly configure this option for the ABR to generate a default route.
  - **metric-type**—(Optional) Specifies the external metric type for the default LSA, which can be either Type 1 or Type 2. When OSPF exports route information from external ASs, it includes a cost, or external metric, in the route. The difference between the two metrics is how OSPF calculates the cost of the route. Type 1 external metrics are equivalent to the link-state metric, where the cost is equal to the sum of the internal costs plus the external cost. Type 2 external metrics use only the external cost assigned by the AS boundary router. By default, OSPF uses the Type 2 external metric.
  - **type-7**—(Optional) Floods Type 7 default LSAs into the NSSA if the **no-summaries** statement is configured. By default, when the **no-summaries** statement is configured, a Type 3 LSA is injected into NSSAs for Junos OS release 5.0 and later. To support backward compatibility with earlier Junos OS releases, include the **type-7** statement.

The second example also shows the optional configuration required to disable exporting Type 7 LSAs into the NSSA by including the **no-nssa-abr** statement on the routing device that performs the functions of both an ABR and an AS boundary router.

Figure 142: OSPF Network Topology with Stub Areas and NSSAs

#### Configuration

- [Configuring Routing Devices to Participate in a Not-So-Stubby-Area on page 4120](#)
- [Disabling the Export of Type 7 Link State Advertisements into Not-So-Stubby Areas on page 4122](#)

#### Configuring Routing Devices to Participate in a Not-So-Stubby-Area

**CLI Quick Configuration** To quickly configure an OSPF NSSA, copy the following command and paste it into the CLI. You must configure all routing devices that are part of the NSSA.

```
[edit]
set protocols ospf area 0.0.0.9 nssa
```

To quickly configure an ABR that participates in an OSPF NSSA, copy the following commands and paste them into the CLI.

```
[edit]
set protocols ospf area 0.0.0.9 nssa default-lsa default-metric 10
set protocols ospf area 0.0.0.9 nssa default-lsa metric-type 1
set protocols ospf area 0.0.0.9 nssa default-lsa type-7
set protocols ospf area 0.0.0.9 nssa no-summaries
```

**Step-by-Step Procedure** To configure OSPF NSSAs:

1. On all routing devices in the area, configure an OSPF NSSA.

**NOTE:** To specify an OSPFv3 NSSA area, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# set protocols ospf area 0.0.0.9 nssa
```

2. On the ABR, enter OSPF configuration mode and specify the NSSA area 0.0.0.9 that you already created.

```
[edit ]
user@host# edit protocols ospf area 0.0.0.9 nssa
```

3. On the ABR, inject a default route into the area.

```
[edit protocols ospf area 0.0.0.9 nssa]
user@host# set default-lsa default-metric 10
```

4. (Optional) On the ABR, specify the external metric type for the default route.

```
[edit protocols ospf area 0.0.0.9 nssa]
user@host# set default-lsa metric-type 1
```

5. (Optional) On the ABR, specify the flooding of Type 7 LSAs.

```
[edit protocols ospf area 0.0.0.9 nssa]
user@host# set default-lsa type-7
```

6. On the ABR, restrict summary LSAs from entering the area.

```
[edit protocols ospf area 0.0.0.9 nssa]
user@host# set no-summaries
```

7. If you are done configuring the devices, commit the configuration.

```
[edit protocols ospf area 0.0.0.9 nssa]
user@host# commit
```

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

Configuration on all routing devices in the area:

```
user@host# show protocols ospf
area 0.0.0.9 {
  nssa;
}
```

Configuration on the ABR. The output also includes the optional **metric-type** and **type-7** statements.

```
user@host# show protocols ospf
area 0.0.0.9 {
  nssa {
    default-lsa {
      default-metric 10;
      metric-type 1;
      type-7;
    }
    no-summaries;
  }
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

#### *Disabling the Export of Type 7 Link State Advertisements into Not-So-Stubby Areas*

**CLI Quick Configuration** To quickly disable exporting Type 7 LSAs into the NSSA, copy the following command and paste it into the CLI. You configure this setting on an AS boundary router that is also an ABR with an NSSA area attached.

```
[edit]
set protocols ospf no-nssa-abr
```

**Step-by-Step Procedure** You can configure this setting if you have an AS boundary router that is also an ABR with an NSSA area attached.

1. Disable exporting Type 7 LSAs into the NSSA.

**NOTE:** To specify OSPFv3, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# set protocols ospf no-nssa-abr
```

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
no-nssa-abr;
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

#### *Verification*

Confirm that the configuration is working properly.

- [Verifying the Interfaces in the Area on page 4122](#)
- [Verifying the Type of OSPF Area on page 4123](#)
- [Verifying the Type of LSAs on page 4123](#)

#### *Verifying the Interfaces in the Area*

**Purpose** Verify that the interface for OSPF has been configured for the appropriate area. Confirm that the output includes Stub NSSA as the type of OSPF area.

**Action** From operational mode, enter the **show ospf interface detail** command for OSPFv2, and enter the **show ospf3 interface detail** command for OSPFv3.

**Verifying the Type of OSPF Area**

**Purpose** Verify that the OSPF area is a stub area. Confirm that the output displays Not so Stubby Stub as the Stub type.

**Action** From operational mode, enter the **show ospf overview** command for OSPFv2, and enter the **show ospf3 overview** command for OSPFv3.

**Verifying the Type of LSAs**

**Purpose** Verify the type of LSAs that are in the area. If you disabled exporting Type 7 LSAs into an NSSA, confirm that the Type field does not include NSSA as a type of LSA.

**Action** From operational mode, enter the **show ospf database** command for OSPFv2, and enter the **show ospf3 database** command for OSPFv3.

**Example: Configuring OSPF Multiarea Adjacency**

- [Multiarea Adjacency for OSPF on page 4123](#)
- [Example: Configuring Multiarea Adjacency for OSPF on page 4124](#)

**Multiarea Adjacency for OSPF**

An area is a set of networks and hosts within an autonomous system (AS) that have been administratively grouped together. By default, a single interface can belong to only one OSPF area. However, in some situations, you might want to configure an interface to belong to more than one area. Doing so allows the corresponding link to be considered an intra-area link in multiple areas and to be preferred over other higher-cost intra-area paths. For example, you can configure an interface to belong to multiple areas with a high-speed backbone link between two area border routers (ABRs) so you can create multiarea adjacencies that belong to different areas.

In Junos OS Release 9.2 and later, you can configure a logical interface to belong to more than one OSPFv2 area. Support for OSPFv3 was introduced in Junos OS Release 9.4. As defined in RFC 5185, *OSPF Multi-Area Adjacency*, the ABRs establish multiple adjacencies belonging to different areas over the same logical interface. Each multiarea adjacency is announced as a point-to-point unnumbered link in the configured area by the routers connected to the link. For each area, one of the logical interfaces is treated as primary, and the remaining interfaces that are configured for the area are designated as secondary.

Any logical interface not configured as a secondary interface for an area is treated as the primary interface for that area. A logical interface can be configured as primary interface only for one area. For any other area for which you configure the interface, you must configure it as a secondary interface.

### Example: Configuring Multiarea Adjacency for OSPF

---

This example shows how to configure multiarea adjacency for OSPF.

- [Requirements on page 4124](#)
- [Overview on page 4124](#)
- [Configuration on page 4125](#)
- [Verification on page 4127](#)

#### Requirements

Before you begin, plan your multiarea OSPF network. See [“Example: Configuring a Multiarea OSPF Network” on page 4109](#).

#### Overview

By default, a single interface can belong to only one OSPF area. You can configure a single interface to belong in multiple OSPF areas. Doing so allows the corresponding link to be considered an intra-area link in multiple areas and to be preferred over other higher-cost intra-area paths. When configuring a secondary interface, consider the following:

- For OSPFv2, you cannot configure point-to-multipoint and nonbroadcast multiaccess (NBMA) network interfaces as a secondary interface because secondary interfaces are treated as a point-to-point unnumbered link.
- Secondary interfaces are supported for LAN interfaces (the primary interface can be a LAN interface, but any secondary interfaces are treated as point-to-point unnumbered links over the LAN). In this scenario, you must ensure that there are only two routing devices on the LAN or that there are only two routing devices on the LAN that have secondary interfaces configured for a specific OSPF area.
- Since the purpose of a secondary interface is to advertise a topological path through an OSPF area, you cannot configure a secondary interface or a primary interface with one or more secondary interfaces to be passive. Passive interfaces advertise their address, but do not run the OSPF protocol (adjacencies are not formed and hello packets are not generated).
- Any logical interface not configured as a secondary interface for an area is treated as a primary interface for that area. A logical interface can be configured as the primary interface only for one area. For any other area for which you configure the interface, you must configure it as a secondary interface.
- You cannot configure the **secondary** statement with the **interface all** statement.
- You cannot configure a secondary interface by its IP address.

In this example, you configure an interface to be in two areas, creating a multiarea adjacency with a link between two ABRs: ABR R1 and ABR R2. On each ABR, area 0.0.0.1 contains the primary interface and is the primary link between the ABRs, and area 0.0.0.2 contains the secondary logical interface, which you configure by including the **secondary** statement. You configure interface **so-0/0/0** on ABR R1 and interface **so-1/0/0** on ABR R2.

**Configuration**

**CLI Quick Configuration** To quickly configure a secondary logical interface for an OSPF area, copy the following commands and paste them into the CLI.

Configuration on ABR R1:

```
[edit]
set interfaces so-0/0/0 unit 0 family inet address 192.168.8.45/30
set routing-options router-id 10.255.0.1
set protocols ospf area 0.0.0.1 interface so-0/0/0
set protocols ospf area 0.0.0.2 interface so-0/0/0 secondary
```

Configuration on ABR R2:

```
[edit]
set interfaces so-1/0/0 unit 0 family inet address 192.168.8.37/30
set routing-options router-id 10.255.0.2
set protocols ospf area 0.0.0.1 interface so-1/0/0
set protocols ospf area 0.0.0.2 interface so-1/0/0 secondary
```

**Step-by-Step Procedure** To configure a secondary logical interface:

1. Configure the device interfaces.

**NOTE:** For OSPFv3, on each interface specify the inet6 address family and include the IPv6 address.

```
[edit]
user@R1# set interfaces so-0/0/0 unit 0 family inet address 192.168.8.45/30
```

```
[edit]
user@R2# set interfaces so-1/0/0 unit 0 family inet address 192.168.8.37/30
```

2. Configure the router identifier.

```
[edit]
user@R1# set routing-options router-id 10.255.0.1
```

```
[edit]
user@R2# set routing-options router-id 10.255.0.2
```

3. On each ABR, configure the primary interface for the OSPF area.

**NOTE:** For OSPFv3, include the ospf3 statement at the [edit protocols] hierarchy level.

```
[edit]
user@R1# set protocols ospf 0.0.0.1 interface so-0/0/0
```

```
[edit ]
user@R2# set protocols ospf 0.0.0.2 interface so-1/0/0
```

4. On each ABR, configure the secondary interface for the OSPF area.

```
[edit ]
user@R1# set protocols ospf area 0.0.0.1 so-0/0/0 secondary
```

```
[edit ]
user@R2# set protocols ospf area 0.0.0.2 so-1/0/0 secondary
```

5. If you are done configuring the devices, commit the configuration.

```
[edit protocols ospf area 0.0.0.1 ]
user@host# commit
```

### **Results**

Confirm your configuration by entering the **show interfaces**, **show routing-options**, and the **show protocols ospf** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

Configuration on ABR R1:

```
user@R1# show interfaces
so-0/0/0 {
  unit 0 {
    family inet {
      address 192.168.8.45/30;
    }
  }
}

user@R1# show routing-options
router-id 10.255.0.1;

user@R1# show protocols ospf
area 0.0.0.1 {
  interface so-0/0/0.0;
}
area 0.0.0.2 {
  interface so-0/0/0.0 {
    secondary;
  }
}
```

Configuration on ABR R2:

```
user@R2# show interfaces
so-0/0/0 {
  unit 0 {
    family inet {
      address 192.168.8.37/30;
    }
  }
}

user@R2# show routing-options
router-id 10.255.0.2;

user@R2# show protocols ospf
area 0.0.0.1 {
```

```

        interface so-1/0/0.0;
    }
    area 0.0.0.2 {
        interface so-1/0/0.0 {
            secondary;
        }
    }
}

```

### **Verification**

Confirm that the configuration is working properly.

- [Verifying the Secondary Interface on page 4127](#)
- [Verifying the Interfaces in the Area on page 4127](#)
- [Verifying Neighbor Adjacencies on page 4127](#)

### **Verifying the Secondary Interface**

**Purpose** Verify that the secondary interface appears for the configured area. The Secondary field displays if the interface is configured as a secondary interface. The output might also show the same interface listed in multiple areas.

**Action** From operational mode, enter the **show ospf interface detail** command for OSPFv2, and enter the **show ospf3 interface detail** command for OSPFv3.

### **Verifying the Interfaces in the Area**

**Purpose** Verify the interfaces configured for the specified area.

**Action** From operational mode, enter the **show ospf interface area *area-id*** command for OSPFv2, and enter the **show ospf3 interface area *area-id*** command for OSPFv3..

### **Verifying Neighbor Adjacencies**

**Purpose** Verify the primary and secondary neighbor adjacencies. The Secondary field displays if the neighbor is on a secondary interface.

**Action** From operational mode, enter the **show ospf neighbor detail** command for OSPFv2, and enter the **show ospf3 neighbor detail** command for OSPFv3.

## OSPFv2 Compatibility with RFC 1583 Overview

---

In the first implementation of OSPF (RFC1583, *OSPF Version 2*), the summary route assumes the cost of the granular route with the lowest cost. OSPF RFC 2328, *OSPF Version 2* changes the behavior so that the summary route assumes the cost of the granular route with the highest cost. OSPF readvertises the summary route whenever the cost of the summary changes. When using the default RFC 1583 behavior, this happens when the granular route with the lowest metric is changed or lost. When RFC 2328 is used, this happens when the granular route with the highest cost is changed or lost.

By default, the Junos OS implementation of OSPF is compatible with RFC 1583. This means that Junos OS maintains a single best route to an autonomous system (AS) boundary router in the OSPF routing table, rather than multiple intra-AS paths, if they are available. You can disable compatibility with RFC 1583. It is preferable to do so when the same external destination is advertised by AS boundary routers that belong to different OSPF areas. When you disable compatibility with RFC 1583, the OSPF routing table maintains the multiple intra-AS paths that are available, which the router uses to calculate AS external routes as defined in RFC 2328. Being able to use multiple available paths to calculate an AS external route can prevent routing loops.

### Example: Disabling OSPFv2 Compatibility with RFC 1583

---

This example shows how to disable OSPFv2 compatibility with RFC 1583 on the routing device.

- [Requirements on page 4128](#)
- [Overview on page 4128](#)
- [Configuration on page 4129](#)
- [Verification on page 4129](#)

#### **Requirements**

No special configuration beyond device initialization is required before disabling OSPFv2 compatibility with RFC 1583.

#### **Overview**

By default, the Junos OS implementation of OSPF is compatible with RFC 1583. This means that Junos OS maintains a single best route to an autonomous system (AS) boundary router in the OSPF routing table, rather than multiple intra-AS paths, if they are available. You can disable compatibility with RFC 1583. It is preferable to do so when the same external destination is advertised by AS boundary routers that belong to different OSPF areas. When you disable compatibility with RFC 1583, the OSPF routing table maintains the multiple intra-AS paths that are available, which the router uses to calculate AS external routes as defined in RFC 2328. Being able to use multiple available paths to calculate an AS external route can prevent routing loops. To minimize the potential for routing loops, configure the same RFC compatibility on all OSPF devices in an OSPF domain.

**Configuration**

**CLI Quick Configuration** To quickly disable OSPFv2 compatibility with RFC 1583, copy the following command and paste it into the CLI. You configure this setting on all devices that are part of the OSPF domain.

```
[edit]
set protocols ospf no-rfc-1583
```

**Step-by-Step Procedure** To disable OSPFv2 compatibility with RFC 1583:

1. Disable RFC 1583.

```
[edit]
user@host# set protocols ospf no-rfc-1583
```

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**NOTE:** Repeat this configuration on each routing device that participates in an OSPF routing domain.

**Results**

Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
no-rfc-1583;
```

**Verification**

Confirm that the configuration is working properly.

**Verifying the OSPF Routes**

**Purpose** Verify that the OSPF routing table maintains the intra-AS paths with the largest metric, which the router uses to calculate AS external routes.

**Action** From operational mode, enter the **show ospf route detail** command.

---

### About OSPF Interfaces

To activate OSPF on a network, you must enable the OSPF protocol on one or more interfaces on each device within the network on which traffic is to travel. How you configure the interface depends on whether the interface is connected to a broadcast or point-to-point network, a point-to-multipoint network, a nonbroadcast multiaccess (NBMA) network, or across a demand circuit.

- A broadcast interface behaves as if the routing device is connected to a LAN.
- A point-to-point interface provides a connection between a single source and a single destination (there is only one OSPF adjacency).
- A point-to-multipoint interface provides a connection between a single source and multiple destinations.
- An NBMA interface behaves in a similar fashion to a point-to-multipoint interface, but you might configure an NBMA interface to interoperate with other equipment.
- A demand circuit is a connection on which you can limit traffic based on user agreements. The demand circuit can limit bandwidth or access time based on agreements between the provider and user.

You can also configure an OSPF interface to be passive, to operate in passive traffic engineering mode, or to be a peer interface.

- A passive interface advertises its address, but does not run the OSPF protocol (adjacencies are not formed and hello packets are not generated).
- An interface operating in OSPF passive traffic engineering mode floods link address information within the autonomous system (AS) and makes it available for traffic engineering calculations.
- A peer interface can be configured for OSPFv2 routing devices. A peer interface is required for Generalized MPLS (GMPLS) to transport traffic engineering information through a link separate from the control channel. You establish this separate link by configuring a peer interface. The peer interface name must match the Link Management Protocol (LMP) peer name. A peer interface is optional for a hierarchy of RSVP label-switched paths (LSPs). After you configure the forwarding adjacency, you can

configure OSPFv2 to advertise the traffic engineering properties of a forwarding adjacency to a specific peer.

Point-to-point interfaces differ from multipoint in that only one OSPF adjacency is possible. (A LAN, for instance, can have multiple addresses and can run OSPF on each subnet simultaneously.) As such, when you configure a numbered point-to-point interface to OSPF by name, multiple OSPF interfaces are created. One, which is unnumbered, is the interface on which the protocol is run. An additional OSPF interface is created for each address configured on the interface, if any, which is automatically marked as passive.

For OSPFv3, one OSPF-specific interface must be created per interface name configured under OSPFv3. OSPFv3 does not allow interfaces to be configured by IP address.

Enabling OSPF on an interface (by including the **interface** statement), disabling it (by including the **disable** statement), and not actually having OSPF run on an interface (by including the **passive** statement) are mutually exclusive states.

**NOTE:** When you configure OSPFv2 on an interface, you must also include the **family inet** statement at the [edit interfaces *interface-name* unit *logical-unit-number*] hierarchy level. When you configure OSPFv3 on an interface, you must also include the **family inet6** statement at the [edit interfaces *interface-name* unit *logical-unit-number*] hierarchy level. In Junos OS Release 9.2 and later, you can configure OSPFv3 to support address families other than unicast IPv6.

### Example: Configuring an Interface on a Broadcast or Point-to-Point Network

This example shows how to configure an OSPF interface on a broadcast or point-to-point network.

- [Requirements on page 4131](#)
- [Overview on page 4132](#)
- [Configuration on page 4132](#)
- [Verification on page 4133](#)

#### Requirements

Before you begin:

- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4102.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4104
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4109.

### Overview

If the interface on which you are configuring OSPF supports broadcast mode (such as a LAN), or if the interface supports point-to-point mode (such as a PPP interface or a point-to-point logical interface on Frame Relay), you specify the interface by including the IP address or the interface name for OSPFv2, or only the interface name for OSPFv3. In Junos OS Release 9.3 and later, an OSPF point-to-point interface can be an Ethernet interface without a subnet. If you configure an interface on a broadcast network, designated router and backup designated router election is performed.

#### NOTE:

- Using both the interface name and the IP address of the same interface produces an invalid configuration.
- Including the IP address of loopback0 interface unit may implicitly enable OSPF on unnumbered interfaces with “unnumbered-address lo0.0” configured.

In this example, you configure interface **ge-0/2/0** as an OSPFv2 interface in OSPF area 0.0.0.1.

### Configuration

#### CLI Quick Configuration

To quickly configure an OSPF interface on a broadcast or point-to-point network, copy the following commands and paste them into the CLI.

```
[edit]
set interfaces ge-0/2/0 unit 0 family inet address 10.0.0.1
set protocols ospf area 0.0.0.1 interface ge-0/2/0
```

#### Step-by-Step Procedure

To configure an OSPF interface on a broadcast or point-to-point network:

1. Configure the interface.

**NOTE:** For an OSPFv3 interface, specify an IPv6 address.

```
[edit]
user@host# set interfaces ge-0/2/0 unit 0 family inet address 10.0.0.1
```

2. Create an OSPF area.

**NOTE:** For an OSPFv3 interface, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# edit protocols ospf area 0.0.0.1
```

3. Assign the interface to the area.  

```
[edit protocols ospf area 0.0.0.1 ]
user@host# set interface ge-0/2/0
```
4. If you are done configuring the device, commit the configuration.  

```
[edit protocols ospf area 0.0.0.1 ]
user@host# commit
```

### Results

Confirm your configuration by entering the **show interfaces** and the **show protocols ospf** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
ge-0/2/0 {
  unit 0 {
    family inet {
      address 10.0.0.1/32;
    }
  }
}

user@host# show protocols ospf
area 0.0.0.1 {
  interface ge-0/2/0.0;
}
```

To confirm your OSPFv3 configuration, enter the **show interfaces** and the **show protocols ospf3** commands.

### Verification

Confirm that the configuration is working properly.

#### Verifying the OSPF Interface

- Purpose** Verify the interface configuration. Depending on your deployment, the Type field might display LAN or P2P.
- Action** From operational mode, enter the **show ospf interface detail** command for OSPFv2, and enter the **show ospf3 interface detail** command for OSPFv3.

### Example: Configuring an OSPFv2 Interface on a Nonbroadcast Multiaccess Network

This example shows how to configure an OSPFv2 interface on a nonbroadcast multiaccess (NBMA) network.

- [Requirements on page 4134](#)
- [Overview on page 4134](#)

- [Configuration on page 4135](#)
- [Verification on page 4136](#)

### **Requirements**

Before you begin:

- Configure the router identifiers for the devices in your OSPF network. See [“Example: Configuring an OSPF Router Identifier” on page 4102](#).
- Control OSPF designated router election. See [“Example: Controlling OSPF Designated Router Election” on page 4104](#).
- Configure a multiarea OSPF network. See [“Example: Configuring a Multiarea OSPF Network” on page 4109](#).

### **Overview**

When you configure OSPFv2 on an NBMA network, you can use nonbroadcast mode rather than point-to-multipoint mode. Using this mode offers no advantages over point-to-multipoint mode, but it has more disadvantages than point-to-multipoint mode. Nevertheless, you might occasionally find it necessary to configure nonbroadcast mode to interoperate with other equipment. Because there is no autodiscovery mechanism, you must configure each neighbor.

Nonbroadcast mode treats the NBMA network as a partially connected LAN, electing designated and backup designated routers. All routing devices must have a direct connection to both the designated and backup designated routers, or unpredictable results occur.

When you configure the interface, specify either the IP address or the interface name. Using both the IP address and the interface name produces an invalid configuration. For nonbroadcast interfaces, specify the IP address of the nonbroadcast interface as the interface name.

In this example, you configure the Asynchronous Transfer Mode (ATM) interface **at-0/1/0** as an OSPFv2 interface in OSPF area 0.0.0.1, and you specify the following settings:

- **interface-type nbma**—Sets the interface to run in NBMA mode. You must explicitly configure the interface to run in NBMA mode.
- **neighbor address <eligible>**—Specifies the IP address of the neighboring device. OSPF routing devices normally discover their neighbors dynamically by listening to the broadcast or multicast hello packets on the network. Because an NBMA network does not support broadcast (or multicast), the device cannot discover its neighbors dynamically, so you must configure all the neighbors statically. To configure multiple neighbors, include multiple **neighbor** statements. If you want the neighbor to be a designated router, include the **eligible** keyword.
- **poll-interval**—Specifies the length of time, in seconds, before the routing device sends hello packets out of the interface before it establishes adjacency with a neighbor. Routing devices send hello packets for a longer interval on nonbroadcast networks to minimize the bandwidth required on slow WAN links. The range is from 1 through 255

seconds. By default, the device sends hello packets out the interface every 120 seconds before it establishes adjacency with a neighbor.

Once the routing device detects an active neighbor, the hello packet interval changes from the time specified in the **poll-interval** statement to the time specified in the **hello-interval** statement.

### Configuration

**CLI Quick Configuration** To quickly configure an OSPFv2 interface on an NBMA network, copy the following commands and paste them into the CLI.

```
[edit]
set interfaces at-0/1/0 unit 0 family inet address 192.0.2.1
set protocols ospf area 0.0.0.1 interface at-0/1/0.0 interface-type nbma
set protocols ospf area 0.0.0.1 interface at-0/1/0.0 neighbor 192.0.2.2 eligible
set protocols ospf area 0.0.0.1 interface at-0/1/0.0 poll-interval 130
```

**Step-by-Step Procedure** To configure an OSPFv2 interface on an NBMA network:

1. Configure the interface.

```
[edit]
user@host# set interfaces at-0/1/0 unit 0 family inet address 192.0.2.1
```

2. Create an OSPF area.

```
[edit]
user@host# edit protocols ospf area 0.0.0.1
```

3. Assign the interface to the area.

In this example, include the **eligible** keyword to allow the neighbor to be a designated router.

```
[edit protocols ospf area 0.0.0.1]
user@host# set interface at-0/1/0 interface-type nbma neighbor 192.0.2.2 eligible
```

4. Configure the poll interval.

```
[edit protocols ospf area 0.0.0.1]
user@host# set interface at-0/1/0 poll-interval 130
```

5. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf area 0.0.0.1]
user@host# commit
```

### Results

Confirm your configuration by entering the **show interfaces** and the **show protocols ospf** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
at-0/1/0 {
  unit 0 {
    family inet {
      address 192.0.2.1/32;
```

```
    }  
  }  
}  
  
user@host# show protocols ospf  
area 0.0.0.1 {  
  interface at-0/1/0.0 {  
    interface-type nbma;  
    neighbor 192.0.2.2 eligible;  
    poll-interval 130;  
  }  
}
```

### **Verification**

Confirm that the configuration is working properly.

### **Verifying the OSPF Interface**

**Purpose** Verify the interface configuration. Confirm that the Type field displays NBMA.

**Action** From operational mode, enter the **show ospf interface detail** command.

---

### **Example: Configuring an OSPFv2 Interface on a Point-to-Multipoint Network**

This example shows how to configure an OSPFv2 interface on a point-to-multipoint network.

- [Requirements on page 4136](#)
- [Overview on page 4136](#)
- [Configuration on page 4137](#)
- [Verification on page 4138](#)

### **Requirements**

Before you begin:

- Configure the router identifiers for the devices in your OSPF network. See [“Example: Configuring an OSPF Router Identifier” on page 4102](#).
- Control OSPF designated router election. See [“Example: Controlling OSPF Designated Router Election” on page 4104](#)
- Configure a multiarea OSPF network. See [“Example: Configuring a Multiarea OSPF Network” on page 4109](#).

### **Overview**

When you configure OSPFv2 on a nonbroadcast multiaccess (NBMA) network, such as a multipoint Asynchronous Transfer Mode (ATM) or Frame Relay, OSPFv2 operates by default in point-to-multipoint mode. In this mode, OSPFv2 treats the network as a set of point-to-point links. Because there is no autodiscovery mechanism, you must configure each neighbor.

When you configure the interface, specify either the IP address or the interface name. Using both the IP address and the interface name produces an invalid configuration.

In this example, you configure ATM interface **at-0/1/0** as an OSPFv2 interface in OSPF area 0.0.0.1, and you specify 192.0.2.1 as the neighbor's IP address.

### Configuration

**CLI Quick Configuration** To quickly configure an OSPFv2 interface on a point-to-multipoint network, copy the following commands and paste them into the CLI.

```
[edit]
set interfaces at-0/1/0 unit 0 family inet address 192.0.2.2
set protocols ospf area 0.0.0.1 interface at-0/1/0 neighbor 192.0.2.1
```

**Step-by-Step Procedure** To configure an OSPFv2 interface on a point-to-multipoint network:

1. Configure the interface.  

```
[edit]
user@host# set interfaces at-0/1/0 unit 0 family inet address 192.0.2.2
```
2. Create an OSPF area.  

```
[edit]
user@host# edit protocols ospf area 0.0.0.1
```
3. Assign the interface to the area and specify the neighbor.  

```
[edit protocols ospf area 0.0.0.1]
user@host# set interface at-0/1/0 neighbor 192.0.2.1
```

To configure multiple neighbors, include a **neighbor** statement for each neighbor.
4. If you are done configuring the device, commit the configuration.  

```
[edit protocols ospf area 0.0.0.1]
user@host# commit
```

### Results

Confirm your configuration by entering the **show interfaces** and the **show protocols ospf** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
at-0/1/0 {
  unit 0 {
    family inet {
      address 192.0.2.2/32;
    }
  }
}

user@host# show protocols ospf
area 0.0.0.1 {
  interface at-0/1/0.0 {
    neighbor 192.0.2.1;
  }
}
```

```
}
```

**Verification**

Confirm that the configuration is working properly.

**Verifying the OSPF Interface**

**Purpose** Verify the interface configuration. Confirm that the Type field displays P2MP.

**Action** From operational mode, enter the **show ospf interface detail** command.

---

**Example: Configuring OSPF Demand Circuits**

---

This example shows how to configure an OSPF demand circuit interface.

- [Requirements on page 4138](#)
- [Overview on page 4138](#)
- [Configuration on page 4139](#)
- [Verification on page 4140](#)

**Requirements**

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.

**NOTE:** If you are using OSPF demand circuits over an ISDN link, you must configure an ISDN interface and enable dial-on-demand routing. See the *Junos OS Network Interfaces Library for Routing Devices*.

- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4102.
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4107.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4109.

**Overview**

OSPF sends periodic hello packets to establish and maintain neighbor adjacencies and uses link-state advertisements (LSAs) to make routing calculations and decisions. OSPF support for demand circuits is defined in RFC 1793, *Extending OSPF to Support Demand Circuits*, and suppresses the periodic hello packets and LSAs. A demand circuit is a connection on which you can limit traffic based on user agreements. The demand circuit can limit bandwidth or access time based on agreements between the provider and user.

You configure demand circuits on an OSPF interface. When the interface becomes a demand circuit, all hello packets and LSAs are suppressed as soon as OSPF

synchronization is achieved. LSAs have a DoNotAge bit that stops the LSA from aging and prevents periodic updates from being sent. Hello packets and LSAs are sent and received on a demand-circuit interface only when there is a change in the network topology. This reduces the amount of traffic through the OSPF interface.

Consider the following when configuring OSPF demand circuits:

- Periodic hellos are only suppressed on point-to-point and point-to-multipoint interfaces. If you configure demand circuits on an OSPF broadcast network or on an OSPF nonbroadcast multiaccess (NBMA) network, periodic hello packets are still sent.
- Demand circuit support on an OSPF point-to-multipoint interface resembles that for point-to-point interfaces. If you configure a point-to-multipoint interface as a demand circuit, the device negotiates hello suppression separately on each interface that is part of the point-to-multipoint network.

This example assumes that you have a point-to-point connection between two devices using SONET/SDH interfaces. A demand-circuit interface automatically negotiates the demand-circuit connection with its OSPF neighbor. If the neighbor does not support demand circuits, then no demand circuit connection is established.

In this example, you configure OSPF interface **so-0/1/0** in OSPF area 0.0.0.1 as a demand circuit.

### Configuration

#### CLI Quick Configuration

To quickly configure an OSPF demand circuit interface, copy the following command and paste it into the CLI. You must configure both neighboring interfaces for OSPF demand circuits for the connection to be established.

```
[edit]
set protocols ospf area 0.0.0.1 interface so-0/1/0 demand-circuit
```

#### Step-by-Step Procedure

To configure an OSPF demand circuit interface on one neighboring interface:

1. Create an OSPF area.

**NOTE:** For OSPFv3, include the **ospf3** statement at the [edit protocols] hierarchy level.

```
[edit ]
user@host# edit protocols ospf area 0.0.0.1
```

2. Configure the neighboring interface as a demand circuit.

```
[edit protocols ospf area 0.0.0.1]
user@host# set interface so-0/1/0 demand-circuit
```

3. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf area 0.0.0.1]
user@host# commit
```

**NOTE:** Repeat this entire configuration on the other neighboring interface.

### **Results**

Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols
ospf {
  area 0.0.0.1 {
    interface so-0/1/0.0 {
      demand-circuit;
    }
  }
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### **Verification**

Confirm that the configuration is working properly.

#### **Verifying the Status of Neighboring Interfaces**

- Purpose** Verify information about the neighboring interface. When the neighbor is configured for demand circuits, a DC flag displays.
- Action** From operational mode, enter the **show ospf neighbor detail** command for OSPFv2, and enter the **show ospf3 neighbor detail** command for OSPFv3.

---

### **Example: Configuring a Passive OSPF Interface**

This example shows how to configure a passive OSPF interface. A passive OSPF interface advertises its address but does not run the OSPF protocol.

- [Requirements on page 4140](#)
- [Overview on page 4141](#)
- [Configuration on page 4141](#)
- [Verification on page 4142](#)

### **Requirements**

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4102.
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4107.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4109.

### Overview

By default, OSPF must be configured on an interface for direct interface addresses to be advertised as interior routes. To advertise the direct interface addresses without actually running OSPF on that interface (adjacencies are not formed and hello packets are not generated), you configure that interface as a passive interface.

Enabling OSPF on an interface (by including the **interface** statement), disabling it (by including the **disable** statement), and not actually having OSPF run on an interface (by including the **passive** statement) are mutually exclusive states.

**NOTE:** If you do not want to see notifications for state changes in a passive OSPF interface, you can disable the OSPF traps for the interface by including the **no-interface-state-traps** statement. The **no-interface-state-traps** statement is supported only for OSPFv2.

In this example, you configure interface **ge-0/2/0** as a passive OSPF interface in area 0.0.0.1 by including the **passive** statement.

### Configuration

#### CLI Quick Configuration

To quickly configure a passive OSPF interface, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf area 0.0.0.1 interface ge-0/2/0 passive
```

#### Step-by-Step Procedure

To configure a passive OSPF interface:

1. Create an OSPF area.

**NOTE:** For an OSPFv3 interface, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# edit protocols ospf area 0.0.0.1
```

2. Configure the passive interface.

```
[edit protocols ospf area 0.0.0.1 ]
user@host# set interface ge-0/2/0 passive
```

3. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf area 0.0.0.1]
user@host# commit
```

### **Results**

Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
  area 0.0.0.1 {
    interface ge-0/2/0.0 {
      passive;
    }
  }
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### **Verification**

Confirm that the configuration is working properly.

#### **Verifying the Status of OSPF Interfaces**

**Purpose** Verify the status of the OSPF interface. If the interface is passive, the Adj count field is 0 because no adjacencies have been formed. Next to this field, you might also see the word Passive.

**Action** From operational mode, enter the **show ospf interface detail** command for OSPFv2, and enter the **show ospf3 interface detail** command for OSPFv3.

---

### **Example: Configuring OSPFv2 Peer interfaces**

This example shows how to configure an OSPFv2 peer interface.

- [Requirements on page 4142](#)
- [Overview on page 4143](#)
- [Configuration on page 4143](#)
- [Verification on page 4144](#)

#### **Requirements**

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure the router identifiers for the devices in your OSPF network. See [“Example: Configuring an OSPF Router Identifier” on page 4102](#).

- Configure a single-area OSPF network. See [“Example: Configuring a Single-Area OSPF Network” on page 4107](#).
- Configure a multiarea OSPF network. See [“Example: Configuring a Multiarea OSPF Network” on page 4109](#).
- Configure Generalized MPLS per your network requirements. See *LMP Configuration Overview* in the *Junos OS MPLS Applications Library for Routing Devices*.

### Overview

You can configure an OSPFv2 peer interface for many reasons, including when you configure Generalized MPLS (GMPLS). This example configures a peer interface for GMPLS. GMPLS requires traffic engineering information to be transported through a link separate from the control channel. You establish this separate link by configuring a peer interface. The OSPFv2 peer interface name must match the Link Management Protocol (LMP) peer name. You configure GMPLS and the LMP settings separately from OSPF.

This example assumes that GMPLS and the LMP peer named **oxc1** are already configured, and you need to configure the OSPFv2 peer interface in area 0.0.0.0.

### Configuration

**CLI Quick Configuration** To quickly configure an OSPFv2 peer interface, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf area 0.0.0.0 peer-interface oxc1
```

**Step-by-Step Procedure** To configure a peer OSPFv2 interface used by the LMP:

1. Create an OSPF area.
 

```
[edit]
user@host# edit protocols ospf area 0.0.0.0
```
2. Configure the peer interface.
 

```
[edit protocols ospf area 0.0.0.0]
user@host# set peer-interface oxc1
```
3. If you are done configuring the device, commit the configuration.
 

```
[edit protocols ospf area 0.0.0.0]
user@host# commit
```

### Results

Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
  area 0.0.0.0 {
    peer-interface oxc1;
  }
```

**Verification**

Confirm that the configuration is working properly.

**Verifying the Configured OSPFv2 Peer**

**Purpose** Verify the status of the OSPFv2 peer. When an OSPFv2 peer is configured for GMPLS, the Peer Name field displays the name of the LMP peer that you created for GMPLS, which is also the configured OSPFv2 peer.

**Action** From operational mode, enter the **show link-management** command.

---

#### Understanding OSPF Route Summarization

Area border routers (ABRs) send summary link advertisements to describe the routes to other areas. Depending on the number of destinations, an area can get flooded with a large number of link-state records, which can utilize routing device resources. To minimize the number of advertisements that are flooded into an area, you can configure the ABR to coalesce, or summarize, a range of IP addresses and send reachability information about these addresses in a single link-state advertisement (LSA). You can summarize one or more ranges of IP addresses, where all routes that match the specified area range are filtered at the area boundary, and the summary is advertised in their place.

For an OSPF area, you can summarize and filter intra-area prefixes. All routes that match the specified area range are filtered at the area boundary, and the summary is advertised in their place. For an OSPF not-so-stubby area (NSSA), you can only coalesce or filter NSSA external (Type 7) LSAs before they are translated into AS external (Type 5) LSAs and enter the backbone area. All external routes learned within the area that do not fall into the range of one of the prefixes are advertised individually to other areas.

In addition, you can also limit the number of prefixes (routes) that are exported into OSPF. By setting a user-defined maximum number of prefixes, you prevent the routing device from flooding an excessive number of routes into an area.

### **Example: Summarizing Ranges of Routes in OSPF Link-State Advertisements**

This example shows how to summarize routes sent into the backbone area.

- [Requirements on page 4145](#)
- [Overview on page 4145](#)
- [Configuration on page 4146](#)
- [Verification on page 4150](#)

#### **Requirements**

Before you begin:

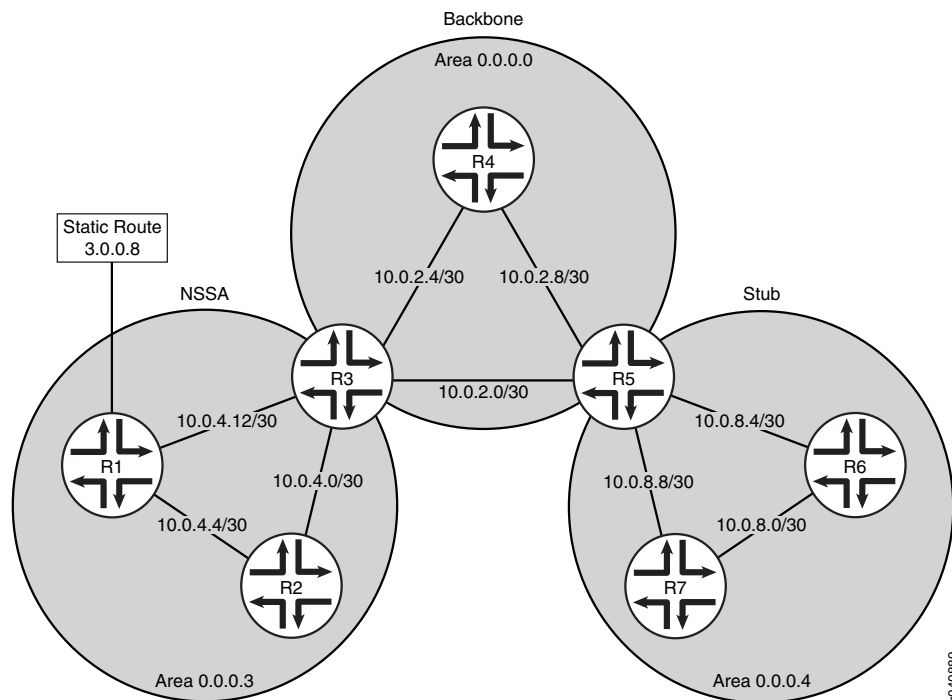

- Configure the router identifiers for the devices in your OSPF network. See [“Example: Configuring an OSPF Router Identifier” on page 4102](#).
- Control OSPF designated router election. See [“Example: Controlling OSPF Designated Router Election” on page 4104](#).
- Configure a static route. See *Examples: Configuring Static Routes* in the *Junos OS Routing Protocols Library for Routing Devices*.

#### **Overview**

You can summarize a range of IP addresses to minimize the size of the backbone router's link-state database. All routes that match the specified area range are filtered at the area boundary, and the summary is advertised in their place.

[Figure 143 on page 4146](#) shows the topology used in this example. R5 is the ABR between area 0.0.0.4 and the backbone. The networks in area 0.0.0.4 are 10.0.8.4/30, 10.0.8.0/30, and 10.0.8.8/30, which can be summarized as 10.0.8.0/28. R3 is the ABR between NSSA area 0.0.0.3 and the backbone. The networks in area 0.0.0.3 are 10.0.4.4/30, 10.0.4.0/30, and 10.0.4.12/30, which can be summarized as 10.0.4.0/28. Area 0.0.0.3 also contains external static route 3.0.0.8 that you will prevent from flooding throughout the network.

Figure 143: Summarizing Ranges of Routes in OSPF

In this example, you configure the ABRs for route summarization by including the following settings:

- **area-range**—For an area, summarizes a range of IP addresses when sending summary intra-area link advertisements. For an NSSA, summarizes a range of IP addresses when sending NSSA link-state advertisements (Type 7 LSAs). The specified prefixes are used to aggregate external routes learned within the area when the routes are advertised to other areas.
- **network/mask-length**—Indicates the summarized IP address range and the number of significant bits in the network mask.
- **restrict**—On the NSSA ABR, prevents the configured summary from being advertised. In this example, we do not want to flood the external route outside of area 0.0.0.3.

### Configuration

#### CLI Quick Configuration

- To quickly configure route summarization for an OSPF area, copy the following commands and paste them into the CLI. The following is the configuration on ABR R5:

```
[edit]
set interfaces fe-0/0/1 unit 0 family inet address 10.0.8.3
set interfaces fe-0/0/2 unit 0 family inet address 10.0.8.4
set interfaces fe-0/0/0 unit 0 family inet address 10.0.2.3
set interfaces fe-0/0/4 unit 0 family inet address 10.0.2.5
set protocols ospf area 0.0.0.4 stub
set protocols ospf area 0.0.0.4 interface fe-0/0/1
set protocols ospf area 0.0.0.4 interface fe-0/0/2
set protocols ospf area 0.0.0.0 interface fe-0/0/0
```

```
set protocols ospf area 0.0.0.0 interface fe-0/0/4
set protocols ospf area 0.0.0.4 area-range 10.0.8.0/28
```

- To quickly configure route summarization for an OSPF NSSA, copy the following commands and paste them into the CLI. The following is the configuration on ABR R3:

```
[edit]
set interfaces fe-0/0/1 unit 0 family inet address 10.0.4.10
set interfaces fe-0/0/2 unit 0 family inet address 10.0.4.1
set interfaces fe-0/0/0 unit 0 family inet address 10.0.2.1
set interfaces fe-0/0/4 unit 0 family inet address 10.0.2.7
set protocols ospf area 0.0.0.3 interface fe-0/0/1
set protocols ospf area 0.0.0.3 interface fe-0/0/2
set protocols ospf area 0.0.0.0 interface fe-0/0/0
set protocols ospf area 0.0.0.0 interface fe-0/0/4
set protocols ospf area 0.0.0.3 area-range 10.0.4.0/28
set protocols ospf area 0.0.0.3 nssa
set protocols ospf area 0.0.0.3 nssa area-range 3.0.0.0/8 restrict
```

### Step-by-Step Procedure

To summarize routes sent to the backbone area:

1. Configure the interfaces.

**NOTE:** For OSPFv3, include IPv6 addresses.

