<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">rip</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols rip group <i>group-name</i> <a href="#">neighbor</a> <i>neighbor-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols rip group <i>group-name</i> <a href="#">neighbor</a> <i>neighbor-name</i>],</p> <p>[edit protocols <a href="#">rip</a>],</p> <p>[edit protocols rip group <i>group-name</i> <a href="#">neighbor</a> <i>neighbor-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols rip group <i>group-name</i> <a href="#">neighbor</a> <i>neighbor-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Require authentication for RIP route queries received on an interface.
<b>Options</b>	<p><b>password</b>—Authentication password. If the password does not match, the packet is rejected. The password can be from 1 through 16 contiguous characters long and can include any ASCII strings.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Route Authentication for RIP on page 4406</a></li> </ul>

## authentication-type (Protocols RIP)

---

<b>Syntax</b>	<code>authentication-type type;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">rip</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols rip group <i>group-name</i> <a href="#">neighbor</a></code> <code>  <i>neighbor-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>  <a href="#">rip</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>  rip group <i>group-name</i> <a href="#">neighbor</a> <i>neighbor-name</i>],</code> <code>[edit protocols <a href="#">rip</a>],</code> <code>[edit protocols rip group <i>group-name</i> <a href="#">neighbor</a> <i>neighbor-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols rip group <i>group-name</i> <a href="#">neighbor</a></code> <code>  <i>neighbor-name</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure the type of authentication for RIP route queries received on an interface.
<b>Default</b>	If you do not include this statement and the <b>authentication-key</b> statement, RIP authentication is disabled.
<b>Options</b>	<b>type</b> —Authentication type: <ul style="list-style-type: none"><li>• <b>md5</b>—Use the MD5 algorithm to create an encoded checksum of the packet. The encoded checksum is included in the transmitted packet. The receiving routing device uses the authentication key to verify the packet, discarding it if the digest does not match. This algorithm provides a more secure authentication scheme.</li><li>• <b>none</b>—Disable authentication. If <b>none</b> is configured, the configured authentication key is ignored.</li><li>• <b>simple</b>—Use a simple password. The password is included in the transmitted packet, which makes this method of authentication relatively insecure. The password can be from 1 through 16 contiguous letters or digits long.</li></ul>
<b>Required Privilege Level</b>	<b>routing</b> —To view this statement in the configuration. <b>routing-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Route Authentication for RIP on page 4406</a></li><li>• <a href="#">authentication-key on page 4463</a></li></ul>

## bfd-liveness-detection (Protocols RIP)

<b>Syntax</b>	<pre> bfd-liveness-detection {     authentication {         algorithm <i>algorithm-name</i>;         key-chain <i>key-chain-name</i>;         loose-check;     }     detection-time {         threshold <i>milliseconds</i>;     }     minimum-interval <i>milliseconds</i>;     minimum-receive-interval <i>milliseconds</i>;     multiplier <i>number</i>;     no-adaptation;     transmit-interval {         minimum-interval <i>milliseconds</i>;         threshold <i>milliseconds</i>;     }     version (1   automatic); } </pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols rip <b>group</b> <i>group-name</i>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols  rip group <i>group-name</i> <b>neighbor</b> <i>neighbor-name</i>],  [edit protocols rip <b>group</b> <i>group-name</i>],  [edit routing-instances <i>routing-instance-name</i> protocols rip group <i>group-name</i> <b>neighbor</b>  <i>neighbor-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.0.</p> <p>Options <b>detection-time threshold</b> and <b>transmit-interval threshold</b> introduced in Junos OS Release 8.2.</p> <p>Support for logical systems introduced in Junos OS Release 8.3.</p> <p>Option <b>no-adaptation</b> introduced in Junos OS Release 9.0.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Options <b>authentication algorithm</b>, <b>authentication key-chain</b>, and <b>authentication loose-check</b> introduced in Junos OS Release 9.6.</p> <p>Options <b>authentication algorithm</b>, <b>authentication key-chain</b>, and <b>authentication loose-check</b> introduced in Junos OS Release 9.6 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Configure bidirectional failure detection timers and authentication.
<b>Options</b>	<p><b>authentication algorithm <i>algorithm-name</i></b> —Configure the algorithm used to authenticate the specified BFD session: <b>simple-password</b>, <b>keyed-md5</b>, <b>keyed-sha-1</b>, <b>meticulous-keyed-md5</b>, or <b>meticulous-keyed-sha-1</b>.</p> <p><b>authentication key-chain <i>key-chain-name</i></b>—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the <b>authentication-key-chains key-chain</b> statement at the [edit security] hierarchy level.</p>

**authentication loose-check**—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication is not configured at both ends of the BFD session.

**detection-time threshold *milliseconds***—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**minimum-interval *milliseconds***—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the **transmit-interval**, **minimum-interval**, and **minimum-receive-interval** statements.

**Range:** 1 through 255,000 milliseconds

**minimum-receive-interval *milliseconds***—Configure the minimum interval after which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the **minimum-interval** statement.

**Range:** 1 through 255,000 milliseconds

**multiplier *number***—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255

**Default:** 3

**no-adaptation**—Configure BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

**transmit-interval threshold *milliseconds***—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**transmit-interval minimum-interval *milliseconds***—Configure a minimum interval after which the local routing device transmits hello packets to a neighbor. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement.

**Range:** 1 through 255,000

**version**—Configure the BFD version to detect: **1** (BFD version 1) or **automatic** (autodetect the BFD version).

**Default:** automatic

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## message-size

---

<b>Syntax</b>	<code>message-size <i>number</i>;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">rip</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols rip group <i>group-name</i> <a href="#">neighbor</a></code> <code>  <i>neighbor-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>  <a href="#">rip</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>  rip group <i>group-name</i> <a href="#">neighbor</a> <i>neighbor-name</i>],</code> <code>[edit protocols <a href="#">rip</a>],</code> <code>[edit protocols rip group <i>group-name</i> <a href="#">neighbor</a> <i>neighbor-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols rip group <i>group-name</i> <a href="#">neighbor</a></code> <code>  <i>neighbor-name</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement for SRX Series devices introduced in Junos OS Release 9.5. Statement for J Series platform introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify the number of route entries to be included in every RIP update message.
<hr/>	
<div> <b>TIP:</b> To ensure interoperability with other vendors' equipment, use the standard of 25 route entries per message. Do not change the default number of route entries in a RIP update message.</div> <hr/>	
<b>Options</b>	<b><i>number</i></b> —Number of route entries per update message. <b>Range:</b> 25 through 255 entries <b>Default:</b> 25 entries
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring RIP on page 4399</a></li></ul>

## metric-in (Protocols RIP)

<b>Syntax</b>	<code>metric-in <i>metric</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">rip</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols rip group <i>group-name</i> <a href="#">neighbor</a> <i>neighbor-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols rip group <i>group-name</i> <a href="#">neighbor</a> <i>neighbor-name</i>],</p> <p>[edit protocols <a href="#">rip</a>],</p> <p>[edit protocols rip group <i>group-name</i> <a href="#">neighbor</a> <i>neighbor-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols rip group <i>group-name</i> <a href="#">neighbor</a> <i>neighbor-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Specify the metric to add to incoming routes when the routing device advertises into RIP routes that were learned from other protocols. Use this statement to configure the routing device to prefer RIP routes learned through a specific neighbor.
<b>Options</b>	<p><i>metric</i>—Metric value.</p> <p><b>Range:</b> 1 through 16</p> <p><b>Default:</b> 1</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring the Metric Value Added to Imported RIP Routes on page 4436</a></li> </ul>

## metric-out (Protocols RIP)

---

<b>Syntax</b>	<code>metric-out <i>metric</i>;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols rip group <i>group-name</i> <b>neighbor</b> <i>neighbor-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols rip group <i>group-name</i> <b>neighbor</b> <i>neighbor-name</i>],</code> <code>[edit protocols rip group <i>group-name</i> <b>neighbor</b> <i>neighbor-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols rip group <i>group-name</i> <b>neighbor</b> <i>neighbor-name</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	<p>Specify the metric value to add to routes transmitted to the neighbor. Use this statement to control how other routing devices prefer RIP routes sent from this neighbor.</p> <p>If you have included the <b>export</b> statement, RIP exports routes it has learned to the neighbors configured by including the <b>neighbor</b> statement.</p> <p>The metric associated with a RIP route (unless modified by an export policy) is the normal RIP metric. For example, a RIP route with a metric of 5 learned from a neighbor configured with a <b>metric-in</b> value of 2 is advertised with a combined metric of 7 when advertised to RIP neighbors in the same group. However, if this route was learned from a RIP neighbor in a different group or from a different protocol, the route is advertised with the metric value configured for that group with the <b>metric-out</b> statement.</p> <p>The metric for a route can be modified with an export policy. That metric is seen when the route is exported to the next hop.</p> <p>To increase the metric for routes advertised outside a group, include the <b>metric-out</b> statement.</p>
<b>Options</b>	<b><i>metric</i></b> —Metric value. <b>Range:</b> 1 through 16 <b>Default:</b> 1
<b>Required Privilege Level</b>	<b>routing</b> —To view this statement in the configuration. <b>routing-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Examples: Controlling Traffic with Metrics in a RIP Network on page 443250</a></li></ul>

## neighbor (Protocols RIP)

**Syntax** `neighbor neighbor-name {`

         rip **group** *group-name*],  
     [edit protocols rip **group** *group-name*],  
     [edit routing-instances *routing-instance-name* protocols rip **group** *group-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
     Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure neighbor-specific RIP parameters, thereby overriding the defaults set for the routing device.

**Options** *neighbor-name*—Name of an interface over which a routing device communicates to its neighbors.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

---

## preference (Protocols RIP)

---

**Syntax** `preference preference;`

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols rip **group** *group-name*],  
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols  
rip **group** *group-name*],  
[edit protocols rip **group** *group-name*],  
[edit routing-instances *routing-instance-name* protocols rip **group** *group-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Specify the preference of external routes learned by RIP as compared to those learned from other routing protocols.

By default, Junos OS assigns a preference of 100 to routes that originate from RIP. When Junos OS determines a route's preference to become the active route, the software selects the route with the lowest preference and installs this route into the forwarding table.

**Options** *preference*—Preference value. A lower value indicates a more preferred route.  
**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )  
**Default:** 100

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

## rib-group (Protocols RIP)

---

<b>Syntax</b>	<code>rib-group group-name;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <a href="#">rip</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a> ], [edit protocols <a href="#">rip</a> ], [edit routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Install RIP routes into multiple routing tables by configuring a routing table group.
<b>Options</b>	<i>group-name</i> —Name of the routing table group.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Redistributing Routes Between Two RIP Instances on page 4445</a></li></ul>

## rip

---

<b>Syntax</b>	<code>rip {...}</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols], [edit protocols], [edit routing-instances <i>routing-instance-name</i> protocols]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Enable RIP routing on the routing device.
<b>Default</b>	RIP is disabled on the routing device.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring RIP on page 4399</a></li></ul>

## route-timeout (Protocols RIP)

<b>Syntax</b>	<code>route-timeout seconds;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">rip</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols rip <a href="#">group</a> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols rip <a href="#">group</a> <i>group-name</i> neighbor <i>neighbor-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols rip <a href="#">group</a> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols rip <a href="#">group</a> <i>group-name</i> neighbor <i>neighbor-name</i>],</p> <p>[edit protocols <a href="#">rip</a>],</p> <p>[edit protocols rip <a href="#">group</a> <i>group-name</i>],</p> <p>[edit protocols rip <a href="#">group</a> <i>group-name</i> neighbor <i>neighbor-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols rip <a href="#">group</a> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols rip <a href="#">group</a> <i>group-name</i> neighbor <i>neighbor-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 7.6.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Configure the route timeout interval for RIP. If a route is not refreshed after being installed in the routing table by the specified timeout interval, the route is marked as invalid and is removed from the routing table after the hold-down period expires.
<b>Options</b>	<p><b>seconds</b>—Estimated time to wait before making updates to the routing table.</p> <p><b>Range:</b> 30 through 360 seconds</p> <p><b>Default:</b> 180 seconds</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring RIP Timers on page 4450</a></li> <li>• <a href="#">RIP Demand Circuits Overview</a></li> </ul>

## send (Protocols RIP)

---

<b>Syntax</b>	<code>send <i>send-options</i>;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">rip</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols rip group <i>group-name</i> <a href="#">neighbor</a></code> <code>  <i>neighbor-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>  <a href="#">rip</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>  rip group <i>group-name</i> <a href="#">neighbor</a> <i>neighbor-name</i>],</code> <code>[edit protocols <a href="#">rip</a>],</code> <code>[edit protocols rip group <i>group-name</i> <a href="#">neighbor</a> <i>neighbor-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols rip group <i>group-name</i> <a href="#">neighbor</a></code> <code>  <i>neighbor-name</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure RIP send options.
<b>Options</b>	<i>send-options</i> —One of the following: <ul style="list-style-type: none"><li>• <b>broadcast</b>—Broadcast RIP version 2 packets (RIP version 1 compatible).</li><li>• <b>multicast</b>—Multicast RIP version 2 packets. This is the default.</li><li>• <b>none</b>—Do not send RIP updates.</li><li>• <b>version-1</b>—Broadcast RIP version 1 packets.</li></ul> <b>Default:</b> multicast
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring the Sending and Receiving of RIPv1 and RIPv2 Packets on page 4440</a></li><li>• <a href="#">receive on page 4479</a></li></ul>

## traceoptions (Protocols RIP)

<b>Syntax</b>	<pre>traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;<i>flag-modifier</i>&gt; &lt;disable&gt;; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <a href="#">rip</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a> ], [edit protocols <a href="#">rip</a> ], [edit routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Set RIP protocol-level tracing options.

**NOTE:** The `traceoptions` statement is not supported on QFabric systems.

**Default** The default RIP protocol-level trace options are inherited from the global `traceoptions` statement.

**Options** **disable**—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

**file *filename***—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place RIP tracing output in the file `/var/log/rip-log`.

**files *number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file.0***, then ***trace-file.1***, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 10 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

### RIP Tracing Options

- **auth**—RIP authentication
- **error**—RIP error packets

- **expiration**—RIP route expiration processing
- **holddown**—RIP hold-down processing
- **nsr-synchronization**—Nonstop routing synchronization events
- **packets**—All RIP packets
- **request**—RIP information packets such as request, poll, and poll entry packets
- **trigger**—RIP triggered updates
- **update**—RIP update packets

#### Global Tracing Options

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **receive**—Trace the packets being received.
- **receive-detail**—Provide detailed trace information for packets being received.
- **send**—Trace the packets being transmitted.
- **send-detail**—Provide detailed trace information for packets being transmitted.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file.0***. When the ***trace-file*** again reaches its maximum size, ***trace-file.0*** is renamed ***trace-file.1*** and ***trace-file*** is renamed ***trace-file.0***. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** ***xk*** to specify KB, ***xm*** to specify MB, or ***xg*** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

<b>Required Privilege</b>	routing—To view this statement in the configuration.
<b>Level</b>	routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Tracing RIP Protocol Traffic on page 4457</a></li> </ul>

## update-interval (Protocols RIP)

---

<b>Syntax</b>	<code>update-interval seconds;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">rip</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">rip</a> group <i>group-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">rip</a> group <i>group-name</i> neighbor</code> <code>    <i>neighbor-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>    <a href="#">rip</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>    <a href="#">rip</a> group <i>group-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>    <a href="#">rip</a> group <i>group-name</i> neighbor <i>neighbor-name</i>],</code> <code>[edit protocols <a href="#">rip</a>],</code> <code>[edit protocols <a href="#">rip</a> group <i>group-name</i>],</code> <code>[edit protocols <a href="#">rip</a> group <i>group-name</i> neighbor <i>neighbor-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a> group <i>group-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a> group <i>group-name</i> neighbor</code> <code>    <i>neighbor-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 7.6. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure the interval at which routes learned by RIP are sent to neighbors. This timer controls the interval between routing updates. This timer is set to 30 seconds, by default, with a small random amount of time added when the timer is reset. This added time prevents congestion that can happen if all routing devices update their neighbors simultaneously.
<b>Options</b>	<b>seconds</b> —Estimated time to wait before making updates to the routing table. <b>Range:</b> 10 through 60 seconds <b>Default:</b> 30 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring RIP Timers on page 4450</a></li></ul>

## CHAPTER 47

# Administration

- [Routine Monitoring on page 4487](#)
- [RIP Operational Commands on page 4487](#)

## Routine Monitoring

---

- [Monitoring RIP Routing Information on page 4487](#)

### Monitoring RIP Routing Information

**Purpose** Use the monitoring functionality to monitor RIP routing on routing devices.

**Action** To view RIP routing information in the CLI, enter the following CLI commands:

- **show rip statistics**
- **show rip neighbor**

**Related Documentation**

- [show rip neighbor on page 4492](#)
- [show rip statistics on page 4494](#)

## RIP Operational Commands

---

- [clear rip general-statistics](#)
- [clear rip statistics](#)
- [show rip general-statistics](#)
- [show rip neighbor](#)
- [show rip statistics](#)

## clear rip general-statistics

---

<b>List of Syntax</b>	<a href="#">Syntax on page 4488</a> <a href="#">Syntax (EX Series Switches and QFX Series) on page 4488</a>
<b>Syntax</b>	clear rip general-statistics <logical-system (all   <i>logical-system-name</i> )>
<b>Syntax (EX Series Switches and QFX Series)</b>	clear rip general-statistics
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Clear RIP general statistics.
<b>Options</b>	<b>none</b> —Clear RIP general statistics.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show rip general-statistics on page 4490</a></li></ul>

## show rip general-statistics

<b>List of Syntax</b>	<a href="#">Syntax on page 4490</a> <a href="#">Syntax (EX Series Switches and QFX Series) on page 4490</a>
<b>Syntax</b>	show rip general-statistics <logical-system (all   <i>logical-system-name</i> )>
<b>Syntax (EX Series Switches and QFX Series)</b>	show rip general-statistics
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Display brief RIP statistics.
<b>Options</b>	none—Display brief RIP statistics.  logical-system (all   <i>logical-system-name</i> )—(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">clear rip general-statistics on page 4488</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show rip general-statistics on page 4490</a>
<b>Output Fields</b>	Table 304 on page 4490 lists the output fields for the <b>show rip general-statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 304: show rip general-statistics Output Fields**

Field Name	Field Description
bad msgs	Number of invalid messages received.
no rcv intf	Number of packets received with no matching interface.
curr memory	Amount of memory currently used by RIP.
max memory	Most memory used by RIP.

## Sample Output

### show rip general-statistics

```
user@host> show rip general-statistics
```

```
RIPv2 I/O info:
  bad msgs      :      0
  no recv intf  :      0
  curr memory    :      0
  max memory    :      0
```

## show rip neighbor

---

<b>List of Syntax</b>	<a href="#">Syntax on page 4492</a> <a href="#">Syntax (EX Series Switches and QFX Series) on page 4492</a>
<b>Syntax</b>	<pre>show rip neighbor &lt;instance (all   <i>instance-name</i>)&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;name&gt;</pre>
<b>Syntax (EX Series Switches and QFX Series)</b>	<pre>show rip neighbor &lt;instance (all   <i>instance-name</i>)&gt; &lt;name&gt;</pre>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Display information about RIP neighbors.
<b>Options</b>	<p><b>none</b>—Display information about all RIP neighbors for all instances.</p> <p><b>instance (all   <i>instance-name</i>)</b>—(Optional) Display RIP neighbor information for all instances or for only the specified routing instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>name</b>—(Optional) Display detailed information about only the specified RIP neighbor.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show rip neighbor on page 4493</a> <a href="#">show rip neighbor (With Demand Circuits Configured) on page 4493</a>
<b>Output Fields</b>	<a href="#">Table 305 on page 4493</a> lists the output fields for the <b>show rip neighbor</b> command. Output fields are listed in the approximate order in which they appear.

Table 305: show rip neighbor Output Fields

Field Name	Field Description
<b>Neighbor</b>	Name of the RIP neighbor.  <b>NOTE:</b> Beginning with Junos OS Release 11.1, when you configure demand circuits, the output displays a demand circuit (DC) flag next to neighbor interfaces configured for demand circuits.  If you configure demand circuits at the <b>[edit protocols rip group group-name neighbor neighbor-name]</b> hierarchy level, the output shows only the neighboring interface that you specifically configured as a demand circuit. If you configure demand circuits at the <b>[edit protocols rip group group-name]</b> hierarchy level, all of the interfaces in the group are configured as demand circuits. Therefore, the output shows all of the interfaces in that group as demand circuits.
<b>State</b>	State of the connection: <b>Up</b> or <b>Dn</b> (Down).
<b>Source Address</b>	Address of the port on the local router.
<b>Destination Address</b>	Address of the port on the remote router.
<b>Send Mode</b>	Send options: <b>broadcast</b> , <b>multicast</b> , <b>none</b> , or <b>version 1</b> .
<b>Receive Mode</b>	Type of packets to accept: <b>both</b> , <b>none</b> , <b>version 1</b> , or <b>version 2</b> .
<b>In Met</b>	Metric added to incoming routes when advertising into RIP routes that were learned from other protocols.

## Sample Output

### show rip neighbor

```

user@host> show rip neighbor
Neighbor      Local  Source      Destination  Send  Receive  In
-----      -
ge-2/3/0.0    Up    192.168.9.105  192.168.9.107  bcast  both      1

## PIM Overview

The predominant multicast routing protocol in use on the Internet today is Protocol Independent Multicast, or PIM. The type of PIM used on the Internet is PIM sparse mode. PIM sparse mode is so accepted that when the simple term “PIM” is used in an Internet context, some form of sparse mode operation is assumed.

PIM emerged as an algorithm to overcome the limitations of dense-mode protocols such as the Distance Vector Multicast Routing Protocol (DVMRP), which was efficient for dense clusters of multicast receivers, but did not scale well for the larger, sparser, groups encountered on the Internet. The Core Based Trees (CBT) Protocol was intended to support sparse mode as well, but CBT, with its all-powerful core approach, made placement of the core critical, and large conference-type applications (many-to-many) resulted in bottlenecks in the core. PIM was designed to avoid the dense-mode scaling issues of DVMRP and the potential performance issues of CBT at the same time.

PIM is one of the most rapidly evolving specifications on the Internet today. Since its introduction in 1995, PIM has already seen two major revisions to its packet structure (PIM version 1 [PIMv1] and PIM version 2 [PIMv2]), two major RFCs (RFC 2362 obsoleted RFC 2117), and numerous drafts describing major components of PIM, such as many-to-many trees and source-specific multicast (SSM). Long-lasting RFCs are not a feature of PIM, and virtually all of PIM must be researched, understood, and implemented directly from Internet drafts. In fact, no current RFC describes PIMv1 at all. The drafts have all expired, and PIMv1 was never issued as an official RFC.

PIM itself is not nonstandard or unstable, however. PIM has been a promising multicast routing protocol since its inception, especially PIM sparse mode, the first real sparse-mode multicast routing protocol. Work continues on PIM in a number of areas, from bidirectional trees to network management, and the rapid pace of development makes drafts essential for PIM.

PIMv1 and PIMv2 can coexist on the same routing device and even on the same interface. The main difference between PIMv1 and PIMv2 is the packet format. PIMv1 messages use Internet Group Management Protocol (IGMP) packets, whereas PIMv2 has its own IP protocol number (103) and packet structure. All routing devices connecting to an IP subnet such as a LAN must use the same PIM version. Some PIM implementations can recognize PIMv1 packets and automatically switch the routing device interface to PIMv1. Because the difference between PIMv1 and PIMv2 involves the message format, but not the meaning of the message or how the routing device processes the PIM message, a routing device can easily mix PIMv1 and PIMv2 interfaces.

PIM is used for efficient routing to multicast groups that might span wide-area and interdomain internetworks. It is called “protocol independent” because it does not depend on a particular unicast routing protocol. Junos OS supports bidirectional mode, sparse mode, dense mode, and sparse-dense mode.

PIM operates in several modes: bidirectional mode, sparse mode, dense mode, and sparse-dense mode. In sparse-dense mode, some multicast groups are configured as dense mode (flood-and-prune, [S,G] state) and others are configured as sparse mode (explicit join to rendezvous point [RP], [\*G] state).

PIM drafts also establish a mode known as PIM source-specific mode, or PIM SSM. In PIM SSM there is only one specific source for the content of a multicast group within a given domain.

Because the PIM mode you choose determines the PIM configuration properties, you first must decide whether PIM operates in bidirectional, sparse, dense, or sparse-dense mode in your network. Each mode has distinct operating advantages in different network environments.

- In sparse mode, routing devices must join and leave multicast groups explicitly. Upstream routing devices do not forward multicast traffic to a downstream routing device unless the downstream routing device has sent an explicit request (by means of a join message) to the rendezvous point (RP) routing device to receive this traffic. The RP serves as the root of the shared multicast delivery tree and is responsible for forwarding multicast data from different sources to the receivers.

Sparse mode is well suited to the Internet, where frequent interdomain join messages and prune messages are common.

**NOTE:** On all the EX series switches (except EX4300 and EX9200) and QFX5100 series switches, the rate limit is set to 1pps per SG to avoid overwhelming the rendezvous point (RP), First hop router (FHR) with PIM-sparse mode (PIM-SM) register messages and cause CPU hogs. This rate limit helps in improving scaling and convergence times by avoiding duplicate packets being trapped, and tunneled to RP in software.

- Bidirectional PIM is similar to sparse mode, and is especially suited to applications that must scale to support a large number of dispersed sources and receivers. In bidirectional PIM, routing devices build shared bidirectional trees and do not switch to a source-based tree. Bidirectional PIM scales well because it needs no source-specific (S,G) state. Instead, it builds only group-specific (\*,G) state.
- Unlike sparse mode and bidirectional mode, in which data is forwarded only to routing devices sending an explicit PIM join request, dense mode implements a *flood-and-prune* mechanism, similar to the Distance Vector Multicast Routing Protocol (DVMRP). In dense mode, a routing device receives the multicast data on the incoming interface, then forwards the traffic to the outgoing interface list. Flooding occurs periodically and is used to refresh state information, such as the source IP address and multicast group pair. If the routing device has no interested receivers for the data, and the outgoing interface list becomes empty, the routing device sends a PIM prune message upstream.

Dense mode works best in networks where few or no prunes occur. In such instances, dense mode is actually more efficient than sparse mode.

- Sparse-dense mode, as the name implies, allows the interface to operate on a per-group basis in either sparse or dense mode. A group specified as “dense” is not mapped to an RP. Instead, data packets destined for that group are forwarded by means of PIM dense mode rules. A group specified as “sparse” is mapped to an RP, and data packets are forwarded by means of PIM sparse-mode rules. Sparse-dense mode is useful in networks implementing auto-RP for PIM sparse mode.

## Basic PIM Network Components

---

PIM dense mode requires only a multicast source and series of multicast-enabled routing devices running PIM dense mode to allow receivers to obtain multicast content. Dense mode makes sure that all multicast traffic gets everywhere by periodically flooding the network with multicast traffic, and relies on prune messages to make sure that subnets where all receivers are uninterested in that particular multicast group stop receiving packets.

PIM sparse mode is more complicated and requires the establishment of special routing devices called *rendezvous points (RPs)* in the network core. These routing devices are where upstream join messages from interested receivers meet downstream traffic from the source of the multicast group content. A network can have many RPs, but PIM sparse mode allows only one RP to be active for any multicast group.

If there is only one RP in a routing domain, the RP and adjacent links might become congested and form a single point of failure for all multicast traffic. Thus, multiple RPs are the rule, but the issue then becomes how other multicast routing devices find the RP that is the source of the multicast group the receiver is trying to join. This RP-to-group mapping is controlled by a special *bootstrap router (BSR)* running the PIM BSR mechanism. There can be more than one bootstrap router as well, also for single-point-of-failure reasons.

The bootstrap router does not have to be an RP itself, although this is a common implementation. The bootstrap router's main function is to manage the collection of RPs and allow interested receivers to find the source of their group's multicast traffic. PIM bootstrap messages are sourced from the loopback address, which is always up. The loopback address must be routable. If it is not routable, then the bootstrap router is unable to send bootstrap messages to update the RP domain members. The **show pim bootstrap** command displays only those bootstrap routers that have routable loopback addresses.

PIM SSM can be seen as a subset of a special case of PIM sparse mode and requires no specialized equipment other than that used for PIM sparse mode (and IGMP version 3).

Bidirectional PIM RPs, unlike RPs for PIM sparse mode, do not need to perform PIM Register tunneling or other specific protocol action. Bidirectional PIM RPs implement no specific functionality. RP addresses are simply a location in the network to rendezvous toward. In fact, for bidirectional PIM, RP addresses need not be loopback interface addresses or even be addresses configured on any routing device, as long as they are covered by a subnet that is connected to a bidirectional PIM-capable routing device and advertised to the network.

## PIM on Aggregated Interfaces

If you configure PIM on an aggregated (**ae-** or **as-**) interface, each of the interfaces in the aggregate is included in the multicast output interface list and carries the single stream

of replicated packets in a load-sharing fashion. The multicast aggregate interface is “expanded” into its constituent interfaces in the next-hop database.

## Introduction to PIM Sparse Mode

- [Understanding PIM Sparse Mode on page 4503](#)
- [Designated Router on page 4506](#)

### Understanding PIM Sparse Mode

A Protocol Independent Multicast (PIM) sparse-mode domain uses reverse-path forwarding (RPF) to create a path from a data source to the receiver requesting the data. When a receiver issues an explicit join request, an RPF check is triggered. A (\*,G) PIM join message is sent toward the RP from the receiver's designated router (DR). (By definition, this message is actually called a join/prune message, but for clarity in this description, it is called either join or prune, depending on its context.) The join message is multicast hop by hop upstream to the ALL-PIM-ROUTERS group (224.0.0.13) by means of each router's RPF interface until it reaches the RP. The RP router receives the (\*,G) PIM join message and adds the interface on which it was received to the outgoing interface list (OIL) of the rendezvous-point tree (RPT) forwarding state entry. This builds the RPT connecting the receiver with the RP. The RPT remains in effect, even if no active sources generate traffic.

**NOTE:** State—the (\*,G) or (S,G) entries—is the information used for forwarding unicast or multicast packets. S is the source IP address, G is the multicast group address, and \* represents any source sending to group G. Routers keep track of the multicast forwarding state for the incoming and outgoing interfaces for each group.

When a source becomes active, the source DR encapsulates multicast data packets into a PIM register message and sends them by means of unicast to the RP router.

If the RP router has interested receivers in the PIM sparse-mode domain, it sends a PIM join message toward the source to build a shortest-path tree (SPT) back to the source. The source sends multicast packets out on the LAN, and the source DR encapsulates the packets in a PIM register message and forwards the message toward the RP router by means of unicast. The RP router receives PIM register messages back from the source, and thus adds a new source to the distribution tree, keeping track of sources in a PIM table. Once an RP router receives packets natively (with S,G), it sends a register stop message to stop receiving the register messages by means of unicast.

In actual application, many receivers with multiple SPTs are involved in a multicast traffic flow. To illustrate the process, we track the multicast traffic from the RP router to one receiver. In such a case, the RP router begins sending multicast packets down the RPT

toward the receiver's DR for delivery to the interested receivers. When the receiver's DR receives the first packet from the RPT, the DR sends a PIM join message toward the source DR to start building an SPT back to the source. When the source DR receives the PIM join message from the receiver's DR, it starts sending traffic down all SPTs. When the first multicast packet is received by the receiver's DR, the receiver's DR sends a PIM prune message to the RP router to stop duplicate packets from being sent through the RPT. In turn, the RP router stops sending multicast packets to the receiver's DR, and sends a PIM prune message for this source over the RPT toward the source DR to halt multicast packet delivery to the RP router from that particular source.

If the RP router receives a PIM register message from an active source but has no interested receivers in the PIM sparse-mode domain, it still adds the active source into the PIM table. However, after adding the active source into the PIM table, the RP router sends a register stop message. The RP router discovers the active source's existence and no longer needs to receive advertisement of the source (which utilizes resources).

**NOTE:** If the number of PIM join messages exceeds the configured MTU, the messages are fragmented in IPv6 PIM sparse mode. To avoid the fragmentation of PIM join messages, the multicast traffic receives the interface MTU instead of the path MTU.

The major characteristics of PIM sparse mode are as follows:

- Routers with downstream receivers join a PIM sparse-mode tree through an explicit join message.
- PIM sparse-mode RPs are the routers where receivers meet sources.
- Senders announce their existence to one or more RPs, and receivers query RPs to find multicast sessions.
- Once receivers get content from sources through the RP, the last-hop router (the router closest to the receiver) can optionally remove the RP from the shared distribution tree (\*;G) if the new source-based tree (S,G) is shorter. Receivers can then get content directly from the source.

The transitional aspect of PIM sparse mode from shared to source-based tree is one of the major features of PIM, because it prevents overloading the RP or surrounding core links.

There are related issues regarding source, RPs, and receivers when sparse mode multicast is used:

- Sources must be able to send to all RPs.
- RPs must all know one another.
- Receivers must send explicit join messages to a known RP.
- Receivers initially need to know only one RP (they later learn about others).

- Receivers can explicitly prune themselves from a tree.
- Receivers that never transition to a source-based tree are effectively running Core Based Trees (CBT).

PIM sparse mode has standard features for all of these issues.

### Rendezvous Point

The RP router serves as the information exchange point for the other routers. All routers in a PIM domain must provide mapping to an RP router. It is the only router that needs to know the active sources for a domain—the other routers just need to know how to reach the RP. In this way, the RP matches receivers with sources.

The RP router is downstream from the source and forms one end of the shortest-path tree. As shown in [Figure 163 on page 4505](#), the RP router is upstream from the receiver and thus forms one end of the rendezvous-point tree.

**Figure 163: Rendezvous Point as Part of the RPT and SPT**

The benefit of using the RP as the information exchange point is that it reduces the amount of state in non-RP routers. No network flooding is required to provide non-RP routers information about active sources.

### RP Mapping Options

RPs can be learned by one of the following mechanisms:

- Static configuration
- Anycast RP
- Auto-RP
- Bootstrap router

We recommend a static RP mapping with anycast RP and a bootstrap router (BSR) with auto-RP configuration, because static mapping provides all the benefits of a bootstrap router and auto-RP without the complexity of the full BSR and auto-RP mechanisms.

## Designated Router

In a PIM sparse mode (PIM-SM) domain, there are two types of designated routers to consider:

- The receiver DR sends PIM join and PIM prune messages from the receiver network toward the RP.
- The source DR sends PIM register messages from the source network to the RP.

Neighboring PIM routers multicast periodic PIM hello messages to each other every 30 seconds (the default). The PIM hello message usually includes a holdtime value for the neighbor to use, but this is not a requirement. If the PIM hello message does not include a holdtime value, a default timeout value (in Junos OS, 105 seconds) is used. On receipt of a PIM hello message, a router stores the IP address and priority for that neighbor. If the DR priorities match, the router with the highest IP address is selected as the DR.

If a DR fails, a new one is selected using the same process of comparing IP addresses.

**NOTE:** In PIM dense mode (PIM-DM), a DR is elected by the same process that PIM-SM uses. However, the only time that a DR has any effect in PIM-DM is when IGMPv1 is used on the interface. (IGMPv2 is the default.) In this case, the DR also functions as the IGMP Query Router because IGMPv1 does not have a Query Router election mechanism.

---

## Introduction to Static RP

- [Understanding Static RP on page 4506](#)

### Understanding Static RP

Protocol Independent Multicast (PIM) sparse mode is the most common multicast protocol used on the Internet. PIM sparse mode is the default mode whenever PIM is configured on any interface of the device. However, because PIM must not be configured on the network management interface, you must disable it on that interface.

Each any-source multicast (ASM) group has a shared tree through which receivers learn about new multicast sources and new receivers learn about all multicast sources. The rendezvous point (RP) router is the root of this shared tree and receives the multicast traffic from the source. To receive multicast traffic from the groups served by the RP, the device must determine the IP address of the RP for the source.

You can configure a static rendezvous point (RP) configuration that is similar to static routes. A static configuration has the benefit of operating in PIM version 1 or version 2. When you configure the static RP, the RP address that you select for a particular group must be consistent across all routers in a multicast domain.

One common way for the device to locate RPs is by static configuration of the IP address of the RP. A static configuration is simple and convenient. However, if the statically

defined RP router becomes unreachable, there is no automatic failover to another RP router. To remedy this problem, you can use anycast RP.

- Related Documentation**
- [Configuring Local PIM RPs on page 4554](#)
  - [Configuring the Static PIM RP Address on the Non-RP Routing Device on page 4556](#)

## Introduction to Anycast RP

- [Understanding RP Mapping with Anycast RP on page 4507](#)

### Understanding RP Mapping with Anycast RP

Having a single active rendezvous point (RP) per multicast group is much the same as having a single server providing any service. All traffic converges on this single point, although other servers are sitting idle, and convergence is slow when the resource fails. In multicast specifically, there might be closer RPs on the shared tree, so the use of a single RP is suboptimal.

For the purposes of load balancing and redundancy, you can configure anycast RP. You can use anycast RP within a domain to provide redundancy and RP load sharing. When an RP fails, sources and receivers are taken to a new RP by means of unicast routing. When you configure anycast RP, you bypass the restriction of having one active RP per multicast group, and instead deploy multiple RPs for the same group range. The RP routers share one unicast IP address. Sources from one RP are known to other RPs that use the Multicast Source Discovery Protocol (MSDP). Sources and receivers use the closest RP, as determined by the interior gateway protocol (IGP).

Anycast means that multiple RP routers share the same unicast IP address. Anycast addresses are advertised by the routing protocols. Packets sent to the anycast address are sent to the nearest RP with this address. Anycast addressing is a generic concept and is used in PIM sparse mode to add load balancing and service reliability to RPs.

Anycast RP is defined in Internet draft draft-ietf-mboned-anycast-rp-08.txt, *Anycast RP Mechanism Using PIM and MSDP*. To access Internet RFCs and drafts, go to the IETF website at <http://www.ietf.org>.

## Introduction to PIM Bootstrap Router

- [Understanding the PIM Bootstrap Router on page 4507](#)

### Understanding the PIM Bootstrap Router

To determine which router is the rendezvous point (RP), all routers within a PIM sparse-mode domain collect bootstrap messages. A PIM sparse-mode domain is a group

of routers that all share the same RP router. The domain bootstrap router initiates bootstrap messages, which are sent hop by hop within the domain. The routers use bootstrap messages to distribute RP information dynamically and to elect a bootstrap router when necessary.

**Related  
Documentation**

- [Configuring PIM Bootstrap Properties for IPv4 or IPv6](#)

---

## Introduction to PIM Filtering

---

- [Understanding Multicast Message Filters on page 4508](#)
- [Filtering MAC Addresses on page 4509](#)
- [Filtering RP and DR Register Messages on page 4509](#)

### Understanding Multicast Message Filters

Multicast sources and routers generate a considerable number of control messages, especially when using PIM sparse mode. These messages form distribution trees, locate rendezvous points (RPs) and designated routers (DRs), and transition from one type of tree to another. In most cases, this multicast messaging system operates transparently and efficiently. However, in some configurations, more control over the sending and receiving of multicast control messages is necessary.

You can configure multicast filtering to control the sending and receiving of multicast control messages.

To prevent unauthorized groups and sources from registering with an RP router, you can define a routing policy to reject PIM register messages from specific groups and sources and configure the policy on the designated router or the RP router.

- If you configure the reject policy on an RP router, it rejects incoming PIM register messages from the specified groups and sources. The RP router also sends a register stop message by means of unicast to the designated router. On receiving the register stop message, the designated router sends periodic null register messages for the specified groups and sources to the RP router.
- If you configure the reject policy on a designated router, it stops sending PIM register messages for the specified groups and sources to the RP router.

**NOTE:** If you have configured the reject policy on an RP router, we recommend that you configure the same policy on all the RP routers in your multicast network.

---

**NOTE:** If you delete a group and source address from the reject policy configured on an RP router and commit the configuration, the RP router will register the group and source only when the designated router sends a null register message.

---

- Related Documentation**
- [Filtering MAC Addresses on page 4509](#)
  - [Filtering RP and DR Register Messages on page 4509](#)
  - [Filtering MSDP SA Messages on page 4528](#)

## Filtering MAC Addresses

When a router is exclusively configured with multicast protocols on an interface, multicast sets the interface media access control (MAC) filter to multicast promiscuous mode, and the number of multicast groups is unlimited. However, when the router is not exclusively used for multicasting and other protocols such as OSPF, Routing Information Protocol version 2 (RIPv2), or Network Time Protocol (NTP) are configured on an interface, each of these protocols individually requests that the interface program the MAC filter to pick up its respective multicast group only. In this case, without multicast configured on the interface, the maximum number of multicast MAC filters is limited to 20. For example, the maximum number of interface MAC filters for protocols such as OSPF (multicast group 224.0.0.5) is 20, unless a multicast protocol is also configured on the interface.

No configuration is necessary for MAC filters.

## Filtering RP and DR Register Messages

You can filter Protocol Independent Multicast (PIM) register messages sent from the designated router (DR) or to the rendezvous point (RP). The PIM RP keeps track of all active sources in a single PIM sparse mode domain. In some cases, more control over which sources an RP discovers, or which sources a DR notifies other RPs about, is desired. A high degree of control over PIM register messages is provided by RP and DR register message filtering. Message filtering also prevents unauthorized groups and sources from registering with an RP router.

Register messages that are filtered at a DR are not sent to the RP, but the sources are available to local users. Register messages that are filtered at an RP arrive from source DRs, but are ignored by the router. Sources on multicast group traffic can be limited or directed by using RP or DR register message filtering alone or together.

If the action of the register filter policy is to discard the register message, the router needs to send a register-stop message to the DR. Register-stop messages are throttled to prevent malicious users from triggering them on purpose to disrupt the routing process.

Multicast group and source information is encapsulated inside unicast IP packets. This feature allows the router to inspect the multicast group and source information before sending or accepting the PIM register message.

Incoming register messages to an RP are passed through the configured register message filtering policy before any further processing. If the register message is rejected, the RP router sends a register-stop message to the DR. When the DR receives the register-stop message, the DR stops sending register messages for the filtered groups and sources to the RP. Two fields are used for register message filtering:

- Group multicast address

- Source address

The syntax of the existing policy statements is used to configure the filtering on these two fields. The **route-filter** statement is useful for multicast group address filtering, and the **source-address-filter** statement is useful for source address filtering. In most cases, the action is to **reject** the register messages, but more complex filtering policies are possible.

Filtering cannot be performed on other header fields, such as DR address, protocol, or port. In some configurations, an RP might not send register-stop messages when the policy action is to discard the register messages. This has no effect on the operation of the feature, but the router will continue to receive register messages.

When anycast RP is configured, register messages can be sent or received by the RP. All the RPs in the anycast RP set need to be configured with the same RP register message filtering policies. Otherwise, it might be possible to circumvent the filtering policy.

## Understanding Multicast Rendezvous Points, Shared Trees, and Rendezvous-Point Trees

In a shared tree, the root of the distribution tree is a router, not a host, and is located somewhere in the core of the network. In the primary sparse mode multicast routing protocol, Protocol Independent Multicast sparse mode (PIM SM), the core router at the root of the shared tree is the rendezvous point (RP). Packets from the upstream source and join messages from the downstream routers “rendezvous” at this core router.

In the RP model, other routers do not need to know the addresses of the sources for every multicast group. All they need to know is the IP address of the RP router. The RP router discovers the sources for all multicast groups.

The RP model shifts the burden of finding sources of multicast content from each router (the (S,G) notation) to the network (the (\*,G) notation knows only the RP). Exactly how the RP finds the unicast IP address of the source varies, but there must be some method to determine the proper source for multicast content for a particular group.

Consider a set of multicast routers without any active multicast traffic for a certain group. When a router learns that an interested receiver for that group is on one of its directly connected subnets, the router attempts to join the distribution tree for that group back to the RP, not to the actual source of the content.

To join the shared tree, or *rendezvous-point tree (RPT)* as it is called in PIM sparse mode, the router must do the following:

- Determine the IP address of the RP for that group. Determining the address can be as simple as static configuration in the router, or as complex as a set of nested protocols.
- Build the shared tree for that group. The router executes an RPF check on the RP address in its routing table, which produces the interface closest to the RP. The router now detects that multicast packets from this RP for this group need to flow into the router on this RPF interface.
- Send a join message out on this interface using the proper multicast protocol (probably PIM sparse mode) to inform the upstream router that it wants to join the shared tree for that group. This message is a (\*,G) join message because S is not known. Only the RP is known, and the RP is not actually the source of the multicast packets. The router receiving the (\*,G) join message adds the interface on which the message was received to its outgoing interface list (OIL) for the group and also performs an RPF check on the RP address. The upstream router then sends a (\*,G) join message out from the RPF interface toward the source, informing the upstream router that it also wants to join the group.

Each upstream router repeats this process, propagating join messages from the RPF interface, building the shared tree as it goes. The process stops when the join message reaches one of the following:

- The RP for the group that is being joined
- A router along the RPT that already has a multicast forwarding state for the group that is being joined

In either case, the branch is created, and packets can flow from the source to the RP and from the RP to the receiver. Note that there is no guarantee that the shared tree (RPT) is the shortest path tree to the source. Most likely it is not. However, there are ways to “migrate” a shared tree to an SPT once the flow of packets begins. In other words, the forwarding state can transition from (\*,G) to (S,G). The formation of both types of tree depends heavily on the operation of the RPF check and the RPF table.

- *Understanding Multicast Reverse Path Forwarding*

## Building an RPT Between the RP and Receivers

The RPT is the path between the RP and receivers (hosts) in a multicast group (see [Figure 164 on page 4512](#)). The RPT is built by means of a PIM join message from a receiver's DR:

1. A receiver sends a request to join group (G) in an Internet Group Management Protocol (IGMP) host membership report. A PIM sparse-mode router, the receiver's DR, receives

the report on a directly attached subnet and creates an RPT branch for the multicast group of interest.

2. The receiver's DR sends a PIM join message to its RPF neighbor, the next-hop address in the RPF table, or the unicast routing table.
3. The PIM join message travels up the tree and is multicast to the ALL-PIM-ROUTERS group (224.0.0.13). Each router in the tree finds its RPF neighbor by using either the RPF table or the unicast routing table. This is done until the message reaches the RP and forms the RPT. Routers along the path set up the multicast forwarding state to forward requested multicast traffic back down the RPT to the receiver.

**Figure 164: Building an RPT Between the RP and the Receiver**

## PIM Sparse Mode Source Registration

The RPT is a unidirectional tree, permitting traffic to flow down from the RP to the receiver in one direction. For multicast traffic to reach the receiver from the source, another branch of the distribution tree, called the shortest-path tree, needs to be built from the source's DR to the RP.

The shortest-path tree is created in the following way:

1. The source becomes active, sending out multicast packets on the LAN to which it is attached. The source's DR receives the packets and encapsulates them in a PIM register message, which it sends to the RP router (see [Figure 165 on page 4513](#)).
2. When the RP router receives the PIM register message from the source, it sends a PIM join message back to the source.

Figure 165: PIM Register Message and PIM Join Message Exchanged

3. The source's DR receives the PIM join message and begins sending traffic down the SPT toward the RP router (see [Figure 166 on page 4514](#)).
4. Once traffic is received by the RP router, it sends a register stop message to the source's DR to stop the register process.

Figure 166: Traffic Sent from the Source to the RP Router

- The RP router sends the multicast traffic down the RPT toward the receiver (see [Figure 167 on page 4514](#)).

Figure 167: Traffic Sent from the RP Router Toward the Receiver

## Multicast Shortest-Path Tree

The distribution tree used for multicast is rooted at the source and is the shortest-path tree (SPT) as well. Consider a set of multicast routers without any active multicast traffic for a certain group (that is, they have no multicast forwarding state for that group). When a router learns that an interested receiver for that group is on one of its directly connected subnets, the router attempts to join the tree for that group.

To join the distribution tree, the router determines the unicast IP address of the source for that group. This address can be a simple static configuration on the router, or as complex as a set of protocols.

To build the SPT for that group, the router executes an a reverse path forwarding (RPF) check on the source address in its routing table. The RPF check produces the interface closest to the source, which is where multicast packets from this source for this group need to flow into the router.

The router next sends a join message out on this interface using the proper multicast protocol to inform the upstream router that it wants to join the distribution tree for that group. This message is an (S,G) join message because both S and G are known. The router receiving the (S,G) join message adds the interface on which the message was received to its output interface list (OIL) for the group and also performs an RPF check on the source address. The upstream router then sends an (S,G) join message out on the RPF interface toward the source, informing the upstream router that it also wants to join the group.

Each upstream router repeats this process, propagating joins out on the RPF interface, building the SPT as it goes. The process stops when the join message does one of two things:

- Reaches the router directly connected to the host that is the source.
- Reaches a router that already has multicast forwarding state for this source-group pair.

In either case, the branch is created, each of the routers has multicast forwarding state for the source-group pair, and packets can flow down the distribution tree from source to receiver. The RPF check at each router makes sure that the tree is an SPT.

SPTs are always the shortest path, but they are not necessarily short. That is, sources and receivers tend to be on the periphery of a router network, not on the backbone, and multicast distribution trees have a tendency to sprawl across almost every router in the network. Because multicast traffic can overwhelm a slow interface, and one packet can easily become a hundred or a thousand on the opposite side of the backbone, it makes sense to provide a shared tree as a distribution tree so that the multicast source can be located more centrally in the network, on the backbone. This sharing of distribution trees with roots in the core network is accomplished by a multicast rendezvous point.

## SPT Cutover

Instead of continuing to use the SPT to the RP and the RPT toward the receiver, a direct SPT is created between the source and the receiver in the following way:

1. Once the receiver's DR receives the first multicast packet from the source, the DR sends a PIM join message to its RPF neighbor (see [Figure 168 on page 4516](#)).
2. The source's DR receives the PIM join message, and an additional (S,G) state is created to form the SPT.
3. Multicast packets from that particular source begin coming from the source's DR and flowing down the new SPT to the receiver's DR. The receiver's DR is now receiving two copies of each multicast packet sent by the source—one from the RPT and one from the new SPT.

**Figure 168: Receiver DR Sends a PIM Join Message to the Source**

4. To stop duplicate multicast packets, the receiver's DR sends a PIM prune message toward the RP router, letting it know that the multicast packets from this particular source coming in from the RPT are no longer needed (see [Figure 169 on page 4517](#)).

**Figure 169: PIM Prune Message Is Sent from the Receiver's DR Toward the RP Router**

5. The PIM prune message is received by the RP router, and it stops sending multicast packets down to the receiver's DR. The receiver's DR is getting multicast packets only for this particular source over the new SPT. However, multicast packets from the source are still arriving from the source's DR toward the RP router (see [Figure 170 on page 4517](#)).

**Figure 170: RP Router Receives PIM Prune Message**

6. To stop the unneeded multicast packets from this particular source, the RP router sends a PIM prune message to the source's DR (see [Figure 171 on page 4518](#)).

**Figure 171: RP Router Sends a PIM Prune Message to the Source DR**

7. The receiver's DR now receives multicast packets only for the particular source from the SPT (see [Figure 172 on page 4518](#)).

**Figure 172: Source's DR Stops Sending Duplicate Multicast Packets Toward the RP Router**

## SPT Cutover Control

In some cases, the last-hop router needs to stay on the shared tree to the RP and not transition to a direct SPT to the source. You might not want the last-hop router to transition when, for example, a low-bandwidth multicast stream is forwarded from the RP to a last-hop router. All routers between last hop and source must maintain and refresh the SPT state. This can become a resource-intensive activity that does not add much to the network efficiency for a particular pair of source and multicast group addresses.

In these cases, you configure an SPT threshold policy on the last-hop router to control the transition to a direct SPT. An SPT cutover threshold of infinity applied to a source-group address pair means the last-hop router will never transition to a direct SPT. For all other source-group address pairs, the last-hop router transitions immediately to a direct SPT rooted at the source DR.

---

## Introduction to IGMP

- [Understanding Group Membership Protocols on page 4519](#)
- [Understanding IGMP on page 4521](#)

## Understanding Group Membership Protocols

There is a big difference between the multicast protocols used between host and router and between the multicast routers themselves. Hosts on a given subnetwork need to inform their router only whether or not they are interested in receiving packets from a certain multicast group. The source host needs to inform its routers only that it is the source of traffic for a particular multicast group. In other words, no detailed knowledge of the distribution tree is needed by any hosts; only a group membership protocol is needed to inform routers of their participation in a multicast group. Between adjacent routers, on the other hand, the multicast routing protocols must avoid loops as they build a detailed sense of the network topology and distribution tree from source to leaf. So, different multicast protocols are used for the host-router portion and the router-router portion of the multicast network.

Multicast group membership protocols enable a router to detect when a host on a directly attached subnet, typically a LAN, wants to receive traffic from a certain multicast group. Even if more than one host on the LAN wants to receive traffic for that multicast group, the router sends only one copy of each packet for that multicast group out on that interface, because of the inherent broadcast nature of LANs. When the multicast group membership protocol informs the router that there are no interested hosts on the subnet, the packets are withheld and that leaf is pruned from the distribution tree.

The Internet Group Management Protocol (IGMP) and the Multicast Listener Discovery (MLD) Protocol are the standard IP multicast group membership protocols: IGMP and MLD have several versions that are supported by hosts and routers:

- IGMPv1—The original protocol defined in RFC 1112. An explicit join message is sent to the router, but a timeout is used to determine when hosts leave a group. This process wastes processing cycles on the router, especially on older or smaller routers.
- IGMPv2—Defined in RFC 2236. Among other features, IGMPv2 adds an explicit leave message to the join message so that routers can more easily determine when a group has no interested listeners on a LAN.
- IGMPv3—Defined in RFC 3376. Among other features, IGMPv3 optimizes support for a single source of content for a multicast group, or *source-specific multicast (SSM)*.
- MLDv1—Defined in RFC 2710. MLDv1 is similar to IGMPv2.
- MLDv2—Defined in RFC 3810. MLDv2 similar to IGMPv3.

The various versions of IGMP and MLD are backward compatible. It is common for a router to run multiple versions of IGMP and MLD on LAN interfaces. Backward compatibility is achieved by dropping back to the most basic of all versions run on a LAN. For example, if one host is running IGMPv1, any router attached to the LAN running IGMPv2 can drop back to IGMPv1 operation, effectively eliminating the IGMPv2 advantages. Running multiple IGMP versions ensures that both IGMPv1 and IGMPv2 hosts find peers for their versions on the router.

**CAUTION:** On MX Series platforms, IGMPv2 and IGMPv3 cannot be configured together on the same interface. Configuring both together causes unexpected behavior in multicast traffic forwarding.

---

## Understanding IGMP

The IPv4 address scheme assigns class D addresses for IP multicast. IGMP is the protocol that uses these addresses, which can be in the range 224.0.0.0 to 239.255.255.255. The following addresses have specific functions or are unavailable:

- 224.0.0.0 is reserved—you cannot assign it to a group.
- 224.0.0.1 is the all-hosts address—a packet sent to this address reaches all hosts on a subnet.
- 224.0.0.2 is the all-routers address—a packet sent to this address reaches all routers on a subnet.

This implementation of IGMP complies with IGMP versions 1, 2, and 3. IGMPv3 supports source-specific join and leave messages and is backward compatible with IGMPv1 and IGMPv2.

IGMPv2 mode interfaces exchange the following types of messages between routers and hosts:

- Group membership queries
- Group membership reports
- Leave group membership messages

IGMPv3 mode interfaces exchange the following types of messages with IGMPv3 hosts:

- Group membership queries
- IGMPv3 group membership reports

IGMP manages the membership of hosts and routers in multicast groups. IP hosts use IGMP to report their multicast group memberships to any immediately neighboring multicast routers. Multicast routers use IGMP to learn, for each of their attached physical networks, which groups have members.

A router receives explicit join and prune messages from those neighboring routers that have downstream group members. When PIM is the multicast protocol in use, IGMP begins the process as follows:

1. To join a multicast group, G, a host conveys its membership information through IGMP.
2. The router then forwards data packets addressed to a multicast group G to only those interfaces on which explicit join messages have been received.
3. A designated router (DR) sends periodic join and prune messages toward a group-specific rendezvous point (RP) for each group for which it has active members. One or more routers are automatically or statically designated as the RP, and all routers must explicitly join through the RP.
4. Each router along the path toward the RP builds a wild card (any-source) state for the group and sends join and prune messages toward the RP.

The term *route entry* is used to refer to the state maintained in a router to represent the distribution tree.

A route entry can include such fields as:

- source address
- group address
- incoming interface from which packets are accepted
- list of outgoing interfaces to which packets are sent
- timers
- flag bits

The wild card route entry's incoming interface points toward the RP.

The outgoing interfaces point to the neighboring downstream routers that have sent join and prune messages toward the RP as well as the directly connected hosts that have requested membership to group G.

5. This state creates a shared, RP-centered, distribution tree that reaches all group members.

IGMP is also used as the transport for several related multicast protocols (for example, Distance Vector Multicast Routing Protocol [DVMRP] and Protocol Independent Multicast version 1 [PIMv1]).

IGMP is an integral part of IP and must be enabled on all routers and hosts that need to receive IP multicast traffic.

For each attached network, a multicast router can be either a querier or a nonquerier. The querier router periodically sends general query messages to solicit group membership information. Hosts on the network that are members of a multicast group send report messages. When a host leaves a group, it sends a leave group message.

IGMP version 3 (IGMPv3) supports inclusion and exclusion lists. Inclusion lists enable you to specify which sources can send to a multicast group. This type of multicast group is called a source-specific multicast (SSM) group, and its multicast address is 232/8.

IGMPv3 provides support for source filtering. For example, a router can specify particular routers from which it accepts or rejects traffic. With IGMPv3, a multicast router can learn which sources are of interest to neighboring routers.

Exclusion mode works the opposite of an inclusion list. It allows any source but the ones listed to send to the SSM group.

IGMPv3 interoperates with versions 1 and 2 of the protocol. However, to remain compatible with older IGMP hosts and routers, IGMPv3 routers must also implement versions 1 and 2 of the protocol. IGMPv3 supports the following membership-report record types: mode is allowed, allow new sources, and block old sources.

## Introduction to IGMP Snooping

---

- [IGMP Snooping Overview on page 4523](#)

### IGMP Snooping Overview

With IGMP snooping enabled, a switch monitors the IGMP (Internet Group Management Protocol) traffic between hosts and multicast routers and uses what it learns to forward multicast traffic to only the downstream interfaces that are connected to interested receivers. This conserves bandwidth by allowing the switch to send multicast traffic to only those interfaces that are connected to devices that want to receive the traffic (instead of flooding the traffic to all the downstream VLAN interfaces).

This IGMP snooping topic includes:

- [How IGMP Snooping Works on page 4523](#)
- [How IGMP Snooping Works with Routed VLAN Interfaces on page 4524](#)
- [How Hosts Join and Leave Multicast Groups on page 4524](#)
- [IGMP Snooping and Forwarding Interfaces on page 4524](#)
- [General Forwarding Rules on page 4525](#)
- [Using a Switch as an IGMP Querier on page 4525](#)

---

### How IGMP Snooping Works

---

A switch usually learns unicast MAC addresses by checking the source address field of the frames it receives and then sends any traffic for that unicast address only to the appropriate interface. However, a multicast MAC address can never be the source address for a packet. As a result, when a switch receives traffic for a multicast destination address, it floods the traffic on the relevant VLAN, which can cause a significant amount of traffic to be sent unnecessarily.

IGMP snooping prevents this flooding. When you enable IGMP snooping, the switch monitors IGMP packets between receivers and multicast routers and uses the content of the packets to build a multicast cache table—a database of multicast groups and the interfaces that are connected to members of the groups. When the switch receives multicast packets, it uses the cache table to selectively forward the traffic to only the interfaces that are connected to members of the appropriate multicast groups.

**NOTE:** IGMP snooping is enabled by default on the default VLAN only. With versions of Junos OS for the QFX Series previous to 13.2, IGMP snooping is enabled by default on all VLANs.

**NOTE:** You cannot configure IGMP snooping on a secondary (private) VLAN.

### How IGMP Snooping Works with Routed VLAN Interfaces

---

A switch can use a routed VLAN interface (RVI) to forward traffic between VLANs that connect to it. IGMP snooping works with Layer 2 interfaces and RVIs to forward multicast traffic in a switched network.

When a switch receives a multicast packet, its Packet Forwarding Engines perform a multicast lookup on the packet to determine how to forward the packet to its local interfaces. From the results of the lookup, each Packet Forwarding Engine extracts a list of Layer 3 interfaces that have ports local to the Packet Forwarding Engine. If the list includes an RVI, the switch provides a bridge multicast group ID for the RVI to the Packet Forwarding Engine.

For VLANs that include multicast receivers, the bridge multicast ID includes a sub-next-hop ID, which identifies the Layer 2 interfaces in the VLAN that are interested in receiving the multicast stream. The Packet Forwarding Engine then forwards multicast traffic to bridge multicast IDs that have multicast receivers for a given multicast group.

### How Hosts Join and Leave Multicast Groups

---

Hosts can join multicast groups in two ways:

- By sending an unsolicited IGMP join message to a multicast router that specifies the IP multicast group that the host is attempting to join.
- By sending an IGMP join message in response to a general query from a multicast router.

A multicast router continues to forward multicast traffic to a VLAN provided that at least one host on that VLAN responds to the periodic general IGMP queries. For a host to remain a member of a multicast group, therefore, it must continue to respond to the periodic general IGMP queries.

To leave a multicast group, either a host cannot respond to the periodic general IGMP queries, which results in a “silent leave” (the only leave option for IGMPv1), or a host can send a group-specific IGMPv2 leave message.

### IGMP Snooping and Forwarding Interfaces

---

To determine how to forward multicast traffic, a switch with IGMP snooping enabled maintains information about the following interfaces in its multicast forwarding table:

- Multicast-router interfaces—These interfaces lead toward multicast routers or IGMP queriers.
- Group-member interfaces—These interfaces lead toward hosts that are members of multicast groups.

The switch learns about these interfaces by monitoring IGMP traffic. If an interface receives IGMP queries or Protocol Independent Multicast (PIM) updates, the switch adds the interface to its multicast forwarding table as a multicast-router interface. If an interface receives membership reports for a multicast group, the switch adds the interface to its multicast forwarding table as a group-member interface.

Table entries for interfaces that the switch learns about are subject to aging. For example, if a learned multicast-router interface does not receive IGMP queries or PIM hellos within a certain interval, the switch removes the entry for that interface from its multicast forwarding table.

**NOTE:** For a switch to learn multicast-router interfaces and group-member interfaces, an IGMP querier must exist in the network. This is often a multicast router, but if there is no multicast router on the local network, you can configure the switch itself to be an IGMP querier.

You can statically configure an interface to be a multicast-router interface or a group-member interface. The switch adds a static interface to its multicast forwarding table without having to learn about the interface, and the entry in the table is not subject to aging. You can have a mix of statically configured and dynamically learned interfaces on a switch.

### General Forwarding Rules

Multicast traffic received on a switch interface in a VLAN on which IGMP snooping is enabled is forwarded according to the following rules.

IGMP traffic is forwarded as follows:

- IGMP general queries received on a multicast-router interface are forwarded to all other interfaces in the VLAN.
- IGMP group-specific queries received on a multicast-router interface are forwarded to only those interfaces in the VLAN that are members of the group.
- IGMP reports received on a host interface are forwarded to multicast-router interfaces in the same VLAN, but not to the other host interfaces in the VLAN.

Multicast traffic that is not IGMP traffic is forwarded as follows:

- A multicast packet with a destination address of 224.0.0.0/24 is flooded to all other interfaces on the VLAN.
- An unregistered multicast packet—that is, a packet for a group that has no current members—is forwarded to all multicast-router interfaces in the VLAN.
- A registered multicast packet is forwarded only to those host interfaces in the VLAN that are members of the multicast group and to all multicast-router interfaces in the VLAN.

### Using a Switch as an IGMP Querier

If IGMP snooping is enabled on a pure Layer 2 local network (that is, Layer 3 is not enabled on the network), and there is not multicast router in the network, multicast traffic might not be properly forwarded through the network. This problem occurs if the local network is configured such that multicast traffic must be forwarded between switches in order to reach a multicast receiver. In this case, an upstream switch does not forward multicast traffic to a downstream switch (and therefore to the multicast receivers

attached to the downstream switch) because the downstream switch does not forward IGMP reports to the upstream switch. You can solve this problem by configuring one of the switches to be an IGMP querier. This switch sends periodic general query packets to all the switches in the network, which ensures that the snooping membership tables are updated and prevents any multicast traffic loss.

If you configure multiple switches to be IGMP queriers, the switch with the lowest (smallest) IGMP querier source address takes precedence and acts as the querier. Switches with higher IGMP querier source addresses stop sending IGMP queries unless they do not receive IGMP queries for 255 seconds. If a switch with a higher IGMP querier source address does not receive any IGMP queries during that period, it starts sending queries again.

To configure a standalone switch to act as an IGMP querier, enter the following:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name l2-querier source-address source address
```

