## [edit services application-identification] Hierarchy Level

To configure application identification services (APPID), include the **application-identification** statement at the **[edit services]** hierarchy level:

```
[edit services]
application-identification {
 application application-name {
 disable;
 idle-timeout seconds;
 index number;
 session-timeout seconds;
 type type;
 type-of-service service-type;
 port-mapping {
 port-range {
 tcp (port | range);
 udp (port | range);
 }
 disable;
 }
 }
}
application-group group-name {
 application-groups {
 name [application-group-name];
 }
 applications {
 name [application-name];
 }
 index number;
 disable;
}
application-system-cache-timeout seconds;
enable-heuristics
max-checked-bytes bytes;
min-checked-bytes bytes;
nested-application
nested-application-settings
no-application-identification;
no-application-system-cache;
no-clear-application-system-cache;
no-protocol-method;
no-signature-based;
profile profile-name {
 [rule-set rule-set-name];
}
rule rule-name {
 disable;
 address address-name {
```

```

 destination {
 ip address </prefix-length>;
 port-range {
 tcp [ports-and-port-ranges];
 udp [ports-and-port-ranges];
 }
 }
 source {
 ip address </prefix-length>;
 port-range {
 tcp [ports-and-port-ranges];
 udp [ports-and-port-ranges];
 }
 }
 order number;
}
application application-name;
}
rule-set rule-set-name {
 rule application-rule-name;
}
signature-method-all-ports
traceoptions {
 file filename <files number> <match regex> <size size> <world-readable |
 no-world-readable>;
 flag flag;
 no-remote-trace;
}
}
[edit services]

## IPsec Hierarchy Level

To configure IP Security (IPsec) services, include the following statements at the **[edit services ipsec-vpn]** hierarchy level:

```
[edit services ipsec-vpn]
clear-ike-sas-on-pic-restart;
clear-ipsec-sas-on-pic-restart;
establish-tunnels (immediately | on-traffic);
ike {
 proposal proposal-name {
 authentication-algorithm (md5 | sha1 | sha-256 | sha-384);
 authentication-method (pre-shared-keys | rsa-signatures);
 description description;
 dh-group (group1 | group2 | group5 | group14 | group19 | group20);
 encryption-algorithm (3des-cbc | aes-128-cbc | aes-192-cbc | aes-256-cbc | des-cbc);
 lifetime-seconds seconds;
 }
 policy policy-name {
 description description;
 local-certificate identifier;
 local-id (ipv4_addr ipv4-address | ipv6_addr ipv6-address | key-id identifier | fqdn fqdn);
 version (1 | 2);
 mode (aggressive | main);
 pre-shared-key (ascii-text key | hexadecimal key);
 proposals [proposal-names];
 remote-id {
 any-remote-id;
 ipv4_addr [values];
 ipv6_addr [values];
 key_id [values];
 fqdn [values];
 }
 }
}
ipsec {
 proposal proposal-name {
 authentication-algorithm (hmac-md5-96 | hmac-sha-256-128 | hmac-sha1-96);
 description description;
 encryption-algorithm (3des-cbc | aes-128-cbc | aes-192-cbc | aes-256-cbc | des-cbc);
 lifetime-seconds seconds;
 protocol (ah | esp | bundle);
 }
 policy policy-name {
 description description;
 perfect-forward-secrecy {
 keys (group1 | group2 | group5 | group14 | group19 | group20);
 }
 }
}
```

```

 proposals [proposal-names];
 }
}
rule rule-name {
 match-direction (input | output);
 term term-name {
 from {
 destination-address address;
 ipsec-inside-interface interface-name;
 source-address address;
 }
 then {
 anti-replay-window-size bits;
 backup-remote-gateway address;
 clear-dont-fragment-bit;
 dynamic {
 ike-policy policy-name;
 ipsec-policy policy-name;
 }

---

**adaptive-services-pics**

---

**Syntax**    `adaptive-services-pics {  
          traceoptions {  
            file filename <files number> <match regular-expression> <size size> <world-readable |  
            no-world-readable>;  
            flag flag;  
            no-remote-trace;  
          }  
          }`

**Hierarchy Level**    [edit services]

**Release Information**    Statement introduced before Junos OS Release 7.4. The **file** option was added in Release 8.0.

**Description**    Define global services properties.

**Options**    The remaining statement is explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.2.                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | When you use round-robin allocation, one port is allocated from each address in a range before repeating the process for each address in the next range. After ports have been allocated for all addresses in the last range, the allocation process wraps around and allocates the next unused port for addresses in the first range. |

## allow-ip-options

---

**Syntax**    `allow-ip-options [ values ];`

**Hierarchy Level**    `[edit services stateful-firewall rule rule-name term term-name then]`

**Release Information**    Statement introduced before Junos OS Release 7.4.

**Description**    Configure how the stateful firewall handles IP header information. This statement is optional.

**Options**    *value*—Can be a set or range of numeric values, or one or more of the following predefined option types. You can enter either the option name or its numeric equivalent.

| Option Name         | Numeric Value |
|---------------------|---------------|
| any                 | 0             |
| ip-security         | 130           |
| ip-stream           | 8             |
| loose-source-route  | 3             |
| route-record        | 7             |
| router-alert        | 148           |
| strict-source-route | 9             |
| timestamp           | 4             |

**Usage Guidelines**    See [“Configuring Actions in Stateful Firewall Rules”](#) on page 332.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                         interface-control—To add this statement to the configuration.

## allow-multicast

---

|                                 |                                                                                                                                 |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | allow-multicast;                                                                                                                |
| <b>Hierarchy Level</b>          | [edit services <a href="#">service-set</a> <i>service-set-name</i> ]                                                            |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.0.                                                                                   |
| <b>Description</b>              | Allow multicast traffic to be sent to the Adaptive Services or Multiservices PIC.                                               |

| <b>Description</b>              | <p>Specify the size of the IPsec antireplay window. This statement is useful for dynamic endpoint tunnels for which you cannot configure the <b>anti-replay-window-size</b> statement at the [edit <b>services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then</b>] hierarchy level.</p> <p>For static IPsec tunnels, this statement sets the antireplay window size for all the static tunnels within this service set. If a particular tunnel needs a specific value for antireplay window size, set the <b>anti-replay-window-size</b> statement at the [edit <b>services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then</b>] hierarchy level. If antireplay check has to be disabled for a particular tunnel in this service set, set the <b>no-anti-replay</b> statement at the [edit <b>services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then</b>] hierarchy level.</p> |
|                                 | <div>  <p><b>NOTE:</b> The anti-replay-window-size and no-anti-replay settings at the [edit <b>services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then</b>] hierarchy level override the settings specified at the [edit <b>services service-set <i>service-set-name</i> ipsec-vpn-options</b>] hierarchy level.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                  | <p><b>bits</b>—Size of the antireplay window, in bits.</p> <p><b>Default:</b> 64 bits (AS PICs), 128 bits (Multiservices PICs and DPCs)</p> <p><b>Range:</b> 64 through 4096 bits</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Release Information</b>      | <code>mapping-timeout</code> statement introduced in JUNOS Release 12.3.                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | Specify the duration for address pooling paired (AP-P) mappings that use the specified NAT pool. If this option is not configured and a timeout value is configured for <a href="#">mapping-timeout</a> , the timeout value configured for <a href="#">mapping-timeout</a> is used. If neither option is specified, the default value of 300 seconds is used. |
| <b>Options</b>                  | <b><code>app-mapping-timeout</code></b> —Lifetime of AP-P mappings in seconds.<br><b>Default:</b> 300<br><b>Range:</b> 120 through 864,000                                                                                                                                                                                                                    |

| <b>Description</b>              | <p>When the MultiServices PIC configured for a service set is either administratively taken offline or undergoes a failure, all the traffic entering the configured interface with an IDP service set would be dropped without notification. To avoid this traffic loss, include the <b>bypass-traffic-on-pic-failure</b> statement. When this statement is configured, the affected packets are forwarded in the event of a MultiServices PIC failure or offlining, as though interface-style services were not configured.</p> <p>This issue applies only to Junos Application Aware (previously known as Dynamic Application Awareness) configurations with IDP service sets.</p> |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>              | <p>Clear the Don't Fragment (DF) bit on all IP version 4 (IPv4) packets entering the generic routing encapsulation (GRE) tunnel on Adaptive Services (AS) or Multiservices interfaces. If the encapsulated packet size exceeds the tunnel maximum transmission unit (MTU), the packet is fragmented before encapsulation. The statement is supported only on MX Series routers and all M Series routers except the M320 router.</p> <p>When you configure the <b>clear-dont-fragment-bit</b> statement on an interface with the MPLS protocol family enabled, you must specify an MTU value. This MTU value must not be greater than maximum supported value, which is 9192.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | <p>Clear the Don't Fragment (DF) bit on all IP version 4 (IPv4) packets entering the IPsec tunnel. If the encapsulated packet size exceeds the tunnel maximum transmission unit (MTU), the packet is fragmented before encapsulation. This statement is useful for dynamic endpoint tunnels, for which you cannot configure the <b>clear-dont-fragment-bit</b> statement at the [edit <a href="#">services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then</a>] hierarchy level.</p> <p>For static IPsec tunnels, setting this statement clears the DF bit on packets entering all the static tunnels within this service set. If you want to clear the DF bit on packets entering a specific tunnel, set the <b>clear-dont-fragment-bit</b> statement at the [edit <a href="#">services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then</a>] hierarchy level.</p> |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | Copy the do not fragment (DF) bit value to only the outer header and not modify the inner header of the IPsec packet. If the encapsulated packet size exceeds the tunnel maximum transmission unit (MTU), the packet is fragmented before encapsulation. This functionality is supported on MX Series routers with MS-MICs and MS-MPCs. These settings apply for static endpoint tunnels and not for dynamic tunnels, for which you need to include the <b>copy-dont-fragment-bit</b> statement at the [edit <b>services</b> <b>service-set</b> <i>service-set-name</i> ipsec-vpn-options] hierarchy level to copy the DF bit value to only the outer header of the packet in a static IPsec tunnel. This functionality is supported on MX Series routers with MS-MICs and MS-MPCs. |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | Copy the do not fragment (DF) bit value to only the outer header and not modify the inner header of the IPsec packet in dynamic endpoint tunnels. If the encapsulated packet size exceeds the tunnel maximum transmission unit (MTU), the packet is fragmented before encapsulation. This functionality is supported on MX Series routers with MS-MICs and MS-MPCs. These settings apply for dynamic endpoint tunnels and not for static tunnels, for which you need to include the <b>copy-dont-fragment-bit</b> statement at the [edit <a href="#">services</a> ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then] hierarchy level to copy the DF bit value to only the outer header of the packet in a static IPsec tunnel. This functionality is supported on MX Series routers with MS-MICs and MS-MPCs. |

| <b>Description</b>              | Configure algorithm-based allocation of blocks of destination ports. By specifying this method, you ensure that an incoming (source) IP address and port always map to the same destination IP address and port block, thus eliminating the need for logging address translations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <p><b>block-size</b>—Maximum number of ports that can be allocated to a user.</p> <hr/> <div>  <p><b>NOTE:</b> When a <b>block-size</b> of 0 is specified, block size is calculated according to the formula: <math>(64512 * \text{Number of IP addresses in the NAT Pool}) / \text{Number of subscribers}</math> where</p> <ul style="list-style-type: none"> <li>64512 is derived from <math>(65535 - 1023)</math> because the regular port assignments start from 1024.</li> <li>Number of subscribers is derived from the <b>from</b> clause of the applicable NAT rule.</li> </ul> </div> <hr/> <p><b>Default:</b> 256</p> <p><b>Range:</b> 0 through 32,000</p> <p><b>include-boundary-addresses</b>—(Optional) Specifies that the lowest and highest addresses in the source address range of a NAT rule should be translated when the NAT pool is used.</p> |

| <b>Description</b>              | Specify the maximum number of inbound flows allowed on EIF mapping to the configured value. This limit is per EIF mapping and is per given instance of time. For example, if <b>eif-flow-limit</b> is configured as n, then only n inbound connections are allowed at a given instance of time. The n+1 and subsequent connections arriving when n connections are alive are dropped . A new inbound connection is allowed only when one of the n connections times out or is closed. This limit is applied for all type of flows. |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                            |

## encryption

|                            |                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <pre> encryption {     algorithm <i>algorithm</i>;     key (ascii-text <i>key</i>   hexadecimal <i>key</i>); } </pre>                                                                         |
| <b>Hierarchy Level</b>     | [edit <a href="#">services</a> ipsec-vpn <a href="#">rule</a> <i>rule-name</i> <a href="#">term</a> <i>term-name</i> <a href="#">then</a> <a href="#">manual</a> direction <i>direction</i> ] |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br><b>aes-128-cbc</b> , <b>aes-192-cbc</b> , and <b>aes-256-cbc</b> options added in Junos OS Release 7.6.                                  |
| <b>Description</b>         | Configure an encryption algorithm and key for manual SA.                                                                                                                                      |

**Options** **algorithm**—Type of encryption algorithm. The algorithm can be one of the following:

- **des-cbc**—Has a block size of 8 bytes (64 bits); the key size is 48 bits long.
- **3des-cbc**—Has a block size of 8 bytes (64 bits); the key size is 192 bits long.
- **aes-128-cbc**—Advanced Encryption Standard (AES) 128-bit encryption algorithm.
- **aes-192-cbc**—Advanced Encryption Standard (AES) 192-bit encryption algorithm.
- **aes-256-cbc**—Advanced Encryption Standard (AES) 256-bit encryption algorithm.