```
[edit]
user@R5# set interfaces fe-0/0/1 unit 0 family inet address 10.0.8.3
user@R5# set interfaces fe-0/0/2 unit 0 family inet address 10.0.8.4
user@R5# set interfaces fe-0/0/0 unit 0 family inet address 10.0.2.3
user@R5# set interfaces fe-0/0/4 unit 0 family inet address 10.0.2.5
```

```
[edit]
user@R3# set interfaces fe-0/0/1 unit 0 family inet address 10.0.4.10
user@R3# set interfaces fe-0/0/2 unit 0 family inet address 10.0.4.1
user@R3# set interfaces fe-0/0/0 unit 0 family inet address 10.0.2.1
user@R3# set interfaces fe-0/0/4 unit 0 family inet address 10.0.2.7
```

2. Configure the type of OSPF area.

**NOTE:** For OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@R5# set protocols ospf area 0.0.0.4 stub
```

```
[edit]
user@R3# set protocols ospf area 0.0.0.3 nssa
```

3. Assign the interfaces to the OSPF areas.

```
user@R5# set protocols ospf area 0.0.0.4 interface fe-0/0/1
user@R5# set protocols ospf area 0.0.0.4 interface fe-0/0/2
```

```
user@R5# set protocols ospf area 0.0.0.0 interface fe-0/0/0
user@R5# set protocols ospf area 0.0.0.0 interface fe-0/0/4

user@R3# set protocols ospf area 0.0.0.3 interface fe-0/0/1
user@R3# set protocols ospf area 0.0.0.3 interface fe-0/0/2
user@R3# set protocols ospf area 0.0.0.0 interface fe-0/0/0
user@R3# set protocols ospf area 0.0.0.0 interface fe-0/0/4
```

4. Summarize the routes that are flooded into the backbone.

```
[edit]
user@R5# set protocols ospf area 0.0.0.4 area-range 10.0.8.0/28

[edit]
user@R3# set protocols ospf area 0.0.0.3 area-range 10.0.4.0/28
```

5. On ABR R3, restrict the external static route from leaving area 0.0.0.3.

```
[edit]
user@R3# set protocols ospf area 0.0.0.3 nssa area-range 3.0.0.0/8 restrict
```

6. If you are done configuring the devices, commit the configuration.

```
[edit]
user@host# commit
```

### Results

Confirm your configuration by entering the **show interfaces** and the **show protocols ospf** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

Configuration on ABR R5:

```
user@R5# show interfaces
fe-0/0/0 {
  unit 0 {
    family inet {
      address 10.0.2.3/32;
    }
  }
}
fe-0/0/1 {
  unit 0 {
    family inet {
      address 10.0.8.3/32;
    }
  }
}
fe-0/0/2 {
  unit 0 {
    family inet {
      address 10.0.8.4/32;
    }
  }
}
fe-0/0/4 {
  unit 0 {
```

```

        family inet {
            address 10.0.2.5/32;
        }
    }
}

user@R5# show protocols ospf
area 0.0.0.0 {
    interface fe-0/0/0.0;
    interface fe-0/0/4.0;
}
area 0.0.0.4 {
    stub;
    area-range 10.0.8.0/28;
    interface fe-0/0/1.0;
    interface fe-0/0/2.0;
}

```

Configuration on ABR R3:

```

user@R3# show interfaces
fe-0/0/0 {
    unit 0 {
        family inet {
            address 10.0.2.1/32;
        }
    }
}
fe-0/0/1 {
    unit 0 {
        family inet {
            address 10.0.4.10/32;
        }
    }
}
fe-0/0/2 {
    unit 0 {
        family inet {
            address 10.0.4.1/32;
        }
    }
}
fe-0/0/4 {
    unit 0 {
        family inet {
            address 10.0.2.7/32;
        }
    }
}

user@R3t# show protocols ospf
area 0.0.0.0 {
    interface fe-0/0/0.0;
    interface fe-0/0/4.0;
}
area 0.0.0.3 {
    nssa {

```

```
        area-range 3.0.0.0/8 restrict;
    }
    area-range 10.0.4.0/28;
    interface fe-0/0/1.0;
    interface fe-0/0/2.0;
}
```

To confirm your OSPFv3 configuration, enter the **show interfaces** and **show protocols ospf3** commands.

### **Verification**

Confirm that the configuration is working properly.

### **Verifying the Summarized Route**

- |                |                                                                                                                                                                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b> | Verify that the routes you configured for route summarization are being aggregated by the ABRs before the routes enter the backbone area. Confirm route summarization by checking the entries of the OSPF link-state database for the routing devices in the backbone. |
| <b>Action</b>  | From operational mode, enter the <b>show ospf database</b> command for OSPFv2, and enter the <b>show ospf3 database</b> command for OSPFv3.                                                                                                                            |

---

### **Example: Limiting the Number of Prefixes Exported to OSPF**

This example shows how to limit the number of prefixes exported to OSPF.

- [Requirements on page 4150](#)
- [Overview on page 4151](#)
- [Configuration on page 4151](#)
- [Verification on page 4152](#)

### **Requirements**

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4102.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4104.
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4107.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4109.

### Overview

By default, there is no limit to the number of prefixes (routes) that can be exported into OSPF. By allowing any number of routes to be exported into OSPF, the routing device can become overwhelmed and potentially flood an excessive number of routes into an area.

You can limit the number of routes exported into OSPF to minimize the load on the routing device and prevent this potential problem. If the routing device exceeds the configured prefix export value, the routing device purges the external prefixes and enters into an overload state. This state ensures that the routing device is not overwhelmed as it attempts to process routing information. The prefix export limit number can be a value from 0 through 4,294,967,295.

In this example, you configure a prefix export limit of 100,000 by including the **prefix-export-limit** statement.

### Configuration

#### CLI Quick Configuration

To quickly limit the number of prefixes exported to OSPF, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf prefix-export-limit 100000
```

#### Step-by-Step Procedure

To limit the number of prefixes exported to OSPF:

1. Configure the prefix export limit value.

**NOTE:** For OSPFv3, include the **ospf3** statement at the [edit protocols] hierarchy level.

```
[edit]
user@host# set protocols ospf prefix-export-limit 100000
```

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

### Results

Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
prefix-export-limit 100000;
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### **Verification**

Confirm that the configuration is working properly.

### **Verifying the Prefix Export Limit**

**Purpose** Verify the prefix export counter that displays the number of routes exported into OSPF.

**Action** From operational mode, enter the **show ospf overview** command for OSPFv2, and enter the **show ospf3 overview** command for OSPFv3.

---

## **Configuring OSPF Refresh and Flooding Reduction in Stable Topologies**

The OSPF standard requires that every link-state advertisement (LSA) be refreshed every 30 minutes. The Juniper Networks implementation refreshes LSAs every 50 minutes. By default, any LSA that is not refreshed expires after 60 minutes. This requirement can result in traffic overhead that makes it difficult to scale OSPF networks. You can override the default behavior by specifying that the DoNotAge bit be set in self-originated LSAs when they are initially sent by the router or switch. Any LSA with the DoNotAge bit set is reflooded only when a change occurs in the LSA. This feature thus reduces protocol traffic overhead while permitting any changed LSAs to be flooded immediately. Routers or switches enabled for flood reduction continue to send hello packets to their neighbors and to age self-originated LSAs in their databases.

The Juniper implementation of OSPF refresh and flooding reduction is based on RFC 4136, *OSPF Refresh and Flooding Reduction in Stable Topologies*. However, the Juniper implementation does not include the forced-flooding interval defined in the RFC. Not implementing the forced-flooding interval ensures that LSAs with the DoNotAge bit set are reflooded only when a change occurs.

This feature is supported for the following:

- OSPFv2 and OSPFv3 interfaces
- OSPFv3 realms
- OSPFv2 and OSPFv3 virtual links
- OSPFv2 sham links
- OSPFv2 peer interfaces
- All routing instances supported by OSPF
- Logical systems

To configure flooding reduction for an OSPF interface, include the **flood-reduction** statement at the **[edit protocols (ospf | ospf3) area *area-id* interface *interface-id*]** hierarchy level.

**NOTE:** If you configure flooding reduction for an interface configured as a demand circuit, the LSAs are not initially flooded, but sent only when their content has changed. Hello packets and LSAs are sent and received on a demand-circuit interface only when a change occurs in the network topology.

In the following example, the OSPF interface `so-0/0/1.0` is configured for flooding reduction. As a result, all the LSAs generated by the routes that traverse the specified interface have the DoNotAge bit set when they are initially flooded, and LSAs are refreshed only when a change occurs.

```
[edit]
protocols ospf {
  area 0.0.0.0 {
    interface so-0/0/1.0 {
      flood-reduction;
    }
    interface lo0.0;
    interface so-0/0/0.0;
  }
}
```

**NOTE:** Beginning with Junos OS Release 12.2, you can configure a global default link-state advertisement (LSA) flooding interval in OSPF for self-generated LSAs by including the `lsa-refresh-interval minutes` statement at the `[edit protocols (ospf | ospf3)]` hierarchy level. The Juniper Networks implementation refreshes LSAs every 50 minutes. The range is 25 through 50 minutes. By default, any LSA that is not refreshed expires after 60 minutes.

If you have both the global LSA refresh interval configured for OSPF and OSPF flooding reduction configured for a specific interface in an OSPF area, the OSPF flood reduction configuration takes precedence for that specific interface.

## Examples: Configuring OSPF Traffic Control

- [Understanding OSPF Traffic Control on page 4153](#)
- [Example: Controlling the Cost of Individual OSPF Network Segments on page 4155](#)
- [Example: Dynamically Adjusting OSPF Interface Metrics Based on Bandwidth on page 4159](#)
- [Example: Controlling OSPF Route Preferences on page 4161](#)

### Understanding OSPF Traffic Control

Once a topology is shared across the network, OSPF uses the topology to route packets between network nodes. Each path between neighbors is assigned a cost based on the

throughput, round-trip time, and reliability of the link. The sum of the costs across a particular path between hosts determines the overall cost of the path. Packets are then routed along the shortest path using the shortest-path-first (SPF) algorithm. Routes with lower total path metrics are preferred over those with higher path metrics.

You can use the following methods to control OSPF traffic:

- Control the cost of individual OSPF network segments
- Dynamically adjust OSPF interface metrics based on bandwidth
- Control OSPF route selection

### ***Controlling the Cost of Individual OSPF Network Segments***

OSPF uses the following formula to determine the cost of a route:

$$\text{cost} = \text{reference-bandwidth} / \text{interface bandwidth}$$

You can modify the reference-bandwidth value, which is used to calculate the default interface cost. The interface bandwidth value is not user-configurable and refers to the actual bandwidth of the physical interface.

By default, OSPF assigns a default cost metric of 1 to any link faster than 100 Mbps, and a default cost metric of 0 to the loopback interface (**lo0**). No bandwidth is associated with the loopback interface.

To control the flow of packets across the network, OSPF allows you to manually assign a cost (or metric) to a particular path segment. When you specify a metric for a specific OSPF interface, that value is used to determine the cost of routes advertised from that interface. For example, if all routers in the OSPF network use default metric values, and you increase the metric on one interface to 5, all paths through that interface have a calculated metric higher than the default and are not preferred.

**NOTE:** Any value you configure for the metric overrides the default behavior of using the reference-bandwidth value to calculate the route cost for that interface.

---

When there are multiple equal-cost routes to the same destination in a routing table, an equal-cost multipath (ECMP) set is formed. If there is an ECMP set for the active route, the Junos OS software uses a hash algorithm to choose one of the next-hop addresses in the ECMP set to install in the forwarding table.

You can configure Junos OS so that multiple next-hop entries in an ECMP set are installed in the forwarding table. Define a load-balancing routing policy by including one or more **policy-statement** configuration statements at the **[edit policy-options]** hierarchy level, with the action **load-balance per-packet**. Then apply the routing policy to routes exported from the routing table to the forwarding table.

### ***Dynamically Adjusting OSPF Interface Metrics Based on Bandwidth***

You can specify a set of bandwidth threshold values and associated metric values for an OSPF interface or for a topology on an OSPF interface. When the bandwidth of an interface changes, the Junos OS automatically sets the interface metric to the value associated with the appropriate bandwidth threshold value. Junos OS uses the smallest configured bandwidth threshold value that is equal to or greater than the actual interface bandwidth to determine the metric value. If the interface bandwidth is greater than any of the configured bandwidth threshold values, the metric value configured for the interface is used instead of any of the bandwidth-based metric values configured. The ability to recalculate the metric for an interface when its bandwidth changes is especially useful for aggregate interfaces.

**NOTE:** You must also configure a metric for the interface when you enable bandwidth-based metrics.

### ***Controlling OSPF Route Preferences***

You can control the flow of packets through the network using route preferences. Route preferences are used to select which route is installed in the forwarding table when several protocols calculate routes to the same destination. The route with the lowest preference value is selected.

By default, internal OSPF routes have a preference value of 10, and external OSPF routes have a preference value of 150. Although the default settings are appropriate for most environments, you might want to modify the default settings if all of the routing devices in your OSPF network use the default preference values, or if you are planning to migrate from OSPF to a different interior gateway protocol (IGP). If all of the devices use the default route preference values, you can change the route preferences to ensure that the path through a particular device is selected for the forwarding table any time multiple equal-cost paths to a destination exist. When migrating from OSPF to a different IGP, modifying the route preferences allows you to perform the migration in a controlled manner.

### ***Example: Controlling the Cost of Individual OSPF Network Segments***

This example shows how to control the cost of individual OSPF network segments.

- [Requirements on page 4155](#)
- [Overview on page 4156](#)
- [Configuration on page 4157](#)
- [Verification on page 4159](#)

#### ***Requirements***

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices* or the *Junos OS Interfaces Configuration Guide for Security Devices*.
- Configure the router identifiers for the devices in your OSPF network. See [“Example: Configuring an OSPF Router Identifier” on page 4102](#).
- Control OSPF designated router election. See [“Example: Controlling OSPF Designated Router Election” on page 4104](#).
- Configure a single-area OSPF network. See [“Example: Configuring a Single-Area OSPF Network” on page 4107](#).

### Overview

All OSPF interfaces have a cost, which is a routing metric that is used in the link-state calculation. Routes with lower total path metrics are preferred to those with higher path metrics. In this example, we explore how to control the cost of OSPF network segments.

By default, OSPF assigns a default cost metric of 1 to any link faster than 100 Mbps, and a default cost metric of 0 to the loopback interface (**lo0**). No bandwidth is associated with the loopback interface. This means that all interfaces faster than 100 Mbps have the same default cost metric of 1. If multiple equal-cost paths exist between a source and destination address, OSPF routes packets along each path alternately, in round-robin fashion.

Having the same default metric might not be a problem if all of the interfaces are running at the same speed. If the interfaces operate at different speeds, you might notice that traffic is not routed over the fastest interface because OSPF equally routes packets across the different interfaces. For example, if your routing device has Fast Ethernet and Gigabit Ethernet interfaces running OSPF, each of these interfaces have a default cost metric of 1.

In the first example, you set the reference bandwidth to 10g (10 Gbps, as denoted by 10,000,000,000 bits) by including the **reference-bandwidth** statement. With this configuration, OSPF assigns the Fast Ethernet interface a default metric of 100, and the Gigabit Ethernet interface a metric of 10. Since the Gigabit Ethernet interface has the lowest metric, OSPF selects it when routing packets. The range is 9600 through 1,000,000,000,000 bits.

[Figure 144 on page 4157](#) shows three routing devices in area 0.0.0.0 and assumes that the link between Device R2 and Device R3 is congested with other traffic. You can also control the flow of packets across the network by manually assigning a metric to a particular path segment. Any value you configure for the metric overrides the default behavior of using the reference-bandwidth value to calculate the route cost for that interface. To prevent the traffic from Device R3 going directly to Device R2, you adjust the metric on the interface on Device R3 that connects with Device R1 so that all traffic goes through Device R1.

In the second example, you set the metric to 5 on interface **fe-1/0/1** on Device R3 that connects with Device R1 by including the **metric** statement. The range is 1 through 65,535.

Figure 144: OSPF Metric Configuration

**Configuration**

- [Configuring the Reference Bandwidth on page 4157](#)
- [Configuring a Metric for a Specific OSPF Interface on page 4158](#)

**Configuring the Reference Bandwidth**

**CLI Quick Configuration** To quickly configure the reference bandwidth, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf reference-bandwidth 10g
```

**Step-by-Step Procedure** To configure the reference bandwidth:

1. Configure the reference bandwidth to calculate the default interface cost.

**NOTE:** To specify OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@host# set protocols ospf reference-bandwidth 10g
```

**TIP:** As a shortcut in this example, you enter `10g` to specify 10 Gbps reference bandwidth. Whether you enter `10g` or `10000000000`, the output of `show protocols ospf` command displays 10 Gbps as `10g`, not `10000000000`.

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**NOTE:** Repeat this entire configuration on all routing devices in a shared network.

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
reference-bandwidth 10g;
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

#### *Configuring a Metric for a Specific OSPF Interface*

**CLI Quick Configuration** To quickly configure a metric for a specific OSPF interface, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf area 0.0.0.0 interface fe-1/0/1 metric 5
```

**Step-by-Step Procedure** To configure the metric for a specific OSPF interface:

1. Create an OSPF area.

**NOTE:** To specify OSPFv3, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# edit protocols ospf area 0.0.0.0
```

2. Configure the metric of the OSPF network segment.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# set interface fe-1/0/1 metric 5
```

3. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# commit
```

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.0 {
  interface fe-1/0/1.0 {
    metric 5;
  }
}
```

```
}

```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying the Configured Metric on page 4159](#)
- [Verifying the Route on page 4159](#)

### **Verifying the Configured Metric**

- Purpose** Verify the metric setting on the interface. Confirm that the Cost field displays the interface's configured metric (cost). When choosing paths to a destination, OSPF uses the path with the lowest cost.
- Action** From operational mode, enter the **show ospf interface detail** command for OSPFv2, and enter the **show ospf3 interface detail** command for OSPFv3.

### **Verifying the Route**

- Purpose** When choosing paths to a destination, OSPF uses the path with the lowest total cost. Confirm that OSPF is using the appropriate path.
- Action** From operational mode, enter the **show route** command.

## **Example: Dynamically Adjusting OSPF Interface Metrics Based on Bandwidth**

This example shows how to dynamically adjust OSPF interface metrics based on bandwidth.

- [Requirements on page 4159](#)
- [Overview on page 4160](#)
- [Configuration on page 4160](#)
- [Verification on page 4161](#)

### **Requirements**

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure the router identifiers for the devices in your OSPF network. See "[Example: Configuring an OSPF Router Identifier](#)" on page 4102.
- Control OSPF designated router election. See "[Example: Controlling OSPF Designated Router Election](#)" on page 4104.
- Configure a single-area OSPF network. See "[Example: Configuring a Single-Area OSPF Network](#)" on page 4107.

### Overview

You can specify a set of bandwidth threshold values and associated metric values for an OSPF interface. When the bandwidth of an interface changes, the Junos OS automatically sets the interface metric to the value associated with the appropriate bandwidth threshold value. When you configure bandwidth-based metric values, you typically configure multiple bandwidth and metric values.

In this example, you configure OSPF interface **ae0** for bandwidth-based metrics by including the **bandwidth-based-metrics** statement and the following settings:

- **bandwidth**—Specifies the bandwidth threshold in bits per second. The range is 9600 through 1,000,000,000,000,000.
- **metric**—Specifies the metric value to associate with a specific bandwidth value. The range is 1 through 65,535.

### Configuration

#### CLI Quick Configuration

To quickly configure bandwidth threshold values and associated metric values for an OSPF interface, copy the following commands, remove any line breaks, and then paste the commands into the CLI.

```
[edit]
set protocols ospf area 0.0.0.0 interface ae0.0 metric 5
set protocols ospf area 0.0.0.0 interface ae0.0 bandwidth-based-metrics bandwidth 1g
metric 60
set protocols ospf area 0.0.0.0 interface ae0.0 bandwidth-based-metrics bandwidth 10g
metric 50
```

To configure the metric for a specific OSPF interface:

1. Create an OSPF area.

**NOTE:** To specify OSPFv3, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# edit protocols ospf area 0.0.0.0
```

2. Configure the metric of the OSPF network segment.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# set interface ae0 metric 5
```

3. Configure the bandwidth threshold values and associated metric values.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# set interface ae0.0 bandwidth-based-metrics bandwidth 1g metric 60
user@host# set interface ae0.0 bandwidth-based-metrics bandwidth 10g metric 50
```

4. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# commit
```

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.0 {
  interface ae0.0 {
    bandwidth-based-metrics {
      bandwidth 1g metric 60;
      bandwidth 10g metric 50;
    }
    metric 5;
  }
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### **Verification**

Confirm that the configuration is working properly.

### **Verifying the Configured Metric**

**Purpose** Verify the metric setting on the interface. Confirm that the Cost field displays the interface's configured metric (cost). When choosing paths to a destination, OSPF uses the path with the lowest cost.

**Action** From operational mode, enter the **show ospf interface detail** command for OSPFv2, and enter the **show ospf3 interface detail** command for OSPFv3.

## **Example: Controlling OSPF Route Preferences**

This example shows how to control OSPF route selection in the forwarding table. This example also shows how you might control route selection if you are migrating from OSPF to another IGP.

- [Requirements on page 4161](#)
- [Overview on page 4162](#)
- [Configuration on page 4162](#)
- [Verification on page 4163](#)

### **Requirements**

This example assumes that OSPF is properly configured and running in your network, and you want to control route selection because you are planning to migrate from OSPF to a different IGP.

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices* or the *Junos OS Interfaces Configuration Guide for Security Devices*.
- Configure the IGP that you want to migrate to. See the *Junos OS Routing Protocols Library for Routing Devices*.

### Overview

Route preferences are used to select which route is installed in the forwarding table when several protocols calculate routes to the same destination. The route with the lowest preference value is selected.

By default, internal OSPF routes have a preference value of 10, and external OSPF routes have a preference value of 150. You might want to modify this setting if you are planning to migrate from OSPF to a different IGP. Modifying the route preferences enables you to perform the migration in a controlled manner.

This example makes the following assumptions:

- OSPF is already running in your network.
- You want to migrate from OSPF to IS-IS.
- You configured IS-IS per your network requirements and confirmed it is working properly.

In this example, you increase the OSPF route preference values to make them less preferred than IS-IS routes by specifying 168 for internal OSPF routes and 169 for external OSPF routes. IS-IS internal routes have a preference of either 15 (for Level 1) or 18 (for Level 2), and external routes have a preference of 160 (for Level 1) or 165 (for Level 2). In general, it is preferred to leave the new protocol at its default settings to minimize complexities and simplify any future addition of routing devices to the network. To modify the OSPF route preference values, configure the following settings:

- **preference**—Specifies the route preference for internal OSPF routes. By default, internal OSPF routes have a value of 10. The range is from 0 through 4,294,967,295 ( $2^{32} - 1$ ).
- **external-preference**—Specifies the route preference for external OSPF routes. By default, external OSPF routes have a value of 150. The range is from 0 through 4,294,967,295 ( $2^{32} - 1$ ).

### Configuration

#### CLI Quick Configuration

To quickly configure the OSPF route preference values, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf preference 168 external-preference 169
```

To configure route selection:

1. Enter OSPF configuration mode and set the external and internal routing preferences.

**NOTE:** To specify OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@host# set protocols ospf preference 168 external-preference 169
```

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
  preference 168;
  external-preference 169;
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### Verification

Confirm that the configuration is working properly.

- [Verifying the Route on page 4163](#)

### Verifying the Route

**Purpose** Verify that the IGP is using the appropriate route. After the new IGP becomes the preferred protocol (in this example, IS-IS), you should monitor the network for any issues. After you confirm that the new IGP is working properly, you can remove the OSPF configuration from the routing device by entering the **delete ospf** command at the **[edit protocols]** hierarchy level.

**Action** From operational mode, enter the **show route** command.

## Example: Configuring OSPF Overload Mode

- [OSPF Overload Function Overview on page 4163](#)
- [Example: Configuring OSPF to Make Routing Devices Appear Overloaded on page 4164](#)

### OSPF Overload Function Overview

If the time elapsed after the OSPF instance is enabled is less than the specified timeout, overload mode is set.

You can configure the local routing device so that it appears to be overloaded. An overloaded routing device determines it is unable to handle any more OSPF transit traffic, which results in sending OSPF transit traffic to other routing devices. OSPF traffic to directly attached interfaces continues to reach the routing device. You might configure overload mode for many reasons, including:

- If you want the routing device to participate in OSPF routing, but do not want it to be used for transit traffic. This could include a routing device that is connected to the

network for analysis purposes, but is not considered part of the production network, such as network management routing devices.

- If you are performing maintenance on a routing device in a production network. You can move traffic off that routing device so network services are not interrupted during your maintenance window.

You configure or disable overload mode in OSPF with or without a timeout. Without a timeout, overload mode is set until it is explicitly deleted from the configuration. With a timeout, overload mode is set if the time elapsed since the OSPF instance started is less than the specified timeout.

A timer is started for the difference between the timeout and the time elapsed since the instance started. When the timer expires, overload mode is cleared. In overload mode, the router link-state advertisement (LSA) is originated with all the transit router links (except stub) set to a metric of 0xFFFF. The stub router links are advertised with the actual cost of the interfaces corresponding to the stub. This causes the transit traffic to avoid the overloaded routing device and to take paths around the routing device. However, the overloaded routing device's own links are still accessible.

The routing device can also dynamically enter the overload state, regardless of configuring the device to appear overloaded. For example, if the routing device exceeds the configured OSPF prefix limit, the routing device purges the external prefixes and enters into an overload state.

In cases of incorrect configurations, the huge number of routes might enter OSPF, which can hamper the network performance. To prevent this, **prefix-export-limit** should be configured which will purge externals and prevent the network from the bad impact.

By allowing any number of routes to be exported into OSPF, the routing device can become overwhelmed and potentially flood an excessive number of routes into an area. You can limit the number of routes exported into OSPF to minimize the load on the routing device and prevent this potential problem.

By default, there is no limit to the number of prefixes (routes) that can be exported into OSPF. To prevent this, **prefix-export-limit** should be configured which will purge externals and prevent the network.

To limit the number of prefixes exported to OSPF:

```
[edit]
set protocols ospf prefix-export-limit number
```

The prefix export limit number can be a value from 0 through 4,294,967,295.

---

### Example: Configuring OSPF to Make Routing Devices Appear Overloaded

---

This example shows how to configure a routing device running OSPF to appear to be overloaded.

- [Requirements on page 4165](#)
- [Overview on page 4165](#)

- [Configuration on page 4165](#)
- [Verification on page 4166](#)

### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4102.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4104
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4107.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4109.

### Overview

You can configure a local routing device running OSPF to appear to be overloaded, which allows the local routing device to participate in OSPF routing, but not for transit traffic. When configured, the transit interface metrics are set to the maximum value of 65535.

This example includes the following settings:

- **overload**—Configures the local routing device so it appears to be overloaded. You might configure this if you want the routing device to participate in OSPF routing, but do not want it to be used for transit traffic, or you are performing maintenance on a routing device in a production network.
- **timeout seconds**—(Optional) Specifies the number of seconds at which the overload is reset. If no timeout interval is specified, the routing device remains in the overload state until the overload statement is deleted or a timeout is set. In this example, you configure 60 seconds as the amount of time the routing device remains in the overload state. By default, the timeout interval is 0 seconds (this value is not configured). The range is from 60 through 1800 seconds.

### Configuration

**CLI Quick Configuration** To quickly configure a local routing device to appear as overloaded, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf overload timeout 60
```

**Step-by-Step Procedure** To configure a local routing device to appear overloaded:

1. Enter OSPF configuration mode.

**NOTE:** To specify OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@host# edit protocols ospf
```

2. Configure the local routing device to be overloaded.

```
[edit protocols ospf]
user@host# set overload
```

3. (Optional) Configure the number of seconds at which overload is reset.

```
[edit protocols ospf]
user@host# set overload timeout 60
```

4. (Optional) Configure the limit on the number prefixes exported to OSPF, to minimise the load on the routing device and prevent the device from entering the overload mode.

```
[edit protocols ospf]
user@host# set prefix-export-limit 50
```

5. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf]
user@host# commit
```

**Results** Confirm your configuration by entering the `show protocols ospf` command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration. The output includes the optional `timeout` and `prefix-export-limit` statements.

```
user@host# show protocols ospf

prefix-export-limit 50;
overload timeout 60;
```

To confirm your OSPFv3 configuration, enter the `show protocols ospf3` command.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying Traffic Has Moved Off Devices on page 4166](#)
- [Verifying Transit Interface Metrics on page 4167](#)
- [Verifying the Overload Configuration on page 4167](#)
- [Verifying the Viable Next Hop on page 4167](#)

### **Verifying Traffic Has Moved Off Devices**

**Purpose** Verify that the traffic has moved off the upstream devices.

**Action** From operational mode, enter the `show interfaces detail` command.

***Verifying Transit Interface Metrics***

**Purpose** Verify that the transit interface metrics are set to the maximum value of 65535 on the downstream neighboring device.

**Action** From operational mode, enter the **show ospf database router detail advertising-router address** command for OSPFv2, and enter the **show ospf3 database router detail advertising-router address** command for OSPFv3.

***Verifying the Overload Configuration***

**Purpose** Verify that overload is configured by reviewing the Configured overload field. If the overload timer is also configured, this field also displays the time that remains before it is set to expire.

**Action** From operational mode, enter the **show ospf overview** command for OSPFv2, and the **show ospf3 overview** command for OSPFv3.

***Verifying the Viable Next Hop***

**Purpose** Verify the viable next hop configuration on the upstream neighboring device. If the neighboring device is overloaded, it is not used for transit traffic and is not displayed in the output.

**Action** From operational mode, enter the **show route address** command.

- [Example: Configuring OSPF Timers on page 4168](#)

#### OSPF Timers Overview

---

OSPF routing devices constantly track the status of their neighbors, sending and receiving hello packets that indicate whether each neighbor still is functioning, and sending and receiving link-state advertisement (LSA) and acknowledgment packets. OSPF sends packets and expects to receive packets at specified intervals.

You configure OSPF timers on the interface of the routing device participating in OSPF. Depending on the timer, the configured interval must be the same on all routing devices on a shared network (area).

You can configure the following OSPF timers:

- Hello interval—Routing devices send hello packets at a fixed interval on all interfaces, including virtual links, to establish and maintain neighbor relationships. The hello interval specifies the length of time, in seconds, before the routing device sends a hello packet out of an interface. This interval must be the same on all routing devices on a shared network. By default, the routing device sends hello packets every 10 seconds (broadcast and point-to-point networks) and 30 seconds (nonbroadcast multiple access (NBMA) networks).
- Poll interval—(OSPFv2, Nonbroadcast networks only) Routing devices send hello packets for a longer interval on nonbroadcast networks to minimize the bandwidth required on slow WAN links. The poll interval specifies the length of time, in seconds, before the routing device sends hello packets out of the interface before establishing adjacency with a neighbor. By default, the routing device sends hello packets every 120 seconds until active neighbors are detected.

Once the routing device detects an active neighbor, the hello packet interval changes from the time specified in the poll interval to the time specified in the hello interval.

- LSA retransmission interval—When a routing device sends LSAs to its neighbors, the routing device expects to receive an acknowledgment packet from each neighbor within a certain amount of time. The LSA retransmission interval specifies the length of time, in seconds, that the routing device waits to receive an LSA packet before retransmitting the LSA to an interface's neighbors. By default, the routing device waits 5 seconds for an acknowledgment before retransmitting the LSA.
- Dead interval—If a routing device does not receive a hello packet from a neighbor within a fixed amount of time, the routing device modifies its topology database to indicate that the neighbor is nonoperational. The dead interval specifies the length of time, in seconds, that the routing device waits before declaring that a neighboring routing device is unavailable. This is an interval during which the routing device receives no hello packets from the neighbor. This interval must be the same on all routing devices on a shared network. By default, this interval is four times the default hello interval, which is 40 seconds (broadcast and point-to-point networks) and 120 seconds (NBMA networks).
- Transit delay—Before a link-state update packet is propagated out of an interface, the routing device must increase the age of the packet. The transit delay sets the estimated time required to transmit a link-state update on the interface. By default, the transit delay is 1 second. You should never have to modify the transit delay time.

---

### Example: Configuring OSPF Timers

This example shows how to configure the OSPF timers.

- [Requirements on page 4169](#)
- [Overview on page 4169](#)

- [Configuration on page 4170](#)
- [Verification on page 4173](#)

### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4102.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4104
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4107.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4109.

### Overview

The default OSPF timer settings are optimal for most networks. However, depending on your network requirements, you might need to modify the timer settings. This example explains why you might need to modify the following timers:

- Hello interval
- Dead interval
- LSA retransmission interval
- Transit delay

### Hello Interval and Dead Interval

The hello interval and the dead interval optimize convergence times by efficiently tracking neighbor status. By lowering the values of the hello interval and the dead interval, you can increase the convergence of OSPF routes if a path fails. These intervals must be the same on all routing devices on a shared network. Otherwise, OSPF cannot establish the appropriate adjacencies.

In the first example, you lower the hello interval to 2 seconds and the dead interval to 8 seconds on point-to-point OSPF interfaces **fe-0/0/1** and **fe-1/0/1** in area 0.0.0.0 by configuring the following settings:

- **hello-interval**—Specifies the length of time, in seconds, before the routing device sends a hello packet out of an interface. By default, the routing device sends hello packets every 10 seconds. The range is from 1 through 255 seconds.
- **dead-interval**—Specifies the length of time, in seconds, that the routing device waits before declaring that a neighboring routing device is unavailable. This is an interval during which the routing device receives no hello packets from the neighbor. By default,

the routing device waits 40 seconds (four times the hello interval). The range is 1 through 65,535 seconds.

### LSA Retransmission Interval

The link-state advertisement (LSA) retransmission interval optimizes the sending and receiving of LSA and acknowledgement packets. You must configure the LSA retransmission interval to be equal to or greater than 3 seconds to avoid triggering a retransmit trap because the Junos OS delays LSA acknowledgments by up to 2 seconds. If you have a virtual link, you might find increased performance by increasing the value of the LSA retransmission interval.

In the second example, you increase the LSA retransmission timer to 8 seconds on OSPF interface **fe-0/0/1** in area 0.0.0.1 by configuring the following setting:

- **retransmit-interval**—Specifies the length of time, in seconds, that the routing device waits to receive an LSA packet before retransmitting LSA to an interface's neighbors. By default, the routing device retransmits LSAs to its neighbors every 5 seconds. The range is from 1 through 65,535 seconds.

### Transit Delay

The transit delay sets the time the routing device uses to age a link-state update packet. If you have a slow link (for example, one with an average propagation delay of multiple seconds), you should increase the age of the packet by a similar amount. Doing this ensures that you do not receive a packet back that is younger than the original copy.

In the final example, you increase the transit delay to 2 seconds on OSPF interface **fe-1/0/1** in area 0.0.0.1. By configuring the following setting, this causes the routing device to age the link-state update packet by 2 seconds:

- **transit-delay**—Sets the estimated time required to transmit a link-state update on the interface. You should never have to modify the transit delay time. By default, the routing device ages the packet by 1 second. The range is from 1 through 65,535 seconds.

### Configuration

- [Configuring the Hello Interval and the Dead Interval on page 4170](#)
- [Controlling the LSA Retransmission Interval on page 4172](#)
- [Specifying the Transit Delay on page 4172](#)

### Configuring the Hello Interval and the Dead Interval

#### CLI Quick Configuration

To quickly configure the hello and dead intervals, copy the following commands and paste them into the CLI.

```
[edit]
set protocols ospf area 0.0.0.0 interface fe-0/0/1 hello-interval 2
set protocols ospf area 0.0.0.0 interface fe-0/0/1 dead-interval 8
set protocols ospf area 0.0.0.0 interface fe-1/0/1 hello-interval 2
set protocols ospf area 0.0.0.0 interface fe-1/0/1 dead-interval 8
```

**Step-by-Step Procedure** To configure the hello and dead intervals:

1. Create an OSPF area.

**NOTE:** To specify OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@host# edit protocols ospf area 0.0.0.0
```

2. Specify the interfaces.

```
[edit protocols ospf area 0.0.0.0]
user@host# set interface fe-0/0/1
user@host# set interface fe-1/0/1
```

3. Configure the hello interval.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# set interface fe-0/0/1 hello-interval 2
user@host# set interface fe-1/0/1 hello-interval 2
```

4. Configure the dead interval.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# set interface fe-0/0/1 dead-interval 8
user@host# set interface fe-1/0/1 dead-interval 8
```

5. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# commit
```

**NOTE:** Repeat this entire configuration on all routing devices in a shared network.

**Results** Confirm your configuration by entering the `show protocols ospf` command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.0 {
  interface fe-0/0/1.0 {
    hello-interval 2;
    dead-interval 8;
  }
  interface fe-1/0/1.0 {
    hello-interval 2;
    dead-interval 8;
  }
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### *Controlling the LSA Retransmission Interval*

**CLI Quick Configuration** To quickly configure the LSA retransmission interval, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf area 0.0.0.1 interface fe-0/0/1 retransmit-interval 8
```

**Step-by-Step Procedure** To configure the LSA retransmission interval:

1. Create an OSPF area.

**NOTE:** To specify OSPFv3, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# edit protocols ospf area 0.0.0.1
```

2. Specify the interface.

```
[edit protocols ospf area 0.0.0.1]
user@host# set interface fe-0/0/1
```

3. Configure the LSA retransmission interval.

```
[edit protocols ospf area 0.0.0.1 ]
user@host# set interface fe-0/0/1 retransmit-interval 8
```

4. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf area 0.0.0.1]
user@host# commit
```

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.1 {
  interface fe-0/0/1.0 {
    retransmit-interval 8;
  }
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### *Specifying the Transit Delay*

**CLI Quick Configuration** To quickly configure the transit delay, copy the following command and paste it into the CLI.

```
[edit]
```

```
set protocols ospf area 0.0.0.1 interface fe-1/0/1 transit-delay 2
```

### Step-by-Step Procedure

To configure the transit delay:

1. Create an OSPF area.

**NOTE:** To specify OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@host# edit protocols ospf area 0.0.0.1
```

2. Specify the interface.

```
[edit protocols ospf area 0.0.0.1]
user@host# set interface fe-1/0/1
```

3. Configure the transit delay.

```
[edit protocols ospf area 0.0.0.1 ]
user@host# set interface fe-1/0/1 transit-delay 2
```

4. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf area 0.0.0.1 ]
user@host# commit
```

**Results** Confirm your configuration by entering the `show protocols ospf` command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.1 {
  interface fe-1/0/1.0 {
    transit-delay 2;
  }
}
```

To confirm your OSPFv3 configuration, enter the `show protocols ospf3` command.

### Verification

Confirm that the configuration is working properly.

### Verifying the Timer Configuration

**Purpose** Verify that the interface for OSPF or OSPFv3 has been configured with the applicable timer values. Confirm that the Hello field, the Dead field, and the ReXmit field display the values that you configured.

**Action** From operational mode, enter the `show ospf interface detail` for OSPFv2, and enter the `show ospf3 interface detail` command for OSPFv3.

### Understanding BFD for OSPF

---

The Bidirectional Forwarding Detection (BFD) protocol is a simple hello mechanism that detects failures in a network. BFD works with a wide variety of network environments and topologies. A pair of routing devices exchange BFD packets. Hello packets are sent at a specified, regular interval. A neighbor failure is detected when the routing device stops receiving a reply after a specified interval. The BFD failure detection timers have shorter time limits than the OSPF failure detection mechanisms, so they provide faster detection.

The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the **clear bfd adaptation** command to return BFD interval timers to their configured values. The **clear bfd adaptation** command is hitless, meaning that the command does not affect traffic flow on the routing device.

**NOTE:** BFD is supported for OSPFv3 in Junos OS Release 9.3 and later.

---

You can configure the following BFD protocol settings:

- **detection-time threshold**—Threshold for the adaptation of the detection time. When the BFD session detection time adapts to a value equal to or greater than the configured threshold, a single trap and a single system log message are sent.
- **full-neighbors-only**—Ability to establish BFD sessions only for OSPF neighbors with full neighbor adjacency. The default behavior is to establish BFD sessions for all OSPF neighbors. This setting is available in Junos OS Release 9.5 and later.
- **minimum-interval**—Minimum transmit and receive interval for failure detection. This setting configures both the minimum interval after which the local routing device transmits hello packets and the minimum interval after which the routing device expects to receive a reply from the neighbor with which it has established a BFD session. Both intervals are in milliseconds. You can also specify the minimum transmit and receive

intervals separately using the **transmit-interval** **minimum-interval** and **minimum-receive-interval** statements.

**NOTE:** BFD is an intensive protocol that consumes system resources. Specifying a minimum interval for BFD of less than 100 ms for Routing Engine-based sessions and 10 ms for distributed BFD sessions can cause undesired BFD flapping.

Depending on your network environment, these additional recommendations might apply:

- For large-scale network deployments with a large number of BFD sessions, specify a minimum interval of 300 ms for Routing Engine-based sessions and 100 ms for distributed BFD sessions.
  - For very large-scale network deployments with a large number of BFD sessions, contact Juniper Networks customer support for more information.
  - For BFD sessions to remain up during a Routing Engine switchover event when nonstop active routing (NSR) is configured, specify a minimum interval of 2500 ms for Routing Engine-based sessions. Without NSR, Routing Engine-based sessions can have a minimum interval of 100 ms. In OSPFv3, BFD is always based in the Routing Engine, meaning that BFD is not distributed. For distributed BFD sessions with NSR configured, the minimum interval recommendations are unchanged and depend only on your network deployment.
- 
- **minimum-receive-interval**—Minimum receive interval for failure detection. This setting configures the minimum receive interval, in milliseconds, after which the routing device expects to receive a hello packet from a neighbor with which it has established a BFD session. You can also specify the minimum receive interval using the **minimum-interval** statement.
  - **multiplier**—Multiplier for hello packets. This setting configures the number of hello packets that are not received by a neighbor, which causes the originating interface to be declared down. By default, three missed hello packets cause the originating interface to be declared down.
  - **no-adaptation**—Disables BFD adaptation. This setting disables BFD sessions from adapting to changing network conditions. This setting is available in Junos OS Release 9.0 and later.

**NOTE:** We recommend that you do not disable BFD adaptation unless it is preferable not to have BFD adaptation in your network.

- 
- **transmit-interval** **minimum-interval**—Minimum transmit interval for failure detection. This setting configures the minimum transmit interval, in milliseconds, at which the local routing device transmits hello packets to the neighbor with which it has established

a BFD session. You can also specify the minimum transmit interval using the **minimum-interval** statement.

- **transmit-interval threshold**—Threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system log message are sent. The threshold value must be greater than the minimum transmit interval. If you attempt to commit a configuration with a threshold value less than the minimum transmit interval, the routing device displays an error and does not accept the configuration.
- **version**—BFD version. This setting configures the BFD version used for detection. You can explicitly configure BFD version 1, or the routing device can automatically detect the BFD version. By default, the routing device automatically detects the BFD version automatically, which is either 0 or 1.

You can also trace BFD operations for troubleshooting purposes.

---

### Example: Configuring BFD for OSPF

This example shows how to configure the Bidirectional Forwarding Detection (BFD) protocol for OSPF.

- [Requirements on page 4176](#)
- [Overview on page 4176](#)
- [Configuration on page 4178](#)
- [Verification on page 4179](#)

#### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4102.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4104.
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4107.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4109.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4109.

#### Overview

An alternative to adjusting the OSPF hello interval and dead interval settings to increase route convergence is to configure BFD. The BFD protocol is a simple hello mechanism that detects failures in a network. The BFD failure detection timers have shorter timer limits than the OSPF failure detection mechanisms, thereby providing faster detection.

BFD is useful on interfaces that are unable to detect failure quickly, such as Ethernet interfaces. Other interfaces, such as SONET interfaces, already have built-in failure detection. Configuring BFD on those interfaces is unnecessary.

You configure BFD on a pair of neighboring OSPF interfaces. Unlike the OSPF hello interval and dead interval settings, you do not have to enable BFD on all interfaces in an OSPF area.

In this example, you enable failure detection by including the **bfd-liveness-detection** statement on the neighbor OSPF interface **fe-0/1/0** in area 0.0.0.0 and configure the BFD packet exchange interval to 300 milliseconds, configure 4 as the number of missed hello packets that causes the originating interface to be declared down, and configure BFD sessions only for OSPF neighbors with full neighbor adjacency by including the following settings:

- **full-neighbors-only**—In Junos OS Release 9.5 and later, configures the BFD protocol to establish BFD sessions only for OSPF neighbors with full neighbor adjacency. The default behavior is to establish BFD sessions for all OSPF neighbors.
- **minimum-interval**—Configures the minimum interval, in milliseconds, after which the local routing device transmits hello packets as well as the minimum interval after which the routing device expects to receive a reply from the neighbor with which it has established a BFD session. You can configure a number in the range from 1 through 255,000 milliseconds. You can also specify the minimum transmit and receive intervals separately using the **transmit-interval minimum-interval** and **minimum-receive-interval** statements.

**NOTE:** BFD is an intensive protocol that consumes system resources. Specifying a minimum interval for BFD of less than 100 ms for Routing Engine-based sessions and 10 ms for distributed BFD sessions can cause undesired BFD flapping.

Depending on your network environment, these additional recommendations might apply:

- For large-scale network deployments with a large number of BFD sessions, specify a minimum interval of 300 ms for Routing Engine-based sessions and 100 ms for distributed BFD sessions.
- For very large-scale network deployments with a large number of BFD sessions, contact Juniper Networks customer support for more information.
- For BFD sessions to remain up during a Routing Engine switchover event when nonstop active routing (NSR) is configured, specify a minimum interval of 2500 ms for Routing Engine-based sessions. For distributed BFD sessions with NSR configured, the minimum interval recommendations are unchanged and depend only on your network deployment.

- **multiplier**—Configures the number of hello packets not received by a neighbor that causes the originating interface to be declared down. By default, three missed hello packets cause the originating interface to be declared down. You can configure a value in the range from 1 through 255.

### Configuration

**CLI Quick Configuration** To quickly configure the BFD protocol for OSPF, copy the following commands, remove any line breaks, and then paste the commands into the CLI.

