user@switch# set interface xe-0/0/6 edge
```

2. Configure BPDU protection on all edge ports:

```
[edit protocols rstp]
user@switch# set bpdu-block-on-edge
```

#### Results

Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface xe-0/0/5.0 {
  edge;
}
interface xe-0/0/6.0 {
  edge;
}
bpdu-block-on-edge;
```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Displaying the Interface State Before BPDU Protection Is Triggered on page 1659](#)
- [Verifying That BPDU Protection Is Working Correctly on page 1659](#)

*Displaying the Interface State Before BPDU Protection Is Triggered*

**Purpose** Before BPDUs are being received from the devices connected to interface **xe-0/0/5** and interface **xe-0/0/6**, confirm the interface state.

**Action** You can verify the interface state using the **show spanning-tree interface** command:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

Interface	Port ID	Designated port ID	Designated bridge ID	Port Cost	State	Role
xe-0/0/0.0	128:513	128:513	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/1.0	128:514	128:514	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/2.0	128:515	128:515	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/3.0	128:516	128:516	32768.0019e2503f00	20000	FWD	DESG
xe-0/0/4.0	128:517	128:517	32768.0019e2503f00	20000	FWD	DESG
xe-0/0/5.0	128:518	128:518	32768.0019e2503f00	20000	FWD	DESG
xe-0/0/6.0	128:519	128:519	32768.0019e2503f00	20000	FWD	DESG

[output truncated]

**Meaning** The output shows that interface **xe-0/0/5.0** and interface **xe-0/0/6.0** are designated ports in a forwarding state.

*Verifying That BPDU Protection Is Working Correctly*

**Purpose** In this example, the devices connected to Switch 2 start sending BPDUs to interface **xe-0/0/5.0** and interface **xe-0/0/6.0**. Verify that BPDU protection is configured on the interfaces.

**Action** You can verify that BPDU protection is configured on the interfaces by using the **show spanning-tree interface** command:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

Interface	Port ID	Designated port ID	Designated bridge ID	Port Cost	State	Role
xe-0/0/0.0	128:513	128:513	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/1.0	128:514	128:514	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/2.0	128:515	128:515	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/3.0	128:516	128:516	32768.0019e2503f00	20000	FWD	DESG
xe-0/0/4.0	128:517	128:517	32768.0019e2503f00	20000	FWD	DESG

(Bpdu-Incon)						
xe-0/0/7.0	128:520	128:1	16384.00aabbcc0348	20000	FWD	ROOT
xe-0/0/8.0	128:521	128:521	32768.0019e2503f00	20000	FWD	DESG

[output truncated]

**Meaning** When BPDUs are sent from the devices to interface **xe-0/0/5.0** and interface **xe-0/0/6.0** on Switch 2, the output from the operational mode command **show spanning-tree interface** shows that the interfaces have transitioned to a BPDU inconsistent state. The BPDU inconsistent state blocks the interfaces and prevents them from forwarding traffic.

Disabling the BPDU protection configuration on an interface does not unblock the interface. If the **disable-timeout** statement has been included in the BPDU configuration, the interface automatically returns to service after the timer expires. Otherwise, use the operational mode command **clear ethernet-switching bpd-error** to unblock the interface.

If the devices connected to Switch 2 send BPDUs to the interfaces again, BPDU protection is triggered once more and the interfaces transition back to the BPDU inconsistent state. In such cases, you need to find and repair the misconfiguration on the devices that is triggering the sending of BPDUs to Switch 2.

### Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree

The QFX Series products provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), and Multiple Spanning Tree Protocol

(MSTP). Loop protection increases the efficiency of STP, RSTP, and MSTP by preventing interfaces from moving into a forwarding state that would create a loop in the network.

This example describes how to configure loop protection for an interface for the QFX Series in an RSTP topology:

- [Requirements on page 1661](#)
- [Overview and Topology on page 1661](#)
- [Configuration on page 1663](#)
- [Verification on page 1663](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.1 or later for the QFX Series
- Three switches in an RSTP topology

**NOTE:** By default, RSTP is enabled for the QFX Series.

### Overview and Topology

A loop-free network in spanning-tree topologies is supported through the exchange of a special type of frame called a bridge protocol data unit (BPDU). Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic (preventing loops) and which interfaces become root ports and forward traffic.

A blocking interface can transition to the forwarding state in error if the interface stops receiving BPDUs from its designated port on the segment. Such a transition error can occur when there is a hardware error on the switch or software configuration error between the switch and its neighbor. When this happens, a loop appears in the spanning tree. Loops in a Layer 2 topology cause broadcast, unicast, and multicast frames to continuously circle the looped network. As a switch processes a flood of frames in a looped network, its resources become depleted, and the ultimate result is a network outage.

**NOTE:** An interface can be configured for either loop protection or root protection, but not for both.

Three switches are displayed in [Figure 26 on page 1662](#). In this example, they are configured for RSTP and create a loop-free topology. Interface **xe-0/0/6** is blocking traffic between Switch 3 and Switch 1; thus, traffic is forwarded through interface **xe-0/0/7** on Switch 2. BPDUs are being sent from the root bridge on Switch 1 to both of these interfaces.

This example shows how to configure loop protection on interface **xe-0/0/6** to prevent it from transitioning from a blocking state to a forwarding state and creating a loop in the spanning-tree topology.

Figure 26: Network Topology for Loop Protection

Table 107 on page 1662 shows the components that will be configured for loop protection.

Table 107: Topology for Configuring Loop Protection on the QFX Series

Components	Settings
Switch 1	Switch 1 is the root bridge.
Switch 2	Switch 2 has the root port <b>xe-0/0/7</b> .
Switch 3	Switch 3 is connected to Switch 1 through interface <b>xe-0/0/6</b> .

A spanning-tree topology contains ports that have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.
- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.

This configuration example uses an RSTP topology. However, you can also configure loop protection for STP or MSTP topologies at the `[edit protocols (mstp | stp)]` hierarchy level.

## Configuration

- CLI Quick Configuration** To quickly configure loop protection on interface **xe-0/0/6**:
- ```
[edit]
set protocols rstp interface xe-0/0/6 bpdu-timeout-action block
```
- Step-by-Step Procedure** To configure loop protection:
1. Configure interface **xe-0/0/6** on Switch 3:
- ```
[edit protocols rstp]
user@switch# set interface xe-0/0/6 bpdu-timeout-action block
```
- Results** Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface xe-0/0/6.0 {
  bpdu-timeout-action {
    block;
  }
}
```

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Displaying the Interface State Before Loop Protection Is Triggered on page 1663](#)
- [Verifying That Loop Protection Is Working on an Interface on page 1664](#)

### *Displaying the Interface State Before Loop Protection Is Triggered*

- Purpose** Before loop protection is triggered on interface **xe-0/0/6**, confirm that the interface is blocked.

- Action** Display the interface state and role before applying root protection:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

Interface	Port ID	Designated port ID	Designated bridge ID	Port Cost	State	Role
xe-0/0/0.0	128:513	128:513	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/1.0	128:514	128:514	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/2.0	128:515	128:515	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/3.0	128:516	128:516	32768.0019e2503f00	20000	FWD	DESG
xe-0/0/4.0	128:517	128:517	32768.0019e2503f00	20000	FWD	DESG
xe-0/0/5.0	128:518	128:518	32768.0019e2503f00	20000	FWD	DESG
xe-0/0/6.0	128:519	128:2	16384.00aabbcc0348	20000	BLK	ALT

[output truncated]

- Meaning** The output from the operational mode command **show spanning-tree interface** shows that **xe-0/0/6.0** is the alternate port and is blocked.

**Verifying That Loop Protection Is Working on an Interface**

**Purpose** Verify that the loop protection configuration on interface **xe-0/0/6**. RSTP has been disabled on interface **xe-0/0/4** on Switch 1. This stops BPDUs from being sent to interface **xe-0/0/6** and triggering loop protection on that interface.

**Action** Display the interface state and role after applying root protection:

```
user@switch> show spanning-tree interface
```

```
Spanning tree interface parameters for instance 0
```

Interface	Port ID	Designated port ID	Designated bridge ID	Port Cost	State	Role
xe-0/0/0.0	128:513	128:513	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/1.0	128:514	128:514	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/2.0	128:515	128:515	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/3.0	128:516	128:516	32768.0019e2503f00	20000	FWD	DESG
xe-0/0/4.0	128:517	128:517	32768.0019e2503f00	20000	FWD	DESG
xe-0/0/5.0	128:518	128:518	32768.0019e2503f00	20000	FWD	DESG
xe-0/0/6.0	128:519	128:519	32768.0019e2503f00	20000	BLK	DIS

(Loop-Incon)  
[output truncated]

**Meaning** The operational mode command **show spanning-tree interface** shows that interface **xe-0/0/6.0** has detected that BPDUs are no longer being forwarded to it and has moved into a loop-inconsistent state. The loop-inconsistent state prevents the interface from transitioning to a forwarding state. The interface recovers and transitions back to its original state as soon as it receives BPDUs.

- Related Documentation**

  - [Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees on page 1664](#)
  - [Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations on page 1656](#)
  - [Understanding Loop Protection for STP, RSTP, VSTP, and MSTP on page 1559](#)

**Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees**

QFX Series products provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Root protection increases the efficiency of STP, RSTP, and MSTP by allowing network administrators to enforce the root bridge placement in the network manually.

This example describes how to configure root protection on an interface for the QFX Series.

- [Requirements on page 1665](#)
- [Overview and Topology on page 1665](#)
- [Configuration on page 1667](#)
- [Verification on page 1667](#)

## Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.1 or later for the QFX Series
- Four switches in an RSTP topology

Before you configure the interface for root protection, be sure you have:

- RSTP operating on the switches.

**NOTE:** By default, RSTP is enabled on the QFX Series.

## Overview and Topology

Peer STP applications running on switch interfaces exchange a special type of frame called a bridge protocol data unit (BPDU). Switches communicate interface information using BPDUs to create a loop-free topology that ultimately determines the root bridge and which interfaces block or forward traffic in the spanning tree.

You can also see BPDUs generated when you run a bridge application on a device attached to the switch. This can interfere with root port election, which may sometimes lead to the wrong root port being elected through the above process. Root protection allows you to manually enforce the root bridge placement in the network.

To prevent this from happening, enable root protection on interfaces that should not receive more BPDUs from the root bridge and should not be elected as the root port. These interfaces are typically located on an administrative boundary and are designated ports.

When root protection is enabled on an interface:

- The interface is blocked from becoming the root port.
- Root protection is enabled for all STP instances on that interface.
- The interface is blocked only for instances for which it receives more BPDUs. Otherwise, it participates in the spanning-tree topology.

**NOTE:** An interface can be configured for either root protection or loop protection, but not for both.

Four switches are displayed in [Figure 27 on page 1666](#). In this example, they are configured for RSTP and create a loop-free topology. Interface **xe-0/0/7** on Switch 1 is a designated port on an administrative boundary. It connects to Switch 4. Switch 3 is the root bridge. Interface **xe-0/0/6** on Switch 1 is the root port.

This example shows how to configure root protection on interface **xe-0/0/7** to prevent it from transitioning to become the root port.

Figure 27: Network Topology for Root Protection

[Table 108 on page 1666](#) shows the components that will be configured for root protection.

Table 108: Topology for Configuring Root Protection on the QFX Series

Component	Settings
Switch 1	Switch 1 is connected to Switch 4 through interface <b>xe-0/0/7</b> .
Switch 2	Switch 2 is connected to Switch 1 and Switch 3. Interface <b>xe-0/0/4</b> is the alternate port in the RSTP topology.
Switch 3	Switch 3 is the root bridge and is connected to Switch 1 and Switch 2.

Table 108: Topology for Configuring Root Protection on the QFX Series (*continued*)

Component	Settings
Switch 4	Switch 4 is connected to Switch 1. After loop protection is configured on interface <b>xe-0/0/7</b> , Switch 4 sends more BPDUs that trigger loop protection on interface <b>xe-0/0/7</b> .

A spanning-tree topology contains ports that have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.
- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.

This configuration example uses an RSTP topology. However, you can also configure root protection for STP or MSTP topologies at the **[edit protocols (mstp | stp)]** hierarchy level.

### Configuration

**CLI Quick Configuration** To quickly configure root protection on interface **xe-0/0/7**, copy the following command and paste it into the switch terminal window:

```
[edit]
set protocols rstp interface xe-0/0/7 no-root-port
```

**Step-by-Step Procedure** To configure root protection:

1. Configure interface **xe-0/0/7**:
 

```
[edit protocols rstp]
user@switch#
set interface xe-0/0/7 no-root-port
```

**Results** Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface xe-0/0/7.0 {
  no-root-port;
}
```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Displaying the Interface State Before Root Protection Is Triggered on page 1667](#)
- [Verifying That Root Protection Is Working on the Interface on page 1668](#)

#### *Displaying the Interface State Before Root Protection Is Triggered*

**Purpose** Before root protection is triggered on interface **xe-0/0/7**, confirm the interface state.

**Action** Confirm the state of the interfaces before root protection is configured:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

Interface	Port ID	Designated port ID	Designated bridge ID	Port Cost	State	Role
xe-0/0/0.0	128:513	128:513	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/1.0	128:514	128:514	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/2.0	128:515	128:515	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/3.0	128:516	128:516	32768.0019e2503f00	20000	FWD	DESG
xe-0/0/4.0	128:517	128:517	32768.0019e2503f00	20000	FWD	DESG
xe-0/0/5.0	128:518	128:2	16384.00aabbcc0348	20000	BLK	ALT
xe-0/0/6.0	128:519	128:1	16384.00aabbcc0348	20000	FWD	ROOT
xe-0/0/7.0	128:520	128:520	32768.0019e2503f00	20000	FWD	DESG

[output truncated]

**Meaning** The output from the operational mode command **show spanning-tree interface** shows that **xe-0/0/7.0** is a designated port in a forwarding state.

#### *Verifying That Root Protection Is Working on the Interface*

**Purpose** A configuration change takes place on Switch 4. A lower bridge priority on Switch 4 causes it to send more BPDUs to interface **xe-0/0/7**. Receipt of more BPDUs on interface **xe-0/0/7** triggers root protection. Verify that root protection is operating on interface **xe-0/0/7**.

**Action** Verify that root protection has been configured and is operating correctly:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

Interface	Port ID	Designated port ID	Designated bridge ID	Port Cost	State	Role
xe-0/0/0.0	128:513	128:513	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/1.0	128:514	128:514	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/2.0	128:515	128:515	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/3.0	128:516	128:516	32768.0019e2503f00	20000	FWD	DESG
xe-0/0/4.0	128:517	128:517	32768.0019e2503f00	20000	FWD	DESG
xe-0/0/5.0	128:518	128:2	16384.00aabbcc0348	20000	BLK	ALT
xe-0/0/6.0	128:519	128:1	16384.00aabbcc0348	20000	FWD	ROOT
xe-0/0/7.0	128:520	128:520	32768.0019e2503f00	20000	BLK	DIS

(Root-Incon)  
[output truncated]

**Meaning** The operational mode command **show spanning-tree interface** shows that interface **xe-0/0/7.0** has transitioned to a loop inconsistent state. The loop inconsistent state blocks the interface and prevents it from becoming a candidate for the root port. When the root bridge no longer receives more STP BPDUs from the interface, the interface recovers and transitions back to a forwarding state. Recovery is automatic.

### Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)

---

**NOTE:** This task uses Junos OS for EX Series switches and Junos OS for QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 43](#).

---

The Ethernet switching table, also known as the forwarding table, specifies the known locations of VLAN nodes and the addresses of devices within those nodes. There are two ways to populate the Ethernet switching table on a switch. The easiest method is to let the switch update the table with MAC addresses.

The second way to populate the Ethernet switching table is to manually insert addresses into the table. You can do this to reduce flooding and speed up the switch’s automatic learning process.

Before configuring a static MAC address, be sure that you have:

- Set up the VLAN. See *Configuring VLANs for EX Series Switches (CLI Procedure)*.

To configure an interface to have a static MAC address:

```
[edit vlans vlan-name switch-options interface interface-name]  
user@switch# set static-mac mac-address
```

## Configuring Ethernet Ring Protection Switching (CLI Procedure)

You can configure Ethernet ring protection switching (ERPS) on connected switches to prevent fatal loops from disrupting a network. ERPS is similar to spanning-tree protocols, but ERPS is more efficient than spanning-tree protocols because it is customized for ring topologies. You must configure at least three switches to form a ring. One of the links, called the ring protection link (RPL) end interface, is blocked until another link fails—at this time the RPL link is unblocked, ensuring connectivity.

**NOTE:** Ethernet OAM connectivity fault management (CFM) can be used with ERPS to detect link faults faster in some cases. See *Configuring Ethernet OAM Connectivity Fault Management (CLI Procedure)*.

The time needed for switchover to the ERPS link is affected by three settings—link failure detection time, the number of nodes in the ring, and the time it takes to unblock the RPL after a failure is detected.

**NOTE:** Do not configure redundant trunk groups on ERPS interfaces. You can configure VSTP on ERPS interfaces if the VSTP uses a VLAN that is not part of the ERPS control VLAN or data channel VLANs. The total number of ERPS and VSTP or MSTP instances is limited to 253.

Before you begin:

- Optionally, configure two interfaces on each switch as trunk ports. See *Configuring Gigabit Ethernet Interfaces (CLI Procedure)*.
- Configure a VLAN to act as a control VLAN for ERPS if your interfaces are trunk ports. Configure the same VLAN on all switches and associate the two network interfaces from each of the switches with the VLAN. See *Configuring VLANs for EX Series Switches (CLI Procedure)*. If you have multiple ERPS instances, the control VLANs and data channel VLANs must not overlap.
- Data channels are optional on the ERPS link. If you plan to use them, configure a VLAN for each data channel.

To configure ERPS:

**NOTE:** You must configure at least three switches, with only one switch designated as the RPL owner node.

1. RSTP and EPRS cannot both be configured on a ring port, and RSTP is configured by default. Disable RSTP on each switch interface:

```
user@switch# set rstp interface interface-name disable
```

2. Create a node ring on each switch:

```
[edit protocols]
user@switch# set protection-group ethernet-ring ring-name
```

3. Configure a control VLAN for the node ring if the links are trunk ports:

```
[edit protocols protection-group ethernet-ring ring name]
user@switch# set control-vlan vlan-name-or-vlan-id
```

4. Configure the east interface of the node ring with the control-channel interface. In addition, configure either the east interface or the west interface (but not both) as a link end.

```
[edit protocols protection-group ethernet-ring ring-name]
user@switch# set east-interface control-channel channel-name
user@switch# set east-interface ring-protection link end
```

5. Configure the west interface of the node ring with the control-channel interface. In addition, configure either the east interface or the west interface (but not both) as a link end.

```
[edit protocols protection-group ethernet-ring ring-name]
user@switch# set west-interface control-channel control-channel-interface-address
user@switch# set west-interface ring protection link end
```

6. Configure only one switch as the RPL owner node:

```
[edit protocols protection-group ethernet-ring ring-name]
user@switch# set ring-protection-link-owner
```

7. The restore interval configures the number of minutes that the node does not process any Ethernet ring protection (ERP) protocol data units (PDUs). When a link goes down, the ring protection link (RPL) activates. When the downed link comes back up, the RPL receives notification, restores the link, and waits the length of time indicated by the restore interval before issuing another block on the same link. Optionally, configure the restore interval on each switch:

```
[edit protocols protection-group ethernet-ring ring-name]
user@switch# set restore-interval restore-interval-value
```

8. The guard interval prevents ring nodes from receiving outdated messages (called RAPs). Optionally, configure the guard interval on each switch:

```
[edit protocols protection-group ethernet-ring ring name]
user@switch# set guard-interval guard-interval-value
```

**NOTE:** Local settings take priority over global settings.

Global settings are used when no local settings are present. Optionally, you can also configure these global settings on the switch:

- restore interval
- guard interval
- ERP traceoptions: file, page size, file size, flag name

9. Optionally, reconfigure the global guard interval on each switch:

```
[edit protocols protection-group ethernet-ring ring name]  
user@switch# set guard-interval guard-interval-value
```

10. Optionally, reconfigure the global restore interval on each switch:

```
[edit protocols protection-group ethernet-ring ring name]  
user@switch# set restore-interval restore-interval-value
```

11. After detection of a link failure, switching takes place after the hold interval has expired. Optionally, reconfigure the global hold interval on each switch:

```
[edit protocols protection-group ethernet-ring ring name]  
user@switch# set hold-interval hold-interval-value
```

12. Optionally, configure VLANs for data channels on the ERPS link:

```
[edit protocols protection-group ethernet-ring ring name]  
user@switch# set data-channel vlan-name
```

## Configuring MAC Limiting (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches and QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [Configuring MAC Limiting \(CLI Procedure\)](#). For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 43](#).

This topic describes various ways of configuring a limitation on MAC addresses in packets that are received and forwarded by the switch.

**NOTE:** On a QFX Series Virtual Chassis, if you include the shutdown option at the [edit vlans *vlan-name* switch-options interface *interface-name* interface-mac-limit packet-action] hierarchy level and issue the commit operation, the system generates a commit error. The system does not generate an error if you include the shutdown option at the [edit switch-options interface *interface-name* interface-mac-limit packet-action] hierarchy level.

The different ways of setting a MAC limit are described in the following sections:

- [Limiting the Number of MAC Addresses Learned by an Interface on page 1673](#)
- [Limiting the Number of MAC Addresses Learned by a VLAN on page 1673](#)

### Limiting the Number of MAC Addresses Learned by an Interface

To secure a port, you can set the maximum number of MAC addresses that can be learned by an interface:

- Set the MAC limit on an interface, and specify an action that the switch takes after the specified limit is exceeded:

```
[edit switch-options]
user@switch# set interface interface-name interface-mac-limit limit packet-action
action
```

After you set a new MAC limit for the interface, the system clears existing entries in the MAC address forwarding table associated with the interface.

### Limiting the Number of MAC Addresses Learned by a VLAN

To limit the number of MAC addresses learned by a VLAN, perform both of the following steps:

1. Set the maximum number of MAC addresses that can be learned by a VLAN, and specify an action that the switch takes after the specified limit is exceeded:

```
[edit vlans]
user@switch# set vlan-name switch-options mac-table-size limit packet-action
action
```

2. Set the maximum number of MAC addresses that can be learned by one or all interfaces in the VLAN, and specify an action that the switch takes after the specified limit is exceeded:

```
[edit vlans]
user@switch# set vlan-name switch-options interface interface-name
interface-mac-limit limit packet-action action
[edit vlans]
user@switch# set vlan-name switch-options interface-mac-limit limit packet-action
action
```

**NOTE:** If you specify a MAC limit and packet action for all interfaces in the VLAN *and* a specific interface in the VLAN, the MAC limit and packet action specified at the specific interface level takes precedence. Also, at the VLAN interface level, only the drop and drop-and-log options are supported.

After you set new MAC limits for a VLAN by using the **mac-table-size** statement or for interfaces associated with a VLAN by using the **interface-mac-limit** statement, the system clears the corresponding existing entries in the MAC address forwarding table.

## Configuring MAC Table Aging

MAC table aging ensures that a switch tracks only active nodes on the network and that it is able to flush out network nodes that are no longer available.

To manage MAC entries more efficiently, you can configure an entry's aging time, which is the maximum time that an entry can remain in the MAC address table before it is deleted because it has reached its maximum age.

**NOTE:** This task uses Junos OS for QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [Configuring MAC Table Aging](#). For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 43](#).

You can use the **set-mac-table-aging-time** command to configure how long entries remain in the Ethernet switching table before expiring. Here the VLAN is **employee-vlan**:

```
[edit vlans employee-vlan switch-options]  
user@switch# set mac-table-aging-time 200
```

- Related Documentation**
- [Understanding Bridging and VLANs on page 1527](#)
  - [Example: Setting Up Bridging with Multiple VLANs on page 1583](#)
  - [Example: Connecting an Access Switch to a Distribution Switch on page 1647](#)

## Configuring IRB Interfaces

Integrated routing and bridging (IRB) interfaces enable a switch to recognize which packets are being sent to local addresses so that they are bridged whenever possible and are routed only when needed. Whenever packets can be switched instead of routed, several layers of processing are eliminated. Switching also reduces the number of address look-ups.

**NOTE:** In versions of Junos OS that do not support Enhanced Layer 2 Software (ELS), this type of interface is called a routed VLAN interface (RVI).

To configure the routed VLAN interface:

1. Create the VLAN by assigning it a name and a VLAN ID:

```
[edit]
user@switch# set vlans support vlan-id 111
```

2. Assign an interface to the VLAN by specifying the logical interface (with the **unit** statement) and specifying the VLAN name as the member:

```
[edit]
user@switch# set interfaces ge-0/0/18 unit 0 family ethernet-switching vlan members
support
```

3. Create the subnet for the VLAN's broadcast domain:

```
[edit]
user@switch# set interfaces irb unit 111 family inet address 111.111.111.1/24
```

4. Bind a Layer 3 interface with the VLAN:

```
[edit]
user@switch# set vlans support l3-interface irb.111
```

**NOTE:** If you are using a version of Junos OS that does not support ELS, you create a Layer 3 virtual interface named **vlan**

**NOTE:** Layer 3 interfaces on trunk ports allow the interface to transfer traffic between multiple VLANs. Within a VLAN, traffic is bridged, while across VLANs, traffic is routed.

You can display the configuration settings:

```
user@switch> show interfaces irb terse
```

Interface	Admin	Link	Proto	Local	Remote
vlan	up	up			
irb.111	up	up	inet	111.111.111.1/24	

```

user@switch> show vlans
Name      Tag      Interfaces
default
None

```

```
employee-vlan 20
marketing      40
support        111
mgmt
                ge-1/0/0.0, ge-1/0/1.0, ge-1/0/2.0
                ge-1/0/10.0, ge-1/0/20.0, ge-1/0/30.0
                ge-0/0/18.0
                bme0.32769, bme0.32771*

user@switch> show ethernet-switching table
Ethernet-switching table: 1 entries, 0 learned
  VLAN      MAC address      Type      Age Interfaces
  support    00:19:e2:50:95:a0 Static    - Router
```

**Related Documentation**

- [Understanding Integrated Routing and Bridging on page 1539](#)

## Configuring Static ARP Entries

You can create static ARP table entries, which are explicit mappings between IP addresses and MAC addresses.

- To configure a static ARP entry:

```
[edit interfaces interface-name unit logical-unit-number family inet address
address]
user@switch# set arp ip-address (mac | multicast-mac) mac-address
```

The IP address that you specify must be part of the subnet defined in the enclosing **address** statement.

To associate a multicast MAC address with a unicast IP address, use the **multicast-mac** statement.

Specify the MAC address as 6 hexadecimal bytes in one of the following formats:  
*nnnnn.nnnnn.nnnnn* or *nn:nn:nn:nn:nn:nn*; for example, 0011.2233.4455 or 00:11:22:33:44:55.

**Related Documentation**

## Configuring the Native VLAN Identifier (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches and Junos OS for QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring the Native VLAN Identifier (CLI Procedure)*. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 43.

Switches can receive and forward routed or bridged Ethernet frames with 802.1Q VLAN tags. Typically, trunk ports, which connect switches to each other, accept untagged control packets but do not accept untagged data packets. You can enable a trunk port to accept untagged data packets by configuring a native VLAN ID on the interface on which you want the untagged data packets to be received. The logical interface on which untagged packets are to be received must be configured with the same VLAN ID as the native VLAN ID configured on the physical interface.

To configure the native VLAN ID by using the command-line interface (CLI):

1. On the interface on which you want untagged data packets to be received, set the interface mode to **trunk**, which specifies that the interface is in multiple VLANs and can multiplex traffic between different VLANs.:

```
[edit interfaces]
user@switch# set interface-name unit logical-unit-number family
ethernet-switching interface-mode trunk
```

2. Configure the native VLAN ID:

```
[edit interfaces]
user@switch# set interface-name native-vlan-id vlan-id
```

3. Specify that the logical interface that will receive the untagged data packets is a member of the native VLAN:

```
[edit interfaces]
user@switch# set interface-name unit logical-unit-number family
ethernet-switching vlan members vlan-id
```

### Related Documentation

- *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch*
- *Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1588*

## Configuring VLANs

Switches use VLANs to make logical groupings of network nodes with their own broadcast domains. You can use VLANs to limit the traffic flowing across the entire LAN and reduce collisions and packet retransmissions.

**NOTE:** This task supports the Enhanced Layer 2 Software (ELS) configuration style. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 43](#). If your switch runs software that does not support ELS, see [Configuring VLANs](#).

For each endpoint on the VLAN, configure the following VLAN parameters on the corresponding interface:

1. Specify the description of the VLAN:

```
[edit interfaces interface-name unit 0]
user@switch# set description vlan-description
```

2. Specify the unique name of the VLAN:

**NOTE:** Switches that run Junos OS with the ELS configuration style do not support a default VLAN. Therefore, on such switches, you must explicitly configure at least one VLAN, even if your network is simple and you want only one broadcast domain to exist.

```
[edit interfaces interface-name unit 0]
user@switch# set family ethernet-switching vlan members vlan-name
```

3. Create the subnet for the VLAN:

```
[edit interfaces]
user@switch# set vlan unit 0 family inet address ip-address
```

4. Configure the VLAN tag ID or VLAN ID list for the VLAN:

```
[edit vlans]
user@switch# set vlan-name vlan-id vlan-id-number
```

or

```
[edit vlans]
user@switch# set vlan-name vlan-id-list [vlan-ids | vlan-id--vlan-id]
```

5. Specify the maximum time that an entry can remain in the forwarding table before it ages out:

```
[edit vlans]
user@switch# set vlan-name switch-options mac-table-aging-time time
```

6. Specify a VLAN firewall filter to be applied to incoming or outgoing packets:

```
[edit vlans]
user@switch# set vlan-name filter (input | output) filter-name
```

### Related Documentation

- [Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1588](#)
- [Configuring IRB Interfaces on page 1675](#)

- *Creating a Series of Tagged VLANs*
- [Understanding Bridging and VLANs on page 1527](#)

## Creating a Series of Tagged VLANs

When you divide an Ethernet LAN into multiple VLANs, each VLAN is assigned a unique IEEE 802.1Q tag. This tag is associated with each frame in the VLAN, and the network nodes receiving the traffic can use the tag to identify which VLAN a frame is associated with.

Instead of configuring VLANs and 802.1Q tags one at a time for a trunk interface, you can configure a VLAN range to create a series of tagged VLANs.

When an Ethernet LAN is divided into VLANs, each VLAN is identified by a unique 802.1Q tag. The tag is applied to all frames so that the network nodes receiving the frames can detect which VLAN the frames belong to. Trunk ports, which multiplex traffic among a number of VLANs, use the tag to determine the origin of frames and where to forward them.

For example, you could configure the VLAN **employee** and specify a tag range of **10 through 12**. This creates the following VLANs and tags:

- VLAN **employee-10**, tag 10
- VLAN **employee-11**, tag 11
- VLAN **employee-12**, tag 12

Creating tagged VLANs in a series has the following limitations:

- Layer 3 interfaces do not support this feature.
- Because an access interface can only support one VLAN member, access interfaces also do not support this feature.

**NOTE:** This task uses Junos OS for Junos OS for QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Creating a Series of Tagged VLANs*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software”](#) on page 43.

---

To configure a series of tagged VLANs using the CLI (here, the VLAN is **employee**):

1. Configure the series (here, a VLAN series from 120 through 130):

```
[edit]
user@switch# set vlans employee vlan-id-list [ 120-130 ]
```

2. Associate a series of tagged VLANs when you configure an interface in one of two ways:

- Include the name of the series:

```
[edit interfaces]
user@switch# set interfaces xe-0/0/22.0 family ethernet-switching vlanmembers employee
```

- Include the VLAN range:

```
[edit interfaces]
user@switch# set interfaces xe-0/0/22.0 family ethernet-switching vlan members 120-130
```

Associating a series of tagged VLANs to an interface by name or by VLAN range the same result: VLANs **\_\_employee\_120\_\_** through **\_\_employee\_130\_\_** are created.

**NOTE:** When a series of VLANs is created using the `vlan-id-list` command, the VLAN names are preceded and followed by a double underscore.

#### Related Documentation

- [Verifying That a Series of Tagged VLANs Has Been Created on page 1827](#)
- [Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1588](#)
- [Example: Setting Up Bridging with Multiple VLANs on page 1583](#)
- [Understanding Bridging and VLANs on page 1527](#)

## Disabling MAC Learning

By default, MAC learning is globally enabled on all node. This topic describes how to disable MAC learning, as well as how to reenable and verify that MAC learning has been enabled or disabled.

**NOTE:** This task supports the Enhanced Layer 2 Software (ELS) configuration style. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 43](#). If your switch runs software that does not support ELS, see [Disabling MAC Learning](#).

Disabling dynamic MAC learning prevents a node from learning source and destination MAC addresses.

- To disable MAC learning:

```
[edit vlans vlan-name switch-options interface interface-name]
user@switch# set no-mac-learning
```

- To enable MAC learning:

```
[edit vlans vlan-name switch-options interface interface-name]
user@switch# delete no-mac-learning
user@switch# deactivate no-mac-learning
```

- To verify the status of MAC learning, view the Ethernet MAC learning statistics in operational mode.

```
user@switch> show ethernet-switching table
Ethernet-switching table: 2 entries, 1 learned
  VLAN      MAC address      Type      Age Interfaces
  default    *                Flood     - All-members
  default    00:1f:12:39:90:80 Learn     29 xe-/0/0.0
```

#### Related Documentation

- [Understanding MAC Learning on page 1540](#)

- *no-mac-learning*

## Configuring MAC Notification (CLI Procedure)

**NOTE:** This task uses the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring MAC Notification (CLI Procedure)* or *Configuring MAC Notification*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 43.

When a switch learns or unlearns a MAC address, SNMP notifications can be sent to the network management system at regular intervals to record the addition or removal of the MAC address. This process is known as MAC notification.

The MAC notification interval defines how often Simple Network Management Protocol (SNMP) notifications logging the addition or removal of MAC addresses on the switch are sent to the network management system.

MAC notification is disabled by default. When MAC notification is enabled, the default MAC notification interval is 30 seconds.

To enable or disable MAC notification, or to set the MAC notification interval, perform these tasks:

- [Enabling MAC Notification on page 1682](#)
- [Disabling MAC Notification on page 1683](#)
- [Setting the MAC Notification Interval on page 1683](#)

### Enabling MAC Notification

MAC notification is disabled by default. You need to perform this procedure to enable MAC notification.

To enable MAC notification on the switch with the default MAC notification interval of 30 seconds:

```
[edit switch-options]
```

```
user@switch# set mac-notification
```

To enable MAC notification on the switch with any other MAC notification interval (here, the MAC notification interval is set to 60 seconds):

```
[edit switch-options]
user@switch# set mac-notification notification-interval 60
```

### Disabling MAC Notification

MAC notification is disabled by default. Perform this procedure only if MAC notification was previously enabled on your switch.

To disable MAC notification on the switch:

```
[edit switch-options]
user@switch# delete mac-notification
```

To disable MAC notification on a specific interface (here, the interface is ge-0/0/3):

```
[edit switch-options]
user@switch# set interface ge-0/0/3 no-mac-notification
```

### Setting the MAC Notification Interval

The default MAC notification interval is 30 seconds. The procedure to change the MAC notification interval to a different interval is identical to the procedure to enable MAC notification on the switch with a nondefault value for the MAC notification interval.

To set the MAC notification interval on the switch (here, the MAC notification interval is set to 5 seconds):

```
[edit switch-options]
user@switch# set mac-notification notification-interval 5
```

**Related Documentation**

- *Verifying That MAC Notification Is Working Properly*

## Q-in-Q Tunneling Configuration Tasks

- [Configuring Q-in-Q Tunneling on page 1683](#)
- [Configuring All-in-One Bundling on page 1691](#)
- [Configuring Many-to-Many Bundling on page 1692](#)
- [Configuring a Specific Interface Mapping with VLAN ID Translation Option on page 1695](#)

### Configuring Q-in-Q Tunneling

Q-in-Q tunneling and VLAN translation allow service providers to create a Layer 2 Ethernet connection between two customer sites. Providers can segregate different customers' VLAN traffic on a link (for example, if the customers use overlapping VLAN IDs) or bundle different customer VLANs into a single service VLAN. Data centers can use Q-in-Q tunneling and VLAN translation to isolate customer traffic within a single site or to enable customer traffic flows between cloud data centers in different geographic locations.

Q-in-Q tunneling adds a service VLAN tag before the customer's 802.1Q VLAN tags. The Juniper Networks Junos operating system implementation of Q-in-Q tunneling supports the IEEE 802.1ad standard.

**NOTE:** This task uses a Junos OS release that supports the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring Q-in-Q Tunneling*.

With releases of Junos OS 13.2X51 previous to 13.2X51-D20, you cannot create a regular VLAN on an interface if you have created an S-VLAN or C-VLAN on that interface for Q-in-Q tunneling. This means that you cannot create an integrated routing and bridging (IRB) interface on that interface because regular VLANs are a required part of IRB configuration. With Junos OS 13.2X51-D25, you can create a regular VLAN on a trunk interface that has an S-VLAN, which means that you can also create an IRB interface on the trunk. In this case, the regular VLAN and S-VLAN on the same trunk interface cannot share the same VLAN ID. Junos OS 13.2X51-D25 does not allow you to create a regular VLAN on an access interface that has a C-VLAN.

Before setting up Q-in-Q tunneling, make sure you have created and configured the necessary customer VLANs on the neighboring switches. See *Configuring VLANs*.

- [Using the Different Mapping Methods on page 1684](#)
- [Configuring All-in-One Bundling on page 1684](#)
- [Configuring Many-to-Many Bundling on page 1686](#)
- [Configuring a Specific Interface Mapping with VLAN ID Translation Option on page 1689](#)

### Using the Different Mapping Methods

---

Once you have created the required VLANs on the neighboring switches, configure Q-in-Q tunneling using one of the three methods to map customer VLANs (C-VLANs) to service-provider-defined service VLANs (S-VLANs):

- All-in-one bundling maps all packets from all C-VLAN interfaces to an S-VLAN. For information about how to use this method, see [“Configuring All-in-One Bundling” on page 1684](#).
- Use many-to-many bundling when you want a subset of the C-VLANs on the access switch to be part of multiple S-VLANs. For information about how to use this method, see [“Configuring Many-to-Many Bundling” on page 1686](#).
- Use specific interface mapping when you want to assign an S-VLAN to a specific C-VLAN on an interface. For information about how to use this method, see [“Configuring a Specific Interface Mapping with VLAN ID Translation Option” on page 1689](#).

### Configuring All-in-One Bundling

---

You can configure Q-in-Q tunneling using the all-in-one bundling method, which forwards all packets that ingress on a C-VLAN interface to an S-VLAN. (Packets are forwarded to

the S-VLAN regardless of whether they are tagged or untagged prior to ingress.) Using this approach saves you the effort of specifying a specific mapping for each C-VLAN.

First configure the S-VLAN and its interface:

1. Create the S-VLAN and assign a VLAN ID for it.

```
[edit vlans vlan-name]
user@switch# vlan-id vlan-id-number
```

2. Assign a logical interface (unit) to be a member of the S-VLAN.

```
[edit vlans vlan-name]
user@switch# interface interface-name.unit-number
```

**NOTE:** Do not use logical interface unit 0. You must later bind a VLAN tag ID to the unit you specify in this step, and you cannot bind a VLAN tag ID to unit 0.

3. Enable the interface to transmit packets with two 802.1Q VLAN tags:

```
[edit interfaces interface-name]
user@switch# flexible-vlan-tagging
```

4. Enable extended VLAN bridge encapsulation on the interface:

```
[edit interfaces interface-name]
user@switch# encapsulation extended-vlan-bridge
```

5. Enable the S-VLAN interface to send and receive untagged packets:

```
[edit interfaces interface-name]
user@switch# set native-vlan-id vlan-id
```

6. Bind the logical interface (unit) of the interface that you specified in step 2 to the VLAN ID for the S-VLAN:

```
[edit interfaces interface-name unit logical-unit-number]
user@switch# vlan-id number
```

For example, the following configuration creates S-VLAN v10, makes xe-1/1/1.10 a member of that VLAN, enables Q-in-Q tunneling on interface xe-1/1/1, enables xe-1/1/1 to accept untagged packets, and binds the VLAN ID of S-VLAN v10 to a logical interface of xe-1/1/1.

```
set vlans v10 vlan-id 10
set vlans v10 interface xe-1/1/1.10
set interfaces xe-1/1/1 flexible-vlan-tagging
set interfaces xe-1/1/1 set native-vlan-id 10
set interfaces xe-1/1/1 encapsulation extended-vlan-bridge
set interfaces xe-1/1/1 unit 10 vlan-id 10
```

Now configure all-in-one bundling on a C-VLAN interface:

1. Assign a logical interface (unit) of the C-VLAN interface to be a member of the S-VLAN.

```
[edit vlans vlan-name]
user@switch# interface interface-name.unit-number
```

2. Enable the interface to transmit packets with 802.1Q VLAN tags :

```
[edit interfaces interface-name]
user@switch# flexible-vlan-tagging
```

3. Enable extended VLAN bridge encapsulation on the interface:

```
[edit interfaces interface-name]
```

```
user@switch# encapsulation extended-vlan-bridge
```

4. Enable the C-VLAN interface to send and receive untagged packets:

```
[edit interfaces interface-name]
```

```
user@switch# set native-vlan-id vlan-id
```

5. Configure a logical interface to receive and forward any tagged packet whose VLAN ID tag matches the list of VLAN IDs you specify:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# vlan-id-list vlan-id-numbers
```

6. Configure the system to add an S-VLAN tag (outer tag) as packets travel from a C-VLAN interface to the S-VLAN:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# input-vlan-map push
```

7. Configure the system to remove the S-VLAN tag when packets are forwarded (internally) from the S-VLAN interface to the C-VLAN interface:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# output-vlan-map pop
```

For example, the following configuration makes xe-0/0/1.10 a member of S-VLAN v10, enables Q-in-Q tunneling, maps packets from C-VLANs 100 through 200 to S-VLAN 10, and enables xe-0/0/1 to accept untagged packets. If a packet originates in C-VLAN 100 and needs to be sent across the S-VLAN, a tag with VLAN ID 10 is added to the packet. When a packet is forwarded (internally) from the S-VLAN interface to interface xe-0/0/1, the tag with VLAN ID 10 is removed.

```
set vlans v10 interface xe-0/0/1.10
set interfaces xe-0/0/1 flexible-vlan-tagging
set interfaces xe-0/0/1 encapsulation extended-vlan-bridge
set interfaces xe-0/0/1 unit 10 vlan-id-list 100-200
set interfaces xe-0/0/1 native-vlan-id 150
set interfaces xe-0/0/1 unit 10 input-vlan-map push
set interfaces xe-0/0/1 unit 10 output-vlan-map pop
```

### Configuring Many-to-Many Bundling

---

You can configure Q-in-Q tunneling using the many-to-many bundling method, which maps packets from multiple C-VLANs to multiple S-VLANs. This method is convenient for mapping a range of C-VLANs without having to specify each one individually. (You can also use this method to configure only one C-VLAN to be mapped to an S-VLAN.)

First configure the S-VLANs and assign them to an interface:

1. Create one of the S-VLANs and assign a VLAN ID for it.

```
[edit vlans vlan-name]
```

```
user@switch# vlan-id vlan-id-number
```

2. Repeat step 1 for the other S-VLANs.

3. Assign a logical interface (unit) to be a member of one of the S-VLANs. Do not use logical interface unit 0.

```
[edit vlans vlan-name]
```

```
user@switch# interface interface-name.unit-number
```

4. Repeat step 3 to assign the other logical interfaces on the same physical interface to be a member of other S-VLANs.

5. Enable the physical interface to transmit packets with two 802.1Q VLAN tags:

```
[edit interfaces interface-name]
user@switch# flexible-vlan-tagging
```

6. Enable extended VLAN bridge encapsulation on the interface:

```
[edit interfaces interface-name]
user@switch# encapsulation extended-vlan-bridge
```

7. Enable the S-VLAN interface to send and receive untagged packets:

```
[edit interfaces interface-name]
user@switch# set native-vlan-id vlan-id
```

8. Bind one of the logical units of the interface to the VLAN ID for one of the S-VLANs.

```
[edit interfaces interface-name unit logical-unit-number]
user@switch# vlan-id number
```

9. Repeat step 8 to bind the VLAN IDs for the other S-VLANs to the other logical units of the interface:

For example, the following configuration creates S-VLANs v10 and v30 and associates them with interface xe-1/1/1. It also enables Q-in-Q tunneling, enables xe-1/1/1 to accept untagged packets, and maps incoming C-VLAN packets to S-VLANs v10 and v30.

```
set vlans v10 vlan-id 10
set vlans v30 vlan-id 30
set vlans v10 interface xe-1/1/1.10
set vlans v30 interface xe-1/1/1.30
set interfaces xe-1/1/1 flexible-vlan-tagging
set interfaces xe-1/1/1 set native-vlan-id 10
set interfaces xe-1/1/1 encapsulation extended-vlan-bridge
set interfaces xe-1/1/1 unit 10 vlan-id 10
set interfaces xe-1/1/1 unit 30 vlan-id 30
```

To configure the many-to-many bundling method on a C-VLAN interface, perform the following steps for each customer:

1. Assign a logical interface (unit) of one C-VLAN interface to be a member of one S-VLAN.

```
[edit vlans vlan-name]
user@switch# interface interface-name.unit-number
```

2. Repeat step 1 to assign another C-VLAN interface (physical interface) to be a member of another S-VLAN.

3. Enable the interface to transmit packets with 802.1Q VLAN tags:

```
[edit interfaces interface-name]
user@switch# flexible-vlan-tagging
```

4. Enable extended VLAN bridge encapsulation on the interface:

```
[edit interfaces interface-name]
user@switch# encapsulation extended-vlan-bridge
```

5. Enable the C-VLAN interface to send and receive untagged packets:

```
[edit interfaces interface-name]
user@switch# set native-vlan-id vlan-id
```

6. For each physical interface, configure a logical interface (unit) to receive and forward any tagged packet whose VLAN ID tag matches the list of VLAN IDs you specify:

```
[edit interfaces interface-name unit logical-unit-number]
user@switch# vlan-id-list vlan-id-numbers
```

To configure only one C-VLAN to be mapped to an S-VLAN, specify only one VLAN ID after *vlan-id-list*.

7. For each physical interface, configure the system to add an S-VLAN tag (outer tag) as packets travel from the C-VLAN interface to the S-VLAN:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# input-vlan-map push
```

8. For each physical interface, configure the system to remove the S-VLAN tag when packets are forwarded from the S-VLAN interface to the C-VLAN interface:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# output-vlan-map pop
```

For example, the following configuration makes xe-0/0/1.10 a member of S-VLAN v10, enables Q-in-Q tunneling, and maps packets from C-VLANs 10 through 20 to S-VLAN 10. The configuration for customer 2 makes xe-0/0/2.30 a member of S-VLAN v30, enables Q-in-Q tunneling, and maps packets from C-VLANs 30 through 40, 50 through 60, and 70 through 80 to S-VLAN 30. Both interfaces are configured to accept untagged packets.

If a packet originates in C-VLAN 10 and needs to be sent over the S-VLAN, a tag with a VLAN ID 10 is added to the packet. If a packet is forwarded internally from the S-VLAN interface to xe-0/0/1.10, the tag with VLAN ID 10 is removed. The same principles apply to the C-VLANs configured on interface xe-0/0/2.

**NOTE:** Notice that you can use the same tag value for an S-VLAN and C-VLAN. For example, the configuration for customer 1 maps C-VLAN ID 10 to S-VLAN ID 10. C-VLAN and S-VLAN tags use separate name spaces, so this configuration is allowed.

Configuration for customer 1:

```
set vlans v10 interface xe-0/0/1.10
set interfaces xe-0/0/1 flexible-vlan-tagging
set interfaces xe-0/0/1 encapsulation extended-vlan-bridge
set interfaces xe-0/0/1 unit 10 vlan-id-list 10-20
set interfaces xe-0/0/1 native-vlan-id 15
set interfaces xe-0/0/1 unit 10 input-vlan-map push
set interfaces xe-0/0/1 unit 10 output-vlan-map pop
```

Configuration for customer 2:

```
set vlans v30 interface xe-0/0/2.30
set interfaces xe-0/0/2 flexible-vlan-tagging
set interfaces xe-0/0/2 encapsulation extended-vlan-bridge
set interfaces xe-0/0/2 unit 30 vlan-id-list 30-40
set interfaces xe-0/0/2 unit 30 vlan-id-list 50-60
set interfaces xe-0/0/2 unit 30 vlan-id-list 70-80
set interfaces xe-0/0/2 native-vlan-id 75
set interfaces xe-0/0/2 unit 30 input-vlan-map push
set interfaces xe-0/0/2 unit 30 output-vlan-map pop
```

### Configuring a Specific Interface Mapping with VLAN ID Translation Option

You can configure Q-in-Q tunneling by mapping packets from a specified C-VLAN to a specified S-VLAN. In addition, you can configure the system to replace a C-VLAN tag with an S-VLAN tag or replace an S-VLAN tag with a C-VLAN tag (instead of double tagging). This is called VLAN translation or VLAN rewriting. VLAN translation is particularly useful if a service provider's Layer 2 network that connects a customer's sites does not support double tagged packets.

When you use VLAN translation, both ends of the link normally must be able to swap the tags appropriately. That is, both ends of the link must be configured to swap the C-VLAN tag for the S-VLAN tag and swap the S-VLAN tag for the C-VLAN tag so that traffic in both directions is tagged appropriately while in transit and after arrival.

First configure the S-VLAN and its interface:

1. Create the S-VLAN and assign a VLAN ID for it.

```
[edit vlans vlan-name]
user@switch# vlan-id vlan-id-number
```

2. Assign a logical interface to be a member of the S-VLAN. Do not use unit 0.

```
[edit vlans vlan-name]
user@switch# interface interface-name.unit-number
```

3. Enable the interface to transmit packets with 802.1Q VLAN tags:

```
[edit interfaces interface-name]
user@switch# flexible-vlan-tagging
```

4. Enable the S-VLAN interface to send and receive untagged packets:

```
[edit interfaces interface-name]
user@switch# set native-vlan-id vlan-id
```

5. Enable extended VLAN bridge encapsulation on the interface:

```
[edit interfaces interface-name]
user@switch# encapsulation extended-vlan-bridge
```

6. Bind the logical interface (unit) of the interface that you specified earlier to the VLAN ID for the S-VLAN:

```
[edit interfaces interface-name unit logical-unit-number]
user@switch# vlan-id number
```

For example, the following configuration creates S-VLAN v200, makes xe-1/1/1.200 a member of that VLAN, enables Q-in-Q tunneling on interface xe-1/1/1, enables xe-1/1/1 to accept untagged packets, and binds a logical interface of xe-1/1/1 to the VLAN ID of VLAN v200.

```
set vlans v200 vlan-id 200
set vlans v200 interface xe-1/1/1.200
set interfaces xe-1/1/1 flexible-vlan-tagging
set interfaces xe-1/1/1 set native-vlan-id 10
set interfaces xe-1/1/1 encapsulation extended-vlan-bridge
set interfaces xe-1/1/1 unit 200 vlan-id 200
```

Now configure a specific interface mapping with optional VLAN ID translation on the C-VLAN interface:

1. Assign a logical interface of the C-VLAN interface to be a member of the S-VLAN.

```
[edit vlans vlan-name]  
user@switch# interface interface-name.unit-number
```

2. Enable the interface to transmit packets with 802.1Q VLAN tags:

```
[edit interfaces interface-name]  
user@switch# flexible-vlan-tagging
```

3. Enable the C-VLAN interface to send and receive untagged packets:

```
[edit interfaces interface-name]  
user@switch# set native-vlan-id vlan-id
```

4. Enable extended VLAN bridge encapsulation on the interface:

```
[edit interfaces interface-name]  
user@switch# encapsulation extended-vlan-bridge
```

5. Configure a logical interface (unit) to receive and forward any tagged packet whose VLAN ID tag matches the VLAN IDs you specify:

```
[edit interfaces interface-name unit logical-unit-number]  
user@switch# vlan-id number
```

6. Configure the system to remove the existing C-VLAN tag and replace it with the S-VLAN tag when packets ingress on the C-VLAN interface and are forwarded to the S-VLAN:

```
[edit interfaces interface-name unit logical-unit-number]  
user@switch# input-vlan-map swap
```

7. Configure the system to remove the existing S-VLAN tag and replace it with the C-VLAN tag when packets are forwarded from the S-VLAN interface to the C-VLAN interface:

```
[edit interfaces interface-name unit logical-unit-number]  
user@switch# output-vlan-map swap
```

8. To configure an S-VLAN and associate it with the appropriate C-VLAN interface:

```
[edit vlans vlan-name]  
user@switch# interface interface-name
```

For example, the following configuration on C-VLAN interface xe-0/0/1 enables Q-in-Q tunneling, enables xe-0/0/1 to accept untagged packets, and maps incoming packets from C-VLAN 150 to logical interface 200, which is a member of S-VLAN 200. Also, when packets egress from C-VLAN interface xe-0/0/1 and travel to the S-VLAN interface, the C-VLAN tag of 150 is removed and replaced with the S-VLAN tag of 200. When packets travel from the S-VLAN interface to the C-VLAN interface, the S-VLAN tag of 200 is removed and replaced with the C-VLAN tag of 150.

```
set vlans v200 interface xe-0/0/1.200  
set interfaces xe-0/0/1 flexible-vlan-tagging  
set interfaces xe-0/0/1 set native-vlan-id 10  
set interfaces xe-0/0/1 encapsulation extended-vlan-bridge  
set interfaces xe-0/0/1 unit 200 vlan-id 150  
set interfaces xe-0/0/1 unit 200 output-vlan-map swap  
set interfaces xe-0/0/1 unit 200 input-vlan-map swap
```

## Configuring All-in-One Bundling

You can configure Q-in-Q tunneling using the all-in-one bundling method, which forwards all packets that ingress on a C-VLAN interface to an S-VLAN. (Packets are forwarded to the S-VLAN regardless of whether they are tagged or untagged prior to ingress.) Using this approach saves you the effort of specifying a specific mapping for each C-VLAN.

First configure the S-VLAN and its interface:

1. Create the S-VLAN and assign a VLAN ID for it.

```
[edit vlans vlan-name]
user@switch# vlan-id vlan-id-number
```

2. Assign a logical interface (unit) to be a member of the S-VLAN.

```
[edit vlans vlan-name]
user@switch# interface interface-name.unit-number
```

**NOTE:** Do not use logical interface unit 0. You must later bind a VLAN tag ID to the unit you specify in this step, and you cannot bind a VLAN tag ID to unit 0.

3. Enable the interface to transmit packets with two 802.1Q VLAN tags:

```
[edit interfaces interface-name]
user@switch# flexible-vlan-tagging
```

4. Enable extended VLAN bridge encapsulation on the interface:

```
[edit interfaces interface-name]
user@switch# encapsulation extended-vlan-bridge
```

5. Enable the S-VLAN interface to send and receive untagged packets:

```
[edit interfaces interface-name]
user@switch# set native-vlan-id vlan-id
```

6. Bind the logical interface (unit) of the interface that you specified in step 2 to the VLAN ID for the S-VLAN:

```
[edit interfaces interface-name unit logical-unit-number]
user@switch# vlan-id number
```

For example, the following configuration creates S-VLAN v10, makes xe-1/1/1.10 a member of that VLAN, enables Q-in-Q tunneling on interface xe-1/1/1, enables xe-1/1/1 to accept untagged packets, and binds the VLAN ID of S-VLAN v10 to a logical interface of xe-1/1/1.

```
set vlans v10 vlan-id 10
set vlans v10 interface xe-1/1/1.10
set interfaces xe-1/1/1 flexible-vlan-tagging
set interfaces xe-1/1/1 set native-vlan-id 10
set interfaces xe-1/1/1 encapsulation extended-vlan-bridge
set interfaces xe-1/1/1 unit 10 vlan-id 10
```

Now configure all-in-one bundling on a C-VLAN interface:

1. Assign a logical interface (unit) of the C-VLAN interface to be a member of the S-VLAN.

```
[edit vlans vlan-name]
```

```
user@switch# interface interface-name.unit-number
```

2. Enable the interface to transmit packets with 802.1Q VLAN tags :

```
[edit interfaces interface-name]
```

```
user@switch# flexible-vlan-tagging
```

3. Enable extended VLAN bridge encapsulation on the interface:

```
[edit interfaces interface-name]
```

```
user@switch# encapsulation extended-vlan-bridge
```

4. Enable the C-VLAN interface to send and receive untagged packets:

```
[edit interfaces interface-name]
```

```
user@switch# set native-vlan-id vlan-id
```

5. Configure a logical interface to receive and forward any tagged packet whose VLAN ID tag matches the list of VLAN IDs you specify:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# vlan-id-list vlan-id-numbers
```

6. Configure the system to add an S-VLAN tag (outer tag) as packets travel from a C-VLAN interface to the S-VLAN:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# input-vlan-map push
```

7. Configure the system to remove the S-VLAN tag when packets are forwarded (internally) from the S-VLAN interface to the C-VLAN interface:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# output-vlan-map pop
```

For example, the following configuration makes xe-0/0/1.10 a member of S-VLAN v10, enables Q-in-Q tunneling, maps packets from C-VLANs 100 through 200 to S-VLAN 10, and enables xe-0/0/1 to accept untagged packets. If a packet originates in C-VLAN 100 and needs to be sent across the S-VLAN, a tag with VLAN ID 10 is added to the packet. When a packet is forwarded (internally) from the S-VLAN interface to interface xe-0/0/1, the tag with VLAN ID 10 is removed.

```
set vlans v10 interface xe-0/0/1.10
set interfaces xe-0/0/1 flexible-vlan-tagging
set interfaces xe-0/0/1 encapsulation extended-vlan-bridge
set interfaces xe-0/0/1 unit 10 vlan-id-list 100-200
set interfaces xe-0/0/1 native-vlan-id 150
set interfaces xe-0/0/1 unit 10 input-vlan-map push
set interfaces xe-0/0/1 unit 10 output-vlan-map pop
```

- [Understanding Q-in-Q Tunneling on page 1547](#)
- [Configuring Many-to-Many Bundling on page 1686](#)
- [Configuring a Specific Interface Mapping with VLAN ID Translation Option on page 1689](#)

## Configuring Many-to-Many Bundling

You can configure Q-in-Q tunneling using the many-to-many bundling method, which maps packets from multiple C-VLANs to multiple S-VLANs. This method is convenient

for mapping a range of C-VLANs without having to specify each one individually. (You can also use this method to configure only one C-VLAN to be mapped to an S-VLAN.)

First configure the S-VLANs and assign them to an interface:

1. Create one of the S-VLANs and assign a VLAN ID for it.

```
[edit vlans vlan-name]
user@switch# vlan-id vlan-id-number
```

2. Repeat step 1 for the other S-VLANs.

3. Assign a logical interface (unit) to be a member of one of the S-VLANs. Do not use logical interface unit 0.

```
[edit vlans vlan-name]
user@switch# interface interface-name.unit-number
```

4. Repeat step 3 to assign the other logical interfaces on the same physical interface to be a member of other S-VLANs.

5. Enable the physical interface to transmit packets with two 802.1Q VLAN tags:

```
[edit interfaces interface-name]
user@switch# flexible-vlan-tagging
```

6. Enable extended VLAN bridge encapsulation on the interface:

```
[edit interfaces interface-name]
user@switch# encapsulation extended-vlan-bridge
```

7. Enable the S-VLAN interface to send and receive untagged packets:

```
[edit interfaces interface-name]
user@switch# set native-vlan-id vlan-id
```

8. Bind one of the logical units of the interface to the VLAN ID for one of the S-VLANs.

```
[edit interfaces interface-name unit logical-unit-number]
user@switch# vlan-id number
```

9. Repeat step 8 to bind the VLAN IDs for the other S-VLANs to the other logical units of the interface:

For example, the following configuration creates S-VLANs v10 and v30 and associates them with interface xe-1/1/1. It also enables Q-in-Q tunneling, enables xe-1/1/1 to accept untagged packets, and maps incoming C-VLAN packets to S-VLANs v10 and v30.

```
set vlans v10 vlan-id 10
set vlans v30 vlan-id 30
set vlans v10 interface xe-1/1/1.10
set vlans v30 interface xe-1/1/1.30
set interfaces xe-1/1/1 flexible-vlan-tagging
set interfaces xe-1/1/1 set native-vlan-id 10
set interfaces xe-1/1/1 encapsulation extended-vlan-bridge
set interfaces xe-1/1/1 unit 10 vlan-id 10
set interfaces xe-1/1/1 unit 30 vlan-id 30
```

To configure the many-to-many bundling method on a C-VLAN interface, perform the following steps for each customer:

1. Assign a logical interface (unit) of one C-VLAN interface to be a member of one S-VLAN.

```
[edit vlans vlan-name]
```

```
user@switch# interface interface-name.unit-number
```

2. Repeat step 1 to assign another C-VLAN interface (physical interface) to be a member of another S-VLAN.

3. Enable the interface to transmit packets with 802.1Q VLAN tags:

```
[edit interfaces interface-name]
```

```
user@switch# flexible-vlan-tagging
```

4. Enable extended VLAN bridge encapsulation on the interface:

```
[edit interfaces interface-name]
```

```
user@switch# encapsulation extended-vlan-bridge
```

5. Enable the C-VLAN interface to send and receive untagged packets:

```
[edit interfaces interface-name]
```

```
user@switch# set native-vlan-id vlan-id
```

6. For each physical interface, configure a logical interface (unit) to receive and forward any tagged packet whose VLAN ID tag matches the list of VLAN IDs you specify:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# vlan-id-list vlan-id-numbers
```

To configure only one C-VLAN to be mapped to an S-VLAN, specify only one VLAN ID after *vlan-id-list*.

7. For each physical interface, configure the system to add an S-VLAN tag (outer tag) as packets travel from the C-VLAN interface to the S-VLAN:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# input-vlan-map push
```

8. For each physical interface, configure the system to remove the S-VLAN tag when packets are forwarded from the S-VLAN interface to the C-VLAN interface:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# output-vlan-map pop
```

For example, the following configuration makes xe-0/0/1.10 a member of S-VLAN v10, enables Q-in-Q tunneling, and maps packets from C-VLANs 10 through 20 to S-VLAN 10. The configuration for customer 2 makes xe-0/0/2.30 a member of S-VLAN v30, enables Q-in-Q tunneling, and maps packets from C-VLANs 30 through 40, 50 through 60, and 70 through 80 to S-VLAN 30. Both interfaces are configured to accept untagged packets.

If a packet originates in C-VLAN 10 and needs to be sent over the S-VLAN, a tag with a VLAN ID 10 is added to the packet. If a packet is forwarded internally from the S-VLAN interface to xe-0/0/1.10, the tag with VLAN ID 10 is removed. The same principles apply to the C-VLANs configured on interface xe-0/0/2.

**NOTE:** Notice that you can use the same tag value for an S-VLAN and C-VLAN. For example, the configuration for customer 1 maps C-VLAN ID 10 to S-VLAN ID 10. C-VLAN and S-VLAN tags use separate name spaces, so this configuration is allowed.

Configuration for customer 1:

```
set vlans v10 interface xe-0/0/1.10
set interfaces xe-0/0/1 flexible-vlan-tagging
set interfaces xe-0/0/1 encapsulation extended-vlan-bridge
set interfaces xe-0/0/1 unit 10 vlan-id-list 10-20
set interfaces xe-0/0/1 native-vlan-id 15
set interfaces xe-0/0/1 unit 10 input-vlan-map push
set interfaces xe-0/0/1 unit 10 output-vlan-map pop
```

Configuration for customer 2:

```
set vlans v30 interface xe-0/0/2.30
set interfaces xe-0/0/2 flexible-vlan-tagging
set interfaces xe-0/0/2 encapsulation extended-vlan-bridge
set interfaces xe-0/0/2 unit 30 vlan-id-list 30-40
set interfaces xe-0/0/2 unit 30 vlan-id-list 50-60
set interfaces xe-0/0/2 unit 30 vlan-id-list 70-80
set interfaces xe-0/0/2 native-vlan-id 75
set interfaces xe-0/0/2 unit 30 input-vlan-map push
set interfaces xe-0/0/2 unit 30 output-vlan-map pop
```

- [Understanding Q-in-Q Tunneling on page 1547](#)
- [Configuring All-in-One Bundling on page 1684](#)
- [Configuring a Specific Interface Mapping with VLAN ID Translation Option on page 1689](#)

## Configuring a Specific Interface Mapping with VLAN ID Translation Option

You can configure Q-in-Q tunneling by mapping packets from a specified C-VLAN to a specified S-VLAN. In addition, you can configure the system to replace a C-VLAN tag with an S-VLAN tag or replace an S-VLAN tag with a C-VLAN tag (instead of double tagging). This is called VLAN translation or VLAN rewriting. VLAN translation is particularly useful if a service provider's Layer 2 network that connects a customer's sites does not support double tagged packets.

When you use VLAN translation, both ends of the link normally must be able to swap the tags appropriately. That is, both ends of the link must be configured to swap the C-VLAN tag for the S-VLAN tag and swap the S-VLAN tag for the C-VLAN tag so that traffic in both directions is tagged appropriately while in transit and after arrival.

First configure the S-VLAN and its interface:

1. Create the S-VLAN and assign a VLAN ID for it.

```
[edit vlans vlan-name]
user@switch# vlan-id vlan-id-number
```

2. Assign a logical interface to be a member of the S-VLAN. Do not use unit 0.

```
[edit vlans vlan-name]
```

```
user@switch# interface interface-name.unit-number
```

3. Enable the interface to transmit packets with 802.1Q VLAN tags:

```
[edit interfaces interface-name]
```

```
user@switch# flexible-vlan-tagging
```

4. Enable the S-VLAN interface to send and receive untagged packets:

```
[edit interfaces interface-name]
```

```
user@switch# set native-vlan-id vlan-id
```

5. Enable extended VLAN bridge encapsulation on the interface:

```
[edit interfaces interface-name]
```

```
user@switch# encapsulation extended-vlan-bridge
```

6. Bind the logical interface (unit) of the interface that you specified earlier to the VLAN ID for the S-VLAN:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# vlan-id number
```

For example, the following configuration creates S-VLAN v200, makes xe-1/1/1.200 a member of that VLAN, enables Q-in-Q tunneling on interface xe-1/1/1, enables xe-1/1/1 to accept untagged packets, and binds a logical interface of xe-1/1/1 to the VLAN ID of VLAN v200.

```
set vlans v200 vlan-id 200
```

```
set vlans v200 interface xe-1/1/1.200
```

```
set interfaces xe-1/1/1 flexible-vlan-tagging
```

```
set interfaces xe-1/1/1 set native-vlan-id 10
```

```
set interfaces xe-1/1/1 encapsulation extended-vlan-bridge
```

```
set interfaces xe-1/1/1 unit 200 vlan-id 200
```

Now configure a specific interface mapping with optional VLAN ID translation on the C-VLAN interface:

1. Assign a logical interface of the C-VLAN interface to be a member of the S-VLAN.

```
[edit vlans vlan-name]
```

```
user@switch# interface interface-name.unit-number
```

2. Enable the interface to transmit packets with 802.1Q VLAN tags:

```
[edit interfaces interface-name]
```

```
user@switch# flexible-vlan-tagging
```

3. Enable the C-VLAN interface to send and receive untagged packets:

```
[edit interfaces interface-name]
```

```
user@switch# set native-vlan-id vlan-id
```

4. Enable extended VLAN bridge encapsulation on the interface:

```
[edit interfaces interface-name]
```

```
user@switch# encapsulation extended-vlan-bridge
```

5. Configure a logical interface (unit) to receive and forward any tagged packet whose VLAN ID tag matches the VLAN IDs you specify:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# vlan-id number
```

6. Configure the system to remove the existing C-VLAN tag and replace it with the S-VLAN tag when packets ingress on the C-VLAN interface and are forwarded to the S-VLAN:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# input-vlan-map swap
```

7. Configure the system to remove the existing S-VLAN tag and replace it with the C-VLAN tag when packets are forwarded from the S-VLAN interface to the C-VLAN interface:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# output-vlan-map swap
```

8. To configure an S-VLAN and associate it with the appropriate C-VLAN interface:

```
[edit vlans vlan-name]
```

```
user@switch# interface interface-name
```

For example, the following configuration on C-VLAN interface xe-0/0/1 enables Q-in-Q tunneling, enables xe-0/0/1 to accept untagged packets, and maps incoming packets from C-VLAN 150 to logical interface 200, which is a member of S-VLAN 200. Also, when packets egress from C-VLAN interface xe-0/0/1 and travel to the S-VLAN interface, the C-VLAN tag of 150 is removed and replaced with the S-VLAN tag of 200. When packets travel from the S-VLAN interface to the C-VLAN interface, the S-VLAN tag of 200 is removed and replaced with the C-VLAN tag of 150.