To configure a QFabric Node device switch to act as an IGMP querier, enter the following:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name igmp-querier source-address source address
```

## Introduction to MSDP

---

- [Understanding MSDP on page 4526](#)
- [Filtering MSDP SA Messages on page 4528](#)

### Understanding MSDP

The Multicast Source Discovery Protocol (MSDP) is used to connect multicast routing domains. It typically runs on the same router as the Protocol Independent Multicast (PIM) sparse-mode rendezvous point (RP). Each MSDP router establishes adjacencies with internal and external MSDP peers similar to the way BGP establishes peers. These peer routers inform each other about active sources within the domain. When they detect active sources, the routers can send PIM sparse-mode explicit join messages to the active source.

The peer with the higher IP address passively listens to a well-known port number and waits for the side with the lower IP address to establish a Transmission Control Protocol (TCP) connection. When a PIM sparse-mode RP that is running MSDP becomes aware of a new local source, it sends source-active type, length, and values (TLVs) to its MSDP peers. When a source-active TLV is received, a peer-reverse-path-forwarding (peer-RPF) check (not the same as a multicast RPF check) is done to make sure that this peer is in the path that leads back to the originating RP. If not, the source-active TLV is dropped. This TLV is counted as a “rejected” source-active message.

The MSDP peer-RPF check is different from the normal RPF checks done by non-MSDP multicast routers. The goal of the peer-RPF check is to stop source-active messages from looping. Router R accepts source-active messages originated by Router S only from neighbor Router N or an MSDP mesh group member. For more information about configuring MSDP mesh groups, see [“Example: Configuring MSDP with Active Source Limits and Mesh Groups” on page 4622](#).

Router R locates its MSDP peer-RPF neighbor (Router N) deterministically. A series of rules is applied in a particular order to received source-active messages, and the first rule that applies determines the peer-RPF neighbor. All source-active messages from other routers are rejected.

The six rules applied to source-active messages originating at Router S received at Router R from Router X are as follows:

1. If Router X originated the source-active message (Router X is Router S), then Router X is also the peer-RPF neighbor, and its source-active messages are accepted.
2. If Router X is a member of the Router R mesh group, or is the configured peer, then Router X is the peer-RPF neighbor, and its source-active messages are accepted.
3. If Router X is the BGP next hop of the active multicast RPF route toward Router S (Router X installed the route on Router R), then Router X is the peer-RPF neighbor, and its source-active messages are accepted.
4. If Router X is an external BGP (EBGP) or internal BGP (IBGP) peer of Router R, and the last autonomous system (AS) number in the BGP AS-path to Router S is the same as Router X's AS number, then Router X is the peer-RPF neighbor, and its source-active messages are accepted.
5. If Router X uses the same next hop as the next hop to Router S, then Router X is the peer-RPF neighbor, and its source-active messages are accepted.
6. If Router X fits none of these criteria, then Router X is not an MSDP peer-RPF neighbor, and its source-active messages are rejected.

The MSDP peers that receive source-active TLVs can be constrained by BGP reachability information. If the AS path of the network layer reachability information (NLRI) contains the receiving peer's AS number prepended second to last, the sending peer is using the receiving peer as a next hop for this source. If the split horizon information is not being received, the peer can be pruned from the source-active TLV distribution list.

## Filtering MSDP SA Messages

Along with applying MSDP source active (SA) filters on all external MSDP sessions (in and out) to prevent SAs for groups and sources from leaking in and out of the network, you need to apply bootstrap router (BSR) filters. Applying a BSR filter to the boundary of a network prevents foreign BSR messages (which announce RP addresses) from leaking into your network. Since the routers in a PIM sparse-mode domain need to know the address of only one RP router, having more than one in the network can create issues.

If you did not use multicast scoping to create boundary filters for all customer-facing interfaces, you might want to use PIM join filters. Multicast scopes prevent the actual multicast data packets from flowing in or out of an interface. PIM join filters prevent PIM sparse-mode state from being created in the first place. Since PIM join filters apply only to the PIM sparse-mode state, it might be more beneficial to use multicast scoping to filter the actual data.

**NOTE:** When you apply firewall filters, firewall action modifiers, such as **log**, **sample**, and **count**, work only when you apply the filter on an inbound interface. The modifiers do not work on an outbound interface.

## Introduction to Source-Specific Multicast

---

- [Source-Specific Multicast Groups Overview on page 4528](#)
- [Understanding PIM Source-Specific Mode on page 4529](#)
- [PIM SSM on page 4530](#)

## Source-Specific Multicast Groups Overview

Source-specific multicast (SSM) is a service model that identifies session traffic by both source and group address. SSM implemented in Junos OS has the efficient explicit join procedures of Protocol Independent Multicast (PIM) sparse mode but eliminates the immediate shared tree and rendezvous point (RP) procedures using (\*,G) pairs. The (\*) is a wildcard referring to any source sending to group G, and "G" refers to the IP multicast group. SSM builds shortest-path trees (SPTs) directly represented by (S,G) pairs. The "S" refers to the source's unicast IP address, and the "G" refers to the specific multicast group address. The SSM (S,G) pairs are called channels to differentiate them from any-source multicast (ASM) groups. Although ASM supports both one-to-many and many-to-many communications, ASM's complexity is in its method of source discovery. For example, if you click a link in a browser, the receiver is notified about the group information, but not the source information. With SSM, the client receives both source and group information.

SSM is ideal for one-to-many multicast services such as network entertainment channels. However, many-to-many multicast services might require ASM.

To deploy SSM successfully, you need an end-to-end multicast-enabled network and applications that use an Internet Group Management Protocol version 3 (IGMPv3) or Multicast Listener Discovery version 2 (MLDv2) stack, or you need to configure SSM mapping from IGMPv1 or IGMPv2 to IGMPv3. An IGMPv3 stack provides the capability of a host operating system to use the IGMPv3 protocol. IGMPv3 is available for Windows XP, Windows Vista, and most UNIX operating systems.

SSM mapping allows operators to support an SSM network without requiring all hosts to support IGMPv3. This support exists in static (S,G) configurations, but SSM mapping also supports dynamic per-source group state information, which changes as hosts join and leave the group using IGMP.

SSM is typically supported with a subset of IGMPv3 and PIM sparse mode known as *PIM SSM*. Using SSM, a client can receive multicast traffic directly from the source. PIM SSM uses the PIM sparse-mode functionality to create an SPT between the client and the source, but builds the SPT without the help of an RP.

An SSM-configured network has distinct advantages over a traditionally configured PIM sparse-mode network. There is no need for shared trees or RP mapping (no RP is required), or for RP-to-RP source discovery through the Multicast Source Discovery Protocol (MSDP).

## Understanding PIM Source-Specific Mode

RFC 1112, the original multicast RFC, supported both many-to-many and one-to-many models. These came to be known collectively as any-source multicast (ASM) because ASM allowed one or many sources for a multicast group's traffic. However, an ASM network must be able to determine the locations of all sources for a particular multicast group whenever there are interested listeners, no matter where the sources might be located in the network. In ASM, the key function of *source discovery* is a required function of the network itself.

Multicast source discovery appears to be an easy process, but in sparse mode it is not. In dense mode, it is simple enough to flood traffic to every router in the whole network so that every router learns the source address of the content for that multicast group. However, the flooding presents scalability and network resource use issues and is not a viable option in sparse mode.

PIM sparse mode (like any sparse mode protocol) achieves the required source discovery functionality without flooding at the cost of a considerable amount of complexity. The RP routers must be added and must know all multicast sources, and complicated shared distribution trees must be built to the RPs.

In an environment where many sources come and go, such as for a videoconferencing service, ASM is appropriate. However, by ignoring the many-to-many model and focusing attention on the one-to-many source-specific multicast (SSM) model, several commercially promising multicast applications, such as television channel distribution over the Internet, might be brought to the Internet much more quickly and efficiently than if full ASM functionality were required of the network.

PIM SSM is simpler than PIM sparse mode because only the one-to-many model is supported. Initial commercial multicast Internet applications are likely to be available to *subscribers* (that is, receivers that issue join messages) from only a single source (a special case of SSM covers the need for a backup source). PIM SSM therefore forms a subset of PIM sparse mode. PIM SSM builds shortest-path trees (SPTs) rooted at the source immediately because in SSM, the router closest to the interested receiver host is informed of the unicast IP address of the source for the multicast traffic. That is, PIM SSM bypasses the RP connection stage through shared distribution trees, as in PIM sparse mode, and goes directly to the source-based distribution tree.

PIM SSM introduces new terms for many of the concepts in PIM sparse mode. PIM SSM can technically be used in the entire 224/4 multicast address range, although PIM SSM operation is guaranteed only in the 232/8 range (232.0.0/24 is reserved). The new SSM terms are appropriate for Internet video applications and are summarized in [Table 307 on page 4530](#).

**Table 307: ASM and SSM Terminology**

Term	Any-Source Multicast	Source-Specific Multicast
Address identifier	G	S,G
Address designation	group	channel
Receiver operations	join, leave	subscribe, unsubscribe
Group address range	224/4 excluding 232/8	224/4 (guaranteed only for 232/8)

Although PIM SSM describes receiver operations as *subscribe* and *unsubscribe*, the same PIM sparse mode join and leave messages are used by both forms of the protocol. The terminology change distinguishes ASM from SSM even though the receiver messages are identical.

## PIM SSM

PIM source-specific multicast (SSM) uses a subset of PIM sparse mode and IGMP version 3 (IGMPv3) to allow a client to receive multicast traffic directly from the source. PIM SSM uses the PIM sparse-mode functionality to create an SPT between the receiver and the source, but builds the SPT without the help of an RP.

By default, the SSM group multicast address is limited to the IP address range from 232.0.0.0 through 232.255.255.255. However, you can extend SSM operations into another Class D range by including the **ssm-groups** statement at the **[edit routing-options multicast]** hierarchy level. The default SSM address range from 232.0.0.0 through 232.255.255.255 cannot be used in the **ssm-groups** statement. This statement is for adding other multicast addresses to the default SSM group addresses. This statement does not override the default SSM group address range.

You can also configure the Junos OS to accept any-source multicast (ASM) join messages (\*,G) for group addresses that are within the default or configured range of source-specific

multicast (SSM) groups. This allows you to support a mix of any-source and source-specific multicast groups simultaneously.

An SSM-configured network has distinct advantages over a traditionally configured PIM sparse-mode network. There is no need for shared trees or RP mapping (no RP is required), or for RP-to-RP source discovery through MSDP.

Deploying SSM is easy. You need to configure PIM sparse mode on all router interfaces and issue the necessary SSM commands, including specifying IGMPv3 on the receiver's LAN. If PIM sparse mode is not explicitly configured on both the source and group member interfaces, multicast packets are not forwarded. Source lists, supported in IGMPv3, are used in PIM SSM. As sources become active and start sending multicast packets, interested receivers in the SSM group receive the multicast packets.

In a PIM SSM-configured network, a host subscribes to an SSM channel (by means of IGMPv3), announcing a desire to join group G and source S (see [Figure 173 on page 4531](#)). The directly connected PIM sparse-mode router, the receiver's DR, sends an (S,G) join message to its RPF neighbor for the source. Notice in [Figure 173 on page 4531](#) that the RP is not contacted in this process by the receiver, as would be the case in normal PIM sparse-mode operations.

**Figure 173: Receiver Announces Desire to Join Group G and Source S**

The (S,G) join message initiates the source tree and then builds it out hop by hop until it reaches the source. In [Figure 174 on page 4531](#), the source tree is built across the network to Router 3, the last-hop router connected to the source.

**Figure 174: Router 3 (Last-Hop Router) Joins the Source Tree**

Using the source tree, multicast traffic is delivered to the subscribing host (see [Figure 175 on page 4532](#)).

Figure 175: (S,G) State Is Built Between the Source and the Receiver

To configure additional SSM groups, include the **ssm-groups** statement at the **[edit routing-options multicast]** hierarchy level.

## Introduction to Multicast VLAN Registration

- [Understanding Multicast VLAN Registration on page 4532](#)

### Understanding Multicast VLAN Registration

Multicast VLAN registration (MVR) enables you to efficiently distribute IPTV multicast streams across an Ethernet ring-based Layer 2 network and reduce the amount of bandwidth consumed by this multicast traffic.

In a standard Layer 2 network, a multicast stream received on one VLAN is never distributed to interfaces outside that VLAN. If hosts in multiple VLANs request the same multicast stream, a separate copy of that multicast stream is distributed to the requesting VLANs.

MVR introduces the concept of a *multicast source VLAN* (MVLAN), which is created by MVR and becomes the only VLAN over which IPTV multicast traffic flows throughout the Layer 2 network. A Juniper Networks EX Series switch or QFX Series switch that is enabled for MVR selectively forwards IPTV multicast traffic from interfaces on the MVLAN (source interfaces) to hosts that are connected to interfaces that are not part of the MVLAN. These interfaces are known as *MVR receiver ports*. The MVR receiver ports can receive traffic from a port on the MVLAN but cannot send traffic onto the MVLAN, and they remain in their own VLANs for bandwidth and security reasons.

This topic includes:

- [How MVR Works on page 4532](#)

#### How MVR Works

In many ways, MVR is similar to IGMP snooping. Both MVR and IGMP snooping monitor IGMP join and leave messages and build forwarding tables based on the media access control (MAC) addresses of the hosts sending those IGMP messages. Whereas IGMP snooping operates within a given VLAN to regulate multicast traffic, MVR can operate

with hosts on different VLANs in a Layer 2 network to selectively deliver IPTV multicast traffic to requesting hosts, thereby reducing the amount of bandwidth needed to forward multicast traffic.

When you configure an MVLAN, you assign a range of multicast group addresses to it. You then configure other VLANs to be MVR receiver VLANs, which receive multicast streams from the MVLAN. The MVR receiver ports comprise all the interfaces that exist on any of the MVR receiver VLANs. Interfaces that are on the MVLAN itself cannot be MVR receiver ports for that MVLAN.

**NOTE:** MVR is supported on VLANs running IGMP version 2 (IGMPv2) only.

### ***MVR Modes***

MVR operates in two modes: MVR transparent mode and MVR proxy mode. Both modes enable MVR to forward only one copy of a multicast stream to the Layer 2 network.

- [MVR Transparent Mode on page 4533](#)
- [MVR Proxy Mode on page 4533](#)

### ***MVR Transparent Mode***

In MVR transparent mode, the switch receives one copy of each IPTV multicast stream and then replicates the stream only to those hosts that want to receive it, while forwarding all other types of multicast traffic without modification. Transparent mode is the default mode.

The switch handles IGMP packets destined for both the multicast source VLAN and multicast receiver VLANs in the same way that it handles them when MVR is not being used. That is, when a host on a VLAN sends IGMP join and leave messages, the switch floods the messages to all router interfaces in the VLAN. Similarly, when a VLAN receives IGMP queries from its router interfaces, it floods the queries to all interfaces in the VLAN.

If a host on a multicast receiver port joins an MVR group on the multicast receiver VLAN, the appropriate bridging entry is added and the MVLAN forwards that group's IPTV multicast traffic on that port (even though that port is not in the MVLAN). Likewise, if a host on a multicast receiver port leaves an MVR group on the multicast receiver VLAN, the appropriate bridging entry is deleted, and the MVLAN stops forwarding that group's IPTV multicast traffic on that port. In addition, you can configure the switch to statically install the bridging entries on the multicast receiver VLAN.

### ***MVR Proxy Mode***

When you use MVR in proxy mode, the switch acts as a proxy for any MVR group in both the upstream and downstream directions. In the downstream direction, the switch acts as the querier for the groups in the MVR receiver VLANs. In the upstream direction, the switch originates the IGMP reports and leaves and answers IGMP queries from multicast routers. When the MVR receiver VLANs receive IGMP joins and leaves, the switch creates bridging entries on the MVLAN as needed, as it does in MVR transparent mode. In addition, the switch sends out IGMP joins and leaves on the MVLAN based on these bridging entries.

Configuring MVR proxy mode on the MVLAN automatically enables IGMP snooping proxy mode on all MVR receiver VLANs as well as on the MVLAN.

---

- [Optimizing the Number of Multicast Flows on QFabric Systems on page 4536](#)

## Optimizing the Number of Multicast Flows on QFabric Systems

Because of the distributed nature of QFabric systems, the default configuration does not allow the maximum number of supported Layer 3 multicast flows to be created. To allow a QFabric system to create the maximum number of supported flows, configure the following statement:

```
set fabric routing-options multicast fabric-optimized-distribution
```

After configuring this statement, you must reboot the QFabric Director group to make the change take effect.

- [Disabling PIM on page 4540](#)

## Changing the PIM Version

All systems on a subnet must run the same version of PIM.

The default PIM version can be version 1 or version 2, depending on the mode you are configuring. PIMv1 is the default for rendezvous point (RP) mode (at the **[edit protocols pim rp static address address]** hierarchy level). However, PIMv2 is the default for interface mode (at the **[edit protocols pim interface interface-name]** hierarchy level). Explicitly configured versions override the defaults.

To configure the PIM version, include the **version** statement:

```
version (1 | 2);
```

## Modifying the PIM Hello Interval

Routing devices send hello messages at a fixed interval on all PIM-enabled interfaces. By using hello messages, routing devices advertise their existence as PIM routing devices on the subnet. With all PIM-enabled routing devices advertised, a single designated router for the subnet is established.

When a routing device is configured for PIM, it sends a hello message at a 30-second default interval. The interval range is from 0 through 255. When the interval counts down to 0, the routing device sends another hello message, and the timer is reset. A routing device that receives no response from a neighbor in 3.5 times the interval value drops the neighbor. In the case of a 30-second interval, the amount of time a routing device waits for a response is 105 seconds.

If a PIM hello message contains the hold-time option, the neighbor timeout is set to the hold-time sent in the message. If a PIM hello message does not contain the hold-time option, the neighbor timeout is set to the default hello hold time.

To modify how often the routing device sends hello messages out of an interface:

1. This example shows the configuration for the routing instance. Configure the interface globally or in the routing instance.

```
[edit routing-instances PIM.master protocols pim interface fe-3/0/2.0]
user@host# set hello-interval 255
```

2. Verify the configuration by checking the **Hello Option Holdtime** field in the output of the **show pim neighbors detail** command.

```
user@host> show pim neighbors detail
Instance: PIM.master
Interface: fe-3/0/2.0
Address: 192.168.195.37, IPv4, PIM v2, Mode: Sparse
Hello Option Holdtime: 255 seconds
Hello Option DR Priority: 1
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported
Rx Join: Group Source Timeout
225.1.1.1 192.168.195.78 0
225.1.1.1 0

Interface: lo0.0
Address: 10.255.245.91, IPv4, PIM v2, Mode: Sparse
Hello Option Holdtime: 255 seconds
Hello Option DR Priority: 1
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported

Interface: pd-6/0/0.32768
Address: 0.0.0.0, IPv4, PIM v2, Mode: Sparse
Hello Option Holdtime: 255 seconds
Hello Option DR Priority: 0
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported
```

**Related Documentation** • [show pim neighbors on page 4895](#) in the [CLI Explorer](#)

## Preserving Multicast Performance by Disabling Response to the ping Utility

The ping utility uses ICMP Echo messages to verify connectivity to any device with an IP address. However, in the case of multicast applications, a single ping sent to a multicast address can degrade the performance of routers because the stream of packets is replicated multiple times.

You can disable the router's response to ping (ICMP Echo) packets sent to multicast addresses. The system responds normally to unicast ping packets.

To disable the router's response to ping packets sent to multicast addresses:

1. Include the **no-multicast-echo** statement:

```
[edit system]
user@host# set no-multicast-echo
```

2. Verify the configuration by checking the **echo drops with broadcast or multicast destination address** field in the output of the **show system statistics icmp** command.

```
user@host> show system statistics icmp

icmp:
0 drops due to rate limit
0 calls to icmp_error
0 errors not generated because old message was icmp
Output histogram:
echo reply: 21
0 messages with bad code fields
0 messages less than the minimum length
0 messages with bad checksum
0 messages with bad source address
0 messages with bad length
100 echo drops with broadcast or multicast destination address
0 timestamp drops with broadcast or multicast destination address
Input histogram:
echo: 21
21 message responses generated
```

## Configuring PIM Trace Options

Tracing operations record detailed messages about the operation of routing protocols, such as the various types of routing protocol packets sent and received, and routing policy actions. You can specify which trace operations are logged by including specific tracing flags. The following table describes the flags that you can include.

Flag	Description
<b>all</b>	Trace all operations.
<b>assert</b>	Trace assert messages, which are used to resolve which of the parallel routers connected to a multiaccess LAN is responsible for forwarding packets to the LAN.
<b>autorp</b>	Trace bootstrap, RP, and auto-RP messages.
<b>bidirectional-df-election</b>	Trace bidirectional PIM designated-forwarder (DF) election events.
<b>bootstrap</b>	Trace bootstrap messages, which are sent periodically by the PIM domain's bootstrap router and are forwarded, hop by hop, to all routers in that domain.
<b>general</b>	Trace general events.

Flag	Description
<b>graft</b>	Trace graft and graft acknowledgment messages.
<b>hello</b>	Trace hello packets, which are sent so that neighboring routers can discover one another.
<b>join</b>	Trace join messages, which are sent to join a branch onto the multicast distribution tree.
<b>mdt</b>	Trace messages related to multicast data tunnels.
<b>normal</b>	Trace normal events.
<b>nsr-synchronization</b>	Trace nonstop routing synchronization events
<b>packets</b>	Trace all PIM packets.
<b>policy</b>	Trace poison-route-reverse packets.
<b>prune</b>	Trace prune messages, which are sent to prune a branch off the multicast distribution tree.
<b>register</b>	Trace register and register-stop messages. Register messages are sent to the RP when a multicast source first starts sending to a group.
<b>route</b>	Trace routing information.
<b>rp</b>	Trace candidate RP advertisements.
<b>state</b>	Trace state transitions.
<b>task</b>	Trace task processing.
<b>timer</b>	Trace timer processing.

In the following example, tracing is enabled for all routing protocol packets. Then tracing is narrowed to focus only on PIM packets of a particular type.

To configure tracing operations for PIM:

1. (Optional) Configure tracing at the [**routing-options** hierarchy level to trace all protocol packets.

```
[edit routing-options traceoptions]
user@host# set file all-packets-trace
user@host# set flag all
```

2. Configure the filename for the PIM trace file.

```
[edit protocols pim traceoptions]
user@host# set file pim-trace
```

3. (Optional) Configure the maximum number of trace files.

```
[edit protocols pim traceoptions]  
user@host# set file files 5
```

4. (Optional) Configure the maximum size of each trace file.

```
[edit protocols pim traceoptions]  
user@host# set file size 1m
```

5. (Optional) Enable unrestricted file access.

```
[edit protocols pim traceoptions]  
user@host# set file world-readable
```

6. Configure tracing flags.

Suppose you are troubleshooting issues with PIM version 1 control packets that are received on an interface configured for PIM version 2. The following example shows how to trace messages associated with this problem.

```
[edit protocols pim traceoptions]  
user@host# set flag packets | match "Rx V1 Require V2"
```

7. View the trace file.

```
user@host> file list /var/log  
user@host> file show /var/log/pim-trace
```

## Disabling PIM

By default, when configured, the PIM protocol is enabled on all interfaces for all families. If desired, you can disable PIM at the protocol, interface, or family hierarchy levels.

The hierarchy in which you configure PIM is critical. In general, the most specific configuration takes precedence. However, if PIM is disabled at the protocol level, then any disable statements with respect to an interface or family are ignored.

For example, the order of precedence for disabling PIM on a particular interface family is:

1. If PIM is disabled at the **[edit protocols pim interface *interface-name* family]** hierarchy level, then PIM is disabled for that interface family.
2. If PIM is not configured at the **[edit protocols pim interface *interface-name* family]** hierarchy level, but is disabled at the **[edit protocols pim interface *interface-name*]** hierarchy level, then PIM is disabled for all families on the specified interface.
3. If PIM is not configured at either the **[edit protocols pim interface *interface-name* family]** hierarchy level or the **[edit protocols pim interface *interface-name*]** hierarchy level, but is disabled at the **[edit protocols pim]** hierarchy level, then the PIM protocol is disabled globally for all interfaces and all families.

The following sections describe how to disable PIM at the various hierarchy levels.

- [Disabling the PIM Protocol on page 4541](#)
- [Disabling PIM On an Interface on page 4541](#)
- [Disabling PIM for a Family on page 4542](#)
- [Disabling PIM for a Rendezvous Point on page 4542](#)

### Disabling the PIM Protocol

You can explicitly disable the PIM protocol. Disabling the PIM protocol disables the protocol for all interfaces and all families. This is accomplished at the **[edit protocols pim]** hierarchy level:

```
[edit protocols]
pim {
  disable;
}
```

To disable the PIM protocol:

1. Include the **disable** statement.
2. (Optional) Verify your configuration settings before committing them by using the **show protocols pim** command.

```
user@host# run show protocols pim
```

### Disabling PIM On an Interface

You can disable the PIM protocol on a per-interface basis. This is accomplished at the **[edit protocols pim interface *interface-name*]** hierarchy level:

```
[edit protocols]
pim {
  interface interface-name {
    disable;
  }
}
```

To disable PIM on an interface:

1. Include the **disable** statement.
2. (Optional) Verify your configuration settings before committing them by using the **show protocols pim** command.

```
user@host# run show protocols pim
```

### Disabling PIM for a Family

---

You can disable the PIM protocol on a per-family basis. This is accomplished at the **[edit protocols pim family]** hierarchy level:

```
[edit protocols]
pim {
  family inet {
    disable;
  }
  family inet6 {
    disable;
  }
}
```

To disable PIM for a family:

1. Include the **disable** statement.

```
user@host# set protocols pim family inet disable
user@host# set protocols pim family inet6 disable
```

2. (Optional) Verify your configuration settings before committing them by using the **show protocols pim** command.

```
user@host# run show protocols pim
```

### Disabling PIM for a Rendezvous Point

---

You can disable the PIM protocol for a rendezvous point (RP) on a per-family basis. This is accomplished at the **[edit protocols pim rp local family]** hierarchy level:

```
[edit protocols]
pim {
  rp {
    local {
      family inet {
        disable;
      }
      family inet6 {
        disable;
      }
    }
  }
}
```

To disable PIM for an RP family:

1. Use the **disable** statement.

```
user@host# set protocols pim rp local family inet disable
user@host# set protocols pim rp local family inet6 disable
```

2. (Optional) Verify your configuration settings before committing them by using the **show protocols pim** command.

```
user@host# run show protocols pim
```

## PIM Designated Router

- [Configuring Interface Priority for PIM Designated Router Selection on page 4543](#)
- [Configuring PIM Designated Router Election on Point-to-Point Links on page 4544](#)

### Configuring Interface Priority for PIM Designated Router Selection

A designated router (DR) sends periodic join messages and prune messages toward a group-specific rendezvous point (RP) for each group for which it has active members. When a Protocol Independent Multicast (PIM) router learns about a source, it originates a Multicast Source Discovery Protocol (MSDP) source-address message if it is the DR on the upstream interface.

By default, every PIM interface has an equal probability (priority 1) of being selected as the DR. Configuring the interface DR priority helps ensure that changing an IP address does not alter your forwarding model.

To configure the interface designated router priority:

1. This example shows the configuration for the routing instance. Configure the interface globally or in the routing instance.

```
[edit routing-instances PIM.master protocols pim interface ge-0/0/0.0 family inet]
user@host# set priority 5
```

2. Verify the configuration by checking the **Hello Option DR Priority** field in the output of the **show pim neighbors detail** command.

```
user@host> show pim neighbors detail
```

```
Instance: PIM.master
Interface: ge-0/0/0.0
Address: 192.168.195.37, IPv4, PIM v2, Mode: Sparse
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 5
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported
Rx Join: Group Source Timeout
225.1.1.1 192.168.195.78 0
225.1.1.1 0
```

```
Interface: lo0.0
Address: 10.255.245.91, IPv4, PIM v2, Mode: Sparse
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 1
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported
```

```
Interface: pd-6/0/0.32768
Address: 0.0.0.0, IPv4, PIM v2, Mode: Sparse
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 0
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported
```

  - [show pim neighbors on page 4895](#) in the CLI Explorer

## Configuring PIM Designated Router Election on Point-to-Point Links

To comply with the latest PIM drafts, enable designated router (DR) election on all PIM interfaces, including point-to-point (P2P) interfaces. (DR election is enabled by default on all other interfaces.) One of the two routers might join a multicast group on its P2P link interface. The DR on that link is responsible for initiating the relevant join messages.

To enable DR election on point-to-point interfaces:

1. On both point-to-point link routers, configure the router globally or in the routing instance. This example shows the configuration for the routing instance.  
  
[edit routing-instances PIM.master protocols pim]  
user@host# **set dr-election-on-p2p**
2. Verify the configuration by checking the **State** field in the output of the **show pim interfaces** command. The possible values for the **State** field are DR, NotDR, and P2P. When a point-to-point link interface is elected to be the DR, the interface state becomes DR instead of P2P.
3. If the **show pim interfaces** command continues to report the P2P state, consider running the **restart routing** command on both routers on the point-to-point link. Then recheck the state.

**CAUTION:** Do not restart a software process unless specifically asked to do so by your Juniper Networks customer support representative. Restarting a software process during normal operation of a routing platform could cause interruption of packet forwarding and loss of data.

[edit]  
user@host# **run restart routing**

## PIM Sparse Mode

- [Enabling PIM Sparse Mode on page 4545](#)
- [Configuring PIM Join Load Balancing on page 4546](#)
- [Modifying the Join State Timeout on page 4549](#)
- [Example: Enabling Join Suppression on page 4549](#)

## Enabling PIM Sparse Mode

In PIM sparse mode (PIM-SM), the assumption is that very few of the possible receivers want packets from a source, so the network establishes and sends packets only on branches that have at least one leaf indicating (by message) a desire for the traffic. WANs are appropriate networks for sparse-mode operation.

By default, PIM is disabled. When you enable PIM, it operates in sparse mode by default. You do not need to configure Internet Group Management Protocol (IGMP) version 2 for a sparse mode configuration. After you enable PIM, by default, IGMP version 2 is also enabled.

All systems on a subnet must run the same version of PIM.

The default PIM version can be version 1 or version 2, depending on the mode you are configuring. PIMv1 is the default for rendezvous point (RP) mode (at the **[edit protocols pim rp static address address]** hierarchy level). However, PIMv2 is the default for interface mode (at the **[edit protocols pim interface interface-name]** hierarchy level). Explicitly configured versions override the defaults. The following example explicitly configures PIMv2 on the interfaces.

You can configure PIM sparse mode globally or for a routing instance. This example shows how to configure PIM sparse mode globally on all interfaces. It also shows how to configure a static RP router and how to configure the non-RP routers.

To configure the router properties for PIM sparse mode:

1. Configure the static RP router.

```
[edit protocols pim]
user@host# set rp local family inet address 192.168.3.253
```

2. Configure the RP router interfaces. When configuring all interfaces, exclude the **fxp0.0** management interface by including the **disable** statement for that interface.

```
[edit protocols pim]
user@host# set interface all mode sparse
user@host# set interface all version 2
user@host# set interface fxp0.0 disable
```

3. Configure the non-RP routers. Include the following configuration on all of the non-RP routers.

```
[edit protocols pim]
user@host# set rp static address 192.168.3.253 version 2
user@host# set interface all mode sparse
user@host# set interface all version 2
user@host# set interface fxp0.0 disable
```

4. Monitor the operation of PIM sparse mode.

- `show pim interfaces`
- `show pim join`

- [show pim neighbors](#)
- [show pim rps](#)

## Configuring PIM Join Load Balancing

By default, PIM join messages are sent toward a source based on the RPF routing table check. If there is more than one equal-cost path toward the source, then one upstream interface is chosen to send the join message. This interface is also used for all downstream traffic, so even though there are alternative interfaces available, the multicast load is concentrated on one upstream interface and routing device.

For PIM sparse mode, you can configure PIM join load balancing to spread join messages and traffic across equal-cost upstream paths (interfaces and routing devices) provided by unicast routing toward a source. PIM join load balancing is only supported for PIM sparse mode configurations.

PIM join load balancing is supported on draft-rosen multicast VPNs (also referred to as dual PIM multicast VPNs). PIM join load balancing is not supported on multiprotocol BGP-based multicast VPNs (also referred to as next-generation Layer 3 VPN multicast). When PIM join load balancing is enabled in a draft-rosen Layer 3 VPN scenario, the load balancing is achieved based on the join counts for the far-end PE routing devices, not for any intermediate P routing devices.

If an internal BGP (IBGP) multipath forwarding VPN route is available, the Junos OS uses the multipath forwarding VPN route to send join messages to the remote PE routers to achieve load balancing over the VPN.

By default, when multiple PIM joins are received for different groups, all joins are sent to the same upstream gateway chosen by the unicast routing protocol. Even if there are multiple equal-cost paths available, these alternative paths are not utilized to distribute multicast traffic from the source to the various groups.

When PIM join load balancing is configured, the PIM joins are distributed equally among all equal-cost upstream interfaces and neighbors. Every new join triggers the selection of the least-loaded upstream interface and neighbor. If there are multiple neighbors on the same interface (for example, on a LAN), join load balancing maintains a value for each of the neighbors and distributes multicast joins (and downstream traffic) among these as well.

Join counts for interfaces and neighbors are maintained globally, not on a per-source basis. Therefore, there is no guarantee that joins for a particular source are load-balanced. However, the joins for all sources and all groups known to the routing device are load-balanced. There is also no way to administratively give preference to one neighbor over another: all equal-cost paths are treated the same way.

You can configure message filtering globally or for a routing instance. This example shows the global configuration.

You configure PIM join load balancing on the non-RP routers in the PIM domain.

1. Determine if there are multiple paths available for a source (for example, an RP) with the output of the **show pim join extensive** or **show pim source** commands.

```
user@host> show pim join extensive
Instance: PIM.master Family: INET

Group: 224.1.1.1
  Source: *
  RP: 10.255.245.6
  Flags: sparse,rptree,wildcard
  Upstream interface: t1-0/2/3.0
  Upstream neighbor: 192.168.38.57
  Upstream state: Join to RP
  Downstream neighbors:
    Interface: t1-0/2/1.0
    192.168.38.16 State: JOIN Flags; SRW Timeout: 164
Group: 224.2.127.254
  Source: *
  RP: 10.255.245.6
  Flags: sparse,rptree,wildcard
  Upstream interface: so-0/3/0.0
  Upstream neighbor: 192.168.38.47
  Upstream state: Join to RP
  Downstream neighbors:
    Interface: t1-0/2/3.0
    192.168.38.16 State: JOIN Flags; SRW Timeout: 164
```

Note that for this router, the RP at IP address 10.255.245.6 is the source for two multicast groups: 224.1.1.1 and 224.2.127.254. This router has two equal-cost paths through two different upstream interfaces (**t1-0/2/3.0** and **so-0/3/0.0**) with two different neighbors (192.168.38.57 and 192.168.38.47). This router is a good candidate for PIM join load balancing.

2. On the non-RP router, configure PIM join load balancing.

```
[edit protocols pim rp]
user@host# set static address 10.10.10.1
user@host# set interface all mode sparse version 2
user@host# set join-load-balance
```

The static address is the address of the RP.

3. Monitor the operation.

If load balancing is enabled for this router, the number of PIM joins sent on each interface is shown in the output for the **show pim interfaces** command.

```
user@host> show pim interfaces
Instance: PIM.master
```

Name	Stat	Mode	IP V	State	NbrCnt	JoinCnt	DR address
lo0.0	Up	Sparse	4 2	DR	0	0	10.255.168.58
pe-1/2/0.32769	Up	Sparse	4 2	P2P	0	0	
so-0/3/0.0	Up	Sparse	4 2	P2P	1	1	
t1-0/2/1.0	Up	Sparse	4 2	P2P	1	0	
t1-0/2/3.0	Up	Sparse	4 2	P2P	1	1	
lo0.0	Up	Sparse	6 2	DR	0	0	fe80::2a0:a5ff:4b7

Note that the two equal-cost paths shown by the **show pim interfaces** command now have nonzero join counts. If the counts differ by more than one and were zero (0) when load balancing commenced, an error occurs (joins before load balancing are not redistributed). The join count also appears in the **show pim neighbors detail** output:

```
user@host> show pim neighbors detail
Interface: so-0/3/0.0
```

```
Address: 192.168.38.46, IPv4, PIM v2, Mode: Sparse, Join Count: 0
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 1
Hello Option Generation ID: 1689116164
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
```

```
Address: 192.168.38.47, IPv4, PIM v2, Join Count: 1
BFD: Disabled
Hello Option Holdtime: 105 seconds 102 remaining
Hello Option DR Priority: 1
Hello Option Generation ID: 792890329
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
```

```
Interface: t1-0/2/3.0
```

```
Address: 192.168.38.56, IPv4, PIM v2, Mode: Sparse, Join Count: 0
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 1
Hello Option Generation ID: 678582286
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
```

```
Address: 192.168.38.57, IPv4, PIM v2, Join Count: 1
BFD: Disabled
Hello Option Holdtime: 105 seconds 97 remaining
Hello Option DR Priority: 1
Hello Option Generation ID: 1854475503
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
```

Note that the join count is nonzero on the two load-balanced interfaces toward the upstream neighbors.

PIM join load balancing only takes effect when the feature is configured. Prior joins are not redistributed to achieve perfect load balancing. In addition, if an interface or neighbor fails, the new joins are redistributed among remaining active interfaces and neighbors. However, when the interface or neighbor is restored, prior joins are not redistributed. The **clear pim join-distribution** command redistributes the existing flows to new or restored upstream neighbors. Redistributing the existing flows causes traffic to be disrupted, so we recommend that you perform PIM join redistribution during a maintenance window.

## Modifying the Join State Timeout

This section describes how to configure the join state timeout.

A downstream router periodically sends join messages to refresh the join state on the upstream router. If the join state is not refreshed before the timeout expires, the join state is removed.

By default, the join state timeout is 210 seconds. You can change this timeout to allow additional time to receive the join messages. Because the messages are called join-prune messages, the name used is the **join-prune-timeout** statement.

To modify the timeout, include the **join-prune-timeout** statement:

```
user@host# set protocols pim join-prune-timeout 230
```

The join timeout value can be from 210 through 240 seconds.

## Example: Enabling Join Suppression

This example describes how to enable PIM join suppression.

- [Requirements on page 4549](#)
- [Overview on page 4549](#)
- [Configuration on page 4552](#)
- [Verification on page 4553](#)

### Requirements

Before you begin:

- Configure the router interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure an interior gateway protocol or static routing. See the *Junos OS Routing Protocols Library for Routing Devices*.
- Configure PIM Sparse Mode on the interfaces. See [“Enabling PIM Sparse Mode” on page 4545](#).

### Overview

PIM join suppression enables a router on a multiaccess network to defer sending join messages to an upstream router when it sees identical join messages on the same network. Eventually, only one router sends these join messages, and the other routers suppress identical messages. Limiting the number of join messages improves scalability and efficiency by reducing the number of messages sent to the same router.

This example includes the following statements:

- **override-interval**—Sets the maximum time in milliseconds to delay sending override join messages. When a router sees a prune message for a join it is currently suppressing, it waits before it sends an override join message. Waiting helps avoid multiple downstream routers sending override join messages at the same time. The override interval is a random timer with a value of 0 through the maximum override value.
- **propagation-delay**—Sets a value in milliseconds for a prune pending timer, which specifies how long to wait before executing a prune on an upstream router. During this period, the router waits for any prune override join messages that might be currently suppressed. The period for the prune pending timer is the sum of the **override-interval** value and the value specified for **propagation-delay**.
- **reset-tracking-bit**—Enables PIM join suppression on each multiaccess downstream interface. This statement resets a tracking bit field (T-bit) on the LAN prune delay hello option from the default of 1 (join suppression disabled) to 0 (join suppression enabled).

When multiple identical join messages are received, a random join suppression timer is activated, with a range of 66 through 84 milliseconds. The timer is reset each time join suppression is triggered.

[Figure 176 on page 4551](#) shows the topology used in this example.

Figure 176: Join Suppression

The items in the figure represent the following functions:

- Host 0 is the multicast source.
- Host 1, Host 2, Host 3, and Host 4 are receivers.
- Router R0 is the first-hop router and the RP.
- Router R1 is an upstream router.
- Routers R2, R3, R4, and R5 are downstream routers in the multicast LAN.

This example shows the configuration of the downstream devices: Routers R2, R3, R4, and R5.

## Configuration

---

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
[edit]
set protocols pim traceoptions file pim.log
set protocols pim traceoptions file size 5m
set protocols pim traceoptions file world-readable
set protocols pim traceoptions flag join detail
set protocols pim traceoptions flag prune detail
set protocols pim traceoptions flag normal detail
set protocols pim traceoptions flag register detail
set protocols pim rp static address 10.255.112.160
set protocols pim interface all mode sparse
set protocols pim interface all version 2
set protocols pim interface fxp0.0 disable
set protocols pim reset-tracking-bit
set protocols pim propagation-delay 500
set protocols pim override-interval 4000
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure PIM join suppression on a non-RP downstream router in the multicast LAN:

1. Configure PIM sparse mode on the interfaces.

```
[edit]
user@host# edit protocols pim
[edit protocols pim]
user@host# set rp static address 10.255.112.160
[edit protocols pim]
user@host# set interface all mode sparse version 2
[edit protocols pim]
user@host# set interface all version 2
[edit protocols pim]
user@host# set interface fxp0.0 disable
```

2. Enable the join suppression timer.

```
[edit protocols pim]
user@host# set reset-tracking-bit
```

3. Configure the prune override interval value.

```
[edit protocols pim]
user@host# set override-interval 4000
```

4. Configure the propagation delay of the link.

```
[edit protocols pim]
user@host# set propagation-delay 500
```

5. (Optional) Configure PIM tracing operations.

```
[edit protocols pim]
user@host# set traceoptions file pim.log size 5m world-readable
[edit protocols pim]
user@host# set traceoptions flag join detail
[edit protocols pim]
user@host# set traceoptions flag normal detail
[edit protocols pim]
user@host# set traceoptions flag register detail
```

6. If you are done configuring the device, commit the configuration.

```
[edit protocols pim]
user@host# commit
```

### Results

From configuration mode, confirm your configuration by entering the **show protocols** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols
pim {
  traceoptions {
    file pim.log size 5m world-readable;
    flag join detail;
    flag prune detail;
    flag normal detail;
    flag register detail;
  }
  rp {
    static {
      address 10.255.112.160;
    }
  }
  interface all {
    mode sparse;
    version 2;
  }
  interface fxp0.0 {
    disable;
  }
  reset-tracking-bit;
  propagation-delay 500;
  override-interval 4000;
}
```

### Verification

To verify the configuration, run the following commands on the upstream and downstream routers:

- **show pim join extensive**
- **show multicast route extensive**

## Static RP

- [Configuring Local PIM RPs on page 4554](#)
- [Configuring the Static PIM RP Address on the Non-RP Routing Device on page 4556](#)

### Configuring Local PIM RPs

Local RP configuration makes the routing device a statically defined RP. Consider statically defining an RP if the network does not have many different RPs defined or if the RP assignment does not change very often. The Junos IPv6 PIM implementation supports only static RP configuration. Automatic RP announcement and bootstrap routers are not available with IPv6.

You can configure a local RP globally or for a routing instance. This example shows how to configure a local RP in a routing instance for IPv4 or IPv6.

To configure the routing device's RP properties:

1. Configure the routing instance as the local RP.

```
[routing-instances VPN-A protocols pim]
user@host# set rp local
```

2. Configure the IP protocol family and IP address.

IPv6 PIM hello messages are sent to every interface on which you configure **family inet6**, whether at the PIM level of the hierarchy or not. As a result, if you configure an interface with both **family inet** at the **[edit interface *interface-name*]** hierarchy level and **family inet6** at the **[edit protocols pim interface *interface-name*]** hierarchy level, PIM sends both IPv4 and IPv6 hellos to that interface.

By default, PIM operates in sparse mode on an interface. If you explicitly configure sparse mode, PIM uses this setting for all IPv6 multicast groups. However, if you configure sparse-dense mode, PIM does not accept IPv6 multicast groups as dense groups and operates in sparse mode over them.

```
[edit routing-instances VPN-A protocols pim rp local]
user@host# set family inet6 address 2001:db8:85a3::8a2e:370:7334
user@host# set family inet address 10.1.2.254
```

3. (IPv4 only) Configure the routing device's RP priority.

**NOTE:** The priority statement is not supported for IPv6, but is included here for informational purposes. The routing device's priority value for becoming the RP is included in the bootstrap messages that the routing device sends. Use a smaller number to increase the likelihood that the routing device becomes the RP for local multicast groups. Each PIM routing device uses the priority value and other factors to determine the candidate RPs for a particular group range. After the set of candidate RPs is distributed, each routing device determines algorithmically the RP from the candidate RP set using a hash function. By default, the priority value is set to 1. If this value is set to 0, the bootstrap router can override the group range being advertised by the candidate RP.

```
[edit routing-instances VPN-A protocols pim rp local]
user@host# set priority 5
```

4. Configure the groups for which the routing device is the RP.

By default, a routing device running PIM is eligible to be the RP for all IPv4 or IPv6 groups (224.0.0.0/4 or FF70::/12 to FFF0::/12). The following example limits the groups for which this routing device can be the RP.

```
[edit routing-instances VPN-A protocols pim rp local]
user@host# set group-ranges fec0::/10
user@host# set group-ranges 10.1.2.0/24
```

5. (IPv4 only) Modify the local RP hold time.

If the local routing device is configured as an RP, it is considered a candidate RP for its local multicast groups. For candidate RPs, the hold time is used by the bootstrap router to time out RPs, and applies to the bootstrap RP-set mechanism. The RP hold time is part of the candidate RP advertisement message sent by the local routing device to the bootstrap router. If the bootstrap router does not receive a candidate RP advertisement from an RP within the hold time, it removes that routing device from its list of candidate RPs. The default hold time is 150 seconds.

```
[edit routing-instances VPN-A protocols pim rp local]
user@host# set hold-time 200
```

6. (Optional) Override dynamic RP for the specified group address range.

If you configure both static RP mapping and dynamic RP mapping (such as auto-RP) in a single routing instance, allow the static mapping to take precedence for the given static RP group range, and allow dynamic RP mapping for all other groups.

If you exclude this statement from the configuration and you use both static and dynamic RP mechanisms for different group ranges within the same routing instance, the dynamic RP mapping takes precedence over the static RP mapping, even if static RP is defined for a specific group range.

```
[edit routing-instances VPN-A protocols pim rp local]
user@host# set override
```

7. Monitor the operation of PIM by running the **show pim** commands. Run **show pim ?** to display the supported commands.

- [PIM Overview on page 4499](#)
  - [Understanding MLD](#)

## Configuring the Static PIM RP Address on the Non-RP Routing Device

Consider statically defining an RP if the network does not have many different RPs defined or if the RP assignment does not change very often. The Junos IPv6 PIM implementation supports only static RP configuration. Automatic RP announcement and bootstrap routers are not available with IPv6.

You configure a static RP address on the non-RP routing device. This enables the non-RP routing device to recognize the local statically defined RP. For example, if R0 is a non-RP router and R1 is the local RP router, you configure R0 with the static RP address of R1. The static IP address is the routable address assigned to the loopback interface on R1. In the following example, the loopback address of the RP is 2001:db8:85a3::8a2e:370:7334.

You can configure a static RP address globally or for a routing instance. This example shows how to configure a static RP address in a routing instance for IPv6.

To configure the static RP address:

1. On a non-RP routing device, configure the routing instance to point to the routable address assigned to the loopback interface of the RP.

```
[routing-instances VPN-A protocols pim rp]
user@host# set static address 2001:db8:85a3::8a2e:370:7334
```

**NOTE:** Logical systems are also supported. You can configure a static RP address in a logical system only if the logical system is not directly connected to a source.

2. (Optional) Set the PIM sparse mode version.

For each static RP address, you can optionally specify the PIM version. The default PIM version is version 1.

```
[edit routing-instances VPN-A protocols pim rp]
user@host# set static address 2001:db8:85a3::8a2e:370:7334 version 2
```

**NOTE:** The default PIM version can be version 1 or version 2, depending on the mode you are configuring. PIM version 1 is the default for RP mode ([edit pim rp static address *address*]). PIM version 2 is the default for interface mode ([edit pim interface *interface-name*]). Explicitly configured versions override the defaults.

3. (Optional) Set the group address range.

By default, a routing device running PIM is eligible to be the RP for all IPv4 or IPv6 groups (224.0.0.0/4 or FF70::/12 to FFF0::/12). The following example limits the groups for which the 2001:db8:85a3::8a2e:370:7334 address can be the RP.

```
[edit routing-instances VPN-A protocols pim rp]
user@host# set static address 2001:db8:85a3::8a2e:370:7334 group-ranges fec0::/10
```

The RP that you select for a particular group must be consistent across all routers in a multicast domain.

4. (Optional) Override dynamic RP for the specified group address range.

If you configure both static RP mapping and dynamic RP mapping (such as auto-RP) in a single routing instance, allow the static mapping to take precedence for the given static RP group range, and allow dynamic RP mapping for all other groups.

If you exclude this statement from the configuration and you use both static and dynamic RP mechanisms for different group ranges within the same routing instance, the dynamic RP mapping takes precedence over the static RP mapping, even if static RP is defined for a specific group range.

```
[edit routing-instances VPN-A protocols pim rp static address
 2001:db8:85a3::8a2e:370:7334]
user@host# set override
```

5. Monitor the operation of PIM by running the **show pim** commands. Run **show pim ?** to display the supported commands.

## Anycast RP

- [Example: Configuring PIM Anycast With or Without MSDP on page 4557](#)
- [Configuring a PIM Anycast RP Router with MSDP on page 4561](#)
- [Configuring a PIM Anycast RP Router Using Only PIM on page 4562](#)
- [Configuring All PIM Anycast Non-RP Routers on page 4563](#)
- [Example: Configuring Multiple RPs in a Domain with Anycast RP on page 4563](#)

### Example: Configuring PIM Anycast With or Without MSDP

When you configure anycast RP, you bypass the restriction of having one active rendezvous point (RP) per multicast group, and instead deploy multiple RPs for the same group range. The RP routers share one unicast IP address. Sources from one RP are known to other RPs that use the Multicast Source Discovery Protocol (MSDP). Sources and receivers use the closest RP, as determined by the interior gateway protocol (IGP).

You can use anycast RP within a domain to provide redundancy and RP load sharing. When an RP stops operating, sources and receivers are taken to a new RP by means of unicast routing.

You can configure anycast RP to use PIM and MSDP for IPv4, or PIM alone for both IPv4 and IPv6 scenarios. Both are discussed in this section.

We recommend a static RP mapping with anycast RP over a bootstrap router and auto-RP configuration because it provides all the benefits of a bootstrap router and auto-RP without the complexity of the BSR and auto-RP mechanisms.

All systems on a subnet must run the same version of PIM.

The default PIM version can be version 1 or version 2, depending on the mode you are configuring. PIMv1 is the default RP mode (at the **[edit protocols pim rp static address address]** hierarchy level). However, PIMv2 is the default for interface mode (at the **[edit protocols pim interface interface-name]** hierarchy level). Explicitly configured versions override the defaults. This example explicitly configures PIMv2 on the interfaces.

The following example shows an anycast RP configuration for the RP routers, first with MSDP and then using PIM alone, and for non-RP routers.

1. For a network using an RP with MSDP, configure the RP using the **lo0** loopback interface, which is always up. Include the **address** statement and specify the unique and routable router ID and the RP address at the **[edit interfaces lo0 unit 0 family inet]** hierarchy level. In this example, the router ID is **198.58.3.254** and the shared RP address is **198.58.3.253**. Include the **primary** statement for the first address. Including the **primary** statement selects the router's primary address from all the preferred addresses on all interfaces.

```
interfaces {
  lo0 {
    description "PIM RP";
    unit 0 {
      family inet {
        address 198.58.3.254/32;
        primary;
        address 198.58.3.253/32;
      }
    }
  }
}
```

2. Specify the RP address. Include the **address** statement at the **[edit protocols pim rp local]** hierarchy level (the same address as the secondary **lo0** interface).

For all interfaces, include the **mode** statement to set the mode to **sparse** and the **version** statement to specify PIM version 2 at the **[edit protocols pim rp local interface all]** hierarchy level. When configuring all interfaces, exclude the **fxp0.0** management interface by including the **disable** statement for that interface.

```
protocols {
  pim {
    rp {
      local {
        family inet;
        address 198.58.3.253;
      }
      interface all {
```

```

        mode sparse;
        version 2;
    }
    interface fxp0.0 {
        disable;
    }
}
}

```

3. Configure MSDP peering. Include the **peer** statement to configure the address of the MSDP peer at the **[edit protocols msdp]** hierarchy level. For MSDP peering, use the unique, primary addresses instead of the anycast address. To specify the local address for MSDP peering, include the **local-address** statement at the **[edit protocols msdp peer]** hierarchy level.

```

protocols {
  msdp {
    peer 198.58.3.250 {
      local-address 198.58.3.254;
    }
  }
}

```

**NOTE:** If you need to configure a PIM RP for both IPv4 and IPv6 scenarios, perform Step 4 and Step 5. Otherwise, go to Step 6.

4. Configure an RP using the **lo0** loopback interface, which is always up. Include the **address** statement to specify the unique and routable router address and the RP address at the **[edit interfaces lo0 unit 0 family inet]** hierarchy level. In this example, the router ID is **198.58.3.254** and the shared RP address is **198.58.3.253**. Include the **primary** statement on the first address. Including the **primary** statement selects the router's primary address from all the preferred addresses on all interfaces.

```

interfaces {
  lo0 {
    description "PIM RP";
    unit 0 {
      family inet {
        address 198.58.3.254/32 {
          primary;
        }
        address 198.58.3.253/32;
      }
    }
  }
}

```

5. Include the **address** statement at the **[edit protocols pim rp local]** hierarchy level to specify the RP address (the same address as the secondary **lo0** interface).

For all interfaces, include the **mode** statement to set the mode to **sparse**, and the **version** statement to specify PIM version 2 at the **[edit protocols pim rp local interface**

**all]** hierarchy level. When configuring all interfaces, exclude the **fxp0.0** management interface by including the **disable** statement for that interface.

Include the **anycast-pim** statement to configure anycast RP without MSDP (for example, if IPv6 is used for multicasting). The other RP routers that share the same IP address are configured using the **rp-set** statement. There is one entry for each RP, and the maximum that can be configured is 15. For each RP, specify the routable IP address of the router and whether MSDP source active (SA) messages are forwarded to the RP.

MSDP configuration is not necessary for this type of IPv4 anycast RP configuration.

```
protocols {
  pim {
    rp {
      local {
        family inet {
          address 198.58.3.253;
          anycast-pim {
            rp-set {
              address 198.58.3.240;
              address 198.58.3.241 forward-msdp-sa;
            }
            local-address 198.58.3.254; #If not configured, use lo0 primary
          }
        }
      }
    }
  }
  interface all {
    mode sparse;
    version 2;
  }
  interface fxp0.0 {
    disable;
  }
}
```

6. Configure the non-RP routers. The anycast RP configuration for a non-RP router is the same whether MSDP is used or not. Specify a static RP by adding the address at the **[edit protocols pim rp static]** hierarchy level. Include the **version** statement at the **[edit protocols pim rp static address]** hierarchy level to specify PIM version 2.

```
protocols {
  pim {
    rp {
      static {
        address 198.58.3.253 {
          version 2;
        }
      }
    }
  }
}
```

7. Include the **mode** statement at the **[edit protocols pim interface all]** hierarchy level to specify sparse mode on all interfaces. Then include the **version** statement at the **[edit protocols pim rp interface all mode]** to configure all interfaces for PIM version 2. When configuring all interfaces, exclude the **fxp0.0** management interface by including the **disable** statement for that interface.

```
protocols {
  pim {
    interface all {
      mode sparse;
      version 2;
    }
    interface fxp0.0 {
      disable;
    }
  }
}
```

## Configuring a PIM Anycast RP Router with MSDP

Add the **address** statement at the **[edit protocols pim rp local]** hierarchy level to specify the RP address (the same address as the secondary **lo0** interface).

For all interfaces, use the **mode** statement to set the mode to **sparse** and the **version** statement to specify PIM version 2 at the **[edit protocols pim rp local interface all]** hierarchy level. When configuring all interfaces, exclude the **fxp0.0** management interface by adding the **disable** statement for that interface.

```
protocols {
  pim {
    rp {
      local {
        family inet;
        address 198.58.3.253;
      }
      interface all {
        mode sparse;
        version 2;
      }
      interface fxp0.0 {
        disable;
      }
    }
  }
}
```

To configure MSDP peering, add the **peer** statement to configure the address of the MSDP peer at the **[edit protocols msdp]** hierarchy level. For MSDP peering, use the unique, primary addresses instead of the anycast address. To specify the local address for MSDP peering, add the **local-address** statement at the **[edit protocols msdp peer]** hierarchy level.

```
protocols {
  msdp {
```

```
peer 198.58.3.250 {  
    local-address 198.58.3.254;  
}  
}  
}
```

## Configuring a PIM Anycast RP Router Using Only PIM

In this example, configure an RP using the **lo0** loopback interface, which is always up. Use the **address** statement to specify the unique and routable router address and the RP address at the **[edit interfaces lo0 unit 0 family inet]** hierarchy level. In this case, the router ID is 198.58.3.254/32 and the shared RP address is 198.58.3.253/32. Add the flag statement **primary** to the first address. Using this flag selects the router's primary address from all the preferred addresses on all interfaces.

```
interfaces {  
    lo0 {  
        description "PIM RP";  
        unit 0 {  
            family inet {  
                address 198.58.3.254/32 {  
                    primary;  
                }  
                address 198.58.3.253/32;  
            }  
        }  
    }  
}
```

Add the **address** statement at the **[edit protocols pim rp local]** hierarchy level to specify the RP address (the same address as the secondary **lo0** interface).

For all interfaces, use the **mode** statement to set the mode to **sparse**, and include the **version** statement to specify PIM version 2 at the **[edit protocols pim rp local interface all]** hierarchy level. When configuring all interfaces, exclude the **fxp0.0** management interface by adding the **disable** statement for that interface.

Use the **anycast-pim** statement to configure anycast RP without MSDP (for example, if IPv6 is used for multicasting). The other RP routers that share the same IP address are configured using the **rp-set** statement. There is one entry for each RP, and the maximum that can be configured is 15. For each RP, specify the routable IP address of the router and whether MSDP source active (SA) messages are forwarded to the RP.

```
protocols {  
    pim {  
        rp {  
            local {  
                family inet {  
                    address 198.58.3.253;  
                    anycast-pim {  
                        rp-set {  
                            address 198.58.3.240;  
                            address 198.58.3.241 forward-msdp-sa;  
                        }  
                    }  
                    local-address 198.58.3.254; #If not configured, use lo0 primary  
                }  
            }  
        }  
    }  
}
```

```

    }
  }
}
interface all {
  mode sparse;
  version 2;
}
interface fxp0.0 {
  disable;
}
}
}

```

MSDP configuration is not necessary for this type of IPv4 anycast RP configuration.

## Configuring All PIM Anycast Non-RP Routers

Use the **mode** statement at the **[edit protocols pim rp interface all]** hierarchy level to specify sparse mode on all interfaces. Then add the **version** statement at the **[edit protocols pim rp interface all mode]** to configure all interfaces for PIM version 2. When configuring all interfaces, exclude the **fxp0.0** management interface by adding the **disable** statement for that interface.

```

protocols {
  pim {
    interface all {
      mode sparse;
      version 2;
    }
    interface fxp0.0 {
      disable;
    }
  }
}

```

## Example: Configuring Multiple RPs in a Domain with Anycast RP

This example shows how to configure anycast RP on each RP router in the PIM-SM domain. With this configuration you can deploy more than one RP for a single group range. This enables load balancing and redundancy.

- [Requirements on page 4563](#)
- [Overview on page 4564](#)
- [Configuration on page 4564](#)
- [Verification on page 4566](#)

### Requirements

Before you begin:

- Configure the router interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.

- Configure an interior gateway protocol or static routing. See the *Junos OS Routing Protocols Library for Routing Devices*.
- Configure PIM Sparse Mode on the interfaces. See [“Enabling PIM Sparse Mode” on page 4545](#).

---

## Overview

When you configure anycast RP, the RP routers in the PIM-SM domain use a shared address. In this example, the shared address is 10.1.1.2/32. Anycast RP uses Multicast Source Discovery Protocol (MSDP) to discover and maintain a consistent view of the active sources. Anycast RP also requires an RP selection method, such as static, auto-RP, or bootstrap RP. This example uses static RP and shows only one RP router configuration.

---

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**RP Routers**

```
set interfaces lo0 unit 0 family inet address 192.168.132.1/32 primary
set interfaces lo0 unit 0 family inet address 10.1.1.2/32
set protocols msdp local-address 192.168.132.1
set protocols msdp peer 192.168.12.1
set protocols pim rp local address 10.1.1.2
set routing-options router-id 192.168.132.1
```

**Non-RP Routers**

```
set protocols pim rp static address 10.1.1.2
```

### Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure anycast RP:

1. On each RP router in the domain, configure the shared anycast address on the router's loopback address.

```
[edit interfaces]
user@host# set lo0 unit 0 family inet address 10.1.1.2/32
```

2. On each RP router in the domain, make sure that the router's regular loopback address is the primary address for the interface, and set the router ID.

```
[edit interfaces]
user@host# set lo0 unit 0 family inet address 192.168.132.1/32 primary
```

```
[edit routing-options]
user@host# set router-id 192.168.132.1
```

3. On each RP router in the domain, configure the local RP address, using the shared address.

```
[edit protocols pim]
```

```
user@host# set rp local address 10.1.1.2
```

4. On each RP router in the domain, create MSDP sessions to the other RPs in the domain.

```
[edit protocols msdp]
user@host# set local-address 192.168.132.1
user@host# set peer 192.168.12.1
```

5. On each non-RP router in the domain, configure a static RP address using the shared address.

```
[edit protocols pim]
user@host# set rp static address 10.1.1.2
```

6. If you are done configuring the devices, commit the configuration.

```
user@host# commit
```

### Results

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
lo0 {
  unit 0 {
    family inet {
      address 192.168.132.1/32 {
        primary;
      }
      address 10.1.1.2/32;
    }
  }
}
```

*On the RP routers:*

```
user@host# show protocols
msdp {
  local-address 192.168.132.1;
  peer 192.168.12.1;
}
pim {
  rp {
    local {
      address 10.1.1.2;
    }
  }
}
```

*On the non-RP routers:*

```
user@host# show protocols
pim {
  rp {
    static {
```

```
        address 10.1.1.2;
    }
}

user@host# show routing-options
router-id 192.168.132.1;
```

---

### Verification

To verify the configuration, run the `show pim rps extensive inet` command.

## PIM Bootstrap Router

- [Configuring PIM Bootstrap Properties for IPv4 or IPv6 on page 4566](#)
- [Example: Rejecting PIM Bootstrap Messages at the Boundary of a PIM Domain on page 4567](#)
- [Example: Configuring PIM BSR Filters on page 4568](#)

### Configuring PIM Bootstrap Properties for IPv4 or IPv6

For correct operation, every multicast router within a PIM domain must be able to map a particular multicast group address to the same rendezvous point (RP). The bootstrap router mechanism is one way that a multicast router can learn the set of group-to-RP mappings. Bootstrap routers are supported in IPv4 and IPv6.

To determine which routing device is the RP, all routing devices within a PIM domain collect bootstrap messages. A PIM domain is a contiguous set of routing devices that implement PIM. All devices are configured to operate within a common boundary. The domain's bootstrap router initiates bootstrap messages, which are sent hop by hop within the domain. The routing devices use bootstrap messages to distribute RP information dynamically and to elect a bootstrap router when necessary.

You can configure bootstrap properties globally or for a routing instance. This example shows the global configuration.

To configure the bootstrap router properties:

1. Configure the bootstrap priority.

By default, each routing device has a bootstrap priority of 0, which means the routing device can never be the bootstrap router. The routing device with the highest priority value is elected to be the bootstrap router. In the case of a tie, the routing device with the highest IP address is elected to be the bootstrap router. A simple bootstrap configuration assigns a bootstrap priority value to a routing device.

**NOTE:** In the IPv4-only configuration, specifying a bootstrap priority of 0 disables the bootstrap function and does not cause the routing device to send BSR packets with a 0 in the priority field. In the combined IPv4 and IPv6 configuration, specifying a bootstrap priority of 0 does not disable the function, but causes the routing device to send BSR packets with a 0 in the priority field. To disable the bootstrap function in the IPv4 and IPv6 configuration, delete the `bootstrap` statement.

```
user@host# edit protocols pim rp
user@host# set bootstrap family inet priority 3
```

2. (Optional) Create import and export policies to control the flow of bootstrap messages to and from the RP, and apply the policies to PIM. Import and export policies are useful when some of the routers in your PIM domain have interfaces that connect to other PIM domains. Configuring a policy prevents bootstrap messages from crossing domain boundaries. The **import** statement prevents messages from being imported into the RP. The **export** statement prevents messages from being exported from the RP.

```
[edit protocols pim rp]
user@host# set bootstrap family inet import pim-bootstrap-import
user@host# set bootstrap family inet export pim-bootstrap-export
user@host# exit
```

3. Configure the policies.

```
user@host# edit policy-options policy-statement pim-bootstrap-import
[edit policy-options policy-statement pim-bootstrap-import]
user@host# set from interface se-0/0/0
user@host# set then reject
user@host# exit
user@host# edit policy-options policy-statement pim-bootstrap-export
user@host# set from interface se-0/0/0
user@host# set then reject
user@host# exit
```

4. Monitor the operation of PIM bootstrap routers by running the `show pim bootstrap` command.

#### Related Documentation

- [Understanding PIM Sparse Mode on page 4503](#)
- [Example: Rejecting PIM Bootstrap Messages at the Boundary of a PIM Domain on page 4567](#)
- [show pim bootstrap on page 4876](#) in the CLI Explorer

### Example: Rejecting PIM Bootstrap Messages at the Boundary of a PIM Domain

In this example, the **from interface so-0-1/0 then reject** policy statement rejects bootstrap messages from the specified interface (the example is configured for both IPv4 and IPv6 operation):

```
protocols {
  pim {
```

```
rp {
  bootstrap {
    family inet {
      priority 1;
      import pim-import;
      export pim-export;
    }
    family inet6 {
      priority 1;
      import pim-import;
      export pim-export;
    }
  }
}
}
policy-options {
  policy-statement pim-import {
    from interface so-0/1/0;
    then reject;
  }
  policy-statement pim-export {
    to interface so-0/1/0;
    then reject;
  }
}
```

### Example: Configuring PIM BSR Filters

Configure a filter to prevent BSR messages from entering or leaving your network. Add this configuration to all routers:

```
protocols {
  pim {
    rp {
      bootstrap-import no-bsr;
      bootstrap-export no-bsr;
    }
  }
}
policy-options {
  policy-statement no-bsr {
    then reject;
  }
}
```

---

## PIM Filtering

- [Configuring Interface-Level PIM Neighbor Policies on page 4569](#)
- [Filtering Outgoing PIM Join Messages on page 4570](#)
- [Filtering Incoming PIM Join Messages on page 4571](#)
- [Configuring Register Message Filters on a PIM RP and DR on page 4572](#)

## Configuring Interface-Level PIM Neighbor Policies

You can configure a policy to filter unwanted PIM neighbors. In the following example, the PIM interface compares neighbor IP addresses with the IP address in the policy statement before any hello processing takes place. If any of the neighbor IP addresses (primary or secondary) match the IP address specified in the prefix list, PIM drops the hello packet and rejects the neighbor.

If you configure a PIM neighbor policy after PIM has already established a neighbor adjacency to an unwanted PIM neighbor, the adjacency remains intact until the neighbor hold time expires. When the unwanted neighbor sends another hello message to update its adjacency, the router recognizes the unwanted address and rejects the neighbor.

To configure a policy to filter unwanted PIM neighbors:

1. Configure the policy. The neighbor policy must be a properly structured policy statement that uses a prefix list (or a route filter) containing the neighbor primary address (or any secondary IP addresses) in a prefix list, and the **reject** option to reject the unwanted address.

```
[edit policy-options]
user@host# set prefix-list nbrGroup 1 20.20.20.1/32
user@host# set policy-statement nbr-policy from prefix-list nbrGroup1
user@host# set policy-statement nbr-policy then reject
```

2. Configure the interface globally or in the routing instance. This example shows the configuration for the routing instance.

```
[edit routing-instances PIM.master protocols pim]
user@host# set neighbor-policy nbr-policy
```

3. Verify the configuration by checking the **Hello dropped on neighbor policy** field in the output of the **show pim statistics** command.

## Filtering Outgoing PIM Join Messages

When the core of your network is using MPLS, PIM join and prune messages stop at the customer edge (CE) routers and are not forwarded toward the core, because these routers do not have PIM neighbors on the core-facing interfaces. When the core of your network is using IP, PIM join and prune messages are forwarded to the upstream PIM neighbors in the core of the network.

When the core of your network is using a mix of IP and MPLS, you might want to filter certain PIM join and prune messages at the upstream egress interface of the CE routers.

You can filter PIM sparse mode (PIM-SM) join and prune messages at the egress interfaces for IPv4 and IPv6 in the upstream direction. The messages can be filtered based on the group address, source address, outgoing interface, PIM neighbor, or a combination of these values. If the filter is removed, the join is sent after the PIM periodic join timer expires.

To filter PIM sparse mode join and prune messages at the egress interfaces, create a policy rejecting the group address, source address, outgoing interface, or PIM neighbor, and then apply the policy.

The following example filters PIM join and prune messages for group addresses 224.0.1.2 and 225.1.1.1.

1. In configuration mode, create the policy.

```
user@host# set policy-options policy-statement block-groups term t1 from route-filter
224.0.1.2/32 exact
user@host# set policy-options policy-statement block-groups term t1 from route-filter
225.1.1.1/32 exact
user@host# set policy-options policy-statement block-groups term t1 then reject
user@host# set policy-options policy-statement block-groups term last then accept
```

2. Verify the policy configuration by running the **show policy-options** command.

```
user@host# show policy-options
policy-statement block-groups {
  term t1 {
    from {
      route-filter 224.0.1.2/32 exact;
      route-filter 225.1.1.1/32 exact;
      then reject;
    }
    term last {
      then accept;
    }
  }
}
```

3. Apply the PIM join and prune message filter.

```
user@host> set protocols pim export block-groups
```

4. After the configuration is committed, use the **show pim statistics** command to verify that outgoing PIM join and prune messages are being filtered.

```
user@host> show pim statistics | grep filtered
```

RP Filtered Source	0
Rx Joins/Prunes filtered	0
Tx Joins/Prunes filtered	254

The egress filter count is shown on the **Tx Joins/Prunes filtered** line.

- [Filtering Incoming PIM Join Messages on page 4571](#)

## Filtering Incoming PIM Join Messages

Multicast scoping controls the propagation of multicast messages. Whereas multicast scoping prevents the actual multicast data packets from flowing in or out of an interface, PIM join filters prevent a state from being created in a router. A state—the (\*G) or (S,G) entries—is the information used for forwarding unicast or multicast packets. Using PIM join filters prevents the transport of multicast traffic across a network and the dropping of packets at a scope at the edge of the network. Also, PIM join filters reduce the potential for denial-of-service (DoS) attacks and PIM state explosion—large numbers of PIM join messages forwarded to each router on the rendezvous-point tree (RPT), resulting in memory consumption.

To use PIM join filters to efficiently restrict multicast traffic from certain source addresses, create and apply the routing policy across all routers in the network.

See [Table 308 on page 4571](#) for a list of match conditions.

**Table 308: PIM Join Filter Match Conditions**

Match Condition	Matches On
<b>interface</b>	Router interface or interfaces specified by name or IP address
<b>neighbor</b>	Neighbor address (the source address in the IP header of the join and prune message)
<b>route-filter</b>	Multicast group address embedded in the join and prune message
<b>source-address-filter</b>	Multicast source address embedded in the join and prune message

The following example shows how to create a PIM join filter. The filter is composed of a route filter and a source address filter—**bad-groups** and **bad-sources**, respectively. the **bad-groups** filter prevents (\*G) or (S,G) join messages from being received for all groups listed. The **bad-sources** filter prevents (S,G) join messages from being received for all sources listed. The **bad-groups** filter and **bad-sources** filter are in two different terms. If route filters and source address filters are in the same term, they are logically ANDed.

To filter incoming PIM join messages:

1. Configure the policy.

[edit [policy-statement](#) pim-join-filter term bad-groups]

```
user@host# set from route-filter 224.0.1.2/32 exact
user@host# set from route-filter 239.0.0.0/8 orlonger
user@host# set then reject

[edit policy-statement pim-join-filter term bad-sources]
user@host# set from source-address-filter 10.0.0.0/8 orlonger
user@host# set from source-address-filter 127.0.0.0/8 orlonger
user@host# set then reject

[edit policy-statement pim-join-filter term last]
user@host# set then accept
```

2. Apply one or more policies to routes being imported into the routing table from PIM.

```
[edit protocols pim]
user@host# set import pim-join-filter
```

3. Verify the configuration by checking the output of the **show pim join** and **show policy** commands.

## Configuring Register Message Filters on a PIM RP and DR

PIM register messages are sent to the rendezvous point (RP) by a designated router (DR). When a source for a group starts transmitting, the DR sends unicast PIM register packets to the RP.

Register messages have the following purposes:

- Notify the RP that a source is sending to a group.
- Deliver the initial multicast packets sent by the source to the RP for delivery down the shortest-path tree (SPT).

The PIM RP keeps track of all active sources in a single PIM sparse mode domain. In some cases, you want more control over which sources an RP discovers, or which sources a DR notifies other RPs about. A high degree of control over PIM register messages is provided by RP or DR register message filtering. Message filtering prevents unauthorized groups and sources from registering with an RP router.

You configure RP or DR register message filtering to control the number and location of multicast sources that an RP discovers. You can apply register message filters on a DR to control outgoing register messages, or apply them on an RP to control incoming register messages.

When anycast RP is configured, all RPs in the anycast RP set need to be configured with the same register message filtering policy.

You can configure message filtering globally or for a routing instance. These examples show the global configuration.

To configure an RP filter to drop the register packets for multicast group range 224.1.1.0/24 from source address 10.10.94.2:

1. On the RP, configure the policy.

```
[edit policy-options policy-statement incoming-policy-for-rp from]
user@host# set route-filter 224.1.1.0/24 orlonger
user@host# set source-address-filter 10.10.94.2/32 exact
user@host# set then reject
user@host# exit
```

2. Apply the policy to the RP.

```
[edit protocols pim rp]
user@host# set rp-register-policy incoming-policy-for-rp
user@host# set local address 10.10.10.5
user@host# exit
```

To configure a DR filter to prevent sending register packets for group range 224.1.1.0/24 and source address 10.10.10.1/32:

1. On the DR, configure the policy.

```
[edit policy-options policy-statement outgoing-policy-for-rp]
user@host# set from route-filter 224.1.1.0/24 orlonger
user@host# set from source-address-filter 10.10.10.1/32 exact
user@host# set then reject
user@host# exit
```

2. Apply the policy to the DR.

The static address is the address of the RP to which you do not want the DR to send the filtered register messages.

```
[edit protocols pim rp]
user@host# set dr-register-policy outgoing-policy-for-dr
user@host# set static 10.10.10.3
user@host# exit
```

To configure a policy expression to accept register messages for multicast group 224.1.1.5 but reject those for 224.1.1.1:

1. On the RP, configure the policies.

```
[edit policy-options policy-statement reject_224_1_1_1]
user@host# set from route-filter 224.1.1.0/24 orlonger
user@host# set from source-address-filter 10.10.94.2/32 exact
user@host# set then reject
user@host# exit

[edit policy-options policy-statement accept_224_1_1_5]
user@host# set term one from route-filter 224.1.1.5/32 exact
user@host# set term one from source-address-filter 10.10.94.2/32 exact
user@host# set term one then accept
user@host# set term two then reject
user@host# exit
```

2. Apply the policies to the RP.