```
[edit]
set protocols ospf area 0.0.0.0 interface fe-0/0/1 bfd-liveness-detection minimum-interval 300
set protocols ospf area 0.0.0.0 interface fe-0/0/1 bfd-liveness-detection multiplier 4
set protocols ospf area 0.0.0.0 interface fe-0/0/1 bfd-liveness-detection full-neighbors-only
```

**Step-by-Step Procedure** To configure the BFD protocol for OSPF on one neighboring interface:

1. Create an OSPF area.

**NOTE:** To specify OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@host# edit protocols ospf area 0.0.0.0
```

2. Specify the interface.

```
[edit protocols ospf area 0.0.0.0]
user@host# set interface fe-0/0/1
```

3. Specify the minimum transmit and receive intervals.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# set interface fe-0/0/1 bfd-liveness-detection minimum-interval 300
```

4. Configure the number of missed hello packets that cause the originating interface to be declared down.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# set interface fe-0/0/1 bfd-liveness-detection multiplier 4
```

5. Configure BFD sessions only for OSPF neighbors with full neighbor adjacency.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# set interface fe-0/0/1 bfd-liveness-detection full-neighbors-only
```

6. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# commit
```

**NOTE:** Repeat this entire configuration on the other neighboring interface.

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.0 {
  interface fe-0/0/1.0 {
    bfd-liveness-detection {
      minimum-interval 300;
      multiplier 4;
      full-neighbors-only;
    }
  }
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### **Verification**

Confirm that the configuration is working properly.

### **Verifying the BFD Sessions**

**Purpose** Verify that the OSPF interfaces have active BFD sessions, and that session components have been configured correctly.

**Action** From operational mode, enter the **show bfd session detail** command.

**Meaning** The output displays information about the BFD sessions.

- The Address field displays the IP address of the neighbor.
- The Interface field displays the interface you configured for BFD.
- The State field displays the state of the neighbor and should show Full to reflect the full neighbor adjacency that you configured.
- The Transmit Interval field displays the time interval you configured to send BFD packets.
- The Multiplier field displays the multiplier you configured.

## BFD Authentication for OSPF Overview

---

Bidirectional Forwarding Detection (BFD) enables rapid detection of communication failures between adjacent systems. By default, authentication for BFD sessions is disabled. However, when you run BFD over Network Layer protocols, the risk of service attacks can be significant. We strongly recommend using authentication if you are running BFD over multiple hops or through insecure tunnels. Beginning with Junos OS Release 9.6, Junos OS supports authentication for BFD sessions running over OSPFv2. BFD authentication is not supported on MPLS OAM sessions. BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

You authenticate BFD sessions by specifying an authentication algorithm and keychain, and then associating that configuration information with a security authentication keychain using the keychain name.

The following sections describe the supported authentication algorithms, security keychains, and level of authentication that can be configured:

- [BFD Authentication Algorithms on page 4180](#)
- [Security Authentication Keychains on page 4181](#)
- [Strict Versus Loose Authentication on page 4181](#)

### **BFD Authentication Algorithms**

Junos OS supports the following algorithms for BFD authentication:

- **simple-password**—Plain-text password. One to 16 bytes of plain text are used to authenticate the BFD session. One or more passwords can be configured. This method is the least secure and should be used only when BFD sessions are not subject to packet interception.
- **keyed-md5**—Keyed Message Digest 5 hash algorithm for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed MD5 uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than or equal to the last sequence number received. Although more secure than a simple password, this method is vulnerable to replay attacks. Increasing the rate at which the sequence number is updated can reduce this risk.
- **meticulous-keyed-md5**—Meticulous keyed Message Digest 5 hash algorithm. This method works in the same manner as keyed MD5, but the sequence number is updated with every packet. Although more secure than keyed MD5 and simple passwords, this method might take additional time to authenticate the session.
- **keyed-sha-1**—Keyed Secure Hash Algorithm I for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed SHA uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. The key is not carried within the packets. With this method,

packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than the last sequence number received.

- **meticulous-keyed-sha-1**—Meticulous keyed Secure Hash Algorithm I. This method works in the same manner as keyed SHA, but the sequence number is updated with every packet. Although more secure than keyed SHA and simple passwords, this method might take additional time to authenticate the session.

**NOTE:** Nonstop active routing (NSR) is not supported with the meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

### **Security Authentication Keychains**

The security authentication keychain defines the authentication attributes used for authentication key updates. When the security authentication keychain is configured and associated with a protocol through the keychain name, authentication key updates can occur without interrupting routing and signaling protocols.

The authentication keychain contains one or more keychains. Each keychain contains one or more keys. Each key holds the secret data and the time at which the key becomes valid. The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

BFD allows multiple clients per session, and each client can have its own keychain and algorithm defined. To avoid confusion, we recommend specifying only one security authentication keychain.

### **Strict Versus Loose Authentication**

By default, strict authentication is enabled and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure *loose checking*. When loose checking is configured, packets are accepted without authentication being checked at each end of the session. This feature is intended for transitional periods only.

### **Configuring BFD Authentication for OSPF**

Beginning with Junos OS Release 9.6, you can configure authentication for BFD sessions running over OSPFv2. Routing instances are also supported.

The following sections provide instructions for configuring and viewing BFD authentication on OSPF:

- [Configuring BFD Authentication Parameters on page 4181](#)
- [Viewing Authentication Information for BFD Sessions on page 4183](#)

### **Configuring BFD Authentication Parameters**

Only three steps are needed to configure authentication on a BFD session:

1. Specify the BFD authentication algorithm for the OSPFv2 protocol.
2. Associate the authentication keychain with the OSPFv2 protocol.
3. Configure the related security authentication keychain.

To configure BFD authentication:

1. Specify the algorithm (**keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**, or **simple-password**) to use for BFD authentication on an OSPF route or routing instance.

[edit]

```
user@host# set protocols ospf area 0.0.0.1 interface if2-ospf bfd-liveness-detection  
authentication algorithm keyed-sha-1
```

**NOTE:** Nonstop active routing (NSR) is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

2. Specify the keychain to be used to associate BFD sessions on the specified OSPF route or routing instance with the unique security authentication keychain attributes.

This keychain should match the keychain name configured at the **[edit security authentication key-chains]** hierarchy level.

[edit]

```
user@host# set protocols ospf area 0.0.0.1 interface if2-ospf bfd-liveness-detection  
authentication keychain bfd-ospf
```

**NOTE:** The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

3. Specify the unique security authentication information for BFD sessions:
  - The matching keychain name as specified in Step 2.
  - At least one key, a unique integer between 0 and 63. Creating multiple keys enables multiple clients to use the BFD session.
  - The secret data used to allow access to the session.
  - The time at which the authentication key becomes active, in the format *yyyy-mm-dd.hh:mm:ss*.

[edit security]

```
user@host# authentication-key-chains key-chain bfd-ospf key 53 secret  
$9$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHM start-time 2009-06-14.10:00:00
```

4. (Optional) Specify loose authentication checking if you are transitioning from nonauthenticated sessions to authenticated sessions.

```
[edit]
user@host> set protocols ospf interface if2-ospf bfd-liveness-detection authentication
loose-check
```

5. (Optional) View your configuration using the **show bfd session detail** or **show bfd session extensive** command.
6. Repeat the steps in this procedure to configure the other end of the BFD session.

**NOTE:** BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

### *Viewing Authentication Information for BFD Sessions*

You can view the existing BFD authentication configuration using the **show bfd session detail** and **show bfd session extensive** commands.

The following example shows BFD authentication configured for the **if2-ospf** BGP group. It specifies the keyed SHA-1 authentication algorithm and a keychain name of **bfd-ospf**. The authentication keychain is configured with two keys. Key 1 contains the secret data “\$9\$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHm” and a start time of June 1, 2009, at 9:46:02 AM PST. Key 2 contains the secret data “\$9\$a5jiKW9l.reP38ny.TszF2/9” and a start time of June 1, 2009, at 3:29:20 PM PST.

```
[edit protocols ospf]
area 0.0.0.1 {
  interface if2-ospf {
    bfd-liveness-detection {
      authentication {
        algorithm keyed-sha-1;
        key-chain bfd-ospf;
      }
    }
  }
}
[edit security]
authentication key-chains {
  key-chain bfd-ospf {
    key 1 {
      secret "$9$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHm";
      start-time "2009-6-1.09:46:02 -0700";
    }
    key 2 {
      secret "$9$a5jiKW9l.reP38ny.TszF2/9";
      start-time "2009-6-1.15:29:20 -0700";
    }
  }
}
```

If you commit these updates to your configuration, you see output similar to the following. In the output for the **show bfd session detail** command, **Authenticate** is displayed to indicate that BFD authentication is configured.

## show bfd session detail

```
user@host# show bfd session detail
```

| Address   | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|-----------|-------|------------|-------------|-------------------|------------|
| 10.9.1.33 | Up    | so-7/1/0.0 | 0.600       | 0.200             | 3          |

Client OSPF, TX interval 0.200, RX interval 0.200, multiplier 3, **Authenticate**  
Session up time 3d 00:34  
Local diagnostic None, remote diagnostic None  
Remote state Up, version 1  
Replicated

1 sessions, 1 clients

Cumulative transmit rate 10.0 pps, cumulative receive rate 10.0 pps

For more information about the configuration, use the **show bfd session extensive** command. The output for this command provides the keychain name, the authentication algorithm and mode for each client in the session, and the overall BFD authentication configuration status, keychain name, and authentication algorithm and mode.

## show bfd session extensive

```
user@host# show bfd session extensive
```

| Address   | State | Interface  | Detect Time | Transmit Interval | Multiplier |

### Graceful Restart for OSPF Overview

Graceful restart allows a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition. During a graceful restart, the restarting device and its neighbors continue forwarding packets without disrupting network performance. Because neighboring devices assist in the restart (these neighbors are called *helper routers*), the restarting device can quickly resume full operation without recalculating algorithms.

**NOTE:** On a broadcast link with a single neighbor, when the neighbor initiates an OSPFv3 graceful restart operation, the restart might be terminated at the point when the local routing device assumes the role of a helper. A change in the LSA is considered a topology change, which terminates the neighbor's restart operation.

Graceful restart is disabled by default. You can globally enable graceful restart for all routing protocols by including the **graceful-restart** statement at the **[edit routing-options]** hierarchy level. To enable graceful restart specifically for OSPF, first you need to globally enable graceful restart for all routing protocols.

This topic describes the following information:

- [Helper Mode for Graceful Restart on page 4185](#)
- [Planned and Unplanned Graceful Restart on page 4186](#)

### Helper Mode for Graceful Restart

When a device enabled for OSPF graceful restart restarts, it retains routes learned before the restart in its forwarding table. The device does not allow new OSPF link-state advertisements (LSAs) to update the routing table. This device continues to forward traffic to other OSPF neighbors (or helper routers), and sends only a limited number of LSAs during the restart period. To reestablish OSPF adjacencies with neighbors, the restarting device must send a grace LSA to all neighbors. In response, the helper routers enter helper mode (the ability to assist a neighboring device attempting a graceful restart) and send an acknowledgment back to the restarting device. If there are no topology changes, the helper routers continue to advertise LSAs as if the restarting device had remained in continuous OSPF operation.

**NOTE:** Helper mode is enabled by default when you start the routing platform, even if graceful restart is not enabled. You can disable helper mode specifically for OSPF.

When the restarting device receives replies from all the helper routers, the restarting device selects routes, updates the forwarding table, and discards the old routes. At this point, full OSPF adjacencies are reestablished and the restarting device receives and processes OSPF LSAs as usual. When the helper routers no longer receive grace LSAs from the restarting device or when the topology of the network changes, the helper routers also resume normal operation.

Beginning with Junos OS Release 11.4, you can configure restart signaling-based helper mode for OSPFv2 graceful restart configurations. The Junos OS implementation is based on RFC 4811, *OSPF Out-of-Band Link State Database (LSDB) Resynchronization*, RFC 4812, *OSPF Restart Signaling*, and RFC 4813, *OSPF Link-Local Signaling*. In restart signaling-based helper mode implementations, the restarting device informs its restart status to its neighbors only after the restart is complete. When the restart is complete, the restarting device sends hello messages to its helper routers with the restart signal (RS) bit set in the hello packet header. When a helper router receives a hello packet with the RS bit set in the header, the helper router returns a hello message to the restarting device. The reply hello message from the helper router contains the ResyncState flag and the ResyncTimeout timer that enable the restarting device to keep track of the helper routers that are syncing up with it. When all helpers complete the synchronization, the restarting device exits the restart mode.

**NOTE:** Restart signaling-based graceful restart helper mode is not supported for OSPFv3 configurations.

---

### ***Planned and Unplanned Graceful Restart***

OSPF supports two types of graceful restart: planned and unplanned. During a planned restart, the restarting routing device informs the neighbors before restarting. The neighbors act as if the routing device is still within the network topology, and continue forwarding traffic to the restarting routing device. A grace period is set to specify when the neighbors should consider the restarting routing device as part of the topology. During an unplanned restart, the routing device restarts without warning.

### **Example: Configuring Graceful Restart for OSPF**

---

This example shows how to configure graceful restart specifically for OSPF.

- [Requirements on page 4186](#)
- [Overview on page 4187](#)
- [Configuration on page 4187](#)
- [Verification on page 4190](#)

#### ***Requirements***

Before you begin:

- Configure the router identifiers for the devices in your OSPF network. See [“Example: Configuring an OSPF Router Identifier” on page 4102](#).
- Control OSPF designated router election. See [“Example: Controlling OSPF Designated Router Election” on page 4104](#).
- Configure a single-area OSPF network. See [“Example: Configuring a Single-Area OSPF Network” on page 4107](#).
- Configure a multiarea OSPF network. See [“Example: Configuring a Multiarea OSPF Network” on page 4109](#).

### Overview

Graceful restart enables a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition. During a graceful restart, the restarting routing device and its neighbors continue forwarding packets without disrupting network performance. By default, graceful restart is disabled. You can globally enable graceful restart for all routing protocols by including the **graceful-restart** statement at the **[edit routing-options]** hierarchy level, or you can enable graceful restart specifically for OSPF by including the **graceful-restart** statement at the **[edit protocols (ospf|ospf3)]** hierarchy level.

The first example shows how to enable graceful restart and configure the optional settings for the grace period interval. In this example, interfaces **fe-1/1/1** and **fe-1/1/2** are in OSPF area 0.0.0.0, and you configure those interfaces for graceful restart. The grace period interval for OSPF graceful restart is determined as equal to or less than the sum of the **notify-duration** time interval and the **restart-duration** time interval. The grace period is the number of seconds that the routing device's neighbors continue to advertise the routing device as fully adjacent, regardless of the connection state between the routing device and its neighbors.

The **notify-duration** statement configures how long (in seconds) the routing device notifies helper routers that it has completed graceful restart by sending purged grace link-state advertisements (LSAs) over all interfaces. By default, the routing device sends grace LSAs for 30 seconds. The range is from 1 through 3600 seconds.

The **restart-duration** statement configures the amount of time the routing device waits (in seconds) to complete reacquisition of OSPF neighbors from each area. By default, the routing device allows 180 seconds. The range is from 1 through 3600 seconds.

The second example shows how to disable graceful restart for OSPF by including the **disable** statement.

### Configuration

- [Enabling Graceful Restart for OSPF on page 4187](#)
- [Disabling Graceful Restart for OSPF on page 4189](#)

#### Enabling Graceful Restart for OSPF

**CLI Quick Configuration** To quickly enable graceful restart for OSPF, copy the following commands and paste them into the CLI.

[edit]

```
set interfaces fe-1/1/1 unit 0 family inet address 10.0.0.4
set interfaces fe-1/1/2 unit 0 family inet address 10.0.0.5
set protocols ospf area 0.0.0.0 interface fe-1/1/1
set protocols ospf area 0.0.0.0 interface fe-1/1/2
set routing-options graceful-restart
set protocols ospf graceful-restart restart-duration 190
set protocols ospf graceful-restart notify-duration 40
```

**Step-by-Step Procedure** To enable graceful restart for OSPF:

1. Configure the interfaces.

**NOTE:** For OSPFv3, use IPv6 addresses.

[edit]

```
user@host# set interfaces fe-1/1/1 unit 0 family inet address 10.0.0.4
```

```
user@host# set interfaces fe-1/1/2 unit 0 family inet address 10.0.0.5
```

2. Configure OSPF on the interfaces.

**NOTE:** To specify OSPFv3, include the `ospf3` statement at the [edit protocols] hierarchy level.

[edit]

```
user@host# set protocols ospf area 0.0.0.0 interface fe-1/1/1
```

```
user@host# set protocols ospf area 0.0.0.0 interface fe-1/1/2
```

3. Configure graceful restart globally

[edit]

```
user@host# edit routing-options graceful-restart
```

4. Configure OSPF graceful restart.

[edit]

```
user@host# edit protocols ospf graceful-restart
```

5. (Optional) Configure the restart duration time.

[edit protocols ospf graceful-restart]

```
user@host# set restart-duration 190
```

6. (Optional) Configure the notify duration time.

[edit protocols ospf graceful-restart]

```
user@host# set notify-duration 40
```

7. If you are done configuring the device, commit the configuration.

[edit protocols ospf graceful-restart]

```
user@host# commit
```

**Results** Confirm your configuration by entering the **show interfaces** and **show protocols ospf** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
fe-1/1/1 {
  unit 0 {
    family inet {
      address 10.0.0.4/32;
    }
  }
}
fe-1/1/2 {
  unit 0 {
    family inet {
      address 10.0.0.5/32;
    }
  }
}
user@host# show protocols ospf
graceful-restart {
  restart-duration 190;
  notify-duration 40;
}
area 0.0.0.0 {
  interface fe-1/1/1.0;
  interface fe-1/1/2.0;
}
```

To confirm an OSPFv3 configuration, enter the **show interfaces** and the **show protocols ospf3** commands.

### *Disabling Graceful Restart for OSPF*

**CLI Quick Configuration** To quickly disable graceful restart for OSPF, copy the following command and paste it into the CLI.

```
[edit]
user@host# set protocols ospf graceful-restart disable
```

**Step-by-Step Procedure** To disable graceful restart for OSPF:

1. Disable graceful restart for the OSPF protocol only.

This command does not affect the global graceful restart configuration setting.

**NOTE:** To specify OSPFv3, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# set protocols ospf graceful-restart disable
```

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
graceful-restart disable;
```

To confirm an OSPFv3 configuration, enter the **show protocols ospf3** command.

### ***Verification***

Confirm that the configuration is working properly.

- [Verifying the OSPF Graceful Restart Configuration on page 4190](#)
- [Verifying Graceful Restart Status on page 4190](#)

### ***Verifying the OSPF Graceful Restart Configuration***

**Purpose** Verify information about your OSPF graceful restart configuration.

**Action** From operational mode, enter the **show ospf overview** command for OSPFv2. Enter the **show ospf3 overview** command for OSPFv3.

**Meaning** The Restart field displays the status of graceful restart as either enabled or disabled. The Restart duration field displays how much time the restarted routing device requires to complete reacquisition of OSPF neighbors. The Restart grace period field displays how much time the neighbors should consider the restarted routing device as part of the topology.

### ***Verifying Graceful Restart Status***

**Purpose** Verify the status of graceful restart.

**Action** From operational mode, enter the **show route instance detail** command.

**Meaning** The Restart State field displays Pending if the restart has not been completed or Complete if the restart has finished. The Path selection timeout field indicates the amount of time remaining until graceful restart is declared complete. There is a more detailed Restart State field that displays a list of protocols that have or have not yet completed graceful restart for the specified routing table.

### **Example: Configuring the Helper Capability Mode for OSPFv2 Graceful Restart**

This example shows how to disable and reenabling the helper mode capability for OSPFv2 graceful restart.

- [Requirements on page 4191](#)
- [Overview on page 4191](#)

- [Configuration on page 4191](#)
- [Verification on page 4193](#)

### Requirements

Before you begin:

- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4102.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4104
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4107.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4109.

### Overview

The OSPF graceful restart helper capability assists a neighboring routing device attempting a graceful restart. By default, the helper capability is globally enabled when you start the routing platform. This means that the helper capability is enabled when you start OSPF, even if graceful restart is not globally enabled or specifically enabled for OSPF. You can further modify your graceful restart configuration to disable the helper capability.

Beginning with Junos OS Release 11.4, you can configure restart signaling-based helper mode for OSPFv2 graceful restart configurations. Both the standard and restart signaling-based helper modes are enabled by default.

In the first example, interfaces **fe-1/1/1** and **fe-1/1/2** are in OSPFv2 area 0.0.0.0, and you configure those interfaces for graceful restart. You then disable the standard OSPFv2 graceful restart helper capability by including the **helper-disable standard** statement. This configuration is useful if you have an environment that contains other vendor equipment that is configured for restart signaling-based graceful restart.

**NOTE:** The **helper-disable** statement and the **no-strict-lsa-checking** statement cannot be configured at the same time. If you attempt to configure both statements at the same time, the routing device displays a warning message when you enter the **show protocols ospf** command.

The second example shows how to reenabling the standard OSPFv2 restart helper capability that you disabled in the first example.

### Configuration

- [Disabling Helper Mode for OSPFv2 on page 4192](#)
- [Reenabling Helper Mode for OSPFv2 on page 4193](#)

### *Disabling Helper Mode for OSPFv2*

**CLI Quick Configuration** To quickly enable graceful restart for OSPFv2 with helper mode disabled, copy the following commands and paste them into the CLI.

```
[edit]
set interfaces fe-1/1/1 unit 0 family inet address 10.0.0.4
set interfaces fe-1/1/2 unit 0 family inet address 10.0.0.5
set protocols ospf area 0.0.0.0 interface fe-1/1/1
set protocols ospf area 0.0.0.0 interface fe-1/1/2
set protocols ospf graceful-restart helper-disable standard
```

**Step-by-Step Procedure** To enable graceful restart for OSPFv2 with helper mode disabled:

1. Configure the interfaces.  

```
[edit]
user@host# set interfaces fe-1/1/1 unit 0 family inet address 10.0.0.4
user@host# set interfaces fe-1/1/2 unit 0 family inet address 10.0.0.5
```
2. Configure OSPFv2 on the interfaces  

```
[edit]
user@host# set protocols ospf area 0.0.0.0 interface fe-1/1/1
user@host# set protocols ospf area 0.0.0.0 interface fe-1/1/2
```
3. Disable the OSPFv2 graceful restart helper capability.  
If you disable the OSPFv2 graceful restart helper capability, you cannot disable strict LSA checking.  

```
[edit]
user@host# set protocols ospf graceful-restart helper-disable standard
```
4. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

**Results** Confirm your configuration by entering the **show interfaces** and the **show protocols ospf** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
fe-1/1/1 {
  unit 0 {
    family inet {
      address 10.0.0.4/32;
    }
  }
}
fe-1/1/2 {
  unit 0 {
    family inet {
      address 10.0.0.5/32;
    }
  }
}
```

```

user@host# show protocols ospf
graceful-restart {
  helper-disable {
    standard;
  }
}
area 0.0.0.0 {
  interface fe-1/1/1.0;
  interface fe-1/1/2.0;
}

```

### *Reenabling Helper Mode for OSPFv2*

#### **CLI Quick Configuration**

To quickly reenable standard helper-mode for OSPFv2, copy the following command and paste it into the CLI.

```

[edit]
delete protocols ospf graceful-restart helper-disable standard

```

**NOTE:** To reenable restart signaling-based helper mode, include the **restart-signaling** statement. To reenable both standard and restart signaling-based helper mode, include the **both** statement.

#### **Step-by-Step Procedure**

To reenable standard helper mode for OSPFv2:

1. Delete the standard helper-mode statement from the OSPFv2 configuration.

```

[edit]
user@host# delete protocols ospf graceful-restart helper-disable standard

```

2. If you are done configuring the device, commit the configuration.

```

[edit]
user@host# commit

```

#### **Results**

After you reenable standard helper mode, the **show protocols ospf** command no longer displays the graceful restart configuration.

#### **Verification**

Confirm that the configuration is working properly.

- [Verifying the OSPFv2 Graceful Restart Configuration on page 4193](#)
- [Verifying Graceful Restart Status on page 4194](#)

#### **Verifying the OSPFv2 Graceful Restart Configuration**

#### **Purpose**

Verify information about your OSPFv2 graceful restart configuration. The Restart field displays the status of graceful restart as either enabled or disabled, the Graceful restart helper mode field displays the status of the standard helper mode capability as enabled or disabled, and the Restart-signaling helper mode field displays the status of the restart

signaling-based helper mode as enabled or disabled. By default, both standard and restart signaling-based helper modes are enabled.

**Action** From operational mode, enter the **show ospf overview** command.

#### ***Verifying Graceful Restart Status***

**Purpose** Verify the status of graceful restart. The Restart State field displays Pending if the restart has not completed, or Complete if the restart has finished. The Path selection timeout field indicates the amount of time remaining until graceful restart is declared complete. #### ***Overview***

The OSPF graceful restart helper capability assists a neighboring routing device attempting a graceful restart. By default, the helper capability is globally enabled when you start the routing platform. This means that the helper capability is enabled when you start OSPF, even if graceful restart is not globally enabled or specifically enabled for OSPF. You can further modify your graceful restart configuration to disable the helper capability.

In the first example, interfaces **fe-1/1/1** and **fe-1/1/2** are in OSPFv3 area 0.0.0.0, and you configure those interfaces for graceful restart. You then disable the OSPFv3 graceful restart helper capability by including the **helper-disable** statement.

**NOTE:** The **helper-disable** statement and the **no-strict-lsa-checking** statement cannot be configured at the same time. If you attempt to configure both statements at the same time, the routing device displays a warning message when you enter the **show protocols ospf** command.

The second example shows how to reenable the OSPFv3 restart helper capability that you disabled in the first example.

### Configuration

- [Disabling Helper Mode for OSPFv3 on page 4195](#)
- [Reenabling Helper Mode for OSPFv3 on page 4196](#)

### Disabling Helper Mode for OSPFv3

#### CLI Quick Configuration

To quickly enable graceful restart for OSPFv3 with helper mode disabled, copy the following commands and paste them into the CLI.

```
[edit]
set interfaces fe-1/1/1 unit 0 family inet6 address 2002:0a00:0004::
set interfaces fe-1/1/2 unit 0 family inet6 address 2002:0a00:0005::
set protocols ospf3 area 0.0.0.0 interface fe-1/1/1
set protocols ospf3 area 0.0.0.0 interface fe-1/1/2
set protocols ospf3 graceful-restart helper-disable
```

#### Step-by-Step Procedure

To enable graceful restart for OSPFv3 with helper mode disabled:

1. Configure the interfaces.
 

```
[edit]
user@host# set interfaces fe-1/1/1 unit 0 family inet6 address 2002:0a00:0004::
user@host# set interfaces fe-1/1/2 unit 0 family inet6 address 2002:0a00:0005::
```
2. Configure OSPFv3 on the interfaces
 

```
[edit]
user@host# set protocols ospf3 area 0.0.0.0 interface fe-1/1/1
user@host# set protocols ospf3 area 0.0.0.0 interface fe-1/1/2
```
3. Disable the OSPFv3 graceful restart helper capability.
 

If you disable the OSPFv3 graceful restart helper capability, you cannot disable strict LSA checking.

```
[edit]
user@host# set protocols ospf3 graceful-restart helper-disable
```
4. If you are done configuring the device, commit the configuration.
 

```
[edit]
user@host# commit
```

**Results** Confirm your configuration by entering the **show interfaces** and the **show protocols ospf3** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
fe-1/1/1 {
  unit 0 {
    family inet6 {
      address 2002:0a00:0004::/128;
    }
  }
}
fe-1/1/2 {
  unit 0 {
    family inet6 {
      address 2002:0a00:0005::/128;
    }
  }
}
user@host# show protocols ospf3
graceful-restart {
  helper-disable;
}
area 0.0.0.0 {
  interface fe-1/1/1.0;
  interface fe-1/1/2.0;
}
```

#### *Reenabling Helper Mode for OSPFv3*

**CLI Quick Configuration** To quickly reenoble helper-mode for OSPFv3, copy the following command and paste it into the CLI.

```
[edit]
delete protocols ospf3 graceful-restart helper-disable
```

**Step-by-Step Procedure** To reenoble helper mode for OSPFv3:

1. Delete the standard helper-mode statement from the OSPFv3 configuration.

```
[edit]
user@host# delete protocols ospf3 graceful-restart helper-disable
```

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**Results** After you reenoble standard helper mode, the **show protocols ospfs** command no longer displays the graceful restart configuration.

**Verification**

Confirm that the configuration is working properly.

- [Verifying the OSPFv3 Graceful Restart Configuration on page 4197](#)
- [Verifying Graceful Restart Status on page 4197](#)

**Verifying the OSPFv3 Graceful Restart Configuration**

**Purpose** Verify information about your OSPFv3 graceful restart configuration. The Restart field displays the status of graceful restart as either enabled or disabled, and the Helper mode field displays the status of the helper mode capability as either enabled or disabled.

**Action** From operational mode, enter the **show ospf3 overview** command.

**Verifying Graceful Restart Status**

**Purpose** Verify the status of graceful restart. The Restart State field displays Pending if the restart has not completed, or Complete if the restart has finished. The Path selection timeout field indicates the amount of time remaining until graceful restart is declared complete. There is a more detailed Restart State field that displays a list of protocols that have completed graceful restart or have not yet completed graceful restart for the specified routing table.

**Action** From operational mode, enter the **show route instance detail** command.

**Example: Disabling Strict LSA Checking for OSPF Graceful Restart**

This example shows how to disable strict link-state advertisement (LSA) checking for OSPF graceful restart.

- [Requirements on page 4197](#)
- [Overview on page 4198](#)
- [Configuration on page 4198](#)
- [Verification on page 4199](#)

**Requirements**

Before you begin:

- Configure the router identifiers for the devices in your OSPF network. See [“Example: Configuring an OSPF Router Identifier” on page 4102](#).
- Control OSPF designated router election. See [“Example: Controlling OSPF Designated Router Election” on page 4104](#)
- Configure a single-area OSPF network. See [“Example: Configuring a Single-Area OSPF Network” on page 4107](#).
- Configure a multiarea OSPF network. See [“Example: Configuring a Multiarea OSPF Network” on page 4109](#).

### Overview

You can disable strict LSA checking to prevent the termination of graceful restart by a helping router. You might configure this option for interoperability with other vendor devices. The OSPF graceful restart helper capability must be enabled if you disable strict LSA checking. By default, LSA checking is enabled.

In this example, interfaces **fe-1/1/1** and **fe-1/1/2** are in OSPF area 0.0.0.0, and you configure those interfaces for graceful restart. You then disable strict LSA checking by including the **no-strict-lsa-checking** statement.

**NOTE:** The **helper-disable** statement and the **no-strict-lsa-checking** statement cannot be configured at the same time. If you attempt to configure both statements at the same time, the routing device displays a warning message when you enter the **show protocols ospf** command.

### Configuration

#### CLI Quick Configuration

To quickly enable graceful restart for OSPF with strict LSA checking disabled, copy the following commands and paste them into the CLI.

```
[edit]
set interfaces fe-1/1/1 unit 0 family inet address 10.0.0.4
set interfaces fe-1/1/2 unit 0 family inet address 10.0.0.5
set protocols ospf area 0.0.0.0 interface fe-1/1/1
set protocols ospf area 0.0.0.0 interface fe-1/1/2
set protocols ospf graceful-restart no-strict-lsa-checking
```

#### Step-by-Step Procedure

To enable graceful restart for OSPF with strict LSA checking disabled:

1. Configure the interfaces.

**NOTE:** For OSPFv3, use IPv6 addresses.

```
[edit]
user@host# set interfaces fe-1/1/1 unit 0 family inet address 10.0.0.4
user@host# set interfaces fe-1/1/2 unit 0 family inet address 10.0.0.5
```

2. Configure OSPF on the interfaces

**NOTE:** To specify OSPFv3, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# set protocols ospf area 0.0.0.0 interface fe-1/1/1
user@host# set protocols ospf area 0.0.0.0 interface fe-1/1/2
```

3. Disable strict LSA checking.

If you disable the strict LSA checking, OSPF graceful restart helper capability must be enabled (which is the default behavior).

```
[edit]
user@host# set protocols ospf graceful-restart no-strict-lsa-checking
```

4. If you are done configuring the device, commit the configuration.

```
[edit ]
user@host# commit
```

**Results** Confirm your configuration by entering the **show interfaces** and the **show protocols ospf** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
fe-1/1/1 {
  unit 0 {
    family inet {
      address 10.0.0.4/32;
    }
  }
}
fe-1/1/2 {
  unit 0 {
    family inet {
      address 10.0.0.5/32;
    }
  }
}
user@host# show protocols ospf
graceful-restart {
  no-strict-lsa-checking;
}
area 0.0.0.0 {
  interface fe-1/1/1.0;
  interface fe-1/1/2.0;
}
```

To confirm your OSPFv3 configuration, enter the **show interfaces** and the **show protocols ospf3** commands.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying the OSPF Graceful Restart Configuration on page 4199](#)
- [Verifying Graceful Restart Status on page 4200](#)

### **Verifying the OSPF Graceful Restart Configuration**

**Purpose** Verify information about your OSPF graceful restart configuration. The Restart field displays the status of graceful restart as either enabled or disabled.

**Action** From operational mode, enter the **show ospf overview** command for OSPFv2, and enter the **show ospf3 overview** command for OSPFv3.

#### ***Verifying Graceful Restart Status***

**Purpose** Verify the status of graceful restart. The Restart State field displays Pending if the restart has not completed, or Complete if the restart has finished. The Path selection timeout field indicates the amount of time remaining until graceful restart is declared complete. There is a more detailed Restart State field that displays a list of protocols that have completed graceful restart or have not yet completed graceful restart for the specified routing table.

**Action** From operational mode, enter the **show route instance detail** command.

#### OSPF Support for Traffic Engineering

Traffic engineering allows you to control the path that data packets follow, bypassing the standard routing model, which uses routing tables. Traffic engineering moves flows from congested links to alternate links that would not be selected by the automatically computed destination-based shortest path.

To help provide traffic engineering and MPLS with information about network topology and loading, extensions have been added to the Junos OS implementation of OSPF. When traffic engineering is enabled on the routing device, you can enable OSPF traffic engineering support. When you enable traffic engineering for OSPF, the shortest-path-first (SPF) algorithm takes into account the various label-switched paths (LSPs) configured under MPLS and configures OSPF to generate opaque link-state advertisements (LSAs) that carry traffic engineering parameters. The parameters are used to populate the traffic engineering database. The traffic engineering database is used exclusively for calculating explicit paths for the placement of LSPs across the physical topology. The Constrained

Shortest Path First (CSPF) algorithm uses the traffic engineering database to compute the paths that MPLS LSPs take. RSVP uses this path information to set up LSPs and to reserve bandwidth for them.

By default, traffic engineering support is disabled. To enable traffic engineering, include the **traffic-engineering** statement. You can also configure the following OSPF traffic engineering extensions:

- **advertise-unnnumbered-interfaces**—(OSPFv2 only) Advertises the link-local identifier in the link-local traffic engineering LSA packet. This statement must be included on both ends of an unnumbered link to allow an ingress LER to update the link in its traffic engineering database and use it for CSPF calculations. The link-local identifier is then used by RSVP to signal unnumbered interfaces as defined in RFC 3477, *Signalling Unnumbered Links in Resource Reservation Protocol - Traffic Engineering (RSVP-TE)*.
- **credibility-protocol-preference**—(OSPFv2 only) Assigns a credibility value to OSPF routes in the traffic engineering database. By default, Junos OS prefers IS-IS routes in the traffic engineering database over other interior gateway protocol (IGP) routes even if the routes of another IGP are configured with a lower, that is, more preferred, preference value. The traffic engineering database assigns a credibility value to each IGP and prefers the routes of the IGP with the highest credibility value. In Junos OS Release 9.4 and later, you can configure OSPF to take protocol preference into account to determine the traffic engineering database credibility value. When protocol preference is used to determine the credibility value, IS-IS routes are not automatically preferred by the traffic engineering database, depending on your configuration.
- **ignore-lsp-metrics**—Ignores RSVP LSP metrics in OSPF traffic engineering shortcut calculations or when you configure LDP over RSVP LSPs. This option avoids mutual dependency between OSPF and RSVP, eliminating the time period when the RSVP metric used for tunneling traffic is not up to date. In addition, If you are using RSVP for traffic engineering, you can run LDP simultaneously to eliminate the distribution of external routes in the core. The LSPs established by LDP are tunneled through the LSPs established by RSVP. LDP effectively treats the traffic-engineered LSPs as single hops.
- **multicast-rpf-routes**—(OSPFv2 only) Installs unicast IPv4 routes (not LSPs) in the multicast routing table (**inet.2**) for multicast reverse-path forwarding (RPF) checks. The **inet.2** routing table consists of unicast routes used for multicast RPF lookup. RPF is an antispoofing mechanism used to check if the packet is coming in on an interface that is also sending data back to the packet source.
- **no-topology**—(OSPFv2 only) To disable the dissemination of link-state topology information. If disabled, traffic engineering topology information is no longer distributed within the OSPF area.
- **shortcuts**—Configures OSPF to use MPLS LSPs as shortcut next hops. By default, shortcut routes calculated through OSPFv2 are installed in the **inet.3** routing table, and shortcut routes calculated through OSPFv3 are installed in the **inet6.3** routing table.

**NOTE:** Whenever possible, use OSPF IGP shortcuts configured at the `[edit protocols mpls traffic-engineering bgp-igp]` hierarchy level instead of traffic engineering shortcuts configured at the `[edit protocols (ospf | ospf3) traffic-engineering shortcuts]` hierarchy level.

If you configure OSPF IGP shortcuts, `inet.3` routes are moved into the `inet.0` routing table. In addition, you can verify the data path using `ping` or `traceroute` commands since the ping and traceroute packets get tunneled into the LSP. In case of a VPN enabled device, we recommend using `[edit protocols mpls traffic-engineering bgp-igp-both-ribs]` because BGP next-hop resolution for VPN prefixes relies on entries in the `inet.3` table.

If you configure traffic engineering shortcuts, OSPF treats the MPLS LSP as a candidate next hop and installs the routes in the `inet.3` (for OSPFv2) and `inet6.3` (for OSPFv3) routing tables. The only use for these tables is to allow BGP to perform next-hop resolution. In addition, you cannot verify the data path of these routes using `ping` or `traceroute` commands because the ping and traceroute packets get tunneled into the LSP.

- **`lsp-metric-info-summary`**—Advertises the LSP metric in summary LSAs to treat the LSP as a link. This configuration allows other routing devices in the network to use this LSP. To accomplish this, you need to configure MPLS and OSPF traffic engineering to advertise the LSP metric in summary LSAs.

When you enable traffic engineering on the routing device, you can also configure an OSPF metric that is used exclusively for traffic engineering. The traffic engineering metric is used for information injected into the traffic engineering database. Its value does not affect normal OSPF forwarding.

**CAUTION:** When the OSPF traffic engineering configuration is considerably modified, the routing table entries are deleted and the routing table is recreated. Changes to configuration that can cause this behavior include enabling or disabling:

- Traffic engineering shortcuts
- IGP shortcuts
- LDP tunneling
- Multiprotocol LSP
- Advertise summary metrics
- Multicast RPF routes

---

### Example: Enabling OSPF Traffic Engineering Support

---

This example shows how to enable OSPF traffic engineering support to advertise the label-switched path (LSP) metric in summary link-state advertisements (LSAs).

- [Requirements on page 4203](#)
- [Overview on page 4203](#)
- [Configuration on page 4204](#)
- [Verification on page 4207](#)

#### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure BGP per your network requirements. See the *Junos OS Routing Protocols Library for Routing Devices*
- Configure MPLS per your network requirements. See the *Junos OS MPLS Applications Library for Routing Devices*.

#### Overview

You can configure OSPF to treat an LSP as a link and have other routing devices in the network use this LSP. To accomplish this, you configure MPLS and OSPF traffic engineering to advertise the LSP metric in summary LSAs.

In this example, there are four routing devices in area 0.0.0.0, and you want OSPF to treat the LSP named R1-to-R4 that goes from the ingress Device R1 to the egress Device R4 as a link.

For OSPF, you enable traffic engineering on all four routing devices in the area by including the **traffic-engineering** statement. This configuration ensures that the shortest-path-first (SPF) algorithm takes into account the LSPs configured under MPLS and configures OSPF to generate LSAs that carry traffic engineering parameters. You further ensure that OSPF uses the MPLS LSP as the next hop and advertises the LSP metric in summary LSAs, by including the optional **shortcuts lsp-metric-into-summary** statement on the ingress Device R1.

For MPLS, you enable traffic engineering so that MPLS performs traffic engineering on both BGP and IGP destinations by including the **traffic-engineering bgp-igp** statement, and you include the LSP named R1-to-R4 by including the **label-switched-path lsp-path-name to address** statement on the ingress Device R1. The address specified in the **to** statement on the ingress Device R1 must match the router ID of the egress Device R4 for the LSP to function as a direct link to the egress routing device and to be used as input to the OSPF SPF calculations. In this example, the router ID of the egress Device R4 is 10.0.0.4.

### Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Modifying the Junos OS Configuration* in *CLI User Guide*.

**CLI Quick Configuration** To quickly enable OSPF traffic engineering support to advertise the LSP metric in summary LSAs, copy the following commands and paste them into the CLI.

Configuration on R1:

```
[edit]
set routing-options router-id 10.0.0.1
set protocols ospf area 0.0.0.0 interface all
set protocols ospf area 0.0.0.0 interface fxp0.0 disable
set protocols ospf traffic-engineering shortcuts lsp-metric-into-summary
set protocols mpls traffic-engineering bgp-igp
set protocols mpls label-switched-path R1-to-R4 to 10.0.0.4
```

Configuration on R2:

```
[edit]
set routing-options router-id 10.0.0.2
set protocols ospf area 0.0.0.0 interface all
set protocols ospf area 0.0.0.0 interface fxp0.0 disable
set protocols ospf traffic-engineering
```

Configuration on R3:

```
[edit]
set routing-options router-id 10.0.0.3
set protocols ospf area 0.0.0.0 interface all
set protocols ospf area 0.0.0.0 interface fxp0.0 disable
set protocols ospf traffic-engineering
```

Configuration on R4:

```
[edit]
set routing-options router-id 10.0.0.4
set protocols ospf area 0.0.0.0 interface all
set protocols ospf area 0.0.0.0 interface fxp0.0 disable
set protocols ospf traffic-engineering
```

**Step-by-Step Procedure** To enable OSPF traffic engineering support to advertise LSP metrics in summary LSAs:

1. Configure the router ID.