**NOTE:** For **3des-cbc**, the first 8 bytes should differ from the second 8 bytes, and the second 8 bytes should be the same as the third 8 bytes.

**key**—Type of encryption key. The key can be one of the following:

- **ascii-text**—ASCII text key. Following are the key lengths, in ASCII characters, for the different encryption options:
  - **des-cbc** option, 8 ASCII characters
  - **3des-cbc** option, 24 ASCII characters
  - **aes-128-cbc** option, 16 ASCII characters
  - **aes-192-cbc** option, 24 ASCII characters
  - **aes-256-cbc** option, 32 ASCII characters
- **hexadecimal**—Hexadecimal key. Following are the key lengths, in hexadecimal characters, for the different encryption options:
  - **des-cbc** option, 16 hexadecimal characters
  - **3des-cbc** option, 48 hexadecimal characters
  - **aes-128-cbc** option, 32 hexadecimal characters
  - **aes-192-cbc** option, 48 hexadecimal characters

- **aes-256-cbc** option, 64 hexadecimal characters

## encryption-algorithm (Services IPsec VPN)

---

**Syntax** encryption-algorithm (3des-cbc | aes-128-cbc | aes-192-cbc | aes-256-cbc | des-cbc);

**Hierarchy Level** [edit [services](#) ipsec-vpn [ike proposal](#) *proposal-name*],  
[edit [services](#) ipsec-vpn [ipsec proposal](#) *proposal-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
**aes-128-cbc**, **aes-192-cbc**, and **aes-256-cbc** options added in Junos OS Release 7.6.

**Description** Configure an IKE or IPsec encryption algorithm.

**Options** **3des-cbc**—Has a block size of 24 bytes; the key size is 192 bits long.

**des-cbc**—Has a block size of 8 bytes; the key size is 48 bits long.

**aes-128-cbc**—Advanced Encryption Standard (AES) 128-bit encryption algorithm.

**aes-192-cbc**—Advanced Encryption Standard (AES) 192-bit encryption algorithm.

**aes-256-cbc**—Advanced Encryption Standard (AES) 256-bit encryption algorithm.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## fragment-threshold (Forwarding Maps)

---

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | fragment-threshold <i>bytes</i> ;                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Hierarchy Level</b>          | [edit class-of-service fragmentation-maps <b>forwarding-class</b> <i>class-name</i> ]                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | For link services IQ ( <b>lsq</b> ) interfaces only, set the fragmentation threshold for an individual forwarding class.                                                                                                                                                                                                                                                                                                                                                                |
| <b>Default</b>                  | If you do not include this statement, the fragmentation threshold you set at the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> ] or [edit interfaces <i>interface-name</i> mlfr-uni-nni-bundle-options] hierarchy level is the default for all forwarding classes. If you do not set a maximum fragment size anywhere in the configuration, packets are fragmented if they exceed the smallest maximum transmission unit (MTU) of all the links in the bundle. |
| <b>Options</b>                  | <b>bytes</b> —Maximum size, in bytes, for multilink packet fragments. Any nonzero value must be a multiple of 64 bytes.<br><b>Range:</b> 128 through 16,320 bytes                                                                                                                                                                                                                                                                                                                       |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                 |

## high-availability-options (aggregated Multiservices)

---

**Syntax**    high-availability-options {  
              many-to-one {  
                  preferred-backup *preferred-backup*;  
              }  
          }

**Hierarchy Level**    [edit interfaces *interface-name* load-balancing-options]

**Release Information**    Statement introduced in Junos OS Release 11.4.

**Description**    Configure the high availability options for the aggregated Multiservices (AMS) interface. For service applications, if only the load-balancing feature is being used, then this configuration is optional.

For many-to-one (N:1) high availability support for service applications like Network Address Translation (NAT), the preferred backup Multiservices PIC, in hot standby mode, backs up one or more (N) active Multiservices PICs.

**NOTE:** In both cases, if one of the active Multiservices PICs goes down, then the backup replaces it as the active Multiservices PIC. When the failed PIC comes back up, it becomes the new backup. This is called floating backup.

---

The remaining statements are explained separately.

**Required Privilege**    interface—To view this statement in the configuration.  
**Level**    interface-control—To add this statement to the configuration.

| <b>Release Information</b>   | Statement introduced in Junos OS Release 7.6.                                                                                                                                                                                                                                                                |
| <b>Description</b>           | For one-to-one AS, rsp, or rms redundancy configurations, specify that the failure detection and recovery must take place in less than 5 seconds. For FRF.15 (MLFR) and FRF.16 (MFR) configuration, specify the switch over time of 5 seconds and less for FRF.15 and a maximum of 10 seconds for FRF.16.    |
| <b>Required Privilege</b>    | interface—To view this statement in the configuration.                                                                                                                                                                                                                                                       |
| <b>Level</b>                 | interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                |

 family family;
 }
}
```

Hierarchy Level [\[edit\]](#)

**Release Information** Statement introduced in Junos OS Release 11.4.

**Description** Configure the aggregated Multiservices (AMS) interface. The AMS interface provides the infrastructure for load balancing and high availability (HA).

**NOTE:** The interfaces must be valid aggregated Multiservices interfaces (*ams*)—for example, *ams0* or *ams1*, and so on. The *ams* infrastructure is supported only in chassis with Trio-based modules and Multiservices Dense Port Concentrators (MS-DPCs).

The remaining statements are explained separately.

**Options** *interface-name*—Name of the aggregated Multiservices interface (*ams*)—for example, *ams0* or *ams1*, and so on.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | For link services IQ ( <b>lsq</b> ) interfaces only, configure the percentage of total bundle bandwidth to be set aside for link-layer overhead. Link-layer overhead accounts for the bit stuffing on serial links. Bit stuffing is used to prevent data from being interpreted as control information. Overhead resulting from link-layer encapsulation and framing is computed automatically. |
| <b>Options</b>                  | <b>percent</b> —Percentage of total bundle bandwidth to be set aside for link-layer overhead.<br><b>Range:</b> 0 through 50 percent<br><b>Default:</b> 0 percent                                                                                                                                                                                                                                |

| <b>Description</b>              | <p>Configure the high availability (HA) options for the aggregated Multiservices (AMS) interface.</p> <p>Many-to-one (N:1) high availability mode for service applications like Network Address Translation (NAT) is supported. In this case, one Multiservices PIC is the backup (in hot standby mode) for one or more (N) active Multiservices PICs. If one of the active Multiservices PICs goes down, then the backup replaces it as the active Multiservices PIC. When the failed PIC comes back online, it becomes the new backup. This is called floating backup mode.</p> <p>The remaining statements are explained separately.</p> |

| <b>Description</b>              | <p>Configure the maximum drop flows allowed per ingress and egress direction. The configuration is per service set. The configured limits indicate the maximum number of drop flows that can be created at a given instance of time in both directions. If max drop flows ingress is 10 and egress is 5 then at a given instance of time maximum of 10 ingress drop flows and 5 egress drop flows can be present. Two counters, one for each direction ingress and egress, are to be added to service set stateful-firewall statistics to track the number of drop flows not created due to the drop flow limits exceeded. These limits applies to all types of drop flows i.e., TCP, UDP, ICMP etc. Ingress drop flows are forward flows for match-direction input rules and reverse flows for match-direction output rules. Similarly egress drop flows are reverse flows for match-direction input and forward flows for match-direction output rules. The limits are applied cumulatively on all the nat rules associated with the service-set.</p> |

| <div> <b>NOTE:</b> When an aggregated multiservices (AMS) interface is configured as the service interface for a service set, the max-flow value configured for the service set is applied to each of the member interfaces in the AMS interface. That is, if you have configured 1000 as the max-flow value for a service set that uses an AMS interface with four active member interfaces, each of the member interfaces can handle 1000 flows each, resulting in an effective max-flow value of 4000.</div> <hr/> |                                                                                                                         |
| <b>Required Privilege Level</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration. |

## member-failure-options (Aggregated Multiservices)

**Syntax**

```
member-failure-options {
 drop-member-traffic {
 rejoin-timeout rejoin-timeout;
 }
 redistribute-all-traffic {
 enable-rejoin;
 }
}
```

**Hierarchy Level** [edit interfaces *interface-name* load-balancing-options]

**Release Information** Statement introduced in Junos OS Release 11.4.

**Description** Configure the possible behavior for the aggregated Multiservices (AMS) interface in case of failure of more than one active member.

**NOTE:** The `drop-member-traffic` configuration and the `redistribute-all-traffic` configuration are mutually exclusive.

Table 41 on page 1204 displays the behavior of the member interface after the failure of the first Multiservices PIC. Table 42 on page 1205 displays the behavior of the member interface after the failure of two Multiservices PICs.

**NOTE:** The AMS infrastructure has been designed to handle one failure automatically. However, in the unlikely event that more than one Multiservices PIC fails, the AMS infrastructure provides configuration options to minimize the impact on existing traffic flows.

**Table 41: Behavior of Member Interface After One Multiservices PIC Fails**

| High Availability Mode                                               | Member Interface Behavior                       |
|----------------------------------------------------------------------|-------------------------------------------------|
| Many-to-one (N:1) high availability support for service applications | Automatically handled by the AMS infrastructure |

Table 42: Behavior of Member Interface After Two Multiservices PICs Fail

| High Availability Mode                                               | Configuration                   | rejoin-timeout | Behavior when member rejoins before rejoin-timeout expires                                                                                                                                                                                                                                    | Behavior when member rejoins after rejoin-timeout expires                                                                                                                                                                                                   |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Specify the member interfaces for the aggregated Multiservices (AMS) interface. You can configure multiple interfaces by specifying each interface in a separate statement.</p> <p>For high availability service applications like Network Address Translation (NAT) that support many-to-one (N:1) redundancy, you can specify two or more interfaces.</p> |
|                                 | <div> <b>NOTE:</b> The member interfaces that you specify must be members of aggregated Multiservices interfaces (mams-).</div>                                                                                                                                               |
|                                 | <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <p><i>interface-name</i>—Name of the member interface. The member interface format is <b>mams-a/b/0</b>, where <b>a</b> is the Flexible PIC Concentrator (FPC) slot number and <b>b</b> is the PIC slot number.</p>                                                                                                                                            |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                             |

| Release Information | Statement introduced in Junos OS Release 10.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Description         | <p>Disable IPsec antireplay service for this service set, which occasionally causes interoperability issues for security associations. This statement is useful for dynamic endpoint tunnels for which you cannot configure the <b>no-anti-reply</b> statement at the [edit <a href="#">services</a> ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then] hierarchy level.</p> <p>For static IPsec tunnels, this statement disables the antireplay check for all the tunnels within this service set. If antireplay check has to be enabled for a particular tunnel, then set the <b>anti-replay-window-size</b> statement at the [edit <a href="#">services</a> ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then] hierarchy level.</p> |

**NOTE:** Setting the anti-replay-window-size and no-anti-replay statements at the [edit [services](#) ipsec-vpn rule *rule-name* term *term-name* then] hierarchy level overrides the settings specified at the [edit [services](#) service-set *service-set-name* ipsec-vpn-options] hierarchy level.

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | <p>For link services IQ (<b>lsq</b>) interfaces only, set traffic on a particular forwarding class to be interleaved, rather than fragmented. This statement specifies that no extra fragmentation header is prepended to the packets received on this queue and that static-link load balancing is used to ensure in-order packet delivery.</p> <p>Static-link load balancing is done based on packet payload. For IP version 4 (IPv4) and IP version 6 (IPv6) traffic, the link is chosen based on a hash computed from the source address, destination address, and protocol. If the IP payload is Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) traffic, the hash also includes source port and destination port. For MPLS traffic, the hash includes all MPLS labels and fields in the payload, whether the MPLS payload is IPv4 or IPv6.</p> |
| <b>Default</b>                  | If you do not include this statement, the traffic in forwarding class <i>class-name</i> is fragmented.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.0.                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | Allows tunneling of malformed packets. When this statement is enabled, traffic bypasses the usual active IP checks. The IPsec tunnel is not treated as a next hop and TTL is not decremented. If the packet size exceeds the tunnel MTU value, an ICMP error is not generated. Passive module tunneling is not supported on MS-MICs and MS-MPCs. |

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 13.2 on 16x10GE MPC and MPC3E line cards.<br>Statement introduced in Junos OS Release 13.2 on PTX Series Packet Transport Routers.<br>Statement introduced in Junos OS Release 13.3 on MPC4E line cards.                                                        |
| <b>Description</b>         | For Channelized OC3 IQ, Channelized OC12 IQ, Channelized STM1 IQ, Channelized T3 IQ, Channelized E1 IQ, E3 IQ, link services IQ interfaces (lsq-), Gigabit Ethernet IQ, Gigabit Ethernet IQ2 and IQ2-E, and 10-, 40-, and 100-Gigabit Ethernet interfaces (including the 16x10GE MPC), enable the association of scheduler map names with logical interfaces. |

**NOTE:** Per-unit scheduling is not supported on T1 interfaces configured on the Channelized OC12 IQ PIC.

**NOTE:** On Gigabit Ethernet IQ2 and IQ2-E PICs without the `per-unit-scheduler` statement, the entire PIC supports 4071 VLANs and the user can configure all the VLANs on the same port.

On Gigabit Ethernet IQ2 and IQ2-E PICs with the `per-unit-scheduler` statement, the entire PIC supports  $1024 - 2 * \text{number of ports}$  (1024 minus two times the number of ports), because each port is allocated two default schedulers.

When including the `per-unit-scheduler` statement, you must also include the `vlan-tagging` statement or the `flexible-vlan-tagging` statement (to apply scheduling to VLANs) or the `encapsulation frame-relay` statement (to apply scheduling to DLCIs) at the `[edit interfaces interface-name]` hierarchy level.

| Description              | Specify the NAT pool port or range. You can configure an automatically assigned port or specify a range with minimum and maximum values.                                                                                                                                                                                                                                                                                                                                                      |
| Options                  | <p><b>automatic</b>—Router-assigned port.</p> <p><b><i>minimum-value</i></b>—Lower boundary for the port range.</p> <p><b><i>maximum-value</i></b>—Upper boundary for the port range.</p> <p><b>preserve-parity</b>—Allocate ports with same parity as the original port.</p> <p><b>preserve-range</b>—Preserve privileged port range after translation.</p> <p><b>random-allocation</b>—Allocate ports within a specified range randomly.</p> <p>Other options are described separately.</p> |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                            |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 7.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>Provide link PIC replication, providing MLPPP link redundancy at the port level. This feature is supported with SONET APS and the following link PICs:</p> <ul style="list-style-type: none"> <li>• Channelized OC3 IQ PIC</li> <li>• Channelized OC12 IQ PIC</li> <li>• Channelized STM1 IQ PIC</li> </ul> <p>Link PIC replication provides the ability to add two sets of links, one from the active SONET PIC and the other from the standby SONET PIC, to the same bundle. If the active SONET PIC fails, links from the standby PIC are used without triggering link renegotiation. All the negotiated state is replicated from the active links to the standby links to prevent link renegotiation.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

 }
}
```