```
set vlans v200 interface xe-0/0/1.200
set interfaces xe-0/0/1 flexible-vlan-tagging
set interfaces xe-0/0/1 set native-vlan-id 10
set interfaces xe-0/0/1 encapsulation extended-vlan-bridge
set interfaces xe-0/0/1 unit 200 vlan-id 150
set interfaces xe-0/0/1 unit 200 output-vlan-map swap
set interfaces xe-0/0/1 unit 200 input-vlan-map swap
```

#### Related Documentation

- [Configuring Many-to-Many Bundling on page 1686](#)

## Unified Forwarding Table Configuration Task

- [Configuring the Unified Forwarding Table on page 1697](#)

### Configuring the Unified Forwarding Table

To optimize the way your switch allocates memory for different types of addresses, you can choose a unified forwarding table profile. In addition to choosing this profile, you can also decide how you want memory allocated for longest prefix match (LPM) entries.

- [Configuring an Address-Storage Profile on page 1698](#)
- [Configuring the LPM Allocation on page 1699](#)

### Configuring an Address-Storage Profile

On QFX5100 and EX4600 switches, you can control the allocation of memory available to store the following:

- MAC addresses
- Layer 3 host entries
- Longest prefix match (LPM) table entries

You configure the mix that best meets your needs by choosing the appropriate profile. [Table 109 on page 1698](#) lists the profiles you can choose and the maximum values for the MAC address and host table entries.

Table 109: Unified Forwarding Table Profiles

Profile Name	MAC Table	Host Table (unicast and multicast addresses)					
		IPv4 unicast	IPv6 unicast	IPv4 (*, G)	IPv4 (S, G)	IPv6 (*, G)	IPv6 (S, G)
<b>l2-profile-one</b>	288K	16K	8K	8K	8K	4K	4K
<b>l2-profile-two</b>	224K	80K	40K	40K	40K	20K	20K
<b>l2-profile-three (default)</b>	160K	144K	72K	72K	72K	36K	36K
<b>l3-profile</b>	96K	208K	104K	104K	104K	52K	52K
<b>lpm-profile*</b>	32K	16K	8K	8K	8K	4K	4K

Note that if the host table stores the maximum number of entries for any given type, the entire table is full and is unable to accommodate *any* entries of any other type. For example, an IPv6 unicast address occupies twice as much memory as an IPv4 unicast address, and an IPv6 multicast address occupies four times as much memory as an IPv4 unicast address. For more information about valid combinations of table entries see *Understanding the Unified Forwarding Table*.

To configure the profile that you want, enter and commit the following statement:

[edit]

```
user@switch# set chassis forwarding-options profile-name
```

**NOTE:** When you configure and commit a profile, the PFE process restarts and all the data interfaces on the switch go down and come back up.

The settings for **l2-profile-three** are configured by default. That is, if you do not enter a **set forwarding-options chassis *profile-name*** statement, these settings are configured.

## Configuring the LPM Allocation

In addition to choosing a profile, you can further optimize memory allocation for LPM table entries by configuring how many IPv6 prefixes in the range /65 through /127 you want the switch to store. The switch uses LPM entries during address lookup to match addresses to the most-specific (longest) applicable prefix. The procedures for configuring the LPM table are different depending on which version of Junos OS you are using.

- [Configuring the LPM Table With Junos OS 13.2X51-D10 and 13.2X52-D10 on page 1699](#)
- [Configuring the LPM Table With Junos OS 13.2x51-D15 on page 1700](#)

### Configuring the LPM Table With Junos OS 13.2X51-D10 and 13.2X52-D10

With Junos OS 13.2x51-D10 and 13.2X52-D10, the switch allocates memory for 16 IPv6 prefixes in the range /65 through /127 by default. If you want to use more than 16 IPv6 prefixes in this range, you must enter and commit the following statement:

```
user@switch# set chassis forwarding-options profile-name num-65-127-prefix [1-128]
```

Each increment adds support for 16 IPv6 prefixes between /65 and /127, for a maximum of 2048 such prefixes (16 x 128 = 2048). The system supports 16 of these prefixes by default, so to increase the number of supported prefixes, you must enter a value of 2 or greater. For example, if you enter 2, the system will support 32 IPv6 prefixes in the range /65 through /127.

**NOTE:** When you configure and commit the `num-65-127-prefix` value, all the data interfaces on the switch restart. The management interfaces are unaffected.

The LPM table is shared, and each increment that you add for IPv6 prefixes in the range /65 through /127 reduces the number of table entries that are available for IPv4 prefixes and IPv6 prefixes shorter than /65. Note that IPv6 prefixes /65 and longer consume twice as much memory as shorter IPv6 prefixes and four times as much memory as IPv4 prefixes. So, for example, entering the following statement

```
user@switch# set chassis forwarding-options l2-profile-one num-65-127-prefix 2
```

provides for 16 additional IPv6 prefixes /65 or longer (for a total of 32 such prefixes) and reduces the numbers of other prefixes that can be stored, as indicated:

- 32 fewer IPv6 prefixes shorter than /65 (16 IPv6 prefixes /65 or longer consume the same amount of memory as 32 IPv6 prefixes shorter than /65), or
- 64 fewer IPv4 prefixes (16 IPv6 prefixes /65 or longer consume the same amount of memory as 64 IPv4 prefixes)

[Table 110 on page 1700](#) provides examples of valid combinations that the LPM table can store using the **l2** and **l3** profiles. Once again, each row in the table represents a case in which the table is full and cannot accommodate any more entries.

Table 110: Example LPM Table Combinations Using l2-and l3 Profiles With Junos OS 13.2X51-D10 and 13.2X52-D10

num-65-127-prefix Value	IPv4 Entries	IPv6 Entries (Prefix <= 64)	IPv6 Entries (Prefix >= 65)
1 (default)	16K-16	0K	16
1 (default)	0K	8K-16	16
1 (default)	8K-16	4K	16
64	4K	4K	1K
64	2K	5K	1K
64	0K	6K	1K
128	4K	2K	2K
128	2K	3K	2K
128	0K	4K	2K

**NOTE:** With Junos OS 13.2X51-D10 and 13.2X52-D10, the `lpm-profile` does not support IPv6 prefixes. If you use this version of Junos OS and also use the `lpm-profile`, do not configure the `num-65-127-prefix` statement. That is, leave it at its default value of 1, which allows for as many as 128K IPv4 prefixes (the maximum possible).

#### Configuring the LPM Table With Junos OS 13.2x51-D15

With Junos OS 13.2X51-D15, you can configure the memory allocation for the LPM table for the `lpm-profile` profile independently of the other profiles. In addition, Junos OS 13.2x51-D15 offers twice as much storage for IPv6 prefixes /65 through /127 (4K instead of 2K) for the `l2` and `l3` profiles.

- [Configuring the l2 and l3 profiles With Junos OS 13.2x51-D15 on page 1700](#)
- [Configuring The lpm-profile With Junos OS 13.2x51-D15 on page 1701](#)

#### Configuring the l2 and l3 profiles With Junos OS 13.2x51-D15

With Junos OS 13.2x51-D15, you can configure the switch to support as many as 4K IPv6 prefixes /65 through /127 if you are using any profile other than the `lpm-profile` profile. To do so, enter and commit the following statement:

```
user@switch# set chassis forwarding-options profile-name num-65-127-prefix [0-4]
```

Each increment adds support for 1K IPv6 prefixes between /65 and /127, for a maximum of 4K such prefixes. The default value is 1, which allocates memory for 1K of IPv6 prefixes in this range. Each increment that you add for IPv6 prefixes in the range /65 through /127 reduces the number of table entries that are available for IPv6 prefixes shorter than /65

and IPv4 prefixes. [Table 111 on page 1701](#) shows the numbers of entries that you can allocate by using the **num-65-127-prefix** statement with Junos OS 13.2X51-D15. Once again, each row represents a case in which the table is full and cannot accommodate any more entries.

**Table 111: LPM Table Combinations for l2 and l3 profiles With Junos OS 13.2X51-D15**

num-65-127-prefix Value	IPv4 Entries	IPv6 Entries (Prefix <= 64)	IPv6 Entries (Prefix >= 65)
0	16K	8K	0K
1 (default)	12K	6K	1K
2	8K	4K	2K
3	4K	2K	3K
4	0K	0K	4K

**NOTE:** When you configure the **num-65-127-prefix** value, the PFE process restarts and all the data interfaces on the switch go down and come back up. The management interfaces are unaffected.

#### **Configuring The *lpm-profile* With Junos OS 13.2x51-D15**

If you use the **lpm-profile** profile with Junos OS 13.2x51-D15, you can control whether the switch allocates any memory for IPv6 prefixes /65 through /127. By default, the switch supports the following with this profile:

- 128K IPv4 prefixes
- 16K IPv6 prefixes (all lengths)

You can disable support for IPv6 prefixes /65 through /127 with the **lpm-profile** profile so that there is more memory for IPv6 prefixes shorter than /65. To do so, enter and commit the following statement:

```
user@switch# set chassis forwarding-options profile-name prefix-65-127-disable
```

If you enter this statement, the switch allocates memory for the following:

- 128K IPv4 and IPv6 prefixes shorter than /65
- 0K IPv6 prefixes /65 through /127

For example, if you use the **prefix-65-127-disable** statement, each of the following combinations are valid:

- 100K IPv4 and 28K IPv6 /64 prefixes
- 64K IPv4 and 64K IPv6 /64 prefixes

- 128K IPv4 and 0K IPv6 /64 prefixes
- 0K IPv4 and 128K IPv6 /64 prefixes

**Related Documentation** • [Understanding the Unified Forwarding Table on page 1545](#)

---

## Forwarding Mode Configuration Task

- [Configuring the Forwarding Mode on page 1702](#)

### Configuring the Forwarding Mode

By default, packets are forwarded using store-and-forward mode. You can configure all the interfaces to use cut-through mode instead.

To enable cut-through switching mode, enter the following statement:

```
[edit forwarding-options]
user@switch# set cut-through
```

**Related Documentation** • [cut-through](#)

---

## Proxy ARP Configuration Task

- [Configuring Proxy ARP \(CLI Procedure\) on page 1702](#)

### Configuring Proxy ARP (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches and QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [Configuring Proxy ARP \(CLI Procedure\)](#) or [Configuring Proxy ARP](#). For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 43](#).

You can configure proxy Address Resolution Protocol (ARP) on your switch to enable the switch to respond to ARP queries for network addresses by offering its own media access control (MAC) address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

To configure proxy ARP on a single interface:

```
[edit interfaces]
user@switch# set interface-name unit logical-unit-number proxy-arp (restricted |
unrestricted)
```

**BEST PRACTICE:** We recommend that you configure proxy ARP in restricted mode. In restricted mode, the switch does not act as a proxy if the source and target IP addresses are on the same subnet. If you decide to use unrestricted mode, disable gratuitous ARP requests on the interface to avoid

a situation wherein the switch's response to a gratuitous ARP request appears to the host to be an indication of an IP conflict.

To configure proxy ARP on an integrated routing and bridging (IRB) interface:

```
[edit interfaces]
user@switch# set irb.logical-unit-number proxy-arp restricted
```

#### Related Documentation

- [Verifying That Proxy ARP Is Working Correctly on page 1834](#)
- [Configuring Integrated Routing and Bridging Interfaces \(CLI Procedure\)](#)

## Reflective Relay Configuration Tasks

- [Configuring Reflective Relay on page 1703](#)

### Configuring Reflective Relay

Configure reflective relay when a switch port must return packets on a downstream port. For example, configure reflective relay when a switch port receives aggregated virtual machine packets from a technology such as virtual Ethernet port aggregator (VEPA). When these packets are passed through the switch, reflective relay allows the switch to send those packets back on the same interface that was used for delivery.

**NOTE:** This task uses Junos OS for QFX3500 and QFX3600 switches that supports the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring Reflective Relay*.

Before you begin configuring reflective relay, ensure that you have:

- Configured packet aggregation on the server connected to the port. See your server documentation.
- Configured the port for all VLANs that could be included in aggregated packets..

To configure reflective relay:

1. Configure an Ethernet interface with an interface mode of **trunk**:

```
[edit]
user@switch# set interfaces interface-name unit number family family-type interface-mode trunk
```

For example:

```
[edit]
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching interface-mode trunk
```

2. Configure the interface for reflective relay:

```
[edit]
```

```
user@switch# set interfaces interface-name unit number family family-type reflective-relay
```

For example:

```
[edit]
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching reflective-relay
```

3. Configure the interface for the VLANs that exist on the VM server:

```
[edit]
user@switch# set interfaces interface-name unit number family family-type vlan members
vlan-names
```

For example:

```
[edit]
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching vlan members
[VLAN_Purple VLAN_Orange VLAN_Blue]
```

#### Related Documentation

## STP Configuration Tasks

- [Configuring STP on page 1704](#)
- [Configuring VLAN Spanning-Tree Protocol on page 1705](#)
- [Unblocking an Interface That Receives BPDUs in Error on page 1708](#)

### Configuring STP

The default spanning-tree protocol on the device is Rapid Spanning Tree Protocol (RSTP). RSTP provides faster convergence times than Spanning Tree Protocol (STP) does. However, some legacy networks require the slower convergence times of basic STP.

If your network includes 802.1D 1998 bridges, you can remove RSTP and explicitly configure STP. When you explicitly configure STP, the device uses the IEEE 802.1D 2004 specification, force version 0. This configuration runs a version of RSTP that is compatible with the classic, basic STP.

To configure STP using the CLI:

1. Delete the RSTP configuration on the interface (here, the interface is **xe-0/0/5**):

```
[edit]
user@switch# delete protocols rstp interface xe-0/0/5
```

2. Configure STP on the interface:

```
[edit]
user@switch# set protocols stp interface xe-0/0/5
```

3. Commit the configuration:

```
[edit]
user@switch# commit
```

#### Related Documentation

- [show spanning-tree bridge on page 1870](#)
- [show spanning-tree interface on page 1875](#)

- [Overview of Spanning-Tree Protocols on page 1554](#)

## Configuring VLAN Spanning-Tree Protocol

You can configure the VLAN Spanning-Tree Protocol (VSTP) under the following hierarchy levels:

**NOTE:** This task supports the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring VLAN Spanning Tree Protocol*.

- [edit *logical-systems logical-system-name protocols*]
- [edit *logical-systems logical-system-name routing-instances routing-instance-name protocols*]
- [edit *protocols*]
- [edit *routing-instances routing-instance-name protocols*]

The routing instance type can be either **virtual-switch** or **layer2-control**.

To configure the VLAN Spanning-Tree Protocol:

1. Enable VSTP as the version of spanning-tree protocol to be configured:

```
[edit]
```

```
user@host@ edit ... protocols (STP Type) vstp
```

2. (Optional) For compatibility with older bridges that do not support VSTP, you can run force VSTP to run as the original IEEE 802.1D Spanning-Tree Protocol (STP) version:

```
[edit ... protocols vstp]
```

```
user@host# set force-version stp
```

**NOTE:** If VSTP has been forced to run as the original STP version, you can revert back to VSTP by first removing the force-version statement from the configuration and then entering the *clear spanning-tree protocol-migration* configuration mode command.

3. Configure the interfaces that participate in the VSTP instance.

- a. Enable configuration of the interface:

```
[edit ... protocols vstp]
user@host# edit interface interface-name
```

- b. Configure the interface priority:

```
[edit ... protocols vstp interface interface-name]
user@host# set priority interface-priority
```

- c. (Optional) By default, the interface link cost is determined by the link speed. You can configure the interface link cost to control which bridge is the designated bridge and which port is the designated port:

```
[edit ... protocols vstp interface interface-name]
user@host# set cost interface-link-cost
```

- d. Configure the interface link mode to identify point-to-point links:

```
[edit ... protocols vstp interface interface-name]
user@host# set mode (p2p | shared)
```

Specify **p2p** if the link is point to point. Specify **shared** if the link is a shared media.

- e. (Optional) Configure the interface as an edge port:

```
[edit ... protocols vstp interface interface-name]
user@host# set edge
```

Edge ports do not expect to receive bridge protocol data unit (BPDU) packets. If a BPDU packet is received for an edge port, the port becomes a nonedge port.

You can also enable BPDU root protection for all spanning-tree protocol instances on the interface. BPDU root protect ensures the port is the spanning-tree designated port. If the port receives superior BPDU packets, root protect moves this port to a root-prevented spanning-tree state. For configuration details, see *Checking the Status of Spanning-Tree Instance Interfaces*.

4. Enable configuration of a VLAN instance:

```
[edit ... protocols vstp]
user@host# edit vlan vlan-id
```

5. Configure the bridge priority

```
[edit ... protocols vstp vlan vlan-id]
user@host# set bridge-priority bridge-priority
```

For more information, see *Bridge Priority for Election of Root Bridge and Designated Bridge*.

## 6. Configure hello BPDU timers.

- a. Configure the maximum expected arrival time of hello BPDUs:

```
[edit ... protocols vstp vlan vlan-id]
user@host# set max-age seconds
```

- b. Configure the time interval at which the root bridge transmits configuration BPDUs:

```
[edit ... protocols vstp vlan vlan-id]
user@host# set hello-time seconds
```

7. (Optional) By default, the bridge port remains in the listening and learning states for 15 seconds before transitioning to the forwarding state. You can specify a delay from 4 through 20 seconds instead:

```
[edit ... protocols vstp vlan vlan-id]
user@host# set forward-delay seconds
```

8. Configure the interfaces that participate in the VSTP instance.

- a. Enable configuration of the interface:

```
[edit ... protocols vstp vlan vlan-id]
user@host# edit interface interface-name
```

- b. Configure the interface priority:

```
[edit ... protocols vstp vlan vlan-id interface interface-name]
user@host# set priority interface-priority
```

- c. (Optional) By default, the interface link cost is determined by the link speed. You can configure the interface link cost to control which bridge is the designated bridge and which port is the designated port:

```
[edit ... protocols vstp vlan vlan-id interface interface-name]
user@host# set cost interface-link-cost
```

- d. Configure the interface link mode to identify point-to-point links:

```
[edit ... protocols vstp vlan vlan-id interface interface-name]
user@host# set mode (p2p | shared)
```

Specify **p2p** if the link is point to point. Specify **shared** if the link is a shared media.

- e. (Optional) Configure the interface as an edge port:

```
[edit ... protocols vstp vlan vlan-id interface interface-name]
user@host# set edge
```

Edge ports do not expect to receive bridge protocol data unit (BPDU) packets. If a BPDU packet is received for an edge port, the port becomes a nonedge port

You can also enable BPDU root protection for all spanning-tree protocol instances on the interface. BPDU root protect ensures the port is the spanning-tree designated port. If the port receives superior BPDU packets, root protect moves this port to a root-prevented spanning-tree state. For configuration details, see *Checking the Status of Spanning-Tree Instance Interfaces*.

9. Verify the VSTP configuration:

```
[edit]
... { # Optional logical system and/or routing instance
  protocols (STP Type) {
    vstp {
```

```

force-version stp; # Optional.
interface interface-name {
    priority interface-priority;
    cost interface-link-cost; # Optional.
    mode (p2p | shared);
    edge; # Optional.
}
vlan vlan-id {
    bridge-priority bridge-priority;
    max-age seconds;
    hello-time seconds;
    forward-delay seconds; # Optional.
    interface interface-name {
        priority interface-priority;
        cost interface-link-cost; # Optional.
        mode (p2p | shared);
        edge; # Optional.
    }
}
}
}
}

```

## Unblocking an Interface That Receives BPDUs in Error

**NOTE:** BPDU block protection is disabled on Node devices.

Devices use bridge protocol data unit (BPDU) protection on interfaces to prevent them from receiving BPDUs that could trigger a spanning-tree misconfiguration. If BPDUs are received on a BPDU-protected interface, the interface transitions to a blocking state and stops forwarding frames.

After you fix the misconfiguration that triggered the sending of BPDUs to an interface, you can unblock the interface and return it to service.

**NOTE:** This task describes how to use both the original CLI and the Enhanced Layer 2 Software (ELS) CLI. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 43](#).

To unblock an interface after fixing the misconfiguration that triggered the BPDUs and return it to service:

- (Original CLI) Automatically unblock an interface by configuring a timer that expires (here, the interface is **xe-0/0/6**):

```
[edit ethernet-switching-options]
user@switch# set bpd-blockdisable-timeout 30 interface xe-0/0/6
```

- (ELS CLI) Automatically unblock an interface by configuring a timer that expires (here, the interface is **xe-0/0/6**):

```
[edit protocols layer2-control]
user@switch# set bpd-blockdisable-timeout 30 interface xe-0/0/6
```

- Manually unblock an interface using the operational mode command:

```
user@switch> clear ethernet-switching bpd-error interface xe-0/0/6
```

```

Hierarchy Level [edit]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure protocols.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation** • [Junos OS Routing Protocols Configuration Guide](#)

## Unified Forwarding Table Configuration Statements

- [forwarding-options \(chassis\) on page 1724](#)
- [num-65-127-prefix on page 1725](#)
- [prefix-65-127-disable on page 1725](#)

## forwarding-options (chassis)

**Syntax** forwarding options *profile-name* {  
     num-65-127-prefix *value*  
     lpm-profile *prefix-65-127-disable*  
 }

**Hierarchy Level** [edit *chassis*]

**Release Information** Statement introduced in Junos 13.2 for the QFX Series.

**Description** Configure a unified forwarding table profile to allocate the amount a memory available for the following:

- MAC addresses
- Layer 3 host entries
- Longest prefix match table entries

**Options** *profile-name*—name of the profile to use for memory allocation in the unified forwarding table. [Table 112 on page 1724](#) lists the profiles you can choose and the associated values for each type of entry.

**Table 112: Unified Forwarding Table Profiles**

Profile Name	MAC Table	Host Table (unicast and multicast addresses)					
	MAC Addresses	IPv4 unicast	IPv6 unicast	IPv4 (*, G)	IPv4 (S, G)	IPv6 (*, G)	IPv6 (S, G)
l2-profile-one	288K	16K	8K	8K	8K	4K	4K
l2-profile-two	224K	80K	40K	40K	40K	20K	20K
l2-profile-three (default)	160K	144K	72K	72K	72K	36K	36K
l3-profile	96K	208K	104K	104K	104K	52K	52K
lpm-profile*	32K	16K	8K	8K	8K	4K	4K

\* This profile supports only IPv4 in Junos OS 13.2X51-D10. With Junos OS 13.2X51-D15 it supports IPv4 and IPv6.

Note that if the host stores the maximum number of entries for any given type, the entire table is full and is unable to accommodate *any* entries of any other type. For information about valid combinations of table entries see [“Understanding the Unified Forwarding Table” on page 1545](#).

You configure the memory allocation for LPM table entries differently depending on whether you use Junos OS 13.2X51-D10 or Junos OS 13.2X51-D15 and later. To learn

how to configure memory allocation for LPM table entries see [“Configuring the Unified Forwarding Table” on page 1697](#).

## num-65-127-prefix

---

**Syntax** num-65-127-prefix *value*

**Hierarchy Level** [edit [chassis forwarding-options](#) *profile-name*]

**Release Information** Statement introduced in Junos 13.2 for the QFX Series.

**Description** Configure the number of supported IPv6 prefixes in the range /65 through /127.

- Options**
- value**—With Junos OS 13.2X51D10: Value in the range 1 through 128. Each increment adds support for 16 IPv6 addresses with prefixes between /65 and /127, for a maximum of 2048 such addresses (16 x 128 = 2048).
- value**—With Junos OS 13.2X51D15: Value in the range 0 through 4. Each increment adds support for 1K IPv6 addresses with prefixes between /65 and /127, for a maximum of 4K such addresses.

**Required Privilege  
Level**

- Related  
Documentation**

## prefix-65-127-disable

---

**Syntax** prefix-65-127-disable

**Hierarchy Level** [edit [chassis forwarding-options](#) lpm-profile]

**Release Information** Statement introduced in Junos 13.2X51-D15 for the QFX Series.

**Description** Disable support in the longest prefix match (LPM) table for IPv6 prefixes in the range /65 through /127.

**Required Privilege  
Level**

## Reflective Relay Configuration Statements

---

- [reflective-relay](#) on page 1726

### reflective-relay

---

<b>Syntax</b>	reflective-relay;
<b>Hierarchy Level</b>	[edit <a href="#">interfaces</a> <i>interface-name</i> <a href="#">unit</a> <i>logical-unit-number</i> family ethernet-switching]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure a switch interface to return packets back to a device on the same interface that was used to deliver the packets.
<b>Default</b>	Switch interfaces are not configured for reflective relay.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Configuring Reflective Relay for Use with VEPA Technology</i></li><li>• <i>Configuring Reflective Relay</i></li></ul>

## alarm (STP)

<b>Syntax</b>	<code>alarm;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp interface</a> (all   <i>interface-name</i> ) <a href="#">bpdu-timeout-action</a> ], [edit protocols <a href="#">rstp interface</a> (all   <i>interface-name</i> ) <a href="#">bpdu-timeout-action</a> ], [edit protocols <a href="#">stp interface</a> (all   <i>interface-name</i> ) <a href="#">bpdu-timeout-action</a> ], [edit protocols <a href="#">vstp vlan <i>vlan-id</i> interface</a> (all   <i>interface-name</i> ) <a href="#">bpdu-timeout-action</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For interfaces configured for loop protection, configure the software to generate a message to be sent to the system log file to record the loop-protection event.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP</a> on page 1624</li> <li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP</a> on page 1610</li> <li>• <a href="#">Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree</a> on page 1660</li> <li>• <a href="#">Understanding Loop Protection for STP, RSTP, VSTP, and MSTP</a> on page 1559</li> <li>• <a href="#">Understanding VSTP</a> on page 1557</li> <li>• <a href="#">show spanning-tree bridge</a> on page 1870</li> <li>• <a href="#">show spanning-tree interface</a></li> </ul>

## block

---

<b>Syntax</b>	block;
<b>Hierarchy Level</b>	[edit protocols mstp (Spanning Trees) <a href="#">interface</a> (all   <i>interface-name</i> ) <a href="#">bpdu-timeout-action</a> ], [edit protocols <a href="#">rstp interface</a> (all   <i>interface-name</i> ) <a href="#">bpdu-timeout-action</a> ], [edit protocols <a href="#">stp interface</a> (all   <i>interface-name</i> ) <a href="#">bpdu-timeout-action</a> ], [edit protocols <a href="#">vstp vlan</a> <i>vlan-id</i> <a href="#">interface</a> (all   <i>interface-name</i> ) <a href="#">bpdu-timeout-action</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure loop protection on a specific interface.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li><li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1610</a></li><li>• <a href="#">Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree on page 1660</a></li><li>• <a href="#">Understanding Loop Protection for STP, RSTP, VSTP, and MSTP on page 1559</a></li><li>• <a href="#">Understanding VSTP on page 1557</a></li><li>• <a href="#">show spanning-tree bridge on page 1870</a></li><li>• <a href="#">show spanning-tree interface</a></li></ul>

## bpdu-block

<b>Syntax</b>	<pre>bpdu-block {   interface (all   [<i>interface-name</i>]);   disable-timeout <i>timeout</i>; }</pre>
<b>Hierarchy Level</b>	<ul style="list-style-type: none"> <li>For platforms with ELS CLI: [edit protocols layer2-control]</li> <li>For platforms with Original CLI: [edit ethernet-switching-options]</li> </ul>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure BPDU protection on an interface. If the interface receives BPDUs, it is disabled.
<div>  <b>NOTE:</b> BPDU block protection is disabled on Node devices. </div> <p>The statements are explained separately.</p>	
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li> <li><a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1610</a></li> <li><a href="#">Unblocking an Interface That Receives BPDUs in Error on page 1708</a></li> <li><a href="#">clear ethernet-switching bpdu-error on page 1837</a></li> <li><a href="#">show spanning-tree bridge on page 1870</a></li> <li><a href="#">show spanning-tree interface</a></li> </ul>

## bpdu-block-on-edge

---

<b>Syntax</b>	bpdu-block-on-edge;
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp</a> ], [edit protocols <a href="#">rstp</a> ], [edit protocols <a href="#">vstp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure bridge protocol data unit (BPDU) protection on all edge ports of a switch.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding VSTP on page 1557</a></li><li>• <a href="#">Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations on page 1656</a></li><li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1610</a></li><li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li><li>• <a href="#">clear ethernet-switching bpdu-error on page 1837</a></li><li>• <a href="#">show spanning-tree bridge on page 1870</a></li><li>• <a href="#">show spanning-tree interface</a></li></ul>

## bpdu-timeout-action

<b>Syntax</b>	bpdu-timeout-action { alarm; block; }
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">rstp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">stp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">vstp vlan <i>vlan-id</i> interface</a> (all   <i>interface-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the BPDU timeout action on a specific interface. You must configure at least one action ( <b>alarm</b> , <b>block</b> , or both).
	The remaining statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1610</a></li> <li>• <a href="#">Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree on page 1660</a></li> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li> <li>• <a href="#">Understanding Loop Protection for STP, RSTP, VSTP, and MSTP on page 1559</a></li> <li>• <a href="#">Understanding VSTP on page 1557</a></li> <li>• <a href="#">show spanning-tree bridge on page 1870</a></li> <li>• <a href="#">show spanning-tree interface</a></li> </ul>

## bridge-priority

---

<b>Syntax</b>	<code>bridge-priority <i>priority</i>;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp</a> ], [edit protocols <a href="#">mstp</a> <i>msti-id</i> ], [edit protocols <a href="#">rstp</a> ], [edit protocols <a href="#">stp</a> ], [edit protocols <a href="#">vstp</a> <i>vlan</i> <i>vlan-id</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the bridge priority. The bridge priority determines which bridge is elected as the root bridge. If two bridges have the same path cost to the root bridge, the bridge priority determines which bridge becomes the designated bridge for a LAN segment.
<b>Options</b>	<b><i>priority</i></b> —Bridge priority. It can be set only in increments of 4096. <b>Range:</b> 0 through 61,440 <b>Default:</b> 32,768
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li><li>• <a href="#">Understanding MSTP on page 1555</a></li><li>• <a href="#">Understanding VSTP on page 1557</a></li><li>• <a href="#">show spanning-tree bridge on page 1870</a></li><li>• <a href="#">show spanning-tree interface</a></li></ul>

---

## configuration-name (MSTP)

---

<b>Syntax</b>	configuration-name <i>configuration-name</i> ;
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the configuration name. The configuration name is the MSTP region name carried in the MSTP BPDUs.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1610</a></li><li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li><li>• <a href="#">Understanding MSTP on page 1555</a></li><li>• <a href="#">show spanning-tree bridge on page 1870</a></li><li>• <i>show spanning-tree interface</i></li></ul>

## cost (STP)

---

<b>Syntax</b>	<code>cost cost;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">mstp msti msti-id interface interface-name</a> ], [edit protocols rstp (Spanning Trees) <a href="#">interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">stp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">vstp vlan vlan-id interface</a> (all   <i>interface-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure the link cost to control which bridge is the designated bridge and which interface is the designated interface.
<b>Default</b>	Link cost is determined by the link speed.
<b>Options</b>	<b>cost</b> —Link cost associated with the port. <b>Range:</b> 1 through 200,000,000
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding MSTP on page 1555</a></li><li>• <a href="#">Overview of Spanning-Tree Protocols on page 1554</a></li><li>• <a href="#">Understanding VSTP on page 1557</a></li><li>• <a href="#">show spanning-tree bridge on page 1870</a></li><li>• <a href="#">show spanning-tree interface</a></li></ul>

## disable (STP)

<b>Syntax</b>	disable;
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp</a> ], [edit protocols <a href="#">mstp</a> <a href="#">interface</a> <i>interface-name</i> ], [edit protocols <a href="#">mstp</a> <a href="#">msti</a> <i>msti-id</i> <a href="#">vlan</a> ( <i>vlan-id</i>   <i>vlan-name</i> ) <a href="#">interface</a> <i>interface-name</i> ], [edit protocols <a href="#">rstp</a> ], [edit protocols <a href="#">rstp</a> <a href="#">interface</a> <i>interface-name</i> ], [edit protocols <a href="#">stp</a> ], [edit protocols <a href="#">stp</a> <a href="#">interface</a> <i>interface-name</i> ], [edit protocols <a href="#">vstp</a> ], [edit protocols <a href="#">vstp</a> <a href="#">vlan</a> <i>vlan-id</i> <a href="#">interface</a> (all   <i>interface-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Disable STP, MSTP, RSTP, or VSTP on the switch or on a specific interface.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li> <li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1610</a></li> <li>• <a href="#">Understanding MSTP on page 1555</a></li> <li>• <a href="#">Overview of Spanning-Tree Protocols on page 1554</a></li> <li>• <a href="#">Understanding VSTP on page 1557</a></li> <li>• <a href="#">show spanning-tree bridge on page 1870</a></li> <li>• <a href="#">show spanning-tree interface</a></li> </ul>

## disable-timeout (BPDU)

---

<b>Syntax</b>	<code>disable-timeout <i>timeout</i>;</code>
<b>Hierarchy Level</b>	[edit ethernet-switching-options <a href="#">bpdu-block</a> ] [edit protocols layer2-control <a href="#">bpdu-block</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For interfaces configured for BPDU protection, specify the amount of time an interface receiving BPDUs is disabled.
<b>Default</b>	The disable timeout is not enabled.
<b>Options</b>	<b>timeout:</b> Length of time, in seconds, that the interface receiving BPDUs is disabled. Once the timeout expires, the interface is brought back into service. <b>Range:</b> 10 through 3600 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li><li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1610</a></li><li>• <a href="#">Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations on page 1656</a></li><li>• <a href="#">Understanding BPDU Protection for STP, RSTP, and MSTP on page 1558</a></li><li>• <a href="#">show spanning-tree bridge on page 1870</a></li><li>• <a href="#">show spanning-tree interface on page 1875</a></li></ul>

## edge (STP)

<b>Syntax</b>	edge;
<b>Hierarchy Level</b>	[edit protocols <b>mstp interface</b> (all   <i>interface-name</i> )], [edit protocols <b>mstp msti</b> <i>msti-id interface interface-name</i> ], [edit protocols <b>rstp interface</b> (all   <i>interface-name</i> )], [edit protocols <b>stp interface</b> (all   <i>interface-name</i> )], [edit protocols <b>vstp vlan</b> <i>vlan-id interface</i> (all   <i>interface-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure interfaces as edge interfaces. Edge interfaces immediately transition to a forwarding state.
<b>Default</b>	Edge interfaces are not enabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li> <li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1610</a></li> <li>• <a href="#">Understanding MSTP on page 1555</a></li> <li>• <a href="#">Overview of Spanning-Tree Protocols on page 1554</a></li> <li>• <a href="#">Understanding VSTP on page 1557</a></li> <li>• <a href="#">show spanning-tree bridge on page 1870</a></li> <li>• <a href="#">show spanning-tree interface</a></li> </ul>

## forward-delay

---

<b>Syntax</b>	<code>forward-delay <i>seconds</i>;</code>
<b>Hierarchy Level</b>	<code>[edit protocols <i>mstp</i>],</code> <code>[edit protocols <i>rstp</i>],</code> <code>[edit protocols <i>stp</i>],</code> <code>[edit protocols <i>vstp</i> <i>vlan</i> <i>vlan-id</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), specify how long a bridge interface remains in the listening and learning states before transitioning to the forwarding state.
<b>Options</b>	<b><i>seconds</i></b> —Number of seconds the bridge interface remains in the listening and learning states. <b>Range:</b> 4 through 30 seconds <b>Default:</b> 15 seconds
<b>Required Privilege Level</b>	<b>routing</b> —To view this statement in the configuration. <b>routing-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li><li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1610</a></li><li>• <a href="#">Understanding MSTP on page 1555</a></li><li>• <a href="#">Overview of Spanning-Tree Protocols on page 1554</a></li><li>• <a href="#">Understanding VSTP on page 1557</a></li><li>• <a href="#">show spanning-tree bridge on page 1870</a></li><li>• <a href="#">show spanning-tree interface</a></li></ul>

---

## force-version

---

<b>Syntax</b>	force-version stp;
<b>Hierarchy Level</b>	[edit protocols <a href="#">vstp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Force VLAN Spanning Tree Protocol (VSTP) to use the STP protocol instead of the default protocol, RSTP.
<b>Options</b>	<b>stp</b> —Spanning Tree Protocol
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show spanning-tree bridge on page 1870</a></li><li>• <i>show spanning-tree interface</i></li><li>• <a href="#">Understanding VSTP on page 1557</a></li></ul>

## hello-time

---

<b>Syntax</b>	<code>hello-time seconds;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp</a> ], [edit protocols <a href="#">rstp</a> ], [edit protocols <a href="#">rstp</a> ], [edit protocols <a href="#">vstp</a> <a href="#">vlan</a> <i>vlan-id</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), specify the time interval at which the root bridge transmits configuration BPDUs.
<b>Options</b>	<b>seconds</b> —Number of seconds between transmissions of configuration BPDUs. <b>Range:</b> 1 through 10 seconds <b>Default:</b> 2 seconds
<b>Required Privilege Level</b>	<b>routing</b> —To view this statement in the configuration. <b>routing-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li><li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1610</a></li><li>• <a href="#">Understanding MSTP on page 1555</a></li><li>• <a href="#">Overview of Spanning-Tree Protocols on page 1554</a></li><li>• <a href="#">Understanding VSTP on page 1557</a></li><li>• <a href="#">show spanning-tree bridge on page 1870</a></li><li>• <a href="#">show spanning-tree interface</a></li></ul>

## interface (Spanning Trees)

<b>Syntax</b>	<pre> interface <i>interface-name</i> {   arp-on-stp;   bpdu-timeout-action     block;     log;   cost <i>cost</i>;   disable;   edge;   mode <i>mode</i>;   no-root-port;   priority <i>priority</i>; }</pre>
<b>Hierarchy Level</b>	<pre> [edit protocols mstp], [edit protocols mstp msti <i>msti-id</i>], [edit protocols rstp], [edit protocols stp], [edit protocols vstp vlan (all   <i>vlan-id</i>   <i>vlan-name</i>)]</pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement updated in Junos OS Release 9.4 for EX Series switches to add VSTP support.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure an interface.</p> <p>The <b>edge</b>, <b>mode</b>, and <b>no-root-port</b> options are not available at the <code>[edit protocols mstp msti <i>msti-id</i>]</code> hierarchy level.</p>
<b>Options</b>	<p><b><i>interface-name</i></b>—Name of an interface.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show spanning-tree bridge</a></li> <li>• <a href="#">show spanning-tree interface</a></li> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on EX Series Switches</a></li> <li>• <a href="#">Example: Faster Convergence and Improved Network Stability with RSTP on EX Series Switches</a></li> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li> <li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1610</a></li> <li>• <a href="#">Configuring VSTP (CLI Procedure)</a></li> </ul>

## interface (BPDU)

---

<b>Syntax</b>	<code>interface (all   <i>interface-name</i>);</code>
<b>Hierarchy Level</b>	[edit ethernet-switching-options <a href="#">bpdu-block</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Apply BPDU protection to all interfaces or one or more interfaces.
<b>Options</b>	<b>all</b> —All interfaces.  <b><i>interface-name</i></b> —Name of the interface.
<b>Required Privilege Level</b>	<b>routing</b> —To view this statement in the configuration. <b>routing-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li><li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1610</a></li><li>• <a href="#">Understanding BPDU Protection for STP, RSTP, and MSTP on page 1558</a></li><li>• <a href="#">show spanning-tree bridge on page 1870</a></li><li>• <a href="#">show spanning-tree interface on page 1875</a></li></ul>

## interface (STP)

<b>Syntax</b>	<pre>interface <i>interface-name</i> {     disable;     cost <i>cost</i>;     edge;     mode <i>mode</i>;     no-root-port;     priority <i>priority</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit protocols <a href="#">mstp</a>], [edit protocols <a href="#">mstp msti</a>], [edit protocols <a href="#">rstp</a>], [edit protocols <a href="#">stp</a>], [edit protocols <a href="#">vstp vlan</a> <i>vlan-id</i>]</pre>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure an interface.
<b>Options</b>	<p><i>interface-name</i>—Name of a Gigabit Ethernet interface.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li> <li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1610</a></li> <li>• <a href="#">Understanding RSTP on page 1556</a></li> <li>• <a href="#">Understanding MSTP on page 1555</a></li> <li>• <a href="#">Overview of Spanning-Tree Protocols on page 1554</a></li> <li>• <a href="#">Understanding VSTP on page 1557</a></li> <li>• <a href="#">show spanning-tree bridge on page 1870</a></li> <li>• <a href="#">show spanning-tree interface</a></li> </ul>

## max-age

---

<b>Syntax</b>	<code>max-age seconds;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp</a> ], [edit protocols <a href="#">rstp</a> ], [edit protocols <a href="#">stp</a> ], [edit protocols <a href="#">vstp</a> <a href="#">vlan</a> <i>vlan-id</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), specify the maximum age of received protocol BPDUs.
<b>Options</b>	<b>seconds</b> —Maximum age of received protocol BPDUs. <b>Range:</b> 6 through 40 seconds <b>Default:</b> 20 seconds
<b>Required Privilege Level</b>	<b>routing</b> —To view this statement in the configuration. <b>routing-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li><li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1610</a></li><li>• <a href="#">Understanding MSTP on page 1555</a></li><li>• <a href="#">Overview of Spanning-Tree Protocols on page 1554</a></li><li>• <a href="#">Understanding VSTP on page 1557</a></li><li>• <a href="#">show spanning-tree bridge on page 1870</a></li><li>• <a href="#">show spanning-tree interface on page 1875</a></li></ul>

---

## max-hops

---

<b>Syntax</b>	<code>max-hops hops;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Multiple Spanning Tree Protocol (MSTP), configure the maximum number of hops that a BPDU can be forwarded in the MSTP region.
<b>Options</b>	<p><i>hops</i> — Number of hops the BPDU can be forwarded.</p> <p><b>Range:</b> 1 through 255 hops</p> <p><b>Default:</b> 20 hops</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li><li>• <a href="#">Understanding MSTP on page 1555</a></li><li>• <a href="#">show spanning-tree bridge on page 1870</a></li><li>• <a href="#">show spanning-tree interface on page 1875</a></li></ul>

## mode (STP)

---

<b>Syntax</b>	<code>mode mode;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">mstp msti msti-id interface interface-name</a> ], [edit protocols <a href="#">rstp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">stp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">vstp vlan vlan-id interface</a> (all   <i>interface-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure the link mode to identify point-to-point links.
<b>Default</b>	For a full-duplex link, the default link mode is <b>point-to-point</b> . For a half-duplex link, the default link mode is <b>shared</b> .
<b>Options</b>	<i>mode</i> —Link mode: <ul style="list-style-type: none"><li>• <b>point-to-point</b>—Link is point to point.</li><li>• <b>shared</b>—Link is shared media.</li></ul>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li><li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1610</a></li><li>• <a href="#">Understanding MSTP on page 1555</a></li><li>• <a href="#">Overview of Spanning-Tree Protocols on page 1554</a></li><li>• <a href="#">Understanding VSTP on page 1557</a></li><li>• <a href="#">show spanning-tree bridge on page 1870</a></li><li>• <a href="#">show spanning-tree interface on page 1875</a></li></ul>

## msti

<b>Syntax</b>	<pre> msti <i>msti-id</i> {   vlan (<i>vlan-id</i>   <i>vlan-name</i>);   interface <i>interface-name</i> {     disable;     cost <i>cost</i>;     edge;     mode <i>mode</i>;     priority <i>priority</i>;   } } </pre>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the Multiple Spanning Tree Instance (MSTI) identifier for Multiple Spanning Tree Protocol (MSTP). MSTI IDs are local to each region, so you can reuse the same MSTI ID in different regions.
<b>Default</b>	MSTI is disabled.
<b>Options</b>	<p><i>msti-id</i> —MSTI identifier.</p> <p><b>Range:</b> 1 through 4094. The Common Instance Spanning Tree (CIST) is always MSTI 0.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show spanning-tree bridge on page 1870</a></li> <li>• <a href="#">show spanning-tree interface on page 1875</a></li> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li> <li>• <a href="#">Understanding MSTP on page 1555</a></li> </ul>

## mstp

---

**Syntax**    mstp {  
              disable;  
              bpdu-timeout-action;  
              bridge-priority *priority*;  
              configuration-name (MSTP) *name*;  
              forward-delay *seconds*;  
              hello-time *seconds*;  
              interface (all | *interface-name*) {  
                  bpdu-timeout-action {  
                      block;  
                      alarm;  
                  }  
                  disable;  
                  cost *cost*;  
                  edge;  
                  mode *mode*;  
                  no-root-port;  
                  priority *priority*;  
              }  
              max-age *seconds*;  
              max-hops *hops*;  
              msti *msti-id* {  
                  vlan (*vlan-id* | *vlan-name*);  
                  interface *interface-name* {  
                      disable;  
                      cost *cost*;  
                      edge;  
                      mode *mode*;  
                      priority *priority*;  
                  }  
              }  
              traceoptions {  
                  file *name* <replace> <size *size*> <files *number*> <no-stamp>  
                      <(world-readable | no-world-readable)>;  
                  flag *flag* <*flag-modifier*> <disable>;  
              }  
              revision-level *revision-level*;  
          }

**Hierarchy Level**    [edit protocols]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure Multiple Spanning Tree Protocol (MSTP). MSTP is defined in the IEEE 802.1Q-2003 specification and is used to create a loop-free topology in networks with multiple spanning-tree regions.

The statements are explained separately.

**Default**    MSTP is disabled.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li> <li>• <a href="#">Understanding MSTP on page 1555</a></li> <li>• <a href="#">show spanning-tree bridge on page 1870</a></li> <li>• <a href="#">show spanning-tree interface on page 1875</a></li> </ul>

## no-root-port

<b>Syntax</b>	no-root-port;
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">rstp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">stp interface</a> (all   <i>interface-name</i> )], [edit protocols <a href="#">vstp vlan <i>vlan-id</i> interface</a> (all   <i>interface-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure an interface to be a spanning tree designated port. If the bridge receives more STP bridge protocol data units (BPDUs) on a root-protected interface, that interface transitions to a root-prevented STP state (inconsistency state) and the interface is blocked. This blocking prevents a bridge that should not be the root bridge from being elected the root bridge. When the bridge stops receiving more STP BPDUs on the root-protected interface, interface traffic is no longer blocked.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees on page 1664</a></li> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li> <li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1610</a></li> <li>• <a href="#">Understanding VSTP on page 1557</a></li> <li>• <a href="#">show spanning-tree bridge on page 1870</a></li> <li>• <a href="#">show spanning-tree interface on page 1875</a></li> </ul>

## priority (STP)

---

<b>Syntax</b>	<code>priority <i>priority</i>;</code>
<b>Hierarchy Level</b>	[edit protocols <b>mstp</b> <b>interface</b> (all   <i>interface-name</i> )], [edit protocols <b>mstp</b> <b>msti</b> <i>msti-id</i> <b>interface</b> <i>interface-name</i> ], [edit protocols <b>rstp</b> <b>interface</b> (all   <i>interface-name</i> )], [edit protocols <b>stp</b> <b>interface</b> (all   <i>interface-name</i> )], [edit protocols <b>vstp</b> <b>vlan</b> <i>vlan-id</i> <b>interface</b> (all   <i>interface-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), specify the interface priority to control which interface is elected as the root port.
<b>Options</b>	<b>priority</b> —Interface priority. The interface priority must be set in increments of 16. <b>Range:</b> 0 through 240 <b>Default:</b> 128
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li><li>• <a href="#">Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1610</a></li><li>• <a href="#">Understanding MSTP on page 1555</a></li><li>• <a href="#">Overview of Spanning-Tree Protocols on page 1554</a></li><li>• <a href="#">Understanding VSTP on page 1557</a></li><li>• <a href="#">show spanning-tree bridge on page 1870</a></li><li>• <a href="#">show spanning-tree interface on page 1875</a></li></ul>

## revision-level

---

<b>Syntax</b>	<code>revision-level <i>revision-level</i>;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mstp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For Multiple Spanning Tree Protocol (MSTP), set the revision number of the MSTP configuration.
<b>Default</b>	The revision number is disabled.
<b>Options</b>	<i>revision-level</i> —Revision number of the MSTP region configuration. <b>Range:</b> 0 through 65535
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Network Regions for VLANs with MSTP on page 1624</a></li> <li>• <a href="#">Understanding MSTP on page 1555</a></li> <li>• <a href="#">show spanning-tree bridge on page 1870</a></li> <li>• <a href="#">show spanning-tree interface on page 1875</a></li> </ul>

## rstp

---

**Syntax**    `rstp {  
    disable;  
    bpdu-block-on-edge;  
    bridge-priority priority;  
    forward-delay seconds;  
    hello-time seconds;  
    interface (all | interface-name) {  
        bpdu-timeout-action {  
            block;  
            alarm;  
        }  
        disable;  
        cost cost;  
        edge;  
        mode mode;  
        no-root-port;  
        priority priority;  
    }  
    max-age seconds;  
    traceoptions {  
        file name <replace> <size size> <files number> <no-stamp>  
        <(world-readable | no-world-readable)>;  
        flag flag <flag-modifier> <disable>;  
    }  
}`

**Hierarchy Level**    [edit protocols]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure Rapid Spanning Tree Protocol (RSTP). RSTP is defined in the IEEE 802.1D-2004 specification and is used to prevent loops in Layer 2 networks, providing shorter convergence times than those provided with basic STP.

The statements are explained separately.

**Default**    RSTP is enabled on all Ethernet switching interfaces.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

**Related Documentation**

## stp

<b>Syntax</b>	<pre> stp {   disable;   bridge-priority <i>priority</i>;   forward-delay <i>seconds</i>;   hello-time <i>seconds</i>;   interface (all   <i>interface-name</i>) {     disable;     bpdu-timeout-action {       block;       alarm;     }     cost <i>cost</i>;     edge;     mode <i>mode</i>;     no-root-port;     priority <i>priority</i>;   }   max-age <i>seconds</i>;   traceoptions {     file <i>name</i> &lt;replace&gt; &lt;size <i>size</i>&gt; &lt;files <i>number</i>&gt; &lt;no-stamp&gt;       &lt;(world-readable   no-world-readable)&gt;;     flag <i>flag</i> &lt;<i>flag-modifier</i>&gt; &lt;disable&gt;;   } } </pre>
<b>Hierarchy Level</b>	[edit protocols]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>When you explicitly configure STP, a switch uses the IEEE 802.1D 2004 specification, force version 0. This configuration runs a version of RSTP that is compatible with the classic, basic STP (defined in the IEEE 802.1D 1998 specification).</p> <p>The remaining statements are explained separately.</p>
<b>Default</b>	STP is disabled; by default, RSTP is enabled on all Ethernet switching ports.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations on page 1656</a></li> <li>• <a href="#">Configuring STP on page 1704</a></li> <li>• <a href="#">Overview of Spanning-Tree Protocols on page 1554</a></li> <li>• <a href="#">show spanning-tree bridge on page 1870</a></li> <li>• <a href="#">show spanning-tree interface on page 1875</a></li> </ul>

## traceoptions (STP)

---

Syntax	<pre>traceoptions {     file <i>name</i> &lt;replace&gt; &lt;size <i>size</i>&gt; &lt;files <i>number</i>&gt; &lt;no-stamp&gt;     &lt;(world-readable   no-world-readable)&gt;;     flag <i>flag</i> &lt;flag-modifier&gt; &lt;disable&gt;; }</pre>
Hierarchy Level	<pre>[edit protocols <i>mstp</i>], [edit protocols <i>rstp</i>], [edit protocols <i>stp</i>], [edit protocols <i>vstp</i> vlan <i>vlan-id</i>] [edit protocols layer2-control]</pre>
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series.

**NOTE:** traceoptions is not supported on QFabric systems.

**Description** Set STP protocol-level tracing options.

**Default** Traceoptions is disabled.

**Options** **disable**—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

**file *name***—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place STP tracing output in the file `/var/log/stp-log`.

**files *number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the size option.

**Range:** 2 through 1000 files

**Default:** 1 trace file only

**flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. These are the STP-specific tracing options:

- **all**—Trace all operations.
- **all-failures**—Trace all failure conditions.
- **bpdu**—Trace BPDU reception and transmission.

- **bridge-detection-state-machine**—Trace the bridge detection state machine.
- **events**—Trace events of the protocol state machine.
- **port-information-state-machine**—Trace the port information state machine.
- **port-migration-state-machine**—Trace the port migration state machine.
- **port-receive-state-machine**—Trace the port receive state machine.
- **port-role-select-state-machine**—Trace the port role selection state machine.
- **port-role-transit-state-machine**—Trace the port role transit state machine.
- **port-transmit-state-machine**—Trace the port transmit state machine.
- **port-state-transit-state-machine**—Trace the port state transit state machine.
- **ppmd**—Trace the state and events for the ppm process.
- **state-machine-variables**—Trace when the state machine variables change.
- **timers**—Trace protocol timers.
- **topology-change-state-machine**—Trace the topology change state machine.

The following are the global tracing options:

- **all**—All tracing operations.
- **config-internal**—Trace configuration internals.
- **general**—Trace general events.
- **normal**—All normal events.

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **parse**—Trace configuration parsing.
- **policy**—Trace policy operations and actions.
- **regex-parse**—Trace regular-expression parsing.
- **route**—Trace routing table changes.
- **state**—Trace state transitions.
- **task**—Trace protocol task processing.
- **timer**—Trace protocol task timer processing.

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.O**. When the **trace-file** again reaches its maximum size, **trace-file.O** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.O**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

<b>Required Privilege</b>	routing—To view this statement in the configuration.
<b>Level</b>	routing-control—To add this statement to the configuration.

## vlan (STP)

```
Syntax  vlan (vlan-id | vlan-name) {
        bridge-priority priority;
        forward-delay seconds;
        hello-time seconds;
        interface (all | interface-name) {
            bpdu-timeout-action {
                block;
                alarm;
            }
            cost cost;
            disable;
            edge;
            mode mode;
            no-root-port;
            priority priority;
        }
        max-age seconds;
        traceoptions {
            file filename <files number > <size size> <no-stamp | world-readable |
            no-world-readable>;
            flag flag;
        }
    }
```

**Hierarchy Level** [edit protocols **mstp** **msti** *msti-id*],  
[edit protocols **vstp**]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the VLANs for a Multiple Spanning Tree Instance (MSTI).

The remaining statements are explained separately.

**TIP:** To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after vlan or vlans in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

**Default** Not enabled.

**Options** *vlan-id*—Numeric VLAN identifier.

*vlan-name*—Name of the VLAN.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## vstp

**Syntax**

```
vstp {
  disable;
  bpd-block-on-edge;
  force-version stp;
  vlan (vlan-id | vlan-name) {
    bridge-priority priority;
    forward-delay seconds;
    hello-time seconds;
    interface (all | interface-name) {
      disable;
      bpd-timeout-action {
        alarm;
        block;
      }
      cost cost;
      edge;
      mode mode;
      no-root-port;
      priority priority;
    }
    max-age seconds;
    traceoptions {
      file name <replace> <size size> <files number> <no-stamp>
        <world-readable | no-world-readable>;
      flag flag <flag-modifier> <disable>;
    }
  }
}
```

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure VLAN Spanning Tree Protocol (VSTP). VSTP is used to prevent loops in Layer 2 networks on a per-VLAN basis.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## [edit vlans] Configuration Statement Hierarchy on the QFX Series

This topic lists supported and unsupported configuration statements in the **[edit vlans]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see *QFX Series Virtual Chassis Software Features Overview*.

This topic lists:

- [Supported Statements in the \[edit vlans\] Hierarchy Level](#) on page 1761
- [Unsupported Statements in the \[edit vlans\] Hierarchy Level](#) on page 1763

### Supported Statements in the [edit vlans] Hierarchy Level

The following hierarchy shows the **[edit vlans]** configuration statements supported on one or more of the EX Series switches:

```

vlans {
  vlan-name {
    description text-description;
    domain-type bridge;
    forwarding-options {
      dhcp-security {
        arp-inspection;
        group group-name {
          interface interface-name {
            static-ip ip-address {
              mac mac-address;
            }
          }
          overrides {
            no-option82;
            trusted;
          }
        }
      }
    }
  }
  ip-source-guard;
}

```

```
no-dhcp-snooping;
option-82 {
  circuit-id {
    prefix {
      host-name;
      logical-system-name;
      routing-instance-name;
    }
    use-interface-description (device | logical);
    use-vlan-id;
  }
  remote-id {
    host-name;
    use-interface-description (device | logical);
    use-string string;
  }
  vendor-id {
    use-string string;
  }
}
}
filter {
  input filter-name;
  output filter-name;
}
flood {
  input filter-name;
}
}
l3-interface irb.logical-unit-number;
multicast-snooping-options {
  flood-groups [group-names];
  forwarding-cache {
    threshold {
      reuse threshold;
      suppress threshold;
    }
  }
}
graceful-restart {
  disable;
  restart-duration duration;
}
host-outbound-traffic {
  dot1p bits;
  forwarding-class forwarding-class;
}
multichassis-lag-replicate-state;
nexthop-hold-time time;
options {
  syslog {
    level level;
    mark interval;
    upto level;
  }
}
}
traceoptions {
```

```
file filename {
  files number;
  no-world-readable;
  size file-size;
  world-readable;
}
flag flag {
  disable;
}
}
switch-options {
  interface interface-name {
    interface-mac-limit limit {
      packet-action action;
    }
    static-mac mac-address;
  }
  interface-mac-limit limit {
    packet-action action;
  }
  mac-move-limit limit {
    packet-action action;
  }
  mac-table-size limit {
    packet-action drop;
  }
  no-mac-learning;
}
vlan-id number;
vlan-id-list [vlan-id | vlan-id-vlan-id];
}
```

Unsupported Statements in the [edit vlans] Hierarchy Level

All statements in the [edit vlans] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented with the following exceptions:

Table 113: Unsupported [edit vlans] Configuration Statements on EX Series Switches

Statement	Hierarchy Level
NOTE: Variables, such as <i>filename</i> , are not shown in the statements or hierarchies.	
mcae-mac-synchronize	[edit vlans]
no-irb-layer-2-copy	[edit vlans]

## control-channel

---

<b>Syntax</b>	<code>control-channel <i>channel-name</i> {     vlan <i>vlan-id</i>;     interface name <i>interface-name</i> }</code>
<b>Hierarchy Level</b>	[edit protocols protection-group <b>ethernet-ring</b> <i>name</i> ( <b>east-interface</b>   <b>west-interface</b> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.
<b>Description</b>	Configure the Ethernet RPS control channel logical interface to carry the RAPS PDU. The related physical interface is the physical ring port.
<b>Options</b>	<b>vlan <i>vlan-id</i></b> —If the control channel logical interface is a trunk port, then a dedicated <b>vlan <i>vlan-id</i></b> defines the dedicated VLAN channel to carry the RAPS traffic. Only configure the <b>vlan-id</b> when the control channel logical interface is the trunk port.  <b>interface name <i>interface-name</i></b> —Interface name of the control channel.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Ethernet Ring Protection Switching Overview on page 1525</a></li><li>• <a href="#">Example: Configuring Ethernet Ring Protection Switching on EX Series Switches</a></li><li>• <a href="#">Example: Configuring Ethernet Ring Protection Switching on EX Series Switches and QFX Switches on page 1563</a></li><li>• <a href="#">Configuring Ethernet Ring Protection Switching (CLI Procedure) on page 1670</a></li></ul>

## control-vlan

---

<b>Syntax</b>	control-vlan ( <i>vlan-id</i>   <i>vlan-name</i> )
<b>Hierarchy Level</b>	[edit protocols protection-group <a href="#">ethernet-ring</a> ] [edit protocols protection-group <a href="#">ethernet-ring</a> name (east-interface  west-interface)]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.
<b>Description</b>	Specify the VLAN that carries the protocol data units (PDUs) between the nodes in the protected Ethernet ring. This is a control VLAN, meaning that it carries data for one instance of an Ethernet ring protection switching (ERPS) in the control channel. Use a control VLAN on trunk port interfaces. One control channel can contain multiple control VLANs.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring Ethernet Ring Protection Switching on EX Series Switches</i></li> <li>• <a href="#">Example: Configuring Ethernet Ring Protection Switching on EX Series Switches and QFX Switches on page 1563</a></li> <li>• <a href="#">Configuring Ethernet Ring Protection Switching (CLI Procedure) on page 1670</a></li> </ul>

## data-channel

---

<b>Syntax</b>	<code>data-channel {     vlan <i>number</i>; }</code>
<b>Hierarchy Level</b>	[edit protocols protection-group <b>ethernet-ring</b> <i>ring-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2. Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.
<b>Description</b>	<p>For Ethernet ring protection, configure a data channel to define a set of VLAN IDs that belong to a ring instance.</p> <p>VLANs specified in the data channel use the same topology used by the ERPS PDU in the control channel. Therefore, if a ring interface is blocked in the control channel, all traffic in the data channel is also blocked on that interface.</p>
<b>Options</b>	<b>vlan <i>number</i></b> —Specify (by VLAN ID) one or more VLANs that belong to a ring instance.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Ethernet Ring Protection Using Ring Instances for Load Balancing</i></li><li>• <i>Example: Configuring Load Balancing Within Ethernet Ring Protection for MX Series Routers</i></li><li>• <a href="#">Example: Configuring Ethernet Ring Protection Switching on EX Series Switches and QFX Switches on page 1563</a></li><li>• <a href="#">Configuring Ethernet Ring Protection Switching (CLI Procedure) on page 1670</a></li></ul>

---

## description (VLAN)

---

<b>Syntax</b>	<code>description <i>text-description</i>;</code>
<b>Hierarchy Level</b>	[edit vlans <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Provide a textual description for the VLAN. The text has no effect on the operation of the VLAN or switch.
<b>Options</b>	<i>text-description</i> —Text to describe the interface. It can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. If the text includes spaces, enclose the entire text in quotation marks.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1588</a></li><li>• <a href="#">Understanding Bridging and VLANs on page 1527</a></li><li>• <a href="#">show vlans on page 1886</a></li></ul>

## dhcp-relay

---

```
Syntax  dhcp-relay {

**Hierarchy Level** [edit forwarding-options],  
[edit vlans forwarding-options]

**Release Information** Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Configure extended Dynamic Host Configuration Protocol (DHCP) relay and DHCPv6 relay options on the switch and enable the switch to function as a DHCP relay agent. A DHCP relay agent forwards DHCP request and reply packets between a DHCP client and a DHCP server.

DHCP relay supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide subscriber authentication. You can attach dynamic profiles and configure authentication support on a global basis or for a specific group of interfaces.

The extended DHCP and DHCPv6 relay agent options configured with the **dhcpr-relay** and **dhcprv6** statements are incompatible with the DHCP/BOOTP relay agent options configured with the **bootp** statement. As a result, the extended DHCP or DHCPv6 relay agent and the DHCP/BOOTP relay agent cannot both be enabled on the router at the same time.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## east-interface

**Syntax**