```
[edit]
user@R1# set routing-options router-id 10.0.0.1
```

```
[edit]
user@R2# set routing-options router-id 10.0.0.2
```

```
[edit]
user@R3# set routing-options router-id 10.0.0.3
```

```
[edit]
user@R4# set routing-options router-id 10.0.0.4
```

2. Configure the OSPF area and add the interfaces.

**NOTE:** To specify OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@R1# set protocols ospf area 0.0.0.0 interface all
user@R1# set protocols ospf area 0.0.0.0 interface fxp0.0 disable
```

```
[edit]
user@R2# set protocols ospf area 0.0.0.0 interface all
user@R2# set protocols ospf area 0.0.0.0 interface fxp0.0 disable
```

```
[edit]
user@R3# set protocols ospf area 0.0.0.0 interface all
user@R3# set protocols ospf area 0.0.0.0 interface fxp0.0 disable
```

```
[edit]
user@R4# set protocols ospf area 0.0.0.0 interface all
user@R4# set protocols ospf area 0.0.0.0 interface fxp0.0 disable
```

3. Enable OSPF traffic engineering.

```
[edit]
user@R1 set protocols ospf traffic-engineering shortcuts lsp-metric-into-summary
```

```
[edit]
user@R2 set protocols ospf traffic-engineering
```

```
[edit]
user@R3 set protocols ospf traffic-engineering
```

```
[edit]
user@R4 set protocols ospf traffic-engineering
```

4. On Device R1, configure MPLS traffic engineering.

```
[edit ]
user@R1 set protocol mpls traffic-engineering bgp-igp
user@R1 set protocols mpls label-switched-path R1-to-R4 to 10.0.0.4
```

5. If you are done configuring the devices, commit the configuration.

```
[edit]
user@host# commit
```

**Results** Confirm your configuration by entering the `show routing-options`, `show protocols ospf`, and `show protocols mpls` commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

Output for R1:

```
user@host# show routing-options
router-id 10.0.0.1;

user@host# show protocols ospf
traffic-engineering {
  shortcuts lsp-metric-into-summary;
```

```
}
area 0.0.0.0 {
  interface all;
  interface fxp0.0 {
    disable;
  }
}

user@host# show protocols mpls
traffic-engineering bgp-igp;
label-switched-path R1-to-R4 {
  to 10.0.0.4;
}
```

Output for R2:

```
user@host# show routing-options
router-id 10.0.0.2;

user@host# show protocols ospf
traffic-engineering;
area 0.0.0.0 {
  interface all;
  interface fxp0.0 {
    disable;
  }
}
```

Output for R3:

```
user@host# show routing-options
router-id 10.0.0.3;

user@host# show protocols ospf
traffic-engineering;
area 0.0.0.0 {
  interface all;
  interface fxp0.0 {
    disable;
  }
}
```

Output for R4:

```
user@host# show routing-options
router-id 10.0.0.4;

user@host# show protocols ospf
traffic-engineering;
area 0.0.0.0 {
  interface all;
  interface fxp0.0 {
    disable;
  }
}
```

To confirm your OSPFv3 configuration, enter the **show routing-options**, **show protocols ospf3**, and **show protocols mpls** commands.

**Verification**

Confirm that the configuration is working properly.

- [Verifying the Traffic Engineering Capability for OSPF on page 4207](#)
- [Verifying OSPF Entries in the Traffic Engineering Database on page 4207](#)
- [Verifying That the Traffic Engineering Database Is Learning Node Information from OSPF on page 4207](#)

**Verifying the Traffic Engineering Capability for OSPF**

**Purpose** Verify that traffic engineering has been enabled for OSPF. By default, traffic engineering is disabled.

**Action** From operational mode, enter the **show ospf overview** command for OSPFv2, and enter the **show ospf3 overview** for OSPFv3.

**Verifying OSPF Entries in the Traffic Engineering Database**

**Purpose** Verify the OSPF information in the traffic engineering database. The Protocol field displays OSPF and the area from which the information was learned.

**Action** From operational mode, enter the **show ted database** command.

**Verifying That the Traffic Engineering Database Is Learning Node Information from OSPF**

**Purpose** Verify that OSPF is reporting node information. The Protocol name field displays OSPF and the area from which the information was learned.

**Action** From operational mode, enter the **show ted protocol** command.

**Example: Configuring the Traffic Engineering Metric for a Specific OSPF Interface**

This example shows how to configure the OSPF metric value used for traffic engineering.

- [Requirements on page 4207](#)
- [Overview on page 4208](#)
- [Configuration on page 4208](#)
- [Verification on page 4209](#)

**Requirements**

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure OSPF for traffic engineering. See “[Example: Enabling OSPF Traffic Engineering Support](#)” on page 4203

### Overview

You can configure an OSPF metric that is used exclusively for traffic engineering. To modify the default value of the traffic engineering metric, include the **te-metric** statement. The OSPF traffic engineering metric does not affect normal OSPF forwarding. By default, the traffic engineering metric is the same value as the OSPF metric. The range is 1 through 65,535.

In this example, you configure the OSPF traffic engineering metric on OSPF interface **fe-0/1/1** in area 0.0.0.0.

### Configuration

#### CLI Quick Configuration

To quickly configure the OSPF traffic engineering metric for a specific interface, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf area 0.0.0.0 interface fe-0/1/1 te-metric 10
```

#### Step-by-Step Procedure

To configure an OSPF traffic engineering metric for a specific interface used only for traffic engineering:

1. Create an OSPF area.

**NOTE:** To specify OSPFv3, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# edit protocols ospf area 0.0.0.0
```

2. Configure the traffic engineering metric of the OSPF network segments.

```
[edit protocols ospf area 0.0.0.0]
user@host# set interface fe-0/1/1 te-metric 10
```

3. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf area 0.0.0.0]
user@host# commit
```

#### Results

Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.0 {
  interface fe-0/1/1.0 {
    te-metric 10;
  }
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

**Verification**

Confirm that the configuration is working properly.

**Verifying the Configured Traffic Engineering Metric**

**Purpose** Verify the traffic engineering metric value. Confirm that Metric field displays the configured traffic engineering metric.

**Action** From operational mode, enter the **show ted database extensive** command.

**Related Documentation**

- [OSPF Configuration Overview](#)
- [Junos OS MPLS Applications Library for Routing Devices](#)

**Example: Configuring OSPF Passive Traffic Engineering Mode**

- [OSPF Passive Traffic Engineering Mode on page 4209](#)
- [Example: Configuring OSPF Passive Traffic Engineering Mode on page 4209](#)

**OSPF Passive Traffic Engineering Mode**

Ordinarily, interior routing protocols such as OSPF are not run on links between autonomous systems. However, for inter-AS traffic engineering to function properly, information about the inter-AS link—in particular, the address on the remote interface—must be made available inside the autonomous system (AS). This information is not normally included either in the external BGP (EBGP) reachability messages or in the OSPF routing advertisements.

To flood this link address information within the AS and make it available for traffic engineering calculations, you must configure OSPF passive mode for traffic engineering on each inter-AS interface. You must also supply the remote address for OSPF to distribute and include it in the traffic engineering database. OSPF traffic engineering mode allows MPLS label-switched paths (LSPs) to dynamically discover OSPF AS boundary routers and to allow routers to establish a traffic engineering LSP across multiple autonomous systems.

**Example: Configuring OSPF Passive Traffic Engineering Mode**

This example shows how to configure OSPF passive mode for traffic engineering on an inter-AS interface. The AS boundary router link between the EBGP peers must be a directly connected link and must be configured as a passive traffic engineering link.

- [Requirements on page 4209](#)
- [Overview on page 4210](#)
- [Configuration on page 4210](#)
- [Verification on page 4211](#)

**Requirements**

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure BGP per your network requirements. See the *Junos OS Routing Protocols Library for Routing Devices*.
- Configure the LSP per your network requirements. See the *Junos OS MPLS Applications Library for Routing Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4102.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4104
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4107.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4109.

### Overview

You can configure OSPF passive mode for traffic engineering on an inter-AS interface. The address used for the remote node of the OSPF passive traffic engineering link must be the same as the address used for the EBGP link. In this example, you configure interface **so-1/1/0** in area 0.0.0.1 as the inter-AS link to distribute traffic engineering information with OSPF within the AS and include the following settings:

- **passive**—Advertises the direct interface addresses on an interface without actually running OSPF on that interface. A passive interface is one for which the address information is advertised as an internal route in OSPF, but on which the protocol does not run.
- **traffic-engineering**—Configures an interface in OSPF passive traffic-engineering mode to enable dynamic discovery of OSPF AS boundary routers. By default, OSPF passive traffic-engineering mode is disabled.
- **remote-node-id**—Specifies the IP address at the far end of the inter-AS link. In this example, the remote IP address is 192.168.207.2.

### Configuration

To quickly configure OSPF passive mode for traffic engineering, copy the following command, remove any line breaks, and paste it into the CLI.

```
[edit]
set protocols ospf area 0.0.0.1 interface so-1/1/0 passive traffic-engineering remote-node-id
192.168.207.2
```

### Step-by-Step Procedure

To configure OSPF passive traffic engineering mode:

1. Create an OSPF area.

**NOTE:** To specify OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@host# set protocols ospf area 0.0.0.1
```

2. Configure interface `so-1/1/0` as a passive interface configured for traffic engineering, and specify the IP address at the far end of the inter-AS link.

```
[edit protocols ospf area 0.0.0.1]
user@host# set interface so-1/1/0 passive traffic-engineering remote-node-id
192.168.207.2
```

3. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf]
user@host# commit
```

**Results** Confirm your configuration by entering the `show protocols ospf` command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.1 {
  interface so-1/1/0.0 {
    passive {
      traffic-engineering {
        remote-node-id 192.168.207.2;
      }
    }
  }
}
```

To confirm your OSPFv3 configuration, enter the `show protocols ospf3` command.

### Verification

Confirm that the configuration is working properly.

#### Verifying the Status of OSPF Interfaces

**Purpose** Verify the status of OSPF interfaces. If the interface is passive, the Adj count field is 0 because no adjacencies have been formed. Next to this field, you might also see the word Passive.

**Action** From operational mode, enter the `show ospf interface detail` command for OSPFv2, and enter the `show ospf3 interface detail` command for OSPFv3.

## OSPF Database Protection Configuration

---

- [Example: Configuring OSPF Database Protection on page 4212](#)

### Example: Configuring OSPF Database Protection

- [OSPF Database Protection Overview on page 4212](#)
- [Configuring OSPF Database Protection on page 4213](#)

#### OSPF Database Protection Overview

---

OSPF database protection allows you to limit the number of link-state advertisements (LSAs) not generated by the local router in a given OSPF routing instance, helping to protect the link-state database from being flooded with excessive LSAs. This feature is particularly useful if VPN routing and forwarding is configured on your provider edge and customer edge routers using OSPF as the routing protocol. An overrun link-state database on the customer edge router can exhaust resources on the provider edge router and impact the rest of the service provider network.

When you enable OSPF database protection, the maximum number of LSAs you specify includes all LSAs whose advertising router ID is not equal to the local router ID (nonsystem-generated LSAs). These might include external LSAs as well as LSAs with any scope such as the link, area, and autonomous system (AS).

Once the specified maximum LSA count is exceeded, the database typically enters into the ignore state. In this state, all neighbors are brought down, and nonsystem-generated LSAs are destroyed. In addition, the database sends out hellos but ignores all received packets. As a result, the database does not form any full neighbors, and therefore does not learn about new LSAs. However, if you have configured the **warning-only** option, only a warning is issued and the database does not enter the ignore state but continues to operate as before.

You can also configure one or more of the following options:

- A warning threshold for issuing a warning message before the LSA limit is reached.
- An ignore state time during which the database must remain in the ignore state and after which normal operations can be resumed.
- An ignore state count that limits the number of times the database can enter the ignore state, after which it must enter the isolate state. The isolate state is very similar to the ignore state, but has one important difference: once the database enters the isolate state, it must remain there until you issue a command to clear database protection before it can return to normal operations.
- A reset time during which the database must stay out of the ignore or isolate state before it is returned to a normal operating state.

## Configuring OSPF Database Protection

By configuring OSPF database protection, you can help prevent your OSPF link-state database from being overrun with excessive LSAs that are not generated by the local router. You specify the maximum number of LSAs whose advertising router ID is not the same as the local router ID in an OSPF instance. This feature is particularly useful if your provider edge and customer edge routers are configured with VPN routing and forwarding using OSPF.

OSPF database protection is supported on:

- Logical systems
- All routing instances supported by OSPFv2 and OSPFv3
- OSPFv2 and OSPFv3 topologies
- OSPFv3 realms

To configure OSPF database protection:

1. Include the **database-protection** statement at one of the following hierarchy levels:
  - [edit protocols ospf | ospf3]
  - [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ospf | ospf3)]
  - [edit routing-instances *routing-instance-name* protocols (ospf | ospf3)]
  - [edit routing-instances *routing-instance-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-unicast | ipv6-multicast)]
2. Include the **maximum-lsa *number*** statement.

**NOTE:** The **maximum-lsa** statement is mandatory, and there is no default value for it. If you omit this statement, you cannot configure OSPF database protection.

3. (Optional) Include the following statements:
  - **ignore-count *number***—Specify the number of times the database can enter the ignore state before it goes into the isolate state.
  - **ignore-time *seconds***—Specify the time limit the database must remain in the ignore state before it resumes regular operations.
  - **reset-time *seconds***—Specify the time during which the database must operate without being in either the ignore or isolate state before it is reset to a normal operating state.
  - **warning-threshold *percent***—Specify the percent of the maximum LSA number that must be exceeded before a warning message is issued.

4. (Optional) Include the **warning-only** statement to prevent the database from entering the ignore state or isolate state when the maximum LSA count is exceeded.

**NOTE:** If you include the **warning-only** statement, values for the other optional statements at the same hierarchy level are not used when the maximum LSA number is exceeded.

5. Verify your configuration by checking the database protection fields in the output of the **show ospf overview** command.

---

#### Understanding OSPF Routing Policy

---

Each routing policy is identified by a policy name. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks. Each routing policy name must be unique within a configuration. Once a policy is created and named, it must be applied before it is active.

In the **import** statement, you list the name of the routing policy used to filter OSPF external routes from being installed into the routing tables of OSPF neighbors. You can filter the routes, but not link-state address (LSA) flooding. An external route is a route that is outside the OSPF Autonomous System (AS). The import policy does not impact the OSPF database. This means that the import policy has no impact on the link-state advertisements.

In the **export** statement, you list the name of the routing policy to be evaluated when routes are being exported from the routing table into OSPF.

By default, if a routing device has multiple OSPF areas, learned routes from other areas are automatically installed into area 0 of the routing table.

To specify more than one policy and create a policy chain, you list the policies using a space as a separator. If multiple policies are specified, the policies are evaluated in the order in which they are specified. As soon as an accept or reject action is executed, the policy chain evaluation ends.

This topic describes the following information:

- [Routing Policy Terms on page 4215](#)
- [Routing Policy Match Conditions on page 4215](#)
- [Routing Policy Actions on page 4216](#)

### ***Routing Policy Terms***

Routing policies are made up of one or more terms. A term is a named structure in which match conditions and actions are defined. You can define one or more terms. The name can contain letters, numbers, and hyphens ( - ) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks.

Each term contains a set of match conditions and a set of actions:

- Match conditions are criteria that a route must match before the actions can be applied. If a route matches all criteria, one or more actions are applied to the route.
- Actions specify whether to accept or reject the route, control how a series of policies are evaluated, and manipulate the characteristics associated with a route.

### ***Routing Policy Match Conditions***

A match condition defines the criteria that a route must match for an action to take place. You can define one or more match conditions for each term. If a route matches all of the match conditions for a particular term, the actions defined for that term are processed.

Each term can include two statements, **from** and **to**, that define the match conditions:

- In the **from** statement, you define the criteria that an incoming route must match. You can specify one or more match conditions. If you specify more than one, they all must match the route for a match to occur.

The **from** statement is optional. If you omit the **from** and the **to** statements, all routes are considered to match.

**NOTE:** In export policies, omitting the **from** statement from a routing policy term might lead to unexpected results. For more information, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

- In the **to** statement, you define the criteria that an outgoing route must match. You can specify one or more match conditions. If you specify more than one, they all must match the route for a match to occur.

The order of the match conditions in a term is not important because a route must match all match conditions in a term for an action to be taken.

For a complete list of match conditions, see *Routing Policy Match Conditions* in the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

### **Routing Policy Actions**

An action defines what the routing device does with the route when the route matches all the match conditions in the **from** and **to** statements for a particular term. If a term does not have **from** and **to** statements, all routes are considered to match and the actions apply to all routes.

Each term can have one or more of the following types of actions. The actions are configured under the **then** statement.

- Flow control actions, which affect whether to accept or reject the route and whether to evaluate the next term or routing policy.
- Actions that manipulate route characteristics.
- Trace action, which logs route matches.

The **then** statement is optional. If you omit it, one of the following occurs:

- The next term in the routing policy, if one exists, is evaluated.
- If the routing policy has no more terms, the next routing policy, if one exists, is evaluated.
- If there are no more terms or routing policies, the **accept** or **reject** action specified by the default policy is executed.

For a complete list of routing policy actions, see *Actions in Routing Policy Terms* in the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

### **Example: Injecting OSPF Routes into the BGP Routing Table**

---

This example shows how to create a policy that injects OSPF routes into the BGP routing table.

- [Requirements on page 4216](#)
- [Overview on page 4217](#)
- [Configuration on page 4217](#)
- [Verification on page 4219](#)
- [Troubleshooting on page 4219](#)

#### **Requirements**

Before you begin:

- Configure network interfaces.
- Configure external peer sessions. See [“Example: Configuring External BGP Point-to-Point Peer Sessions” on page 3430](#).

- Configure interior gateway protocol (IGP) sessions between peers.

### Overview

In this example, you create a routing policy called **injectpolicy1** and a routing term called **injectterm1**. The policy injects OSPF routes into the BGP routing table.

### Configuration

- [Configuring the Routing Policy on page 4217](#)
- [Configuring Tracing for the Routing Policy on page 4218](#)

### Configuring the Routing Policy

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set policy-options policy-statement injectpolicy1 term injectterm1 from protocol ospf
set policy-options policy-statement injectpolicy1 term injectterm1 from area 0.0.0.1
set policy-options policy-statement injectpolicy1 term injectterm1 then accept
set protocols bgp export injectpolicy1
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To inject OSPF routes into a BGP routing table:

1. Create the policy term.

```
[edit policy-options policy-statement injectpolicy1]
user@host# set term injectterm1
```

2. Specify OSPF as a match condition.

```
[edit policy-options policy-statement injectpolicy1 term injectterm1]
user@host# set from protocol ospf
```

3. Specify the routes from an OSPF area as a match condition.

```
[edit policy-options policy-statement injectpolicy1 term injectterm1]
user@host# set from area 0.0.0.1
```

4. Specify that the route is to be accepted if the previous conditions are matched.

```
[edit policy-options policy-statement injectpolicy1 term injectterm1]
user@host# set then accept
```

5. Apply the routing policy to BGP.

```
[edit]
user@host# set protocols bgp export injectpolicy1
```

**Results** Confirm your configuration by entering the **show policy-options** and **show protocols bgp** commands from configuration mode. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show policy-options
policy-statement injectpolicy1 {
  term injectterm1 {
    from {
      protocol ospf;
      area 0.0.0.1;
    }
    then accept;
  }
}

user@host# show protocols bgp
export injectpolicy1;
```

If you are done configuring the device, enter **commit** from configuration mode.

#### *Configuring Tracing for the Routing Policy*

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set policy-options policy-statement injectpolicy1 term injectterm1 then trace
set routing-options traceoptions file ospf-bgp-policy-log
set routing-options traceoptions file size 5m
set routing-options traceoptions file files 5
set routing-options traceoptions flag policy
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Include a trace action in the policy.

```
[edit policy-options policy-statement injectpolicy1 term injectterm1]
user@host# then trace
```

2. Configure the tracing file for the output.

```
[edit routing-options traceoptions]
user@host# set file ospf-bgp-policy-log
user@host# set file size 5m
user@host# set file files 5
user@host# set flag policy
```

**Results** Confirm your configuration by entering the **show policy-options** and **show routing-options** commands from configuration mode. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show policy-options
```

```

policy-statement injectpolicy1 {
  term injectterm1 {
    then {
      trace;
    }
  }
}

user@host# show routing-options
traceoptions {
  file ospf-bgp-policy-log size 5m files 5;
  flag policy;
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

### Verifying That the Expected BGP Routes Are Present

**Purpose** Verify the effect of the export policy.

**Action** From operational mode, enter the **show route** command.

### Troubleshooting

- [Using the show log Command to Examine the Actions of the Routing Policy on page 4219](#)

### Using the show log Command to Examine the Actions of the Routing Policy

**Problem** The routing table contains unexpected routes, or routes are missing from the routing table.

**Solution** If you configure policy tracing as shown in this example, you can run the **show log ospf-bgp-policy-log** command to diagnose problems with the routing policy. The **show log ospf-bgp-policy-log** command displays information about the routes that the **injectpolicy1** policy term analyzes and acts upon.

### Example: Redistributing Static Routes into OSPF

This example shows how to create a policy that redistributes static routes into OSPF.

- [Requirements on page 4219](#)
- [Overview on page 4220](#)
- [Configuration on page 4220](#)
- [Verification on page 4221](#)

### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure static routes. See *Examples: Configuring Static Routes* in the *Junos OS Routing Protocols Library for Routing Devices*.

### Overview

In this example, you create a routing policy called `exportstatic1` and a routing term called `exportstatic1`. The policy injects static routes into OSPF. This example includes the following settings:

- **policy-statement**—Defines the routing policy. You specify the name of the policy and further define the elements of the policy. The policy name must be unique and can contain letters, numbers, and hyphens ( - ) and be up to 255 characters long.
- **term**—Defines the match condition and applicable actions for the routing policy. The term name can contain letters, numbers, and hyphens ( - ) and be up to 255 characters long. You specify the name of the term and define the criteria that an incoming route must match by including the **from** statement and the action to take if the route matches the conditions by including the **then** statement. In this example you specify the static protocol match condition and the accept action.
- **export**—Applies the export policy you created to be evaluated when routes are being exported from the routing table into OSPF.

### Configuration

#### CLI Quick Configuration

To quickly create a policy that injects static routes into OSPF, copy the following commands and paste them into the CLI.

```
[edit]
set policy-options policy-statement exportstatic1 term exportstatic1 from protocol static
set policy-options policy-statement exportstatic1 term exportstatic1 then accept
set protocols ospf export exportstatic1
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Modifying the Junos OS Configuration* in *CLI User Guide*.

To inject static routes into OSPF:

1. Create the routing policy.  

```
[edit]
user@host# edit policy-options policy-statement exportstatic1
```
2. Create the policy term.  

```
[edit policy-options policy-statement exportstatic1]
user@host# set term exportstatic1
```
3. Specify static as a match condition.  

```
[edit policy-options policy-statement exportstatic1 term exportstatic1]
user@host# set from protocol static
```

4. Specify that the route is to be accepted if the previous condition is matched.

```
[edit policy-options policy-statement exportstatic1 term exportstatic1]
user@host# set then accept
```

5. Apply the routing policy to OSPF.

**NOTE:** For OSPFv3, include the `ospf3` statement at the [edit protocols] hierarchy level.

```
[edit]
user@host# set protocols ospf export exportstatic1
```

6. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**Results** Confirm your configuration by entering the `show policy-options` and `show protocols ospf` commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show policy-options
policy-statement exportstatic1 {
  term exportstatic1 {
    from protocol static;
    then accept;
  }
}
```

```
user@host# show protocols ospf
export exportstatic1;
```

To confirm your OSPFv3 configuration, enter the `show policy-options` and the `show protocols ospf3` commands.

### Verification

Confirm that the configuration is working properly.

- [Verifying That the Expected Static Routes Are Present on page 4221](#)
- [Verifying That AS External LSAs Are Added to the Routing Table on page 4222](#)

### Verifying That the Expected Static Routes Are Present

**Purpose** Verify the effect of the export policy.

**Action** From operational mode, enter the `show route` command.

### ***Verifying That AS External LSAs Are Added to the Routing Table***

- Purpose** On the routing device where you configured the export policy, verify that the routing device originates an AS external LSA for the static routes that are added to the routing table.
- Action** From operational mode, enter the **show ospf database** command for OSPFv2, and enter the **show ospf3 database** command for OSPFv3.

---

### **Example: Configuring an OSPF Import Policy**

This example shows how to create an OSPF import policy. OSPF import policies apply to external routes only. An external route is a route that is outside the OSPF autonomous system (AS).

- [Requirements on page 4222](#)
- [Overview on page 4222](#)
- [Configuration on page 4223](#)
- [Verification on page 4225](#)

#### ***Requirements***

Before you begin:

- Configure static routes. See *Examples: Configuring Static Routes* in the *Junos OS Routing Protocols Library for Routing Devices*.
- Configure the router identifiers for the devices in your OSPF network. See [“Example: Configuring an OSPF Router Identifier” on page 4102](#).
- Control OSPF designated router election. See [“Example: Controlling OSPF Designated Router Election” on page 4104](#).
- Configure a single-area OSPF network. See [“Example: Configuring a Single-Area OSPF Network” on page 4107](#).

#### ***Overview***

External routes are learned by AS boundary routers. External routes can be advertised throughout the OSPF domain if you configure the AS boundary router to redistribute the route into OSPF. An external route might be learned by the AS boundary router from a routing protocol other than OSPF, or the external route might be a static route that you configure on the AS boundary router.

For OSPFv3, the link-state advertisement (LSA) is referred to as the interarea prefix LSA and performs the same function as a network-summary LSA performs for OSPFv2. An area border router (ABR) originates an interarea prefix LSA for each IPv6 prefix that must be advertised into an area.

OSPF import policy allows you to prevent external routes from being added to the routing tables of OSPF neighbors. The import policy does not impact the OSPF database. This means that the import policy has no impact on the link-state advertisements. The filtering

is done only on external routes in OSPF. The intra-area and interarea routes are not considered for filtering. The default action is to accept the route when the route does not match the policy.

This example includes the following OSPF policy settings:

- **policy-statement**—Defines the routing policy. You specify the name of the policy and further define the elements of the policy. The policy name must be unique and can contain letters, numbers, and hyphens ( - ) and be up to 255 characters long.
- **export**—Applies the export policy you created to be evaluated when network summary LSAs are flooded into an area. In this example, the export policy is named `export_static`.
- **import**—Applies the import policy you created to prevent external routes from being added to the routing table. In this example, the import policy is named `filter_routes`.

The devices you configure in this example represent the following functions:

- **R1**—Device R1 is in area 0.0.0.0 and has a direct connection to device R2. R1 has an OSPF export policy configured. The export policy redistributes static routes from R1's routing table into R1's OSPF database. Because the static route is in R1's OSPF database, the route is advertised in an LSA to R1's OSPF neighbor. R1's OSPF neighbor is device R2.
- **R2**—Device R2 is in area 0.0.0.0 and has a direct connection to device R1. R2 has an OSPF import policy configured that matches the static route to the 10.0.16.0/30 network and prevents the static route from being installed in R2's routing table. R2's OSPF neighbor is device R1.

### Configuration

#### CLI Quick Configuration

To quickly configure an OSPF import policy, copy the following commands, removing any line breaks, and then paste the commands into the CLI.

Configuration on Device R1:

```
[edit]
set interfaces so-0/2/0 unit 0 family inet address 10.0.2.1/30
set protocols ospf export export_static
set protocols ospf area 0.0.0.0 interface so-0/2/0
set policy-options policy-statement export_static from protocol static
set policy-options policy-statement export_static then accept
```

Configuration on Device R2:

```
[edit]
set interfaces so-0/2/0 unit 0 family inet address 10.0.2.2/30
set protocols ospf import filter_routes
set protocols ospf area 0.0.0.0 interface so-0/2/0
set policy-options policy-statement filter_routes from route-filter 10.0.16.0/30 exact
set policy-options policy-statement filter_routes then reject
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Modifying the Junos OS Configuration* in *CLI User Guide*.

To configure an OSPF import policy:

1. Configure the interfaces.

```
[edit]
user@R1# set interfaces so-0/2/0 unit 0 family inet address 10.0.2.1/30
```

```
[edit]
user@R2# set interfaces so-0/2/0 unit 0 family inet address 10.0.2.2/30
```

2. Enable OSPF on the interfaces.

**NOTE:** For OSPFv3, include the `ospf3` statement at the [edit protocols] hierarchy level.

```
[edit]
user@R1# set protocols ospf area 0.0.0.0 interface so-0/2/0
```

```
[edit]
user@R2# set protocols ospf area 0.0.0.0 interface so-0/2/0
```

3. On R1, redistribute the static route into OSPF.

```
[edit]
user@R1# set protocols ospf export export_static
user@R1# set policy-options policy-statement export_static from protocol static
user@R1# set policy-options policy-statement export_static then accept
```

4. On R2, configure the OSPF import policy.

```
[edit]
user@R2# set protocols ospf import filter_routes
user@R2# set policy-options policy-statement filter_routes from route-filter
10.0.16.0/30 exact
user@R2# set policy-options policy-statement filter_routes then reject
```

5. If you are done configuring the devices, commit the configuration.

```
[edit]
user@host# commit
```

**Results** Confirm your configuration by entering the `show interfaces`, `show policy-options`, and `show protocols ospf` commands on the appropriate device. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

Output for R1:

```
user@R1# show interfaces
so-0/2/0 {
  unit 0 {
    family inet {
```

```

        address 10.0.2.1/30;
    }
}

user@R1# show policy-options
policy-statement export_static {
    from protocol static;
    then accept;
}

user@R1# show protocols ospf
export export_static;
area 0.0.0.0 {
    interface so-0/2/0.0;
}

```

Output for R2:

```

user@R2# show interfaces
so-0/2/0 {
    unit 0 {
        family inet {
            address 10.0.2.2/30;
        }
    }
}

user@R2# show policy-options
policy-statement filter_routes {
    from {
        route-filter 10.0.16.0/30 exact;
    }
    then reject;
}

user@R2# show protocols ospf
import filter_routes;
area 0.0.0.0 {
    interface so-0/2/0.0;
}

```

To confirm your OSPFv3 configuration, enter the **show interfaces**, **show policy-options**, **show routing-options**, and **show protocols ospf3** commands on the appropriate device.

### Verification

Confirm that the configuration is working properly.

- [Verifying the OSPF Database on page 4225](#)
- [Verifying the Routing Table on page 4226](#)

### Verifying the OSPF Database

**Purpose** Verify that OSPF is advertising the static route in the OSPF database.

**Action** From operational mode, enter the **show ospf database** for OSPFv2, and enter the **show ospf3 database** command for OSPFv3.

#### *Verifying the Routing Table*

**Purpose** Verify the entries in the routing table.

**Action** From operational mode, enter the **show route** command.

### **Example: Configuring a Route Filter Policy to Specify Priority for Prefixes Learned Through OSPF**

---

This example shows how to create an OSPF import policy that prioritizes specific prefixes learned through OSPF.

- [Requirements on page 4226](#)
- [Overview on page 4226](#)
- [Configuration on page 4227](#)
- [Verification on page 4230](#)

#### **Requirements**

Before you begin:

- Configure the device interfaces.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4102.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4104.
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4107.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4109.

#### **Overview**

In a network with a large number of OSPF routes, it can be useful to control the order in which routes are updated in response to a network topology change. In Junos OS Release 9.3 and later, you can specify a priority of high, medium, or low for prefixes included in an OSPF import policy. In the event of an OSPF topology change, high priority prefixes are updated in the routing table first, followed by medium and then low priority prefixes.

OSPF import policy can only be used to set priority or to filter OSPF external routes. If an OSPF import policy is applied that results in a **reject** terminating action for a nonexternal route, then the **reject** action is ignored and the route is accepted anyway. By default, such a route is now installed in the routing table with a priority of low. This behavior prevents traffic black holes, that is, silently discarded traffic, by ensuring consistent routing within the OSPF domain.

In general, OSPF routes that are not explicitly assigned a priority are treated as priority medium, except for the following:

- Summary discard routes have a default priority of low.
- Local routes that are not added to the routing table are assigned a priority of low.
- External routes that are rejected by import policy and thus not added to the routing table are assigned a priority of low.

Any available match criteria applicable to OSPF routes can be used to determine the priority. Two of the most commonly used match criteria for OSPF are the **route-filter** and **tag** statements.

In this example, the routing device is in area 0.0.0.0, with interfaces fe-0/1/0 and fe-1/1/0 connecting to neighboring devices. You configure an import routing policy named ospf-import to specify a priority for prefixes learned through OSPF. Routes associated with these prefixes are installed in the routing table in the order of the prefixes' specified priority. Routes matching **200.3.0.0/16 orlonger** are installed first because they have a priority of **high**. Routes matching **200.2.0.0/16 orlonger** are installed next because they have a priority of **medium**. Routes matching **200.1.0.0/16 orlonger** are installed last because they have a priority of **low**. You then apply the import policy to OSPF.

**NOTE:** The priority value takes effect when a new route is installed, or when there is a change to an existing route.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set interfaces fe-0/1/0 unit 0 family inet address 192.168.8.4/30
set interfaces fe-0/2/0 unit 0 family inet address 192.168.8.5/30
set policy-options policy-statement ospf-import term t1 from route-filter 200.1.0.0/16
  orlonger
set policy-options policy-statement ospf-import term t1 then priority low
set policy-options policy-statement ospf-import term t1 then accept
set policy-options policy-statement ospf-import term t2 from route-filter 200.2.0.0/16
  orlonger
set policy-options policy-statement ospf-import term t2 then priority medium
set policy-options policy-statement ospf-import term t2 then accept
set policy-options policy-statement ospf-import term t3 from route-filter 200.3.0.0/16
  orlonger
set policy-options policy-statement ospf-import term t3 then priority high
set policy-options policy-statement ospf-import term t3 then accept
set protocols ospf import ospf-import
set protocols ospf area 0.0.0.0 interface fe-0/1/0.0
set protocols ospf area 0.0.0.0 interface fe-0/2/0.0
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure an OSPF import policy that prioritizes specific prefixes:

1. Configure the device interfaces.

```
[edit interfaces]
user@host# set fe-0/1/0 unit 0 family inet address 192.168.8.4/30

user@host# set fe-0/2/0 unit 0 family inet address 192.168.8.5/30
```

2. Enable OSPF on the interfaces.

**NOTE:** For OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit protocols ospf area 0.0.0.0]
user@host# set interface fe-0/1/0.0
user@host# set interface fe-0/2/0.0
```

3. Configure the policy to specify the priority for prefixes learned through OSPF.

```
[edit policy-options policy-statement ospf-import]
user@host# set term t1 from route-filter 200.1.0.0/16 orlonger
user@host# set term t1 then priority low
user@host# set term t1 then accept

user@host# set term t2 from route-filter 200.2.0.0/16 orlonger
user@host# set term t2 then priority medium
user@host# set term t2 then accept

user@host# set term t3 from route-filter 200.3.0.0/16 orlonger
user@host# set term t3 then priority high
user@host# set term t3 then accept
```

4. Apply the policy to OSPF.

```
[edit protocols ospf]
user@host# set import ospf-import
```

5. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols ospf**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
fe-0/1/0 {
```

```

    unit 0 {
        family inet {
            address 192.168.8.4/30;
        }
    }
}
fe-0/2/0 {
    unit 0 {
        family inet {
            address 192.168.8.5/30;
        }
    }
}

user@host# show protocols ospf
import ospf-import;
area 0.0.0.0 {
    interface fe-0/1/0.0;
    interface fe-0/2/0.0;
}

user@host# show policy-options
policy-statement ospf-import {
    term t1 {
        from {
            route-filter 200.1.0.0/16 orlonger;
        }
        then {
            priority low;
            accept;
        }
    }
    term t2 {
        from {
            route-filter 200.2.0.0/16 orlonger;
        }
        then {
            priority medium;
            accept;
        }
    }
    term t3 {
        from {
            route-filter 200.3.0.0/16 orlonger;
        }
        then {
            priority high;
            accept;
        }
    }
}

```

To confirm your OSPFv3 configuration, enter the **show interfaces**, **show protocols ospf3**, and **show policy-options** commands.

**Verification**

Confirm that the configuration is working properly.

**Verifying the Prefix Priority in the OSPF Routing Table**

**Purpose** Verify the priority assigned to the prefix in the OSPF routing table.

**Action** From operational mode, enter the **show ospf route detail** for OSPFv2, and enter the **show ospf3 route detail** command for OSPFv3.

**Import and Export Policies for Network Summaries Overview**

---

By default, OSPF uses network-summary link-state advertisements (LSAs) to transmit route information across area boundaries. Each area border router (ABR) floods network-summary LSAs to other routing devices in the same area. The ABR also controls which routes from the area are used to generate network-summary LSAs into other areas. Each ABR maintains a separate topological database for each area to which they are connected. In Junos OS Release 9.1 and later, you can configure export and import policies for OSPFv2 and OSPFv3 that enable you to control how network-summary LSAs, which contain information about interarea OSPF prefixes, are distributed and generated. For OSPFv3, the LSA is referred to as the interarea prefix LSA and performs the same function as a network-summary LSA performs for OSPFv2. An ABR originates an interarea prefix LSA for each IPv6 prefix that must be advertised into an area.

The export policy enables you to specify which summary LSAs are flooded into an area. The import policy enables you to control which routes learned from an area are used to generate summary LSAs into other areas. You define a routing policy at the **[edit policy-options policy-statement *policy-name*]** hierarchy level. As with all OSPF export policies, the default for network-summary LSA export policies is to reject everything. Similarly, as with all OSPF import policies, the default for network-summary LSA import policies is to accept all OSPF routes.

### Example: Configuring an OSPF Export Policy for Network Summaries

This example shows how to create an OSPF export policy to control the network-summary (Type 3) LSAs that the ABR floods into an OSPF area.

- [Requirements on page 4231](#)
- [Overview on page 4231](#)
- [Configuration on page 4233](#)
- [Verification on page 4238](#)

#### Requirements

Before you begin:

- Configure the router identifiers for the devices in your OSPF network. See [“Example: Configuring an OSPF Router Identifier” on page 4102](#).
- Control OSPF designated router election. See [“Example: Controlling OSPF Designated Router Election” on page 4104](#)

#### Overview

OSPF uses network-summary LSAs to transmit route information across area boundaries. Depending on your network environment, you might want to further filter the network-summary LSAs between OSPF areas. For example, if you create OSPF areas to define administrative boundaries, you might not want to advertise internal route information between those areas. To further improve the control of route distribution between multiple OSPF areas, you can configure network summary policies on the ABR for the area that you want to filter the advertisement of network-summary LSAs.

**NOTE:** For OSPFv3, the LSA is referred to as the interarea prefix LSA and performs the same function as a network-summary LSA performs for OSPFv2. An ABR originates an interarea prefix LSA for each IPv6 prefix that must be advertised into an area. In this topic, the terms network summary policy and network-summary policy are used to describe both OSPFv2 and OSPFv3 functionality.

The following guidelines apply to export network summary policies:

- You should have a thorough understanding of your network before configuring these policies. Incorrect network summary policy configuration might result in an unintended result such as suboptimal routing or dropped traffic.
- We recommend that you use the **route-filter** policy match condition for these types of policies.
- We recommend that you use the **accept** and **reject** routing policy terms for these types of policies.

Figure 145 on page 4232 shows a sample topology with three OSPF areas. R4 generates network summaries for the routes in area 4 and sends them out of area 4 to area 0. R3 generates network summaries for the routes in area 3 and sends them out of area 3 to area 0.

Figure 145: Sample Topology Used for an OSPF Export Network Summary Policy

In this example, you configure R4 with an export network summary policy named `export-policy` that only allows routes that match the `10.0.4.4` prefix from area 3 into area 4. The export policy controls the network-summary LSAs that R4 floods into area 4. This results in only the allowed interarea route to enter area 4, and all other interarea routes to be purged from the OSPF database and the routing table of the devices in area 4. You first define the policy and then apply it to the ABR by including the **network-summary-export** statement for OSPFv2 or the **inter-area-prefix-export** statement for OSPFv3.

The devices operate as follows:

- **R1**—Device R1 is an internal router in area 3. Interface `ge-0/0/1` has an IP address of 10.0.4.13/30 and connects to R3. Interface `ge-0/0/0` has an IP address of 10.0.4.5/30 and connects to R2.
- **R2**—Device R2 is an internal router in area 3. Interface `ge-0/0/0` has an IP address of 10.0.4.6/30 and connects to R1. Interface `ge-0/0/2` has an IP address of 10.0.4.1 and connects to R3.
- **R3**—Device R3 participates in area 3 and area 0. R3 is the ABR between area 3 and area 0, and passes network-summary LSAs between the areas. Interface `ge-0/0/2` has an IP address of 10.0.4.2/30 and connects to R2. Interface `ge-0/0/1` has an IP address of 10.0.4.14/30 and connects to R1. Interface `ge-0/0/0` has an IP address of 10.0.2.1/30 and connects to R4.
- **R4**—Device R4 participates in area 0 and area 4. R4 is the ABR between area 0 and area 4, and passes network-summary LSAs between the areas. Interface `ge-0/0/0` has an IP address of 10.0.2.4/30 and connects to R3. Interface `ge-0/0/1` has an IP

address of 10.0.8.6/30 and connects to R5. Interface **ge-0/0/2** has an IP address of 10.0.8.9/30 and connects to R6.

- R5—Device R5 is an internal router in area 4. Interface **ge-0/0/1** has an IP address of 10.0.8.5/30 and connects to R4.
- R6—Device R6 is an internal router in area 4. Interface **ge-0/0/2** has an IP address of 10.0.8.10/30 and connects to R4.

### Configuration

**CLI Quick Configuration** To quickly configure an OSPF export policy for network summaries, copy the following commands, removing any line breaks, and then paste the commands into the CLI.

Configuration on Device R1:

```
[edit]
set interfaces ge-0/0/0 unit 0 family inet address 10.0.4.5/30
set interfaces ge-0/0/1 unit 0 family inet address 10.0.4.13/30
set protocols ospf area 0.0.0.3 interface ge-0/0/1
set protocols ospf area 0.0.0.3 interface ge-0/0/0
```

Configuration on Device R2:

```
[edit]
set interfaces ge-0/0/0 unit 0 family inet address 10.0.4.6/30
set interfaces ge-0/0/2 unit 0 family inet address 10.0.4.1/30
set protocols ospf area 0.0.0.3 interface ge-0/0/2
set protocols ospf area 0.0.0.3 interface ge-0/0/1
```

Configuration on Device R3:

```
[edit]
set interfaces ge-0/0/0 unit 0 family inet address 10.0.4.2/30
set interfaces ge-0/0/1 unit 0 family inet address 10.0.4.14/30
set interfaces ge-0/0/2 unit 0 family inet address 10.0.2.1/30
set protocols ospf area 0.0.0.0 interface ge-0/0/0
set protocols ospf area 0.0.0.3 interface ge-0/0/1
set protocols ospf area 0.0.0.3 interface ge-0/0/2
```

Configuration on Device R4:

```
[edit]
set interfaces ge-0/0/0 unit 0 family inet address 10.0.2.1/30
set interfaces ge-0/0/1 unit 0 family inet address 10.0.8.6/30
set interfaces ge-0/0/2 unit 0 family inet address 10.0.8.9/30
set protocols ospf area 0.0.0.0 interface ge-0/0/0
set protocols ospf area 0.0.0.4 network-summary-export export-policy
set protocols ospf area 0.0.0.4 interface ge-0/0/1
set protocols ospf area 0.0.0.4 interface ge-0/0/2
set policy-options policy-statement export-policy term term1 from route-filter 10.0.4.4/30
  prefix-length-range /30-/30
set policy-options policy-statement export-policy term term1 then accept
```

Configuration on Device R5:

```
[edit]
set interfaces ge-0/0/1 unit 0 family inet address 10.0.8.5/30
```

```
set protocols ospf area 0.0.0.4 interface ge-0/0/1
```

Configuration on Device R6:

```
[edit]
set interfaces ge-0/0/2 unit 0 family inet address 10.0.8.10/30
set protocols ospf area 0.0.0.4 interface ge-0/0/2
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Modifying the Junos OS Configuration* in *CLI User Guide*.

To configure an OSPF export policy for network summaries:

1. Configure the interfaces.

**NOTE:** For OSPFv3, use IPv6 addresses.