**Hierarchy Level** [edit [services](#) nat],  
[edit [services](#) nat [rule-set](#) rule-set-name]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Specify the rule the router uses when applying this service.

**NOTE:** You are limited to a maximum of 200 terms for a NAT rule that is applied to an inline services (type si) interface. If you specify more than 200 terms, you will receive following error when you commit the configuration:

```
[edit]
' service-set service-set-name'
 NAT rule rule-name with more than 200 terms is disallowed for
 si-n/n.n.n
error: configuration check-out failed
```

**Options** *rule-name*—Identifier for the collection of terms that make up this rule.

The remaining statements are explained separately.

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

## rule (Services Stateful Firewall)

---

**Syntax**

```
rule rule-name {
 match-direction (input | output | input-output);
 term term-name {
 from {
 application-sets set-name;
 applications [application-names];
 destination-address (address | any-unicast) <except>;
 destination-address-range low minimum-value high maximum-value <except>;
 destination-prefix-list list-name <except>;
 source-address (address | any-unicast) <except>;
 source-address-range low minimum-value high maximum-value <except>;
 source-prefix-list list-name <except>;
 }
 then {
 (accept | discard | reject);
 syslog;
 }
 }
}
```

**Hierarchy Level** [edit [services](#) stateful-firewall],  
[edit [services](#) stateful-firewall [rule-set](#) rule-set-name]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Specify the rule the router uses when applying this service.

**Options** *rule-name*—Identifier for the collection of terms that constitute this rule.

The remaining statements are explained separately.

**Usage Guidelines** See “[Configuring Stateful Firewall Rules](#)” on page 329.

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | When you use block allocation, one or more blocks of ports in a NAT pool address range are available for assignment to a subscriber.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>                  | <p><b><i>block-size</i></b>—Number of ports included in a block.<br/><b>Default:</b> 128<br/><b>Range:</b> 1 to 32,000</p> <p><b><i>max-blocks</i></b>—Maximum number of blocks that can be allocated to a user address.<br/><b>Default:</b> 8<br/><b>Range:</b> 1 to 512</p> <p><b><i>timeout-seconds</i></b>—Interval, in seconds, during which a block is active. After timeout, a new block is allocated, even if ports are available in the active block.<br/><b>Default:</b> 0—The default timeout of the active block is 0 (infinite). In this case, the active block transitions to inactive only when it runs out of ports and a new block is allocated. Any inactive block without any ports in use will be freed to the NAT pool.<br/><b>Range:</b> Any value greater than or equal to 120.</p> |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## server (pcp)

**Syntax** `server server-name {  
 ipv4-address ipv4-address;  
 ipv6-address ipv6-address;  
 software-concentrator software-concentrator-name;  
 mapping-lifetime-min mapping-lifetime-min;  
 mapping-lifetime-max mapping-lifetime-max;  
 short-lifetime-error short-lifetime-error;  
 long-lifetime-error long-lifetime-error;  
 nat-options {  
 pool pool-name ;  
 }  
 pcp-options {  
 third-party  
 prefer-failure  
 }  
 max-mapping-per-client max-mapping-per-client;  
}`

**Hierarchy Level** [edit services pcp]

**Release Information** Statement introduced in Junos OS Release 13.2R1.

**Description** Configure PCP server options.

**Options** *ipv4-address*—IPv4 address of the PCP server.

*ipv6-address*—IPv6 address of the PCP server.

*software-concentrator-name*—Softwire concentrator name whose softwire-address is used in creating PCP mappings. The PCP server address must be the same as the softwire-concentrator address.

*mapping-lifetime-min*—Minimum lifetime, in seconds, for PCP mapping. If a PCP client requests a lifetime less than the minimum configured, the server will assign a minimum lifetime and respond accordingly.

**Default:** 300 seconds

**Range:** 120 through 3600 seconds

*mapping-lifetime-max mapping-lifetime-max*—Maximum lifetime, in seconds, for PCP mapping. If the PCP client requests a lifetime less than the maximum configured, the server will assign the maximum lifetime and respond accordingly.

**Default:** 86,400 seconds

**Range:** 3600 through 2147483647 seconds

*short-lifetime-error short-lifetime-error*—Certain error opcodes mentioned in section 2 are classified as short lifetime errors. In case of these errors, the PCP server will use the value configured with this option to respond to the PCP client.

**Default:** 30 seconds

**Range:** 15 through 300 seconds

**long-lifetime-error**—Certain error opcodes mentioned in section 2 are classified as long lifetime errors. In case of these errors, the PCP server will use the value configured with this option to respond to the PCP client.

**Default:** 1800 seconds

**Range:** 900 through 18,000 seconds

**max-mapping-per-client *number-of-mappings***—Maximum number of PCP mappings that the PCP client can request.

**Default:** 32

**Range:** 1 through 32

The other statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## service

---

**Syntax**

```
service {
 input {
 [service-set service-set-name <service-filter filter-name>];
 post-service-filter filter-name;
 }
 output {
 [service-set service-set-name <service-filter filter-name>];
 }
}
```

**Hierarchy Level** [edit [interfaces](#) *interface-name* [unit](#) *logical-unit-number* [family](#) inet],  
[edit logical-systems *logical-system-name* [interfaces](#) *interface-name* [unit](#) *logical-unit-number* [family](#) inet]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Define the service sets and filters to be applied to an interface.

**Options** The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## syslog (Services Service Set)

---

**Syntax**    `syslog {  
              host hostname {  
                  class {  
                    alg-logs;  
                    ids-logs;  
                    nat-logs;  
                    packet-logs;  
                    pcp-logs;  
                    session-logs <open | close>;  
                    stateful-firewall-logs ;  
                  }  
                  services severity-level;  
                  facility-override facility-name;  
                  interface-service prefix-value;  
              }  
          }`

**Hierarchy Level**    `[edit services service-set service-set-name]`

**Release Information**    Statement introduced before Junos OS Release 7.4.

**Description**    Configure generation of system log messages for the service set. The system log information is passed to the kernel for logging in the `/var/log` directory. These settings override the values defined at the `[edit interfaces interface-name services-options]` hierarchy level; for more information on configuring those values, see [“Configuring System Logging for Services Interfaces” on page 20](#).

**Options**    The remaining statements are described separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

| <b>Description</b>     | Configure security public key infrastructure (PKI) trace options. To specify more than one trace option, include multiple <b>flag</b> statements. Trace option output is recorded in the <code>/var/log/pkid</code> file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>         | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. To include the <b>file</b> statement, you must specify a filename.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file (for example, <b>pkid</b>) reaches its maximum size, it is renamed <b>pkid.0</b>, then <b>pkid.1</b>, and so on, until the maximum number of trace files is reached. When the maximum number is reached, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag</b>—Trace operation to perform. To specify more than one trace operation, include multiple flag statements:</p> <ul style="list-style-type: none"><li><b>all</b>—Trace with all flags enabled.</li><li><b>certificate-verification</b>—Trace PKI certificate verification events.</li><li><b>online-crl-check</b>—Trace PKI online certificate revocation list (CRL) events.</li><li><b>enrollment</b>—PKI certificate enrollment tracing.</li></ul> <p><b>match <i>regular-expression</i></b>—(Optional) Refine the output to include lines that contain the regular expression.</p> <p><b>size <i>maximum-file-size</i></b>—(Optional) Maximum size of each trace file, in kilobytes (KB). If you specify a maximum file size, you also must specify a maximum number of trace files with the <b>files <i>number</i></b> option.</p> <p><b>Default:</b> 1024 KB</p> <p><b>world-readable   no-world-readable</b>—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The <b>world-readable</b> option enables any user to read the file. To explicitly set the default behavior, use the <b>no-world-readable</b> option.</p> |

## traceoptions (Services L2TP)

---

**Syntax**    `traceoptions {  
          debug-level level;  
          file filename <files number> <match regular-expression > <size maximum-file-size>  
                  <world-readable | no-world-readable>;  
          filter {  
            protocol name;  
            user user@domain;  
            user-name username;  
          }  
          flag flag;  
          interfaces interface-name {  
            debug-level level;  
            flag flag;  
          }  
          level (all | error | info | notice | verbose | warning);  
          no-remote-trace;  
          }`

**Hierarchy Level**    [edit services l2tp]

**Release Information**    Statement introduced before Junos OS Release 7.4.

**Description**    Define tracing operations for L2TP processes.

**Options**    **debug-level *level***—Trace level for PPP, L2TP, RADIUS, and UDP; this option does not apply to L2TP on MX Series routers:

- **detail**—Trace detailed debug information.
- **error**—Trace error information.
- **packet-dump**—Trace packet decoding information.

**file *filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

**files *number***—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000

**Default:** 3 files

**filter**—Additional filter to refine the output to display particular subscribers. Filtering based on the following subscriber identifiers simplifies troubleshooting in a scaled environment.

- **protocol *name***—One of the following protocols; this option does not apply to L2TP on MX Series routers:
  - **l2tp**

- **ppp**
- **radius**
- **udp**
- **user** *user@domain*—Username of a subscriber; this option does not apply to L2TP on M Series routers. Optionally use an asterisk (\*) as a wildcard to substitute for characters at the beginning or end of either term or both terms.
- **user-name** *username*—Username of a subscriber; this option does not apply to L2TP on MX Series routers.