```
east-interface {
  node-id mac-address;
  control-channel channel-name {
    vlan number;
    interface name interface-name
  }
  interface-name
  ring-protection-link-end;
}
```

**Hierarchy Level** [edit protocols protection-group **ethernet-ring** *ring-name*]

**Release Information** Statement introduced in Junos OS Release 9.4.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.  
Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.

**Description** Define one of the two interface ports for Ethernet ring protection, the other being defined by the **west-interface** statement at the same hierarchy level. The interface must use the control channel's logical interface name. The control channel is a dedicated VLAN channel for the ring port.

EX Series switches do not use the node-id statement--the node ID is automatically configured on the switches using the MAC address.

**NOTE:** Always configure this port first, before configuring the **west-interface** statement.

**NOTE:** The Node ID is not configurable on EX Series switches. The node ID is automatically configured using the MAC address.

The statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## ethernet-ring

---

**Syntax**    ethernet-ring *ring-name* {  
              control-vlan (*vlan-id* | *vlan-name*);  
              data-channel {  
                  vlan *number*  
              }  
              east-interface {  
                  control-channel *channel-name* {  
                      vlan *number*;  
                      interface name *interface-name*  
                  }  
              }  
              guard-interval *number*;  
              node-id *mac-address*;  
              restore-interval *number*;  
              ring-protection-link-owner;  
              west-interface {  
                  control-channel *channel-name* {  
                      vlan *number*;  
                  }  
              }  
          }

**Hierarchy Level**    [edit protocols protection-group]

**Release Information**    Statement introduced in Junos OS Release 9.4.  
                              Statement introduced in Junos OS Release 12.1 for EX Series switches.  
                              Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.

**Description**    For Ethernet PICs on MX Series routers or for EX Series switches, , specify the Ethernet ring in an Ethernet ring protection switching configuration.

**Options**    *ring-name*—Name of the Ethernet protection ring.  
  
              The remaining statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

<b>Hierarchy Level</b>	<a href="#">[edit]</a> <a href="#">[edit vlans]</a>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 11.3 for QFX Series switches.
<b>Description</b>	Configure traffic forwarding.  The statements are explained separately.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

## guard-interval

<b>Syntax</b>	<code>guard-interval <i>number</i>;</code>
<b>Hierarchy Level</b>	<a href="#">[edit protocols protection-group <b>ethernet-ring</b> <i>ring-name</i>]</a>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.
<b>Description</b>	When a link goes down, the ring protection link (RPL) activates. When the downed link comes back up, the RPL link receives notification, restores the link, and waits for the restore interval before issuing another block on the same link. This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value.
<b>Options</b>	<i>number</i> —Guard timer interval, in milliseconds. <b>Range:</b> 10 through 2000 ms <b>Default:</b> 500 ms
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Ethernet Ring Protection Switching Overview on page 1525</a></li> <li>• <a href="#">Example: Configuring Ethernet Ring Protection Switching on EX Series Switches</a></li> <li>• <a href="#">Example: Configuring Ethernet Ring Protection Switching on EX Series Switches and QFX Switches on page 1563</a></li> <li>• <a href="#">Configuring Ethernet Ring Protection Switching (CLI Procedure) on page 1670</a></li> </ul>

## hold-interval (Protection Group)

---

<b>Syntax</b>	<code>hold-interval <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit protocols protection-group <a href="#">ethernet-ring <i>name</i></a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4.
<b>Description</b>	Specify the hold-off timer interval <i>for all rings</i> in 100 millisecond (ms) increments.
<b>Options</b>	<i>number</i> —Hold-timer interval, in milliseconds. <b>Range:</b> 0 through 10,000 ms <b>Default:</b> 100 ms
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Ethernet Ring Protection Switching Overview on page 1525</a></li><li>• <a href="#">Example: Configuring Ethernet Ring Protection Switching on EX Series Switches</a></li><li>• <a href="#">Example: Configuring Ethernet Ring Protection Switching on EX Series Switches and QFX Switches on page 1563</a></li></ul>

## interface (VLANs)

---

<b>Syntax</b>	<pre>interface <i>interface-name</i> {     mapping (native (push   swap)   tag (push   swap)); }</pre>
<b>Hierarchy Level</b>	[edit vlans <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For a specific VLAN, configure an interface.
<b>Options</b>	<i>interface-name</i> —Name of the interface.  The remaining statement is explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1588</a></li><li>• <a href="#">Configuring VLANs</a></li><li>• <a href="#">Understanding Bridging and VLANs</a></li></ul>

## interface-mac-limit

<b>Syntax</b>	<pre>interface-mac-limit <i>limit</i> {     <b>packet-action</b> drop; }</pre>
<b>Hierarchy Level</b>	<p>[edit bridge-domains <i>bridge-domain-name</i> bridge-options],          [edit bridge-domains <i>bridge-domain-name</i> bridge-options interface <i>interface-name</i>],          [edit logical-systems <i>logical-system-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options],          [edit logical-systems <i>logical-system-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options interface <i>interface-name</i>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options interface <i>interface-name</i>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> switch-options],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> switch-options interface <i>interface-name</i>],          [edit logical-systems <i>logical-system-name</i> switch-options],          [edit logical-systems <i>logical-system-name</i> switch-options interface <i>interface-name</i>],          [edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options],          [edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options interface <i>interface-name</i>],          [edit routing-instances <i>routing-instance-name</i> switch-options],          [edit routing-instances <i>routing-instance-name</i> switch-options interface <i>interface-name</i>],          [edit switch-options],          [edit switch-options interface <i>interface-name</i>],          [edit switch-options interface <i>interface-name</i>],          [edit vlans <i>vlan-name</i> switch-options],          [edit vlans <i>vlan-name</i> switch-options interface <i>interface-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.4.</p> <p>Support for the <b>switch-options</b> statement added in Junos OS Release 9.2.</p> <p>Support for top-level configuration for the <b>virtual-switch</b> type of routing instance added in Junos OS Release 9.2. In Junos OS Release 9.1 and earlier, the routing instances hierarchy supported this statement only for a VPLS instance or a bridge domain configured within a virtual switch.</p> <p>Support for logical systems added in Junos OS Release 9.6.</p> <p>[edit switch-options], [edit switch-options interface <i>interface-name</i>], [edit vlans <i>vlan-name</i> switch-options], and [edit vlans <i>vlan-name</i> switch-options interface <i>interface-name</i>] hierarchy levels introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	<p>(MX Series routers or EX Series switches only) Configure a limit to the number of MAC addresses that can be learned from a bridge domain, VLAN, virtual switch, or set of bridge domains or VLANs.</p>

**NOTE:** For multichassis link aggregation (MC-LAG) peers in active-active mode, configuring the `interface-mac-limit` statement or changing the `interface-mac-limit` configuration when traffic is flowing can cause the MAC entries to be out of synchronization between the two MC-LAG peers, which might result in flooding. To avoid flooding, you must either halt traffic forwarding and then configure the `interface-mac-limit` statement or use the `commit at configuration` statement to commit the changes at the same time in both the peer nodes.

Alternatively, if flooding does occur, you can clear the bridge MAC table on both the routers by using the `clear bridge mac-table` command. Running this command ensures that the MAC entries are re-learned and in synchronization between both the peers.

---

**Default** For an access port, the default MAC limit is 1024 MAC addresses. For a trunk port, the default MAC limit is 8192 MAC addresses.

**Options** *limit*—Maximum number of MAC addresses learned from an interface.

**Range:** 1 through 131,071 MAC addresses per interface

The remaining statement is explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## interface-mode

<b>Syntax</b>	interface-mode (access   trunk);
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family bridge], [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family ethernet-switching], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family bridge]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches. Statement introduced in Junos OS Release 13.2 for the QFX Series.
<b>Description</b>	<div>  <p><b>NOTE:</b> This statement supports the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see <a href="#">port-mode</a>. For ELS details, see “<a href="#">Getting Started with Enhanced Layer 2 Software</a>” on page 43.</p> </div> <p>(QFX Series 3500 and 3600 standalone switches)—Determine whether the logical interface accepts or discards packets based on VLAN tags. Specify the <b>trunk</b> option to accept packets with a VLAN ID that matches the list of VLAN IDs specified in the <b>vlan-id</b> or <b>vlan-id-list</b> statement, then forward the packet within the bridge domain or VLAN configured with the matching VLAN ID. Specify the <b>access</b> option to accept packets with no VLAN ID, then forward the packet within the bridge domain or VLAN configured with the VLAN ID that matches the VLAN ID specified in the <b>vlan-id</b> statement.</p> <div>  <p><b>NOTE:</b> On MX Series routers, if you want IGMP snooping to be functional for a bridge domain, then you should not configure <b>interface-mode</b> and <b>irb</b> for that bridge. Such a configuration commit succeeds, but IGMP snooping is not functional, and a message informing the same is displayed. For more information, see <i>Configuring a Trunk Interface on a Bridge Network</i>.</p> </div>
<b>Options</b>	<p><b>access</b>—Configure a logical interface to accept untagged packets. Specify the VLAN to which this interface belongs using the <b>vlan-id</b> statement.</p> <p><b>trunk</b>—Configure a single logical interface to accept packets tagged with any VLAN ID specified with the <b>vlan-id</b> or <b>vlan-id-list</b> statement.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Configuring a Logical Interface for Access Mode</li> <li>Configuring a Logical Interface for Trunk Mode</li> </ul>

**Hierarchy Level** [edit interfaces *interface-name*

<b>Release Information</b>	Statement introduced in Junos OS Release 12.3R2 for EX Series switches. <b>irb</b> option introduced in Junos OS Release 13.2 for the QFX Series.
<b>Description</b>	Configure the properties of a specific integrated bridging and routing (IRB) interface.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>[edit interfaces] Hierarchy Level</i></li><li>• <i>[edit interfaces] Configuration Statement Hierarchy on EX Series Switches</i></li></ul>

---

## l3-interface (VLAN)

---

<b>Syntax</b>	<code>l3-interface (vlan.logical-interface-number   irb.logical-interface-number);</code>
<b>Hierarchy Level</b>	<code>[edit vlans vlan-name]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series. <b>irb</b> option introduced in Junos OS Release 13.2 for the QFX Series.
<b>Description</b>	Associate a Layer 3 interface with the VLAN. Configure Layer 3 interfaces on trunk ports to allow the interface to transfer traffic between VLANs. Traffic between VLANs must be routed, which requires a common Layer 3 interface.
<b>Default</b>	No Layer 3 (routing) interface is associated with the VLAN.
<b>Options</b>	<code>vlan.logical-interface-number</code> —Number of the logical interface. Use the <b>unit</b> number that you used when you created the <b>vlan</b> interface with a <b>set interfaces vlan unit</b> statement.

**NOTE:** Use this statement with versions of Junos OS that do not support Enhanced Layer 2 Software (ELS).

---

`irb.logical-interface-number`—Logical interface defined with a **set interfaces irb** statement.

---

**NOTE:** Use this statement with versions of Junos OS that support Enhanced Layer 2 Software (ELS).

---

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show ethernet-switching interfaces on page 1482</a></li><li>• <a href="#">show vlans on page 1886</a></li></ul>

## mac (Static MAC-Based VLANs)

<b>Syntax</b>	<code>mac mac-address {     next-hop interface-name; }</code>
<b>Hierarchy Level</b>	<code>[edit ethernet-switching-options static vlan vlan-name]</code>
<b>Description</b>	Specify the MAC address to add to the Ethernet switching table.  The remaining statement is explained separately.
<b>Options</b>	<i>mac-address</i> —MAC address
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)</i></li> </ul>

## mac-limit

<b>Syntax</b>	<code>mac-limit number;</code>
<b>Hierarchy Level</b>	<code>[edit vlans vlan-name]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the number of MAC addresses allowed on a VLAN.
<b>Default</b>	MAC limit is disabled.
<b>Options</b>	<i>number</i> —Maximum number of MAC addresses. <b>Range:</b> 1 through 32768

**NOTE:** This statement is not supported on QFabric systems.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show vlans on page 1886</a></li> <li>• <a href="#">Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1588</a></li> <li>• <a href="#">Configuring MAC Table Aging</a></li> <li>• <a href="#">Understanding Bridging and VLANs</a></li> </ul>

## mac-notification

---

<b>Syntax</b>	<pre>mac-notification {     notification-interval <i>seconds</i>; }</pre>
<b>Hierarchy Level</b>	[edit ethernet-switching-options] [edit switch-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series. Hierarchy level <b>[edit switch-options]</b> added in Junos OS Release 14.1X53-D10 for EX Series and QFX Series.
<b>Description</b>	<p>Enable MAC notification for a switch. If you configure this statement without setting a notification interval, MAC notification is enabled with the default MAC notification interval of 30 seconds.</p> <p>The remaining statement is explained separately.</p>
<b>Default</b>	MAC notification is disabled by default.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring MAC Notification</i></li><li>• <a href="#">Configuring MAC Notification (CLI Procedure) on page 1682</a></li></ul>

## mac-statistics

<b>Syntax</b>	mac-statistics;
<b>Hierarchy Level</b>	<p>[edit bridge-domains <i>bridge-domain-name</i> bridge-options],</p> <p>[edit logical-systems <i>logical-system-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> switch-options],</p> <p>[edit logical-systems <i>logical-system-name</i> switch-options],</p> <p>[edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options],</p> <p>[edit routing-instances <i>routing-instance-name</i> switch-options],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols evpn],</p> <p>[edit switch-options],</p> <p>[edit switch-options],</p> <p>[edit vlans <i>vlan-name</i> switch-options]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.4.</p> <p>Support for the <b>switch-options</b> statement added in Junos OS Release 9.2.</p> <p>Support for top-level configuration for the <b>virtual-switch</b> type of routing instance added in Junos OS Release 9.2. In Junos OS Release 9.1 and earlier, the routing instances hierarchy supported this statement only for a VPLS instance or a bridge domain configured within a virtual switch.</p> <p>Support for logical systems added in Junos OS Release 9.6.</p> <p>[edit switch-options] and [edit vlans <i>vlan-name</i> switch-options] hierarchy levels introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Support for EVPNs added in Junos OS Release 13.2 for MX 3D Series routers.</p> <p>[edit switch-options] and [edit vlans <i>vlan-name</i> switch-options] hierarchy levels introduced in Junos OS Release 13.2 for the QFX Series.</p>
<b>Description</b>	(MX Series routers, EX Series switches, and QFX Series only) For bridge domains or VLANs, enable MAC accounting either for a specific bridge domain or VLAN, or for a set of bridge domains or VLANs associated with a Layer 2 trunk port.
<b>Default</b>	disabled
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Layer 2 Learning and Forwarding for Bridge Domains Overview</i></li> <li>• <a href="#">Layer 2 Learning and Forwarding for VLANs Overview on page 1526</a></li> <li>• <i>Layer 2 Learning and Forwarding for Bridge Domains Functioning as Switches with Layer 2 Trunk Ports</i></li> <li>• <i>Layer 2 Learning and Forwarding for VLANs Acting as a Switch for a Layer 2 Trunk Port</i></li> <li>• <i>Configuring EVPN Routing Instances</i></li> </ul>

## mac-table-aging-time

---

<b>Syntax</b>	<code>mac-table-aging-time seconds;</code>
<b>Hierarchy Level</b>	For platforms without ELS:  [edit ethernet-switching-options], [edit vlans <i>vlan-name</i> ]  For platforms with ELS:  [edit vlans <i>vlan-name</i> switch-options]
<b>Release Information</b>	Statement introduced for specific VLANs in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define how long entries remain in the Ethernet switching table before expiring: <ul style="list-style-type: none"><li>• If you specify this statement at the <b>[ethernet-switching-options]</b> hierarchy level, it applies to all VLANs on the switch.</li><li>• If you specify this statement at the <b>[vlans]</b> hierarchy level, it applies to the specified VLAN.</li></ul>
<b>Default</b>	300 seconds
<b>Options</b>	<b>seconds</b> —Time that entries remain in the Ethernet switching table before being removed. <ul style="list-style-type: none"><li>• <b>Range</b>—60 to 1,000,000 seconds.</li><li>• <b>Default</b>—300 seconds.</li></ul>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1588</a></li><li>• <a href="#">Configuring MAC Table Aging</a></li><li>• <a href="#">Configuring MAC Table Aging on page 1674</a></li><li>• <a href="#">Understanding Bridging and VLANs on page 1527</a></li><li>• <a href="#">show ethernet-switching statistics aging on page 1858</a></li></ul>

## mac-table-size

<b>Syntax</b>	<code>mac-table-size <i>limit</i> {     <code>packet-action</code> drop; }</code>
<b>Hierarchy Level</b>	[edit bridge-domains <i>bridge-domain-name</i> bridge-options], [edit logical-systems <i>logical-system-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> switch-options], [edit logical-systems <i>logical-system-name</i> switch-options], [edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options], [edit routing-instances <i>routing-instance-name</i> switch-options], [edit switch-options], [edit vlans <i>vlan-name</i> switch-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.4. Support for the <b>switch-options</b> statement added in Junos OS Release 9.2. Support for top-level configuration for the <b>virtual-switch</b> type of routing instance added in Junos OS Release 9.2. In Junos OS Release 9.1 and earlier, the routing instances hierarchy supported this statement only for a VPLS instance or a bridge domain configured within a virtual switch. Support for logical systems added in Junos OS Release 9.6. <b>[edit switch-options]</b> and <b>[edit vlans <i>vlan-name</i> switch-options]</b> hierarchy levels introduced in Junos OS Release 12.3R2 for EX Series switches. Support at the <b>[edit vlans <i>vlan-name</i> switch-options]</b> hierarchy level introduced in Junos OS Release 13.2 for the QFX Series.
<b>Description</b>	Modify the size of the MAC address table for the bridge domain or VLAN, a set of bridge domains or VLANs associated with a trunk port, or a virtual switch. The default is 5120 MAC addresses.

**NOTE:** For multichassis link aggregation (MC-LAG) peers in active-active mode, configuring the **mac-table-size** statement or changing the **mac-table-size** configuration when traffic is flowing can cause the MAC entries to be out of synchronization between the two MC-LAG peers, which might result in flooding. To avoid flooding, you must either halt traffic forwarding and then configure the **mac-table-size** statement or use the **commit at** configuration statement to commit the changes at the same time in both the peer nodes.

Alternatively, if flooding does occur, you can clear the bridge MAC table on both the routers by using the **clear bridge mac-table** command. Running this command ensures that the MAC entries are re-learned and in synchronization between both the peers.

**Options** *limit*—Specify the maximum number of addresses in the MAC address table.

**Range:** 16 through 1,048,575 MAC addresses

**Default:** 5120 MAC addresses There is no default MAC address limit for the **mac-table-size** statement at the **[edit switch-options]** hierarchy level. The number of MAC addresses that can be learned is only limited by the platform, 65,535 MAC addresses for EX Series switches and 1,048,575 MAC addresses for other devices.

The remaining statement is explained separately.

**Required Privilege** routing—To view this statement in the configuration.

**Level** routing-control—To add this statement to the configuration.

## members

<b>Syntax</b>	<code>members [(all   <i>names</i>   <i>vlan-ids</i>)];</code>
<b>Hierarchy Level</b>	[edit <a href="#">interfaces</a> <i>interface-name</i> unit 0 family ethernet-switching vlan]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	For trunk interfaces, configure the VLANs for which the interface can carry traffic.

**TIP:** To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after `vlan` or `vlands` in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

**Options** `all`—Specify that this trunk interface be a member of all the VLANs that are configured on this switch. When a new VLAN is configured on the switch, this trunk interface automatically becomes a member of the VLAN.

**NOTE:** Each VLAN that is configured must have a specified VLAN ID when you attempt to commit the configuration; otherwise, the configuration commit fails. Also, `all` cannot be the name of a VLAN on the switch.

*names*—Names of one or more VLANs.

*vlan-ids*—Numeric identifiers of one or more VLANs.

**Required Privilege Level**  
`routing`—To view this statement in the configuration.  
`routing-control`—To add this statement to the configuration.

## native-vlan-id

---

<b>Syntax</b>	<code>native-vlan-id <i>vlan-id</i>;</code>
<b>Hierarchy Level</b>	For platforms without ELS:  <code>[edit <a href="#">interfaces</a> <i>interface-name</i> unit 0 family ethernet-switching],</code>  For platforms with ELS:  <code>[edit <a href="#">interfaces</a> <i>interface-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure the VLAN identifier to associate with untagged packets received on the interface. The logical interface on which untagged packets are received must be configured with the same VLAN ID as the native VLAN ID configured on the physical interface. To configure the logical interface, include the <b>vlan-id</b> statement (matching the <b>native-vlan-id</b> statement on the physical interface) at the <code>[edit <a href="#">interfaces</a> <i>interface-name</i> unit <i>logical-unit-number</i>]</code> hierarchy level.</p> <p>When the <b>native-vlan-id</b> statement is combined with the <a href="#">interface-mode</a> statement, untagged packets are accepted and forwarded within the bridge domain or VLAN that is configured with the matching VLAN ID.</p> <p>When the <b>native-vlan-id</b> statement is combined with the <a href="#">flexible-vlan-tagging</a> statement, untagged packets are accepted on the interfaces that are configured for Q-in-Q tunneling.</p> <p>.</p>
<b>Options</b>	<p><b>vlan-id</b>—Numeric identifier of the VLAN.</p> <p><b>Range:</b> 1 through 4094</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Junos OS Network Interfaces Configuration Guide</a></li><li>• .</li><li>• <a href="#">show ethernet-switching interfaces on page 1482</a></li><li>• <a href="#">show vlans on page 1886</a></li></ul>

## notification-interval

---

<b>Syntax</b>	notification-interval <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit ethernet-switching-options mac-notification] [edit switch-options mac-notification]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series. Hierarchy level <b>[edit switch-options]</b> added in Junos OS Release 14.1X53-D10 for EX Series and QFX Series.
<b>Description</b>	Configure the MAC notification interval for a switch.  The MAC notification interval is the amount of time the switch waits before sending learned or unlearned MAC address SNMP notifications to the network management server. For instance, if the MAC notification interval is set to 10, all of the MAC address addition and removal SNMP notifications are sent to the network management system every 10 seconds.
<b>Options</b>	<b><i>seconds</i></b> —The MAC notification interval, in seconds. <b>Range:</b> 1 through 60 <b>Default:</b> 30
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring MAC Notification</i></li> <li>• <a href="#">Configuring MAC Notification (CLI Procedure) on page 1682</a></li> </ul>

## packet-action

**Syntax** `packet-action action;`

**Hierarchy Level** [edit bridge-domains *bridge-domain-name* bridge-options interface *interface-name* **interface-mac-limit** *limit*],

 [edit vlans *vlan-name* switch-options interface *interface-name* **interface-mac-limit** *limit*],  
 [edit vlans *vlan-name* switch-options **mac-table-size** *limit*]

**Release Information** Statement introduced in Junos OS Release 8.4.  
 Support for the **switch-options** statement added in Junos OS Release 9.2.  
 Support for top-level configuration for the **virtual-switch** type of routing instance added in Junos OS Release 9.2. In Junos OS Release 9.1 and earlier, the routing instances hierarchy supported this statement only for a VPLS instance or a bridge domain configured within a virtual switch.

Support for logical systems added in Junos OS Release 9.6.

[edit switch-options interface *interface-name* interface-mac-limit *limit*], [edit switch-options interface-mac-limit *limit*], [edit switch-options mac-table-size *limit*], [edit vlans *vlan-name* switch-options interface *interface-name* interface-mac-limit *limit*], [edit vlans *vlan-name* switch-options interface-mac-limit *limit*], and [edit vlans *vlan-name* switch-options mac-table-size *limit*] hierarchy levels introduced in Junos OS Release 12.3R2 for EX Series switches.

Support for EVPNs introduced in Junos OS Release 13.2 on MX Series 3D Universal Edge Routers.

Support at the [edit switch-options interface *interface-name* interface-mac-limit *limit*] hierarchy level and hierarchy levels under [edit vlans *vlan-name*] introduced in Junos OS Release 13.2X50-D10 for EX Series switches and Junos OS Release 13.2 for the QFX Series.

**Description** Specify the action taken when packets with new source MAC addresses are received after the MAC address limit is reached. If this statement is not configured, packets with new source MAC addresses are forwarded by default.

**Default**

**NOTE:** On a QFX Series Virtual Chassis, if you include the shutdown option at the [edit vlans *vlan-name* switch-options interface *interface-name* interface-mac-limit packet-action] hierarchy level and issue the commit operation, the system generates a commit error. The system does not generate an error if you include the shutdown option at the [edit switch-options interface *interface-name* interface-mac-limit packet-action] hierarchy level.

Disabled. The default is for packets for new source MAC addresses to be forwarded after the MAC address limit is reached.

**Options**

- drop**—Drop packets with new source MAC addresses, and do not learn the new source MAC addresses.
- drop-and-log**—(EX Series switches and QFX Series only) Drop packets with new source MAC addresses, and generate an alarm, an SNMP trap, or a system log entry.
- log**—(EX Series switches and QFX Series only) Hold packets with new source MAC addresses, and generate an alarm, an SNMP trap, or a system log entry.
- none**—(EX Series switches and QFX Series only) Forward packets with new source MAC addresses, and learn the new source MAC address.
- shutdown**—(EX Series switches and QFX Series only) Disable the specified interface, and generate an alarm, an SNMP trap, or a system log entry.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

## port-mode

<b>Syntax</b>	port-mode (access   tagged-access   trunk);
<b>Hierarchy Level</b>	[edit <a href="#">interfaces</a> <i>interface-name</i> <a href="#">unit</a> <i>logical-unit-number</i> family ethernet-switching]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<div>  <p><b>NOTE:</b> This statement does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see <a href="#">interface-mode</a>. For ELS details, see “<a href="#">Getting Started with Enhanced Layer 2 Software</a>” on page 43.</p> </div> <p>Configure whether an interface on the switch operates in access, tagged access, or trunk mode.</p>
<b>Default</b>	All switch interfaces are in access mode.
<b>Options</b>	<p><b>access</b>—Have the interface operate in access mode. In this mode, the interface can be in a single VLAN only. Access interfaces typically connect to network devices, such as PCs, printers, IP telephones, and IP cameras.</p> <p><b>tagged-access</b>—Have the interface operate in tagged-access mode. In this mode, the interface can be in multiple VLANs. Tagged access interfaces typically connect to network devices, such as PCs, printers, IP telephones, and IP cameras.</p> <p><b>trunk</b>—Have the interface operate in trunk mode. In this mode, the interface can be in multiple VLANs and can multiplex traffic between different VLANs. Trunk interfaces typically connect to other switches and to routers on the LAN.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

## restore-interval

---

<b>Syntax</b>	<code>restore-interval <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit protocols protection-group <a href="#">ethernet-ring <i>ring-name</i></a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.
<b>Description</b>	Configures the number of minutes that the node does not process any Ethernet ring protection (ERP) protocol data units (PDUs).. This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value.
<b>Options</b>	<i>number</i> —Specify the restore interval. <b>Range:</b> 5 through 12 minutes
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Ethernet Ring Protection Switching Overview on page 1525</a></li> <li>• <a href="#">Example: Configuring Ethernet Ring Protection Switching on EX Series Switches</a></li> <li>• <a href="#">Example: Configuring Ethernet Ring Protection Switching on EX Series Switches and QFX Switches on page 1563</a></li> <li>• <a href="#">Configuring Ethernet Ring Protection Switching (CLI Procedure) on page 1670</a></li> </ul>

## ring-protection-link-end

---

<b>Syntax</b>	ring-protection-link-end;
<b>Hierarchy Level</b>	[edit protocols protection-group <a href="#">ethernet-ring</a> <i>ring-name</i> ( <a href="#">east-interface</a>   <a href="#">west-interface</a> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 12.1 for EX Series switches.
<b>Description</b>	Specify that the port is one side of a ring protection link (RPL) by setting the RPL end flag.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Ethernet Ring Protection Switching Overview on page 1525</a></li><li>• <a href="#">Example: Configuring Ethernet Ring Protection Switching on EX Series Switches</a></li><li>• <a href="#">Example: Configuring Ethernet Ring Protection Switching on EX Series Switches and QFX Switches on page 1563</a></li><li>• <a href="#">Configuring Ethernet Ring Protection Switching (CLI Procedure) on page 1670</a></li></ul>

## ring-protection-link-owner

---

<b>Syntax</b>	ring-protection-link-owner;
<b>Hierarchy Level</b>	[edit protocols protection-group <a href="#">ethernet-ring</a> <i>ring-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.
<b>Description</b>	Specify the ring protection link (RPL) owner flag in the Ethernet protection ring. Include this statement only once for each ring (only one node can function as the RPL owner).
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Ethernet Ring Protection Switching Overview on page 1525</a></li><li>• <a href="#">Example: Configuring Ethernet Ring Protection Switching on EX Series Switches</a></li><li>• <a href="#">Example: Configuring Ethernet Ring Protection Switching on EX Series Switches and QFX Switches on page 1563</a></li></ul>

---

## service-id

---

<b>Syntax</b>	<code>service-id <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit switch-options] [edit vlans <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3R2 for EX Series switches and MX Series routers. Statement introduced in Junos OS Release 13.2 for the QFX Series.
<b>Description</b>	Specify a service identifier for each multichassis aggregated Ethernet interface that belongs to a link aggregation group (LAG).
<b>Options</b>	<b>number</b> —A number that identifies a particular service. <b>Range:</b> 1 through 65535
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system control—To add this statement to the configuration.

## switch-options

---

<b>Syntax</b>	<pre>switch-options {   interface <i>interface-name</i> {     interface-mac-limit <i>limit</i> {       packet-action drop;     }     no-mac-learning;     static-mac <i>static-mac-address</i> {       vlan-id <i>number</i>;     }   }   interface-mac-limit <i>limit</i> {     packet-action drop;   }   mac-statistics;   mac-table-size <i>limit</i> {     packet-action drop;   }   no-mac-learning;   service-id <i>number</i>;   vtep-source-interface }</pre>
<b>Hierarchy Level</b>	<pre>[edit <i>number</i>], [edit vlans <i>vlan--name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> vlans   <i>vlan-name</i>], [edit routing-instances <i>routing-instance-name</i> vlans <i>vlan-name</i>]</pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches and MX Series routers.</p> <p>Statement introduced in Junos OS Release 13.2 for the QFX Series.</p>
<b>Description</b>	<p>Configure Layer 2 learning and forwarding properties for a VLAN or a virtual switch.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

---

## static (Static MAC-Based VLANs)

---

**Syntax**   static {  
              vlan *vlan-name* {  
                  mac *mac-address* {  
                      next-hop *interface-name*;  
                  }  
              }  
          }

**Hierarchy Level**   [edit ethernet-switching-options]

**Release Information**   Statement introduced in Junos OS Release 11.1 for EX Series switches.

**Description**       Specify VLAN and MAC addresses to add to the Ethernet switching table.  
  
                      The remaining statements are explained separately.

**Required Privilege**   system—To view this statement in the configuration.  
                  **Level**   system-control—To add this statement to the configuration.

**Related**           • *Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)*  
**Documentation**

## static-mac

---

<b>Syntax</b>	<code>static-mac <i>mac-address</i> {     vlan-id <i>number</i>; }</code>
<b>Hierarchy Level</b>	[edit bridge-domains <i>bridge-domain-name</i> bridge-options interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options interface <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options interface <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols evpn interface <i>interface-name</i> ] [edit vlans <i>vlan-name</i> switch-options interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.4. Support for logical systems added in Junos OS Release 9.6. [edit vlans <i>vlan-name</i> switch-options interface <i>interface name</i> ] hierarchy level introduced in Junos OS Release 12.3R2 for EX Series switches. Support for EVPNs added in Junos OS Release 13.2 for MX 3D Series routers. The <b>vlan-id</b> option is not available for EVPNs. [edit vlans <i>vlan-name</i> switch-options interface <i>interface name</i> ] hierarchy level introduced in Junos OS Release 13.2 for the QFX Series.
<b>Description</b>	Configure a static MAC address for a logical interface in a bridge domain or VLAN.  The <b>vlan-id</b> option can be specified for <b>static-macs</b> only if <b>vlan-id all</b> is configured for the bridging domain or VLAN.
<b>Options</b>	<b><i>mac-address</i></b> —MAC address  <b><i>vlan-id number</i></b> —(Optional) VLAN identifier to associate with static MAC address.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring EVPN Routing Instances</i></li><li>• <i>Layer 2 Learning and Forwarding for Bridge Domains Overview</i></li><li>• <a href="#">Layer 2 Learning and Forwarding for VLANs Overview on page 1526</a></li></ul>

## vlan-id (VLANs)

<b>Syntax</b>	<code>vlan-id <i>number</i>;</code>
<b>Hierarchy Level</b>	<p>For platforms without ELS:</p> <pre>[edit vlans <i>vlan-name</i> <i>vlan-range</i>]</pre> <p>For platforms without ELS and with ELS:</p> <pre>[edit vlans <i>vlan-name</i>]</pre> <p>For ELS platforms only:</p> <pre>[edit interfaces <i>interface-name</i> unit <i>number</i>] [edit vlans <i>vlan-name</i> <i>vlan-id-list</i>]</pre>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure an 802.1Q tag to apply to all traffic that originates on the VLAN.
<b>Default</b>	<p>On a QFX3500 and QFX3500 switch, if you use the default factory configuration, all traffic originating on the VLAN is untagged and has a VLAN identifier of 1. The number zero is reserved for priority tagging and the number 4093 is also reserved.</p> <p>On a QFX5100 switch, if you use the default factory configuration, all traffic originating on the VLAN is untagged and has a VLAN identifier of 1. The number zero is reserved for priority tagging and the number 4093 is also reserved.</p>
	<div>  <p><b>NOTE:</b> You can only create up to 4090 VLANs on a QFX5100 switch. If you create more than 4090 VLANs, the interfaces associated with the extra VLANs are not displayed in the <code>show vlans</code> command output. For example, if you create 4094 VLANs, the extra VLANs will not have interfaces associated with the VLANs. The order in which you configure the extra VLANs determines which interfaces are missing from the <code>show vlans</code> command output.</p> </div>
<b>Options</b>	<p><i>number</i> —VLAN tag identifier.</p> <p><b>Range:</b> 0 through 4093.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Setting Up Bridging with Multiple VLANs</i></li> <li>• <i>Understanding Bridging and VLANs</i></li> </ul>

## vlan-id-list

<b>Syntax</b>	<code>vlan-id-list [ <i>vlan-id-numbers</i> ];</code>
<b>Hierarchy Level</b>	<p>[edit bridge-domains <i>bridge-domain-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> bridge-domains <i>bridge-domain-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i>]</p> <p>[edit interfaces <i>interface-name</i> unit 0],</p> <p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>],</p> <p>[edit vlans <i>vlan-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.4.</p> <p>Support for logical systems added in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2 for the QFX Series.</p>
<b>Description</b>	<p>Specify a VLAN identifier list to use for a bridge domain or VLAN in trunk mode.</p> <p>Specify the <b>trunk</b> option in the <b>interface-mode</b> statement to accept packets with a VLAN ID that matches the list of VLAN IDs specified in the <b>vlan-id-list</b> statement to forward the packet within the bridge domain or VLAN configured with the matching VLAN ID. Specify the <b>access</b> option to accept packets with no VLAN ID to forward the packet within the bridge domain or VLAN configured with the VLAN ID that matches the VLAN ID specified in the <b>vlan-id</b> statement.</p> <p>This statement also enables you to bind a logical interface to a list of VLAN IDs, thereby configuring the logical interface to receive and forward a frame with a tag that matches the specified VLAN ID list.</p>
<b>Options</b>	<p><b><i>vlan-id-numbers</i></b>—Valid VLAN identifiers. You can combine individual numbers with range lists including a hyphen.</p> <p><b>Range:</b> 0 through 4095</p>

**NOTE:** On EX Series switches and the QFX Series, the range is 0 through 4094.

<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

## vlan-rewrite

<b>Syntax</b>	vlan-rewrite translate (200 500   201 501)
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>number</i> family bridge interface-mode trunk] [edit interfaces <i>interface-name</i> unit <i>number</i> family ethernet-switching interface-mode trunk]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 12.3R2 for EX Series switches. Statement introduced in Junos OS Release 13.2 for the QFX Series.
<b>Description</b>	Translates an incoming VLAN to a bridge-domain VLAN, corresponding counter translation at egress. Supports translation of VLAN 200 to VLAN 500 and VLAN 201 to VLAN 501. Other valid VLANs pass through without translation.
<b>Options</b>	<b>translate 200 500</b> —Translates incoming packets with VLAN 200 to 500.  <b>translate 201 501</b> —Translates incoming packets with VLAN 201 to 501.  <b>translate 202 502</b> —Translates incoming packets with VLAN 202 to 502.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Rewriting a VLAN Tag and Adding a New Tag</i></li> </ul>

## vlan-tagging

<b>Syntax</b>	vlan-tagging;
<b>Hierarchy Level</b>	[edit <a href="#">interfaces</a> <i>interface-name</i> ] [edit <a href="#">interfaces</a> <a href="#">interface-range</a> <i>interface-range-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Enable VLAN tagging. The platform receives and forwards single-tag frames with 802.1Q VLAN tags.
<b>Default</b>	VLAN tagging is disabled by default.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">vlan-id on page 2746</a></li> <li>• <a href="#">Configuring a Layer 3 Logical Interface on page 2593</a></li> </ul>

```

**Hierarchy Level** [edit]

**Release Information** Statement introduced in Junos OS Release 13.2 for the QFX Series.  
Statements for private VLANs and Q-in-Q tunneling introduced in Junos OS Release 12.1 for the QFX Series.

**Description** Configure VLAN properties on the QFX Series.

**Default** If you use the default factory configuration, all switch interfaces become part of the VLAN **default**.

**Options** *vlan-name*—Name of the VLAN. The name can contain letters, numbers, hyphens (-), and periods (.) and can be up to 255 characters long.

The remaining statements are described separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing—control—To add this statement to the configuration.

## west-interface

<b>Syntax</b>	<pre> west-interface {   node-id <i>mac-address</i>;   control-channel <i>channel-name</i> {     vlan <i>number</i>;     interface name <i>interface-name</i>   }   interface-name   ring-protection-link-end; } </pre>
<b>Hierarchy Level</b>	[edit protocols protection-group <b>ethernet-ring</b> <i>ring-name</i> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.5.</p> <p>Statement introduced in Junos OS Release 12.1 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.</p>
<b>Description</b>	<p>Define one of the two interface ports for Ethernet ring protection, the other being defined by the <b>east-interface</b> statement at the same hierarchy level. The interface must use the control channel's logical interface name. The control channel is a dedicated VLAN channel for the ring port.</p>
<div>  <b>NOTE:</b> Always configure this port second, after configuring the <b>east-interface</b> statement. </div>	
<p>The statements are explained separately.</p>	
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Ethernet Ring Protection Switching Overview on page 1525</a></li> <li>• <a href="#">Ethernet Ring Protection Using Ring Instances for Load Balancing</a></li> <li>• <a href="#">east-interface on page 1773</a></li> <li>• <a href="#">ethernet-ring on page 1774</a></li> <li>• <a href="#">Example: Configuring Ethernet Ring Protection Switching on EX Series Switches</a></li> <li>• <a href="#">Example: Configuring Ethernet Ring Protection Switching on EX Series Switches and QFX Switches on page 1563</a></li> <li>• <a href="#">Configuring Ethernet Ring Protection Switching (CLI Procedure) on page 1670</a></li> </ul>

---

## flexible-vlan-tagging

---

<b>Syntax</b>	flexible-vlan-tagging;
<b>Hierarchy Level</b>	[edit interfaces aex], [edit interfaces ge- <i>fpc/pic/port</i> ], [edit interfaces et- <i>fpc/pic/port</i> ], [edit interfaces ps0], [edit interfaces xe- <i>fpc/pic/port</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.1. Support for aggregated Ethernet added in Junos OS Release 9.0. Statement introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers. Statement introduced in Junos OS Release 13.2X50-D15 for EX Series switches. Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.
<b>Description</b>	Support simultaneous transmission of 802.1Q VLAN single-tag and dual-tag frames on logical interfaces on the same Ethernet port, and on pseudowire logical interfaces.  This statement is supported on M Series and T Series routers, for Fast Ethernet and Gigabit Ethernet interfaces only on Gigabit Ethernet IQ2 and IQ2-E, IQ, and IQE PICs, and for aggregated Ethernet interfaces with member links in IQ2, IQ2-E, and IQ PICs or in MX Series DPCs, or on Ethernet interfaces for PTX Series Packet Transport Routers or 100-Gigabit Ethernet Type 5 PIC with CFP. This statement is supported on Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces on EX Series switches.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Mixed Tagging</i></li><li>• <i>Configuring Flexible VLAN Tagging on PTX Series Packet Transport Routers</i></li></ul>

## input-vlan-map

<b>Syntax</b>	<pre>input-vlan-map {   (pop   pop-pop   pop-swap   push   push-push   swap   swap-push   swap-swap);   inner-tag-protocol-id <i>tpid</i>;   inner-vlan-id <i>number</i>;   tag-protocol-id <i>tpid</i>;   vlan-id <i>number</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i>]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p><b>pop-pop</b>, <b>pop-swap</b>, <b>push-push</b>, <b>swap-push</b>, and <b>swap-swap</b> statements introduced in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.</p>
<b>Description</b>	<p>For Gigabit Ethernet IQ, 10-Gigabit Ethernet SFPP interfaces, 100-Gigabit Ethernet Type 5 PIC with CFP only as well as Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces, define the rewrite profile to be applied to incoming frames on this logical interface.</p> <p>The statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Stacking a VLAN Tag</i></li> <li>• <a href="#">output-vlan-map on page 1821</a></li> <li>• <i>Configuring Q-in-Q Tunneling (CLI Procedure)</i></li> </ul>

## native-vlan-id

---

<b>Syntax</b>	<code>native-vlan-id <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit interfaces <i>ge-fpc/pic/port</i> ], [edit interfaces <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers. Statement introduced in Junos OS Release 12.3R2 for EX Series switches. Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.
<b>Description</b>	<p>Configure mixed tagging support for untagged packets on a port for the following:</p> <ul style="list-style-type: none"><li>• M Series routers with Gigabit Ethernet IQ PICs with SFP and Gigabit Ethernet IQ2 PICs with SFP configured for 802.1Q flexible VLAN tagging</li><li>• MX Series routers with Gigabit Ethernet DPCs and MICs, Tri-Rate Ethernet DPCs and MICs, and 10-Gigabit Ethernet DPCs and MICs and MPCs configured for 802.1Q flexible VLAN tagging</li><li>• T4000 routers with 100-Gigabit Ethernet Type 5 PIC with CFP</li><li>• EX Series switches with Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces</li></ul> <p>When the <b>native-vlan-id</b> statement is included with the <a href="#">flexible-vlan-tagging</a> statement, untagged packets are accepted on the same mixed VLAN-tagged port.</p> <p>The logical interface on which untagged packets are received must be configured with the same VLAN ID as the native VLAN ID configured on the physical interface. To configure the logical interface, include the <b>vlan-id</b> statement (matching the <b>native-vlan-id</b> statement on the physical interface) at the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>] hierarchy level.</p> <p>When the <b>native-vlan-id</b> statement is included with the <a href="#">interface-mode</a> statement, untagged packets are accepted and forwarded within the bridge domain or VLAN that is configured with the matching VLAN ID.</p>
<b>Options</b>	<p><b><i>number</i></b>—VLAN ID number.</p> <p><b>Range:</b> (ACX Series routers and EX Series switches) 0 through 4094.</p>
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Mixed Tagging Support for Untagged Packets</i></li><li>• <i>Configuring a Logical Interface for Access Mode</i></li><li>• <a href="#">Configuring the Native VLAN Identifier (CLI Procedure) on page 1677</a></li><li>• <i>Understanding Bridging and VLANs on EX Series Switches</i></li></ul>

## output-vlan-map

<b>Syntax</b>	<pre>output-vlan-map {   (pop   pop-pop   pop-swap   push   push-push   swap   swap-push   swap-swap);   inner-tag-protocol-id <i>tpid</i>;   inner-vlan-id <i>number</i>;   tag-protocol-id <i>tpid</i>;   vlan-id <i>number</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i>]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p><b>pop-pop</b>, <b>pop-swap</b>, <b>push-push</b>, <b>swap-push</b>, and <b>swap-swap</b> statements added in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.</p>
<b>Description</b>	<p>For Gigabit Ethernet IQ, 10-Port 10-Gigabit Ethernet SFPP interfaces, 100-Gigabit Ethernet Type 5 PIC with CFP only, Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces, define the rewrite operation to be applied to outgoing frames on this logical interface.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Stacking and Rewriting Gigabit Ethernet VLAN Tags</i></li> <li>• <a href="#">input-vlan-map on page 1819</a></li> <li>• <i>Configuring Q-in-Q Tunneling (CLI Procedure)</i></li> </ul>

## pop

---

<b>Syntax</b>	pop;
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> <b>input-vlan-map</b> ], [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> <b>output-vlan-map</b> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> <b>input-vlan-map</b> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> <b>output-vlan-map</b> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3R2 for EX Series switches. Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.
<b>Description</b>	<div> <b>NOTE:</b> On EX4300 switches, pop is not supported at the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> <b>input-vlan-map</b>] hierarchy level.</div> <p>For Gigabit Ethernet IQ, 10-Gigabit Ethernet IQ2, and IQ2-E interfaces; 10-Gigabit Ethernet LAN/WAN PIC; aggregated Ethernet interfaces using Gigabit Ethernet IQ interfaces; 100-Gigabit Ethernet Type 5 PIC with CFP; and Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces, specify the VLAN rewrite operation to remove a VLAN tag from the top of the VLAN tag stack. The outer VLAN tag of the frame is removed.</p>
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Removing a VLAN Tag</i></li><li>• <i>Configuring Q-in-Q Tunneling (CLI Procedure)</i></li></ul>

## push

<b>Syntax</b>	<code>push;</code>
<b>Hierarchy Level</b>	<code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> <a href="#">input-vlan-map</a>],</code> <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> <a href="#">output-vlan-map</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i></code> <code>  <a href="#">input-vlan-map</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i></code> <code>  output-vlan-map]</code>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.</p>
<b>Description</b>	<p> <b>NOTE:</b> On EX4300 switches, <code>push</code> is not supported at the <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> output-vlan-map]</code> hierarchy level.</p> <p>Specify the VLAN rewrite operation to add a new VLAN tag to the top of the VLAN stack. An outer VLAN tag is pushed in front of the existing VLAN tag.</p> <p>You can use this statement on Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces; 10-Gigabit Ethernet LAN/WAN PIC; aggregated Ethernet interfaces using Gigabit Ethernet IQ interfaces; 100-Gigabit Ethernet Type 5 PIC with CFP; and Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces.</p> <p>If you include the <b>push</b> statement in the configuration, you must also include the <a href="#">pop</a> statement at the <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> output-vlan-map]</code> hierarchy level.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Stacking a VLAN Tag</i></li> <li>• <i>Configuring Q-in-Q Tunneling (CLI Procedure)</i></li> </ul>

## swap

---

<b>Syntax</b>	swap;
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> <b>input-vlan-map</b> ], [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> <b>output-vlan-map</b> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> <b>input-vlan-map</b> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> <b>output-vlan-map</b> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3R2 for EX Series switches. Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.
<b>Description</b>	<p>Specify the VLAN rewrite operation to replace a VLAN tag. The outer VLAN tag of the frame is overwritten with the user-specified VLAN tag information.</p> <p>On MX Series routers, you can enter this statement on Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces, 10-Gigabit Ethernet LAN/WAN PIC, aggregated Ethernet using Gigabit Ethernet IQ interfaces, and 100-Gigabit Ethernet Type 5 PIC with CFP. On EX Series switches, you can enter this statement on Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces.</p>
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Rewriting the VLAN Tag on Tagged Frames</i></li><li>• <i>Configuring Q-in-Q Tunneling (CLI Procedure)</i></li></ul>

## vlan-id-list

<b>Syntax</b>	<code>vlan-id-list [ <i>vlan-id-numbers</i> ];</code>
<b>Hierarchy Level</b>	<p>[edit bridge-domains <i>bridge-domain-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> bridge-domains <i>bridge-domain-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i>]</p> <p>[edit interfaces <i>interface-name</i> unit 0],</p> <p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>],</p> <p>[edit vlans <i>vlan-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.4.</p> <p>Support for logical systems added in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2 for the QFX Series.</p>
<b>Description</b>	<p>Specify a VLAN identifier list to use for a bridge domain or VLAN in trunk mode.</p> <p>Specify the <b>trunk</b> option in the <b>interface-mode</b> statement to accept packets with a VLAN ID that matches the list of VLAN IDs specified in the <b>vlan-id-list</b> statement to forward the packet within the bridge domain or VLAN configured with the matching VLAN ID. Specify the <b>access</b> option to accept packets with no VLAN ID to forward the packet within the bridge domain or VLAN configured with the VLAN ID that matches the VLAN ID specified in the <b>vlan-id</b> statement.</p> <p>This statement also enables you to bind a logical interface to a list of VLAN IDs, thereby configuring the logical interface to receive and forward a frame with a tag that matches the specified VLAN ID list.</p>
<b>Options</b>	<p><b><i>vlan-id-numbers</i></b>—Valid VLAN identifiers. You can combine individual numbers with range lists including a hyphen.</p> <p><b>Range:</b> 0 through 4095</p>

**NOTE:** On EX Series switches and the QFX Series, the range is 0 through 4094.

<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

## CHAPTER 16

# Administration

- [Routine Monitoring on page 1827](#)
- [Monitoring Commands on page 1835](#)

## Routine Monitoring

---

- [Verifying That MAC Notification Is Working Properly on page 1827](#)
- [Verifying That a Series of Tagged VLANs Has Been Created on page 1827](#)
- [Verifying That a Private VLAN Is Working on page 1829](#)
- [Verifying That Proxy ARP Is Working Correctly on page 1834](#)

### Verifying That MAC Notification Is Working Properly

**Purpose** Verify that MAC notification is enabled or disabled, and that the MAC notification interval is set to the specified value.

**Action** To verify that MAC notification is enabled or disabled and also to verify the MAC notification interval setting.

```
user@switch> show ethernet-switching mac-notification
Notification Status: Enabled
Notification Interval: 60
Notifications Sent      : 0
Notifications Table Maxsize : 256
```

**Meaning** The output in the **Notification Status** field shows that MAC notification is enabled. The output in the **Notification Status** field would display **Disabled** if MAC notification was disabled.

The **Notification Interval** field output shows that the MAC notification interval is set to 60 seconds.

**Related Documentation**

- [Configuring MAC Notification](#)
- [Configuring MAC Notification \(CLI Procedure\) on page 1682](#)

### Verifying That a Series of Tagged VLANs Has Been Created

**Purpose** Verify that a series of tagged VLANs has been created on the switch.

- Action** 1. Display the VLANs in the ascending order of their VLAN ID:

```
user@switch> show vlans sort-by tag
```

Name	Tag	Interfaces
__employee_120__	120	xe-0/0/22.0*
__employee_121__	121	xe-0/0/22.0*
__employee_122__	122	xe-0/0/22.0*
__employee_123__	123	xe-0/0/22.0*
__employee_124__	124	xe-0/0/22.0*
__employee_125__	125	xe-0/0/22.0*
__employee_126__	126	xe-0/0/22.0*
__employee_127__	127	xe-0/0/22.0*
__employee_128__	128	xe-0/0/22.0*
__employee_129__	129	xe-0/0/22.0*
__employee_130__	130	xe-0/0/22.0*

2. Display the VLANs by the alphabetical order of the VLAN name:

```
user@switch> show vlans sort-by name
```

Name	Tag	Interfaces
__employee_120__	120	xe-0/0/22.0*
__employee_121__	121	xe-0/0/22.0*
__employee_122__	122	xe-0/0/22.0*
__employee_123__	123	xe-0/0/22.0*
__employee_124__	124	xe-0/0/22.0*
__employee_125__	125	xe-0/0/22.0*
__employee_126__	126	xe-0/0/22.0*
__employee_127__	127	xe-0/0/22.0*
__employee_128__	128	xe-0/0/22.0*
__employee_129__	129	xe-0/0/22.0*
__employee_130__	130	xe-0/0/22.0*

3. Display the VLANs by specifying the VLAN range name (here, the VLAN range name is **employee**):

```
user@switch> show vlans employee
```

Name	Tag	Interfaces
__employee_120__	120	xe-0/0/22.0*
__employee_121__	121	xe-0/0/22.0*
__employee_122__	122	xe-0/0/22.0*
__employee_123__	123	xe-0/0/22.0*
__employee_124__	124	xe-0/0/22.0*
__employee_125__	125	xe-0/0/22.0*
__employee_126__	126	xe-0/0/22.0*
__employee_127__	127	xe-0/0/22.0*
__employee_128__	128	xe-0/0/22.0*
__employee_129__	129	xe-0/0/22.0*
__employee_130__	130	xe-0/0/22.0*

**Meaning** The sample output shows the VLANs configured on the switch. The series of tagged VLANs is displayed: **\_\_employee\_120\_\_** through **\_\_employee\_130\_\_**. Each of the tagged VLANs is configured on the trunk interface **xe-0/0/22.0**. The asterisk (\*) next to the interface name indicates that the interface is **UP**.

When a series of VLANs is created using the **vlan-range** statement, the VLAN names are preceded and followed by a double underscore.

- Related Documentation**
- *Creating a Series of Tagged VLANs*
  - [Creating a Series of Tagged VLANs on page 1680](#)

## Verifying That a Private VLAN Is Working

**Purpose** After creating and configuring private VLANs (PVLANS), verify that they are set up properly.

**Action** 1. To determine whether you successfully created the primary and secondary VLAN configurations:

- For a PVLAN on a single switch, use the **show configuration vlans** command:

```
user@switch> show configuration vlans
community1 {
    interface {
        interface a;
        interface b;
    }
    primary-vlan pvlan;
}
community2 {
    interface {
```

```

        interface d;
        interface e;
    }
    primary-vlan pvlan;
}
pvlan {
    vlan-id 1000;
    interface {
        isolated1;
        isolated2;
        trunk1;
        trunk2;
    }
    no-local-switching;
}

```

- For a PVLAN spanning multiple switches, use the **show vlans extensive** command:

```

user@switch> show vlans extensive
VLAN: COM1, Created at: Tue May 11 18:16:05 2010

```

2. Use the **show vlans extensive** command to view VLAN information and link status for a PVLAN on a single switch or for a PVLAN spanning multiple switches.

- For a PVLAN on a single switch:

```

user@switch> show vlans pvlan extensive
VLAN: pvlan, Created at: time
802.1Q Tag: vlan-id, Internal index: index-number, Admin State: Enabled,
Origin: Static
Private VLAN Mode: Primary
Protocol: Port Mode
Number of interfaces: Tagged 2 (Active = 0), Untagged 6 (Active = 0)
    trunk1, tagged, trunk
    interface a, untagged, access
    interface b, untagged, access
    interface c, untagged, access
    interface d, untagged, access
    interface e, untagged, access
    interface f, untagged, access
    trunk2, tagged, trunk
Secondary VLANs: Isolated 2, Community 2
Isolated VLANs :
    __pvlan_pvlan_isolated1__
    __pvlan_pvlan_isolated2__
Community VLANs :

```

```
community1
community2
```

- For a PVLAN spanning multiple switches:

```
user@switch> show vlans extensive
VLAN: COM1, Created at: Tue May 11 18:16:05 2010
802.1Q Tag: 100, Internal index: 3, Admin State: Enabled, Origin: Static
Private VLAN Mode: Community, Primary VLAN: primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 3 (Active = 3), Untagged 1 (Active = 1)
    ge-0/0/20.0*, tagged, trunk
    ge-0/0/22.0*, tagged, trunk, pvlan-trunk
    ge-0/0/23.0*, tagged, trunk, pvlan-trunk
    ge-0/0/7.0*, untagged, access

    ge-0/0/2.0, untagged, access

VLAN: __pvlan_primary_isiv__, Created at: Tue May 11 18:16:05 2010
802.1Q Tag: 50, Internal index: 7, Admin State: Enabled, Origin: Static
Private VLAN Mode: Inter-switch-isolated, Primary VLAN: primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 3 (Active = 3), Untagged 0 (Active = 0)
    ge-0/0/20.0*, tagged, trunk
    ge-0/0/22.0*, tagged, trunk, pvlan-trunk
    ge-0/0/23.0*, tagged, trunk, pvlan-trunk

VLAN: community2, Created at: Tue May 11 18:16:05 2010
802.1Q Tag: 20, Internal index: 8, Admin State: Enabled, Origin: Static
Private VLAN Mode: Community, Primary VLAN: primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 3 (Active = 3), Untagged 2 (Active = 2)
    ge-0/0/20.0*, tagged, trunk
    ge-0/0/22.0*, tagged, trunk, pvlan-trunk
    ge-0/0/23.0*, tagged, trunk, pvlan-trunk
    ge-0/0/1.0*, untagged, access
    ge-1/0/6.0*, untagged, access

VLAN: primary, Created at: Tue May 11 18:16:05 2010
802.1Q Tag: 10, Internal index: 2, Admin State: Enabled, Origin: Static
```

```

Private VLAN Mode: Primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 3 (Active = 3), Untagged 5 (Active = 4)
    ge-0/0/20.0*, tagged, trunk
    ge-0/0/22.0*, tagged, trunk, pvlan-trunk
    ge-0/0/23.0*, tagged, trunk, pvlan-trunk
    ge-0/0/0.0*, untagged, access
    ge-0/0/1.0*, untagged, access
    ge-0/0/2.0, untagged, access
    ge-0/0/7.0*, untagged, access
    ge-1/0/6.0*, untagged, access

Secondary VLANs: Isolated 2, Community 2, Inter-switch-isolated 1
Isolated VLANs :
    __pvlan_primary_ge-0/0/0.0__
    __pvlan_primary_ge-0/0/2.0__
Community VLANs :
    COM1
    community2
Inter-switch-isolated VLAN :
    __pvlan_primary_isiv__

```

3. Use the **show ethernet-switching table** command to view logs for MAC learning on the VLANs:

```

user@switch> show ethernet-switching table
Ethernet-switching table: 8 entries, 1 learned

```

VLAN	MAC address	Type	Age	Interfaces
default	*	Flood	-	All-members
pvlan	*	Flood	-	All-members
pvlan	MAC1	Replicated	-	interface a
pvlan	MAC2	Replicated	-	interface c
pvlan	MAC3	Replicated	-	isolated2
pvlan	MAC4	Learn	0	trunk1
__pvlan_pvlan_isolated1__ *		Flood	-	All-members
__pvlan_pvlan_isolated1__ MAC4		Replicated	-	trunk1
__pvlan_pvlan_isolated2__ *		Flood	-	All-members
__pvlan_pvlan_isolated2__ MAC3		Learn	0	isolated2
__pvlan_pvlan_isolated2__ MAC4		Replicated	-	trunk1
community1	*	Flood	-	All-members
community1	MAC1	Learn	0	interface a
community1	MAC4	Replicated	-	trunk1
community2	*	Flood	-	All-members

community2	MAC2	Learn	0 interface c
community2	MAC4	Replicated	- trunk1

**NOTE:** If you have configured a PVLAN spanning multiple switches, you can use the same command on all the switches to check the logs for MAC learning on those switches.

**Meaning** In the output displays for a PVLAN on a single switch, you can see that the primary VLAN contains two community domains (**community1** and **community2**), two isolated ports, and two trunk ports. The PVLAN on a single switch has only one tag (1000), which is for the primary VLAN.

The PVLAN that spans multiple switches contains multiple tags:

- The community domain **COM1** is identified with tag **100**.
- The community domain **community2** is identified with tag **20**.
- The interswitch isolated domain is identified with tag **50**.
- The primary VLAN **primary** is identified with tag **10**.

Also, for the PVLAN that spans multiple switches, the trunk interfaces are identified as **pvlan-trunk**.

## Verifying That Proxy ARP Is Working Correctly

**Purpose** Verify that the switch is sending proxy ARP messages.

**Action** List the system statistics for ARP:

```
user@switch> show system statistics arp
arp:
  90060 datagrams received
  34 ARP requests received
  610 ARP replies received
  2 resolution request received
  0 unrestricted proxy requests
  0 restricted proxy requests
  0 received proxy requests
  0 unrestricted proxy requests not proxied
  0 restricted proxy requests not proxied
```

```

0 datagrams with bogus interface
0 datagrams with incorrect length
0 datagrams for non-IP protocol
0 datagrams with unsupported op code
0 datagrams with bad protocol address length
0 datagrams with bad hardware address length
0 datagrams with multicast source address
0 datagrams with multicast target address
0 datagrams with my own hardware address
0 datagrams for an address not on the interface
0 datagrams with a broadcast source address
294 datagrams with source address duplicate to mine
89113 datagrams which were not for me
0 packets discarded waiting for resolution
0 packets sent after waiting for resolution
309 ARP requests sent
35 ARP replies sent
0 requests for memory denied
0 requests dropped on entry
0 requests dropped during retry
0 requests dropped due to interface deletion
0 requests on unnumbered interfaces
0 new requests on unnumbered interfaces
0 replies for from unnumbered interfaces
0 requests on unnumbered interface with non-subnetted donor
0 replies from unnumbered interface with non-subnetted donor

```

**Meaning** The statistics show that two proxy ARP requests were received. The **unrestricted proxy requests not proxied** and **restricted proxy requests not proxied** fields indicate that all the unproxied ARP requests received have been proxied by the switch.

## clear ethernet-switching bpdu-error

<b>Syntax</b>	<code>clear ethernet-switching bpdu-error interface <i>interface-name</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.1 for EX Series switches. Command updated in Junos OS Release 11.1 for EX Series switches—a BPDU error shuts down the interface and this command brings the interface back up. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear bridge protocol data unit (BPDU) errors from an interface and bring up the interface.
<b>Options</b>	<i>interface-name</i> —Clear BPDU errors on the specified interface.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show spanning-tree interface on page 1875</a></li> <li>• <a href="#">Understanding BPDU Protection for STP, RSTP, and MSTP on EX Series Switches</a></li> <li>• <a href="#">Understanding BPDU Protection for STP, RSTP, and MSTP on page 1558</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear ethernet-switching bpdu-error interface on page 1837</a>

### Sample Output

#### clear ethernet-switching bpdu-error interface

```
user@switch> clear ethernet-switching bpdu-error interface xe-0/0/1.0
```

## clear ethernet-switching layer2-protocol-tunneling error

---

<b>Syntax</b>	clear ethernet-switching layer2-protocol-tunneling error <interface <i>interface-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 10.0 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Clear Layer 2 protocol tunneling (L2PT) errors on one or more interfaces. If an interface has been disabled because the amount of Layer 2 protocol traffic exceeded the shutdown threshold or because the switch has detected an error in the network topology or configuration, use this command to reenable the interface.
<b>Options</b>	<b>none</b> —Clears L2PT errors on all interfaces.  <b>interface <i>interface-name</i></b> —(Optional) Clear L2PT errors on the specified interface.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Configuring Layer 2 Protocol Tunneling on EX Series Switches</i></li><li>• <i>Configuring Layer 2 Protocol Tunneling on EX Series Switches (CLI Procedure)</i></li><li>• <i>Configuring Layer 2 Protocol Tunneling</i></li></ul>
<b>List of Sample Output</b>	<a href="#">clear ethernet-switching layer2-protocol-tunneling error on page 1838</a> <a href="#">clear ethernet-switching layer2-protocol-tunneling error interface xe-0/0/1.0 on page 1838</a>

### Sample Output

#### clear ethernet-switching layer2-protocol-tunneling error

```
user@switch> clear ethernet-switching layer2-protocol-tunneling error
```

#### clear ethernet-switching layer2-protocol-tunneling error interface xe-0/0/1.0

```
user@switch> clear ethernet-switching layer2-protocol-tunneling error interface xe-0/0/1.0
```

## clear ethernet-switching layer2-protocol-tunneling statistics

<b>Syntax</b>	clear ethernet-switching layer2-protocol-tunneling statistics <interface <i>interface-name</i> > <vlan <i>vlan-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 10.0 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Clear Layer 2 protocol tunneling (L2PT) statistics on one or more interfaces or VLANs.
<b>Options</b>	<p><b>none</b>—Clear L2PT statistics on all interfaces and VLANs.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Clear L2PT statistics on the specified interface.</p> <p><b>vlan <i>vlan-name</i></b>—(Optional) Clear L2PT statistics on the specified VLAN.</p>

user@switch> clear ethernet-switching layer2-protocol-tunneling statistics vlan v2
```

## clear ethernet-switching table

---

<b>Syntax</b>	clear ethernet-switching table <interface <i>interface-name</i> > <mac <i>mac-address</i> > <management-vlan> <persistent-mac < <i>interface</i>   <i>mac-address</i> >> <vlan <i>vlan-name</i> >
<b>Syntax (QFX Series)</b>	clear ethernet-switching table <interface <i>interface-name</i> > <mac <i>mac-address</i> > <persistent-mac < <i>interface</i>   <i>mac-address</i> >> <vlan <i>vlan-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 9.3 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<div> <b>NOTE:</b> On a QFabric system, using this command on an FCoE-enabled VLAN when FCoE sessions are active can cause traffic flooding and FCoE traffic drop. The FCoE sessions are not terminated and the traffic reconverges after a short period of time.</div> <div>Clear learned entries, which are media access control (MAC) addresses, in the Ethernet switching table (also called the forwarding database table).</div>
<b>Options</b>	<p><b>none</b>—Clear learned entries in the Ethernet switching table, except for persistent MAC addresses.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Clear all learned MAC addresses for the specified interface from the Ethernet switching table.</p> <p><b>mac <i>mac-address</i></b>—(Optional) Clear the specified learned MAC address from the Ethernet switching table.</p> <p><b>management-vlan</b>—(Optional) Clear all MAC addresses learned for the management VLAN from the Ethernet switching table. Note that you do not specify a VLAN name because only one management VLAN exists.</p> <p><b>persistent-mac &lt;<i>interface</i>   <i>mac-address</i>&gt;</b>—(Optional) Clear all MAC addresses, including persistent MAC addresses. Use the <b>interface</b> option to clear all MAC addresses on an interface, or use the <b>mac-address</b> option to clear all entries for a specific MAC address.</p> <p>Use this command whenever you move a device in your network that has a persistent MAC address on the switch. If you move the device to another port on the switch and do not clear the persistent MAC address from the original port it was learned on, then the new port will not learn the MAC address and the device will not be able to connect. If the original port is down when you move the device, then the new port</p>

will learn the MAC address and the device can connect—however, unless you cleared the MAC address on the original port, when the port comes back up, the system reinstalls the persistent MAC address in the forwarding table for that port. If this occurs, the address is removed from the new port and the device loses connectivity.

**vlan *vlan-name***—(Optional) Clear all MAC addresses learned for the specified VLAN from the Ethernet switching table.

**Required Privilege Level**

## show ethernet-switching layer2-protocol-tunneling interface

<b>Syntax</b>	<code>show ethernet-switching-layer2-protocol-tunneling interface</code> <code>&lt;interface-name&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.0 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Display information about Layer 2 protocol tunneling (L2PT) on interfaces that have been configured for L2PT.
<b>Options</b>	<b>none</b> —Display L2PT information about all interfaces on which L2PT is enabled. <b>interface-name</b> —(Optional) Display L2PT information for the specified interface.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ethernet-switching layer2-protocol-tunneling statistics on page 1849</a></li> <li>• <a href="#">show ethernet-switching layer2-protocol-tunneling vlan on page 1852</a></li> <li>• <i>Configuring Layer 2 Protocol Tunneling on EX Series Switches (CLI Procedure)</i></li> <li>• <a href="#">show ethernet-switching layer2-protocol-tunneling statistics on page 1849</a></li> <li>• <a href="#">show ethernet-switching layer2-protocol-tunneling vlan on page 1852</a></li> <li>• <i>Configuring Layer 2 Protocol Tunneling</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ethernet-switching layer2-protocol-tunneling interface on page 1848</a> <a href="#">show ethernet-switching layer2-protocol-tunneling interface xe-0/0/0.0 on page 1848</a>
<b>Output Fields</b>	Table 115 on page 1847 lists the output fields for the <b>show ethernet-switching layer2-protocol-tunneling interface</b> command. Output fields are listed in the approximate order in which they appear.

Table 115: show ethernet-switching layer2-protocol-tunneling interface Output Fields

Field Name	Field Description
<b>Interface</b>	Name of an interface on the switch.
<b>Operation</b>	Type of operation being performed on the interface. Values are <b>Encapsulation</b> and <b>Decapsulation</b> .
<b>State</b>	State of the interface. Values are <b>active</b> and <b>shutdown</b> .
<b>Description</b>	If the interface state is <b>shutdown</b> , displays why the interface is shut down. If the description says <b>Loop detected</b> , it means that the interface is an access interface that has received L2PT-enabled PDUs. Access interfaces should not receive L2PT-enabled PDUs. This scenario might mean that there is a loop in the network.

## Sample Output

### show ethernet-switching layer2-protocol-tunneling interface

```
user@switch> show ethernet-switching layer2-protocol-tunneling interface
```

Layer2 Protocol Tunneling information:

Interface	Operation	State	Description
xe-0/0/0.0	Encapsulation	Shutdown	Shutdown threshold exceeded
xe-0/0/1.0	Decapsulation	Shutdown	Loop detected
xe-0/0/2.0	Decapsulation	Active	

### show ethernet-switching layer2-protocol-tunneling interface xe-0/0/0.0

```
user@switch> show ethernet-switching layer2-protocol-tunneling interface xe-0/0/0.0
```

Layer2 Protocol Tunneling information:

Interface	Operation	State	Description
xe-0/0/0.0	Encapsulation	Shutdown	Shutdown threshold exceeded

## show ethernet-switching layer2-protocol-tunneling statistics

<b>Syntax</b>	show ethernet-switching-layer2-protocol-tunneling statistics <interface <i>interface-name</i> > <vlan <i>vlan-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 10.0 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Display Layer 2 protocol tunneling (L2PT) statistics for Layer 2 PDU packets received by the switch.
<div>  <b>NOTE:</b> The show ethernet-switching-layer2-protocol-tunneling statistics command does not display L2PT statistics for Layer 2 PDU packets transmitted from the switch. </div>	
<b>Options</b>	<p><b>none</b>—Display L2PT statistics for all interfaces on which you enabled L2PT.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Display L2PT statistics for the specified interface.</p> <p><b>vlan <i>vlan-name</i></b>—(Optional) Display L2PT statistics for the specified VLAN.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear ethernet-switching layer2-protocol-tunneling statistics on page 1839</a></li> <li>• <a href="#">show ethernet-switching layer2-protocol-tunneling interface on page 1847</a></li> <li>• <a href="#">show ethernet-switching layer2-protocol-tunneling vlan on page 1852</a></li> <li>• <a href="#">show vlans</a></li> <li>• <a href="#">Example: Configuring Layer 2 Protocol Tunneling on EX Series Switches</a></li> <li>• <a href="#">Configuring Layer 2 Protocol Tunneling on EX Series Switches (CLI Procedure)</a></li> <li>• <a href="#">show vlans on page 1886</a></li> <li>• <a href="#">Configuring Layer 2 Protocol Tunneling</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ethernet-switching layer2-protocol-tunneling statistics on page 1850</a> <a href="#">show ethernet-switching layer2-protocol-tunneling statistics interface xe-0/0/0.0 on page 1850</a> <a href="#">show ethernet-switching layer2-protocol-tunneling statistics vlan v2 on page 1850</a>
<b>Output Fields</b>	Table 116 on page 1850 lists the output fields for the <b>show ethernet-switching layer2-protocol-tunneling statistics</b> command. Output fields are listed in the approximate order in which they appear.

Table 116: show ethernet-switching layer2-protocol-tunneling statistics Output Fields

VLAN	Field Description
<b>VLAN</b>	Name of a VLAN on which L2PT has been configured.
<b>Interface</b>	Name of an interface on which L2PT has been configured.
<b>Protocol</b>	Name of a protocol for which L2PT has been enabled. Values are <b>all</b> , <b>802.1x</b> , <b>802.3ah</b> , <b>cdp</b> , <b>e-lmi</b> , <b>gvrp</b> , <b>lACP</b> , <b>lldp</b> , <b>mmrp</b> , <b>mvrp</b> , <b>stp</b> , <b>udld</b> , <b>vstp</b> , and <b>vtp</b> .
<b>Operation</b>	Type of operation being performed on the interface. Values are <b>Encapsulation</b> and <b>Decapsulation</b> .
<b>Packets</b>	Number of packets that have been encapsulated or de-encapsulated.
<b>Drops</b>	Number of packets that have exceeded the drop threshold and have been dropped.
<b>Shutdowns</b>	Number of times that packets have exceeded the shutdown threshold and the interface has been shut down.

## Sample Output

### show ethernet-switching layer2-protocol-tunneling statistics

```
user@switch> show ethernet-switching layer2-protocol-tunneling statistics
```

```
Layer2 Protocol Tunneling Statistics:
VLAN  Interface  Protocol  Operation  Packets  Drops  Shutdowns
v1    xe-0/0/0.0  mvrp     Encapsulation  0        0      0

## show ethernet-switching layer2-protocol-tunneling vlan

<b>Syntax</b>	show ethernet-switching-layer2-protocol-tunneling vlan <vlan-name>
<b>Release Information</b>	Command introduced in Junos OS Release 10.0 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Display information about Layer 2 protocol tunneling (L2PT) on VLANs that have been configured for L2PT.
<b>Options</b>	<b>none</b> —Display information about L2PT for the VLANs on which you have configured L2PT. <b>vlan-name</b> —(Optional) Display information about L2PT for the specified VLAN.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ethernet-switching layer2-protocol-tunneling interface on page 1847</a></li> <li>• <a href="#">show ethernet-switching layer2-protocol-tunneling statistics on page 1849</a></li> <li>• <a href="#">show vlans</a></li> <li>• <a href="#">Example: Configuring Layer 2 Protocol Tunneling on EX Series Switches</a></li> <li>• <a href="#">Configuring Layer 2 Protocol Tunneling on EX Series Switches (CLI Procedure)</a></li> <li>• <a href="#">show vlans on page 1886</a></li> <li>• <a href="#">Configuring Layer 2 Protocol Tunneling</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ethernet-switching layer2-protocol-tunneling vlan on page 1853</a> <a href="#">show ethernet-switching layer2-protocol-tunneling vlan v2 on page 1853</a>
<b>Output Fields</b>	Table 117 on page 1852 lists the output fields for the <b>show ethernet-switching layer2-protocol-tunneling vlan</b> command. Output fields are listed in the approximate order in which they appear.