```
[edit protocols pim rp]
user@host# set rp-register-policy [ reject_224_1_1_1 | accept_224_1_1_5 ]
user@host# set local address 10.10.10.5
```

To monitor the operation of the filters, run the **show pim statistics** command. The command output contains the following fields related to filtering:

- RP Filtered Source
- Rx Joins/Prunes filtered
- Tx Joins/Prunes filtered
- Rx Register msgs filtering drop
- Tx Register msgs filtering drop

- [Example: Configuring the PIM SPT Threshold Policy on page 4577](#)

### Example: Configuring the PIM Assert Timeout

This example shows how to configure the timeout period for a PIM assert forwarder.

- [Requirements on page 4574](#)
- [Overview on page 4575](#)
- [Configuration on page 4576](#)

---

#### Requirements

Before you begin:

- Configure the router interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure an interior gateway protocol or static routing. See the *Junos OS Routing Protocols Library for Routing Devices*.
- Configure PIM Sparse Mode on the interfaces. See [“Enabling PIM Sparse Mode” on page 4545](#).

---

## Overview

---

The role of PIM assert messages is to determine the forwarder on a network with multiple routers. The forwarder is the router that forwards multicast packets to a network with multicast group members. The forwarder is generally the same as the PIM DR.

A router sends an assert message when it receives a multicast packet on an interface that is listed in the outgoing interface list of the matching routing entry. Receiving a message on an outgoing interface is an indication that more than one router forwards the same multicast packets to a network.

In [Figure 177 on page 4576](#), both routing devices R1 and R2 forward multicast packets for the same (S,G) entry on a network. Both devices detect this situation and both devices send assert messages on the Ethernet network. An assert message contains, in addition to a source address and group address, a unicast cost metric for sending packets to the source, and a preference metric for the unicast cost. The preference metric expresses a preference between unicast routing protocols. The routing device with the smallest preference metric becomes the forwarder (also called the assert winner). If the preference metrics are equal, the device that sent the lowest unicast cost metric becomes the forwarder. If the unicast metrics are also equal, the routing device with the highest IP address becomes the forwarder. After the transmission of assert messages, only the forwarder continues to forward messages on the network.

When an assert message is received and the RPF neighbor is changed to the assert winner, the assert timer is set to an assert timeout period. The assert timeout period is restarted every time a subsequent assert message for the route entry is received on the incoming interface. When the assert timer expires, the routing device resets its RPF neighbor according to its unicast routing table. Then, if multiple forwarders still exist, the forwarders reenter the assert message cycle. In effect, the assert timeout period determines how often multicast routing devices enter a PIM assert message cycle.

The range is from 5 through 210 seconds. The default is 180 seconds.

Assert messages are useful for LANs that connect multiple routing devices and no hosts.

[Figure 177 on page 4576](#) shows the topology for this example.

Figure 177: PIM Assert Topology

### Configuration

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure an assert timeout:

1. Configure the timeout period, in seconds.  

```
[edit protocols pim]
user@host# set assert-timeout 60
```
2. (Optional) Trace assert messages.  

```
[edit protocols pim]
user@host# set traceoptions file PIM.log
user@host# set traceoptions flag assert detail
```
3. If you are done configuring the device, commit the configuration.  

```
user@host# commit
```
4. To verify the configuration, run the following commands:
  - `show pim join`
  - `show pim statistics`

## Example: Configuring the PIM SPT Threshold Policy

This example shows how to apply a policy that suppresses the transition from the rendezvous-point tree (RPT) rooted at the RP to the shortest-path tree (SPT) rooted at the source.

- [Requirements on page 4577](#)
- [Overview on page 4577](#)
- [Configuration on page 4578](#)
- [Verification on page 4580](#)

### Requirements

Before you begin:

- Configure the router interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure an interior gateway protocol or static routing. See the *Junos OS Routing Protocols Library for Routing Devices*.
- Configure PIM Sparse Mode on the interfaces. See “[Enabling PIM Sparse Mode](#)” on [page 4545](#).

### Overview

Multicast routing devices running PIM sparse mode can forward the same stream of multicast packets onto the same LAN through an RPT rooted at the RP or through an SPT rooted at the source. In some cases, the last-hop routing device needs to stay on the shared RPT to the RP and not transition to a direct SPT to the source. Receiving the multicast data traffic on SPT is optimal but introduces more state in the network, which might not be desirable in some multicast deployments. Ideally, low-bandwidth multicast streams can be forwarded on the SPT, and high-bandwidth streams can use the SPT. This example shows how to configure such a policy.

This example includes the following settings:

- **spt-threshold**—Enables you to configure an SPT threshold policy on the last-hop routing device to control the transition to a direct SPT. When you include this statement in the main PIM instance, the PE router stays on the RPT for control traffic.
- **infinity**—Applies an SPT cutover threshold of infinity to a source-group address pair, so that the last-hop routing device never transitions to a direct SPT. For all other source-group address pairs, the last-hop routing device transitions immediately to a direct SPT rooted at the source DR. This statement must reference a properly configured policy to set the SPT cutover threshold for a particular source-group pair to infinity. The use of values other than infinity for the SPT threshold is not supported. You can configure more than one policy.
- **policy-statement**—Configures the policy. The simplest type of SPT threshold policy uses a route filter and source address filter to specify the multicast group and source

addresses and to set the SPT threshold for that pair of addresses to infinity. The policy is applied to the main PIM instance.

This example sets the SPT transition value for the source-group pair 10.10.10.1 and 224.1.1.1 to infinity. When the policy is applied to the last-hop router, multicast traffic from this source-group pair never transitions to a direct SPT to the source. Traffic will continue to arrive through the RP. However, traffic for any other source-group address combination at this router transitions to a direct SPT to the source.

Note these points when configuring the SPT threshold policy:

- Configuration changes to the SPT threshold policy affect how the routing device handles the SPT transition.

Note these points when configuring the SPT threshold policy:

- Configuration changes to the SPT threshold policy affect how the routing device handles the SPT transition.

Note these points when configuring the SPT threshold policy:

- Configuration changes to the SPT threshold policy affect how the routing device handles the SPT transition.
- When the policy is configured for the first time, the routing device continues to transition to the direct SPT for the source-group address pair until the PIM-join state is cleared with the **clear pim join** command.
- If you do not clear the PIM-join state when you apply the infinity policy configuration for the first time, you must apply it before the PE router is brought up.
- When the policy is deleted for a source-group address pair for the first time, the routing device does not transition to the direct SPT for that source-group address pair until the PIM-join state is cleared with the **clear pim join** command.
- When the policy is changed for a source-group address pair for the first time, the routing device does not use the new policy until the PIM-join state is cleared with the **clear pim join** command.

---

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
[edit]
set policy-options policy-statement spt-infinity-policy term one from route-filter
  224.1.1.1/32 exact
set policy-options policy-statement spt-infinity-policy term one from source-address-filter
  10.10.10.1/32 exact
set policy-options policy-statement spt-infinity-policy term one then accept
set policy-options policy-statement spt-infinity-policy term two then reject
set protocols pim spt-threshold infinity spt-infinity-policy
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see the *CLI User Guide*.

To configure an SPT threshold policy:

1. Apply the policy.

```
[edit]
user@host# edit protocols pim
[edit protocols pim]
user@host# set spt-threshold infinity spt-infinity-policy
[edit protocols pim]
user@host# exit
```

2. Configure the policy.

```
[edit]
user@host# edit policy-options policy-statement spt-infinity-policy
[edit policy-options policy-statement spt-infinity-policy]
user@host# set term one from route-filter 224.1.1.1/32 exact
[edit policy-options policy-statement spt-infinity-policy]
user@host# set term one from source-address-filter 10.10.10.1/32 exact
[edit policy-options policy-statement spt-infinity-policy]
user@host# set term one then accept
[edit policy-options policy-statement spt-infinity-policy]
user@host# set term two then reject
[edit policy-options policy-statement spt-infinity-policy]
user@host# exit
policy-statement {
```

3. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

4. Clear the PIM join cache to force the configuration to take effect.

```
[edit]
user@host# run clear pim join
```

### Results

Confirm your configuration by entering the **show policy-options** command and the **show protocols** command from configuration mode. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show policy-options
policy-statement spt-infinity-policy {
  term one {
    from {
      route-filter 224.1.1.1/32 exact;
      source-address-filter 10.10.10.1/32 exact;
    }
    then accept;
  }
  term two {
    then reject;
  }
}
```

```
    }  
  }  
  
user@host# show protocols  
pim {  
  spt-threshold {  
    infinity spt-infinity-policy;  
  }  
}
```

---

### Verification

To verify the configuration, run the `show pim join` command.

## PIM and the BFD Protocol

- [Configuring BFD for PIM on page 4580](#)
- [Configuring BFD Authentication for PIM on page 4582](#)

### Configuring BFD for PIM

The Bidirectional Forwarding Detection (BFD) Protocol is a simple hello mechanism that detects failures in a network. BFD works with a wide variety of network environments and topologies. A pair of routing devices exchanges BFD packets. Hello packets are sent at a specified, regular interval. A neighbor failure is detected when the routing device stops receiving a reply after a specified interval. The BFD failure detection timers have shorter time limits than the Protocol Independent Multicast (PIM) hello hold time, so they provide faster detection.

The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the `clear bfd adaptation` command to return BFD interval timers to their configured values. The `clear bfd adaptation` command is hitless, meaning that the command does not affect traffic flow on the routing device.

You must specify the minimum transmit and minimum receive intervals to enable BFD on PIM.

To enable failure detection:

1. Configure the interface globally or in a routing instance.

This example shows the global configuration.

```
[edit protocols pim]
user@host# edit interface fe-1/0/0.0 family inet bfd-liveness-detection
```

2. Configure the minimum transmit interval.

This is the minimum interval after which the routing device transmits hello packets to a neighbor with which it has established a BFD session. Specifying an interval smaller than 300 ms can cause undesired BFD flapping.

```
[edit protocols pim interface fe-1/0/0.0 family inet bfd-liveness-detection]
user@host# set transmit-interval 350
```

3. Configure the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session.

Specifying an interval smaller than 300 ms can cause undesired BFD flapping.

```
[edit protocols pim interface fe-1/0/0.0 family inet bfd-liveness-detection]
user@host# set minimum-receive-interval 350
```

4. (Optional) Configure other BFD settings.

As an alternative to setting the receive and transmit intervals separately, configure one interval for both.

```
[edit protocols pim interface fe-1/0/0.0 family inet bfd-liveness-detection]
user@host# set minimum-interval 350
```

5. Configure the threshold for the adaptation of the BFD session detection time.

When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

```
[edit protocols pim interface fe-1/0/0.0 family inet bfd-liveness-detection]
user@host# set detection-time threshold 800
```

6. Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

```
[edit protocols pim interface fe-1/0/0.0 family inet bfd-liveness-detection]
user@host# set multiplier 50
```

7. Configure the BFD version.

```
[edit protocols pim interface fe-1/0/0.0 family inet bfd-liveness-detection]
user@host# set version 1
```

8. Specify that BFD sessions should not adapt to changing network conditions.

We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

```
[edit protocols pim interface fe-1/0/0.0 family inet bfd-liveness-detection]
user@host# set no-adaptation
```

9. Verify the configuration by checking the output of the **show bfd session** command.

**Related Documentation**

- *show bfd session* in the [CLI Explorer](#)

## Configuring BFD Authentication for PIM

Beginning with Junos OS Release 9.6, you can configure authentication for Bidirectional Forwarding Detection (BFD) sessions running over Protocol Independent Multicast (PIM). Routing instances are also supported. The following steps are needed to configure authentication on a BFD session:

1. Specify the BFD authentication algorithm for the PIM protocol.
2. Associate the authentication keychain with the PIM protocol.
3. Configure the related security authentication keychain.

The following sections provide instructions for configuring and viewing BFD authentication on PIM:

- [Configuring BFD Authentication Parameters on page 4582](#)
- [Viewing Authentication Information for BFD Sessions on page 4583](#)

---

### Configuring BFD Authentication Parameters

BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

To configure BFD authentication:

1. Specify the algorithm (**keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**, or **simple-password**) to use for BFD authentication on a PIM route or routing instance.

```
[edit protocols pim]
```

```
user@host# set interface ge-0/1/5 family inet bfd-liveness-detection authentication  
algorithm keyed-sha-1
```

**NOTE:** Nonstop active routing (NSR) is not supported with the **meticulous-keyed-md5** and **meticulous-keyed-sha-1** authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

2. Specify the keychain to be used to associate BFD sessions on the specified PIM route or routing instance with the unique security authentication keychain attributes.

The keychain you specify must match the keychain name configured at the **[edit security authentication key-chains]** hierarchy level.

```
[edit protocols pim]
```

```
user@host# set interface ge-0/1/5 family inet bfd-liveness-detection authentication  
keychain bfd-pim
```

**NOTE:** The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

3. Specify the unique security authentication information for BFD sessions:

- The matching keychain name as specified in Step 2.
- At least one key, a unique integer between 0 and 63. Creating multiple keys allows multiple clients to use the BFD session.
- The secret data used to allow access to the session.
- The time at which the authentication key becomes active, in the format *yyyy-mm-dd.hh:mm:ss*.

[edit security]

```
user@host# set authentication-key-chains key-chain bfd-pim key 53 secret
$9$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHm start-time 2009-06-14.10:00:00
```

4. (Optional) Specify loose authentication checking if you are transitioning from nonauthenticated sessions to authenticated sessions.

[edit protocols pim]

```
user@host# set interface ge-0/1/5 family inet bfd-liveness-detection authentication
loose-check
```

5. (Optional) View your configuration by using the **show bfd session detail** or **show bfd session extensive** command.

6. Repeat these steps to configure the other end of the BFD session.

### Viewing Authentication Information for BFD Sessions

You can view the existing BFD authentication configuration by using the **show bfd session detail** and **show bfd session extensive** commands.

The following example shows BFD authentication configured for the **ge-0/1/5** interface. It specifies the keyed SHA-1 authentication algorithm and a keychain name of **bfd-pim**. The authentication keychain is configured with two keys. Key 1 contains the secret data “\$9\$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHm” and a start time of June 1, 2009, at 9:46:02 AM PST. Key 2 contains the secret data “\$9\$a5jiKW9L.reP38ny.TszF2/9” and a start time of June 1, 2009, at 3:29:20 PM PST.

[edit protocols pim]

```
interface ge-0/1/5 {
  family inet {
    bfd-liveness-detection {
      authentication {
        key-chain bfd-pim;
        algorithm keyed-sha-1;
      }
    }
  }
}
```

```

}
[edit security]
authentication key-chains {
  key-chain bfd-pim {
    key 1 {
      secret "$9$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHm";
      start-time "2009-6-1.09:46:02 -0700";
    }
    key 2 {
      secret "$9$a5jiKW9l.reP38ny.TszF2/9";
      start-time "2009-6-1.15:29:20 -0700";
    }
  }
}
}

```

If you commit these updates to your configuration, you see output similar to the following example. In the output for the **show bfd session detail** command, **Authenticate** is displayed to indicate that BFD authentication is configured. For more information about the configuration, use the **show bfd session extensive** command. The output for this command provides the keychain name, the authentication algorithm and mode for each client in the session, and the overall BFD authentication configuration status, keychain name, and authentication algorithm and mode.

## Configuring IGMP

Before you begin:

1. Determine whether the router is directly attached to any multicast sources. Receivers must be able to locate these sources.
2. Determine whether the router is directly attached to any multicast group receivers. If receivers are present, IGMP is needed.
3. Determine whether to configure multicast to use sparse, dense, or sparse-dense mode. Each mode has different configuration considerations.
4. Determine the address of the RP if sparse or sparse-dense mode is used.
5. Determine whether to locate the RP with the static configuration, BSR, or auto-RP method.

6. Determine whether to configure multicast to use its own RPF routing table when configuring PIM in sparse, dense, or sparse-dense mode.
7. Configure the SAP and SDP protocols to listen for multicast session announcements. See *Configuring the Session Announcement Protocol*.

To configure the Internet Group Management Protocol (IGMP), include the **igmp** statement:

```
igmp {
  accounting;
  interface interface-name {
    disable;
    (accounting | no-accounting);
    group-policy [ policy-names ];
    immediate-leave;
    oif-map map-name;
    promiscuous-mode;
    ssm-map ssm-map-name;
    static {
      group multicast-group-address {
        exclude;
        group-count number;
        group-increment increment;
        source ip-address {
          source-count number;
          source-increment increment;
        }
      }
    }
  }
  version version;
}
query-interval seconds;
query-last-member-interval seconds;
query-response-interval seconds;
robust-count number;
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable>;
  flag flag <flag-modifier> <disable>;
}
```

You can include this statement at the following hierarchy levels:

- [edit protocols]
- [edit logical-systems *logical-system-name* protocols]

By default, IGMP is enabled on all interfaces on which you configure Protocol Independent Multicast (PIM), and on all broadcast interfaces on which you configure the Distance Vector Multicast Routing Protocol (DVMRP).

**NOTE:** You can configure IGMP on an interface without configuring PIM. PIM is generally not needed on IGMP downstream interfaces. Therefore, only one “pseudo PIM interface” is created to represent all IGMP downstream (IGMP-only) interfaces on the router. This reduces the amount of router resources, such as memory, that are consumed. You must configure PIM on upstream IGMP interfaces to enable multicast routing, perform reverse-path forwarding for multicast data packets, populate the multicast forwarding table for upstream interfaces, and in the case of bidirectional PIM and PIM sparse mode, to distribute IGMP group memberships into the multicast routing domain.

## Enabling IGMP

The Internet Group Management Protocol (IGMP) manages multicast groups by establishing, maintaining, and removing groups on a subnet. Multicast routing devices use IGMP to learn which groups have members on each of their attached physical networks. IGMP must be enabled for the router to receive IPv4 multicast packets. IGMP is only needed for IPv4 networks, because multicast is handled differently in IPv6 networks. IGMP is automatically enabled on all IPv4 interfaces on which you configure PIM and on all IPv4 broadcast interfaces when you configure DVMRP.

If IGMP is not running on an interface—either because PIM and DVMRP are not configured on the interface or because IGMP is explicitly disabled on the interface—you can explicitly enable IGMP.

To explicitly enable IGMP:

1. If PIM and DVMRP are not running on the interface, explicitly enable IGMP by including the interface name.

```
[edit protocols igmp]
user@host# set interface fe-0/0/0.0
```

2. See if IGMP is disabled on any interfaces. In the following example, IGMP is disabled on a Gigabit Ethernet interface.

```
[edit protocols igmp]
user@host# show
interface fe-0/0/0.0;
interface ge-1/0/0.0 {
  disable;
}
```

3. Enable IGMP on the interface by deleting the **disable** statement.

```
[edit protocols igmp]
delete interface ge-1/0/0.0 disable
```

4. Verify the configuration.

```
[edit protocols igmp]
user@host# show
interface fe-0/0/0.0;
```

```
interface ge-1/0/0.0;
```

5. Verify the operation of IGMP on the interfaces by checking the output of the **show igmp interface** command.

## Changing the IGMP Version

By default, the routing device runs IGMPv2. Routing devices running different versions of IGMP determine the lowest common version of IGMP that is supported by hosts on their subnet and operate in that version.

To enable source-specific multicast (SSM) functionality, you must configure version 3 on the host and the host's directly connected routing device. If a source address is specified in a multicast group that is statically configured, the version must be set to IGMPv3.

If a static multicast group is configured with the source address defined, and the IGMP version is configured to be version 2, the source is ignored and only the group is added. In this case, the join is treated as an IGMPv2 group join.

If you configure the IGMP version setting at the individual interface hierarchy level, it overrides the **interface all** statement.

If you have already configured the routing device to use IGMP version 1 (IGMPv1) and then configure it to use IGMPv2, the routing device continues to use IGMPv1 for up to 6 minutes and then uses IGMPv2.

To change to IGMPv3 for SSM functionality:

1. Configure the IGMP interface.

```
[edit protocols igmp]  
user@host# set interface ge-0/0/0 version 3
```

2. Verify the configuration by checking the version field in the output of the **show igmp interfaces** command. The **show igmp statistics** command has version-specific output fields, such as V1 Membership Report, V2 Membership Report, and V3 Membership Report.

**CAUTION:** On MX Series platforms, IGMPv2 and IGMPv3 cannot be configured together on the same interface. Configuring both together causes unexpected behavior in multicast traffic forwarding.

## Modifying the IGMP Host-Query Message Interval

The objective of IGMP is to keep routers up to date with group membership of the entire subnet. Routers need not know who all the members are, only that members exist. Each host keeps track of which multicast groups are subscribed to. On each link, one router is elected the querier. The IGMP querier router periodically sends general host-query messages on each attached network to solicit membership information. The messages are sent to the all-systems multicast group address, 224.0.0.1.

The query interval, the response interval, and the robustness variable are related in that they are all variables that are used to calculate the group membership timeout. The group membership timeout is the number of seconds that must pass before a multicast router determines that no more members of a host group exist on a subnet. The group membership timeout is calculated as the (robustness variable x query-interval) + (query-response-interval). If no reports are received for a particular group before the group membership timeout has expired, the routing device stops forwarding remotely-originated multicast packets for that group onto the attached network.

By default, host-query messages are sent every 125 seconds. You can change this interval to change the number of IGMP messages sent on the subnet.

To modify the query interval:

1. Configure the interval.

```
[edit protocols igmp]
user@host# set query-interval 200
```

The value can be from 1 through 1024 seconds.

2. Verify the configuration by checking the IGMP Query Interval field in the output of the **show igmp interface** command.
3. Verify the operation of the query interval by checking the Membership Query field in the output of the **show igmp statistics** command.

## Modifying the IGMP Last-Member Query Interval

The last-member query interval is the maximum amount of time between group-specific query messages, including those sent in response to leave-group messages. You can configure this interval to change the amount of time it takes a routing device to detect the loss of the last member of a group.

When the routing device that is serving as the querier receives a leave-group message from a host, the routing device sends multiple group-specific queries to the group being left. The querier sends a specific number of these queries at a specific interval. The number of queries sent is called the last-member query count. The interval at which the queries are sent is called the last-member query interval. Because both settings are configurable, you can adjust the leave latency. The IGMP leave latency is the time between a request to leave a multicast group and the receipt of the last byte of data for the multicast group.

The last-member query count x (times) the last-member query interval = (equals) the amount of time it takes a routing device to determine that the last member of a group has left the group and to stop forwarding group traffic.

The default last-member query interval is 1 second. You can configure a subsecond interval up to one digit to the right of the decimal point. The configurable range is 0.1 through 0.9, then in 1-second intervals 1 through 999,999.

To modify this interval:

1. Configure the time (in seconds) that the routing device waits for a report in response to a group-specific query.

```
[edit protocols igmp]
```

```
user@host# set query-last-member-interval 0.1
```

2. Verify the configuration by checking the IGMP Last Member Query Interval field in the output of the **show igmp interfaces** command.

**NOTE:** You can configure the last-member query count by configuring the robustness variable. The two are always equal.

## Specifying Immediate-Leave Host Removal for IGMP

The immediate leave setting is useful for minimizing the leave latency of IGMP memberships. When this setting is enabled, the routing device leaves the multicast group immediately after the last host leaves the multicast group.

The immediate-leave setting enables host tracking, meaning that the device keeps track of the hosts that send join messages. This allows IGMP to determine when the last host sends a leave message for the multicast group.

When the immediate leave setting is enabled, the device removes an interface from the forwarding-table entry without first sending IGMP group-specific queries to the interface. The interface is pruned from the multicast tree for the multicast group specified in the IGMP leave message. The immediate leave setting ensures optimal bandwidth management for hosts on a switched network, even when multiple multicast groups are being used simultaneously.

When immediate leave is disabled and one host sends a leave group message, the routing device first sends a group query to determine if another receiver responds. If no receiver responds, the routing device removes all hosts on the interface from the multicast group. Immediate leave is disabled by default for both IGMP version 2 and IGMP version 3.

**NOTE:** Although host tracking is enabled for IGMPv2 and MLDv1 when you enable immediate leave, use immediate leave with these versions only when there is one host on the interface. The reason is that IGMPv2 and MLDv1 use a report suppression mechanism whereby only one host on an interface sends a group join report in response to a membership query. The other interested hosts suppress their reports. The purpose of this mechanism is to avoid a flood of reports for the same group. But it also interferes with host tracking, because the router only knows about the one interested host and does not know about the others.

To enable immediate leave on an interface:

1. Configure immediate leave on the IGMP interface.

```
[edit protocols IGMP]
user@host# set interface ge-0/0/0.1 immediate-leave
```

2. Verify the configuration by checking the Immediate Leave field in the output of the `show igmp interface` command.

## Filtering Unwanted IGMP Reports at the IGMP Interface Level

Suppose you need to limit the subnets that can join a certain multicast group. The **group-policy** statement enables you to filter unwanted IGMP reports at the interface level. When this statement is enabled on a router running IGMP version 2 (IGMPv2) or version 3 (IGMPv3), after the router receives an IGMP report, the router compares the group against the specified group policy and performs the action configured in that policy (for example, rejects the report if the policy matches the defined address or network).

You define the policy to match only IGMP group addresses (for IGMPv2) by using the policy's **route-filter** statement to match the group address. You define the policy to match IGMP (source, group) addresses (for IGMPv3) by using the policy's **route-filter** statement to match the group address and the policy's **source-address-filter** statement to match the source address.

**CAUTION:** On MX Series platforms, IGMPv2 and IGMPv3 cannot be configured together on the same interface. Configuring both together causes unexpected behavior in multicast traffic forwarding.

To filter unwanted IGMP reports:

1. Configure an IGMPv2 policy.

```
[edit policy-statement reject_policy_v2]
user@host# set from route-filter 224.1.1.1/32 exact
user@host# set from route-filter 239.0.0.0/8 orlonger
user@host# set then reject
```

2. Configure an IGMPv3 policy.

```
[edit policy-statement reject_policy_v3]
user@host# set from route-filter 224.1.1.1/32 exact
user@host# set from route-filter 239.0.0.0/8 orlonger
user@host# set from source-address-filter 10.0.0.0/8 orlonger
user@host# set from source-address-filter 127.0.0.0/8 orlonger
user@host# set then reject
```

3. Apply the policies to the IGMP interfaces on which you prefer not to receive specific group or (source, group) reports. In this example, **ge-0/0/0.1** is running IGMPv2, and **ge-0/1/1.0** is running IGMPv3.

```
[edit protocols igmp]
user@host# set interface ge-0/0/0.1 group-policy reject_policy_v2
user@host# set interface ge-0/1/1.0 group-policy reject_policy_v3
```

4. Verify the operation of the filter by checking the Rejected Report field in the output of the **show igmp statistics** command.

- [show igmp statistics on page 4821](#)

## Accepting IGMP Messages from Remote Subnetworks

By default, IGMP interfaces accept IGMP messages only from the same subnet. Including the **promiscuous-mode** statement enables the routing device to accept IGMP messages from indirectly connected subnets.

**NOTE:** When you enable IGMP on an unnumbered Ethernet interface that uses a /32 loopback address as a donor address, you must configure IGMP promiscuous mode to accept the IGMP packets received on this interface.

**NOTE:** When enabling promiscuous-mode, all routers on the ethernet segment must be configured with the promiscuous mode statement. Otherwise, only the interface configured with lowest IPv4 address acts as the querier for IGMP for this Ethernet segment.

To enable IGMP promiscuous mode on an interface:

1. Configure the IGMP interface.

```
[edit protocols igmp]
user@host# set interface ge-0/1/1.0 promiscuous-mode
```

2. Verify the configuration by checking the Promiscuous Mode field in the output of the **show igmp interface** command.
3. Verify the operation of the filter by checking the Rx non-local field in the output of the **show igmp statistics** command.

## Modifying the IGMP Query Response Interval

The query response interval is the maximum amount of time that can elapse between when the querier router sends a host-query message and when it receives a response from a host. Configuring this interval allows you to adjust the burst peaks of IGMP messages on the subnet. Set a larger interval to make the traffic less bursty. Bursty traffic refers to an uneven pattern of data transmission: sometimes a very high data transmission rate, whereas at other times a very low data transmission rate.

The query response interval, the host-query interval, and the robustness variable are related in that they are all variables that are used to calculate the group membership timeout. The group membership timeout is the number of seconds that must pass before a multicast router determines that no more members of a host group exist on a subnet. The group membership timeout is calculated as the (robustness variable x query-interval) + (query-response-interval). If no reports are received for a particular group before the group membership timeout has expired, the routing device stops forwarding remotely originated multicast packets for that group onto the attached network.

The default query response interval is 10 seconds. You can configure a subsecond interval up to one digit to the right of the decimal point. The configurable range is 0.1 through 0.9, then in 1-second intervals 1 through 999,999.

To modify the query response interval:

1. Configure the interval.

```
[edit protocols igmp]
user@host# set query-response-interval 0.4
```

2. Verify the configuration by checking the IGMP Query Response Interval field in the output of the **show igmp interface** command.
3. Verify the operation of the query interval by checking the Membership Query field in the output of the **show igmp statistics** command.

**Related  
Documentation**

- [show igmp statistics on page 4821](#)

## Modifying the IGMP Robustness Variable

Fine-tune the IGMP robustness variable to allow for expected packet loss on a subnet. The robust count automatically changes certain IGMP message intervals for IGMPv2 and IGMPv3. Increasing the robust count allows for more packet loss but increases the leave latency of the subnetwork.

When the query router receives an IGMP leave message on a shared network running IGMPv2, the query router must send an IGMP group query message a specified number of times. The number of IGMP group query messages sent is determined by the robust count.

The value of the robustness variable is also used in calculating the following IGMP message intervals:

- Group member interval—Amount of time that must pass before a multicast router determines that there are no more members of a group on a network. This interval is calculated as follows: (robustness variable x query-interval) + (1 x query-response-interval).
- Other querier present interval—The robust count is used to calculate the amount of time that must pass before a multicast router determines that there is no longer another multicast router that is the querier. This interval is calculated as follows: (robustness variable x query-interval) + (0.5 x query-response-interval).
- Last-member query count—Number of group-specific queries sent before the router assumes there are no local members of a group. The number of queries is equal to the value of the robustness variable.

In IGMPv3, a change of interface state causes the system to immediately transmit a state-change report from that interface. In case the state-change report is missed by one or more multicast routers, it is retransmitted. The number of times it is retransmitted

is the robust count minus one. In IGMPv3, the robust count is also a factor in determining the group membership interval, the older version querier interval, and the other querier present interval.

By default, the robustness variable is set to 2. You might want to increase this value if you expect a subnet to lose packets.

The number can be from 2 through 10.

To change the value of the robustness variable:

1. Configure the robust count.

When you set the robust count, you are in effect configuring the number of times the querier retries queries on the connected subnets.

```
[edit protocols igmp]
user@host# set robust-count 5
```

2. Verify the configuration by checking the IGMP Robustness Count field in the output of the **show igmp interfaces** command.

## Limiting the Maximum IGMP Message Rate

This section describes how to change the limit for the maximum number of IGMP packets transmitted in 1 second by the router.

Increasing the maximum number of IGMP packets transmitted per second might be useful on a router with a large number of interfaces participating in IGMP.

To change the limit for the maximum number of IGMP packets the router can transmit in 1 second, include the **maximum-transmit-rate** statement and specify the maximum number of packets per second to be transmitted.

#### Related Documentation

- [maximum-transmit-rate \(Protocols IGMP\) on page 4724](#)

## Enabling IGMP Static Group Membership

You can create IGMP static group membership to test multicast forwarding without a receiver host. When you enable IGMP static group membership, data is forwarded to an interface without that interface receiving membership reports from downstream hosts.

The router on which you enable static IGMP group membership must be the designated router (DR) for the subnet. Otherwise, traffic does not flow downstream.

When enabling IGMP static group membership, you cannot configure multiple groups using the **group-count**, **group-increment**, **source-count**, and **source-increment** statements if the **all** option is specified as the IGMP interface.

Class-of-service (CoS) adjustment is not supported with IGMP static group membership.

In this example, you create static group 225.1.1.1.

1. On the DR, configure the static groups to be created by including the **static** statement and **group** statement and specifying which IP multicast address of the group to be created. When creating groups individually, you must specify a unique address for each group.

```
[edit protocols igmp]
```

```
user@host# set interface fe-0/1/2 static group 225.1.1.1
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp
```

```
interface fe-0/1/2.0 {
  static {
    group 225.1.1.1;
  }
}
```

3. After you have committed the configuration and the source is sending traffic, use the **show igmp group** command to verify that static group 225.1.1.1 has been created.

```
user@host> show igmp group
Interface: fe-0/1/2
Group: 225.1.1.1
Source: 10.0.0.2
Last reported by: Local
Timeout: 0 Type: Static
```

**NOTE:** When you configure static IGMP group entries on point-to-point links that connect routing devices to a rendezvous point (RP), the static IGMP group entries do not generate join messages toward the RP.

When you create IGMP static group membership to test multicast forwarding on an interface on which you want to receive multicast traffic, you can specify that a number of static groups be automatically created. This is useful when you want to test forwarding to multiple receivers without having to configure each receiver separately.

In this example, you create three groups.

1. On the DR, configure the number of static groups to be created by including the **group-count** statement and specifying the number of groups to be created.

```
[edit protocols igmp]
```

```
user@host# set interface fe-0/1/2 static group 225.1.1.1 group-count 3
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp

interface fe-0/1/2.0 {
  static {
    group 225.1.1.1 {
      group-count 3;
    }
  }
}
```

3. After you have committed the configuration and after the source is sending traffic, use the **show igmp group** command to verify that static groups 225.1.1.1, 225.1.1.2, and 225.1.1.3 have been created.

```
user@host> show igmp group
Interface: fe-0/1/2
  Group: 225.1.1.1
    Source: 10.0.0.2
    Last reported by: Local
    Timeout: 0 Type: Static
  Group: 225.1.1.2
    Source: 10.0.0.2
    Last reported by: Local
    Timeout: 0 Type: Static
  Group: 225.1.1.3
    Source: 10.0.0.2
    Last reported by: Local
    Timeout: 0 Type: Static
```

When you create IGMP static group membership to test multicast forwarding on an interface on which you want to receive multicast traffic, you can also configure the group address to be automatically incremented for each group created. This is useful when you want to test forwarding to multiple receivers without having to configure each receiver separately and when you do not want the group addresses to be sequential.

In this example, you create three groups and increase the group address by an increment of two for each group.

1. On the DR, configure the group address increment by including the **group-increment** statement and specifying the number by which the address should be incremented for each group. The increment is specified in dotted decimal notation similar to an IPv4 address.

```
[edit protocols igmp]
user@host# set interface fe-0/1/2 static group 225.1.1.1 group-count 3 group-increment
0.0.0.2
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp

interface fe-0/1/2.0 {
  version 3;
```

```
static {  
  group 225.1.1.1 {  
    group-increment 0.0.0.2;  
    group-count 3;  
  }  
}
```

3. After you have committed the configuration and after the source is sending traffic, use the **show igmp group** command to verify that static groups 225.1.1.1, 225.1.1.3, and 225.1.1.5 have been created.

```
user@host> show igmp group  
Interface: fe-0/1/2  
  Group: 225.1.1.1  
    Source: 10.0.0.2  
    Last reported by: Local  
    Timeout: 0 Type: Static  
  Group: 225.1.1.3  
    Source: 10.0.0.2  
    Last reported by: Local  
    Timeout: 0 Type: Static  
  Group: 225.1.1.5  
    Source: 10.0.0.2  
    Last reported by: Local  
    Timeout: 0 Type: Static
```

When you create IGMP static group membership to test multicast forwarding on an interface on which you want to receive multicast traffic, and your network is operating in source-specific multicast (SSM) mode, you can also specify that the multicast source address be accepted. This is useful when you want to test forwarding to multicast receivers from a specific multicast source.

If you specify a group address in the SSM range, you must also specify a source.

If a source address is specified in a multicast group that is statically configured, the IGMP version on the interface must be set to IGMPv3. IGMPv2 is the default value.

In this example, you create group 225.1.1.1 and accept IP address 10.0.0.2 as the only source.

1. On the DR, configure the source address by including the **source** statement and specifying the IPv4 address of the source host.

```
[edit protocols igmp]  
user@host# set interface fe-0/1/2 static group 225.1.1.1 source 10.0.0.2
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp  
interface fe-0/1/2.0 {  
  version 3;  
  static {  
    group 225.1.1.1 {  
      source 10.0.0.2;  
    }  
  }  
}
```

```
    }
  }
```

3. After you have committed the configuration and the source is sending traffic, use the **show igmp group** command to verify that static group 225.1.1.1 has been created and that source 10.0.0.2 has been accepted.

```
user@host> show igmp group
Interface: fe-0/1/2
  Group: 225.1.1.1
    Source: 10.0.0.2
    Last reported by: Local
    Timeout: 0 Type: Static
```

When you create IGMP static group membership to test multicast forwarding on an interface on which you want to receive multicast traffic, you can specify that a number of multicast sources be automatically accepted. This is useful when you want to test forwarding to multicast receivers from more than one specified multicast source.

In this example, you create group 255.1.1.1 and accept addresses 10.0.0.2, 10.0.0.3, and 10.0.0.4 as the sources.

1. On the DR, configure the number of multicast source addresses to be accepted by including the **source-count** statement and specifying the number of sources to be accepted.

```
[edit protocols igmp]
user@host# set interface fe-0/1/2 static group 225.1.1.1 source 10.0.0.2 source-count
3
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp
interface fe-0/1/2.0 {
  version 3;
  static {
    group 225.1.1.1 {
      source 10.0.0.2 {
        source-count 3;
      }
    }
  }
}
```

3. After you have committed the configuration and the source is sending traffic, use the **show igmp group** command to verify that static group 225.1.1.1 has been created and that sources 10.0.0.2, 10.0.0.3, and 10.0.0.4 have been accepted.

```
user@host> show igmp group
Interface: fe-0/1/2
  Group: 225.1.1.1
    Source: 10.0.0.2
    Last reported by: Local
    Timeout: 0 Type: Static
  Group: 225.1.1.1
    Source: 10.0.0.3
    Last reported by: Local
```

```
Timeout: 0 Type: Static
Group: 225.1.1.1
Source: 10.0.0.4
Last reported by: Local
Timeout: 0 Type: Static
```

When you configure static groups on an interface on which you want to receive multicast traffic, and specify that a number of multicast sources be automatically accepted, you can also specify the number by which the address should be incremented for each source accepted. This is useful when you want to test forwarding to multiple receivers without having to configure each receiver separately and you do not want the source addresses to be sequential.

In this example, you create group 225.1.1.1 and accept addresses 10.0.0.2, 10.0.0.4, and 10.0.0.6 as the sources.

1. Configure the multicast source address increment by including the **source-increment** statement and specifying the number by which the address should be incremented for each source. The increment is specified in dotted decimal notation similar to an IPv4 address.

```
[edit protocols igmp]
```

```
user@host# set interface fe-0/1/2 static group 225.1.1.1 source 10.0.0.2 source-count
3 source-increment 0.0.0.2
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp
```

```
interface fe-0/1/2.0 {
  version 3;
  static {
    group 225.1.1.1 {
      source 10.0.0.2 {
        source-count 3;
        source-increment 0.0.0.2;
      }
    }
  }
}
```

3. After you have committed the configuration and after the source is sending traffic, use the **show igmp group** command to verify that static group 225.1.1.1 has been created and that sources 10.0.0.2, 10.0.0.4, and 10.0.0.6 have been accepted.

```
user@host> show igmp group
Interface: fe-0/1/2
  Group: 225.1.1.1
    Source: 10.0.0.2
    Last reported by: Local
    Timeout: 0 Type: Static
  Group: 225.1.1.1
    Source: 10.0.0.4
    Last reported by: Local
    Timeout: 0 Type: Static
  Group: 225.1.1.1
    Source: 10.0.0.6
```

Last reported by: Local  
Timeout: 0 Type: Static

When you configure static groups on an interface on which you want to receive multicast traffic and your network is operating in source-specific multicast (SSM) mode, you can specify that certain multicast source addresses be excluded.

By default the multicast source address configured in a static group operates in include mode. In include mode the multicast traffic for the group is accepted from the source address configured. You can also configure the static group to operate in exclude mode. In exclude mode the multicast traffic for the group is accepted from any address other than the source address configured.

If a source address is specified in a multicast group that is statically configured, the IGMP version on the interface must be set to IGMPv3. IGMPv2 is the default value.

In this example, you exclude address 10.0.0.2 as a source for group 225.1.1.1.

1. On the DR, configure a multicast static group to operate in exclude mode by including the **exclude** statement and specifying which IPv4 source address to exclude.

```
[edit protocols igmp]
user@host# set interface fe-0/1/2 static group 225.1.1.1 exclude source 10.0.0.2
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp

interface fe-0/1/2.0 {
  version 3;
  static {
    group 225.1.1.1 {
      exclude;
      source 10.0.0.2;
    }
  }
}
```

3. After you have committed the configuration and the source is sending traffic, use the **show igmp group detail** command to verify that static group 225.1.1.1 has been created and that the static group is operating in exclude mode.

```
user@host> show igmp group detail
Interface: fe-0/1/2
Group: 225.1.1.1
Group mode: Exclude
Source: 10.0.0.2
Last reported by: Local
Timeout: 0 Type: Static
```

## Recording IGMP Join and Leave Events

To determine whether IGMP tuning is needed in a network, you can configure the routing device to record IGMP join and leave events. You can record events globally for the routing device or for individual interfaces.

[Table 309 on page 4602](#) describes the recordable IGMP events.

**Table 309: IGMP Event Messages**

ERRMSG Tag	Definition
RPD_IGMP_JOIN	Records IGMP join events.
RPD_IGMP_LEAVE	Records IGMP leave events.
RPD_IGMP_ACCOUNTING_ON	Records when IGMP accounting is enabled on an IGMP interface.
RPD_IGMP_ACCOUNTING_OFF	Records when IGMP accounting is disabled on an IGMP interface.
RPD_IGMP_MEMBERSHIP_TIMEOUT	Records IGMP membership timeout events.

To enable IGMP accounting:

1. Enable accounting globally or on an IGMP interface. This example shows both options.

```
[edit protocols igmp]
user@host# set accounting
user@host# set interface fe-0/1/0.2 accounting
```

2. Configure the events to be recorded and filter the events to a system log file with a descriptive filename, such as **igmp-events**.

```
[edit system syslog file igmp-events]
user@host# set any info
user@host# set match ".*RPD_IGMP_JOIN.* | .*RPD_IGMP_LEAVE.* |
.*RPD_IGMP_ACCOUNTING.* | .*RPD_IGMP_MEMBERSHIP_TIMEOUT.*"
```

3. Periodically archive the log file.

This example rotates the file size when it reaches 100 KB and keeps three files.

```
[edit system syslog file igmp-events]
user@host# set archive size 100000
user@host# set archive files 3
user@host# set archive archive-sites "ftp://user@host1//var/tmp" password
"anonymous"
user@host# set archive archive-sites "ftp://user@host2//var/tmp" password "test"
```

```
user@host# set archive transfer-interval 24
user@host# set archive start-time 2011-01-07:12:30
```

4. You can monitor the system log file as entries are added to the file by running the **monitor start** and **monitor stop** commands.

```
user@host> monitor start igmp-events

*** igmp-events ***
Apr 16 13:08:23 host mgd[16416]: UI_CMDLINE_READ_LINE: User 'user', command
'run monitor start igmp-events '
monitor
```

## Limiting the Number of IGMP Multicast Group Joins on Logical Interfaces

The **group-limit** statement enables you to limit the number of IGMP multicast group joins for logical interfaces. When this statement is enabled on a router running IGMP version 2 (IGMPv2) or version 3 (IGMPv3), the limit is applied upon receipt of the group report. Once the group limit is reached, subsequent join requests are rejected.

When configuring limits for IGMP multicast groups, keep the following in mind:

- Each any-source group (\*G) counts as one group toward the limit.
- Each source-specific group (S,G) counts as one group toward the limit.
- Groups in IGMPv3 exclude mode are counted toward the limit.
- Multiple source-specific groups count individually toward the group limit, even if they are for the same group. For example, (S1, G1) and (S2, G1) would count as two groups toward the configured limit.
- Combinations of any-source groups and source-specific groups count individually toward the group limit, even if they are for the same group. For example, (\*, G1) and (S, G1) would count as two groups toward the configured limit.
- Configuring and committing a group limit on a network that is lower than what already exists on the network results in the removal of all groups from the configuration. The groups must then request to rejoin the network (up to the newly configured group limit).
- You can dynamically limit multicast groups on IGMP logical interfaces using dynamic profiles.

Beginning with Junos OS 12.2, you can optionally configure a system log warning threshold for IGMP multicast group joins received on the logical interface. It is helpful to review the system log messages for troubleshooting purposes and to detect if an excessive amount of IGMP multicast group joins have been received on the interface. These log messages convey when the configured group limit has been exceeded, when the configured threshold has been exceeded, and when the number of groups drop below the configured threshold.

The **group-threshold** statement enables you to configure the threshold at which a warning message is logged. The range is 1 through 100 percent. The warning threshold is a percentage of the group limit, so you must configure the **group-limit** statement to configure a warning threshold. For instance, when the number of groups exceed the configured warning threshold, but remain below the configured group limit, multicast groups continue to be accepted, and the device logs the warning message. In addition, the device logs a warning message after the number of groups drop below the configured warning threshold. You can further specify the amount of time (in seconds) between the log messages by configuring the **log-interval** statement. The range is 6 through 32,767 seconds.

You might consider throttling log messages because every entry added after the configured threshold and every entry rejected after the configured limit causes a warning message to be logged. By configuring a log interval, you can throttle the amount of system log warning messages generated for IGMP multicast group joins.

To limit multicast group joins on an IGMP logical interface:

1. Access the logical interface at the IGMP protocol hierarchy level.

```
[edit]
user@host# edit protocols igmp interface interface-name
```

2. Specify the group limit for the interface.

```
[edit protocols igmp interface interface-name]
user@host# set group-limit limit
```

3. (Optional) Configure the threshold at which a warning message is logged.

```
[edit protocols igmp interface interface-name]
user@host# set group-threshold value
```

4. (Optional) Configure the amount of time between log messages.

```
[edit protocols igmp interface interface-name]
user@host# set log-interval seconds
```

To confirm your configuration, use the **show protocols igmp** command. To verify the operation of IGMP on the interface, including the configured group limit and the optional warning threshold and interval between log messages, use the **show igmp interface** command.

## Tracing IGMP Protocol Traffic

Tracing operations record detailed messages about the operation of routing protocols, such as the various types of routing protocol packets sent and received, and routing policy actions. You can specify which trace operations are logged by including specific tracing flags. The following table describes the flags that you can include.

Flag	Description
all	Trace all operations.

Flag	Description
<b>client-notification</b>	Trace notifications.
<b>general</b>	Trace general flow.
<b>group</b>	Trace group operations.
<b>host-notification</b>	Trace host notifications.
<b>leave</b>	Trace leave group messages (IGMPv2 only).
<b>mtrace</b>	Trace mtrace packets. Use the <b>mtrace</b> command to troubleshoot the software.
<b>normal</b>	Trace normal events.
<b>packets</b>	Trace all IGMP packets.
<b>policy</b>	Trace policy processing.
<b>query</b>	Trace IGMP membership query messages, including general and group-specific queries.
<b>report</b>	Trace membership report messages.
<b>route</b>	Trace routing information.
<b>state</b>	Trace state transitions.
<b>task</b>	Trace task processing.
<b>timer</b>	Trace timer processing.

In the following example, tracing is enabled for all routing protocol packets. Then tracing is narrowed to focus only on IGMP packets of a particular type. To configure tracing operations for IGMP:

1. (Optional) Configure tracing at the routing options level to trace all protocol packets.

```
[edit routing-options traceoptions]
user@host# set file all-packets-trace
user@host# set flag all
```

2. Configure the filename for the IGMP trace file.

```
[edit protocols igmp traceoptions]
user@host# set file igmp-trace
```

3. (Optional) Configure the maximum number of trace files.

```
[edit protocols igmp traceoptions]
user@host# set file files 5
```

4. (Optional) Configure the maximum size of each trace file.

```
[edit protocols igmp traceoptions]  
user@host# set file size 1m
```

5. (Optional) Enable unrestricted file access.

```
[edit protocols igmp traceoptions]  
user@host# set file world-readable
```

6. Configure tracing flags. Suppose you are troubleshooting issues with a particular multicast group. The following example shows how to flag all events for packets associated with the group IP address.

```
[edit protocols igmp traceoptions]  
user@host# set flag group | match 232.1.1.2
```

7. View the trace file.

```
user@host> file list /var/log  
user@host> file show /var/log/igmp-trace
```

## Disabling IGMP

To disable IGMP on an interface, include the **disable** statement:

```
disable;
```

You can include this statement at the following hierarchy levels:

- **[edit protocols igmp interface *interface-name*]**
- **[edit logical-systems *logical-system-name* protocols igmp interface *interface-name*]**

- [Configuring Multicast VLAN Registration \(CLI Procedure\) on page 4611](#)
- [Example: Configuring Multicast VLAN Registration on page 4612](#)

## Configuring IGMP Snooping

With IGMP snooping enabled, a switch monitors the IGMP (Internet Group Management Protocol) traffic between hosts and multicast routers and uses what it learns to forward multicast traffic to only the downstream interfaces that are connected to interested receivers. This conserves bandwidth by allowing the switch to send multicast traffic to only those interfaces that are connected to devices that want to receive the traffic (instead of flooding the traffic to all the downstream VLAN interfaces).

**NOTE:** You cannot configure IGMP snooping on a secondary VLAN.

To enable IGMP snooping and configure individual options as needed for your network by using the CLI:

1. Enable IGMP snooping on a VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan
```

2. Configure the switch to immediately remove group membership from interfaces on a VLAN when it receives a leave message through that VLAN, and have it not forward any membership queries for the multicast group to the VLAN (IGMPv2 only):

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name immediate-leave
```

3. Configure an interface to belong to a multicast group:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name interface interface-name static group
group-address
```

4. Configure an interface to forward IGMP queries received from multicast routers.

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name interface interface-name
multicast-router-interface
```

5. Configure the switch to wait for four timeout intervals before timing out a multicast group on a VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name robust-count 4
```

6. If you want a standalone switch to act as an IGMP querier, enter the following:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name l2-querier source-address source address
```

The switch uses the address that you configure as the source address in the IGMP queries that it sends. If there are any multicast routers on the same local network, make sure the source address for the IGMP querier is greater (a higher number) than the IP addresses for those routers on the network. This ensures that switch is always the IGMP querier on the network.

7. If you want a QFabric Node device to act as an IGMP querier, enter the following:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name igmp-querier source-address source address
```

- Related Documentation**

  - [Example: Configuring IGMP Snooping on page 4608](#)
  - [Changing the IGMP Snooping Group Timeout Value on page 4608](#)
  - [Monitoring IGMP Snooping on page 4775](#)

## Changing the IGMP Snooping Group Timeout Value

The IGMP snooping group timeout value determines how long a switch waits to receive an IGMP query from a multicast router before removing a multicast group from its multicast cache table. A switch calculates the timeout value by using the **query-interval** and **query-response-interval** values.

When you enable IGMP snooping, the **query-interval** and **query-response-interval** values are applied to all VLANs on the switch. The values are:

- **query-interval**—125 seconds
- **query-response-interval**—10 seconds

The switch automatically calculates the group timeout value for an IGMP snooping-enabled switch by multiplying the **query-interval** value by 2 (the default **robust-count** value) and then adding the **query-response-interval** value. By default, the switch waits 260 seconds to receive an IGMP query before removing a multicast group from its multicast cache table:  $(125 \times 2) + 10 = 260$ .

You can modify the group timeout value by changing the **robust-count** value. For example, if you want the system to wait 510 seconds before timing groups out— $(125 \times 4) + 10 = 510$ —enter this command:

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan robust-count (IGMP Snooping) 4
```

- Related Documentation**
- [Verifying the IGMP Snooping Group Timeout Value on page 4776](#)
  - [Example: Configuring IGMP Snooping on page 4608](#)
  - [Configuring IGMP Snooping on page 4607](#)

## Example: Configuring IGMP Snooping

With IGMP snooping enabled, a switch monitors the IGMP (Internet Group Management Protocol) traffic between hosts and multicast routers and uses what it learns to forward multicast traffic to only the downstream interfaces that are connected to interested receivers. This conserves bandwidth by allowing the switch to send multicast traffic to only those interfaces that are connected to devices that want to receive the traffic (instead of flooding the traffic to all the downstream VLAN interfaces).

This example describes how to configure IGMP snooping:

- [Requirements on page 4609](#)
- [Overview and Topology on page 4609](#)
- [Configuration on page 4609](#)

Requirements

This example requires Junos OS Release 11.1 or later on a QFX Series product.

Before you configure IGMP snooping, be sure you have:

- Configured the **employee-vlan** VLAN
- Assigned interfaces **ge-0/0/1**, **ge-0/0/2**, and **ge-0/0/3** to **employee-vlan**

Overview and Topology

In this example you configure an interface to receive multicast traffic from a source and configure some multicast-related behavior for downstream interfaces. The example assumes that IGMP snooping was previously disabled for the VLAN.

[Table 310 on page 4609](#) shows the components of the topology for this example.

Table 310: Components of the IGMP Snooping Topology

Components	Settings
VLAN name	employee-vlan, tag 20
Interfaces in employee-vlan	ge-0/0/1, ge-0/0/2, ge-0/0/3
Multicast IP address for employee-vlan	225.100.100.100

Configuration

To configure basic IGMP snooping on a switch:

CLI Quick Configuration

To quickly configure IGMP snooping, copy the following commands and paste them into a terminal window:  
  
[edit protocols]  
set igmp-snooping vlan employee-vlan  
set igmp-snooping vlan employee-vlan interface ge-0/0/3 static group 225.100.100.100  
set igmp-snooping vlan employee-vlan interface ge-0/0/2 multicast-router-interface  
set igmp-snooping vlan employee-vlan robust-count 4

Step-by-Step Procedure

Configure IGMP snooping:  
  
1. Enable and configure IGMP snooping on the VLAN **employee-vlan**:  
  
[edit protocols]  
user@switch# set igmp-snooping vlan employee-vlan  
  
2. Configure a interface to belong to a multicast group:  
  
[edit protocols]

- ```
user@switch# set igmp-snooping vlan employee-vlan interface ge-0/0/3 static group 255.100.100.100
```
3. Configure an interface to forward IGMP queries received from multicast routers.  

```
[edit protocols]  
user@switch# set igmp-snooping vlan employee-vlan interface ge-0/0/2 multicast-router-interface
```
  4. Configure the switch to wait for four timeout intervals before timing out a multicast group on a VLAN:  

```
[edit protocols]  
user@switch# set igmp-snooping vlan employee-vlan robust-count 4
```

**Results** Check the results of the configuration:

```
user@switch# show protocols igmp-snooping  
vlan employee-vlan {  
  robust-count 4;  
}  
interface ge-0/0/2 {  
  multicast-router-interface;  
}  
interface ge-0/0/3 {  
  static {  
    group 255.100.100.100;  
  }  
}
```

## Using a Switch as an IGMP Querier

If IGMP snooping is enabled on a pure Layer 2 local network (that is, Layer 3 is not enabled on the network), and there is not multicast router in the network, multicast traffic might not be properly forwarded through the network. This problem occurs if the local network is configured such that multicast traffic must be forwarded between switches in order to reach a multicast receiver. In this case, an upstream switch does not forward multicast traffic to a downstream switch (and therefore to the multicast receivers attached to the downstream switch) because the downstream switch does not forward IGMP reports to the upstream switch. You can solve this problem by configuring one of the switches to be an IGMP querier. This switch sends periodic general query packets to all the switches in the network, which ensures that the snooping membership tables are updated and prevents any multicast traffic loss.

If you configure multiple switches to be IGMP queriers, the switch with the lowest (smallest) IGMP querier source address takes precedence and acts as the querier.

Switches with higher IGMP querier source addresses stop sending IGMP queries unless they do not receive IGMP queries for 255 seconds. If a switch with a higher IGMP querier source address does not receive any IGMP queries during that period, it starts sending queries again.

To configure a standalone switch to act as an IGMP querier, enter the following:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name l2-querier source-address source address
```

To configure a QFabric Node device to act as an IGMP querier, enter the following:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name igmp-querier source-address source address
```

## Configuring Multicast VLAN Registration (CLI Procedure)

Multicast VLAN registration (MVR) enables hosts that are not part of a multicast source VLAN (MVLAN) to still receive multicast streams from the MVLAN, allowing an MVLAN to be shared across a Layer 2 network. Hosts remain in their own VLANs for bandwidth and security reasons but are able to receive multicast streams from the MVLAN.

You can configure one or more VLANs on a switch to be MVLANs or MVR receiver VLANs. By default, MVR is not configured on EX Series switches and the QFX Series.

**NOTE:** MVR is supported on VLANs running IGMP version 2 (IGMPv2) only.

**NOTE:** When you configure MVR, the following restrictions apply:

- You cannot enable multicast protocols on VLAN interfaces that are members of MVLANs.
- If you configure an MVLAN in proxy mode, IGMP snooping proxy mode is automatically enabled on all MVR receiver VLANs of this MVLAN. If a VLAN is an MVR receiver VLAN for multiple MVLANs, all of the MVLANs must have proxy mode enabled or all must have proxy mode disabled. You can enable proxy mode only on VLANs that are configured as MVR source VLANs and that are not configured for Q-in-Q tunneling.
- After you configure a VLAN as an MVLAN, that VLAN is no longer available for other uses.

To configure MVR:

1. Configure the VLAN named mv0 to be an MVLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan mv0 data-forwarding source groups
225.10.0.0/16
```

2. Configure the MVLAN mv0 to be a proxy VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan mv0 proxy source-address 10.0.0.1
```

3. Configure the VLAN named v2 to be an MVR receiver VLAN with mv0 as its source:

```
[edit protocols]
user@switch# set igmp-snooping vlan v2 data-forwarding receiver source-vlans mv0
```

4. Install forwarding entries in the MVR receiver VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan mv0 data-forwarding receiver install
```

## Example: Configuring Multicast VLAN Registration

Multicast VLAN registration (MVR) enables hosts that are not part of a multicast VLAN (MVLAN) to receive multicast streams from the MVLAN, which enable the MVLAN to be shared across the Layer 2 network and eliminate the need to send duplicate multicast streams to each requesting VLAN in the network. Hosts remain in their own VLANs for bandwidth and security reasons.

This example describes how to configure MVR on EX Series switches and the QFX Series.

- [Requirements on page 4612](#)
- [Overview and Topology on page 4613](#)
- [Configuration on page 4615](#)

### Requirements

---

This example uses the following hardware and software components:

- One EX Series or QFX Series switch
- Junos OS Release 9.6 or later for EX Series switches or Junos OS Release 12.3 or later for the QFX Series

Before you configure MVR, be sure you have:

- Configured two or more VLANs on the switch. See the task for your platform:
  - [Example: Setting Up Bridging with Multiple VLANs for EX Series Switches](#)

- [“Example: Setting Up Bridging with Multiple VLANs” on page 2110](#) for the QFX Series and EX4600 switch
- Connected the switch to a network that can transmit IPTV multicast streams from a video server.
- Connected a host that is capable of receiving IPTV multicast streams to an interface in one of the VLANs.

## Overview and Topology

In a standard Layer 2 network, a multicast stream received on one VLAN is never distributed to interfaces outside that VLAN. If hosts in multiple VLANs request the same multicast stream, a separate copy of that multicast stream is distributed to the requesting VLANs.

MVR introduces the concept of a *multicast source VLAN* (MVLAN), which is created by MVR and becomes the only VLAN over which multicast traffic flows throughout the Layer 2 network. Multicast traffic can then be selectively forwarded from interfaces on the MVLAN (source ports) to hosts that are connected to interfaces (multicast receiver ports) that are not part of the multicast source VLAN. When you configure an MVLAN, you assign a range of multicast group addresses to it. You then configure other VLANs to be MVR receiver VLANs, which receive multicast streams from the MVLAN. The MVR receiver ports comprise all the interfaces that exist on any of the MVR receiver VLANs.

You can configure MVR to operate in one of two modes: transparent mode (the default mode) or proxy mode. Both modes enable MVR to forward only one copy of a multicast stream to the Layer 2 network.

In transparent mode, the switch receives one copy of each IPTV multicast stream and then replicates the stream only to those hosts that want to receive it, while forwarding all other types of multicast traffic without modification. [Figure 178 on page 4614](#) shows how MVR operates in transparent mode.

In proxy mode, the switch acts as a proxy for the IGMP multicast router in the MVLAN for MVR group memberships established in the MVR receiver VLANs and generates and sends IGMP packets into the MVLAN as needed. [Figure 179 on page 4615](#) shows how MVR operates in proxy mode.

This example shows how to configure MVR in both transparent mode and proxy mode on an EX Series switch or the QFX Series. The topology includes a video server that is connected to a multicast router, which in turn forwards the IPTV multicast traffic in the MVLAN to the Layer 2 network.

[Figure 178 on page 4614](#) shows the MVR topology in transparent mode. Interfaces P1 and P2 on Switch C belong to service VLAN s0 and MVLAN mv0. Interface P4 of Switch C also belongs to service VLAN s0. In the upstream direction of the network, only non-IPTV traffic is being carried in individual customer VLANs of service VLAN s0. VLAN c0 is an example of this type of customer VLAN. IPTV traffic is being carried on MVLAN mv0. If any host on any customer VLAN connected to port P4 requests an MVR stream, Switch C takes the stream from VLAN mv0 and replicates that stream onto port P4 with tag mv0.

IPTV traffic, along with other network traffic, flows from port P4 out to the Digital Subscriber Line Access Multiplexer (DSLAM) D1.

Figure 178: MVR Topology in Transparent Mode

Figure 179 on page 4615 shows the MVR topology in proxy mode. Interfaces P1 and P2 on Switch C belong to MVLAN mv0 and customer VLAN c0. Interface P4 on Switch C is an access port of customer VLAN c0. In the upstream direction of the network, only non-IPTV traffic is being carried on customer VLAN c0. Any IPTV traffic requested by hosts on VLAN c0 is replicated untagged to port P4 based on streams received in MVLAN mv0. IPTV traffic flows from port P4 out to an IPTV-enabled device in Host H1. Other traffic, such as data and voice traffic, also flows from port P4 to other network devices in Host H1.

Figure 179: MVR Topology in Proxy Mode

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit protocols igmp-snooping]** hierarchy level.

```
set vlan mv0 data-forwarding source groups 225.10.0.0/16
set vlan v2 data-forwarding receiver source-vlans mv0
set vlan v2 data-forwarding receiver install
set vlan mv0 proxy source-address 10.1.1.1
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure MVR:

1. Configure VLAN mv0 to be an MVLAN:  

```
[edit protocols igmp-snooping]  
user@switch# set vlan mv0 data-forwarding source groups 225.10.0.0/16
```
2. Configure VLAN v2 to be a multicast receiver VLAN with mv0 as its source:  

```
[edit protocols igmp-snooping]  
user@switch# set vlan v2 data-forwarding receiver source-vlans mv0
```
3. (Optional) Install forwarding entries in the multicast receiver VLAN v2:  

```
[edit protocols igmp-snooping]  
user@switch# set vlan v2 data-forwarding receiver install
```
4. (Optional) Configure MVR in proxy mode:  

```
[edit protocols igmp-snooping]  
user@switch# set vlan mv0 proxy source-address 10.1.1.1
```

**Results** From configuration mode, confirm your configuration by entering the **show** command at the **[edit protocols igmp-snooping]** hierarchy level. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit protocols igmp-snooping]  
user@switch# show  
vlan mv0 {  
  proxy {  
    source-address 10.1.1.1;  
  }  
  data-forwarding {  
    source {  
      groups 225.10.0.0/16;  
    }  
  }  
}  
vlan v2 {  
  data-forwarding {  
    receiver {  
      source-vlans mv0;  
      install;  
    }  
  }  
}
```

## Configuring MSDP

To configure the Multicast Source Discovery Protocol (MSDP), include the **msdp** statement:

```
msdp {
  disable;
  active-source-limit {
    maximum number;
    threshold number;
  }
  data-encapsulation (disable | enable);
  export [ policy-names ];
  group group-name {
    ... group-configuration ...
  }
  hold-time seconds;
  import [ policy-names ];
  local-address address;
  keep-alive seconds;
  peer address {
    ... peer-configuration ...
  }
  rib-group group-name;
  source ip-prefix </prefix-length> {
    active-source-limit {
      maximum number;
      threshold number;
    }
  }
  sa-hold-time seconds;
  traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
  }
  group group-name {
    disable;
    export [ policy-names ];
    import [ policy-names ];
    local-address address;
    mode (mesh-group | standard);
  }
}
```

```

peer address {
  ... same statements as at the [edit protocols msdp peer address] hierarchy level shown
  just following ...
}
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable>;
  flag flag <flag-modifier> <disable>;
}
}
peer address {
  disable;
  active-source-limit {
    maximum number;
    threshold number;
  }
  authentication-key peer-key;
  default-peer;
  export [ policy-names ];
  import [ policy-names ];
  local-address address;
  traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
  }
}
}

```

You can include this statement at the following hierarchy levels:

- [edit protocols]
- [edit routing-instances *routing-instance-name* protocols]
- [edit logical-systems *logical-system-name* protocols]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols]

By default, MSDP is disabled.

## Tracing MSDP Protocol Traffic

Tracing operations record detailed messages about the operation of routing protocols, such as the various types of routing protocol packets sent and received, and routing policy actions. You can specify which trace operations are logged by including specific tracing flags. The following table describes the flags that you can include.

| Flag | Description           |
|------|-----------------------|
| all  | Trace all operations. |

| Flag                          | Description                              |
|-------------------------------|------------------------------------------|
| <b>general</b>                | Trace general events.                    |
| <b>keepalive</b>              | Trace keepalive messages.                |
| <b>normal</b>                 | Trace normal events.                     |
| <b>packets</b>                | Trace all MSDP packets.                  |
| <b>policy</b>                 | Trace policy processing.                 |
| <b>route</b>                  | Trace MSDP changes to the routing table. |
| <b>source-active</b>          | Trace source-active packets.             |
| <b>source-active-request</b>  | Trace source-active request packets.     |
| <b>source-active-response</b> | Trace source-active response packets.    |
| <b>state</b>                  | Trace state transitions.                 |
| <b>task</b>                   | Trace task processing.                   |
| <b>timer</b>                  | Trace timer processing.                  |

You can configure MSDP tracing for all peers, for all peers in a particular group, or for a particular peer.

In the following example, tracing is enabled for all routing protocol packets. Then tracing is narrowed to focus only on MSDP peers in a particular group. To configure tracing operations for MSDP:

1. (Optional) Configure tracing by including the **traceoptions** statement at the **[edit routing-options]** hierarchy level and set the **all-packets-trace** and **all** flags to trace all protocol packets.

```
[edit routing-options traceoptions]
user@host# set file all-packets-trace
user@host# set flag all
```

2. Configure the filename for the MSDP trace file.

```
[edit protocols msdp group groupa traceoptions]
user@host# set file msdp-trace
```

3. (Optional) Configure the maximum number of trace files.

```
[edit protocols msdp group groupa traceoptions]
user@host# set file files 5
```

4. (Optional) Configure the maximum size of each trace file.

```
[edit protocols msdp group groupa traceoptions]
```

```
user@host# set file size 1m
```

5. (Optional) Enable unrestricted file access.

```
[edit protocols msdp group groupa traceoptions]
```

```
user@host# set file world-readable
```

6. Configure tracing flags. Suppose you are troubleshooting issues with the source-active cache for **groupa**. The following example shows how to trace messages associated with the group address.

```
[edit protocols msdp group groupa traceoptions]
```

```
user@host# set flag source-active | match 230.0.0.3
```

7. View the trace file.

```
user@host> file list /var/log
```

```
user@host> file show /var/log/msdp-trace
```

## Configuring the Interface to Accept Traffic from a Remote Source

You can configure an incoming interface to accept traffic from a remote source. A remote source is a source that is not on the same subnet as the incoming interface. This enables the remote source to be learned and advertised by MSDP so that receivers in other MSDP areas can join the source. You do not need to disable RPF checking, but you do need to ensure that the best path to reach the remote source is through the incoming interface.

In this sample configuration, the incoming interface (**ge-1/3/0**) is on a provider edge (PE) router on the receiver side of a multicast VPN.

To accept traffic from a remote source:

1. Edit the incoming interface.

```
[edit protocols pim interface ge-1/3/0.0]
```

```
user@host# set accept-remote-source
```

2. If the incoming interface is not the only way to reach the remote source, ensure that the best path to reach the remote source is through the incoming interface. One way to do this is to use AS path prepending on the other possible routes.