```
[edit]
user@R1# set interfaces ge-0/0/0 unit 0 family inet address 10.0.4.5/30
user@R1# set interfaces ge-0/0/1 unit 0 family inet address 10.0.4.13/30

[edit]
user@R2# set interfaces ge-0/0/0 unit 0 family inet address 10.0.4.6/30
user@R2# set interfaces ge-0/0/2 unit 0 family inet address 10.0.4.1/30

[edit]
user@R3# set interfaces fe-1/0/0 unit 0 family inet address 10.0.4.2/30
user@R3# set interfaces fe-1/1/0 unit 0 family inet address 10.0.4.14/30
user@R3# set interfaces fe-0/0/1 unit 0 family inet address 10.0.2.1/30

[edit]
user@R4# set interfaces ge-0/0/0 unit 0 family inet address 10.0.4.2/30
user@R4# set interfaces ge-0/0/1 unit 0 family inet address 10.0.4.14/30
user@R4# set interfaces ge-0/0/2 unit 0 family inet address 10.0.2.1/30

[edit]
user@R5# set interfaces ge-0/0/1 unit 0 family inet address 10.0.8.5/30

[edit]
user@R6# set interfaces ge-0/0/2 unit 0 family inet address 10.0.8.10/30
```

2. Enable OSPF on the interfaces.

**NOTE:** For OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@R1# set protocols ospf area 0.0.0.3 interface ge-0/0/1
user@R1# set protocols ospf area 0.0.0.3 interface ge-0/0/0

[edit]
user@R2# set protocols ospf area 0.0.0.3 interface ge-0/0/2
```

```

user@R2# set protocols ospf area 0.0.0.3 interface ge-0/0/1
[edit]
user@R3# set protocols ospf area 0.0.0.3 interface ge-0/0/1
user@R3# set protocols ospf area 0.0.0.3 interface ge-0/0/2
user@R3# set protocols ospf area 0.0.0.0 interface ge-0/0/0

[edit]
user@R4# set protocols ospf area 0.0.0.0 interface ge-0/0/0
user@R4# set protocols ospf area 0.0.0.4 interface ge-0/0/1
user@R4# set protocols ospf area 0.0.0.4 interface ge-0/0/2

[edit]
user@R5# set protocols ospf area 0.0.0.4 interface fe-0/0/1

[edit]
user@R6# set protocols ospf area 0.0.0.4 interface fe-0/0/2

```

3. On R4, configure the export network summary policy.

```

[edit ]
user@R4# set policy-options policy-statement export-policy term term1 from
route-filter 10.0.4.4/30 prefix-length-range /30-/30
user@R4# set policy-options policy-statement export-policy term term1 then accept

```

4. On R4, apply the export network summary policy to OSPF.

**NOTE:** For OSPFv3, include the `inter-area-prefix-export` statement at the `[edit protocols ospf3 area area-id]` hierarchy level.

```

[edit]
user@R4# set protocols ospf area 0.0.0.4 network-summary-export export-policy

```

5. If you are done configuring the devices, commit the configuration.

```

[edit]
user@host# commit

```

**Results** Confirm your configuration by entering the `show interfaces`, `show policy-options`, and `show protocols ospf` commands on the appropriate device. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

Output for R1:

```

user@R1# show interfaces
ge-0/0/0 {
  unit 0 {
    family inet {
      address 10.0.4.5/30;
    }
  }
}
ge-0/0/1 {
  unit 0 {
    family inet {

```

```
        address 10.0.4.13/30;
    }
}

user@R1# show protocols ospf
area 0.0.0.3 {
    interface ge-0/0/1.0;
    interface ge-0/0/0.0;
}
```

Output for R2:

```
user@R2# show interfaces
ge-0/0/0 {
    unit 0 {
        family inet {
            address 10.0.4.6/30;
        }
    }
}
ge-0/0/2 {
    unit 0 {
        family inet {
            address 10.0.4.1/30;
        }
    }
}

user@R2# show protocols ospf
area 0.0.0.3 {
    interface ge-0/0/2.0;
    interface ge-0/0/1.0;
}
```

Output for R3:

```
user@R3# show interfaces
ge-0/0/0 {
    unit 0 {
        family inet {
            address 10.0.2.1/30;
            address 10.0.4.2/30;
        }
    }
}
ge-0/0/1 {
    unit 0 {
        family inet {
            address 10.0.4.14/30;
        }
    }
}
ge-0/0/2 {
    unit 0 {
        family inet {
            address 10.0.4.2/30;
            address 10.0.2.1/30;
        }
    }
}
```

```

    }
  }
}

user@R3# show protocols ospf
area 0.0.0.0 {
  interface ge-0/0/0.0;
}
area 0.0.0.3 {
  interface ge-0/0/1.0;
  interface ge-0/0/2.0;
}

```

Output for R4:

```

user@R4# show interfaces
ge-0/0/0 {
  unit 0 {
    family inet {
      address 10.0.2.1/30;
    }
  }
}
ge-0/0/1 {
  unit 0 {
    family inet {
      address 10.0.8.6/30;
    }
  }
}
ge-0/0/2 {
  unit 0 {
    family inet {
      address 10.0.8.9/30;
    }
  }
}

user@R4# show protocols ospf
ospf {
  area 0.0.0.0 {
    interface ge-0/0/0.0;
  }
  area 0.0.0.4 {
    network-summary-export export-policy;
    interface ge-0/0/1.0;
    interface ge-0/0/2.0;
  }
}

user@R4# show policy-options
policy-statement export-policy {
  term term1 {
    from {
      route-filter 10.0.4.4/30 prefix-length-range /30-/30;
    }
    then accept;
  }
}

```

```
}  
}
```

Output for R5:

```
user@R5# show interfaces  
ge-0/0/1 {  
  unit 0 {  
    family inet {  
      address 10.0.8.5/30;  
    }  
  }  
}  
  
user@R5# show protocols ospf  
ospf {  
  area 0.0.0.4 {  
    interface ge-0/0/1.0;  
  }  
}
```

Output for R6:

```
user@R6# show interfaces  
ge-0/0/2 {  
  unit 0 {  
    family inet {  
      address 10.0.8.10/30;  
    }  
  }  
}  
  
user@R6# show protocols ospf  
area 0.0.0.4 {  
  interface ge-0/0/2.0;  
}
```

To confirm your OSPFv3 configuration, enter the **show interfaces**, **show policy-options**, and **show protocols ospf3** commands on the appropriate device.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying the OSPF Database on page 4238](#)
- [Verifying the Routing Table on page 4239](#)

### **Verifying the OSPF Database**

**Purpose** Verify that the OSPF database for the devices in area 4 includes the interarea route that we permitted on the ABR R4. The other interarea routes that are not specified should age out or no longer be present in the OSPF database.

**Action** From operational mode, enter the **show ospf database** command.

## Sample Output

```
user@R4>show ospf database
OSPF database, Area 0.0.0.0
```

### Verifying the Routing Table

- Purpose** Verify that the routes corresponding to the rejected network summaries are no longer present in R4's, R5's, or R6's routing table.
- Action** From operational mode, enter the **show route protocol ospf** command for both OSPFv2 and OSPFv3.

## Sample Output

```
user@R4> show route protocol ospf
inet.0: 10 destinations, 10 routes (10 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.4.0/30          *[OSPF/10] 00:37:05, metric 2
                    > to 10.0.2.1 via ge-3/0/2.4
10.0.4.4/30          *[OSPF/10] 00:36:59, metric 3
```

```
10.0.4.12/30      > to 10.0.2.1 via ge-3/0/2.4
                  *[OSPF/10] 00:37:05, metric 2
224.0.0.5/32     > to 10.0.2.1 via ge-3/0/2.4
                  *[OSPF/10] 00:38:05, metric 1
                  MultiRecv
```

user@R5> show route protocol ospf

inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)  
+ = Active Route, - = Last Active, \* = Both

```
10.0.4.4/30      *[OSPF/10] 00:37:09, metric 4
                  > to 10.0.8.6 via ge-3/0/2.5
10.0.8.8/30      *[OSPF/10] 00:37:30, metric 2
                  > to 10.0.8.6 via ge-3/0/2.5
224.0.0.5/32     *[OSPF/10] 00:38:20, metric 1
                  MultiRecv
```

user@6> show route protocol ospf

inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)  
+ = Active Route, - = Last Active, \* = Both

```
10.0.4.4/30      *[OSPF/10] 00:38:19, metric 4
                  > to 10.0.8.9 via ge-3/0/2.6
10.0.8.4/30      *[OSPF/10] 00:38:34, metric 2
                  > to 10.0.8.9 via ge-3/0/2.6
224.0.0.5/32     *[OSPF/10] 00:39:34, metric 1
                  MultiRecv
```

---

### Example: Configuring an OSPF Import Policy for Network Summaries

This example shows how to create an OSPF import policy to control the network-summary (Type 3) LSAs that the ABR advertises out of an OSPF area.

- [Requirements on page 4240](#)
- [Overview on page 4240](#)
- [Configuration on page 4242](#)
- [Verification on page 4248](#)

#### Requirements

Before you begin:

- Configure the router identifiers for the devices in your OSPF network. See [“Example: Configuring an OSPF Router Identifier” on page 4102](#).
- Control OSPF designated router election. See [“Example: Controlling OSPF Designated Router Election” on page 4104](#).

#### Overview

OSPF uses network-summary LSAs to transmit route information across area boundaries. Depending on your network environment, you might want to further filter the network-summary LSAs between OSPF areas. For example, if you create OSPF areas to define administrative boundaries, you might not want to advertise internal route information between those areas. To further improve the control of route distribution

between multiple OSPF areas, you can configure network summary policies on the ABR for the area that you want to filter the advertisement of network-summary LSAs.

**NOTE:** For OSPFv3, the LSA is referred to as the interarea prefix LSA and performs the same function as a network-summary LSA performs for OSPFv2. An ABR originates an interarea prefix LSA for each IPv6 prefix that must be advertised into an area. In this topic, the terms network summary policy and network-summary policy are used to describe both OSPFv2 and OSPFv3 functionality.

The following guidelines apply to import network summary policies:

- You should have a thorough understanding of your network before configuring these policies. Incorrect network summary policy configuration might result in an unintended result such as suboptimal routing or dropped traffic.
- We recommend that you use the **route-filter** policy match condition for these types of policies.
- We recommend that you use the **accept** and **reject** routing policy terms for these types of policies.

Figure 146 on page 4241 shows a sample topology with three OSPF areas. R4 generates network summaries for the routes in area 4 and sends them out of area 4 to area 0. R3 generates network summaries for the routes in area 3 and sends them out of area 3 to area 0.

**Figure 146: Sample Topology Used for an OSPF Import Network Summary Policy**

In this example, you configure R3 with an import network summary policy named **import-policy** so R3 only generates network summaries for the route 10.0.4.12/30. The import policy controls the routes and therefore the network summaries that R3 advertises out of area 3, so applying this policy means that R3 only advertises route 10.0.4.12/30 out of area 3. This results in existing network summaries from other interarea routes

getting purged from the OSPF database in area 0 and area 4, as well as the routing tables of the devices in areas 0 and area 4. You first define the policy and then apply it to the ABR by including the **network-summary-import** statement for OSPFv2 or the **inter-area-prefix-import** statement for OSPFv3.

The devices operate as follows:

- R1—Device R1 is an internal router in area 3. Interface **fe-0/1/0** has an IP address of 10.0.4.13/30 and connects to R3. Interface **fe-0/0/1** has an IP address of 10.0.4.5/30 and connects to R2.
- R2—Device R2 is an internal router in area 3. Interface **fe-0/0/1** has an IP address of 10.0.4.6/30 and connects to R1. Interface **fe-1/0/0** has an IP address of 10.0.4.1/30 and connects to R3.
- R3—Device R3 participates in area 3 and area 0. R3 is the ABR between area 3 and area 0, and passes network-summary LSAs between the areas. Interface **fe-1/0/0** has an IP address of 10.0.4.2/30 and connects to R2. Interface **fe-1/1/0** has an IP address of 10.0.4.14/30 and connects to R1. Interface **fe-0/0/1** has an IP address of 10.0.2.1/30 and connects to R4.
- R4—Device R4 participates in area 0 and area 4. R4 is the ABR between area 0 and area 4, and passes network-summary LSAs between the areas. Interface **fe-0/0/1** has an IP address of 10.0.2.1/30 and connects to R3. Interface **fe-1/1/0** has an IP address of 10.0.8.6/30 and connects to R5. Interface **fe-1/0/0** has an IP address of 10.0.8.9/30 and connects to R6.
- R5—Device R5 is an internal router in area 4. Interface **fe-1/1/0** has an IP address of 10.0.8.5/30 and connects to R4.
- R6—Device R6 is an internal router in area 4. Interface **fe-1/0/0** has an IP address of 10.0.8.10/30 and connects to R4.

### *Configuration*

**CLI Quick Configuration** To quickly configure an OSPF import policy for network summaries, copy the following commands, removing any line breaks, and then paste the commands into CLI.

Configuration on Device R1:

```
[edit]
set interfaces fe-0/1/0 unit 0 family inet address 10.0.4.13/30
set interfaces fe-0/0/1 unit 0 family inet address 10.0.4.5/30
set protocols ospf area 0.0.0.3 interface fe-0/1/0
set protocols ospf area 0.0.0.3 interface fe-0/0/1
```

Configuration on Device R2:

```
[edit]
set interfaces fe-0/1/0 unit 0 family inet address 10.0.4.6/30
set interfaces fe-1/0/0 unit 0 family inet address 10.0.4.1/30
set protocols ospf area 0.0.0.3 interface fe-0/1/0
set protocols ospf area 0.0.0.3 interface fe-1/0/0
```

Configuration on Device R3:

```
[edit]
set interfaces fe-1/0/0 unit 0 family inet address 10.0.4.2/30
set interfaces fe-1/1/0 unit 0 family inet address 10.0.4.14/30
set interfaces fe-0/0/1 unit 0 family inet address 10.0.2.1/30
set policy-options policy-statement import-policy term term1 from route-filter 10.0.4.12/30
  prefix-length-range /30-/30
set policy-options policy-statement import-policy term term1 then accept
set protocols ospf area 0.0.0.3 interface fe-1/0/0
set protocols ospf area 0.0.0.3 interface fe-1/1/0
set protocols ospf area 0.0.0.0 interface fe-0/0/1
set protocols ospf area 0.0.0.3 network-summary-import import-policy
```

Configuration on Device R4:

```
[edit]
set interfaces fe-0/0/1 unit 0 family inet address 10.0.2.1/30
set interfaces fe-1/1/0 unit 0 family inet address 10.0.8.6/30
set interfaces fe-1/0/0 unit 0 family inet address 10.0.8.9/30
set protocols ospf area 0.0.0.0 interface fe-0/0/1
set protocols ospf area 0.0.0.4 interface fe-1/1/0
set protocols ospf area 0.0.0.4 interface fe-1/0/0
```

Configuration on Device R5:

```
[edit]
set interfaces fe-1/1/0 unit 0 family inet address 10.0.8.5/30
set protocols ospf area 0.0.0.4 interface fe-1/1/0
```

Configuration on Device R6:

```
[edit]
set interfaces fe-1/0/0 unit 0 family inet address 10.0.8.10/30
set protocols ospf area 0.0.0.4 interface fe-1/0/0
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Modifying the Junos OS Configuration* in *CLI User Guide*.

To configure an OSPF import policy for network summaries:

1. Configure the interfaces.

**NOTE:** For OSPFv3, use IPv6 addresses.

```
[edit]
user@R1# set interfaces fe-0/1/0 unit 0 family inet address 10.0.4.13/30
user@R1# set interfaces fe-0/0/1 unit 0 family inet address 10.0.4.5/30

[edit]
user@R2# set interfaces fe-0/1/0 unit 0 family inet address 10.0.4.6/30
user@R2# set interfaces fe-1/0/0 unit 0 family inet address 10.0.4.1/30

[edit]
user@R3# set interfaces fe-1/0/0 unit 0 family inet address 10.0.4.2/30
user@R3# set interfaces fe-1/1/0 unit 0 family inet address 10.0.4.14/30
```

```

user@R3#set interfaces fe-0/0/1 unit 0 family inet address 10.0.2.1/30
[edit]
user@R4# set interfaces fe-0/0/1 unit 0 family inet address 10.0.2.1/30
user@R4# set interfaces fe-1/1/0 unit 0 family inet address 10.0.8.6/30
user@R4# set interfaces fe-1/0/0 unit 0 family inet address 10.0.8.9/30
[edit]
user@R5# set interfaces fe-1/1/0 unit 0 family inet address 10.0.8.5/30
[edit]
user@R6# set interfaces fe-1/0/0 unit 0 family inet address 10.0.8.10/30

```

2. Enable OSPF on the interfaces.

**NOTE:** For OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```

[edit]
user@R1# set protocols ospf area 0.0.0.3 interface fe-0/1/0
user@R1# set protocols ospf area 0.0.0.3 interface fe-0/0/1
[edit]
user@R2# set protocols ospf area 0.0.0.3 interface fe-0/1/0
user@R2# set protocols ospf area 0.0.0.3 interface fe-1/0/0
[edit]
user@R3# set protocols ospf area 0.0.0.3 interface fe-1/0/0
user@R3# set protocols ospf area 0.0.0.3 interface fe-1/1/0
user@R3# set protocols ospf area 0.0.0.0 interface fe-0/0/1
[edit]
user@R4# set protocols ospf area 0.0.0.0 interface fe-0/0/1
user@R4# set protocols ospf area 0.0.0.4 interface fe-1/1/0
user@R4# set protocols ospf area 0.0.0.4 interface fe-1/0/0
[edit]
user@R5# set protocols ospf area 0.0.0.4 interface fe-1/1/0
[edit]
user@R6# set protocols ospf area 0.0.0.4 interface fe-1/0/0

```

3. On R3, configure the import network summary policy.

```

[edit ]
user@R3# set policy-options policy-statement import-policy term term1 from
route-filter 10.0.4.12/30 prefix-length-range /30-/30
user@R3# set policy-options policy-statement import-policy term term1 then accept

```

4. On R3, apply the import network summary policy to OSPF.

**NOTE:** For OSPFv3, include the `inter-area-prefix-export` statement at the `[edit protocols ospf3 area area-id]` hierarchy level.

```

[edit]

```

```
user@R3# set protocols ospf area 0.0.0.3 network-summary-import import-policy
```

5. If you are done configuring the devices, commit the configuration.

```
[edit]
user@host# commit
```

**Results** Confirm your configuration by entering the **show interfaces**, **show policy-options**, and **show protocols ospf** commands on the appropriate device. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

Output for R1:

```
user@R1# show interfaces
fe-0/0/1 {
  unit 0 {
    family inet {
      address 10.0.4.5/30;
    }
  }
}
fe-0/1/0 {
  unit 0 {
    family inet {
      address 10.0.4.13/30;
    }
  }
}

user@R1# show protocols ospf
area 0.0.0.3 {
  interface fe-0/1/0.0;
  interface fe-0/0/1.0;
}
```

Output for R2:

```
user@R2# show interfaces
fe-0/1/0 {
  unit 0 {
    family inet {
      address 10.0.4.6/30;
    }
  }
}
fe-1/0/0 {
  unit 0 {
    family inet {
      address 10.0.4.1/30;
    }
  }
}

user@R2# show protocols ospf
area 0.0.0.3 {
  interface fe-0/1/0.0;
```

```
    interface fe-1/0/0.0;  
  }
```

Output for R3:

```
user@R3# show interfaces  
fe-0/0/1 {  
  unit 0 {  
    family inet {  
      address 10.0.2.1/30;  
    }  
  }  
}  
fe-1/0/0 {  
  unit 0 {  
    family inet {  
      address 10.0.4.2/30;  
    }  
  }  
}  
fe-1/1/0 {  
  unit 0 {  
    family inet {  
      address 10.0.4.14/30;  
    }  
  }  
}  
  
user@R3# show protocols ospf  
area 0.0.0.0 {  
  interface fe-0/0/1.0;  
}  
area 0.0.0.3 {  
  network-summary-import import-policy;  
  interface fe-1/0/0.0;  
  interface fe-1/1/0.0;  
}  
  
user@R3# show policy-options  
policy-statement import-policy {  
  term term1 {  
    from {  
      route-filter 10.0.4.12/30 prefix-length-range /30-/30;  
    }  
    then accept;  
  }  
}
```

Output for R4:

```
user@R4# show interfaces  
fe-0/0/1 {  
  unit 0 {  
    family inet {  
      address 10.0.2.1/30;  
    }  
  }  
}
```

```

fe-1/0/0 {
  unit 0 {
    family inet {
      address 10.0.8.9/30;
    }
  }
}
fe-1/1/0 {
  unit 0 {
    family inet {
      address 10.0.8.6/30;
    }
  }
}

user@R4# show protocols ospf
area 0.0.0.0 {
  interface fe-0/0/1.0;
}
area 0.0.0.4 {
  interface fe-0/1/0.0;
  interface fe-1/0/0.0;
}

```

Output for R5:

```

user@R5# show interfaces
fe-1/1/0 {
  unit 0 {
    family inet {
      address 10.0.8.5/30;
    }
  }
}

user@R5# show protocols ospf
area 0.0.0.4 {
  interface fe-1/1/0.0;
}

```

Output for R6:

```

user@R6# show interfaces
fe-1/0/0 {
  unit 0 {
    family inet {
      address 10.0.8.10/30;
    }
  }
}

user@R6# show protocols ospf
area 0.0.0.4 {
  interface fe-1/0/0.0;
}

```

To confirm your OSPFv3 configuration, enter the **show interfaces**, **show policy-options**, and **show protocols ospf3** commands on the appropriate device.

**Verification**

Confirm that the configuration is working properly.

- [Verifying the OSPF Database on page 4248](#)
- [Verifying the Routing Table on page 4248](#)

**Verifying the OSPF Database**

**Purpose** Verify that the OSPF database for the devices in area 4 includes the interarea route that we are advertising from R3. Any other routes from area 3 should not be advertised into area 4, so those entries should age out or no longer be present in the OSPF database.

**Action** From operational mode, enter the **show ospf database netsummary area 0.0.0.4** command for OSPFv2, and enter the **show ospf3 database inter-area-prefix area 0.0.0.4** command for OSPFv3.

**Verifying the Routing Table**

**Purpose** Verify that the specified route is included in R4's, R5's, or R6's routing table. Any other routes from area 3 should not be advertised into area 4.

**Action** From operational mode, enter the **show route protocol ospf** command for both OSPFv2 and OSPFv3.

## OSPF Monitoring Configuration

- [Example: Configuring OSPF Trace Options on page 4248](#)

### Example: Configuring OSPF Trace Options

- [Tracing OSPF Protocol Traffic on page 4248](#)
- [Example: Tracing OSPF Protocol Traffic on page 4250](#)

---

#### Tracing OSPF Protocol Traffic

Tracing operations record detailed messages about the operation of OSPF. You can trace OSPF protocol traffic to help debug OSPF protocol issues. When you trace OSPF protocol traffic, you specify the name of the file and the type of information you want to trace.

You can specify the following OSPF protocol-specific trace options:

- **database-description**—All database description packets, which are used in synchronizing the OSPF topological database
- **error**—OSPF error packets
- **event**—OSPF state transitions
- **flooding**—Link-state flooding packets
- **graceful-restart**—Graceful-restart events
- **hello**—Hello packets, which are used to establish neighbor adjacencies and to determine whether neighbors are reachable
- **ldp-synchronization**—Synchronization events between OSPF and LDP
- **lsa-ack**—Link-state acknowledgment packets, which are used in synchronizing the OSPF topological database
- **lsa-analysis**—Link-state analysis. Specific to the Juniper Networks implementation of OSPF, Junos OS performs LSA analysis before running the shortest-path-first (SPF) algorithm. LSA analysis helps to speed the calculations performed by the SPF algorithm.
- **lsa-request**—Link-state request packets, which are used in synchronizing the OSPF topological database
- **lsa-update**—Link-state updates packets, which are used in synchronizing the OSPF topological database
- **nsr-synchronization**—Nonstop routing synchronization events
- **on-demand**—Trace demand circuit extensions
- **packet-dump**—Dump the contents of selected packet types
- **packets**—All OSPF packets
- **restart-signaling**—(OSPFv2 only) Restart-signaling graceful restart events
- **spf**—Shortest path first (SPF) calculations

You can optionally specify one or more of the following flag modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**NOTE:** Use the **detail** flag modifier with caution as it might cause the CPU to become very busy.

Global tracing options are inherited from the configuration set by the **traceoptions** statement at the **[edit routing-options]** hierarchy level. You can override the following global trace options for the OSPF protocol using the **traceoptions flag** statement included at the **[edit protocols ospf]** hierarchy level:

- **all**—All tracing operations
- **general**—All normal operations and routing table changes (a combination of the normal and route trace operations)
- **normal**—Normal events
- **policy**—Policy processing
- **route**—Routing information
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

**NOTE:** Use the trace flag **all** with caution as it might cause the CPU to become very busy.

---

### Example: Tracing OSPF Protocol Traffic

---

This example shows how to trace OSPF protocol traffic.

- [Requirements on page 4250](#)
- [Overview on page 4250](#)
- [Configuration on page 4251](#)
- [Verification on page 4255](#)

#### **Requirements**

This example assumes that OSPF is properly configured and running in your network, and you want to trace OSPF protocol traffic for debugging purposes.

#### **Overview**

You can trace OSPF protocol traffic to help debug OSPF protocol issues. When you trace OSPF protocol traffic, you specify the name of the file and the type of information you want to trace. All files are placed in a directory on the routing device's hard disk. On M Series and T Series routers, trace files are stored in the `/var/log` directory.

This example shows a few configurations that might be useful when debugging OSPF protocol issues. The verification output displayed is specific to each configuration.

---

**TIP:** To keep track of your log files, create a meaningful and descriptive name so it is easy to remember the content of the trace file. We recommend that

you place global routing protocol tracing output in the file `routing-log`, and OSPF tracing output in the file `ospf-log`.

In the first example, you globally enable tracing operations for all routing protocols that are actively running on your routing device to the file `routing-log`. With this configuration, you keep the default settings for the trace file size and the number of trace files. After enabling global tracing operations, you enable tracing operations to provide detailed information about OSPF packets, including link-state advertisements, requests, and updates, database description packets, and hello packets to the file `ospf-log`, and you configure the following options:

- **size**—Specifies the maximum size of each trace file, in KB, MB, or GB. In this example, you configure 10 KB as the maximum size. When the file reaches its maximum size, it is renamed with a .0 extension. When the file again reaches its maximum size, it is renamed with a .1 extension, and the newly created file is renamed with a .0 extension. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option. You specify **k** for KB, **m** for MB, and **g** for GB. By default, the trace file size is 128 KB. The file size range is 10 KB through the maximum file size supported on your system.
- **files**—Specifies the maximum number of trace files. In this example, you configure a maximum of 5 trace files. When a trace file reaches its maximum size, it is renamed with a .0 extension, then a .1 extension, and so on until the maximum number of trace files is reached. When the maximum number of files is reached, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the **size** option. By default, there are 10 files. The range is 2 through 1000 files.

In the second example, you trace all SPF calculations to the file `ospf-log` by including the **spf** flag. You keep the default settings for the trace file size and the number of trace files.

In the third example, you trace the creation, receipt, and retransmission of all LSAs to the file `ospf-log` by including the **lsa-request**, **lsa-update**, and **lsa-ack** flags. You keep the default settings for the trace file size and the number of trace files.

### **Configuration**

- [Tracing SPF Calculations on page 4253](#)
- [Tracing Link-State Advertisements on page 4254](#)

### **Configuring Global Tracing Operations and Tracing OSPF Packet Information**

#### **CLI Quick Configuration**

To quickly enable global tracing operations for all routing protocols actively running on your routing device and to trace detailed information about OSPF packets, copy the following commands and paste them into the CLI.

[edit]

```
set routing-options traceoptions file routing-log
set protocols ospf traceoptions file ospf-log
set protocols ospf traceoptions file files 5 size 10k
set protocols ospf traceoptions flag lsa-ack
set protocols ospf traceoptions flag database-description
set protocols ospf traceoptions flag hello
set protocols ospf traceoptions flag lsa-update
set protocols ospf traceoptions flag lsa-request
```

**Step-by-Step  
Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Modifying the Junos OS Configuration* in *CLI User Guide*.

To configure global routing tracing operations and tracing operations for OSPF packets:

1. Configure tracing at the routing options level to collect information about the active routing protocols on your routing device.

```
[edit]
user@host# edit routing-options traceoptions
```

2. Configure the filename for the global trace file.

```
[edit routing-options traceoptions]
user@host# set file routing-log
```

3. Configure the filename for the OSPF trace file.

**NOTE:** To specify OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

---

```
[edit]
user@host# edit protocols ospf traceoptions
user@host# set file ospf-log
```

4. Configure the maximum number of trace files.

```
[edit protocols ospf traceoptions]
user@host# set file files 5
```

5. Configure the maximum size of each trace file.

```
[edit protocols ospf traceoptions]
user@host# set file size 10k
```

6. Configure tracing flags.

```
[edit protocols ospf traceoptions]
user@host# set flag lsa-ack
user@host# set flag database-description
user@host# set flag hello
user@host# set flag lsa-update
user@host# set flag lsa-request
```

7. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf traceoptions]
```

```
user@host# commit
```

**Results** Confirm your configuration by entering the **show routing-options** and the **show protocols ospf** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show routing-options
traceoptions {
  file routing-log;
}
```

```
user@host# show protocols ospf
traceoptions {
  file ospf-log size 10k files 5;
  flag lsa-ack;
  flag database-description;
  flag hello;
  flag lsa-update;
  flag lsa-request;
}
```

To confirm your OSPFv3 configuration, enter the **show routing-options** and the **show protocols ospf3** commands.

### *Tracing SPF Calculations*

**CLI Quick Configuration** To quickly trace SPF calculations, copy the following commands and paste them into the CLI.

```
[edit]
set protocols ospf traceoptions file ospf-log
set protocols ospf traceoptions flag spf
```

**Step-by-Step Procedure** To configure SPF tracing operations for OSPF:

1. Configure the filename for the OSPF trace file.

**NOTE:** To specify OSPFv3, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# edit protocols ospf traceoptions
user@host# set file ospf-log
```

2. Configure the SPF tracing flag.

```
[edit protocols ospf traceoptions]
user@host# set flag spf
```

3. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf traceoptions]
user@host# commit
```

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
traceoptions {
  file ospf-log ;
  flag spf;
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### *Tracing Link-State Advertisements*

**CLI Quick Configuration** To quickly trace the creation, receipt, and retransmission of all LSAs, copy the following commands and paste them into the CLI.

```
[edit]
set protocols ospf traceoptions file ospf-log
set protocols ospf traceoptions flag lsa-request
set protocols ospf traceoptions flag lsa-update
set protocols ospf traceoptions flag lsa-ack
```

**Step-by-Step Procedure** To configure link-state advertisement tracing operations for OSPF:

1. Configure the filename for the OSPF trace file.

**NOTE:** To specify OSPFv3, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# edit protocols ospf traceoptions
user@host# set file ospf-log
```

2. Configure the link-state advertisement tracing flags.

```
[edit protocols ospf traceoptions]
user@host# set flag lsa-request
user@host# set flag lsa-update
user@host# set flag lsa-ack
```

3. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf traceoptions]
user@host# commit
```

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
traceoptions {
  file ospf-log;
```

```

    flag lsa-request;
    flag lsa-update;
    flag lsa-ack;
}

```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### Verification

Confirm that the configuration is working properly.

### Verifying Trace Operations

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>         | <p>Specify the area identifier for this routing device to use when participating in OSPF routing. All routing devices in an area must use the same area identifier to establish adjacencies.</p> <p>Specify multiple <b>area</b> statements to configure the routing device as an area border router. An area border router does not automatically summarize routes between areas. Use the <b>area-range</b> statement to configure route summarization. By definition, an area border router must be connected to the backbone area either through a physical link or through a virtual link. To create a virtual link, include the <b>virtual-link</b> statement.</p> <p>To specify that the routing device is directly connected to the OSPF backbone, include the <b>area 0.0.0.0</b> statement.</p> <p>All routing devices on the backbone must be contiguous. If they are not, use the <b>virtual-link</b> statement to create the appearance of connectivity to the backbone.</p> |

You can also configure any interface that belongs to one or more topologies to advertise the direct interface addresses without actually running OSPF on that interface. By default, OSPF must be configured on an interface in order for direct interface addresses to be advertised as interior routes.

**NOTE:** If you configure an interface with the **passive** statement, it applies to all the topologies to which the interface belongs. You cannot configure an interface as passive for only one specific topology and have it remain active for any other topologies to which it belongs.

|                                 |                                                                                                                                                                                                                               |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Options</b>                  | <b>area-id</b> —Area identifier. The identifier can be up to 32 bits. It is common to specify the area number as a simple integer or an IP address. Area number <b>0.0.0.0</b> is reserved for the OSPF backbone area.        |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                           |

| <b>Description</b>         | <p>(Area border routers only) For an area, summarize a range of IP addresses when sending summary link advertisements (within an area). To summarize multiple ranges, include multiple <b>area-range</b> statements.</p> <p>For a not-so-stubby area (NSSA), summarize a range of IP addresses when sending NSSA link-state advertisements. The specified prefixes are used to aggregate external routes learned within the area when the routes are advertised to other areas. To specify multiple prefixes, include multiple <b>area-range</b> statements. All external routes learned within the area that do not fall into one of the prefixes are advertised individually to other areas.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Default</b>             | By default, area border routing devices do not summarize routes being sent from one area to other areas, but rather send all routes explicitly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>             | <p><b>exact</b>—(Optional) Summarization of a route is advertised only when an exact match is made with the configured summary range.</p> <p><b>mask-length</b>—Number of significant bits in the network mask.</p> <p><b>network</b>—IP address. You can specify one or more IP addresses.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**override-metric *metric***—(Optional) Override the metric for the IP address range and configure a specific metric value.

**restrict**—(Optional) Do not advertise the configured summary. This hides all routes that are contained within the summary, effectively creating a route filter.

**Range:** 1 through 16,777,215

| <b>Description</b>              | <p>Configure options for running the shortest-path-first (SPF) algorithm for backup next hops for protected interfaces. Use these options to override the default behavior of having Junos OS calculate backup paths for all the topologies in an instance when at least one interface is configured with link protection or node-link protection. These options also enable you to change the default behavior for a specific topology in an OSPF instance.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><b>disable</b>—Do not calculate backup next hops for the specified instance or topology.</p> <p><b>downstream-paths-only</b>—Calculate and install only downstream paths as defined in RFC 5286, <i>Basic Specification for IP Fast Reroute: Loop-Free Alternates</i> for the specified instance or topology.</p> <p><b>no-install</b>—Do not install the backup next hops for the specified instance or topology.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>         | <p>Specify a set of bandwidth threshold values and associated metric values for an OSPF interface or for a topology on an OSPF interface. When the bandwidth of an interface changes, Junos OS automatically sets the interface metric to the value associated with the appropriate bandwidth threshold value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**NOTE:** You must also configure a static metric value for the OSPF interface or topology with the metric statement. Junos OS uses this value to calculate the cost of a route from the OSPF interface or topology if the bandwidth for the interface is higher than of any bandwidth threshold values configured for bandwidth-based metrics.

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                               Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                               **detection-time threshold** and **transmit-interval threshold** options added in Junos OS  
                               Release 8.2.  
                               Support for logical systems introduced in Junos OS Release 8.3.  
                               **no-adaptation** option introduced in Junos OS Release 9.0.  
                               **no-adaptation** option introduced in Junos OS Release 9.0 for EX Series switches.  
                               Support for OSPFv3 introduced in Junos OS Release 9.3.  
                               Support for OSPFv3 introduced in Junos OS Release 9.3 for EX Series switches.  
                               **full-neighbors-only** option introduced in Junos OS Release 9.5.  
                               **full-neighbors-only** option introduced in Junos OS Release 9.5 for EX Series switches.

**authentication algorithm**, **authentication key-chain**, and **authentication loose-check** options introduced in Junos OS Release 9.6.

Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description** Configure bidirectional failure detection timers and authentication for OSPF.

The remaining statements are explained separately.

**Options** **authentication algorithm *algorithm-name***—Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, or **meticulous-keyed-sha-1**.

**authentication key-chain *key-chain-name***—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

**authentication loose-check**—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

**detection-time threshold *milliseconds***—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**full-neighbors-only**—Establish BFD sessions only for OSPF neighbors in the full state. The default behavior is to establish BFD sessions for all OSPF neighbors.

**minimum-interval *milliseconds***—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the **transmit-interval minimum-interval** and **minimum-receive-interval** statements.

**Range:** 1 through 255,000 milliseconds

**minimum-receive-interval *milliseconds***—Configure the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the **minimum-interval** statement.

**Range:** 1 through 255,000 milliseconds

**multiplier *number***—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255

**Default:** 3

**no-adaptation**—Specify that BFD sessions should not adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

**transmit-interval threshold *milliseconds***—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**transmit-interval minimum-interval *milliseconds***—Configure the minimum interval at which the routing device transmits hello packets to a neighbor with which it has established

a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement.

**Range:** 1 through 255,000

**version**—Configure the BFD version to detect: **1** (BFD version 1) or **automatic** (autodetect the BFD version).

**Default:** **automatic**

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## context-identifier (Protocols OSPF)

---

**Syntax** context-identifier *identifier*

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols (ospf | ospf3) **area** *area-id*],  
[edit protocols (ospf | ospf3) **area** *area-id* ]

**Release Information** Statement introduced in Junos OS Release 10.4.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Configure OSPF context-identifier information.

**Options** *identifer*—IPv4 address that defines a protection pair. The context identifier is manually configured on both the primary and protector provider edge (PE) devices.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>         | Configure the maximum number of link-state advertisements (LSAs) that are not generated by the router or switch in a given OSPF instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Default</b>             | By default, OSPF database protection is not enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>             | <p><b>ignore-count <i>number</i></b>—Configure the number of times the database can enter the ignore state. When the ignore count is exceeded, the database enters the isolate state.</p> <p><b>Range:</b> 1 through 32</p> <p><b>Default:</b> 5</p> <p><b>ignore-time <i>seconds</i></b>—Configure the time the database must remain in the ignore state before it resumes regular operations (enters retry state).</p> <p><b>Range:</b> 30 through 3,600 seconds</p> <p><b>Default:</b> 300 seconds</p> <p><b>maximum-lsa <i>number</i></b>—Configure the maximum number of LSAs whose advertising router ID is different from the local router ID in a given OSPF instance. This includes external LSAs as well as LSAs with any scope, such as the link, area, and autonomous system (AS). This value is mandatory.</p> <p><b>Range:</b> 1 through 1,000,000</p> <p><b>Default:</b> None</p> <p><b>reset-time <i>seconds</i></b>—Configure the time period during which the database must operate without being in the ignore or isolate state before it is reset to a normal operating state.</p> <p><b>Range:</b> 60 through 86,400 seconds</p> <p><b>Default:</b> 600 seconds</p> |

**warning-only**—Specify that only a warning should be issued when the maximum LSA number is exceeded. If configured, no other action is taken against the database.

**warning-threshold *percent***—Configure the percentage of the maximum number of LSAs to be exceeded before a warning message is logged.

**Range:** 30 through 100 percent

**Default:** 75 percent

| <b>Description</b>              | Specify how long OSPF waits before declaring that a neighboring routing device is unavailable. This is an interval during which the routing device receives no hello packets from the neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>         | <p>Disable OSPF, an OSPF interface, or an OSPF virtual link.</p> <p>By default, control packets sent to the remote end of a virtual link must be forwarded using the default topology. In addition, the transit area path consists only of links that</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

are in the default topology. You can disable a virtual link for a configured topology, but not for a default topology. Include the **disable** statement at the **[edit protocols ospf area *area-id* virtual-link neighbor-id router-id transit-area *area-id* topology *name*]** hierarchy level.

**NOTE:** If you disable the virtual link by including the **disable** statement at the **[edit protocols ospf area *area-id* virtual-link neighbor-id router-id transit-area *area-id*]** hierarchy level, you disable the virtual link for all topologies, including the default topology. You cannot disable the virtual link only in the default topology.

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 10.4 for EX Series switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | Specify to send self-generated link-state advertisements (LSAs) with the DoNotAge bit set. As a result, self-originated LSAs are not reflooded every 30 minutes, as required by OSPF by default. An LSA is refreshed only when the content of the LSA changes, which reduces OSPF traffic overhead in stable topologies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>         | <p>Configure graceful restart for OSPF.</p> <p>Graceful restart allows a routing device to restart with minimal effects to the network, and is enabled for all routing protocols at the <b>[edit routing-options]</b> hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>             | <p><b>disable</b>—Disable graceful restart for OSPF.</p> <p><b>helper-disable (standard   restart-signaling   both)</b>—Disable helper mode for graceful restart. When helper mode is disabled, a device cannot help a neighboring device that is attempting to restart. Beginning with Junos OS Release 11.4, you can configure restart signaling-based helper mode for OSPFv2 graceful restart configurations. The <b>standard</b>, <b>restart-signaling</b>, and <b>both</b> options are only supported for OSPFv2. Specify <b>standard</b> to disable helper mode for standard graceful restart (based on RFC 3623). Specify <b>restart-signaling</b> to disable helper mode for restart signaling-based graceful restart (based on RFC 4811, RFC 4812, and RFC 4813). Specify <b>both</b> to disable helper mode for both standard and restart signaling-based graceful restart. The last committed statement takes precedence over the previously configured statement.</p> <p><b>Default:</b> Helper mode is enabled by default. For OSPFv2, both standard and restart-signaling based helper modes are enabled by default.</p> <p><b>no-strict-lsa-checking</b>—Disable strict OSPF link-state advertisement (LSA) checking to prevent the termination of graceful restart by a helping router. LSA checking is enabled by default.</p> |

**NOTE:** The **helper-disable** statement and the **no-strict-lsa-checking** statement cannot be configured at the same time. If you attempt to configure both

statements at the same time, the routing device displays a warning message when you enter the `show protocols (ospf | ospf3)` command.

**notify-duration seconds**—Estimated time needed to send out purged grace LSAs over all the interfaces.

**Range:** 1 through 3600 seconds

**Default:** 30 seconds

**restart-duration seconds**—Estimated time needed to reacquire a full OSPF neighbor from each area.

**Range:** 1 through 3600 seconds

**Default:** 180 seconds

| <b>Description</b>              | Specify how often the routing device sends hello packets out the interface. The hello interval must be the same for all routing devices on a shared logical IP network.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>              | Disable helper mode for graceful restart. When helper mode is disabled, a router or switch cannot help a neighboring router that is attempting to restart.                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Default</b>                  | Helper mode is enabled by default for these supported protocols: IS-IS, LDP, OSPF/OSPFv3, and RSVP.                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | Apply an import policy for OSPFv3 to specify which routes learned from an area are used to generate interarea prefixes into other areas.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Support for the **topology** statement introduced in Junos OS Release 9.0.  
 Support for the **topology** statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Support for the **realm** statement introduced in Junos OS Release 9.2.  
 Support for the **realm** statement introduced in Junos OS Release 9.2 for EX Series switches.  
 Support for the **no-interface-state-traps** statement introduced in Junos OS Release 10.3.  
 This statement is supported only for OSPFv2.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Enable OSPF routing on a routing device interface.

You must include at least one **interface** statement in the configuration to enable OSPF on the routing device.

**Options** *interface-name*—Name of the interface. Specify the interface by IP address or interface name for OSPFv2, or only the interface name for OSPFv3. Using both the interface name and IP address of the same interface produces an invalid configuration. To configure all interfaces, you can specify **all**. Specifying a particular interface and **all** produces an invalid configuration.

**NOTE:** For nonbroadcast interfaces, specify the IP address of the nonbroadcast interface as *interface-name*.

The remaining statements are explained separately.

**NOTE:** You cannot run both OSPF and ethernet-tcc encapsulation between two Juniper Networks routing devices.

**Required Privilege Level** routing—To view this statement in the configuration.  
 routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Specify the type of interface.</p> <p>By default, the software chooses the correct interface type based on the type of physical interface. Therefore, you should never have to set the interface type. The exception to this is for NBMA interfaces, which default to an interface type of point-to-multipoint. To have these interfaces explicitly run in Nonbroadcast multiaccess (NBMA) mode, configure the <b>nbma</b> interface type, using the IP address of the local ATM interface.</p> <p>In Junos OS Release 9.3 and later, a point-to-point interface can be an Ethernet interface without a subnet.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Default</b>                  | The software chooses the correct interface type based on the type of physical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | <p>Configure the refresh interval for all self-generated link-state advertisement (LSAs). The OSPF standard requires that every LSA be refreshed every 30 minutes. The Juniper Networks implementation refreshes LSAs every 50 minutes. By default, any LSA that is not refreshed expires after 60 minutes. By using this configuration, you can specify when self-originated LSAs are refreshed.</p> <p>You can override the default behavior by globally configuring the OSPF LSA refresh interval at the <code>[edit protocols ospf   ospf3]</code> hierarchy level. However, if you also have OSPF flood reduction configured for a specific interface in an OSPF area at the <code>[edit protocols ospf   ospf3 area <i>area-id</i> interface <i>interface-name</i>]</code> hierarchy level, the flood reduction configuration takes precedence for that specific interface.</p>                                                                                                                                                                                                               |

| <b>Description</b>              | Disable compatibility with RFC 1583, <i>OSPF Version 2</i> . If the same external destination is advertised by AS boundary routers that belong to different OSPF areas, disabling compatibility with RFC 1583 can prevent routing loops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Default</b>                  | Compatibility with RFC 1583 is enabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>                                                                                                                                                                                                                                                                                                                           | Enable node-link protection on the specified OSPF interface. Junos OS creates an alternate loop-free path to the primary next hop for all destination routes that traverse a protected interface. This alternate path avoids the primary next-hop router altogether and establishes a path through a different router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <div>  <p><b>NOTE:</b> This feature is not supported for the OSPF IPv4 multicast topology or for the OSPFv3 IPv4 multicast or IPv6 multicast topologies because node-link protection creates alternate next-hop paths only for unicast routes.</p> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>              | <p>Advertise the direct interface addresses on an interface without actually running OSPF on that interface. A passive interface is one for which the address information is advertised as an internal route in OSPF, but on which the protocol does not run.</p> <p>To configure an interface in OSPF passive traffic engineering mode, include the <b>traffic-engineering</b> statement. Configuring OSPF passive traffic engineering mode enables the dynamic discovery of OSPF AS boundary routers.</p> <p>Enable OSPF on an interface by including the <b>interface</b> statement at the [edit protocols (ospf   ospf3) area <i>area-id</i>] or the [edit routing-instances <i>routing-instance-name</i> protocols ospf area <i>area-id</i>] hierarchy levels. Disable it by including the <b>disable</b> statement. To prevent OSPF from running on an interface, include the <b>passive</b> statement. These three states are mutually exclusive.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>              | Specify the routing device's priority for becoming the designated routing device. The routing device that has the highest priority value on the logical IP network or subnet becomes the network's designated router. You must configure at least one routing device on each logical IP network or subnet to be the designated router. You also should specify a routing device's priority for becoming the designated router on point-to-point interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b>number</b>—Routing device's priority for becoming the designated router. A priority value of 0 means that the routing device never becomes the designated router. A value of 1 means that the routing device has the least chance of becoming a designated router.</p> <p><b>Range:</b> 0 through 255</p> <p><b>Default:</b> 128</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.2.<br>Statement introduced in Junos OS Release 9.2 for EX Series switches.                                                                                                                                                                                           |
| <b>Description</b>              | Configure OSPFv3 to advertise address families other than unicast IPv6. Junos OS maps each address family you configure to a separate realm with its own set of neighbors and link-state database.                                                                                                              |
| <b>Options</b>                  | <p><b>ipv4-unicast</b>—Configure a realm for IPv4 unicast routes.</p> <p><b>ipv4-multicast</b>—Configure a realm for IPv4 multicast routes.</p> <p><b>ipv6-multicast</b>—Configure a realm for IPv6 multicast routes.</p> <p>The remaining statements are explained separately.</p>                             |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                             |

**NOTE:** You must configure LSA retransmit intervals to be equal to or greater than 3 seconds to avoid triggering a retransmit trap, because Junos OS delays LSA acknowledgments by up to 2 seconds.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Configure options for running the shortest-path-first (SPF) algorithm. You can configure the following:</p> <ul style="list-style-type: none"> <li>• A delay for when to run the SPF algorithm after a network topology change is detected.</li> <li>• The maximum number of times the SPF algorithm can run in succession.</li> <li>• A hold-down interval after the SPF algorithm runs the maximum number of times.</li> </ul> <p>Running the SPF algorithm is usually the beginning of a series of larger system-wide events. For example, the SPF algorithm can lead to interior gateway protocol (IGP) prefix changes, which then lead to BGP nexthop resolution changes. Consider what happens if there are rapid link changes in the network. The local routing device can become overwhelmed. This is why it sometimes makes sense to throttle the scheduling of the SPF algorithm.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b> | The default OSPF protocol-level tracing options are those inherited from the routing protocols <b>traceoptions</b> statement included at the <b>[edit routing-options]</b> hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b> | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place OSPF tracing output in the file <b>ospf-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p> |

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 10 files

**flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

#### OSPF Tracing Flags

- **database-description**—Database description packets, which are used in synchronizing the OSPF and OSPFv3 topological database.
- **error**—OSPF and OSPFv3 error packets.
- **event**—OSPF and OSPFv3 state transitions.
- **flooding**—Link-state flooding packets.
- **graceful-restart**—Graceful-restart events.
- **hello**—Hello packets, which are used to establish neighbor adjacencies and to determine whether neighbors are reachable.
- **ldp-synchronization**—Synchronization events between OSPF and LDP.
- **lsa-ack**—Link-state acknowledgment packets, which are used in synchronizing the OSPF topological database.
- **lsa-analysis**—Link-state analysis. Specific to the Juniper Networks implementation of OSPF, Junos OS performs LSA analysis before running the shortest-path-first (SPF) algorithm. LSA analysis helps to speed the calculations performed by the SPF algorithm.
- **lsa-request**—Link-state request packets, which are used in synchronizing the OSPF topological database.
- **lsa-update**—Link-state updates packets, which are used in synchronizing the OSPF topological database.
- **nsr-synchronization**—Nonstop routing synchronization events.
- **on-demand**—Trace demand circuit extensions.
- **packet-dump**—Content of selected packet types.
- **packets**—All OSPF packets.
- **restart-signaling**—(OSPFv2 only) Restart-signaling graceful restart events.
- **spf**—Shortest-path-first (SPF) calculations.

#### Global Tracing Flags

- **all**—All tracing operations.
- **general**—A combination of the **normal** and **route** trace operations.
- **normal**—All normal operations. If you do not specify this option, only unusual or abnormal operations are traced.
- **policy**—Policy operations and actions.
- **route**—Routing table changes.
- **state**—State transitions.
- **task**—Routing protocol task processing.
- **timer**—Routing protocol timer processing.

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information.
- **receive**—Packets being received.
- **send**—Packets being transmitted.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Description</b>         | Enable the OSPF traffic engineering features.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Default</b>             | Traffic engineering support is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>             | <p><b>advertise-unnumbered-interfaces</b>—(Optional) (OSPFv2 only) Include the link-local identifier in the link-local traffic-engineering link-state advertisement. This statement must be included on both ends of an unnumbered link to allow an ingress LER to update the link in its traffic engineering database and use it for CSPF calculations. The link-local identifier is then used by RSVP to signal unnumbered interfaces as defined in RFC 3477.</p> <p><b>credibility-protocol-preference</b>—(Optional) (OSPFv2 only) Use the configured preference value for OSPF routes to calculate the traffic engineering database credibility value used to select IGP routes. Use this statement to override the default behavior, in which the traffic engineering database prefers IS-IS routes even if OSPF routes are configured with a lower, that is, preferred, preference value. For example, OSPF routes have a default preference value of 10, whereas IS-IS Level 1 routes have a default preference value of 15. When protocol preference is enabled, the credibility value is determined by deducting the protocol preference value from a base value of 512. Using default protocol preference values, OSPF has a credibility value of 502, whereas IS-IS has a credibility value of 497. Because the traffic engineering database prefers IGP routes with the highest credibility value, OSPF routes are now preferred.</p> |

**multicast-rpf-routes**—(Optional) (OSPFv2 only) Install routes for multicast RPF checks into the **inet.2** routing table. The **inet.2** routing table consists of unicast routes used for multicast RPF lookup. RPF is an antispoofing mechanism used to check whether the packet is coming in on an interface that is also sending data back to the packet source.

**NOTE:** You must enable OSPF traffic engineering shortcuts to use the **multicast-rpf-routes** statement. You must not allow LSP advertisements into OSPF when configuring the **multicast-rpf-routes** statement.

**no-topology**—(Optional) (OSPFv2 only) Disable the dissemination of the link-state topology information.

The remaining statements are explained separately.

**CAUTION:** When the OSPF traffic engineering configuration is considerably modified, the routing table entries are deleted and the routing table is recreated. Changes to configuration that can cause this behavior include enabling or disabling:

- Traffic engineering shortcuts
- IGP shortcuts
- LDP tunneling
- Multiprotocol LSP
- Advertise summary metrics
- Multicast RPF routes

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

---

## (OBSOLETE) transmit-interval (Protocols OSPF)

---

**Syntax**    transmit-interval *milliseconds*;

**Hierarchy Level**

**Release Information**    Statement introduced before Junos OS Release 7.4.

**Description**    Set the interval at which OSPF packets are transmitted on an interface.

**Options**    *milliseconds*—Transmission interval, in milliseconds.

**Range:** 1 through 4,294,967 milliseconds

**Default:** 30 milliseconds

**Required Privilege**    routing—To view this statement in the configuration.

**Level**    routing-control—To add this statement to the configuration.

## transit-delay (OSPF)

## CHAPTER 44

# Administration

- [Routine Monitoring on page 4321](#)
- [Operational Commands on page 4321](#)

## Routine Monitoring

---

- [Monitoring OSPF Routing Information on page 4321](#)

### Monitoring OSPF Routing Information

**Purpose** Use the monitoring functionality to monitor OSPF routing information on routing devices.

**Action** To view OSPF routing information in the CLI, enter the following CLI commands:

- `show ospf neighbor`
- `show ospf interface`
- `show ospf statistics`

**Related Documentation**

- [show \(ospf | ospf3\) interface on page 4359](#)
- [clear \(ospf | ospf3\) neighbor on page 4328](#)
- [show \(ospf | ospf3\) statistics on page 4387](#)

## Operational Commands

---

- `clear (ospf | ospf3) database`
- `clear (ospf | ospf3) database-protection`
- `clear (ospf | ospf3) io-statistics`
- `clear (ospf | ospf3) neighbor`
- `clear (ospf | ospf3) overload`
- `clear (ospf | ospf3) statistics`
- `show (ospf | ospf3) backup coverage`
- `show (ospf | ospf3) backup neighbor`

- `show ospf context-identifier`
- `show ospf database`
- `show ospf3 database`
- `show (ospf | ospf3) interface`
- `show (ospf | ospf3) io-statistics`
- `show (ospf | ospf3) log`
- `show (ospf | ospf3) neighbor`
- `show (ospf | ospf3) overview`
- `show (ospf | ospf3) route`
- `show (ospf | ospf3) statistics`

## clear (ospf | ospf3) database

**List of Syntax**    [Syntax on page 4323](#)  
                          [Syntax \(EX Series Switch and QFX Series\) on page 4323](#)

**Syntax**    clear (ospf | ospf3) database  
                  <advertising-router (*router-id* | self) >  
                  <area *area-id* >  
                  <asbrsummary >  
                  <external >  
                  <instance *instance-name* >  
                  <inter-area-prefix >  
                  <inter-area-router >  
                  <intra-area-prefix >  
                  <link-local >  
                  <logical-system (all | *logical-system-name*) >  
                  <lsa-id *lsa-id* >  
                  <netsummary >  
                  <network >  
                  <nssa >  
                  <opaque-area >  
                  <purge >  
                  <realm (ipv4-multicast | ipv4-unicast | ipv6-multicast) >  
                  <router >

**Syntax (EX Series Switch and QFX Series)**    clear (ospf | ospf3) database  
                  <advertising-router (*router-id* | self) >  
                  <area *area-id* >  
                  <asbrsummary >  
                  <external >  
                  <instance *instance-name* >  
                  <inter-area-prefix >  
                  <inter-area-router >  
                  <intra-area-prefix >  
                  <link-local >  
                  <lsa-id *lsa-id* >  
                  <netsummary >  
                  <network >  
                  <nssa >  
                  <opaque-area >  
                  <purge >  
                  <router >

**Release Information**    Command introduced before Junos OS Release 7.4.  
                  **advertising-router** *router-id*, **netsummary**, **network**, **nssa**, **opaque-area**, and **router** options added in Junos OS Release 8.3. You must use the **purge** command with these options.  
                  **area** *area-id* option added in Junos OS Release 8.3.  
                  Command introduced in Junos OS Release 9.0 for EX Series switches.  
                  **realm** option added in Junos OS Release 9.2.  
                  **advertising-router** (*router-id* | **self**) option added in Junos OS Release 9.5.  
                  **advertising-router** (*router-id* | **self**) option introduced in Junos OS Release 9.5 for EX Series switches.  
                  Command introduced in Junos OS Release 11.3 for the QFX Series.

**purge** option (and all options that are dependent on the **purge** option) hidden in Junos OS Release 13.3.

**Description** With the master Routing Engine, delete entries in the Open Shortest Path First (OSPF) link-state advertisement (LSA) database. With the backup Routing Engine, delete the OSPF LSA database and sync the new database with the master Routing Engine.

**CAUTION:** You can also use the **purge** command with any of the options to discard rather than delete the specified LSA entries. This command is useful only for testing. Use it with care, because it causes significant network disruption.

**Options** **none**—Delete all LSAs other than the system's own LSAs, which are regenerated. To resynchronize the database, the system destroys all adjacent neighbors that are in the state **EXSTART** or higher. The neighbors are then reacquired and the databases are synchronized.

**advertising-router (router-id | self)**—(Hidden) Discard entries for the LSA entries advertised by the specified routing device or by this routing device.

**area area-id**—(Optional) Discard entries for the LSAs in the specified area.

**asbrsummary**—(Optional) Discard summary AS boundary router LSA entries.

**external**—(Optional) Discard external LSAs.

**instance instance-name**—(Optional) Delete or discard entries for the specified routing instance only.

**inter-area-prefix**—(OSPFv3 only) (Optional) Discard interarea prefix LSAs.

**inter-area-router**—(OSPFv3 only) (Optional) Discard interarea router LSAs.

**intra-area-prefix**—(OSPFv3 only) (Optional) Discard intra-area prefix LSAs.

**logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**link-local**—(Optional) Delete link-local LSAs.

**lsa-id lsa-id**—(Optional) Discard the LSA entries with the specified LSA identifier.

**netsummary**—(Hidden) Discard summary network LSAs.

**network**—(Hidden) Discard network LSAs.

**nssa**—(Hidden) Discard not-so-stubby area (NSSA) LSAs.

**opaque-area**—(Hidden) Discard opaque area-scope LSAs.

**purge**—(Hidden) Discard all entries in the link-state advertisement database. All link-state advertisements are set to **MAXAGE** and are flooded. The database is repopulated when the originators of the link-state advertisements receive the **MAXAGE** link-state advertisements and reissue them.

**realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)**—(OSPFv3 only) (Optional) Delete the entries for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**router**—(Hidden) Discard router LSAs.

**Required Privilege Level**

clear

**Related Documentation**

- [show ospf3 database on page 4348](#)

**List of Sample Output** [clear ospf database on page 4325](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear ospf database