Table 117: show ethernet-switching layer2-protocol-tunneling vlan Output Fields

Field Name	Field Description
VLAN	Name of the VLAN on which L2PT has been configured.
Protocol	Name of a protocol for which L2PT has been enabled. Values are <b>all</b> , <b>802.1x</b> , <b>802.3ah</b> , <b>cdp</b> , <b>e-lmi</b> , <b>gvrp</b> , <b>lACP</b> , <b>lldp</b> , <b>mmrp</b> , <b>mvrp</b> , <b>stp</b> , <b>vstp</b> , and <b>vtp</b> .
Drop Threshold	Maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the VLAN before the switch begins dropping the Layer 2 PDUs.
Shutdown Threshold	Maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the VLAN before the interface is disabled.

## Sample Output

### show ethernet-switching layer2-protocol-tunneling vlan

```
user@switch> show ethernet-switching layer2-protocol-tunneling vlan
```

```
Layer2 Protocol Tunneling VLAN information:
VLAN          Protocol      Drop          Shutdown
                Threshold Threshold
v1             mvrp          100           200
v2             cdp            0             0
v2             cdp            0             0
v2             gvrp           0             0
```

### show ethernet-switching layer2-protocol-tunneling vlan v2

```
user@switch> show ethernet-switching layer2-protocol-tunneling vlan v2
```

```
Layer2 Protocol Tunneling VLAN information:
VLAN          Protocol      Drop          Shutdown
                Threshold Threshold
v2             cdp            0             0
v2             cdp            0             0
v2             gvrp           0             0
```

## show ethernet-switching mac-learning-log

<b>Syntax</b>	show ethernet-switching mac-learning-log
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Displays the event log of learned MAC addresses.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ethernet-switching table on page 1864</a></li> <li>• <a href="#">show ethernet-switching interfaces on page 1482</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ethernet-switching mac-learning-log on page 1854</a>
<b>Output Fields</b>	Table 118 on page 1854 lists the output fields for the <b>show ethernet-switching mac-learning-log</b> command. Output fields are listed in the approximate order in which they appear.

Table 118: show ethernet-switching mac-learning-log Output Fields

Field Name	Field Description
<b>Date and Time</b>	Timestamp in UTC when the MAC operation occurred.
<b>vlan_name</b>	VLAN name. A value defined by the user for all user-configured VLANs. The name of the VLAN on which the MAC is learned.
<b>MAC</b>	Learned MAC address.
<b>Event op</b>	MAC address that are added, learned, deleted, changed or moved from one interface to another interface.
<b>Interface Name</b>	The name of the interface on which the MAC address is learned. When a MAC address is moved, there is another field with the name of the interface. The log displays the name of the interface from where the MAC address moved, and the name of the interface to where the MAC address moved.
<b>Flags</b>	Displays the MAC address flags in which the MAC event occurred. This option is for debugging purposes.

## Sample Output

### show ethernet-switching mac-learning-log

```

user@switch> show ethernet-switching mac-learning-log
Mon Jun 30 13:49:49 2014 vlan_name v11+11 mac 00:10:94:00:00:02 was learned on
ge-1/0/22.0 with flags: 0x2001f    << MAC address that as dynamically learned
Mon Jun 30 13:50:29 2014 vlan_name v11+11 mac 00:10:94:00:00:02 was deleted from
ge-1/0/22.0 with flags: 0x1080    << MAC address that was deleted
Mon Jun 30 13:51:28 2014 vlan_name v11+11 mac 00:00:00:01:01:01 was added to
ge-1/0/22.0 with flags: 0x2013f    << Static MAC address that was added
Mon Jun 30 13:51:46 2014 vlan_name v11+11 mac 00:00:00:01:01:01 was deleted from

```

```
ge-1/0/22.0 with flags: 0x1120 << delete of Static MAC address that was deleted
Mon Jun 30 13:52:03 2014 vlan_name v11+11 mac 00:10:94:00:00:02 was learned on
ge-1/0/22.0 with flags: 0x2001f << MAC address that was dynamically learned
Mon Jun 30 13:52:11 2014 vlan_name v11+11 mac 00:10:94:00:00:02 was moved from
ge-1/0/22.0 to ge-1/0/21.0 with flags: 0x2101f << MAC address that was moved
Mon Jun 30 13:54:24 2014 vlan_name v11+11 mac 00:10:94:00:00:02 was changed on
ge-1/0/21.0 with flags: 0x2113f << MAC address that changed from a dynamic
address to a static address
```

## show ethernet-switching mac-notification

<b>Syntax</b>	show ethernet-switching mac-notification
<b>Release Information</b>	Command introduced in Junos OS Release 9.6 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display information about MAC notification.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Verifying That MAC Notification Is Working Properly</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ethernet-switching mac-notification (MAC Notification Enabled) on page 1856</a> <a href="#">show ethernet-switching mac-notification (MAC Notification Disabled) on page 1856</a>
<b>Output Fields</b>	Table 119 on page 1856 lists the output fields for the <b>show ethernet-switching mac-notification</b> command. Output fields are listed in the order in which they appear.

Table 119: show ethernet-switching mac-notification Output Fields

Field Name	Field Description
<b>Notification Status</b>	MAC notification status: <ul style="list-style-type: none"> <li>• <b>Enabled</b>—MAC notification is enabled.</li> <li>• <b>Disabled</b>—MAC notification is disabled.</li> </ul>
<b>Notification Interval</b>	MAC notification interval in seconds.
<b>Notifications Sent</b>	Number of notifications sent to SNMP when MACs are learned or when MACs age out.
<b>Notifications Table Maxsize</b>	Maximum size of the notification table, which is populated when notifications are sent to the SNMP server.

### Sample Output

#### show ethernet-switching mac-notification (MAC Notification Enabled)

```

user@switch> show ethernet-switching mac-notification
Notification Status           : Enabled
Notification Interval         : 30
Notifications Sent            : 0
Notifications Table Maxsize   : 256

```

### Sample Output

#### show ethernet-switching mac-notification (MAC Notification Disabled)

```

user@switch> show ethernet-switching mac-notification
Notification Status           : Disabled
Notification Interval         : 0

```

Notifications Sent : 0  
Notifications Table Maxsize : 256

## show ethernet-switching statistics aging

<b>Syntax</b>	show ethernet-switching statistics aging <brief   detail>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display media access control (MAC) aging statistics.
<b>Options</b>	<b>none</b> —(Optional) Display MAC aging statistics. <b>brief   detail</b> —(Optional) Display the specified level of output.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ethernet-switching statistics mac-learning on page 1860</a></li> <li>• <a href="#">mac-table-aging-time on page 1794</a></li> <li>• <i>Configuring MAC Table Aging</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ethernet-switching statistics aging on page 1859</a>
<b>Output Fields</b>	Table 120 on page 1858 lists the output fields for the <b>show ethernet-switching statistics aging</b> command. Output fields are listed in the approximate order in which they appear.

Table 120: show ethernet-switching statistics aging Output Fields

Field Name	Field Description	Level of Output
<b>Total age messages received</b>	Total number of aging messages received from the hardware.	All levels
<b>Immediate aging</b>	Aging message indicating that the entry should be removed immediately.	All levels
<b>MAC address seen</b>	Aging message indicating that the MAC address has been detected by hardware and that the aging timer should be stopped.	All levels
<b>MAC address not seen</b>	Aging message indicating that the MAC address has not been detected by the hardware and that the aging timer should be started.	All levels
<b>Error age messages</b>	The received aging message contains the following errors: <ul style="list-style-type: none"> <li>• <b>Invalid VLAN</b>—The VLAN of the packet does not exist.</li> <li>• <b>No such entry</b>—The MAC address and VLAN pair provided by the aging message does not exist.</li> <li>• <b>Static entry</b>—An unsuccessful attempt was made to age out a static MAC entry.</li> </ul>	All levels

## Sample Output

### show ethernet-switching statistics aging

```
user@switch> show ethernet-switching statistics aging
```

```
Total age messages received: 0
```

```
Immediate aging: 0, MAC address seen: 0, MAC address not seen: 0
```

```
Error age messages: 0
```

```
Invalid VLAN: 0, No such entry: 0, Static entry: 0
```

## show ethernet-switching statistics mac-learning

---

<b>Syntax</b>	<code>show ethernet-switching statistics mac-learning</code> <code>&lt;brief   detail&gt;</code> <code>&lt;interface <i>interface-name</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.4 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display media access control (MAC) learning statistics.
<b>Options</b>	<b>none</b> —(Optional) Display MAC learning statistics for all interfaces.  <b>brief   detail</b> —(Optional) Display the specified level of output. The default is <b>brief</b> .  <b>interface <i>interface-name</i></b> —(Optional) Display MAC learning statistics for the specified interface.

## show ethernet-switching table

<b>Syntax</b>	show ethernet-switching table <brief   detail   extensive   summary> <interface <i>interface-name</i> > <management-vlan> <sort-by ( <i>name</i>   <i>tag</i> )> <vlan <i>vlan-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series. Output for private VLANs introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Displays the Ethernet switching table.
<b>Options</b>	<p><b>none</b>—(Optional) Display brief information about the Ethernet switching table.</p> <p><b>brief   detail   extensive   summary</b>—(Optional) Display the specified level of output.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Display the Ethernet switching table for a specific interface.</p> <p><b>management-vlan</b>—(Optional) Display the Ethernet switching table for a management VLAN.</p> <p><b>sort-by (<i>name</i>   <i>tag</i>)</b>—(Optional) Display VLANs in ascending order of VLAN IDs or VLAN names.</p> <p><b>vlan <i>vlan-name</i></b>—(Optional) Display the Ethernet switching table for a specific VLAN.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1588</a></li> <li>• <a href="#">Example: Setting Up Bridging with Multiple VLANs</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ethernet-switching table on page 1865</a> <a href="#">show ethernet-switching table (Private VLANs) on page 1866</a> <a href="#">show ethernet-switching table brief on page 1866</a> <a href="#">show ethernet-switching table detail on page 1866</a> <a href="#">show ethernet-switching table extensive on page 1868</a> <a href="#">show ethernet-switching table interface on page 1869</a>
<b>Output Fields</b>	<a href="#">Table 122 on page 1864</a> lists the output fields for the <b>show ethernet-switching table</b> command. Output fields are listed in the approximate order in which they appear.

**Table 122: show ethernet-switching table Output Fields**

Field Name	Field Description	Level of Output
VLAN	Name of a VLAN.	All levels

Table 122: show ethernet-switching table Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>MAC address</b>	MAC address associated with the VLAN.	All levels
<b>Type</b>	Type of MAC address: <ul style="list-style-type: none"> <li>• <b>static</b>—The MAC address is manually created.</li> <li>• <b>learn</b>—The MAC address is learned dynamically from a packet's source MAC address.</li> <li>• <b>flood</b>—The MAC address is unknown and flooded to all members.</li> </ul>	All levels
<b>Age</b>	Time remaining before the entry ages out and is removed from the Ethernet switching table.	All levels
<b>Interfaces</b>	Interface associated with learned MAC addresses or with the <b>All-members</b> option (flood entry).	All levels
<b>Learned</b>	For learned entries, the time at which the entry was added to the Ethernet switching table.	<b>detail, extensive</b>

## Sample Output

### show ethernet-switching table

```

user@switch> show ethernet-switching table
Ethernet-switching table: 57 entries, 17 learned

[show spanning-tree bridge \(RSTP\) on page 1873](#)  
[show spanning-tree bridge vlan-id \(RSTP\) on page 1874](#)

**Output Fields** [Table 123 on page 1870](#) lists the output fields for the **show spanning-tree bridge** command. Output fields are listed in the approximate order in which they appear.

**Table 123: show spanning-tree bridge Output Fields**

Field Name	Field Description
Routing instance name	Name of the routing instance under which the bridge is configured.
Enabled protocol	Spanning Tree Protocol type enabled.

Table 123: show spanning-tree bridge Output Fields (*continued*)

Field Name	Field Description
Root ID	Bridge ID of the elected spanning-tree root bridge. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge.
Root cost	Calculated cost to reach the root bridge from the bridge where the command is entered.
Root port	Interface that is the current elected root port for this bridge.
CIST regional root	Bridge ID of the elected MSTP regional root bridge.
CIST internal root cost	Calculated cost to reach the regional root bridge from the bridge where the command is entered.
Hello time	Configured number of seconds between transmissions of configuration bridge protocol data units (BPDUs).
Maximum age	Configured maximum expected arrival time of hello bridge protocol data units (BPDUs).
Forward delay	How long an STP bridge port remains in the listening and learning states before transitioning to the forwarding state.
Hop count	Configured maximum number of hops a BPDU can be forwarded in the MSTP region.
Message age	Number of elapsed seconds since the most recent BPDU was received.
Number of topology changes	Total number of STP topology changes detected since the routing device last booted.
Time since last topology change	Number of elapsed seconds since the most recent topology change.
Bridge ID (Local)	Locally configured bridge ID. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge.
Extended system ID	System identifier.
MSTI regional root	Bridge ID of the elected MSTP regional root bridge.

## Sample Output

### show spanning-tree bridge routing-instance

<b>Syntax (EX Series Switches and the QFX Series)</b>	<pre>show spanning-tree interface &lt;brief   detail&gt; &lt;msti <i>msti-id</i>&gt; &lt;vlan-id <i>vlan-id</i>&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 8.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Display the configured or calculated interface-level STP parameters.
<b>Options</b>	<p><b>none</b>—Display brief STP interface information.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>msti <i>msti-id</i></b>—(Optional) Display STP interface information for the specified MST instance.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—(Optional) Display STP interface information for the specified routing instance.</p> <p><b>vlan-id <i>vlan-id</i></b>—(Optional) Display STP interface information for the specified VLAN.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show spanning-tree interface on page 1876</a> <a href="#">show spanning-tree interface (QFX Series) on page 1877</a> <a href="#">show spanning-tree interface detail on page 1877</a> <a href="#">show spanning-tree interface msti on page 1879</a> <a href="#">show spanning-tree interface vlan-id on page 1879</a> <a href="#">show spanning-tree interface (VSTP) on page 1880</a> <a href="#">show spanning-tree interface vlan-id (VSTP) on page 1880</a>
<b>Output Fields</b>	<p><a href="#">Table 124 on page 1875</a> lists the output fields for the <b>show spanning-tree interface</b> command. Output fields are listed in the approximate order in which they appear.</p>

**Table 124: show spanning-tree Interface Output Fields**

Field Name	Field Description
<b>Interface name</b>	Interface configured to participate in the STP, RSTP, VSTP, or MSTP instance.

Table 124: show spanning-tree Interface Output Fields (*continued*)

Field Name	Field Description
<b>Port ID</b>	Logical interface identifier configured to participate in the MSTP or VSTP instance.
<b>Designated port ID</b>	Port ID of the designated port for the LAN segment to which this interface is attached.
<b>Designated bridge ID</b>	Bridge ID of the designated bridge for the LAN segment to which this interface is attached.
<b>Port Cost</b>	Configured cost for the interface.
<b>Port State</b>	STP port state: forwarding ( <b>FWD</b> ), blocking ( <b>BLK</b> ), listening, learning, or disabled.
<b>Port Role</b>	MSTP, VSTP, or RSTP port role: designated ( <b>DESG</b> ), backup ( <b>BKUP</b> ), alternate ( <b>ALT</b> ), ( <b>ROOT</b> ), or Root Prevented ( <b>Root-Prev</b> ).
<b>Link type</b>	MSTP, VSTP, or RSTP link type. Shared or point-to-point (pt-pt) and edge or nonedge.
<b>Alternate</b>	Identifies the interface as an MSTP, VSTP, or RSTP alternate root port ( <b>Yes</b> ) or nonalternate root port ( <b>No</b> ).
<b>Boundary Port</b>	Identifies the interface as an MSTP regional boundary port ( <b>Yes</b> ) or nonboundary port ( <b>No</b> ).

## show spanning-tree mstp configuration

<b>List of Syntax</b>	<a href="#">Syntax on page 1881</a> <a href="#">Syntax (EX Series Switch and the QFX Series) on page 1881</a>
<b>Syntax</b>	show spanning-tree mstp configuration <brief   detail> <routing-instance <i>routing-instance-name</i> >
<b>Syntax (EX Series Switch and the QFX Series)</b>	show spanning-tree mstp configuration <brief   detail>
<b>Release Information</b>	Command introduced in Junos OS Release 8.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the MSTP configuration.
<b>Options</b>	<b>none</b> —Display MSTP configuration information.  <b>brief   detail</b> —(Optional) Display the specified level of output.  <b>routing-instance <i>routing-instance-name</i></b> —(Optional) Display MSTP configuration information for the specified routing instance.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show spanning-tree mstp configuration detail on page 1882</a> <a href="#">show spanning-tree mstp configuration detail (QFX Series) on page 1882</a>
<b>Output Fields</b>	<a href="#">Table 125 on page 1881</a> lists the output fields for the <b>show spanning-tree mstp configuration</b> command. Output fields are listed in the approximate order in which they appear.

**Table 125: show spanning-tree mstp configuration Output Fields**

Field Name	Field Description
<b>Context id</b>	Internally generated identifier.
<b>Region name</b>	MSTP region name carried in the MSTP BPDUs.
<b>Revision</b>	Revision number of the MSTP configuration.
<b>Configuration digest</b>	Numerical value derived from the VLAN-to-instance mapping table.
<b>MSTI</b>	MST instance identifier.
<b>Member VLANs</b>	VLAN identifiers associated with the MSTI.

## Sample Output

### show spanning-tree mstp configuration detail

```
user@host> show spanning-tree mstp configuration routing-instance vs1 detail
MSTP configuration information
Context identifier      : 1
Region name            : henry
Revision               : 3
Configuration digest    : 0x6da4b5c4fd587757eef35675365e1

MSTI      Member VLANs
  0 0-99,101-199,201-4094
  1 100
  2 200
```

### show spanning-tree mstp configuration detail (QFX Series)

```
user@1f0> show spanning-tree mstp configuration routing-instance vs1 detail
MSTP configuration information
Context identifier      : 1
Region name            : henry

**Table 126: show spanning-tree statistics Output Fields**

Field Name	Field Description
Message type	Type of message being counted.
BPDUs sent	Total number of BPDUs sent.
BPDUs received	Total number of BPDUs received.
BPDUs sent in last interval	Number of BPDUs sent within a specified interval.
BPDUs received in last interval	Number of BPDUs received within a specified interval.

Table 126: show spanning-tree statistics Output Fields (*continued*)

Field Name	Field Description
<b>Interface</b>	Interface for which the statistics are being displayed.
<b>Next BPDU transmission</b>	Number of seconds until the next BPDU is scheduled to be sent.

## Sample Output

### show spanning-tree statistics routing-instance

```
user@host> show spanning-tree statistics routing-instance vs1 detail
Routing instance level STP statistics
Message type           : bpdus
BPDUs sent             : 1396
BPDUs received         : 1027
BPDUs sent in last interval : 5      (duration: 4 sec)
BPDUs received in last interval: 4    (duration: 4 sec)
```

### show spanning-tree statistics interface routing-instance detail

```
user@host> show spanning-tree statistics interface ge-11/1/4 routing-instance vs1 detail
Interface  BPDUs sent  BPDUs received  Next BPDU
                                     transmission
ge-11/1/4      7           190           0
```

## show system statistics arp

<b>Syntax</b>	show system statistics arp
<b>Release Information</b>	Command introduced in Junos OS Release 9.6 for EX Series switches.
<b>Description</b>	Display system-wide Address Resolution Protocol (ARP) statistics.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring Proxy ARP on an EX Series Switch</i></li> <li>• <a href="#">Verifying That Proxy ARP Is Working Correctly on page 1834</a></li> </ul>

## show system statistics arp

```

user@switch> show system statistics arp
arp:
    90060 datagrams received
    34 ARP requests received
    610 ARP replies received
    0 resolution request received
    0 unrestricted proxy requests
    0 restricted proxy requests
    0 received proxy requests
    0 unrestricted proxy requests not proxied
    0 restricted proxy requests not proxied
    0 datagrams with bogus interface
    0 datagrams with incorrect length
    0 datagrams for non-IP protocol
    0 datagrams with unsupported op code
    0 datagrams with bad protocol address length
    0 datagrams with bad hardware address length
    0 datagrams with multicast source address
    0 datagrams with multicast target address
    0 datagrams with my own hardware address
    0 datagrams for an address not on the interface
    0 datagrams with a broadcast source address
    294 datagrams with source address duplicate to mine
    89113 datagrams which were not for me
    0 packets discarded waiting for resolution
    0 packets sent after waiting for resolution
    309 ARP requests sent
    35 ARP replies sent
    0 requests for memory denied
    0 requests dropped on entry
    0 requests dropped during retry
    0 requests dropped due to interface deletion
    0 requests on unnumbered interfaces
    0 new requests on unnumbered interfaces
    0 replies for from unnumbered interfaces
    0 requests on unnumbered interface with non-subnetted donor
    0 replies from unnumbered interface with non-subnetted donor

```

## show vlans

**Syntax** `show vlans`  
`<brief | detail | extensive>`  
`<dot1q-tunneling>`  
`<sort-by (tag | name)>`  
`<vlan-range-name>`

**Release Information** Command introduced in Junos OS Release 11.1 for the QFX Series.  
Option **dot1q-tunneling** added in Junos OS Release 12.1 for the QFX Series.

**Description** Display information about VLANs configured on bridged Ethernet interfaces. For interfaces configured to support a VoIP VLAN and a data VLAN, the **show vlans** command displays both tagged and untagged membership for those VLANs.

**NOTE:** When a series of VLANs is created using the `vlan-range` statement, such VLAN names are preceded and followed by a double underscore. For example, a series of VLANs using the VLAN range 1 through 3 and the base VLAN name `marketing` would be displayed as `__marketing_1__`, `__marketing_2__`, and `__marketing_3__`.

**NOTE:** To display an 802.1X supplicant successfully authenticated in multiple-suppliant mode with dynamic VLAN movement, use the `show vlans vlan-name extensive` operational mode command, where `vlan-name` is the dynamic VLAN.

**Options** **none**—Display information for all VLANs. VLAN information is displayed by VLAN name in ascending order.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**sort-by (tag | name)**—(Optional) Display VLANs in ascending order of VLAN IDs or VLAN names.

**vlan-range-name**—(Optional) Display VLANs in ascending order of VLAN range names.

**Required Privilege Level** `view`

**Output Fields** Table 89 on page 1497 lists the output fields for the **show vlans** command. Output fields are listed in the approximate order in which they appear.

**Table 127: show vlans Output Fields**

Field Name	Field Description	Level of Output
<b>Name</b>	Name of a VLAN.	none, <b>brief</b>
<b>Tag</b>	802.1Q tag applied to this VLAN. If <b>none</b> is displayed, no tag is applied.	All levels
<b>Interfaces</b>	Interface associated with learned MAC addresses or <b>All-members</b> option (flood entry). An asterisk (*) beside the interface indicates that the interface is <b>UP</b> .	All levels
<b>Address</b>	IP address.	none, <b>brief</b>
<b>Ports Active /Total</b>	Number of interfaces associated with a VLAN: <b>Active</b> indicates interfaces that are <b>UP</b> , and <b>Total</b> indicates interfaces that are active and inactive.	<b>brief</b>
<b>VLAN</b>	Name of a VLAN.	<b>detail, extensive</b>
<b>Admin state</b>	State of the interface. Values are:  <b>enabled</b> —The interface is turned on, and the physical link is operational and can pass packets.	<b>detail,extensive</b>
<b>MAC learning Status</b>	Indicates if MAC learning is disabled.	<b>detail, extensive</b>
<b>Description</b>	Description for the VLAN.	<b>detail,extensive</b>
<b>Primary IP</b>	Primary IP address associated with a VLAN.	<b>detail</b>
<b>Number of interfaces</b>	Number of interfaces associated with a VLAN. Both the total number of interfaces and the number of active interfaces associated with a VLAN are displayed.	<b>detail, extensive</b>
<b>STP</b>	Spanning tree associated with a VLAN.	<b>detail,extensive</b>
<b>Tagged interfaces</b>	Tagged interfaces with which a VLAN is associated.	<b>detail,extensive</b>

Table 127: show vlans Output Fields (*continued*)

Field Name	Field Description	Level of Output
Untagged interfaces	Untagged interfaces with which a VLAN is associated.	detail. extensive
Dot1q Tunneling Status	Indicates if Q-in-Q tunneling is enabled.	extensive
Customer VLAN ranges	List of customer VLAN (C-VLAN) ranges associated with this service VLAN (S-VLAN).	extensive
Private VLAN Mode	The private VLAN mode for this VLAN. Values include <b>Primary</b> , <b>Isolated</b> , and <b>Community</b> .	extensive
Primary VLAN	Primary VLAN tag for this secondary VLAN.	extensive
Internal Index	VLAN index internal to Junos OS software.	extensive
Origin	Manner in which the VLAN was created: <b>static</b> or <b>learn</b> .	extensive
Protocol	Port-based VLAN or MAC-based VLAN. MAC-based protocol is displayed when VLAN assignment is done either statically or dynamically through 802.1X,	extensive
IP addresses	IP address associated with a VLAN.	extensive
Number of MAC entries	For MAC-based VLANs created either statically or dynamically, the MAC addresses associated with an interface.	extensive
Number of mapping rules	Number of mapping rules for Q-in-Q tunneling ( <b>Push</b> ) and VLAN translation ( <b>Swap</b> ).	
Secondary VLANs	Secondary VLANs associated with a primary VLAN.	extensive
Isolated VLANs	Isolated VLANs associated with a primary VLAN.	extensive
Community VLANs	Community VLANs associated with a primary VLAN.	extensive
VLANs summary	VLAN counts: <ul style="list-style-type: none"> <li>• <b>Total</b>—Total number of VLANs on the switch.</li> <li>• <b>Configured VLANs</b>—Number of VLANs that are based on user-configured settings.</li> <li>• <b>Internal VLANs</b>—Number of VLANs created by the system with no explicit configuration or protocol—for example, the <b>default</b> VLAN and the VLAN created when a trunk interface is not configured with native VLAN membership.</li> <li>• <b>Temporary VLANs</b>—Number of VLANs from the previous configuration that the system retains for a limited time after restart. Temporary VLANs are converted into one of the other types of VLAN, or are removed from the system if the current configuration does not require them.</li> </ul>	All levels

Table 127: show vlans Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Dot1q VLANs summary</b>	802.1Q VLAN counts: <ul style="list-style-type: none"> <li>• <b>Total</b>—Total number of 802.1Q-tagged and untagged VLANs on the switch.</li> <li>• <b>Tagged VLANs</b>—Number of 802.1Q-tagged VLANs.</li> <li>• <b>Untagged VLANs</b>—Number of untagged 802.1Q VLANs.</li> <li>• <b>Private VLAN</b>—Counts of the following kinds of 802.1Q private VLANs (PVLANS):           <ul style="list-style-type: none"> <li>• <b>Primary VLANs</b>—Number of primary forwarding private VLANs.</li> <li>• <b>Community VLANs</b>—Number of community transporting and forwarding private VLANs.</li> <li>• <b>Isolated VLANs</b>—Number of isolated receiving and forwarding private VLANs.</li> <li>• <b>Inter-switch-isolated VLANs</b>—Number of inter-switch isolated receiving and forwarding private VLANs.</li> </ul> </li> </ul>	All levels
<b>Dot1q Tunneled VLANs summary</b>	Q-in-Q-tunneled VLAN counts: <ul style="list-style-type: none"> <li>• <b>Total</b>—Total number of Q-in-Q-tunneled VLANs on the switch.</li> <li>• <b>Private VLAN</b>—Counts of primary, community, and isolated Q-in-Q-tunneled private VLANs (PVLANS).</li> </ul>	All levels

## Troubleshooting Procedures

---

- [Troubleshooting Ethernet Switching on page 1895](#)

### Troubleshooting Ethernet Switching

**Problem**    **Description:** Sometimes a MAC address entry in the switch's Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch. Typically, the switch does not wait for a MAC address expiration when a MAC move operation occurs. As soon as the switch detects the MAC address on the new interface, it immediately updates the table. Many network devices send a gratuitous ARP packet when switching an IP address from one device to another. The switch updates its ARP cache table after receipt of such gratuitous ARP messages, and then it also updates its Ethernet switching table.

Sometimes silent devices, such as syslog servers or SNMP trap receivers that receive UDP traffic but do not return acknowledgment (ACK) messages to the traffic source, fail to send gratuitous ARP packets when a device moves. If such a move occurs when the system administrator is not available to explicitly clear the affected interfaces by issuing the **clear ethernet-switching table** command, the entry for the moved device in the Ethernet switching table is not updated.

**Solution**    Set up the switch to handle unattended MAC address switchovers.

1. Reduce the system-wide ARP aging timer. (By default, the ARP aging timer is set at 20 minutes. The range of the ARP aging timer is from 1 through 240 minutes.)

```
[edit system arp]
user@switch# set aging-timer 3
```

2. Set the MAC aging timer to the same value as the ARP timer. (By default, the MAC aging timer is set to 300 seconds. The range is 15 to 1,000,000 seconds.)

```
[edit vlans]
user@switch# set vlans sales mac-table-aging-time 180
```

The ARP entry and the MAC address entry for the moved device expire within the times specified by the aging timer values. After the entries expire, the switch sends a new ARP message to the IP address of the device. The device responds to the ARP message,

thereby refreshing the entries in the switch's ARP cache table and Ethernet switching table.

## Understanding the Junos OS Implementation of VXLAN and OVSDDB in a VMware NSX for Multi-Hypervisor Environment for the Data Center

Some Juniper Networks devices support Virtual Extensible LAN (VXLAN) and the Open vSwitch Database (OVSDDB) management protocol. (For information about the Juniper Networks devices on which OVSDDB is supported and the Junos OS release in which support is introduced, see [“Open vSwitch Database Support on Juniper Networks Devices” on page 1899](#).) Support for VXLAN and OVSDDB enables the Juniper Networks devices in a physical network to be integrated into a virtual network.

The implementation of VXLAN and OVSDDB on Juniper Networks devices is supported in a VMware NSX for Multi-Hypervisor environment for the data center. [Table 129 on page 1900](#) outlines the components that compose this environment and products that are typically deployed for each component.

**Table 129: NSX Multi-Hypervisor Components and Products That Can Be Implemented**

Component	Products
Cloud management platform (CMP)	CloudStack OpenStack Custom CMP
Network virtualization platform	NSX for Multi-Hypervisor
Hypervisor	Kernel-based Virtual Machine (KVM) Red Hat VMware ESXi Xen <b>NOTE:</b> Juniper Networks supports KVM and ESXi only.
Virtual switch	Open vSwitch (OVS) NSX vSwitch
SDN controller	NSX multi-hypervisor controller <b>NOTE:</b> Juniper Networks supports NSX multi-hypervisor controller version 4.0.3.
Overlay protocol	VXLAN
MAC learning protocol	OVSDDB

Figure 28 on page 1901 shows a high-level view of the architecture into which the NSX for Multi-Hypervisor platform fits, while Figure 29 on page 1901 provides a more detailed representation of the components in the virtual and physical networks.

Figure 28: High-Level NSX for Multi-Hypervisor Architecture

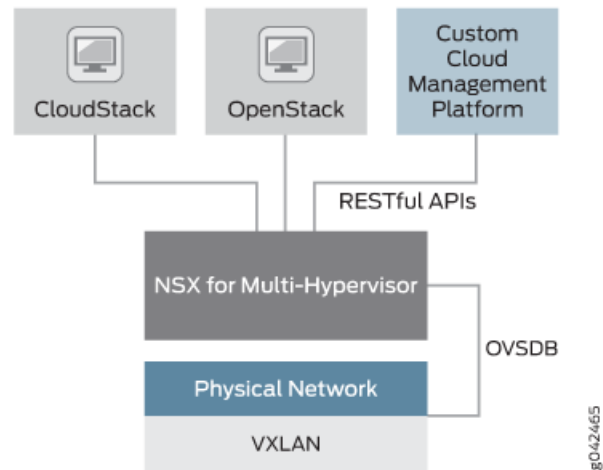

Figure 29: Integration of Juniper Networks Device That Implements VXLAN and OVSDB into NSX for Multi-Hypervisor Environment

In the data center topology shown in Figure 29 on page 1901, the physical and virtual servers need to communicate. To facilitate this communication, a Juniper Networks device that supports VXLAN is strategically deployed so that it serves as a *gateway*, which is also known as a hardware virtual tunnel endpoint (VTEP), at the edge of the physical network. Working in conjunction with the software VTEP, which is deployed at the edge of the virtual network, the hardware VTEP encapsulates packets from resources on physical

server 1 with a VXLAN header, and after the packets traverse the Layer 3 transport network, the software VTEP removes the VXLAN header from the packets and forwards the packets to the appropriate virtual machines (VMs). In essence, the encapsulation and de-encapsulation of packets by the hardware and software VTEPs enables components in the physical and virtual networks to coexist without one needing to understand the workings of the other.

The same Juniper Networks device that acts as hardware VTEP in [Figure 29 on page 1901](#) implements OVSDb, which enables this device to learn the MAC addresses of physical server 1 and other physical servers, and publish the addresses in the OVSDb schema, which was defined for physical devices. In the virtual network, one or more NSX controllers collect the MAC addresses of HOST 1 and other virtual servers, and publish the addresses in the OVSDb schema. Using the OVSDb schema, components in the physical and virtual networks can exchange MAC addresses, as well as statistical information, enabling the components to learn about and reach each other in their respective networks.

## Understanding the Open vSwitch Database Management Protocol Running on Juniper Networks Devices

The Juniper Networks Junos operating system (Junos OS) implementation of the Open vSwitch Database (OVSDb) management protocol provides a means through which VMware NSX controllers and Juniper Networks devices that support OVSDb can communicate. In an NSX multi-hypervisor environment, NSX controllers and Juniper Networks devices exchange control and statistical information, thereby enabling virtual machine (VM) traffic from entities in a virtual network to be forwarded to entities in a physical network and vice versa.

To enable communication between NSX controllers and Juniper Networks devices, the Junos OS implementation of OVSDb includes an OVSDb server and an OVSDb client, both of which run on each Juniper Networks device that supports OVSDb.

The OVSDb server on a Juniper Networks device can communicate with an OVSDb client on one or more NSX controllers. To establish a connection between a Juniper Networks device and an NSX controller, you must specify information about the controller (IP address) and the connection (port over which the connection occurs and the communication protocol to be used) on each Juniper Networks device. After the configuration is successfully committed, the connection is established between the management port (fxp0) of the Juniper Networks device and the NSX controller port that you specify in the Junos OS configuration.

The OVSDb server stores and maintains an OVSDb database schema, which is defined for physical devices. This schema contains control and statistical information provided by the OVSDb client on the Juniper Networks devices and NSX controllers. This information is stored in various tables in the schema. The OVSDb client on the Juniper Networks devices and NSX controllers monitors the schema for additions, deletions, and

modifications to this information, and the information is used for various purposes such as learning the MAC addresses of virtual hosts and physical servers.

The schema provides a means through which the Juniper Networks devices and the NSX controllers can exchange information. For example, the Juniper Networks devices capture MAC routes to entities in the physical network and push this information to a table in the schema so that NSX controllers with connections to these Juniper Networks devices can access the MAC routes. Conversely, NSX controllers capture MAC routes to entities in the virtual network and push this information to a table in the schema so that Juniper Networks devices with connections to the NSX controllers can access the MAC routes.

Some of the OVSDb table names include the words *local* or *remote*, for example, *unicast MACs local table* and *unicast MACs remote table*. Information in *local* tables is learned by a Juniper Networks device that functions as a hardware virtual tunnel endpoint (VTEP), while information in *remote* tables is learned from other software or hardware VTEPs.

- [Open vSwitch Database Schema For Physical Devices on page 1910](#)

## Understanding How to Set Up Open vSwitch Database Connections Between Juniper Networks Devices and Controllers

The Juniper Networks Junos operating system (Junos OS) implementation of the Open vSwitch Database (OVSDb) management protocol provides a means through which VMware NSX controllers and Juniper Networks devices that support OVSDb can communicate. This implementation of OVSDb supports one cluster of NSX controllers, which includes three or five controllers as recommended by VMware.

To implement the OVSDb management protocol on a Juniper Networks device, you must explicitly configure a connection to one NSX controller, using the Junos OS CLI. If the NSX controller to which you explicitly configure a connection is in a cluster, the controller pushes information about other controllers in the same cluster to the device, and the device establishes connections with the other controllers. However, you can also explicitly configure connections with the other controllers in the cluster, using the Junos OS CLI.

A Juniper Networks device exchanges control and statistical data with each NSX controller to which it is connected. Therefore, the benefits of connecting a Juniper Networks device to multiple NSX controllers include redundancy and load-balancing of the controller workload.

Connections to all NSX controllers are made on the management interface of the Juniper Networks device. (The management interface on MX Series routers is fxp0 and on QFX5100 switches is em0 or em1.) To set up a connection between a Juniper Networks device and an NSX controller, you need to configure the following parameters on the Juniper Networks device:

- IP address of the NSX controller.
- The protocol that secures the connection. Secure Sockets Layer (SSL) is the supported protocol.

**NOTE:** The SSL connection requires a private key and certificates, which must be stored in the `/var/db/certs` directory of the Juniper Networks device. For more information about the files, including actions you must take to create and install some of the files, see [“Creating and Installing an SSL Key and Certificate on a Juniper Networks Device for Connection with VMware NSX Controllers”](#) on page 1984.

- Number of the port over which the connection is made. The port number of the default port is 6632.

Optionally, you can configure the following connection timers on the Juniper Networks device:

- Inactivity probe duration—The maximum amount of time, in milliseconds, that the connection can be inactive before an inactivity probe is sent. The default value is 0 milliseconds, which means that an inactivity probe is never sent.
- Maximum backoff duration—If an attempt to connect to an NSX controller fails, the maximum amount of time, in milliseconds, before the device can make the next attempt. The default value is 1000 milliseconds.

## Understanding How Layer 2 BUM Traffic and Layer 3 Routed Multicast Traffic Are Handled in VXLANs Managed by OVSDb

The Juniper Networks Junos operating system (Junos OS) implementation of the Open vSwitch Database (OVSDb) management protocol provides a means through which VMware NSX controllers and Juniper Networks devices that support OVSDb can communicate.

This topic explains how a Juniper Networks device with Virtual Extensible LAN (VXLAN) and OVSDb management protocol capabilities handles the following types of traffic:

- Layer 2 broadcast, unknown unicast, and multicast (BUM) traffic that originates in an OVSDb-managed VXLAN and is forwarded to interfaces within the same VXLAN.
- Layer 3 multicast traffic that is received by an integrated routing and bridging (IRB) interface in an OVSDb-managed VXLAN and is forwarded to interfaces in another OVSDb-managed VXLAN.

By default, Layer 2 BUM traffic that originates in an OVSDb-managed VXLAN is handled by one or more service nodes in the same VXLAN. When this option is used, the table for remote multicast MAC addresses in the OVSDb schema for physical devices contains only one entry that has the keyword **unknown-dst** as the MAC string and a list of software virtual tunnel endpoints (VTEPs) that host the service nodes.

Given the previously described table entry, Layer 2 BUM traffic received on an interface in the OVSDB-managed VXLAN is forwarded to one of the software VTEPs. The software VTEP, and therefore, the service node to which a BUM packet is forwarded, is determined by the Juniper Networks device on which the OVSDB-managed VXLAN is configured. On receiving the BUM packet, the service node replicates the packet and forwards the replicas to all interfaces within the VXLAN.

Instead of using service nodes, you can optionally enable ingress node replication to handle Layer 2 BUM traffic on Juniper Networks devices that support OVSDB.

**NOTE:** Ingress node replication is supported on all Juniper Networks devices that support OVSDB except the QFX5100 switch.

With ingress node replication enabled, on receiving a Layer 2 BUM packet on an interface in an OVSDB-managed VXLAN, the Juniper Networks device replicates the packet and then forwards the replicas to all software VTEPs included in the unicast MACs remote table in the OVSDB schema. The software VTEPs then forward the replicas to all virtual machines (VMs), except service VMs or nodes, on the same host.

**NOTE:** When Juniper Networks devices replicate Layer 2 BUM packets to a large number of remote software VTEPs, the performance of the Juniper Networks devices can be impacted.

On IRB interfaces that forward Layer 3 multicast traffic from one OVSDB-managed VXLAN to another, ingress node replication is automatically implemented. With ingress node replication, the Juniper Networks device replicates a Layer 3 multicast packet and then the IRB interface forwards the replicas to all hardware and software VTEPs, but not to service nodes, in the other OVSDB-managed VXLAN. For the routing of Layer 3 multicast traffic from one OVSDB-managed VXLAN to another, ingress node replication is the only option and does not need to be configured.

## Understanding How to Set Up Virtual Extensible LANs in an Open vSwitch Database Environment

The Juniper Networks Junos operating system (Junos OS) implementation of the Open vSwitch Database (OVSDB) management protocol provides a means through which VMware NSX controllers and Juniper Networks devices that support OVSDB can communicate.

In a Junos OS environment, the concept of an OVSDB-managed Layer 2 broadcast domain in which data flows are limited to that domain is known as a *VXLAN*. In an NSX environment, the same concept is known as a *logical switch*. Understanding the different terminology in turn enables you to better understand the configuration tasks required for setting up OVSDB-managed VXLANs.

The following sections explain what you need to do to set up OVSDB-managed VXLANs properly for each Juniper Networks device that supports OVSDB and VXLAN:

- [Understanding How to Set Up OVSDB-Managed VXLANs On All Juniper Networks Devices Except QFX5100 Switches on page 1906](#)
- [Understanding How to Set Up OVSDB-Managed VXLANs On QFX5100 Switches on page 1907](#)
- [Understanding Automatically Created OVSDB-Managed VXLANs on a QFX5100 Switch on page 1908](#)
- [Understanding How to Determine the State of an OVSDB-Managed VXLAN on page 1909](#)

### **[Understanding How to Set Up OVSDB-Managed VXLANs On All Juniper Networks Devices Except QFX5100 Switches](#)**

---

For each VXLAN that you plan to implement, you must first configure a logical switch, using NSX Manager or the NSX API. Based on the name and the VXLAN network identifier (VNI) that you specify, NSX automatically generates a universally unique identifier (UUID) for the logical switch. You must retain the UUID of the logical switch for later use.

Next, on the Juniper Networks device, you must configure the corresponding VXLAN, including the same VNI specified for the logical switch, using the Junos OS CLI. For the name of the VXLAN, you must specify the UUID for the logical switch.

When configuring a logical switch and a corresponding VXLAN, it is important that the UUID and VNI in both configurations are the same. If these elements are not the same, the logical switch and VXLAN cannot become operational, which means they cannot exchange MAC addresses learned in the NSX and Junos OS environments, respectively.

[Table 130 on page 1907](#) provides a summary of the procedure that you must perform for each OVSDB-managed VXLAN on each Juniper Networks device, where to get more information about the configuration task, and the configuration statements that you must use to configure the VXLAN.

**Table 130: Summary of Configuration Tasks for Setting Up An OVSDb-Managed VXLAN on All Juniper Networks Devices Except QFX5100 Switches**

Juniper Networks Device That Supports OVSDb and VXLAN	Configure Logical Switch, Using NSX Manager or the NSX API?	Where to Find More Configuration Information	Configure Corresponding VXLAN on Juniper Networks Device?	Junos OS Statement to Configure the OVSDb-Managed VXLAN	Where to Find More Configuration Information
MX Series routers	Yes	See the documentation that accompanies NSX Manager or the NSX API.	Yes	<b>ovsdb-managed</b> statement in the <b>[edit bridge-domains domain-name vxlan]</b> hierarchy.  For the name of the VXLAN, specify the UUID for the logical switch configured in NSX Manager or in the NSX API.	<a href="#">"Configuring OVSDb-Managed VXLANs" on page 1989</a>

### Understanding How to Set Up OVSDb-Managed VXLANs On QFX5100 Switches

For each OVSDb-managed VXLAN that you plan to implement, we recommend a particular configuration workflow. First, you must specify a few statements in the Junos OS CLI of the QFX5100 switch. Then, you must configure a logical switch, using NSX Manager or the NSX API. Based on the name and the VNI that you specify, NSX automatically generates a UUID for the logical switch.

After you create a logical switch in NSX Manager or in the NSX API, the NSX controller pushes relevant information to the logical switch table in the OVSDb schema for physical devices. This schema resides in the QFX5100 switch. Based on the information pushed by the NSX controller, the switch then automatically creates a corresponding VXLAN, thereby eliminating the need for you to perform this task, using the Junos OS CLI. For the name of the VXLAN, the switch uses the UUID of the logical switch. For more information about automatically created VXLANs, see ["Understanding Automatically Created OVSDb-Managed VXLANs on a QFX5100 Switch" on page 1908](#).

[Table 131 on page 1908](#) provides a summary of the procedure that you must perform for each OVSDb-managed VXLAN on a QFX5100 switch, where to get more information about the configuration task, and the configuration statements that you must use to configure the VXLAN.

Table 131: Summary of Configuration Tasks for Setting Up An OVSDb-Managed VXLAN on QFX5100 Switches

Required Junos OS Configuration	Configure Logical Switch, Using NSX Manager or the NSX API?	Where to Find More Configuration Information	Configure Corresponding VXLAN on Juniper Networks Device?	Junos OS Statement to Configure the OVSDb-Managed VXLAN
<ul style="list-style-type: none"> <li>Enter the <b>set switch-options ovssdb-managed</b> configuration mode command.</li> <li>Use the <b>set interfaces interface-name unit logical-unit-number family ethernet-switching interface-mode access</b> configuration mode command to configure each interface that you want to associate with the VXLAN.</li> </ul>	Yes	See the documentation that accompanies NSX Manager or the NSX API.	No. The QFX5100 switch automatically creates a corresponding OVSDb-managed VXLAN.	—

As described in [Table 131 on page 1908](#), you must issue the **set switch-options ovssdb-managed** statement in the Junos OS CLI of the switch. Issuing this statement and committing the configuration enable the QFX5100 switch to automatically configure an OVSDb-managed VXLAN after the NSX controller pushes relevant information about the corresponding logical switch to the QFX5100 switch. Upon receipt of a logical switch information, if the QFX5100 switch does not detect the presence of this statement, it cannot start the automatic configuration of the corresponding VXLAN.

### Understanding Automatically Created OVSDb-Managed VXLANs on a QFX5100 Switch

After a QFX5100 switch creates a VXLAN, you can issue the **show configuration** operational mode command in the Junos OS CLI, and a configuration similar to the following sample appears:

```
set vlans 28805c1d-0122-495d-85df-19abd647d772 vxlan vni 100
set vlans 28805c1d-0122-495d-85df-19abd647d772 vlan-id 75
```

Also, if you specified the following command in the Junos OS CLI of the switch to configure interface ge-1/0/0 unit 0:

```
set interfaces ge-1/0/0 unit 0 family ethernet-switching interface-mode access
```

The switch automatically associates the interface with the VXLAN as shown:

```
set interfaces ge-1/0/0 unit 0 family ethernet-switching interface-mode access vlan
members 28805c1d-0122-495d-85df-19abd647d772
```

Note the following about this sample configuration:

- The name of the VXLAN is 28805c1d-0122-495d-85df-19abd647d772, which assumes that the logical switch UUID generated by NSX is 28805c1d-0122-495d-85df-19abd647d772.
- The QFX5100 switch automatically generated the VLAN ID of 75 for the VXLAN. In general, when generating a VLAN ID, the switch uses a VLAN ID that is not currently used either by NSX Manager or the NSX API, or by the QFX5100 switch.

Furthermore, if the switch detects an already used VLAN ID in a configuration performed in the Junos OS CLI, the switch displays an error message.

- After the switch automatically associates interface ge-1/0/0 unit 0 with VXLAN 28805c1d-0122-495d-85df-19abd647d772, keep in mind that you must also configure the interface as OVSDB-managed in the Junos OS CLI. For information about configuring an interface as OVSDB-managed, see [“Setting Up the Open vSwitch Database Management Protocol on Juniper Networks Devices” on page 1985](#).
- The QFX5100 switch can automatically associate access interfaces with the VXLAN. It cannot automatically associate trunk interfaces with the VXLAN.

If you need to modify or delete an OVSDB-managed VXLAN that was automatically created by a QFX5100 switch, you must modify or delete the corresponding logical switch configuration in NSX Manager or in the NSX API. After you update the logical switch configuration, the NSX controller pushes the update to the QFX5100 switch, and the switch modifies or deletes its configuration accordingly. Modifying or deleting the VXLAN configuration by using the Junos OS CLI on the switch does not work.

### Understanding How to Determine the State of an OVSDB-Managed VXLAN

Regardless of the Juniper Networks device and the procedure that you follow to set up OVSDB-managed VXLANs, after configuring one or more logical switches in NSX Manager or in the NSX API, the NSX controller pushes relevant information to the logical switch table in the OVSDB schema, which resides on the respective devices.

To determine the state of a VXLAN and corresponding logical switch, you can use the **show ovbdb logical-switch** command. The following are possible states:

- Created by Controller**—A logical switch was configured in NSX Manager or in the NSX API, but the corresponding VXLAN is not yet created on the Juniper Networks device. In this state, the VXLAN and corresponding logical switch are not yet operational.
- Created by L2ALD**—A VXLAN was created, but the corresponding logical switch is not yet configured in NSX Manager or in the NSX API. In this state, the VXLAN and corresponding logical switch are not yet operational.
- Created by both**—A logical switch was configured in NSX Manager or in the NSX API, and a corresponding VXLAN was created. In this state, the VXLAN and corresponding logical switch are operational.
- Tunnel key mismatch**—The VNIs specified in the logical switch and corresponding VXLAN configurations do not match. In this state, the VXLAN and corresponding logical switch are not yet operational.

## Open vSwitch Database Schema For Physical Devices

An Open vSwitch Database (OVSSDB) server runs on a Juniper Networks device that supports the OVSSDB management protocol. When this device is connected to one or more VMware NSX controllers, the connections provide a means through which the Juniper Networks device and the controllers can communicate.

In an NSX multi-hypervisor environment, Juniper Networks devices that support OVSSDB and NSX controllers exchange control and statistical data. This data is stored in the OVSSDB database schema, which was defined for physical devices, and the schema resides in the OVSSDB server. The schema includes several tables. Juniper Networks devices and NSX controllers, which are both OVSSDB clients, can add rows to the tables as well as monitor for the addition, deletion, and modification of rows.

For example, the OVSSDB client on a Juniper Networks device or NSX controller can collect MAC routes learned by entities in the physical or virtual networks, respectively, and publish the routes to the appropriate table in the schema. By using the MAC routes and other information provided in the table, Juniper Networks devices in the physical network and entities in the virtual network can determine where to forward virtual machine (VM) traffic.

Some of the OVSSDB table names include the words *local* or *remote*, for example, the *unicast MACs local table* and the *unicast MACs remote table*. Information in *local* tables is learned by a Juniper Networks device that functions as a hardware virtual tunnel endpoint (VTEP), while information in *remote* tables is learned from other software or hardware VTEPs.

[Table 132 on page 1910](#) describes the tables in the schema, the physical or virtual entity that is the source of the data provided in the table, and the command that you can enter in the CLI of the Juniper Networks device to get similar information.

**Table 132: OVSSDB Schema Tables**

Table Name	Description	Source of Information	Command
Global table	Includes the top-level configuration for the Juniper Networks device.	Juniper Networks device	None
Manager table	Includes information for each NSX controller that is connected to the Juniper Networks device.	<ul style="list-style-type: none"> <li>• Juniper Networks device</li> <li>• NSX controller</li> </ul>	<a href="#">show ovssdb controller</a>

Table 132: OVSDB Schema Tables (*continued*)

Table Name	Description	Source of Information	Command
Physical switch table	Includes information about the Juniper Networks device on which a hardware VTEP is implemented. This table includes information only for the device on which the table resides.	Juniper Networks device	None
Physical port table	Includes information about OVSDB-managed interfaces.	Juniper Networks device	<a href="#">show ovssdb interface</a>
Logical switch table	Includes information about logical switches, which you configured in NSX Manager or the NSX API, and the corresponding Virtual Extensible LANs (VXLANs), which was configured on the Juniper Networks device.	Juniper Networks device	<a href="#">show ovssdb logical-switch</a>
Logical binding statistics table	Includes statistics for OVSDB-managed interfaces.	Juniper Networks device	<a href="#">show ovssdb statistics interface</a>
Physical locator table	Includes information about Juniper Networks devices configured as hardware VTEPs, software VTEPs, and service nodes.	Juniper Networks device	<a href="#">show ovssdb virtual-tunnel-end-point</a>
Physical locator set table	Includes a list of service nodes for a logical switch.	Juniper Networks device	None
Unicast MACs remote table	Reachability information, including unicast MAC addresses, for entities in the virtual network.	NSX controller	<a href="#">show ovssdb mac</a>
Unicast MACs local table	Reachability information, including unicast MAC addresses, for entities in the physical network.	Juniper Networks device that is configured as a hardware VTEP.	<a href="#">show ovssdb mac</a>
Multicast MACs remote table	Includes only one row. In this row, the MAC column includes the keyword <b>unknown dst</b> along with a list of software VTEPs that host a cluster of service nodes, which handle multicast traffic.	NSX controller	<a href="#">show ovssdb mac</a>

#### VXLAN Benefits

---

Virtual Extensible Local Area Network (VXLAN) is a technology that allows you to segment your networks (as VLANs do) but that also solves the scaling limitation of VLANs and provides benefits that VLANs cannot. Here are the most important benefits of using VXLANs:

- You can theoretically create as many as 16 million VXLANs in an administrative domain (as opposed to 4094 VLANs on a Juniper Networks device).
- MX Series routers support as many as 32K VXLANs. This means that VXLANs provide network segmentation at the scale required by cloud builders to support very large numbers of tenants.
- QFX 5100 switches support 4K VXLANs.
- You can enable migration of virtual machines between servers that exist in separate Layer 2 domains by tunneling the traffic over Layer 3 networks. This functionality allows you to dynamically allocate resources within or between data centers without being constrained by Layer 2 boundaries or being forced to create large or geographically stretched Layer 2 domains.

Using VXLANs to create smaller Layer 2 domains that are connected over a Layer 3 network means that you don't need to use STP to converge the topology but can use more-robust routing protocols in the Layer 3 network instead. In the absence of STP, none of your links are blocked, which means you can get full value from all the ports that you purchase. Using routing protocols to connect your Layer 2 domains also allows you to load balance the traffic to ensure that you get the best use of your available bandwidth. Given the amount of east-west traffic that often flows within or between data centers, maximizing your network performance for that traffic is very important.

The video *Why Use an Overlay Network in a Data Center?* presents a brief overview of the advantages of using VXLANs.

Video: [Why Use an Overlay Network in a Data Center?](#)

### What is a VXLAN?

VXLAN is often described as an overlay technology because it allows you to stretch Layer 2 connections over an intervening Layer 3 network by encapsulating (tunneling) Ethernet frames in a VXLAN packet that includes IP addresses. The devices that encapsulate traffic that must be transported over a VXLAN and de-encapsulate traffic when it must leave the VXLAN tunnel are virtual tunnel endpoints (VTEPs), which can be end hosts or network switches or routers. To encapsulate an Ethernet frame, VTEPs add a number of fields, including the following:

- Outer MAC destination address (MAC address of the tunnel endpoint VTEP)
- Outer MAC source address (MAC address of the tunnel source VTEP)
- Outer IP destination address (IP address of the tunnel endpoint VTEP)
- Outer IP source address (IP address of the tunnel source VTEP)
- Outer UDP header
- A VXLAN header that includes a 24-bit field—called the VXLAN network identifier (VNI)—that is used to uniquely identify the VXLAN. The VNI is similar to a VLAN ID, but having 24 bits allows you to create many more VXLANs than VLANs.

Figure 30 on page 1913 shows the VXLAN packet format.

**Figure 30: VXLAN Packet Format**

### Using a QFX5100 Switch with VXLANs

You can configure a QFX5100 switch to perform all of the following roles:

- Act as a transit Layer 3 switch for downstream hosts acting as VTEPs. In this configuration, you do not need to configure any VXLAN functionality on the switch. You do need to configure IGMP and PIM so that the switch can form the multicast trees for the VXLAN multicast groups. (See [Manual VXLANs Require PIM on page 1914](#) for more information.)

- Act as a Layer 2 gateway between virtualized and non-virtualized networks in the same data center or between data centers. For example, you can use a QFX5100 switch to connect a network that uses VXLANs to one that uses VLANs.
- Act as a Layer 2 gateway between virtualized networks in the same or different data centers and allow virtual machines to move (VMotion) between those networks and data centers. For example, if you want to allow VMotion between devices in two different networks, you can create the same VLAN in both networks and put both devices on that VLAN. The QFX5100 switches connected to these devices, acting as VTEPs, can map that VLAN to the same VXLAN, and the VXLAN traffic can then be routed between the two networks.

**NOTE:** A QFX 5100 switch cannot route traffic between different VXLANs. To connect devices in different VXLANs you need a VXLAN-capable Layer 3 gateway, such as a Juniper Networks MX Series router.

---

### Using an MX Series Routers as a VTEP

---

You can configure an MX Series router to act as a VTEP and perform all of the following roles:

- Act as a Layer 2 gateway between virtualized and non-virtualized networks in the same data center or between data centers. For example, you can use an MX Series router to connect a network that uses VXLANs to one that uses VLANs.
- Act as a Layer 2 gateway between virtualized networks in the same or different data centers and allow virtual machines to move (VMotion) between those networks and data centers.
- Act as a Layer 3 gateway to route traffic between different VXLANs in the same data center.
- Act as a Layer 3 gateway to route traffic between different VXLANs in different data centers over a WAN or the Internet using standard routing protocols or VPLS tunnels.

**NOTE:** If you want an MX Series router to be a VXLAN Layer 3 gateway, you must configure integrated routing and bridging (IRB) interfaces to connect the VXLANs, just as you do if you want to route traffic between VLANs.

---

### Manual VXLANs Require PIM

---

You can use a controller (such as VMware's NSX) to provision VXLANs on a Juniper Networks device. A controller also provides a control plane that VTEPs use to advertise their reachability and learn about the reachability of other VTEPs. You can also manually create VXLANs on Juniper Networks devices instead of using a controller. If you use this approach, you must also configure PIM on the VTEPs so that they can create VXLAN tunnels between themselves.

You must also configure each VTEP in a given VXLAN to be a member of the same multicast group. (If possible, you should assign a different multicast group address to each VXLAN.) The VTEPs can then forward ARP requests they receive from their connected hosts to the multicast group. The other VTEPs in the group de-encapsulate the VXLAN information, and (assuming they are members of the same VXLAN) they forward the ARP request to their connected hosts. When the target host receives the ARP request, it responds with its MAC address, and its VTEP forwards this ARP reply back to the source VTEP. Through this process, the VTEPs learn the IP addresses of the other VTEPs in the VXLAN and the MAC addresses of the hosts connected to the other VTEPs.

The multicast groups and trees are also used to forward broadcast, unknown unicast, and multicast (BUM) traffic between VTEPs. This prevents BUM traffic from being unnecessarily flooded outside the VXLAN.

**NOTE:** Multicast traffic that is forwarded through a VXLAN tunnel is sent only to the remote VTEPs in the VXLAN. That is, the encapsulating VTEP does not copy and send copies of the packets according to the multicast tree—it only forwards the received multicast packets to the remote VTEPs. The remote VTEPs de-encapsulate the encapsulated multicast packets and forward them the appropriate Layer 2 interfaces. The remote VTEPs also do not copy and send copies of the packets according to the multicast tree.

### Load Balancing VXLAN Traffic

On QFX5100 switches, the Layer 3 routes that form VXLAN tunnels use per-packet load balancing by default, which means that load balancing is implemented if there are ECMP paths to the remote VTEP. This is different from normal routing behavior in which per-packet load balancing is not used by default. (Normal routing uses per-prefix load balancing by default.)

The source port field in the UDP header is used to enable ECMP load balancing of the VXLAN traffic in the Layer 3 network. This field is set to a hash of the inner packet fields, which results in a variable that ECMP can use to distinguish between tunnels (flows). (None of the other fields that flow-based ECMP normally uses are suitable for use with VXLANs. All tunnels between the same two VTEPs have the same outer source and destination IP addresses, and the UDP destination port is set to port 4789 by definition. Therefore, none of these fields provide a sufficient way for ECMP to differentiate flows.)

#### Example: Setting Up a VXLAN Layer 2 Gateway and OVSDB Connections Between Virtual and Physical Entities in a Data Center

In a physical network, a Juniper Networks device that supports Virtual Extensible LAN (VXLAN) can function as a hardware virtual tunnel endpoint (VTEP), which enables software applications running directly on physical servers to communicate with virtual machines (VMs) in a virtual network.

In this environment, you can also include VMware NSX controllers and implement the Open vSwitch Database (OVSDB) management protocol on the Juniper Networks device that functions as a hardware VTEP. The Junos OS implementation of OVSDB provides a means through which VMware NSX controllers and Juniper Networks devices that support OVSDB can communicate. These components serve the following purposes:

- Centralized configuration (QFX5100 switch only)—After you configure a logical switch, using NSX Manager or the NSX API, the NSX controller pushes relevant information about the configuration to the switch (the QFX5100 switch in this example) that functions as a hardware VTEP. Using the relevant configuration information, the switch automatically creates the configuration of a VXLAN, which is the Junos OS-equivalent of the logical switch.

- Centralized storage and exchange of MAC route information—Availability of MAC routes enables the hardware VTEP in the physical network and the software VTEP in the virtual network to forward VM traffic between entities in the physical and virtual networks.

This example explains how to configure a QFX5100 switch as a hardware VTEP, which serves as a Layer 2 gateway, and set up this device with an OVSDb connection to an NSX controller.

- [Requirements on page 1918](#)
- [Overview and Topology on page 1919](#)
- [Configuration on page 1921](#)
- [Verification on page 1923](#)

### Requirements

---

The topology for this example includes the following hardware and software components:

- A physical server on which software applications directly run.
- A QFX5100 switch that is running Junos OS release 14.1X53-D10 or later and an OVSDb software package. The OVSDb software package release must be the same as the Junos OS release running on the device. This switch is configured to function as a hardware VTEP.
- A cluster of five NSX controllers, each of which is running NSX software version 4.0.3. (In this example, you explicitly configure a connection with one NSX controller.)
- NSX Manager version 4.0.3.
- A service node that handles the replication and forwarding of Layer 2 broadcast, unknown unicast, and multicast (BUM) traffic in the VXLAN used in this example.
- A host that includes VMs managed by a hypervisor, which includes a software VTEP.

Before you begin the configuration, you need to perform the following tasks:

- Using NSX Manager version 4.0.3, specify the IP address of the service node.
- Create an SSL private key and certificate, and install them in the `/var/db/certs` directory of the QFX5100 switch. For more information, see [“Creating and Installing an SSL Key and Certificate on a Juniper Networks Device for Connection with VMware NSX Controllers” on page 1984](#).
- Issue the **set switch-options ovbdb-managed** configuration mode command in the Junos OS CLI on the QFX5100 switch. Issuing this command and committing the configuration enable the QFX5100 switch to automatically create OVSDb-managed VXLANs.
- For each interface that you want to associate with the OVSDb-managed VXLAN, issue the **set interfaces interface-name unit logical-unit-number family ethernet-switching interface-mode access** configuration mode command in the Junos OS CLI on the QFX5100 switch. In this example, interface ge-1/0/0.0 is associated with the VXLAN,

so the command is issued once with `ge-1/0/0` specified as the interface name and 0 specified as the logical unit number.

- Using NSX Manager version 4.0.3, configure a logical switch for each VXLAN that OVSDb will manage. This example implements one OVSDb-managed VXLAN; therefore, you must configure one logical switch. After you configure the logical switch, the QFX5100 switch creates the configuration of a Junos OS-equivalent VXLAN. The name of the VXLAN is derived from the universally unique identifier (UUID) that the NSX controller automatically generated for the logical switch. A sample UUID is 28805c1d-0122-495d-85df-19abd647d772.

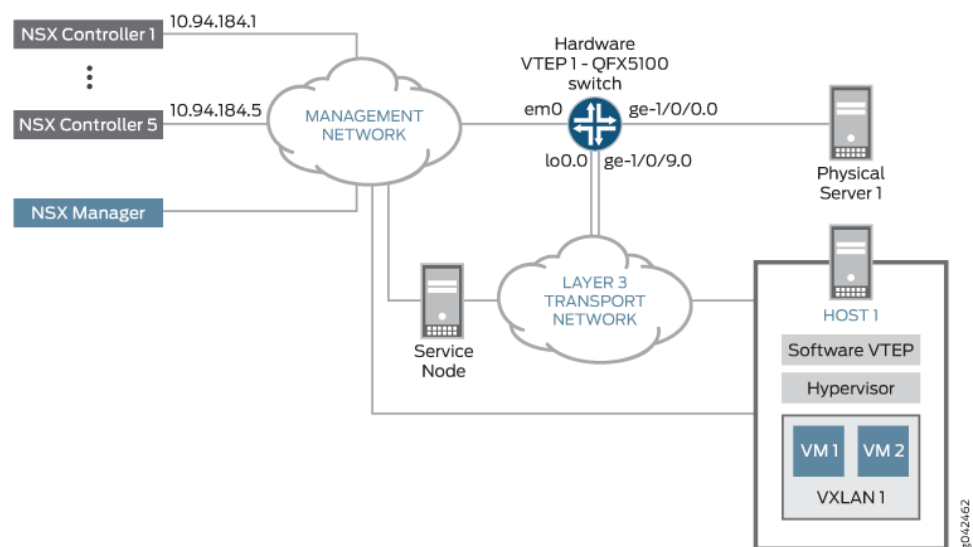

For more information about logical switches, VXLANs, and the automatic creation of VXLANs by the QFX5100 switch, see [“Understanding How to Set Up Virtual Extensible LANs in an Open vSwitch Database Environment”](#) on page 1905.

For information about using NSX Manager, see the documentation that accompanies these products.

### Overview and Topology

Figure 31 on page 1919 shows a topology in which a software application running directly on Physical Server 1 in the physical network needs to communicate with virtual machine VM 1 in VXLAN 1 and vice versa. To enable this communication, a QFX5100 switch is configured as Hardware VTEP 1.

Figure 31: VXLAN/OVSDb Layer 2 Gateway Topology

Based on the configuration of a logical switch in NSX Manager, the QFX5100 switch automatically creates a configuration for a Junos OS-equivalent VXLAN. A sample configuration using the UUID of 28805c1d-0122-495d-85df-19abd647d772 is as follows:

```
set vlans 28805c1d-0122-495d-85df-19abd647d772 vxlan vni 100
set vlans 28805c1d-0122-495d-85df-19abd647d772 vlan-id 75
```

**NOTE:** In the sample configuration, the switch automatically generates a VLAN ID of 75. In general, when generating a VLAN ID, the switch uses a VLAN ID that is not currently used by either NSX Manager or the NSX API, or by the QFX5100 switch.