**flag** *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Trace all operations.
- **configuration**—Trace configuration events.
- **events**—Trace interface events.
- **general**—Trace general events.
- **gres**—Trace GRES events.
- **init**—Trace daemon initialization.
- **ipc-rx**—Trace IPC receive events.
- **ipc-tx**—Trace IPC transmit events.
- **memory**—Trace memory management code.
- **message**—Trace message processing code.
- **packet-error**—Trace packet error events.
- **parse**—Trace parsing events.
- **protocol**—Trace L2TP events.
- **receive-packets**—Trace received L2TP packets.
- **routing-process**—Trace routing process interactions.
- **routing-socket**—Trace routing socket events.
- **session-db**—Trace session database interactions.
- **states**—Trace state machine events.
- **timer**—Trace timer events.
- **transmit-packets**—Trace transmitted L2TP packets.
- **tunnel**—Trace tunnel events.

**interfaces *interface-name***—Apply L2TP traceoptions to a specific services interface. This option does not apply to L2TP on MX Series routers.

- **debug-level *level***—Trace level for the interface; this option does not apply to L2TP on MX Series routers:
  - **detail**—Trace detailed debug information.
  - **error**—Trace error information.
  - **extensive**—Trace all PIC debug information.
- **flag *flag***—Tracing operation to perform for the interface. This option does not apply to L2TP on MX Series routers. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:
  - **all**—Trace everything.
  - **ipc**—Trace L2TP Inter-Process Communication (IPC) messages between the PIC and the Routing Engine.
  - **packet-dump**—Dump each packet content based on debug level.
  - **protocol**—Trace L2TP, PPP, and multilink handling.
  - **system**—Trace packet processing on the PIC.

**level**—Specify level of tracing to perform. The option you configure enables tracing of events at that level and all higher (more restrictive) levels. You can specify any of the following levels:

- **all**—Match messages of all levels.
- **error**—Match error messages.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages. This is the lowest (least restrictive) severity level; when you configure **verbose**, messages at all higher levels are traced. Therefore, the result is the same as when you configure **all**.
- **warning**—Match warning messages.

**Default:** error

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size** *maximum-file-size*—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**world-readable**—(Optional) Enable unrestricted file access.

|                                 |                                                                                                                                                                      |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Required Privilege Level</b> | trace—To view this statement in the configuration.                                                                                                                   |
|                                 | trace-control—To add this statement to the configuration.                                                                                                            |

| Release Information | Statement introduced before Junos OS Release 7.4.<br><b>file</b> option added in Release 8.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description         | Configure Adaptive Services or Multiservices PIC tracing operations. The messages are output to <b>/var/log/serviced</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Options             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b><i>trace-file</i></b> reaches its maximum size, it is renamed <b><i>trace-file.0</i></b>, then <b><i>trace-file.1</i></b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files<br/><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform:</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace everything.</li><li>• <b>command-queued</b>—Trace command enqueue events.</li><li>• <b>config</b>—Trace configuration events.</li><li>• <b>handshake</b>—Trace handshake events.</li><li>• <b>init</b>—Trace initialization events.</li><li>• <b>interfaces</b>—Trace interface events.</li><li>• <b>mib</b>—Trace GGSN SNMP MIB events.</li><li>• <b>removed-client</b>—Trace client cleanup events.</li><li>• <b>show</b>—Trace CLI command servicing.</li></ul> <p><b>match <i>regex</i></b>—(Optional) Match output to a defined regular expression (regex).</p> |

**Default:** If you do not include this option, the trace operation output includes all lines relevant to the logged events.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

| Description         | Specify the NAT translation types.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Options             | <ul style="list-style-type: none"><li>• <b>basic-nat44</b>—Translate the source address statically (IPv4 to IPv4).</li><li>• <b>basic-nat66</b>—Translate the source address statically (IPv6 to IPv6).</li><li>• <b>basic-nat-pt</b>—Translate the addresses of IPv6 hosts as they originate sessions to the IPv4 hosts in the external domain. The <b>basic-nat-pt</b> option is always implemented with DNS ALG.</li><li>• <b>deterministic-napt44</b>—Translate as <b>napt-44</b>, and use deterministic port block allocation for port translation.</li><li>• <b>dnat-44</b>—Translate the destination address statically (IPv4 to IPv4).</li><li>• <b>dynamic-nat44</b>—Translate only the source address by dynamically choosing the NAT address from the source address pool.</li></ul>                        |

- **napt-44**—Translate the transport identifier of the IPv4 private network to a single IPv4 external address.
- **napt-66**—Translate the transport identifier of the IPv6 private network to a single IPv6 external address.
- **napt-pt**—Bind addresses in an IPv6 network with addresses in an IPv4 network and vice versa to provide transparent routing for the datagrams traversing between the address realms.
- **stateful-nat64**—Implement dynamic address and port translation for source IP addresses (IPv6-to-IPv4) and prefix removal translation for the destination IP addresses (IPv6-to-IPv4).
- **twice-basic-nat-44**—Translate the source and destination addresses statically (IPv4 to IPv4).
- **twice-dynamic-nat-44**—Translate the source address by dynamically choosing the NAT address from the source address pool. Translate the destination address statically.
- **twice-dynamic-napt-44**—Translate the transport identifier of the IPv4 private network to a single IPv4 external address. Translate the destination address statically.

## tunnel-group

**Syntax** `tunnel-group group-name {  
aaa-access-profile profile-name;  
dynamic-profile profile-name;  
hello-interval seconds;  
hide-avps;  
l2tp-access-profile profile-name;  
local-gateway address {  
address address;  
gateway-name gateway-name;  
}  
maximum-send-window packets;  
ppp-access-profile profile-name;  
receive-window packets;  
retransmit-interval seconds;  
service-device-pool pool-name;  
service-interface interface-name;  
syslog {  
host hostname {  
services severity-level;  
facility-override facility-name;  
log-prefix prefix-value;  
}  
}  
}  
tos-reflect;  
tunnel-switch-profile profile-name;  
tunnel-timeout seconds;  
}`

**Hierarchy Level** [edit services l2tp]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Support for MX Series routers introduced in Junos OS Release 11.4.

**Description** Specify the L2TP tunnel properties.

**NOTE:** Subordinate statement support depends on the platform. See individual statement topics for more detailed support information.

**Options** *group-name*—Identifier for the tunnel group.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## [edit services aacl] Hierarchy List

To configure application-aware access list (AACL) services, include the **aacl** statements at the **[edit services]** hierarchy level:

```
[edit services]
aacl {
 rule rule-name {
 match-direction (input | output | input-output);
 term term-name {
 from {
 application-group-any;
 application-groups [application-group-names];
 application-unknown;
```

```
 applications [application-names];
 destination-address address <any-unicast>;
 destination-address-range low minimum-value high maximum-value;
 destination-prefix-list list-name;
 source-address address <any-unicast>;
 source-address-range low minimum-value high maximum-value;
 source-prefix-list list-name;
 }
 then {
 (accept | discard);
 count (application | application-group | application-group-any | none);
 forwarding-class class-name;
 policer policer-name;
 }
}
}
rule-set rule-set-name {
 [rule rule-names];
}
}
```

## [edit services application-identification] Hierarchy Level

To configure application identification services (APPID), include the **application-identification** statement at the **[edit services]** hierarchy level:

```
[edit services]
application-identification {
 application application-name {
 disable;
 idle-timeout seconds;
 index number;
 session-timeout seconds;
 type type;
 type-of-service service-type;
 port-mapping {
 port-range {
 tcp (port | range);
 udp (port | range);
 }
 disable;
 }
 }
}
application-group group-name {
 application-groups {
 name [application-group-name];
 }
 applications {
 name [application-name];
 }
}
```

```

 }
 index number;
 disable;
 }
 application-system-cache-timeout seconds;
 enable-heuristics
 max-checked-bytes bytes;
 min-checked-bytes bytes;
 nested-application
 nested-application-settings
 no-application-identification;
 no-application-system-cache;
 no-clear-application-system-cache;
 no-protocol-method;
 no-signature-based;
 profile profile-name {
 [rule-set rule-set-name];
 }
 rule rule-name {
 disable;
 address address-name {
 destination {
 ip address</prefix-length>;
 port-range {
 tcp [ports-and-port-ranges];
 udp [ports-and-port-ranges];
 }
 }
 source {
 ip address</prefix-length>;
 port-range {
 tcp [ports-and-port-ranges];
 udp [ports-and-port-ranges];
 }
 }
 order number;
 }
 application application-name;
 }
 rule-set rule-set-name {
 rule application-rule-name;
 }
 signature-method-all-ports
 traceoptions {
 file filename <files number> <match regex> <size size> <world-readable |
 no-world-readable>;
 flag flag;
 no-remote-trace;
 }
}

[edit services]
hcm {
 url-rule url-rule-name {
 term term-num {
 from {

```

```
url-list url-list-name ;
url url_identifier {
 host hostname ;
 request-url page-name ;
}
}
then {
 discard;
 accept;
 count;
 log-request;
}
}
url-rule-set url-rule-set-name {
 url-rule rule1;
 url-rule rule2 ;
}
}
```

## address

```
Syntax address address-name {
 destination {
 ip address</prefix-length>;
 port-range {
 tcp [ports-and-port-ranges];
 udp [ports-and-port-ranges];
 }
 }
 source {
 ip address</prefix-length>;
 port-range {
 tcp [ports-and-port-ranges];
 udp [ports-and-port-ranges];
 }
 }
 order number;
 }
```

**Hierarchy Level** [edit services application-identification **rule** *rule-name*]

**Release Information** Statement introduced in Junos OS Release 9.5.

**Description** Define address properties for application-identification rule processing. This statement is mandatory; you must specify either the destination or source properties.

**Options** *address-name*—Identifier for address information.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## application (Defining)

---

**Syntax**    `application application-name {  
              disable;  
              idle-timeout seconds;  
              index number;  
              port-mapping {  
                  disable;  
                  port-range {  
                      tcp [ ports-and-port-ranges ];  
                      udp [ ports-and-port-ranges ];  
                  }  
              }  
              session-timeout seconds;  
              type type;  
              type-of-service service-type;  
          }`

**Hierarchy Level**    [edit services application-identification]

**Release Information**    Statement introduced in Junos OS Release 9.5.

**Description**    Define the application and its properties.

The remaining statements are explained separately.

**Options**    *application-name*—Identifier for the application. This is a mandatory value and has a maximum length of 32 characters.

**Required Privilege**    interface—To view this statement in the configuration.

**Level**    interface-control—To add this statement to the configuration.

## nested-application

---

**Syntax**    `nested-application name {  
              index number;  
              protocol protocol ;  
              signature name {  
                  chain-order ;  
                  maximum-transactions number;  
                  member name {  
                      context (http-header-content-type | http-header-host | http-url-parsed |  
                              http-url-parsed-param-parsed);  
                      direction (any | client-to-server | server-to-client);  
                      pattern dfa-pattern;  
                  }  
                  order number;  
                  }  
              type type;  
          }`

**Hierarchy Level**    [edit services application-identification]

**Release Information**    Statement introduced in Junos OS Release 10.2.

**Description**    Configure a custom nested application definition for the desired application name that will be used by the system to identify the nested application as it passes through the device. Custom nested application definitions can be used for nested applications that are not part of the Juniper Networks predefined nested application database.

**Options**    *name*—Name of nested application.

The remaining statements are explained separately.