```
[edit policy-options policy-statement as-path-prepend term prepend]
```

```
user@host# set from route-filter 192.168.0.0/16 orlonger
```

```
user@host# set from route-filter 172.16.0.0/16 orlonger
```

```
user@host# set then as-path-prepend "1111"
```

Another way to do this might be to configure a static route on the receiver side PE router to the source.

3. After the configuration is committed, use the **show pim statistics** and **show msdp source** commands to verify that the interface is accepting traffic from the remote source.

## Example: Configuring MSDP

Configure a router to act as a PIM sparse-mode rendezvous point and an MSDP peer:

```
[edit]
routing-options {
  interface-routes {
    rib-group ifrg;
  }
  rib-groups {
    ifrg {
      import-rib [inet.0 inet.2];
    }
    mcrg {
      export-rib inet.2;
      import-rib inet.2;
    }
  }
}
protocols {
  bgp {
    group lab {
      type internal;
      family any;
      neighbor 192.168.6.18 {
        local-address 192.168.6.17;
      }
    }
  }
  pim {
    dense-groups {
      224.0.1.39/32;
      224.0.1.40/32;
    }
    rib-group mcrg;
    rp {
      local {
        address 192.168.1.1;
      }
    }
    interface all {
      mode sparse-dense;
      version 1;
    }
  }
  msdp {
```

```
rib-group mcrg;  
group lab {  
    peer 192.168.6.18 {  
        local-address 192.168.6.17;  
    }  
}  
}
```

## Example: Configuring MSDP with Active Source Limits and Mesh Groups

This example shows how to configure MSDP to filter source-active messages and limit the flooding of source-active messages.

- [Requirements on page 4622](#)
- [Overview on page 4622](#)
- [Configuration on page 4626](#)
- [Verification on page 4628](#)

### Requirements

---

Before you begin:

- Configure the router interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure an interior gateway protocol or static routing. See the *Junos OS Routing Protocols Library for Routing Devices*.
- Enable PIM sparse mode. See “[PIM Overview](#)” on page 4499.
- Configure the router as a PIM sparse-mode RP. See “[Configuring Local PIM RPs](#)” on page 4554.

### Overview

---

A router interested in MSDP messages, such as an RP, might have to process a large number of MSDP messages, especially source-active messages, arriving from other routers. Because of the potential need for a router to examine, process, and create state tables for many MSDP packets, there is a possibility of an MSDP-based denial-of-service (DoS) attack on a router running MSDP. To minimize this possibility, you can configure the router to limit the number of source active messages the router accepts. Also, you can configure a threshold for applying random early discard (RED) to drop some but not all MSDP active source messages. Beginning with Junos OS 12.2, you can optionally configure a warning threshold so the device can log warning messages in the system log when a certain number of source-active messages have been received. It is helpful to review the system log messages for troubleshooting purposes and to detect if an excessive amount of source-active messages have been received. These log messages convey when the configured message limit has been exceeded, when the configured warning threshold has been exceeded, and when the number of messages drop below the configured warning threshold.

By default, the router accepts 25,000 source active messages before ignoring the rest. The limit can be from 1 through 1,000,000. The limit is applied to both the number of messages and the number of MSDP peers.

By default, the router accepts 24,000 source-active messages before applying the RED profile to prevent a possible DoS attack. This number can also range from 1 through 1,000,000. The next 1000 messages are screened by the RED profile and the accepted messages processed. If you configure no drop profiles (as this example does not), RED is still in effect and functions as the primary mechanism for managing congestion. In the default RED drop profile, when the packet queue fill-level is 0 percent, the drop probability is 0 percent. When the fill-level is 100 percent, the drop probability is 100 percent.

**NOTE:** The router ignores source-active messages with encapsulated TCP packets. Multicast does not use TCP; segments inside source-active messages are most likely the result of worm activity.

The number configured for the threshold must be less than the number configured for the maximum number of active MSDP sources.

The warning threshold is a percentage of maximum number of MSDP source-active messages received, so you must configure the source-active message limit to configure a warning threshold. The range for the warning threshold is 1 through 100 percent. You can further specify the amount of time (in seconds) between the log messages. The range is 6 through 32,767 seconds.

You can configure an active source limit globally, for a group, or for a peer. If active source limits are configured at multiple levels of the hierarchy (as shown in this example), all are applied.

You can configure an active source limit for an address range as well as for a specific peer. A per-source active source limit uses an IP prefix and prefix length instead of a specific address. You can configure more than one per-source active source limit. The longest match determines the limit.

Per-source active source limits can be combined with active source limits at the peer, group, and global (instance) hierarchy level. Per-source limits are applied before any other type of active source limit. Limits are tested in the following order:

- Per-source
- Per-peer or group
- Per-instance

An active source message must “pass” all limits established before being accepted. For example, if a source is configured with an active source limit of 10,000 active multicast groups and the instance is configured with a limit of 5000 (and there are no other sources or limits configured), only 5000 active source messages are accepted from this source.

MSDP mesh groups are groups of peers configured in a full-mesh topology that limits the flooding of source-active messages to neighboring peers. Every mesh group member

must have a peer connection with every other mesh group member. When a source-active message is received from a mesh group member, the source-active message is always accepted but is not flooded to other members of the same mesh group. However, the source-active message is flooded to non-mesh group peers or members of other mesh groups. By default, standard flooding rules apply if **mesh-group** is not specified.

**CAUTION:** When configuring MSDP mesh groups, you must configure all members the same way. If you do not configure a full mesh, excessive flooding of source-active messages can occur.

A common application for MSDP mesh groups is peer-reverse-path-forwarding (peer-RPF) check bypass. For example, if there are two MSDP peers inside an autonomous system (AS), and only one of them has an external MSDP session to another AS, the internal MSDP peer often rejects incoming source-active messages relayed by the peer with the external link. Rejection occurs because the external MSDP peer must be reachable by the internal MSDP peer through the next hop toward the source in another AS, and this next-hop condition is not certain. To prevent rejections, configure an MSDP mesh group on the internal MSDP peer so it always accepts source-active messages.

**NOTE:** An alternative way to bypass the peer-RPF check is to configure a default peer. In networks with only one MSDP peer, especially stub networks, the source-active message always needs to be accepted. An MSDP default peer is an MSDP peer from which all source-active messages are accepted without performing the peer-RPF check. You can establish a default peer at the peer or group level by including the **default-peer** statement.

Table 311 on page 4624 explains how flooding is handled by peers in this example. Figure 180 on page 4625 illustrates source-active message flooding between different mesh groups and peers within the same mesh group.

**Table 311: Source-Active Message Flooding Explanation**

| Source-Active Message Received From | Source-Active Message Flooded To                     | Source-Active Message Not Flooded To |
|-------------------------------------|------------------------------------------------------|--------------------------------------|
| Peer 21                             | Peer 11, Peer 12, Peer 13, Peer 31, Peer 32          | Peer 22                              |
| Peer 11                             | Peer 21, Peer 22, Peer 31, Peer 32                   | Peer 12, Peer 13                     |
| Peer 31                             | Peer 21, Peer 22, Peer 11, Peer 12, Peer 13, Peer 32 | —                                    |

Figure 180: Source-Active Message Flooding

This example includes the following settings:

- **active-source-limit maximum 10000**—Applies a limit of 10,000 active sources to all other peers.
- **active-source-limit log-warning 80**—(Optional) Applies a warning threshold of 80 percent. In this example, the active source maximum is 10,000, so the device will start logging warning messages once it receives 8,000 active source messages.
- **active-source-limit log-interval 20**—(Optional) Applies a 20 second waiting period between system log messages.
- **data-encapsulation disable**—On an RP router using MSDP, disables the default encapsulation of multicast data received in MSDP register messages inside MSDP source-active messages.

MSDP data encapsulation mainly concerns bursty sources of multicast traffic. Sources that send only one packet every few minutes have trouble with the timeout of state relationships between sources and their multicast groups (S,G). Routers lose data while they attempt to reestablish (S,G) state tables. As a result, multicast register messages contain data, and this data encapsulation in MSDP source-active messages can be turned on or off through configuration.

By default, MSDP data encapsulation is enabled. An RP running MSDP takes the data packets arriving in the source's register message and encapsulates the data inside an MSDP source-active message.

However, data encapsulation creates both a multicast forwarding cache entry in the **inet.1** table (this is also the forwarding table) and a routing table entry in the **inet.4** table. Without data encapsulation, MSDP creates only a routing table entry in the **inet.4** table. In some circumstances, such as the presence of Internet worms or other forms of DoS attack, the router's forwarding table might fill up with these entries. To prevent the forwarding table from filling up with MSDP entries, you can configure the router not to use MSDP data encapsulation. However, if you disable data encapsulation, the router ignores and discards the encapsulated data. Without data encapsulation,

multicast applications with bursty sources having transmit intervals greater than about 3 minutes might not work well.

- **group MSDP-group local-address 10.1.2.3**—Specifies the address of the local router (this router).
- **group MSDP-group mode mesh-group**—Specifies that all peers belonging to the MSDP-group group are mesh group members.
- **group MSDP-group peer 10.10.10.10**—Prevents the sending of source-active messages to neighboring peer 10.10.10.10.
- **group MSDP-group peer 10.10.10.10 active-source-limit maximum 7500**—Applies a limit of 7500 active sources to MSDP peer 10.10.10.10 in group MSDP-group.
- **peer 10.0.0.1 active-source-limit maximum 5000 threshold 4000**—Applies a threshold of 4000 active sources and a limit of 5000 active sources to MSDP peer 10.0.0.1.
- **source 10.1.0.0/16 active-source-limit maximum 500**—Applies a limit of 500 active sources to any source on the 10.1.0.0/16 network.

### Configuration

---

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set protocols msdp data-encapsulation disable
set protocols msdp active-source-limit maximum 10000
set protocols msdp active-source-limit log-warning 80
set protocols msdp active-source-limit log-interval 20
set protocols msdp peer 10.0.0.1 active-source-limit maximum 5000
set protocols msdp peer 10.0.0.1 active-source-limit threshold 4000
set protocols msdp source 10.1.0.0/16 active-source-limit maximum 500
set protocols msdp group MSDP-group mode mesh-group
set protocols msdp group MSDP-group local-address 10.1.2.3
set protocols msdp group MSDP-group peer 10.10.10.10 active-source-limit maximum
7500
```

#### Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure MSDP source active routes and mesh groups:

1. (Optional) Disable data encapsulation.

```
[edit protocols msdp]
user@host# set data-encapsulation disable
```

2. Configure the active source limits.

```
[edit protocols msdp]
user@host# set peer 10.0.0.1 active-source-limit maximum 5000 threshold 4000
```

```

user@host# set group MSDP-group peer 10.10.10.10 active-source-limit maximum
7500
user@host# set active-source-limit maximum 10000
user@host# set source 10.1.0.0/16 active-source-limit maximum 500

```

3. (Optional) Configure the threshold at which warning messages are logged and the amount of time between log messages.

```

[edit protocols msdp]
user@host# set active-source-limit log-warning 80
user@host# set active-source-limit log-interval 20

```

4. Configure the mesh group.

```

[edit protocols msdp]
user@host# set group MSDP-group mode mesh-group
user@host# set group MSDP-group peer 10.10.10.10
user@host# set group MSDP-group local-address 10.1.2.3

```

5. If you are done configuring the device, commit the configuration.

```

[edit routing-instances]
user@host# commit

```

## Results

Confirm your configuration by entering the **show protocols** command.

```

user@host# show protocols
msdp {
  data-encapsulation disable;
  active-source-limit {
    maximum 10000;
    log-warning 80;
    log-interval 20;
  }
  peer 10.0.0.1 {
    active-source-limit {
      maximum 5000;
      threshold 4000;
    }
  }
  source 10.1.0.0/16 {
    active-source-limit {
      maximum 500;
    }
  }
  group MSDP-group {
    mode mesh-group;
    local-address 10.1.2.3;
    peer 10.10.10.10 {
      active-source-limit {
        maximum 7500;
      }
    }
  }
}

```

## Verification

---

To verify the configuration, run the following commands:

- `show msdp source-active`
- `show msdp statistics`

## Example: Configuring PIM Anycast With or Without MSDP

When you configure anycast RP, you bypass the restriction of having one active rendezvous point (RP) per multicast group, and instead deploy multiple RPs for the same group range. The RP routers share one unicast IP address. Sources from one RP are known to other RPs that use the Multicast Source Discovery Protocol (MSDP). Sources and receivers use the closest RP, as determined by the interior gateway protocol (IGP).

You can use anycast RP within a domain to provide redundancy and RP load sharing. When an RP stops operating, sources and receivers are taken to a new RP by means of unicast routing.

You can configure anycast RP to use PIM and MSDP for IPv4, or PIM alone for both IPv4 and IPv6 scenarios. Both are discussed in this section.

We recommend a static RP mapping with anycast RP over a bootstrap router and auto-RP configuration because it provides all the benefits of a bootstrap router and auto-RP without the complexity of the BSR and auto-RP mechanisms.

All systems on a subnet must run the same version of PIM.

The default PIM version can be version 1 or version 2, depending on the mode you are configuring. PIMv1 is the default RP mode (at the **[edit protocols pim rp static address address]** hierarchy level). However, PIMv2 is the default for interface mode (at the **[edit protocols pim interface interface-name]** hierarchy level). Explicitly configured versions override the defaults. This example explicitly configures PIMv2 on the interfaces.

The following example shows an anycast RP configuration for the RP routers, first with MSDP and then using PIM alone, and for non-RP routers.

1. For a network using an RP with MSDP, configure the RP using the **lo0** loopback interface, which is always up. Include the **address** statement and specify the unique and routable router ID and the RP address at the **[edit interfaces lo0 unit 0 family inet]** hierarchy level. In this example, the router ID is **198.58.3.254** and the shared RP address is **198.58.3.253**. Include the **primary** statement for the first address. Including the

**primary** statement selects the router's primary address from all the preferred addresses on all interfaces.

```

interfaces {
  lo0 {
    description "PIM RP";
    unit 0 {
      family inet {
        address 198.58.3.254/32;
        primary;
        address 198.58.3.253/32;
      }
    }
  }
}

```

2. Specify the RP address. Include the **address** statement at the **[edit protocols pim rp local]** hierarchy level (the same address as the secondary **lo0** interface).

For all interfaces, include the **mode** statement to set the mode to **sparse** and the **version** statement to specify PIM version 2 at the **[edit protocols pim rp local interface all]** hierarchy level. When configuring all interfaces, exclude the **fxp0.0** management interface by including the **disable** statement for that interface.

```

protocols {
  pim {
    rp {
      local {
        family inet;
        address 198.58.3.253;
      }
      interface all {
        mode sparse;
        version 2;
      }
      interface fxp0.0 {
        disable;
      }
    }
  }
}

```

3. Configure MSDP peering. Include the **peer** statement to configure the address of the MSDP peer at the **[edit protocols msdp]** hierarchy level. For MSDP peering, use the unique, primary addresses instead of the anycast address. To specify the local address for MSDP peering, include the **local-address** statement at the **[edit protocols msdp peer]** hierarchy level.

```

protocols {
  msdp {
    peer 198.58.3.250 {
      local-address 198.58.3.254;
    }
  }
}

```

**NOTE:** If you need to configure a PIM RP for both IPv4 and IPv6 scenarios, perform Step 4 and Step 5. Otherwise, go to Step 6.

4. Configure an RP using the **lo0** loopback interface, which is always up. Include the **address** statement to specify the unique and routable router address and the RP address at the **[edit interfaces lo0 unit 0 family inet]** hierarchy level. In this example, the router ID is **198.58.3.254** and the shared RP address is **198.58.3.253**. Include the **primary** statement on the first address. Including the **primary** statement selects the router's primary address from all the preferred addresses on all interfaces.

```
interfaces {
  lo0 {
    description "PIM RP";
    unit 0 {
      family inet {
        address 198.58.3.254/32 {
          primary;
        }
        address 198.58.3.253/32;
      }
    }
  }
}
```

5. Include the **address** statement at the **[edit protocols pim rp local]** hierarchy level to specify the RP address (the same address as the secondary **lo0** interface).

For all interfaces, include the **mode** statement to set the mode to **sparse**, and the **version** statement to specify PIM version 2 at the **[edit protocols pim rp local interface all]** hierarchy level. When configuring all interfaces, exclude the **fxp0.0** management interface by including the **disable** statement for that interface.

Include the **anycast-pim** statement to configure anycast RP without MSDP (for example, if IPv6 is used for multicasting). The other RP routers that share the same IP address are configured using the **rp-set** statement. There is one entry for each RP, and the maximum that can be configured is 15. For each RP, specify the routable IP address of the router and whether MSDP source active (SA) messages are forwarded to the RP.

MSDP configuration is not necessary for this type of IPv4 anycast RP configuration.

```
protocols {
  pim {
    rp {
      local {
        family inet {
          address 198.58.3.253;
          anycast-pim {
            rp-set {
              address 198.58.3.240;
              address 198.58.3.241 forward-msdp-sa;
            }
            local-address 198.58.3.254; #If not configured, use lo0 primary
          }
        }
      }
    }
  }
}
```

```

    }
  }
}
interface all {
  mode sparse;
  version 2;
}
interface fxp0.0 {
  disable;
}
}
}

```

6. Configure the non-RP routers. The anycast RP configuration for a non-RP router is the same whether MSDP is used or not. Specify a static RP by adding the address at the **[edit protocols pim rp static]** hierarchy level. Include the **version** statement at the **[edit protocols pim rp static address]** hierarchy level to specify PIM version 2.

```

protocols {
  pim {
    rp {
      static {
        address 198.58.3.253 {
          version 2;
        }
      }
    }
  }
}

```

7. Include the **mode** statement at the **[edit protocols pim interface all]** hierarchy level to specify sparse mode on all interfaces. Then include the **version** statement at the **[edit protocols pim rp interface all mode]** to configure all interfaces for PIM version 2. When configuring all interfaces, exclude the **fxp0.0** management interface by including the **disable** statement for that interface.

```

protocols {
  pim {
    interface all {
      mode sparse;
      version 2;
    }
    interface fxp0.0 {
      disable;
    }
  }
}

```

## Configuring a PIM Anycast RP Router with MSDP

Add the **address** statement at the **[edit protocols pim rp local]** hierarchy level to specify the RP address (the same address as the secondary **lo0** interface).

For all interfaces, use the **mode** statement to set the mode to **sparse** and the **version** statement to specify PIM version 2 at the **[edit protocols pim rp local interface all]** hierarchy level. When configuring all interfaces, exclude the **fxp0.0** management interface by adding the **disable** statement for that interface.

```
protocols {
  pim {
    rp {
      local {
        family inet;
        address 198.58.3.253;
      }
      interface all {
        mode sparse;
        version 2;
      }
      interface fxp0.0 {
        disable;
      }
    }
  }
}
```

To configure MSDP peering, add the **peer** statement to configure the address of the MSDP peer at the **[edit protocols msdp]** hierarchy level. For MSDP peering, use the unique, primary addresses instead of the anycast address. To specify the local address for MSDP peering, add the **local-address** statement at the **[edit protocols msdp peer]** hierarchy level.

```
protocols {
  msdp {
    peer 198.58.3.250 {
      local-address 198.58.3.254;
    }
  }
}
```

---

## Source-Specific Multicast

- [Example: Configuring PIM SSM on a Network on page 4632](#)
- [Example: Configuring an SSM-Only Domain on page 4634](#)
- [Example: Configuring SSM Mapping on page 4634](#)
- [Example: Configuring Source-Specific Multicast Groups with Any-Source Override on page 4637](#)
- [Example: Configuring SSM Maps for Different Groups to Different Sources on page 4640](#)

### Example: Configuring PIM SSM on a Network

The following example shows how PIM SSM is configured between a receiver and a source in the network illustrated in [Figure 181 on page 4633](#).

Figure 181: Network on Which to Configure PIM SSM

This example shows how to configure the IGMP version to IGMPv3 on all receiving host interfaces.

1. Enable IGMPv3 on all host-facing interfaces, and disable IGMP on the **fxp0.0** interface on Router 1.

```

user@router1# set protocols igmp interface all version 3
user@router1# set protocols igmp interface fxp0.0 disable

```

**NOTE:** When you configure IGMPv3 on a router, hosts on interfaces configured with IGMPv2 cannot join the source tree.

2. After the configuration is committed, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```

user@router1> show configuration protocol igmp

[edit protocols igmp]
interface all {
    version 3;
}
interface fxp0.0 {
    disable;
}

```

3. Use the **show igmp interface** command to verify that IGMP interfaces are configured.

```

user@router1> show igmp interface
Interface      State   Querier      Timeout  Version  Groups
fe-0/0/0.0     Up      198.58.3.245  213      3         0
fe-0/0/1.0     Up      198.58.3.241  220      3         0
fe-0/0/2.0     Up      198.58.3.237  218      3         0
Configured Parameters:
IGMP Query Interval (1/10 secs): 1250
IGMP Query Response Interval (1/10 secs): 100
IGMP Last Member Query Interval (1/10 secs): 10
IGMP Robustness Count: 2
Derived Parameters:
IGMP Membership Timeout (1/10 secs): 2600
IGMP Other Querier Present Timeout (1/10 secs): 2550

```

4. Use the **show pim join extensive** command to verify the PIM join state on Router 2 and Router 3 (the upstream routers).

```

user@router2> show pim join extensive
232.1.1.1      10.4.1.2      sparse
Upstream interface: fe-1/1/3.0

```

```
Upstream State: Local Source
Keepalive timeout: 209
Downstream Neighbors:
  Interface: so-1/0/2.0
    10.10.71.1      State: Join   Flags: S   Timeout: 209
```

5. Use the **show pim join extensive** command to verify the PIM join state on Router 1 (the router connected to the receiver).

```
user@router1> show pim join extensive
232.1.1.1      10.4.1.2      sparse
  Upstream interface: so-1/0/2.0
  Upstream State: Join to Source
  Keepalive timeout: 209
  Downstream Neighbors:
    Interface: fe-0/2/3.0
      10.3.1.1      State: Join   Flags: S   Timeout: Infinity
```

## Example: Configuring an SSM-Only Domain

Deploying an SSM-only domain is much simpler than deploying an ASM domain because it only requires a few configuration steps. Enable PIM sparse mode on all interfaces by adding the **mode** statement at the **[edit protocols pim interface all]** hierarchy level. When configuring all interfaces, exclude the **fxp0.0** management interface by adding the **disable** statement for that interface. Then configure IGMPv3 on all host-facing interfaces by adding the **version** statement at the **[edit protocols igmp interface *interface-name*]** hierarchy level.

In the following example, the host-facing interface is **fe-0/1/2**:

```
[edit]
protocols {
  pim {
    interface all {
      mode sparse;
      version 2;
    }
    interface fxp0.0 {
      disable;
    }
  }
  igmp {
    interface fe-0/1/2 {
      version 3;
    }
  }
}
```

## Example: Configuring SSM Mapping

SSM mapping does not require that all hosts support IGMPv3. SSM mapping translates IGMPv1 or IGMPv2 membership reports to an IGMPv3 report. This enables hosts running IGMPv1 or IGMPv2 to participate in SSM until the hosts transition to IGMPv3.

SSM mapping applies to all group addresses that match the policy, not just those that conform to SSM addressing conventions (232/8 for IPv4, ff30::/32 through ff3F::/32 for IPv6).

We recommend separate SSM maps for IPv4 and IPv6 if both address families require SSM support. If you apply an SSM map containing both IPv4 and IPv6 addresses to an interface in an IPv4 context (using IGMP), only the IPv4 addresses in the list are used. If there are no such addresses, no action is taken. Similarly, if you apply an SSM map containing both IPv4 and IPv6 addresses to an interface in an IPv6 context (using MLD), only the IPv6 addresses in the list are used. If there are no such addresses, no action is taken.

In this example, you create a policy to match the group addresses that you want to translate to IGMPv3. Then you define the SSM map that associates the policy with the source addresses where these group addresses are found. Finally, you apply the SSM map to one or more IGMP (for IPv4) or MLD (for IPv6) interfaces.

1. Create an SSM policy named **ssm-policy-example**. The policy terms match the IPv4 SSM group address 232.1.1.1/32 and the IPv6 SSM group address ff35::1/128. All other addresses are rejected.

```
user@router1# set policy-options policy-statement ssm-policy-example term A from
route-filter 232.1.1.1/32 exact
user@router1# set policy-options policy-statement ssm-policy-example term A then
accept
user@router1# set policy-options policy-statement ssm-policy-example term B from
route-filter ff35::1/128 exact
user@router1# set policy-options policy-statement ssm-policy-example term B then
accept
```

2. After the configuration is committed, use the **show configuration policy-options** command to verify the policy configuration.

```
user@host> show configuration policy-options

[edit policy-options]
policy-statement ssm-policy-example {
  term A {
    from {
      route-filter 232.1.1.1/32 exact;
    }
    then accept;
  }
  term B {
    from {
      route-filter ff35::1/128 exact;
    }
    then accept;
  }
  then reject;
}
```

The group addresses must match the configured policy for SSM mapping to occur.

3. Define two SSM maps, one called **ssm-map-ipv6-example** and one called **ssm-map-ipv4-example**, by applying the policy and configuring the source addresses as a multicast routing option.

```
user@host# set routing-options multicast ssm-map ssm-map-ipv6-example policy
ssm-policy-example
user@host# set routing-options multicast ssm-map ssm-map-ipv6-example source
fec0::1 fec0::12
user@host# set routing-options multicast ssm-map ssm-map-ipv4-example policy
ssm-policy-example
user@host# set routing-options multicast ssm-map ssm-map-ipv4-example source
10.10.10.4
user@host# set routing-options multicast ssm-map ssm-map-ipv4-example source
192.168.43.66
```

4. After the configuration is committed, use the **show configuration routing-options** command to verify the policy configuration.

```
user@host> show configuration routing-options

[edit routing-options]
multicast {
  ssm-map ssm-map-ipv6-example {
    policy ssm-policy-example;
    source [ fec0::1 fec0::12 ];
  }
  ssm-map ssm-map-ipv4-example {
    policy ssm-policy-example;
    source [ 10.10.10.4 192.168.43.66 ];
  }
}
```

We recommend separate SSM maps for IPv4 and IPv6.

5. Apply SSM maps for IPv4-to-IGMP interfaces and SSM maps for IPv6-to-MLD interfaces:

```
user@host# set protocols igmp interface fe-0/1/0.0 ssm-map ssm-map-ipv4-example
user@host# set protocols mld interface fe-0/1/1.0 ssm-map ssm-map-ipv6-example
```

6. After the configuration is committed, use the **show configuration protocol** command to verify the IGMP and MLD protocol configuration.

```
user@router1> show configuration protocol

[edit protocols]
igmp {
  interface fe-0/1/0.0 {
    ssm-map ssm-map-ipv4-example;
  }
}
mld {
  interface fe-0/1/1.0 {
    ssm-map ssm-map-ipv6-example;
  }
}
```

7. Use the **show igmp interface** and the **show mld interface** commands to verify that the SSM maps are applied to the interfaces.

```

user@host> show igmp interface fe-0/1/0.0
Interface: fe-0/1/0.0
  Querier: 192.168.224.28
  State:      Up Timeout:      None Version:  2 Groups:  2
  SSM Map: ssm-map-ipv4-example

user@host> show mld interface fe-0/1/1.0
Interface: fe-0/1/1.0
  Querier: fec0:0:0:0:1::12
  State:      Up Timeout:      None Version:  2 Groups:  2
  SSM Map: ssm-map-ipv6-example

```

## Example: Configuring Source-Specific Multicast Groups with Any-Source Override

This example shows how to extend source-specific multicast (SSM) group operations beyond the default IP address range of 232.0.0.0 through 232.255.255.255. This example also shows how to accept any-source multicast (ASM) join messages (\*G) for group addresses that are within the default or configured range of SSM groups. This allows you to support a mix of any-source and source-specific multicast groups simultaneously.

- [Requirements on page 4637](#)
- [Overview on page 4637](#)
- [Configuration on page 4639](#)
- [Verification on page 4640](#)

### Requirements

Before you begin, configure the router interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.

### Overview

To deploy SSM, configure PIM sparse mode on all routing device interfaces and issue the necessary SSM commands, including specifying IGMPv3 or MLDv2 on the receiver's LAN. If PIM sparse mode is not explicitly configured on both the source and group members interfaces, multicast packets are not forwarded. Source lists, supported in IGMPv3 and MLDv2, are used in PIM SSM. Only sources that are specified send traffic to the SSM group.

In a PIM SSM-configured network, a host subscribes to an SSM channel (by means of IGMPv3 or MLDv2) to join group G and source S (see [Figure 182 on page 4638](#)). The directly connected PIM sparse-mode router, the receiver's designated router (DR), sends an (S,G) join message to its reverse-path forwarding (RPF) neighbor for the source. Notice in [Figure 182 on page 4638](#) that the RP is not contacted in this process by the receiver, as would be the case in normal PIM sparse-mode operations.

Figure 182: Receiver Sends Messages to Join Group G and Source S

The (S,G) join message initiates the source tree and then builds it out hop by hop until it reaches the source. In [Figure 183 on page 4638](#), the source tree is built across the network to Router 3, the last-hop router connected to the source.

Figure 183: Router 3 (Last-Hop Router) Joins the Source Tree

Using the source tree, multicast traffic is delivered to the subscribing host (see [Figure 184 on page 4638](#)).

Figure 184: (S,G) State Is Built Between the Source and the Receiver

SSM can operate in include mode or in exclude mode. In exclude mode the receiver specifies a list of sources that it does not want to receive the multicast group traffic from. The routing device forwards traffic to the receiver from any source except the sources specified in the exclusion list. The receiver accepts traffic from any sources except the sources specified in the exclusion list.

This example works with the simple RPF topology shown in [Figure 185 on page 4638](#).

Figure 185: Simple RPF Topology

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set protocols ospf area 0.0.0.0 interface fxp0.0 disable
set protocols ospf area 0.0.0.0 interface all
set protocols pim rp local address 10.255.72.46
set protocols pim rp local group-ranges 239.0.0.0/24
set protocols pim interface fe-1/0/0.0 mode sparse
set protocols pim interface lo0.0 mode sparse
set routing-options multicast ssm-groups 232.0.0.0/8
set routing-options multicast ssm-groups 239.0.0.0/8
set routing-options multicast asm-override-ssm
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure an RPF policy:

1. Configure OSPF.

```
[edit protocols ospf]
user@host# set area 0.0.0.0 interface fxp0.0 disable
user@host# set area 0.0.0.0 interface all
```

2. Configure PIM sparse mode.

```
[edit protocols pim]
user@host# set rp local address 10.255.72.46
user@host# set rp local group-ranges 239.0.0.0/24
user@host# set interface fe-1/0/0.0 mode sparse
user@host# set interface lo0.0 mode sparse
```

3. Configure additional SSM groups.

```
[edit routing-options]
user@host# set ssm-groups [ 232.0.0.0/8 239.0.0.0/8 ]
```

4. Configure the RP to accept ASM join messages for groups within the SSM address range.

```
[edit routing-options]
user@host# set multicast asm-override-ssm
```

5. If you are done configuring the device, commit the configuration.

```
user@host# commit
```

## Results

Confirm your configuration by entering the **show protocols** and **show routing-options** commands.

```
user@host# show protocols
ospf {
  area 0.0.0.0 {
    interface fxp0.0 {
      disable;
    }
    interface all;
  }
}
pim {
  rp {
    local {
      address 10.255.72.46;
      group-ranges {
        239.0.0.0/24;
      }
    }
  }
  interface fe-1/0/0.0 {
    mode sparse;
  }
  interface lo0.0 {
    mode sparse;
  }
}

user@host# show routing-options
multicast {
  ssm-groups [ 232.0.0.0/8 239.0.0.0/8 ];
  asm-override-ssm;
}
```

---

### Verification

To verify the configuration, run the following commands:

- [show igmp group](#)
- [show igmp statistics](#)
- [show pim join](#)

---

### Multiple SSM Maps and Groups for Interfaces

You can configure multiple source-specific multicast (SSM) maps so that different groups map to different sources, which enables a single multicast group to map to different sources for different interfaces.

Example: Configuring Multiple SSM Maps Per Interface

This example shows how to assign more than one SSM map to an IGMP interface.

- [Requirements on page 4641](#)
- [Overview on page 4641](#)
- [Configuration on page 4641](#)
- [Verification on page 4643](#)

Requirements

This example requires Junos OS Release 11.4 or later.

Overview

In this example, you configure a routing policy, POLICY-ipv4-example1, that maps multicast group join messages over an IGMP logical interface to IPv4 multicast source addresses based on destination IP address as follows:

| Routing Policy Name         | Multicast Group Join Messages for a Route Filter at This Destination Address | Multicast Source Addresses   |
|-----------------------------|------------------------------------------------------------------------------|------------------------------|
| POLICY-ipv4-example1 term 1 | 232.1.1.1                                                                    | 10.10.10.4,<br>192.168.43.66 |
| POLICY-ipv4-example1 term 2 | 232.1.1.2                                                                    | 10.10.10.5,<br>192.168.43.67 |

You apply routing policy POLICY-ipv4-example1 to IGMP logical interface fe-0/1/0.0.

Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see the *CLI User Guide*.

To configure this example, perform the following task:

CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the [edit] hierarchy level.

```
set policy-options policy-statement POLICY-ipv4-example1 term 1 from route-filter
  232.1.1.1/32 exact
set policy-options policy-statement POLICY-ipv4-example1 term 1 then ssm-source
  10.10.10.4
set policy-options policy-statement POLICY-ipv4-example1 term 1 then ssm-source
  192.168.43.66
set policy-options policy-statement POLICY-ipv4-example1 term 1 then accept
set policy-options policy-statement POLICY-ipv4-example1 term 2 from route-filter
  232.1.1.2/32 exact
set policy-options policy-statement POLICY-ipv4-example1 term 2 then ssm-source
  10.10.10.5
```

```
set policy-options policy-statement POLICY-ipv4-example1 term 2 then ssm-source
192.168.43.67
set policy-options policy-statement POLICY-ipv4-example1 term 2 then accept
set protocols igmp interface fe-0/1/0.0 ssm-map-policy POLICY-ipv4-example1
```

**Step-by-Step  
Procedure**

To configure multiple SSM maps per interface:

1. Configure protocol-independent routing options for route filter 232.1.1.1, and specify the multicast source addresses to which matching multicast groups are to be mapped.

```
[edit policy-options policy-statement POLICY-ipv4-example1 term 1]
user@host# set from route-filter 232.1.1.1/32 exact
user@host# set then ssm-source 10.10.10.4
user@host# set then ssm-source 192.168.43.66
user@host# set then accept
```

2. Configure protocol-independent routing options for route filter 232.1.1.2, and specify the multicast source addresses to which matching multicast groups are to be mapped.

```
[edit policy-options policy-statement POLICY-ipv4-example1 term 2]
user@host# set from route-filter 232.1.1.2/32 exact
user@host# set then ssm-source 10.10.10.5
user@host# set then ssm-source 192.168.43.67
user@host# set then accept
```

3. Apply the policy map POLICY-ipv4-example1 to IGMP logical interface fe-0/1/1/0.

```
[edit protocols igmp interface fe-0/1/0.0]
user@host# set ssm-map-policy POLICY-ipv4-example1
```

**Results**

After the configuration is committed, confirm the configuration by entering the **show policy-options** and **show protocols** configuration mode commands. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
user@host#> show policy-options
policy-statement POLICY-ipv4-example1 {
  term 1 {
    from {
      route-filter 232.1.1.1/32 exact;
    }
    then {
      ssm-source [ 10.10.10.4 192.168.43.66 ];
      accept;
    }
  }
  term 2 {
    from {
      route-filter 232.1.1.2/32 exact;
    }
    then {
      ssm-source [ 10.10.10.5 192.168.43.67 ];
      accept;
    }
  }
}
```

```

}

user@host# show protocols
igmp {
  interface fe-0/1/0.0 {
    ssm-map-policy POLICY-ipv4-example1;
  }
}

```

### Verification

Confirm that the configuration is working properly.

- [Displaying Information About IGMP-Enabled Interfaces on page 4643](#)
- [Displaying the PIM Groups on page 4643](#)
- [Displaying the Entries in the IP Multicast Forwarding Table on page 4643](#)

### Displaying Information About IGMP-Enabled Interfaces

**Purpose** Verify that the SSM map policy POLICY-ipv4-example1 is applied to logical interface fe-0/1/0.0.

**Action** Use the [show igmp interface](#) operational mode command for the IGMP logical interface to which you applied the SSM map policy.

```

user@host> show igmp interface
Interface: fe-0/1/0.0
  Querier: 10.111.30.1
  State:      Up Timeout:    None Version:  2 Groups:      2
  SSM Map Policy: POLICY-ipv4-example1;

```

```

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

```

```

Derived Parameters:
IGMP Membership Timeout: 260.0
IGMP Other Querier Present Timeout: 255.0

```

The command output displays the name of IGMP logical interface (fe-0/1/0.0), the address of the routing device that has been elected to send membership queries and group information.

### Displaying the PIM Groups

**Purpose** Verify the Protocol Independent Multicast (PIM) source and group pair (S,G) entries.

**Action** Use the [show pim join extensive 232.1.1.1](#) operational mode command to display the PIM source and group pair (S,G) entries for the 232.1.1.1 group.

### Displaying the Entries in the IP Multicast Forwarding Table

**Purpose** Verify that the IP multicast forwarding table displays the mroute state.

**Action** Use the [show multicast route extensive](#) operational mode command to display the entries in the IP multicast forwarding table to verify that the **Route state** is active and that the **Forwarding state** is forwarding.

| Description              | <p>Configure static rendezvous point (RP) addresses. You can configure a static RP in a logical system only if the logical system is not directly connected to a source.</p> <p>For each static RP address, you can optionally specify the PIM version and the groups for which this address can be the RP. The default PIM version is version 1.</p>                    |
| Options                  | <p><b>address</b>—Static RP address.</p> <p><b>Default:</b> 224.0.0.0/4</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                    |

| <b>Description</b>              | Multicast routing devices running PIM sparse mode often forward the same stream of multicast packets onto the same LAN through the rendezvous-point tree (RPT) and shortest-path tree (SPT). PIM assert messages help routing devices determine which routing device forwards the traffic and prunes the RPT for this group. By default, routing devices enter an assert cycle every 180 seconds. You can configure this assert timeout to be between 5 and 210 seconds. |
| <b>Options</b>                  | <b><i>seconds</i></b> —Time for routing device to wait before another assert message cycle.<br><b>Range:</b> 5 through 210 seconds<br><b>Default:</b> 180 seconds                                                                                                                                                                                                                                                                                                        |

| Description              | <p>Enable BFD failure detection. The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the <b>clear bfd adaptation</b> command to return BFD interval timers to their configured values. The <b>clear bfd adaptation</b> command is hitless, meaning that the command does not affect traffic flow on the routing device.</p> <p>The remaining statement is explained separately.</p> |
| Required Privilege Level | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Description</b>              | <p>Specify loose authentication checking on the BFD session. Use loose authentication for transitional periods only when authentication might not be configured at both ends of the BFD session.</p> <p>By default, strict authentication is enabled and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure <i>loose checking</i>. When loose checking is configured, packets are accepted without authentication being checked at each end of the session.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.1.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | Set the maximum time in milliseconds to delay sending override join messages for a multicast network that has join suppression enabled. When a router or switch sees a prune message for a join it is currently suppressing, it waits for the interval specified by the override timer before it sends an override join message.                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | This is a random timer with a value in milliseconds.<br><b>Range:</b> 0 through maximum override value<br><b>Default:</b> 2000 milliseconds                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>              | Set a delay for implementing a PIM prune message on the upstream routing device on a multicast network for which join suppression has been enabled. The routing device waits for the prune pending period to detect whether a join message is currently being suppressed by another routing device.                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | Change the value of a tracking bit (T-bit) field in the LAN prune delay hello option from the default of 1 to 0, which enables join suppression for a multicast interface. When the network starts receiving multiple identical join messages, join suppression triggers a random timer with a value of 66 through 84 milliseconds ( $1.1 \times \text{periodic}$ through $1.4 \times \text{periodic}$ , where periodic is 60 seconds). This creates an interval during which no identical join messages are sent. Eventually, only one of the identical messages is sent. Join suppression is triggered each time identical messages are sent for the same join. |

| <b>Description</b>              | <p>Set the SPT threshold to infinity for a source-group address pair. Last-hop multicast routing devices running PIM sparse mode can forward the same stream of multicast packets onto the same LAN through an RPT rooted at the RP or an SPT rooted at the source. By default, last-hop routing devices transition to a direct SPT to the source. You can configure this routing device to set the SPT transition value to infinity to prevent this transition for any source-group address pair.</p> <p>The remaining statements are explained separately.</p> |

## threshold (PIM BFD Detection Time)

|                            |                                                                                                                                                                                                                                                                  |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>threshold <i>milliseconds</i>;</code>                                                                                                                                                                                                                      |
| <b>Hierarchy Level</b>     | [edit protocols pim interface <i>interface-name</i> bfd-liveness-detection detection-time],<br>[edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> bfd-liveness-detection detection-time]                         |
| <b>Release Information</b> | Statement introduced in Junos OS Release 8.2.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Support for BFD authentication introduced in Junos OS Release 9.6.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series. |
| <b>Description</b>         | Specify the threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.                                            |

**NOTE:** The threshold value must be equal to or greater than the transmit interval.

The threshold time must be equal to or greater than the value specified in the [minimum-interval](#) or the [minimum-receive-interval](#) statement.

|                                 |                                                                                                                                                                                                                                                                                                                                                          |

| <b>Description</b>              | <p>Specify the transmit interval for the <b>bfd-liveness-detection</b> statement. The negotiated transmit interval for a peer is the interval between the sending of BFD packets to peers. The receive interval for a peer is the minimum interval between receiving packets sent from its peer; the receive interval is not negotiated between peers. To determine the transmit interval, each peer compares its configured minimum transmit interval with its peer's minimum receive interval. The larger of the two numbers is accepted as the transmit interval for that peer.</p> <p>The remaining statements are explained separately.</p> |

| <b>Description</b>         | <p>Configure PIM tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Default</b>             | The default PIM trace options are those inherited from the routing protocol's <b>traceoptions</b> statement included at the <b>[edit routing-options]</b> hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place tracing output in the <b>pim-log</b> file.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p><b>PIM Tracing Flags</b></p> <ul style="list-style-type: none"><li>• <b>assert</b>—Assert messages</li><li>• <b>bidirectional-df-election</b>—Bidirectional PIM designated-forwarder (DF) election events</li></ul> |

- **bootstrap**—Bootstrap messages
- **cache**—Packets in the PIM sparse mode routing cache
- **graft**—Graft and graft acknowledgment messages
- **hello**—Hello packets
- **join**—Join messages
- **mt**—Multicast tunnel messages
- **nsr-synchronization**—Nonstop active routing (NSR) synchronization messages
- **packets**—All PIM packets
- **prune**—Prune messages
- **register**—Register and register stop messages
- **rp**—Candidate RP advertisements
- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Do not allow users to read the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size** *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 0 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.4.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                                                                                                                                                        |
| <b>Description</b>              | <p>Configure a limit for the number of multicast groups (or [S,G] channels in IGMPv3) allowed on an interface. After this limit is reached, new reports are ignored and all related flows are not flooded on the interface.</p> <p>To confirm the configured group limit on the interface, use the <b>show igmp interface</b> command.</p> |
| <b>Default</b>                  | By default, there is no limit to the number of multicast groups that can join the interface.                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <b>limit</b> —group limit value for the interface.<br><b>Range:</b> 1 through 32767                                                                                                                                                                                                                                                        |

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 12.1 for the QFX Series.  
                              Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**    Enable IGMP on the router or switch. IGMP must be enabled for the router or switch to receive multicast packets.

The remaining statements are explained separately.

|                                 |                                                                                                                                                                                                                    |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>                  | IGMP is disabled on the router or switch. IGMP is automatically enabled on all broadcast interfaces when you configure Protocol Independent Multicast (PIM) or Distance Vector Multicast Routing Protocol (DVMRP). |

| <b>Description</b>              | <p>The immediate leave setting is useful for minimizing the leave latency of IGMP memberships. When this setting is enabled, the routing device leaves the multicast group immediately after the last host leaves the multicast group.</p> <p>Starting in Junos OS Release 9.3, both IGMP version 2 and IGMP version 3 do host tracking when the <b>immediate-leave</b> statement is configured. This means that the multicast group leaves only when the last host leaves. The routing device keeps track of the hosts that send join messages. This allows IGMP to determine when the last host sends a leave message for the multicast group.</p> <p>When the immediate leave setting is enabled, the device removes an interface from the forwarding-table entry without first sending IGMP group-specific queries to the interface. The interface is pruned from the multicast tree for the multicast group specified in the IGMP leave message. The immediate leave setting ensures optimal bandwidth management for hosts on a switched network, even when multiple multicast groups are being used simultaneously.</p> <p>When immediate leave is disabled and one host sends a leave group message, the routing device first sends a group query to determine if another receiver responds. If no receiver responds, the routing device removes all hosts on the interface from the multicast group. Immediate leave is disabled by default for both IGMP version 2 and IGMP version 3.</p> |
|                                 | <p> <b>NOTE:</b> Although host tracking is enabled for IGMPv2 and MLDv1 when you enable immediate leave, use immediate leave with these versions only when there is one host on the interface. The reason is that IGMPv2 and MLDv1 use a report suppression mechanism whereby only one host on an interface sends a group join report in response to a membership query. The other interested hosts suppress their reports. The purpose of this mechanism is to avoid a flood of reports for the same group. But it also interferes with host tracking, because the routing device only knows about the one interested host and does not know about the others.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## static (Protocols IGMP)

---

**Syntax**    static {  
              group *multicast-group-address* {  
                  exclude;  
                  group-count *number*;  
                  group-increment *increment*;  
                  source *ip-address* {  
                      source-count *number*;  
                      source-increment *increment*;  
                  }  
              }  
          }  
      }

**Hierarchy Level**    [edit logical-systems *logical-system-name* protocols **igmp** interface *interface-name*],  
                          [edit protocols **igmp** interface *interface-name*]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                              Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**    Test multicast forwarding on an interface without a receiver host.

The **static** statement simulates IGMP joins on a routing device statically on an interface without any IGMP hosts. It is supported for both IGMPv2 and IGMPv3 joins. This statement is especially useful for testing multicast forwarding on an interface without a receiver host.

**NOTE:** To prevent joining too many groups accidentally, the **static** statement is not supported with the **interface all** statement.

---

The remaining statements are explained separately.

**Required Privilege Level**    routing and trace—To view this statement in the configuration.  
                                  routing-control and trace-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Configure IGMP tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p>To trace the paths of multicast packets, use the <b>mtrace</b> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Default</b>             | The default IGMP trace options are those inherited from the routing protocols <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place tracing output in the file <b>igmp-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p><b>IGMP Tracing Flags</b></p> <ul style="list-style-type: none"> <li><b>leave</b>—Leave group messages (for IGMP version 2 only).</li> <li><b>mtrace</b>—Mtrace packets. Use the <b>mtrace</b> command to troubleshoot the software.</li> <li><b>packets</b>—All IGMP packets.</li> </ul> |

- **query**—IGMP membership query messages, including general and group-specific queries.
- **report**—Membership report messages.

#### Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Do not allow users to read the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1X53-D15 for QFabric Systems.                                                                                                                                                                                                                                                    |
| <b>Description</b>              | Configure a QFabric Node device to be an IGMP querier. If there are any multicast routers on the same local network, make sure the source address for the IGMP querier is lower (a smaller number) than the IP addresses for those routers on the network. This ensures that Node is always the IGMP querier on the network. |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                          |

## igmp-snooping

```
Syntax  igmp-snooping {
        traceoptions {
            file filename <files number> <size size> <world-readable | no-world-readable> <match
              regex>;
            flag flag (detail | disable | receive | send);
        }
        vlan vlan-name {
            data-forwarding {
                source {
                    groups group-prefix;
                }
                receiver {
                    source-vlans vlan-list;
                    install;
                }
            }
            disable;
            immediate-leave;
            interface interface-name {
                multicast-router-interface;
                static {
                    group ip-address;
                }
            }
            robust-count number;
            version number;
        }
    }
```

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.  
**version** statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description** Enable and configure IGMP snooping.  
 The remaining statements are explained separately.

**Default** IGMP snooping is disabled by default.

**Required Privilege Level** routing—To view this statement in the configuration.  
 routing-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>         | Define tracing operations for IGMP snooping.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Default</b>             | The <b>traceoptions</b> feature is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached (<b>xk</b> to specify KB, <b>xm</b> to specify MB, or <b>xg</b> to specify gigabytes), at which point the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b> —Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—All tracing operations.</li> <li>• <b>general</b>—Trace general IGMP snooping protocol events.</li> <li>• <b>krt</b>—Trace communication over routing sockets.</li> <li>• <b>nexthop</b>— Trace next-hop related events.</li> <li>• <b>normal</b>—Trace normal IGMP snooping protocol events.</li> <li>• <b>packets</b>—Trace all IGMP packets.</li> <li>• <b>policy</b>—Trace policy processing.</li> <li>• <b>query</b>—Trace IGMP membership query messages.</li> <li>• <b>report</b>—Trace membership report messages.</li> </ul> |

- **route**—Trace routing information.
- **state**—Trace IGMP state transitions.
- **task**—Trace routing protocol task processing.
- **timer**—Trace routing protocol timer processing.
- **vlan**—Trace VLAN related events.

**no-stamp**—(Optional) Do not time stamp trace file.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**size size** —(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option. Use **xk** to specify KB, **xm** to specify MB, or **xg** to specify gigabytes.

**Range:** 10 KB through 1 gigabytes

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

## vlan (IGMP Snooping)

|                            |                                                                                                                                                                                                                                        |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <pre> vlan <i>vlan-name</i> {     immediate-leave;     interface <i>interface-name</i> {         multicast-router-interface;         static {             group <i>ip-address</i>;         }     }     version <i>number</i>; } </pre> |
| <b>Hierarchy Level</b>     | [edit protocols <a href="#">igmp-snooping</a> ]                                                                                                                                                                                        |
| <b>Release Information</b> | Statement introduced in Junos OS Release 11.1 for the QFX Series.<br><b>version</b> statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                  |
| <b>Description</b>         | Configure IGMP snooping parameters for a VLAN.<br><br>The remaining statements are explained separately.                                                                                                                               |

**TIP:** To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after `vlan` or `vlands` in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range. For IGMP snooping, secondary private VLANs are not listed.

|                                 |                                                                                                                                                                                                                                                        |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>                  | IGMP snooping options apply to the specified VLAN.                                                                                                                                                                                                     |
| <b>Options</b>                  | <i>vlan-name</i> —Name of a VLAN.                                                                                                                                                                                                                      |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                    |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                                                                                                                                                                                             |
| <b>Description</b>              | Specify the IGMP version for the IGMP general query that the switch sends to hosts when an interface comes up. The configured IGMP version affects only the version of the general queries sent by a switch. It does not affect the version of IGMP messages that the switch can snoop. For example, If the switch is configured for IGMP version 1 (IGMPv1), it can snoop IGMPv2 and IGMPv3 messages. |
| <b>Default</b>                  | If you do not configure the <b>version</b> statement, the default is IGMPv2.                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <b>version</b> —IGMP version number.<br><b>Range:</b> 1 and 2.                                                                                                                                                                                                                                                                                                                                         |

[msdp](#)],  
 [edit protocols [msdp](#)],  
 [edit routing-instances *routing-instance-name* protocols [msdp](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description** Define an MSDP peer group. MSDP peers within groups share common tracing options, if present and not overridden for an individual peer with the [peer](#) statement. To configure multiple MSDP groups, include multiple **group** statements.

By default, the group's options are identical to the global MSDP options. To override the global options, include group-specific options within the **group** statement.

The group must contain at least one peer.

**Options** *group-name*—Name of the MSDP group.

The remaining statements are explained separately.

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

                          [edit routing-instances *routing-instance-name* protocols **msdp group** *group-name*]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**    Define an MSDP peering relationship. An MSDP routing device must know which routing devices are its peers. You define the peer relationships explicitly by configuring the neighboring routing devices that are the MSDP peers of the local routing device. After peer relationships are established, the MSDP peers exchange messages to advertise active multicast sources. To configure multiple MSDP peers, include multiple **peer** statements.

By default, the peer's options are identical to the global or group-level MSDP options. To override the global or group-level options, include peer-specific options within the **peer (Protocols MSDP)** statement.

At least one peer must be configured for MSDP to function. You must configure **address** and **local-address**.

**Options**    **address**—Name of the MSDP peer.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Configure MSDP tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Default</b>             | The default MSDP trace options are those inherited from the routing protocol's <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file</b> <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place tracing output in the <b>msdp-log</b> file.</p> <p><b>files</b> <i>number</i>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

If you specify a maximum number of files, you must also include the **size** statement to specify the maximum file size.

**Range:** 2 through 1000 files

**Default:** 2 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

#### MSDP Tracing Flags

- **keepalive**—Keepalive messages
- **packets**—All MSDP packets
- **route**—MSDP changes to the routing table
- **source-active**—Source-active packets
- **source-active-request**—Source-active request packets
- **source-active-response**—Source-active response packets

#### Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

***flag-modifier***—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Do not allow any user to read the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Description</b>              | <p>Configure source-specific multicast (SSM) groups.</p> <p>By default, the SSM group multicast address is limited to the IP address range from 232.0.0.0 through 232.255.255.255. However, you can extend SSM operations into another Class D range by including the <b>ssm-groups</b> statement in the configuration. The default SSM address range from 232.0.0.0 through 232.255.255.255 cannot be used in the <b>ssm-groups</b> statement. This statement is for adding other multicast addresses to the default SSM group addresses. This statement does not override the default SSM group address range.</p> <p>IGMPv3 supports SSM groups. By utilizing inclusion lists, only sources that are specified send to the SSM group.</p> |
| <b>Options</b>                  | <i>ip-addresses</i> —List of one or more additional SSM group addresses separated by a space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Routine Monitoring

- [Monitoring IGMP Snooping on page 4775](#)
- [Verifying the IGMP Snooping Group Timeout Value on page 4776](#)

## Monitoring IGMP Snooping

- Purpose** Use the monitoring feature to view status and information about the IGMP snooping configuration.
- Action** To display IGMP snooping details in the CLI, enter the following commands:
  - `show igmp-snooping vlans`
  - `show igmp-snooping statistics`
  - `show igmp-snooping route`
  - `show igmp-snooping membership`
- Meaning** [Table 312 on page 4775](#) summarizes the IGMP snooping details displayed.

Table 312: Summary of IGMP Snooping Output Fields

| Field                 | Values                                              |
|-----------------------|-----------------------------------------------------|
| IGMP Snooping Monitor |                                                     |
| VLAN                  | VLAN for which IGMP snooping is enabled.            |
| Interfaces            | Interface connected to a multicast router.          |
| Groups                | Number of the multicast groups learned by the VLAN. |
| MRouters              | Multicast router.                                   |
| Receivers             | Multicast receiver.                                 |

Table 312: Summary of IGMP Snooping Output Fields (*continued*)

| Field                  | Values                                                             |
|------------------------|--------------------------------------------------------------------|
| IGMP Route Information |                                                                    |
| VLAN                   | VLAN for which IGMP snooping is enabled.                           |
| Next-Hop               | Next hop assigned by the switch after performing the route lookup. |
| Group                  | Multicast groups learned by the VLAN.                              |

## Verifying the IGMP Snooping Group Timeout Value

**Purpose** Verify that the IGMP snooping group timeout value has been changed correctly from its default value.

**Action** Display the IGMP snooping membership information, which contains the group timeout value that was derived from the IGMP configuration:

```
user@switch> show igmp-snooping membership detail
VLAN: v43 Tag: 43 (Index: 4)
Group: 225.0.0.1
Receiver count: 1, Flags: <v2-hosts>
ge-0/0/15.0 Uptime: 00:00:05 timeout: 510
```

**Meaning** The IGMP snooping group timeout value determines how long a switch waits to receive an IGMP query from a multicast router before removing a multicast group from its multicast cache table. When you enable IGMP snooping, the default IGMP snooping group timeout value of 260 seconds is applied to all VLANs, which means that the switch waits 260 seconds to receive an IGMP query before removing a multicast group from its multicast cache table. You can change the timeout value by using the **robust-count** option.

## Sample Output

### clear multicast statistics

```
user@host> clear multicast statistics
```

## clear pim join

**List of Syntax** [Syntax on page 4793](#)

[Syntax \(EX Series Switch and the QFX Series\) on page 4793](#)

**Syntax** clear pim join  
 <group-address>  
 <bidirectional | dense | sparse>  
 <exact>  
 <inet | inet6>  
 <instance instance-name>  
 <logical-system (all | logical-system-name)>  
 <rp ip-address/prefix | source ip-address/prefix>  
 <sg | star-g>

**Syntax (EX Series Switch and the QFX Series)** clear pim join  
 <group-address>  
 <dense | sparse>  
 <exact>  
 <inet | inet6>  
 <instance instance-name>  
 <rp ip-address/prefix | source ip-address/prefix>  
 <sg | star-g>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
**inet6** and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.3 for the QFX Series.  
 Multiple new filter options introduced in Junos OS Release 13.2.

**Description** Clear the Protocol Independent Multicast (PIM) join and prune states.

**Options** **none**—Clear the PIM join and prune states for all groups, family addresses, and instances.

**group-address**—(Optional) Clear the PIM join and prune states for a group address.

**bidirectional | dense | sparse**—(Optional) Clear PIM bidirectional mode, dense mode, or sparse and source-specific multicast (SSM) mode entries.

**exact**—(Optional) Clear only the group that exactly matches the specified group address.

**inet | inet6**—(Optional) Clear the PIM entries for IPv4 or IPv6 family addresses, respectively.

**instance instance-name**—(Optional) Clear the entries for a specific PIM-enabled routing instance.

**logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**rp ip-address/prefix | source ip-address/prefix**—(Optional) Clear the PIM entries with a specified rendezvous point (RP) address and prefix or with a specified source address and prefix. You can omit the prefix.

**sg | star-g**—(Optional) Clear PIM (S,G) or (\*,G) entries.

**Additional Information** The **clear pim join** command cannot be used to clear the PIM join and prune state on a backup Routing Engine when nonstop active routing is enabled.

**Required Privilege Level** clear

## Sample Output

### clear pim join

```
user@host> clear pim join
Cleared 8 Join/Prune states
```

### clear pim join inet6

```
user@host> clear pim join inet6
Cleared 4 Join/Prune states
```

### clear pim join inet6 star-g

```
user@host> clear pim join inet6 star-g
Cleared 1 Join/Prune states
```

## clear pim register

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | Display trace information about an IP multicast path.                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <i>source</i> —Source hostname or address.<br><br><i>logical-system (logical-system-name)</i> —(Optional) Perform this operation on a logical system.<br><br><i>routing-instance routing-instance-name</i> —(Optional) Trace a particular routing instance.                                                                                                            |
| <b>Additional Information</b>   | The <b>mtrace</b> command for multicast traffic is similar to the <b>traceroute</b> command used for unicast traffic. Unlike <b>traceroute</b> , <b>mtrace</b> traces traffic backwards, from the receiver to the source.                                                                                                                                              |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                   |
| <b>List of Sample Output</b>    | <a href="#">mtrace source on page 4802</a>                                                                                                                                                                                                                                                                                                                             |
| <b>Output Fields</b>            | <a href="#">Table 313 on page 4800</a> describes the output fields for the <b>mtrace</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                              |

**Table 313: mtrace Output Fields**

| Field Name                        | Field Description                                             |
|-----------------------------------|---------------------------------------------------------------|
| <b>Mtrace from</b>                | IP address of the receiver.                                   |
| <b>to</b>                         | IP address of the source.                                     |
| <b>via group</b>                  | IP address of the multicast group (if any).                   |
| <b>Querying full reverse path</b> | Indicates the full reverse path query has begun.              |
| <i>number-of-hops</i>             | Number of hops from the source to the named router or switch. |
| <i>router-name</i>                | Name of the router or switch for this hop.                    |
| <i>address</i>                    | Address of the router or switch for this hop.                 |

Table 313: mtrace Output Fields (*continued*)

| Field Name      | Field Description                              |
|-----------------|------------------------------------------------|
| <i>protocol</i> | Protocol used (for example, PIM).              |
| Round trip time | Average round-trip time, in milliseconds (ms). |
| total ttl of    | Time-to-live (TTL) threshold.                  |

## Sample Output

### mtrace source

```
user@host> mtrace 192.1.4.2
Mtrace from 192.1.4.2 to 192.1.1.2 via group 0.0.0.0
Querying full reverse path... * *
  0  routerA.lab.mycompany.net (192.1.1.2)
 -1  routerB.lab.mycompany.net (192.1.2.2) PIM thresh^ 1
 -2  routerC.lab.mycompany.net (192.1.3.2) PIM thresh^ 1
 -3  hostA.lab.mycompany.net (192.1.4.2)
Round trip time 2 ms; total ttl of 2 required.
```

## mtrace from-source

**Syntax** `mtrace from-source source source`  
`<brief | detail>`  
`<extra-hops extra-hops>`  
`<group group>`  
`<interval interval>`  
`<loop>`  
`<max-hops max-hops>`  
`<max-queries max-queries>`  
`<multicast-response | unicast-response>`  
`<no-resolve>`  
`<no-router-alert>`  
`<response response>`  
`<routing-instance routing-instance-name>`  
`<ttl tll>`  
`<wait-time wait-time>`

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Display trace information about an IP multicast path from a source to this router or switch. If you specify a group address with this command, Junos OS returns additional information, such as packet rates and losses.

**Options** `brief | detail`—(Optional) Display the specified level of output.

`extra-hops extra-hops`—(Optional) Number of hops to take after reaching a nonresponsive router. You can specify a number between **0** and **255**.

`group group`—(Optional) Group address for which to trace the path. The default group address is **0.0.0.0**.

`interval interval`—(Optional) Number of seconds to wait before gathering statistics again. The default value is **10** seconds.

`loop`—(Optional) Loop indefinitely, displaying rate and loss statistics.

`max-hops max-hops`—(Optional) Maximum hops to trace toward the source. The range of values is **0** through **255**. The default value is **32** hops.

`max-queries max-queries`—(Optional) Maximum number of query attempts for any hop. The range of values is 1 through **32**. The default is **3**.

`multicast-response`—(Optional) Always request the response using multicast.

`no-resolve`—(Optional) Do not attempt to display addresses symbolically.

`no-router-alert`—(Optional) Do not use the router-alert IP option.

`response response`—(Optional) Send trace response to a host or multicast address.

**routing-instance** *routing-instance-name*—(Optional) Trace a particular routing instance.

**source** *source*—Source hostname or address.

**ttl** *tll*—(Optional) IP time-to-live (TTL) value. You can specify a number between 0 and 255. Local queries to the multicast group use a value of 1. Otherwise, the default value is 127.

**unicast-response**—(Optional) Always request the response using unicast.

**wait-time** *wait-time*—(Optional) Number of seconds to wait for a response. The default value is 3.

**Required Privilege Level** view

**List of Sample Output** [mtrace from-source on page 4805](#)

**Output Fields** [Table 314 on page 4804](#) describes the output fields for the **mtrace from-source** command. Output fields are listed in the approximate order in which they appear.

**Table 314: mtrace from-source Output Fields**

| Field Name                        | Field Description                                             |
|-----------------------------------|---------------------------------------------------------------|
| <b>Mtrace from</b>                | IP address of the receiver.                                   |
| <b>to</b>                         | IP address of the source.                                     |
| <b>via group</b>                  | IP address of the multicast group (if any).                   |
| <b>Querying full reverse path</b> | Indicates the full reverse path query has begun.              |
| <b>number-of-hops</b>             | Number of hops from the source to the named router or switch. |
| <b>router-name</b>                | Name of the router or switch for this hop.                    |
| <b>address</b>                    | Address of the router or switch for this hop.                 |
| <b>protocol</b>                   | Protocol used (for example, PIM).                             |
| <b>Round trip time</b>            | Average round-trip time, in milliseconds (ms).                |
| <b>total ttl of</b>               | Time-to-live (TTL) threshold.                                 |
| <b>source</b>                     | Source address.                                               |
| <b>Response Dest</b>              | Response destination address.                                 |
| <b>Overall</b>                    | Average packet rate for all traffic at each hop.              |

Table 314: mtrace from-source Output Fields (*continued*)

| Field Name                                | Field Description                                                                                                |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Packet Statistics for Traffic From</b> | Number of packets lost, number of packets sent, percentage of packets lost, and average packet rate at each hop. |
| <b>Receiver</b>                           | IP address receiving the multicast.                                                                              |
| <b>Query source</b>                       | IP address sending the mtrace query.                                                                             |

## Sample Output

### mtrace from-source

```

user@host> mtrace from-source source 192.1.4.2 group 225.1.1.1
Mtrace from 192.1.4.2 to 192.1.1.2 via group 225.1.1.1
Querying full reverse path... * *
 0 routerA.lab.mycompany.net (192.1.1.2)
-1 routerB.lab.mycompany.net (192.1.2.2) PIM thresh^ 1
-2 routerC.lab.mycompany.net (192.1.3.2) PIM thresh^ 1
-3 hostA.lab.mycompany.net (192.1.4.2)
Round trip time 2 ms; total ttl of 2 required.

Waiting to accumulate statistics...Results after 10 seconds:

| <b>Description</b>         | Display trace information about a multicast path from this router or switch to a gateway router or switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>             | <b>gateway gateway</b> —Send the trace query to a gateway multicast address.<br><br><b>brief   detail</b> —(Optional) Display the specified level of output.<br><br><b>extra-hops <i>extra-hops</i></b> —(Optional) Number of hops to take after reaching a nonresponsive router or switch. You can specify a number between <b>0</b> and <b>255</b> .<br><br><b>group <i>group</i></b> —(Optional) Group address for which to trace the path. The default group address is <b>0.0.0.0</b> .<br><br><b>interface <i>interface-name</i></b> —(Optional) Source address for sending the trace query.<br><br><b>interval <i>interval</i></b> —(Optional) Number of seconds to wait before gathering statistics again. The default value is <b>10</b> .<br><br><b>loop</b> —(Optional) Loop indefinitely, displaying rate and loss statistics.<br><br><b>max-hops <i>max-hops</i></b> —(Optional) Maximum hops to trace toward the source. You can specify a number between <b>0</b> and <b>255</b> . The default value is <b>32</b> .<br><br><b>max-queries <i>max-queries</i></b> —(Optional) Maximum number of query attempts for any hop. You can specify a number between <b>0</b> and <b>255</b> . The default value is <b>3</b> .<br><br><b>multicast-response</b> —(Optional) Always request the response using multicast.<br><br><b>no-resolve</b> —(Optional) Do not attempt to display addresses symbolically. |

**no-router-alert**—(Optional) Do not use the router-alert IP option.

**response *response***—(Optional) Send trace response to a host or multicast address.

**routing-instance *routing-instance-name***—(Optional) Trace a particular routing instance.

**ttl *tll***—(Optional) IP time-to-live value. You can specify a number between 0 and 225.

Local queries to the multicast group use TTL 1. Otherwise, the default value is 127.

**unicast-response**—(Optional) Always request the response using unicast.

**wait-time *wait-time***—(Optional) Number of seconds to wait for a response. The default value is 3.

**List of Sample Output** [mtrace to-gateway on page 4809](#)

**Output Fields** [Table 316 on page 4809](#) describes the output fields for the **mtrace to-gateway** command. Output fields are listed in the approximate order in which they appear.

**Table 316: mtrace to-gateway Output Fields**

| Field Name                        | Field Description                                             |
|-----------------------------------|---------------------------------------------------------------|
| <b>Mtrace from</b>                | IP address of the receiver.                                   |
| <b>to</b>                         | IP address of the source.                                     |
| <b>via group</b>                  | IP address of the multicast group (if any).                   |
| <b>Querying full reverse path</b> | Indicates the full reverse path query has begun.              |
| <b><i>number-of-hops</i></b>      | Number of hops from the source to the named router or switch. |
| <b><i>router-name</i></b>         | Name of the router or switch for this hop.                    |
| <b><i>address</i></b>             | Address of the router or switch for this hop.                 |
| <b><i>protocol</i></b>            | Protocol used (for example, PIM).                             |
| <b>Round trip time</b>            | Average round-trip time, in milliseconds (ms).                |
| <b>total ttl of</b>               | Time-to-live (TTL) threshold.                                 |

## Sample Output

### mtrace to-gateway

```
user@host> mtrace to-gateway gateway 192.1.3.2 group 225.1.1.1 interface 192.1.1.73 brief
```

```
Mtrace from 192.1.1.73 to 192.1.1.2 via group 225.1.1.1
```

```
Querying full reverse path... * *
 0 routerA.lab.mycompany.net (192.1.1.2)
-1 routerA.lab.mycompany.net (192.1.1.2) PIM thresh^ 1
-2 routerB.lab.mycompany.net (192.1.2.2) PIM thresh^ 1
-3 routerC.lab.mycompany.net (192.1.3.2) PIM thresh^ 1
Round trip time 2 ms; total ttl of 3 required.
```

**Table 318: show igmp group Output Fields**

| Field Name        | Field Description                                                                                                                                       | Level of Output |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Interface</b>  | Name of the interface that received the IGMP membership report. A name of <b>local</b> indicates that the local routing device joined the group itself. | All levels      |
| <b>Group</b>      | Group address.                                                                                                                                          | All levels      |
| <b>Group Mode</b> | Mode the SSM group is operating in: <b>Include</b> or <b>Exclude</b> .                                                                                  | All levels      |

Table 318: show igmp group Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                         | Level of Output   |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <b>Source</b>           | Source address.                                                                                                                                                                                                           | All levels        |
| <b>Source timeout</b>   | Time remaining until the group traffic is no longer forwarded. The timer is refreshed when a listener in include mode sends a report. A group in exclude mode or configured as a static group displays a zero timer.      | <b>detail</b>     |
| <b>Last reported by</b> | Address of the host that last reported membership in this group.                                                                                                                                                          | All levels        |
| <b>Timeout</b>          | Time remaining until the group membership is removed.                                                                                                                                                                     | <b>brief none</b> |
| <b>Group timeout</b>    | Time remaining until a group in exclude mode moves to include mode. The timer is refreshed when a listener in exclude mode sends a report. A group in include mode or configured as a static group displays a zero timer. | <b>detail</b>     |
| <b>Type</b>             | Type of group membership: <ul style="list-style-type: none"> <li>• <b>Dynamic</b>—Host reported the membership.</li> <li>• <b>Static</b>—Membership is configured.</li> </ul>                                             | All levels        |

## Sample Output

### show igmp group (Include Mode)

```

user@host> show igmp group
Interface: t1-0/1/0.0
  Group: 232.1.1.1
    Group mode: Include
    Source: 10.0.0.2
    Last reported by: 10.9.5.2
    Timeout:      24 Type: Dynamic
  Group: 232.1.1.1
    Group mode: Include
    Source: 10.0.0.3
    Last reported by: 10.9.5.2
    Timeout:      24 Type: Dynamic
  Group: 232.1.1.1
    Group mode: Include
    Source: 10.0.0.4
    Last reported by: 10.9.5.2
    Timeout:      24 Type: Dynamic
  Group: 232.1.1.2
    Group mode: Include
    Source: 10.0.0.4
    Last reported by: 10.9.5.2
    Timeout:      24 Type: Dynamic
Interface: t1-0/1/1.0
Interface: ge-0/2/2.0
Interface: ge-0/2/0.0
Interface: local
  Group: 224.0.0.2
    Source: 0.0.0.0
    Last reported by: Local
    Timeout:      0 Type: Dynamic

```

```

Group: 224.0.0.22
Source: 0.0.0.0
Last reported by: Local
Timeout: 0 Type: Dynamic

```

### show igmp group (Exclude Mode)

```

user@host> show igmp group
Interface: t1-0/1/0.0
Interface: t1-0/1/1.0
Interface: ge-0/2/2.0
Interface: ge-0/2/0.0
Interface: local
  Group: 224.0.0.2
    Source: 0.0.0.0
    Last reported by: Local
    Timeout: 0 Type: Dynamic
  Group: 224.0.0.22
    Source: 0.0.0.0
    Last reported by: Local
    Timeout: 0 Type: Dynamic

```

### show igmp group brief

The output for the **show igmp group brief** command is identical to that for the **show igmp group** command.

### show igmp group detail

```

user@host> show igmp group detail
Interface: t1-0/1/0.0
  Group: 232.1.1.1
    Group mode: Include
    Source: 10.0.0.2
    Source timeout: 12
    Last reported by: 10.9.5.2
    Group timeout: 0 Type: Dynamic
  Group: 232.1.1.1
    Group mode: Include
    Source: 10.0.0.3
    Source timeout: 12
    Last reported by: 10.9.5.2
    Group timeout: 0 Type: Dynamic
  Group: 232.1.1.1
    Group mode: Include
    Source: 10.0.0.4
    Source timeout: 12
    Last reported by: 10.9.5.2
    Group timeout: 0 Type: Dynamic
  Group: 232.1.1.2
    Group mode: Include
    Source: 10.0.0.4
    Source timeout: 12
    Last reported by: 10.9.5.2
    Group timeout: 0 Type: Dynamic
Interface: t1-0/1/1.0
Interface: ge-0/2/2.0
Interface: ge-0/2/0.0
Interface: local
  Group: 224.0.0.2
    Group mode: Exclude

```

```
Source: 0.0.0.0
Source timeout: 0
Last reported by: Local
Group timeout:      0 Type: Dynamic
Group: 224.0.0.22
Group mode: Exclude
Source: 0.0.0.0

| <b>OIF map</b>               | Name of the OIF map (if configured) associated with the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| <b>SSM map</b>               | Name of the source-specific multicast (SSM) map (if configured) used on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | All levels      |
| <b>Configured Parameters</b> | Information configured by the user: <ul style="list-style-type: none"> <li>• <b>IGMP Query Interval</b>—Interval (in seconds) at which this router sends membership queries when it is the querier.</li> <li>• <b>IGMP Query Response Interval</b>—Time (in seconds) that the router waits for a report in response to a general query.</li> <li>• <b>IGMP Last Member Query Interval</b>—Time (in seconds) that the router waits for a report in response to a group-specific query.</li> <li>• <b>IGMP Robustness Count</b>—Number of times the router retries a query.</li> </ul> | All levels      |
| <b>Derived Parameters</b>    | Derived information: <ul style="list-style-type: none"> <li>• <b>IGMP Membership Timeout</b>—Timeout period (in seconds) for group membership. If no report is received for these groups before the timeout expires, the group membership is removed.</li> <li>• <b>IGMP Other Querier Present Timeout</b>—Time (in seconds) that the router waits for the IGMP querier to send a query.</li> </ul>                                                                                                                                                                                  | All levels      |

## Sample Output

### show igmp interface

```

user@host> show igmp interface
Interface: at-0/3/1.0
  Querier: 10.111.30.1
  State:      Up Timeout:  None Version:  2 Groups:    4
  SSM Map Policy: ssm-policy-A
Interface: so-1/0/0.0
  Querier: 10.111.10.1
  State:      Up Timeout:  None Version:  2 Groups:    2
  SSM Map Policy: ssm-policy-B
Interface: so-1/0/1.0
  Querier: 10.111.20.1
  State:      Up Timeout:  None Version:  2 Groups:    4
  SSM Map Policy: ssm-policy-C
Immediate Leave: On
Promiscuous Mode: Off

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

Derived Parameters:
IGMP Membership Timeout: 260.0
IGMP Other Querier Present Timeout: 255.0

```

### show igmp interface brief

The output for the **show igmp interface brief** command is identical to that for the **show igmp interface** command. For sample output, see [show igmp interface on page 4819](#).