Also, the following command was specified in the Junos OS CLI to configure interface ge-1/0/0 unit 0:

```
set interfaces ge-1/0/0 unit 0 family ethernet-switching interface-mode access
```

The switch automatically associates the interface with the VXLAN as shown:

```
set interfaces ge-1/0/0 unit 0 family ethernet-switching interface-mode access vlan  
members 28805c1d-0122-495d-85df-19abd647d772
```

**NOTE:** Keep in mind that you must also configure this interface as OVSDB-managed in the Junos OS CLI. This example provides information about performing this step.

The purpose of VXLAN 28805c1d-0122-495d-85df-19abd647d772 is to provide a means of mapping physical server 1 to VXLAN 1 using VXLAN 1's VNI of 100.

On the management interface **em0** or **em1** of the QFX5100 switch, a connection with an NSX controller is explicitly configured, by using the Junos OS CLI.

Each VXLAN-encapsulated packet must include a source IP address, which identifies the source hardware or software VTEP, in the outer IP header. In this example, the IP address of the loopback interface (lo0) on the QFX5100 switch is used for hardware VTEP 1.

Within VXLAN 28805c1d-0122-495d-85df-19abd647d772, Layer 2 BUM packets are replicated by the service node, which then forwards the replicas to all interfaces in the VXLAN. Having the service node handle the Layer 2 BUM traffic is the default behavior, and no configuration is required on the QFX5100 switch.

In this example, the tracing of all OVSDB events is configured. The output of the OVSDB events is placed in a file named **ovsdb**, which is stored in the **/var/log** directory. By default, a maximum of 10 trace files can exist, and the configured maximum size of each file is 10 MB.

The components of the topology for this example are shown in [Table 133 on page 1921](#).

Table 133: Components of the Topology for Setting Up a VXLAN Layer 2 Gateway and OVSDB Connections

Property	Settings
OVSDB-managed VXLAN	<p><b>NOTE:</b> The QFX5100 switch automatically creates this VXLAN configuration, which is based on the NSX-equivalent logical switch configuration in NSX Manager. Therefore, no configuration is required.</p> <p>VXLAN name: 28805c1d-0122-495d-85df-19abd647d772</p> <p>VLAN ID: 100</p> <p>VNI: 100 (VXLAN 1)</p>
OVSDB-managed interface	<p>Interface name: ge-1/0/0.0</p> <p>Interface type: access</p> <p><b>NOTE:</b> We recommend that you configure this interface in the Junos OS CLI <i>before</i> you create the logical switch in NSX Manager. After you configure the logical switch, the NSX controller pushes relevant information to the QFX5100 switch, and the switch automatically associates the interface with the VXLAN. You must then specify this interface as an OVSDB-managed interface in the Junos OS CLI.</p>
NSX controller	IP address: 10.94.184.1
Handling of Layer 2 BUM traffic in VXLAN 28805c1d-0122-495d-85df-19abd647d772	<p>Service node</p> <p><b>NOTE:</b> By default, one or more service nodes handle Layer 2 BUM traffic in a VXLAN; therefore, no configuration is required.</p>
Hardware VTEP source identifier	<p>Source interface: loopback (lo0.0)</p> <p>Source IP address: 10.17.17.17/32</p>

### Configuration

Perform this task:

- [Configuring the QFX5100 Switch as Hardware VTEP 1 on page 1922](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set chassis network-services enhanced-ip
set interfaces ge-1/0/9 unit 0 family inet address 10.40.40.1/24
set routing-options static route 10.19.19.19/32 next-hop 10.40.40.2
```

```
set routing-options router-id 10.17.17.17
set protocols ospf area 0.0.0.0 interface lo0.0
set protocols ospf area 0.0.0.0 interface ge-1/0/9.0
set interfaces lo0 unit 0 family inet address 10.17.17.17/32 primary
set interfaces lo0 unit 0 family inet address 10.17.17.17/32 preferred
set switch-options vtep-source-interface lo0.0
set protocols ovssdb traceoptions file ovssdb
set protocols ovssdb traceoptions file size 10m
set protocols ovssdb traceoptions flag all
set protocols ovssdb interfaces ge-1/0/0.0
set protocols ovssdb controller 10.94.184.1
```

**NOTE:** After completing this configuration, you must configure a gateway, which is the NSX-equivalent of a hardware VTEP. This example implements one hardware VTEP; therefore, you must configure one gateway, a gateway service, and a logical switch port by using NSX Manager or the NSX API. For more information about the tasks you must perform and key NSX Manager configuration details, see [“VMware NSX Configuration for Juniper Networks Devices That Function as Virtual Tunnel Endpoints”](#) on page 1986.

---

### *Configuring the QFX5100 Switch as Hardware VTEP 1*

#### **Step-by-Step Procedure**

To configure a QFX5100 switch as hardware VTEP 1 and with an OVSSDB connection to an NSX controller, follow these steps:

1. Configure the Layer 3 network.

```
[edit chassis]
user@switch# set network-services enhanced-ip
[edit interfaces]
user@switch# set ge-1/0/9 unit 0 family inet address 10.40.40.1/24
[edit routing-options]
user@switch# set static route 10.19.19.19/32 next-hop 10.40.40.2
user@switch# set router-id 10.17.17.17
[edit protocols]
user@switch# set ospf area 0.0.0.0 interface lo0.0
user@switch# set ospf area 0.0.0.0 interface ge-1/0/9.0
```

2. Specify an IP address for the loopback interface. This IP address serves as the source IP address in the outer header of any VXLAN-encapsulated packets.

```
[edit interfaces]
user@switch# set lo0 unit 0 family inet address 10.17.17.17/32 primary
user@switch# set lo0 unit 0 family inet address 10.17.17.17/32 preferred
```

3. Set the loopback interface as the interface that identifies hardware VTEP 1.

```
[edit switch-options]
user@switch# set vtep-source-interface lo0.0
```

4. Set up OVSSDB tracing operations.

```
[edit protocols]
user@switch# set ovssdb traceoptions file ovssdb
```

```
user@switch# set ovssdb traceoptions file size 10m
user@switch# set ovssdb traceoptions flag all
```

5. Specify that the interface between hardware VTEP 1 and physical server 1 is managed by OVSSDB.

```
[edit protocols]
user@switch# set ovssdb interfaces ge-1/0/0.0
```

6. Configure a connection with an NSX controller.

```
[edit protocols]
user@switch# set ovssdb controller 10.94.184.1
```

**NOTE:** After completing this configuration, you must configure a gateway, which is the NSX-equivalent of a hardware VTEP. This example implements one hardware VTEP; therefore, you must configure one gateway, a gateway service, and a logical switch port by using NSX Manager or the NSX API. For more information about the tasks you must perform and key NSX Manager configuration details, see [“VMware NSX Configuration for Juniper Networks Devices That Function as Virtual Tunnel Endpoints” on page 1986](#).

## Verification

- [Verifying the Logical Switch on page 1923](#)
- [Verifying the MAC Address of VM 1 on page 1924](#)
- [Verifying the NSX Controller Connection on page 1924](#)
- [Verifying the OVSSDB-Managed Interface on page 1924](#)

### Verifying the Logical Switch

**Purpose** Verify that the configuration of the logical switch with the UUID of 28805c1d-0122-495d-85df-19abd647d772 is present in the OVSSDB schema for physical devices and that the state (**Flags**) of the logical switch is **Created by both**.

**Action** Issue the **show ovssdb logical-switch** operational mode command.

```
user@switch> show ovssdb logical-switch
Logical switch information:
Logical Switch Name: 28805c1d-0122-495d-85df-19abd647d772
Flags: Created by both
VNI: 100
Num of Remote MAC: 1
Num of Local MAC: 0
```

**Meaning** The output verifies that the configuration for the logical switch is present. The **Created by both** state indicates that the logical switch was configured in NSX Manager, and that

the QFX5100 switch automatically created the corresponding VXLAN. In this state, the logical switch and VXLAN are operational.

If the state of the logical switch is something other than **Created by both**, see [“Troubleshooting a Nonoperational VMware NSX Logical Switch and Corresponding Junos OS OVSDb-Managed VXLAN” on page 2045](#).

#### ***Verifying the MAC Address of VM 1***

**Purpose** Verify that the MAC address of VM 1 is present in the OVSDb schema.

**Action** Issue the **show ovssdb mac remote** operational mode command.

```
user@switch> show ovssdb mac remote
Logical Switch Name: 28805c1d-0122-495d-85df-19abd647d772
  Mac      IP      Encapsulation      Vtep
  Address  Address
a8:59:5e:f6:38:90    0.0.0.0      Vxlan over Ipv4    10.17.17.17
```

**Meaning** The output shows that the MAC address for VM 1 is present and is associated with the logical switch with the UUID of 28805c1d-0122-495d-85df-19abd647d772. Given that the MAC address is present, VM 1 is reachable through the QFX5100 switch, which functions as a hardware VTEP.

#### ***Verifying the NSX Controller Connection***

**Purpose** Verify that the connection with the NSX controller is up.

**Action** Issue the **show ovssdb controller** operational mode command, and verify that the controller connection state is **up**.

```
user@switch> show ovssdb controller
VTEP controller information:
Controller IP address: 10.94.184.1
Controller protocol: ssl
Controller port: 6632
Controller connection: up
Controller seconds-since-connect: 542325
Controller seconds-since-disconnect: 542346
Controller connection status: active
```

**Meaning** The output shows that the connection state of the NSX controller is **up**, in addition to other information about the controller. By virtue of this connection being up, OVSDb is enabled on the QFX5100 switch.

#### ***Verifying the OVSDb-Managed Interface***

**Purpose** Verify that interface ge-1/0/0.0 is managed by OVSDb.

**Action** Issue the **show ovssdb interface** operational mode command, and verify that interface ge-1/0/0.0 is managed by OVSSDB.

```
user@switch> show ovssdb interface
Interface          VLAN ID          Bridge-domain
ge-1/0/0.0
```

**Meaning** The output shows that interface ge-1/0/0.0 is managed by OVSSDB and that the VLAN ID and VLAN are correctly configured.

## Example: Setting Up Inter-VXLAN Routing and OVSSDB Connections in a Data Center

This example shows a data center in which virtual machines (VMs) in different Virtual Extensible LANs (VXLANs) need to communicate. The Juniper Networks device that is integrated into this environment functions as a hardware virtual tunnel endpoint (VTEP) that can route VM traffic from one VXLAN (Layer 2) environment to another.

The Juniper Networks device implements the Open vSwitch Database (OVSSDB) management protocol and has a connection with a VMware NSX controller, both of which enable these two entities to exchange MAC routes to and from VMs in the physical and virtual networks. .

This example explains how to configure a Juniper Networks device as hardware VTEPs and set up OVSSDB connections to an NSX controller.

- [Requirements on page 1925](#)
- [Overview and Topology on page 1926](#)
- [Configuration on page 1929](#)
- [Verification on page 1932](#)

### Requirements

In this example, the topology includes the following hardware and software components:

- A cluster of five NSX controllers, each of which is running NSX software version 4.0.3.
- NSX Manager.
- A service node that handles broadcast, unknown unicast, and multicast (BUM) traffic within each of the two VXLANs.
- Two hosts, each of which includes VMs managed by a hypervisor. Each hypervisor includes a software VTEP. The VMs on each of the hosts belong to different VXLANs.
- A Juniper Networks device that routes VM traffic between the two VXLANs. For example, an MX Series router running Junos OS Release 14.1R2 or later. The Juniper Networks device must also run an OVSSDB software package, and the release of this package must be the same as the Junos OS release running on the device. This device is configured to function as a hardware VTEP.

Before you start the configuration of the Juniper Networks device, you need to perform the following tasks:

- In NSX Manager version 4.0.3 or the NSX API, specify the IP address of the service node.
- In NSX Manager version 4.0.3 or the NSX API, configure a logical switch for each VXLAN that OVSDb will manage. This example implements two OVSDb-managed VXLANs; therefore, you must configure two logical switches. After the configuration of each logical switch, NSX automatically generates a universally unique identifier (UUID) for the logical switch. If you have not already, retrieve the UUID for each logical switch. A sample UUID is 28805c1d-0122-495d-85df-19abd647d772. When configuring the equivalent VXLANs on the Juniper Networks device, you must use the UUID of the logical switch as the bridge domain or VLAN name.

For more information about logical switches and VXLANs, see [“Understanding How to Set Up Virtual Extensible LANs in an Open vSwitch Database Environment”](#) on page 1905.

- Create an SSL private key and certificate, and install them in the `/var/db/certs` directory of the Juniper Networks device. For more information, see [“Creating and Installing an SSL Key and Certificate on a Juniper Networks Device for Connection with VMware NSX Controllers”](#) on page 1984.

For information about using NSX Manager or the NSX API to perform these configuration tasks, see the documentation that accompanies these respective products.

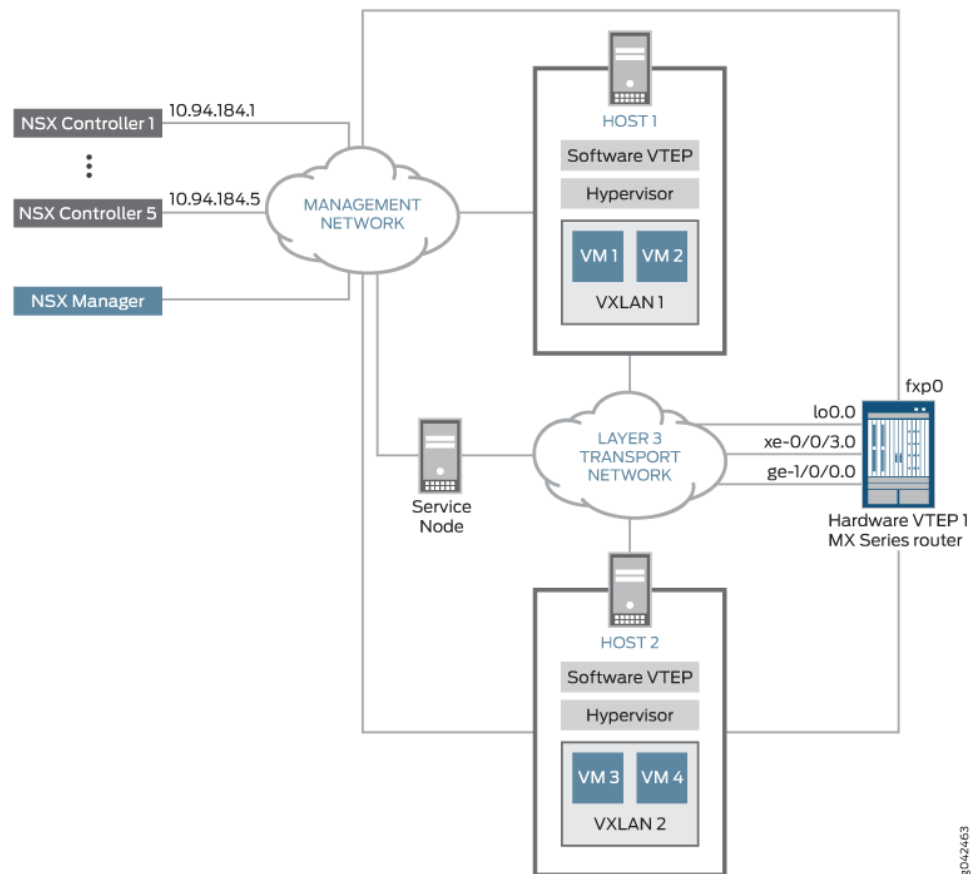

### Overview and Topology

---

In the topology shown in [Figure 32 on page 1927](#), VM 1 in VXLAN 1 needs to communicate with VM 3 in VXLAN 2. To enable this communication, hardware VTEP 1, which can be an MX Series router, is configured to route VM traffic between the two VXLANs.

Figure 32: Inter-VXLAN Routing and OVSDb Topology

On hardware VTEP 1, a routing instance (virtual switch) is set up. Within the routing instance, two VXLANs are configured: VXLAN 1 and VXLAN 2. Both of the VXLANs are associated with an integrated routing and bridging (IRB) interface, over which VM traffic is routed between the VXLANs.

On hardware VTEP 1, a connection with an NSX controller is configured on the management interface fxp0. This configuration enables the NSX controller to push MAC routes for VM 1 and VM 3 to the hardware VTEP by way of the table for remote unicast MAC addresses in the OVSDb schema for physical devices.

Each VXLAN-encapsulated packet must include a source IP address, which identifies the source hardware or software VTEP, in the outer IP header. In this example, for hardware VTEP 1, the IP address of the loopback interface (lo0) is used.

Within each of the two VXLANs, a service node replicates Layer 2 BUM packets then forwards the replicas to all interfaces in the VXLANs. Having the service node handle the Layer 2 BUM traffic is the default behavior, and no configuration is required for this Juniper Networks device.

Between the two VXLANs, ingress node replication is automatically implemented and does not need to be configured. With this feature, hardware VTEP 1 replicates a Layer 3 multicast packet, then the IRB interface associated with the VXLAN that originated the packet forwards the replicas to all hardware and software VTEPs, but not to service nodes, in the other OVSDB-managed VXLAN.

In this example, the tracing of all OVSDB events are configured. The output of the OVSDB events are placed in a file named **ovsdb**, which is stored in the **/var/log** directory. By default, a maximum of 10 trace files can exist, and the configured maximum size of each file is 50 MB.

[Table 133 on page 1921](#) describes the components of the example topology.

**Table 134: Components of the Topology for Setting Up Inter-VXLAN Routing and OVSDB Connections in a Data Center**

Property	Settings
Routing instance	Name: vx1  Type: virtual switch  OVSDB-managed VXLANs included: VXLAN 1 and VXLAN 2
VXLAN 1	Bridge domain or VLAN associated with: 28805c1d-0122-495d-85df-19abd647d772  Interface: xe-0/0/2.0  VLAN ID: 100  VNI: 100  IRB for inter-VXLAN traffic: irb.0; 10.20.20.1/24
VXLAN 2	Bridge domain or VLAN associated with: 96a382cd-a570-4ac8-a77a-8bb8b16bde70  Interface: xe-1/2/0.0  VLAN ID: 200  VNI: 200  IRB for inter-VXLAN traffic: irb.1; 10.10.10.3/24
Handling of BUM traffic in each VXLAN	Service node  <b>NOTE:</b> By default, one or more service nodes handle Layer 2 BUM traffic in a VXLAN; therefore, no configuration is required.
Handling of Layer 3 multicast traffic between VXLANs	Ingress node replication  <b>NOTE:</b> On IRB interfaces that forward Layer 3 multicast traffic from one OVSDB-managed VXLAN to another, ingress node replication is automatically implemented; therefore, no configuration is required.

Table 134: Components of the Topology for Setting Up Inter-VXLAN Routing and OVSDb Connections in a Data Center (*continued*)

Property	Settings
Hardware VTEP source identifier	Source interface: loopback (lo0.0) Source IP address: 10.19.19.19/32
NSX controller	IP address: 10.94.184.1
OVSDb tracing operations	Filename: /var/log/ovsdb File size: 50 m Flag: All

### Configuration

An MX Series router can function as hardware VTEP 1 in this example.

To configure inter-VXLAN routing and OVSDb connections in a data center topology, you need to perform this task:

- [Configuring an MX Series Router as a Hardware VTEP with an OVSDb Connection on page 1930](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

**NOTE:** After completing this configuration, you must configure a gateway, which is the NSX-equivalent of a hardware VTEP. This example implements one hardware VTEP; therefore, you must configure one gateway, a gateway service, and a logical switch port using NSX Manager or the NSX API. For more information about the tasks you must perform and key NSX Manager configuration details, see [“VMware NSX Configuration for Juniper Networks Devices That Function as Virtual Tunnel Endpoints” on page 1986](#).

MX Series router configuration:

```
set chassis network-services enhanced-ip
set interfaces xe-0/0/3 unit 0 family inet address 10.50.50.2/24
set interfaces ge-1/0/0 unit 0 family inet address 10.100.100.99/24
set routing-options router-id 10.19.19.19
set protocols ospf area 0.0.0.0 interface xe-0/0/3.0
set protocols ospf area 0.0.0.0 interface ge-1/0/0.0
set protocols ospf area 0.0.0.0 interface lo0.0
set interfaces xe-0/0/2 unit 0 family bridge interface-mode access
set interfaces xe-0/0/2 unit 0 family bridge vlan-id 100
```

```
set interfaces xe-1/2/0 unit 0 family bridge interface-mode access
set interfaces xe-1/2/0 unit 0 family bridge vlan-id 200
set interfaces irb unit 0 family inet address 10.20.20.1/24
set interfaces irb unit 1 family inet address 10.10.10.3/24
set routing-instances vx1 vtep-source-interface lo0.0
set routing-instances vx1 instance-type virtual-switch
set routing-instances vx1 interface xe-0/0/2.0
set routing-instances vx1 interface xe-1/2/0.0
set routing-instances vx1 bridge-domains 28805c1d-0122-495d-85df-19abd647d772
  vlan-id 100
set routing-instances vx1 bridge-domains 28805c1d-0122-495d-85df-19abd647d772

  vxlan ovssdb-managed
set routing-instances vx1 bridge-domains 96a382cd-a570-4ac8-a77a-8bb8b16bde70
  vxlan vni 200
set interfaces lo0 unit 0 family inet address 10.19.19.19/32 primary
set interfaces lo0 unit 0 family inet address 10.19.19.19/32 preferred
set protocols ovssdb traceoptions file ovssdb
set protocols ovssdb traceoptions file size 50m
set protocols ovssdb traceoptions flag all
set protocols ovssdb controller 10.94.184.1
set protocols ovssdb interfaces xe-0/0/2.0
set protocols ovssdb interfaces xe-1/2/0.0
```

### *Configuring an MX Series Router as a Hardware VTEP with an OVSSDB Connection*

**Step-by-Step Procedure** To configure an MX Series router as hardware VTEP 1 with an OVSSDB connection to an NSX controller, follow these steps:

1. Create the Layer 3 network.  

```
[edit chassis]
user@router# set network-services enhanced-ip
[edit interfaces]
user@router# set xe-0/0/3 unit 0 family inet address 10.50.50.2/24
user@router# set ge-1/0/0 unit 0 family inet address 10.100.100.99/24
[edit routing-options]
user@router# set router-id 10.19.19.19
[edit protocols]
user@router# set ospf area 0.0.0.0 interface xe-0/0/3.0
user@router# set ospf area 0.0.0.0 interface ge-1/0/0.0
user@router# set ospf area 0.0.0.0 interface lo0.0
```
2. Create an access interface for VXLAN 1, and associate the interface with the VXLAN.  

```
[edit interfaces]
user@router# set xe-0/0/2 unit 0 family bridge interface-mode access
```

- ```

user@router# set xe-0/0/2 unit 0 family bridge vlan-id 100

```
3. Create an access interface for VXLAN 2, and associate the interface with the VXLAN.
 

```

[edit interfaces]
user@router# set xe-1/2/0 unit 0 family bridge interface-mode access
user@router# set xe-1/2/0 unit 0 family bridge vlan-id 200

```
  4. Create an IRB interface to handle inter-VXLAN traffic for VXLAN 1.
 

```

[edit interfaces]
user@router# set irb unit 0 family inet address 10.20.20.1/24

```
  5. Create an IRB interface to handle inter-VXLAN traffic for VXLAN 2.
 

```

[edit interfaces]
user@router# set irb unit 1 family inet address 10.10.10.3/24

```
  6. Set up the virtual switch routing instance.
 

```

[edit routing-instances]
user@router# set vx1 vtep-source-interface lo0.0
user@router# set vx1 instance-type virtual-switch
user@router# set vx1 interface xe-0/0/2.0
user@router# set vx1 interface xe-1/2/0.0
user@router# set vx1 bridge-domains 28805c1d-0122-495d-85df-19abd647d772
vlan-id 100
user@router# set vx1 bridge-domains 28805c1d-0122-495d-85df-19abd647d772
routing-interface irb.0
user@router# set vx1 bridge-domains 28805c1d-0122-495d-85df-19abd647d772
vxlan ovsdb-managed
user@router# set vx1 bridge-domains 28805c1d-0122-495d-85df-19abd647d772
vxlan vni 100
user@router# set vx1 bridge-domains 96a382cd-a570-4ac8-a77a-8bb8b16bde70
vlan-id 200
user@router# set vx1 bridge-domains 96a382cd-a570-4ac8-a77a-8bb8b16bde70
routing-interface irb.1
user@router# set vx1 bridge-domains 96a382cd-a570-4ac8-a77a-8bb8b16bde70
vxlan ovsdb-managed
user@router# set vx1 bridge-domains 96a382cd-a570-4ac8-a77a-8bb8b16bde70
vxlan vni 200

```
  7. Specify an IP address for the loopback interface. This IP address serves as the source IP address in the outer header of any VXLAN-encapsulated packets.
 

```

[edit interfaces]
user@router# set lo0 unit 0 family inet address 10.19.19.19/32 primary
user@router# set lo0 unit 0 family inet address 10.19.19.19/32 preferred

```
  8. Set up OVSDB tracing operations.
 

```

[edit protocols]
user@router# set ovsdb traceoptions file ovsdb
user@router# set ovsdb traceoptions file size 50m
user@router# set ovsdb traceoptions flag all

```
  9. Configure a connection with an NSX controller.
 

```

[edit protocols]
user@router# set ovsdb controller 10.94.184.1

```

10. Configure interfaces xe-0/0/2.0 and xe-1/2/0.0 to be managed by OVSDb.

[edit protocols]

user@router# set **ovsdb interfaces** xe-0/0/2.0

user@router# set **ovsdb interfaces** xe-1/2/0.0

**NOTE:** After completing this configuration, you must configure a gateway, which is the NSX-equivalent of a hardware VTEP. This example implements one hardware VTEP; therefore, you must configure one gateway, a gateway service, and a logical switch port by using NSX Manager or the NSX API. For more information about the tasks you must perform and key NSX Manager configuration details, see [“VMware NSX Configuration for Juniper Networks Devices That Function as Virtual Tunnel Endpoints”](#) on page 1986.

---

## Verification

- [Verifying the Logical Switches on page 1932](#)
- [Verifying the MAC Addresses of VM 1 and VM 3 on page 1933](#)
- [Verifying the NSX Controller Connection on page 1933](#)

### *Verifying the Logical Switches*

**Purpose** Verify that logical switches with the UUIDs of 28805c1d-0122-495d-85df-19abd647d772 and 96a382cd-a570-4ac8-a77a-8bb8b16bde70 are configured in NSX Manager or the NSX API, and that information about the logical switches is published in the OVSDb schema.

**Action** Issue the **show ovsdb logical-switch** operational mode command.

```
user@host> show ovsdb logical-switch
Logical switch information:
Logical Switch Name: 28805c1d-0122-495d-85df-19abd647d772
Flags: Created by both
VNI: 100
Num of Remote MAC: 1
Num of Local MAC: 0
Logical Switch Name: 96a382cd-a570-4ac8-a77a-8bb8b16bde70
Flags: Created by both
VNI: 200
Num of Remote MAC: 1
Num of Local MAC: 1
```

**Meaning** The output verifies that information about the logical switches is published in the OVSDb schema. The **Created by both** state indicates that the logical switches are configured in NSX Manager or the NSX API, and the corresponding VXLANs are configured on the Juniper Networks device. In this state, the logical switches and VXLANs are operational.

If the state of the logical switches is something other than **Created by both**, see [“Troubleshooting a Nonoperational VMware NSX Logical Switch and Corresponding Junos OS OVSDb-Managed VXLAN” on page 2045](#).

### ***Verifying the MAC Addresses of VM 1 and VM 3***

**Purpose** Verify that the MAC addresses of VM 1 and VM 3 are present in the OVSDb schema.

**Action** Issue the **show ovssdb mac remote** operational mode command, and verify that the MAC addresses for VM 1 and VM 3 are present.

```
user@host> show ovssdb mac remote
Logical Switch Name: 28805c1d-0122-495d-85df-19abd647d772
  Mac          IP          Encapsulation  Vtep
  Address      Address
  08:33:9d:5f:a7:f1  0.0.0.0        Vxlan over Ipv4  10.19.19.19
Logical Switch Name: 96a382cd-a570-4ac8-a77a-8bb8b16bde70
  Mac          IP          Encapsulation  Vtep
  Address      Address
  a8:59:5e:f6:38:90  0.0.0.0        Vxlan over Ipv4  10.19.19.10
```

**Meaning** The output shows that the MAC addresses for VM 1 and VM 3 are present and are associated with logical switches with the UUIDs of 28805c1d-0122-495d-85df-19abd647d772 and 96a382cd-a570-4ac8-a77a-8bb8b16bde70, respectively. Given that the MAC addresses are present, VM 1 and VM 3 are reachable through hardware VTEP 1.

### ***Verifying the NSX Controller Connection***

**Purpose** Verify that the connection with the NSX controller is up.

**Action** Issue the **show ovssdb controller** operational mode command, and verify that the controller connection state is **up**.

```
user@host> show ovssdb controller
VTEP controller information:
Controller IP address: 10.94.184.1
Controller protocol: ssl
Controller port: 6632
Controller connection: up
Controller seconds-since-connect: 542325
Controller seconds-since-disconnect: 542346
Controller connection status: active
```

**Meaning** The output shows that the connection state of the NSX controller is **up**, in addition to other information about the controller. By virtue of this connection being up, OVSDb is enabled on the Juniper Networks device.

## Example: Configuring VXLAN on MX Series Routers

Virtual Extensible Local Area Network (VXLAN) is a Layer 3 encapsulation protocol that enables MX Series routers to push Layer 2 or Layer 3 packets through a VXLAN tunnel to a virtualized data center or the Internet. Communication is established between two virtual tunnel endpoints (VTEPs). VTEPs encapsulate the virtual machine traffic into a VXLAN header and strip off the encapsulation.

This example shows how to configure VXLAN on MX Series routers using switch options in a default bridge domain.

- [Requirements on page 1934](#)
- [Overview on page 1934](#)
- [Configuring VXLAN on MX Series Routers on page 1935](#)
- [Verification on page 1941](#)

### Requirements

---

This example uses the following hardware and software components:

- An MX Series router
- A VXLAN capable peer router
- Junos OS Release 14.1

### Overview

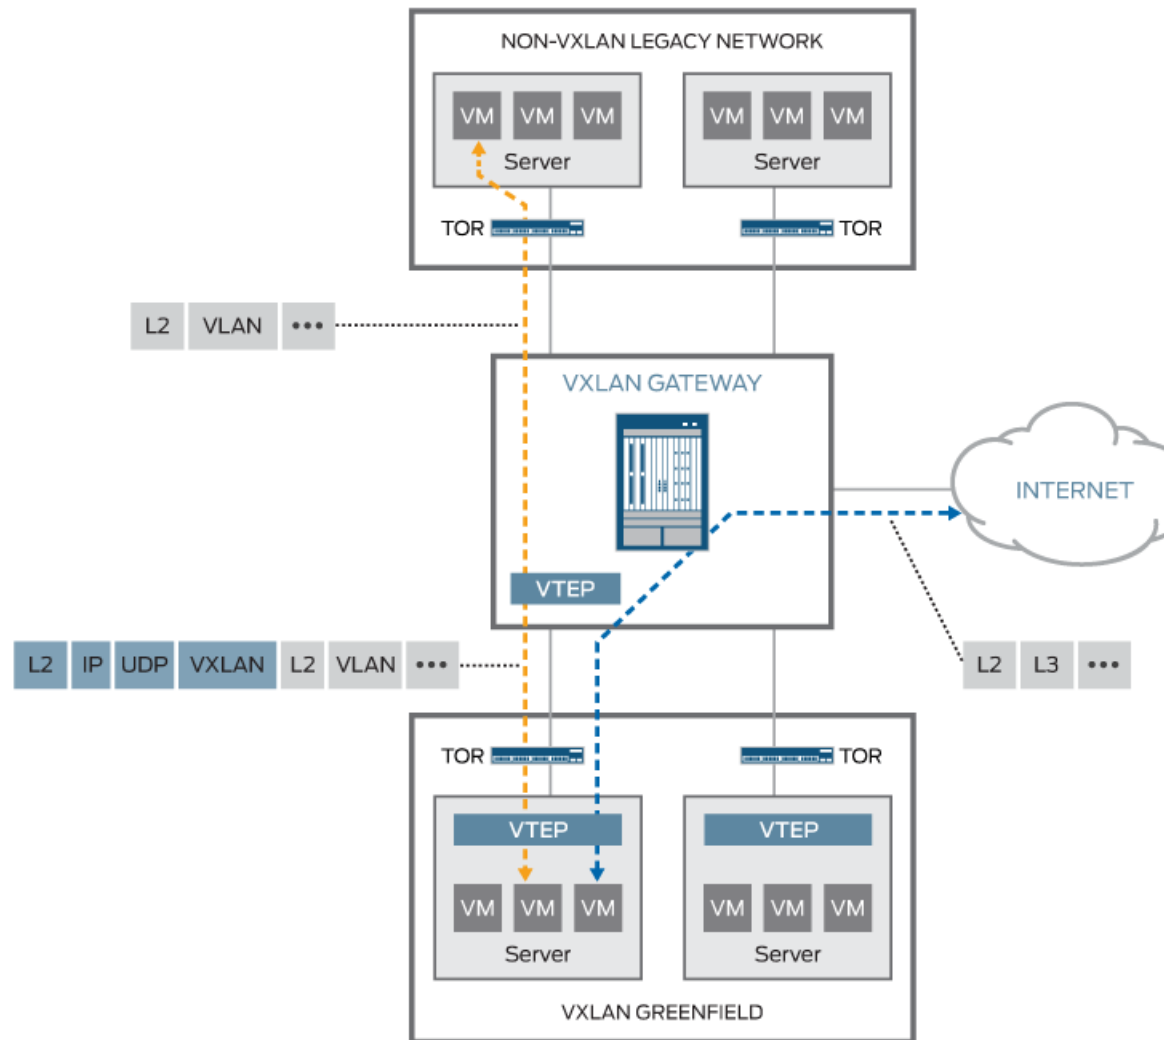

---

In this example, VXLAN is configured to run on a default bridge domain. VTEP interfaces sources are configured to the loopback address, and VLAN groups are configured under bridge domains with VXLAN enabled. Interfaces are configured for VLAN tagging and encapsulation, and IRB is enabled. OSPF and PIM protocols are configured to facilitate unicast and multicast routing. The chassis is configured for GRES and enhanced IP services.

### Topology

Figure 1: VXLAN Topology

### Configuring VXLAN on MX Series Routers

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set switch-options vtep-source-interface lo0.0
set bridge-domains vlan-5 vxlan vni 100
set bridge-domains vlan-5 vxlan multicast-group 239.1.1.1
set bridge-domains vlan-5 vlan-id 100
set bridge-domains vlan-5 routing-interface irb.0
set bridge-domains vlan-5 interface xe-1/0/0.0
```

```
set bridge-domains vlan-6 vxlan vni 200
set bridge-domains vlan-6 vxlan multicast-group 239.1.1.1
set bridge-domains vlan-6 vlan-id 200
set bridge-domains vlan-6 routing-interface irb.1
set bridge-domains vlan-6 interface xe-2/0/0.0
set interfaces xe-1/0/0 vlan-tagging
set interfaces xe-1/0/0 encapsulation flexible-ethernet-services
set interfaces xe-1/0/0 unit 0 encapsulation vlan-bridge
set interfaces xe-1/0/0 unit 0 vlan-id 100
set interfaces xe-2/0/0 vlan-tagging
set interfaces xe-2/0/0 encapsulation flexible-ethernet-services
set interfaces xe-2/0/0 unit 0 encapsulation vlan-bridge
set interfaces xe-2/0/0 unit 0 vlan-id 200
set interface irb unit 0 family inet address 5.5.5.1/24
set interface irb unit 1 family inet address 6.6.6.1/24
set interfaces lo0 unit 0 family inet address 3.3.3.3/32
set protocols ospf area 0.0.0.0 interface ge-8/3/8.0
set protocols ospf area 0.0.0.0 interface lo0.0
set protocols ospf area 0.0.0.0 interface xe-0/1/3.0
set protocols ospf area 0.0.0.0 interface ge-8/3/2.0
set protocols pim rp static address 10.2.1.3
set protocols pim interface lo0.0 mode bidirectional-sparse
set protocols pim interface ge-8/3/8.0 mode bidirectional-sparse
set protocols pim interface xe-0/1/3.0 mode bidirectional-sparse
set protocols pim interface ge-8/3/2.0 mode bidirectional-sparse
set chassis redundancy graceful-switchover
set chassis aggregated-devices ethernet device-count 10
set chassis fpc 1 pic 0 tunnel-services bandwidth 10g
set chassis network-services enhanced-ip
```

### *Configuring VXLAN*

#### **Step-by-Step Procedure**

The following example show how to set up a basic VXLAN configuration with default bridge domains and switch options. To configure VXLAN on an MX Series router, follow these steps:

1. Configure VTEP interface sources under **switch-options** for the default-switch.  
[edit]  
user@router# set switch-options vtep-source-interface lo0.0
2. Set up a VLAN group named **vlan-5** and set its VXLAN Network Identifier (VNI) to 100.  
[edit]  
user@router# set bridge-domains vlan-5 vxlan vni 100
3. Configure the **vlan-5** multicast group address for VXLAN.  
[edit]  
user@router# set bridge-domains vlan-5 vxlan multicast-group 239.1.1.1
4. Set the VLAN ID to 100 for **vlan-5**.  
[edit]  
user@router# set bridge-domains vlan-5 vlan-id 100

5. Configure integrated bridging and routing (IRB) for **vlan-5**.  

```
[edit]
user@router# set bridge-domains vlan-5 routing-interface irb.0
```
6. Assign the xe-1/0/0.0 interface to **vlan-5**.  

```
[edit]
user@router# set bridge-domains vlan-5 interface xe-1/0/0.0
```
7. Set up a VLAN group named **vlan-6** and set its VXLAN Network Identifier (VNI) to 200.  

```
[edit]
user@router# set bridge-domains vlan-6 vxlan vni 200
```
8. Configure the **vlan-6** multicast group address for VXLAN.  

```
[edit]
user@router# set bridge-domains vlan-6 vxlan multicast-group 239.1.1.1
```
9. Set the VLAN ID to 100 for **vlan-6**.  

```
[edit]
user@router# set bridge-domains vlan-6 vlan-id 200
```
10. Configure IRB for **vlan-6**.  

```
[edit]
user@router# set bridge-domains vlan-6 routing-interface irb.1
```
11. Assign the xe-2/0/0.0 interface to **vlan-6**.  

```
[edit]
user@router# set bridge-domains vlan-6 interface xe-2/0/0.0
```
12. Set up VLAN tagging for xe-1/0/0.  

```
[edit]
user@router# set interfaces xe-1/0/0 vlan-tagging
```
13. Configure flexible Ethernet service encapsulation on xe-1/0/0.  

```
[edit]
user@router# set interfaces xe-1/0/0 encapsulation flexible-ethernet-services
```
14. Set up VLAN bridging encapsulation for xe-1/0/0 unit 0.  

```
[edit]
user@router# set interfaces xe-1/0/0 unit 0 encapsulation vlan-bridge
```
15. Set the xe-1/0/0 unit 0 VLAN ID to 100.  

```
[edit]
user@router# set interfaces xe-1/0/0 unit 0 vlan-id 100
```
16. Configure VLAN tagging for xe-2/0/0  

```
[edit]
user@router# set interfaces xe-2/0/0 vlan-tagging
```

17. Set up flexible Ethernet service encapsulation on xe-2/0/0.  
[edit]  
user@router# set interfaces xe-2/0/0 encapsulation flexible-ethernet-services
18. Configure VLAN bridging encapsulation for xe-2/0/0 unit 0.  
[edit]  
user@router# set interfaces xe-2/0/0 unit 0 encapsulation vlan-bridge
19. Set the xe-2/0/0 unit 0 VLAN ID to 200.  
[edit]  
user@router# set interfaces xe-2/0/0 unit 0 vlan-id 200
20. Configure the IRB unit 0 family inet address.  
[edit]  
user@router# set interface irb unit 0 family inet address 5.5.5.1/24
21. Configure the IRB unit 1 family inet address.  
[edit]  
user@router# set interface irb unit 1 family inet address 6.6.6.1/24
22. Set the family inet address for the loopback unit 0.  
[edit]  
user@router# set interfaces lo0 unit 0 family inet address 3.3.3.3/32
23. Set up OSPF for the ge-8/3/8.0 interface.  
[edit]  
user@router# set protocols ospf area 0.0.0.0 interface ge-8/3/8.0
24. Configure OSPF for the loopback interface.  
[edit]  
user@router# set protocols ospf area 0.0.0.0 interface lo0.0
25. Set up OSPF for the xe-0/1/3.0 interface.  
[edit]  
user@router# set protocols ospf area 0.0.0.0 interface xe-0/1/3.0
26. Configure OSPF for the ge-8/3/2.0 interface.  
[edit]  
user@router# set protocols ospf area 0.0.0.0 interface ge-8/3/2.0
27. Set up the static address for the physical interface module (PIM) rendezvous point (RP).  
[edit]  
user@router# set protocols pim rp static address 10.2.1.3
28. Configure the loopback interface to bidirectional sparse mode for the PIM protocol.  
[edit]  
user@router# set protocols pim interface lo0.0 mode bidirectional-sparse

29. Set the ge-8/3/8.0 interface to bidirectional sparse mode for the PIM protocol.  

```
[edit]
user@router# set protocols pim interface ge-8/3/8.0 mode bidirectional-sparse
```
30. Configure the xe-0/1/3.0 interface to bidirectional sparse mode for the PIM protocol.  

```
[edit]
user@router# set protocols pim interface xe-0/1/3.0 mode bidirectional-sparse
```
31. Set the ge-8/3/2.0 interface to bidirectional sparse mode for the PIM protocol.  

```
[edit]
user@router# set protocols pim interface ge-8/3/2.0 mode bidirectional-sparse
```
32. Configure redundant graceful switchover on the chassis.  

```
[edit]
user@router# set chassis redundancy graceful-switchover
```
33. Set the aggregated ethernet device count to 10.  

```
[edit]
user@router# set chassis aggregated-devices ethernet device-count 10
```
34. Configure the tunnel services bandwidth for FPC 1/PIC 0.  

```
[edit]
user@router# set chassis fpc 1 pic 0 tunnel-services bandwidth 10g
```
35. Enable enhanced IP for network services on the chassis.  

```
[edit]
user@router# set chassis network-services enhanced-ip
```

### Results

From configuration mode, confirm your configuration by entering the following commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@router# show switch-options
```

```
switch-options {
  vtep-source-interface lo0.0;
}
```

```
user@router# show bridge-domains
```

```
bridge-domains {
  vlan-5 {
    vxlan {
      vni 100;
      multicast-group 239.1.1.1;
    }
    vlan-id 100;
    routing-interface irb.0;
    interface xe-1/0/0.0;
  }
}
```

```
vlan-6 {  
  vxlan {  
    vni 200;  
    multicast-group 239.2.1.1;  
  }  
  vlan-id 200;  
  routing-interface irb.1;  
  interface xe-2/0/0.0;  
}  
}
```

user@router# show interfaces

```
interfaces {  
  xe-1/0/0 {  
    vlan-tagging;  
    encapsulation flexible-ethernet-services;  
    unit 0 {  
      encapsulation vlan-bridge;  
      vlan-id 100;  
    }  
  }  
  xe-2/0/0 {  
    vlan-tagging;  
    encapsulation flexible-ethernet-services;  
    unit 0 {  
      encapsulation vlan-bridge;  
      vlan-id 200;  
    }  
  }  
  irb {  
    unit 0 {  
      family inet {  
        address 5.5.5.1/24;  
      }  
    }  
    unit 1 {  
      family inet {  
        address 6.6.6.1/24;  
      }  
    }  
  }  
  lo0 {  
    unit 0 {  
      family inet {  
        address 3.3.3.3/32;  
      }  
    }  
  }  
}
```

user@router# show protocols ospf

```
area 0.0.0.0 {  
  interface ge-8/3/8.0;  
  interface lo0.0;  
  interface xe-0/1/3.0;  
  interface ge-8/3/2.0;
```

```
}  
user@router# show protocols pim  
  
rp {  
  static {  
    address 10.2.1.3;  
  }  
}  
  
user@router# show chassis  
  
redundancy {  
  graceful-switchover;  
}  
aggregated-devices {  
  ethernet {  
    device-count 10;  
  }  
}  
fpc 1 {  
  pic 0 {  
    tunnel-services {  
      bandwidth 10g;  
    }  
  }  
}  
network-services enhanced-ip;
```

---

## Verification

Confirm that the configuration is working properly.

- [Verifying Reachability on page 1941](#)
- [Verifying VXLAN on page 1942](#)

### *Verifying Reachability*

**Purpose** Verify that the network is up and running with the proper interfaces and routes installed.

**Action** user@router> show interfaces terse irb

| Interface | Admin | Link | Proto | Local        | Remote |
|-----------|-------|------|-------|--------------|--------|
| irb       | up    | up   |       |              |        |
| irb.0     | up    | up   | inet  | 5.5.5.1/24   |        |
|           |       |      |       | multiservice |        |
| irb.1     | up    | up   | inet  | 6.6.6.1/24   |        |
|           |       |      |       | multiservice |        |

user@router> ping 5.5.5.1/24

```
PING 5.5.5.1 (5.5.5.1): 56 data bytes
64 bytes from 5.5.5.1: icmp_seq=0 ttl=64 time=0.965 ms
64 bytes from 5.5.5.1: icmp_seq=1 ttl=64 time=0.960 ms
64 bytes from 5.5.5.1: icmp_seq=2 ttl=64 time=0.940 ms
^C
--- 1.1.1.1 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.940/0.955/0.965/0.011 ms
```

**Meaning** Use the **show interfaces terse irb** command to verify that the IRB interface has been properly configured. The **irb.0** and **irb.1** interfaces should display the proper multiservice inet addresses.

Use the **ping** command to confirm that the network is connected to the IRB multiservice address.

#### *Verifying VXLAN*

**Purpose** Verify that VXLAN is working and the proper protocols are enabled.

**Action** `user@router> show interfaces vtep`

```
Physical interface: vtep, Enabled, Physical link is Up
  Interface index: 133, SNMP ifIndex: 575
  Type: Software-Pseudo, Link-level type: VxLAN-Tunnel-Endpoint, MTU: 1600, Speed:
Unlimited
  Device flags   : Present Running
  Interface flags: SNMP-Traps
  Link type      : Full-Duplex
  Link flags     : None
  Last flapped   : Never
    Input packets : 0
    Output packets: 0

  Logical interface vtep.32768 (Index 334) (SNMP ifIndex 607)
    Flags: Up SNMP-Traps Encapsulation: ENET2
    VXLAN Endpoint Type: Source, VXLAN Endpoint Address: 10.255.187.32, L2 Routing
Instance: default-switch, L3 Routing Instance: default
    Input packets : 0
    Output packets: 0

user@router> show l2-learning vxlan-tunnel-end-point remote mac-table
MAC flags (S -static MAC, D -dynamic MAC, L -locally learned, C -Control MAC
          SE -Statistics enabled, NM -Non configured MAC, R -Remote PE MAC)

Logical system : <default>
Routing instance : default-switch
  Bridging domain : vlan-5+100, VLAN : 100, VNID : 100
  Bridging domain : vlan-6+200, VLAN : 200, VNID : 200

user@router> show l2-learning vxlan-tunnel-end-point source
```

| Logical System Name | Id | SVTEP-IP      | IFL   | L3-Idx |             |
|---------------------|----|---------------|-------|--------|-------------|
| <default>           | 0  | 10.255.187.32 | lo0.0 | 0      |             |
| L2-RTT              |    | Bridge Domain |       | VNID   | MC-Group-IP |
| default-switch      |    | vlan-5+100    |       | 100    | 239.1.1.1   |
| default-switch      |    | vlan-6+200    |       | 200    | 239.1.1.1   |

**Meaning** Use the `show interface vtep` command to displays information about VXLAN endpoint configuration. Make sure the routing instance is assigned to the default-switch..

Use the `show l2-learning vxlan-tunnel-end-point remote mac-table` command to confirm that the bridging domain VLAN groups were configured correctly.

Use the `show l2-learning vxlan-tunnel-end-point source` command to confirm the multicast IP addresses for bridging domain VLAN groups.

## Examples: Configuring VXLANs on QFX Series Switches

These examples show how to configure VXLANs on QFX Series Switches for several use cases.

- [Example: Configuring a VXLAN Transit Switch on page 1944](#)
- [Example: Configuring a VXLAN Layer 2 Gateway on page 1945](#)

### Example: Configuring a VXLAN Transit Switch

If a QFX switch acts as a transit switch for downstream devices acting as VTEPs, you do not need to configure any VXLAN information on the QFX switch. You do need to configure PIM on the switch so that it can form the multicast tree required so that the VTEPs can establish reachability with each other.

- [Requirements on page 1944](#)
- [Overview on page 1944](#)
- [Configuring PIM on the Transit Switches on page 1945](#)

#### **Requirements**

This example uses the following hardware and software components:

- Two QFX5100 switches
- Junos OS 14.1X53-D10

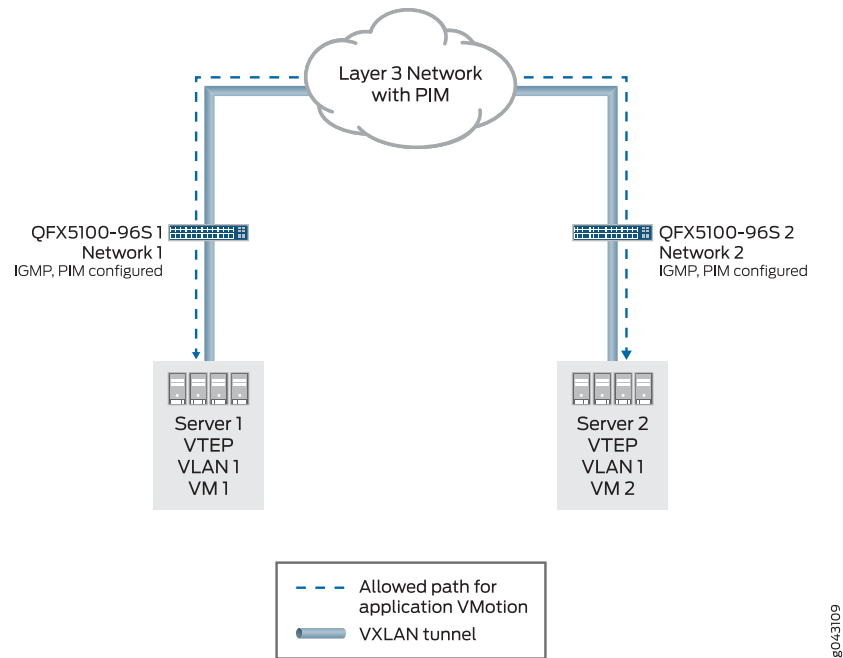

#### **Overview**

This example shows a simple use case in which QFX switches are connected to downstream servers acting as VTEPs and need to forward VXLAN packets between VM 1 on Server 1 and VM 2 on Server 2. Because this configuration allows Layer 2 connectivity between the VMs through the VXLAN tunnels, applications can VMotion between the VMs.

#### **Topology**

[Figure 33 on page 1945](#) shows a QFX 5100 switch configured to forward VXLAN packets for downstream VTEPs.

Figure 33: QFX5100 Acting as a VXLAN Transit Switch

### Configuring PIM on the Transit Switches

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set protocols pim interface all
set protocols pim rp static address ip-address
```

#### Step-by-Step Procedure

If you are not using a controller to create a VXLAN control plane, you must enable PIM on each switch so that the VTEP can use multicast groups to advertise its existence and to learn about other VTEPs. (Configuring PIM automatically enables IGMP.) You do not need to perform any VXLAN-specific configuration. Note that you also do not need to configure VLAN 1 or 2 on either switch.

1. Enable PIM:
 

```
[edit]
user@switch# set protocols pim interface all
```
2. Configure the address of a PIM rendezvous point:
 

```
[edit]
user@switch# set protocols pim rp static address ip-address
```

### Example: Configuring a VXLAN Layer 2 Gateway

If a QFX switch is connected to a downstream server that hosts a VM that needs Layer 2 connectivity with another VM that is reachable only through a Layer 3 network, you

must configure the switch to act as a VTEP—that is, a Layer 2 gateway for downstream Layer 2 devices. You also need to configure PIM on the switch so that it can form the multicast tree required for reachability with other VTEPs and to allow BUM traffic to be forwarded between the VTEPs.

- [Requirements on page 1946](#)
- [Overview on page 1946](#)
- [Configuring the Switches on page 1947](#)
- [Verification on page 1950](#)

### **Requirements**

This example uses the following hardware and software components:

- Two QFX5100 switches
- Junos OS 14.1X53-D10

### **Overview**

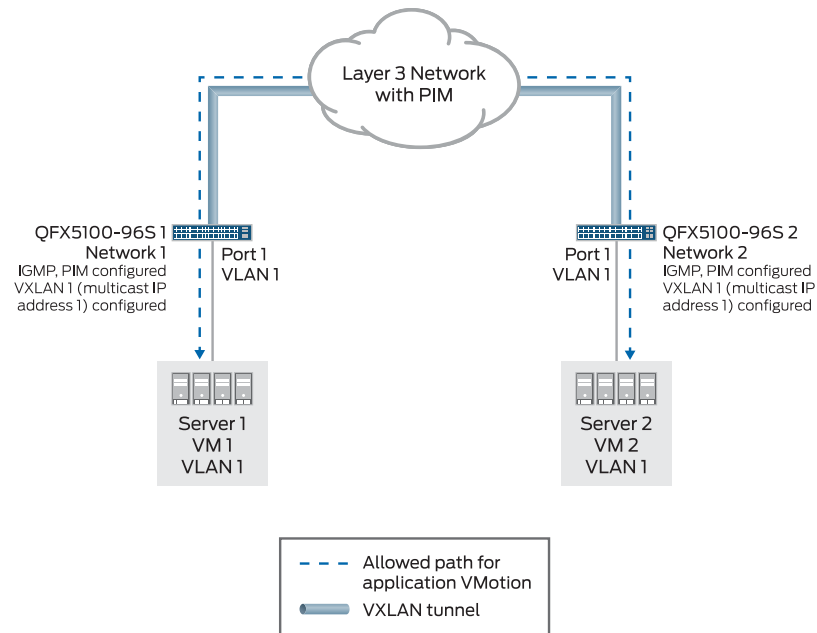

This example shows a use case in which QFX switches are connected to downstream VTEPs and need to allow Layer 2 connectivity between VM 1 on Server 1 and VM 2 on Server 2 so that VMotion can occur between the VMs. The servers in this example can be in the same or different data centers—the only constraint is that there must be Layer 3 connectivity between the QFX switches. This allows your network to be very agile in response to demand for server usage or changes in bandwidth requirements.

Note that because the same VLAN exists in both Layer 2 domains and both switches encapsulate the VLAN traffic into the same VXLAN, you do not need a gateway for the VXLAN traffic in the Layer 3 network. The Layer 3 VXLAN packets are routed normally and no de-encapsulation or re-encapsulation is required..

### **Topology**

[Figure 34 on page 1947](#) shows a QFX 5100 switch configured to act as a VTEP.

Figure 34: QFX5100 Acting as a VTEP

8043108

### Configuring the Switches

#### CLI Quick Configuration

To quickly configure the QFX5100-96S 1 in this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level.

```
set interfaces lo0 unit 0 family inet address 10.1.1.1
set switch-options vtep-source-interface lo0.0
set protocols pim interface all
set protocols pim rp static address 10.2.2.2
set vlans VLAN1 vlan-id 100 vxlan vni 100 multicast-group 232.1.1.1
set vlans VLAN1 vxlan encapsulate-inner-vlan
set vlans VLAN1 vxlan decapsulate-inner-vlan
set vlans VLAN1 vxlan unreachable-vtep-aging-timer 600
set interfaces xe-0/0/0 unit 0 family inet address 10.2.2.100/24
set interfaces xe-0/0/1 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/1 unit 0 family ethernet-switching vlan members all
```

The configuration for QFX5100-96S 2 is almost identical. The only changes a few of the addresses:

```
set interfaces lo0 unit 0 family inet address 10.1.1.2
set switch-options vtep-source-interface lo0.0
set protocols pim interface all
set protocols pim rp static address 10.2.2.2
set vlans VLAN1 vlan-id 100 vxlan vni 100 multicast-group 232.1.1.1
set vlans VLAN1 vxlan encapsulate-inner-vlan
set vlans VLAN1 vxlan decapsulate-inner-vlan
set vlans VLAN1 vxlan unreachable-vtep-aging-timer 600
```

```
set interfaces xe-0/0/0 unit 0 family inet address 10.2.2.200/24
set interfaces xe-0/0/1 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/1 unit 0 family ethernet-switching vlan members all
```

**NOTE:** You must configure the same multicast group address for VLAN1 on both switches.

**Step-by-Step Procedure** Perform the following procedure on both switches to set up the example configuration. You do not need to perform any VXLAN-specific configuration. Note that you also do not need to configure VLAN 1 or 2 on either switch.

1. Create a reachable IPv4 address on the loopback interface.  

```
[edit]
user@switch# set interfaces lo0.0 unit 0 family inet address 10.1.1.1
```

For switch QFX5100-96S 2, use address 10.1.1.2.
2. Configure the loopback interface—and therefore, its associated address—to be used as the tunnel source address:  

```
[edit]
user@switch# set switch-options vtep-source-interface lo0.0
```
3. Enable PIM:  

```
[edit]
user@switch# set protocols pim interface all
```
4. Configure the address of a PIM rendezvous point:  

```
[edit]
user@switch# set protocols pim rp static address 10.2.2.2
```
5. Create a VLAN, map it to a VXLAN, and assign a multicast group address to the VXLAN. All members of a VXLAN must use the same multicast group address:  

```
[edit]
user@switch# set vlans VLAN1 vlan-id 100 vxlan vni 100 multicast-group 232.1.1.1
```

In this example, the **vlan-id** and **vni** are both set to 100. This is done only for simplicity and clarity. You do not need to set the **vlan-id** and **vni** to the same value.
6. (Optional) Configure the switch to retain the original VLAN tag (in the inner Ethernet packet) after VXLAN encapsulation. By default, the original tag is dropped when the packet is encapsulated:  

```
[edit]
user@switch# set vlans VLAN1 vxlan encapsulate-inner-vlan
```
7. (Optional) Configure the switch to de-encapsulate and accept original VLAN tags in VXLAN packets. By default, a preserved VLAN tag is dropped when the packet is de-encapsulated:  

```
[edit]
user@switch# set vlans VLAN1 vxlan decapsulate-accept-inner-vlan
```

(Optional) Configure the system to age out the address for the remote VTEP (the other QFX5100 switch) if all the MAC addresses learned from that VTEP age out. The address for the remote VTEP expires the configured number of seconds after the last learned MAC address expires.

- ```
[edit]
user@switch# set vlans VLAN1 vxlan unreachable-vtep-aging-timer 600
```
8. Configure the interface that connects to the Layer 3 network:
- ```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.2.2.100/24
For switch QFX5100-96S 2, use address 10.2.2.200.
```
9. Configure the server-facing interface to support multiple VLANs:
- ```
[edit]
user@switch# set interfaces xe-0/0/1 unit 0 family ethernet-switching interface-mode
trunk
[edit]
user@switch# set interfaces xe-0/0/1 unit 0 family ethernet-switching vlan members all
```

**NOTE:** Because this example shows only one VLAN, this step is not required for the example. In a real-world configuration, however, it would be required in order to support multiple VMs connected to multiple VLANs. In this case you would also need to configure additional VLAN to VXLAN mappings.

### Results

From configuration mode, confirm your configuration by entering the following commands on QFX5100-96S 1. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@switch# show switch-options
```

```
vtep-source-interface lo0.0;
```

```
user@switch# show vlans
```

```
VLAN1 {
  vlan-id 100;
  vxlan {
    vni 100;
    multicast-group 232.1.1.1;
    encapsulate-inner-vlan;
  }
}
```

```
user@switch# show interfaces
```

```
xe-0/0/0 {
  unit 0 {
    family inet {
      address 10.2.2.100/24;
    }
  }
}
xe-0/0/1 {
  unit 0 {
    family ethernet-switching {
      interface-mode trunk;
    }
  }
}
```

```
        vlan {
            members all;
        }
    }
}
lo0 {
    unit 0 {
        family inet {
            address 10.1.1.1/32;
        }
    }
}

user@switch# show protocols pim

rp {
    static {
        address 10.2.2.2;
    }
}
interface xe-0/0/1.0 {
    mode sparse;
}
```

### **Verification**

Confirm that the configuration is working properly.

- [Verifying VXLAN Reachability on page 1950](#)
- [Verifying That the Local VTEP is Configured Correctly on page 1951](#)
- [Verifying MAC Learning from the Remote VTEP on page 1951](#)
- [Monitor the Remote Interface on page 1951](#)

### **Verifying VXLAN Reachability**

**Purpose** On QFX5100-96S 1, verify that there is connectivity with the remote VTEP (QFX5100-96S 2).

**Action** user@switch> show ethernet-switching vxlan-tunnel-end-point remote

Logical System Name	Id	SVTEP-IP	IFL	L3-Idx
<default>	0	10.1.1.2	1o0.0	0
RVTEP-IP	IFL-Idx	NH-Id		
10.1.1.2	559	1728		
VNID	MC-Group-IP			
100	232.1.1.1			

**Meaning** The VTEP on QFX5100-96S 2 is reachable because its IP address (the address assigned to the loopback interface) appears in the output. The output also shows that the VXLAN (VNI 100) and corresponding multicast group are configured correctly on the remote VTEP.

**Verifying That the Local VTEP is Configured Correctly**

**Purpose** On QFX5100-96S 1, verify that the tunnel endpoint is correct..

**Action** user@switch> show ethernet-switching vxlan-tunnel-end-point source

Logical System Name	Id	SVTEP-IP	IFL	L3-Idx
<default>	0	10.1.1.1	lo0.0	0
L2-RTT	Bridge Domain		VNID	MC-Group-IP
default-switch	VLAN1+100		100	232.1.1.1

**Meaning** The VTEP on QFX5100-96S 1 shows the correct tunnel source IP address (assigned to the loopback interface), VLAN, and multicast group for the VXLAN.

**Verifying MAC Learning from the Remote VTEP**

**Purpose** On QFX5100-96S 1, verify that it is learning MAC addresses from the remote VTEP.

**Action** user@switch> show ethernet-switching table

MAC flags (S - static MAC, D - dynamic MAC, L - locally learned, P - Persistent static

SE - statistics enabled, NM - non configured MAC, R - remote PE MAC)

Ethernet switching table : 2 entries, 2 learned

Routing instance : default-switch

Vlan name	MAC address	MAC flags	Age	Logical interface
VLAN1	00:00:00:ff:ff:ff	D	-	vtep.12345
VLAN1	00:10:94:00:00:02	D	-	xe-0/0/0.0

**Meaning** This shows the MAC addresses learned from the remote VTEP (in addition to those learned on the normal Layer 2 interfaces). It also shows the logical name of the remote VTEP interface (**vtep.12345** in the above output).

**Monitor the Remote Interface**

**Purpose** On QFX5100-96S 1, monitor traffic details for the remote VTEP interface.

**Action** user@switch> show interface vtep.12345 detail

```
M   Flags: Up SNMP-Traps Encapsulation: ENET2
      VXLAN Endpoint Type: Remote, VXLAN Endpoint Address: 10.1.1.2, L2 Routing
Instance: default-switch, L3 Routing Instance: default
      Traffic statistics:
        Input bytes :          228851738624
        Output bytes :              0
        Input packets:          714162415
        Output packets:              0
      Local statistics:
        Input bytes :              0
        Output bytes :              0
        Input packets:              0
        Output packets:              0
      Transit statistics:
        Input bytes :          228851738624          0 bps
        Output bytes :              0          0 bps
        Input packets:          714162415          0 pps
        Output packets:              0          0 pps
      Protocol eth-switch, MTU: 1600, Generation: 277, Route table: 5
```

**Meaning** This shows traffic details for the remote VTEP interface. To get this information, you must supply the logical name of the remote VTEP interface (vtep.12345 in the above output), which you can learn by using the **show ethernet-switching table** command.

## Example: Configuring VXLAN to VPLS Stitching with OVSDb

Virtual Extensible LAN (VXLAN) can be utilized with the Open vSwitch Database (OVSDb) management protocol in a VPLS-enabled network to stitch a virtualized data center into a Layer 2 VPN network. This configuration allows for seamless interconnection between different data centers using Layer 2 VPN regardless of whether it is virtualized, physical, or both.

- [Requirements on page 1952](#)
- [Overview on page 1953](#)
- [Configuration on page 1954](#)
- [Verification on page 1967](#)

### Requirements

---

This example uses the following hardware and software components:

- Two MX Series routers running Junos OS 14.1R2 or later
- Two MX Series routers running Junos OS 14.1R2 or later with an OVSDb software package. The release of this package must be the same as the Junos OS release running on the device.
- One EX9200 switch

- One VMware NSX controller running NSX software version 4.0.3
- NSX Manager version 4.0.3

Before you start the configuration, you must perform the following tasks:

- In NSX Manager version 4.0.3 or the NSX API, configure a logical switch for each VXLAN that OVSDb will manage. This example implements two OVSDb-managed VXLANs, so you must configure two logical switches. After the configuration of each logical switch, NSX automatically generates a universally unique identifier (UUID) for the logical switch. If you have not done so already, retrieve the UUID for each logical switch. A sample UUID is 28805c1d-0122-495d-85df-19abd647d772. When configuring the equivalent VXLANs on the Juniper Networks device, you must use the UUID of the logical switch as the bridge domain name.

For more information about logical switches and VXLANs, see [“Understanding How to Set Up Virtual Extensible LANs in an Open vSwitch Database Environment” on page 1905](#).

- Create an SSL private key and certificate, and install them in the `/var/db/certs` directory of the Juniper Networks device. For more information, see [“Creating and Installing an SSL Key and Certificate on a Juniper Networks Device for Connection with VMware NSX Controllers” on page 1984](#).

---

## Overview

In this example, four MX Series routers are configured to function together for VXLAN to virtual private LAN service (VPLS) stitching. Each router performs a different role in the configuration. The following diagram shows the topology of these MX Series routers. MX1 is the core router that handles Layer 3 traffic and protocols. MX2 is the VXLAN gateway router that functions as a virtual tunnel endpoint (VTEP) and handles switching for Layer 2, VPLS, and VXLAN. The MX3 router is configured to handle VPLS traffic. The MX4 router is configured as a VTEP to accept and decapsulate VXLAN packets.

### Topology

### Configuration

To configure VXLAN to VPLS stitching with OVSDDB:

```

### Configuring MX1

**Step-by-Step Procedure** The first router to be configured is the core router. This MX Series router handles Layer 3 traffic and protocols for the rest of the network.

To configure the MX1 router:

1. Specify the IPv4, IPv6, and ISO addresses for the loopback interface.
 

```

[edit groups global interfaces]
user@MX1# set lo0 unit 0 family inet address 127.0.0.1/32
user@MX1# set lo0 unit 0 family inet address 10.255.181.13/32primary
user@MX1# set lo0 unit 0 family iso
    47.0005.80ff.f800.0000.0108.0001.0102.5518.1013.00
user@MX1# set lo0 unit 0 family inet6 address abcd::10:255:181:13/128primary

```
2. Configure the Layer 3 network.
 

```

[edit interfaces]
user@MX1# set apply-groups LAG-options
user@MX1# set xe-0/0/2 mtu 9000
user@MX1# set xe-0/0/2 unit 0 family inet address 80.80.0.250/24
user@MX1# set xe-0/0/3 unit 0 family inet address 30.30.30.6/30
user@MX1# set ge-1/0/5 mtu 1600
user@MX1# set ge-1/0/5 unit 0 family inet address 20.20.20.2/30
user@MX1# set ge-1/0/6 unit 0 family inet address 20.20.20.10/30
user@MX1# set ge-1/0/7 gigether-options 802.3ad ae2
user@MX1# set ge-1/0/8 gigether-options 802.3ad ae2

```

```
user@MX1# set ge-1/1/2 unit 0 family inet address 30.30.30.2/30
user@MX1# set ae2 mtu 1600
user@MX1# set ae2 unit 0 family inet address 20.20.20.6/30
```

3. Enable OSPF and PIM.

```
[edit protocols]
user@MX1# set ospf area 0.0.0.0 interface xe-0/0/2.0
user@MX1# set ospf area 0.0.0.0 interface ge-1/0/5.0
user@MX1# set ospf area 0.0.0.0 interface lo0.0 passive
user@MX1# set ospf area 0.0.0.0 interface fxp0.0 disable
user@MX1# set ospf area 0.0.0.0 interface ae2.0
user@MX1# set ospf area 0.0.0.0 interface ge-1/0/6.0
user@MX1# set ospf area 0.0.0.0 interface all
user@MX1# set pim rp local address 10.255.181.13
user@MX1# set pim interface all mode sparse-dense
```

### *Configuring MX2*

**Step-by-Step Procedure** The second router to be configured is the VXLAN gateway router. This MX Series router is configured as a VTEP, and it handles switching for Layer 2, VPLS, and VXLAN.