**Required Privilege Level**    system—To view this statement in the configuration.  
                                  system control—To add this statement to the configuration.

| <b>Description</b>              | Sometimes there is a need to identify multiple different applications running on the same Layer 7 protocols. For example, both Facebook and Yahoo Messenger can run over HTTP, but there is a need to identify them as two different applications. To do this, the application layer is split into two layers: Layer 7 applications and Layer 7 protocols. This function is turned on by default. Use the <b>no-nested-application</b> statement to turn it off. |
| <b>Required Privilege Level</b> | system—To view this statement in the configuration.<br>system control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                |

## rule (Application Identification)

---

**Syntax**

```
rule rule-name {
 address {
 destination {
 ip address </prefix-length>;
 port-range {
 tcp [ports-and-port-ranges];
 udp [ports-and-port-ranges];
 }
 }
 source {
 ip address </prefix-length>;
 port-range {
 tcp [ports-and-port-ranges];
 udp [ports-and-port-ranges];
 }
 }
 order number;
 }
 application application-name;
}
```

**Hierarchy Level** [edit services application-identification]

**Release Information** Statement introduced in Junos OS Release 9.5.

**Description** Define properties for application-identification rule processing.

**Options** *rule-name*—Unique identifier for the rule.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## term

---

**Syntax**    `term term-name {`  
              `from {`  
                  `application-group-any;`  
                  `application-groups [ application-group-names ];`  
                  `application-unknown;`  
                  `applications [ application-names ];`  
                  `destination-address address <any-unicast>;`  
                  `destination-address-range low minimum-value high maximum-value;`  
                  `destination-prefix-list list-name;`  
                  `nested-application-unknown;`  
                  `source-address address <any-unicast>;`  
                  `source-address-range low minimum-value high maximum-value;`  
                  `source-prefix-list list-name;`  
              `}`  
              `then {`  
                  `(accept | discard);`  
                  `count (application | application-group | application-group-any | nested-application |`  
                      `none);`  
                  `forwarding-class class-name;`  
                  `policer policer-name;`  
              `}`  
              `}`

**Hierarchy Level**    `[edit services aacl rule rule-name]`

**Release Information**    Statement introduced in Junos OS Release 9.5.

**Description**    Define the AACL term properties.

**Options**    *term-name*—Identifier for the term.  
  
              The remaining statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

| <b>Description</b>         | Define the AACL term actions. You can configure the router to accept or discard the targeted traffic. The action modifiers (count and forwarding-class) are optional.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>             | <p>You can configure one of the following actions:</p> <ul style="list-style-type: none"> <li>• <b>accept</b>—Accept the packets and all subsequent packets in flows that match the rules.</li> <li>• <b>discard</b>—Discard the packet and all subsequent packets in flows that match the rules.</li> </ul> <p>When you select <b>accept</b> as the action, you can optionally configure one or both of the following action modifiers. No action modifiers are allowed with the <b>discard</b> action.</p> <ul style="list-style-type: none"> <li>• <b>count (application   application-group   application-group-any   nested-application   none)</b>—For all accepted packets that match the rules, record a packet count using AACL statistics practices. You can specify one of the following options; there is no default setting: <ul style="list-style-type: none"> <li>• <b>application</b>—Count the application that matched in the <b>from</b> clause.</li> <li>• <b>application-group</b>—Count the application group that matched in the <b>from</b> clause.</li> <li>• <b>application-group-any</b>—Count all application groups that match <b>from</b> <b>application-group-any</b> under the <b>any</b> group name.</li> <li>• <b>nested-application</b>—Count all nested applications that matched in the <b>from</b> clause.</li> <li>• <b>none</b>—Same as not specifying <b>count</b> as an action.</li> </ul> </li> <li>• <b>forwarding-class <i>class-name</i></b>—Specify the packets' forwarding-class name.</li> </ul> <p><b>policer <i>policer-name</i></b>—Apply rate-limiting properties to the traffic as configured at the [edit firewall <b>policer</b> <i>policer-name</i>] hierarchy level. This configuration allows bit-rate and burst-size attributes to be applied to the traffic that are not supported by AACL rules. When you include a policer, the only allowed action is <b>discard</b>. For more information on policers, see the <i>Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices</i>.</p> |

| <b>Description</b>         | <p>Configure application identification tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b><i>trace-file</i></b> reaches its maximum size, it is renamed <b><i>trace-file.0</i></b>, then <b><i>trace-file.1</i></b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>flag</b>—Tracing operation to perform. <b>all</b> is the only valid completion.</p> <ul style="list-style-type: none"> <li><b>all</b>—Trace all events.</li> </ul> <p><b>match <i>regex</i></b>—(Optional) Regular expression for lines to be logged.</p> <p><b>no-world-readable</b>—(Optional) Disallow any user to read the log file.</p> <p><b>size <i>size</i></b>—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b><i>trace-file</i></b> reaches this size, it is renamed <b><i>trace-file.0</i></b>. When the <b><i>trace-file</i></b> again reaches its maximum size, <b><i>trace-file.0</i></b> is renamed <b><i>trace-file.1</i></b> and <b><i>trace-file</i></b> is renamed <b><i>trace-file.0</i></b>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Syntax:</b> <b>xk</b> to specify KB, <b>xm</b> to specify MB, or <b>xg</b> to specify GB</p> <p><b>Range:</b> 10240 through 1073741824 or the maximum file size supported on your system</p> <p>If you specify a maximum file size, you also must specify a maximum number of trace files with the <b>files</b> option.</p> <p><b>world-readable</b>—(Optional) Allow any user to read the log file.</p> |

| <b>Description</b>         | Configure local policy decision function (L-PDF) tracing options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b><i>trace-file</i></b> reaches its maximum size, it is renamed <b><i>trace-file.0</i></b>, then <b><i>trace-file.1</i></b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b><i>flag</i></b>—Tracing operation to perform. To specify more than one flag, include multiple <b>flag</b> statements.</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Everything</li> <li>• <b>configuration</b>—Configuration traces</li> <li>• <b>database</b>—Database traces</li> <li>• <b>general</b>—Miscellaneous traces</li> <li>• <b>gres</b>—Graceful Routing Engine switchover (GRES) traces</li> <li>• <b>ptsp-statistics</b>—PTSP statistics traces</li> <li>• <b>rtsock</b>—Routing socket traces</li> <li>• <b>statistics</b>—Statistics traces</li> <li>• <b>subscriber</b>—Subscriber traces</li> </ul> <p><b>no-remote-trace</b>—Disable remote tracing.</p> <p><b>size <i>size</i></b>—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b><i>trace-file</i></b> reaches this size, it is renamed <b><i>trace-file.0</i></b>. When the <b><i>trace-file</i></b> again reaches its maximum size, <b><i>trace-file.0</i></b> is renamed</p> |

***trace-file.1*** and ***trace-file*** is renamed ***trace-file.0***. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Syntax:** ***xk*** to specify KB, ***xm*** to specify MB, or ***xg*** to specify GB

**Range:** 10240 through 1073741824 or the maximum file size supported on your system

If you specify a maximum file size, you also must specify a maximum number of trace files with the ***files*** option.

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

## type

---

**Syntax** type *type*;

**Hierarchy Level** [edit services application-identification [application](#) *application-name*]  
[edit services application-identification [nested-application](#) *name*]

**Release Information** Statement introduced in Junos OS Release 9.5.

**Description** Define type of application, such as HTTP or FTP.

**Options** ***type***—Application type. This is a mandatory value and has a maximum length of 32 characters.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.5.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | Define the type of service by service objective. There is no default value.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>                  | <p>The following <i>service-type</i> options are available:</p> <ul style="list-style-type: none"><li>• <b>maximize-reliability</b>—Service designed for maximum reliability in packet transmission.</li><li>• <b>maximize-throughput</b>—Service designed for maximum throughput.</li><li>• <b>minimize-delay</b>—Service designed for minimum delay in packet transmission.</li><li>• <b>minimize-monetary-cost</b>—Service designed for minimum monetary cost.</li></ul> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                          |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Defining an Application Identification on page 660</a></li></ul>                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>              | For multilink or link services interfaces only, set the maximum received reconstructed unit (MRRU). The MRRU is similar to the maximum transmission unit (MTU), but is specific to multilink interfaces.                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <p><i>bytes</i>—MRRU size.</p> <p><b>Range:</b> 1500 through 4500 bytes</p> <p><b>Default:</b> 1500 bytes</p>                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## [edit forwarding-options] Hierarchy Level

To configure flow monitoring and accounting properties, include the following statements at the **[edit forwarding-options]** hierarchy level:

```
[edit forwarding-options]
accounting name {
 output {
 aggregate-export-interval seconds;
 cflowd hostname {
 aggregation {
 autonomous-system;
 destination-prefix;
 protocol-port;
 source-destination-prefix {
 caida-compliant;
```

```

 }
 source-prefix;
 }
 autonomous-system-type (origin | peer);
 port port-number;
 version format;
}
flow-active-timeout seconds;
flow-inactive-timeout seconds;
interface interface-name {
 engine-id number;
 engine-type number;
 source-address address;
}
}
}
monitoring name {
 family family {
 output {
 cflowd hostname port port-number;
 export-format format;
 flow-active-timeout seconds;
 flow-export-destination {
 collector-pic;
 }
 flow-inactive-timeout seconds;
 interface interface-name {
 engine-id number;
 engine-type number;
 input-interface-index number;
 output-interface-index number;
 source-address address;
 }
 }
 }
}
next-hop-group group-names {
 interface interface-name {
 next-hop address;
 }
}
port-mirroring {
 input {
 rate rate;
 run-length number;
 maximum-packet-length bytes
 }
 family (inet | inet6) {
 output {
 interface interface-name {
 next-hop address;
 }
 no-filter-check;
 }
 }
}
traceoptions {
 file filename {

```

```

 files number;
 size bytes;
 (world-readable | no-world-readable);
 }
}
sampling {
 disable;
 sample-once;
 input {
 rate number;
 run-length number;
 max-packets-per-second number;
 maximum-packet-length bytes;
 }
 traceoptions {
 no-remote-trace;
 file filename <files number> <size bytes> <match expression> <world-readable |
 no-world-readable>;
 }
}
family (inet | inet6 | mpls) {
 disable;
 output {
 aggregate-export-interval seconds;
 flow-active-timeout seconds;
 flow-inactive-timeout seconds;
 extension-service service-name;
 flow-server hostname {
 aggregation {
 autonomous-system;
 destination-prefix;
 protocol-port;
 source-destination-prefix {
 caida-compliant;
 }
 source-prefix;
 }
 autonomous-system-type (origin | peer);
 (local-dump | no-local-dump);
 port port-number;
 source-address address;
 version format;
 version9 {
 template template-name;
 }
 }
 }
 interface interface-name {
 engine-id number;
 engine-type number;
 source-address address;
 }
 file {
 disable;
 filename filename;
 files number;
 size bytes;
 }
}

```

```

 (stamp | no-stamp);
 (world-readable | no-world-readable);
 }
}
instance instance-name {
 disable;
 input {
 rate number;
 run-length number;
 max-packets-per-second number;
 maximum-packet-length bytes;
 }
 family (inet | inet6 | mpls) {
 disable;
 output {
 aggregate-export-interval seconds;
 flow-active-timeout seconds;
 flow-inactive-timeout seconds;
 extension-service service-name;
 flow-server hostname {
 aggregation {
 autonomous-system;
 destination-prefix;
 protocol-port;
 source-destination-prefix {
 caida-compliant;
 }
 source-prefix;
 }
 autonomous-system-type (origin | peer);
 (local-dump | no-local-dump);
 port port-number;
 source-address address;
 version format;
 version9 {
 template template-name;
 }
 }
 }
 interface interface-name {
 engine-id number;
 engine-type number;
 source-address address;
 }
 inline-jflow {
 source-address address;
 flow-export-rate rate;
 }
 }
}
}
}

```

**NOTE:** For the complete [edit forwarding-options] hierarchy, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*. This section documents only the statements used in flow monitoring and accounting services.

**Related  
Documentation**

- [\[edit interfaces\] Hierarchy Level on page 1424](#)
- [\[edit services flow-monitoring\] Hierarchy Level on page 1426](#)

---

## [edit interfaces] Hierarchy Level

To configure flow monitoring and accounting interfaces, include the following statements at the [edit interfaces] hierarchy level:

```
[edit interfaces]
mo-fpc/pic/port {
 unit logical-unit-number {
 family inet {
 accounting {
 destination-class-usage;
 source-class-usage direction;
 }
 }
 address address {
 destination address;
 }
 filter {
 group filter-group-number;
 input filter-name;
 output filter-name;
 }
 receive-options-packets;
 receive-ttl-exceeded;
 sampling direction;
 }
}
multiservice-options {
 (core-dump | no-core-dump);
 (syslog | no-syslog);
 flow-control-options {
 down-on-flow-control;
 dump-on-flow-control;
 reset-on-flow-control;
 }
}
(at-fpc/pic/port | fe-fpc/pic/port | ge-fpc/pic/port) {
 passive-monitor-mode;
}
so-fpc/pic/port {
 unit logical-unit-number {
 passive-monitor-mode;
 }
}
```

}

**Related Documentation**

- [\[edit forwarding-options\] Hierarchy Level on page 1420](#)
- [\[edit services flow-monitoring\] Hierarchy Level on page 1426](#)

## [\[edit services dynamic-flow-control\] Hierarchy Level](#)

To configure dynamic flow capture, include the **dynamic-flow-capture** statement at the **[edit services]** hierarchy level:

```
[edit services]
dynamic-flow-capture {
 capture-group client-name {
 content-destination identifier {
 address address;
 hard-limit bandwidth;
 hard-limit-target bandwidth;
 soft-limit bandwidth;
 soft-limit-clear bandwidth;
 ttl hops;
 }
 control-source identifier {
 allowed-destinations [destinations];
 minimum-priority value;
 no-syslog;
 notification-targets address port port-number;
 service-port port-number;
 shared-key value;
 source-addresses [addresses];
 }
 duplicates-dropped-periodicity seconds;
 input-packet-rate-threshold rate;
 interfaces interface-name;
 max-duplicates number;
 pic-memory-threshold percentage percentage;
 }
 g-duplicates-dropped-periodicity seconds;
 g-max-duplicates number;
 traceoptions{
 file filename <files number> <size size> <world-readable | non-world-readable>;
 }
}
```

**Related Documentation**

- [Configuring Junos Capture Vision on page 835](#)

## [\[edit services flow-collector\] Hierarchy Level](#)

To configure flow collection, include the **flow-collector** statement at the **[edit services]** hierarchy level:

```
flow-collector {
 analyzer-address address;
```

```
analyzer-id name;
destinations {
 ftp:url {
 password "password";
 }
 file-specification {
 variant variant-number {
 data-format format;
 name-format format;
 transfer {
 record-level number;
 timeout seconds;
 }
 }
 }
}
interface-map {
 collector interface-name;
 file-specification variant-number;
 interface-name {
 collector interface-name;
 file-specification variant-number;
 }
}
retry number;
retry-delay seconds;
transfer-log-archive {
 archive-sites {
 ftp:url {
 password "password";
 username username;
 }
 }
 filename-prefix prefix;
 maximum-age minutes;
}
}
```

 seconds seconds;
}
peer-as-billing-template;
option-refresh-rate packets;
template-refresh-rate packets;
}
}
}

```

**Related  
Documentation**

- *Notational Conventions Used in Junos OS Configuration Hierarchies*
- *[edit services] Hierarchy Level*

## [edit services flow-tap] Hierarchy Level

To configure flow-tap services, include the **flow-tap** statement at the **[edit services]** hierarchy level. You can also specify whether you want to apply the flow-tap service to IPv4 traffic or IPv6 traffic by including the **family inet | inet6** statement. If the **family** statement is not included in the configuration, the flow-tap service is applied only to the IPv4 traffic.