### show igmp interface detail

The output for the **show igmp interface detail** command is identical to that for the **show igmp interface** command. For sample output, see [show igmp interface on page 4819](#).

### show igmp interface <interface-name>

```
user@host# show igmp interface ge-3/2/0.0
Interface: ge-3/2/0.0
Querier: 20.1.1.1
State: Up Timeout:      None Version: 3 Groups:      1
Group limit: 8
Group threshold: 60
Group log-interval: 10
Immediate leave: Off
Promiscuous mode: Off
```

## show igmp statistics

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 322: show igmp-snooping route Output Fields**

| Field Name | Field Description                              |
|------------|------------------------------------------------|
| Table      | (For internal use only. Value is always 0.)    |
| VLAN       | Name of the VLAN.                              |
| Group      | Multicast group address.                       |
| Interfaces | Interfaces on which IGMP packets were snooped. |
| Next-hop   | ID associated with the next-hop device.        |

## Sample Output

### show igmp-snooping route

```
user@switch> show igmp-snooping route
VLAN          Group          Next-hop
V11           224.1.1.1, *      533
               Interfaces: ge-0/0/13.0, ge-0/0/1.0
VLAN          Group          Next-hop
v12           224.1.1.3, *      534
               Interfaces: ge-0/0/13.0, ge-0/0/0.0
```

### show igmp-snooping route vlan v1

```
user@switch> show igmp-snooping route vlan v1
Table: 0
VLAN          Group          Next-hop
v1           224.1.1.1, *      1266
               Interfaces: ge-0/0/0.0
v1           224.1.1.3, *      1266
               Interfaces: ge-0/0/0.0
v1           224.1.1.5, *      1266
               Interfaces: ge-0/0/0.0
v1           224.1.1.7, *      1266
               Interfaces: ge-0/0/0.0
v1           224.1.1.9, *      1266
               Interfaces: ge-0/0/0.0
v1           224.1.1.11, *     1266
               Interfaces: ge-0/0/0.0
```

| <b>Output Fields</b>            | Table 323 on page 4829 lists the output fields for the <b>show igmp-snooping statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                  |

**Table 323: show igmp-snooping statistics Output Fields**

| Field Name        | Field Description                                                                           |
|-------------------|---------------------------------------------------------------------------------------------|
| Bad length        | IGMP packet has illegal or bad length.                                                      |
| Bad checksum      | IGMP or IP checksum is incorrect.                                                           |
| Invalid interface | Packet was received through an invalid interface.                                           |
| Not local         | Number of packets received from senders that are not local.                                 |
| Receive unknown   | Unknown IGMP type.                                                                          |
| Timed out         | Number of timeouts for all multicast groups.                                                |
| IGMP Type         | Type of IGMP message ( <b>Queries</b> , <b>Reports</b> , <b>Leaves</b> , or <b>Other</b> ). |
| Received          | Number of IGMP packets received.                                                            |
| Transmitted       | Number of IGMP packets transmitted.                                                         |
| Recv Errors       | Number of general receive errors.                                                           |

## Sample Output

### show igmp-snooping statistics

```
user@switch> show igmp-snooping statistics
Bad length: 0 Bad checksum: 0 Invalid interface: 0
Not local: 0 Receive unknown: 0 Timed out: 58
```

| IGMP Type | Received | Transmitted | Recv Errors |
|-----------|----------|-------------|-------------|
| Queries:  | 74295    | 0           | 0           |
| Reports:  | 18148423 | 0           | 16333523    |
| Leaves:   | 0        | 0           | 0           |
| Other:    | 0        | 0           | 0           |

**Output Fields** Table 326 on page 4836 describes the output fields for the **show msdp source** command. Output fields are listed in the approximate order in which they appear.

**Table 326: show msdp source Output Fields**

| Field Name     | Field Description                                                                                                                                                                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source address | IP address of the source.                                                                                                                                                                                                                                               |
| /Len           | Length of the prefix for this IP address.                                                                                                                                                                                                                               |
| Type           | Discovery method for this multicast source: <ul style="list-style-type: none"> <li>• <b>Configured</b>—Source-active limit explicitly configured for this source.</li> <li>• <b>Dynamic</b>—Source-active limit established when this source was discovered.</li> </ul> |
| Maximum        | Source-active limit applied to this source.                                                                                                                                                                                                                             |
| Threshold      | Source-active threshold applied to this source.                                                                                                                                                                                                                         |
| Exceeded       | Number of source-active messages received from this source exceeding the established maximum.                                                                                                                                                                           |

## Sample Output

**show msdp source**

```

user@host> show msdp source
Source address /Len  Type      Maximum  Threshold  Exceeded
0.0.0.0        /0    Configured    5         none        0
10.1.0.0       /16   Configured    500        none        0
10.1.1.1       /32   Configured   10000      none        0
10.1.1.2       /32   Dynamic     6936       none        0
10.1.5.5       /32   Dynamic     500        none       123
10.2.1.1       /32   Dynamic      2          none        0

```

## show msdp source-active

| <b>Output Fields</b>            | Table 327 on page 4838 describes the output fields for the <b>show msdp source-active</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 327: show msdp source-active Output Fields

| Field Name                              | Field Description                                                                                                                                          |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global active source limit exceeded     | Number of times all peers have exceeded configured active source limits.                                                                                   |
| Global active source limit maximum      | Configured number of active source messages accepted by the device.                                                                                        |
| Global active source limit threshold    | Configured threshold for applying random early discard (RED) to drop some but not all MSDP active source messages.                                         |
| Global active source limit log-warning  | Threshold at which a warning message is logged (percentage of the number of active source messages accepted by the device).                                |
| Global active source limit log interval | Time (in seconds) between consecutive log messages.                                                                                                        |
| Group address                           | Multicast address of the group.                                                                                                                            |
| Source address                          | IP address of the source.                                                                                                                                  |
| Peer address                            | IP address of the peer.                                                                                                                                    |
| Originator                              | Router ID configured on the source of the rendezvous point (RP) that originated the message, or the loopback address when the router ID is not configured. |
| Flags                                   | Flags: Accept, Reject, or Filtered.                                                                                                                        |

## Sample Output

### show msdp source-active

```

user@host> show msdp source-active

### show msdp source-active brief

The output for the **show msdp source-active brief** command is identical to that for the **show msdp source-active** command. For sample output, see [show msdp source-active on page 4838](#).

### show msdp source-active detail

The output for the **show msdp source-active detail** command is identical to that for the **show msdp source-active** command. For sample output, see [show msdp source-active on page 4838](#).

### show msdp source-active source

```
user@host> show msdp source-active source 192.168.215.246
```

```
Global active source limit exceeded: 0
```

```
Global active source limit maximum: 25000
```

```
Global active source limit threshold: 24000
```

```
Global active source limit log-warning: 100
```

```
Global active source limit log interval: 0
```

| Group address | Source address  | Peer address   | Originator     | Flags  |

| <b>Output Fields</b>            | <a href="#">Table 328 on page 4840</a> describes the output fields for the <b>show msdp statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                        |

**Table 328: show msdp statistics Output Fields**

| Field Name                              | Field Description                                                                                                           |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Global active source limit exceeded     | Number of times all peers have exceeded configured active source limits.                                                    |
| Global active source limit maximum      | Configured number of active source messages accepted by the device.                                                         |
| Global active source limit threshold    | Configured threshold for applying random early discard (RED) to drop some but not all MSDP active source messages.          |
| Global active source limit log-warning  | Threshold at which a warning message is logged (percentage of the number of active source messages accepted by the device). |
| Global active source limit log interval | Time (in seconds) between consecutive log messages.                                                                         |
| Peer                                    | Address of peer.                                                                                                            |

Table 328: show msdp statistics Output Fields (*continued*)

| Field Name                          | Field Description                                                                                                                                   |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Last State Change                   | How long ago the peer state changed.                                                                                                                |
| Last message received from the peer | How long ago the last message was received from the peer.                                                                                           |
| RPF Failures                        | Number of reverse path forwarding (RPF) failures.                                                                                                   |
| Remote Closes                       | Number of times the remote peer closed.                                                                                                             |
| Peer Timeouts                       | Number of peer timeouts.                                                                                                                            |
| SA messages sent                    | Number of source-active messages sent.                                                                                                              |
| SA messages received                | Number of source-active messages received.                                                                                                          |
| SA request messages sent            | Number of source-active request messages sent.                                                                                                      |
| SA request messages received        | Number of source-active request messages received.                                                                                                  |
| SA response messages sent           | Number of source-active response messages sent.                                                                                                     |
| SA response messages received       | Number of source-active response messages received.                                                                                                 |
| Active source exceeded              | Number of times this peer has exceeded configured source-active limits.                                                                             |
| Active source Maximum               | Configured number of active source messages accepted by this peer.                                                                                  |
| Active source threshold             | Configured threshold on this peer for applying random early discard (RED) to drop some but not all MSDP active source messages.                     |
| Active source log-warning           | Configured threshold on this peer at which a warning message is logged (percentage of the number of active source messages accepted by the device). |
| Active source log-interval          | Time (in seconds) between consecutive log messages on this peer.                                                                                    |
| Keepalive messages sent             | Number of keepalive messages sent.                                                                                                                  |
| Keepalive messages received         | Number of keepalive messages received.                                                                                                              |
| Unknown messages received           | Number of unknown messages received.                                                                                                                |

Table 328: show msdp statistics Output Fields (*continued*)

| Field Name              | Field Description                  |
|-------------------------|------------------------------------|
| Error messages received | Number of error messages received. |

## Sample Output

### show msdp statistics

```

user@host> show msdp statistics
Global active source limit exceeded: 0
Global active source limit maximum: 10
Global active source limit threshold: 8
Global active source limit log-warning: 60
Global active source limit log interval: 60

Peer: 10.255.245.39
Last State Change: 11:54:49 (00:24:59)

Output fields are listed in the approximate order in which they appear.                                                                                                                                               |

Table 329: show multicast flow-map Output Fields

| Field Name           | Field Description                                         | Levels of Output |
|----------------------|-----------------------------------------------------------|------------------|
| <b>Name</b>          | Name of the flow map.                                     | All levels       |
| <b>Policy</b>        | Name of the policy associated with the flow map.          | All levels       |
| <b>Cache-timeout</b> | Cache timeout value assigned to the flow map.             | All levels       |
| <b>Bandwidth</b>     | Bandwidth setting associated with the flow map.           | All levels       |
| <b>Adaptive</b>      | Whether or not adaptive mode is enabled for the flow map. | none             |
| <b>Flow-map</b>      | Name of the flow map.                                     | <b>detail</b>    |

Table 329: show multicast flow-map Output Fields (*continued*)

| Field Name                | Field Description                                         | Levels of Output |
|---------------------------|-----------------------------------------------------------|------------------|
| <b>Adaptive Bandwidth</b> | Whether or not adaptive mode is enabled for the flow map. | <b>detail</b>    |
| <b>Redundant Sources</b>  | Redundant sources defined for the same destination group. | <b>detail</b>    |

## Sample Output

### show multicast flow-map

```

user@host> show multicast flow-map
Instance: master
Name          Policy          Cache timeout    Bandwidth Adaptive
map2          policy2         never            2000000 no
map1          policy1         60 seconds      2000000 no

```

## Sample Output

### show multicast flow-map detail

```

user@host> show multicast flow-map detail
Instance: master
Flow-map: map1
  Policy:          policy1
  Cache Timeout:   600 seconds
  Bandwidth:       2000000
  Adaptive Bandwidth: yes
  Redundant Sources: 11.11.11.11
  Redundant Sources: 11.11.11.12
  Redundant Sources: 11.11.11.13

```

**Output Fields** Table 332 on page 4851 describes the output fields for the **show multicast next-hops** command. Output fields are listed in the approximate order in which they appear.

**Table 332: show multicast next-hops Output Fields**

| Field Name                     | Field Description                                                                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Family</b>                  | Protocol family (such as <b>INET</b> ).                                                                                                                |
| <b>ID</b>                      | Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine.                                        |
| <b>Refcount</b>                | Number of cache entries that are using this next hop.                                                                                                  |
| <b>KRefcount</b>               | Kernel reference count for the next hop.                                                                                                               |
| <b>Downstream interface</b>    | Interface names associated with each multicast next-hop ID.                                                                                            |
| <b>Incoming interface list</b> | List of interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM. |

## Sample Output

### show multicast next-hops

```
user@host> show multicast next-hops
Family: INET
ID      Refcount  KRefcount Downstream interface
262142      4          2 so-1/0/0.0
262143      2          1 mt-1/1/0.49152
262148      2          1 mt-1/1/0.32769
```

### show multicast next-hops (Bidirectional PIM)

```
user@host> show multicast next-hops
Family: INET
ID      Refcount  KRefcount Downstream interface
2097151      8          4 ge-0/0/1.0

Family: INET6
ID      Refcount  KRefcount Downstream interface
2097157      2          1 ge-0/0/1.0

Family: Incoming interface list
ID      Refcount  KRefcount Downstream interface
513      5          2 lo0.0
           ge-0/0/1.0
514      5          2 lo0.0
           ge-0/0/1.0
           xe-4/1/0.0
515      3          1 lo0.0
           ge-0/0/1.0
           xe-4/1/0.0
544      1          0 lo0.0
           xe-4/1/0.0
```

### show multicast next-hops brief

The output for the **show multicast next-hops brief** command is identical to that for the **show multicast next-hops** command. For sample output, see [show multicast next-hops on page 4851](#).

### show multicast next-hops detail

```
user@host> show multicast next-hops detail
Family: INET
ID          Refcount KRefCount Downstream interface
1048577      2          1 fe-0/1/2.0-(1048574)
              ge-0/2/3.0-(1048576)
```

## show multicast pim-to-igmp-proxy

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 333: show multicast pim-to-igmp-proxy Output Fields**

| Field Name         | Field Description                                                                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b>    | Routing instance. Default instance is <b>master</b> (inet.0 routing table).                                                                           |
| <b>Proxy state</b> | State of PIM-to-IGMP message translation, also known as PIM-to-IGMP proxy, on the configured upstream interfaces: <b>enabled</b> or <b>disabled</b> . |

Table 333: show multicast pim-to-igmp-proxy Output Fields (*continued*)

| Field Name            | Field Description                                                                                             |
|-----------------------|---------------------------------------------------------------------------------------------------------------|
| <i>interface-name</i> | Name of upstream interface (no more than two allowed) on which PIM-to-IGMP message translation is configured. |

---

## Sample Output

### show multicast pim-to-igmp-proxy

```
user@host> show multicast pim-to-igmp-proxy
Instance: master Proxy state: enabled
ge-0/1/0.1
ge-0/1/0.2
```

### show multicast pim-to-igmp-proxy instance

```
user@host> show multicast pim-to-igmp-proxy instance VPN-A
Instance: VPN-A Proxy state: enabled
ge-0/1/0.1
```

## show multicast pim-to-mld-proxy

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Output fields are listed in the order in which they appear.                                                                                                                                                                                                                                                                        |

**Table 334: show multicast pim-to-mld-proxy Output Fields**

| Field Name            | Field Description                                                                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Proxy state</b>    | State of PIM-to-MLD message translation, also known as PIM-to-MLD proxy, on the configured upstream interfaces: <b>enabled</b> or <b>disabled</b> . |
| <i>interface-name</i> | Name of upstream interface (no more than two allowed) on which PIM-to-MLD message translation is configured.                                        |

## Sample Output

### show multicast pim-to-mld-proxy

```
user@host> show multicast pim-to-mld-proxy
Instance: master Proxy state: enabled
ge-0/5/0.1
ge-0/5/0.2
```

### show multicast pim-to-mld-proxy instance

```
user@host> show multicast pim-to-mld-proxy instance VPN-A
Instance: VPN-A Proxy state: enabled
ge-0/5/0.1
```

## show multicast route

**List of Syntax** [Syntax on page 4857](#)  
[Syntax \(EX Series Switch and the QFX Series\) on page 4857](#)

**Syntax** show multicast route  
 <brief | detail | extensive | summary>  
 <active | all | inactive>  
 <group *group*>  
 <inet | inet6>  
 <instance *instance name*>  
 <logical-system (all | *logical-system-name*)>  
 <*regular-expression*>  
 <source-prefix *source-prefix*>

**Syntax (EX Series Switch and the QFX Series)** show multicast route  
 <brief | detail | extensive | summary>  
 <active | all | inactive>  
 <group *group*>  
 <inet | inet6>  
 <instance *instance name*>  
 <*regular-expression*>  
 <source-prefix *source-prefix*>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.3 for the QFX Series.  
 Support for bidirectional PIM added in Junos OS Release 12.1.

**Description** Display the entries in the IP multicast forwarding table. You can display similar information with the **show route table inet.1** command.

**Options** **none**—Display standard information about all entries in the multicast forwarding table for all routing instances.

**brief | detail | extensive | summary**—(Optional) Display the specified level of output.

**active | all | inactive**—(Optional) Display all active entries, all entries, or all inactive entries, respectively, in the multicast forwarding table.

**group *group***—(Optional) Display the cache entries for a particular group.

**inet | inet6**—(Optional) Display multicast forwarding table entries for IPv4 or IPv6 family addresses, respectively.

**instance *instance-name***—(Optional) Display entries in the multicast forwarding table for a specific multicast instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**regular-expression**—(Optional) Display information about the multicast forwarding table entries that match a UNIX OS-style regular expression.

**source-prefix *source-prefix***—(Optional) Display the cache entries for a particular source prefix.

**Required Privilege Level** view

**Output Fields** [Table 335 on page 4858](#) describes the output fields for the **show multicast route** command. Output fields are listed in the approximate order in which they appear.

**Table 335: show multicast route Output Fields**

| Field Name                    | Field Description                                                                                                                                                                               | Level of Output  |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| family                        | IPv4 address family ( <b>INET</b> ) or IPv6 address family ( <b>INET6</b> ).                                                                                                                    | All levels       |
| Group                         | Group address.<br><br>For any-source multicast routes, for example for bidirectional PIM, the group address includes the prefix length.                                                         | All levels       |
| Source                        | Prefix and length of the source as it is in the multicast forwarding table.                                                                                                                     | All levels       |
| Incoming interface list       | List of interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.                                          | All levels       |
| Upstream interface            | Name of the interface on which the packet with this source prefix is expected to arrive.                                                                                                        | All levels       |
| Upstream rpf interface list   | When multicast-only fast reroute (MoFRR) is enabled, a PIM router propagates join messages on two upstream RPF interfaces to receive multicast traffic on both links for the same join request. | All levels       |
| Downstream interface list     | List of interface names to which the packet with this source prefix is forwarded.                                                                                                               | All levels       |
| Number of outgoing interfaces | Total number of outgoing interfaces for each (S,G) entry.                                                                                                                                       | <b>extensive</b> |

Table 335: show multicast route Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output   |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| Session description                    | Name of the multicast session.                                                                                                                                                                                                                                                                                                                                                                                                        | detail extensive  |
| Statistics                             | Rate at which packets are being forwarded for this source and group entry (in Kbps and pps), and number of packets that have been forwarded to this prefix. If one or more of the kilobits per second packet forwarding statistic queries fails or times out, the statistics field displays <b>Forwarding statistics are not available</b> .<br><br><b>NOTE:</b> On QFX Series switches, this field does not report valid statistics. | detail extensive  |
| Next-hop ID                            | Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine and is also displayed in the output of the <b>show multicast nexthops</b> command.                                                                                                                                                                                                                                     | detail extensive  |
| Incoming interface list ID             | For bidirectional PIM, incoming interface list identifier.<br><br>Identifiers for interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.                                                                                                                                                                                                      | detail extensive  |
| Upstream protocol                      | The protocol that maintains the active multicast forwarding route for this group or source.<br><br>When the <b>show multicast route extensive</b> command is used with the <b>display-origin-protocol</b> option, the field name is only <b>Protocol</b> and not <b>Upstream Protocol</b> . However, this field also displays the protocol that installed the active route.                                                           | detail extensive  |
| Route type                             | Type of multicast route. Values can be (S,G) or (*G).                                                                                                                                                                                                                                                                                                                                                                                 | summary           |
| Route state                            | Whether the group is <b>Active</b> or <b>Inactive</b> .                                                                                                                                                                                                                                                                                                                                                                               | summary extensive |
| Route count                            | Number of multicast routes.                                                                                                                                                                                                                                                                                                                                                                                                           | summary           |
| Forwarding state                       | Whether the prefix is pruned or forwarding.                                                                                                                                                                                                                                                                                                                                                                                           | extensive         |
| Cache lifetime/timeout                 | Number of seconds until the prefix is removed from the multicast forwarding table. A value of <b>never</b> indicates a permanent forwarding entry. A value of <b>forever</b> indicates routes that do not have keepalive times.                                                                                                                                                                                                       | extensive         |
| Wrong incoming interface notifications | Number of times that the upstream interface was not available.                                                                                                                                                                                                                                                                                                                                                                        | extensive         |
| Uptime                                 | Time since the creation of a multicast route.                                                                                                                                                                                                                                                                                                                                                                                         | extensive         |

## Sample Output

### show multicast route

```
user@host> show multicast route

#### show multicast route brief

The output for the **show multicast route brief** command is identical to that for the **show multicast route** command. For sample output, see [show multicast route on page 4859](#) or [show multicast route \(Bidirectional PIM\) on page 4860](#).

**show multicast route detail**

```

user@host> show multicast route detail

**Output Fields** Table 336 on page 4865 describes the output fields for the **show multicast rpf** command. Output fields are listed in the approximate order in which they appear.

**Table 336: show multicast rpf Output Fields**

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b>      | Name of the routing instance. (Displayed when multicast is configured within a routing instance.)                                                                                                                                                                                                                                                                                                             |
| <b>Source prefix</b> | Prefix and length of the source as it exists in the multicast forwarding table.                                                                                                                                                                                                                                                                                                                               |
| <b>Protocol</b>      | How the route was learned.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Interface</b>     | Upstream RPF interface.<br><br><b>NOTE:</b> The displayed interface information does not apply to bidirectional PIM RP addresses. This is because the <b>show multicast rpf</b> command does not take into account equal-cost paths or the designated forwarder. For accurate upstream RPF interface information, always use the <b>show pim join extensive</b> command when bidirectional PIM is configured. |
| <b>Neighbor</b>      | Upstream RPF neighbor.<br><br><b>NOTE:</b> The displayed neighbor information does not apply to bidirectional PIM. This is because the <b>show multicast rpf</b> command does not take into account equal-cost paths or the designated forwarder. For accurate upstream RPF neighbor information, always use the <b>show pim join extensive</b> command when bidirectional PIM is configured.                 |

## Sample Output

### show multicast rpf

```

user@host> show multicast rpf

Multicast RPF table: inet.0, 12 entries

**Table 337: show multicast scope Output Fields**

| Field Name   | Field Description                                           |
|--------------|-------------------------------------------------------------|
| Scope name   | Name of the multicast scope.                                |
| Group Prefix | Range of multicast groups that are scoped.                  |
| Interface    | Interface that is the boundary of the administrative scope. |

Table 337: show multicast scope Output Fields (*continued*)

| Field Name      | Field Description                 |
|-----------------|-----------------------------------|
| Resolve Rejects | Number of kernel resolve rejects. |

## Sample Output

### show multicast scope

```
user@host> show multicast scope
```

| Scope name | Group Prefix   | Interface  | Resolve Rejects |
|------------|----------------|------------|-----------------|
| 232-net    | 232.232.0.0/16 | fe-0/0/0.1 | 0               |
| local      | 239.255.0.0/16 | fe-0/0/0.1 | 0               |
| local      | ff05::/16      | fe-0/0/0.1 | 0               |
| larry      | ff05::1234/128 | fe-0/0/0.1 | 0               |

### show multicast scope inet

```
user@host> show multicast scope inet
```

| Scope name | Group Prefix   | Interface  | Resolve Rejects |
|------------|----------------|------------|-----------------|
| 232-net    | 232.232.0.0/16 | fe-0/0/0.1 | 0               |
| local      | 239.255.0.0/16 | fe-0/0/0.1 | 0               |

### show multicast scope inet6

```
user@host> show multicast scope inet6
```

| Scope name | Group Prefix   | Interface  | Resolve Rejects |
|------------|----------------|------------|-----------------|

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Table 339: show multicast usage Output Fields

| Field Name      | Field Description                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b> | Name of the routing instance. (Displayed when multicast is configured within a routing instance.)                                                                                        |
| <b>Group</b>    | Group address.                                                                                                                                                                           |
| <b>Sources</b>  | Number of sources.                                                                                                                                                                       |
| <b>Packets</b>  | Number of packets that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the packets field displays <b>unavailable</b> . |
| <b>Bytes</b>    | Number of bytes that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the bytes field displays <b>unavailable</b> .     |
| <b>Prefix</b>   | IP address.                                                                                                                                                                              |
| <b>/len</b>     | Prefix length.                                                                                                                                                                           |
| <b>Groups</b>   | Number of multicast groups.                                                                                                                                                              |

## Sample Output

### show multicast usage

```

user@host> show multicast usage
Group          Sources  Packets      Bytes
228.0.0.0      1        52847      4439148
239.1.1.1      2        13450      1125530

Prefix         /len  Groups  Packets      Bytes
10.255.14.144  /32   2        66254      5561304
10.255.70.15   /32   1         43        3374...
```

### show multicast usage brief

The output for the **show multicast usage brief** command is identical to that for the **show multicast usage** command. For sample output, see [show multicast usage on page 4874](#).

### show multicast usage instance

```

user@host> show multicast usage instance VPN-A
Group          Sources  Packets      Bytes
224.2.127.254  1        5538      509496
224.0.1.39     1         13         624
224.0.1.40     1         13         624

Prefix         /len  Groups  Packets      Bytes
192.168.195.34 /32   1        5538      509496
10.255.14.30   /32   1         13         624
```

```
10.255.245.91 /32 1 13 624
...
```

### show multicast usage detail

```
user@host> show multicast usage detail
Group          Sources Packets          Bytes
228.0.0.0      1          53159          4465356
  Source: 10.255.14.144 /32 Packets: 53159 Bytes: 4465356

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                       |

**Table 340: show pim bootstrap Output Fields**

| Field Name           | Field Description                                                            |
|----------------------|------------------------------------------------------------------------------|
| <b>Instance</b>      | Name of the routing instance.                                                |
| <b>BSR</b>           | Bootstrap router.                                                            |
| <b>Pri</b>           | Priority of the routing device as elected to be the bootstrap router.        |
| <b>Local address</b> | Local routing device address.                                                |
| <b>Pri</b>           | Local routing device address priority to be elected as the bootstrap router. |

Table 340: show pim bootstrap Output Fields (*continued*)

| Field Name     | Field Description                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------|
| <b>State</b>   | Local routing device election state: <b>Candidate</b> , <b>Elected</b> , or <b>Ineligible</b> .      |
| <b>Timeout</b> | How long until the local routing device declares the bootstrap router to be unreachable, in seconds. |

## Sample Output

### show pim bootstrap

```
user@host> show pim bootstrap
Instance: PIM.master
```

| BSR                     | Pri | Local address           | Pri | State      | Timeout |
|-------------------------|-----|-------------------------|-----|------------|---------|
| None                    | 0   | 10.255.71.46            | 0   | InEligible | 0       |
| feco:1:1:1:1:0:aff:785c | 34  | feco:1:1:1:1:0:aff:7c12 | 0   | InEligible | 0       |

### show pim bootstrap instance

```
user@host> show pim bootstrap instance VPN-A
Instance: PIM.VPN-A
```

| BSR  | Pri | Local address   | Pri | State      | Timeout |
|------|-----|-----------------|-----|------------|---------|
| None | 0   | 192.168.196.105 | 0   | InEligible | 0       |

## show pim interfaces

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|-----------------|--------------------------------------------------------------------------------------------|
| <b>Instance</b> | Name of the routing instance.                                                              |
| <b>Name</b>     | Interface name.                                                                            |
| <b>State</b>    | State of the interface. The state also is displayed in the <b>show interfaces</b> command. |

Table 341: show pim interfaces Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mode</b>         | <p>PIM mode running on the interface:</p> <ul style="list-style-type: none"> <li>• <b>B</b>—In bidirectional mode, multicast groups are carried across the network over bidirectional shared trees. This type of tree minimizes PIM routing state, which is especially important in networks with numerous and dispersed senders and receivers.</li> <li>• <b>S</b>—In sparse mode, routing devices must join and leave multicast groups explicitly. Upstream routing devices do not forward multicast traffic to this routing device unless this device has sent an explicit request (using a join message) to receive multicast traffic.</li> <li>• <b>Dense</b>—Unlike sparse mode, where data is forwarded only to routing devices sending an explicit request, dense mode implements a flood-and-prune mechanism, similar to DVMRP (the first multicast protocol used to support the multicast backbone). (Not supported on QFX Series.)</li> <li>• <b>Sparse-Dense</b>—Sparse-dense mode allows the interface to operate on a per-group basis in either sparse or dense mode. A group specified as <b>dense</b> is not mapped to a rendezvous point (RP). Instead, data packets destined for that group are forwarded using PIM-Dense Mode (PIM-DM) rules. A group specified as <b>sparse</b> is mapped to an RP, and data packets are forwarded using PIM-Sparse Mode (PIM-SM) rules.</li> </ul> <p>When sparse-dense mode is configured, the output includes both <b>S</b> and <b>D</b>. When bidirectional-sparse mode is configured, the output includes <b>S</b> and <b>B</b>. When bidirectional-sparse-dense mode is configured, the output includes <b>B</b>, <b>S</b>, and <b>D</b>.</p> |
| <b>IP</b>           | Version number of the address family on the interface: <b>4</b> (IPv4) or <b>6</b> (IPv6).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>V</b>            | PIM version running on the interface: 1 or 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>State</b>        | <p>State of PIM on the interface:</p> <ul style="list-style-type: none"> <li>• <b>Active</b>—Bidirectional mode is enabled on the interface and on all PIM neighbors.</li> <li>• <b>DR</b>—Designated router.</li> <li>• <b>NotCap</b>—Bidirectional mode is not enabled on the interface. This can happen when bidirectional PIM is not configured locally, when one of the neighbors is not configured for bidirectional PIM, or when one of the neighbors has not implemented the bidirectional PIM protocol.</li> <li>• <b>NotDR</b>—Not the designated router.</li> <li>• <b>P2P</b>—Point to point.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
**summary** option introduced in Junos OS Release 9.6.  
**inet6** and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.  
 Support for bidirectional PIM added in Junos OS Release 12.1.  
 Command introduced in Junos OS Release 11.3 for the QFX Series.  
 Multiple new filter options introduced in Junos OS Release 13.2.

**Description** Display information about Protocol Independent Multicast (PIM) groups for all PIM modes.

For bidirectional PIM, display information about PIM group ranges (\*G-range) for each active bidirectional RP group range, in addition to each of the joined (\*G) routes.

**Options** **none**—Display the standard information about PIM groups for all supported family addresses for all routing instances.

**brief | detail | extensive | summary**—(Optional) Display the specified level of output.

**bidirectional | dense | sparse**—(Optional) Display information about PIM bidirectional mode, dense mode, or sparse and source-specific multicast (SSM) mode entries.

**exact**—(Optional) Display information about only the group that exactly matches the specified group address.

**inet | inet6**—(Optional) Display PIM group information for IPv4 or IPv6 family addresses, respectively.

**instance *instance-name***—(Optional) Display information about groups for the specified PIM-enabled routing instance only.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**range**—(Optional) Address range of the group, specified as *prefix/prefix-length*.

**rp *ip-address/prefix* | source *ip-address/prefix***—(Optional) Display information about the PIM entries with a specified rendezvous point (RP) address and prefix or with a specified source address and prefix. You can omit the prefix.

**sg | star-g**—(Optional) Display information about PIM (S,G) or (\*,G) entries.

**Required Privilege Level**

| <b>Upstream neighbor</b>        | <p>Information about the upstream neighbor: <b>Direct</b>, <b>Local</b>, <b>Unknown</b>, or a specific IP address.</p> <p>For bidirectional PIM, <b>Direct</b> means that the interface is directly connected to a subnet that contains a phantom RP address.</p> <p>The multipoint LDP (M-LDP) root appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>extensive</b> |
| Active upstream interface       | When multicast-only fast reroute (MoFRR) is configured in a PIM domain, the upstream interface for the active path. A PIM router propagates join messages on two upstream RPF interfaces to receive multicast traffic on both links for the same join request. Preference is given to two paths that do not converge to the same immediate upstream router. PIM installs appropriate multicast routes with upstream neighbors as RPF next hops with two (primary and backup) interfaces.                                                                                                                                                                                                                                                                                                                                                                                        | <b>extensive</b> |
| Active upstream neighbor        | On the MoFRR primary path, the IP address of the neighbor that is directly connected to the active upstream interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>extensive</b> |
| MoFRR Backup upstream interface | <p>The MoFRR upstream interface that is used when the primary path fails.</p> <p>When the primary path fails, the backup path is upgraded to primary, and traffic is forwarded accordingly. If there are alternate paths available, a new backup path is calculated and the appropriate multicast route is updated or installed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>extensive</b> |
| <b>Upstream state</b>           | <p>Information about the upstream interface:</p> <ul style="list-style-type: none"> <li>• <b>Join to RP</b>—Sending a join to the rendezvous point.</li> <li>• <b>Join to Source</b>—Sending a join to the source.</li> <li>• <b>Local RP</b>—Sending neither join messages nor prune messages toward the RP, because this routing device is the rendezvous point.</li> <li>• <b>Local Source</b>—Sending neither join messages nor prune messages toward the source, because the source is locally attached to this routing device.</li> <li>• <b>Prune to RP</b>—Sending a prune to the rendezvous point.</li> <li>• <b>Prune to Source</b>—Sending a prune to the source.</li> </ul> <p><b>NOTE:</b> RP group range entries have <b>None</b> in the <b>Upstream state</b> field because RP group ranges do not trigger actual PIM join messages between routing devices.</p> | <b>extensive</b> |

| <b>Interface</b>                                 | Interface through which the neighbor is reachable.                                                                                                                                                                                                                                                             | All levels        |
| <b>Neighbor addr</b>                             | Address of the neighboring PIM routing device.                                                                                                                                                                                                                                                                 | All levels        |
| <b>IP</b>                                        | IP version: 4 or 6.                                                                                                                                                                                                                                                                                            | All levels        |
| <b>V</b>                                         | PIM version running on the neighbor: 1 or 2.                                                                                                                                                                                                                                                                   | All levels        |
| <b>Mode</b>                                      | PIM mode of the neighbor: <b>Sparse</b> , <b>Dense</b> , <b>SparseDense</b> , or <b>Unknown</b> . When the neighbor is running PIM version 2, this mode is always <b>Unknown</b> .                                                                                                                             | All levels        |
| <b>Option</b>                                    | Can be one or more of the following: <ul style="list-style-type: none"> <li>• <b>B</b>—Bidirectional Capable.</li> <li>• <b>H</b>—Hello Option Holdtime.</li> <li>• <b>G</b>—Generation Identifier.</li> <li>• <b>P</b>—Hello Option DR Priority.</li> <li>• <b>L</b>—Hello Option LAN Prune Delay.</li> </ul> | <b>brief</b> none |
| <b>Uptime</b>                                    | Time the neighbor has been operational since the PIM process was last initialized, in the format <b>dd:hh:mm:ss ago</b> for less than a week and <b>nwnd:hh:mm:ss ago</b> for more than a week.                                                                                                                | All levels        |
| <b>Address</b>                                   | Address of the neighboring PIM routing device.                                                                                                                                                                                                                                                                 | <b>detail</b>     |
| <b>BFD</b>                                       | Status and operational state of the Bidirectional Forwarding Detection (BFD) protocol on the interface: <b>Enabled</b> , <b>Operational state is up</b> , or <b>Disabled</b> .                                                                                                                                 | <b>detail</b>     |
| <b>Hello Option Holdtime</b>                     | Time for which the neighbor is available, in seconds. The range of values is 0 through 65,535.                                                                                                                                                                                                                 | <b>detail</b>     |
| <b>Hello Default Holdtime</b>                    | Default holdtime and the time remaining if the <b>holdtime</b> option is not in the received hello message.                                                                                                                                                                                                    | <b>detail</b>     |
| <b>Hello Option DR Priority</b>                  | Designated router election priority. The range of values is 0 through 255.                                                                                                                                                                                                                                     | <b>detail</b>     |
| <b>Hello Option Generation ID</b>                | 9-digit or 10-digit number used to tag hello messages.                                                                                                                                                                                                                                                         | <b>detail</b>     |
| <b>Hello Option Bi-Directional PIM supported</b> | Neighbor can process bidirectional PIM messages.                                                                                                                                                                                                                                                               | <b>detail</b>     |
| <b>Hello Option LAN Prune Delay</b>              | Time to wait before the neighbor receives prune messages, in the format <b>delay nnn ms override nnnn ms</b> .                                                                                                                                                                                                 | <b>detail</b>     |

Table 343: show pim neighbors Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                   | Level of Output |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Join Suppression supported | Neighbor is capable of join suppression.                                                                                                                                                                                                                                            | detail          |
| Rx Join                    | Information about joins received from the neighbor. <ul style="list-style-type: none"> <li><b>Group</b>—Group addresses in the join message.</li> <li><b>Source</b>—Address of the source in the join message.</li> <li><b>Timeout</b>—Time for which the join is valid.</li> </ul> | detail          |

## Sample Output

### show pim neighbors

```

user@host> show pim neighbors
Instance: PIM.master
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority

Interface      IP V Mode      Option      Uptime Neighbor addr
so-1/0/0.0      4 2            HPLG        00:07:10 10.111.10.2

```

### show pim neighbors brief

The output for the **show pim neighbors brief** command is identical to that for the **show pim neighbors** command. For sample output, see [show pim neighbors on page 4897](#).

### show pim neighbors instance

```

user@host> show pim neighbors instance VPN-A
Instance: PIM.VPN-A
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority

Interface      IP V Mode      Option      Uptime Neighbor addr
at-0/3/1.0      4 2            HPLG        00:07:54 10.111.30.2
mt-1/1/0.32768  4 2            HPLG        00:07:22 10.10.47.101
so-1/0/1.0      4 2            HPLG        00:07:50 10.111.20.2

```

### show pim neighbors detail

```

user@host> show pim neighbors detail
Instance: PIM.master
Interface: ge-0/0/1.0

Address: 10.10.1.1, IPv4, PIM v2, Mode: SparseDense, sg Join Count: 0, tsf
Join Count: 2
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 1
Hello Option Generation ID: 2053759302
Hello Option Bi-Directional PIM supported
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported

```

```
Address: 10.10.1.2, IPv4, PIM v2, sg Join Count: 0, tsg Join Count: 2
  BFD: Disabled
  Hello Option Holdtime: 105 seconds 93 remaining
  Hello Option DR Priority: 1
  Hello Option Generation ID: 1734018161
  Hello Option Bi-Directional PIM supported
  Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
                                Join Suppression supported
```

Interface: lo0.0

```
Address: 10.255.179.246, IPv4, PIM v2, Mode: SparseDense, sg Join Count:
0, tsg Join Count: 0
  Hello Option Holdtime: 65535 seconds
  Hello Option DR Priority: 1
  Hello Option Generation ID: 1997462267
  Hello Option Bi-Directional PIM supported
  Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
                                Join Suppression supported
```

#### show pim neighbors detail (With BFD)

```
user@host> show pim neighbors detail
```

Instance: PIM.master

Interface: fe-1/0/0.0

```
Address: 192.168.11.1, IPv4, PIM v2, Mode: Sparse
  Hello Option Holdtime: 65535 seconds
  Hello Option DR Priority: 1
  Hello Option Generation ID: 836607909
  Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
```

```
Address: 192.168.11.2, IPv4, PIM v2
  BFD: Enabled, Operational state is up
  Hello Default Holdtime: 105 seconds 104 remaining
  Hello Option DR Priority: 1
  Hello Option Generation ID: 1907549685
  Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
```

Interface: fe-1/0/1.0

```
Address: 192.168.12.1, IPv4, PIM v2
  BFD: Disabled
  Hello Default Holdtime: 105 seconds 80 remaining
  Hello Option DR Priority: 1
  Hello Option Generation ID: 1971554705
  Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
```

Table 344: show pim rps Output Fields (*continued*)

| Field Name                        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Level of Output      |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| <b>Anycast-PIM Register State</b> | <p>If anycast RP is configured, the current register state for each group:</p> <ul style="list-style-type: none"> <li>• <b>Group</b>—Multicast group address.</li> <li>• <b>Source</b>—Multicast source address for which the PIM register is sent or received, depending on whether this routing device is a designated router facing an RP router, or is the local RP, respectively.</li> <li>• <b>Origin</b>—How the information was obtained: <ul style="list-style-type: none"> <li>• <b>DIRECT</b>—From a local attachment</li> <li>• <b>MSDP</b>—From the Multicast Source Discovery Protocol (MSDP)</li> <li>• <b>DR</b>—From the designated router</li> </ul> </li> </ul> | <b>extensive</b>     |
| <b>RP selected</b>                | For sparse mode and bidirectional mode, the identity of the RP for the specified group address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <i>group-address</i> |

## Sample Output

### show pim rps

```

user@host> show pim rps
Instance: PIM.master
Address family INET
RP address      Type      Mode   Holdtime Timeout Groups  Group prefixes
10.10.1.3       static   bidir   150     None     2  224.1.3.0/24
                225.1.3.0/24
10.10.13.2      static   bidir   150     None     2  224.1.1.0/24
                225.1.1.0/24

```

### show pim rps brief

The output for the **show pim rps brief** command is identical to that for the **show pim rps** command. For sample output, see [show pim rps on page 4902](#).

### show pim rps <group-address> (Bidirectional PIM)

```

user@host> show pim rps 224.1.1.1
Instance: PIM.master

224.1.0.0/16
  11.4.12.75 (Bidirectional)

RP selected: 11.4.12.75

```

### show pim rps <group-address> (PIM Dense Mode)

```

user@host> show pim rps 224.1.1.1
Instance: PIM.master

Dense Mode active for group 224.1.1.1

```

### show pim rps <group-address> (SSM Range Without asm-override-ssm Configured)

```

user@host> show pim rps 224.1.1.1

```

Instance: PIM.master

Source-specific Mode (SSM) active for group 224.1.1.1

#### show pim rps <group-address> (SSM Range With asm-override-ssm Configured and a Sparse-Mode RP)

user@host> show pim rps 224.1.1.1

Instance: PIM.master

Source-specific Mode (SSM) active with Sparse Mode ASM override for group 224.1.1.1

224.1.0.0/16  
11.4.12.75

RP selected: 11.4.12.75

#### show pim rps <group-address> (SSM Range With asm-override-ssm Configured and a Bidirectional RP)

user@host> show pim rps 224.1.1.1

Instance: PIM.master

Source-specific Mode (SSM) active with Sparse Mode ASM override for group 224.1.1.1

224.1.0.0/16  
11.4.12.75 (Bidirectional)

RP selected: (null)

#### show pim rps instance

user@host> show pim rps instance VPN-A

Instance: PIM.VPN-A

Address family INET

| RP address   | Type   | Holdtime | Timeout | Groups | Group prefixes |
|--------------|--------|----------|---------|--------|----------------|
| 10.10.47.100 | static | 0        | None    | 1      | 224.0.0.0/4    |

Address family INET6

#### show pim rps extensive (PIM Sparse Mode)

user@host> show pim rps extensive

Instance: PIM.master

Family: INET

RP: 10.255.245.91

Learned via: static configuration

| <b>Output Fields</b>                                | <a href="#">Table 345 on page 4907</a> describes the output fields for the <b>show pim source</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 345: show pim source Output Fields

| Field Name                | Field Description                                                                                                                                                                     |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b>           | Name of the routing instance.                                                                                                                                                         |
| <b>Source</b>             | Address of the source or reverse path.                                                                                                                                                |
| <b>Prefix/length</b>      | Prefix and prefix length for the route used to reach the RPF address.                                                                                                                 |
| <b>Upstream Protocol</b>  | Protocol toward the source address.                                                                                                                                                   |
| <b>Upstream interface</b> | RPF interface toward the source address.<br><br>A pseudo multipoint LDP (M-LDP) interface appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.            |
| <b>Upstream Neighbor</b>  | Address of the RPF neighbor used to reach the source address.<br><br>The multipoint LDP (M-LDP) root appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling. |

## Sample Output

### show pim source

```

user@host> show pim source
Instance: PIM.master Family: INET

Source 10.255.14.144
  Prefix 10.255.14.144/32
  Upstream interface Local
  Upstream neighbor Local

Source 10.255.70.15
  Prefix 10.255.70.15/32
  Upstream interface so-1/0/0.0
  Upstream neighbor 10.111.10.2

Instance: PIM.master Family: INET6

```

### show pim source brief

The output for the **show pim source brief** command is identical to that for the **show pim source** command. For sample output, see [show pim source on page 4907](#).

### show pim source detail

```

user@host> show pim source detail
Instance: PIM.master Family: INET

Source 10.255.14.144
  Prefix 10.255.14.144/32
  Upstream interface Local
  Upstream neighbor Local
  Active groups:228.0.0.0
  239.1.1.1

```

239.1.1.1

Source 10.255.70.15  
Prefix 10.255.70.15/32  
Upstream interface so-1/0/0.0  
Upstream neighbor 10.111.10.2  
Active groups:239.1.1.1

Instance: PIM.master Family: INET6

#### show pim source (Egress Node with Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs)

user@host> show pim source

Instance: PIM.master Family: INET

Source 1.1.1.1  
Prefix 1.1.1.1/32  
Upstream interface Local  
Upstream neighbor Local

Source 1.2.7.7  
Prefix 1.2.7.0/24  
Upstream protocol MLDP  
Upstream interface Pseudo MLDP  
Upstream neighbor MLDP LSP root <1.1.1.2>

Source 192.168.219.11  
Prefix 192.168.219.0/28  
Upstream protocol MLDP  
Upstream interface Pseudo MLDP  
Upstream neighbor MLDP LSP root <1.1.1.2>

Instance: PIM.master Family: INET6

Source abcd::1:2:7:7  
Prefix abcd::1:2:7:0/120  
Upstream protocol MLDP  
Upstream interface Pseudo MLDP  
Upstream neighbor MLDP LSP root <1.1.1.2>

| PIM statistics   | PIM statistics for all interfaces or for the specified interface.                                                                                                                                                                                                                                                                                                                                                       |
| PIM message type | Message type for which statistics are displayed.                                                                                                                                                                                                                                                                                                                                                                        |
| Received         | Number of received statistics.                                                                                                                                                                                                                                                                                                                                                                                          |
| Sent             | Number of messages sent of a certain type.                                                                                                                                                                                                                                                                                                                                                                              |
| Rx errors        | Number of received packets that contained errors.                                                                                                                                                                                                                                                                                                                                                                       |
| V2 Hello         | PIM version 2 hello packets.                                                                                                                                                                                                                                                                                                                                                                                            |
| V2 Register      | PIM version 2 register packets.                                                                                                                                                                                                                                                                                                                                                                                         |
| V2 Register Stop | PIM version 2 register stop packets.                                                                                                                                                                                                                                                                                                                                                                                    |
| V2 Join Prune    | PIM version 2 join and prune packets.                                                                                                                                                                                                                                                                                                                                                                                   |
| V2 Bootstrap     | PIM version 2 bootstrap packets.                                                                                                                                                                                                                                                                                                                                                                                        |
| V2 Assert        | PIM version 2 assert packets.                                                                                                                                                                                                                                                                                                                                                                                           |
| V2 Graft         | PIM version 2 graft packets.                                                                                                                                                                                                                                                                                                                                                                                            |
| V2 Graft Ack     | PIM version 2 graft acknowledgment packets.                                                                                                                                                                                                                                                                                                                                                                             |
| V2 Candidate RP  | PIM version 2 candidate RP packets.                                                                                                                                                                                                                                                                                                                                                                                     |
| V2 State Refresh | <p>PIM version 2 control messages related to PIM dense mode (PIM-DM) state refresh.</p> <p>State refresh is an extension to PIM-DM. It not supported in Junos OS.</p>                                                                                                                                                                                                                                                   |

Table 346: show pim statistics Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                   |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------|
| V2 DF Election                   | PIM version 2 send and receive messages associated with bidirectional PIM designated forwarder election.            |
| V1 Query                         | PIM version 1 query packets.                                                                                        |
| V1 Register                      | PIM version 1 register packets.                                                                                     |
| V1 Register Stop                 | PIM version 1 register stop packets.                                                                                |
| V1 Join Prune                    | PIM version 1 join and prune packets.                                                                               |
| V1 RP Reachability               | PIM version 1 RP reachability packets.                                                                              |
| V1 Assert                        | PIM version 1 assert packets.                                                                                       |
| V1 Graft                         | PIM version 1 graft packets.                                                                                        |
| V1 Graft Ack                     | PIM version 1 graft acknowledgment packets.                                                                         |
| AutoRP Announce                  | Auto-RP announce packets.                                                                                           |
| AutoRP Mapping                   | Auto-RP mapping packets.                                                                                            |
| AutoRP Unknown type              | Auto-RP packets with an unknown type.                                                                               |
| Anycast Register                 | Auto-RP announce packets.                                                                                           |
| Anycast Register Stop            | Auto-RP announce packets.                                                                                           |
| Global Statistics                | Summary of PIM statistics for all interfaces.                                                                       |
| Hello dropped on neighbor policy | Number of hello packets dropped because of a configured neighbor policy.                                            |
| Unknown type                     | Number of PIM control packets received with an unknown type.                                                        |
| V1 Unknown type                  | Number of PIM version 1 control packets received with an unknown type.                                              |
| Unknown Version                  | Number of PIM control packets received with an unknown version. The version is not version 1 or version 2.          |
| Neighbor unknown                 | Number of PIM control packets received (excluding PIM hello) without first receiving the hello packet.              |
| Bad Length                       | Number of PIM control packets received for which the packet size does not match the PIM length field in the packet. |

Table 346: show pim statistics Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                         |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Bad Checksum                    | Number of PIM control packets received for which the calculated checksum does not match the checksum field in the packet. |
| Bad Receive If                  | Number of PIM control packets received on an interface that does not have PIM configured.                                 |
| Rx Bad Data                     | Number of PIM control packets received that contain data for TCP Bad register packets.                                    |
| Rx Intf disabled                | Number of PIM control packets received on an interface that has PIM disabled.                                             |
| Rx V1 Require V2                | Number of PIM version 1 control packets received on an interface configured for PIM version 2.                            |
| Rx V2 Require V1                | Number of PIM version 2 control packets received on an interface configured for PIM version 1.                            |
| Rx Register not RP              | Number of PIM register packets received when the routing device is not the RP for the group.                              |
| Rx Register no route            | Number of PIM register packets received when the RP does not have a unicast route back to the source.                     |
| Rx Register no decap if         | Number of PIM register packets received when the RP does not have a de-encapsulation interface.                           |
| Null Register Timeout           | Number of NULL register timeout packets.                                                                                  |
| RP Filtered Source              | Number of PIM packets received when the routing device has a source address filter configured for the RP.                 |
| Rx Unknown Reg Stop             | Number of register stop messages received with an unknown type.                                                           |
| Rx Join/Prune no state          | Number of join and prune messages received for which the routing device has no state.                                     |
| Rx Join/Prune on upstream if    | Number of join and prune messages received on the interface used to reach the upstream routing device, toward the RP.     |
| Rx Join/Prune for invalid group | Number of join or prune messages received for invalid multicast group addresses.                                          |
| Rx Join/Prune messages dropped  | Number of join and prune messages received and dropped.                                                                   |
| Rx sparse join for dense group  | Number of PIM sparse mode join messages received for a group that is configured for dense mode.                           |

Table 346: show pim statistics Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                           |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rx Graft/Graft Ack no state | Number of graft and graft acknowledgment messages received for which the router or switch has no state.                                                                     |
| Rx Graft on upstream if     | Number of graft messages received on the interface used to reach the upstream routing device, toward the RP.                                                                |
| Rx CRP not BSR              | Number of BSR messages received in which the PIM message type is Candidate-RP-Advertisement, not Bootstrap.                                                                 |
| Rx BSR when BSR             | Number of BSR messages received in which the PIM message type is Bootstrap.                                                                                                 |
| Rx BSR not RPF if           | Number of BSR messages received on an interface that is not the RPF interface.                                                                                              |
| Rx unknown hello opt        | Number of PIM hello packets received with options that Junos OS does not support.                                                                                           |
| Rx data no state            | Number of PIM control packets received for which the routing device has no state for the data type.                                                                         |
| Rx RP no state              | Number of PIM control packets received for which the routing device has no state for the RP.                                                                                |
| Rx aggregate                | Number of PIM aggregate MDT packets received.                                                                                                                               |
| Rx malformed packet         | Number of PIM control packets received with a malformed IP unicast or multicast address family.                                                                             |
| No RP                       | Number of PIM control packets received with no RP address.                                                                                                                  |
| No register encaps if       | Number of PIM register packets received when the first-hop routing device does not have an encapsulation interface.                                                         |
| No route upstream           | Number of PIM control packets received when the routing device does not have a unicast route to the the interface used to reach the upstream routing device, toward the RP. |
| Nexthop Unusable            | Number of PIM control packets with an unusable nexthop. A path can be unusable if the route is hidden or the link is down.                                                  |
| RP mismatch                 | Number of PIM control packets received for which the routing device has an RP mismatch.                                                                                     |
| RP mode mismatch            | RP mode (sparse or bidirectional) mismatches encountered when processing join and prune messages.                                                                           |
| RPF neighbor unknown        | Number of PIM control packets received for which the routing device has an unknown RPF neighbor for the source.                                                             |

Table 346: show pim statistics Output Fields (*continued*)

| Field Name                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rx Joins/Prunes filtered            | The number of join and prune messages filtered because of configured route filters and source address filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Tx Joins/Prunes filtered            | The number of join and prune messages filtered because of configured route filters and source address filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Embedded-RP invalid addr            | Number of packets received with an invalid embedded RP address in PIM join messages and other types of messages sent between routing domains.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Embedded-RP limit exceed            | Number of times the limit configured with the <b>maximum-rps</b> statement is exceeded. The <b>maximum-rps</b> statement limits the number of embedded RPs created in a specific routing instance. The range is from 1 through 500. The default is 100.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Embedded-RP added                   | <p>Number of packets in which the embedded RP for IPv6 is added.</p> <p>The following receive events trigger extraction of an IPv6 embedded RP address on the routing device:</p> <ul style="list-style-type: none"> <li>• Multicast Listener Discovery (MLD) report for an embedded RP multicast group address</li> <li>• PIM join message with an embedded RP multicast group address</li> <li>• Static embedded RP multicast group address associated with an interface</li> <li>• Packets sent to an embedded RP multicast group address received on the DR</li> </ul> <p>An embedded RP node discovered through these receive events is added if it does not already exist on the routing platform.</p> |
| Embedded-RP removed                 | Number of packets in which the embedded RP for IPv6 is removed. The embedded RP is removed whenever all PIM join states using this RP are removed or the configuration changes to remove the embedded RP feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Rx Register msgs filtering drop     | Number of received register messages dropped because of a filter configured for PIM register messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Tx Register msgs filtering drop     | Number of register messages dropped because of a filter configured for PIM register messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Rx Bidir Join/Prune on non-Bidir if | Error counter for join and prune messages received on non-bidirectional PIM interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Rx Bidir Join/Prune on non-DF if    | Error counter for join and prune messages received on non-designated forwarder interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| V4 (S,G) Maximum                    | Maximum number of (S,G) IPv4 multicast routes accepted for the VPN routing and forwarding (VRF) routing instance. If this number is met, additional (S,G) entries are not accepted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Table 346: show pim statistics Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                                                                                   |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| V4 (S,G) Accepted                | Number of accepted (S,G) IPv4 multicast routes.                                                                                                                                     |
| V4 (S,G) Threshold               | Threshold at which a warning message is logged (percentage of the maximum number of (S,G) IPv4 multicast routes accepted by the device).                                            |
| V4 (S,G) Log Interval            | Time (in seconds) between consecutive log messages.                                                                                                                                 |
| V6 (S,G) Maximum                 | Maximum number of (S,G) IPv6 multicast routes accepted for the VPN routing and forwarding (VRF) routing instance. If this number is met, additional (S,G) entries are not accepted. |
| V6 (S,G) Accepted                | Number of accepted (S,G) IPv6 multicast routes.                                                                                                                                     |
| V6 (S,G) Threshold               | Threshold at which a warning message is logged (percentage of the maximum number of (S,G) IPv6 multicast routes accepted by the device).                                            |
| V6 (S,G) Log Interval            | Time (in seconds) between consecutive log messages.                                                                                                                                 |
| V4 (grp-prefix, RP) Maximum      | Maximum number of group-to-rendezvous point (RP) IPv4 multicast mappings accepted for the VRF routing instance. If this number is met, additional mappings are not accepted.        |
| V4 (grp-prefix, RP) Accepted     | Number of accepted group-to-RP IPv4 multicast mappings.                                                                                                                             |
| V4 (grp-prefix, RP) Threshold    | Threshold at which a warning message is logged (percentage of the maximum number of group-to-RP IPv4 multicast mappings accepted by the device).                                    |
| V4 (grp-prefix, RP) Log Interval | Time (in seconds) between consecutive log messages.                                                                                                                                 |
| V6 (grp-prefix, RP) Maximum      | Maximum number of group-to RP IPv6 multicast mappings accepted for the VRF routing instance. If this number is met, additional mappings are not accepted.                           |
| V6 (grp-prefix, RP) Accepted     | Number of accepted group-to-RP IPv6 multicast mappings.                                                                                                                             |
| V6 (grp-prefix, RP) Threshold    | Threshold at which a warning message is logged (percentage of the maximum number of group-to-RP IPv6 multicast mappings accepted by the device).                                    |
| V6 (grp-prefix, RP) Log Interval | Time (in seconds) between consecutive log messages.                                                                                                                                 |

| <b>Description</b>                    | Display system-wide Internet Group Management Protocol (IGMP) statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>                        | <b>none</b> —Display system statistics for IGMP.<br><br><b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only ) (Optional) Display system statistics for IGMP for all the routers in the chassis.<br><br><b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for IGMP for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for IGMP for all connected T1600 or T4000 LCCs.<br><br><b>all-members</b> —(EX4200 switches only) (Optional) Display IGMP statistics for all members of the Virtual Chassis configuration.<br><br><b>lcc <i>number</i></b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for IGMP for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for IGMP for a specific router that is connected to the TX Matrix Plus router. Replace <i>number</i> with the following values depending on the LCC configuration: <ul style="list-style-type: none"><li>• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.</li><li>• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.</li></ul> |

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches only) (Optional) Display IGMP statistics for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches only) (Optional) Display IGMP statistics for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

**scc**—(TX Matrix routers only) (Optional) Display system statistics for IGMP for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display system statistics for IGMP for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system statistics igmp** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

## Sample Output

### show system statistics igmp

```
user@host> show system statistics igmp
igmp:
    17178 messages received
    0 messages received with too few bytes
    0 messages received with bad checksum
    0 membership queries received
    0 membership queries received with invalid field(s)
    0 membership reports received
    0 membership reports received with invalid field(s)
    0 membership reports received for groups to which we belong
    0 membership reports sent
```

### show system statistics igmp (EX Series Switches)

```
user@host> show system statistics igmp
```

```
igmp:
  0 messages received
  0 messages received with too few bytes
  0 messages received with bad checksum
  0 membership queries received
  0 membership queries received with invalid fields
  0 membership reports received
  0 membership reports received with invalid fields
  0 membership reports received for groups to which we belong
  0 Membership reports sent
```

### show system statistics igmp (TX Matrix Plus Router)

```
user@host> show system statistics igmp
sfc0-re0:
```

```
-----
igmp:
  0 messages received
  0 messages received with too few bytes
  0 messages received with bad checksum

## Overview of Firewall Filters

Firewall filters provide rules that define whether to accept or discard packets that are transiting an interface. If a packet is accepted, you can configure additional actions to perform on the packet, such as class-of-service (CoS) marking (grouping similar types of traffic together and treating each type of traffic as a class with its own level of service priority) and traffic policing (controlling the maximum rate of traffic sent or received). You configure firewall filters to determine whether to accept or discard a packet before it enters or exits any of these:

- Port
- VLAN

- Layer 3 (routed) interface
- Routed VLAN interface (RVI)

An *ingress* firewall filter is applied to packets that are entering an interface or VLAN, and an *egress* firewall filter is applied to packets that are exiting an interface or VLAN.

**NOTE:** Firewall filters are sometimes called *access control lists (ACLs)*.

---

### Firewall Filter Types

---

The following firewall filter types are supported:

- Port (Layer 2) firewall filter—Port firewall filters apply to Layer 2 traffic transiting system ports.
- VLAN firewall filter—VLAN firewall filters provide access control for packets that enter a VLAN, are bridged within a VLAN, or leave a VLAN.
- Router (Layer 3) firewall filter—You can apply a router firewall filter in both ingress and egress directions on IPv4 or IPv6 Layer 3 (routed) interfaces, routed VLAN interfaces (RVI) and a loopback interface, which filters traffic sent to the switch itself or generated by the switch. (You apply a filter to a loopback interface in the input direction to protect the switch from unwanted traffic. You also might want to apply a filter to a loopback interface in the output direction so that you can set the forwarding class and DSCP bit value for packets that originate on the switch itself. This feature gives you very fine control over the classification of CPU generated packets. For example, you might want to assign different DSCP values and forwarding classes to traffic generated by different routing protocols so the traffic for those protocols can be treated in a differentiated manner by other devices. You can apply a filter to a loopback interface in the output direction starting with Junos OS 13.2X51-D15.)

**NOTE:** You can apply a firewall filter to a management interface (for example, `me0`) on a QFX and EX4600 standalone switch. You cannot apply a firewall filter to a management interface on a QFX3000-G or QFX3000-M system.

- MPLS filter—You can apply a firewall filter to an MPLS interface

To apply a firewall filter:

1. Configure the firewall filter.
2. Apply the firewall filter to a port, VLAN, or router interface.

**NOTE:** You can apply only one firewall filter to a port, VLAN, or interface for a given direction. For example, for interface ge-0/0/6.0, you can apply one filter for the ingress direction and one for the egress direction.

## Firewall Filter Components

In a firewall filter, you first define the family address type (ethernet-switching, inet (for IPv4), inet6 (for IPv6), or mpls) and then define one or more terms that specify the filtering criteria and the action to take if a match occurs.

Each term consists of the following components:

- Match conditions—Specify values that a packet must contain to be considered a match. You can specify values for most fields in the IP, TCP, UDP, or ICMP headers. You can also match on interface names.
- Action—Specifies what to do if a packet matches the match conditions. A filter can accept, discard, or reject a matching packet and then perform additional actions, such as counting, classifying, and policing. If no action is specified for a term, the default is to accept the matching packet.

## Firewall Filter Processing

If there are multiple terms in a filter, the order of the terms is important. If a packet matches the first term, the switch executes the action defined by that term, and no other terms are evaluated. If the switch does not find a match between the packet and the first term, it compares the packet to the next term. If no match occurs between the packet and the second term, the system continues to compare the packet to each successive term in the filter until a match is found. If the packet does not match any terms in the filter, the switch discards the packet by default.

## Understanding How Firewall Filters Are Evaluated

A firewall filter consists of one or more terms, and the order of the terms within a filter is important. Before you configure firewall filters, you should understand how switches evaluate the terms within a filter and how packets are evaluated against the terms.

When a firewall filter consists of a single term, the filter is evaluated as follows:

- If the packet matches all the conditions, the action in the **then** statement is taken.
- If the packet matches all the conditions, and no action is specified in the **then** statement, the default action **accept** is taken.
- If the packet does not match all the conditions, the switch discards it.

When a firewall filter consists of more than one term, the filter is evaluated sequentially:

1. The packet is evaluated against the conditions in the **from** statement in the first term.
2. If the packet matches all the conditions in the term, the action in the **then** statement is taken and the evaluation ends. Subsequent terms in the filter are not evaluated.
3. If the packet does not match all the conditions in the term, the packet is evaluated against the conditions in the **from** statement in the second term.

This process continues until the packet matches all the conditions in the **from** statement in one of the subsequent terms or there are no more terms in the filter.

4. If a packet passes through all the terms in the filter without a match, the switch discards it.

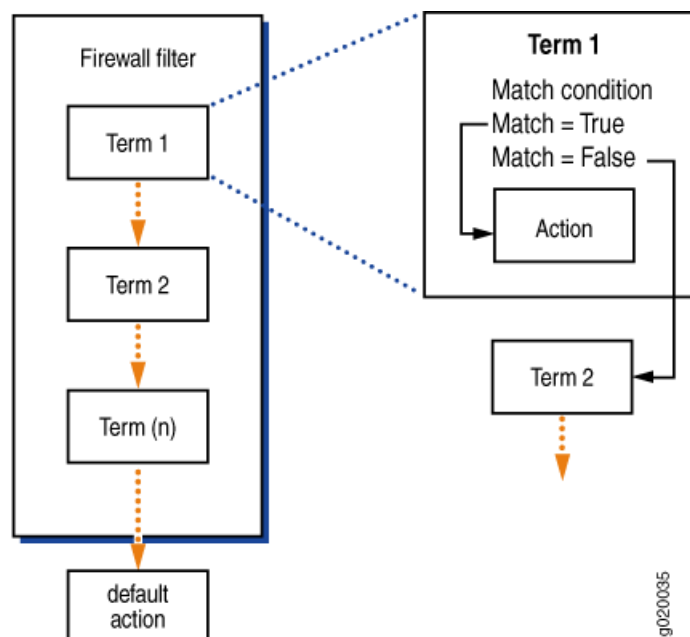

**NOTE:** The order of conditions in a **from** statement is not important because a packet must match all the conditions to be considered a match.

---

Figure 186 on page 4933 shows how switches evaluate the terms within a firewall filter.

Figure 186: Evaluation of Terms Within a Firewall Filter

If you do not include a **from** statement in a term, all packets will match the term and be processed by the **then** statement. If a term does not contain a **then** statement or if an action has not been configured in the **then** statement, the term accepts any matching packets.

Every firewall filter contains an implicit **deny** statement at the end of the filter, which is equivalent to the following explicit filter term:

```
term implicit-rule {
  then discard;
}
```

Consequently, a packet that does not match any of the terms in a firewall filter is discarded. If you configure a filter that has no terms, all packets that pass through the filter are discarded.

**NOTE:** Firewall filtering is supported on packets that are at least 64 bytes long.

## Understanding How Firewall Filters Control Packet Flows

A switch supports firewall filters that allow you to control flows of data packets and local packets. *Data packets* transit a switch as they are forwarded from a source to a destination. *Local packets* are destined for or sent by a Routing Engine (they do not transit a switch). Local packets usually contain routing protocol data, data for IP services such as Telnet or SSH, or data for administrative protocols such as the Internet Control Message Protocol (ICMP).

Firewall filters affect packet flows entering into or exiting from a switch as follows:

- Ingress firewall filters affect the flow of data packets that are received on switch interfaces. When a switch receives a data packet, the Packet Forwarding Engine in the system that contains the ingress interface determines where to forward the packet by looking in its Layer 2 or Layer 3 forwarding table for the best route to the destination. Data packets are forwarded to an egress interface. Locally destined packets are forwarded to the Routing Engine.
- Egress firewall filters affect data packets that are transiting a switch but do not affect packets sent by the Routing Engine. These filters are applied by the Packet Forwarding Engine in the system that contains the egress interface.

Figure 187 on page 4934 illustrates the application of ingress and egress firewall filters to control the flow of packets through a switch:

1. Ingress firewall filter applied to locally destined packets that are received on switch interfaces and are destined for the Routing Engine.
2. Ingress firewall filter applied to data packets that are received on switch interfaces and will transit the switch.
3. Egress firewall filter applied to data packets that are transiting the switch.

## Understanding Firewall Filter Match Conditions

Before you define terms for firewall filters, you must understand how the conditions in a term are handled and how to specify interface, numeric, address, and bit-field filter match conditions to achieve the desired filter results.

- [Filter Match Conditions on page 4935](#)
- [Numeric Filter Match Conditions on page 4935](#)
- [Interface Filter Match Conditions on page 4936](#)
- [IP Address Filter Match Conditions on page 4936](#)
- [MAC Address Filter Match Conditions on page 4937](#)
- [Bit-Field Filter Match Conditions on page 4937](#)

### Filter Match Conditions

In the **from** statement of a firewall filter term, you specify the conditions that the packet must match for the action in the **then** statement to be taken. All conditions must match for the action to be implemented. The order in which you specify match conditions is not important, because a packet must match all the conditions in a term for a match to occur.

If you specify multiple values for the same condition, a match on any one of those values matches that condition. For example, if you specify multiple IP source addresses using the **source-address** statement, a packet that contains any one of those IP source addresses matches the condition. In some cases you can specify multiple values for the same condition by enclosing the possible values in square brackets, as in:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set protocol (icmp | udp)
```

In other cases you must enter multiple statements, as in:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-address 10.1.1.1
user@switch# set source-address 10.1.1.2
```

If you specify no match conditions in a term, that term matches all packets.

**NOTE:** Unlike traditional Junos OS firewall filters, you cannot use **except** in a condition statement to negate the condition.

### Numeric Filter Match Conditions

You can specify numeric filter match conditions that are identified by a numeric value, such as port and protocol numbers. For numeric filter match conditions, you specify the

condition and a single value that a field in a packet must contain to be considered a match.

You can specify the numeric value in one of the following ways:

- Single number—A match occurs if the value of the field matches the number. For example, to match Telnet traffic:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-port 23
```

- Text synonym for a single number—A match occurs if the value of the field matches the number that corresponds to the synonym. For example, to match Telnet traffic:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-port telnet
```

- To specify multiple values for the same match condition in a filter term, enter each value in its own match statement. For example, a match occurs in the following term if the value of the source port in the packet is 22 or 23.

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-port 22
user@switch# set source-port 23
```

---

### Interface Filter Match Conditions

You can specify an interface filter match condition to match an interface on which a packet is received or transmitted. For example, if you apply a filter to a VLAN you might want the filter to match on some interfaces that participate in the VLAN and not match on other interfaces in the VLAN. When you specify the name of the interface, you must include a logical unit.