To configure the MX2 router:

1. Configure interfaces for the VXLAN gateway.

```
[edit interfaces]
user@MX2# set xe-1/2/0 gigether-options 802.3ad ae1
user@MX2# set xe-5/0/0 gigether-options 802.3ad ae1
user@MX2# set ge-7/0/0 gigether-options 802.3ad ae2
user@MX2# set ge-7/0/1 mtu 1600
user@MX2# set ge-7/0/1 unit 0 family inet address 20.20.20.1/30
user@MX2# set ge-7/1/3 gigether-options 802.3ad ae2
user@MX2# set xe-10/3/0 vlan-tagging
user@MX2# set xe-10/3/0 encapsulation flexible-ethernet-services
user@MX2# set xe-10/3/0 unit 100 family bridge interface-mode trunk
user@MX2# set xe-10/3/0 unit 100 family bridge vlan-id-list 100-101
user@MX2# set xe-10/3/0 unit 102 family bridge interface-mode trunk
user@MX2# set xe-10/3/0 unit 102 family bridge vlan-id-list 102-103
user@MX2# set ae1 vlan-tagging
user@MX2# set ae1 encapsulation flexible-ethernet-services
user@MX2# set ae1 unit 100 family bridge interface-mode trunk
user@MX2# set ae1 unit 100 family bridge vlan-id-list 100-101
user@MX2# set ae1 unit 102 family bridge interface-mode trunk
user@MX2# set ae1 unit 102 family bridge vlan-id-list 102-103
user@MX2# set ae2 mtu 1600
user@MX2# set ae2 unit 0 family inet address 20.20.20.5/30
user@MX2# set irb unit 1 family inet address 2.2.1.1/24
user@MX2# set irb unit 2 family inet address 2.2.2.1/24
user@MX2# set irb unit 3 family inet address 2.2.3.1/24
user@MX2# set irb unit 4 family inet address 2.2.4.1/24
user@MX2# set irb unit 5 family inet address 2.2.5.1/24
user@MX2# set irb unit 11 family inet address 2.2.11.1/24
user@MX2# set irb unit 12 family inet address 2.2.12.1/24
user@MX2# set irb unit 13 family inet address 2.2.13.1/24
user@MX2# set irb unit 14 family inet address 2.2.14.1/24
user@MX2# set irb unit 15 family inet address 2.2.15.1/24
```

```
user@MX2# set lo0 unit 1 family inet address 200.1.1/32
```

2. Configure OSPF interface settings and the Layer 2 learning traceoption file.

```
[edit protocols]
user@MX2# set ospf area 0.0.0.0 interface ge-7/0/1.0
user@MX2# set ospf area 0.0.0.0 interface fxp0.0 disable
user@MX2# set ospf area 0.0.0.0 interface lo0.0 passive
user@MX2# set l2-learning traceoptions file vxlan-l2ald.log
user@MX2# set l2-learning traceoptions file size 100m
user@MX2# set l2-learning traceoptions file files 10
user@MX2# set l2-learning traceoptions level all
user@MX2# set l2-learning traceoptions flag all
user@MX2# set layer2-control nonstop-bridging
```

3. Set up OVSDb tracing operations.

```
[edit protocols]
user@MX2# set ovssdb traceoptions file ovssdb.log
user@MX2# set ovssdb traceoptions file size 100m
user@MX2# set ovssdb traceoptions file files 10
user@MX2# set ovssdb traceoptions level all
user@MX2# set ovssdb traceoptions flag all
```

4. Specify that interfaces xe-10/3/0.1, xe-10/3/0.0, ae1.0, and ae1.1 are managed by OVSDb.

```
[edit protocols]
user@MX2# set ovssdb interfaces xe-10/3/0.1
user@MX2# set ovssdb interfaces xe-10/3/0.0
user@MX2# set ovssdb interfaces ae1.0
user@MX2# set ovssdb interfaces ae1.1
```

5. Configure a connection with an NSX controller.

```
[edit protocols]
user@MX2# set ovssdb controller 192.168.182.45 protocol ssl port 6632
```

6. Configure the **default-VS1** virtual switch instance as a VTEP.

```
[edit routing-instances]
user@MX2# set default-VS1 vtep-source-interface lo0.1
user@MX2# set default-VS1 instance-type virtual-switch
user@MX2# set default-VS1 interface xe-10/3/0.102
user@MX2# set default-VS1 interface ae1.102
```

7. Configure a set of bridge domains that are associated with VXLAN under the virtual switch instance.

```
[edit routing-instances]
user@MX2# set default-VS1 bridge-domains
bf6d4fd4-f5f6-430c-8c37-4033ef1c55ab vlan-id 102
user@MX2# set default-VS1 bridge-domains
bf6d4fd4-f5f6-430c-8c37-4033ef1c55ab routing-interface irb.102
user@MX2# set default-VS1 bridge-domains
bf6d4fd4-f5f6-430c-8c37-4033ef1c55ab vxlan ovssdb-managed
user@MX2# set default-VS1 bridge-domains
bf6d4fd4-f5f6-430c-8c37-4033ef1c55ab vxlan vni 102
user@MX2# set default-VS1 bridge-domains
bf6d4fd4-f5f6-430c-8c37-4033ef1c55ab vxlan ingress-node-replication
```

```

user@MX2# set default-VS1 bridge-domains
f293dd5b-a901-4dba-bcbf-18a9979cf9d3 vlan-id 103
user@MX2# set default-VS1 bridge-domains
f293dd5b-a901-4dba-bcbf-18a9979cf9d3 routing-interface irb.103
user@MX2# set default-VS1 bridge-domains
f293dd5b-a901-4dba-bcbf-18a9979cf9d3 vxlan ovsdb-managed
user@MX2# set default-VS1 bridge-domains
f293dd5b-a901-4dba-bcbf-18a9979cf9d3 vxlan vni 103
user@MX2# set default-VS1 bridge-domains
f293dd5b-a901-4dba-bcbf-18a9979cf9d3 vxlan ingress-node-replication

```

8. Set up VPN routing and forwarding.

```

[edit routing- instances]
user@MX2# set vrf1 instance-type vrf
user@MX2# set vrf1 interface ae2.0
user@MX2# set vrf1 interface lo0.1
user@MX2# set vrf1 route-distinguisher 100:100
user@MX2# set vrf1 vrf-target target:100:100
user@MX2# set vrf1 protocols ospf area 0.0.0.0 interface ae2.0
user@MX2# set vrf1 protocols ospf area 0.0.0.0 interface lo0.1 passive
user@MX2# set vrf1 protocols pim rp static address 10.255.181.13
user@MX2# set vrf1 protocols pim interface all

```

9. Configure bridge domains with VXLAN information.

```

[edit bridge-domains]
user@MX2# set 24a76aff-7e61-4520-a78d-3eca26ad7510 vlan-id 100
user@MX2# set 24a76aff-7e61-4520-a78d-3eca26ad7510 routing-interface irb.100
user@MX2# set 24a76aff-7e61-4520-a78d-3eca26ad7510 vxlan ovsdb-managed
user@MX2# set 24a76aff-7e61-4520-a78d-3eca26ad7510 vxlan vni 100
user@MX2# set 24a76aff-7e61-4520-a78d-3eca26ad7510 vxlan
ingress-node-replication
user@MX2# set cadbc185-f60f-48a6-93fd-dc14a6420c60 vlan-id 101
user@MX2# set cadbc185-f60f-48a6-93fd-dc14a6420c60 routing-interface irb.101
user@MX2# set cadbc185-f60f-48a6-93fd-dc14a6420c60 vxlan ovsdb-managed
user@MX2# set cadbc185-f60f-48a6-93fd-dc14a6420c60 vxlan vni 101
user@MX2# set cadbc185-f60f-48a6-93fd-dc14a6420c60 vxlan
ingress-node-replication

```

10. Configure the loopback interface to be used as the tunnel source address.

```

[edit switch-options]
user@MX2# set vtep-source-interface lo0.0

```

**NOTE:** After completing this configuration, you must configure a gateway, which is the NSX equivalent of a hardware VTEP. This configuration implements one hardware VTEP, so you must configure one gateway, a gateway service, and a logical switch port using NSX Manager or the NSX API. For more information about the tasks you must perform as well as key NSX Manager configuration details, see [“VMware NSX Configuration for Juniper Networks Devices That Function as Virtual Tunnel Endpoints” on page 1986](#).

**Configuring MX3**

**Step-by-Step Procedure** The third MX Series router must be configured to handle VPLS traffic.

To configure the MX3 router:

1. Specify the IPv4, IPv6, and ISO addresses for the loopback interface.
 

```
[edit groups global interfaces]
user@MX3# set lo0 unit 0 family inet address 127.0.0.1/32
user@MX3# set lo0 unit 0 family inet address 10.255.181.98/32 primary
user@MX3# set lo0 unit 0 family iso address
47.0005.80ff.f800.0000.0108.0001.0102.5518.1098.00
user@MX3# set lo0 unit 0 family inet6 address abcd::10:255:181:98/128 primary
```
2. Configure the interfaces.
 

```
[edit interfaces]
user@MX3# set fxp0 unit 0 family inet address 192.168.181.97/25
user@MX3# set xe-0/0/0 gigether-options 802.3ad ae1
user@MX3# set xe-0/0/1 gigether-options 802.3ad ae1
user@MX3# set xe-0/0/3 vlan-tagging
user@MX3# set xe-0/0/3 encapsulation flexible-ethernet-services
user@MX3# set xe-0/0/3 unit 0 family bridge interface-mode trunk
user@MX3# set xe-0/0/3 unit 0 family bridge vlan-id-list 1-40
user@MX3# set ae1 vlan-tagging
user@MX3# set ae1 encapsulation flexible-ethernet-services
user@MX3# set ae1 unit 0 family bridge interface-mode trunk vlan-id-list 1-40
```
3. Enable PIM.
 

```
[edit protocols]
user@MX3# set pim dense-groups 224.0.1.39/32
user@MX3# set pim dense-groups 224.0.1.40/32
user@MX3# set pim rp auto-rp discovery
user@MX3# set pim interface all mode sparse-dense
```
4. Configure the VPLS bridge domain and interfaces.
 

```
[edit routing-instances]
user@MX3# set vs1 instance-type virtual-switch
user@MX3# set vs1 interface xe-0/0/3.0
user@MX3# set vs1 interface ae1.0
user@MX3# set vs1 bridge-domains v1 vlan-id-list 1-40
```

**Configuring MX4**

**Step-by-Step Procedure** The fourth MX Series router is configured as a VTEP to accept and decapsulate VXLAN packets.

To configure the MX4 router:

1. Specify the IPv4, IPv6, and ISO addresses for the loopback interface.
 

```
[edit groups global interfaces]
user@MX4# set lo0 unit 0 family inet address 127.0.0.1/32
user@MX4# set lo0 unit 0 family inet address 10.255.181.43/32 primary
```

```
user@MX4# set lo0 unit 0 family iso address
47.0005.80ff.f800.0000.0108.0001.0102.5518.1043.00
user@MX4# set lo0 unit 0 family inet6 address abcd::10:255:181:43/128 primary
```

2. Configure the interfaces.

```
[edit interfaces]
user@MX4# set xe-0/0/0 vlan-tagging
user@MX4# set xe-0/0/0 encapsulation flexible-ethernet-services
user@MX4# set xe-0/0/0 unit 0 family bridge interface-mode trunk
user@MX4# set xe-0/0/0 unit 0 family bridge vlan-id-list 1-10
user@MX4# set xe-0/0/0 unit 1 family bridge interface-mode trunk
user@MX4# set xe-0/0/0 unit 1 family bridge vlan-id-list 11-15
user@MX4# set xe-0/0/0 unit 2 family bridge interface-mode trunk
user@MX4# set xe-0/0/0 unit 2 family bridge vlan-id-list 21-30
user@MX4# set xe-0/0/0 unit 3 family bridge interface-mode trunk
user@MX4# set xe-0/0/0 unit 3 family bridge vlan-id-list 31-40
user@MX4# set ge-0/2/6 unit 0 family inet address 30.30.30.1/30
user@MX4# set ge-0/3/0 unit 0 family inet address 3.3.3.2/30
user@MX4# set irb unit 1 family inet address 2.2.1.2/24
user@MX4# set irb unit 2 family inet address 2.2.2.2/24
user@MX4# set irb unit 3 family inet address 2.2.3.2/24
user@MX4# set irb unit 4 family inet address 2.2.4.2/24
user@MX4# set irb unit 5 family inet address 2.2.5.2/24
user@MX4# set irb unit 11 family inet address 2.2.11.2/24
user@MX4# set irb unit 12 family inet address 2.2.12.2/24
user@MX4# set irb unit 13 family inet address 2.2.13.2/24
user@MX4# set irb unit 14 family inet address 2.2.14.2/24
user@MX4# set irb unit 15 family inet address 2.2.15.2/24
```

3. Configure OSPF interface settings and the Layer 2 learning traceoption file.

```
[edit protocols]
user@MX4# set ospf area 0.0.0.0 interface ge-0/2/6.0
user@MX4# set ospf area 0.0.0.0 interface fxp0.0 disable
user@MX4# set ospf area 0.0.0.0 interface lo0.0 passive
user@MX4# set ospf area 0.0.0.0 interface ge-0/3/0.0
user@MX4# set l2-learning traceoptions file vxlan-l2ald.log size 100m files 10
user@MX4# set l2-learning traceoptions level all
user@MX4# set l2-learning traceoptions flag all
user@MX4# set layer2-control nonstop-bridging
```

4. Enable PIM.

```
[edit protocols]
user@MX4# set pim rp auto-rp discovery
user@MX4# set pim rp static address 10.255.181.13
user@MX4# set pim rp interface all mode sparse-dense
```

5. Set up OVSDB tracing operations.

```
[edit protocols]
user@MX4# set ovsdb traceoptions file ovsdb.log size 100m files 10
user@MX4# set ovsdb traceoptions level all
user@MX4# set ovsdb traceoptions flag all
```

6. Specify that interfaces xe-0/0/0.1 and xe-0/0/0.0 are managed by OVSDB.

```
[edit protocols]
```

- ```

user@MX4# set ovsdb interfaces xe-0/0/0.1
user@MX4# set ovsdb interfaces xe-0/0/0.0

```
7. Configure a connection with an NSX controller.
 

```

[edit protocols]
user@MX4# set ovsdb controller 192.168.182.45 protocol ssl port 6632

```
  8. Configure the VPLS interface.
 

```

[edit routing-instances]
user@MX4# set default-vs1 vtep-source-interface lo0.0
user@MX4# set default-vs1 instance-type virtual-switch
user@MX4# set default-vs1 interface xe-0/0/0.1

```
  9. Configure the **default-VS1** instance with a set of bridge domains that are associated with VXLAN.
 

```

[edit routing-instances]
user@MX4# set default-VS1 bridge-domains
bf6d4fd4-f5f6-430c-8c37-4033ef1c55ab vlan-id 11

user@MX4# set v5 vlan-id 5
user@MX4# set v5 routing-interface irb.5
user@MX4# set v5 vxlan vni 5
user@MX4# set v5 vxlan multicast-group 228.1.1.5

```

12. Configure the loopback interface to be used as the tunnel source address.

```

[edit switch-options]
user@MX4# set vtep-source-interface lo0.0

```

**NOTE:** After completing this configuration, you must configure a gateway, which is the NSX equivalent of a hardware VTEP. This configuration implements one hardware VTEP, so you must configure one gateway, a gateway service, and a logical switch port using NSX Manager or the NSX API. For more information about the tasks you must perform as well as key NSX Manager configuration details, see [“VMware NSX Configuration for Juniper Networks Devices That Function as Virtual Tunnel Endpoints” on page 1986](#).

**Results**

From configuration mode, confirm your configuration by entering the following commands on each router. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

**Verification**

---

Confirm that the configuration is working properly.

- [Verifying MX1 on page 1967](#)
- [Verifying MX2 on page 1970](#)
- [Verifying MX3 on page 1975](#)
- [Verifying MX4 on page 1977](#)

**Verifying MX1**

**Purpose** Verify your configuration on MX1.

**Action** Verify that the interfaces are configured properly.

```
user@MX1# show interface
```

```
apply-groups LAG-options;

  routing-interface irb.101;
  vxlan {
    ovsdb-managed;
    vni 101;
    ingress-node-replication;
  }
}

```

Verify that the loopback interface is used as the tunnel source address.

```

user@MX2# show switch-options
  vtep-source-interface lo0.0;

```

### Verifying MX3

**Purpose** Verify your configuration on MX3.

**Action** Verify that the global group interfaces are configured properly.

```
user@MX3# show groups global interfaces
```

```
lo0 {
  unit 0 {
    family inet {
      address 127.0.0.1/32;
      address 10.255.181.98/32 {
        primary;
      }
    }
    family iso {
      address 47.0005.80ff.f800.0000.0108.0001.0102.5518.1098.00;
    }
    family inet6 {
      address abcd::10:255:181:98/128 {
        primary;
      }
    }
  }
}
```

Verify that the interfaces are configured properly.

```
user@MX3# show interfaces
```

```
xe-0/0/0 {
  gigether-options {
    802.3ad ae1;
  }
}
xe-0/0/1 {
  gigether-options {
    802.3ad ae1;
  }
}
xe-0/0/3 {
  vlan-tagging;
  encapsulation flexible-ethernet-services;
  unit 0 {
    family bridge {
      interface-mode trunk;
      vlan-id-list 1-40;
    }
  }
}
ae1 {
  vlan-tagging;
  encapsulation flexible-ethernet-services;
  unit 0 {
    family bridge {
      interface-mode trunk;
      vlan-id-list 1-40;
    }
  }
}
```

```
}
```

Verify that the PIM is configured properly.

```
user@MX3# show protocols pim
  dense-groups {
    224.0.1.39/32;
    224.0.1.40/32;
  }
  rp {
    auto-rp discovery;
  }
  interface all {
    mode sparse-dense;
  }
```

Verify the VPLS bridge domain and interfaces configuration.

```
user@MX3# show protocols pim
  instance-type virtual-switch;
  interface xe-0/0/3.0;
  interface ae1.0;
  bridge-domains {
    v1 {
      vlan-id-list 1-40;
    }
  }
```

#### ***Verifying MX4***

**Purpose** Verify your configuration on MX4.

**Action** Verify that the global group interfaces are configured properly.

```
user@MX4# show groups global interfaces
```

```
lo0 {
  unit 0 {
    family inet {
      address 127.0.0.1/32;
      address 10.255.181.43/32 {
        primary;
      }
    }
    family iso {
      address 47.0005.80ff.f800.0000.0108.0001.0102.5518.1043.00;
    }
    family inet6 {
      address abcd::10:255:181:43/128 {
        primary;
      }
    }
  }
}
```

Verify that the interfaces are configured properly.

```
user@MX4# show interfaces
```

```
xe-0/0/0 {
  vlan-tagging;
  encapsulation flexible-ethernet-services;
  unit 0 {
    family bridge {
      interface-mode trunk;
      vlan-id-list 1-10;
    }
  }
  unit 1 {
    family bridge {
      interface-mode trunk;
      vlan-id-list 11-15;
    }
  }
  unit 2 {

### Installing Open vSwitch Database Components on Juniper Networks Devices

To install Open vSwitch Database (OVSDb) components on a Juniper Networks device, you must copy the OVSDb software package to the Juniper Networks device and then install the package. The OVSDb software package name uses the following format:

`jsdn-packageID-release`

where:

- *packageID* identifies the package that should run on each Juniper Networks device.

- *release* identifies the OVSDB release; for example, 14.1R2. The OVSDB software release and the Junos OS release running on the device must be the same.

For information about OVSDB support on Juniper Networks devices and the software package for each device, see [“Open vSwitch Database Support on Juniper Networks Devices” on page 1899](#).

To install the OVSDB software package on a Juniper Networks device:

1. Download the software package to the Juniper Networks device.
2. If an OVSDB software package already exists on the Juniper Networks device, remove the package by issuing the **request system software delete** operational mode command.

```
user@device> request system software delete existing-ovsdb-package
```

3. Install the new software package by using the **request system software add** operational mode command.

```
user@device> request system software add path-to-ovsdb-package
```

**Related Documentation** • [Understanding the Open vSwitch Database Management Protocol Running on Juniper Networks Devices on page 1902](#)

## Creating and Installing an SSL Key and Certificate on a Juniper Networks Device for Connection with VMware NSX Controllers

To secure a connection between a Juniper Networks device that supports the Open vSwitch Database (OVSDB) management protocol and one or more VMware NSX controllers, the following Secure Sockets Layer (SSL) files must be present in the **/var/db/certs** directory on the device:

- vtep-privkey.pem
- vtep-cert.pem
- ca-cert.pem

You must create the vtep-privkey.pem and vtep-cert.pem files for the device, and then install the two files in the **/var/db/certs** directory on the device.

Upon the initial connection between a Juniper Networks device with OVSDB implemented and an NSX controller, the ca-cert.pem file is automatically generated, and then installed in the **/var/db/certs** directory on the device.

The procedure provided in this topic uses the OpenFlow public key infrastructure (PKI) management utility ovs-pki on a Linux computer to initialize a public key infrastructure (PKI) and create the vtep-privkey.pem and vtep-cert.pem files. (If you have an existing PKI on your Linux computer, you can skip the step to initialize a new one.) By default, the utility initializes the PKI and places these files in the **/usr/local/share/openvswitch/pki** directory of the Linux computer.

To create and install an SSL key and certificate on a Juniper Networks device:

1. Initialize a PKI if one does not already exist on your Linux computer.

```
# ovs-pki init
```

2. On the same Linux computer on which the PKI exists, create a new key and certificate for the Juniper Networks device.

```
# ovs-pki req+sign vtep
```

3. Copy only the vtep-privkey.pem and vtep-cert.pem files from the Linux computer to the `/var/db/certs` directory on the Juniper Networks device.

## Setting Up the Open vSwitch Database Management Protocol on Juniper Networks Devices

To implement the Open vSwitch Database (OVSDB) management protocol on a Juniper Networks device, you must explicitly configure a connection to at least one VMware NSX controller, using the Junos OS CLI.

All NSX controller connections are made on the management interface (fxp0, em0, or em1) of the Juniper Networks device. This connection is secured by using the Secure Sockets Layer (SSL) protocol. The default port number over which the connection is made is 6632.

You must also specify that any interface with a physical server is managed by OVSDB. By performing this configuration, you are essentially disabling the Juniper Networks device from learning about other Juniper Networks devices that function as hardware virtual tunnel endpoints (VTEPs) and the MAC addresses learned by the hardware VTEPs, and enabling OVSDB to learn about these elements.

Before setting up OVSDB on a Juniper Networks device, you must do the following:

- Ensure that the Juniper Networks device has an OVSDB software package installed, and that the OVSDB software package release is the same as the Junos OS release running on the device.
- Determine the IP address of the NSX controller.
- Create an SSL private key and certificate, and install them in the `/var/db/certs` directory of the Juniper Networks device. For more information, see [“Creating and Installing an SSL Key and Certificate on a Juniper Networks Device for Connection with VMware NSX Controllers” on page 1984](#).

To set up OVSDb on a Juniper Networks device:

1. Specify the IP address of the NSX controller.

```
[edit protocols ovssdb]
user@host# set controller ip-address
```

2. Specify SSL as the protocol that secures the connection.

```
[edit protocols ovssdb controller ip-address]
user@host# set protocol ssl
```

3. Set the number of the port over which the connection to the NSX controller is made.

```
[edit protocols ovssdb controller ip-address protocol ssl]
user@host# set port number
```

4. (Optional) Specify (in milliseconds) how long the connection can be inactive before an inactivity probe is sent.

```
[edit protocols ovssdb controller ip-address]
user@host# set inactivity-probe-duration milliseconds
```

5. (Optional) Specify (in milliseconds) how long the device must wait before it can try to connect to the NSX controller again if the previous attempt failed.

```
[edit protocols ovssdb controller ip-address]
user@host# set maximum-backoff-duration milliseconds
```

6. (Optional) Repeat steps 1 through 5 to explicitly configure a connection to an additional NSX controller in the same cluster.

7. Specify the interfaces that you want OVSDb to manage.

```
[edit protocols ovssdb]
user@host# set interfaces interface-name unit logical-unit-number
```

**NOTE:** After completing this procedure, you must set up OVSDb-managed VXLANs. For more information, see [“Configuring OVSDb-Managed VXLANs” on page 1989](#).

## VMware NSX Configuration for Juniper Networks Devices That Function as Virtual Tunnel Endpoints

For each Juniper Networks Junos operating system (Junos OS) network device that you plan to deploy as a hardware virtual tunnel endpoint (VTEP) in a physical network, you must create a VMware NSX-equivalent entity, which is known as a *gateway*, in NSX Manager version 4.0.3 or in the NSX API. You must also map the gateway to a logical switch, which is the NSX equivalent of an Open vSwitch Database (OVSDb)-managed Virtual Extensible LAN (VXLAN) in the physical network. Performing this configuration enables connectivity between physical servers in the physical network and virtual machines (VMs) in the virtual network.

This topic provides a high-level summary of the tasks that you must perform to create a gateway. Although you can create a gateway either in NSX Manager or in the NSX API, this topic describes the necessary tasks from the perspective of NSX Manager. Also, this

topic does not include a complete procedure for each task. Rather, it includes key NSX Manager configuration details for ensuring the correct configuration of the virtual entities so that they function properly with the physical entities. For complete information about performing the tasks described in this topic, see the documentation that accompanies NSX Manager.

For each hardware VTEP that you deploy in the physical network, you must perform the following tasks:

- [Creating a Gateway on page 1987](#)
- [Creating a Gateway Service on page 1987](#)
- [Creating a Logical Switch Port on page 1988](#)

### Creating a Gateway

In NSX Manager, you must create a gateway for each hardware VTEP that you implement in the physical network. [Table 135 on page 1987](#) provides a summary of key configuration fields in NSX Manager and how to configure them when creating a gateway.

Before you begin this task, you must configure a logical switch in NSX Manager or in the NSX API for each OVSDB-managed VXLAN that you plan to implement in the physical network. For information about configuring a logical switch, see the documentation that accompanies NSX Manager or the NSX API.

**Table 135: Create a Gateway in NSX Manager: Key Configurations**

| NSX Manager Configuration Page/Dialog Box | NSX Manager Configuration Field | How to Configure   |
|---|---------------------------------|--|
| Type                                      | Transport Node Type             | Select <b>Gateway</b> .  |
| Properties                                | VTEP Enabled                    | Select <b>VTEP Enabled</b> .   |
| Credential                                | Type                            | Select <b>Management Address</b> .   |
| Credential                                | Management Address              | Specify the management IP address of the Juniper Networks device.                      |
| Connections/Create Transport Connector    | Transport Type                  | Select <b>VXLAN</b> .  |
| Connections/Create Transport Connector    | Transport Zone UUID             | Select the UUID of an existing transport zone, or create a new transport zone.         |
| Connections/Create Transport Connector    | IP Address                      | Specify the IP address of the loopback interface (lo0) of the Juniper Networks device. |

### Creating a Gateway Service

In NSX Manager, you must create a gateway service for each hardware VTEP that you implement in the physical network. [Table 136 on page 1988](#) provides a summary of key

configuration fields in NSX Manager and how to configure them when creating a gateway service.

Before you start this task, make sure that you have configured the OVSDDB-managed interfaces on the hardware VTEP. For information about configuring OVSDDB-managed interfaces, see [“Setting Up the Open vSwitch Database Management Protocol on Juniper Networks Devices” on page 1985](#).

**Table 136: Create a Gateway Service in NSX Manager: Key Configurations**

| NSX Manager Configuration Page/Dialog Box | NSX Manager Configuration Field | How to Configure  |
|---|---------------------------------|---|
| Type                                      | Gateway Service Type            | Select <b>VTEP L2 Gateway Service</b> .                             |
| Transport Nodes/Edit Gateway              | Transport Node                  | Select the gateway that you created for the hardware VTEP.          |
| Transport Nodes/Edit Gateway              | Port ID                         | Select an OVSDDB-managed interface configured on the hardware VTEP. |

#### Creating a Logical Switch Port

In NSX Manager, you must create a logical switch port for each hardware VTEP that you implement in the physical network. [Table 137 on page 1988](#) provides a summary of key configuration fields in NSX Manager and how to configure them when creating a logical switch port.

Before you start this task, you must configure a logical switch in NSX Manager or in the NSX API for each OVSDDB-managed VXLAN that you plan to implement in the physical network. For information about configuring a logical switch, see the documentation that accompanies NSX Manager or the NSX API.

**Table 137: Create a Logical Switch Port in NSX Manager: Key Configurations**

| NSX Manager Configuration Page/Dialog Box | NSX Manager Configuration Field | How to Configure   |
|---|---------------------------------|--|
| Logical Switch                            | Logical Switch UUID             | Select the UUID of the logical switch that corresponds to the hardware VTEP. |
| Attachment                                | Attachment Type                 | Select <b>VTEP L2 Gateway</b> .  |
| Attachment                                | VTEP L2 Gateway Service UUID    | Select the UUID of the gateway service you created for the hardware VTEP.    |

**Related Documentation**

- [Configuring OVSDDB-Managed VXLANs on page 1989](#)

## Configuring OVSDB-Managed VXLANs

**NOTE:** This topic does not apply to QFX5100 switches that support Open vSwitch Database (OVSDB) and Virtual Extensible LAN (VXLAN). The QFX5100 switch automatically creates OVSDB-managed VXLANs, thereby eliminating the need for you to configure them, using the Junos OS CLI. In addition, the QFX5100 switch does not support ingress node replication, which is described in this topic. However, there are other configuration tasks that must be performed to set up OVSDB on a QFX5100 switch. For more information, see [“Understanding How to Set Up Virtual Extensible LANs in an Open vSwitch Database Environment”](#) on page 1905.

To implement the OVSDB management protocol on a Juniper Networks device, you must configure OVSDB-managed VXLANs.

For Layer 2 broadcast, unknown unicast, and multicast (BUM) traffic that originates in an OVSDB-managed VXLAN and is forwarded to interfaces within the same VXLAN, you can optionally enable ingress node replication. With this feature enabled, the Juniper Networks device handles the replication of these packets and the forwarding of the replicas to interfaces within the same OVSDB-managed VXLAN. For more information about using ingress node replication or a service node, which is the default way to handle Layer 2 BUM traffic, see [“Understanding How Layer 2 BUM Traffic and Layer 3 Routed Multicast Traffic Are Handled in VXLANs Managed by OVSDB”](#) on page 1904.

**NOTE:** When Juniper Networks devices replicate Layer 2 BUM packets to a large number of remote software virtual tunnel endpoints (VTEPs), the performance of the Juniper Networks devices can be impacted.

Before you configure VXLANs on a Juniper Networks device, using the Junos OS CLI:

- For each OVSDB-managed VXLAN that you plan to configure on a Juniper Networks device, you must configure a logical switch in VMware NSX Manager version 4.0.3 or the NSX API. (For information about configuring a logical switch, see the documentation that accompanies NSX Manager or the NSX API.) Based on the name and VXLAN network identifier (VNI) that you configure for the logical switch, NSX automatically generates a universally unique identifier (UUID) for the logical switch. You must retain the UUID of the logical switch for use when configuring a corresponding VXLAN on the Juniper Networks device as described in the following procedure.
- You must perform the configuration described in [“Setting Up the Open vSwitch Database Management Protocol on Juniper Networks Devices”](#) on page 1985.

To configure an OVSDB-managed VXLAN on a Juniper Networks device:

1. Configure the VXLANs that you want OVSDB to manage. You can configure the VXLANs in the context of a bridge domain, routing instance, or switching instance.

**NOTE:** For the name of the bridge domain, you must specify the UUID for the logical switch configured in NSX Manager or the NSX API.

Bridge domains:

```
[edit bridge-domains bridge-domain-name vxlan]
user@host# set ovsdb-managed
```

Bridge domains within the specified routing instance:

```
[edit routing-instances routing-instance-name bridge-domains bridge-domain-name
vxlan]
user@host# set ovsdb-managed
```

VLANs within the specified routing instance:

```
[edit routing-instances routing-instance-name vlans vlan-name vxlan]
user@device# set ovsdb-managed
```

Default switching instance within the specified routing instance:

```
[edit routing-instances routing-instance-name switch-options]
user@host# set ovsdb-managed
```

All VXLAN entities within the specified routing instance:

```
[edit routing-instances routing-instance-name vxlan]
user@host# set ovsdb-managed
```

2. (Optional) Enable ingress node replication to handle Layer 2 BUM traffic on interfaces in the same VXLAN in which the traffic originated. You can configure ingress node replication in the context of a bridge domain or routing instance.

Bridge domains:

```
[edit bridge-domains bridge-domain-name vxlan]
user@host# set ingress-node-replication
```

Bridge domains or all VXLAN entities, respectively, within the specified routing instance:

```
[edit routing-instances routing-instance-name bridge-domains bridge-domain-name
vxlan]
[edit routing-instances routing-instance-name vlans vlan-name vxlan]
[edit routing-instances routing-instance-name vxlan]
user@host# set ingress-node-replication
```

3. For each Juniper Networks device that you plan to implement as a hardware VTEP, you must perform some configuration tasks in NSX Manager or in the NSX API.

For more information about the tasks you must perform and key NSX Manager configuration details, see [“VMware NSX Configuration for Juniper Networks Devices That Function as Virtual Tunnel Endpoints” on page 1986](#).

#### Related Documentation

- [Example: Setting Up a VXLAN Layer 2 Gateway and OVSDDB Connections Between Virtual and Physical Entities in a Data Center on page 1917](#)
- [Example: Setting Up Inter-VXLAN Routing and OVSDDB Connections in a Data Center on page 1925](#)

## Configuring VXLANs on a QFX5100 Switch

Follow these steps to configure a QFX5100 switch to act as a VTEP. (If the switch is acting as a transit Layer 3 switch for downstream VTEPs, you do not need to perform these steps. No special configuration is needed in this case.)

- [Configuring a Source IP Address on page 1991](#)
- [Configuring PIM for VXLANs on page 1991](#)
- [Configuring VXLANs on page 1991](#)

### Configuring a Source IP Address

On a switch that will act as a VTEP, you must configure an IP address that will be used as the source address in the outer IP header of the VXLAN packet. This is the VXLAN tunnel source address.

1. Create a reachable IPv4 address on the loopback interface and configure it to be used as the tunnel source address:

```
[edit]
user@switch# set interfaces lo0.0 unit 0 family inet address ip-address
[edit]
user@switch# set switch-options vtep-interface-source lo0.0
```

### Configuring PIM for VXLANs

If you are not using a controller to create a VXLAN control plane, you must enable PIM on the switch so that the VTEP can use multicast groups to establish reachability with other VTEPs and forward BUM traffic.

1. Enable PIM:

```
[edit]
user@switch# set protocols pim interface all
```

2. Configure the address of a PIM rendezvous point:

```
[edit]
user@switch# set protocols pim rp static address ip-address
```

### Configuring VXLANs

You configure VXLANs under the **vlan** stanza (which is why a QFX5100 switch supports 4K VLANs). You must also configure the server-facing interfaces to be VLAN members.

1. Create a VLAN to VXLAN mapping and assign a multicast group address to the VXLAN. All members of a VXLAN must use the same multicast group address:

```
[edit]
user@switch# set vlans name vlan-id ID vxlan vni ID multicast-group multicast-group-address
```

2. (Optional) Configure the switch to retain the original VLAN tag (in the inner Ethernet packet) after VXLAN encapsulation. By default, the original tag is dropped when the packet is encapsulated:

```
[edit]
user@switch# set vlans name vxlan encapsulate-inner-vlan
```

3. (Optional) Configure the switch to de-encapsulate and accept original VLAN tags in VXLAN packets. By default, the original tag is dropped when the packet is encapsulated:

```
[edit]
user@switch# set protocols l2-learning decapsulate-accept-inner-vlan
```

4. Configure server-facing interfaces to support multiple VLANs:

```
[edit]
user@switch# set interfaces interface unit unit family ethernet-switching interface-mode trunk
```

```
[edit]
user@switch# set interfaces interface unit unit family ethernet-switching vlan members all
```

You must create a VLAN to VXLAN mapping for each VLAN that will need Layer 2 connectivity over the Layer 3 network.

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 14.1R2.</p> <p>Statement introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.</p>   |
| <b>Description</b>              | <p>Configure a connection between a Juniper Networks device and a VMware NSX controller. The Junos OS device must be running a release that supports the Open vSwitch Database (OVSDB) management protocol and have the OVSDB software package installed. The OVSDB software package release must be the same as the Junos OS release running on the device.</p> <p>The Junos OS implementation of OVSDB supports one cluster of NSX controllers, which includes three or five controllers as per VMware recommendations.</p> <p>To implement OVSDB on a Junos OS device, you must explicitly configure a connection to at least one NSX controller, using the Junos OS CLI. If the NSX controller to which you explicitly configure a connection is in a cluster, the controller pushes information about other controllers in the same cluster to the device, and the device establishes connections with the other controllers. However, you can also explicitly configure connections with the other controllers in the cluster, using the Junos OS CLI.</p> |
| <b>Options</b>                  | <p><b><i>ip-address</i></b> —IPv4 address of the NSX controller.</p> <p>The remaining statements are explained separately.</p>   |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>   |

## inactivity-probe-duration

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>inactivity-probe-duration <i>milliseconds</i>;</code>   |
| <b>Hierarchy Level</b>          | [edit protocols <a href="#">ovsdb controller</a> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1R2.<br>Statement introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.   |
| <b>Description</b>              | Configure the maximum amount of time, in milliseconds, that the connection between a Juniper Networks device that supports the Open vSwitch Database (OVSDB) management protocol and a VMware NSX controller can be inactive before an inactivity probe is sent.  |
| <b>Options</b>                  | <b><i>milliseconds</i></b> —Number of milliseconds that the connection can be inactive before an inactivity probe is sent.<br><b>Range:</b> 0 through 4,294,967,295<br><b>Default:</b> 0. This value indicates that an inactivity probe is never sent.  |
| <b>Required Privilege Level</b> | <b>admin</b> —To view this statement in the configuration.<br><b>admin-control</b> —To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Setting Up the Open vSwitch Database Management Protocol on Juniper Networks Devices on page 1985</a></li><li>• <a href="#">Understanding How to Set Up Open vSwitch Database Connections Between Juniper Networks Devices and Controllers on page 1903</a></li></ul> |

## ingress-node-replication

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | ingress-node-replication;  |
| <b>Hierarchy Level</b>          | [edit bridge-domains <i>bridge-domain-name</i> vxlan],<br>[edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> vxlan],<br>[edit routing-instances <i>routing-instance-name</i> vlans <i>vlan-name</i> vxlan],<br>[edit routing-instances <i>routing-instance-name</i> vxlan]<br>[edit vlans <i>vlan-name</i> vxlan]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1R2.   |
| <b>Description</b>              | <p>Enable ingress node replication for a specified Virtual Extensible LAN (VXLAN) that is managed by the Open vSwitch Database (OVSDB) management protocol.</p> <p>With this feature enabled, instead of service nodes, Juniper Networks devices with OVSDB implemented handle incoming broadcast, unknown unicast, or multicast (BUM) traffic. For more information about the scenarios in which you can use ingress node replication and how it works, see <a href="#">“Understanding How Layer 2 BUM Traffic and Layer 3 Routed Multicast Traffic Are Handled in VXLANs Managed by OVSDB”</a> on page 1904.</p> |
|                                 | <div>  <p><b>NOTE:</b> When Juniper Networks devices replicate Layer 2 BUM packets to a large number of remote software VTEPs, the performance of the Juniper Networks devices can be impacted.</p> </div>   |
| <b>Default</b>                  | If you do not include the <b>ingress-node-replication</b> statement, one or more service nodes handle BUM traffic.   |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Configuring OVSDB-Managed VXLANs on page 1989</a></li> </ul>  |

## interfaces (OVSDB)

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>interfaces <i>interface-name</i>;</code>   |
| <b>Hierarchy Level</b>          | [edit protocols <a href="#">ovsdb</a> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1R2.<br>Statement introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.  |
| <b>Description</b>              | Specify the interfaces to be managed by the Open vSwitch Database (OVSDB) management protocol. Typically, the only interfaces that need to be managed by OVSDB are interfaces with physical servers. |
| <b>Options</b>                  | <i>interface-name</i> —Name of the interface, including the logical unit number—for example, xe-1/1/0.0.   |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Configuring OVSDB-Managed VXLANs on page 1989</a></li></ul>  |

## maximum-backoff-duration

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>maximum-backoff-duration <i>milliseconds</i>;</code>  |
| <b>Hierarchy Level</b>          | [edit protocols <a href="#">ovsdb controller</a> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1R2.<br>Statement introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.   |
| <b>Description</b>              | Specify (in milliseconds) how long a Juniper Networks device that supports the Open vSwitch Database (OVSDB) management protocol waits before it re-attempts to connect with a VMware NSX controller if a previous attempt failed.  |
| <b>Options</b>                  | <i>milliseconds</i> —Number of milliseconds a Juniper Networks device waits before it re-attempts to connect with an NSX controller.<br><b>Range:</b> 1000 through 4,294,967,295<br><b>Default:</b> 1000  |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Setting Up the Open vSwitch Database Management Protocol on Juniper Networks Devices on page 1985</a></li><li>• <a href="#">Understanding How to Set Up Open vSwitch Database Connections Between Juniper Networks Devices and Controllers on page 1903</a></li></ul> |

## ovsdb

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <pre> ovsdb {   controller <i>ip-address</i> {     inactivity-probe-duration <i>milliseconds</i>;     maximum-backoff-duration <i>milliseconds</i>;     protocol <i>protocol</i> {       port <i>number</i>;     }   }   interfaces <i>interface-name</i>;   traceoptions {     file &lt;<i>filename</i>&gt; &lt;<i>files number</i>&gt; &lt;match <i>regular-expression</i>&gt; &lt;no-world-readable         world-readable&gt; &lt;<i>size size</i>&gt;;     flag <i>flag</i>;     no-remote-trace;   } } </pre> |
| <b>Hierarchy Level</b>          | [edit protocols]  |
| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 14.1R2.</p> <p>Statement introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.</p>  |
| <b>Description</b>              | <p>Configure support for the Open vSwitch Database (OVSDB) management protocol on a Juniper Networks device. The Juniper Networks device must be running a release that supports OVSDB and have the OVSDB software package installed. The OVSDB software package release must be the same as the Junos OS release that is running on the device.</p> <p>The remaining statements are explained separately.</p>  |
| <b>Default</b>                  | The OVSDB management protocol is disabled on Juniper Networks devices.  |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Understanding the Open vSwitch Database Management Protocol Running on Juniper Networks Devices on page 1902</a></li> <li>• <a href="#">Configuring OVSDB-Managed VXLANs on page 1989</a></li> </ul>   |

## ovsdb-managed

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | ovsdb-managed;  |
| <b>Hierarchy Level</b>          | [edit bridge-domains <i>bridge-domain-name</i> vxlan],<br>[edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> vxlan],<br>[edit routing-instances <i>routing-instance-name</i> switch-options],<br>[edit routing-instances <i>routing-instance-name</i> vlans <i>vlan-name</i> vxlan],<br>[edit routing-instances <i>routing-instance-name</i> vxlan],<br>[edit switch-options]<br>[edit vlans <i>vlan-name</i> vxlan]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1R2.<br>Statement introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.   |
| <b>Description</b>              | <p>Disable a Junos OS device from learning about other Junos OS devices that function as hardware virtual tunnel endpoints (VTEPs) in a specified Virtual Extensible LAN (VXLAN) and the MAC addresses learned by the hardware VTEPs. Instead, the Junos OS device uses the Open vSwitch Database (OVSDB) management protocol to learn about the hardware VTEPs in the VXLAN and the MAC addresses learned by the hardware VTEPs.</p> <p>The specified VXLAN must have a VXLAN Network Identifier (VNI) configured, using the <b>vni</b> statement in the [edit bridge-domains <i>bridge-domain-name</i> vxlan], [edit routing-instance <i>routing-instance-name</i> vxlan], or [edit vlans <i>vlan-name</i> vxlan] hierarchy.</p> <p>Also, this implementation of OVSDB uses the multicast scheme described in <a href="#">“Understanding How Layer 2 BUM Traffic and Layer 3 Routed Multicast Traffic Are Handled in VXLANs Managed by OVSDB” on page 1904</a>. Therefore, specifying the <b>multicast-group</b> statement in the [edit bridge-domains <i>bridge-domain-name</i> vxlan], [edit routing-instances <i>routing-instance-name</i> vxlan], or [edit vlans <i>vlan-name</i> vxlan] hierarchy has no effect.</p> |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.   |

---

## port (OVSDB)

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>port number;</code>   |
| <b>Hierarchy Level</b>          | [edit protocols <a href="#">ovsdb controller protocol</a> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1R2.<br>Statement introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.   |
| <b>Description</b>              | Specify the VMware NSX controller port to which a Juniper Networks device that supports the Open vSwitch Database (OVSDb) management protocol connects.   |
| <b>Options</b>                  | <b>number</b> —Port number of NSX controller port.<br><b>Range:</b> 1024 through 65,535<br><b>Default:</b> 6632   |
| <b>Required Privilege Level</b> | <b>admin</b> —To view this statement in the configuration.<br><b>admin-control</b> —To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Setting Up the Open vSwitch Database Management Protocol on Juniper Networks Devices on page 1985</a></li><li>• <a href="#">Understanding How to Set Up Open vSwitch Database Connections Between Juniper Networks Devices and Controllers on page 1903</a></li></ul> |

## protocol (OVSDB)

---

|  |   |
|--|---|
| <b>Syntax</b>  | <code>protocol protocol {<br/>    port number;<br/>}</code>   |
| <b>Hierarchy Level</b>   | [edit protocols <a href="#">ovsdb controller</a> ]  |
| <b>Release Information</b>   | Statement introduced in Junos OS Release 14.1R2.<br>Statement introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.   |
| <b>Description</b>   | <p>Configure the security protocol that protects the connection between a Juniper Networks device that supports the Open vSwitch Database (OVSDB) management protocol and a VMware NSX controller.</p> <p>The Secure Sockets Layer (SSL) connection requires a private key and certificates, which must be stored in the <code>/var/db/certs</code> directory of the Juniper Networks device. For more information about the files, including actions you must take to create and install some of the files, see <a href="#">“Creating and Installing an SSL Key and Certificate on a Juniper Networks Device for Connection with VMware NSX Controllers” on page 1984</a>.</p> |
| <b>Options</b>   | <b>protocol</b> —Establish a secure connection to the NSX controller, using SSL or the Transmission Control Protocol (TCP).   |
| <hr/> <div> <b>NOTE:</b> SSL is the only supported connection protocol.</div> <hr/> |   |
| <b>Default:</b>  | ssl   |
|  | The remaining statement is explained separately.  |
| <b>Required Privilege Level</b>  | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>   | <ul style="list-style-type: none"><li>• <a href="#">Setting Up the Open vSwitch Database Management Protocol on Juniper Networks Devices on page 1985</a></li><li>• <a href="#">Understanding How to Set Up Open vSwitch Database Connections Between Juniper Networks Devices and Controllers on page 1903</a></li></ul>   |

## traceoptions (OVSDB)

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | <pre> traceoptions {     file &lt;filename&gt; &lt;files number&gt; &lt;match regular-expression&gt; &lt;no-world-readable       world-readable&gt; &lt;size size&gt;;     flag flag;     no-remote-trace; } </pre>   |
| <b>Hierarchy Level</b>     | [edit protocols <a href="#">ovsdb</a> ]   |
| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 14.1R2.</p> <p>Statement introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.</p>  |
| <b>Description</b>         | Define tracing operations for the Open vSwitch Database (OVSDB) management protocol, which is supported on Juniper Networks devices.  |
| <b>Default</b>             | If you do not include this statement, OVSDB-specific tracing operations are not performed.  |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of file in which the system places the output of the tracing operations. By default, the system places all files in the <code>/var/log</code> directory.</p> <p><b>Default:</b> <code>/var/log/vgd</code></p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file reaches the size specified by the <b>size</b> option, the filename is appended with 0 and compressed. For example, a trace file named <b>trace-file.gz</b> would be renamed <b>trace-file.0.gz</b>. When <b>trace-file.0.gz</b> reaches the specified size, it is renamed <b>trace-file.1.gz</b> and its contents are compressed to <b>trace-file.0.gz</b>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option and a filename.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 10 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. You can include one or more of the following flags:</p> <ul style="list-style-type: none"> <li><b>all</b>—All OVSDB events.</li> <li><b>configuration</b>—OVSDB configuration events.</li> <li><b>core</b>—OVSDB core events.</li> <li><b>function</b>—OVSDB function events.</li> <li><b>interface</b>—OVSDB interface events.</li> <li><b>l2-client</b>—OVSDB Layer 2 client events.</li> <li><b>ovs-client</b>—OVSDB client events.</li> </ul> |

**match *regular-expression***—(Optional) Only log lines that match the regular expression.

**no-remote-trace**—(Optional) Disable tracing and logging operations that track normal operations, error conditions, and packets that are generated by or passed through the Juniper Networks device.

**no-world-readable**—Restrict access to the trace files to the owner.

**Default:** no-world-readable

**size *size***—(Optional) Maximum size of each trace file in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). If you do not specify a unit, the default is bytes. If you specify a maximum file size, you also must specify a maximum number of trace files by using the **files** option and a filename by using the **file** option.

**Syntax:** *size* to specify bytes, *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB.

**Range:** 10,240 through 1,073,741,824 bytes

**Default:** 128 KB

**world-readable**—Enable any user to access the trace files.

- [show vpls mac-table](#)

## show bridge mac-table

---

|                          |  |
|--------------------------|--|
| Syntax                   | <pre>show bridge mac-table &lt;brief   count   detail   extensive&gt; &lt;bridge-domain (all   <i>bridge-domain-name</i>)&gt; &lt;global-count&gt; &lt;interface <i>interface-name</i>&gt; &lt;mac-address&gt; &lt;vlan-id (all-vlan   <i>vlan-id</i>)&gt;</pre>   |
| Release Information      | Command introduced in Junos OS Release 8.4.  |
| Description              | (MX Series routers only) Display Layer 2 MAC address information.  |
| Options                  | <p><b>none</b>—Display all learned Layer 2 MAC address information.</p> <p><b>brief   count   detail   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>bridge-domain (all   <i>bridge-domain-name</i>)</b>—(Optional) Display learned Layer 2 MAC addresses for all bridging domains or for the specified bridging domain.</p> <p><b>global-count</b>—(Optional) Display the total number of learned Layer 2 MAC addresses on the system.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display learned Layer 2 MAC addresses for the specified routing instance.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Display learned Layer 2 MAC addresses for the specified interface.</p> <p><b>mac-address</b>—(Optional) Display the specified learned Layer 2 MAC address information.</p> <p><b>vlan-id (all-vlan   <i>vlan-id</i>)</b>—(Optional) Display learned Layer 2 MAC addresses for all VLANs or for the specified VLAN.</p> |
| Additional Information   | When Layer 2 protocol tunneling is enabled, the tunneling MAC address 01:00:0c:cd:cd:d0 is installed in the MAC table. When the Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunk Protocol (VTP) is configured for Layer 2 protocol tunneling on an interface, the corresponding protocol MAC address is installed in the MAC table.   |
| Required Privilege Level | view   |
| List of Sample Output    | <p><a href="#">show bridge mac-table on page 2011</a></p> <p><a href="#">show bridge mac-table (with VXLAN enabled) on page 2012</a></p> <p><a href="#">show bridge mac-table count on page 2012</a></p> <p><a href="#">show bridge mac-table detail on page 2013</a></p>  |
| Output Fields            | <p><a href="#">Table 138 on page 2011</a> describes the output fields for the <b>show bridge mac-table</b> command. Output fields are listed in the approximate order in which they appear.</p>  |

Table 138: show bridge mac-table Output fields

| Field Name                | Field Description   |
|---------------------------|---|
| <b>Routing instance</b>   | Name of the routing instance.   |
| <b>Bridging domain</b>    | Name of the bridging domain.  |
| <b>MAC address</b>        | MAC address or addresses learned on a logical interface.  |
| <b>MAC flags</b>          | Status of MAC address learning properties for each interface: <ul style="list-style-type: none"> <li>• <b>S</b>—Static MAC address is configured.</li> <li>• <b>D</b>—Dynamic MAC address is configured.</li> <li>• <b>L</b>—Locally learned MAC address is configured.</li> <li>• <b>C</b>—Control MAC address is configured.</li> <li>• <b>SE</b>—MAC accounting is enabled.</li> <li>• <b>NM</b>—Non-configured MAC.</li> <li>• <b>R</b>—Remote PE MAC address is configured.</li> </ul> |
| <b>Logical interface</b>  | Name of the logical interface.  |
| <b>MAC count</b>          | Number of MAC addresses learned on the specific routing instance or interface.  |
| <b>Learning interface</b> | Name of the logical interface on which the MAC address was learned.   |
| <b>Learning VLAN</b>      | VLAN ID of the routing instance or bridge domain in which the MAC address was learned.  |
| <b>VXLAN ID/VXLAN</b>     | VXLAN Network Identifier (VNI)  |
| <b>Layer 2 flags</b>      | Debugging flags signifying that the MAC address is present in various lists.  |
| <b>Epoch</b>              | Spanning Tree Protocol epoch number identifying when the MAC address was learned. Used for debugging.   |
| <b>Sequence number</b>    | Sequence number assigned to this MAC address. Used for debugging.   |
| <b>Learning mask</b>      | Mask of the Packet Forwarding Engines where this MAC address was learned. Used for debugging.   |
| <b>IPC generation</b>     | Creation time of the logical interface when this MAC address was learned. Used for debugging.   |

## Sample Output

### show bridge mac-table

```

user@host> show bridge mac-table
MAC flags (S -static MAC, D -dynamic MAC, L -locally learned, C -Control MAC
          SE -Statistics enabled, NM -Non configured MAC, R -Remote PE MAC)

```

```

Routing instance : default-switch
Bridging domain : test1, VLAN : 1
MAC          MAC      Logical   NH      RTR
address      flags    interface Index   ID
01:00:0c:cc:cc:cc S,NM    NULL
01:00:0c:cc:cc:cd S,NM    NULL
01:00:0c:cd:cd:d0 S,NM    NULL
64:87:88:6a:17:d0 D        ae0.1
64:87:88:6a:17:f0 D        ae0.1

```

### show bridge mac-table (with VXLAN enabled)

```

user@host> show bridge mac-table
MAC flags (S -static MAC, D -dynamic MAC, L -locally learned
          SE -Statistics enabled, NM -Non configured MAC, R -Remote PE MAC)

```

```

Routing instance : default-switch
Bridging domain : vlan-1, VLAN : 1
VXLAN: Id : 100, Multicast group: 226.1.1.1
MAC          MAC      Logical   NH      RTR
address      flags    interface Index   ID
00:01:01:00:01:f7 D,SE    vtep.1052010
00:03:00:32:01:f7 D,SE    vtep.1052011

```

```

Routing instance : default-switch
Bridging domain : vlan-2, VLAN : 2, VXLAN : 200
VXLAN: Id : 200, Multicast group: 226.1.1.2
MAC          MAC      Logical   NH      RTR
address      flags    interface Index   ID
00:02:01:33:01:f7 D,SE    vtep.1052010
00:04:00:14:01:f7 D,SE    vtep.1052011
00:00:21:11:21:10 DL        ge-1/0/0.1
00:00:21:11:21:11 DL        ge-1/1/0.1

```

### show bridge mac-table count

```

user@host> show bridge mac-table count
2 MAC address learned in routing instance vs1 bridge domain vlan100

```

MAC address count per interface within routing instance:

| Logical interface | MAC count |
|-------------------|-----------|
| ge-11/0/3.0       | 1         |
| ge-11/1/4.100     | 0         |
| ge-11/1/1.100     | 0         |
| ge-11/1/0.100     | 0         |
| xe-10/2/0.100     | 1         |
| xe-10/0/0.100     | 0         |

MAC address count per learn VLAN within routing instance:

| Learn VLAN ID | MAC count |
|---------------|-----------|
| 0             | 2         |

```

0 MAC address learned in routing instance vs1 bridge domain vlan200

```

MAC address count per interface within routing instance:

| Logical interface | MAC count |
|-------------------|-----------|
|-------------------|-----------|

|               |   |
|---------------|---|
| ge-11/1/0.200 | 0 |
| ge-11/1/1.200 | 0 |
| ge-11/1/4.200 | 0 |
| xe-10/0/0.200 | 0 |
| xe-10/2/0.200 | 0 |

MAC address count per learn VLAN within routing instance:

| Learn VLAN ID | MAC count |
|---------------|-----------|
| 0             | 0         |

### show bridge mac-table detail

```
user@host> show bridge mac-table detail
```

MAC address: 00:00:00:19:1c:db

Routing instance: vs1

Bridging domain: vlan100

Learning interface: ge-11/0/3.0      Learning VLAN: 0

Layer 2 flags: in\_ifd, in\_ifl, in\_vlan, kernel

Epoch: 4      Sequence number: 0

Learning mask: 0x800      IPC generation: 0

MAC address: 00:00:00:59:3a:2f

Routing instance: vs1

Bridging domain: vlan100

Learning interface: xe-10/2/0.100      Learning VLAN: 0

Layer 2 flags: in\_ifd, in\_ifl, in\_vlan, kernel

Epoch: 7      Sequence number: 0

Learning mask: 0x400      IPC generation: 0

## show ovsdb controller

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>show ovsdb controller</code><br><code>&lt;address ip-address&gt;</code>   |
| <b>Release Information</b>      | Command introduced in Junos OS Release 14.1R2.<br>Command introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.   |
| <b>Description</b>              | <p>Display information and connection status for VMware NSX controllers to which the Juniper Networks device is connected. This command displays information for NSX controllers with connections to a Juniper Networks device that are made in the following ways:</p> <ul style="list-style-type: none"> <li>• With explicit configuration—The connection is explicitly configured using the Junos OS CLI.</li> <li>• Without explicit configuration—An NSX controller to which the Juniper Networks device is connected pushes information about other controllers in the same cluster to the device. With this method, the Juniper Networks device learns about the other controllers in the same cluster and connections to these controllers are established without explicit configuration.</li> </ul> |
| <b>Options</b>                  | <p><b>none</b>—Display information about all NSX controllers to which the Juniper Networks device is connected.</p> <p><b>address ip-address</b>—Display information about the NSX controller at the specified IP address.</p>  |
| <b>Required Privilege Level</b> | admin   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Setting Up the Open vSwitch Database Management Protocol on Juniper Networks Devices on page 1985</a></li> <li>• <a href="#">Understanding How to Set Up Open vSwitch Database Connections Between Juniper Networks Devices and Controllers on page 1903</a></li> </ul>  |
| <b>List of Sample Output</b>    | <a href="#">show ovsdb controller on page 2015</a><br><a href="#">show ovsdb controller address on page 2015</a>  |
| <b>Output Fields</b>            | Table 139 on page 2014 lists the output fields for the <b>show ovsdb controller</b> command. Output fields are listed in the approximate order in which they appear.  |

Table 139: show ovsdb controller Output Fields

| Field Name            | Field Descriptions  |
|-----------------------|---|
| Controller IP address | IP address of an NSX controller to which the Juniper Networks device is connected.            |
| Controller protocol   | Protocol used by the Juniper Networks device to initiate a connection with an NSX controller. |

Table 139: show ovssdb controller Output Fields (*continued*)

| Field Name                          | Field Descriptions   |
|-------------------------------------|--|
| Controller port                     | NSX controller port to which the Juniper Networks device is connected.   |
| Controller connection               | State of the connection between the Juniper Networks device and an NSX controller.                             |
| Controller seconds-since-connect    | Number of seconds since the connection between the Juniper Networks device and NSX controller was established. |
| Controller seconds-since-disconnect | Number of seconds since the connection between the Juniper Networks device and NSX controller was dropped.     |
| Controller connection status        | Status of the connection between the Juniper Networks device and an NSX controller.                            |

## Sample Output

### show ovssdb controller

```

user@host> show ovssdb controller
VTEP controller information:
Controller IP address: 10.168.66.189
Controller protocol: ssl
Controller port: 6632
Controller connection: up
Controller seconds-since-connect: 56290
Controller seconds-since-disconnect: 0
Controller connection status: active

Controller IP address: 10.168.181.54
Controller protocol: ssl
Controller port: 6632
Controller connection: up
Controller seconds-since-connect: 56292
Controller seconds-since-disconnect: 0
Controller connection status: active

Controller IP address: 10.168.182.45
Controller protocol: ssl
Controller port: 6632
Controller connection: up
Controller seconds-since-connect: 56292
Controller seconds-since-disconnect: 0
Controller connection status: active

```

### show ovssdb controller address

```

user@host> show ovssdb controller address 10.168.182.45
VTEP controller information:
Controller IP address: 192.168.182.45
Controller protocol: ssl
Controller port: 6632
Controller connection: up
Controller seconds-since-connect: 56347
Controller seconds-since-disconnect: 0
Controller connection status: active

```

## show ovssdb interface

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>show ovssdb interface</code><br><code>&lt;interface-name&gt;</code>   |
| <b>Release Information</b>      | Command introduced in Junos OS Release 14.1R2.<br>Command introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.   |
| <b>Description</b>              | Display information about Open vSwitch Database (OVSSDB)-managed interfaces configured by using the <b>interfaces interface-name</b> statement in the <b>[edit protocols ovssdb]</b> hierarchy. |
| <b>Options</b>                  | <b>none</b> —Display information about all OVSSDB-managed interfaces.<br><br><b>interface-name</b> —Display information about the specified OVSSDB-managed interface.                           |
| <b>Required Privilege Level</b> | admin   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Configuring OVSSDB-Managed VXLANs on page 1989</a></li> <li>• <a href="#">show ovssdb statistics interface on page 2025</a></li> </ul>     |
| <b>List of Sample Output</b>    | <a href="#">show ovssdb interface on page 2017</a><br><a href="#">show ovssdb (Specific Interface) on page 2018</a>   |
| <b>Output Fields</b>            | Table 140 on page 2017 lists the output fields for the <b>show ovssdb interface</b> command. Output fields are listed in the approximate order in which they appear.                            |

Table 140: show ovssdb interface Output Fields

| Field Name            | Field Description   |
|-----------------------|---|
| Interface             | Name of interface.  |
| VLAN ID               | ID of Virtual Extensible LAN (VXLAN) with which the interface is associated.<br><br><b>NOTE:</b> This field is not supported by MX Series routers.. |
| Bridge domain or VLAN | Bridge domain or VLAN under which the VXLAN is created.<br><br><b>NOTE:</b> This field is not supported by MX Series routers.                       |

## Sample Output

### show ovssdb interface

```

user@host> show ovssdb interface
Interface          VLAN ID          Bridge-domain
ge-7/0/9.0
ge-7/0/9.1
irb.11
irb.12

```

```
irb.2
irb.3
xe-10/3/0.0
xe-10/3/0.1
```

#### show ovssdb (Specific Interface)

```
user@host> show ovssdb interface ge-7/0/9.0
Interface          VLAN ID      Bridge-domain
ge-7/0/9.0
```

## show ovssdb logical-switch

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>show ovssdb logical-switch</code><br><code>&lt;logical-switch-name&gt;</code>   |
| <b>Release Information</b>      | Command introduced in Junos OS Release 14.1R2.<br>Command introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.   |
| <b>Description</b>              | <p>Display information about logical switches, which you configured in NSX Manager or the NSX API, and the corresponding Virtual Extensible LANs (VXLANs), which were configured on the Juniper Networks device.</p> <p>In the command output, each logical switch is identified by a universally unique identifier (UUID), which in the context of this command, is also known as a logical switch name.</p> <p>The <b>show ovssdb logical-switch</b> command displays the state of the logical switch (<b>Flags</b>), which can be one of the following:</p> <p><b>Created by Controller</b>—A logical switch was configured in NSX Manager. In this state, the logical switch and corresponding VXLAN are not yet operational.</p> <p><b>Created by L2ALD</b>—A VXLAN was configured on a Juniper Networks device. In this state, the logical switch-VXLAN are not yet operational.</p> <p><b>Created by both</b>—A logical switch was configured in NSX Manager, and a corresponding VXLAN was configured on a Juniper Networks device. In this state, the logical switch-VXLAN are operational.</p> <p><b>Tunnel key mismatch</b>—The VNIs specified in the logical switch and corresponding VXLAN configurations do not match. In this state, the logical switch-VXLAN are not yet operational.</p> <p>For more information about configuring the logical switch and corresponding VXLAN, see <a href="#">“Understanding How to Set Up Virtual Extensible LANs in an Open vSwitch Database Environment” on page 1905</a>.</p> |
| <b>Options</b>                  | <p><b>none</b>—Display information about all logical switches that are present in the OVSSDB schema for physical devices.</p> <p><b>logical-switch-name</b>—Display information about the specified logical switch.</p>   |
| <b>Required Privilege Level</b> | admin   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Open vSwitch Database Schema For Physical Devices on page 1910</a></li> <li>• <a href="#">Troubleshooting a Nonoperational VMware NSX Logical Switch and Corresponding Junos OS OVSSDB-Managed VXLAN on page 2045</a></li> </ul>   |
| <b>List of Sample Output</b>    | <p><a href="#">show ovssdb logical-switch on page 2020</a></p> <p><a href="#">show ovssdb logical-switch (Specific Logical Switch) on page 2020</a></p>   |

**Output Fields** [Table 141 on page 2020](#) lists the output fields for the **show ovssdb logical-switch** command. Output fields are listed in the approximate order in which they appear.

**Table 141: show ovssdb logical-switch Output Fields**

| Field Name          | Field Description   |
|---------------------|---|
| Logical Switch Name | UUID that is automatically generated by NSX and assigned to the logical switch after you configure it in NSX Manager or the NSX API. When configuring the corresponding VXLAN in the Junos OS CLI, the same UUID must be specified as the VXLAN name. |
| Flags               | State of the logical switch. For possible states, see the Description section of this topic.  |
| VNI                 | VNI that is configured for the logical switch and corresponding VXLAN.  |
| Num of Remote MAC   | The total number of remote MAC addresses associated with the logical switch. These addresses are learned by software and hardware virtual tunnel endpoints (VTEPs) in the NSX environment.  |
| Num of Local MAC    | The total number of local MAC addresses associated with the logical switch. <i>Local MAC addresses</i> are addresses learned on the local physical ports.   |

## Sample Output

### show ovssdb logical-switch

```

user@host> show ovssdb logical-switch
Logical switch information:
Logical Switch Name: 24a76aff-7e61-4520-a78d-3eca26ad7510
Flags: Created by both
VNI: 3
Num of Remote MAC: 13
Num of Local MAC: 12
Logical Switch Name: 9b4f880e-dac8-4612-a832-97ad9dec270f
Flags: Created by Controller
VNI: 50
Num of Remote MAC: 0
Num of Local MAC: 0
Logical Switch Name: bc0da2da-6c16-44bf-b655-442484294ded
Flags: Created by Controller
VNI: 51
Num of Remote MAC: 0
Num of Local MAC: 0

```

### show ovssdb logical-switch (Specific Logical Switch)