```

flow-tap {
 interface interface-name;
 family inet | inet6;
}

```

Other statements are configured at the **[edit interfaces]** and **[edit system]** hierarchy levels.

## [edit services rpm] Hierarchy Level

---

To configure Real-Time Performance Monitoring (RPM) services, include the **rpm** statement at the **[edit services]** hierarchy level:

```
[edit services]
rpm {
 bgp {
 data-fill data;
 data-size size;
 destination-port port;
 history-size size;
 logical-system logical-system-name [routing-instances routing-instance-name];
 moving-average-size number;
 probe-count count;
 probe-interval seconds;
 probe-type type;
 routing-instances instance-name;
 test-interval interval;
 }
 probe owner {
 test test-name {
 data-fill data;
 data-size size;
 destination-interface interface-name;
 destination-port port;
 dscp-code-point dscp-bits;
 hardware-timestamp;
 history-size size;
 moving-average-size number;
 one-way-hardware-timestamp;
 probe-count count;
 probe-interval seconds;

## capture-group

**Syntax** `capture-group client-name {  
     content-destination identifier {  
         address address;  
         hard-limit bandwidth;  
         hard-limit-target bandwidth;  
         soft-limit bandwidth;  
         soft-limit-clear bandwidth;  
         ttl hops;  
     }  
     control-source identifier {  
         allowed-destinations [ destinations ];  
         minimum-priority value;  
         no-syslog;  
         notification-targets address port port-number;  
         service-port port-number;  
         shared-key value;  
         source-addresses [ addresses ];  
     }  
     duplicates-dropped-periodicity seconds;  
     input-packet-rate-threshold rate;  
     interfaces interface-name;  
     max-duplicates number;  
     pic-memory-threshold percentage percentage;  
 }`

**Hierarchy Level** [edit services dynamic-flow-capture]

**Release Information** Statement introduced in Junos OS Release 7.4.

**Description** Define the capture group values.

**Options** The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

| Syntax              | <code>data-size size;</code>                                                                                                                                                                                        |
| Hierarchy Level     | [edit services rpm bgp],<br>[edit <a href="#">services</a> rpm <a href="#">probe</a> owner <a href="#">test</a> test-name]                                                                                          |
| Release Information | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.3 for EX Series switches.<br>Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers. |
| Description         | Specify the size of the data portion of ICMP probes. The <b>data-size</b> statement is not valid with the <b>http-get</b> or <b>http-metadata-get</b> probe type.                                                   |
| Options             | <b>data</b> —The size can be from 0 through 65400<br><b>Default:</b> 0                                                                                                                                              |

**NOTE:** If you configure the hardware timestamp feature (see [“Configuring RPM Timestamping” on page 944](#)):

- The **data-size** default value is 32 bytes and 32 is the minimum value for explicit configuration. The UDP timestamp probe type is an exception; it requires a minimum data size of 52 bytes.
  - The **data-size** must be at least 100 bytes smaller than the default MTU of the interface of the RPM client interface.
-

| Description              | <p>On M Series and T Series routers, specify a services (<b>sp-</b>) interface that adds a timestamp to RPM probe messages. This feature is supported only with <b>icmp-ping</b>, <b>icmp-ping-timestamp</b>, <b>udp-ping</b>, and <b>udp-ping-timestamp</b> probe types. You must also configure the <b>rpm</b> statement on the <b>sp-</b> interface and include the <b>unit 0 family inet</b> statement with a <b>/32</b> address.</p> <p>On M Series, MX Series, and T Series routers, specify a multiservices (<b>ms-</b>) interface that adds a timestamp to RPM probe messages. This feature is supported only with <b>icmp-ping</b>, <b>icmp-ping-timestamp</b>, <b>udp-ping</b>, and <b>udp-ping-timestamp</b> probe types. You must also configure the <b>rpm</b> statement on the <b>ms-</b> interface and include the <b>unit 0 family inet</b> statement with a <b>/32</b> address.</p> <p>To enable RPM for the extension-provider packages on the adaptive services interface, configure the <b>object-cache-size</b>, <b>policy-db-size</b>, and <b>package</b> statements at the [edit <b>chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider</b>] hierarchy level. For the extension-provider package, <b>package-name</b> in the <b>package package-name</b> statement is <b>jservices-rpm</b>.</p> |
| Options                  | <b>interface-name</b> —Name of the adaptive services interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## **duplicates-dropped-periodicity**

---

**Syntax** `duplicates-dropped-periodicity seconds;`

**Hierarchy Level** [edit services dynamic-flow-capture [capture-group](#) *client-name*]

**Release Information** Statement introduced in Junos OS Release 9.2.

**Description** Specify the frequency for sending notifications to affected control sources when transmission of duplicate sets of data is restricted because the **max-duplicates** threshold has been reached.

**Options** ***seconds***—Period for sending DuplicatesDropped notifications.  
**Default:** 30 seconds

**Usage Guidelines** See .

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## family (Monitoring)

---

**Syntax**

```
family inet {
 output {
 flow-active-timeout seconds;
 flow-inactive-timeout seconds;
 export-format format;
 cflowd hostname {
 aggregation {
 autonomous-system;
 destination-prefix;
 protocol-port;
 source-destination-prefix {
 caida-compliant;
 }
 source-prefix;
 }
 }
 port port-number;
 }
 interface interface-name {
 engine-id number;
 engine-type number;
 input-interface-index number;
 output-interface-index number;
 source-address address;
 }
}
```

**Hierarchy Level** [edit forwarding-options [monitoring name](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Specify input and output interfaces and properties for flow monitoring. Only IPv4 ([inet](#)) is supported.

The statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## family (Sampling)

---

```
Syntax family (inet | inet6 | mpls) {
 disable;
 output {
 aggregate-export-interval seconds;
 flow-active-timeout seconds;
 flow-inactive-timeout seconds;
 extension-service service-name;
 flow-server hostname {
 aggregation {
 autonomous-system;
 destination-prefix;
 protocol-port;
 source-destination-prefix {
 caida-compliant;
 }
 source-prefix;
 }
 autonomous-system-type (origin | peer);
 (local-dump | no-local-dump);
 port port-number;
 source-address address;
 version format;
 version9 {
 template template-name;
 }
 }
 }
 interface interface-name {
 engine-id number;
 engine-type number;
 source-address address;
 }
 file {
 disable;
 filename filename;
 files number;
 size bytes;
 (stamp | no-stamp);
 (world-readable | no-world-readable);
 }
 inline-jflow {
 source-address address;
 flow-export-rate rate;
 }
 }
```

**Hierarchy Level** [edit forwarding-options [sampling](#)],  
[edit forwarding-options [sampling instance](#) *instance-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
**mpls** option introduced in Release 8.3.  
**inet6** option introduced in Release 9.4.

**Description** Configure the protocol family to be sampled. IPv4 (**inet**) is supported for most purposes, but you can configure **family mpls** to collect and export MPLS label information or **family inet6** to collect and export IPv6 traffic using flow aggregation version 9.

The remaining statements are explained separately.

**NOTE:** The `inline-jflow` statement is valid only under the `[edit forwarding-options sampling instance instance-name family inet output]` hierarchy level. The `file` statement is valid only under the `[edit forwarding-options sampling family inet output]` hierarchy level.

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

**Related Documentation** • [Configuring Traffic Sampling on page 857](#)

## file (Sampling)

**Syntax**

```
file {
 disable;
 filename filename;
 files number;
 size bytes;
 (stamp | no-stamp);
 (world-readable | no-world-readable);
}
```

**Hierarchy Level** [edit forwarding-options **sampling family inet output**]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Collect the traffic samples in a file.

The statements are explained separately.

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

**Related Documentation** • [Configuring Traffic Sampling on page 857](#)

| <div>  <p><b>NOTE:</b> In active flow monitoring, the cflowd or flow monitoring version 9 records are exported after a time period that is a multiple of 60 seconds and greater than or equal to the configured active timeout value. For example, if the active timeout value is 90 seconds, the cflowd or flow monitoring version 9 records are exported at 120-second intervals. If the active timeout value is 150 seconds, the cflowd or flow monitoring version 9 records are exported at 180-second intervals, and so forth.</p> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br><b>version9</b> statement introduced in Junos OS Release 8.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>         | <p>Collect an aggregate of sampled flows and send the aggregate to a specified host system that runs the collection utility cfdcollect. Specify a host system to collect sampled flows using the version 9 format.</p> <p>You can configure up to one version 5 and one version 8 flow format at the <b>[edit forwarding-options sampling family (inet   inet6   mpls) output flow-server <i>hostname</i>]</b> hierarchy level. For the same configuration, you can specify only either version 9 flow record formats or formats using versions 5 and 8, not both types of formats.</p> |
| <b>Options</b>             | <p><b>hostname</b>—The IP address—IPv4 or IPv6—or identifier of the host system (the workstation either running the cflowd utility or collecting traffic flows using version 9).</p> <p>You can configure only one host system for version 9.</p>                                                                                                                                                                                                                                                                                                                                       |

**NOTE:** IPv6 configuration for **flow-server** is supported only in Junos OS Release 12.3 and later.

Note that when you configure an IPv6 address for the **flow-server** statement, you must also configure an IPv6 address for the **inline-jflow source-address** statement at the **[edit forwarding-options sampling instance *instance-name* family (inet | inet6 | mpls) output]** hierarchy level.

The remaining statements are explained separately.

| Description              | <p>On MX Series routers, on M-320 routers using the Enhanced Queuing MPC, and on EX Series switches only, enable timestamping of RPM probe messages in the Packet Forwarding Engine host processor. This feature is supported only with <b>icmp-ping</b>, <b>icmp-ping-timestamp</b>, <b>udp-ping</b>, and <b>udp-ping-timestamp</b> probe types.</p> <p>When you configure either <b>probe-type udp-ping</b> or <b>probe-type udp-ping-timestamp</b> along with the <b>hardware-timestamp</b> command, the value for the <b>destination-port</b> can be only 7. A constraint check prevents you for configuring any other value for the destination port in this case.</p> <p>This constraint does not apply when you are configuring <b>one-way-hardware-timestamp</b>.</p> |

## interfaces (Video Monitoring)

```
Syntax interfaces {
 interface-name {
 family {
 inet {
 input-flows {
 input-flow-name {
 source-address [address];
 destination-address [address];
 source-port [port];
 destination-port [port];
 template template-name;
 }
 }
 }
 }
 }
 }
 }
 }
```

**Hierarchy Level** [edit services [video-monitoring](#)]

**Release Information** Statement introduced in Junos OS Release 14.1.

**Description** Define video monitoring for specified input or output flows on selected interfaces.

**Options** *interface-name*—Name of the interace to monitor.

*address*—Source or destination IPv4 address or prefix value.

*port*—Port number.