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set interface ge-0/0/6.0
```

In this example, the final character (0) specifies the logical unit. You can include the wildcard (\*) as part of the interface name. For example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set interface ge-0/*/6.0
user@switch# set interface ge-0/1/*.0
user@switch# set interface ge-0/0/6.*
```

Note that you must specify a value or a wildcard for the logical unit.

---

### IP Address Filter Match Conditions

You can specify an address filter match condition to match an IP source or destination address or prefix in a packet. Specify the address or prefix type and the address or prefix itself. For example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-address 10.2.1.0/24;
```

If you omit the prefix length, it defaults to /32. For example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-address 10
[edit firewall family family-name filter filter-name term term-name from]
user@switch# show
destination-address {
```

```
10.0.0.0/32;
}
```

To specify more than one IP address or prefix in a filter term, enter each address or prefix in its own match statement. For example, a match occurs in the following term if the source address of a packet matches either of the following prefixes:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-address 10.1.0.0/16
user@switch# set source-address 10.2.0.0/16
```

### MAC Address Filter Match Conditions

You can specify a MAC address filter match condition to match a source or destination MAC address. You specify the address type and value that a packet must contain to be considered a match.

You can specify the MAC address as six hexadecimal bytes in any of the following formats:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-mac-address 00:11:22:33:44:55
```

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-mac-address 0011.2233.4455
```

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-mac-address 001122334455
```

Regardless of the formats you use, the system resolves the address to the standard format, in this case 00:11:22:33:44:55.

To specify more than one MAC address in a filter term, enter each MAC address in its own match statement. For example, a match occurs in the following term if the value of the MAC source address matches either of the following addresses:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-mac-address 00:11:22:33:44:55
user@switch# set source-mac-address 00:11:22:33:20:15
```

### Bit-Field Filter Match Conditions

You can specify bit-field filter match conditions to match particular bits within certain fields in Ethernet frames and IP, TCP, UDP, and ICMP headers. You usually specify the field and the bit within the field that must be set in a packet to be considered a match.

In most cases you can use a keyword to specify the bit you want to match on. For example, to match on a TCP SYN packet you can enter **syn**, as in:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags syn
```

You can also enter **0x02** because the SYN bit is the third least-significant bit of the 8-bit tcp-flags field:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags 0x02
```

To match multiple bit-field values, use the logical operators, which are described in [Table 347 on page 4938](#). The operators are listed in order from highest precedence to lowest precedence. Operations are evaluated from left to right.

Table 347: Actions for Firewall Filters

| Logical Operators | Description |
|-------------------|-------------|
| !                 | Negation    |
| &                 | Logical AND |
|                   | Logical OR  |

If you use a logical operator, enclose the values in quotation marks and do not include any spaces. For example, the following statement matches the second packet of a TCP handshake:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags "syn&ack"
```

To negate a match, precede the value with an exclamation point. For example, the following statement matches only the initial packet of a TCP handshake:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags "syn!ack"
```

You can use text synonyms to specify some common bit-field matches. For example, the following statement also matches the initial packet of a TCP handshake:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-initial
```

## Firewall Filter Match Conditions and Actions

Each term in a firewall filter consists of *match conditions* and an *action*. Match conditions are the fields and values that a packet must contain to be considered a match. You can define single or multiple match conditions in *match statements*. You can also include no match statement, in which case the term matches all packets.

When a packet matches a filter, a switch takes the action specified in the term. In addition, you can specify action modifiers to count, mirror, rate-limit, and classify packets. If no match conditions are specified for the term, the switch accepts the packet by default.

This topic describes the various match conditions, actions, and action modifiers that you can define in a firewall filter.

- [Table 348 on page 4939](#) describes the match conditions you can specify when configuring a firewall filter. Some of the numeric range and bit-field match conditions allow you to specify a text synonym. To see a list of all the synonyms for a match condition, type ? at the appropriate place in a statement.

- [Table 349 on page 4956](#) shows the actions that you can specify in a term.
- [Table 350 on page 4957](#) shows the action modifiers you can use to count, mirror, rate-limit, and classify packets.

**Table 348: Supported Match Conditions for Firewall Filters**

| Match Condition                                   | Description                                                                       | Direction and Interface                                                                                                                       |
|---------------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>arp-type</b>                                   | ARP request packet or ARP reply packet.                                           | Egress and ingress ports.                                                                                                                     |
| <b>destination-address</b><br><i>ip-address</i>   | IP destination address field, which is the address of the final destination node. | Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.<br><br>Egress IPv4 (inet) interfaces, and IPv6 (inet6) interfaces. |
| <b>destination-mac-address</b> <i>mac-address</i> | Destination media access control (MAC) address of the packet.                     | Ingress ports, VLANs and IPv4 (inet) interfaces.<br><br>Egress ports and VLANs.                                                               |

Table 348: Supported Match Conditions for Firewall Filters (*continued*)

| Match Condition               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Direction and Interface                                                                                                 |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>destination-port value</b> | <p>TCP or UDP destination port field. Typically, you specify this match in conjunction with the <b>protocol</b> match statement. For the following well-known ports you can specify text synonyms (the port numbers are also listed):</p> <p><b>afs</b> (1483), <b>bgp</b> (179), <b>biff</b> (512), <b>bootpc</b> (68), <b>bootps</b> (67),</p> <p><b>cmd</b> (514), <b>cvspserver</b> (2401),</p> <p><b>dhcp</b> (67), <b>domain</b> (53),</p> <p><b>eklogin</b> (2105), <b>ekshell</b> (2106), <b>exec</b> (512),</p> <p><b>finger</b> (79), <b>ftp</b> (21), <b>ftp-data</b> (20),</p> <p><b>http</b> (80), <b>https</b> (443),</p> <p><b>ident</b> (113), <b>imap</b> (143),</p> <p><b>kerberos-sec</b> (88), <b>klogin</b> (543), <b>kpasswd</b> (761), <b>krb-prop</b> (754), <b>krbupdate</b> (760), <b>kshell</b> (544),</p> <p><b>ldap</b> (389), <b>login</b> (513),</p> <p><b>mobileip-agent</b> (434), <b>mobileip-mn</b> (435), <b>msdp</b> (639),</p> <p><b>netbios-dgm</b> (138), <b>netbios-ns</b> (137), <b>netbios-ssn</b> (139), <b>nfsd</b> (2049), <b>nntp</b> (119), <b>ntalk</b> (518), <b>ntp</b> (123),</p> <p><b>pop3</b> (110), <b>pptp</b> (1723), <b>printer</b> (515),</p> <p><b>radacct</b> (1813), <b>radius</b> (1812), <b>rip</b> (520), <b>rkinit</b> (2108),</p> <p><b>smtp</b> (25), <b>snmp</b> (161), <b>snmptrap</b> (162), <b>snpp</b> (444), <b>socks</b> (1080), <b>ssh</b> (22), <b>sunrpc</b> (111), <b>syslog</b> (514),</p> <p><b>tacacs-ds</b> (65), <b>talk</b> (517), <b>telnet</b> (23), <b>tftp</b> (69), <b>timed</b> (525),</p> <p><b>who</b> (513),</p> <p><b>xmcp</b> (177),</p> <p><b>zephyr-clt</b> (2103), <b>zephyr-hm</b> (2104)</p> | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p> |

Table 348: Supported Match Conditions for Firewall Filters (*continued*)

| Match Condition                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Direction and Interface                                                                                                                      |
|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>destination-port range-optimize <i>range</i></b> | Match a range of TCP or UDP port ranges while using the available memory more efficiently. Using this condition allows you to configure more firewall filters than if you configure individual destination ports. (Not supported with filter-based forwarding.)                                                                                                                                                                                                                                                                                                                                                                                                                     | Egress and ingress IPv4 (inet) interfaces.                                                                                                   |
| <b>destination-prefix-list <i>prefix-list</i></b>   | IP destination prefix list field. You can define a list of IP address prefixes under a prefix-list alias for frequent use. Define this list at the <b>[edit policy-options]</b> hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.<br><br>Egress IPv4 (inet) interfaces and IPv6 (inet6) interfaces. |
| <b>dot1q-tag <i>number</i></b>                      | 802.1Q VLAN ID field in the Ethernet frame. The tag values can be 1–4094.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Ingress ports and VLANs.<br><br>Egress ports and VLANs ( <i>Number</i> must be the VLAN ID of the VLAN you want to match).                   |
| <b>dot1q-user-priority <i>number</i></b>            | <p>802.1Q priority field in the Ethernet frame (used for class-of-service priorities). Values can be 0–7.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <ul style="list-style-type: none"> <li>• <b>best-effort (0)</b>—Best effort</li> <li>• <b>background (1)</b>—Background</li> <li>• <b>standard (2)</b>—Standard or spare</li> <li>• <b>excellent-load (3)</b>—Excellent load</li> <li>• <b>controlled-load (4)</b>—Controlled load</li> <li>• <b>video (5)</b>—Video</li> <li>• <b>voice (6)</b>—Voice</li> <li>• <b>network-control (7)</b>—Network control reserved traffic</li> </ul> | Ingress ports and VLANs.<br><br>Egress ports and VLANs.                                                                                      |

Table 348: Supported Match Conditions for Firewall Filters (*continued*)

| Match Condition   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Direction and Interface                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| <b>dscp value</b> | <p>Differentiated Services code point (DSCP). The DiffServ protocol uses the type-of-service (ToS) byte in the IP header. The most-significant 6 bits of this byte form the DSCP.</p> <p>You can specify DSCP in hexadecimal, binary, or decimal form.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <ul style="list-style-type: none"> <li>• <b>be</b>—best effort (default)</li> <li>• <b>ef (46)</b>—as defined in <a href="#">RFC 3246</a>, <i>An Expedited Forwarding PHB</i>.</li> <li>• <b>af11 (10), af12 (12), af13 (14); af21 (18), af22 (20), af23 (22); af31 (26), af32 (28), af33 (30); af41 (34), af42 (36), af43 (38)</b><br/>These four classes, with three drop precedences in each class, for a total of 12 code points, are defined in <a href="#">RFC 2597</a>, <i>Assured Forwarding PHB</i>.</li> <li>• <b>cs0, cs1, cs2, cs3, cs4, cs5, cs6, cs7, cs5</b></li> </ul> | <p>Ingress ports, VLANs, and IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p> |

Table 348: Supported Match Conditions for Firewall Filters (*continued*)

| Match Condition             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Direction and Interface                                        |

Table 348: Supported Match Conditions for Firewall Filters (*continued*)

| Match Condition | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Direction and Interface |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
|                 | <p>(QFabric systems only) Traffic flows forwarded from a QFabric system Interconnect device egress interface to a Node device ingress interface.</p> <p>In one “from” filter term, use one or more of the following match conditions to identify a flow of traffic:</p> <ul style="list-style-type: none"> <li>Client-side MAC address (for example, an FCF MAC address for FCoE traffic) (<b>destination-mac-address <i>mac-address</i></b>) or <b>source-mac-address <i>mac-address</i></b>)</li> <li>Server-side MAC address (for example, an ENode MAC address for FCoE traffic) (<b>destination-mac-address <i>mac-address</i></b>) or <b>source-mac-address <i>mac-address</i></b>)</li> <li>EtherType (<b>ether-type <i>value</i></b>)</li> </ul> <p><b>NOTE:</b> If you remap an FCoE flow using EtherType as the match condition, you need to include two terms in the filter in each direction of flow to identify the traffic, one term to identify FCoE traffic (EtherType 0x8906), and one term to identify FIP traffic (EtherType 0x8914).</p> <ul style="list-style-type: none"> <li>VLAN (<b>vlan (<i>vlan-name</i>   <i>vlan-id</i>)</b>)</li> <li>.1q user priority (<b>dot1q-user-priority</b>)</li> </ul> <p>In the same “from” filter term, use the “from-fabric” match condition to match traffic flowing from the Interconnect device to the Node device. In the “then” statement of the filter term, remap the identified traffic flow from the forwarding class used on the Interconnect device back into its original forwarding class, by specifying the original forwarding class and loss priority as action modifiers. This programs the QFabric system to use the original forwarding class for the flow when the flow is forwarded out of the QFabric system, not the temporarily remapped forwarding class the flow uses as it crosses the Interconnect device. The “to-fabric” match condition, which you configure using a different term in the same filter, maps the flow from the original forwarding class into a new forwarding class at the Node device egress, before the traffic crosses the Interconnect device. The “to-fabric” and the “from-fabric” match conditions combine to enable you to avoid traffic flow fate sharing as the traffic crosses the</p> |                         |

Table 348: Supported Match Conditions for Firewall Filters (*continued*)

| Match Condition        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Direction and Interface                                                                                                 |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>icmp-code value</b> | <p>ICMP code field. Because the meaning of the value depends upon the associated <b>icmp-type</b>, you must specify a value for <b>icmp-type</b> along with a value for <b>icmp-code</b>. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed). The keywords are grouped by the ICMP type with which they are associated:</p> <ul style="list-style-type: none"> <li>• <i>IPv4</i>:<br/>parameter-problem—ip-header-bad (0), required-option-missing (1)</li> <li>• <i>IPv6</i>:<br/>parameter-problem—ip6-header-bad (0), unrecognized-next-header (1), unrecognized-option (2)</li> <li>• redirect—redirect-for-network (0), redirect-for-host (1), redirect-for-tos-and-net (2), redirect-for-tos-and-host (3)</li> <li>• time-exceeded—ttl-eq-zero-during-reassembly (1), ttl-eq-zero-during-transit (0)</li> <li>• <i>IPv4</i>:<br/>unreachable—network-unreachable (0), host-unreachable (1), protocol-unreachable (2), port-unreachable (3), fragmentation-needed (4), source-route-failed (5), destination-network-unknown (6), destination-host-unknown (7), source-host-isolated (8), destination-network-prohibited (9), destination-host-prohibited (10), network-unreachable-for-TOS (11), host-unreachable-for-TOS (12), communication-prohibited-by-filtering (13), host-precedence-violation (14), precedence-cutoff-in-effect (15)</li> <li>• <i>IPv6</i>:<br/>unreachable—address-unreachable (3), administratively-prohibited (1), no-route-to-destination (0), port-unreachable (4)</li> </ul> | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p> |
| <b>hop-limitvalue</b>  | <p>Match the the specified hop limit or set of hop limits. Specify a single value or a range of values from 0 through 255.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Ingress and egress IPv6 (inet6) interfaces.</p>                                                                      |

Table 348: Supported Match Conditions for Firewall Filters (*continued*)

| Match Condition                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Direction and Interface                                                                                                                             |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>icmp-type</b> <i>value</i>                 | <p>ICMP message type field. Typically, you specify this match in conjunction with the <b>protocol</b> match statement to determine which protocol is being used on the port. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <p><i>IPv4:</i> echo-reply (0), destination unreachable (3), source-quench (4), redirect (5), echo-request (8), IPv4 (inet)-advertisement (9), IPv4 (inet)-solicit (10), time-exceeded (11), parameter-problem (12), timestamp (13), timestamp-reply (14), info-request (15), info-reply (16), mask-request (17), mask-reply (18)</p> <p><i>IPv6:</i> destination-unreachable (1), packet-too-big (2), time-exceeded (3), parameter-problem (4), echo-request (128), echo-reply (129), membership-query (130), membership-report (131), membership-termination (132), router-solicit (133), router-advertisement (134), neighbor-solicit (135), neighbor-advertisement (136), redirect (137), router-renumbering (138), node-information-request (139), node-information-reply (140)</p> <p>See also <b>icmp-code</b> <i>variable</i>.</p> | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>                             |
| <b>interface</b> <i>interface-name</i>        | <p>Interface on which the packet is received, including the logical unit. You can include the wildcard character (*) as part of an interface name or logical unit.</p> <p><b>NOTE:</b> An interface from which a packet is sent cannot be used as a match condition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces and IPv6 (inet6) interfaces.</p> |
| <b>ip-destination-address</b> <i>address</i>  | IPv4 address that is the final destination node address for the packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Ingress ports and VLANs.                                                                                                                            |
| <b>ip6-destination-address</b> <i>address</i> | IPv6 address that is the final destination node address for the packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Ingress ports and VLANs. (You cannot simultaneously apply a filter with this match criterion to a Layer 2 port and VLAN that includes that port.)   |
| <b>ip-options</b>                             | Specify <b>any</b> to create a match if anything is specified in the options field in the IP header.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>Ingress ports, VLANs, and IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>                                                      |

Table 348: Supported Match Conditions for Firewall Filters (*continued*)

| Match Condition                                 | Description                                                                                                                                                                                                                                                                                                                                                           | Direction and Interface                                                                                                                           |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip-precedence</b> <i>ip-precedence-field</i> | IP precedence field. In place of the numeric field value, you can specify one of the following text synonyms (the field values are also listed): <b>critical-ecp</b> (0xa0), <b>flash</b> (0x60), <b>flash-override</b> (0x80), <b>immediate</b> (0x40), <b>internet-control</b> (0xc0), <b>net-control</b> (0xe0), <b>priority</b> (0x20), or <b>routine</b> (0x00). | Ingress ports, VLANs, and IPv4 (inet) interfaces.<br><br>Egress IPv4 (inet) interfaces.                                                           |
| <b>ip-protocol</b> <i>number</i>                | IP protocol field.                                                                                                                                                                                                                                                                                                                                                    | Ingress ports, VLANs, and IPv4 (inet) interfaces.<br><br>Egress IPv4 (inet) interfaces.                                                           |
| <b>ip-source-address</b> <i>address</i>         | IPv4 address of the source node sending the packet.                                                                                                                                                                                                                                                                                                                   | Ingress ports and VLANs.                                                                                                                          |
| <b>ip6-source-address</b> <i>address</i>        | IPv6 address of the source node sending the packet.                                                                                                                                                                                                                                                                                                                   | Ingress ports and VLANs. (You cannot simultaneously apply a filter with this match criterion to a Layer 2 port and VLAN that includes that port.) |
| <b>ip-version</b> <i>address</i>                | IP version of the packet. Use this condition to match IPv4 or IPv6 header fields in traffic that arrives on a Layer 2 port or VLAN interface.                                                                                                                                                                                                                         | Ingress ports and VLANs.                                                                                                                          |
| <b>is-fragment</b>                              | Using this condition causes a match if the More Fragments flag is enabled in the IP header or if the fragment offset is not zero.                                                                                                                                                                                                                                     | Ingress ports, VLANs, and IPv4 (inet) interfaces.<br><br>Egress IPv4 (inet) interfaces.                                                           |
| <b>l2-encap-type</b> <i>llc-non-snap</i>        | Match on logical link control (LLC) layer packets for non-Subnet Access Protocol (SNAP) Ethernet Encapsulation type.                                                                                                                                                                                                                                                  | Ingress ports and VLANs.<br><br>Egress ports and VLANs.                                                                                           |
| <b>label</b>                                    | Match on MPLS label bits.                                                                                                                                                                                                                                                                                                                                             | Ingress MPLS interfaces.<br><br>Egress MPLS interfaces.                                                                                           |
| <b>learn-vlan-id</b> <i>number</i>              | VLAN identifier used for MAC learning.                                                                                                                                                                                                                                                                                                                                | Ingress ports and VLANs.<br><br>Egress ports and VLANs.                                                                                           |

Table 348: Supported Match Conditions for Firewall Filters (*continued*)

| Match Condition         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Direction and Interface                                                                                      |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>next-header</b>      | <p>IPv4 or IPv6 protocol value. In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):</p> <p><b>hop-by-hop (0), icmp (1), icmp6 (58), igmp (2), ipip (4), tcp (6), egp (8), udp (17), ipv6 (41), routing (43), fragment (44), rsvp (46), gre (47), esp (50), ah (51), icmp6 (58), no-next-header (59), dstopts (60), ospf (89), pim (103), vrrp (112), sctp (132)</b></p>                                                                                                                                  | <p>Ingress ports, VLANs, and IPv6 (inet6) interfaces.</p> <p>Egress IPv6 (inet6) interfaces.</p>             |
| <b>packet-length</b>    | <p>Packet length in bytes. You must enter a value between 0 and 65535.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Ingress ports, VLANs, IPv4 (inet), and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p> |
| <b>payload-protocol</b> | <p>IPv4 or IPv6 protocol value. In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):</p> <p><b>hop-by-hop (0), icmp (1), icmp6 (58), igmp (2), ipip (4), tcp (6), egp (8), udp (17), ipv6 (41), routing (43), fragment (44), rsvp (46), gre (47), esp (50), ah (51), icmp6 (58), no-next-header (59), dstopts (60), ospf (89), pim (103), vrrp (112), sctp (132)</b></p>                                                                                                                                  | <p>Ingress ports, VLANs, and IPv6 (inet6) interfaces.</p> <p>Egress IPv6 (inet6) interfaces.</p>             |
| <b>precedence value</b> | <p>IP precedence bits in the type-of-service (ToS) byte in the IP header. (This byte can also be used for the DiffServ DSCP.) | <b>rat-type</b><br><b>tech-type-value</b>    | <p>Match the radio-access technology (RAT) type specified in the 8-bit Tech-Type field of Proxy Mobile IPv4 (PMIPv4) access technology type extension. The technology type specifies the access technology through which the mobile device is connected to the access network. Specify a single value, a range of values, or a set of values. You can specify a technology type as a numeric value from 0 through 255 or as a system keyword.</p> <ul style="list-style-type: none"> <li>Numeric value 1 matches IEEE 802.3.</li> <li>Numeric value 2 matches IEEE 802.11a/b/g.</li> <li>Numeric value 3 matches IEEE 802.16e</li> <li>Numeric value 4 matches IEEE 802.16m.</li> <li>Text string <b>eutran</b> matches 4G.</li> <li>Text string <b>geran</b> matches 2G.</li> <li>Text string <b>utran</b> matches 3G.</li> <li>.</li> </ul> | Egress and ingress IPv4 (inet) interfaces.                                                                              |
| <b>sample</b>                                | Sample the packet traffic. Apply this option only if you have enabled traffic sampling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Egress and ingress IPv4 (inet) interfaces.                                                                              |
| <b>source-address</b><br><b>ip-address</b>   | IP source address field, which is the address of the node that sent the packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p> |
| <b>source-mac-address</b> <i>mac-address</i> | Source media access control (MAC) address of the packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Ingress ports and VLANs.</p> <p>Egress ports and VLANs.</p>                                                          |

Table 348: Supported Match Conditions for Firewall Filters (*continued*)

| Match Condition                                | Description                                                                                                                                                                                                                                                                                                                                                         | Direction and Interface                                                                                          |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>source-port</b> <i>value</i>                | TCP or UDP source port. Typically, you specify this match in conjunction with the <b>protocol</b> match statement. In place of the numeric field, you can specify one of the text synonyms listed under <b>destination-port</b> .                                                                                                                                   | Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.<br><br>Egress IPv4 (inet) interfaces. |
| <b>source-port range-optimize</b> <i>range</i> | Match a range of TCP or UDP port ranges while using the available memory more efficiently. Using this condition allows you to configure more firewall filters than if you configure individual source ports. (Not supported with filter-based forwarding.)                                                                                                          | Egress and ingress IPv4 (inet) interfaces.                                                                       |
| <b>source-prefix-list</b> <i>prefix-list</i>   | IP source prefix list. You can define a list of IP address prefixes under a prefix-list alias for frequent use. Define this list at the <b>[edit policy-options]</b> hierarchy level.                                                                                                                                                                               | Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.<br><br>Egress IPv4 (inet) interfaces. |
| <b>tcp-established</b>                         | Match packets of an established TCP connection. This condition matches packets other than those used to set up a TCP connection—that is, three-way handshake packets are not matched.<br><br>When you specify <b>tcp-established</b> , a switch does not implicitly verify that the protocol is TCP. You must also specify the <b>protocol tcp</b> match condition. | Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.<br><br>Egress IPv4 (inet) interfaces. |
| <b>tcp-flags</b> <i>value</i>                  | One or more TCP flags:<br><ul style="list-style-type: none"> <li>• <b>ack</b> (0x10)</li> <li>• <b>fin</b> (0x01)</li> <li>• <b>push</b> (0x08)</li> <li>• <b>rst</b> (0x04)</li> <li>• <b>syn</b> (0x02)</li> <li>• <b>urgent</b> (0x20)</li> </ul>                                                                                                                | Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.<br><br>Egress IPv4 (inet) interfaces. |
| <b>tcp-initial</b>                             | Match the first TCP packet of a connection. A match occurs when the TCP flag <b>SYN</b> is set and the TCP flag <b>ACK</b> is not set.<br><br>When you specify <b>tcp-initial</b> , a switch does not implicitly verify that the protocol is TCP. You must also specify the <b>protocol tcp</b> match condition.                                                    | Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.<br><br>Egress IPv4 (inet) interfaces. |

Table 348: Supported Match Conditions for Firewall Filters (*continued*)

| Match Condition    | Description | Direction and Interface                                                                   |
|--------------------|-------------|-------------------------------------------------------------------------------------------|
| to-fabric <except> |             | VLANs. Filter applies to traffic forwarded from a Node device to the Interconnect device. |

Table 348: Supported Match Conditions for Firewall Filters (*continued*)

| Match Condition | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Direction and Interface |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
|                 | <p>(QFabric systems only) Traffic flows forwarded from a QFabric system Node device egress interface to an Interconnect device ingress interface.</p> <p>In one “from” filter term, use one or more of the following match conditions to identify a flow of traffic:</p> <ul style="list-style-type: none"> <li>Client-side MAC address (for example, an FCF MAC address for FCoE traffic) (<b>destination-mac-address <i>mac-address</i></b>) or <b>source-mac-address <i>mac-address</i></b>)</li> <li>Server-side MAC address (for example, an ENode MAC address for FCoE traffic) (<b>destination-mac-address <i>mac-address</i></b>) or <b>source-mac-address <i>mac-address</i></b>)</li> <li>EtherType (<b>ether-type <i>value</i></b>)</li> </ul> <p><b>NOTE:</b> If you remap an FCoE flow using EtherType as the match condition, you need to include two terms in the filter in each direction of flow to identify the traffic, one term to identify FCoE traffic (EtherType 0x8906), and one term to identify FIP traffic (EtherType 0x8914).</p> <ul style="list-style-type: none"> <li>VLAN (<b>vlan (<i>vlan-name</i>   <i>vlan-id</i>)</b>)</li> <li>.1q user priority (<b>dot1q-user-priority</b>)</li> </ul> <p>In the same “from” filter term, use the “to-fabric” match condition to match traffic flowing from the Node device to the Interconnect device. In the “then” statement of the filter term, remap the identified traffic flow from its current forwarding class into another forwarding class (default or user-defined) and loss priority by specifying the forwarding class and loss priority as action modifiers.</p> <p>The QFabric system uses the remapped forwarding class to transport the flow across the Interconnect device. The “from-fabric” match condition, which you configure using a different term in the same filter, maps the flow back to the original forwarding class after the flow traverses the Interconnect device, when the flow enters the Node device from which the traffic will egress from the QFabric system. The “to-fabric” and the “from-fabric” match conditions combine to enable you to avoid traffic flow fate sharing as the traffic crosses the Interconnect device. The to-fabric match</p> |                         |

Table 348: Supported Match Conditions for Firewall Filters (*continued*)

| Match Condition                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Direction and Interface                                                                          |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
|                                    | <p>condition allows you to separate the flow into multiple forwarding classes as it crosses the Interconnect device, and the from-fabric match condition brings the traffic back together into the same forwarding class before the traffic leaves the QFabric system.</p> <p>The <b>except</b> option matches traffic that is locally switched—that is, traffic that enters and exits the same QFabric system Node device and does not cross the Interconnect device. If traffic identified by the match conditions contains some flows that are locally switched, the “except” option remaps the forwarding class for the locally switched traffic and does <i>not</i> remap the forwarding class for remotely switched traffic.</p> |                                                                                                  |
| <b>traffic-class</b>               | <p>8-bit field that specifies the class-of-service (CoS) priority of the packet. The traffic-class field is used to specify a DiffServ code point (DSCP) value. This field was previously used as the type-of-service (ToS) field in IPv4, and, the semantics of this field (for example, DSCP) are identical to those of IPv4.</p> <p>You can specify one of the following text synonyms (the field values are also listed):</p> <p><b>af11 (10), af12 (12), af13 (14), af21 (18), af22 (20), af23 (22), af31 (26), af32 (28), af33 (30), af41 (34), af42 (36), af43 (38), cs0 (0), cs1 (8), cs2 (16), cs3 (24), cs4 (32), cs5 (40), cs6 (48), cs7 (56), ef (46)</b></p>                                                              | <p>Ingress ports, VLANs, and IPv6 (inet6) interfaces.</p> <p>Egress IPv6 (inet6) interfaces.</p> |
| <b>ttl value</b>                   | <p>IP Time-to-live (TTL) field in decimal. The value can be 1-255.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>Ingress IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>                     |
| <b>user-vlan-1p-priority value</b> | <p>Match on the IEEE 802.1p user priority bits in the customer VLAN tag (the inner tag in a dual-tag frame with 802.1Q VLAN tags). Specify a single value or multiple values from 0 through 7.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Ingress ports, VLANs, and IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>   |
| <b>user-vlan-id number</b>         | <p>Match the first VLAN identifier that is part of the payload.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Ingress ports, VLANs, and IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>   |

Table 348: Supported Match Conditions for Firewall Filters (*continued*)

| Match Condition                                   | Description       | Direction and Interface                             |
|---------------------------------------------------|-------------------|-----------------------------------------------------|
| <b>vlan</b> ( <i>vlan-name</i>   <i>vlan-id</i> ) | VLAN names or ID. | Ingress ports and VLANs.<br>Egress ports and VLANs. |

Use **then** statements to define actions that should occur if a packet matches all conditions in a **from** statement. [Table 349 on page 4956](#) shows the actions that you can specify in a term. (If you do not include a **then** statement, the system accepts packets that match the filter.)

Table 349: Actions for Firewall Filters

| Action                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>accept</b>                                | Accept a packet. This is the default action for packets that match a term.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>discard</b>                               | Discard a packet silently without sending an Internet Control Message Protocol (ICMP) message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>reject</b> <i>message-type</i>            | <p>Discard a packet and send a “destination unreachable” ICMPv4 message (type 3). To log rejected packets, configure the <b>syslog</b> action modifier.</p> <p>You can specify one of the following message types:<br/> <b>administratively-prohibited</b> (default), <b>bad-host-tos</b>, <b>bad-network-tos</b>, <b>host-prohibited</b>, <b>host-unknown</b>, <b>host-unreachable</b>, <b>network-prohibited</b>, <b>network-unknown</b>, <b>network-unreachable</b>, <b>port-unreachable</b>, <b>precedence-cutoff</b>, <b>precedence-violation</b>, <b>protocol-unreachable</b>, <b>source-host-isolated</b>, <b>source-route-failed</b>, or <b>tcp-reset</b>.</p> <p>If you specify <b>tcp-reset</b>, the system sends a TCP reset if the packet is a TCP packet; otherwise nothing is sent.</p> <p>If you do not specify a message type, the ICMP notification “destination unreachable” is sent with the default message “communication administratively filtered.”</p> <p><b>NOTE:</b> The <b>reject</b> action is supported on ingress interfaces only.</p> |
| <b>routing-instance</b> <i>instance-name</i> | Forward matched packets to a virtual routing instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>vlan</b> <i>VLAN-name</i>                 | Forward matched packets to a specific VLAN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                              | <b>NOTE:</b> The <b>vlan</b> action is supported on ingress interfaces only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

You can also specify the action modifiers listed in [Table 350 on page 4957](#) to count, mirror, rate-limit, and classify packets.

Table 350: Action Modifiers for Firewall Filters

| Action Modifier                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>analyzer</b> <i>analyzer-name</i>                        | <p>(Non-ELS platforms) Mirror traffic (copy packets) to an analyzer configured at the <b>[edit ethernet-switching-options analyzer]</b> hierarchy level.</p> <p>You can specify port mirroring for ingress port, VLAN, and IPv4 (inet) firewall filters only.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>count</b> <i>counter-name</i>                            | Count the number of packets that match the term.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>decapsulate</b> [ <i>gre</i>   <i>routing-instance</i> ] | De-encapsulate GRE packets or forward de-encapsulated GRE packets to the specified routing instance                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>dscp</b> <i>value</i>                                    | <p>Differentiated Services code point (DSCP). The DiffServ protocol uses the type-of-service (ToS) byte in the IP header. The most-significant 6 bits of this byte form the DSCP.</p> <p>You can specify DSCP in hexadecimal, binary, or decimal form.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <ul style="list-style-type: none"> <li><b>be</b>—best effort (default)</li> <li><b>ef (46)</b>—as defined in <a href="#">RFC 3246</a>, <i>An Expedited Forwarding PHB</i>.</li> <li><b>af11 (10), af12 (12), af13 (14);</b><br/><b>af21 (18), af22 (20), af23 (22);</b><br/><b>af31 (26), af32 (28), af33 (30);</b><br/><b>af41 (34), af42 (36), af43 (38)</b></li> </ul> <p>These four classes, with three drop precedences in each class, for a total of 12 code points, are defined in <a href="#">RFC 2597</a>, <i>Assured Forwarding PHB</i>.</p> <ul style="list-style-type: none"> <li><b>cs0, cs1, cs2, cs3, cs4, cs5, cs6, cs7, cs5</b></li> </ul> |

## Understanding How a Firewall Filter Tests a Protocol

When examining match conditions in a firewall filter, a switch tests only the fields that you specify. It does not implicitly test any fields that you do not explicitly configure. For example, if you specify a match condition of **source-port ssh**, there is no implied test to determine if the protocol is TCP. In this case, the switch considers any packet that has a value of **22** (decimal) in the 2-byte field that follows a *presumed* IP header to be a match. To ensure that the term matches on TCP packets, you also specify an **ip-protocol tcp** match condition.

For the following match conditions, you should explicitly specify the protocol match condition in the same term:

- **destination-port**—Specify protocol **tcp** or protocol **udp**.
- **icmp-code**—Specify protocol **icmp** and **icmp-type**.
- **icmp-type**—Specify protocol **icmp** or protocol **icmp6**.
- **source-port**—Specify protocol **tcp** or protocol **udp**.
- **tcp-flags**—Specify protocol **tcp**.

## Understanding Firewall Filter Planning

Before you create a firewall filter and apply it, determine what you want the filter to accomplish and how to use its match conditions and actions to achieve your goals. It is important that you understand how packets are matched, the default and configured actions of the firewall filter, and where to apply the firewall filter.

You can apply no more than one firewall filter per port, VLAN, or router interface per direction (input and output). For example, for a given port you can apply at most one filter in the input direction and one filter in the output direction. You should try to be conservative in the number of terms (rules) that you include in each firewall filter, because a large number of terms requires longer processing time during a commit operation and can make testing and troubleshooting more difficult.

Before you configure and apply firewall filters, answer the following questions for each of them:

1. What is the purpose of the filter?

For example, the system can drop packets based on header information, rate-limit traffic, classify packets into forwarding classes, log and count packets, or prevent denial-of-service attacks.

2. What are the appropriate match conditions? Determine the packet header fields that the packet must contain for a match. Possible fields include:

- Layer 2 header fields—Source and destination MAC addresses, 802.1Q tag, Ethernet type, or VLAN.
- Layer 3 header fields—Source and destination IP addresses, protocols, and IP options (IP precedence, IP fragmentation flags, or TTL type).
- TCP header fields—Source and destination ports and flags.
- ICMP header fields—Packet type and code.

3. What are the appropriate actions to take if a match occurs?

The system can accept, discard, or reject packets.

4. What additional action modifiers might be required?

For example, you can configure the system to mirror (copy) packets to a specified port, count matching packets, apply traffic management, or police packets.

5. On what port, router interface, or VLAN should the firewall filter be applied?

Start with the following basic guidelines:

- If packets entering or leaving a Layer 2 interface (port) need to be filtered, apply the filter at the **[edit family ethernet switching filter]** hierarchy level. This is a port filter.
- If packets entering or leaving any port in a specific VLAN need to be filtered, use a VLAN filter.

- If packets entering or leaving a Layer 3 (routed) interface or routed VLAN interface (RVI) need to be filtered, use a router firewall filter. Apply the filter to the interface at the **[edit family inet]** hierarchy level. You can also apply a router firewall filter on a loopback interface.

Before you choose the interface or VLAN on which to apply a firewall filter, understand how that placement can affect traffic flow to other interfaces. In general, apply a filter close to the source device if the filter matches on source or destination IP addresses, IP protocols, or protocol information—such as ICMP message types, and TCP or UDP port numbers. However, you should apply a filter close to the destination device if the filter matches *only* on a source IP address. When you apply a filter too close to the source device, the filter could prevent that source device from accessing other services that are available on the network.

**NOTE:** Egress firewall filters do not affect the flow of locally generated control packets from the Routing Engine.

6. In which direction should the firewall filter be applied?

You typically configure different actions for traffic entering an interface than you configure for traffic exiting an interface.

7. How many filters should I create?

See “[Planning the Number of Firewall Filters to Create](#)” on [page 4961](#) for information about how many firewall filters you can apply.

### Understanding How Many Firewall Filters Are Supported

QFX3500, QFX3600, QFX5100, and EX4600 switches, QFabric Node devices, and VCF members support the maximum numbers of firewall filter terms per type of attachment point shown in [Table 351 on page 4962](#).

**Table 351: Supported Firewall Filter Numbers**

| Filter Type | QFX3500, QFX3600 | QFX5100, EX4600 |
|-------------|------------------|-----------------|
| Ingress     | 768              | 1536            |
| Egress      | 1024             | 1024            |

These totals are applied in aggregate. For example, on the QFX3500 and QFX3600 you can apply a total of 768 terms in all your port filters, Layer 3 filters, and VLAN filters that are applied in the input direction and 1024 terms in port filters, Layer 3 filters, and VLAN filters that are applied in the output direction.

**NOTE:** If you want to create more than 512 egress VLAN filters, your first VLAN ID should be 6 and the subsequent VLAN IDs should increase by 1. For example, to create 1024 egress VLAN filters, the first VLAN ID would be 6, the second ID would be 7, and the sequence would continue through VLAN ID 1029. Similarly, if you want to create fewer than 512 egress VLAN filters but want the total number of terms in those filters to exceed 512, you should number your VLAN IDs in the same manner. If you do not use this approach to create your VLAN IDs, the total number of allowed terms or filters will be less than 1024 and might be 512.

The ternary content addressable memory (TCAM) for firewall filters is divided into slices that accommodate 256 terms, and all the terms in a memory slice must be in filters of the same type and applied in the same direction. A memory slice is reserved as soon as you commit a filter. For example, if you create a port filter and apply it in the input direction, a memory slice is reserved that will only store ingress port filters. If you create and apply only one ingress port filter and that filter has only one term, the rest of this slice is unused and is unavailable for other filter types.

Continuing with the above example, assume that you create and apply 256 ingress port filters with one term each so that one memory slice is filled. This leaves two more memory slices available for ingress filters. (Remember that the maximum number of ingress terms is 768.) If you then create and apply an ingress Layer 3 filter with one term, another memory slice is reserved for ingress Layer 3 filters. As before, the rest of the slice is unused and is unavailable for different filter types. At this point there is one memory slice available for any ingress filter type.

Now assume that you create and apply a VLAN ingress filter. The final memory slice is reserved for VLAN ingress filters. Memory allocation for ingress filters (once again assuming one term per filter) is as follows:

- Slice 1: Filled with 256 ingress port filters. You cannot commit any more ingress port filters.
- Slice 2: Contains one ingress Layer 3 filter with one term. You can commit 255 more terms in ingress Layer 3 filters.
- Slice 3: Contains one ingress VLAN filter with one term. You can commit 255 more terms in ingress VLAN filters.

Here is another example. Assume that you create 257 ingress port filters with one term per filter—that is, you create one more term than a single memory slice can accommodate. When you apply the filters and commit the configuration, the filter memory allocation is:

- Slice 1: Filled with 256 ingress port filters. You cannot apply any more ingress port filters.
- Slice 2: Contains one ingress port filter. You can apply 255 more terms in ingress port filters.
- Slice 3: This slice is unassigned. You can create and apply 256 terms in ingress filters of any type (port, Layer 3, or VLAN), but all the filters must be of the same type.

### Egress Filters

All of the preceding principles also apply to egress filters, but four memory slices are used because IPv4 Layer 3 filters and IPv6 Layer 3 filters are stored in separate slices. The memory slices for egress filters are the same size as those for ingress filters, so the maximum number of egress filter terms is therefore 1024.

### Avoid Configuring too Many Filters

If you violate any of these restrictions and commit a configuration that is not in compliance, Junos OS rejects the excessive filters. For example, if you configure 300 ingress port filters and 300 ingress Layer 3 filters and try to commit the configuration, Junos OS does the following (again assuming one term per filter):

- Accepts the 300 ingress port filters (storing them in two memory slices).
- Accepts the first 256 ingress Layer 3 filters it processes (storing them in the third memory slice).
- Rejects the remaining 44 ingress Layer 3 filters.

**NOTE:** In this situation, be sure to delete excessive filters (for example, the remaining 44 ingress Layer 3 filters) from the configuration before you reboot the device. If you reboot a device that has a noncompliant configuration, you cannot predict which filters are installed after the reboot. Using the example above, the 44 ingress Layer 3 filters that were originally rejected might be installed, and 44 of the port filters that were originally accepted might be rejected.

### Configuring TCAM Error Messages

---

You can configure your switch to display error messages if a filter cannot be installed because there isn't enough TCAM space available. To have TCAM error messages sent to a syslog file, enter

```
set system syslog file filename pfe emergency
```

To have TCAM error messages sent to the console, enter

```
set system syslog console pfe emergency
```

To have TCAM error messages sent to an SSH terminal session, enter

```
set system syslog user user-login pfe emergency
```

### Policers can Limit Egress Filters

---

The number of egress policers that you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that consume two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

You can prevent this problem from occurring by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

### Planning for Filter-Specific Policers

You can configure policers to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps. However, the behavior of a filter-specific policer is affected by how the firewall filter terms that reference the policer are stored in ternary content addressable memory (TCAM). If you create a filter-specific policer and reference it in multiple firewall filter terms, the policer allows more traffic than expected if the terms are stored in different TCAM slices. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms that are stored in three separate memory slices, the total bandwidth allowed by the filter is 3 Gbps, not 1 Gbps.

To prevent this unexpected behavior from occurring, use the information about TCAM slices presented above to organize your configuration file so that all the firewall filter terms that reference a given filter-specific policer are stored in the same TCAM slice.

### Understanding Firewall Filter Processing Points for Bridged and Routed Packets

You apply firewall filters at multiple processing points in the forwarding path. At each processing point, the action to be taken on a packet is determined by the configuration of the filter and the results of the lookup in the forwarding or routing table.

For both bridged (Layer 2) unicast packets and routed (Layer 3) unicast packets, firewall filters are applied in the prescribed order shown below (assuming that each filter is present and a packet is accepted by each one).

Bridged packets:

1. Ingress port filter
2. Ingress VLAN filter

3. Egress VLAN filter
4. Egress port filter

Routed packets:

1. Ingress port firewall filter
2. Ingress VLAN firewall filter (Layer 2 CoS)
3. Ingress router firewall filter (Layer 3 CoS)
4. Egress router firewall filter
5. Egress VLAN firewall filter
6. Egress port filter

**NOTE:** MAC learning occurs before filters are applied, so switches learn the MAC addresses of packets that are dropped by ingress filters.

## Applying Firewall Filters to Interfaces

For a firewall filter to work, you must apply it to at least one interface. To do this, include the **filter** statement when configuring a logical interface at the **[edit interfaces]** hierarchy level:

```
[edit interfaces]
user@switch# set interface-name unit logical-unit-number family family-name filter (input |
output) filter-name
```

In the **input** statement, specify a firewall filter to be evaluated when packets are received on the interface. Input filters applied to a loopback interface affect only traffic destined for the Routing Engine.

In the **output** statement, specify a filter to be evaluated when packets exit the interface.

**NOTE:** When you create a loopback interface, it is important to apply an ingress filter to it so the Routing Engine is protected. We recommend that when you apply a filter to the loopback interface `lo0`, you include the **apply-groups** statement. Doing so ensures that the filter is automatically inherited on every loopback interface, including `lo0` and other loopback interfaces.

### Overview of Policers

A switch polices traffic by limiting the input or output transmission rate of a class of traffic according to user-defined criteria. Policing (or rate-limiting) traffic allows you to control the maximum rate of traffic sent or received on an interface and to provide multiple priority levels or classes of service.

---

### Policer Overview

---

You use policers to apply limits to traffic flow and set consequences for packets that exceed these limits—usually applying a higher loss priority—so that if packets encounter downstream congestion, they can be discarded first. Policers apply only to unicast packets.

Policers provide two functions: metering and marking. A policer meters (measures) each packet against traffic rates and burst sizes that you configure. It then passes the packet and the metering result to the marker, which assigns a packet loss priority that corresponds to the metering result. [Figure 188 on page 4968](#) illustrates this process.

Figure 188: Flow of Tricolor Marking Policer Operation

9017049

After you name and configure a policer, you use it by specifying it as an action in one or more firewall filters.

### Policer Types

A switch supports three types of policers:

- Single-rate two-color marker—A two-color policer (or “policer” when used without qualification) meters the traffic stream and classifies packets into two categories of packet loss priority (PLP) according to a configured bandwidth and burst-size limit. You can mark packets that exceed the bandwidth and burst-size limit with a specified PLP or simply discard them.

You can specify this type of policer in an ingress or egress firewall.

**NOTE:** A two-color policer is most useful for metering traffic at the port (physical interface) level.

- Single-rate three-color marker—This type of policer is defined in RFC 2697, *A Single Rate Three Color Marker*, as part of an assured forwarding (AF) per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment. This type of policer meters traffic based on one rate—the configured committed information rate (CIR) as well as the committed burst size (CBS) and the excess burst size (EBS). The CIR specifies the average rate at which bits are admitted to the switch. The CBS specifies the usual burst size in bytes and the EBS specifies the maximum burst size in bytes. The EBS must be greater than or equal to the CBS, and neither can be 0.

You can specify this type of policer in an ingress or egress firewall.

**NOTE:** A single-rate three-color marker (TCM) is most useful when a service is structured according to packet length and not peak arrival rate.

- Two-rate three-color marker—This type of policer is defined in RFC 2698, *A Two Rate Three Color Marker*, as part of an assured forwarding per-hop-behavior classification system for a Differentiated Services environment. This type of policer meters traffic based on two rates—the CIR and peak information rate (PIR) along with their associated burst sizes, the CBS and peak burst size (PBS). The PIR specifies the maximum rate at which bits are admitted to the network and must be greater than or equal to the CIR.

You can specify this type of policer in an ingress or egress firewall.

**NOTE:** A two-rate three-color policer is most useful when a service is structured according to arrival rates and not necessarily packet length.

See [Table 352 on page 4969](#) for information about how metering results are applied for each of these policer types.

### Policer Actions

Policer actions are implicit or explicit and vary by policer type. *Implicit* means that Junos OS assigns the loss priority automatically. [Table 352 on page 4969](#) describes the policer actions.

**Table 352: Policer Actions**

| Policer                 | Marking                        | Implicit Action                  | Configurable Action |
|-------------------------|--------------------------------|----------------------------------|---------------------|
| Single-rate two-color   | Green (conforming)             | Assign low loss priority         | None                |
|                         | Red (nonconforming)            | None                             | Discard             |
| Single-rate three-color | Green (conforming)             | Assign low loss priority         | None                |
|                         | Yellow (above the CIR and CBS) | Assign medium-high loss priority | None                |
|                         | Red (above the EBS)            | Assign high loss priority        | Discard             |
| Two-rate three-color    | Green (conforming)             | Assign low loss priority         | None                |
|                         | Yellow (above the CIR and CBS) | Assign medium-high loss priority | None                |
|                         | Red (above the PIR and PBS)    | Assign high loss priority        | Discard             |

**NOTE:** If you specify a policer in an egress firewall filter, the only supported action is discard.

### Policer Colors

Single-rate and two-rate three-color policers can operate in two modes:

- **Color-blind**—In color-blind mode, the three-color policer assumes that all packets examined have not been previously marked or metered. In other words, the three-color policer is “blind” to any previous coloring a packet might have had.
- **Color-aware**—In color-aware mode, the three-color policer assumes that all packets examined have been previously marked or metered. In other words, the three-color policer is “aware” of the previous coloring a packet might have had. In color-aware mode, the three-color policer can increase the PLP of a packet but cannot decrease it. For example, if a color-aware three-color policer meters a packet with a medium PLP marking, it can raise the PLP level to high but cannot reduce the PLP level to low.

---

### Filter-Specific Policers

You can configure policers to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps. However, the behavior of a filter-specific policer is affected by how the firewall filter terms that reference the policer are stored in TCAM. If you create a filter-specific policer and reference it in multiple firewall filter terms, the policer allows more traffic than expected if the terms are stored in different TCAM slices. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms that are stored in three separate memory slices, the total bandwidth allowed by the filter is 3 Gbps, not 1 Gbps.

To prevent this unexpected behavior from occurring, use the information about TCAM slices presented in [“Planning the Number of Firewall Filters to Create” on page 4961](#) to organize your configuration file so that all the firewall filter terms that reference a given filter-specific policer are stored in the same TCAM slice.

---

### Suggested Naming Convention for Policers

We recommend that you use the naming convention ***policertypeTCM#-color type*** when configuring three-color policers and ***policer#*** when configuring two-color policers. TCM stands for three-color marker. Because policers can be numerous and must be applied correctly to work, a simple naming convention makes it easier to apply the policers properly. For example, the first single-rate, color-aware three-color policer configured would be named **srTCM1-ca**. The second two-rate, color-blind three-color configured would be named **trTCM2-cb**. The elements of this naming convention are explained below:

- sr (single-rate)
- tr (two-rate)
- TCM (tricolor marking)
- 1 or 2 (number of marker)
- ca (color-aware)
- cb (color-blind)

---

## Policer Counters

Each policer that you configure includes an implicit counter that counts the number of packets that exceed the rate limits that are specified for the policer. If you use the same policer in multiple terms—either within the same filter or in different filters—the implicit counter counts all the packets that are policed in all of these terms. If you want to obtain separate packet counts for each term, use these options:

- Configure a unique policer for each term.
- Configure only one policer, but use a unique, explicit counter in each term.

---

## Policer Algorithms

Policing uses the *token-bucket algorithm*, which enforces a limit on average bandwidth while allowing bursts up to a specified maximum value. It offers more flexibility than the *leaky bucket algorithm* in allowing a certain amount of bursty traffic before it starts discarding packets.

---

## How Many Policers are Supported?

You can configure and commit the following numbers of policers on QFX3500 and QFX3600 standalone switches and QFabric Node devices:

- Two-color policers used in ingress firewall filters: 767
- Three-color policers used in ingress firewall filters: 767
- Two-color policers used in egress firewall filters: 1022
- Three-color policers used in egress firewall filters: 512

---

## Policers can Limit Egress Firewall Filters

The number of egress policers that you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that consume two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.

- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

## Understanding Policers with Link Aggregation Groups

If you apply a policer to a link aggregation group (LAG) on a QFX3500 switch or node, the policer applies to all the interfaces in the LAG in aggregate. For example, if you configure a policer to rate-limit at 1 Gbps and apply the policer (by using a firewall filter) to a LAG that has two member interfaces on a single switch or node, the total allowed throughput for both members is 1 Gbps.

If you apply a policer to a LAG that has members on different nodes in a QFabric network Node group or redundant server Node group, the configured rate applies to the interface on each node. For example, if you configure a policer to rate-limit at 1 Gbps and apply the policer to a LAG that has one member on server node A and one member on server node B, the allowed throughput for each member is 1 Gbps, for a total allowed throughput of 2 Gbps.

## Understanding Color-Blind Mode for Single-Rate Tricolor Marking

With the color-blind mode of single-rate tricolor marking, all packets are evaluated against the CBS. If a packet exceeds the CBS, it is evaluated against the EBS. In color-blind mode, the policer supports three loss priorities only: low, medium-high, and high.

Packets that exceed the CBS but are below the EBS are marked yellow (medium-high). Packets that exceed the EBS are marked red (high), as shown in [Table 353 on page 4973](#).

**Table 353: Color-Blind Mode TCM Color-to-PLP Mapping**

| Color  | PLP         | Meaning                                                     |
|--------|-------------|-------------------------------------------------------------|
| Green  | low         | Conforming.                                                 |
| Yellow | medium-high | Packet exceeds the CIR and CBS but does not exceed the EBS. |
| Red    | high        | Packet exceeds the EBS.                                     |

## Understanding Color-Aware Mode for Single-Rate Tricolor Marking

In color-aware mode, the treatment the packet receives depends on its classification. Marking can increase a preassigned PLP but cannot decrease it.

### Summary of PLP Changes

[Table 354 on page 4973](#) shows how a packet's incoming priority can be modified with single-rate marking.

**Table 354: Color-Aware Mode Single-Rate PLP Mapping**

| Incoming PLP | Packet Metered Against | Possible Cases                                              | Outgoing PLP |
|--------------|------------------------|-------------------------------------------------------------|--------------|
| low          | CIR, CBS, and EBS      | Conforming                                                  | low          |
|              |                        | Packet exceeds the CIR and CBS but does not exceed the EBS. | medium-high  |
|              |                        | Packet exceeds the EBS.                                     | high         |
| medium-low   | EBS only               | Packet does not exceed the EBS.                             | medium-low   |
|              |                        | Packet exceeds the EBS.                                     | high         |
| medium-high  | EBS only               | Packet does not exceed the EBS.                             | medium-high  |
|              |                        | Packet exceeds the EBS.                                     | high         |

**Table 354: Color-Aware Mode Single-Rate PLP Mapping (*continued*)**

| Incoming PLP | Packet Metered Against      | Possible Cases | Outgoing PLP |
|--------------|-----------------------------|----------------|--------------|
| high         | Not metered by the policer. | All cases.     | high         |

The following sections describe single-rate color-aware PLP mapping in more detail.

#### ***Effect on Green Packets (Low PLP)***

Packets belonging to the green class have already been marked by a classifier with low PLP. The marking policer can leave the PLP unchanged or increase it to medium-high or high, so these packets are therefore metered against both the CBS and the EBS. For example, if a behavior aggregate or multifield classifier marks a packet with low PLP and the two-rate TCM policer is in color-aware mode, the output loss priority is as follows:

- If the rate of traffic flow is less than the CIR, packets remain marked as low PLP.
- If bursts exceed the CBS but not the EBS, some of the packets are marked as medium-high PLP, and some of the packets remain marked as low PLP.
- If bursts exceed the EBS, some of the packets are marked as high PLP, and some of the packets remain marked as low PLP.

#### ***Effect on Yellow Packets (Medium PLP)***

Packets belonging to the yellow class have already been marked by a classifier with medium-low or medium-high PLP. The marking policer can leave the PLP unchanged or increase it to high, so these packets are therefore metered against the EBS only. For example, if a behavior aggregate or multifield classifier marks a packet with medium-low PLP and the two-rate TCM policer is in color-aware mode, the output loss priority is as follows:

- If the rate of traffic flow is less than the CBS, the packets remain marked as medium-low PLP.
- If the rate of traffic flow is greater than the CBS but less than the EBS, the packets remain marked as medium-low PLP.
- If the rate of traffic flow is greater than the EBS, some of the packets are marked as high PLP and some remain marked as medium-low PLP.

If a BA or multifield classifier marks a packet with medium-high PLP and the two-rate TCM policer is in color-aware mode, the policer assigns output loss priority as follows:

- If the rate of traffic flow is less than the CBS, the packets remain marked as medium-high PLP.
- If the rate of traffic flow is greater than the CBS but less than the EBS, the packets remain marked as medium-high PLP.
- If the rate of traffic flow is greater than the EBS, some of the packets are marked as high PLP and some remain marked as medium-high PLP.

***Effect on Red Packets (High PLP)***

Packets belonging to the red class have already been marked by a classifier with high PLP. Because the policer cannot decrease the PLP, it does not change it, and these packets are not metered against the CBS or the EBS.

## Understanding Color-Blind Mode for Two-Rate Tricolor Marking

With the color-blind mode of two-rate tricolor marking, all packets are evaluated against the committed information rate (CIR). If a packet exceeds the CIR, it is evaluated against the peak information rate (PIR). Packets that exceed the CIR but are below the PIR are marked yellow (medium-high). Packets that exceed the PIR are marked red (high).

**Table 355: Color-Blind Mode TCM Color-to-PLP Mapping**

| Color  | PLP                | Meaning                                             |
|--------|--------------------|-----------------------------------------------------|
| Green  | <b>low</b>         | Packet does not exceed the CIR.                     |
| Yellow | <b>medium-high</b> | Packet exceeds the CIR but does not exceed the PIR. |
| Red    | <b>high</b>        | Packet exceeds the PIR.                             |

- Related Documentation**

## Understanding Color-Aware Mode for Two-Rate Tricolor Marking

In color-aware mode, the treatment the packet receives depends on its classification. Marking can increase the preassigned PLP but cannot decrease it

### Summary of PLP Changes

Table 356 on page 4975 shows how a packet's incoming priority can be modified with two-rate marking.

**Table 356: Color-Aware Mode Two-Rate PLP Mapping**

| Incoming PLP | Packet Metered Against | Possible Cases                          | Outgoing PLP       |
|--------------|------------------------|-----------------------------------------|--------------------|
| <b>low</b>   | CIR and PIR            | Packet does not exceed the CIR.         | <b>low</b>         |
|              |                        | Packet exceeds the CIR but not the PIR. | <b>medium-high</b> |
|              |                        | Packet exceeds the PIR.                 | <b>high</b>        |

Table 356: Color-Aware Mode Two-Rate PLP Mapping (*continued*)

| Incoming PLP | Packet Metered Against      | Possible Cases                  | Outgoing PLP |
|--------------|-----------------------------|---------------------------------|--------------|
| medium-low   | PIR only                    | Packet does not exceed the PIR. | medium-low   |
|              |                             | Packet exceeds the PIR.         | high         |
| medium-high  | PIR only                    | Packet does not exceed the PIR. | medium-high  |
|              |                             | Packet exceeds the PIR.         | high         |
| high         | Not metered by the policer. | All cases.                      | high         |

The following sections describe color-aware two-rate PLP mapping in more detail.

#### Effect on Green Packets (Low PLP)

Packets belonging to the green class have already been marked by a classifier with low PLP. The marking policer can leave the packet's PLP unchanged or increase the PLP to medium-high or high. These packets are therefore metered against both the CIR and the PIR. For example, if a behavior aggregate or multifield classifier marks a packet with low PLP and the two-rate TCM policer is in color-aware mode, the output loss priority is as follows:

- If the rate of traffic flow is less than the CIR, the packets remain marked as low PLP.
- If the rate of traffic flow is greater than the CIR but less than the PIR, some of the packets are marked as medium-high PLP and some of the packets remain marked as low PLP.
- If the rate of traffic flow is greater than the PIR, some of the packets are marked as high PLP and some of the packets remain marked as low PLP.

#### Effect on Yellow Packets (Medium PLP)

Packets belonging to the yellow class have already been marked by a classifier with medium-low or medium-high PLP. The marking policer can leave the PLP unchanged or increase it to high. These packets are therefore metered against the PIR only. For example, if a behavior aggregate (BA) or multifield classifier marks a packet with medium-low PLP and the two-rate TCM policer is in color-aware mode, the policer assigns output loss priority as follows:

- If the rate of traffic flow is less than the CIR, the packets remain marked as medium-low PLP.
- If the rate of traffic flow is greater than the CIR but less than the PIR, the packets remain marked as medium-low PLP.
- If the rate of traffic flow is greater than the PIR, some of the packets are marked as high PLP and some of the packets remain marked as medium-low PLP.

If a BA or multifield classifier marks a packet with medium-high PLP and the two-rate TCM policer is in color-aware mode, the policer assigns output loss priority as follows:

- If the rate of traffic flow is less than the CIR, the packets remain marked as medium-high PLP.
- If the rate of traffic flow is greater than the CIR but less than the PIR, the packets remain marked as medium-high PLP.
- If the rate of traffic flow is greater than the PIR, some of the packets are marked as high PLP and some of the packets remain marked as medium-high PLP.

### **Effect on Red Packets (High PLP)**

---

Packets belonging to the red class have already been marked by a classifier with high PLP. Because the policer cannot decrease the PLP, it does not change it, and these packets are not metered against the CIR or the PIR.

### Mitigation of Ethernet Switching Table Overflow Attacks

---

In an overflow attack on an Ethernet switching table, an intruder sends so many requests from new MAC addresses that the table cannot learn all the addresses. The attack forces the switch to send broadcast messages when it needs to send traffic to addresses for which it lacks MAC addresses. In addition to generating unnecessary traffic, the attacker might be able to sniff the broadcast packets.

To mitigate such attacks, you can configure a limit for learned MAC addresses or allow only specific MAC addresses. Use the MAC limit feature to control the total number of MAC addresses that can be added to the Ethernet switching table for the specified interface or interfaces. By setting the MAC addresses that are explicitly allowed, you ensure that the addresses of network devices whose network access is critical are guaranteed to be included in the Ethernet switching table.

### Mitigation of Rogue DHCP Server Attacks

---

By default, all access ports are untrusted, and all trunk ports are trusted with regard to DHCP. Trusted ports allow DHCP servers to provide IP addresses and other information to requesting devices. If someone connects an unauthorized DHCP server to a trusted port, the unauthorized server can start issuing IP addresses and configuration information to the network's DHCP clients. The information provided to the clients by this server can disrupt their network access. The unauthorized server might also assign itself as the default gateway device for the network. An attacker can then sniff the network traffic and perpetrate a man-in-the-middle attack—that is, it misdirects traffic intended for a legitimate network device to a device of its choice.

To mitigate this problem, set the interface to which the unauthorized server is connected as untrusted. That action blocks all ingress DHCP server messages from that interface.

**NOTE:** The switch logs all DHCP server packets that are received on untrusted ports. For example:

```
5 untrusted DHCPOFFER received, interface xe-0/0/2.0[65], vlan v1[10] server  
ip/mac 12.12.12.1/00:00:00:00:01:12 offer ip/client mac  
12.12.12.253/00:AA:BB:CC:DD:01
```

You can use these messages to detect unauthorized DHCP servers on the network.

**NOTE:** If you attach a DHCP server to an access port, you must configure the port as trusted.

---

### Protection Against ARP Spoofing Attacks

---

In ARP spoofing, an attacker sends faked ARP messages on the network. The attacker associates its own MAC address with the IP address of a network device connected to

the switch. Any traffic sent to that IP address is instead sent to the attacker. Now the attacker can create various types of problems, including sniffing the packets that were meant for another host and perpetrating man-in-the-middle attacks. (In a man-in-the-middle attack, the attacker intercepts messages between two hosts, reads them, and perhaps alters them, all without the original hosts knowing that their communications have been compromised.)

To protect against ARP spoofing on your switch, enable both DHCP snooping and dynamic ARP inspection (DAI). DHCP snooping builds and maintains the DHCP snooping table. That table contains the MAC addresses, IP addresses, lease times, binding types, VLAN information, and interface information for the untrusted interfaces on the switch. DAI uses the information in the DHCP snooping table to validate ARP packets. Invalid ARP packets are blocked, and when they are blocked, a system log message is recorded that includes the type of ARP packet and the sender's IP address and MAC address.

See [“Example: Configuring DHCP Snooping and DAI to Protect the Switch from ARP Spoofing Attacks” on page 5033](#).

### Protection Against DHCP Snooping Database Alteration Attacks

In an attack designed to alter the DHCP snooping database, an intruder introduces a DHCP client on one of the switch's untrusted access interfaces that has a MAC address identical to that of a client on another untrusted port. The intruder acquires the DHCP lease, which results in changes to the entries in the DHCP snooping table. Subsequently, what would have been valid ARP requests from the legitimate client are blocked.

To protect against this type of alteration of the DHCP snooping database, configure MAC addresses that are explicitly allowed on the interface. See [“Example: Configuring Allowed MAC Addresses to Protect the Switch from DHCP Snooping Database Alteration Attacks” on page 5038](#).

### Protection Against DHCP Starvation Attacks

In a DHCP starvation attack, an attacker floods an Ethernet LAN with DHCP requests from spoofed (counterfeit) MAC addresses so that trusted DHCP servers cannot keep up with requests from legitimate DHCP clients. The address space of those servers is completely used up, so they can no longer assign IP addresses and lease times to clients. DHCP requests from those clients are either dropped—that is, the result is a denial of service (DoS)—or directed to a rogue DHCP server set up by the attacker to imitate a legitimate DHCP server.

To protect the switch from DHCP starvation attacks, use the MAC limiting feature. Specify the maximum number of MAC addresses that the switch can learn on the access interfaces to which DHCP clients connect. The DHCP server or servers can then supply only the specified number of IP addresses over each of those interfaces. If a DHCP starvation attack occurs after the maximum number of IP addresses has been assigned, the attack fails.

## Understanding Port Security

Ethernet LANs are vulnerable to attacks such as address spoofing (forging) and Layer 2 denial of service (DoS) on network devices. Port security features help protect the access ports on your device against the loss of information and productivity that such attacks can cause.

The Juniper Networks Junos operating system (Junos OS) provides features to help secure ports on a device. Ports can be categorized as either trusted or untrusted. You apply policies appropriate to each category to protect ports against various types of attacks.

Basic port security features are enabled in the device's default configuration. You can configure additional features with minimal configuration steps.

Depending on the particular feature, you can configure the feature either on VLANs or bridge domain interfaces.

Port security features supported on switching devices are:

- DHCP snooping—Filters and blocks ingress Dynamic Host Configuration Protocol (DHCP) server messages on untrusted ports; builds and maintains a database of DHCP lease information, which is called the DHCP snooping database.

**NOTE:** DHCP snooping is not enabled in the default configuration of the switching device. DHCP snooping is enabled on a VLAN or bridge domain. The details of enabling DHCP snooping depend on the particular device.

- DHCPv6 snooping—DHCP snooping for IPv6.
- DHCP option 82—Also known as the DHCP Relay Agent Information option. This DHCPv4 feature helps protect the switching device against attacks such as spoofing of IP addresses and MAC addresses and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.
- DHCPv6 option 37—Option 37 is the remote ID option for DHCPv6 and is used to insert information about the network location of the remote host into DHCPv6 packets. You enable option 37 on a VLAN.

**NOTE:** DHCPv6 snooping with option 37 is not supported on the MX Series.

- DHCPv6 option 18—Option 18 is the circuit ID option for DHCPv6 and is used to insert information about the client port into DHCPv6 packets. This option includes other details that can be optionally configured, such as the prefix and the interface description.
- DHCPv6 option 16—Option 16 is the vendor ID option for DHCPv6 and is used to insert information about the vendor of the client hardware into DHCPv6 packets.
- Dynamic ARP inspection (DAI)—Prevents Address Resolution Protocol (ARP) spoofing attacks. ARP requests and replies are compared against entries in the DHCP snooping database, and filtering decisions are made on the basis of the results of those comparisons. You enable DAI on a VLAN.
- IPv6 neighbor discovery inspection—Prevents IPv6 address spoofing attacks. Neighbor discovery requests and replies are compared against entries in the DHCPv6 snooping database, and filtering decisions are made on the basis of the results of those comparisons. You enable neighbor discovery inspection on a VLAN.
- IP source guard—Mitigates the effects of IP address spoofing attacks on the Ethernet LAN. With IP source guard enabled, the source IP address in the packet sent from an untrusted access interface is validated against the DHCP snooping database. If the packet cannot be validated, it is discarded. You enable IP source guard on a VLAN or bridge domain.