```

user@host> show ovssdb logical-switch 24a76aff-7e61-4520-a78d-3eca26ad7510
Logical switch information:
Logical Switch Name: 24a76aff-7e61-4520-a78d-3eca26ad7510
Flags: Created by both
VNI: 3
Num of Remote MAC: 13
Num of Local MAC: 12

```

## show ovssdb mac

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <pre>show ovssdb mac &lt;address <i>mac-address</i>&gt; &lt;local&gt; &lt;logical-switch <i>logical-switch-uuid</i>&gt; &lt;multicast&gt; &lt;remote&gt; &lt;unicast&gt;</pre>  |
| <b>Release Information</b>      | <p>Command introduced in Junos OS Release 14.1R2.</p> <p>Command introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.</p>  |
| <b>Description</b>              | <p>Display MAC addresses, as well as information about the MAC addresses, learned by a Juniper Networks device that functions as a hardware virtual tunnel endpoint (VTEP). Using the Open vSwitch Database (OVSSDB) management protocol, this hardware VTEP can learn about MAC addresses directly or from other software or hardware VTEPs. The MAC addresses learned directly by the hardware VTEP are known as local addresses, while the addresses learned from other software or hardware VTEPs are known as remote addresses.</p>  |
| <b>Options</b>                  | <p>Use one or more of the following options to display a more specific list of MAC addresses and information about the MAC addresses. For example, to display a list of local unicast MAC addresses, you can issue the <b>show ovssdb mac local unicast</b> command.</p> <p><b>none</b>—Display all MAC addresses, which includes all local, remote, unicast, and multicast addresses associated with all logical switches.</p> <p><b>address <i>mac-address</i></b>—Display the specified MAC address.</p> <p><b>local</b>—Display all local MAC addresses.</p> <p><b>logical-switch <i>logical-switch-uuid</i></b>—Display all MAC addresses associated with the specified logical switch.</p> <p><b>multicast</b>—Display all multicast MAC addresses.</p> <p><b>remote</b>—Display all remote MAC addresses.</p> <p><b>unicast</b>—Display all unicast MAC addresses.</p> |
| <b>Required Privilege Level</b> | admin   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Open vSwitch Database Schema For Physical Devices on page 1910</a></li> </ul>  |
| <b>List of Sample Output</b>    | <p><a href="#">show ovssdb mac on page 2022</a></p> <p><a href="#">show ovssdb mac address on page 2023</a></p> <p><a href="#">show ovssdb mac logical-switch on page 2023</a></p> <p><a href="#">show ovssdb mac local unicast on page 2023</a></p>  |

**Output Fields** Table 142 on page 2022 lists the output fields for the **show ovssdb mac** command. Output fields are listed in the approximate order in which they appear.

**Table 142: show ovssdb mac Output Fields**

| Field Name          | Field Description  |
|---------------------|--|
| Logical Switch Name | Universally unique identifier (UUID) of the logical switch. For more information about logical switches and UUIDs, see <a href="#">“Understanding How to Set Up Virtual Extensible LANs in an Open vSwitch Database Environment”</a> on page 1905. |
| MAC Address         | MAC addresses of virtual machines (VMs).   |
| IP Address          | IP address of VMs.<br><br><b>NOTE:</b> If the IP addresses of VMs are not published by the NSX controller, this field displays 0.0.0.0.  |
| Encapsulation       | Encapsulation type.  |
| VTEP Address        | IP address of the hardware or software VTEP from which the MAC address was learned. Further, this VTEP can forward VM traffic to the associated host.  |

## Sample Output

| <b>List of Sample Output</b>    | <a href="#">show ovssdb virtual-tunnel-end-point on page 2028</a><br><a href="#">show ovssdb virtual-tunnel-end-point address (Specific Address) on page 2028</a><br><a href="#">show ovssdb virtual-tunnel-end-point encapsulation (Specific Encapsulation) on page 2028</a><br><a href="#">show ovssdb virtual-tunnel-end-point address (Specific Address) encapsulation (Specific Encapsulation) on page 2028</a> |
| <b>Output Fields</b>            | Table 144 on page 2027 lists the output fields for the <b>show ovssdb virtual-tunnel-end-point</b> command. Output fields are listed in the approximate order in which they appear.  |

Table 144: show ovssdb virtual-tunnel-end-point Output Fields

| Field Name    | Field Description                              |
|---------------|--|
| Encapsulation | Encapsulation type of entity.                  |
| IP Address    | IP address of entity.                          |
| Num of MACs   | Number of MAC addresses learned by the entity. |

## Sample Output

### show ovssdb virtual-tunnel-end-point

```
user@host> show ovssdb virtual-tunnel-end-point
Encapsulation      Ip Address      Num of MAC's
VXLAN over IPv4    10.255.181.43   24
VXLAN over IPv4    10.255.181.50   12
VXLAN over IPv4    10.255.181.72   24
```

### show ovssdb virtual-tunnel-end-point address (Specific Address)

```
user@host> show ovssdb virtual-tunnel-end-point address 10.255.181.43
Encapsulation      Ip Address      Num of MAC's
VXLAN over IPv4    10.255.181.43   24
```

### show ovssdb virtual-tunnel-end-point encapsulation (Specific Encapsulation)

```
user@host> show ovssdb virtual-tunnel-end-point encapsulation vxlan-over-ipv4
Encapsulation      Ip Address      Num of MAC's
VXLAN over IPv4    10.255.181.43   24
VXLAN over IPv4    10.255.181.50   12
VXLAN over IPv4    10.255.181.72   24
```

### show ovssdb virtual-tunnel-end-point address (Specific Address) encapsulation (Specific Encapsulation)

```
user@host> show ovssdb virtual-tunnel-end-point address 10.255.181.43 encapsulation
vxlan-over-ipv4
Encapsulation      Ip Address      Num of MAC's
VXLAN over IPv4    10.255.181.43   24
```

## show vpls mac-table

## show bridge mac-table

---

|                          |  |
|--------------------------|--|
| Syntax                   | <pre>show bridge mac-table &lt;brief   count   detail   extensive&gt; &lt;bridge-domain (all   <i>bridge-domain-name</i>)&gt; &lt;global-count&gt; &lt;interface <i>interface-name</i>&gt; &lt;mac-address&gt; &lt;vlan-id (all-vlan   <i>vlan-id</i>)&gt;</pre>   |
| Release Information      | Command introduced in Junos OS Release 8.4.  |
| Description              | (MX Series routers only) Display Layer 2 MAC address information.  |
| Options                  | <p><b>none</b>—Display all learned Layer 2 MAC address information.</p> <p><b>brief   count   detail   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>bridge-domain (all   <i>bridge-domain-name</i>)</b>—(Optional) Display learned Layer 2 MAC addresses for all bridging domains or for the specified bridging domain.</p> <p><b>global-count</b>—(Optional) Display the total number of learned Layer 2 MAC addresses on the system.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display learned Layer 2 MAC addresses for the specified routing instance.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Display learned Layer 2 MAC addresses for the specified interface.</p> <p><b>mac-address</b>—(Optional) Display the specified learned Layer 2 MAC address information.</p> <p><b>vlan-id (all-vlan   <i>vlan-id</i>)</b>—(Optional) Display learned Layer 2 MAC addresses for all VLANs or for the specified VLAN.</p> |
| Additional Information   | When Layer 2 protocol tunneling is enabled, the tunneling MAC address 01:00:0c:cd:cd:d0 is installed in the MAC table. When the Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunk Protocol (VTP) is configured for Layer 2 protocol tunneling on an interface, the corresponding protocol MAC address is installed in the MAC table.   |

| <b>Output Fields</b>            | <p><a href="#">Table 145 on page 2029</a> describes the output fields for the <b>show bridge mac-table</b> command. Output fields are listed in the approximate order in which they appear.</p>   |

Table 147: show vpls mac-table Output fields

| Field Name       | Field Description             |
|------------------|-------------------------------|
| Routing instance | Name of the routing instance. |

Table 147: show vpls mac-table Output fields (*continued*)

| Field Name                | Field Description  |
|---------------------------|--|
| <b>Bridging domain</b>    | Name of the bridging domain.   |
| <b>MAC address</b>        | MAC address or addresses learned on a logical interface.   |
| <b>MAC flags</b>          | Status of MAC address learning properties for each interface: <ul style="list-style-type: none"> <li>• <b>S</b>—Static MAC address configured.</li> <li>• <b>D</b>—Dynamic MAC address learned.</li> <li>• <b>SE</b>—MAC accounting is enabled.</li> <li>• <b>NM</b>—Nonconfigured MAC.</li> </ul> |
| <b>Logical interface</b>  | Name of the logical interface.   |
| <b>MAC count</b>          | Number of MAC addresses learned on a specific routing instance or interface.   |
| <b>Learning interface</b> | Logical interface or logical Label Switched Interface (LSI) the address is learned on.   |
| <b>Learn VLAN ID/VLAN</b> | VLAN ID of the routing instance or bridge domain in which the MAC address was learned.   |
| <b>VXLAN ID/VXLAN</b>     | VXLAN Network Identifier (VNI)   |
| <b>Layer 2 flags</b>      | Debugging flags signifying that the MAC address is present in various lists.   |
| <b>Epoch</b>              | Spanning Tree Protocol epoch number identifying when the MAC address was learned. Used for debugging.  |
| <b>Sequence number</b>    | Sequence number assigned to this MAC address. Used for debugging.  |
| <b>Learning mask</b>      | Mask of Packet Forwarding Engines where this MAC address was learned. Used for debugging.  |
| <b>IPC generation</b>     | Creation time of the logical interface when this MAC address was learned. Used for debugging.  |

## Sample Output

### show vpls mac-table

```

user@host> show vpls mac-table
MAC flags (S -static MAC, D -dynamic MAC,
          SE -Statistics enabled, NM -Non configured MAC)

Routing instance : vpls_ldp1
VLAN : 223
  MAC          MAC      Logical
  address      flags    interface
  00:90:69:9c:1c:5d  D      ge-0/2/5.400

MAC flags (S -static MAC, D -dynamic MAC,
          SE -Statistics enabled, NM -Non configured MAC)

Routing instance : vpls_red

```

```

VLAN : 401
MAC          MAC      Logical
address      flags    interface
00:00:aa:12:12:12 D      lsi.1051138
00:05:85:74:9f:f0 D      lsi.1051138

```

### show vpls mac-table (with VXLAN enabled)

```

user@host> show vpls mac-table
MAC flags (S -static MAC, D -dynamic MAC, L -locally learned
          SE -Statistics enabled, NM -Non configured MAC, R -Remote PE MAC)

```

```

Epoch: 0                               Sequence number: 0
Learning mask: 0x1                       IPC generation: 0
```

## Verifying VXLAN Reachability

**Purpose** On the local VTEP, verify that there is connectivity with the remote VTEP.

**Action** `user@switch> show ethernet-switching vxlan-tunnel-end-point remote`

| Logical System Name | Id          | SVTEP-IP | IFL   | L3-Idx |
|---------------------|-------------|----------|-------|--------|
| <default>           | 0           | 10.1.1.2 | 1o0.0 | 0      |
| RVTEP-IP            | IFL-Idx     | NH-Id    |       |        |
| 10.1.1.2            | 559         | 1728     |       |        |
| VNID                | MC-Group-IP |          |       |        |
| 100                 | 232.1.1.1   |          |       |        |

**Meaning** The remote VTEP is reachable because its IP address appears in the output. The output also shows that the VXLAN (VNI 100) and corresponding multicast group are configured correctly on the remote VTEP.

## Verifying That a Local VXLAN VTEP is Configured Correctly

**Purpose** Verify that a local VTEP is correct..

**Action** `user@switch> show ethernet-switching vxlan-tunnel-end-point source`

| Logical System Name | Id            | SVTEP-IP | IFL   | L3-Idx      |
|---------------------|---------------|----------|-------|-------------|
| <default>           | 0             | 10.1.1.1 | 1o0.0 | 0           |
| L2-RTT              | Bridge Domain |          | VNID  | MC-Group-IP |
| default-switch      | VLAN1+100     |          | 100   | 232.1.1.1   |

**Meaning** The output should show the correct tunnel source IP address (loopback address), VLAN, and multicast group for the VXLAN.

- Related Documentation**

## Verifying MAC Learning from a Remote VTEP

**Purpose** Verify that a local VTEP is learning MAC addresses from a remote VTEP.

**Action** user@switch> show ethernet-switching table

MAC flags (S - static MAC, D - dynamic MAC, L - locally learned, P - Persistent static

SE - statistics enabled, NM - non configured MAC, R - remote PE MAC)

Ethernet switching table : 2 entries, 2 learned

Routing instance : default-switch

| Vlan<br>name | MAC<br>address    | MAC<br>flags | Age | Logical<br>interface |
|--------------|-------------------|--------------|-----|----------------------|
| VLAN1        | 00:00:00:ff:ff:ff | D            | -   | vtep.12345           |
| VLAN1        | 00:10:94:00:00:02 | D            | -   | xe-0/0/0.0           |

**Meaning** This shows the MAC addresses learned from the remote VTEP (in addition to those learned on the normal Layer 2 interfaces). It also shows the logical name of the remote VTEP interface (**vtep.12345** in the above output).

- Related Documentation**
- [Understanding VXLANs on page 1912](#)
  - [Configuring VXLANs on a QFX5100 Switch on page 1991](#)
  - [Examples: Configuring VXLANs on QFX Series Switches on page 1944](#)

## Monitor a Remote VTEP Interface

**Purpose** Monitor traffic details for a remote VTEP interface.

**Action** user@switch> show interface *logical-name* detail

```

M   Flags: Up SNMP-Traps Encapsulation: ENET2
      VXLAN Endpoint Type: Remote, VXLAN Endpoint Address: 10.1.1.2, L2 Routing
Instance: default-switch, L3 Routing Instance: default
      Traffic statistics:
        Input bytes :          228851738624
        Output bytes :              0
        Input packets:          714162415
        Output packets:              0
      Local statistics:
        Input bytes :              0
        Output bytes :              0
        Input packets:              0
        Output packets:              0
      Transit statistics:
        Input bytes :          228851738624          0 bps
        Output bytes :              0          0 bps
        Input packets:          714162415          0 pps
        Output packets:              0          0 pps
      Protocol eth-switch, MTU: 1600, Generation: 277, Route table: 5

```

**Meaning** This shows traffic details for the remote VTEP interface. To get this information, you must supply the logical name of the remote VTEP interface (vtep.12345 in the above output), which you can learn by using the **show ethernet-switching table** command.

- [Troubleshooting a Nonoperational VMware NSX Logical Switch and Corresponding Junos OS OVSDb-Managed VXLAN on page 2045](#)

### Troubleshooting a Nonoperational VMware NSX Logical Switch and Corresponding Junos OS OVSDb-Managed VXLAN

**Problem**    **Description:** A logical switch configured by using VMware NSX Manager or the NSX API, and the corresponding Open vSwitch Database (OVSDb)-Managed Virtual Extensible LAN (VXLAN), which is configured on a Juniper Networks device, are not exchanging MAC addresses learned in the NSX and Junos OS environments, respectively. Also, the **Flags** field in the **show ovssdb logical-switch** operational mode command output is one of the following:

- **Created by Controller**
- **Created by L2ALD**
- **Tunnel key mismatch**

**Cause**

- If the **Flags** field displays **Created by Controller**, a logical switch is configured in NSX Manager or in the NSX API, but a corresponding VXLAN is not configured or is improperly configured on the Juniper Networks device.
- If the **Flags** field displays **Created by L2ALD**, a VXLAN is configured on the Juniper Networks device, but a corresponding logical switch is not configured in NSX Manager or in the NSX API.
- If the **Flags** field displays **Tunnel key mismatch**, the VXLAN network identifiers (VNIs) in the logical switch and corresponding VXLAN configurations do not match.

**Solution**    If the **Flags** field displays **Created by Controller**, take the following action:

- On a QFX5100 switch, verify that the **set switch-options ovssdb-managed** configuration command was issued in the Junos OS CLI. Issuing this command and committing the configuration enable the switch to automatically create OVSDb-managed VXLANs.

If this command was already issued, another possible cause is that the L2ALD daemon has become non-functional. If this is the case, wait for a few seconds, reissue the **show ovssdb logical-switch** operational mode command, and recheck the setting of the **Flags** field.

- On all other Juniper Networks devices that support VXLAN and OVSSDB, determine whether a corresponding VXLAN is configured on the device. If the VXLAN is not configured, configure it using the procedure in [“Configuring OVSSDB-Managed VXLANs” on page 1989](#). If a VXLAN is configured, check the VXLAN name to make sure that it is the same as the universally unique identifier (UUID) of the logical switch. Also, check the VNI to make sure that the value is the same as the value in the logical switch configuration.

If the **Flags** field displays **Created by L2ALD**, take the following action:

- On a QFX5100 switch, two issues exist. First, despite the fact that the switch automatically creates OVSSDB-managed VXLANs, this VXLAN was manually configured by using the Junos OS CLI. Second, a corresponding logical switch was not configured. To resolve both issues, configure a logical switch in NSX Manager or in the NSX API. After the NSX controller pushes relevant logical switch information to the switch, the switch automatically creates a corresponding VXLAN and deletes the manually configured VXLAN.
- On all other Juniper Networks devices that support VXLAN and OVSSDB, determine whether a corresponding logical switch is configured in NSX Manager or in the NSX API. If a logical switch is not configured, configure one, keeping in mind that NSX automatically generates a UUID for the logical switch and that this UUID must be used as the name of the VXLAN. That is, the VXLAN name must be reconfigured with the logical switch UUID. Another possibility is that the logical switch might exist, but the logical switch UUID might not be the VXLAN name. In NSX Manager or in the NSX API, check for a logical switch that has the same configuration as the VXLAN but has a different UUID.

If the **Flags** field displays **Tunnel key mismatch**, take the following action:

- For a QFX5100 switch, check the configuration of the VNI in NSX Manager or in the NSX API to see whether it was changed after the switch created the corresponding VXLAN. If it was changed, update the VNI on the QFX5100 switch, using the Junos OS CLI.
- On all other Juniper Networks devices that support VXLAN and OVSSDB, check the values of the VNI in NSX Manager or in the NSX API and the Junos OS CLI, and change the incorrect value.

### OpenFlow Overview

OpenFlow is an open standard that enables you to control traffic and run experimental protocols in an existing network using a remote controller. The OpenFlow components consist of a controller, an OpenFlow or OpenFlow-enabled switch, and the OpenFlow protocol. The OpenFlow protocol is a Layer 2 protocol that permits an OpenFlow controller access to the data plane of an OpenFlow-enabled switch over an SSL or TCP/IP connection.

Using OpenFlow, you can control traffic paths in a network by creating, deleting, and modifying flows in each device along a path. Flow entries specify match conditions against which packets are compared, and a set of actions (OpenFlow v1.0) or instructions (OpenFlow v1.3.1) that are applied to matching packets.

You can configure certain devices running the Junos operating system (Junos OS) as OpenFlow-enabled switches. The Junos OS process, `openflowd (ofd)`, handles OpenFlow functionality on these devices. When implementing OpenFlow in an existing network, you must isolate experimental flows from production flows so that normal network traffic is not impacted. On devices running Junos OS, you isolate OpenFlow traffic by configuring one or more virtual switches that act as logically separate flood domains. The virtual switch and controller communicate by exchanging OpenFlow protocol messages, which the controller uses to add, delete, and modify flows on the switch.

For more information about OpenFlow, see the Open Networking Foundation website at <https://www.opennetworking.org/>.

## OpenFlow Virtual Switches

To isolate and control OpenFlow traffic on devices running Junos OS, you configure virtual switches. Each virtual switch configuration contains the controller connection information, the set of logical interfaces participating in OpenFlow, and the default action executed when a packet does not match any existing flow entry. You configure the OpenFlow protocol and OpenFlow virtual switches at the **[edit protocols openflow]** hierarchy level.

Depending on the platform, a default VLAN or bridge domain is assigned to each virtual switch. This VLAN or bridge domain acts as a logically separate flood domain, which isolates OpenFlow traffic from normal traffic. On certain platforms, you must also configure a separate virtual switch routing instance at the **[edit routing-instances]** hierarchy level.

You can configure a single OpenFlow virtual switch on devices running Junos OS that support OpenFlow, and you can configure one controller connection per virtual switch. By default, if you configure a virtual switch with a single controller, the controller is in active mode. If a controller is in active mode, the switch automatically initiates a connection to the controller.

## OpenFlow Interfaces

When you configure an OpenFlow virtual switch on a device running Junos OS, you must specify the logical interfaces that are participating in OpenFlow for that virtual switch instance. OpenFlow traffic can only either enter or exit from OpenFlow-enabled interfaces, and MAC address learning is disabled on these interfaces.

Interfaces participating in OpenFlow must be configured as Layer 2 interfaces. To configure the interface as OpenFlow-enabled, you add the logical interface to the OpenFlow virtual switch configuration at the **[edit protocols openflow switch switch-name interfaces]** hierarchy level. An OpenFlow interface can only be configured under a single virtual switch. On platforms that require a separate virtual switch routing instance for OpenFlow traffic, you must also configure the OpenFlow interfaces under the OpenFlow virtual switch routing instance.

On certain devices running Junos OS, you can only configure a single logical unit using logical unit number 0 on an OpenFlow interface. However, on certain platforms that support OpenFlow, a single physical interface can be configured as a hybrid interface that supports both OpenFlow and non-OpenFlow logical interfaces. For example, you could configure interface ge-1/0/1 to have two logical interfaces ge-1/0/1.0 and ge-1/0/1.1, where ge-1/0/1.0 does not participate in OpenFlow, and ge-1/0/1.1 is an OpenFlow-enabled interface.

## Understanding OpenFlow Operation and Forwarding Actions on Devices Running Junos OS

This topic summarizes the OpenFlow features and forwarding actions supported on devices running Junos OS. For detailed information about support for specific OpenFlow v1.0 messages and fields, match conditions, wildcards, flow actions, statistics, and features, see “[OpenFlow v1.0 Compliance Matrix for Devices Running Junos OS](#)” on [page 2065](#). For a detailed list of supported OpenFlow v1.3.1 messages and fields, port structure flags and numbering, match conditions, flow actions, multipart messages, flow instructions, and group types, see “[OpenFlow v1.3.1 Compliance Matrix for Devices Running Junos OS](#)” on [page 2087](#).

- [OpenFlow Operation and Support on page 2051](#)
- [OpenFlow Forwarding Actions on page 2054](#)

### OpenFlow Operation and Support

To isolate and control OpenFlow traffic on devices running Junos OS, you configure virtual switches. You can configure one OpenFlow virtual switch and one active OpenFlow controller on each device running Junos OS that supports OpenFlow. You configure the OpenFlow protocol, virtual switch, and controller connection information at the **[edit protocols openflow]** hierarchy level.

OpenFlow traffic can only either enter or exit from OpenFlow-enabled ports. If a flow modification message is sent to an ingress port that is not enabled for OpenFlow, the device sends an ofp\_error\_msg with an OFPET\_FLOW\_MOD\_FAILED error type and OFPFMFC\_UNKNOWN code to the controller. If a flow modification action is requested

for a port that is not enabled for OpenFlow, the device sends an ofp\_error\_msg with an OFPET\_BAD\_ACTION error type and OFPBAC\_BAD\_OUT\_PORT code to the controller.

[Table 148 on page 2052](#) summarizes the general features supported on devices running Junos OS that support OpenFlow v1.0. For information about support on specific platforms, see *OpenFlow Support on Devices Running Junos OS*.

**Table 148: OpenFlow v1.0 Support on Devices Running Junos OS**

| Feature   | Support  |
|---|--|
| OpenFlow v1.0   | Supported.   |
| OpenFlow virtual switch                                       | 1 OpenFlow virtual switch.   |
| Controller  | 1 active OpenFlow controller per virtual switch. Tested controllers include Floodlight and OESS.   |
| Controller connection   | TCP/IP connection. Only passive connections are accepted. The controller cannot actively connect to the OpenFlow switch.<br><br>SSL connections are not supported.   |
| Emergency mode  | Not supported as defined in OpenFlow Switch Specification v1.0. If the controller connection is lost and cannot be reestablished, the switch maintains all flow states in the control and data planes.   |
| Flow classification and mapping as a Layer 2 or Layer 3 route | Not supported.   |
| Flow priority   | Supported as per OpenFlow Switch Specification v1.3 in which there is no prioritization of exact match entries over wildcard entries.  |
| Flow table  | Single flow table.   |
| Forwarding actions  | <ul style="list-style-type: none"> <li>Forward to an OpenFlow-enabled physical port</li> <li>ALL, CONTROLLER, NORMAL, and FLOOD for normal flow actions</li> <li>ALL and FLOOD for Send Packet flow actions</li> </ul> <p><b>NOTE:</b> The QFX5100 switch does not support NORMAL for normal flow actions.</p> |
| Hybrid interfaces   | Supported on some devices. OpenFlow-enabled devices that support hybrid interfaces permit a physical interface to concurrently support logical interfaces for normal traffic and logical interfaces for OpenFlow traffic.  |
| Interfaces  | You can configure Ethernet interfaces only as OpenFlow interfaces.   |
| Multi-VLAN actions  | Supported on some devices. OpenFlow-enabled devices that support multi-VLAN actions have the ability to associate a different VLAN and different VLAN action with each egress port.  |

**Table 148: OpenFlow v1.0 Support on Devices Running Junos OS (continued)**

| Feature                                    | Support  |
|--|--|
| Port modification                          | Not supported. OpenFlow-enabled devices ignore all OpenFlow controller OFPT_PORT_MOD requests. |
| Queues, queue messages, or enqueue actions | Not supported.   |

[Table 149 on page 2053](#) summarizes the general features supported on devices running Junos OS that support OpenFlow v1.3.1. For information about support on specific platforms, see *OpenFlow Support on Devices Running Junos OS*.

**Table 149: OpenFlow v1.3.1 Support on Devices Running Junos OS**

| Feature   | Support  |
|---|--|
| OpenFlow v1.3.1   | Supported.   |
| OpenFlow virtual switch                                       | 1 OpenFlow virtual switch.   |
| Controller  | 1 active OpenFlow controller per virtual switch. Tested controllers include NEC and Ixia. .  |
| Controller connection   | TCP/IP connection. Only passive connections are accepted. The controller cannot actively connect to the OpenFlow switch.<br><br>SSL connections are not supported.   |
| Flow classification and mapping as a Layer 2 or Layer 3 route | Not supported.   |
| Flow priority   | Supported as per OpenFlow Switch Specification v1.3 in which there is no prioritization of exact match entries over wildcard entries.  |
| Flow instructions   | For each flow entry, 1 flow instruction is supported. A flow instruction can be one of the following: <ul style="list-style-type: none"> <li>• OFPIT_APPLY_ACTIONS</li> <li>• OFPIT_WRITE_ACTIONS</li> </ul> |
| Flow table  | Single flow table.   |

**Table 149: OpenFlow v1.3.1 Support on Devices Running Junos OS (continued)**

| Feature                                    | Support  |
|--|--|
| Forwarding actions                         | <ul style="list-style-type: none"> <li>Forward to an OpenFlow-enabled physical port</li> <li>ALL, CONTROLLER, NORMAL, and FLOOD for normal flow actions</li> <li>ALL and FLOOD for Send Packet flow actions</li> </ul> <p><b>NOTE:</b> The QFX5100 switch does not support NORMAL for normal flow actions.</p> |
| Group action                               | <p>Supported. A group can include 1 to 32 buckets, and a bucket can have a set of actions (set, pop, or output).</p> <p>Group types OFPGT_ALL and OFPGT_INDIRECT are supported.</p>  |
| Interfaces                                 | You can configure Ethernet interfaces only as OpenFlow interfaces.   |
| Multi-VLAN actions                         | Supported on some devices. OpenFlow-enabled devices that support multi-VLAN actions have the ability to associate a different VLAN and different VLAN action with each egress port.  |
| Multipart messages                         | <p>Supported for requesting and returning the following information:</p> <ul style="list-style-type: none"> <li>Switch, group, or port descriptions</li> <li>Single-flow, aggregate-flow, flow table, port, or group statistics</li> <li>Group or table features</li> </ul>                                    |
| OpenFlow version negotiation               | Supported for OpenFlow controller and Junos OS device OpenFlow version negotiation.  |
| Port modification                          | Not supported. OpenFlow-enabled devices ignore all OpenFlow controller OFPT_PORT_MOD requests.   |
| Queues, queue messages, or enqueue actions | Not supported.   |

## OpenFlow Forwarding Actions

**NOTE:** The information in this section applies to both OpenFlow v1.0 and v1.3.1 except where noted.

OpenFlow-enabled devices running Junos OS support several flow actions for forwarding OpenFlow packets. For normal flow actions, the following forwarding actions are supported:

- **physical port**—Forward unicast or multicast packets out the specified OpenFlow-enabled interfaces.
- **ALL**—Flood the packet out all OpenFlow interfaces configured for that virtual switch instance except the ingress interface.
- **CONTROLLER**—Send the packet to the OpenFlow controller for processing.
- **FLOOD**—Flood the packet along the minimum spanning tree, which includes all OpenFlow interfaces configured for that virtual switch instance except the ingress interface and any interfaces that are disabled by the Spanning Tree Protocol (STP). Because devices running Junos OS do not support 802.1D STP capabilities for OpenFlow, the FLOOD forwarding action behaves like the ALL forwarding action.
- **NORMAL**—Process the packet, using traditional Layer 2 or Layer 3 processing.

**NOTE:** The QFX5100 switch does not support NORMAL for normal flow actions.

The OpenFlow controller can also use a Send Packet message (OFPT\_PACKET\_OUT) to direct the OpenFlow virtual switch to send a packet out of a specified port. The Send Packet message includes the packet to be forwarded and the forwarding action indicating the interface out of which the packet must be forwarded. Supported forwarding actions for the Send Packet message include ALL and FLOOD.

Each OpenFlow virtual switch is a logically separate flood domain. Therefore, the OpenFlow ALL and FLOOD actions only flood packets out OpenFlow interfaces configured under that specific virtual switch excluding the ingress OpenFlow interface.

## Understanding the Virtual Switch Connection to the OpenFlow Controller on Devices Running Junos OS

---

On devices running the Junos operating system (Junos OS), each OpenFlow virtual switch establishes an independent connection with the controller and is represented by a unique runtime datapath ID consisting of the management port MAC address and an internally assigned virtual switch ID. The controller and virtual switch connect to each other using a TCP/IP connection on the management plane. Thus, OpenFlow-enabled devices that are managed by a controller must be connected to the management network (for example, connected using the `me0`, `fxp0`, `em0`, or `em1` management port) and must be reachable from the controller IP address.

Upon establishing a connection with the controller, the switch and the controller exchange hello messages that specify the highest OpenFlow protocol version supported by the sender. If the first packet received by the switch is not an `OFPT_HELLO` message, the switch tears down the connection and attempts to establish a new connection with the controller. Additionally, if the controller and the switch negotiate an OpenFlow protocol version that one of the parties does not support, the connection is terminated with an error message indicating an `OFPET_HELLO_FAILED` error type and an `OFPHFC_INCOMPATIBLE` code.

The session is established when the switch and controller successfully exchange Hello messages and negotiate the OpenFlow protocol version. After session establishment, the controller sends the switch a feature request message to request the capabilities supported by the switch. The switch responds with a feature reply message, which includes the local MAC address in the virtual switch datapath ID field. If the local MAC address is unavailable, the switch terminates the connection.

After establishing the session, the controller and virtual switch exchange echo request and reply messages as a keepalive mechanism. The keepalive timer is reset if the virtual switch or controller receives either an echo reply or a packet. Echo requests are sent every 10 seconds during idle windows in the absence of other messages. If the switch receives no echo reply or other message from the controller for 120 seconds, the connection is considered lost, and the switch attempts to reestablish the connection for 10 seconds. If the connection cannot be established, the switch enters emergency mode as defined in the OpenFlow v1.3 specification. In emergency mode, the switch deletes normal flow entries, and after 30 seconds, purges flow entries that are installed in hardware.

If at any point after the session is established the recipient receives an OpenFlow message that specifies the wrong OpenFlow version, the recipient responds with an error message indicating an `OFPET_BAD_REQUEST` type and `OFPBRC_BAD_VERSION` code. If the switch cannot process the version and type of an OpenFlow packet in the TCP buffer, or if the switch fails sending OpenFlow messages to the controller, the switch terminates the connection.

Modifying, deleting, or deactivating the virtual switch configuration also impacts the connection to the controller. If you modify an existing virtual switch configuration, the virtual switch tears down the existing connection to the controller and establishes a new session with the updated configuration information. If you delete or deactivate an existing

virtual switch configuration, the virtual switch automatically disconnects from the controller.

To summarize, the switch disconnects from the controller under the following circumstances:

- The first packet the switch receives from the controller is not a hello message.
- The switch receives a hello message with an unsupported OpenFlow version.
- The local MAC address is not available for inclusion in the feature reply message.
- The switch receives no echo reply or other message from the controller for 120 seconds.
- The existing virtual switch configuration is deleted or deactivated.
- The existing virtual switch configuration is modified. In this case, after disconnecting from the controller, the switch attempts to establish a new connection and session.
- The switch cannot process the version and type of an OpenFlow packet in the TCP buffer.
- The switch fails to send OpenFlow messages to the controller, which is treated as a dead TCP socket connection.

## Understanding the OpenFlow Version Negotiation Between the Controller and Junos OS Devices

Upon establishing an initial connection, an OpenFlow controller and a Junos OS device negotiate the OpenFlow version to be used. In general, the OpenFlow controller must support at least one of the versions run on the Junos OS device. Otherwise, a connection cannot be established.

**NOTE:** The Junos OS implementation of OpenFlow 1.3.1 does not support the OFPHET\_VERSIONBITMAP Hello message element.

[Table 150 on page 2057](#) outlines the OpenFlow versions run by the Junos OS device and controller, the negotiated version, and the *numerical value* associated with each version.

**Table 150: OpenFlow Versions Negotiated Between the Controller and a Junos OS Device and the Numerical Value Associated with Each Version**

| OpenFlow Version Run by Junos OS Device | OpenFlow Version Supported by Controller | Negotiated Version | Numerical Value Associated with Negotiated OpenFlow Version |
|---|--|--------------------|---|
| 1.0                                     | 1.0                                      | 1.0                | 1   |

**Table 150: OpenFlow Versions Negotiated Between the Controller and a Junos OS Device and the Numerical Value Associated with Each Version (*continued*)**

| OpenFlow Version Run by Junos OS Device | OpenFlow Version Supported by Controller   | Negotiated Version  | Numerical Value Associated with Negotiated OpenFlow Version |
|---|--|---------------------|---|
| 1.3.1                                   | 1.3.1  | 1.3.1               | 4   |
| 1.0 and 1.3.1                           | 1.0 and 1.3.1  | 1.3.1               | 4   |
| 1.0 and 1.3.1                           | 1.0  | 1.0                 | 1   |
| 1.0 and 1.3.1                           | 1.3.1  | 1.3.1               | 4   |
| 1.0 and/or 1.3.1                        | <ul style="list-style-type: none"> <li>Neither 1.0 nor 1.3.1</li> <li>Connection with Junos OS device is down</li> </ul> | None; no connection | 0   |

To determine the negotiated version running on a Junos OS device, you enter the [show openflow controller](#) command. The output of this command includes a **Negotiated version** field and a numerical value that represents the negotiated version number. Use [Table 150 on page 2057](#) to correlate the numerical values shown in this field with the negotiated versions.

## Understanding OpenFlow Flows and Filters on Devices Running Junos OS

OpenFlow flows are defined by various elements. [Table 151 on page 2058](#) outlines the flow elements supported in OpenFlow v1.0 and v1.3.1. The elements supported by the OpenFlow versions uniquely identify a flow.

**Table 151: OpenFlow Flow Elements**

| Flow Element                | Supported In OpenFlow v1.0? | Supported In OpenFlow v1.3.1? |
|-----------------------------|-----------------------------|-------------------------------|
| Match conditions            | Yes                         | Yes                           |
| Set of actions              | Yes                         | No                            |
| Flow instructions           | No                          | Yes                           |
| Flow priority               | Yes                         | Yes                           |
| Flow timeout information    | Yes                         | Yes                           |
| Flow cookie and cookie mask | No                          | Yes                           |

Flow entries specify wildcard match conditions for fields that do not require an exact match. If a flow entry contains wildcards for all match conditions, then all packets match that flow entry.

To implement OpenFlow flow-based forwarding, devices running Junos OS use filters. For each logical interface configured to participate in OpenFlow, a single filter is created and applied to the logical interface in the input direction. The filter name is the concatenation of the interface name, including the logical unit number, and an internally assigned virtual switch ID, for example `ge-1/1/0.0_0`.

**NOTE:** If you manually configure a filter name or a filter term name that conflicts with an autogenerated OpenFlow filter name or filter term name, Junos OS does not generate an error during a **commit** check. If there is a conflict, the commit succeeds, but one of the filters or filter terms is rejected based on the order in which they were received.

A filter consists of one or more terms with match conditions, and actions (for OpenFlow v1.0) or instructions (for OpenFlow v1.3.1). OpenFlow flows are mapped to filter terms, and OpenFlow controller requests to add, delete, and modify flows result in the addition, deletion, or modification of terms in the filter. When the OpenFlow controller sends a flow modification request, the flow entry match condition for the ingress port determines which logical interface filter is updated. The OpenFlow flow priority determines the order of the terms in the filter, where higher priority terms are installed above lower priority terms. Flow match conditions are mapped to the filter term match conditions, and flow actions or instructions are mapped to the filter term **then** statement. Depending on the flow action or instruction, the **then** statement might include actions for forwarding the packet to the next hop or OpenFlow controller, or discarding the packet.

**NOTE:** If the OpenFlow controller sends a request to modify a flow, but no flow entries match the conditions, OpenFlow v1.0 adds an entry for the flow to the flow table. However, in the same situation, OpenFlow v1.3.1 does not add this flow to the flow table, nor is an error logged.

Each OpenFlow flow entry corresponds to a filter term. However, each flow entry might map to a term in one or more filters depending on the match condition for the ingress port. If the ingress port is a wildcard match, the flow entry appears as a term in all of the interface filters for that OpenFlow virtual switch. For example, suppose that the OpenFlow controller sends a request to add a new flow entry with a wildcard match for the ingress port field. In this case, the flow is added as a new filter term for all OpenFlow logical interfaces configured under that virtual switch.

Devices running Junos OS support both strict and non-strict flow mod commands for modifying and deleting flows. OpenFlow controller strict modify and strict delete flow mod requests only modify or delete flows that exactly match the description for all header fields including wildcards and priorities. Non-strict modify and delete flow mod requests modify or delete flows that exactly match or are more specific than the request.

In addition to the functionality already described, OpenFlow v1.3.1 supports a flow cookie, which is an identifier that the OpenFlow controller can specify when a flow is installed in the flow table. This cookie enables OpenFlow to filter flows selected for flow modification and delete operations.

You can configure the default action for packets that do not match on any flow entry as either **drop**, which discards the packet, or **packet-in**, which accepts the packet and forwards it to the controller. The default action is specific to the OpenFlow virtual switch and is the same across all filters associated with that virtual switch. If you do not explicitly configure the default action, the default is **packet-in**.

In the event that a logical interface becomes unavailable, the filter associated with that logical interface is removed from the Packet Forwarding Engine. Although the filter is removed, the Routing Engine retains flows that match on the logical interface as the ingress port until such time as the flows are purged in response to OpenFlow timers. For information about OpenFlow timers, see [“Understanding OpenFlow Flow Entry Timers on Devices Running Junos OS” on page 2062](#). If the logical interface becomes available before the flows are purged, the filter and any flows retained by the Routing Engine at that point are reinstalled in hardware.

Similarly, when a logical interface becomes unavailable, flows that have that logical interface as the only active egress interface in their action set or instruction are considered invalid. The invalid flows are removed from the Packet Forwarding Engine but are indefinitely retained by the Routing Engine until the flows are purged in response to various OpenFlow timers. Alternatively, flows that include the logical interface as one of several active egress interfaces in their action set or instruction are still valid. In that case, the flow remains in the Packet Forwarding Engine, but the multicast next hop is updated to remove that logical interface as a valid egress interface.

## Understanding OpenFlow Flow Instructions on Devices Running Junos OS

---

**NOTE:** Flow instructions are supported only on Juniper Networks devices running OpenFlow v1.3.1 or later.

When a packet matches a particular OpenFlow flow, a Juniper Networks device running OpenFlow v1.0 applies a set of actions to the packet. Instead of applying a set of actions, starting with OpenFlow v1.3.1, the Juniper Networks device applies a flow instruction to a matching packet.

In the Junos OS implementation of OpenFlow v1.3.1, a flow entry can include only one flow instruction, which can be one of the following:

- Apply actions (OFPIT\_APPLY\_ACTIONS)
- Write actions (OFPIT\_WRITE\_ACTIONS)

Each of the instructions mentioned above includes a list of actions that the device applies immediately in the order in which they appear the list.

**Related  
Documentation**

- [OpenFlow v1.3.1 Compliance Matrix for Devices Running Junos OS on page 2087](#)

## Understanding How the OpenFlow Group Action Works

**NOTE:** The group action is supported only on Juniper Networks devices running OpenFlow v1.3.1 or later.

OpenFlow uses flow entries as a means to match flows and specify an action for incoming packets on logical OpenFlow interfaces. The action specified in one or more flow entries can direct packets to, or reference, a base action called a *group* action. The purpose of the group action is to further process these packets and assign a more specific forwarding action to them.

A group can include 1 to 32 buckets, and in turn, a bucket can have a set of actions (set, pop, or output).

For information about the specific actions that are supported for each base type, see the [“OpenFlow v1.3.1 Compliance Matrix for Devices Running Junos OS” on page 2087](#).

Junos OS devices support the following *group types*, which define how buckets are implemented:

- All—Multiple buckets are implemented for the handling of multicast and broadcast packets. Each incoming packet is replicated and processed by each bucket in the group.
- Indirect—One bucket is implemented. An indirect group is typically referenced by multiple flow entries, thereby allowing each of these entities to have a centralized action that can be easily updated.

For example, an all group type with a unique OpenFlow-controller-assigned identifier, say, 50 can have two buckets: bucket 1 and bucket 2. The action associated with bucket 1 might be to set the VLAN ID field in the packet to 3022 and to output the packet to an OpenFlow port—for example, 118. The action associated with bucket 2 might be to set the VLAN ID field in the packet to—for example, 2022—and to output the packet to an OpenFlow port—for example, 117.

You can add a group with one or more buckets on the OpenFlow controller, and the controller pushes the group to the Junos OS devices with which it is connected. Each Junos OS device checks to see whether the group already exists. If it does not, the group is added to the group table on the Junos OS devices. After the group is in the group table, you can modify or delete it from the table by way of the OpenFlow controller.

## Understanding OpenFlow Flow Entry Timers on Devices Running Junos OS

- [OpenFlow Flow Entry Timer Overview on page 2062](#)
- [Idle Timeout and Hard Timeout on page 2062](#)
- [Purge Flow Timer on page 2063](#)

### OpenFlow Flow Entry Timer Overview

For each logical interface participating in OpenFlow on a device running Junos OS, a single filter is created and applied to the logical interface in the input direction. OpenFlow flows are mapped to the filter as filter terms. Each flow has a number of timers associated with it, some of which are configured through the OpenFlow controller while others are configured through the Junos OS CLI. OpenFlow flow entry timers include the idle timeout, the hard timeout, and the purge flow timer. [Table 152 on page 2062](#) summarizes the various OpenFlow flow timers.

**Table 152: OpenFlow Flow Entry Timers**

| Timer            | Configured Through  | Range (Seconds)      |
|------------------|---|----------------------|
| Idle timeout     | Controller  | 0, 11 through 65,535 |
| Hard timeout     | Controller  | 0 through 65,535     |
| Purge flow timer | Junos OS CLI by using the <b>purge-flow-timer</b> configuration statement | 0 through 300        |

### Idle Timeout and Hard Timeout

Each flow entry has an idle timeout and a hard timeout associated with it, both of which are configured through the OpenFlow controller. The idle timeout is the number of seconds after which the flow is removed from the flow table and the hardware provided there are no matching packets. The hard timeout is the number of seconds after which the flow is removed from the flow table and the hardware regardless of the number of matching packets.

If a flow entry has both an idle timer and a hard timer associated with it, the first timer to expire causes the flow entry to be removed. If the idle timer expires first, the flow is removed at that point only if there are no matching packets. Otherwise, the flow is removed when the hard timer expires.

When the controller sends a flow entry modification message (OFPT\_FLOW\_MOD) to the switch, it specifies the idle timeout and hard timeout for that flow entry. On devices running Junos OS, the idle timeout value can be 0, or it can range from 11 through 65,535 seconds. If the controller sets the idle timeout to 0, the flow entry does not experience an idle time out. The hard timeout value can range from 0 through 65,535 seconds. If the controller sets the hard timeout to 0, the flow entry does not experience a hard time out. If the controller requests an invalid timeout value, the switch rejects the flow modification message and sends an error message back to the controller.

## Purge Flow Timer

On devices running Junos OS, you can configure a purge flow timer, which is the number of seconds after which an invalid OpenFlow flow entry is deleted from the flow table. The **purge-flow-timer** statement is configured through the Junos OS CLI at the **[edit protocols openflow switch switch-name]** hierarchy level. The **purge-flow-timer** value is specific to the OpenFlow virtual switch under which it is configured, and it is the same for all flow entries associated with that virtual switch.

If you do not configure the **purge-flow-timer** statement, the device purges invalid flows from hardware, but indefinitely retains the corresponding flow entries in the flow table on the Routing Engine. If you configure the **purge-flow-timer** statement, the device purges invalid flow entries from hardware, and after the specified number of seconds, deletes the invalid flow entries from the flow table. Configuring a value of 0 causes the device to immediately delete invalid flow entries from the flow table.

For example, consider the case of an OpenFlow logical interface that becomes temporarily unavailable. When the interface becomes unavailable, flow entries that have the logical interface as the matching ingress interface or as the only active egress interface in their action set (for OpenFlow v1.0) or flow instruction (for OpenFlow v1.3.1) are marked as invalid. Although the logical interface is not available, the flow entries could still be valid. The **purge-flow-timer** configuration statement determines how to handle the flows.

In this example, if you do not configure the **purge-flow-timer** statement, then when the logical interface becomes unavailable, the device removes the invalid flows from the hardware but indefinitely retains the flow entries in the flow table. If the logical interface later becomes available, the flows are reinstalled in the hardware without any controller intervention.

On the other hand, if you configure the **purge-flow-timer** statement, then when the logical interface becomes unavailable, the device removes the flows from the hardware, and retains the flow entries in the flow table for the configured number of **purge-flow-timer** seconds. If the interface does not become available and the timer expires, the device deletes the flow entries from the flow table. After the interface comes back up, the OpenFlow controller must send new flow entry modification messages to the OpenFlow switch in order to restore the flow entries to the flow table and to the hardware.

**NOTE:** By default, if you remove an active OpenFlow logical interface from an existing OpenFlow configuration, flow entries that match on this logical interface as the ingress interface and flow entries that include this logical interface as the only active egress interface in their action list or flow instruction are invalid and are automatically purged from the flow table and from the hardware regardless of whether you configure the **purge-flow-timer** statement.

## Understanding OpenFlow Barrier Messages on Devices Running Junos OS

---

OpenFlow-enabled devices running Junos OS support the OpenFlow protocol controller-to-switch Barrier Request message (OFPT\_BARRIER\_REQUEST). The OpenFlow controller sends a Barrier Request message to request that the OpenFlow-enabled switch complete processing of all messages sent before the Barrier Request message before processing any messages sent after the Barrier Request message. This ensures that the virtual switch processes all message dependencies and sends all notifications for completed operations before proceeding with new requests.

When the OpenFlow virtual switch receives a Barrier Request message, it queues all subsequent incoming messages, with the exception of echo request and reply messages, until processing of all prior messages is complete. Echo request and reply messages are required to maintain connectivity to the controller.

When the switch completes an operation, it sends a reply message back to the controller. Only after the reply is sent to the controller does the switch mark the message or operation as processed. After the switch completes processing for all operations requested prior to the Barrier Request message, the switch sends a Barrier Reply (OFPT\_BARRIER\_REPLY) message, which includes the ID of the original request message, to the OpenFlow controller. At that point, the switch resumes processing of the queued messages.

## Understanding OpenFlow Multipart Messages on Devices Running Junos OS

---

**NOTE:** Multipart messages are supported only on Juniper Networks devices running OpenFlow v1.3.1 or later.

To more efficiently process large OpenFlow data responses, OpenFlow v1.3.1 introduces support for multipart messages.

The OpenFlow controller can request the following information, using a multipart request message:

- Switch, group, or port descriptions
- Single-flow, aggregate-flow, flow table, port, or group statistics
- Group or table features

In response, a Juniper Networks device can send one or more multipart response messages wherein each message includes the same request identifier. In addition, each message in the sequence, except the last message, includes a flag that indicates more messages are to follow.

[Table 155 on page 2068](#) lists OpenFlow v1.0 match condition support.

**Table 163: Junos OS Support for OpenFlow v1.0 Match Conditions**

| Section | Specification                    | QFX5100   |
|---------|----------------------------------|-----------|
| 5.2.3   | dl_src (Ethernet source address) | Supported |

**Table 163: Junos OS Support for OpenFlow v1.0 Match Conditions** (*continued*)

| Section | Specification  | QFX5100   |
|---------|--|-----------|
|         | dl_dst (Ethernet destination address)  | Supported |
|         | dl_vlan (Input VLAN ID)  | Supported |
|         | <b>NOTE:</b> The flow match condition for the VLAN ID must be less than 4096. Otherwise, the flow is not installed. The only exception is VLAN ID 65535, which corresponds to untagged frames. |           |
|         | dl_vlan_pcp (Input VLAN priority)  | Supported |
|         | <b>NOTE:</b> The flow match condition for the VLAN priority must be in accordance with 802.1p specifications. Otherwise, the flow is not installed.  |           |
|         | dl_type (Ethernet frame type)  | Supported |
|         | nw_tos (IP TOS (6-bit DSCP))   | Supported |
|         | nw_proto (IP Protocol or lower 8 bits of ARP opcode)   | Supported |
|         | nw_src (IP source address)   | Supported |
|         | nw_dst (IP destination address)  | Supported |
|         | tp_src (TCP/UDP source port/ICMPv4 type)   | Supported |
|         | tp_dst (TCP/UDP destination port/ICMPv4 code)  | Supported |
|         | Match all 12 tuples or a combination of tuples   | Supported |

Table 156 on page 2069 lists the OpenFlow v1.0 wildcard support.

**Table 164: Junos OS Support for OpenFlow v1.0 Wildcards**

| Section | Specification  | QFX5100   |
|---------|----------------|-----------|
| 5.2.3   | OFPFW_IN_PORT  | Supported |
|         | OFPFW_DL_VLAN  | Supported |
|         | OFPFW_DL_SRC   | Supported |
|         | OFPFW_DL_DST   | Supported |
|         | OFPFW_DL_TYPE  | Supported |
|         | OFPFW_NW_PROTO | Supported |

Table 164: Junos OS Support for OpenFlow v1.0 Wildcards (*continued*)

| Section | Specification                             | QFX5100   |
|---------|---|-----------|
|         | OFPFW_TP_SRC                              | Supported |
|         | OFPFW_TP_DST                              | Supported |
|         | No wild cards set. Match entire 12 tuple. | Supported |

Table 157 on page 2069 lists the OpenFlow v1.0 flow action support.

Table 165: Junos OS Support for OpenFlow v1.0 Flow Actions

## Installing Support for OpenFlow on Devices Running Junos OS

---

You can add support for OpenFlow on a device running Junos OS by copying the software package to your device and then installing the package. The software package is identified by the jsdn prefix, and the filename string begins with the following format:

*jsdn-packageID-release*

where:

- *packageID* identifies the devices running Junos OS on which you can install the package.
- *release* identifies the release, for example, 13.3. The jsdn software release and the Junos OS release of the device on which it is installed must match.

For information about OpenFlow support on devices running Junos OS and the corresponding installation package for that device, see *OpenFlow Support on Devices Running Junos OS*.

To install the jsdn software package on a device running Junos OS:

1. Download the software package to the device.
2. If you previously installed the jsdn software package, remove the existing package using the **request system software delete** operational mode command.

```
user@host> request system software delete existing-jsdn-package
```

3. Install the new software package using the **request system software add** operational mode command.

```
user@h> request system software add path-to-jsdn-package
```

## Configuring Support for OpenFlow on MX Series Routers

---

The following sections configure MX Series routers to support OpenFlow using interfaces that participate solely in OpenFlow. For information about configuring hybrid interfaces, which concurrently support OpenFlow logical interfaces and non-OpenFlow logical interfaces, see [“Configuring OpenFlow Hybrid Interfaces on MX Series Routers” on page 2128](#).

Before configuring support for OpenFlow, ensure that the router meets the following requirements:

- MX Series router running Junos OS Release 13.3 or a later release
- OpenFlow software package with a software package release that matches the Junos OS release of the device on which it is installed
- TCP connection between the router and an OpenFlow controller
- Connection between the management interface of the router and the management network, which is reachable from the controller IP address

Configuration tasks are described in detail in the following sections:

- [Configuring the OpenFlow Interfaces on page 2100](#)
- [Configuring the OpenFlow Protocol on page 2100](#)
- [Configuring the OpenFlow Routing Instance on page 2101](#)

## Configuring the OpenFlow Interfaces

You must configure interfaces participating in OpenFlow as Layer 2 interfaces. On MX Series routers, you configure the interfaces with encapsulation **ethernet-bridge** and protocol family **bridge**.

To configure the OpenFlow Interfaces:

- Configure the physical link-layer encapsulation type and the logical interface and protocol family.

```
[edit interfaces interface-name]  
user@host# set encapsulation ethernet-bridge  
user@host# set unit unit family bridge
```

## Configuring the OpenFlow Protocol

To configure support for OpenFlow, create a virtual switch instance, and specify a switch name, which must be 60 characters or less. For the virtual switch instance, configure the OpenFlow controller information and the participating logical interfaces. Optionally, configure the default action for packets that do not match a flow entry, the purge timer for invalid flows, and any OpenFlow traceoptions.

To configure the OpenFlow protocol:

1. Configure the OpenFlow controller IP address and the connection protocol.

```
[edit protocols openflow switch switch-name]  
user@host# set controller address address  
user@host# set controller protocol tcp
```

2. Specify the logical interfaces participating in OpenFlow under this virtual switch instance.

```
[edit protocols openflow switch switch-name]  
user@host# set interfaces interface-name1.unit1  
user@host# set interfaces interface-name2.unit1
```

3. (Optional) Configure the **default-action** statement for packets that do not match on an existing flow entry.

If you do not configure the **default-action** statement, the default is **packet-in**, which indicates that packets with no matching flow entry must be sent to the controller for processing.

```
[edit protocols openflow switch switch-name]  
user@host# set default-action (drop | packet-in)
```

4. (Optional) Configure the **purge-flow-timer** statement, which is the number of seconds after which an invalid flow is purged from the flow table.

```
[edit protocols openflow switch switch-name]  
user@host# set purge-flow-timer seconds
```

5. (Optional) Configure OpenFlow traceoptions.

If you do not configure a log filename, OpenFlow trace messages are logged in the default OpenFlow log file `/var/log/ofd`.

```
[edit protocols openflow]
user@host# set traceoptions flag flag
user@host# set traceoptions file file-name
```

## Configuring the OpenFlow Routing Instance

To configure the virtual switch routing instance for OpenFlow traffic:

1. Configure the routing instance type as **virtual-switch**.

```
[edit routing-instances routing-instance-name]
user@host# set instance-type virtual-switch
```

2. Configure the bridge domain name and type.

```
[edit routing-instances routing-instance-name]
user@host# set bridge-domains name domain-type bridge
```

3. Configure the VLAN ID as **none**.

```
[edit routing-instances routing-instance-name]
user@host# set bridge-domains name vlan-id none
```

4. Configure the OpenFlow logical interfaces that will be bound to the routing instance.

```
[edit routing-instances routing-instance-name]
user@host# set bridge-domains name interface interface-name1.unit1
user@host# set bridge-domains name interface interface-name2.unit1
```

5. (Optional) If you use the NORMAL forward action to forward OpenFlow traffic using traditional Layer 2 and Layer 3 processing, configure an integrated routing and bridging (IRB) interface, and include the appropriate logical interface in the bridge domain configuration.

```
[edit routing-instances routing-instance-name]
user@host# set bridge-domains name routing-interface irb.unit
```

## Example: Enabling OpenFlow on MX Series Routers

---

OpenFlow is an open standard that allows you to control traffic paths in a network by creating, deleting, and modifying flows in each device along a path. This example shows how to configure OpenFlow support on an MX240 router running Junos OS.

- [Requirements on page 2102](#)
- [Overview on page 2102](#)
- [Configuration on page 2103](#)
- [Verification on page 2105](#)

### Requirements

This example uses the following hardware and software components:

- MX240 router running Junos OS Release 13.3 or a later release
- OpenFlow software package with a software package release that matches the Junos OS release of the device on which it is installed
- TCP connection between the router and an OpenFlow controller
- Connection between the management interface of the router and the management network, which is reachable from the OpenFlow controller IP address

### Overview

In this example, you configure support for OpenFlow on an MX240 router. The router has three interfaces that participate solely in OpenFlow: ge-1/0/0.0, ge-1/1/0.0, and xe-0/0/0.0. You first configure the interfaces as Layer 2 interfaces using physical link-layer encapsulation type **ethernet-bridge** and protocol family **bridge**.

MX Series routers require a separate virtual switch routing instance to isolate the OpenFlow traffic from the normal network traffic. This example configures a virtual switch routing instance, `rt-bd-1`, using instance type **virtual-switch** at the **[edit routing-instances]** hierarchy level. Within the routing instance, the bridge domain **of-bridge** includes all of the logical interfaces participating in OpenFlow.

You configure the OpenFlow virtual switch and OpenFlow protocol statements at the **[edit protocols openflow]** hierarchy level. In this example, the virtual switch, `OFswitch1`, connects to the controller over a TCP connection at IP address 172.16.1.1. The virtual switch configuration must include all of the logical interfaces participating in OpenFlow, and OpenFlow traffic will only enter or exit from these interfaces.

Within the OpenFlow configuration, the **default-action** statement indicates the action the switch must take for packets that do not have a matching flow entry. If you omit the **default-action** statement, the default action is **packet-in**, which indicates that packets with no matching flow entry must be sent to the controller for processing. This example explicitly configures the default action for packets that do not have a matching flow entry as **packet-in**.

This example also configures OpenFlow traceoptions. In this case, the **flag all** statement indicates that all OpenFlow trace events should be captured and logged. Since the example does not configure a specific filename for the log file, OpenFlow trace messages are logged in the default OpenFlow log file `/var/log/ofd`.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-1/0/0 encapsulation ethernet-bridge unit 0 family bridge
set interfaces ge-1/1/0 encapsulation ethernet-bridge unit 0 family bridge
set interfaces xe-0/0/0 encapsulation ethernet-bridge unit 0 family bridge
set routing-instances rt-bd-1 instance-type virtual-switch
set routing-instances rt-bd-1 bridge-domains of-bridge vlan-id none
set routing-instances rt-bd-1 bridge-domains of-bridge interface ge-1/0/0.0
set routing-instances rt-bd-1 bridge-domains of-bridge interface ge-1/1/0.0
set routing-instances rt-bd-1 bridge-domains of-bridge interface xe-0/0/0.0
set protocols openflow switch OFswitch1 controller address 172.16.1.1
set protocols openflow switch OFswitch1 controller protocol tcp
set protocols openflow switch OFswitch1 interfaces ge-1/0/0.0
set protocols openflow switch OFswitch1 interfaces ge-1/1/0.0
set protocols openflow switch OFswitch1 interfaces xe-0/0/0.0
set protocols openflow switch OFswitch1 default-action packet-in
set protocols openflow traceoptions flag all
```

**Step-by-Step Procedure** To configure support for OpenFlow:

1. Configure the OpenFlow interfaces as Layer 2 interfaces.

```
[edit interfaces]
user@host# set ge-1/0/0 encapsulation ethernet-bridge unit 0 family bridge
user@host# set ge-1/1/0 encapsulation ethernet-bridge unit 0 family bridge
user@host# set xe-0/0/0 encapsulation ethernet-bridge unit 0 family bridge
```

2. Configure the virtual switch routing instance.

```
[edit routing-instances]
user@host# set rt-bd-1 instance-type virtual-switch
user@host# set rt-bd-1 bridge-domains of-bridge vlan-id none
user@host# set rt-bd-1 bridge-domains of-bridge interface ge-1/0/0.0
user@host# set rt-bd-1 bridge-domains of-bridge interface ge-1/1/0.0
user@host# set rt-bd-1 bridge-domains of-bridge interface xe-0/0/0.0
```

3. Configure the OpenFlow controller IP address and the connection protocol.

```
[edit protocols openflow switch OFswitch1]
user@host# set controller address 172.16.1.1
user@host# set controller protocol tcp
```

4. Configure the logical interfaces participating in OpenFlow under this virtual switch instance.

```
[edit protocols openflow switch OFswitch1]
user@host# set interfaces ge-1/0/0.0
```

```
user@host# set interfaces ge-1/1/0.0
user@host# set interfaces xe-0/0/0.0
```

5. Configure the default action for packets that do not have a matching flow entry.

```
[edit protocols openflow switch OFswitch1]
user@host# set default-action packet-in
```

6. Configure OpenFlow traceoptions.

```
[edit protocols openflow]
user@host# set traceoptions flag all
```

7. Commit the configuration.

```
[edit]
user@host# commit
```

---

## Results

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols openflow**, and **show routing-instances** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
ge-1/0/0 {
  encapsulation ethernet-bridge;
  unit 0 {
    family bridge;
  }
}
ge-1/1/0 {
  encapsulation ethernet-bridge;
  unit 0 {
    family bridge;
  }
}
xe-0/0/0 {
  encapsulation ethernet-bridge;
  unit 0 {
    family bridge;
  }
}

user@host# show protocols openflow
switch OFswitch1 {
  default-action packet-in;
  interfaces {
    ge-1/0/0.0;
    ge-1/1/0.0;
    xe-0/0/0.0;
  }
  controller {
    address 172.16.1.1;
    protocol tcp;
  }
}
```

```

}
traceoptions {
  flag all;
}

user@host# show routing-instances
rt-bd-1 {
  instance-type virtual-switch;
  bridge-domains {
    of-bridge {
      vlan-id none;
      interface ge-1/0/0.0;
      interface ge-1/1/0.0;
      interface xe-0/0/0.0;
    }
  }
}
}

```

## Verification

Confirm that the configuration is working properly.

- [Verifying that the OpenFlow Controller Connection is Up on page 2105](#)
- [Verifying that the OpenFlow Interfaces Are Up on page 2105](#)

### Verifying that the OpenFlow Controller Connection is Up

**Purpose** Verify that the OpenFlow controller connection is up.

**Action** Issue the **show openflow controller** operational mode command, and verify that the controller connection state is **up**. Because the virtual switch configuration has only a single controller, the virtual switch should automatically initiate a connection to the controller after you commit the configuration.

```

user@host> show openflow controller
Openflowd controller information:
Controller socket: 11
Controller IP address: 172.16.1.1
Controller protocol: tcp
Controller port: 6633
Controller connection state: up
Number of connection attempt: 1
Controller role: equal

```

**Meaning** The output shows that the connection state of the OpenFlow controller is **up**, in addition to other information about the controller.

### Verifying that the OpenFlow Interfaces Are Up

**Purpose** Verify that the OpenFlow interfaces are up.

**Action** Issue the **show openflow interfaces** operational mode command, and verify that the state of each OpenFlow interface is **Up**.

```

user@host> show openflow interfaces

```

```
Switch name: OFswitch1
Interface Name: ge-1/0/0.0
Interface port number: 41507
Interface Hardware Address: 00:00:5e:00:53:b1
Interface speed: 1Gb Full-duplex
Interface Auto-Negotiation: Disabled
Interface media type: Fiber
Interface state: Up
```

```
Switch name: OFswitch1
Interface Name: ge-1/1/0.0
Interface port number: 44538
Interface Hardware Address: 00:00:5e:00:53:b2
Interface speed: 1Gb Full-duplex
Interface Auto-Negotiation: Disabled
Interface media type: Fiber
Interface state: Up
```

```
Switch name: OFswitch1
Interface Name: xe-0/0/0.0
Interface port number: 45549
Interface Hardware Address: 00:00:5e:00:53:b3
Interface speed: 10Gb Full-duplex
Interface Auto-Negotiation: Disabled
Interface media type: Fiber
Interface state: Up
```

**Meaning** The output shows that the state of each OpenFlow interface is **Up**, in addition to other information about the interfaces.

## Configuring Support for OpenFlow on EX9200 Switches

The following sections detail one method to configure EX9200 switches to support OpenFlow using interfaces that participate solely in OpenFlow. For information about configuring hybrid interfaces, which concurrently support OpenFlow logical interfaces and non-OpenFlow logical interfaces, see [“Configuring OpenFlow Hybrid Interfaces on EX9200 Switches” on page 2138](#).

Before configuring support for OpenFlow, ensure that the switch meets the following requirements:

- EX9200 switch running Junos OS Release 13.3 or a later release.
- OpenFlow software package with a software package release that matches the Junos OS release of the device on which it is installed

- TCP connection between the switch and an OpenFlow controller
- Connection between the management interface of the switch and the management network, which is reachable from the controller IP address

Configuration tasks are described in detail in the following sections:

- [Configuring the OpenFlow Interfaces on page 2107](#)
- [Configuring the OpenFlow Protocol on page 2107](#)
- [Configuring the OpenFlow Routing Instance on page 2108](#)

## Configuring the OpenFlow Interfaces

To configure the OpenFlow interfaces:

1. Specify the desired VLAN tagging and configure the encapsulation type.

```
[edit interfaces interface-name]
user@host# set flexible-vlan-tagging
user@host# set encapsulation flexible-ethernet-services
```

2. Configure the logical interface and the protocol family.

```
[edit interfaces interface-name]
user@host# set unit unit family ethernet-switching
```

3. Configure the interface as a trunk interface and specify the VLAN members associated with OpenFlow.

```
[edit interfaces interface-name]
user@host# set unit unit family ethernet-switching interface-mode trunk
user@host# set unit unit family ethernet-switching vlan members openflow-vlan-ids
```

## Configuring the OpenFlow Protocol

To configure support for OpenFlow, create a virtual switch instance, and specify a switch name, which must be 60 characters or less. For the virtual switch instance, configure the OpenFlow controller information and the participating logical interfaces. Optionally, configure the default action for packets that do not match a flow entry, the purge timer for invalid flows, and any OpenFlow traceoptions.

To configure the OpenFlow protocol:

1. Configure the OpenFlow controller IP address and the connection protocol.

```
[edit protocols openflow switch switch-name]
user@host# set controller address address
user@host# set controller protocol tcp
```

2. Specify the logical interfaces participating in OpenFlow under this virtual switch instance.

```
[edit protocols openflow switch switch-name]
user@host# set interfaces interface-name1.unit1
user@host# set interfaces interface-name2.unit1
```

3. (Optional) Configure the **default-action** statement for packets that do not match on an existing flow entry.

If you do not configure the **default-action** statement, the default is **packet-in**, which indicates that packets with no matching flow entry must be sent to the controller for processing.

```
[edit protocols openflow switch switch-name]  
user@host# set default-action (drop | packet-in)
```

4. (Optional) Configure the **purge-flow-timer** statement, which is the number of seconds after which an invalid flow is purged from the flow table.

```
[edit protocols openflow switch switch-name]  
user@host# set purge-flow-timer seconds
```

5. (Optional) Configure OpenFlow traceoptions.

If you do not configure a log filename, OpenFlow trace messages are logged in the default OpenFlow log file `/var/log/ofd`.

```
[edit protocols openflow]  
user@host# set traceoptions flag flag  
user@host# set traceoptions file file-name
```

## Configuring the OpenFlow Routing Instance

To configure the virtual switch routing instance for OpenFlow traffic:

1. Configure the routing instance type as **virtual-switch**.

```
[edit routing-instances routing-instance-name]  
user@host# set instance-type virtual-switch
```

2. Configure the OpenFlow logical interfaces that will be bound to the routing instance.

```
[edit routing-instances routing-instance-name]  
user@host# set interface interface-name1.unit1  
user@host# set interface interface-name2.unit1
```

3. Configure the OpenFlow VLAN members under the **vlan**s hierarchy.

```
[edit routing-instances routing-instance-name]  
user@host# set vlans name (vlan-id | vlan-id-list) openflow-vlan-ids
```

4. (Optional) If you use the NORMAL forward action to forward OpenFlow traffic using traditional Layer 2 and Layer 3 processing, configure an integrated routing and bridging (IRB) interface, and bind the appropriate logical interface to the VLAN.