**Range:** 0 through 65,535

*template-name*—Name of the template used to monitor flows on an interface.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## maximum-packet-length

|                            |                                                                                                                                                                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>maximum-packet-length bytes;</code>                                                                                                                                                                                                                              |
| <b>Hierarchy Level</b>     | [edit forwarding-options port-mirroring input],<br>[edit forwarding-options port-mirroring instance <i>instance-name</i> input],<br>[edit forwarding-options <b>sampling input</b> ],<br>[edit forwarding-options <b>sampling instance</b> <i>instance-name</i> input] |
| <b>Release Information</b> | Statement introduced in Junos OS Release 9.6.<br>Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.                                                                                                                             |
| <b>Description</b>         | Set the maximum length of the packet used for port mirroring or traffic sampling. Packets with lengths greater than the specified maximum are truncated.                                                                                                               |

**NOTE:** The `maximum-packet-length` statement is not supported on MX80 routers.

**NOTE:** For MX-Series devices with Modular Port Interface Concentrators (MPCs), when `maximum-packet-length` (clip length) is configured for port-mirrored packets and the mirror-destination interface is a next-hop-group, the clip length would be effective only for the first member interface of the next-hop-group. The mirrored packet copy sent to the rest of the interfaces would not be clipped.

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Options</b>                  | <p><i>bytes</i>—Maximum length (in bytes) of the mirrored packet or the sampled packet.</p> <p><b>Range:</b> 0 through 9216</p> <p><b>Default:</b> 0</p> <p>For MX-Series devices with Modular Port Concentrators (MPCs), port-mirrored or sampled packets can be truncated (or clipped) to any length in the range of 1 to 255 bytes. Only 1 to 255 are valid values for packet truncation on these devices. For other devices, the range is from 0 to 9216. A <code>maximum-packet-length</code> value of zero represents that truncation is disabled, and the entire packet is mirrored or sampled.</p> |

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>         | Specify the name format for a specific file format. The files may include supported macros. Use macros to organize files on the external machine to which they are exported from the collector PIC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><b>format</b>—Specify the filename format, within quotation marks. The name format can include the following macros, typed in braces:</p> <ul style="list-style-type: none"> <li>• <b>{%D}</b>—Date</li> <li>• <b>{%T}</b>—Time when the file is created</li> <li>• <b>{%I}</b>—Description string for the logical interface configured using the <b>collector</b> statement at the [edit services flow-collector interface-map] hierarchy level</li> <li>• <b>{%N}</b>—Unique, sequential number for each new file created</li> <li>• <b>{am_pm}</b>—AM or PM</li> <li>• <b>{date}</b>—Current date using the {year} {month} {day} macros</li> <li>• <b>{day}</b>—From 01 through 31</li> <li>• <b>{day_abbrev}</b>—Sun through Sat</li> <li>• <b>{day_full}</b>—Sunday through Saturday</li> <li>• <b>{generation number}</b>—Unique, sequential number for each new file created</li> <li>• <b>{hour_12}</b>—From 01 through 12</li> <li>• <b>{hour_24}</b>—From 00 through 23</li> <li>• <b>{ifalias}</b>—Description string for the logical interface configured using the <b>collector</b> statement at the [edit services flow-collector interface-map] hierarchy level</li> <li>• <b>{minute}</b>—From 00 through 59</li> <li>• <b>{month}</b>—From 01 through 12</li> <li>• <b>{month_abbrev}</b>—Jan through Dec</li> <li>• <b>{month_full}</b>—January through December</li> <li>• <b>{num_zone}</b>—From -2359 through +2359; this macro is not supported</li> <li>• <b>{second}</b>—From 00 through 60</li> <li>• <b>{time}</b>—Time the file is created, using the {hour_24} {minute} {second} macros</li> <li>• <b>{time_zone}</b>—Time zone code name of the locale; for example, <b>gmt</b> (this macro is not supported).</li> </ul> |

- **{year}**—In the format YYYY; for example, 1970
- **{year\_abbrev}**—From 00 through 99

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

---

## next-hop (Forwarding Options)

---

**Syntax** next-hop *address*;

**Hierarchy Level** [edit forwarding-options port-mirroring *family* (inet | inet6) *output interface interface-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Specify the next-hop address for sending copies of packets to an analyzer.

**Options** *address*—IP address of the next-hop router.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | <p>For IPFIX flows, an identifier of an Observation Domain is locally unique to an exporting process of the templates. The export process uses the Observation Domain ID to uniquely identify to the collection process in which the flows were metered. We recommend that you configure this ID to be unique for each IPFIX flow. A value of 0 indicates that no specific Observation Domain is identified by this information element. Typically, this attribute is used to limit the scope of other information elements. If the observation domain is not unique, the collector cannot uniquely identify an IPFIX device.</p> <p>If you configure the same Observation Domain ID for different template types, such as for IPv4 and IPv6, it does not impact flow monitoring because the actual or the base observation domain ID is transmitted in the flow. The actual observation domain ID is derived from the value you configure and also in conjunction with other parameters such as the slot number, lookup chip (LU) instance, Packet Forwarding Engine instance. Such a method of computation of the observation domain ID ensures that this ID is not the same for two IPFIX devices.</p> |
| <b>Options</b>                  | <p><b><i>domain-id</i></b>—Specify a unique identifier for the observation domain for IPFIX flows.</p> <p><b>Range:</b> 0 through 255</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | Define a unique options template ID to be used for flow aggregation of version 9 and IPFIX flows. If you do not configure values for the template ID and options template ID, default values are assumed for these IDs, which are different for the various address families. If you configure the same template ID or options template ID value for different address families, such a setting is not processed properly and might cause unexpected behavior. For example, if you configure the same template ID value for both IPv4 and IPv6, the collector validates the export data based on the template ID value that it last receives. In this case, if IPv6 is configured after IPv4, the value is effective for IPv6 and the default value is used for IPv4. |
| <b>Options</b>                  | <i>id</i> —Specify a unique identifier for the options template to be used for version 9 or IPFIX flows.<br><b>Range:</b> 1024 through 65535                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## output (Accounting)

---

**Syntax**    `output {  
          aggregate-export-interval seconds;  
          cflowd hostname {  
            aggregation {  
              autonomous-system;  
              destination-prefix;  
              protocol-port;  
              source-destination-prefix {  
                caida-compliant;  
              }  
              source-prefix;  
            }  
            autonomous-system-type (origin | peer);  
            (local-dump | no-local-dump);  
            port port-number;  
            source-address address;  
            version format;  
          }  
          flow-active-timeout seconds;  
          flow-inactive-timeout seconds;  
          interface interface-name {  
            engine-id number;  
            engine-type number;  
            source-address address;  
          }  
        }`

**Hierarchy Level**    [edit forwarding-options **accounting** *name*]

**Release Information**    Statement introduced before Junos OS Release 7.4.

**Description**    Configure cflowd, output interfaces, and flow properties.

The statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

**Related Documentation**    • [Configuring Discard Accounting on page 868](#)

## output (Monitoring)

**Syntax**    output {  
               cflowd *hostname* **port** *port-number*;  
               export-format *format*;  
               flow-active-timeout *seconds*;  
               flow-export-destination {  
                   (cflowd-collector | collector-pic);  
               }  
               flow-inactive-timeout *seconds*;  
               interface *interface-name* {  
                   engine-id *number*;  
                   engine-type *number*;  
                   input-interface-index *number*;  
                   output-interface-index *number*;  
                   source-address *address*;  
               }  
           }

**Hierarchy Level**    [edit forwarding-options **monitoring** *name* family inet]

**Release Information**    Statement introduced before Junos OS Release 7.4.

**Description**    Configure cflowd, output interfaces, and flow properties.

The statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                   interface-control—To add this statement to the configuration.

**Related Documentation**    • [Configuring Flow Monitoring on page 804](#)

## output (Port Mirroring)

---

## output (Sampling)

```
Syntax output {
 aggregate-export-interval seconds;
 flow-active-timeout seconds;
 flow-inactive-timeout seconds;
 extension-service service-name;
 flow-server hostname {
 aggregation {
 autonomous-system;
 destination-prefix;
 protocol-port;
 source-destination-prefix {
 caida-compliant;
 }
 source-prefix;
 }
 autonomous-system-type (origin | peer);
 (local-dump | no-local-dump);
 port port-number;
 source-address address;
 version format;
 version9 {
 template template-name;
 }
 }
 interface interface-name {
 engine-id number;
 engine-type number;
 source-address address;
 }
 file {
 disable;
 filename filename;
 files number;
 size bytes;
 (stamp | no-stamp);
 (world-readable | no-world-readable);
 }
 inline-jflow {
 source-address address;
 flow-export-rate rate;
 }
}
```

**Hierarchy Level** [edit forwarding-options **sampling instance** *instance-name* **family** (inet | inet6 | mpls)],  
[edit forwarding-options **sampling family** (inet | inet6 | mpls)]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Configure cflowd or flow monitoring, output files and interfaces, and flow properties.

The statements are explained separately.

**NOTE:** The inline-jflow statement is valid only under the [edit forwarding-options sampling instance *instance-name* family inet output] hierarchy level. The file statement is valid only under the [edit forwarding-options sampling family inet output] hierarchy level.

---

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

---

## passive-monitor-mode

---

**Syntax** passive-monitor-mode;

**Hierarchy Level** [edit interfaces *interface-name* [unit logical-unit-number](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** For Asynchronous Transfer Mode (ATM), SONET/SDH, Fast Ethernet, and Gigabit Ethernet interfaces only, monitor packet flows from another router. If you include this statement in the configuration, the SONET/SDH interface does not send keepalives or alarms, and does not participate actively on the network.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>For passive monitoring on ATM, SONET/SDH, Fast Ethernet, and Gigabit Ethernet interfaces only, removes up to two MPLS labels from incoming IP packets. For passive monitoring on T Series devices, removes up to five MPLS labels from incoming IP packets.</p> <p>This statement has no effect on IP packets with more than two MPLS labels, or IP packets with more than five MPLS labels on T Series devices. Packets with MPLS labels cannot be processed by the monitoring PIC; if packets with MPLS labels are forwarded to the monitoring PIC, they are discarded.</p> <p>The remaining statement is explained separately.</p> |
| <b>Default</b>                  | If you omit this statement, the MPLS labels are not removed, and the packet is not processed by the monitoring PIC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## probe

---

**Syntax**    `probe owner {  
              test test-name {  
                  data-fill data;  
                  data-size size;  
                  destination-interface interface-name;  
                  destination-port port;  
                  dscp-code-point dscp-bits;  
                  hardware-timestamp;  
                  history-size size;  
                  moving-average-size number;  
                  one-way-hardware-timestamp;  
                  probe-count count;  
                  probe-interval seconds;  
                  probe-type type;  
                  routing-instance instance-name;  
                  source-address address;  
                  target (url | address);  
                  test-interval interval;  
                  thresholds thresholds;  
                  traps traps;  
              }  
          }`

**Hierarchy Level**    [edit [services](#) rpm]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 9.3 for EX Series switches.

**Description**    Specify an owner name. The owner name combined with the test name represent a single RPM configuration instance.

**Options**    *owner*—Specify an owner name up to 32 characters in length.  
  
              The remaining statements are explained separately.

**Required Privilege Level**    system—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

## probe-server

```
Syntax probe-server {
 tcp {
 destination-interface interface-name;
 port number;
 }
 udp {
 destination-interface interface-name;
 port number;
 }
 }
```

**Hierarchy Level** [edit [services](#) rpm]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.3 for EX Series switches.  
Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

**Description** Specify the server to act as a receiver for the probes.  
  
The remaining statements are explained separately.

**NOTE:** The `destination-interface` statement is not supported on PTX Series routers.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## rfc2544-benchmarking

---

**Syntax**    rfc2544-benchmarking {  
              tests{  
                test-name *test-name* {  
                  test-interface *interface-name*;  
                  mode reflect;  
                  family (inet | ccc);  
                  destination-ipv4-address *address*;  
                  destination-udp-port *port-number*;  
                  source-ipv4-address *address*;  
                  source-udp-port *port-number*;  
                  direction (egress | ingress);  
                }  
              }  
            }

**Hierarchy Level**    [edit [services](#) rpm]

**Release Information**    Statement introduced in Junos OS Release 12.3X52 for ACX Series routers.  
                              Statement introduced in Junos OS Release 13.3 for MX104 3D Universal Edge Routers.

**Description**    Configure the parameters for the RFC 2544-based benchmarking test. You must configure a test profile, which specifies the type of test and the manner in which it must be performed, and associate the test profile with a test name. The test name that you configure contains details, such as the address family and the test mode, for the test. You can associate the same test profile with multiple test names.