**NOTE:** IP source guard is not supported on the QFX Series.

- IPv6 source guard—IP source guard for IPv6.

**NOTE:** IPv6 source guard is not supported on the QFX Series.

- MAC limiting—Protects against flooding of the Ethernet switching table (also known as the MAC forwarding table or Layer 2 forwarding table). You can enable MAC limiting on an interface.
- MAC move limiting—(Not supported on EX9200) Tracks MAC movement and detects MAC spoofing on access ports. You enable this feature on a VLAN or bridge domain.
- Persistent MAC learning—Also known as sticky MAC. Persistent MAC learning enables interfaces to retain dynamically learned MAC addresses across switch reboots. You enable this feature on an interface.
- Trusted DHCP server—Configuring the DHCP server on a trusted port protects against rogue DHCP servers sending leases. You enable this feature on an interface (port). By default, access ports are untrusted, and trunk ports are trusted. (Access ports are the switch ports that connect to Ethernet endpoints such as user PCs and laptops, servers, and printers. Trunk ports are the switch ports that connect an Ethernet switch to other switches or to routers.)

## Understanding DHCP Snooping for Port Security

DHCP snooping enables the switching device, which can be either a switch or a router, to monitor and control DHCP messages received from untrusted devices connected to it. When DHCP snooping is enabled, the system snoops the DHCP messages to view DHCP lease information and builds and maintains a database of valid bindings between IP addresses and MAC address (IP-MAC bindings) called the DHCP snooping database. Only clients with valid bindings are allowed access to the network.

---

### DHCP Snooping Basics

The Dynamic Host Configuration Protocol (DHCP) allocates IP addresses dynamically, *leasing* addresses to devices so that the addresses can be reused when no longer needed. Hosts and end devices that require IP addresses obtained through DHCP must communicate with a DHCP server across the LAN.

DHCP snooping acts as a guardian of network security by keeping track of valid IP addresses assigned to downstream network devices by a trusted DHCP server (the server is connected to a trusted network port).

By default, all trunk ports on the switch are trusted and all access ports are untrusted for DHCP snooping.

When DHCP snooping is enabled, the lease information from the switching device is used to create the DHCP snooping table, also known as the binding table. The table shows current IP-MAC bindings, as well as lease time, type of binding, names of associated VLANs, and associated interfaces.

**NOTE:** DHCP snooping is disabled in the default configuration of the switching device. You must explicitly enable DHCP snooping by setting `examine-dhcp` at the `[edit ethernet-switching-options secure-access-port]` hierarchy level.

Entries in the DHCP snooping database are updated in these events:

- When a DHCP client releases an IP address (sends a DHCPRELEASE message). In this event, the associated mapping entry is deleted from the database.
- If you move a network device from one VLAN to another. In this event, typically the device needs to acquire a new IP address. Therefore, its entry in the database, including its VLAN ID, is updated.
- When the lease time (timeout value) assigned by the DHCP server expires. In this event, the associated entry is deleted from the database.

**TIP:** By default, the IP-MAC bindings are lost when the switching device is rebooted and DHCP clients (the network devices, or hosts) must reacquire bindings. However, you can configure the bindings to persist by setting the `dhcp-snooping-file` statement to store the database file either locally or remotely.

You can configure the switching device to snoop DHCP server responses from particular VLANs only. This prevents spoofing of DHCP server messages.

You configure DHCP snooping per VLAN, not per interface (port). DHCP snooping is disabled by default on switching devices.

### DHCP Snooping Process

The basic process of DHCP snooping consists of the following steps:

**NOTE:** When DHCP snooping is enabled for a VLAN, all DHCP packets sent from the network devices in that VLAN are subjected to DHCP snooping. The final IP-MAC binding occurs when the DHCP server sends DHCPACK to the DHCP client.

1. The network device sends a DHCPDISCOVER packet to request an IP address.
2. The switching device forwards the packet to the DHCP server.
3. The server sends a DHCPOFFER packet to offer an address. If the DHCPOFFER packet is from a trusted interface, the switching device forwards the packet to the DHCP client.
4. The network device sends a DHCPREQUEST packet to accept the IP address. The switching device adds an IP-MAC placeholder binding to the database. The entry is

considered a placeholder until a DHCPACK packet is received from the server. Until then, the IP address could still be assigned to some other host.

5. The server sends a DHCPACK packet to assign the IP address or a DHCPNAK packet to deny the address request.
6. The switching device updates the DHCP snooping database according to the type of packet received:
  - If the switching device receives a DHCPACK packet, it updates lease information for the IP-MAC bindings in its database.
  - If the switching device receives a DHCPNACK packet, it deletes the placeholder.

**NOTE:** The DHCP snooping database is updated only after the DHCPREQUEST packet has been sent.

For general information about the messages that the DHCP client and DHCP server exchange during the assignment of an IP address for the client, see the *Junos OS Administration Library for Routing Devices*.

### DHCPv6 Snooping

DHCPv6 snooping is the equivalent of DHCP snooping for IPv6. The process for DHCPv6 snooping is similar to that for DHCP snooping, but uses different names for the messages exchanged between the client and server to assign IPv6 addresses. [Table 357 on page 4984](#) shows DHCPv6 messages and their DHCP equivalents.

**Table 357: DHCPv6 Messages and Equivalent DHCPv4 Messages**

| Sent by | DHCPv6 Messages         | Equivalent DHCP Messages |
|---------|-------------------------|--------------------------|
| Client  | SOLICIT                 | DHCPDISCOVER             |
| Server  | ADVERTISE               | DHCPOFFER                |
| Client  | REQUEST, RENEW, REBIND  | DHCPREQUEST              |
| Server  | REPLY                   | DHCPACK/DHCPNAK          |
| Client  | RELEASE                 | DHCPRELEASE              |
| Client  | INFORMATION-REQUEST     | DHCPINFORM               |
| Client  | DECLINE                 | DHCPDECLINE              |
| Client  | CONFIRM                 | none                     |
| Server  | RECONFIGURE             | DHCPFORCERENEW           |
| Client  | RELAY-FORW, RELAY-REPLY | none                     |

---

## Rapid Commit for DHCPv6

---

DHCPv6 provides for a Rapid Commit option (DHCPv6 option 14), which, when supported by the server and set by the client, shortens the exchange from a four-way relay to a two-message handshake. For more information about enabling the Rapid Commit option, see *Enabling DHCPv6 Rapid Commit Support*.

In the rapid commit process:

1. The DHCPv6 client sends out a SOLICIT message that contains a request that rapid assignment of address, prefix, and other configuration parameters be preferred.
2. If the DHCPv6 server supports rapid assignment, it responds with a REPLY message, which contains the assigned IPv6 address and prefix and other configuration parameters.

---

## DHCP Server Access

---

You can configure a switching device's access to the DHCP server in three ways:

- [Switching Device, DHCP Clients, and DHCP Server Are All on the Same VLAN on page 4985](#)
- [Switching Device Acts as DHCP Server on page 4986](#)
- [Switching Device Acts as Relay Agent on page 4987](#)

### ***Switching Device, DHCP Clients, and DHCP Server Are All on the Same VLAN***

When the switching device, DHCP clients, and DHCP server are *all members of the same VLAN*, the DHCP server can be connected to the switching device in one of two ways:

- The server is directly connected to the same switching device as the one connected to the DHCP clients (the hosts, or network devices, that are requesting IP addresses from the server). The VLAN is enabled for DHCP snooping to protect the untrusted access ports. The trunk port is configured by default as a trusted port. See [Figure 189 on page 4986](#).
- The server is connected to an intermediary switching device (Switching Device 2). The DHCP clients are connected to Switching Device 1, which is connected through a trunk port to Switching Device 2. Switching Device 2 is being used as a transit device. The VLAN is enabled for DHCP snooping to protect the untrusted access ports. The trunk port is configured by default as a trusted port. As shown in [Figure 190 on page 4986](#), ge-0/0/11 is a trusted trunk port.

Figure 189: DHCP Server Connected Directly to a Switching Device

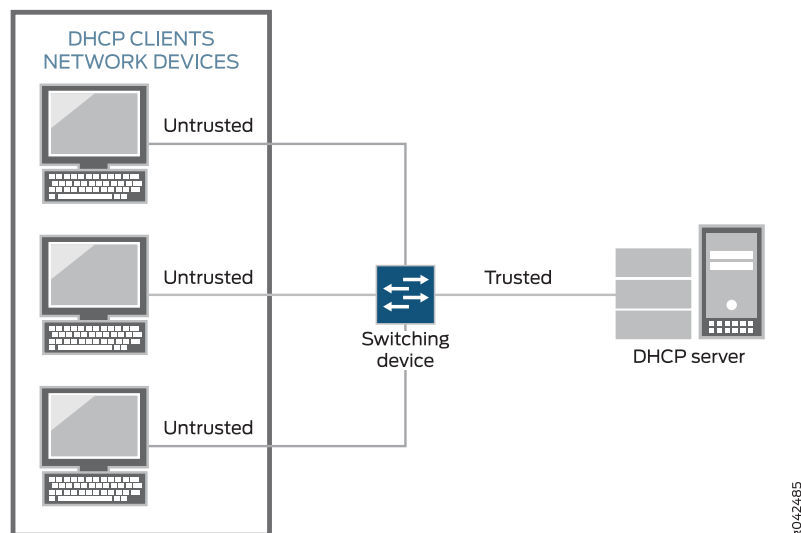

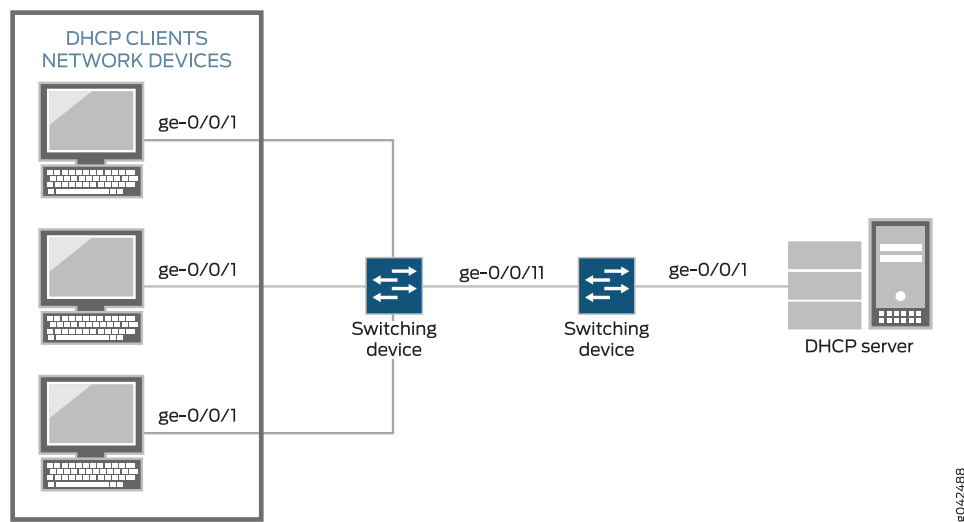

Figure 190: DHCP Server Connected Directly to Switching Device 2, with Switching Device 2 Connected to Switching Device 1 Through a Trusted Trunk Port

### Switching Device Acts as DHCP Server

**NOTE:** The switching device acting as a DHCP server is not supported on the QFX Series.

The switching device itself is configured as a DHCP server; this is known as a *local configuration*. See [Figure 191 on page 4987](#).

Figure 191: Switching Device Is the DHCP Server

8042486

***Switching Device Acts as Relay Agent***

The switching device functions as a relay agent when the DHCP clients or the DHCP server is connected to the device through a Layer 3 interface. The Layer 3 interfaces on the switching device are configured as routed VLAN interfaces (RVIs), which are also known as integrated routing and bridging (IRB) interfaces. The trunk interfaces are trusted by default.

These two scenarios illustrate the switching device acting as a relay agent:

- The DHCP server and clients are in different VLANs.
- The switching device is connected to a router that is in turn connected to the DHCP server. See [Figure 192 on page 4988](#).

**Figure 192: Switching Device Acting as Relay Agent Through Router to DHCP Server**

8042487

### Static IP Address Additions to the DHCP Snooping Database

You can add specific static IP addresses to the database as well as have the addresses dynamically assigned through DHCP snooping. To add static IP addresses, you supply the IP address, the MAC address of the device, the interface on which the device is connected, and the VLAN with which the interface is associated. No lease time is assigned to the entry. The statically configured entry never expires.

### Snooping DHCP Packets That Have Invalid IP Addresses

If you enable DHCP snooping on a VLAN and then devices on that VLAN send DHCP packets that request invalid IP addresses, these invalid IP addresses are stored in the DHCP snooping database until they are deleted when their default timeout is reached. To eliminate this unnecessary consumption of space in the DHCP snooping database, the switching device drops the DHCP packets that request invalid IP addresses, preventing the snooping of these packets. The invalid IP addresses are:

- 0.0.0.0
- 128.0.x.x
- 191.255.x.x
- 192.0.0.x
- 223.255.255.x
- 224.x.x.x
- 240.x.x.x to 255.255.255.255

## Prioritizing Snooped Packets

**NOTE:** Prioritizing snooped packets is not supported on the QFX Series and the EX4600 switch.

You can use class-of-service (CoS) forwarding classes and queues to prioritize DHCP snooped packets for a specified VLAN. This type of configuration places the DHCP snooped packets for that VLAN in a specified egress queue, so that the security procedure does not interfere with the transmission of high-priority traffic. For additional information, see *Example: Using CoS Forwarding Classes to Prioritize Snooped Packets in Heavy Network Traffic*.

## Understanding DAI for Port Security

Dynamic ARP inspection (DAI) protects switching devices against ARP spoofing.

DAI inspects Address Resolution Protocol (ARP) packets on the LAN and uses the information in the DHCP snooping database on the switch to validate ARP packets and to protect against ARP spoofing (also known as ARP poisoning or ARP cache poisoning). ARP requests and replies are compared against entries in the DHCP snooping database, and filtering decisions are made based on the results of those comparisons. When an attacker tries to use a forged ARP packet to spoof an address, the switch compares the address with entries in the database. If the media access control (MAC) address or IP address in the ARP packet does not match a valid entry in the DHCP snooping database, the packet is dropped.

ARP packets are sent to the Routing Engine and are rate-limited to protect the switching device from CPU overload.

- [Address Resolution Protocol on page 4989](#)
- [ARP Spoofing on page 4990](#)
- [Dynamic ARP Inspection on page 4990](#)
- [Prioritizing Inspected Packets on page 4991](#)

### Address Resolution Protocol

Sending IP packets on a multi-access network requires mapping an IP address to an Ethernet MAC address.

Ethernet LANs use ARP to map MAC addresses to IP addresses.

The switching device maintains this mapping in a cache that it consults when forwarding packets to network devices. If the ARP cache does not contain an entry for the destination device, the host (the DHCP client) broadcasts an ARP request for that device's address and stores the response in the cache.

### ARP Spoofing

---

ARP spoofing is one way to initiate man-in-the-middle attacks. The attacker sends an ARP packet that spoofs the MAC address of another device on the LAN. Instead of the switching device sending traffic to the proper network device, it sends the traffic to the device with the spoofed address that is impersonating the proper device. If the impersonating device is the attacker's machine, the attacker receives all the traffic from the switch that must have gone to another device. The result is that traffic from the switching device is misdirected and cannot reach its proper destination.

One type of ARP spoofing is gratuitous ARP, which is when a network device sends an ARP request to resolve its own IP address. In normal LAN operation, gratuitous ARP messages indicate that two devices have the same MAC address. They are also broadcast when a network interface card (NIC) in a device is changed and the device is rebooted, so that other devices on the LAN update their ARP caches. In malicious situations, an attacker can poison the ARP cache of a network device by sending an ARP response to the device that directs all packets destined for a certain IP address to go to a different MAC address instead.

To prevent MAC spoofing through gratuitous ARP and through other types of spoofing, the switches examine ARP responses through DAI.

### Dynamic ARP Inspection

---

DAI examines ARP requests and responses on the LAN and validates ARP packets. The switch intercepts ARP packets from an access port and validates them against the DHCP snooping database. If no IP-MAC entry in the database corresponds to the information in the ARP packet, DAI drops the ARP packet and the local ARP cache is not updated with the information in that packet. DAI also drops ARP packets when the IP address in the packet is invalid. ARP probe packets are not subjected to dynamic ARP inspection. The switch always forwards such packets.

Junos OS for EX Series switches and the QFX Series uses DAI for ARP packets received on access ports because these ports are untrusted by default. Trunk ports are trusted by default, and therefore ARP packets bypass DAI on them.

You configure DAI for each VLAN, not for each interface (port). By default, DAI is disabled for all VLANs.

If you set an interface to be a DHCP trusted port, it is also trusted for ARP packets.

**NOTE:**

- If your switching device is an EX Series switch and uses Junos OS with support for the Enhanced Layer 2 Software (ELS) configuration style, see *Enabling a Trusted DHCP Server (CLI Procedure)* for information about configuring an access interface to be a DHCP trusted port.
- If your switching device is an EX Series switch and is *not* using Junos OS with support for the Enhanced Layer 2 Software (ELS) configuration style, see “[Enabling a Trusted DHCP Server \(CLI Procedure\)](#)” on page 5070 for information about configuring an access interface to be a DHCP trusted port.

For packets directed to the switching device to which a network device is connected, ARP queries are broadcast on the VLAN. The ARP responses to those queries are subjected to the DAI check.

For DAI, all ARP packets are trapped to the Packet Forwarding Engine. To prevent CPU overloading, ARP packets destined for the Routing Engine are rate-limited.

If the DHCP server goes down and the lease time for an IP-MAC entry for a previously valid ARP packet runs out, that packet is blocked.

### Prioritizing Inspected Packets

**NOTE:** Prioritizing inspected packets is not supported on the QFX Series and the EX4600 switch.

You can use class-of-service (CoS) forwarding classes and queues to prioritize DAI packets for a specified VLAN. This type of configuration places inspected packets for that VLAN in the egress queue, that you specify, ensuring that the security procedure does not interfere with the transmission of high-priority traffic.

## Understanding MAC Limiting and MAC Move Limiting for Port Security

MAC limiting protects against flooding of the Ethernet switching table (also known as the MAC forwarding table or Layer 2 forwarding table). You enable this feature on Layer 2 interfaces (ports). MAC move limiting detects MAC movement and MAC spoofing on access interfaces. You enable this feature on VLANs.

- [MAC Limiting on page 4992](#)
- [MAC Move Limiting on page 4992](#)
- [Actions for MAC Limiting on page 4993](#)
- [MAC Addresses That Exceed the MAC Limit or MAC Move Limit on page 4993](#)

---

### MAC Limiting

MAC limiting sets a limit on the number of MAC addresses that can be learned on a single Layer 2 access interface or on all the Layer 2 access interfaces on the switch. Junos OS provides two MAC limiting methods:

- **Maximum number of MAC addresses**—You configure the maximum number of dynamic MAC addresses allowed per interface. When the limit is exceeded, incoming packets with new MAC addresses can be ignored, dropped, or logged. You can also specify that the interface be shut down or temporarily disabled.
- **Allowed MAC addresses**—You configure specific “allowed” MAC addresses for the access interface. Any MAC address that is not in the list of configured addresses is not learned, and the switch logs an appropriate message. Allowed MAC binds MAC addresses to a VLAN so that the address does not get registered outside the VLAN. If an allowed MAC setting conflicts with a dynamic MAC setting, the allowed MAC setting takes precedence.

**NOTE:** If you do not want the system to log messages about invalid MAC addresses received by an interface that has been configured for allowed MAC addresses, disable the logging by configuring the [no-allowed-mac-log](#) statement.

---

You configure MAC limiting per interface, not per VLAN. You can specify the maximum number of dynamic MAC addresses that can be learned on a single Layer 2 access interface (including tagged-access interfaces) or on all Layer 2 access interfaces.

---

### MAC Move Limiting

MAC move limiting causes the switch to track the number of times a MAC address can move to a new interface (port). It can help to prevent MAC spoofing, and it can also detect and prevent loops.

If a MAC address moves more than the configured number of times within 1 second, the switch performs the configured action. You can configure MAC move limiting to apply to all VLANs or to a specific VLAN.

**CAUTION:** Mac move limiting does not work properly on a QFX5100 switch used as a Node device in a QFabric system. Do not use this feature on a QFX5100 switch in a QFabric system.

### Actions for MAC Limiting

You can choose to have one of the following actions performed when the limit of MAC addresses or the limit of MAC moves is exceeded:

- **drop**—Drop the packet and generate a system log entry. This is the default.
- **log**—Do not drop the packet but generate a system log entry.
- **none**—Take no action.
- **shutdown**—Disable the interface and generate an alarm. If you configure the switch with the **port-error-disable** statement, the disabled interface recovers automatically upon expiration of the specified timeout. If this is not configured, you can bring up the disabled interfaces by running the **clear ethernet-switching port-error** command.

See descriptions of results of these various action settings in “[Verifying That MAC Limiting Is Working Correctly](#)” on page 5159.

If you set a MAC limit to apply to all interfaces on the switch, you can override that setting for a particular interface by specifying action **none**. See “[Configuring the none Action to Override a MAC Limit Applied to All Interfaces \(CLI Procedure\)](#)” on page 5064

### MAC Addresses That Exceed the MAC Limit or MAC Move Limit

If you have configured the **port-error-disable** statement, you can view which interfaces are temporarily disabled because the MAC limit or MAC move limit was exceeded. Use the **show ethernet-switching interfaces** command.

The log messages that indicate the MAC limit or MAC move limit has been exceeded include the offending MAC addresses.

## Understanding Trusted and Untrusted Ports

By default, all access ports are untrusted and all trunk ports are trusted in regard to DHCP. Trusted ports allow DHCP servers to provide IP addresses and other information to requesting devices. Untrusted ports drop traffic from DHCP servers to prevent unauthorized servers from providing any configuration information to clients.

If you attach a DHCP server to an access port, you must configure the port as trusted. Before you do so, ensure that the server is physically secure—that is, that access to the server is monitored and controlled.

## Understanding Trusted DHCP Servers for Port Security

Any interface on the switching device that connects to a DHCP server can be configured as a trusted port. Configuring a DHCP server on a trusted port protects against rogue DHCP servers sending leases.

Ensure that the DHCP server interface is physically secure—that is, that access to the server is monitored and controlled at the site—before you configure the port as trusted.

## Understanding DHCP Option 82 for Port Security

You can use DHCP option 82, also known as the DHCP relay agent information option, to help protect the switch against attacks such as spoofing (forging) of IP addresses and MAC addresses, and DHCP IP address starvation. Hosts on untrusted access interfaces on Ethernet LAN switches send requests for IP addresses in order to access the Internet. The switch forwards or relays these requests to DHCP servers, and the servers send offers for IP address leases in response. Attackers can use these messages to perpetrate address spoofing and starvation.

Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client. The Juniper Networks Junos operating system (Junos OS) implementation of DHCP option 82 supports RFC 3046, *DHCP Relay Agent Information Option*, at <http://tools.ietf.org/html/rfc3046>.

This topic covers:

- [DHCP Option 82 Processing on page 4995](#)
- [Suboption Components of Option 82 on page 4996](#)
- [Configurations That Support Option 82 on page 4996](#)

### DHCP Option 82 Processing

If DHCP option 82 is enabled on the switch, then when a DHCP client that is connected to the switch on an untrusted interface sends a DHCP request, the switch inserts information about the client's network location into the packet header of that request. The switch then sends the request to the DHCP server. The DHCP server reads the option 82 information in the packet header and uses it to implement the IP address or another parameter for the client. See “[Suboption Components of Option 82](#)” on [page 4996](#) for details about option 82 information.

You can enable DHCP option 82 on a single VLAN or on all VLANs on the switch. You can also configure it on Layer 3 interfaces (in routed VLAN interfaces, or RVIs) when the switch is functioning as a relay agent.

When option 82 is enabled on the switch, then this sequence of events occurs when a DHCP client sends a DHCP request:

1. The switch receives the request and inserts the option 82 information in the packet header.
2. The switch forwards or relays the request to the DHCP server.
3. The server uses the DHCP option 82 information to formulate its reply and sends a response back to the switch. It does not alter the option 82 information.
4. The switch strips the option 82 information from the response packet.
5. The switch forwards the response packet to the client.

**NOTE:** To use the DHCP option 82 feature, you must ensure that the DHCP server is configured to accept option 82. If it is not configured to accept option 82, then when it receives requests containing option 82 information, it does not use the information in setting parameters and it does not echo the information in its response message.

---

### Suboption Components of Option 82

---

When configuring DHCP option 82, you can use the following suboptions:

- **circuit ID**—Identifies the circuit (interface and/or VLAN) on the switch on which the request was received. The circuit ID contains the interface name and/or VLAN name, with the two elements separated by a colon—for example, **xe-0/0/10:vlan1**. If the request packet is received on a Layer 3 interface, the circuit ID is just the interface name—for example, **xe-0/0/10**.

Use the **prefix** option to add an optional prefix to the circuit ID. If you enable the **prefix** option, the hostname for the switch is used as the prefix; for example, **switch1:xe-0/0/10:vlan1**.

You can also specify that the interface description be used rather than the interface name and that the VLAN ID be used rather than the VLAN name.

- **remote ID**—Identifies the host. By default, the remote ID is the MAC address of the switch. You can specify that the remote ID be the hostname of the switch, the interface description, or a character string of your choice. You can also add an optional prefix to the remote ID.
- **vendor ID**—Identifies the vendor of the host. If you specify the **vendor-id** option but do not enter a value, the default value **Juniper** is used. To specify a value, you type a character string.

---

### Configurations That Support Option 82

---

You can use option 82 with the following configurations:

- The DHCP client and the DHCP server are on the same VLAN. In this case the switch forwards the requests from the clients on untrusted access interfaces to the server on a trusted interface. For this configuration, you set DHCP option 82 at the **[edit ethernet-switching-options secure-access-port vlan]** hierarchy level.
- The DHCP client or the DHCP server is connected to the switch through a Layer 3 interface and the switch is configured to relay DHCP requests. [Figure 193 on page 4997](#) illustrates a scenario for the switch-as-relay-agent; in this instance, the switch relays requests through a router to the server.

Figure 193: Switch Relays DHCP Requests to Server

For the configuration shown in [Figure 193 on page 4997](#), you set DHCP option 82 at the `[edit forwarding-options helpers bootp]` hierarchy level.

## Understanding Static ARP Entries

You can create explicit mappings between IP addresses and MAC addresses, which are called static ARP table entries. Unlike dynamically learned ARP entries, static entries do not age out. You might want to create static ARP entries in a troubleshooting situation or if your device is unable to learn a MAC address dynamically for any reason.

## Device Security

---

- [Understanding Storm Control on page 4998](#)

### Understanding Storm Control

A traffic storm occurs when broadcast packets prompt receiving devices to broadcast packets in response. This prompts further responses, creating a snowball effect. The switch is flooded with packets, which creates unnecessary traffic that leads to poor performance or even a complete loss of service by some clients. Storm control causes a device to monitor traffic levels and take a specified action when a specified traffic level—called the *storm control level*—is exceeded, thus preventing packets from proliferating and degrading service. You can configure devices to drop broadcast and unknown unicast packets, shut down interfaces, or temporarily disable interfaces when the storm control level is exceeded.

Storm control is enabled by default on ELS platforms and disabled by default on non-ELS platforms. If storm control is enabled, the default level is 80 percent of the available bandwidth for ingress traffic. You can change the storm control level by configuring it as a specific bandwidth value. (The **level** configuration statement, which allows you to configure the storm control level as a percentage of the combined broadcast and unknown unicast streams, is deprecated and might be removed from future releases. We recommend that you phase out its use and replace it with the **bandwidth** statement.)

**NOTE:** Storm control is not enabled by default on MX platforms.

**NOTE:** When you configure storm control bandwidth, the value you configure is rounded off internally to the closest multiple of 64 Kbps, and the rounded-off value represents the bandwidth that is actually enforced. For example, if you configure a bandwidth limit of 150 Kbps, storm control enforces a bandwidth limit of 128 Kbps.

**NOTE:** On an FCoE-FC gateway, storm control must be disabled on all Ethernet interfaces that belong to an FCoE VLAN to prevent FCoE traffic from being dropped. Configuring storm control on an Ethernet interface that is included in an FCoE-FC gateway may have undesirable effects, including FCoE packet loss. After disabling storm control on all interfaces, enable storm control on any interfaces that are not part of an FCoE-FC gateway on which you want to use storm control. However, on an FCoE transit switch, you can enable storm control on interfaces that carry FCoE traffic.

**CAUTION:** The Junos OS allows you to configure a storm control value that exceeds the bandwidth of the interface. If you configure an interface this way,

storm control does not drop broadcast or unknown unicast packets even if they consume all the available bandwidth.

.....

To recognize a storm, you must be able to identify when traffic has reached an abnormal level. Suspect a storm when operations begin timing out and network response times slow down. Users might be unable to access expected services. Monitor the percentage of broadcast and unknown unicast traffic in the network when it is operating normally. This data can then be used as a benchmark to determine when traffic levels are too high. You can then configure storm control to set the level at which you want to drop broadcast and unknown unicast traffic.

### Firewall and Policer Configuration Examples

---

- [Example: Using Two-Color Policers and Prefix Lists on page 5001](#)
- [Example: Using Policers to Manage Oversubscription on page 5004](#)

#### Example: Using Two-Color Policers and Prefix Lists

If you provide specific amounts of bandwidth to internal or external customers, you can use policing to make sure that customers do not consume more bandwidth than they should receive. For example, you might connect many customers to one 10-Gbps interface and want to ensure that none of them congest the interface by using more bandwidth than they have been allotted.

You could accomplish this by creating a two-color policer similar to the following for each customer:

```
firewall {
  policer Limit-Customer-1 {
    if-exceeding {
      bandwidth-limit 100m;
      burst-size-limit 150m;
    }
    then discard;
  }
}
```

Creating a policer for each customer is clearly not a scalable solution, however. As an alternative, you can create prefix lists that group classes of customers and then create policers for each prefix list. For example, you could create prefix lists such as

**Class-A-Customer-Prefixes**, **Class-B-Customer-Prefixes**, and **Class-C-Customer-Prefixes** (at the **[edit policy-options]** hierarchy level) and create the following corresponding policers:

```
firewall {
  policer Class-A {
    if-exceeding {
      bandwidth-limit 100m;
      burst-size-limit 150m;
    }
    then discard;
  }
  policer Class-B {
    if-exceeding {
      bandwidth-limit 75m;
      burst-size-limit 100m;
    }
    then discard;
  }
  policer Class-C {
    if-exceeding {
      bandwidth-limit 50m;
      burst-size-limit 75m;
    }
    then discard;
  }
}
```

You must create filter terms that specify the prefix lists in their **from** statements and the corresponding policers in their **then** statements similar to the following:

```
firewall
family inet {
  filter Class-A-Customers {
    term term-1 {
      from {
        destination-prefix-list {
          Class-A-Customer-Prefixes;
        }
      }
      then policer Class-A;
    }
  }
  filter Class-B-Customers {
    term term-1 {
      from {
        destination-prefix-list {
          Class-B-Customer-Prefixes;
        }
      }
      then policer Class-B;
    }
  }
  filter Class-C-Customers {
    term term-1 {
      from {
```

```

        destination-prefix-list {
            Class-C-Customer-Prefixes;
        }
    }
    then policer Class-C;
}
}
}

```

Here are the steps to create this firewall configuration:

1. Create the first policer:

```

[edit firewall]
user@switch# set policer Class-A if-exceeding bandwidth-limit 100m burst-size-limit 150m
user@switch# set policer Class-A then discard

```

2. Create the second policer:

```

[edit firewall]
user@switch# set policer Class-B if-exceeding bandwidth-limit 75m burst-size-limit 100m
user@switch# set policer Class-B then discard

```

3. Create the third policer:

```

[edit firewall]
user@switch# set policer Class-C if-exceeding bandwidth-limit 50m burst-size-limit 75m
user@switch# set policer Class-C then discard

```

4. Create a filter for class A customers:

```

[edit firewall]
user@switch# edit family inet filter Class-A-Customers

```

5. Configure the filter to send packets matching the **Class-A-Customer-Prefixes** prefix list to the **Class-A** policer:

```

[edit firewall family inet filter Class-A-Customers]
user@switch# set term term-1 from source-prefix-list Class-A-Customers
user@switch# set term term-1 then policer Class-A

```

6. Create a filter for class B customers:

```

[edit firewall]
user@switch# edit family inet filter Class-B-Customers

```

7. Configure the filter to send packets matching the **Class-B-Customer-Prefixes** prefix list to the **Class-B** policer:

```

[edit firewall family inet filter Class-B-Customers]
user@switch# set term term-1 from source-prefix-list Class-B-Customers
user@switch# set term term-1 then policer Class-B

```

8. Create a filter for class C customers:

```

[edit firewall]
user@switch# edit family inet filter Class-C-Customers

```

9. Configure the filter to send packets matching the **Class-C-Customer-Prefixes** prefix list to the **Class-C** policer:

```

[edit firewall family inet filter Class-C-Customers]
user@switch# set term term-1 from source-prefix-list Class-C-Customers
user@switch# set term term-1 then policer Class-C

```

10. Apply the filters you created to the appropriate interfaces in the output direction.

**NOTE:** Note that the implicit deny statement in this filter will block traffic from any source that does not match one of the prefix lists. If you want the filter to allow this traffic, you must include an explicit term for this purpose.

- [Applying Firewall Filters to Interfaces on page 4966](#)
- *prefix-list*

### Example: Using Policers to Manage Oversubscription

You might want to use a policer when an interface is oversubscribed and you want to control what will happen if congestion occurs. For example, you might have servers connected to a switch as listed in [Table 358 on page 5004](#).

**Table 358: Servers Connected to Switch**

| Server Type                | Connection           | IP Address |
|----------------------------|----------------------|------------|
| Network application server | 1-gigabit interface  | 10.0.0.1   |
| Authentication server      | 1-gigabit interface  | 10.0.0.2   |
| Database server            | 10-gigabit interface | 10.0.0.3   |

In this example, users access services provided by the network application server, which requests information from the database server as appropriate. When it receives a request from a user, the network application server first contacts the authentication server to verify the user's credentials. When a user is authenticated and the network application server provides the requested service, all the packets sent from the database server to the application server must transit the 1-Gigabit Ethernet interface connected to the application server twice—once on ingress to the application server and again on egress to the user.

The sequence of events for a user session is as follows:

1. A user connects to the application server and requests a service.
2. The application server requests the user's credentials and relays them to the authentication server.
3. If the authentication server verifies the credentials, the application server initiates the requested service.
4. The application server requests the files necessary to meet the user's request from the database server.
5. The database server sends the requested files to the application server.
6. The application server includes the requested files in its response to the user.

Traffic from the database server to the application server might congest the 1-gigabit interface to which the application server is connected. This congestion might prevent the server from responding to requests from users and creating new sessions for them. You can use policing to make sure that this does not occur.

To create this firewall configuration, perform the following steps on the database server:

1. Create a policer to drop traffic from the database server to the application server if it exceeds certain limits:

```
[edit firewall]
user@switch# set policer Database-Egress-Policer if-exceeding bandwidth-limit 400
burst-size-limit 500m
user@switch# set policer Database-Egress-Policer then discard
```

2. Create a filter to examine traffic from the database server to the application server:

```
[edit firewall]
user@switch# edit family inet filter Database-Egress-Filter
```

3. Configure the filter to apply the policer to traffic egressing the database server and destined for the application server:

```
[edit firewall family inet filter Database-Egress-Filter]
user@switch# set term term-1 from destination-address 10.0.0.1
user@switch# set term term-1 then policer Database-Egress-Policer
```

4. If required, configure a term to allow traffic from the database server to other destinations (otherwise the traffic will be dropped by the implicit deny statement):

```
[edit firewall family inet filter Database-Egress-Filter]
user@switch# set term term-2 then accept
```

Note that omitting a **from** statement causes the term to match all packets, which is the desired behavior.

5. Install the egress filter as an output filter on the database server interface that is connected the application server:

```
[edit interfaces]
user@switch# set xe-0/0/3 unit 0 family inet filter output Database-Egress-Filter
```

Here is how the final configuration would appear:

```
firewall {
  policer Database-Egress-Policer {
    if-exceeding {
      bandwidth-limit 400;
      burst-size-limit 500m;
    }
    then discard;
  }
  family inet {
    filter Database-Egress-Filter {
      term term-1 {
        from {
          destination-address {
            10.0.0.1/24;
          }
        }
        then policer Database-Egress-Policer;
      }
    }
  }
}
```

```
term term-2 { # If required, include this term so that traffic from the database server
    to other destinations is allowed.
    then accept;
}
}
]
```

- [Example: Setting Up DHCP Option 82 with a Switch as a Relay Agent Between Clients and a DHCP Server on page 5045](#)

### Example: Configuring Basic Port Security Features

You can configure DHCP snooping, dynamic ARP inspection (DAI), MAC limiting, persistent MAC learning, and MAC move limiting on the access ports of switches to protect the switches and the Ethernet LAN against address spoofing and Layer 2 denial-of-service (DoS) attacks. You can also configure a trusted DHCP server and specific (allowed) MAC addresses for the switch interfaces.

This example describes how to configure basic port security features on a switch:

- [Requirements on page 5007](#)
- [Overview and Topology on page 5007](#)
- [Configuration on page 5009](#)
- [Verification on page 5010](#)

## Requirements

This example uses the following hardware and software components:

- One EX Series or QFX Series.
- Junos OS Release 11.4 or later for EX Series switches or Junos OS Release 12.1 or later for the QFX Series
- A DHCP server to provide IP addresses to network devices on the switch

Before you configure basic port security features, be sure you have:

- Connected the DHCP server to the switch.
- Configured a VLAN on the switch. See the task for your platform:
  - *Configuring VLANs for EX Series Switches (CLI Procedure)*
  - [“Configuring VLANs” on page 2214](#) for the QFX Series

**NOTE:** In this example, the DHCP server and its clients are all members of a single VLAN on the switch.

## Overview and Topology

Ethernet LANs are vulnerable to address spoofing and DoS attacks on network devices. To protect the devices from such attacks, you can configure:

- DHCP snooping to validate DHCP server messages
- DAI to protect against MAC spoofing
- MAC limiting to constrain the number of MAC addresses the switch adds to its MAC address cache
- MAC move limiting to help prevent MAC spoofing
- Persistent MAC learning (sticky MAC) to constrain the MAC addresses that can be learned on an interface to the first ones learned, even after a reboot of the switch
- Trusted DHCP server configured on a trusted port to protect against rogue DHCP servers sending leases

This example shows how to configure these security features on a switch connected to a DHCP server.

The setup for this example includes the VLAN **employee-vlan** on the switch. [Figure 194 on page 5008](#) illustrates the topology for this example.

Figure 194: Network Topology for Basic Port Security

The components of the topology for this example are shown in [Table 359 on page 5008](#).

Table 359: Components of the Port Security Topology

| Properties                         | Settings                                                                                   |
|------------------------------------|--------------------------------------------------------------------------------------------|
| Switch hardware                    | One EX Series or QFX series switch                                                         |
| VLAN name and ID                   | <b>employee-vlan</b> , tag 20                                                              |
| VLAN subnets                       | 192.0.2.16/28<br>192.0.2.17 through 192.0.2.30<br>192.0.2.31 is subnet's broadcast address |
| Interfaces in <b>employee-vlan</b> | ge-0/0/1, ge-0/0/2, ge-0/0/3, ge-0/0/8                                                     |
| Interface for DHCP server          | ge-0/0/8                                                                                   |

In this example, the switch is initially configured with the default port security setup. In the default switch configuration:

- Secure port access is activated on the switch.
- DHCP snooping and DAI are disabled on all VLANs.
- All access ports are untrusted, and all trunk ports are trusted for DHCP snooping.

In the configuration tasks for this example, you set the DHCP server as trusted; you enable DHCP snooping, DAI, and MAC move limiting on a VLAN; you set a value for a MAC limit on some interfaces; you configure some specific (allowed) MAC addresses on an interface; and you configure persistent MAC learning on an interface.

## Configuration

To configure basic port security on a switch whose DHCP server and client ports are in a single VLAN:

### CLI Quick Configuration

To quickly configure basic port security on the switch, copy the following commands and paste them into the switch terminal window:

```
[edit ethernet-switching-options secure-access-port]
set interface ge-0/0/1 mac-limit 4
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:80
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:81
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:83
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:85
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:88
set interface ge-0/0/2 mac-limit 4
set interface ge-0/0/1 persistent-learning
set interface ge-0/0/8 dhcp-trusted
set vlan employee-vlan arp-inspection
set vlan employee-vlan examine-dhcp
set vlan employee-vlan mac-move-limit 5
```

### Step-by-Step Procedure

Configure basic port security on the switch:

1. Enable DHCP snooping on the VLAN:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee-vlan examine-dhcp
```

2. Specify the interface (port) from which DHCP responses are allowed:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge-0/0/8 dhcp-trusted
```

3. Enable dynamic ARP inspection (DAI) on the VLAN:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee-vlan arp-inspection
```

4. Configure a MAC limit of 4 and use the default action, **drop**. (Packets are dropped, and the MAC address is not added to the Ethernet switching table if the MAC limit is exceeded on the interfaces):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge-0/0/1 mac-limit 4
user@switch# set interface ge-0/0/2 mac-limit 4
```

5. Allow learned MAC addresses for a particular interface to persist across restarts of the switch and interface-down events by enabling persistent MAC learning:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge-0/0/1 persistent-learning
```

6. Configure a MAC move limit of 5 and use the default action, **drop**. (Packets are dropped, and the MAC address is not added to the Ethernet switching table if a MAC address has exceeded the MAC move limit):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee-vlan mac-move-limit 5
```

7. Configure allowed MAC addresses:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:80
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:81
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:83
```

```
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:85
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:88
```

### **Results**

Check the results of the configuration:

```
[edit ethernet-switching-options secure-access-port]
user@switch# show
interface ge-0/0/1.0 {
    mac-limit 4;
    persistent-learning;
}
interface ge-0/0/2.0 {
    allowed-mac [ 00:05:85:3a:82:80 00:05:85:3a:82:81 00:05:85:3a:82:83
    00:05:85:3a:82:85 00:05:85:3a:82:88 ];
    mac-limit 4;
}
interface ge-0/0/8.0 {
    dhcp-trusted;
}
vlan employee-vlan {
    arp-inspection
    examine-dhcp;
    mac-move-limit 5;
}
```

### **Verification**

---

To confirm that the configuration is working properly:

- [Verifying That DHCP Snooping Is Working Correctly on the Switch on page 5010](#)
- [Verifying That DAI Is Working Correctly on the Switch on page 5011](#)
- [Verifying That MAC Limiting, MAC Move Limiting, and Persistent MAC Learning Are Working Correctly on the Switch on page 5012](#)
- [Verifying That Allowed MAC Addresses Are Working Correctly on the Switch on page 5012](#)

#### ***Verifying That DHCP Snooping Is Working Correctly on the Switch***

**Purpose** Verify that DHCP snooping is working on the switch.

**Action** Send some DHCP requests from network devices (here they are DHCP clients) connected to the switch.

Display the DHCP snooping information when the interface on which the DHCP server connects to the switch is trusted. The following output results when requests are sent from the MAC addresses and the server has provided the IP addresses and leases:

```
user@switch> show dhcp snooping binding
DHCP Snooping Information:
MAC Address      IP Address      Lease    Type    VLAN      Interface
-----
00:05:85:3A:82:77 192.0.2.17      600     dynamic employee-vlan ge-0/0/1.0
00:05:85:3A:82:79 192.0.2.18      653     dynamic employee-vlan ge-0/0/1.0
00:05:85:3A:82:80 192.0.2.19      720     dynamic employee-vlan ge-0/0/2.0
00:05:85:3A:82:81 192.0.2.20      932     dynamic employee-vlan ge-0/0/2.0
00:05:85:3A:82:83 192.0.2.21      1230    dynamic employee-vlan ge-0/0/2.0
00:05:85:27:32:88 192.0.2.22      3200    dynamic employee-vlan ge-0/0/2.0
```

**Meaning** When the interface on which the DHCP server connects to the switch has been set to trusted, the output (see preceding sample) shows, for each MAC address, the assigned IP address and lease time—that is, the time, in seconds, remaining before the lease expires.

If the DHCP server had been configured as untrusted, no entries would be added to the DHCP snooping database, and nothing would be shown in the output of the **show dhcp snooping binding** command.

#### *Verifying That DAI Is Working Correctly on the Switch*

**Purpose** Verify that DAI is working on the switch.

**Action** Send some ARP requests from network devices connected to the switch.

Display the DAI information:

```
user@switch> show arp inspection statistics
ARP inspection statistics:
Interface      Packets received  ARP inspection pass  ARP inspection failed
-----
ge-0/0/1.0      7                 5                     2
ge-0/0/2.0     10                10                    0
ge-0/0/3.0     12                12                    0
```

**Meaning** The sample output shows the number of ARP packets received and inspected per interface, with a listing of how many packets passed and how many failed the inspection on each interface. The switch compares the ARP requests and replies against the entries in the DHCP snooping database. If a MAC address or IP address in the ARP packet does not match a valid entry in the database, the packet is dropped.

**Verifying That MAC Limiting, MAC Move Limiting, and Persistent MAC Learning Are Working Correctly on the Switch**

**Purpose** Verify that MAC limiting, MAC move limiting, and persistent MAC learning are working on the switch.

**Action** Suppose that two packets have been sent from hosts on **ge-0/0/1** and five packets from hosts on **ge-0/0/2**, with both interfaces set to a MAC limit of 4 with the default action **drop** and **ge-0/0/1** enabled for persistent MAC learning.

Display the MAC addresses learned:

```
user@switch> show ethernet-switching table
Ethernet-switching table: 7 entries, 4 learned, 2 persistent entries
```

| VLAN          | MAC address       | Type       | Age | Interfaces  |
|---------------|-------------------|------------|-----|-------------|
| employee-vlan | *                 | Flood      | -   | All-members |
| employee-vlan | 00:05:85:3A:82:77 | Persistent | 0   | ge-0/0/1.0  |
| employee-vlan | 00:05:85:3A:82:79 | Persistent | 0   | ge-0/0/1.0  |
| employee-vlan | 00:05:85:3A:82:80 | Learn      | 0   | ge-0/0/2.0  |
| employee-vlan | 00:05:85:3A:82:81 | Learn      | 0   | ge-0/0/2.0  |
| employee-vlan | 00:05:85:3A:82:83 | Learn      | 0   | ge-0/0/2.0  |
| employee-vlan | 00:05:85:3A:82:85 | Learn      | 0   | ge-0/0/2.0  |

Now suppose packets have been sent from two of the hosts on **ge-0/0/2** after they have been moved to other interfaces more than five times in 1 second, with **employee-vlan** set to a MAC move limit of 5 with the default action **drop**.

Display the MAC addresses in the table:

```
user@switch> show ethernet-switching table
Ethernet-switching table: 7 entries, 2 learned, 2 persistent entries
```

| VLAN          | MAC address       | Type       | Age | Interfaces  |
|---------------|-------------------|------------|-----|-------------|
| employee-vlan | *                 | Flood      | -   | All-members |
| employee-vlan | 00:05:85:3A:82:77 | Persistent | 0   | ge-0/0/1.0  |
| employee-vlan | 00:05:85:3A:82:79 | Persistent | 0   | ge-0/0/1.0  |
| employee-vlan | 00:05:85:3A:82:80 | Learn      | 0   | ge-0/0/2.0  |
| employee-vlan | 00:05:85:3A:82:81 | Learn      | 0   | ge-0/0/2.0  |
| employee-vlan | *                 | Flood      | -   | ge-0/0/2.0  |
| employee-vlan | *                 | Flood      | -   | ge-0/0/2.0  |

**Meaning** The first sample output shows that with a MAC limit of 4 for each interface, the fifth MAC address on **ge-0/0/2** was not learned because it exceeded the MAC limit. The second sample output shows that MAC addresses for three of the hosts on **ge-0/0/2** were not learned, because the hosts had been moved back more than five times in 1 second.

Interface **ge-0/0/1.0** was enabled for persistent MAC learning, so the MAC addresses associated with this interface are of the type **persistent**.

**Verifying That Allowed MAC Addresses Are Working Correctly on the Switch**

**Purpose** Verify that allowed MAC addresses are working on the switch.

**Action** Display the MAC cache information after five allowed MAC addresses have been configured on interface `ge-0/0/2`:

```
user@switch> show ethernet-switching table
Ethernet-switching table: 5 entries, 4 learned
```

| VLAN          | MAC address       | Type  | Age | Interfaces |
|---------------|-------------------|-------|-----|------------|
| employee-vlan | 00:05:85:3A:82:80 | Learn | 0   | ge-0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:81 | Learn | 0   | ge-0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:83 | Learn | 0   | ge-0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:85 | Learn | 0   | ge-0/0/2.0 |
| employee-vlan | *                 | Flood | -   | ge-0/0/2.0 |

**Meaning** Because the MAC limit value for this interface has been set to 4, only four of the five configured allowed addresses are learned.

## Example: Configuring Storm Control to Prevent Network Outages

Using storm control can prevent problems caused by broadcast storms. You can configure storm control to rate-limit broadcast traffic and unknown unicast traffic at a specified level and to drop packets when the specified traffic level is exceeded, which prevents packets from proliferating and degrading service or causing a security issue. You can also

configure the switch to shut down or temporarily disable an interface when the storm control limit is exceeded.

This example shows how to configure storm control:

**NOTE:** This example uses a Junos OS release that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see *Example: Configuring Storm Control to Prevent Network Outages*.

- [Requirements on page 5014](#)
- [Overview and Topology on page 5014](#)
- [Configuration on page 5015](#)

---

## Requirements

This example uses the following hardware and software components:

- A switch
- Junos OS Release 11.1 or later

---

## Overview and Topology

A traffic storm occurs when broadcast packets prompt receiving devices to broadcast packets in response. This prompts further responses, creating a snowball effect. The switch is flooded with packets, and the resulting unnecessary traffic leads to poor performance or even a complete loss of service by some clients. Storm control causes a device to monitor traffic levels and take a specified action when a specified traffic level—called the *storm control level*—is exceeded, thus preventing packets from proliferating and degrading service.

Storm control monitors the incoming broadcast traffic and unknown unicast traffic and compares it with the level that you specify. If broadcast traffic and unknown unicast traffic exceed the specified level, the switch drops packets for the controlled traffic types. On non-ELS systems, storm control is disabled by default on all interfaces. If you enable storm control, the default level is 80 percent of the available bandwidth.

This example shows how to configure the storm control level on interface **xe-0/0/0** by setting the level to a traffic rate of 5000000 Kbps, based on the total of the combined broadcast and unknown unicast streams. If broadcast traffic and unknown unicast traffic exceed these levels, the switch drops packets for the controlled traffic types.

### Configuration

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Example: Configuring MAC Limiting to Protect the Switch from DHCP Starvation Attacks

In a DHCP starvation attack, an attacker floods an Ethernet LAN with DHCP requests from spoofed (counterfeit) MAC addresses. The switch's trusted DHCP server or servers cannot keep up with the requests and can no longer assign IP addresses and lease times to legitimate DHCP clients on the switch. Requests from those clients are either dropped or directed to a rogue DHCP server set up by the attacker.

This example describes how to configure MAC limiting, a port security feature, to protect the switch against DHCP starvation attacks:

- [Requirements on page 5015](#)
- [Overview and Topology on page 5016](#)
- [Configuration on page 5017](#)
- [Verification on page 5017](#)

### Requirements

This example uses the following hardware and software components:

- One QFX3500 switch
- Junos OS Release 12.1 or later for the QFX Series

- A DHCP server to provide IP addresses to network devices on the switch

Before you configure MAC limiting, a port security feature, to mitigate DHCP starvation attacks, be sure you have:

- Connected the DHCP server to the switch.
- Configured the VLAN **employee-vlan** on the switch. See [“Example: Setting Up Bridging with Multiple VLANs” on page 2110](#).

### Overview and Topology

Ethernet LANs are vulnerable to address spoofing and DoS attacks on network devices. This example describes how to protect the switch against one common type of attack, a DHCP starvation attack.

This example shows how to configure port security features on a switch that is connected to a DHCP server.

The setup for this example includes the VLAN **employee-vlan** on the switch. [Figure 195 on page 5016](#) illustrates the topology for this example.

**Figure 195: Network Topology for Basic Port Security**

The components of the topology for this example are shown in [Table 360 on page 5016](#).

**Table 360: Components of the Port Security Topology**

| Properties       | Settings             |
|------------------|----------------------|
| Switch hardware  | One QFX3500 switch   |
| VLAN name and ID | <b>employee-vlan</b> |

Table 360: Components of the Port Security Topology (*continued*)

| Properties                         | Settings                                      |
|------------------------------------|-----------------------------------------------|
| Interfaces in <b>employee-vlan</b> | <b>ge-0/0/1, ge-0/0/2, ge-0/0/3, ge-0/0/8</b> |
| Interface for DHCP server          | <b>ge-0/0/8</b>                               |

In this example, the switch has already been configured as follows:

- Secure port access is activated on the switch.
- No MAC limit is set on any of the interfaces.
- DHCP snooping is disabled on the VLAN **employee-vlan**.
- All access interfaces are untrusted, which is the default setting.

### Configuration

To configure the MAC limiting port security feature to protect the switch against DHCP starvation attacks:

#### CLI Quick Configuration

To quickly configure MAC limiting, copy the following commands and paste them into the switch terminal window:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge-0/0/1 mac-limit 3 action drop
user@switch# set interface ge-0/0/2 mac-limit 3 action drop
```

#### Step-by-Step Procedure

Configure MAC limiting:

1. Configure a MAC limit of **3** on **ge-0/0/1** and specify that packets with new addresses be dropped if the limit has been exceeded on the interface:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge-0/0/1 mac-limit (Access Port Security) 3 action drop
```

2. Configure a MAC limit of **3** on **ge-0/0/2** and specify that packets with new addresses be dropped if the limit has been exceeded on the interface:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge-0/0/2 mac-limit 3 action drop
```

#### Results

Check the results of the configuration:

```
[edit ethernet-switching-options secure-access-port]
user@switch# show
interface ge-0/0/1.0 {
  mac-limit 3 action drop;
}
interface ge-0/0/2.0 {
  mac-limit 3 action drop;
}
```

### Verification

Confirm that the configuration is working properly.

**Verifying That MAC Limiting Is Working Correctly on the Switch**

**Purpose** Verify that MAC limiting is working on the switch.

**Action** Send some DHCP requests from network devices (here they are DHCP clients) connected to the switch.

Display the MAC addresses learned when DHCP requests are sent from hosts on **ge-0/0/1** and from hosts on **ge-0/0/2**, with both interfaces set to a MAC limit of **3** with the action **drop**:

```
user@switch> show ethernet-switching table
Ethernet-switching table: 7 entries, 6 learned
  VLAN      MAC address      Type      Age      Interfaces
-----
  default   *                Flood     -        ge-0/0/2.0
  default   00:05:85:3A:82:77 Learn     0        ge-0/0/1.0
  default   00:05:85:3A:82:79 Learn     0        ge-0/0/1.0
  default   00:05:85:3A:82:80 Learn     0        ge-0/0/1.0
  default   00:05:85:3A:82:81 Learn     0        ge-0/0/2.0
  default   00:05:85:3A:82:83 Learn     0        ge-0/0/2.0
  default   00:05:85:3A:82:85 Learn     0        ge-0/0/2.0
```

**Meaning** The sample output shows that with a MAC limit of **3** for each interface, the DHCP request for a fourth MAC address on **ge-0/0/2** was dropped because it exceeded the MAC limit.

Because only 3 MAC addresses can be learned on each of the two interfaces, attempted DHCP starvation attacks fail.

**Related Documentation**

- [Understanding MAC Limiting and MAC Move Limiting for Port Security on page 4992](#)
- [Configuring MAC Limiting on page 5060](#)

**Example: Configuring MAC Limiting, Including Dynamic and Allowed MAC Addresses, to Protect the Switch from Ethernet Switching Table Overflow Attacks**

In an Ethernet switching table overflow attack, an intruder sends so many requests from new MAC addresses that the Ethernet switching table fills up and then overflows, forcing the switch to broadcast all messages.

This example describes how to configure MAC limiting and allowed MAC addresses, two port security features, to protect the switch from Ethernet switching table attacks:

- [Requirements on page 5019](#)
- [Overview and Topology on page 5019](#)
- [Configuration on page 5021](#)
- [Verification on page 5021](#)

## Requirements

---

This example uses the following hardware and software components:

- One EX Series switch or QFX3500 switch
- Junos OS Release 9.0 or later for EX Series switches or Junos OS 12.1 or later for the QFX Series.
- A DHCP server to provide IP addresses to network devices on the switch

Before you configure specific port security features to mitigate common access-interface attacks, be sure you have:

- Connected the DHCP server to the switch.
- Configured a VLAN on the switch. See the task for your platform:

## Overview and Topology

---

Ethernet LANs are vulnerable to address spoofing and DoS attacks on network devices. This example describes how to protect the switch from an attack on the Ethernet switching table that causes the table to overflow and thus forces the switch to broadcast all messages.

This example shows how to configure port security features on a switch connected to a DHCP server.

The setup for this example includes the VLAN **employee-vlan** on the switch. The procedure for creating that VLAN is described in the topic *Example: Setting Up Bridging with Multiple VLANs for EX Series Switches* and [“Example: Setting Up Bridging with Multiple VLANs” on page 2110](#) for the QFX Series. That procedure is not repeated here. [Figure 196 on page 5020](#) illustrates the topology for this example.

Figure 196: Network Topology for Basic Port Security

The components of the topology for this example are shown in [Table 361 on page 5020](#).

Table 361: Components of the Port Security Topology

| Properties                         | Settings                                                                                   |
|------------------------------------|--------------------------------------------------------------------------------------------|
| Switch hardware                    | One EX Series switch or one QFX3500 switch                                                 |
| VLAN name and ID                   | <b>employee-vlan</b> , tag 20                                                              |
| VLAN subnets                       | 192.0.2.16/28<br>192.0.2.17 through 192.0.2.30<br>192.0.2.31 is subnet's broadcast address |
| Interfaces in <b>employee-vlan</b> | <b>ge-0/0/1</b> , <b>ge-0/0/2</b> , <b>ge-0/0/3</b> , <b>ge-0/0/8</b>                      |
| Interface for DHCP server          | <b>ge-0/0/8</b>                                                                            |

In this example, use the MAC limit feature to control the total number of MAC addresses that can be added to the Ethernet switching table for the specified interface. Use the allowed MAC addresses feature to ensure that the addresses of network devices whose network access is critical are guaranteed to be included in the Ethernet switching table.

In this example, the switch has already been configured as follows:

- Secure port access is activated on the switch.
- No MAC limit is set on any of the interfaces.
- All access interfaces are untrusted, which is the default setting.

## Configuration

To configure MAC limiting and some allowed MAC addresses to protect the switch against Ethernet switching table overflow attacks:

### CLI Quick Configuration

To quickly configure MAC limiting, clear the MAC forwarding table, and configure some allowed MAC addresses, copy the following commands and paste them into the switch terminal window:

```
[edit ethernet-switching-options secure-access-port]
set interface ge-0/0/1 mac-limit 4 action drop
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:80
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:81
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:83
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:85
exit
exit
clear ethernet-switching-table interface ge-0/0/1
```

### Step-by-Step Procedure

Configure MAC limiting and some allowed MAC addresses:

1. Configure a MAC limit of 4 on **ge-0/0/1** and specify that incoming packets with different addresses be dropped once the limit is exceeded on the interface:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge-0/0/1 mac-limit (Access Port Security) 4 action drop
```

2. Clear the current entries for interface **ge-0/0/1** from the MAC address forwarding table :

```
user@switch# clear ethernet-switching-table interface ge-0/0/1
```

3. Configure the allowed MAC addresses on **ge-0/0/2**:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:80
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:81
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:83
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:85
```

**Results** Check the results of the configuration:

```
[edit ethernet-switching-options secure-access-port]
user@switch# show
interface ge-0/0/1.0 {
  mac-limit 4 action drop;
}
interface ge-0/0/2.0 {
  allowed-mac [ 00:05:85:3a:82:80 00:05:85:3a:82:81 00:05:85:3a:82:83 00:05:85:3a:82:85 ];
}
```

## Verification

To confirm that the configuration is working properly:

- [Verifying That MAC Limiting Is Working Correctly on the Switch on page 5022](#)

**Verifying That MAC Limiting Is Working Correctly on the Switch**

**Purpose** Verify that MAC limiting is working on the switch.

**Action** Display the MAC cache information after DHCP requests have been sent from hosts on **ge-0/0/1**, with the interface set to a MAC limit of 4 with the action **drop**, and after four allowed MAC addresses have been configured on interface **ge-0/0/2**:

```
user@switch> show ethernet-switching table
Ethernet-switching table: 5 entries, 4 learned
```

| VLAN          | MAC address       | Type  | Age | Interfaces |
|---------------|-------------------|-------|-----|------------|
| employee-vlan | 00:05:85:3A:82:71 | Learn | 0   | ge-0/0/1.0 |
| employee-vlan | 00:05:85:3A:82:74 | Learn | 0   | ge-0/0/1.0 |
| employee-vlan | 00:05:85:3A:82:77 | Learn | 0   | ge-0/0/1.0 |
| employee-vlan | 00:05:85:3A:82:79 | Learn | 0   | ge-0/0/1.0 |
| employee-vlan | *                 | Flood | 0   | ge-0/0/1.0 |
| employee-vlan | 00:05:85:3A:82:80 | Learn | 0   | ge-0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:81 | Learn | 0   | ge-0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:83 | Learn | 0   | ge-0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:85 | Learn | 0   | ge-0/0/2.0 |
| employee-vlan | *                 | Flood | -   | ge-0/0/2.0 |

**Meaning** The sample output shows that with a MAC limit of 4 for the interface, the DHCP request for a fifth MAC address on **ge-0/0/1** was dropped because it exceeded the MAC limit and that only the specified allowed MAC addresses have been learned on the **ge-0/0/2** interface.

## Example: Configuring a DHCP Server Interface as Untrusted to Protect the Switch from Rogue DHCP Server Attacks

In a rogue DHCP server attack, an attacker has introduced a rogue server into the network, allowing it to give IP address leases to the network's DHCP clients and to assign itself as the gateway device.

This example describes how to configure a DHCP server interface as untrusted to protect the switch from a rogue DHCP server:

- [Requirements on page 5023](#)
- [Overview and Topology on page 5023](#)
- [Configuration on page 5024](#)
- [Verification on page 5025](#)

## Requirements

---

This example uses the following hardware and software components:

- One EX Series switch or one QFX3500 switch
- Junos OS Release 9.0 or later for EX Series switches or Junos OS Release 12.1 or later for the QFX Series
- A DHCP server to provide IP addresses to network devices on the switch

Before you configure an untrusted DHCP server interface to mitigate rogue DHCP server attacks, be sure you have:

- Connected the DHCP server to the switch.
- Enabled DHCP snooping on the VLAN.
- Configured a VLAN on the switch. See the task for your platform:
  - *Example: Setting Up Bridging with Multiple VLANs for EX Series Switches*
  - [“Example: Setting Up Bridging with Multiple VLANs” on page 2110](#) for the QFX Series

## Overview and Topology

---

Ethernet LANs are vulnerable to address spoofing and DoS attacks on network devices. This example describes how to protect the switch from rogue DHCP server attacks.

This example shows how to explicitly configure an untrusted interface on an EX3200-24P switch and a QFX3500 switch. [Figure 197 on page 5024](#) illustrates the topology for this example.

Figure 197: Network Topology for Basic Port Security

The components of the topology for this example are shown in [Table 362 on page 5024](#).

Table 362: Components of the Port Security Topology

| Properties                         | Settings                                                                                       |
|------------------------------------|------------------------------------------------------------------------------------------------|
| Switch hardware                    | One EX3200-24P, 24 ports (8 PoE ports) or one QFX3500 switch                                   |
| VLAN name and ID                   | <b>employee-vlan</b> , tag 20                                                                  |
| VLAN subnets                       | 192.0.2.16/28<br>192.0.2.17 through 192.0.2.30<br>192.0.2.31 is the subnet's broadcast address |
| Interfaces in <b>employee-vlan</b> | <code>ge-0/0/1</code> , <code>ge-0/0/2</code> , <code>ge-0/0/3</code> , <code>ge-0/0/8</code>  |
| Interface for DHCP server          | <code>ge-0/0/8</code>                                                                          |

In this example, the switch has already been configured as follows:

- Secure port access is activated on the switch.
- DHCP snooping is enabled on the VLAN **employee-vlan**.
- The interface (port) where the rogue DHCP server has connected to the switch is currently trusted.