```
user@host> clear ospf database
```

## clear (ospf | ospf3) database-protection

**Table 290: show (ospf | ospf3) backup coverage Output Fields**

| Field Name    | Field Description                                     |
|---------------|-------------------------------------------------------|
| Node Coverage | Information about backup coverage for each OSPF node. |
| Area          | Area number. Area 0.0.0.0 is the backbone.            |

Table 290: show (ospf | ospf3) backup coverage Output Fields (*continued*)

| Field Name             | Field Description                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------|
| <b>Covered Nodes</b>   | Number of nodes for which backup coverage is available.                                       |
| <b>Total Nodes</b>     | Total number of OSPF nodes.                                                                   |
| <b>Route Coverage</b>  | Information about backup coverage for each type of OSPF route.                                |
| <b>Path Type</b>       | Type of OSPF path: <b>Intra</b> , <b>Inter</b> , <b>Ext1</b> , <b>Ext2</b> , and <b>All</b> . |
| <b>Covered Routes</b>  | For each path type, the number of routes for which backup coverage is available.              |
| <b>Total Routes</b>    | For each path type, the total number of configured routes.                                    |
| <b>Percent Covered</b> | For all nodes and for each path type, the percentage for which backup coverage is available.  |

## Sample Output

### show ospf backup coverage

```

user@host> show ospf backup coverage
Topology default coverage:

Node Coverage:

Area              Covered  Total  Percent
                  Nodes   Nodes  Covered
0.0.0.0           4        5    80.00%

Route Coverage:

Path Type  Covered  Total  Percent
          Routes Routes  Covered
Intra      8        14    57.14%
Inter      0         0   100.00%
Ext1       0         0   100.00%
Ext2       1         1   100.00%
All        9        15    60.00%

```

### show ospf3 backup coverage

```

user @host > show ospf3 backup coverage
show ospf3 backup coverage
Node Coverage:

Area              Covered  Total  Percent
                  Nodes   Nodes  Covered
0.0.0.0           4        5    80.00%

Route Coverage:

Path Type  Covered  Total  Percent
          Routes Routes  Covered

```

|       |   |   |         |
|-------|---|---|---------|
| Intra | 4 | 6 | 66.67%  |
| Inter | 0 | 0 | 100.00% |
| Ext1  | 0 | 0 | 100.00% |
| Ext2  | 1 | 1 | 100.00% |
| All   | 5 | 7 | 71.43%  |

## show (ospf | ospf3) backup neighbor

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Output Fields</b>            | <a href="#">Table 291 on page 4336</a> lists the output fields for the <b>show (ospf   ospf3) backup neighbor</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 291: show (ospf | ospf3) backup neighbor Output Fields**

| Field Name              | Field Description                                 | Level of Output |
|-------------------------|---------------------------------------------------|-----------------|
| Neighbor to Self Metric | Metric from the backup neighbor to the OSPF node. | All levels      |
| Self to Neighbor Metric | Metric from the OSPF node to the backup neighbor. | All levels      |

Table 291: show (ospf |ospf3) backup neighbor Output Fields (*continued*)

| Field Name      | Field Description                             | Level of Output |
|-----------------|-----------------------------------------------|-----------------|
| Direct next-hop | Interface and address of the direct next hop. | All levels      |

## Sample Output

### show ospf backup neighbor

```
user@host> show ospf backup neighbor
Topology default backup neighbors:

Area 0.0.0.5 backup neighbors:

10.0.0.5
  Neighbor to Self Metric: 5
  Self to Neighbor Metric: 5
  Direct next-hop: ge-4/0/0.111 via 10.0.175.5

10.0.0.6
  Neighbor to Self Metric: 5
  Self to Neighbor Metric: 5
  Direct next-hop: ge-4/1/0.110 via 10.0.176.6
```

## show ospf context-identifier

## Sample Output

### show ospf context-identifier

```
user@host> show ospf context-identifier
Context-id: 2.2.4.3
Status: active, Metric: 65534, PE role: protector, Area: 0.0.0.0
```

### show ospf context-identifier detail

```
user@host> show ospf context-identifier detail
Context-id: 88.24.13.1
Status: inactive, Metric: 0, PE role: protector, Area: 0.0.0.13
Other Advertisements:
Advertising router: 8.8.8.103
Type: stub link
Metric: 65534
```

## show ospf database

**Release Information**    Command introduced before Junos OS Release 7.4.  
                         Command introduced in Junos OS Release 9.0 for EX Series switches.  
                         **advertising-router self (*address* | self)** option introduced in Junos OS Release 9.5.  
                         **advertising-router self (*address* | self)** option introduced in Junos OS Release 9.5 for EX Series switches.  
                         Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**    Display the entries in the OSPF version 2 (OSPFv2) link-state database, which contains data about link-state advertisement (LSA) packets.

**Options**    **none**—Display standard information about entries in the OSPFv2 link-state database for all routing instances.

**brief | detail | extensive | summary**—(Optional) Display the specified level of output.

**advertising-router (*address* | self)**—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.

**area** *area-id*—(Optional) Display the LSAs in a particular area.

**asbrsummary**—(Optional) Display summary AS boundary router LSA entries.

**external**—(Optional) Display external LSAs.

**instance** *instance-name*—(Optional) Display all OSPF database information under the named routing instance.

**link-local**—(Optional) Display information about link-local LSAs.

**logical-system** (**all** | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

**lsa-id** *lsa-id*—(Optional) Display the LSA with the specified LSA identifier.

**netsummary**—(Optional) Display summary network LSAs.

**network**—(Optional) Display information about network LSAs.

**nssa**—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

**opaque-area**—(Optional) Display opaque area-scope LSAs.

**router**—(Optional) Display information about router LSAs.

**Required Privilege Level**

**Output Fields**

[Table 293 on page 4341](#) describes the output fields for the **show ospf database** command. Output fields are listed in the approximate order in which they appear.

**Table 293: show ospf database Output Fields**

| Field Name     | Field Description                                                                                                                                        | Level of Output |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>area</b>    | Area number. Area 0.0.0.0 is the backbone area.                                                                                                          | All levels      |
| <b>Type</b>    | Type of link advertisement: <b>ASBRSum</b> , <b>Extern</b> , <b>Network</b> , <b>NSSA</b> , <b>OpaqArea</b> , <b>Router</b> , or <b>Summary</b> .        | All levels      |
| <b>ID</b>      | LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device. | All levels      |
| <b>Adv Rtr</b> | Address of the routing device that sent the advertisement.                                                                                               | All levels      |

Table 293: show ospf database Output Fields (*continued*)

| Field Name                              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output         |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Seq</b>                              | Link sequence number of the advertisement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels              |
| <b>Age</b>                              | Time elapsed since the LSA was originated, in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | All levels              |
| <b>Opt</b>                              | Optional OSPF capabilities associated with the LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels              |

**Release Information**   Command introduced before Junos OS Release 7.4.  
    Command introduced in Junos OS Release 9.0 for EX Series switches.  
    **realm** option introduced in Junos OS Release 9.2.  
    **advertising-router (address | self)** option introduced in Junos Release 9.5.  
    **advertising-router (address | self)** option introduced in Junos OS Release 9.5 for EX Series switches.  
    Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**   Display the entries in the OSPF version 3 (OSPFv3) link-state database, which contains data about link-state advertisement (LSA) packets.

**Options**   **none**—Display standard information about all entries in the OSPFv3 link-state database.  
    **brief | detail | extensive | summary**—(Optional) Display the specified level of output.

**advertising-router** (*address* | *self*)—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.

**area** *area-id*—(Optional) Display the LSAs in a particular area.

**external**—(Optional) Display external LSAs.

**instance** *instance-name*—(Optional) Display all OSPF database information under the named routing instance.

**inter-area-prefix**—(Optional) Display information about interarea-prefix LSAs.

**inter-area-router**—(Optional) Display information about interarea-router LSAs.

**intra-area-prefix**—(Optional) Display information about intra-area-prefix LSAs.

**link**—(Optional) Display information about link LSAs.

**link-local**—(Optional) Display information about link-local LSAs.

**logical-system** (*all* | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

**lsa-id** *lsa-id*—(Optional) Display the LSA with the specified LSA identifier.

**network**—(Optional) Display information about network LSAs.

**nssa**—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

**realm** (*ipv4-multicast* | *ipv4-unicast* | *ipv6-multicast*)—(Optional) Display information about the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family other than IPv6 unicast, which is the default.

**router**—(Optional) Display information about router LSAs.

**Required Privilege Level**

**Output Fields** Table 295 on page 4360 lists the output fields for the **show (ospf | ospf3) interface** command. Output fields are listed in the approximate order in which they appear.

**Table 295: show (ospf | ospf3) interface Output Fields**

| Field Name              | Field Description                                                                                                                                                                                    | Level of Output         |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Interface</b>        | Name of the interface running OSPF version 2 or OSPF version 3.                                                                                                                                      | All levels              |
| <b>State</b>            | State of the interface: <b>BDR</b> , <b>Down</b> , <b>DR</b> , <b>DRother</b> , <b>Loop</b> , <b>PtToPt</b> , or <b>Waiting</b> .                                                                    | All levels              |
| <b>Area</b>             | Number of the area that the interface is in.                                                                                                                                                         | All levels              |
| <b>DR ID</b>            | Address of the area's designated router.                                                                                                                                                             | All levels              |
| <b>BDR ID</b>           | Backup designated router for a particular subnet.                                                                                                                                                    | All levels              |
| <b>Nbrs</b>             | Number of neighbors on this interface.                                                                                                                                                               | All levels              |
| <b>Type</b>             | Type of interface: <b>LAN</b> , <b>NBMA</b> , <b>P2MP</b> , <b>P2P</b> , or <b>Virtual</b> .                                                                                                         | <b>detail extensive</b> |
| <b>Address</b>          | IP address of the neighbor.                                                                                                                                                                          | <b>detail extensive</b> |
| <b>Mask</b>             | Netmask of the neighbor.                                                                                                                                                                             | <b>detail extensive</b> |
| <b>Prefix-length</b>    | (OSPFv3) IPv6 prefix length, in bits.                                                                                                                                                                | <b>detail extensive</b> |
| <b>OSPF3-Intf-Index</b> | (OSPFv3) OSPF version 3 interface index.                                                                                                                                                             | <b>detail extensive</b> |
| <b>MTU</b>              | Interface maximum transmission unit (MTU).                                                                                                                                                           | <b>detail extensive</b> |
| <b>Cost</b>             | Interface cost (metric).                                                                                                                                                                             | <b>detail extensive</b> |
| <b>DR addr</b>          | Address of the designated router.                                                                                                                                                                    | <b>detail extensive</b> |
| <b>BDR addr</b>         | Address of the backup designated router.                                                                                                                                                             | <b>detail extensive</b> |
| <b>Adj count</b>        | Number of adjacent neighbors.                                                                                                                                                                        | <b>detail extensive</b> |
| <b>Secondary</b>        | Indicates that this interface is configured as a secondary interface for this area. This interface can belong to more than one area, but can be designated as a primary interface for only one area. | <b>detail extensive</b> |

Table 295: show (ospf | ospf3) interface Output Fields (*continued*)

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Level of Output         |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Flood Reduction</b> | Indicates that this interface is configured with flooding reduction. All self-originated LSAs from this interface are initially sent with the <b>DoNotAge</b> bit set. As a result, LSAs are refreshed only when a change occurs.                                                                                                                                                                                                                                   | <b>extensive</b>        |
| <b>Priority</b>        | Router priority used in designated router (DR) election on this interface.                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail extensive</b> |
| <b>Flood list</b>      | List of link-state advertisements (LSAs) that might be about to flood this interface.                                                                                                                                                                                                                                                                                                                                                                               | <b>extensive</b>        |
| <b>Ack list</b>        | Acknowledgment list. List of pending acknowledgments on this interface.                                                                                                                                                                                                                                                                                                                                                                                             | <b>extensive</b>        |
| <b>Descriptor list</b> | List of packet descriptors.                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>extensive</b>        |
| <b>Hello</b>           | Configured value for the hello timer.                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| <b>Dead</b>            | Configured value for the dead timer.                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> |
| <b>Auth type</b>       | (OSPFv2) Authentication mechanism for sending and receiving OSPF protocol packets: <ul style="list-style-type: none"> <li>• <b>MD5</b>—The MD5 mechanism is configured in accordance with RFC 2328.</li> <li>• <b>None</b>—No authentication method is configured.</li> <li>• <b>Password</b>—A simple password (RFC 2328) is configured.</li> </ul>                                                                                                                | <b>detail extensive</b> |
| <b>Topology</b>        | (Multiarea adjacency) Name of topology: <b>default</b> or <b>name</b> .                                                                                                                                                                                                                                                                                                                                                                                             |                         |
| <b>LDP sync state</b>  | (OSPFv2 and LDP synchronization) Current state of LDP synchronization: <b>in sync</b> , <b>in holddown</b> , and <b>not supported</b> .                                                                                                                                                                                                                                                                                                                             | <b>extensive</b>        |
| <b>reason</b>          | (OSPFv2 and LDP synchronization) Reason for the current state of LDP synchronization. The LDP session might be up or down, or adjacency might be up or down.                                                                                                                                                                                                                                                                                                        | <b>extensive</b>        |
| <b>config holdtime</b> | (OSPFv2 and LDP synchronization) Configured value of the hold timer.<br><br>If the state is not synchronized, and the hold time is not infinity, the <b>remaining</b> field displays the number of seconds that remain until the configured hold timer expires.                                                                                                                                                                                                     | <b>extensive</b>        |
| <b>IPSec SA name</b>   | (OSPFv2) Name of the IPSec security association name.                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| <b>Active key ID</b>   | (OSPFv2 and MD5) Number from <b>0</b> to <b>255</b> that uniquely identifies an MD5 key.                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |
| <b>Start time</b>      | (OSPFv2 and MD5) Time at which the routing device starts using an MD5 key to authenticate OSPF packets transmitted on the interface on which this key is configured. To authenticate received OSPF protocol packets, the key becomes effective immediately after the configuration is committed. If the start time option is not configured, the key is effective immediately for send and receive and is displayed as <b>Start time 1970 Jan 01 00:00:00 PST</b> . | <b>detail extensive</b> |

Table 295: show (ospf | ospf3) interface Output Fields (*continued*)

| Field Name                   | Field Description                          | Level of Output  |
|------------------------------|--------------------------------------------|------------------|
| ReXmit                       | Configured value for the Retransmit timer. | detail extensive |
| Stub, Not Stub, or Stub NSSA | Type of area.                              | detail extensive |

| <b>Output Fields</b>                            | <p><a href="#">Table 297 on page 4367</a> lists the output fields for the <b>show (ospf   ospf3) log</b> command. Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 297: show (ospf | ospf3) log Output Fields**

| Field Name  | Field Description                                                                      |
|-------------|----------------------------------------------------------------------------------------|
| <b>When</b> | Time, in weeks ( <b>w</b> ) and days ( <b>d</b> ), since the SPF calculation was made. |

Table 297: show (ospf | ospf3) log Output Fields (*continued*)

| Field Name | Field Description                                                                                                                                                                   |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type       | Type of calculation: Cleanup, External, Interarea, NSSA, Redist, SPF, Stub, Total, or Virtuallink.                                                                                  |
| Elapsed    | Amount of time, in seconds, that elapsed during the operation, or the time required to complete the SPF calculation. The start time is the time displayed in the <b>When</b> field. |

## Sample Output

### show ospf log

```

user@host> show ospf log
When          Type          Elapsed
1w4d 17:25:58 Stub          0.000017
1w4d 17:25:58 SPF            0.000070
1w4d 17:25:58 Stub          0.000019
1w4d 17:25:58 Interarea       0.000054
1w4d 17:25:58 External        0.000005
1w4d 17:25:58 Cleanup         0.000203
1w4d 17:25:58 Total          0.000537
1w4d 17:24:48 SPF            0.000125
1w4d 17:24:48 Stub          0.000017
1w4d 17:24:48 SPF            0.000100
1w4d 17:24:48 Stub          0.000016
1w4d 17:24:48 Interarea       0.000056
1w4d 17:24:48 External        0.000005

## show (ospf | ospf3) neighbor

---

**List of Syntax**    [Syntax on page 4370](#)  
                         [Syntax \(EX Series Switches and QFX Series\) on page 4370](#)

**Syntax**    `show (ospf | ospf3) neighbor`  
                 `<brief | detail | extensive>`  
                 `<area area-id>`  
                 `<instance (all | instance-name)>`  
                 `<interface interface-name>`  
                 `<logical-system (all | logical-system-name)>`  
                 `<neighbor>`  
                 `<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>`

**Syntax (EX Series Switches and QFX Series)**    `show (ospf | ospf3) neighbor`  
                 `<brief | detail | extensive>`  
                 `<area area-id>`  
                 `<instance (all | instance-name)>`  
                 `<interface interface-name>`  
                 `<neighbor>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              **instance all** option introduced in Junos OS Release 9.1.  
                              **instance all** option introduced in Junos OS Release 9.1 for EX Series switches.  
                              **area**, **interface**, and **realm** options introduced in Junos OS Release 9.2.  
                              **area** and **interface** options introduced in Junos OS Release 9.2 for EX Series switches.  
                              Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**    Display information about OSPF neighbors.

CPU utilization might increase while the device learns its OSPF neighbors. We recommend that you use the **show (ospf | ospf3) neighbor** command after the device learns and establishes OSPF neighbor adjacencies. Depending on the size of your network, this might take several minutes. If you receive a “timeout communicating with routing daemon” error when using the **show (ospf | ospf3) neighbor** command, wait several minutes before attempting to use the command again. This is not a critical system error, but you might experience a delay in using the CLI.

**Options**    **none**—Display standard information about all OSPF neighbors for all routing instances.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**area *area-id***—(Optional) Display information about the OSPF neighbors for the specified area.

**instance (all | *instance-name*)**—(Optional) Display all OSPF interfaces for all routing instances or under the named routing instance.

**interface *interface-name***—(Optional) Display information about OSPF neighbors for the specified logical interface.

**logical-system** (**all** | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

**neighbor**—(Optional) Display information about the specified OSPF neighbor.

**realm** (**ipv4-multicast** | **ipv4-unicast** | **ipv6-multicast**)—(OSPFv3 only) (Optional) Display information about the OSPF neighbors for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**Required Privilege Level** view

**Output Fields** [Table 298 on page 4371](#) lists the output fields for the **show (ospf | ospf3) neighbor** command. Output fields are listed in the approximate order in which they appear.

**Table 298: show (ospf | ospf3) neighbor Output Fields**

| Field Name       | Field Description                                  | Level of Output |
|------------------|----------------------------------------------------|-----------------|
| <b>Address</b>   | Address of the neighbor.                           | All levels      |
| <b>Interface</b> | Interface through which the neighbor is reachable. | All levels      |

Table 298: show (ospf | ospf3) neighbor Output Fields (*continued*)

| Field Name                            | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Level of Output         |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>State</b>                          | <p>State of the neighbor:</p> <ul style="list-style-type: none"> <li>• <b>Attempt</b>—Valid only for neighbors attached to nonbroadcast networks. It indicates that no recent information has been received from the neighbor, but that a more concerted effort must be made to contact the neighbor.</li> <li>• <b>Down</b>—Initial state of a neighbor conversation. It indicates that no recent information has been received from the neighbor. Hello packets might continue to be sent to neighbors in the <b>Down</b> state, although at a reduced frequency.</li> <li>• <b>Exchange</b>—Routing device is describing its entire link-state database by sending database description packets to the neighbor. Each packet has a sequence number and is explicitly acknowledged.</li> <li>• <b>ExStart</b>—First step in creating an adjacency between the two neighboring routing devices. The goal of this step is to determine which routing device is the master, and to determine the initial sequence number.</li> <li>• <b>Full</b>—Neighboring routing devices are fully adjacent. These adjacencies appear in router link and network link advertisements.</li> <li>• <b>Init</b>—A hello packet has recently been sent by the neighbor. However, bidirectional communication has not yet been established with the neighbor. This state might occur, for example, because the routing device itself did not appear in the neighbor's hello packet.</li> <li>• <b>Loading</b>—Link-state request packets are sent to the neighbor to acquire more recent advertisements that have been discovered (but not yet received) in the <b>Exchange</b> state.</li> <li>• <b>2Way</b>—Communication between the two routing devices is bidirectional. This state has been ensured by the operation of the Hello Protocol. This is the most advanced state short of beginning adjacency establishment. The (backup) designated router is selected from the set of neighbors in state <b>2Way</b> or greater.</li> </ul> | All levels              |
| <b>ID</b>                             | Router ID of the neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels              |
| <b>Pri</b>                            | Priority of the neighbor to become the designated router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | All levels              |

| <b>Link state retransmission list</b> | <p>Total number of link-state advertisements retransmitted. For <b>extensive</b> output only, the following information is also displayed:</p> <ul style="list-style-type: none"> <li>• <b>Type</b>—Type of link advertisement: <b>ASBR</b>, <b>Sum</b>, <b>Extern</b>, <b>Network</b>, <b>NSSA</b>, <b>OpaqArea</b>, <b>Router</b>, or <b>Summary</b>.</li> <li>• <b>LSA ID</b>—LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device.</li> <li>• <b>Adv rtr</b>—Address of the routing device that sent the advertisement.</li> <li>• <b>Seq</b>—Link sequence number of the advertisement.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b> |

Table 298: show (ospf | ospf3) neighbor Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                | Level of Output         |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Neighbor-address</b> | (OSPFv3 only) If the neighbor uses virtual links, the <b>Neighbor-address</b> is the site-local, local, or global address. If the neighbor uses a physical interface, the <b>Neighbor-address</b> is an IPv6 link-local address. | <b>detail extensive</b> |
| <b>area</b>             | Area that the neighbor is in.                                                                                                                                                                                                    | <b>detail extensive</b> |
| <b>OSPF3-Intf-Index</b> | (OSPFv3 only) Displays the OSPFv3 interface index.                                                                                                                                                                               | <b>detail extensive</b> |
| <b>opt</b>              | Option bits received in the hello packets from the neighbor.                                                                                                                                                                     | <b>detail extensive</b> |
| <b>DR or DR-ID</b>      | Address of the designated router.                                                                                                                                                                                                | <b>detail extensive</b> |
| <b>BDR or BDR-ID</b>    | Address of the backup designated router.                                                                                                                                                                                         | <b>detail extensive</b> |
| <b>Up</b>               | Length of time since the neighbor came up.                                                                                                                                                                                       | <b>detail extensive</b> |
| <b>adjacent</b>         | Length of time since the adjacency with the neighbor was established.                                                                                                                                                            | <b>detail extensive</b> |

## Sample Output

| <b>Output Fields</b>                            | <a href="#">Table 198 on page 2568</a> lists the output fields for the <b>show ospf overview</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Table 299: show ospf overview Output Fields

| Field name                       | Field Description                                                                                                                                                                        | Level of Output |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Instance</b>                  | OSPF routing instance.                                                                                                                                                                   | All levels      |
| <b>Router ID</b>                 | Router ID of the routing device.                                                                                                                                                         | All levels      |
| <b>Route table index</b>         | Route table index.                                                                                                                                                                       | All levels      |
| <b>Configured overload</b>       | Overload capability is enabled. If the overload timer is also configured, display the time that remains before it is set to expire. This field is not displayed after the timer expires. | All levels      |
| <b>Topology</b>                  | Topology identifier.                                                                                                                                                                     | All levels      |
| <b>Prefix export count</b>       | Number of prefixes exported into OSPF.                                                                                                                                                   | All levels      |
| <b>Full SPF runs</b>             | Number of complete Shortest Path First calculations.                                                                                                                                     | All levels      |
| <b>SPF delay</b>                 | Delay before performing consecutive Shortest Path First calculations.                                                                                                                    | All levels      |
| <b>SPF holddown</b>              | Delay before performing additional Shortest Path First (SPF) calculations after the maximum number of consecutive SPF calculations is reached.                                           | All levels      |
| <b>SPF rapid runs</b>            | Maximum number of Shortest Path First calculations that can be performed in succession before the hold-down timer begins.                                                                | All levels      |
| <b>LSA refresh time</b>          | Refresh period for link-state advertisement (in minutes).                                                                                                                                | All levels      |
| <b>Database protection state</b> | Current state of database protection.                                                                                                                                                    | All levels      |
| <b>Warning threshold</b>         | Threshold at which a warning message is logged (percentage of maximum LSA count).                                                                                                        | All levels      |
| <b>Non self-generated LSAs</b>   | Number of LSAs whose router ID is not equal to the local router ID: <b>Current</b> , <b>Warning</b> (threshold), and <b>Allowed</b> .                                                    | All levels      |
| <b>Ignore time</b>               | How long the database has been in the ignore state.                                                                                                                                      | All levels      |
| <b>Reset time</b>                | How long the database must stay out of the ignore or isolated state before it returns to normal operations.                                                                              | All levels      |
| <b>Ignore count</b>              | Number of times the database has been in the ignore state: <b>Current</b> and <b>Allowed</b> .                                                                                           | All levels      |
| <b>Restart</b>                   | Graceful restart capability: <b>enabled</b> or <b>disabled</b> .                                                                                                                         | All levels      |
| <b>Restart duration</b>          | Time period for complete reacquisition of OSPF neighbors.                                                                                                                                | All levels      |
| <b>Restart grace period</b>      | Time period for which the neighbors should consider the restarting routing device as part of the topology.                                                                               | All levels      |

Table 299: show ospf overview Output Fields (*continued*)

| Field name                    | Field Description                                                                                                                                                                                                                                                                                                                     | Level of Output  |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| Graceful restart helper mode  | (OSPFv2) Standard graceful restart helper capability (based on RFC 3623): <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                                                         | All levels       |
| Restart-signaling helper mode | (OSPFv2) Restart signaling-based graceful restart helper capability (based on RFC 4811, RFC 4812, and RFC 4813): <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                  | All levels       |
| Helper mode                   | (OSPFv3) Graceful restart helper capability: <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                                                                                      | All levels       |
| Trace options                 | OSPF-specific trace options.                                                                                                                                                                                                                                                                                                          | <b>extensive</b> |
| Trace file                    | Name of the file to receive the output of the tracing operation.                                                                                                                                                                                                                                                                      | <b>extensive</b> |
| Area                          | Area number. Area 0.0.0.0 is the backbone area.                                                                                                                                                                                                                                                                                       | All levels       |

| Authentication Type           | Type of authentication: <b>None</b> , <b>Password</b> , or <b>MD5</b> .<br><br><b>NOTE:</b> The <b>Authentication Type</b> field refers to the authentication configured at the <b>[edit protocols ospf area area-id]</b> level. Any authentication configured for an interface in this area will not affect the value of this field. | All levels       |
| Area border routers           | Number of area border routers.                                                                                                                                                                                                                                                                                                        | All levels       |
| Neighbors                     | Number of autonomous system boundary routers.                                                                                                                                                                                                                                                                                         | All levels       |

## Sample Output

### show ospf overview

```

user@host> show ospf overview
Instance: master
  Router ID: 10.255.245.6
  Route table index: 0
  Configured overload, expires in 118 seconds
  LSA refresh time: 50 minutes
  Restart: Enabled
    Restart duration: 20 sec
    Restart grace period: 40 sec
    Helper mode: enabled
  Area: 0.0.0.0
    Stub type: Not Stub
    Authentication Type: None
    Area border routers: 0, AS boundary routers: 0
    Neighbors
      Up (in full state): 0
  Topology: default (ID 0)
  Prefix export count: 0
  Full SPF runs: 1
  SPF delay: 0.200000 sec, SPF holddown: 5 sec, SPF rapid runs: 3

```

**show ospf overview (With Database Protection)**

```

user@host> show ospf overview
Instance: master
  Router ID: 10.255.112.218
  Route table index: 0
  LSA refresh time: 50 minutes
  Traffic engineering
  Restart: Enabled
    Restart duration: 180 sec
    Restart grace period: 210 sec
    Graceful restart helper mode: Enabled
    Restart-signaling helper mode: Enabled
  Database protection state: Normal
    Warning threshold: 70 percent
    Non self-generated LSAs: Current 582, Warning 700, Allowed 1000
    Ignore time: 30, Reset time: 60
    Ignore count: Current 0, Allowed 1
  Area: 0.0.0.0
    Stub type: Not Stub
    Authentication Type: None
    Area border routers: 0, AS boundary routers: 0
  Neighbors
    Up (in full state): 160
  Topology: default (ID 0)
  Prefix export count: 0
  Full SPF runs: 70
  SPF delay: 0.200000 sec, SPF holddown: 5 sec, SPF rapid runs: 3
  Backup SPF: Not Needed

```

**show ospf3 overview (With Database Protection)**

```

user@host> show ospf3 overview
Instance: master
  Router ID: 10.255.112.128
  Route table index: 0
  LSA refresh time: 50 minutes
  Database protection state: Normal
    Warning threshold: 80 percent
    Non self-generated LSAs: Current 3, Warning 8, Allowed 10
    Ignore time: 30, Reset time: 60
    Ignore count: Current 0, Allowed 2
  Area: 0.0.0.0
    Stub type: Not Stub

## show (ospf | ospf3) route

**List of Syntax**    [Syntax on page 4381](#)  
                          [Syntax \(EX Series Switch and QFX Series\) on page 4381](#)

**Syntax**    show (ospf | ospf3) route  
                  <brief | detail | extensive>  
                  <abr | asbr | extern | inter | intra>  
                  <destination>  
                  <instance (default | ipv4-multicast | *instance-name*)>  
                  <logical-system (default | ipv4-multicast | *logical-system-name*)>  
                  <network>  
                  <no-backup-coverage>  
                  <realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>  
                  <router>  
                  <topology (default | ipv4-multicast | *topology-name*)>  
                  <transit>

**Syntax (EX Series Switch and QFX Series)**    show (ospf | ospf3) route  
                  <brief | detail | extensive>  
                  <abr | asbr | extern | inter | intra>  
                  <destination>  
                  <instance *instance-name*>  
                  <network>  
                  <no-backup-coverage>  
                  <router>  
                  <topology (default | ipv4-multicast | *topology-name*)>  
                  <transit>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                  **topology** option introduced in Junos OS Release 9.0.  
                                  **realm** option introduced in Junos OS Release 9.2.  
                                  Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**    Display the entries in the Open Shortest Path First (OSPF) routing table.

**Options**    **none**—Display standard information about all entries in the OSPF routing table for all routing instances and all topologies.

**destination**—Display routes to the specified IP address (with optional destination prefix length).

**brief | detail | extensive**—(Optional) Display the specified level of output.

**abr**—(Optional) Display routes to area border routers.

**asbr**—(Optional) Display routes to autonomous system border routers.

**extern**—(Optional) Display external routes.

**inter**—(Optional) Display interarea routes.

**intra**—(Optional) Display intra-area routes.

**instance** (**default** | **ipv4-multicast** | *instance-name*)—(Optional) Display entries for the default routing instance, the IPv4 multicast routing instance, or for the specified routing instance.

**logical-system** (**default** | **ipv4-multicast** | *logical-system-name*)—(Optional) Perform this operation on the default logical system, the IPv4 multicast logical system, or on a particular logical system.

**network**—(Optional) Display routes to networks.

**no-backup-coverage**—(Optional) Display routes with no backup coverage.

**realm** (**ipv4-multicast** | **ipv4-unicast** | **ipv6-multicast**)—(OSPFv3 only) (Optional) Display entries in the routing table for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**router**—(Optional) Display routes to all routers.

**topology** (**default** | **ipv4-multicast** | *topology-name*)—(OSPFv2 only) (Optional) Display routes for the default OSPF topology, IPv4 multicast topology, or for a particular topology.

**transit**—(Optional) (OSPFv3 only) Display OSPFv3 routes to pseudonodes.

**Required Privilege Level**

view

| <b>Type 7</b>             | Route was learned through a not-so-stubby area (NSSA) link-state advertisement (LSA).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | detail       |
| <b>P-bit</b>              | Route was learned through NSSA LSA and the propagate bit was set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | detail       |
| <b>Fwd NZ</b>             | Forwarding address is nonzero. <b>Fwd NZ</b> is only displayed if the route is learned through an NSSA LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | detail       |

Table 300: show (ospf | ospf3) route Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Output Level  |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| <b>optional-capability</b> | Optional capabilities propagated in the router LSA. This field is in the output for intra-area router routes only (when <b>Route Type</b> is <b>Area BR</b> , <b>AS BR</b> , <b>Area/AS BR</b> , or <b>Router</b> ), not for interarea router routes or network routes. Three bits in this field are defined as follows: <ul style="list-style-type: none"> <li>• <b>0x4 (V)</b>—Routing device is at the end of a virtual active link.</li> <li>• <b>0x2 (E)</b>—Routing device is an autonomous system boundary router.</li> <li>• <b>0x1 (B)</b>—Routing device is an area border router.</li> </ul> | <b>detail</b> |
| <b>priority</b>            | The priority assigned to the prefix: <ul style="list-style-type: none"> <li>• <b>high</b></li> <li>• <b>medium</b></li> <li>• <b>low</b></li> </ul> <p><b>NOTE:</b> The <b>priority</b> field applies only to routes of type <b>Network</b>.</p>                                                                                                                                                                                                                                                                                                                                                        | <b>detail</b> |

## Sample Output

### show ospf route

```

## RIP Overview

---

- [RIP Overview on page 4393](#)

### RIP Overview

RIP is an interior gateway protocol (IGP) that uses a distance-vector algorithm to determine the best route to a destination, using the hop count as the metric.