**Options**    **rfc2544-benchmarking**—Define the attributes for the RFC 2544-based benchmarking test to examine and analyze the performance characteristics of a network interconnecting device.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Specify the maximum size of each file containing sample or log data. The file size is limited by the number of files to be created and the available hard disk space.</p> <p>When a traffic sampling file named <b>sampling-file</b> reaches the maximum size, it is renamed <b>sampling-file.0</b>. When the <b>sampling-file</b> again reaches its maximum size, <b>sampling-file.0</b> is renamed <b>sampling-file.1</b> and <b>sampling-file</b> is renamed <b>sampling-file.0</b>. This renaming scheme continues until the maximum number of traffic sampling files is reached. Then the oldest traffic sampling file is overwritten.</p> |
| <b>Options</b>                  | <p><b>bytes</b>—Maximum size of each traffic sampling file or trace log file, in kilobytes (KB), megabytes (MB), or gigabytes (GB).</p> <p><b>Syntax:</b> <i>xk</i> to specify KB, <i>xm</i> to specify MB, or <i>xg</i> to specify GB</p> <p><b>Range:</b> 10 KB through the maximum file size supported on your router</p> <p><b>Default:</b> 1 MB for sampling data; 128 KB for log information</p>                                                                                                                                                                                                                                             |

**Hierarchy Level** [edit services [video-monitoring](#)]

**Release Information** Statement introduced in Junos OS Release 14.1.

**Description** Configure the media delivery index template containing the measurement parameters for video monitoring.

**Options** **delay-factor**—Define delay factor syslog threshold levels.

***delay-factor-threshold***—Delay factor threshold in milliseconds. When the threshold is exceeded, a syslog message is generated.

**Default:** 0—Do not generate syslogs.

**Range:** 0 though 65535 milliseconds

**disable**—Disable logging for the threshold.

***inactive-timeout***—Number of seconds of flow inactivity after which time media delivery index statistics collection for a flow is terminated.

**Range:** 30 through 300 seconds

**info | warning | critical**—Level of syslog message generated when a threshold is exceeded.

**interval-duration**—Number of seconds after which time media delivery index flow monitoring statistics for the interval are reported.

**Range:** 1 through 50

**layer3-packets-per-second**—Layer 3 packet rate in IP packets per second.

**Range:** 0 through 4,294,967,295 pps

**media-bits-per-second**—Media bit rate for the stream in bits per second.

**media-loss-rate**—Define media loss rate syslog threshold levels.

**media-packets-count-in-layer-3**—Number of media packets in an IP packet.

**Range:** 1 through 32

**media-packet-size**—Size of media packet in bits.

**Default:** 188

**Range:** 1 through 2048

**media-rate-variation**—Define delay factor syslog threshold levels.

**mlr-packet-count**—Media loss rate threshold expressed as the number of packets dropped. When the threshold is exceeded, a syslog message is generated.

**mlr-percentage**—Media loss rate threshold expressed as the percentage of total packets dropped. When the threshold is exceeded, a syslog message is generated.

**Range:** 0 through 100

**mrv-variation**—Media rate variation threshold. The variation is the ratio of actual media rate to the configured media rate, expressed as a percentage.

**template-name**—Name of the template containing media delivery index measurement criteria. The template can be assigned to an interface.

## tests (RFC 2544 Benchmarking)

**Syntax**

```
tests {
 test-name test-name {
 test-interface interface-name;
 mode reflect;
 family (inet | ccc);
 destination-ipv4-address address;
 destination-udp-port port-number;
 source-ipv4-address address;
 source-udp-port port-number;
 direction (egress | ingress);
 }
}
```

**Hierarchy Level** [edit [services](#) rpm [rfc2544-benchmarking](#)]

**Release Information** Statement introduced in Junos OS Release 13.3 for MX104 3D Universal Edge Routers.

**Description** Specify the attributes of the test iteration, such as the address family (type of service, IPv4 or Ethernet), the logical interface, test duration, and test packet size, that are used for a benchmarking test to be run. The test name combined with the test profile represent a single real-time performance monitoring (RPM) configuration instance.

**Options** **tests**—Define the test iteration for the RFC 2544-based benchmarking test.

The remaining statements are explained separately.

**Required Privilege Level**

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.3 for MX104 3D Universal Edge Routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | Specify the logical interface on which the RFC 2544-based benchmarking test is run. If you configure an <b>inet</b> family and the test mode to initiate and terminate test frames on the same device, the interface you configure is not effective. Instead, the test is run on the egress logical interface that is determined using route lookup on the specified destination IPv4 address. If you configure an <b>inet</b> family and the test mode to reflect the frames back on the sender from the other end, the logical interface is used as the interface to enable the reflection service (reflection is performed on the packets entering the specified interface). If you not configure the logical interface for reflection test mode, a lookup is performed on the source IPv4 address to determine the interface that hosts the address. |
| <b>Options</b>                  | <i>interface-name</i> —Name of the logical interface on which the test needs to be run.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Required Privilege Level</b> | <i>interface</i> —To view this statement in the configuration.<br><i>interface-control</i> —To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## test-name (RFC 2544 Benchmarking)

---

**Syntax**    `test-name test-name {  
              test-interface interface-name;  
              mode reflect;  
              family (inet | ccc);  
              destination-ipv4-address address;  
              destination-udp-port port-number;  
              source-ipv4-address address;  
              source-udp-port port-number;  
              direction (egress | ingress);  
          }`

**Hierarchy Level**    [edit [services](#) rpm [rfc2544-benchmarking tests](#)]

**Release Information**    Statement introduced in Junos OS Release 13.3 for MX104 3D Universal Edge Routers.

**Description**    Define the name of the RFC 2544-based benchmarking test. For each unique test name that you configure, you can specify a test profile, which contains the settings for a test and its type, and also a test interface, which contains the settings for test packets that are sent and received on the selected interface.

**Options**    *test-name*—Specify a test name. The name can be up to 32 characters in length.  
  
The remaining statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

| <b>Description</b>              | Specify thresholds used for the probes. A system log message is generated when the configured threshold is exceeded. Likewise, an SNMP trap (if configured) is generated when a threshold is exceeded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>                  | <p><b>thresholds</b>—Specify one or more threshold measurements. The following options are supported:</p> <ul style="list-style-type: none"> <li>• <b>egress-time</b>—Measures maximum source-to-destination time per probe.</li> <li>• <b>ingress-time</b>—Measures maximum destination-to-source time per probe.</li> <li>• <b>jitter-egress</b>—Measures maximum source-to-destination jitter per test.</li> <li>• <b>jitter-ingress</b>—Measures maximum destination-to- source jitter per test.</li> <li>• <b>jitter-rtt</b>—Measures maximum jitter per test, from 0 through 60,000,000 microseconds.</li> <li>• <b>rtt</b>—Measures maximum round-trip time per probe, in microseconds.</li> <li>• <b>std-dev-egress</b>—Measures maximum source-to-destination standard deviation per test.</li> <li>• <b>std-dev-ingress</b>—Measures maximum destination-to-source standard deviation per test.</li> <li>• <b>std-dev-rtt</b>—Measures maximum standard deviation per test, in microseconds.</li> <li>• <b>successive-loss</b>—Measures successive probe loss count, indicating probe failure.</li> <li>• <b>total-loss</b>—Measures total probe loss count indicating test failure, from 0 through 15.</li> </ul> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>         | Define tracing operations for RPM processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. All files are placed in the directory <code>/var/log</code>.</p> <p><b>Default:</b> <code>rmopd</code></p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>match <i>regular-expression</i></b>—(Optional) Refine the output to include lines that contain the regular expression.</p> <p><b>size <i>maximum-file-size</i></b>—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the <b>files</b> option.</p> <p><b>Range:</b> 10 KB through 1 GB</p> <p><b>Default:</b> 128 KB</p> <p><b>world-readable</b>—(Optional) Enable unrestricted file access.</p> <p><b>no-world-readable</b>—(Default) Disable unrestricted file access. This means the log file can be accessed only by the user who configured the tracing operation.</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>configuration</b>—Trace configuration events.</li> <li>• <b>error</b>—Trace events related to catastrophic errors in daemon.</li> <li>• <b>ipc</b>—Trace IPC events.</li> <li>• <b>ppm</b>—Trace ppm events.</li> <li>• <b>statistics</b>—Trace statistics.</li> </ul> |

## transfer

---

**Syntax** transfer {  
    record-level *number*;  
    timeout *seconds*;  
}

**Hierarchy Level** [edit services flow-collector file-specification variant *variant-number*]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Specify when to send the flow collection file. The file is sent when either of the two conditions is met.

**Options** record-level *number*—Number of flow collection files collected.  
  
timeout *seconds*—Timeout duration.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>         | Set the trap bit to generate traps for probes. Traps are sent if the configured threshold is met or exceeded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>             | <p><b>traps</b>—Specify one or more traps. The following options are supported:</p> <ul style="list-style-type: none"><li>• <b>egress-jitter-exceeded</b>—Generates traps when the jitter in egress time threshold is met or exceeded.</li><li>• <b>egress-std-dev-exceeded</b>—Generates traps when the egress time standard deviation threshold is met or exceeded.</li><li>• <b>egress-time-exceeded</b>—Generates traps when the maximum egress time threshold is met or exceeded.</li><li>• <b>ingress-jitter-exceeded</b>—Generates traps when the jitter in ingress time threshold is met or exceeded.</li><li>• <b>ingress-std-dev-exceeded</b>—Generates traps when the ingress time standard deviation threshold is met or exceeded.</li><li>• <b>ingress-time-exceeded</b>—Generates traps when the maximum ingress time threshold is met or exceeded.</li><li>• <b>jitter-exceeded</b>—Generates traps when the jitter in round-trip time threshold is met or exceeded.</li><li>• <b>probe-failure</b>—Generates traps for successive probe loss thresholds crossed.</li><li>• <b>rtt-exceeded</b>—Generates traps when the maximum round-trip time threshold is met or exceeded.</li><li>• <b>std-dev-exceeded</b>—Generates traps when the round-trip time standard deviation threshold is met or exceeded.</li><li>• <b>test-completion</b>—Generates traps when a test is completed.</li><li>• <b>test-failure</b>—Generates traps when the total probe loss threshold is met or exceeded.</li></ul> |

**NOTE:** For RPM traps to be generated, you must configure the remote-operations SNMP trap category by including the `categories` statement at the [edit `snmp trap-group trap-group-name`] hierarchy level.

---

## tth

---

**Syntax** `tth hops;`

**Hierarchy Level** [edit services dynamic-flow-capture `capture-group client-name content-destination identifier`]

**Release Information** Statement introduced in Junos OS Release 7.4.

**Description** Time-to-live (TTL) value for the IP-IP header.

**Options** `hops`—TTL value.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | Define a template ID to be used for flow aggregation of version 9 and IPFIX flows. If you do not configure values for the template ID and options template ID, default values are assumed for these IDs, which are different for the various address families. If you configure the same template ID or options template ID value for different address families, such a setting is not processed properly and might cause unexpected behavior. For example, if you configure the same template ID value for both IPv4 and IPv6, the collector validates the export data based on the template ID value that it last receives. In this case, if IPv6 is configured after IPv4, the value is effective for IPv6 and the default value is used for IPv4. |
| <b>Options</b>                  | <i>id</i> —Specify a unique identifier for the template to be used for version 9 or IPFIX flows.<br><b>Range:</b> 1024 through 65535                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.1.                                                                                                                                                                                                                    |
| <b>Description</b>              | Enable any plug-in or daemon on a PIC to generate a flow offload request to of-load flows to the Packet Forwarding Engine. This command is available on MX Series routers with Modular Port Concentrators (MPCs) and Modular Interface Cards (MICs).              |
| <b>Options</b>                  | <i>minimum-bytes</i> —The minimum number of bytes that trigger offloading. When this option is omitted, offloading is triggered when both the forward and reverse flows of the session have begun, meaning that at least one packet has flowed in each direction. |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                           |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Flow Offloading on page 813</a></li> </ul>                                                                                                                                                                   |

## udp

---

**Syntax**    `udp {  
              destination-interface interface-name;  
              port port;  
          }`

**Hierarchy Level**    [edit `services` rpm `probe-server`]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.3 for EX Series switches.  
Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

**Description**    Specify the port information for the UDP server.  
  
The remaining statements are explained separately.

**NOTE:** The `destination-interface` statement is not supported on PTX Series routers.

---

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

**Related Documentation**    • [Configuring RPM Receiver Servers on page 943](#)

## unit

**Syntax**

```
unit logical-unit-number {
 family inet {
 address address {
 destination destination-address;
 }
 filter {
 group filter-group-number;
 input filter-name;
 output filter-name;
 }
 sampling direction;
 }
}
```

**Hierarchy Level** [edit interfaces *interface-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Configure a logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

**Options** *logical-unit-number*—Number of the logical unit.

**Range:** 0 through 16,384

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.