### Configuration

To configure the DHCP server interface as untrusted because the interface is being used by a rogue DHCP server:

**CLI Quick Configuration** To quickly set the rogue DHCP server interface as untrusted, copy the following command and paste it into the switch terminal window:

```
[edit ethernet-switching-options secure-access-port]
set interface ge-0/0/8 no-dhcp-trusted
```

**Step-by-Step Procedure** To set the DHCP server interface as untrusted:

- Specify the interface (port) from which DHCP responses are not allowed:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge-0/0/8 no-dhcp-trusted
```

**Results** Check the results of the configuration:

```
[edit ethernet-switching-options secure-access-port]
user@switch# show
interface ge-0/0/8.0 {
    no-dhcp-trusted;
}
```

### Verification

Confirm that the configuration is working properly.

#### *Verifying That the DHCP Server Interface Is Untrusted*

**Purpose** Verify that the DHCP server is untrusted.

- Action**
1. Send some DHCP requests from network devices (here they are DHCP clients) connected to the switch.
  2. Display the DHCP snooping information when the port on which the DHCP server connects to the switch is not trusted.

**Meaning** There is no output from the command because no entries are added to the DHCP snooping database.

- Related Documentation**

  - [secure-access-port on page 5132](#)
  - [show dhcp snooping binding on page 5171](#)

### Example: Configuring DHCP Snooping, DAI , and MAC Limiting on a Switch with Access to a DHCP Server Through a Second Switch

You can configure DHCP snooping, dynamic ARP inspection (DAI), and MAC limiting on the access interfaces of a switch to protect the switch and the Ethernet LAN against

address spoofing and Layer 2 denial-of-service (DoS) attacks. To obtain the basic settings for these features, you can use the switch's default configuration for port security, configure the MAC limit, and enable DHCP snooping and DAI on a VLAN. You can configure these features when the DHCP server is connected to a switch that is different from the one to which the DHCP clients (network devices) are connected.

This example describes how to configure port security features on a switch whose hosts obtain IP addresses and lease times from a DHCP server connected to a second switch:

- [Requirements on page 5026](#)
- [Overview and Topology on page 5026](#)
- [Configuring a VLAN, Interfaces, and Port Security Features on Switch 1 on page 5028](#)
- [Configuring a VLAN and Interfaces on Switch 2 on page 5030](#)
- [Verification on page 5031](#)

---

## Requirements

This example uses the following hardware and software components:

- One EX Series switch or QFX3500 switch—*Switch 1* in this example.
- An additional EX Series switch or QFX3500 switch—*Switch 2* in this example. You do not configure port security on this second switch.
- Junos OS Release 9.0 or later for EX Series switches or Junos OS Release 12.1 or later for the QFX Series.
- A DHCP server connected to Switch 2. You use the server to provide IP addresses to network devices connected to Switch 1.
- At least two network devices (hosts) that you connect to access interfaces on Switch 1. These devices are DHCP clients.

Before you configure DHCP snooping, DAI, and MAC limiting port security features, be sure you have:

- Connected the DHCP server to Switch 2.
- Configured a VLAN on Switch 1. See the task for your platform:
  - *Example: Setting Up Bridging with Multiple VLANs for EX Series Switches*
  - [“Example: Setting Up Bridging with Multiple VLANs” on page 2110](#) for the QFX Series

---

## Overview and Topology

Ethernet LANs are vulnerable to address spoofing and DoS attacks on network devices. To protect the devices from such attacks, you can configure:

- DHCP snooping to validate DHCP server messages
- DAI to protect against ARP spoofing
- MAC limiting to constrain the number of MAC addresses the switch adds to its MAC address cache

This example shows how to configure these port security features on Switch 1. Switch 1 is connected to another switch (Switch 2), which is not configured with port security features. Switch 2 is connected to a DHCP server (see [Figure 198 on page 5027](#).) Network devices (hosts) that are connected to Switch 1 send requests for IP addresses (these network devices are DHCP clients). Those requests are transmitted from Switch 1 to Switch 2 and then to the DHCP server connected to Switch 2. Responses to the requests are transmitted along the reverse path of the one followed by the requests.

The setup for this example includes the VLAN **employee-vlan** on both switches.

[Figure 198 on page 5027](#) shows the network topology for the example.

**Figure 198: Network Topology for Port Security Setup with Two Switches on the Same VLAN**

The components of the topology for this example are shown in [Table 363 on page 5027](#).

**Table 363: Components of Port Security Setup on Switch 1 with a DHCP Server Connected to Switch 2**

| Properties                       | Settings                                                                                                               |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------|
| Switch hardware                  | One EX Series switch or one QFX3500 switch (Switch 1), and an additional EX Series switch or QFX3500 switch (Switch 2) |
| VLAN name and ID                 | <b>employee-vlan</b> , tag 20                                                                                          |
| VLAN subnets                     | 192.0.2.16/28<br>192.0.2.17 through 192.0.2.30<br>192.0.2.31 is subnet's broadcast address                             |
| Trunk interface on both switches | ge-0/0/11                                                                                                              |

**Table 363: Components of Port Security Setup on Switch 1 with a DHCP Server Connected to Switch 2 (continued)**

| Properties                    | Settings                         |
|-------------------------------|----------------------------------|
| Access interfaces on Switch 1 | ge-0/0/1, ge-0/0/2, and ge-0/0/3 |
| Access interface on Switch 2  | ge-0/0/1                         |
| Interface for DHCP server     | ge-0/0/1 on Switch 2             |

Switch 1 is initially configured with the default port security setup. In the default configuration on the switch:

- Secure port access is activated on the switch.
- The switch does not drop any packets, which is the default setting.
- DHCP snooping and DAI are disabled on all VLANs.
- All access interfaces are untrusted and trunk interfaces are trusted; these are the default settings.

In the configuration tasks for this example, you configure a VLAN on both switches.

In addition to configuring the VLAN, you enable DHCP snooping on Switch 1. In this example, you also enable DAI and a MAC limit of 5 on Switch 1.

Because the interface that connects Switch 2 to Switch 1 is a trunk interface, you do not need to configure this interface to be trusted. As noted above, trunk interfaces are automatically trusted, so DHCP messages coming from the DHCP server to Switch 2 and then on to Switch 1 are trusted.

#### Configuring a VLAN, Interfaces, and Port Security Features on Switch 1

##### **CLI Quick Configuration**

To quickly configure a VLAN, interfaces, and port security features, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans employee-vlan vlan-id 20
set interfaces ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members 20
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members 20
set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members 20
set interfaces ge-0/0/11 unit 0 family ethernet-switching vlan members 20
set ethernet-switching-options secure-access-port interface ge-0/0/1 mac-limit 5 action drop
set ethernet-switching-options secure-access-port vlan employee-vlan arp-inspection
set ethernet-switching-options secure-access-port vlan employee-vlan examine-dhcp
clear ethernet-switching table interface ge-0/0/1
```

**Step-by-Step Procedure** To configure MAC limiting, a VLAN, and interfaces on Switch 1 and enable DAI and DHCP on the VLAN:

1. Configure the VLAN **employee-vlan** with VLAN ID **20**:  

```
[edit vlans]
user@switch1# set employee-vlan vlan-id 20
```
2. Configure an interface on Switch 1 as a trunk interface:  

```
[edit interfaces]
user@switch1# set ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
```
3. Associate the VLAN with interfaces ge-0/0/1, ge-0/0/2, ge-0/0/3, and ge-0/0/11:  

```
[edit interfaces]
user@switch1# set ge-0/0/1 unit 0 family ethernet-switching vlan members 20
user@switch1# set ge-0/0/2 unit 0 family ethernet-switching vlan members 20
user@switch1# set ge-0/0/3 unit 0 family ethernet-switching vlan members 20
user@switch1# set ge-0/0/11 unit 0 family ethernet-switching vlan members 20
```
4. Enable DHCP snooping on the VLAN:  

```
[edit ethernet-switching-options secure-access-port]
user@switch1# set vlan employee-vlan examine-dhcp
```
5. Enable DAI on the VLAN:  

```
[edit ethernet-switching-options secure-access-port]
user@switch1# set vlan employee-vlan arp-inspection
```
6. Configure a MAC limit of **5** on ge-0/0/1 and use the default action, **drop** (packets with new addresses are dropped if the limit is exceeded):  

```
[edit ethernet-switching-options secure-access-port]
user@switch1# set interface ge-0/0/1 mac-limit 5 drop
```
7. Clear the existing MAC address table entries from interface ge-0/0/1:  

```
user@switch1# clear ethernet-switching table interface ge-0/0/1
```

**Results** Display the results of the configuration:

```
[edit]
user@switch1# show
ethernet-switching-options {
  secure-access-port {
    interface ge-0/0/1.0 {
      mac-limit 5 action drop;
    }
    vlan employee-vlan {
      arp-inspection;
      examine-dhcp;
    }
  }
}
interfaces {
  ge-0/0/1 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members 20;
        }
      }
    }
  }
}
```

```
}
ge-0/0/2 {
  unit 0 {
    family ethernet-switching {
      vlan {
        members 20;
      }
    }
  }
}
ge-0/0/3 {
  unit 0 {
    family ethernet-switching {
      vlan {
        port-mode trunk;
        members 20;
      }
    }
  }
}
ge-0/0/11 {
  unit 0 {
    family ethernet-switching {
      port-mode trunk;
      vlan {
        members 20;
      }
    }
  }
}
vlands {
  employee-vlan {
    vlan-id 20;
  }
}
```

---

### Configuring a VLAN and Interfaces on Switch 2

To configure the VLAN and interfaces on Switch 2:

#### CLI Quick Configuration

To quickly configure the VLAN and interfaces on Switch 2, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans employee-vlan vlan-id 20
set interfaces ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/11 unit 0 family ethernet-switching vlan members 20
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members 20
```

#### Step-by-Step Procedure

To configure the VLAN and interfaces on Switch 2:

1. Configure the VLAN **employee-vlan** with VLAN ID 20:  

```
[edit vlans]
user@switch1# set employee-vlan vlan-id 20
```
2. Configure an interface on Switch 2 as a trunk interface:

```
[edit interfaces]
user@switch2# set ge-0/0/11 unit 0 ethernet-switching port-mode trunk
3. Associate the VLAN with interfaces ge-0/0/1 and ge-0/0/11:
[edit interfaces]
user@switch2# set ge-0/0/1 unit 0 family ethernet-switching vlan members 20
user@switch2# set ge-0/0/11 unit 0 family ethernet-switching vlan members 20
```

**Results** Display the results of the configuration:

```
[edit]
user@switch2# show
interfaces {
  ge-0/0/1 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members 20;
        }
      }
    }
  }
  ge-0/0/11 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 20;
        }
      }
    }
  }
}
vlans {
  employee-vlan {
    vlan-id 20;
  }
}
```

### Verification

To confirm that the configuration is working properly.

- [Verifying That DHCP Snooping Is Working Correctly on Switch 1 on page 5031](#)
- [Verifying That DAI Is Working Correctly on Switch 1 on page 5032](#)
- [Verifying That MAC Limiting Is Working Correctly on Switch 1 on page 5032](#)

#### *Verifying That DHCP Snooping Is Working Correctly on Switch 1*

**Purpose** Verify that DHCP snooping is working on Switch 1.

**Action** Send some DHCP requests from network devices (here they are DHCP clients) connected to the switch.

issue the operational mode command **show dhcp snooping binding** to display the DHCP snooping information when the interface through which Switch 2 sends the DHCP server replies to clients connected to Switch 1 is trusted. The server has provided the IP addresses and leases:

```
user@switch1> show dhcp snooping binding
DHCP Snooping Information:
MAC Address      IP Address      Lease    Type    VLAN      Interface
-----
00:05:85:3A:82:77 192.0.2.17      600     dynamic employee-vlan ge-0/0/1.0
00:05:85:3A:82:79 192.0.2.18      653     dynamic employee-vlan ge-0/0/1.0
00:05:85:3A:82:80 192.0.2.19      720     dynamic employee-vlan ge-0/0/1.0
00:05:85:3A:82:81 192.0.2.20      932     dynamic employee-vlan ge-0/0/1.0
00:05:85:3A:82:83 192.0.2.21      1230    dynamic employee-vlan ge-0/0/1.0
00:05:85:3A:82:90 192.0.2.20      932     dynamic employee-vlan ge-0/0/2.0
00:05:85:3A:82:91 192.0.2.21      1230    dynamic employee-vlan ge-0/0/3.0
```

**Meaning** The output shows, for each MAC address, the assigned IP address and lease time—that is, the time, in seconds, remaining before the lease expires.

#### *Verifying That DAI Is Working Correctly on Switch 1*

**Purpose** Verify that DAI is working on Switch 1.

**Action** Send some ARP requests from network devices connected to the switch.

Issue the operational mode command **show arp inspection statistics** to display the DAI information:

```
user@switch1> show arp inspection statistics
ARP inspection statistics:
Interface      Packets received  ARP inspection pass  ARP inspection failed
-----
ge-0/0/1.0      7                 5                    2
ge-0/0/2.0     10                10                   0
ge-0/0/3.0     18                15                   3
```

**Meaning** The output shows the number of ARP packets received and inspected per interface, with a listing of how many packets passed and how many failed the inspection on each interface. The switch compares the ARP requests and replies against the entries in the DHCP snooping database. If a MAC address or IP address in the ARP packet does not match a valid entry in the database, the packet is dropped.

#### *Verifying That MAC Limiting Is Working Correctly on Switch 1*

**Purpose** Verify that MAC limiting is working on Switch 1.

**Action** Issue the operational mode command **show ethernet-switching table** to display the MAC addresses that are learned when DHCP requests are sent from hosts on ge-0/0/1:

```
user@switch1> show ethernet-switching table
```

Ethernet-switching table: 6 entries, 5 learned

| VLAN          | MAC address       | Type  | Age | Interfaces |
|---------------|-------------------|-------|-----|------------|
| employee-vlan | 00:05:85:3A:82:77 | Learn | 0   | ge-0/0/1.0 |
| employee-vlan | 00:05:85:3A:82:79 | Learn | 0   | ge-0/0/1.0 |
| employee-vlan | 00:05:85:3A:82:80 | Learn | 0   | ge-0/0/1.0 |
| employee-vlan | 00:05:85:3A:82:81 | Learn | 0   | ge-0/0/1.0 |
| employee-vlan | 00:05:85:3A:82:83 | Learn | 0   | ge-0/0/1.0 |
| employee-vlan | *                 | Flood | -   | ge-0/0/1.0 |

**Meaning** The output shows that five MAC addresses have been learned for interface **ge-0/0/1**, which corresponds to the MAC limit of **5** set in the configuration. The last line of the output shows that a sixth MAC address request was dropped, as indicated by the asterisk (\*) in the **MAC address** column.

### Example: Configuring DHCP Snooping and DAI to Protect the Switch from ARP Spoofing Attacks

In an ARP spoofing attack, the attacker associates its own MAC address with the IP address of a network device connected to the switch. Traffic intended for that IP address is now sent to the attacker instead of being sent to the intended destination. The attacker can send faked, or “spoofed,” ARP messages on the LAN.

**NOTE:** When dynamic ARP inspection (DAI) is enabled, the switch logs the number of invalid ARP packets that it receives on each interface, along with the sender's IP and MAC addresses. You can use these log messages to discover ARP spoofing on the network. ARP probe packets are not subjected to dynamic ARP inspection. The switch always forwards such packets.

This example describes how to configure DHCP snooping and dynamic ARP inspection (DAI), two port security features, to protect the switch against ARP spoofing attacks:

- [Requirements on page 5034](#)
- [Overview and Topology on page 5034](#)
- [Configuration on page 5035](#)
- [Verification on page 5036](#)

---

### Requirements

This example uses the following hardware and software components:

- One EX Series switch or one QFX3500 switch
- Junos OS Release 11.4 or later for EX Series switches or Junos OS Release 12.1 or later for the QFX Series
- A DHCP server to provide IP addresses to network devices on the switch

Before you configure DHCP snooping and DAI (two port security features) to mitigate ARP spoofing attacks, be sure you have:

- Connected the DHCP server to the switch.
- Configured a VLAN on the switch. See the task for your platform:
  - *Example: Setting Up Bridging with Multiple VLANs for EX Series Switches*
  - [“Example: Setting Up Bridging with Multiple VLANs” on page 2110](#) for the QFX Series

---

### Overview and Topology

Ethernet LANs are vulnerable to address spoofing and DoS attacks on network devices. This example describes how to protect the switch against one common type of attack, an ARP spoofing attack.

In an ARP spoofing attack, the attacker sends faked ARP messages, thus creating various types of problems on the LAN—for example, the attacker might launch a man-in-the middle attack.

This example shows how to configure port security features on a switch that is connected to a DHCP server. The setup for this example includes the VLAN **employee-vlan** on the switch. The procedure for creating that VLAN is described in the topic *Example: Setting Up Bridging with Multiple VLANs for EX Series Switches* and [“Example: Setting Up Bridging with Multiple VLANs” on page 2110](#) for the QFX Series. That procedure is not repeated here. [Figure 199 on page 5035](#) illustrates the topology for this example.

Figure 199: Network Topology for Basic Port Security

The components of the topology for this example are shown in [Table 364 on page 5035](#).

Table 364: Components of the Port Security Topology

| Properties                         | Settings                                                                                       |
|------------------------------------|------------------------------------------------------------------------------------------------|
| Switch hardware                    | One EX3200-24P, 24 ports (8 PoE ports) or one QFX3500 switch                                   |
| VLAN name and ID                   | <b>employee-vlan</b> , tag 20                                                                  |
| VLAN subnets                       | 192.0.2.16/28<br>192.0.2.17 through 192.0.2.30<br>192.0.2.31 is the subnet's broadcast address |
| Interfaces in <b>employee-vlan</b> | <code>ge-0/0/1</code> , <code>ge-0/0/2</code> , <code>ge-0/0/3</code> , <code>ge-0/0/8</code>  |
| Interface for DHCP server          | <code>ge-0/0/8</code>                                                                          |

In this example, the switch has already been configured as follows:

- Secure port access is activated on the switch.
- DHCP snooping is disabled on the VLAN **employee-vlan**.
- All access ports are untrusted, which is the default setting.

### Configuration

To configure DHCP snooping and dynamic ARP inspection (DAI) to protect the switch against ARP attacks:

**CLI Quick Configuration** To quickly configure DHCP snooping and dynamic ARP inspection (DAI), copy the following commands and paste them into the switch terminal window:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge-0/0/8 dhcp-trusted
user@switch# set vlan employee-vlan examine-dhcp
user@switch# set vlan employee-vlan arp-inspection
```

**Step-by-Step Procedure** Configure DHCP snooping and dynamic ARP inspection (DAI) on the VLAN:

1. Set the **ge-0/0/8** interface as trusted:  

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge-0/0/8 dhcp-trusted
```
2. Enable DHCP snooping on the VLAN:  

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee-vlan examine-dhcp
```
3. Enable DAI on the VLAN:  

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee-vlan arp-inspection
```

**Results** Check the results of the configuration:

```
[edit ethernet-switching-options secure-access-port]
user@switch# show
interface ge-0/0/8.0 {
  dhcp-trusted;
}
vlan employee-vlan {
  arp-inspection;
  examine-dhcp;
}
```

---

### Verification

Confirm that the configuration is working properly.

- [Verifying That DHCP Snooping Is Working Correctly on the Switch on page 5036](#)
- [Verifying That DAI Is Working Correctly on the Switch on page 5037](#)

#### *Verifying That DHCP Snooping Is Working Correctly on the Switch*

**Purpose** Verify that DHCP snooping is working on the switch.

**Action** Send some DHCP requests from network devices (here they are DHCP clients) connected to the switch.

Display the DHCP snooping information when the port on which the DHCP server connects to the switch is trusted. The following output results when requests are sent from the MAC addresses and the server has provided the IP addresses and leases:

```
user@switch> show dhcp-snooping binding
DHCP Snooping Information:
MAC Address      IP Address      Lease    Type    VLAN          Interface
-----
00:05:85:3A:82:77 192.0.2.17      600     dynamic employee-vlan ge-0/0/1.0
00:05:85:3A:82:79 192.0.2.18      653     dynamic employee-vlan ge-0/0/1.0
00:05:85:3A:82:80 192.0.2.19      720     dynamic employee-vlan ge-0/0/2.0
00:05:85:3A:82:81 192.0.2.20      932     dynamic employee-vlan ge-0/0/2.0
00:05:85:3A:82:83 192.0.2.21      1230    dynamic employee-vlan ge-0/0/2.0
00:05:85:27:32:88 192.0.2.22      3200    dynamic employee-vlan ge-0/0/3.0
```

**Meaning** When the interface on which the DHCP server connects to the switch has been set to trusted, the output (see preceding sample) shows, for each MAC address, the assigned IP address and lease time—that is, the time, in seconds, remaining before the lease expires.

#### *Verifying That DAI Is Working Correctly on the Switch*

**Purpose** Verify that DAI is working on the switch.

**Action** Send some ARP requests from network devices connected to the switch.

Display the DAI information:

```
user@switch> show arp inspection statistics
ARP inspection statistics:
Interface      Packets received  ARP inspection pass  ARP inspection failed
-----
ge-0/0/1.0      7                 5                    2
ge-0/0/2.0     10                10                   0
ge-0/0/3.0     12                12                   0
```

**Meaning** The sample output shows the number of ARP packets received and inspected per interface, with a listing of how many packets passed and how many failed the inspection on each interface. The switch compares the ARP requests and replies against the entries in the DHCP snooping database. If a MAC address or IP address in the ARP packet does not match a valid entry in the database, the packet is dropped.

## Example: Configuring Allowed MAC Addresses to Protect the Switch from DHCP Snooping Database Alteration Attacks

In one type of attack on the DHCP snooping database, an intruder introduces a DHCP client on an untrusted access interface with a MAC address identical to that of a client on another untrusted interface. The intruder then acquires the DHCP lease of that other client, thus changing the entries in the DHCP snooping table. Subsequently, what would have been valid ARP requests from the legitimate client are blocked.

This example describes how to configure allowed MAC addresses, a port security feature, to protect the switch from DHCP snooping database alteration attacks:

- [Requirements on page 5038](#)
- [Overview and Topology on page 5038](#)
- [Configuration on page 5040](#)
- [Verification on page 5040](#)

### Requirements

---

This example uses the following hardware and software components:

- One EX Series switch or one QFX3500 switch
- Junos OS Release 11.4 or later for EX Series switches or Junos OS Release 12.1 or later for the QFX Series
- A DHCP server to provide IP addresses to network devices on the switch

Before you configure specific port security features to mitigate common access-interface attacks, be sure you have:

- Connected the DHCP server to the switch.
- Configured a VLAN on the switch. See the task for your platform:
  - *Example: Setting Up Bridging with Multiple VLANs for EX Series Switches*
  - [“Example: Setting Up Bridging with Multiple VLANs” on page 2110](#) for the QFX Series

### Overview and Topology

---

Ethernet LANs are vulnerable to address spoofing and DoS attacks on network devices. This example describes how to protect the switch from an attack on the DHCP snooping database that alters the MAC addresses assigned to some clients.

This example shows how to configure port security features on a switch that is connected to a DHCP server.

The setup for this example includes the VLAN **employee-vlan** on the switch. [Figure 200 on page 5039](#) illustrates the topology for this example.

**Figure 200: Network Topology for Basic Port Security**

The components of the topology for this example are shown in [Table 365 on page 5039](#).

**Table 365: Components of the Port Security Topology**

| Properties                         | Settings                                                                                       |
|------------------------------------|------------------------------------------------------------------------------------------------|
| Switch hardware                    | One EX3200-24P, 24 ports (8 PoE ports) or one QFX3500 switch                                   |
| VLAN name and ID                   | <b>employee-vlan</b> , tag 20                                                                  |
| VLAN subnets                       | 192.0.2.16/28<br>192.0.2.17 through 192.0.2.30<br>192.0.2.31 is the subnet's broadcast address |
| Interfaces in <b>employee-vlan</b> | ge-0/0/1, ge-0/0/2, ge-0/0/3, ge-0/0/8                                                         |
| Interface for DHCP server          | ge-0/0/8                                                                                       |

In this example, the switch has already been configured as follows:

- Secure port access is activated on the switch.
- DHCP snooping is enabled on the VLAN **employee-vlan**.
- All access ports are untrusted, which is the default setting.

## Configuration

---

To configure allowed MAC addresses to protect the switch against DHCP snooping database alteration attacks:

**CLI Quick Configuration** To quickly configure some allowed MAC addresses on an interface, copy the following commands and paste them into the switch terminal window:

```
[edit ethernet-switching-options secure-access-port]
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:80
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:81
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:83
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:85
set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:88
```

**Step-by-Step Procedure** To configure some allowed MAC addresses on an interface:  
Configure the five allowed MAC addresses on an interface:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:80
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:81
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:83
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:85
user@switch# set interface ge-0/0/2 allowed-mac 00:05:85:3A:82:88
```

**Results** Check the results of the configuration:

```
[edit ethernet-switching-options secure-access-port]
user@switch# show
interface ge-0/0/2.0 {
    allowed-mac [ 00:05:85:3a:82:80 00:05:85:3a:82:81 00:05:85:3a:82:83 00:05:85:
:3a:82:85 00:05:85:3a:82:88 ];
}
```

## Verification

---

Confirm that the configuration is working properly.

- [Verifying That Allowed MAC Addresses Are Working Correctly on the Switch on page 5040](#)

### *Verifying That Allowed MAC Addresses Are Working Correctly on the Switch*

**Purpose** Verify that allowed MAC addresses are working on the switch.

**Action** Display the MAC cache information:

```
user@switch> show ethernet-switching table
Ethernet-switching table: 6 entries, 5 learned
```

| VLAN          | MAC address       | Type  | Age | Interfaces |
|---------------|-------------------|-------|-----|------------|
| employee-vlan | 00:05:85:3A:82:80 | Learn | 0   | ge-0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:81 | Learn | 0   | ge-0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:83 | Learn | 0   | ge-0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:85 | Learn | 0   | ge-0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:88 | Learn | 0   | ge-0/0/2.0 |
| employee-vlan | *                 | Flood | -   | ge-0/0/2.0 |

**Meaning** The output shows that the five MAC addresses configured as allowed MAC addresses have been learned and are displayed in the MAC cache. The last MAC address in the list, one that had not been configured as allowed, has not been added to the list of learned addresses.

## Example: Setting Up DHCP Option 82 with a Switch with No Relay Agent Between Clients and a DHCP Server

You can use DHCP option 82, also known as the DHCP relay agent information option, to help protect the switch against attacks such as spoofing (forging) of IP addresses and MAC addresses, and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.

This example describes how to configure DHCP option 82 on a switch with DHCP clients, DHCP server, and switch all on the same VLAN:

- [Requirements on page 5041](#)
- [Overview and Topology on page 5042](#)
- [Configuration on page 5043](#)

### Requirements

This example uses the following hardware and software components:

- One EX Series or QFX Series switch

- Junos OS Release 9.3 or later for EX Series switches or Junos OS Release 12.1 or later for the QFX Series
- A DHCP server to provide IP addresses to network devices on the switch

Before you configure DHCP option 82 on the switch, be sure you have:

- Connected and configured the DHCP server.

**NOTE:** Your DHCP server must be configured to accept DHCP option 82. If it is not configured for DHCP option 82, it does not use the DHCP option 82 information in the requests sent to it when it formulates its reply messages.

- Configured the **employee** VLAN on the switch and associated the interfaces on which the clients and the server connect to the switch with that VLAN. See the task for your platform:
  - *Configuring VLANs for EX Series Switches (CLI Procedure)*
  - “Configuring VLANs” on page 2214 for the QFX Series

---

## Overview and Topology

If DHCP option 82 is enabled on the switch, then when a network device—a DHCP client—that is connected to the switch on an untrusted interface sends a DHCP request, the switch inserts information about the client's network location into the packet header of that request. The switch then sends the request to the DHCP server. The DHCP server reads the option 82 information in the packet header and uses it to implement the IP address or other parameter for the client.

DHCP option 82 is enabled on an individual VLAN or on all VLANs on the switch.

When option 82 is enabled on the switch, then this sequence of events occurs when a DHCP client sends a DHCP request:

1. The switch receives the request and inserts the option 82 information in the packet header.
2. The switch forwards the request to the DHCP server.
3. The server uses the DHCP option 82 information to formulate its reply and sends a response back to the switch. It does not alter the option 82 information.
4. The switch strips the option 82 information from the response packet.
5. The switch forwards the response packet to the client.

Figure 201 on page 5043 illustrates the topology for this example.

Figure 201: Network Topology for Configuring DHCP Option 82 on a Switch That Is on the Same VLAN as the DHCP Clients and the DHCP Server

In this example, you configure DHCP option 82 on the switch. The switch connects to the DHCP server on interface `ge-0/0/8`. The DHCP clients connect to the switch on interfaces `ge-0/0/1`, `ge-0/0/2`, and `ge-0/0/3`. The switch, server, and clients are all members of the **employee** VLAN.

### Configuration

#### CLI Quick Configuration

To quickly configure DHCP option 82, copy the following commands and paste them into the switch terminal window:

```
set ethernet-switching-options secure-access-port vlan employee dhcp-option82
set ethernet-switching-options secure-access-port vlan employee dhcp-option82 circuit-id prefix
hostname
set ethernet-switching-options secure-access-port vlan employee dhcp-option82 circuit-id
use-vlan-id
set ethernet-switching-options secure-access-port vlan employee dhcp-option82 remote-id
set ethernet-switching-options secure-access-port vlan employee dhcp-option82 remote-id
prefix mac
set ethernet-switching-options secure-access-port vlan employee dhcp-option82 remote-id
use-string employee-switch1
set ethernet-switching-options secure-access-port vlan employee dhcp-option82 vendor-id
```

#### Step-by-Step Procedure

To configure DHCP option 82:

1. Specify DHCP option 82 for the **employee** VLAN:
 

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82
```
2. Configure a prefix for the circuit ID suboption (the prefix is always the hostname of the switch):
 

```
[edit ethernet-switching-options secure-access-port]
```

- ```
user@switch# set vlan employee dhcp-option82 circuit-id prefix hostname
```
3. Specify that the circuit ID suboption value contains the VLAN ID rather than the VLAN name (the default):
 

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 circuit-id use-vlan-id
```
  4. Specify that the remote ID suboption be included in the DHCP option 82 information:
 

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 remote-id
```
  5. Configure a prefix for the remote ID suboption (here, the prefix is the MAC address of the switch):
 

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 remote-id prefix mac
```
  6. Specify that the remote ID suboption value contain a character string (here, the string is **employee-switch1**):
 

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 remote-id use-string employee-switch1
```
  7. Configure a vendor ID suboption value, and use the default value. To use the default value, do not type a character string after the **vendor-id** option keyword:
 

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 vendor-id
```

**Results** Check the results of the configuration:

```
[edit ethernet-switching-options secure-access-port]
user@switch# show
vlan employee {
  dhcp-option82 {
    circuit-id {
      prefix hostname;
      use-vlan-id;
    }
    remote-id {
      prefix mac;
      use-string employee-switch1;
    }
    vendor-id;
  }
}
```

- *secure-access-port*
- [secure-access-port on page 5132](#)

## Example: Setting Up DHCP Option 82 with a Switch as a Relay Agent Between Clients and a DHCP Server

You can use DHCP option 82, also known as the DHCP relay agent information option, to help protect the switch against attacks such as spoofing (forging) of IP addresses and MAC addresses, and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.

This example describes how to configure DHCP option 82 on a switch that is on the same VLAN with the DHCP clients but on a different VLAN from the DHCP server. In this example, the switch acts as a relay agent:

- [Requirements on page 5045](#)
- [Overview and Topology on page 5046](#)
- [Configuration on page 5046](#)

### Requirements

This example uses the following hardware and software components:

- One EX4200-24P switch or one QFX3500 switch
- Junos OS Release 9.3 or later for EX Series switches or Junos OS Release 12.1 or later for the QFX Series
- A DHCP server to provide IP addresses to network devices on the switch

Before you configure DHCP option 82 on the switch, be sure you have:

- Connected and configured the DHCP server.

**NOTE:** Your DHCP server must be configured to accept DHCP option 82. If it is not configured for DHCP option 82, it does not use the DHCP option 82 information in the requests sent to it when it formulates its reply messages.

- Configured the **employee** VLAN on the switch and associated the interfaces on which the clients connect to the switch with that VLAN. See the task for your platform:
  - [Configuring VLANs for EX Series Switches \(CLI Procedure\)](#)
  - [“Configuring VLANs” on page 2214](#) for the QFX Series
- Configured the **corporate** VLAN for the DHCP server.
- Configured the switch as a BOOTP relay agent. See *DHCP/BOOTP Relay for Switches Overview*.
- Configured the routed VLAN interface (RVI) to allow the switch to relay packets to the server and receive packets from the server. See *Configuring Routed VLAN Interfaces (CLI Procedure)* or [“Configuring IRB Interfaces” on page 2240](#) for the QFX Series.

## Overview and Topology

---

If DHCP option 82 is enabled on the switch, then when a network device—a DHCP client—that is connected to the switch on an untrusted interface sends a DHCP request, the switch inserts information about the client's network location into the packet header of that request. The switch then sends the request (in this setting, it relays the request) to the DHCP server. The DHCP server reads the option 82 information in the packet header and uses it to implement the IP address or other parameter for the client.

When option 82 is enabled on the switch, then this sequence of events occurs when a DHCP client sends a DHCP request:

1. The switch receives the request and inserts the option 82 information in the packet header.
2. The switch relays the request to the DHCP server.
3. The server uses the DHCP option 82 information to formulate its reply and sends a response back to the switch. It does not alter the option 82 information.
4. The switch strips the option 82 information from the response packet.
5. The switch forwards the response packet to the client.

In this example, you configure option 82 on the switch. The switch is configured as a BOOTP relay agent. The switch connects to the DHCP server through the routed VLAN interface (RVI) that you configured. The switch and clients are members of the **employee** VLAN. The DHCP server is a member of the **corporate** VLAN.

## Configuration

---

To configure DHCP option 82:

### CLI Quick Configuration

To quickly configure DHCP option 82, copy the following commands and paste them into the switch terminal window:

```
set forwarding-options helpers bootp dhcp-option82
set forwarding-options helpers bootp dhcp-option82 circuit-id prefix hostname
set forwarding-options helpers bootp dhcp-option82 circuit-id use-vlan-id
set forwarding-options helpers bootp dhcp-option82 remote-id
set forwarding-options helpers bootp dhcp-option82 remote-id prefix mac
set forwarding-options helpers bootp dhcp-option82 remote-id use-string employee-switch1
set forwarding-options helpers bootp dhcp-option82 vendor-id
```

### Step-by-Step Procedure

To configure DHCP option 82:

1. Specify DHCP option 82 for the **employee** VLAN:  

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82
```
2. Configure a prefix for the circuit ID suboption (the prefix is always the hostname of the switch):  

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82 circuit-id prefix hostname
```
3. Specify that the circuit ID suboption value contains the VLAN ID rather than the VLAN name (the default):

- ```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82 circuit-id use-vlan-id
```
4. Specify that the remote ID suboption be included in the DHCP option 82 information:
 

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82 remote-id
```
  5. Configure a prefix for the remote ID suboption (here, the prefix is the MAC address of the switch):
 

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82 remote-id prefix mac
```
  6. Specify that the remote ID suboption value contains a character string (here, the string is **employee-switch1**):
 

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82 remote-id use-string employee-switch1
```
  7. Configure a vendor ID suboption value, and use the default value. To use the default value, do not type a character string after the **vendor-id** option keyword:
 

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82 vendor-id
```

**Results** Check the results of the configuration:

```
[edit forwarding-options helpers bootp]
user@switch# show
dhcp-option82 {
  circuit-id {
    prefix hostname;
    use-vlan-id;
  }
  remote-id {
    prefix mac;
    use-string employee-switch1;
  }
  vendor-id;
}
```

## Configuring Firewall Filters

You can configure firewall filters in a switch to control traffic that enters switch ports or enters and exits VLANs and Layer 3 (routed) interfaces. To use a firewall filter, you must configure the filter and then apply it to a port, VLAN, or Layer 3 interface.

- [Configuring a Firewall Filter on page 5048](#)
- [Applying a Firewall Filter to a Port on page 5050](#)
- [Applying a Firewall Filter to a VLAN on page 5050](#)
- [Applying a Firewall Filter to a Layer 3 \(Routed\) Interface on page 5050](#)

### Configuring a Firewall Filter

---

To configure a firewall filter:

1. Configure the family address type, filter name, term name, and at least one match condition—for example, match on packets that contain a specific source address:

```
[edit]
user@switch# set firewall family ethernet-switching filter ingress-port-filter term term-one
from source-address 192.0.2.14
```

For a firewall filter that is applied to a port or VLAN, specify the family address type **ethernet-switching**. For a firewall filter that is applied to a Layer 3 (routed) interface, specify the family address type **inet**.

The filter and term names can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. Each filter name must be unique. A filter can contain one or more terms, and each term name must be unique within a filter.

2. Configure additional match conditions. For example, match on packets that contain a specific source port:

```
[edit firewall family ethernet-switching filter ingress-port-filter term
term-one from]
user@switch# set source-port 80
```

You can specify one or more match conditions in a single **from** statement. For a match to occur, the packet must match all the conditions in the term. The **from** statement is optional, but if included in a term, it cannot be empty. If you omit the **from** statement, all packets are considered to match.

3. If you want to apply a firewall filter to multiple interfaces and be able to see counters specific to each interface, configure the **interface-specific** option:

```
[edit firewall family ethernet-switching filter ingress-port-filter]
user@switch# set interface-specific
```

4. In each firewall filter term, specify the actions to take if the packet matches all the conditions in that term. You can specify an action and action modifiers:

- To specify a filter action, for example, to discard packets that match the conditions of the filter term:

```
[edit firewall] family ethernet-switching filter ingress-port-filter term
term-one then]
```

```
user@switch# set discard
```

You can specify no more than one action (**accept**, **discard**, **reject**, **routing-instance**, or **vlan**) per term.

- To specify action modifiers, for example, to count and classify packets to a forwarding class:

```
[edit firewall] family ethernet-switching filter ingress-port-filter term
term-one then]
```

```
user@switch# set count counter-one
```

```
user@switch# set forwarding-class expedited-forwarding
```

```
user@switch# set loss-priority high
```

You can specify any of the following action modifiers in a **then** statement:

- **analyzer *analyzer-name***—Mirror port traffic to a specified analyzer, which you must configure at the **[ethernet-switching-options]** level.
- **count *counter-name***—Count the number of packets that pass this filter term.

**NOTE:** We recommend that you configure a counter for each term in a firewall filter, so that you can monitor the number of packets that match the conditions specified in each filter term.

**NOTE:** On QFX3500 and QFX3600 switches, filters automatically count packets that have been dropped on ingress because of cyclic redundancy check (CRC) errors.

- **forwarding-class *class***—Assign packets to a forwarding class.
- **log**—Log the packet header information in the Routing Engine.
- **loss-priority *priority***—Set the priority of dropping a packet.
- **policer *policer-name***—Apply rate-limiting to the traffic.
- **syslog**—Log an alert for this packet.

If you omit the **then** statement or do not specify an action, packets that match all the conditions in the **from** statement are accepted. However, you should always explicitly configure an action in the **then** statement. You can include no more than one action statement, but you can use any combination of action modifiers. For an action or action modifier to take effect, all conditions in the **from** statement must match.

**NOTE:** Implicit discard is also applicable to a firewall filter applied to the loopback interface, lo0.

### Applying a Firewall Filter to a Port

---

To apply a firewall filter to an ingress port:

1. Provide a meaningful description of the firewall filter in the configuration of the port to which the filter will be applied:

```
[edit]
user@switch# set interfaces ge-0/0/6 description "filter to limit tcp traffic at trunk port for employee-vlan"
```

2. Apply the filter to the interface, specifying the unit number, family address type, the direction of the filter (for packets entering the port), and the filter name:

```
[edit]
user@switch# set ge-0/0/6 unit 0 family ethernet-switching filter input ingress-port-filter
```

For firewall filters that are applied to ports, the family address type must be **ethernet-switching**.

**NOTE:** You can apply only one filter to a port for a given direction (ingress or egress).

---

### Applying a Firewall Filter to a VLAN

---

To apply a firewall filter to a VLAN:

1. Provide a meaningful description of the firewall filter in the configuration of the VLAN to which the filter will be applied:

```
[edit]
user@switch# set vlans employee-vlan vlan-id 20 description "filter to block rogue devices on employee-vlan"
```

2. Apply firewall filters to filter packets that are entering or exiting the VLAN:

- To apply a filter to match packets that are entering the VLAN:

```
[edit]
user@switch# set vlans employee-vlan vlan-id 20 filter input ingress-vlan-rogue-block
```

- To apply a firewall filter to match packets that are exiting the VLAN:

```
[edit]
user@switch# set vlans employee-vlan vlan-id 20 filter output egress-vlan-filter
```

**NOTE:** You can apply only one filter to a VLAN for a given direction (ingress or egress).

---

### Applying a Firewall Filter to a Layer 3 (Routed) Interface

---

To apply a firewall filter to a Layer 3 routed interface:

1. Provide a meaningful description of the firewall filter in the configuration of the interface to which the filter will be applied:

```
[edit]
```

```
user@switch# set interfaces ge-0/1/6 description "filter to count and monitor traffic on layer 3 interface"
```

2. You can apply firewall filters to filter packets that enter or exit a Layer 3 routed interface:

- To apply a firewall filter to filter packets that enter a Layer 3 interface:

```
[edit]
```

```
user@switch# set interfaces ge-0/1/6 unit 0 family inet filter input ingress-router-filter
```

- To apply a firewall filter to filter packets that exit a Layer 3 interface:

```
[edit]
```

```
user@switch# set interfaces ge-0/1/6 unit 0 family inet filter output egress-router-filter
```

For firewall filters applied to Layer 3 routed interfaces, the family address type must be **inet**.

**NOTE:** You can apply only one filter to an interface for a given direction (ingress or egress).

## Applying Firewall Filters to Interfaces

For a firewall filter to work, you must apply it to at least one interface. To do this, include the **filter** statement when configuring a logical interface at the **[edit interfaces]** hierarchy level:

```
[edit interfaces]
```

```
user@switch# set interface-name unit logical-unit-number family family-name filter (input | output) filter-name
```

In the **input** statement, specify a firewall filter to be evaluated when packets are received on the interface. Input filters applied to a loopback interface affect only traffic destined for the Routing Engine.

In the **output** statement, specify a filter to be evaluated when packets exit the interface.

**NOTE:** When you create a loopback interface, it is important to apply an ingress filter to it so the Routing Engine is protected. We recommend that when you apply a filter to the loopback interface lo0, you include the **apply-groups** statement. Doing so ensures that the filter is automatically inherited on every loopback interface, including lo0 and other loopback interfaces.

**Related Documentation** • [Configuring Firewall Filters on page 5048](#)

## Assigning Forwarding Classes and Loss Priority

You can configure firewall filters to assign packet loss priority (PLP) and forwarding classes so that if congestion occurs, the marked packets can be dropped according to the priority you set. The valid match conditions are one or more of the six packet header fields: destination address, source address, IP protocol, source port, destination port, and DSCP. In other words, you can set the forwarding class and the PLP for each packet entering or an interface with a specific destination address, source address, IP protocol, source port, destination port, or DSCP.

**NOTE:** Junos OS assigns forwarding classes and PLP on ingress only. Do not use a filter that assigns forwarding classes or PLP as an egress filter.

When tricolor marking is enabled, a switch supports four PLP designations: **low**, **medium-low**, **medium-high**, and **high**. You can also specify any of the forwarding classes listed in [Table 366 on page 5052](#)

**Table 366: Unicast Forwarding Classes**

| Unicast Forwarding Class | For CoS Traffic Type                                               |
|--------------------------|--------------------------------------------------------------------|
| be                       | Best-effort traffic                                                |
| no-loss                  | Guaranteed delivery for TCP traffic                                |
| fcoe                     | Guaranteed delivery for Fibre Channel over Ethernet (FCoE) traffic |
| nc                       | Network-control traffic                                            |

To assign forwarding classes in firewall filters:

1. Configure the family address type and filter name:

```
[edit]
user@switch# edit firewall family ethernet-switching filter ingress-filter
```

2. Configure the terms of the filter as appropriate, including the **forwarding-class** and **loss-priority** action modifiers. For example, each of the following terms in the filter examines various packet header fields and assigns the appropriate forwarding class and packet loss priority:

- The term **corp-traffic** matches all IPv4 packets with a **10.1.1.0/24** source address and assigns the packets to forwarding class **no-loss** with a loss priority of **low**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term corp-traffic from source-address 10.1.1.0/24;
user@switch# set term corp-traffic then forwarding-class no-loss
user@switch# set term corp-traffic then loss-priority low
```

- The term **data-traffic** matches all IPv4 packets with a **10.1.2.0/24** source address and assigns the packets to forwarding class **be** (best effort) with a loss priority of **medium-high**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term data-traffic from source-address 10.1.2.0/24;
user@switch# set term data-traffic then forwarding-class be
user@switch# set term data-traffic then loss-priority medium-high
```

- Because the loss of network-generated packets can jeopardize proper network operation, the delay of these packets is preferable to discarding these packets. The term **network-traffic** assigns the packets with an IP precedence of **net-control** to forwarding class **nc** (network control) with a loss priority of **low**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term network-traffic from precedence net-control
user@switch# set term network-traffic then forwarding-class nc
user@switch# set term network-traffic then loss-priority low
```

- The last term **accept-traffic** matches any packets that did not match on any of the preceding terms and assigns the packets to forwarding class **be** with a loss priority of **high**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term accept-traffic then forwarding-class be
user@switch# set term accept-traffic then loss-priority high
```

3. Apply the filter **ingress-filter** to a port, VLAN, or Layer 3 interface. For information about applying the filter, see [“Configuring Firewall Filters” on page 5048](#). (Assigning forwarding classes and PLP is supported only on ingress filters.)

## Configuring Color-Blind Egress Policers for Medium-Low PLP

If you use color-blind mode and want to configure an egress policer that marks packets to have medium-low PLP, you must configure a single-rate two-color policer at the **[edit firewall policer *policer-name*]** hierarchy level, because color-blind mode does not support medium-low priority. For example:

1. Specify the name of the policer, the bandwidth limit in bits per second (bps) to control the traffic rate on an interface, and the maximum allowed burst size to control the amount of traffic bursting:

```
[edit]
user@switch# set firewall policer policer-name if-exceeding bandwidth-limit bytes
burst-size-limit bytes
```

2. Specify medium-low loss priority for matching packets:

```
[edit]
```

```
user@switch# set firewall policer policer-name then loss-priority medium-low;
```

3. Apply the filter to a port, VLAN, or Layer 3 interface.

- [Understanding Color-Blind Mode for Two-Rate Tricolor Marking on page 4975](#)
- [Configuring Firewall Filters on page 5048](#)
- [Configuring Two-Color and Three-Color Policers to Control Traffic Rates on page 5054](#)

## Configuring Two-Color and Three-Color Policers to Control Traffic Rates

You can rate-limit traffic by configuring a policer and specifying it as an action modifier for a term in a firewall filter. By default, if you specify the same policer in multiple terms, Junos OS creates a separate policer instance for each term and applies rate limiting separately for each instance. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, each policer instance enforces a 1-Gbps limit. In this case, the total bandwidth allowed by the filter is 3 Gbps.

You can also configure a policer to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps.

NOTE: You can include two-color policer actions on ingress firewall filters only. You can include three-color policer actions on ingress and egress filters.

1. [Configuring Two-Color Policers on page 5054](#)
2. [Configuring Three-Color Policers on page 5055](#)
3. [Specifying Policers in a Firewall Filter Configuration on page 5055](#)
4. [Applying a Firewall Filter That Includes a Policer on page 5056](#)

---

### Configuring Two-Color Policers

To configure a two-color policer:

1. Specify the name of the policer, the bandwidth limit to control the traffic rate on an interface, and the maximum allowed burst size to control the amount of traffic bursting:

```
[edit firewall]
```

```
user@switch# set policer policer-name <filter-specific> if-exceeding bandwidth-limit bps  
burst-size-limit bytes
```

The policer name can contain letters, numbers, and hyphens (-) and can have as many as 64 characters.

The range for the bandwidth limit is 32000 (32k) through 102,300,000,000 (102300m) bps.

To determine the value for the burst-size limit, multiply the bandwidth of the interface on which the filter is applied by the amount of time to allow a burst of traffic at that bandwidth to occur and divide the result by 8:

**maximum burst size = (interface bandwidth) X (allowable time for burst) / (8 bits/byte)**

The range for the burst-size limit is 1 through 2,147,450,880 bytes.

2. Specify the policer action to discard or assign a loss priority to packets that exceed the rate limits:

```
[edit firewall policer policer-name]
user@switch# set then (discard | loss-priority low | loss-priority high)
```

### Configuring Three-Color Policers

To configure a three-color policer:

1. Specify the name of the policer and (optionally) whether to automatically discard packets with high loss priority (PLP):

```
[edit firewall]
user@switch# set three-color-policer policer-name
user@switch# set three-color-policer policer-name action loss-priority high then discard
```

2. Specify whether the three-color policer should be single-rate or two-rate and whether it should be color-aware or color-blind:

```
[edit firewall three-color-policer policer-name]
user@switch# set (single-rate | two-rate) (color-aware | color-blind)
```

3. For single-rate three-color policers, configure the CIR, CBS, and EBS:

```
[edit firewall three-color-policer policer-name single-rate]
user@switch# set committed-information-rate bps
user@switch# set committed-burst-size bytes
user@switch# set excess-burst-size bytes
```

4. For two-rate three-color policers, configure the CIR, CBS, PIR, and PBS:

```
[edit firewall three-color-policer policer-name single-rate]
user@switch# set committed-information-rate bps
user@switch# set committed-burst-size bytes
user@switch# set peak-information-rate bps
user@switch# set peak-burst-size bytes
```

### Specifying Policers in a Firewall Filter Configuration

To use a two-color policer, configure a filter term that includes the action **policer**:

```
[edit firewall family family-name]
user@switch# set filter filter-name term name then name
```

For example, the following commands apply a two-color policer to all packets sent from 192.0.2.0/24.

```
[edit firewall family family-name]
user@switch# set filter limit—hosts term term1 from source-address 192.0.2.0/24
user@switch# set filter limit—hosts term term1 then policer policer1
```

To use a three-color policer, configure a filter term that includes the action **three-color-policer**:

```
[edit firewall family name]
user@switch# set filter name term name from match-condition
user@switch# set filter name term name then three-color-policer (single-rate | two-rate) name
```

For example, the following commands apply a single-rate three-color policer to all packets received or sent by interface **ge-0/0/6** (depending on whether the filter is an ingress or egress filter).

```
[edit firewall family name]
user@switch# set filter srTCM term term-one from interface ge-0/0/6
user@switch# set filter srTCM term term-one then three-color-policer single-rate srTCM1-ca
```

You must specify whether the three-color policer is single-rate or two-rate, and this must match the policer itself. Otherwise, the configuration listing includes an error message indicating that the three-color policer you referenced in the filter does not exist.

---

### Applying a Firewall Filter That Includes a Policer

---

A firewall filter that includes one or more policer action modifiers must be applied to a port, VLAN, or Layer 3 interface like any other filter. For information about applying firewall filters, see “Configuring Firewall Filters” on page 5048.

**NOTE:** You can include two-color policer actions on ingress firewall filters only. You can include three-color policer actions on ingress and egress filters.

## Configuring Port Security (CLI Procedure)

Ethernet LANs are vulnerable to attacks such as address spoofing and Layer 2 denial of service (DoS) on network devices. Port security features such as DHCP snooping, DAI (dynamic ARP inspection), MAC limiting, MAC move limiting, and persistent MAC learning, as well as trusted DHCP server, help protect the access ports on the switch against the loss of information and productivity that such attacks can cause.

Depending on the particular feature, you can configure the port security feature either on:

- VLANs—A specific VLAN or all VLANs
- Interfaces—A specific interface or all interfaces

**NOTE:** If you configure one of the port security features on all VLANs or all interfaces, the switch software enables that port security feature on all VLANs and all interfaces that are not explicitly configured with other port security features.

However, if you do explicitly configure one of the port security features on a specific VLAN or on a specific interface, you must explicitly configure any additional port security features that you want to apply to that VLAN or interface. Otherwise, the switch software automatically applies the default values for the feature.

For example, if you disable DHCP snooping on all VLANs and decide to explicitly enable IP source guard only on a specific VLAN, you must also explicitly enable DHCP snooping on that specific VLAN. Otherwise, the default value of no DHCP snooping applies to that VLAN.

To configure port security features by using the CLI:

- [Enabling DHCP Snooping on page 5058](#)
- [Enabling Dynamic ARP Inspection \(DAI\) on page 5058](#)
- [Enabling IPv6 Neighbor Discovery Inspection on page 5058](#)
- [Limiting Dynamic MAC Addresses on an Interface on page 5059](#)
- [Enabling Persistent MAC Learning on an Interface on page 5059](#)

- [Limiting MAC Address Movement on page 5059](#)
- [Configuring Trusted DHCP Servers on an Interface on page 5059](#)

---

### Enabling DHCP Snooping

You can configure DHCP snooping to enable the device to monitor DHCP messages received, ensure that hosts use only the IP addresses that are assigned to them, and allow access only to authorized DHCP servers.

To enable DHCP snooping:

- On a specific VLAN:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan vlan-name examine-dhcp
```

- On all VLANs:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan all examine-dhcp
```

To enable DHCPv6 snooping:

- On a specific VLAN:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan vlan-name examine-dhcpv6
```

- On all VLANs:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan all examine-dhcpv6
```

---

### Enabling Dynamic ARP Inspection (DAI)

You can enable DAI to protect against ARP spoofing. To enable DAI:

- On a single VLAN:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan vlan-name arp-inspection
```

- On all VLANs:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan all arp-inspection
```

---

### Enabling IPv6 Neighbor Discovery Inspection

You can enable neighbor discovery inspection to protect against IPv6 address spoofing.

- To enable neighbor discovery on a single VLAN:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan vlan-name neighbor-discovery-inspection
```

- To enable neighbor discovery on all VLANs:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan all neighbor-discovery-inspection
```

### Limiting Dynamic MAC Addresses on an Interface

Limit the number of dynamic MAC addresses allowed on an interface and specify the action to take if the limit is exceeded:

- On a single interface:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface interface-name mac-limit limit action action
```

- On all interfaces:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface all mac-limit limit action action
```

### Enabling Persistent MAC Learning on an Interface

You can configure learned MAC addresses to persist on an interface across restarts of the switch:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface interface-name persistent-learning
```

### Limiting MAC Address Movement

You can limit the number of times a MAC address can move from its original interface in 1 second:

- On a single VLAN:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan vlan-name mac-move-limit limit action action
```

- On all VLANs:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan all mac-move-limit limit action action
```

### Configuring Trusted DHCP Servers on an Interface

Configure a trusted DHCP server on an interface:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface interface-name dhcp-trusted
```

## Configuring MAC Limiting

To configure MAC limiting on a specific interface or on all interfaces:

1. To limit the number of dynamic MAC addresses, set a MAC limit of 5.

The action is not specified, so the switch performs the default action **drop** if the limit is exceeded:

- On a single interface (here, the interface is **xe-0/0/1**):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface xe-0/0/1 mac-limit (Access Port Security) 5
```

- On all interfaces:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface all mac-limit 5
```

**CAUTION:** Do not set the MAC limit to 1. The first learned MAC address is often inserted into the forwarding database automatically. (For instance, the first MAC address inserted into the forwarding database for routed VLAN interfaces is the MAC address of the RVI. For Aggregated Ethernet bundles using LACP, the first MAC address inserted into the forwarding database in the forwarding table is the source address of the protocol packet.) The switch therefore fails to learn MAC addresses other than the automatic addresses when the MAC limit is set to 1, and this causes problems with MAC learning and forwarding.

2. To specify allowed MAC addresses:

- On a single interface (here, the interface is **xe-0/0/2**):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface xe-0/0/2 allowed-mac 00:05:85:3A:82:80
user@switch# set interface xe-0/0/2 allowed-mac 00:05:85:3A:82:81
user@switch# set interface xe-0/0/2 allowed-mac 00:05:85:3A:82:83
```

- On all interfaces:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface all allowed-mac 00:05:85:3A:82:80
user@switch# set interface all allowed-mac 00:05:85:3A:82:81
user@switch# set interface all allowed-mac 00:05:85:3A:82:83
```

## Configuring MAC Move Limiting (CLI Procedure)

When MAC move limiting is configured, MAC address movements are tracked by the switch and, if a MAC address changes more than the configured number of times within 1 second, the changes to MAC addresses are dropped, logged, ignored, or the interface is shut down.

**NOTE:** Although you enable this feature on VLANs, the MAC move limitation pertains to the number of movements for each individual MAC address rather than the total number of MAC address moves in the VLAN. For example, if the MAC move limit is set to 1, the switch allows an unlimited number of MAC address movements within the VLAN as long as the same MAC address does not change more than once.

You configure MAC move limiting per VLAN, not per interface (port). In the default configuration, the number of MAC moves permitted is unlimited.

You can choose to have one of the following actions performed when the MAC move limit is exceeded:

- **drop**—Drop the packet and generate a system log entry. This is the default.
- **log**—Do not drop the packet but generate a system log entry.
- **none**—Take no action.
- **shutdown**—Disable the interfaces in the VLAN and generate a system log entry. If you have configured the switch with the **port-error-disable** statement, the disabled interfaces recover automatically upon expiration of the specified disable timeout. If you have not configured the switch for autorecovery from port error disabled conditions, you can bring up the disabled interfaces by running the **clear ethernet-switching port-error** command.

To configure a MAC move limit for MAC addresses within a specific VLAN or for MAC addresses within all VLANs, using the CLI:

- On a single VLAN: To limit the number of MAC address movements that can be made by an individual MAC address within the VLAN **employee-vlan**, set a MAC move limit of 5:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee-vlan mac-move-limit 5
```

The action is not specified, so the switch performs the default action **drop** if it tracks that an individual MAC address within the **employee-vlan** has moved more than 5 times within one second.

- On all VLANs: To limit the number of MAC movements that can be made by individual MAC addresses within all VLANs, set a MAC move limit of 5:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan all mac-move-limit 5
```

The action is not specified, so the switch performs the default action **drop** if it tracks that an individual MAC address within any of the VLANs has moved more than 5 times within 1 second.

- [secure-access-port on page 5132](#)

## Configuring Autorecovery for MAC Limited or Storm Control Interfaces (CLI Procedure)

An Ethernet access interface might shut down or be disabled as a result of one of the following configurations:

- MAC limiting—**mac-limit** statement is configured with action **shutdown**.
- MAC move limiting—**mac-move-limit** statement is configured with action **shutdown**.
- Storm control—**storm-control** statement is configured with the action **shutdown**.

You can configure a device to automatically restore the disabled interfaces to service after a specified period of time. Autorecovery applies to all the interfaces that have been disabled due to MAC limiting, MAC move limiting, or storm control errors.

To configure autorecovery from the disabled state due to MAC limiting, MAC move limiting, or storm control shutdown actions:

```
[edit ethernet-switching-options]  
user@switch# set port-error-disable disable-timeout seconds
```

**NOTE:** You must specify the disable timeout value—there is no default disable timeout period. If you do not specify a timeout value, you must use the [clear ethernet-switching port-error](#) command to clear the errors and restore the interfaces to service.

## Configuring the none Action to Override a MAC Limit Applied to All Interfaces (CLI Procedure)

If you set a MAC limit in your port security settings to apply to all interfaces, you can override that setting for a particular interface by specifying the action **none**.

To use the **none** action to override a MAC limit setting:

1. Set the MAC limit for all interfaces—for example, a limit of **5** with action **drop**:

```
[edit ethernet-switching-options secure-access-port]  
user@switch# set interface all mac-limit (Access Port Security) 5 action drop
```

2. Change the action for one interface with this command.

```
[edit ethernet-switching-options secure-access-port]  
user@switch# set interface xe-0/0/2 mac-limit action none
```

## Configuring Static ARP Entries

You can create static ARP table entries, which are explicit mappings between IP addresses and MAC addresses.

- To configure a static ARP entry:

```
[edit interfaces interface-name unit logical-unit-number family inet address
address]
user@switch# set arp ip-address (mac | multicast-mac) mac-address
```

The IP address that you specify must be part of the subnet defined in the enclosing **address** statement.

To associate a multicast MAC address with a unicast IP address, use the **multicast-mac** statement.

Specify the MAC address as 6 hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*; for example, 0011.2233.4455 or 00:11:22:33:44:55.

### Related Documentation

- [arp on page 2323](#)

## Configuring Static IP Addresses for DHCP Bindings on Access Ports (CLI Procedure)

You can add static (fixed) IP addresses and bind them to fixed MAC addresses in the DHCP snooping database. These bindings are labeled *static* in the database, while those bindings that have been added through the process of DHCP snooping are labeled *dynamic*.

To configure a static IP-MAC address binding in the DHCP snooping database:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface interface-name static-ip ip-address vlan data-vlan mac mac-address
```

To configure a static IP-MAC address binding in the DHCPv6 snooping database:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface interface-name static-ipv6 ip-address vlan data-vlan mac mac-address
```

To view results of the configuration steps before committing the configuration, type the **show** command at the user prompt.

To commit these changes to the active configuration, type the **commit** command at the user prompt.

### Related Documentation

- [Verifying That DHCP Snooping Is Working Correctly on page 5158](#)
- [Understanding DHCP Snooping for Port Security on page 4982](#)

- [secure-access-port](#)
- [secure-access-port on page 5132](#)

## Enabling DHCP Snooping (CLI Procedure)

DHCP snooping enables the switch to monitor and control DHCP messages received from untrusted devices connected to the switch. The switch builds and maintains a database of valid bindings between IP address and MAC addresses (IP-MAC bindings) called the DHCP snooping database.

**NOTE:** If you configure DHCP snooping for all VLANs and you enable a different port security feature on a specific VLAN, you must also explicitly enable DHCP snooping on that VLAN. Otherwise, the default value of no DHCP snooping applies to that VLAN.

This topic describes:

- [Enabling DHCP Snooping on page 5067](#)
- [Applying CoS Forwarding Classes to Prioritize Snooped Packets on page 5067](#)

## Enabling DHCP Snooping

You configure DHCP snooping per VLAN, not per interface (port). By default, DHCP snooping is disabled for all VLANs. You can enable DHCP snooping on all VLANs or on specific VLANs.

To enable DHCP snooping:

- On a specific VLAN:

```
[edit ethernet-switching-options secure-access port]
user@switch# set vlan vlan-name examine-dhcp
```

- On all VLANs:

```
[edit ethernet-switching-options secure-access port]
user@switch# set vlan all examine-dhcp
```

To enable DHCPv6 snooping:

- On a specific VLAN:

```
[edit ethernet-switching-options secure-access port]
user@switch# set vlan vlan-name examine-dhcpv6
```

- On all VLANs:

```
[edit ethernet-switching-options secure-access port]
user@switch# set vlan all examine-dhcpv6
```

**TIP:** By default, the IP-MAC bindings are lost when the switch is rebooted and DHCP clients (the network devices, or hosts) must reacquire bindings. However, you can configure the bindings to persist by setting the `dhcp-snooping-file` statement to store the database file either locally or remotely.

**TIP:** For private VLANs (PVLANS), enable DHCP snooping on the primary VLAN. If you enable DHCP snooping only on a community VLAN, DHCP messages coming from PVLAN trunk ports are not snooped.

## Applying CoS Forwarding Classes to Prioritize Snooped Packets

On EX Series switches you might need to use class of service (CoS) to protect packets from critical applications from being dropped during periods of network congestion and delay, and might also need to configure the port security features of DHCP snooping on the ports through which those packets enter or leave.

**NOTE:** Prioritizing snooped packets by using CoS forwarding classes is not supported on the QFX Series switch.

To apply CoS forwarding classes and queues to snooped packets:

1. Create a user-defined forwarding class to be used for prioritizing snooped packets:

```
[edit class-of-service]
user@switch# set forwarding-classes class class-name queue-num queue-number
```

2. Enable DHCP snooping on a specific VLAN or on all VLANs and apply the required forwarding class on the snooped packets:

- On a specific VLAN:

```
[edit ethernet-switching-options secure-access port]
user@switch# set vlan vlan-name examine-dhcp forwarding-class class-name
```

- On all VLANs:

```
[edit ethernet-switching-options secure-access port]
user@switch# set vlan all examine-dhcp forwarding-class class-name
```

**NOTE:** Replace `examine-dhcp` with `examine-dhcpv6` to enable DHCPv6 snooping.

---

#### Related Documentation

- [secure-access-port](#)
- [secure-access-port on page 5132](#)

## Enabling Dynamic ARP Inspection (CLI Procedure)

Dynamic ARP inspection (DAI) protects switches against ARP spoofing. DAI inspects ARP packets on the LAN and uses the information in the DHCP snooping database on the switch to validate ARP packets and to protect against ARP cache poisoning.

This topic describes:

- [Enabling DAI on page 5069](#)
- [Applying CoS Forwarding Classes to Prioritize Inspected Packets on page 5069](#)

## Enabling DAI

You configure DAI for each VLAN, not for each interface (port). By default, DAI is disabled for all VLANs.

To enable DAI on a VLAN or all VLANs:

- On a single VLAN:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan vlan-name arp-inspection
```

- On all VLANs:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan all arp-inspection
```

## Applying CoS Forwarding Classes to Prioritize Inspected Packets

You might need to use class of service (CoS) to protect packets from critical applications from being dropped during periods of network congestion and delay and you might also need the port security features of DHCP snooping on the same ports through which those critical packets are entering and leaving.

To apply CoS forwarding classes and queues to DAI packets:

- Create a user-defined forwarding class to be used for prioritizing DAI packets:

```
[edit class-of-service]
user@switch# set forwarding-classes class class-name queue queue-number
```

- Enable DAI on a specific VLAN or on all VLANs and apply the desired forwarding class on the DAI packets:

- On a specific VLAN:

```
[edit ethernet-switching-options secure-access port]
user@switch# set vlan vlan-name arp-inspection forwarding-class class-name
```

- On all VLANs:

```
[edit ethernet-switching-options secure-access port]
user@switch# set vlan all arp-inspection forwarding-class class-name
```

## Enabling a Trusted DHCP Server (CLI Procedure)

You can configure any interface on a switch that connects to a DHCP server as a trusted interface (port). Configuring a DHCP server on a trusted interface protects against rogue DHCP servers sending leases.

You configure a trusted DHCP server on an interface, not on a VLAN. By default, all access interfaces are untrusted, and all trunk interfaces are trusted.

To configure a trusted interface for a DHCP server by using the CLI (here, the interface is **ge-0/0/8**):

```
[edit ethernet-switching-options secure-access port]  
user@switch# set interface ge-0/0/8 dhcp-trusted
```

### Related Documentation

- [Understanding Trusted DHCP Servers for Port Security on page 4994](#)
- [secure-access-port](#)
- [secure-access-port on page 5132](#)

## Enabling a Trusted Port for DHCP

By default, all access ports are untrusted and all trunk ports are trusted with regard to DHCP. Trusted ports allow DHCP servers to provide IP addresses and other information to requesting devices. Untrusted ports drop traffic from DHCP servers to prevent unauthorized servers from providing any configuration information to clients.

If you attach a DHCP server to an access port, you must configure it as trusted. You configure a trusted DHCP server on an interface, not on a VLAN.

**NOTE:** Before you attach a DHCP server to a trusted access port, ensure that the server is physically secure—that is, that access to the server is monitored and controlled.

- To configure a trusted interface for a DHCP server by using the CLI (here, the interface is `xe-0/0/8`):

```
[edit ethernet-switching-options secure-access port]
user@switch# set interface xe-0/0/8 dhcp-trusted
```

### Related Documentation

## Setting Up DHCP Option 82 on the Switch with No Relay Agent Between Clients and DHCP Server (CLI Procedure)

You can use DHCP option 82, also known as the DHCP relay agent information option, to help protect the switch against attacks such as spoofing (forging) of IP addresses and MAC addresses, and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.

You can configure the DHCP option 82 feature in two topologies:

- The switch, DHCP clients, and DHCP server are all on the same VLAN. The switch forwards the clients' requests to the server and forwards the server's replies to the clients. This topic describes this configuration.
- The switch functions as a relay agent when the DHCP clients or the DHCP server is connected to the switch through a Layer 3 interface. On the switch, these interfaces are configured as routed VLAN interfaces, or RVIs. The switch relays the clients' requests to the server and then forwards the server's replies to the clients. This configuration is described in [“Setting Up DHCP Option 82 with the Switch as a Relay Agent Between Clients and DHCP Server \(CLI Procedure\)”](#) on page 5075.

Before you configure DHCP option 82 on the switch, perform these tasks:

- Connect and configure the DHCP server.

.....

**NOTE:** Your DHCP server must be configured to accept DHCP option 82. If the server is not configured for DHCP option 82, the server does not use the DHCP option 82 information in the requests sent to it when it formulates its reply messages.

.....

- Configure a VLAN on the switch and associate the interfaces on which the clients and the server connect to the switch with that VLAN.

To configure DHCP option 82:

**NOTE:** Replace values displayed in *italics* with values for your configuration.

1. Specify DHCP option 82 for all VLANs associated with the switch or for a specified VLAN. (You can also configure the feature for a VLAN range.)

- On a specific VLAN:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82
```

- On all VLANs:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan all dhcp-option82
```

The remaining steps are optional.

2. To configure a prefix for the circuit ID suboption (the prefix is always the hostname of the switch):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 circuit-id prefix hostname
```

3. To specify that the circuit ID suboption value should contain the interface description rather than the interface name (the default):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 circuit-id use-interface-description
```

4. To specify that the circuit ID suboption value should contain the VLAN ID rather than the VLAN name (the default):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 circuit-id use-vlan-id
```

5. To specify that the remote ID suboption be included in the DHCP option 82 information:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 remote-id
```

6. To configure a prefix for the remote ID suboption (here, the prefix is the MAC address of the switch):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 remote-id prefix mac
```

7. To specify that the prefix for the remote ID suboption be the hostname of the switch rather than the MAC address of the switch (the default):

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 remote-id prefix hostname
```

8. To specify that the remote ID suboption value should contain the interface description:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 remote-id use-interface-description
```

9. To specify that the remote ID suboption value should contain a character string:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan employee dhcp-option82 remote-id use-string mystring
```

10. To configure a vendor ID suboption and use the default value (the default value is **Juniper**), do not type a character string after the **vendor-id** option keyword:

```
[edit ethernet-switching-options secure-access-port]
```

```
user@switch# set vlan employee dhcp-option82 vendor-id
```

11. To specify that the vendor ID suboption value should contain a character string value that you specify rather than **Juniper** (the default):

```
[edit ethernet-switching-options secure-access-port]
```

```
user@switch# set vlan employee dhcp-option82 vendor-id mystring
```

## Setting Up DHCP Option 82 with the Switch as a Relay Agent Between Clients and DHCP Server (CLI Procedure)

You can use DHCP option 82, also known as the DHCP relay agent information option, to help switches against attacks such as spoofing (forging) of IP addresses and MAC addresses, and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.

You can configure the DHCP option 82 feature in two topologies:

- The switch functions as a relay agent when the DHCP clients or the DHCP server is connected to the switch through a Layer 3 interface. On the switch, these interfaces are configured as routed VLAN interfaces, or RVIs. The switch relays the clients' requests to the server and then forwards the server's replies to the clients. This topic describes this configuration. The configuration for this topology is the same regardless of whether your switch is running Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style or not.
- The switch, DHCP clients, and DHCP server are all on the same VLAN. The switch forwards the clients' requests to the server and forwards the server's replies to the clients. This configuration for this topology differs if your switch is running Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style.
  - If your switch is running Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. see *Setting Up DHCP Option 82 on the Switch with No Relay Agent Between Clients and DHCP Server (CLI Procedure)*.
  - If your switch is running Junos OS for EX Series switches without support for ELS, see *"Setting Up DHCP Option 82 on the Switch with No Relay Agent Between Clients and DHCP Server (CLI Procedure)" on page 5072*.

Before you configure DHCP option 82 on the switch, perform these tasks:

- Connect and configure the DHCP server.

**NOTE:** Your DHCP server must be configured to accept DHCP option 82. If the server is not configured for DHCP option 82, the server does not use the DHCP option 82 information in the requests sent to it when it formulates its reply messages.

- Configure the VLAN on the switch and associate the interfaces on which the clients connect to the switch with that VLAN.
- Configure the routed VLAN interface (RVI) to allow the switch to relay packets to the server and receive packets from the server. See *Configuring Routed VLAN Interfaces (CLI Procedure)* or *"Configuring IRB Interfaces" on page 2240* for the QFX Series.
- Configure the switch as a BOOTP relay agent. See *DHCP/BOOTP Relay for Switches Overview*.

To configure DHCP option 82:

**NOTE:** Replace values displayed in *italics* with values for your configuration.

1. Specify DHCP option 82 for the BOOTP server:

- On all interfaces that connect to the server:

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82
```

- On a specific interface that connects to the server:

```
[edit forwarding-options helpers bootp]
user@switch# set interface ge-0/0/10 dhcp-option82
```

The remaining steps are optional. They show configurations for all interfaces; include the specific interface designation to configure any of the following options on a specific interface:

2. To configure a prefix for the circuit ID suboption (the prefix is always the hostname of the switch):

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82 circuit-id prefix hostname
```

3. To specify that the circuit ID suboption value should contain the interface description rather than the interface name (the default):

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82 circuit-id use-interface-description
```

4. To specify that the circuit ID suboption value should contain the VLAN ID rather than the VLAN name (the default):

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82 circuit-id use-vlan-id
```

5. To specify that the remote ID suboption be included in the DHCP option 82 information:

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82 remote-id
```

6. To configure a prefix for the remote ID suboption (here, the prefix is the MAC address of the switch):

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82 remote-id prefix mac
```

7. To specify that the prefix for the remote ID suboption be the hostname of the switch rather than the MAC address of the switch (the default):

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82 remote-id prefix hostname
```

8. To specify that the remote ID suboption value should contain the interface description:

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82 remote-id use-interface-description
```

9. To specify that the remote ID suboption value should contain a character string:

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82 remote-id use-string mystring
```

10. To configure a vendor ID suboption and use the default value (the default value is **Juniper**), do not type a character string after the **vendor-id** option keyword:

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82 vendor-id
```

11. To specify that the vendor ID suboption value contains a character string value that you specify rather than **Juniper** (the default):

```
[edit forwarding-options helpers bootp]
user@switch# set dhcp-option82 vendor-id mystring
```

To view results of the configuration steps before committing the configuration, type the **show** command at the user prompt.

To commit these changes to the active configuration, type the **commit** command at the user prompt.

## family

---

**Syntax**    family *family-name* {  
              filter *filter-name* {  
                  interface-specific;  
                  term *term-name* {  
                      from {  
                          match-conditions;  
                      }  
                      then {  
                          action;  
                          action-modifiers;  
                      }  
                  }  
              }  
          }

**Hierarchy Level**    [edit [firewall](#)]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure the fields a firewall filter can match on.

**Options**    *family-name*—Type of addressing protocol:

- **ethernet-switching**—Filter Layer 2 Ethernet packets and Layer 3 (IP) packets (allows some Layer 3 filtering).
- **inet**—Filter Layer 3 IPv4 packets (provides additional Layer 3 filter options).
- **inet6**—Filter Layer 3 IPv6 packets (provides additional Layer 3 filter options).
- **mpls**—Filter multiprotocol label switched packets.

The remaining statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | Configure the way preclassified packets are metered. In color-aware mode, the switch can assign a higher packet-loss priority, but cannot assign a lower packet loss priority (PLP). For example, suppose an upstream device assigns medium-high PLP to a packet because the packet exceeded its committed information rate (CIR). The switch cannot change the PLP to low even if the packet conforms to the configured CIR of the appropriate interface. On the other hand, if an upstream device assigns low PLP to a packet but the packet exceeds the CIR and committed burst size (CBS) of the switch interface, the switch can increase the PLP to medium-high. |
| <b>Default</b>                  | If you omit the <b>color-aware</b> statement, the default behavior is color-aware mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