In a RIP network, each router's forwarding table is distributed among the nodes through the flooding of routing table information. Because topology changes are flooded throughout the network, every node maintains the same list of destinations. Packets are then routed to these destinations based on path-cost calculations done at each node in the network.

NOTE: In general, the term *RIP* refers to RIP version 1 and RIP version 2.

This topic contains the following sections:

### Distance-Vector Routing Protocols

---

Distance-vector routing protocols transmit routing information that includes a distance vector, typically expressed as the number of hops to the destination. This information is flooded out all protocol-enabled interfaces at regular intervals (every 30 seconds in the case of RIP) to create a network map that is stored in each node's local topology database. [Figure 147 on page 4394](#) shows how distance-vector routing works.

Figure 147: Distance-Vector Protocol

In Figure 147 on page 4394, Routers A and B have RIP enabled on adjacent interfaces. Router A has known RIP neighbors Routers C, D, and E, which are 1, 2, and 3 hops away, respectively. Router B has known RIP neighbors Routers X, Y, and Z, which are 1, 2, and 3 hops away, respectively. Every 30 seconds, each router floods its entire routing table information out all RIP-enabled interfaces. In this case, flooding exchanges routing table information across the RIP link.

When Router A receives routing information from Router B, it adds 1 to the hop count to determine the new hop count. For example, Router X has a hop count of 1, but when Router A imports the route to X, the new hop count is 2. The imported route also includes information about where the route was learned, so that the original route is imported as a route to Router X through Router B with a hop count of 2.

When multiple routes to the same host are received, RIP uses the distance-vector algorithm to determine which path to import into the forwarding table. The route with the smallest hop count is imported. If there are multiple routes with the same hop count, all are imported into the forwarding table, and traffic is sent along the paths in round-robin fashion.

### RIP Protocol Overview

The RIP IGP uses the Bellman-Ford, or *distance-vector*, algorithm to determine the best route to a destination. RIP uses the hop count as the metric. RIP enables hosts and routers to exchange information for computing routes through an IP-based network. RIP is intended to be used as an IGP in reasonably homogeneous networks of moderate size.

The Junos® operating system (Junos OS) supports RIP versions 1 and 2.

**NOTE:** RIP is not supported for multipoint interfaces.

RIP version 1 packets contain the minimal information necessary to route packets through a network. However, this version of RIP does not support authentication or subnetting.

RIP uses User Datagram Protocol (UDP) port 520.

RIP has the following architectural limitations:

- The longest network path cannot exceed 15 hops (assuming that each network, or hop, has a cost of 1).
- RIP depends on counting to infinity to resolve certain unusual situations—When the network consists of several hundred routers, and when a routing loop has formed, the amount of time and network bandwidth required to resolve a next hop might be great.
- RIP uses only a fixed metric to select a route. Other IGPs use additional parameters, such as measured delay, reliability, and load.

### RIP Packets

RIP packets contain the following fields:

- Command—Indicates whether the packet is a request or response message. Request messages seek information for the router's routing table. Response messages are sent periodically and also when a request message is received. Periodic response messages are called *update messages*. Update messages contain the command and version fields and 25 destinations (by default), each of which includes the destination IP address and the metric to reach that destination.

**NOTE:** Beginning with Junos OS Release 11.1, three additional command field types are available to support RIP demand circuits. When you configure an interface for RIP demand circuits, the command field indicates whether the packet is an update request, update response, or update acknowledge message. Neighbor interfaces send updates on demand, not periodically. These command field types are only valid on interfaces configured for RIP demand circuits. For more detailed information, see *RIP Demand Circuits Overview*.

- Version number—Version of RIP that the originating router is running.
- Address family identifier—Address family used by the originating router. The family is always IP.
- Address—IP address included in the packet.
- Metric—Value of the metric advertised for the address.
- Mask—Mask associated with the IP address (RIP version 2 only).
- Next hop—IP address of the next-hop router (RIP version 2 only).

Routing information is exchanged in a RIP network by RIP request and RIP response packets. A router that has just booted can broadcast a RIP request on all RIP-enabled interfaces. Any routers running RIP on those links receive the request and respond by sending a RIP response packet immediately to the router. The response packet contains the routing table information required to build the local copy of the network topology map.

In the absence of RIP request packets, all RIP routers broadcast a RIP response packet every 30 seconds on all RIP-enabled interfaces. The RIP broadcast is the primary way in which topology information is flooded throughout the network.

Once a router learns about a particular destination through RIP, it starts a timer. Every time it receives a new response packet with information about the destination, the router resets the timer to zero. However, if the router receives no updates about a particular destination for 180 seconds, it removes the destination from its RIP routing table.

In addition to the regular transmission of RIP packets every 30 seconds, if a router detects a new neighbor or detects that an interface is unavailable, it generates a triggered update. The new routing information is immediately broadcast out all RIP-enabled interfaces, and the change is reflected in all subsequent RIP response packets.

### Maximizing Hop Count

The successful routing of traffic across a RIP network requires that every node in the network maintain the same view of the topology. Topology information is broadcast between RIP neighbors every 30 seconds. If Router A is many hops away from a new host, Router B, the route to B might take significant time to propagate through the network and be imported into Router A's routing table. If the two routers are 5 hops away from each other, Router A cannot import the route to Router B until 2.5 minutes after Router B is online (30 seconds per hop). For large numbers of hops, the delay becomes prohibitive. To help prevent this delay from growing arbitrarily large, RIP enforces a maximum hop count of 15 hops. Any prefix that is more than 15 hops away is treated as unreachable and assigned a hop count equal to infinity. This maximum hop count is called the *network diameter*.

### Split Horizon and Poison Reverse Efficiency Techniques

Because RIP functions by periodically flooding the entire routing table out to the network, it generates a lot of traffic. The split horizon and poison reverse techniques can help reduce the amount of network traffic originated by RIP hosts and make the transmission of routing information more efficient.

If a router receives a set of route advertisements on a particular interface, RIP determines that those advertisements do not need to be retransmitted out the same interface. This technique, known as *split horizon*, helps limit the amount of RIP routing traffic by eliminating information that other neighbors on that interface have already learned.

[Figure 148 on page 4396](#) shows an example of the split horizon technique.

**Figure 148: Split Horizon Example**

In [Figure 148 on page 4396](#), Router A advertises routes to Routers C, D, and E to Router B. In this example, Router A can reach Router C in 2 hops. When Router A advertises the route to Router B, Router B imports it as a route to Router C through Router A in 3 hops. If Router B then readvertised this route to Router A, Router A would import it as a route to Router C through Router B in 4 hops. However, the advertisement from Router B to Router A is unnecessary, because Router A can already reach the route in 2 hops. The split horizon technique helps reduce extra traffic by eliminating this type of route advertisement.

Similarly, the poison reverse technique helps to optimize the transmission of routing information and improve the time to reach network convergence. If Router A learns about unreachable routes through one of its interfaces, it advertises those routes as unreachable (hop count of 16) out the same interface. [Figure 149 on page 4397](#) shows an example of the poison reverse technique.

**Figure 149: Poison Reverse Example**

In [Figure 149 on page 4397](#), Router A learns through one of its interfaces that routes to Routers C, D, and E are unreachable. Router A readvertises those routes out the same interface as unreachable. The advertisement informs Router B that Routers C, D, and E are definitely not reachable through Router A.

### Limitations of Unidirectional Connectivity

Because RIP processes routing information based solely on the receipt of routing table updates, it cannot ensure bidirectional connectivity. As [Figure 150 on page 4398](#) shows, RIP networks are limited by their unidirectional connectivity.

**Figure 150: Limitations of Unidirectional Connectivity**

In [Figure 150 on page 4398](#), Routers A and D flood their routing table information to Router B. Because the path to Router E has the fewest hops when routed through Router A, that route is imported into Router B's forwarding table. However, suppose that Router A can transmit traffic but is not receiving traffic from Router B because of an unavailable link or invalid routing policy. If the only route to Router E is through Router A, any traffic destined for Router A is lost, because bidirectional connectivity was never established.

OSPF establishes bidirectional connectivity with a three-way handshake.

- [Example: Configuring a Basic RIP Network on page 4400](#)

#### Understanding Basic RIP Routing

---

RIP is an interior gateway protocol (IGP) that routes packets within a single autonomous system (AS). By default, RIP does not advertise the subnets that are directly connected through the device's interfaces. For traffic to pass through a RIP network, you must create a routing policy to export these routes. Advertising only the direct routes propagates the routes to the immediately adjacent RIP-enabled router only. To propagate all routes through the entire RIP network, you must configure the routing policy to export the routes learned through RIP.

### Example: Configuring a Basic RIP Network

This example shows how to configure a basic RIP network.

- [Requirements on page 4400](#)
- [Overview on page 4400](#)
- [Configuration on page 4400](#)
- [Verification on page 4403](#)

#### Requirements

No special configuration beyond device initialization is required before configuring this example.

#### Overview

In this example, you configure a basic RIP network, create a RIP group called **rip-group**, and add the directly connected interfaces to the RIP group. Then you configure a routing policy to advertise direct routes using policy statement **advertise-routes-through-rip**.

By default, Junos OS does not advertise RIP routes, not even routes that are learned through RIP. To advertise RIP routes, you must configure and apply an export routing policy that advertises RIP-learned and direct routes.

In Junos OS, you do not need to configure the RIP version. RIP version 2 is used by default.

To use RIP on the device, you must configure RIP on all of the RIP interfaces within the network. [Figure 151 on page 4400](#) shows the topology used in this example.

**Figure 151: Sample RIP Network Topology**

"CLI Quick Configuration" on [page 4400](#) shows the configuration for all of the devices in [Figure 151 on page 4400](#). The section "Step-by-Step Procedure" on [page 4401](#) describes the steps on Device R1.

#### Configuration

##### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

##### Device R1

```
set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
```

```

set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Device R2**

```

set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor fe-1/2/1.5
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Device R3**

```

set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a basic RIP network:

1. Configure the network interfaces.

This example shows multiple loopback interface addresses to simulate attached networks.

```

[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30

```

```

user@R1# set lo0 unit 1 family inet address 172.16.0.1/32
user@R1# set lo0 unit 1 family inet address 192.168.1.1/32

```

2. Create the RIP group and add the interface.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

```

[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1

```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept
```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 172.16.0.1/32;
      address 192.168.1.1/32;
    }
  }
}

user@R1# show protocols
rip {
  group rip-group {
    export advertise-routes-through-rip;
    neighbor fe-1/2/0.1;
  }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
  term 1 {
    from protocol [ direct rip ];
    then accept;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

**Verification**

Confirm that the configuration is working properly.

- [Checking the Routing Table on page 4403](#)
- [Looking at the Routes That Device R1 Is Advertising to Device R2 on page 4403](#)
- [Looking at the Routes That Device R1 Is Receiving from Device R2 on page 4404](#)
- [Verifying the RIP-Enabled Interfaces on page 4404](#)
- [Verifying the Exchange of RIP Messages on page 4404](#)
- [Verifying Reachability of All Hosts in the RIP Network on page 4405](#)

**Checking the Routing Table**

**Purpose** Verify that the routing table is populated with the expected routes..

**Action** From operational mode, enter the **show route protocol rip** command.

```
user@R1> show route protocol rip
inet.0: 10 destinations, 10 routes (10 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.4/30      *[RIP/100] 00:59:15, metric 2, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
172.16.2.2/32   *[RIP/100] 02:52:48, metric 2, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
172.16.3.3/32   *[RIP/100] 00:45:05, metric 3, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
192.168.2.2/32  *[RIP/100] 02:52:48, metric 2, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
192.168.3.3/32  *[RIP/100] 00:45:05, metric 3, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
224.0.0.9/32    *[RIP/100] 00:45:09, metric 1
                 MultiRecv
```

**Meaning** The output shows that the routes have been learned from Device R2 and Device R3.

If you were to delete the **from protocol rip** condition in the routing policy on Device R2, the remote routes from Device R3 would not be learned on Device R1.

**Looking at the Routes That Device R1 Is Advertising to Device R2**

**Purpose** Verify that Device R1 is sending the expected routes.

**Action** From operational mode, enter the **show route advertising-protocol rip** command.

```
user@R1> show route advertising-protocol rip 10.0.0.1
inet.0: 10 destinations, 10 routes (10 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.0.1/32   *[Direct/0] 05:18:26
                 > via lo0.1
192.168.1.1/32  *[Direct/0] 05:18:25
                 > via lo0.1
```

**Meaning** Device R1 is sending routes to its directly connected networks.

*Looking at the Routes That Device R1 Is Receiving from Device R2*

**Purpose** Verify that Device R1 is receiving the expected routes.

**Action** From operational mode, enter the **show route receive-protocol rip** command.

```
user@R1> show route receive-protocol rip 10.0.0.2
inet.0: 10 destinations, 10 routes (10 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.4/30          *[RIP/100] 02:31:22, metric 2, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
172.16.2.2/32       *[RIP/100] 04:24:55, metric 2, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
172.16.3.3/32       *[RIP/100] 02:17:12, metric 3, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
192.168.2.2/32      *[RIP/100] 04:24:55, metric 2, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
192.168.3.3/32      *[RIP/100] 02:17:12, metric 3, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
```

**Meaning** Device R1 is receiving from Device R2 all of Device R2's directly connected networks. Device R1 is also receiving from Device R2 all of Device R3's directly connected networks, which Device R2 learned from Device R3 through RIP.

*Verifying the RIP-Enabled Interfaces*

**Purpose** Verify that all RIP-enabled Interfaces are available and active.

**Action** From operational mode, enter the **show rip neighbor** command.

```
user@R1> show rip neighbor
```

| Neighbor   | Local<br>State | Source<br>Address | Destination<br>Address | Send<br>Mode | Receive<br>Mode | In<br>Met |
|------------|----------------|-------------------|------------------------|--------------|-----------------|-----------|
| fe-1/2/0.1 | Up             | 10.0.0.1          | 224.0.0.9              | mcast        | both            | 1         |

**Meaning** The output shows that the RIP-enabled interface on Device R1 is operational.

In general for this command, the output shows a list of the RIP neighbors that are configured on the device. Verify the following information:

- Each configured interface is present. Interfaces are listed in alphabetical order.
- Each configured interface is up. The state of the interface is listed in the **Local State** column. A state of **Up** indicates that the link is passing RIP traffic. A state of **Dn** indicates that the link is not passing RIP traffic. In a point-to-point link, this state generally means that either the end point is not configured for RIP or the link is unavailable.

*Verifying the Exchange of RIP Messages*

**Purpose** Verify that RIP messages are being sent and received on all RIP-enabled interfaces.

**Action** From operational mode, enter the **show rip statistics** command.

```

user@R1> show rip statistics
RIPv2 info: port 520; holddown 120s.
      rts learned  rts held down  rqsts dropped  resps dropped
              5              0              0              0

fe-1/2/0.1: 5 routes learned; 2 routes advertised; timeout 180s; update interval
30s
Counter              Total      Last 5 min  Last minute
-----
Updates Sent          2669          10           2
Triggered Updates Sent      2           0           0
Responses Sent           0           0           0
Bad Messages            0           0           0
RIPv1 Updates Received     0           0           0
RIPv1 Bad Route Entries    0           0           0
RIPv1 Updates Ignored      0           0           0
RIPv2 Updates Received    2675          11           2
RIPv2 Bad Route Entries    0           0           0
RIPv2 Updates Ignored      0           0           0
Authentication Failures    0           0           0
RIP Requests Received      0           0           0
RIP Requests Ignored       0           0           0
none                      0           0           0

```

**Meaning** The output shows the number of RIP routes learned. It also shows the number of RIP updates sent and received on the RIP-enabled interfaces. Verify the following information:

- The number of RIP routes learned matches the number of expected routes learned. Subnets learned by direct connectivity through an outgoing interface are not listed as RIP routes.
- RIP updates are being sent on each RIP-enabled interface. If no updates are being sent, the routing policy might not be configured to export routes.
- RIP updates are being received on each RIP-enabled interface. If no updates are being received, the routing policy might not be configured to export routes on the host connected to that subnet. The lack of updates might also indicate an authentication error.

#### *Verifying Reachability of All Hosts in the RIP Network*

**Purpose** Use the **traceroute** command on each loopback address in the network to verify that all hosts in the RIP network are reachable from each Juniper Networks device.

**Action** From operational mode, enter the **traceroute** command.

```

user@R1> traceroute 192.168.3.3
traceroute to 192.168.3.3 (192.168.3.3), 30 hops max, 40 byte packets
 1  10.0.0.2 (10.0.0.2)  1.094 ms  1.028 ms  0.957 ms
 2  192.168.3.3 (192.168.3.3)  1.344 ms  2.245 ms  2.125 ms

```

**Meaning** Each numbered row in the output indicates a routing hop in the path to the host. The three-time increments indicate the round-trip time (RTT) between the device and the hop for each traceroute packet.

To ensure that the RIP network is healthy, verify the following information:

- The final hop in the list is the host you want to reach.
- The number of expected hops to the host matches the number of hops in the traceroute output. The appearance of more hops than expected in the output indicates that a network segment is probably unreachable. It might also indicate that the incoming or outgoing metric on one or more hosts has been set unexpectedly.

## Example: Configuring Authentication for RIP Routes

- [Understanding RIP Authentication on page 4406](#)
- [Example: Configuring Route Authentication for RIP on page 4406](#)
- [Enabling Authentication with Plain-Text Passwords \(CLI Procedure\) on page 4411](#)
- [Enabling Authentication with MD5 Authentication \(CLI Procedure\) on page 4411](#)

### Understanding RIP Authentication

---

RIPv2 provides authentication support so that RIP links can require authentication keys (passwords) before they become active. Authentication provides an additional layer of security on the network beyond the other security features. By default, this authentication is disabled.

Authentication keys can be specified in either plain-text or MD5 form. Authentication requires all routers within the RIP network or subnetwork to have the same authentication type and key (password) configured.

This type of authentication is not supported on RIPv1 networks.

### Example: Configuring Route Authentication for RIP

---

This example shows how to configure authentication for a RIP network.

- [Requirements on page 4406](#)
- [Overview on page 4406](#)
- [Configuration on page 4407](#)
- [Verification on page 4410](#)

#### **Requirements**

No special configuration beyond device initialization is required before configuring this example.

#### **Overview**

You can configure the router to authenticate RIP route queries. By default, authentication is disabled. You can use one of the following authentication methods:

- Simple authentication—Uses a text password that is included in the transmitted packet. The receiving router uses an authentication key (password) to verify the packet.
- MD5 authentication—Creates an encoded checksum that is included in the transmitted packet. The receiving router uses an authentication key (password) to verify the packet's MD5 checksum.

This example shows MD5 authentication.

Figure 152 on page 4407 shows the topology used in this example.

**Figure 152: RIP Authentication Network Topology**

"CLI Quick Configuration" on page 4407 shows the configuration for all of the devices in Figure 152 on page 4407. The section "Step-by-Step Procedure" on page 4408 describes the steps on Device R1.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1
set protocols rip authentication-type md5
set protocols rip authentication-key "$9$ONLRBhreK87dsM8i.5FAtM8XxNb"
set protocols rip traceoptions file rip-authentication-messages
set protocols rip traceoptions flag auth
set protocols rip traceoptions flag packets
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Device R2**

```

set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2

```

```
set protocols rip group rip-group neighbor fe-1/2/1.5
set protocols rip authentication-type md5
set protocols rip authentication-key "$9$Lf1Xds2gJDHmoJCu1hKvoJGUjq"
set protocols rip traceoptions file rip-authentication-messages
set protocols rip traceoptions flag auth
set protocols rip traceoptions flag packets
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Device R3**

```
set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set protocols rip authentication-type md5
set protocols rip authentication-key "$9$G.UkP5T39tOz3K87V4oz36/Cu"
set protocols rip traceoptions file rip-authentication-messages
set protocols rip traceoptions flag auth
set protocols rip traceoptions flag packets
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure RIP authentication:

1. Configure the network interfaces.

This example shows multiple loopback interface addresses to simulate attached networks.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30
```

```
user@R1# set lo0 unit 1 family inet address 172.16.0.1/32
user@R1# set lo0 unit 1 family inet address 192.168.1.1/32
```

2. Create the RIP group and add the interface.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

```
[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1
```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
```

```
user@R1# set from protocol rip
user@R1# set then accept
```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip
```

5. Require MD5 authentication for RIP route queries received on an interface.

The passwords must match on neighboring RIP routers. If the password does not match, the packet is rejected. The password can be from 1 through 16 contiguous characters long and can include any ASCII strings.

Do not enter the password as shown here. The password shown here is the encrypted password that is displayed in the configuration after the actual password is already configured.

```
[edit protocols rip]
user@R1# set authentication-type md5
user@R1# set authentication-key "$9$ONLRBhreK87dsM8i.5FAtM8XxNb"
```

6. Configure tracing operations to track authentication.

```
[edit protocols rip traceoptions]
user@R1# set file rip-authentication-messages
user@R1# set flag auth
user@R1# set flag packets
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 172.16.0.1/32;
      address 192.168.1.1/32;
    }
  }
}

user@R1# show protocols
rip {
  traceoptions {
    file rip-authentication-messages;
    flag auth;
```

```

        flag packets;
    }
    authentication-type md5;
    authentication-key "$9$ONLRBhreK87dsM8i.5FAtM8XxNb"; ## SECRET-DATA
    group rip-group {
        export advertise-routes-through-rip;
        neighbor fe-1/2/0.1;
    }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
    term 1 {
        from protocol [ direct rip ];
        then accept;
    }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Checking for Authentication Failures on page 4410](#)
- [Verifying That MD5 Authentication Is Enabled in RIP Update Packets on page 4411](#)

### Checking for Authentication Failures

**Purpose** Verify that there are no authentication failures.

**Action** From operational mode, enter the **show rip statistics** command.

```

user@R1> show rip statistics
RIPv2 info: port 520; holddown 120s.
      rts learned  rts held down  rqsts dropped  resps dropped
              5              0              0              0

fe-1/2/0.1: 5 routes learned; 2 routes advertised; timeout 180s; update interval
30s
Counter              Total    Last 5 min  Last minute
-----
Updates Sent          2669         10          2
Triggered Updates Sent      2          0          0
Responses Sent          0          0          0
Bad Messages           0          0          0
RIPv1 Updates Received     0          0          0
RIPv1 Bad Route Entries    0          0          0
RIPv1 Updates Ignored      0          0          0
RIPv2 Updates Received    2675         11          2
RIPv2 Bad Route Entries    0          0          0
RIPv2 Updates Ignored      0          0          0
Authentication Failures      0          0          0
RIP Requests Received      0          0          0
RIP Requests Ignored        0          0          0
none                     0          0          0

```

**Meaning** The output shows that there are no authentication failures.

### Verifying That MD5 Authentication Is Enabled in RIP Update Packets

**Purpose** Use tracing operations to verify that MD5 authentication is enabled in RIP updates.

**Action** From operational mode, enter the **show log** command.

```
user@R1> show log rip-authentication-messages | match md5
Feb 15 15:45:13.969462      sending msg 0xb9a8c04, 3 rtes (needs MD5)
Feb 15 15:45:43.229867      sending msg 0xb9a8c04, 3 rtes (needs MD5)
Feb 15 15:46:13.174410      sending msg 0xb9a8c04, 3 rtes (needs MD5)
Feb 15 15:46:42.716566      sending msg 0xb9a8c04, 3 rtes (needs MD5)
Feb 15 15:47:11.425076      sending msg 0xb9a8c04, 3 rtes (needs MD5)
...
```

**Meaning** The **(needs MD5)** output shows that all route updates require MD5 authentication.

### Enabling Authentication with Plain-Text Passwords (CLI Procedure)

To configure authentication that requires a plain-text password to be included in the transmitted packet, enable simple authentication by performing these steps on all RIP devices in the network:

1. Navigate to the top of the configuration hierarchy.
2. Perform the configuration tasks described in [Table 302 on page 4411](#).
3. If you are finished configuring the router, commit the configuration.

**Table 302: Configuring Simple RIP Authentication**

| Task                                                                                                                                                             | CLI Configuration Editor                                                                                   |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| Navigate to <b>Rip</b> level in the configuration hierarchy.                                                                                                     | From the <b>[edit]</b> hierarchy level, enter<br><br><b>edit protocols rip</b>                             |
| Set the authentication type to <b>simple</b> .                                                                                                                   | Set the authentication type to <b>simple</b> :<br><br><b>set authentication-type simple</b>                |
| Set the authentication key to a simple-text password.<br><br>The password can be from 1 through 16 contiguous characters long and can include any ASCII strings. | Set the authentication key to a simple-text password:<br><br><b>set authentication-key <i>password</i></b> |

### Enabling Authentication with MD5 Authentication (CLI Procedure)

To configure authentication that requires an MD5 password to be included in the transmitted packet, enable MD5 authentication by performing these steps on all RIP devices in the network:

1. Navigate to the top of the configuration hierarchy.
2. Perform the configuration tasks described in [Table 303 on page 4412](#).
3. If you are finished configuring the router, commit the configuration.

Table 303: Configuring MD5 RIP Authentication

| Task                                                                                                                                             | CLI Configuration Editor                                                              |
|--------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| Navigate to <b>Rip</b> level in the configuration hierarchy.                                                                                     | From the <b>[edit]</b> hierarchy level, enter<br><br><b>edit protocols rip</b>        |
| Set the authentication type to <b>MD5</b> .                                                                                                      | Set the authentication type to <b>md5</b> :<br><br><b>set authentication-type md5</b> |
| Set the MD5 authentication key (password).<br><br>The key can be from 1 through 16 contiguous characters long and can include any ASCII strings. | Set the MD5 authentication key:<br><br><b>set authentication-key password</b>         |

### Example: Configuring BFD for RIP

- [Understanding BFD for RIP on page 4412](#)
- [Example: Configuring BFD for RIP on page 4413](#)

#### Understanding BFD for RIP

The Bidirectional Forwarding Detection (BFD) Protocol is a simple hello mechanism that detects failures in a network. Hello packets are sent at a specified, regular interval. A neighbor failure is detected when the routing device stops receiving a reply after a specified interval. BFD works with a wide variety of network environments and topologies. BFD failure detection times are shorter than RIP detection times, providing faster reaction times to various kinds of failures in the network. Instead of waiting for the routing protocol neighbor timeout, BFD provides rapid detection of link failures. BFD timers are adaptive and can be adjusted to be more or less aggressive. For example, a timer can adapt to a higher value if the adjacency fails, or a neighbor can negotiate a higher value for a timer than the one configured.

BFD enables quick failover between a primary and a secondary routed path. The protocol tests the operational status of the interface multiple times per second. BFD provides for configuration timers and thresholds for failure detection. For example, if the minimum interval is set for 50 milliseconds and the threshold uses the default value of three missed messages, a failure is detected on an interface within 200 milliseconds of the failure.

Intervening devices (for example, an Ethernet LAN switch) hide link-layer failures from routing protocol peers, such as when two routers are connected by way of a LAN switch, where the local interface status remains up even when a physical fault happens on the remote link. Link-layer failure detection times vary, depending on the physical media and the Layer 2 encapsulation. BFD can provide fast failure detection times for all media types, encapsulations, topologies, and routing protocols.

To enable BFD for RIP, both sides of the connection must receive an update message from the peer. By default, RIP does not export any routes. Therefore, you must enable update messages to be sent by configuring an export policy for routes before a BFD session is triggered.

### Example: Configuring BFD for RIP

This example shows how to configure Bidirectional Forwarding Detection (BFD) for a RIP network.

- [Requirements on page 4413](#)
- [Overview on page 4413](#)
- [Configuration on page 4415](#)
- [Verification on page 4417](#)

#### Requirements

No special configuration beyond device initialization is required before configuring this example.

#### Overview

To enable failure detection, include the **bfd-liveness-detection** statement:

```
bfd-liveness-detection {
  detection-time {
    threshold milliseconds;
  }
  minimum-interval milliseconds;
  minimum-receive-interval milliseconds;
  multiplier number;
  no-adaptation;
  transmit-interval {
    threshold milliseconds;
    minimum-interval milliseconds;
  }
  version (1 | automatic);
}
```

Optionally, you can specify the threshold for the adaptation of the detection time by including the **threshold** statement. When the BFD session detection time adapts to a value equal to or greater than the threshold, a single trap and a system log message are sent.

To specify the minimum transmit and receive interval for failure detection, include the **minimum-interval** statement. This value represents the minimum interval at which the local routing device transmits hello packets as well as the minimum interval at which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a value in the range from 1 through 255,000 milliseconds. This examples sets a minimum interval of 600 milliseconds.

**NOTE:** BFD is an intensive protocol that consumes system resources. Specifying a minimum interval for BFD of less than 100 ms for Routing Engine-based sessions and 10 ms for distributed BFD sessions can cause undesired BFD flapping.

Depending on your network environment, these additional recommendations might apply:

- For large-scale network deployments with a large number of BFD sessions, specify a minimum interval of 300 ms for Routing Engine-based sessions and 100 ms for distributed BFD sessions.
- For very large-scale network deployments with a large number of BFD sessions, contact Juniper Networks customer support for more information.
- For BFD sessions to remain up during a Routing Engine switchover event when nonstop active routing (NSR) is configured, specify a minimum interval of 2500 ms for Routing Engine-based sessions. For distributed BFD sessions with nonstop active routing configured, the minimum interval recommendations are unchanged and depend only on your network deployment.

---

You can optionally specify the minimum transmit and receive intervals separately.

To specify only the minimum receive interval for failure detection, include the **minimum-receive-interval** statement. This value represents the minimum interval at which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a value in the range from 1 through 255,00 milliseconds.

To specify only the minimum transmit interval for failure detection, include the **transmit-interval minimum-interval** statement. This value represents the minimum interval at which the local routing device transmits hello packets to the neighbor with which it has established a BFD session. You can configure a value in the range from 1 through 255,000 milliseconds.

To specify the number of hello packets not received by a neighbor that causes the originating interface to be declared down, include the **multiplier** statement. The default is 3, and you can configure a value in the range from 1 through 255.

To specify the threshold for detecting the adaptation of the transmit interval, include the **transmit-interval threshold** statement. The threshold value must be greater than the transmit interval.

To specify the BFD version used for detection, include the **version** statement. The default is to have the version detected automatically.

You can trace BFD operations by including the **traceoptions** statement at the **[edit protocols bfd]** hierarchy level.

In Junos OS Release 9.0 and later, you can configure BFD sessions not to adapt to changing network conditions. To disable BFD adaptation, include the **no-adaptation** statement. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

Figure 153 on page 4415 shows the topology used in this example.

Figure 153: RIP BFD Network Topology

"CLI Quick Configuration" on page 4415 shows the configuration for all of the devices in Figure 153 on page 4415. The section "Step-by-Step Procedure" on page 4416 describes the steps on Device R1.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set protocols bfd traceoptions file bfd-trace
set protocols bfd traceoptions flag all
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1
set protocols rip group rip-group bfd-liveness-detection minimum-interval 600
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Device R2**

```

set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor fe-1/2/1.5
set protocols rip group rip-group bfd-liveness-detection minimum-interval 600
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Device R3**

```

set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set protocols rip group rip-group export advertise-routes-through-rip

```

```
set protocols rip group rip-group neighbor fe-1/2/0.6
set protocols rip group rip-group bfd-liveness-detection minimum-interval 600
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Step-by-Step  
Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a BFD for a RIP network:

1. Configure the network interfaces.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30
```

2. Create the RIP group and add the interface.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

```
[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1
```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept
```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip
```

5. Enable BFD.

```
[edit protocols rip group rip-group]
user@R1# set bfd-liveness-detection minimum-interval 600
```

6. Configure tracing operations to track BFD messages.

```
[edit protocols bfd traceoptions]
user@R1# set file bfd-trace
user@R1# set flag all
```

**Results**

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
```

```

unit 1 {
    family inet {
        address 10.0.0.1/30;
    }
}

user@R1# show protocols
bfd {
    traceoptions {
        file bfd-trace;
        flag all;
    }
}
rip {
    group rip-group {
        export advertise-routes-through-rip;
        bfd-liveness-detection {
            minimum-interval 600;
        }
        neighbor fe-1/2/0.1;
    }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
    term 1 {
        from protocol [ direct rip ];
        then accept;
    }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying That the BFD Sessions Are Up on page 4417](#)
- [Checking the BFD Trace File on page 4418](#)

### Verifying That the BFD Sessions Are Up

**Purpose** Make sure that the BFD sessions are operating.

**Action** From operational mode, enter the **show bfd session** command.

```

user@R1> show bfd session

```

| Address  | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|----------|-------|------------|-------------|-------------------|------------|
| 10.0.0.2 | Up    | fe-1/2/0.1 | 1.800       | 0.600             | 3          |

```

1 sessions, 1 clients
Cumulative transmit rate 1.7 pps, cumulative receive rate 1.7 pps

```

**Meaning** The output shows that there are no authentication failures.

### Checking the BFD Trace File

**Purpose** Use tracing operations to verify that BFD packets are being exchanged.

**Action** From operational mode, enter the **show log** command.

```
user@R1> show log bfd-trace
Feb 16 10:26:32 PPM Trace: BFD periodic xmit to 10.0.0.2 (IFL 124, rtbl 53,
single-hop port)
Feb 16 10:26:32 Received Downstream TraceMsg (24) len 86:
Feb 16 10:26:32   IfIndex (3) len 4: 0
Feb 16 10:26:32   Protocol (1) len 1: BFD
Feb 16 10:26:32   Data (9) len 61: (hex) 42 46 44 20 70 61 63 6b 65 74 20 66 72
6f 6d 20 31 30 2e
Feb 16 10:26:32 PPM Trace: BFD packet from 10.0.0.1 (IFL 73, rtbl 56, ttl 255)
absorbed
Feb 16 10:26:32 Received Downstream TraceMsg (24) len 60:
Feb 16 10:26:32   IfIndex (3) len 4: 0
Feb 16 10:26:32   Protocol (1) len 1: BFD
Feb 16 10:26:32   Data (9) len 35: (hex) 42 46 44 20 70 65 72 69 6f 64 69 63 20
78 6d 69 74 20 6f
...
```

**Meaning** The output shows the normal functioning of BFD.

---

#### Understanding BFD Authentication for RIP

BFD enables rapid detection of communication failures between adjacent systems. By default, authentication for BFD sessions is disabled. However, when running BFD over Network Layer protocols, the risk of service attacks can be significant. We strongly recommend using authentication if you are running BFD over multiple hops or through insecure tunnels. Beginning with Junos OS Release 9.6, Junos OS supports authentication for BFD sessions running over RIP. BFD authentication is only supported in the domestic image and is not available in the export image.

You authenticate BFD sessions by specifying an authentication algorithm and keychain, and then associating that configuration information with a security authentication keychain using the keychain name.

The following sections describe the supported authentication algorithms, security keychains, and the level of authentication that can be configured:

- [BFD Authentication Algorithms on page 4419](#)
- [Security Authentication Keychains on page 4419](#)
- [Strict Versus Loose Authentication on page 4420](#)

### ***BFD Authentication Algorithms***

Junos OS supports the following algorithms for BFD authentication:

- **simple-password**—Plain-text password. One to 16 bytes of plain text are used to authenticate the BFD session. One or more passwords can be configured. This method is the least secure and should be used only when BFD sessions are not subject to packet interception.
- **keyed-md5**—Keyed Message Digest 5 hash algorithm for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed MD5 uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than or equal to the last sequence number received. Although more secure than a simple password, this method is vulnerable to replay attacks. Increasing the rate at which the sequence number is updated can reduce this risk.
- **meticulous-keyed-md5**—Meticulous keyed Message Digest 5 hash algorithm. This method works in the same manner as keyed MD5, but the sequence number is updated with every packet. Although more secure than keyed MD5 and simple passwords, this method might take additional time to authenticate the session.
- **keyed-sha-1**—Keyed Secure Hash Algorithm I for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed SHA uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. The key is not carried within the packets. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than the last sequence number received.
- **meticulous-keyed-sha-1**—Meticulous keyed Secure Hash Algorithm I. This method works in the same manner as keyed SHA, but the sequence number is updated with every packet. Although more secure than keyed SHA and simple passwords, this method might take additional time to authenticate the session.

**NOTE:** Nonstop active routing is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

### ***Security Authentication Keychains***

The security authentication keychain defines the authentication attributes used for authentication key updates. When the security authentication keychain is configured and

associated with a protocol through the keychain name, authentication key updates can occur without interrupting routing and signaling protocols.

The authentication keychain contains one or more keychains. Each keychain contains one or more keys. Each key holds the secret data and the time at which the key becomes valid. The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

BFD allows multiple clients per session, and each client can have its own keychain and algorithm defined. To avoid confusion, we recommend specifying only one security authentication keychain.

### ***Strict Versus Loose Authentication***

By default, strict authentication is enabled and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure *loose checking*. When loose checking is configured, packets are accepted without authentication being checked at each end of the session. This feature is intended for transitional periods only.

---

### **Example: Configuring BFD Authentication for RIP**

This example shows how to configure Bidirectional Forwarding Detection (BFD) authentication for a RIP network.

- [Requirements on page 4420](#)
- [Overview on page 4420](#)
- [Configuration on page 4421](#)
- [Verification on page 4425](#)

#### ***Requirements***

No special configuration beyond device initialization is required before configuring this example.

The devices must be running Junos OS Release 9.6 or later.

#### ***Overview***

Only three steps are needed to configure authentication on a BFD session:

1. Specify the BFD authentication algorithm for the RIP protocol.
2. Associate the authentication keychain with the RIP protocol.
3. Configure the related security authentication keychain.

[Figure 154 on page 4421](#) shows the topology used in this example.

Figure 154: RIP BFD Authentication Network Topology

g041216

"CLI Quick Configuration" on page 4421 shows the configuration for all of the devices in Figure 154 on page 4421. The section "Step-by-Step Procedure" on page 4422 describes the steps on Device R1.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

#### Device R1

```
set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set protocols bfd traceoptions file bfd-trace
set protocols bfd traceoptions flag all
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1
set protocols rip group rip-group bfd-liveness-detection minimum-interval 600
set protocols rip group rip-group bfd-liveness-detection authentication key-chain bfd-rip
set protocols rip group rip-group bfd-liveness-detection authentication algorithm
    keyed-md5
set protocols rip group rip-group bfd-liveness-detection authentication loose-check
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
    direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
    rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
set security authentication-key-chains key-chain bfd-rip key 53 secret
    "$9$dlV2aZGi.fzDiORSeXxDikqmT"
set security authentication-key-chains key-chain bfd-rip key 53 start-time
    "2012-2-16.12:00:00 -0800"
```

#### Device R2

```
set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor fe-1/2/1.5
set protocols rip group rip-group bfd-liveness-detection minimum-interval 600
set protocols rip group rip-group bfd-liveness-detection authentication key-chain bfd-rip
set protocols rip group rip-group bfd-liveness-detection authentication algorithm
    keyed-md5
set protocols rip group rip-group bfd-liveness-detection authentication loose-check
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
    direct
```

```
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
set security authentication-key-chains key-chain bfd-rip key 53 secret
  "$9$d1V2aZGi.fzDiORSeXxDikqmT"
set security authentication-key-chains key-chain bfd-rip key 53 start-time
  "2012-2-16.12:00:00 -0800"
```

**Device R3**

```
set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set protocols rip group rip-group bfd-liveness-detection minimum-interval 600
set protocols rip group rip-group bfd-liveness-detection authentication key-chain bfd-rip
set protocols rip group rip-group bfd-liveness-detection authentication algorithm
  keyed-md5
set protocols rip group rip-group bfd-liveness-detection authentication loose-check
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
set security authentication-key-chains key-chain bfd-rip key 53 secret
  "$9$d1V2aZGi.fzDiORSeXxDikqmT"
set security authentication-key-chains key-chain bfd-rip key 53 start-time
  "2012-2-16.12:00:00 -0800"
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a BFD authentication:

1. Configure the network interfaces.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30
```

2. Create the RIP group and add the interface.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

```
[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1
```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept
```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip
```

5. Enable BFD.

```
[edit protocols rip group rip-group]
user@R1# set bfd-liveness-detection minimum-interval 600
```

6. Specify the algorithm (**keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**, or **simple-password**) to use.

**NOTE:** Nonstop active routing is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

```
[edit protocols rip group rip-group]
user@R1# set bfd-liveness-detection authentication algorithm keyed-md5
```

7. Specify the keychain to be used to associate BFD sessions on RIP with the unique security authentication keychain attributes.

The keychain you specify must match a keychain name configured at the **[edit security authentication key-chains]** hierarchy level.

The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

```
[edit protocols rip group rip-group]
user@R1# set bfd-liveness-detection authentication key-chain bfd-rip
```

8. (Optional) Specify loose authentication checking if you are transitioning from nonauthenticated sessions to authenticated sessions.

```
[edit protocols rip group rip-group]
user@R1# set bfd-liveness-detection authentication loose-check
```

9. Specify the unique security authentication information for BFD sessions:

- The matching keychain name as specified in Step 7.
- At least one key, a unique integer between 0 and 63. Creating multiple keys allows multiple clients to use the BFD session.
- The secret data used to allow access to the session.
- The time at which the authentication key becomes active, in the format *yyyy-mm-dd.hh:mm:ss*.

```
[edit security authentication-key-chains key-chain bfd-rip]
user@R1# set key 53 secret "$9$d1V2aZGi.fzDiORSeXxDikqmT"
user@R1# set key 53 start-time "2012-2-16.12:00:00 -0800"
```

10. Configure tracing operations to track BFD authentication.

```
[edit protocols bfd traceoptions]
user@R1# set file bfd-trace
user@R1# set flag all
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show security** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}

user@R1# show protocols
bfd {
  traceoptions {
    file bfd-trace;
    flag all;
  }
}
rip {
  group rip-group {
    export advertise-routes-through-rip;
    bfd-liveness-detection {
      minimum-interval 600;
    }
    neighbor fe-1/2/0.1;
  }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
  term 1 {
    from protocol [ direct rip ];
    then accept;
  }
}

user@R1# show security
authentication-key-chains {
  key-chain bfd-rip {
    key 53 {
      secret "$9$d1V2aZGi.fzDiORSeXxDikqmT"; ## SECRET-DATA
      start-time "2012-2-16.12:00:00 -0800";
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

**Verification**

Confirm that the configuration is working properly.

- [Verifying That the BFD Sessions Are Authenticated on page 4425](#)
- [Viewing Extensive Information About the BFD Authentication on page 4425](#)
- [Checking the BFD Trace File on page 4426](#)

**Verifying That the BFD Sessions Are Authenticated**

**Purpose** Make sure that the BFD sessions are authenticated.

**Action** From operational mode, enter the **show bfd session detail** command.

```
user@R1> show bfd session detail
```

| Address  | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|----------|-------|------------|-------------|-------------------|------------|
| 10.0.0.2 | Up    | fe-1/2/0.1 | 1.800       | 0.600             | 3          |

Client RIP, TX interval 0.600, RX interval 0.600, **Authenticate**  
 Session up time 01:39:34  
 Local diagnostic None, remote diagnostic None  
 Remote state Up, version 1  
 Logical system 6, routing table index 53

1 sessions, 1 clients  
 Cumulative transmit rate 1.7 pps, cumulative receive rate 1.7 pps

**Meaning** **Authenticate** is displayed to indicate that BFD authentication is configured.

**Viewing Extensive Information About the BFD Authentication**

**Purpose** View the keychain name, the authentication algorithm and mode for each client in the session, and the BFD authentication configuration status.

**Action** From operational mode, enter the **show bfd session extensive** command.

```
user@R1> show bfd session extensive
```

| Address  | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|----------|-------|------------|-------------|-------------------|------------|
| 10.0.0.2 | Up    | fe-1/2/0.1 | 1.800       | 0.600             | 3          |

Client RIP, TX interval 0.600, RX interval 0.600, **Authenticate**  
**keychain bfd-rip, algo keyed-md5, mode loose**  
 Session up time 01:46:29  
 Local diagnostic None, remote diagnostic None  
 Remote state Up, version 1  
 Logical system 6, routing table index 53  
 Min async interval 0.600, min slow interval 1.000  
 Adaptive async TX interval 0.600, RX interval 0.600  
 Local min TX interval 0.600, minimum RX interval 0.600, multiplier 3  
 Remote min TX interval 0.600, min RX interval 0.600, multiplier 3  
 Local discriminator 225, remote discriminator 226  
 Echo mode disabled/inactive  
**Authentication enabled/active, keychain bfd-rip, algo keyed-md5, mode loose**  
 Session ID: 0x300501

1 sessions, 1 clients  
 Cumulative transmit rate 1.7 pps, cumulative receive rate 1.7 pps

**Meaning** The output shows the keychain name, the authentication algorithm and mode for the client in the session, and the BFD authentication configuration status.

#### *Checking the BFD Trace File*

**Purpose** Use tracing operations to verify that BFD packets are being exchanged.

**Action** From operational mode, enter the **show log** command.

```
user@R1> show log bfd-trace
Feb 16 10:26:32 PPM Trace: BFD periodic xmit to 10.0.0.2 (IFL 124, rtbl 53,
single-hop port)
Feb 16 10:26:32 Received Downstream TraceMsg (24) len 86:
Feb 16 10:26:32   IfIndex (3) len 4: 0
Feb 16 10:26:32   Protocol (1) len 1: BFD
Feb 16 10:26:32   Data (9) len 61: (hex) 42 46 44 20 70 61 63 6b 65 74 20 66 72

  - [Example: Configuring Authentication for RIP Routes on page 4406](#)
  - [Example: Configuring RIP on page 4399](#)

### Example: Applying Policies to RIP Routes Imported from Neighbors

- [Understanding RIP Import Policy on page 4426](#)
- [Example: Applying Policies to RIP Routes Imported from Neighbors on page 4426](#)

---

#### Understanding RIP Import Policy

The default RIP import policy is to accept all received RIP routes that pass a sanity check. To filter routes being imported by the local routing device from its neighbors, include the **import** statement, and list the names of one or more policies to be evaluated. If you specify more than one policy, they are evaluated in order (first to last) and the first matching policy is applied to the route. If no match is found, the local routing device does not import any routes.

---

#### Example: Applying Policies to RIP Routes Imported from Neighbors

This example shows how to configure an import policy in a RIP network.

- [Requirements on page 4427](#)
- [Overview on page 4427](#)

- [Configuration on page 4427](#)
- [Verification on page 4430](#)

### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

In this example, Device R1 has an import policy that accepts the 10/8 and 192.168/16 RIP routes and rejects all other RIP routes. This means that the 172.16/16 RIP routes are excluded from Device R1's routing table.

An export policy is also shown because an export policy is required as part of the minimum configuration for RIP.

[Figure 155 on page 4427](#) shows the topology used in this example.

**Figure 155: RIP Import Policy Network Topology**

"[CLI Quick Configuration](#)" on page 4427 shows the configuration for all of the devices in [Figure 155 on page 4427](#). The section "[Step-by-Step Procedure](#)" on page 4428 describes the steps on Device R1.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

#### Device R1

```
set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip import rip-import
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
set policy-options policy-statement rip-import term 1 from protocol rip
set policy-options policy-statement rip-import term 1 from route-filter 10.0.0.0/8 orlonger
set policy-options policy-statement rip-import term 1 from route-filter 192.168.0.0/16
  orlonger
```

```
set policy-options policy-statement rip-import term 1 then accept
set policy-options policy-statement rip-import term 2 then reject
```

**Device R2**

```
set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor fe-1/2/1.5
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Device R3**

```
set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a RIP import policy:

1. Configure the network interfaces.

This example shows multiple loopback interface addresses to simulate attached networks.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30
```

```
user@R1# set lo0 unit 1 family inet address 172.16.0.1/32
user@R1# set lo0 unit 1 family inet address 192.168.1.1/32
```

2. Create the RIP group and add the interface.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled.

You do not need to enable RIP on the loopback interface.

```
[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1
```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
```

```

user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept

```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```

[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip

```

5. Configure the import policy.

```

[edit policy-options policy-statement rip-import]
user@R1# set term 1 from protocol rip
user@R1# set term 1 from route-filter 10.0.0.0/8 orlonger
user@R1# set term 1 from route-filter 192.168.0.0/16 orlonger
user@R1# set term 1 then accept
user@R1# set term 2 then reject

```

6. Apply the import policy.

```

[edit protocols rip]
user@R1# set import rip-import

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 172.16.0.1/32;
      address 192.168.1.1/32;
    }
  }
}

user@R1# show protocols
rip {
  import rip-import;
  group rip-group {
    export advertise-routes-through-rip;
    neighbor fe-1/2/0.1;
  }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {

```

```
term 1 {
    from protocol [ direct rip ];
    then accept;
}
}
policy-statement rip-import {
    term 1 {
        from {
            protocol rip;
            route-filter 10.0.0.0/8 orlonger;
            route-filter 192.168.0.0/16 orlonger;
        }
        then accept;
    }
    term 2 {
        then reject;
    }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Looking at the Routes That Device R2 Is Advertising to Device R1 on page 4430](#)
- [Looking at the Routes That Device R1 Is Receiving from Device R2 on page 4431](#)
- [Checking the Routing Table on page 4431](#)
- [Testing the Import Policy on page 4431](#)

### **Looking at the Routes That Device R2 Is Advertising to Device R1**

**Purpose** Verify that Device R2 is sending the expected routes.

**Action** From operational mode, enter the **show route advertising-protocol rip** command.

```
user@R2> show route advertising-protocol rip 10.0.0.2
```

```
inet.0: 11 destinations, 11 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
10.0.0.4/30      *[Direct/0] 2d 01:17:44
                  >   via fe-1/2/0.5
172.16.2.2/32    *[Direct/0] 2d 04:09:52
                  >   via lo0.2
172.16.3.3/32    *[RIP/100] 23:40:02, metric 2, tag 0
                  > to 10.0.0.6 via fe-1/2/0.5
192.168.2.2/32   *[Direct/0] 2d 04:09:52
                  >   via lo0.2
192.168.3.3/32   *[RIP/100] 23:40:02, metric 2, tag 0
                  > to 10.0.0.6 via fe-1/2/0.5
```

**Meaning** Device R2 is sending 172.16/16 routes to Device R1.

*Looking at the Routes That Device R1 Is Receiving from Device R2*

**Purpose** Verify that Device R1 is receiving the expected routes.

**Action** From operational mode, enter the **show route receive-protocol rip** command.

```
user@R1> show route receive-protocol rip 10.0.0.2
inet.0: 8 destinations, 8 routes (8 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.4/30          *[RIP/100] 01:06:03, metric 2, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
192.168.2.2/32      *[RIP/100] 01:06:03, metric 2, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
192.168.3.3/32      *[RIP/100] 01:06:03, metric 3, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
```

**Meaning** The output shows that the 172.16/16 routes are excluded.

*Checking the Routing Table*

**Purpose** Verify that the routing table is populated with the expected routes.

**Action** From operational mode, enter the **show route protocol rip** command.

```
user@R1> show route protocol rip

inet.0: 8 destinations, 8 routes (8 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.4/30          *[RIP/100] 00:54:34, metric 2, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
192.168.2.2/32      *[RIP/100] 00:54:34, metric 2, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
192.168.3.3/32      *[RIP/100] 00:54:34, metric 3, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
224.0.0.9/32        *[RIP/100] 00:49:00, metric 1
                    MultiRecv
```

**Meaning** The output shows that the routes have been learned from Device R2 and Device R3.

If you delete or deactivate the import policy, the routing table contains the 172.16/16 routes.

*Testing the Import Policy*

**Purpose** By using the **test policy** command, monitor the number of rejected prefixes.

**Action** From operational mode, enter the **test policy rip-import 172.16/16** command.

```
user@R1> test policy rip-import 172.16/16
Policy rip-import: 0 prefix accepted, 1 prefix rejected
```

**Meaning** The output shows that the policy rejected one prefix.

### Understanding Traffic Control with Metrics in a RIP Network

To tune a RIP network and to control traffic flowing through the network, you increase or decrease the cost of the paths through the network. RIP provides two ways to modify the path cost: an incoming metric and an outgoing metric, which are each set to 1 by default. In other words, by default, the metric of routes that RIP imports from a neighbor or exports to a neighbor is incremented by 1. These routes include those learned from RIP as well as those learned from other protocols. The metrics are attributes that specify the cost of any route advertised through a host. By increasing or decreasing the metrics—and thus the cost—of links throughout the network, you can control packet transmission across the network.

The incoming metric modifies the cost of an individual segment when a route across the segment is imported into the routing table. For example, if you set the incoming metric on the segment to **3**, the individual segment cost along the link is changed from 1 to **3**. The increased cost affects all route calculations through that link. Other routes that were previously excluded because of a high hop count might now be included in the router's forwarding table.

The outgoing metric modifies the path cost for all the routes advertised out of a particular interface. Unlike the incoming metric, the outgoing metric modifies the routes that other routers are learning and thereby controls the way they send traffic.

If an exported route was learned from a member of the same RIP group, the metric associated with that route is the normal RIP metric. For example, a RIP route with a metric of 5 learned from a neighbor configured with an incoming metric of 2 is advertised with a combined metric of 7 when advertised to neighbors in the same group. However, if this route was learned from a RIP neighbor in a different group or from a different protocol, the route is advertised with the metric value configured in the outgoing metric for that group.

You might want to increase the metric of routes to decrease the likelihood that a particular route is selected and installed in the routing table. This process is sometimes referred to as *route poisoning*. Some reasons that you might want to poison a route are that the route is relatively expensive to use, or it has relatively low bandwidth.

A route with a higher metric than another route becomes the active route only when the lower-metric route becomes unavailable. In this way, the higher-metric route serves as a backup path.

One way to increase the metric of imported routes is to configure an import policy. Another way is to include the **metric-in** statement in the RIP neighbor configuration. One way to increase the metric of export routes is to configure an export policy. Another way is to include the **metric-out** statement in the RIP neighbor configuration.

### Example: Controlling Traffic in a RIP Network with an Incoming Metric

This example shows how to control traffic with an incoming metric.

- [Requirements on page 4433](#)
- [Overview on page 4433](#)
- [Configuration on page 4434](#)
- [Verification on page 4434](#)

#### Requirements

Before you begin, define RIP groups, and add interfaces to the groups. Then configure a routing policy to export directly connected routes and routes learned through the RIP routing exchanges. See “[Example: Configuring a Basic RIP Network](#)” on page 4400.

#### Overview

In this example, routes to Router D are received by Router A across both of its RIP-enabled interfaces as shown in [Figure 156 on page 4433](#). Because the route through Router B and the route through Router C have the same number of hops, both routes are imported into the forwarding table. However, because the T3 link from Router B to Router D has a higher bandwidth than the T1 link from Router C to Router D, you want traffic to flow from Router A through Router B to Router D.

Figure 156: Controlling Traffic in a RIP Network with the Incoming Metric

To force this flow, you can modify the route metrics as they are imported into Router A's routing table. By setting the incoming metric on the interface from Router A to Router C, you modify the metric on all routes received through that interface. Setting the incoming route metric on Router A changes only the routes in Router A's routing table, and affects only how Router A sends traffic to Router D. Router D's route selection is based on its own routing table, which, by default, includes no adjusted metric values.

In the example, Router C receives a route advertisement from Router D and readvertises the route to Router A. When Router A receives the route, it applies the incoming metric on the interface. Instead of incrementing the metric by 1 (the default), Router A increments it by 3 (the configured incoming metric), giving the route from Router A to Router D

through Router C a total path metric of 4. Because the route through Router B has a metric of 2, it becomes the preferred route for all traffic from Router A to Router D.

This example uses a RIP group called **alpha 1** on interface **ge-0/0/0**.

### **Configuration**

#### **Step-by-Step Procedure**

To control traffic with an incoming metric:

1. Enable RIP on the interface.  

```
[edit protocols rip]  
user@host# set group alpha1 neighbor ge-0/0/0
```
2. Set the incoming metric.  

```
[edit protocols rip]  
user@host# set metric-in 3
```
3. If you are done configuring the device, commit the configuration.  

```
[edit]  
user@host# commit
```

### **Verification**

To verify that the configuration is working properly, enter the **show route protocols rip** command.

---

### **Example: Controlling Traffic in a RIP Network with an Outgoing Metric**

This example shows how to control traffic with an outgoing metric.

- [Requirements on page 4434](#)
- [Overview on page 4434](#)
- [Configuration on page 4435](#)
- [Verification on page 4435](#)

### **Requirements**

Before you begin:

- Define RIP groups, and add interfaces to the groups. Then configure a routing policy to export directly connected routes and routes learned through RIP routing exchanges. See [“Example: Configuring a Basic RIP Network” on page 4400](#).
- Control traffic with an incoming metric. See [“Example: Controlling Traffic in a RIP Network with an Incoming Metric” on page 4433](#).

### **Overview**

In this example, each route from Router A to Router D has two hops as shown in [Figure 157 on page 4435](#). However, because the link from Router A to Router B in the RIP group has a higher bandwidth than the link from Router A to Router C in RIP group Alpha 1, you want traffic from Router D to Router A to flow through Router B. To control the

way Router D sends traffic to Router A, you can alter the routes that Router D receives by configuring the outgoing metric on Router A's interfaces in the Alpha 1 RIP group.

**Figure 157: Controlling Traffic in a RIP Network with the Outgoing Metric**

If the outgoing metric for the Alpha 1 RIP group—the A-to-C link—is changed to 3, Router D calculates the total path metric from Router A through Router C as 4. In contrast, the unchanged default total path metric to Router A through Router B in the RIP group is 2. The fact that Router A's interfaces belong to two different RIP groups allows you to configure two different outgoing metrics on its interfaces, because you configure path metrics at the group level.

By configuring the outgoing metric, you control the way Router A sends traffic to Router D. By configuring the outgoing metric on the same router, you control the way Router D sends traffic to Router A.

This example uses an outgoing metric of 3.

### Configuration

#### Step-by-Step Procedure

To control traffic with an outgoing metric:

1. Set the outgoing metric.
 

```
[edit protocols rip group alpha1]
user@host# set metric-out 3
```
2. If you are done configuring the device, commit the configuration.
 

```
[edit]
user@host# commit
```

### Verification

To verify that the configuration is working properly, enter the **show protocols rip** command.

### Example: Configuring the Metric Value Added to Imported RIP Routes

This example shows how to change the default metric to be added to incoming routes to control the route selection process.

- [Requirements on page 4436](#)
- [Overview on page 4436](#)
- [Configuration on page 4436](#)
- [Verification on page 4439](#)

#### Requirements

No special configuration beyond device initialization is required before configuring this example.

#### Overview

Normally, when multiple routes are available, RIP selects the route with the lowest hop count. Changing the default metric enables you to control the route selection process such that a route with a higher hop count can be preferred over of a route with a lower hop count.

[Figure 158 on page 4436](#) shows the topology used in this example.

**Figure 158: RIP Incoming Metrics Network Topology**

Device R1 has two potential paths to reach 172.16.2.2/32. The default behavior is to send traffic out the 0.1/30 interface facing Device R2. Suppose, though, that the path through Device R3 is less expensive to use or has higher bandwidth links. This example shows how to use the **metric-in** statement to ensure that Device R1 uses the path through Device R3 to reach 172.16.2.2/32. “[CLI Quick Configuration](#)” on [page 4436](#) shows the configuration for all of the devices in [Figure 158 on page 4436](#). The section “[Step-by-Step Procedure](#)” on [page 4437](#) describes the steps on Device R1.

#### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```
set interfaces fe-1/2/0 unit 1 description to-R2
set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces ge-1/2/1 unit 10 description to-R3
```

```

set interfaces ge-1/2/1 unit 10 family inet address 10.0.0.10/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip group primary export advertise-routes-through-rip
set protocols rip group primary neighbor ge-1/2/1.10
set protocols rip group secondary export advertise-routes-through-rip
set protocols rip group secondary neighbor fe-1/2/0.1 metric-in 4
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Device R2**

```

set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces ge-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor ge-1/2/1.5
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Device R3**

```

set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces ge-1/2/1 unit 9 family inet address 10.0.0.9/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set protocols rip group rip-group neighbor ge-1/2/1.9
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a RIP metrics:

1. Configure the network interfaces.

```

[edit interfaces]
user@R1# set fe-1/2/0 unit 1 description to-R2
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30

user@R1# set ge-1/2/1 unit 10 description to-R3
user@R1# set ge-1/2/1 unit 10 family inet address 10.0.0.10/30

user@R1# set lo0 unit 1 family inet address 172.16.0.1/32

```

```
user@R1# set lo0 unit 1 family inet address 192.168.1.1/32
```

2. Create the RIP groups and add the interfaces.

To configure RIP in Junos OS, you must configure one or more groups that contain the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

For the interface that is facing Device R2, the **metric-in 4** setting causes this route to be less likely to be chosen as the active route.

```
[edit protocols rip]
user@R1# set group primary neighbor ge-1/2/1.10
user@R1# set group secondary neighbor fe-1/2/0.1 metric-in 4
```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept
```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip]
user@R1# set group primary export advertise-routes-through-rip
user@R1# set group secondary export advertise-routes-through-rip
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    description to-R2;
    family inet {
      address 10.0.0.1/30;
    }
  }
}
ge-1/2/1 {
  unit 10 {
    description to-R3;
    family inet {
      address 10.0.0.10/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 172.16.0.1/32;
      address 192.168.1.1/32;
    }
  }
}
```

```

    }
  }
user@R1# show protocols
rip {
  group primary {
    export advertise-routes-through-rip;
    neighbor ge-1/2/1.10;
  }
  group secondary {
    export advertise-routes-through-rip;
    neighbor fe-1/2/0.1 {
      metric-in 4;
    }
  }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
  term 1 {
    from protocol [ direct rip ];
    then accept;
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying That the Expected Route Is Active on page 4439](#)
- [Removing the metric-in Statement on page 4439](#)

### Verifying That the Expected Route Is Active

**Purpose** Make sure that to reach 172.16.2.2/32, Device R1 uses the path through Device R3.

**Action** From operational mode, enter the **show route 172.16.2.2** command.

```

user@R1> show route 172.16.2.2
inet.0: 12 destinations, 12 routes (12 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.2.2/32      *[RIP/100] 00:15:46, metric 3, tag 0
                  > to 10.0.0.9 via ge-1/2/1.10

```

**Meaning** The **to 10.0.0.9 via ge-1/2/1.10** output shows that Device R1 uses the path through Device R3 to reach 172.16.2.2/32. The metric for this route is 3.

### Removing the metric-in Statement

**Purpose** Delete or deactivate the **metric-in** statement to see what happens to the 172.16.2.2/32 route.

**Action** 1. From configuration mode, deactivate the **metric-in** statement.

```
[edit protocols rip group secondary neighbor fe-1/2/0.1]
user@R1# deactivate metric-in
user@R1# commit
```

2. From operational mode, enter the **show route 172.16.2.2** command.

```
user@R1> show route 172.16.2.2
inet.0: 12 destinations, 12 routes (12 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.2.2/32      * [RIP/100] 00:00:06, metric 2, tag 0
> to 10.0.0.2 via fe-1/2/0.1
```

**Meaning** The **to 10.0.0.2 via fe-1/2/0.1** output shows that Device R1 uses the path through Device R2 to reach 172.16.2.2/32. The metric for this route is 2.

**Related Documentation**

## Example: Configuring the Sending and Receiving of RIPv1 and RIPv2 Packets

- [Understanding the Sending and Receiving of RIPv1 and RIPv2 Packets on page 4440](#)
- [Example: Configuring the Sending and Receiving of RIPv1 and RIPv2 Packets on page 4440](#)

### Understanding the Sending and Receiving of RIPv1 and RIPv2 Packets

RIP version 1 (RIPv1) and RIP version 2 (RIPv2) can run simultaneously. This might make sense when you are migrating a RIPv1 network to a RIPv2 network. This also allows interoperation with a device that supports RIPv1 but not RIPv2.

By default, when RIP is enabled on an interface, Junos OS receives both RIPv1 and RIPv2 packets and sends only RIPv2 packets. You can configure this behavior by including the [send](#) and [receive](#) statements in the RIP configuration.

### Example: Configuring the Sending and Receiving of RIPv1 and RIPv2 Packets

This example shows how to configure whether the RIP update messages conform to RIP version 1 (RIPv1) only, to RIP version 2 (RIPv2) only, or to both versions. You can also disable the sending or receiving of update messages.

#### **Requirements**

No special configuration beyond device initialization is required before configuring this example.

#### **Overview**

By default, when RIP is enabled on an interface, Junos OS receives both RIPv1 and RIPv2 packets and sends only RIPv2 packets.

Figure 159 on page 4441 shows the topology used in this example.

**Figure 159: Sending and Receiving RIPv1 and RIPv2 Packets Network Topology**

In this example, Device R1 is configured to receive only RIPv2 packets.

“CLI Quick Configuration” on page 4441 shows the configuration for all of the devices in Figure 159 on page 4441. The section “Step-by-Step Procedure” on page 4442 describes the steps on Device R1.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

- Device R1**
- ```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1 receive version-2
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```
- Device R2**
- ```

set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor fe-1/2/1.5
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```
- Device R3**
- ```

set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip

```

```
set protocols rip group rip-group neighbor fe-1/2/0.6
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a RIP packet versions that can be received:

1. Configure the network interfaces.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30
```

```
user@R1# set lo0 unit 1 family inet address 172.16.0.1/32
user@R1# set lo0 unit 1 family inet address 192.168.1.1/32
```

2. Create the RIP groups and add the interfaces.

To configure RIP in Junos OS, you must configure one or more groups that contain the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

For the interface that is facing Device R2, the **receive version-2** setting causes this interface to accept only RIPv2 packets.

```
[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1 receive version-2
```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept
```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
```

```

    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 172.16.0.1/32;
      address 192.168.1.1/32;
    }
  }
}

user@R1# show protocols
rip {
  group rip-group {
    export advertise-routes-through-rip;
    neighbor fe-1/2/0.1 {
      receive version-2;
    }
  }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
  term 1 {
    from protocol [ direct rip ];
    then accept;
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

#### Verifying That the Receive Mode Is Set to RIPv2 Only

**Purpose** Make sure that the interfacing Device R2 is configured to receive only RIPv2 packets, instead of both RIPv1 and RIPv2 packets.

**Action** From operational mode, enter the **show rip neighbor** command.

```
user@R1> show rip neighbor
```

Neighbor	Local State	Source Address	Destination Address	Send Mode	Receive Mode	In Met
fe-1/2/0.1	Up	10.0.0.1	224.0.0.9	mcast	v2 only	1

**Meaning** In the output, the **Receive Mode** field displays **v2 only**. The default **Receive Mode** is **both**.

---

### Understanding Route Redistribution Among RIP instances

You can redistribute routes among RIP processes. Another way to say this is to export RIP routes from one RIP instance to other RIP instances.

In Junos OS, route redistribution among routing instances is accomplished by using routing table groups, also called RIB groups. Routing table groups allow you to import and export routes from a protocol within one routing table into another routing table.

**NOTE:** In contrast, the policy-based import and export functions allow you import and export routes between different protocols within the same routing table.

---

Consider the following partial example:

```
protocols {
  rip {
    rib-group inet-to-voice;
  }
}
routing-instances {
  voice {
    protocols {
      rip {
        rib-group voice-to-inet;
      }
    }
  }
}
routing-options {
  rib-groups {
    inet-to-voice {
      import-rib [ inet.0 voice.inet.0 ];
    }
    voice-to-inet {
      import-rib [ voice.inet.0 inet.0 ];
    }
  }
}
```

The way to read the **import-rib** statement is as follows. Take the routes from the protocol (RIP, in this case), and import them into the primary (or local) routing table and also into any other routing tables listed after this. The primary routing table is the routing table where the routing table group is being used. That would be either **inet.0** if used in the main routing instance or **voice.inet.0** if used within the routing instance. In the **inet-to-voice** routing table group, **inet.0** is listed first because this routing table group is used in the

main routing instance. In the **voice-to-inet** routing table group, **voice.inet.0** is listed first because this routing table group is used in the voice routing instance.

### Example: Redistributing Routes Between Two RIP Instances

This example shows how to configure a RIP routing instance and control the redistribution of RIP routes between the routing instance and the master instance.

- [Requirements on page 4445](#)
- [Overview on page 4445](#)
- [Configuration on page 4445](#)
- [Verification on page 4449](#)

#### Requirements

No special configuration beyond device initialization is required before configuring this example.

#### Overview

When you create a routing instance called voice, Junos OS creates a routing table called **voice.inet.0**. The example shows how to install routes learned through the master RIP instance into the **voice.inet.0** routing table. The example also shows how to install routes learned through the voice routing instance into **inet.0**. This is done by configuring routing table groups. RIP routes are installed into each routing table that belongs to a routing table group.

[Figure 160 on page 4445](#) shows the topology used in this example.

**Figure 160: Redistributing Routes Between RIP Instances Network Topology**

[“CLI Quick Configuration” on page 4445](#) shows the configuration for all of the devices in [Figure 160 on page 4445](#). The section [“Step-by-Step Procedure” on page 4446](#) describes the steps on Device R2.

#### Configuration

##### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32

```

```
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip group to-R2 export advertise-routes-through-rip
set protocols rip group to-R2 neighbor fe-1/2/0.1
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Device R2**

```
set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip rib-group inet-to-voice
set protocols rip group to-R3 export advertise-routes-through-rip
set protocols rip group to-R3 neighbor fe-1/2/1.5
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
set routing-instances voice protocols rip group to-R1 export advertise-routes-through-rip
set routing-instances voice interface fe-1/2/0.2
set routing-instances voice protocols rip rib-group voice-to-inet
set routing-instances voice protocols rip group to-R1 neighbor fe-1/2/0.2
set routing-options rib-groups inet-to-voice import-rib inet.0
set routing-options rib-groups inet-to-voice import-rib voice.inet.0
set routing-options rib-groups voice-to-inet import-rib voice.inet.0
set routing-options rib-groups voice-to-inet import-rib inet.0
```

**Device R3**

```
set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group to-R2 export advertise-routes-through-rip
set protocols rip group to-R2 neighbor fe-1/2/0.6
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To redistribute RIP routes between routing instances:

1. Configure the network interfaces.

```
[edit interfaces]
user@R2# set fe-1/2/0 unit 2 family inet address 10.0.0.2/30

user@R2# set fe-1/2/1 unit 5 family inet address 10.0.0.5/30

user@R2# set lo0 unit 2 family inet address 192.168.2.2/32
```

```
user@R2# set lo0 unit 2 family inet address 172.16.2.2/32
```

2. Create the routing instance, and add one or more interfaces to the routing instance.

```
[edit routing-instances voice]
user@R2# set interface fe-1/2/0.2
```

3. Create the RIP groups and add the interfaces.

```
[edit protocols rip group to-R3]
user@R2# set neighbor fe-1/2/1.5

[edit routing-instances voice protocols rip group to-R1]
user@R2# set neighbor fe-1/2/0.2
```

4. Create the routing table groups.

```
[edit routing-options rib-groups]
user@R2# set inet-to-voice import-rib inet.0
user@R2# set inet-to-voice import-rib voice.inet.0

user@R2# set voice-to-inet import-rib voice.inet.0
user@R2# set voice-to-inet import-rib inet.0
```

5. Apply the routing table groups.

```
[edit protocols rip]
user@R2# set rib-group inet-to-voice

[edit routing-instances voice protocols rip]
user@R2# set rib-group voice-to-inet
```

6. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R2# set from protocol direct
user@R2# set from protocol rip
user@R2# set then accept
```

7. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group to-R3]
user@R2# set export advertise-routes-through-rip

[edit routing-instances voice protocols rip group to-R1]
user@R2# set export advertise-routes-through-rip
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, **show routing-instances**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 2 {
    family inet {
```

```
        address 10.0.0.2/30;
    }
}
fe-1/2/1 {
    unit 5 {
        family inet {
            address 10.0.0.5/30;
        }
    }
}
lo0 {
    unit 2 {
        family inet {
            address 192.168.2.2/32;
            address 172.16.2.2/32;
        }
    }
}

user@R2# show protocols
rip {
    rib-group inet-to-voice;
    group to-R3 {
        export advertise-routes-through-rip;
        neighbor fe-1/2/1.5;
    }
}

user@R2# show policy-options
policy-statement advertise-routes-through-rip {
    term 1 {
        from protocol [ direct rip ];
        then accept;
    }
}

user@R2# show routing-instances
voice {
    interface fe-1/2/0.2;
    protocols {
        rip {
            rib-group voice-to-inet;
            group to-R1 {
                export advertise-routes-through-rip;
                neighbor fe-1/2/0.2;
            }
        }
    }
}

user@R2# show routing-options
rib-groups {
    inet-to-voice {
        import-rib [ inet.0 voice.inet.0 ];
    }
    voice-to-inet {
```

```

import-rib [ voice.inet.0 inet.0 ];
}
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

### Checking the Routing Tables

**Purpose** Make sure that the routing tables contain the expected routes.

**Action** From operational mode, enter the **show route protocol rip** command.

```

user@R2> show route protocol rip
inet.0: 9 destinations, 9 routes (9 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.0.1/32    * [RIP/100] 01:58:14, metric 2, tag 0
                 > to 10.0.0.1 via fe-1/2/0.2
172.16.3.3/32    * [RIP/100] 02:06:03, metric 2, tag 0
                 > to 10.0.0.6 via fe-1/2/0.5
192.168.1.1/32   * [RIP/100] 01:58:14, metric 2, tag 0
                 > to 10.0.0.1 via fe-1/2/0.2
192.168.3.3/32   * [RIP/100] 02:06:03, metric 2, tag 0
                 > to 10.0.0.6 via fe-1/2/0.5
224.0.0.9/32     * [RIP/100] 01:44:13, metric 1
                 MultiRecv

voice.inet.0: 7 destinations, 7 routes (7 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.0.1/32    * [RIP/100] 02:06:03, metric 2, tag 0
                 > to 10.0.0.1 via fe-1/2/0.2
172.16.3.3/32    * [RIP/100] 01:58:14, metric 2, tag 0
                 > to 10.0.0.6 via fe-1/2/0.5
192.168.1.1/32   * [RIP/100] 02:06:03, metric 2, tag 0
                 > to 10.0.0.1 via fe-1/2/0.2
192.168.3.3/32   * [RIP/100] 01:58:14, metric 2, tag 0
                 > to 10.0.0.6 via fe-1/2/0.5
224.0.0.9/32     * [RIP/100] 01:44:13, metric 1
                 MultiRecv

```

**Meaning** The output shows that both routing tables contain all of the RIP routes.

## Understanding RIP Timers

---

RIP uses several timers to regulate its operation.

The update interval is the interval at which routes that are learned by RIP are advertised to neighbors. This timer controls the interval between routing updates. The update interval is set to 30 seconds, by default, with a small random amount of time added when the timer is reset. This added time prevents congestion that can occur if all routing devices update their neighbors simultaneously.

To configure the update time interval, include the **update-interval** statement:

**update-interval** *seconds*;

*seconds* can be a value from 10 through 60.

You can set a route timeout interval. If a route is not refreshed after being installed in the routing table by the specified time interval, the route is marked as invalid and is removed from the routing table after the hold-down period expires.

To configure the route timeout for RIP, include the **route-timeout** statement:

**route-timeout** *seconds*;

*seconds* can be a value from 30 through 360. The default value is 180 seconds.

RIP routes expire when either a route timeout limit is met or a route metric reaches infinity, and the route is no longer valid. However, the expired route is retained in the routing table for a specified period so that neighbors can be notified that the route has been dropped. This time period is set by configuring the hold-down timer. Upon expiration of the hold-down timer, the route is removed from the routing table.

To configure the hold-down timer for RIP, include the **holddown** statement:

**holddown** *seconds*;

*seconds* can be a value from 10 through 180. The default value is 120 seconds.

**NOTE:** In Junos OS Release 11.1 and later, a retransmission timer is available for RIP demand circuits.

---

Generally, we recommend against changing the RIP timers, unless the effects of a change are well understood. The route timeout should be at least three times the update interval. Normally, the default values are best left in effect for standard operations.

## Example: Configuring RIP Timers

---

This example shows how to configure the RIP update interval and how to monitor the impact of the change.

- [Requirements on page 4451](#)
- [Overview on page 4451](#)

- [Configuration on page 4451](#)
- [Verification on page 4454](#)

### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

In this example, Device R2 has an update interval of 60 seconds for its neighbor, Device R1, and an update interval of 10 seconds for its neighbor, Device R3.

This example is not necessarily practical, but it is shown for demonstration purposes. Generally, we recommend against changing the RIP timers, unless the effects of a change are well understood. Normally, the default values are best left in effect for standard operations.

An export policy is also shown because an export policy is required as part of the minimum configuration for RIP.

[Figure 161 on page 4451](#) shows the topology used in this example.

**Figure 161: RIP Timers Network Topology**

"CLI Quick Configuration" on [page 4451](#) shows the configuration for all of the devices in [Figure 161 on page 4451](#). The section "Step-by-Step Procedure" on [page 4452](#) describes the steps on Device R2.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Device R2**

```
set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2 update-interval 60
set protocols rip group rip-group neighbor fe-1/2/1.5 update-interval 10
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Device R3**

```
set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the RIP update interval:

1. Configure the network interfaces.

This example shows multiple loopback interface addresses to simulate attached networks.

[edit interfaces]

```
user@R2# set fe-1/2/0 unit 2 family inet address 10.0.0.2/30
```

```
user@R2# set fe-1/2/1 unit 5 family inet address 10.0.0.5/30
```

```
user@R2# set lo0 unit 2 family inet address 192.168.2.2/32
```

```
user@R2# set lo0 unit 2 family inet address 172.16.2.2/32
```

2. Configure different update intervals for the two RIP neighbors.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

[edit protocols rip group rip-group]

```
user@R2# set neighbor fe-1/2/0.2 update-interval 60
```

```
user@R2# set neighbor fe-1/2/1.5 update-interval 10
```

3. Create the routing policy to advertise both direct and RIP-learned routes.

[edit policy-options policy-statement advertise-routes-through-rip term 1]

```
user@R2# set from protocol direct
```

```
user@R2# set from protocol rip
```

```
user@R2# set then accept
```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R2# set export advertise-routes-through-rip
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 2 {
    family inet {
      address 10.0.0.2/30;
    }
  }
}
fe-1/2/1 {
  unit 5 {
    family inet {
      address 10.0.0.5/30;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 192.168.2.2/32;
      address 172.16.2.2/32;
    }
  }
}

user@R2# show protocols
rip {
  group rip-group {
    export advertise-routes-through-rip;
    neighbor fe-1/2/0.2 {
      update-interval 60;
    }
    neighbor fe-1/2/1.5 {
      update-interval 10;
    }
  }
}

user@R2# show policy-options
policy-statement advertise-routes-through-rip {
  term 1 {
    from protocol [ direct rip ];
    then accept;
  }
}
```

```
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Checking the RIP Updates Sent by Device R2 on page 4454](#)
- [Checking the RIP Updates Received by Device R2 on page 4455](#)
- [Checking the RIP Updates Received by Device R3 on page 4455](#)

### Checking the RIP Updates Sent by Device R2

**Purpose** Make sure that the RIP update packets are sent at the expected interval.

**Action** From operational mode, enter the **show rip statistics** command.

```
user@R2> show rip statistics
```

```
RIPv2 info: port 520; holddown 120s.
```

```
    rts learned   rts held down   rqsts dropped   resps dropped
          4             2             0             0
```

```
fe-1/2/0.2: 2 routes learned; 5 routes advertised; timeout 180s; update interval 60s
```

Counter	Total	Last 5 min	Last minute
Updates Sent	123	5	1
Triggered Updates Sent	0	0	0
Responses Sent	0	0	0
Bad Messages	0	0	0
RIPv1 Updates Received	0	0	0
RIPv1 Bad Route Entries	0	0	0
RIPv1 Updates Ignored	0	0	0
RIPv2 Updates Received	244	10	2
RIPv2 Bad Route Entries	0	0	0
RIPv2 Updates Ignored	0	0	0
Authentication Failures	0	0	0
RIP Requests Received	0	0	0
RIP Requests Ignored	0	0	0
none	0	0	0

```
fe-1/2/1.5: 2 routes learned; 5 routes advertised; timeout 180s; update interval 10s
```

Counter	Total	Last 5 min	Last minute
Updates Sent	734	32	6
Triggered Updates Sent	0	0	0
Responses Sent	0	0	0
Bad Messages	0	0	0
RIPv1 Updates Received	0	0	0
RIPv1 Bad Route Entries	0	0	0
RIPv1 Updates Ignored	0	0	0
RIPv2 Updates Received	245	11	2
RIPv2 Bad Route Entries	0	0	0
RIPv2 Updates Ignored	0	0	0
Authentication Failures	0	0	0
RIP Requests Received	0	0	0

RIP Requests Ignored	0	0	0
none	0	0	0

**Meaning** The **update interval** field shows that the interval is 60 seconds for Neighbor R1 and 10 seconds for Neighbor R3. The **Updates Sent** field shows that Device R2 is sending updates to Device R1 at roughly 1/6 of the rate that it is sending updates to Device R3.

### *Checking the RIP Updates Received by Device R2*

**Purpose** Make sure that the RIP update packets are sent at the expected interval.

**Action** From operational mode, enter the **show rip statistics** command.

```
user@R1> show rip statistics
```

```
RIPv2 info: port 520; holddown 120s.
```

rts learned	rts held down	rqsts dropped	resps dropped
5	0	0	0

```
fe-1/2/0.1: 5 routes learned; 2 routes advertised; timeout 180s; update interval 30s
```

Counter	Total	Last 5 min	Last minute
-----	-----	-----	-----
Updates Sent	312	10	2
Triggered Updates Sent	2	0	0
Responses Sent	0	0	0
Bad Messages	0	0	0
RIPv1 Updates Received	0	0	0
RIPv1 Bad Route Entries	0	0	0
RIPv1 Updates Ignored	0	0	0
RIPv2 Updates Received	181	5	1
RIPv2 Bad Route Entries	0	0	0
RIPv2 Updates Ignored	0	0	0
Authentication Failures	0	0	0
RIP Requests Received	1	0	0
RIP Requests Ignored	0	0	0
none	0	0	0

**Meaning** The **RIPv2 Updates Received** field shows the number of updates received from Device R2.

### *Checking the RIP Updates Received by Device R3*

**Purpose** Make sure that the RIP update packets are sent at the expected interval.

**Action** From operational mode, enter the **show rip statistics** command.

```
user@R3> show rip statistics
```

```
RIPv2 info: port 520; holddown 120s.
```

rts learned	rts held down	rqsts dropped	resps dropped

- [Example: Tracing RIP Protocol Traffic on page 4457](#)

---

### Understanding RIP Trace Operations

You can trace various types of RIP protocol traffic to help debug RIP protocol issues.

To trace RIP protocol traffic, include the **traceoptions** statement at the **[edit protocols rip]** hierarchy level:

```
traceoptions {  
    file filename <files number> <size size> <world-readable | no-world-readable>;  
    flag flag <flag-modifier> <disable>;  
}
```

You can specify the following RIP protocol-specific trace options using the **flag** statement:

- **auth**—RIP authentication
- **error**—RIP error packets
- **expiration**—RIP route expiration processing
- **holddown**—RIP hold-down processing
- **nsr-synchronization**—Nonstop active routing synchronization events
- **packets**—All RIP packets
- **request**—RIP information packets
- **trigger**—RIP triggered updates
- **update**—RIP update packets

You can optionally specify one or more of the following flag modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**NOTE:** Use the **detail** flag modifier with caution as this may cause the CPU to become very busy.

Global tracing options are inherited from the configuration set by the **traceoptions** statement at the **[edit routing-options]** hierarchy level. You can override the following global trace options for the RIP protocol using the **traceoptions flag** statement included at the **[edit protocols rip]** hierarchy level:

- **all**—All tracing operations
- **general**—All normal operations and routing table changes (a combination of the normal and route trace operations)
- **normal**—Normal events
- **policy**—Policy processing
- **route**—Routing information
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

**NOTE:** Use the trace flag **all** with caution because this may cause the CPU to become very busy.

### Example: Tracing RIP Protocol Traffic

This example shows how to trace RIP protocol operations.

- [Requirements on page 4457](#)
- [Overview on page 4458](#)
- [Configuration on page 4458](#)
- [Verification on page 4460](#)

#### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

In this example, Device R1 is set to trace routing information updates.

An export policy is also shown because an export policy is required as part of the minimum configuration for RIP.

Figure 162 on page 4458 shows the topology used in this example.

**Figure 162: RIP Trace Operations Network Topology**

“CLI Quick Configuration” on page 4458 shows the configuration for all of the devices in Figure 162 on page 4458. The section “Step-by-Step Procedure” on page 4459 describes the steps on Device R1.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip traceoptions file rip-trace-file
set protocols rip traceoptions flag route
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Device R2**

```

set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor fe-1/2/1.5
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip

```

```
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Device R3**

```
set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the RIP update interval:

1. Configure the network interfaces.

This example shows multiple loopback interface addresses to simulate attached networks.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30

user@R1# set lo0 unit 1 family inet address 172.16.0.1/32
user@R1# set lo0 unit 1 family inet address 192.168.1.1/32
```

2. Configure the RIP group, and add the interface to the group.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

```
[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1
```

3. Configure RIP tracing operations.

```
[edit protocols rip traceoptions]
user@R1# set file rip-trace-file
user@R1# set flag route
```

4. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept
```

5. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 172.16.0.1/32;
      address 192.168.1.1/32;
    }
  }
}

user@R1# show protocols
rip {
  traceoptions {
    file rip-trace-file;
    flag route;
  }
  group rip-group {
    export advertise-routes-through-rip;
    neighbor fe-1/2/0.1;
  }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
  term 1 {
    from protocol [ direct rip ];
    then accept;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

### **Checking the Log File**

**Purpose** Make sure that the RIP route updates are logged in the configured log file.

**Action** 1. Deactivate the extra loopback interface address on Device R3.

```
[edit interfaces lo0 unit 3 family inet]
user@R3# deactivate address 172.16.3.3/32
user@R3# commit
```

2. From operational mode on Device R1, enter the **show log rip-trace-file** command with the **| match 172.16.3.3** option.

```

user@R1> show log rip-trace-file | match 172.16.3.3
Mar  1 11:39:53.975192 Setting RIPv2 rtbit on route 172.16.3.3/32, tsi =
0xbb69228
Mar  1 11:39:59.847118 172.16.3.3/32: metric-in: 16, change: 3 -> 16; # gw:
1, pkt_upd_src 10.0.0.2, inx: 0, rte_upd_src 10.0.0.2
Mar  1 11:39:59.847568 CHANGE 172.16.3.3/32      nhid 591 gw 10.0.0.2
RIP      pref 100/0 metric 3/0 fe-1/2/0.1 <Delete Int>
Mar  1 11:39:59.847629 Best route to 172.16.3.3/32 got deleted. Doing route calculation
on the stored rte-info

```

**Meaning** The output shows that the route to 172.16.3.3/32 was deleted.

## any-sender

---

<b>Syntax</b>	any-sender;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rip group <i>group-name</i> <b>neighbor</b> <i>neighbor-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols rip group <i>group-name</i> <b>neighbor</b> <i>neighbor-name</i> ], [edit protocols rip group <i>group-name</i> <b>neighbor</b> <i>neighbor-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols rip group <i>group-name</i> <b>neighbor</b> <i>neighbor-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	<p>Disable strict sender address checks.</p> <p>If the sender of a RIP message does not belong to the subnet of the interface, the message is discarded. This situation might cause problems with dropped packets when RIP is running on point-to-point interfaces, or when the addresses on the interfaces do not fall in the same subnet. You can resolve this by disabling strict address checks on the RIP traffic.</p>
<div> <b>NOTE:</b> The <b>any-sender</b> statement is supported only for peer-to-peer interfaces.</div>	
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