```
[edit routing-instances routing-instance-name]  
user@host# set vlans name l3-interface irb.unit
```

## Example: Enabling OpenFlow on EX9200 Switches

OpenFlow is an open standard that enables you to control traffic paths in a network by creating, deleting, and modifying flows in each device, including EX9200 switches that have an OpenFlow software package installed, along a path. This example shows how to configure OpenFlow support on an EX9200 switch.

- [Requirements on page 2109](#)
- [Overview on page 2109](#)
- [Configuration on page 2110](#)
- [Verification on page 2112](#)

### Requirements

This example uses the following hardware and software components:

- An EX9200 switch running Junos OS Release 13.3 or a later release.
- An OpenFlow software package is installed on the switch, and the software package release matches the Junos OS release running on the switch.
- The switch has a TCP connection to an OpenFlow controller, which needs to access the data plane of the switch.
- The switch is connected to the management network through the fxp0 interface and is reachable from the OpenFlow controller IP address.

### Overview

In this example, you configure support for OpenFlow on an EX9200 switch. The switch has three interfaces that are dedicated to handling OpenFlow traffic: ge-1/0/0.0, ge-1/1/0.0, and xe-0/0/0.0.

EX9200 switches require a separate routing instance for a virtual switch. This routing instance isolates the experimental OpenFlow traffic from the normal network traffic. In this example, you configure a routing instance for the virtual switch, **OF-ri**, by using the instance type **virtual-switch** at the **[edit routing-instances]** hierarchy level. The routing instance **OF-ri** includes all of the logical interfaces participating in OpenFlow.

The virtual switch, **OFswitch1**, connects to the OpenFlow controller over a TCP connection at the IP address 198.51.100.174. The virtual switch configuration must include all of the logical interfaces participating in OpenFlow, and OpenFlow traffic only will either enter or exit these interfaces.

A flow entry consists of a match condition against which packets entering an OpenFlow interface are compared, and the action that is applied to packets that match the condition. Each OpenFlow interface can have one or more flow entries. The **default-action** statement in the OpenFlow configuration indicates the action the switch applies for packets that

do not have a matching flow entry. If you do not explicitly configure the **default-action** statement, the default action is **packet-in**, which indicates that packets that have no matching flow entry are sent to the OpenFlow controller for processing. In this example, you explicitly configure **packet-in** as the default action for packets that do not have a matching flow entry.

In this example, you configure OpenFlow traceoptions also. When traceoptions are configured with the **flag all** statement, all OpenFlow events are captured and logged. In this example, a specific filename is not configured for the log file. Therefore, OpenFlow events are logged in the default OpenFlow log file at **/var/log/ofd**.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-1/0/0 unit 0 family ethernet-switching
set interfaces ge-1/1/0 unit 0 family ethernet-switching
set interfaces xe-0/0/0 unit 0 family ethernet-switching
set routing-instances OF-ri instance-type virtual-switch
set routing-instances OF-ri interface ge-1/0/0.0
set routing-instances OF-ri interface ge-1/1/0.0
set routing-instances OF-ri interface xe-0/0/0.0
set routing-instances OF-ri vlans of-bridge vlan-id none
set protocols openflow switch OFswitch1 controller address 198.51.100.174
set protocols openflow switch OFswitch1 controller protocol tcp port 6633
set protocols openflow switch OFswitch1 interfaces ge-1/0/0.0
set protocols openflow switch OFswitch1 interfaces ge-1/1/0.0
set protocols openflow switch OFswitch1 interfaces xe-0/0/0.0
set protocols openflow switch OFswitch1 default-action packet-in
set protocols openflow traceoptions flag all
```

### Step-by-Step Procedure

To configure support for OpenFlow:

1. Configure the OpenFlow interfaces as Layer 2 interfaces.

```
[edit interfaces]
user@switch# set ge-1/0/0 unit 0 family ethernet-switching
user@switch# set ge-1/1/0 unit 0 family ethernet-switching
user@switch# set xe-0/0/0 unit 0 family ethernet-switching
```

2. Configure the virtual switch routing instance.

```
[edit routing-instances]
user@switch# set OF-ri instance-type virtual-switch
user@switch# set OF-ri interface ge-1/0/0.0
user@switch# set OF-ri interface ge-1/1/0.0
user@switch# set OF-ri interface xe-0/0/0.0
user@switch# set OF-ri vlans of-bridge vlan-id none
```

3. Configure the OpenFlow controller IP address and the connection protocol.

```
[edit protocols openflow switch OFswitch1]
user@switch# set controller address 198.51.100.174
```

```
user@switch# set controller protocol tcp port 6633
```

4. Configure the logical interfaces participating in OpenFlow under this virtual switch instance.

```
[edit protocols openflow switch OFswitch1]
user@switch# set interfaces ge-1/0/0.0
user@switch# set interfaces ge-1/1/0.0
user@switch# set interfaces xe-0/0/0.0
```

5. Configure the default action for packets that do not have a matching flow entry.

```
[edit protocols openflow switch OFswitch1]
user@switch# set default-action packet-in
```

6. Configure OpenFlow traceoptions.

```
[edit protocols openflow]
user@switch# set traceoptions flag all
```

7. Commit the configuration.

```
[edit]
user@switch# commit
```

## Results

From operational mode, display the results of your configuration by entering the **show configuration interfaces**, **show configuration protocols openflow**, and **show configuration routing-instances** commands. If the output does not display the specified configuration, repeat the instructions in this example to correct the configuration.

```
user@switch> show configuration interfaces
ge-1/0/0 {
  unit 0 {
    family ethernet-switching;
  }
}
ge-1/1/0 {
  unit 0 {
    family ethernet-switching;
  }
}
xe-0/0/0 {
  unit 0 {
    family ethernet-switching;
  }
}

user@switch> show configuration protocols openflow
switch OFswitch1 {
  default-action {
    packet-in;
  }
  interfaces {
    ge-1/0/0.0;
    ge-1/1/0.0;
```

```
        xe-0/0/0.0;
    }
    controller {
        address 198.51.100.174;
        protocol tcp {
            port 6633;
        }
    }
    traceoptions {
        flag all;
    }
}

user@switch> show configuration routing-instances
OF-ri {
    instance-type virtual-switch;
    interface ge-1/0/0.0;
    interface ge-1/1/0.0;
    interface xe-0/0/0.0;
    vlans {
        of-bridge {
            vlan-id none;
        }
    }
}
```

## Verification

Confirm that the configuration is working properly.

- [Verifying the OpenFlow Controller Connection on page 2112](#)
- [Verifying the OpenFlow Interfaces on page 2113](#)

### Verifying the OpenFlow Controller Connection

---

**Purpose** Verify that the OpenFlow controller connection is up.

**Action** Issue the **show openflow controller** operational mode command, and verify that the controller connection state is **up**. Because the virtual switch configuration has only a single controller, the virtual switch automatically initiates a connection to the controller after you commit the configuration.

```
user@switch> show openflow controller
Openflowd controller information:
Controller socket: 11
Controller IP address: 198.51.100.174
Controller protocol: tcp
Controller port: 6633
Controller connection state: up
Number of connection attempt: 5
Controller role: equal
```

**Meaning** The output shows that the connection state of the OpenFlow controller is **up**, in addition to other information about the controller.

### Verifying the OpenFlow Interfaces

|                              |  |
|------------------------------|--|
| <b>Purpose</b>               | Verify that the OpenFlow interfaces are up.  |
| <b>Action</b>                | <p>Issue the <b>show openflow interfaces</b> operational mode command, and verify that the state of each OpenFlow interface is <b>Up</b>.</p> <pre> user@switch&gt; show openflow interfaces Switch name: OFswitch1 Interface Name: ge-1/0/0.0 Interface port number: 41507 Interface Hardware Address: 00:00:5E:00:53:b1 Interface speed: 1Gb Full-duplex Interface Auto-Negotiation: Disabled Interface media type: Fiber <b>Interface state: Up</b>  Switch name: OFswitch1 Interface Name: ge-1/1/0.0 Interface port number: 44538 Interface Hardware Address: 00:00:5E:00:53:b2 Interface speed: 1Gb Full-duplex Interface Auto-Negotiation: Disabled Interface media type: Fiber <b>Interface state: Up</b>  Switch name: OFswitch1 Interface Name: xe-0/0/0.0 Interface port number: 45549 Interface Hardware Address: 00:00:5E:00:53:b3 Interface speed: 10Gb Full-duplex Interface Auto-Negotiation: Disabled Interface media type: Fiber <b>Interface state: Up</b> </pre> |
| <b>Meaning</b>               | The output shows that the state of each OpenFlow interface is <b>Up</b> , in addition to other information about the interfaces.   |

### Configuring Support for OpenFlow on QFX5100 Switches

This topic describes how to configure QFX5100 switches with interfaces that participate solely in OpenFlow.

Before configuring support for OpenFlow, ensure that the switch meets the following requirements:

- QFX5100 switch running Junos OS Release 14.1X53-D10 or later
- OpenFlow software package with a release that matches the Junos OS release running on the switch
- TCP connection between the switch and an OpenFlow controller
- Connection between the management interface (em0 or em1) of the switch and the management network

Configuration tasks are described in detail in the following sections:

- [Configuring the OpenFlow Interfaces on page 2114](#)
- [Configuring the OpenFlow Protocol on page 2114](#)

## Configuring the OpenFlow Interfaces

You must configure interfaces participating in OpenFlow as Layer 2 interfaces. On QFX5100 switches, you configure the interfaces with protocol family **ethernet-switching**. Also, you can configure only a single logical port by specifying logical unit number 0.

To configure the OpenFlow interfaces:

- Configure the logical interface and protocol family.

```
[edit interfaces interface-name]  
user@switch# set unit 0 family ethernet-switching
```

## Configuring the OpenFlow Protocol

To configure support for OpenFlow, you must create a virtual switch, and then, configure the connection with the OpenFlow controller and the logical interfaces participating in OpenFlow for the virtual switch. Optionally, configure the default action for packets that do not match a flow entry, the purge timer for invalid flows, and any OpenFlow traceoptions.

To configure the OpenFlow protocol:

1. Create an OpenFlow virtual switch, and specify a switch name, which can contain a maximum of 60 characters.

```
[edit protocols openflow]  
user@switch# set switch switch-name
```

2. Configure the OpenFlow controller IP address and the connection protocol.

```
[edit protocols openflow switch switch-name]  
user@switch# set controller address address  
user@switch# set controller protocol tcp
```

3. Specify the logical interfaces participating in OpenFlow under this virtual switch.

```
[edit protocols openflow switch switch-name]  
user@switch# set interfaces interface-name.0
```

```
user@switch# set interfaces interface-name 2.0
```

4. (Optional) Configure the **default-action** statement for packets that do not match an existing flow entry.

If you do not configure the **default-action** statement, the default is **packet-in**, which indicates that packets with no matching flow entry are sent to the controller for processing.

```
[edit protocols openflow switch switch-name]
user@switch# set default-action (drop | packet-in)
```

5. (Optional) Configure the **purge-flow-timer** statement, which specifies the number of seconds after which an invalid flow is purged from the flow table.

```
[edit protocols openflow switch switch-name]
user@switch# set purge-flow-timer seconds
```

6. (Optional) Configure OpenFlow traceoptions.

If you do not configure a log file by specifying its filename, OpenFlow trace messages are logged in the default OpenFlow log file `/var/log/ofd`.

```
[edit protocols openflow]
user@switch# set traceoptions flag all
user@switch# set traceoptions file file-name
```

## Example: Enabling OpenFlow on QFX5100 Switches

OpenFlow is an open standard that enables you to control traffic paths in a network by creating, deleting, and modifying flows in each device along a path. This example shows how to configure OpenFlow support on a QFX5100 switch.

To isolate and control OpenFlow traffic on a QFX5100 switch, you configure a virtual switch. You also configure a Secure Sockets Layer (SSL) or TCP/IP connection between the virtual switch and a remote OpenFlow controller. Using this connection, the OpenFlow controller can access the flows in the virtual switch.

- [Requirements on page 2116](#)
- [Overview on page 2116](#)
- [Configuration on page 2116](#)
- [Verification on page 2118](#)

## Requirements

This example uses the following hardware and software components:

- A QFX5100 switch running Junos OS Release 14.1X53-D10 or later.
- An OpenFlow software package is installed on the switch, and the release of this package matches the Junos OS release running on the switch.
- A TCP connection between the switch and an OpenFlow controller.
- A connection between the management interface (em0 or em1) of the switch and the management network.

## Overview

In this example, you configure support for OpenFlow on a QFX5100 switch. The switch has three interfaces that are dedicated to handling OpenFlow traffic: xe-0/0/10.0, xe-0/0/11.0, and xe-0/0/12.0. Note that on QFX5100 switches, you can configure only a single logical interface, using logical unit number 0 for each OpenFlow interface.

In an OpenFlow topology, a virtual switch is used to isolate and control OpenFlow traffic. You configure the OpenFlow virtual switch and OpenFlow protocol statements at the **[edit protocols openflow]** hierarchy level.

Virtual switch 100 also connects to an OpenFlow controller over a TCP connection at the IP address 10.51.100.174. The virtual switch configuration must include all of the logical interfaces participating in OpenFlow; OpenFlow traffic enters and exits only through these interfaces.

A flow entry consists of a match condition against which packets entering an OpenFlow interface are compared, and the action that is applied to packets that match the condition. Each OpenFlow interface can have one or more flow entries. The **default-action** statement in the OpenFlow configuration indicates the action the switch applies to packets that do not have a matching flow entry. This example uses the **drop** option, which specifies that packets that do not match a flow entry are dropped.

This example also configures OpenFlow traceoptions, along with the **flag all** statement, which captures and logs all OpenFlow events. This example does not configure a specific filename for the log file. As a result, OpenFlow events are logged in the default OpenFlow log directory **/var/log/ofd**.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces xe-0/0/10 unit 0 family ethernet-switching
set interfaces xe-0/0/11 unit 0 family ethernet-switching
set interfaces xe-0/0/12 unit 0 family ethernet-switching
set protocols openflow switch 100 controller address 10.51.100.174
set protocols openflow switch 100 controller protocol tcp
```

```

set protocols openflow switch 100 interfaces xe-0/0/10.0
set protocols openflow switch 100 interfaces xe-0/0/11.0
set protocols openflow switch 100 interfaces xe-0/0/12.0
set protocols openflow switch 100 default-action drop
set protocols openflow traceoptions flag all

```

### Step-by-Step Procedure

To configure support for OpenFlow:

1. Configure the OpenFlow interfaces as Layer 2 interfaces.

```

[edit interfaces]
user@switch# set xe-0/0/10 unit 0 family ethernet-switching
user@switch# set xe-0/0/11 unit 0 family ethernet-switching
user@switch# set xe-0/0/12 unit 0 family ethernet-switching

```

2. Configure an OpenFlow virtual switch named 100.

```

[edit protocols openflow]
user@switch# set switch 100

```

3. Configure the OpenFlow controller IP address and the connection protocol.

```

[edit protocols openflow switch 100]
user@switch# set controller address 10.51.100.174
user@switch# set controller protocol tcp

```

4. Configure the logical interfaces in this virtual switch that participate in OpenFlow.

```

[edit protocols openflow switch 100]
user@switch# set interfaces xe-0/0/10.0
user@switch# set interfaces xe-0/0/11.0
user@switch# set interfaces xe-0/0/12.0

```

5. Configure the default action for packets that do not have a matching flow entry.

```

[edit protocols openflow switch 100]
user@switch# set default-action drop

```

6. Configure OpenFlow traceoptions.

```

[edit protocols openflow]
user@switch# set traceoptions flag all

```

7. Commit the configuration.

```

[edit]
user@switch# commit

```

### Results

From operational mode, confirm your configuration by entering the **show configuration interfaces** and **show configuration protocols openflow** commands.

```

user@switch> show configuration interfaces
xe-0/0/10 {
  unit 0 {
    family ethernet-switching;
  }
}

```

```
}
xe-0/0/11 {
  unit 0 {
    family ethernet-switching;
  }
}
xe-0/0/12 {
  unit 0 {
    family ethernet-switching;
  }
}

user@switch> show configuration protocols openflow
switch 100 {
  default-action {
    drop;
  }
  interfaces {
    xe-0/0/10.0;
    xe-0/0/11.0;
    xe-0/0/12.0;
  }
  controller {
    protocol {
      tcp {
        address 10.51.100.174;
      }
    }
  }
}
traceoptions {
  flag all;
}
```

## Verification

Confirm that the configuration is working properly.

- [Verifying That the OpenFlow Controller Connection Is Up on page 2118](#)
- [Verifying that the OpenFlow Interfaces Are Up on page 2119](#)

### Verifying That the OpenFlow Controller Connection Is Up

**Purpose** Verify that the OpenFlow controller connection is up.

**Action** Issue the **show openflow controller** operational mode command, and verify that the controller connection state is **up**. Because the virtual switch configuration has only a single controller, the virtual switch automatically initiates a connection to the controller after you commit the configuration.

```
user@switch> show openflow controller
Openflowd controller information:
Controller socket: 12
Controller IP address: 10.51.100.174
Controller protocol: tcp
Controller port: 6633
Controller connection state: up
Number of connection attempt: 4
Controller role: equal
```

Negotiated version: 4

**Meaning** The output shows that the connection state of the OpenFlow controller is **up**, in addition to other information about the controller.

### Verifying that the OpenFlow Interfaces Are Up

**Purpose** Verify that the OpenFlow interfaces are up.

**Action** Issue the **show openflow interfaces** operational mode command, and verify that the state of each OpenFlow interface is **Up**.

```
user@switch> show openflow interfaces
Switch name: 100
Interface Name: xe-0/0/10.0
Interface port number: 41507
Interface Hardware Address: 00:00:5e:00:53:00
Interface speed: 10Gb Full-duplex
Interface Auto-Negotiation: Disabled
Interface media type: Fiber
Interface state: Up

Switch name: 100
Interface Name: xe-0/0/11.0
Interface port number: 44538
Interface Hardware Address: 00:00:5e:00:53:01
Interface speed: 10Gb Full-duplex
Interface Auto-Negotiation: Disabled
Interface media type: Fiber
Interface state: Up

Switch name: 100
Interface Name: xe-0/0/12.0
Interface port number: 45549
Interface Hardware Address: 00:00:5e:00:53:02
Interface speed: 10Gb Full-duplex
Interface Auto-Negotiation: Disabled
Interface media type: Fiber
Interface state: Up
```

**Meaning** The output shows that the state of each OpenFlow interface is **Up**, in addition to other information about the interfaces.

## Configuring Support for OpenFlow on EX4550 Switches

---

The following sections configure EX4550 switches to support OpenFlow using interfaces that participate solely in OpenFlow.

Before configuring support for OpenFlow, ensure that the switch meets the following requirements:

- EX4550 switch running Junos OS Release 13.2X51-D20 or a later release
- OpenFlow software package with a software package release that matches the Junos OS release of the device on which it is installed
- TCP connection between the switch and an OpenFlow controller
- Connection between the management interface of the switch and the management network, which is reachable from the controller IP address

Configuration tasks are described in detail in the following sections:

- [Configuring the OpenFlow Interfaces on page 2120](#)
- [Configuring the OpenFlow Protocol on page 2120](#)

### Configuring the OpenFlow Interfaces

You must configure interfaces participating in OpenFlow as Layer 2 interfaces. On EX Series Ethernet Switches, you configure the interfaces with protocol family **ethernet-switching**. On EX4550 switches, you can configure only a single logical port using logical unit number 0.

To configure the OpenFlow interfaces:

- Configure the logical interface and the protocol family.

```
[edit interfaces interface-name]  
user@host# set unit 0 family ethernet-switching
```

### Configuring the OpenFlow Protocol

To configure support for OpenFlow, create a virtual switch instance, and specify a switch name, which must be 60 characters or less. For the virtual switch instance, configure the OpenFlow controller information and the participating logical interfaces. Optionally, configure the default action for packets that do not match a flow entry, the purge timer for invalid flows, and any OpenFlow traceoptions.

To configure the OpenFlow protocol:

1. Configure the OpenFlow controller IP address and the connection protocol.

```
[edit protocols openflow switch switch-name]  
user@host# set controller address address  
user@host# set controller protocol tcp
```

2. Specify the logical interfaces participating in OpenFlow under this virtual switch instance.

```
[edit protocols openflow switch switch-name]
user@host# set interfaces interface-name1.0
user@host# set interfaces interface-name2.0
```

3. (Optional) Configure the **default-action** statement for packets that do not match on an existing flow entry.

If you do not configure the **default-action** statement, the default is **packet-in**, which indicates that packets with no matching flow entry must be sent to the controller for processing.

```
[edit protocols openflow switch switch-name]
user@host# set default-action (drop | packet-in)
```

4. (Optional) Configure the **purge-flow-timer** statement, which is the number of seconds after which an invalid flow is purged from the flow table.

```
[edit protocols openflow switch switch-name]
user@host# set purge-flow-timer seconds
```

5. (Optional) Configure OpenFlow traceoptions.

If you do not configure a log filename, OpenFlow trace messages are logged in the default OpenFlow log file `/var/log/ofd`.

```
[edit protocols openflow]
user@host# set traceoptions flag all
user@host# set traceoptions file file-name
```

#### Related Documentation

- [Example: Enabling OpenFlow on EX4550 Switches on page 2121](#)

- [openflow \(Protocols OpenFlow\) on page 2175](#)
- [\[edit protocols openflow\] Hierarchy Level on page 2169](#)

## Example: Enabling OpenFlow on EX4550 Switches

OpenFlow is an open standard that enables you to control traffic paths in a network by creating, deleting, and modifying flows in each device, including EX4550 switches that have an OpenFlow software package installed, along a path. This example shows how to configure OpenFlow support on an EX4550 switch.

- [Requirements on page 2122](#)
- [Overview on page 2122](#)
- [Configuration on page 2123](#)
- [Verification on page 2124](#)

## Requirements

This example uses the following hardware and software components:

- An EX4550 switch running Junos OS Release 13.2X51-D20 or a later release.
- An OpenFlow software package is installed on the switch, and the software package release matches the Junos OS release running on the switch.
- A TCP connection between the switch and an OpenFlow controller, which needs to access the data plane of the switch.
- A connection between the me0 interface of the switch and the management network.

## Overview

In this example, you configure support for OpenFlow on an EX4550 switch. The switch has three interfaces that are dedicated to handling OpenFlow traffic: xe-0/0/4.0, xe-0/0/5.0, and xe-0/0/6.0. Note that on EX4550 switches, you can configure only a single logical unit by using logical unit number 0 for OpenFlow interfaces.

In an OpenFlow topology, a virtual switch is used to isolate and control OpenFlow traffic. You configure the OpenFlow virtual switch and OpenFlow protocol statements at the **[edit protocols openflow]** hierarchy level. In this example, the virtual switch, 100, is assigned a default VLAN, which acts as a logically separate flood domain. The assignment of the default VLAN to virtual switch 100 is automatic, and no configuration is required to set up the default VLAN.

Virtual switch 100 also connects to the controller over a TCP connection at the IP address 198.51.100.174. The virtual switch configuration must include all of the logical interfaces participating in OpenFlow, and OpenFlow traffic will only enter or exit from these interfaces.

A flow entry consists of a match condition against which packets entering an OpenFlow interface are compared, and the action that is applied to packets that match the condition. Each OpenFlow interface can have one or more flow entries. The **default-action** statement in the OpenFlow configuration indicates the action the switch applies to packets that do not have a matching flow entry. If you omit the **default-action** statement, the default action is **packet-in**, which means that packets that have no matching flow entry are sent to the controller for processing. This example explicitly configures **packet-in** as the default action for packets that do not have a matching flow entry.

This example also configures OpenFlow traceoptions, along with the **flag all** statement, which captures and logs all OpenFlow events. This example does not configure a specific filename for the log file. As a result, OpenFlow events are logged in the default OpenFlow log directory **/var/log/ofd**.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces xe-0/0/4 unit 0 family ethernet-switching
set interfaces xe-0/0/5 unit 0 family ethernet-switching
set interfaces xe-0/0/6 unit 0 family ethernet-switching
set protocols openflow switch 100 controller address 198.51.100.174
set protocols openflow switch 100 controller protocol tcp
set protocols openflow switch 100 interfaces xe-0/0/4.0
set protocols openflow switch 100 interfaces xe-0/0/5.0
set protocols openflow switch 100 interfaces xe-0/0/6.0
set protocols openflow switch 100 default-action packet-in
set protocols openflow traceoptions flag all
```

**Step-by-Step Procedure** To configure support for OpenFlow:

1. Configure the OpenFlow interfaces as Layer 2 interfaces.  
  

```
[edit interfaces]
user@switch# set xe-0/0/4 unit 0 family ethernet-switching
user@switch# set xe-0/0/5 unit 0 family ethernet-switching
user@switch# set xe-0/0/6 unit 0 family ethernet-switching
```
2. Configure an OpenFlow virtual switch.  
  

```
[edit protocols openflow]
user@switch# set switch 100
```
3. Configure the OpenFlow controller IP address and the connection protocol.  
  

```
[edit protocols openflow switch 100]
user@switch# set controller address 198.51.100.174
user@switch# set controller protocol tcp
```
4. Configure the logical interfaces participating in OpenFlow under this virtual switch.  
  

```
[edit protocols openflow switch 100]
user@switch# set interfaces xe-0/0/4.0
user@switch# set interfaces xe-0/0/5.0
user@switch# set interfaces xe-0/0/6.0
```
5. Configure the default action for packets that do not have a matching flow entry.  
  

```
[edit protocols openflow switch 100]
user@switch# set default-action packet-in
```
6. Configure OpenFlow traceoptions.  
  

```
[edit protocols openflow]
user@switch# set traceoptions flag all
```
7. Commit the configuration.  
  

```
[edit]
user@switch# commit
```

## Results

---

From operational mode, confirm your configuration by entering the **show configuration interfaces** and **show configuration protocols openflow** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@switch> show configuration interfaces
xe-0/0/4 {
  unit 0 {
    family ethernet-switching;
  }
}
xe-0/0/5 {
  unit 0 {
    family ethernet-switching;
  }
}
xe-0/0/6 {
  unit 0 {
    family ethernet-switching;
  }
}

user@switch> show configuration protocols openflow
switch 100 {
  default-action packet-in;
  interfaces {
    xe-0/0/4.0;
    xe-0/0/5.0;
    xe-0/0/6.0;
  }
  controller {
    address 198.51.100.174;
    protocol tcp;
  }
}
traceoptions {
  flag all;
}
```

## Verification

Confirm that the configuration is working properly.

- [Verifying that the OpenFlow Controller Connection Is Up on page 2124](#)
- [Verifying that the OpenFlow Interfaces Are Up on page 2125](#)

### Verifying that the OpenFlow Controller Connection Is Up

---

**Purpose** Verify that the OpenFlow controller connection is up.

**Action** Issue the **show openflow controller** operational mode command, and verify that the controller connection state is **up**. Because the virtual switch configuration has only a

single controller, the virtual switch should automatically initiate a connection to the controller after you commit the configuration.

```
user@switch> show openflow controller
Openflowd controller information:
Controller socket: 12
Controller IP address: 198.51.100.174
Controller protocol: tcp
Controller port: 6633
Controller connection state: up
Number of connection attempt: 4
Controller role: equal
```

**Meaning** The output shows that the connection state of the OpenFlow controller is **up**, in addition to other information about the controller.

### Verifying that the OpenFlow Interfaces Are Up

**Purpose** Verify that the OpenFlow interfaces are up.

**Action** Issue the **show openflow interfaces** operational mode command, and verify that the state of each OpenFlow interface is **Up**.

```
user@switch> show openflow interfaces
Switch name: 100
Interface Name: xe-0/0/4.0
Interface port number: 41507
Interface Hardware Address: 00:00:5e:00:53:00
Interface speed: 10Gb Full-duplex
Interface Auto-Negotiation: Disabled
Interface media type: Fiber
Interface state: Up
```

```
Switch name: 100
Interface Name: xe-0/0/5.0
Interface port number: 44538
Interface Hardware Address: 00:00:5e:00:53:01
Interface speed: 10Gb Full-duplex
Interface Auto-Negotiation: Disabled
Interface media type: Fiber
Interface state: Up
```

```
Switch name: 100
Interface Name: xe-0/0/6.0
Interface port number: 45549
Interface Hardware Address: 00:00:5e:00:53:02
Interface speed: 10Gb Full-duplex
Interface Auto-Negotiation: Disabled
Interface media type: Fiber
Interface state: Up
```

**Meaning** The output shows that the state of each OpenFlow interface is **Up**, in addition to other information about the interfaces.

## Understanding OpenFlow Hybrid Interfaces on Devices Running Junos OS

---

On Juniper Networks EX9200 Ethernet Switches and on MX Series 3D Universal Edge Routers that support OpenFlow, you can configure physical interfaces that support multiple logical interfaces as hybrid interfaces. A hybrid interface concurrently supports OpenFlow logical interfaces and non-OpenFlow logical interfaces.

On a hybrid interface, the OpenFlow protocol and the non-OpenFlow protocols essentially exist independently. Traffic does not get forwarded across OpenFlow and non-OpenFlow logical interfaces. Instead VLANs and VLAN tags are used to distinguish the OpenFlow traffic from the normal traffic. To accomplish this, you must enable the reception and transmission of 802.1Q VLAN-tagged frames on all interfaces, including both hybrid and non-hybrid interfaces. You must also configure separate virtual switch routing instances for OpenFlow traffic and for normal traffic, which serve to separate the VLAN ID space.

On devices using hybrid interfaces, traffic entering an interface must be VLAN-tagged. The VLAN ID differentiates the OpenFlow traffic from the normal traffic, and on the hybrid interface, the VLAN ID also determines the associated logical interface. Once the logical interface is known, the traffic is forwarded accordingly. The device forwards OpenFlow traffic according to OpenFlow flow entries, and it forwards normal traffic using traditional Layer 2 and Layer 3 processing. If you do not configure a native VLAN, untagged packets are dropped.

On a hybrid interface, you configure a logical interface as a trunk interface, which accepts and forwards tagged packets from multiple VLANs. Additionally, you can configure certain non-OpenFlow logical interfaces as Layer 3 subinterfaces that perform traditional Layer 3 or MPLS-based forwarding.

To configure a logical interface to receive and forward VLAN-tagged frames, you must bind a VLAN ID, or a range or list of VLAN IDs, to the logical interface. OpenFlow interfaces must have a different set of VLANs from normal interfaces. On a hybrid interface,

OpenFlow traffic can only egress from an interface that has the same VLAN ID range as that of the ingress interface.

A hybrid interface configuration with multiple logical interfaces permits OpenFlow and non-OpenFlow traffic to traverse the same interface while keeping the traffic in separate routing or bridging domains. One advantage of using hybrid interfaces is that you can use fewer physical interfaces where port density is an issue. However, using hybrid interfaces requires some additional configuration, and untagged traffic entering a hybrid port cannot be forwarded according to OpenFlow flow entries. Additionally, several physical port properties such as Layer 1 statistics are reported for all logical interfaces on that physical interface. Thus, when you configure a physical interface in hybrid mode, these properties are reported for all OpenFlow and non-OpenFlow logical interfaces on that physical interface. These properties include queue drops, framing errors, CRC errors, and collisions. When using hybrid interfaces, if you use the Link Layer Discovery Protocol (LLDP) for topology discovery, you must ensure that any LLDP frames entering a hybrid interface are tagged appropriately.

## Configuring OpenFlow Hybrid Interfaces on MX Series Routers

---

On MX Series routers that support OpenFlow, you can configure a physical interface as a hybrid interface that concurrently supports OpenFlow logical interfaces and non-OpenFlow logical interfaces. If you configure an OpenFlow hybrid interface on a device running Junos OS, you must enable the reception and transmission of 802.1Q VLAN-tagged frames on all interfaces, including both hybrid and non-hybrid interfaces, and you must configure a virtual switch routing instance for the OpenFlow traffic and a separate virtual switch routing instance for the normal traffic.

The following sections detail configuring an MX Series router that supports OpenFlow with a mix of hybrid and normal interfaces:

- [Configuring the Hybrid Physical Interface on page 2129](#)
- [Configuring the Hybrid Interface Logical Units on page 2129](#)
- [Configuring the Non-Hybrid Interfaces on page 2129](#)
- [Configuring OpenFlow on page 2130](#)
- [Configuring the Virtual Switch Routing Instances on page 2130](#)

## Configuring the Hybrid Physical Interface

To configure the hybrid physical interface:

1. Enable VLAN tagging.

Configure **vlan-tagging** to support 802.1Q VLAN single-tag frames for both OpenFlow and non-OpenFlow traffic, or configure **flexible-vlan-tagging** to support both 802.1Q VLAN single-tag and dual-tag frames.

```
[edit interfaces interface-name]
user@host# set (vlan-tagging | flexible-vlan-tagging)
```

2. Configure flexible Ethernet services encapsulation to enable multiple per-unit Ethernet encapsulations.

```
[edit interfaces interface-name]
user@host# set encapsulation flexible-ethernet-services
```

## Configuring the Hybrid Interface Logical Units

On a hybrid interface, you configure an OpenFlow or non-OpenFlow logical interface as a Layer 2 trunk interface. Additionally, you can configure a non-OpenFlow logical interface as a Layer 3 subinterface that performs traditional Layer 3 or MPLS-based forwarding. To configure a logical interface to receive and forward VLAN-tagged frames, you must bind a VLAN ID, or a range or list of VLAN IDs, to the logical interface. Configure Layer 2 interfaces using family **bridge** on MX Series routers.

To configure the hybrid interface logical units:

1. Configure the OpenFlow logical interfaces and any non-OpenFlow Layer 2 logical interfaces, and specify the interface mode and VLAN membership.

```
[edit interfaces interface-name]
user@host# set unit unit family bridge interface-mode trunk
user@host# set unit unit family bridge vlan-id-list vlan-ids
```

2. Configure any non-OpenFlow Layer 3 logical interfaces, and specify the VLAN membership.

```
[edit interfaces interface-name]
user@host# set unit unit (vlan-id | vlan-id-list | vlan-id-range) vlan-ids
user@host# set unit unit family inet address address
```

## Configuring the Non-Hybrid Interfaces

Non-hybrid interfaces support either OpenFlow traffic or non-OpenFlow traffic, but not both simultaneously.

To configure the non-hybrid interfaces:

1. Configure interfaces that support only OpenFlow traffic as Layer 2 trunk interfaces, and specify the interface mode and VLAN membership.

```
[edit interfaces interface-name]
user@host# set vlan-tagging
```

```
user@host# set unit unit family bridge interface-mode trunk
user@host# set unit unit family bridge vlan-id-list vlan-ids
```

2. Configure interfaces that support only normal traffic, and specify the interface mode for the Layer 2 interfaces and the VLAN membership.

For example:

```
[edit interfaces interface-name]
user@host# set vlan-tagging
user@host# set unit unit family bridge interface-mode trunk
user@host# set unit unit family bridge vlan-id-list vlan-ids
```

## Configuring OpenFlow

To configure the OpenFlow virtual switch instance:

1. Configure the OpenFlow controller IP address and the connection protocol.

```
[edit protocols openflow switch switch-name]
user@host# set controller address address
user@host# set controller protocol tcp port port
```

2. Specify all logical interfaces participating in OpenFlow under this virtual switch instance.

```
[edit protocols openflow switch switch-name]
user@host# set interfaces interface-name
```

## Configuring the Virtual Switch Routing Instances

Configure separate virtual switch routing instances for the OpenFlow traffic and the non-OpenFlow traffic. The configured interface names must include a logical unit number.

To configure the virtual switch routing instances:

1. Configure the virtual switch routing instance for the OpenFlow traffic, and specify the OpenFlow logical interfaces and VLANs.

```
[edit routing-instances of-routing-instance-name]
user@host# set instance-type virtual-switch
user@host# set interface of-interface-name1
user@host# set interface of-interface-name2
user@host# set bridge-domains name vlan-id-list of-vlan-id-list
```

2. Configure the virtual switch routing instance for the non-OpenFlow traffic, and specify the non-OpenFlow logical interfaces and VLANs.

```
[edit routing instances non-of-routing-instance-name]
user@host# set instance-type virtual-switch
user@host# set interface non-of-interface-name1
user@host# set interface non-of-interface-name2
user@host# set bridge-domains name vlan-id-list non-of-vlan-id-list
```

## Example: Configuring OpenFlow Hybrid Interfaces on MX Series Routers

On MX series routers that support OpenFlow, you can configure physical interfaces that support multiple logical interfaces as hybrid interfaces. A hybrid interface concurrently supports both OpenFlow logical interfaces and non-OpenFlow logical interfaces, thus allowing OpenFlow and non-OpenFlow traffic to traverse the same interface.

Hybrid interfaces enable you to use your physical interfaces more efficiently, especially in a situation where port density is an issue.

This example shows how to configure an MX Series router with OpenFlow hybrid interfaces.

- [Requirements on page 2131](#)
- [Overview on page 2131](#)
- [Configuration on page 2133](#)
- [Verification on page 2136](#)

### Requirements

This example uses the following hardware and software components:

- MX240 router running Junos OS Release 13.3 or a later release
- OpenFlow software package with a software package release that matches the Junos OS release of the device on which it is installed
- TCP connection between the router and an OpenFlow controller
- Connection between the fxp0 management interface of the router and the management network, which is reachable from the OpenFlow controller IP address

### Overview

In this example, you configure an MX240 router with a hybrid interface, ge-1/0/1, an OpenFlow interface, ge-1/0/2, and a non-OpenFlow interface, ge-1/0/3. On the hybrid interface, logical interface ge-1/0/1.0 participates in OpenFlow, and logical interfaces ge-1/0/1.1 and ge-1/0/1.2 do not participate in OpenFlow.

When using OpenFlow hybrid interfaces, you use VLANs to distinguish the OpenFlow traffic from the normal traffic. Thus, you must enable VLAN tagging on all interfaces, and traffic entering the interfaces must be vlan-tagged. Untagged traffic entering the hybrid interface is dropped. In this example, you configure the hybrid interface using **flexible-vlan-tagging**, which enables VLAN tagging and supports both 802.1Q VLAN single-tag and dual-tag frames for all traffic on the interface. You configure interfaces ge-1/0/2 and ge-1/0/3 using **vlan-tagging**.

You configure the hybrid interface encapsulation as flexible Ethernet services. Note that for interfaces with this encapsulation, all VLAN IDs are valid. VLAN IDs from 1 through 511

are no longer reserved for normal VLANs. In this example, VLANs 1 through 100 are used for OpenFlow traffic, and VLANs 101 through 200 and VLAN 300 are used for normal traffic.

All logical interfaces except ge-1/0/1.2 are configured as Layer 2 trunk interfaces using family **bridge** and interface mode **trunk**. Logical interfaces ge-1/0/1.0 and ge-1/0/2.0 participate in OpenFlow and receive and forward traffic with OpenFlow VLAN IDs 1 through 100. Logical interfaces ge-1/0/1.1 and ge-1/0/3.0 do not participate in OpenFlow and receive and forward traffic with non-OpenFlow VLAN IDs 101 through 200.

ge-1/0/1.2 is a Layer 3 logical interface with IP address 198.51.100.10/24 that performs Layer 3 routing. This interface does not participate in OpenFlow and routes traffic with VLAN ID 300.

[Table 186 on page 2132](#) summarizes the logical interfaces, traffic type, and associated VLAN IDs.

**Table 186: Summary of Logical Interfaces**

| Logical Interface | Traffic Type | VLANs           |
|-------------------|--------------|-----------------|
| ge-1/0/1.0        | OpenFlow     | 1 through 100   |
| ge-1/0/1.1        | non-OpenFlow | 101 through 200 |
| ge-1/0/1.2        | non-OpenFlow | 300             |
| ge-1/0/2.0        | OpenFlow     | 1 through 100   |
| ge-1/0/3.0        | non-OpenFlow | 101 through 200 |

You configure the OpenFlow virtual switch and OpenFlow protocol statements at the **[edit protocols openflow]** hierarchy level. The virtual switch, OFswitch2, connects to the controller over a TCP connection at IP address 172.16.1.1. The virtual switch configuration must include all of the logical interfaces participating in OpenFlow, which includes ge-1/0/1.0 and ge-1/0/2.0.

When configuring OpenFlow on MX Series routers, you must configure a virtual switch routing instance for the OpenFlow traffic that isolates it from the normal network traffic. Additionally, when using hybrid interfaces, you configure both a virtual switch routing instance for the OpenFlow traffic and also a separate virtual switch routing instance for the normal traffic. In this example, you configure routing instance rt1 for the OpenFlow traffic and routing instance rt2 for the normal traffic.

Routing instance rt1 includes the interfaces participating in OpenFlow, ge-1/0/1.0 and ge-1/0/2.0. Within the routing instance you configure the bridge domain to include all OpenFlow VLANs 1 through 100. Routing instance rt2 includes the Layer 2 interfaces that do not participate in OpenFlow, ge-1/0/1.1 and ge-1/0/3.0. Within the routing instance you configure the bridge domain to include the non-OpenFlow VLANs 101 through 200.

**NOTE:** In order to direct OpenFlow traffic, the OpenFlow controller must install flow entries that select the appropriate traffic and forward it to the correct OpenFlow interface.

## Configuration

- [Results on page 2135](#)

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-1/0/1 flexible-vlan-tagging
set interfaces ge-1/0/1 encapsulation flexible-ethernet-services
set interfaces ge-1/0/1 unit 0 family bridge interface-mode trunk
set interfaces ge-1/0/1 unit 0 family bridge vlan-id-list 1-100
set interfaces ge-1/0/1 unit 1 family bridge interface-mode trunk
set interfaces ge-1/0/1 unit 1 family bridge vlan-id-list 101-200
set interfaces ge-1/0/1 unit 2 vlan-id 300
set interfaces ge-1/0/1 unit 2 family inet address 198.51.100.10/24
set interfaces ge-1/0/2 vlan-tagging
set interfaces ge-1/0/2 unit 0 family bridge interface-mode trunk
set interfaces ge-1/0/2 unit 0 family bridge vlan-id-list 1-100
set interfaces ge-1/0/3 vlan-tagging
set interfaces ge-1/0/3 unit 0 family bridge interface-mode trunk
set interfaces ge-1/0/3 unit 0 family bridge vlan-id-list 101-200
set protocols openflow switch OFswitch2 controller address 172.16.1.1
set protocols openflow switch OFswitch2 controller protocol tcp port 6633
set protocols openflow switch OFswitch2 interfaces ge-1/0/1.0
set protocols openflow switch OFswitch2 interfaces ge-1/0/2.0
set routing-instances rt1 instance-type virtual-switch
set routing-instances rt1 interface ge-1/0/1.0
set routing-instances rt1 interface ge-1/0/2.0
set routing-instances rt1 bridge-domains bd-of vlan-id-list 1-100
set routing-instances rt2 instance-type virtual-switch
set routing-instances rt2 interface ge-1/0/1.1
set routing-instances rt2 interface ge-1/0/3.0
set routing-instances rt2 bridge-domains bd-nonof vlan-id-list 101-200
```

### Configuring the Interfaces

#### Step-by-Step Procedure

To configure the interfaces:

1. On the hybrid physical interface, enable VLAN tagging and configure the encapsulation.

```
[edit interfaces ge-1/0/1]
user@host# set flexible-vlan-tagging
```

```
user@host# set encapsulation flexible-ethernet-services
```

2. Configure OpenFlow logical interface ge-1/0/1.0 as a Layer 2 trunk that supports VLANs 1-100.

```
[edit interfaces ge-1/0/1]
user@host# set unit 0 family bridge interface-mode trunk
user@host# set unit 0 family bridge vlan-id-list 1-100
```

3. Configure non-OpenFlow logical interface ge-1/0/1.1 as a Layer 2 trunk that supports VLANs 101-200.

```
[edit interfaces ge-1/0/1]
user@host# set unit 1 family bridge interface-mode trunk
user@host# set unit 1 family bridge vlan-id-list 101-200
```

4. Configure non-OpenFlow logical interface ge-1/0/1.2 as a Layer 3 subinterface.

```
[edit interfaces ge-1/0/1]
user@host# set unit 2 vlan-id 300
user@host# set unit 2 family inet address 198.51.100.10/24
```

5. On ge-1/0/2, enable VLAN tagging, and configure the logical interface as a Layer 2 trunk that supports VLANs 1-100.

```
[edit interfaces ge-1/0/2]
user@host# set vlan-tagging
user@host# set unit 0 family bridge interface-mode trunk
user@host# set unit 0 family bridge vlan-id-list 1-100
```

6. On ge-1/0/3, enable VLAN tagging, and configure the logical interface as a Layer 2 trunk that supports VLANs 101-200:

```
[edit interfaces ge-1/0/3]
user@host# set vlan-tagging
user@host# set unit 0 family bridge interface-mode trunk
user@host# set unit 0 family bridge vlan-id-list 101-200
```

---

### Configuring OpenFlow

#### Step-by-Step Procedure

To configure OpenFlow:

1. Configure the OpenFlow controller IP address and the connection protocol.

```
[edit protocols openflow switch OFswitch2]
user@host# set controller address 172.16.1.1
user@host# set controller protocol tcp port 6633
```

2. Specify the logical interfaces participating in OpenFlow under this virtual switch instance.

```
[edit protocols openflow switch OFswitch2]
user@host# set interfaces ge-1/0/1.0
user@host# set interfaces ge-1/0/2.0
```

## Configuring the Virtual Switch Routing Instances

### Step-by-Step Procedure

To configure the virtual switch routing instances:

1. Configure the virtual switch routing instance for the OpenFlow traffic.  
  

```
[edit]
user@host# set routing-instances rt1 instance-type virtual-switch
user@host# set routing-instances rt1 interface ge-1/0/1.0
user@host# set routing-instances rt1 interface ge-1/0/2.0
user@host# set routing-instances rt1 bridge-domains bd-of vlan-id-list 1-100
```
2. Configure the virtual switch routing instance for the non-OpenFlow traffic.  
  

```
[edit]
user@host# set routing-instances rt2 instance-type virtual-switch
user@host# set routing-instances rt2 interface ge-1/0/1.1
user@host# set routing-instances rt2 interface ge-1/0/3.0
user@host# set routing-instances rt2 bridge-domains bd-nonof vlan-id-list 101-200
```
3. Commit the configuration.  
  

```
[edit]
user@host# commit
```

## Results

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols openflow**, and **show routing-instances** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct the configuration.

```
user@host# show interfaces
ge-1/0/1 {
  flexible-vlan-tagging;
  encapsulation flexible-ethernet-services;
  unit 0 {
    family bridge {
      interface-mode trunk;
      vlan-id-list 1-100;
    }
  }
  unit 1 {
    family bridge {
      interface-mode trunk;
      vlan-id-list 101-200;
    }
  }
  unit 2 {
    vlan-id 300;
    family inet {
      address 198.51.100.10/24;
    }
  }
}

ge-1/0/2 {
  vlan-tagging;
```

```
unit 0 {
    family bridge {
        interface-mode trunk;
        vlan-id-list 1-100;
    }
}

ge-1/0/3 {
    vlan-tagging;
    unit 0 {
        family bridge {
            interface-mode trunk;
            vlan-id-list 101-200;
        }
    }
}

user@host# show protocols openflow
switch OFswitch2 {
    interfaces {
        ge-1/0/1.0;
        ge-1/0/2.0;
    }
    controller {
        protocol tcp {
            port 6633;
        }
        address 172.16.1.1;
    }
}

user@host# show routing-instances
rt1 {
    instance-type virtual-switch;
    interface ge-1/0/1.0;
    interface ge-1/0/2.0;

        bd-of {
            vlan-id-list 1-100;
        }
    }
}
rt2 {
    instance-type virtual-switch;
    interface ge-1/0/1.1;
    interface ge-1/0/3.0;
    bridge-domains {
        bd-nonof {
            vlan-id-list 101-200;
        }
    }
}
```

## Verification

Confirm that the configuration is working properly.

- [Verifying that the OpenFlow Controller Connection is Up on page 2137](#)
- [Verifying that the OpenFlow Interfaces Are Up on page 2137](#)

### Verifying that the OpenFlow Controller Connection is Up

- Purpose** Verify that the OpenFlow controller connection is up.
- Action** Issue the **show openflow controller** operational mode command, and verify that the controller connection state is **up**. Because the virtual switch configuration has only a single controller, the virtual switch should automatically initiate a connection to the controller after you commit the configuration.
- ```
user@host> show openflow controller
Openflowd controller information:
Controller socket: 11
Controller IP address: 172.16.1.1
Controller protocol: tcp
Controller port: 6633
Controller connection state: up
Number of connection attempt: 1
Controller role: equal
```
- Meaning** The output shows that the connection state of the OpenFlow controller is **up**, in addition to other information about the controller.

### Verifying that the OpenFlow Interfaces Are Up

- Purpose** Verify that the OpenFlow interfaces are up.
- Action** Issue the **show openflow interfaces** operational mode command, and verify that the state of each OpenFlow interface is **Up**.
- ```
user@host> show openflow interfaces
Switch name: OFswitch2
Interface Name: ge-1/0/1.0
Interface port number: 41500
Interface Hardware Address: 00:00:5e:00:53:a1
Interface speed: 1Gb Full-duplex
Interface Auto-Negotiation: Disabled
Interface media type: Fiber
Interface state: Up

Switch name: OFswitch2
Interface Name: ge-1/0/2.0
Interface port number: 41501
Interface Hardware Address: 00:00:5e:00:53:00
Interface speed: 1Gb Full-duplex
Interface Auto-Negotiation: Disabled
Interface media type: Fiber
Interface state: Up
```
- Meaning** The output shows that the state of each OpenFlow interface is **Up**, in addition to other information about the interfaces.

## Configuring OpenFlow Hybrid Interfaces on EX9200 Switches

---

On EX9200 switches that support OpenFlow, you can configure a physical interface as a hybrid interface that concurrently supports OpenFlow logical interfaces and non-OpenFlow logical interfaces. If you configure an OpenFlow hybrid interface on a device running Junos OS, you must enable the reception and transmission of 802.1Q VLAN-tagged frames on all interfaces, including both hybrid and non-hybrid interfaces, and you must configure a virtual switch routing instance for the OpenFlow traffic and a separate virtual switch routing instance for the normal traffic.

The following sections detail configuring an EX9200 switch that supports OpenFlow with a mix of hybrid and normal interfaces:

- [Configuring the Hybrid Physical Interface on page 2138](#)
- [Configuring the Hybrid Interface Logical Units on page 2139](#)
- [Configuring the Non-Hybrid Interfaces on page 2139](#)
- [Configuring OpenFlow on page 2140](#)
- [Configuring the Virtual Switch Routing Instances on page 2140](#)

### Configuring the Hybrid Physical Interface

To configure the hybrid physical interface:

1. Enable VLAN tagging.

Configure **vlan-tagging** to support 802.1Q VLAN single-tag frames for both OpenFlow and non-OpenFlow traffic, or configure **flexible-vlan-tagging** to support both 802.1Q VLAN single-tag and dual-tag frames.

```
[edit interfaces interface-name]  
user@host# set (vlan-tagging | flexible-vlan-tagging)
```

2. Configure flexible Ethernet services encapsulation to enable multiple per-unit Ethernet encapsulations.

```
[edit interfaces interface-name]  
user@host# set encapsulation flexible-ethernet-services
```

## Configuring the Hybrid Interface Logical Units

On a hybrid interface, you configure an OpenFlow or non-OpenFlow logical interface as a Layer 2 trunk interface. Additionally, you can configure a non-OpenFlow logical interface as a Layer 3 subinterface that performs traditional Layer 3 forwarding. To configure a logical interface to receive and forward VLAN-tagged frames, you must bind a VLAN ID, or a range or list of VLAN IDs, to the logical interface. Configure Layer 2 interfaces using family **ethernet-switching** on EX9200 switches.

To configure the hybrid interface logical units:

1. Configure the OpenFlow logical interfaces and any non-OpenFlow Layer 2 logical interfaces, and specify the interface mode and VLAN membership.

```
[edit interfaces interface-name]
user@host# set unit unit family ethernet-switching interface-mode trunk
user@host# set unit unit family ethernet-switching vlan members vlan-ids
```

2. Configure any non-OpenFlow Layer 3 logical interfaces, and specify the VLAN membership.

```
[edit interfaces interface-name]
user@host# set unit unit (vlan-id | vlan-id-list | vlan-id-range) vlan-ids
user@host# set unit unit family inet address address
```

## Configuring the Non-Hybrid Interfaces

Non-hybrid interfaces support either OpenFlow traffic or non-OpenFlow traffic, but not both simultaneously.

To configure the non-hybrid interfaces:

1. Configure interfaces that support only OpenFlow traffic as Layer 2 trunk interfaces, and specify the interface mode and VLAN membership.

```
[edit interfaces interface-name]
user@host# set vlan-tagging
user@host# set unit unit family ethernet-switching interface-mode trunk
user@host# set unit unit family ethernet-switching vlan members (vlan-id | vlan-id-list)
```

2. Configure interfaces that support only normal traffic, and specify the interface mode for the Layer 2 interfaces and the VLAN membership.

For example:

```
[edit interfaces interface-name]
user@host# set vlan-tagging
user@host# set unit unit family ethernet-switching interface-mode trunk
user@host# set unit unit family ethernet-switching vlan members (vlan-id | vlan-id-list)
```

## Configuring OpenFlow

To configure the OpenFlow virtual switch instance:

1. Configure the OpenFlow controller IP address and the connection protocol.

```
[edit protocols openflow switch switch-name]  
user@host# set controller address address  
user@host# set controller protocol tcp port port
```

2. Specify all logical interfaces participating in OpenFlow under this virtual switch instance.

```
[edit protocols openflow switch switch-name]  
user@host# set interfaces interface-name
```

## Configuring the Virtual Switch Routing Instances

Configure separate virtual switch routing instances for the OpenFlow traffic and the non-OpenFlow traffic. The configured interface names must include a logical unit number.

To configure the virtual switch routing instances:

1. Configure the virtual switch routing instance for the OpenFlow traffic, and specify the OpenFlow logical interfaces and VLANs.

```
[edit routing-instances of-routing-instance-name]  
user@host# set instance-type virtual-switch  
user@host# set interface of-interface-name1  
user@host# set interface of-interface-name2  
user@host# set vlans name vlan-id-list of-vlan-id-list
```

2. Configure the virtual switch routing instance for the non-OpenFlow traffic, and specify the non-OpenFlow logical interfaces and VLANs.

```
[edit routing-instances non-of-routing-instance-name]  
user@host# set instance-type virtual-switch  
user@host# set interface non-of-interface-name1  
user@host# set interface non-of-interface-name2  
user@host# set vlans name vlan-id-list non-of-vlan-id-list
```

## Example: Configuring OpenFlow Hybrid Interfaces on EX9200 Switches

On EX9200 switches that have the OpenFlow software package installed, you can configure physical interfaces that support multiple logical interfaces as OpenFlow hybrid interfaces. A hybrid interface concurrently supports OpenFlow logical interfaces and non-OpenFlow logical interfaces. A hybrid interface enables OpenFlow and non-OpenFlow traffic to traverse the same physical interface while keeping the traffic in separate VLANs.

Hybrid interfaces enable you to use physical interfaces more efficiently, especially in a situation where having an adequate number of physical interfaces available is important.

This example shows how to configure an OpenFlow hybrid interface on an EX9200 switch.

- [Requirements on page 2141](#)
- [Overview on page 2141](#)
- [Configuration on page 2143](#)
- [Verification on page 2147](#)

## Requirements

This example uses the following hardware and software components:

- An EX9200 switch running Junos OS Release 13.3 or a later release.
- An OpenFlow software package is installed on the switch, and the software package release matches the Junos OS release running on the switch.
- The switch has a TCP connection to an OpenFlow controller, which needs to access the data plane of the switch.
- The switch is connected to the management network through the fxp0 interface and is reachable from the controller IP address.

## Overview

In this example, you configure an EX9200 switch with:

- One hybrid interface, xe-2/1/0
- One non-hybrid interface, xe-2/1/1, which handles OpenFlow traffic only
- One non-hybrid interface, xe-2/1/2, which handles non-OpenFlow traffic only

On the hybrid interface, logical interface xe-2/1/0.0 participates in OpenFlow, and logical interfaces xe-2/1/0.1 and xe-2/1/0.2 do not participate in OpenFlow.

When using hybrid interfaces, you use VLAN tagging to distinguish OpenFlow traffic from non-OpenFlow traffic. Thus, you must enable VLAN tagging on all interfaces, and traffic entering the interfaces must be VLAN-tagged. If you do not configure a native VLAN, untagged traffic entering a hybrid interface is dropped. In this example, you configure the hybrid interface by using **flexible-vlan-tagging**, which enables VLAN tagging and supports both 802.1Q VLAN single-tag and dual-tag frames for all traffic on the interface. You also configure the OpenFlow interface xe-2/1/1 and the non-OpenFlow interface xe-2/1/2 by using **vlan-tagging**, which enables VLAN tagging and supports only 802.1Q VLAN single-tag frames for all traffic on the interface.

You configure the hybrid interface encapsulation as flexible Ethernet services. Note that for interfaces with this type of encapsulation, all VLAN IDs are valid. VLAN IDs from 1 through 511 are no longer reserved for normal Ethernet VLANs. In this example, VLANs

100 through 200 are used for OpenFlow traffic, and VLANs 700 and 800 are used for non-OpenFlow traffic.

All logical interfaces except xe-2/1/0.2 are configured as Layer 2 trunk interfaces by using family **ethernet-switching** and interface mode **trunk**. Logical interfaces xe-2/1/0.0 and xe-2/1/1.0 participate in OpenFlow and receive and forward traffic with OpenFlow VLAN IDs 100 through 200. Logical interfaces xe-2/1/0.1 and xe-2/1/2.0 do not participate in OpenFlow and receive and forward traffic with non-OpenFlow VLAN ID 700.

Logical interface xe-2/1/0.2 is a subinterface with the IP address 198.51.100.10/24 and performs Layer 3 routing. This interface does not participate in OpenFlow and routes traffic with VLAN ID 800.

[Table 187 on page 2142](#) summarizes the logical interfaces, traffic types, and associated VLAN IDs.

**Table 187: Summary of Logical Interfaces**

| Logical Interface | Traffic Type | VLANs           |
|-------------------|--------------|-----------------|
| xe-2/1/0.0        | OpenFlow     | 100 through 200 |
| xe-2/1/0.1        | Non-OpenFlow | 700             |
| xe-2/1/0.2        | Non-OpenFlow | 800             |
| xe-2/1/1.0        | OpenFlow     | 200             |
| xe-2/1/2.0        | Non-OpenFlow | 700             |

You configure the OpenFlow virtual switch and OpenFlow protocol statements at the **[edit protocols openflow]** hierarchy level. The virtual switch 100 connects to the OpenFlow controller over a TCP connection at the IP address 198.51.100.174. The virtual switch configuration must include all of the logical interfaces participating in OpenFlow, which includes xe-2/1/0.0 and xe-2/1/1.0.

An EX9200 switch requires a separate routing instance for a virtual switch. This routing instance isolates the OpenFlow traffic from the non-OpenFlow traffic. When using hybrid interfaces, you configure a virtual switch routing instance for the OpenFlow traffic and another virtual switch routing instance for non-OpenFlow traffic. In this example, you configure routing instance **OF** for the OpenFlow traffic and routing instance **NON-OF** for the non-OpenFlow traffic.

Routing instance **OF** includes the interfaces participating in OpenFlow—xe-2/1/0.0 and xe-2/1/1.0. Within this routing instance, you configure a VLAN to include OpenFlow VLANs 100 through 200. Routing instance **NON-OF** includes the Layer 2 interfaces that do not participate in OpenFlow—xe-2/1/0.1 and xe-2/1/2.0. Within this routing instance, you configure a VLAN to include the non-OpenFlow VLAN 700.

**NOTE:** To direct OpenFlow traffic, the OpenFlow controller must install flow entries that select the appropriate traffic and forward it to the correct OpenFlow interface.

## Configuration

- [Results on page 2145](#)

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces xe-2/1/0 flexible-vlan-tagging
set interfaces xe-2/1/0 encapsulation flexible-ethernet-services
set interfaces xe-2/1/0 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-2/1/0 unit 0 family ethernet-switching vlan members 100-200
set interfaces xe-2/1/0 unit 1 family ethernet-switching interface-mode trunk
set interfaces xe-2/1/0 unit 1 family ethernet-switching vlan members 700
set interfaces xe-2/1/0 unit 2 vlan-id 800
set interfaces xe-2/1/0 unit 2 family inet address 198.51.100.10/24
set interfaces xe-2/1/1 vlan-tagging
set interfaces xe-2/1/1 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-2/1/1 unit 0 family ethernet-switching vlan members 200
set interfaces xe-2/1/2 vlan-tagging
set interfaces xe-2/1/2 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-2/1/2 unit 0 family ethernet-switching vlan members 700
set protocols openflow switch 100 controller address 198.51.100.174
set protocols openflow switch 100 controller protocol tcp port 6633
set protocols openflow switch 100 interfaces xe-2/1/0.0
set protocols openflow switch 100 interfaces xe-2/1/1.0
set routing-instances OF instance-type virtual-switch
set routing-instances OF interface xe-2/1/0.0
set routing-instances OF interface xe-2/1/1.0
set routing-instances OF vlans OF-vlan vlan-id-list 100-200
set routing-instances NON-OF instance-type virtual-switch
set routing-instances NON-OF interface xe-2/1/0.1
set routing-instances NON-OF interface xe-2/1/2.0
set routing-instances NON-OF vlans OF-vlan vlan-id-list 700
```

### Configuring the Interfaces

#### Step-by-Step Procedure

To configure the interfaces:

1. On the hybrid physical interface, enable VLAN tagging and configure the encapsulation.

```
[edit interfaces xe-2/1/0]
user@switch# set flexible-vlan-tagging
```

```
user@switch# set encapsulation flexible-ethernet-services
```

2. Configure the OpenFlow logical interface xe-2/1/0.0 as a Layer 2 trunk that supports VLANs 100 through 200.

```
[edit interfaces xe-2/1/0]
user@switch# set unit 0 family ethernet-switching interface-mode trunk
user@switch# set unit 0 family ethernet-switching vlan members 100-200
```

3. Configure the non-OpenFlow logical interface xe-2/1/0.1 as a Layer 2 trunk that supports VLAN 700.

```
[edit interfaces xe-2/1/0]
user@switch# set unit 1 family ethernet-switching interface-mode trunk
user@switch# set unit 1 family ethernet-switching vlan members 700
```

4. Configure the non-OpenFlow logical interface xe-2/1/0.2 as a Layer 3 subinterface.

```
[edit interfaces xe-2/1/0]
user@switch# set unit 2 vlan-id 800
user@switch# set unit 2 family inet address 198.51.100.10/24
```

5. On xe-2/1/1, enable VLAN tagging, and configure the logical interface as a Layer 2 trunk that supports VLAN 200.

```
[edit interfaces xe-2/1/1]
user@switch# set vlan-tagging
user@switch# set unit 0 family ethernet-switching interface-mode trunk
user@switch# set unit 0 family ethernet-switching vlan members 200
```

6. On xe-2/1/2, enable VLAN tagging, and configure the logical interface as a Layer 2 trunk that supports VLAN 700.

```
[edit interfaces xe-2/1/2]
user@switch# set vlan-tagging
user@switch# set unit 0 family ethernet-switching interface-mode trunk
user@switch# set unit 0 family ethernet-switching vlan members 700
```

---

### Configuring OpenFlow

#### Step-by-Step Procedure

To configure OpenFlow:

1. Configure the OpenFlow controller IP address and the connection protocol.

```
[edit protocols openflow switch 100]
user@switch# set controller address 198.51.100.174
user@switch# set controller protocol tcp port 6633
```

2. Specify the logical interfaces participating in OpenFlow under virtual switch 100.

```
[edit protocols openflow switch 100]
user@switch# set interfaces xe-2/1/0.0
user@switch# set interfaces xe-2/1/1.0
```

## Configuring the Virtual Switch Routing Instances

### Step-by-Step Procedure

To configure the routing instances:

1. Configure the routing instance for the OpenFlow traffic.  
  

```
[edit]
user@switch# set routing-instances OF instance-type virtual-switch
user@switch# set routing-instances OF interface xe-2/1/0.0
user@switch# set routing-instances OF interface xe-2/1/1.0
user@switch# set routing-instances OF vlans OF-vlan vlan-id-list 100-200
```
2. Configure the routing instance for the non-OpenFlow traffic on Layer 2 interfaces.  
  

```
[edit]
user@switch# set routing-instances NON-OF instance-type virtual-switch
user@switch# set routing-instances NON-OF interface xe-2/1/0.1
user@switch# set routing-instances NON-OF interface xe-2/1/2.0
user@switch# set routing-instances NON-OF vlans NOF-vlan vlan-id-list 700
```
3. Commit the configuration.  
  

```
[edit]
user@switch# commit
```

## Results

From operational mode, confirm your configuration by entering the **show configuration interfaces**, **show configuration protocols openflow**, and **show configuration routing-instances** commands. If the output does not display the specified configuration, repeat the configuration instructions in this example to correct the configuration.

```
user@switch> show configuration interfaces
xe-2/1/0 {
  flexible-vlan-tagging;
  encapsulation flexible-ethernet-services;
  unit 0 {
    family ethernet-switching {
      interface-mode trunk;
      vlan {
        members 100-200;
      }
    }
  }
  unit 1 {
    family ethernet-switching {
      interface-mode trunk;
      vlan {
        members 700;
      }
    }
  }
  unit 2 {
    vlan-id 800;
    family inet {
```

```
        address 198.51.100.10/24;
    }
}
xe-2/1/1 {
    vlan-tagging;
    unit 0 {
        family ethernet-switching {
            interface-mode trunk;
            vlan {
                members 200;
            }
        }
    }
}
xe-2/1/2 {
    vlan-tagging;
    unit 0 {
        family ethernet-switching {
            interface-mode trunk;
            vlan {
                members 700;
            }
        }
    }
}

user@switch> show configuration protocols openflow
switch 100 {
    interfaces {
        xe-2/1/0.0;
        xe-2/1/1.0;
    }
    controller {
        protocol tcp {
            port 6633;
        }
        address 198.51.100.174;
    }
}

user@switch> show configuration routing-instances
OF {
    instance-type virtual-switch;
    interface xe-2/1/0.0;
    interface xe-2/1/1.0;
    vlans {
        OF-vlan {
            vlan-id-list 100-200;
        }
    }
}
NON-OF {
    instance-type virtual-switch;
    interface xe-2/1/0.1;
    interface xe-2/1/2.0;
    vlans {
        NOF-vlan {
            vlan-id 700;
        }
    }
}
```

```

    }
  }
}

```

## Verification

Confirm that the configuration is working properly.

- [Verifying the OpenFlow Controller Connection on page 2147](#)
- [Verifying the OpenFlow Interfaces on page 2147](#)

### Verifying the OpenFlow Controller Connection

**Purpose** Verify that the OpenFlow controller connection is up.

**Action** Issue the **show openflow controller** operational mode command, and verify that the controller connection state is **up**. Because the virtual switch configuration has only a single controller, the virtual switch automatically initiates a connection to the controller after you commit the configuration.

```

user@switch> show openflow controller
Openflowd controller information:
Controller socket: 11
Controller IP address: 198.51.100.174
Controller protocol: tcp
Controller port: 6633
Controller connection state: up
Number of connection attempt: 5
Controller role: equal

```

**Meaning** The output shows that the connection state of the OpenFlow controller is **up**, in addition to other information about the controller.

### Verifying the OpenFlow Interfaces

**Purpose** Verify that the OpenFlow interfaces are up.

**Action** Issue the **show openflow interfaces** operational mode command, and verify that the state of each OpenFlow interface is **Up**.

```

user@switch> show openflow interfaces
Switch name: 100
Interface Name: xe-2/1/0.0
Interface port number: 41500
Interface Hardware Address: 00:00:5E:00:53:cf
Interface speed: 10Gb Full-duplex
Interface Auto-Negotiation: Disabled
Interface media type: Fiber
Interface state: Up

Switch name: 100
Interface Name: xe-2/1/1.0
Interface port number: 41501
Interface Hardware Address: 00:00:5E:00:53:d0
Interface speed: 10Gb Full-duplex

```

Interface Auto-Negotiation: Disabled  
Interface media type: Fiber  
**Interface state: Up**

**Meaning** The output shows that the state of each OpenFlow interface is **Up**, in addition to other information about the interfaces.

# Configuring OpenFlow Traffic Steering Across MPLS Networks

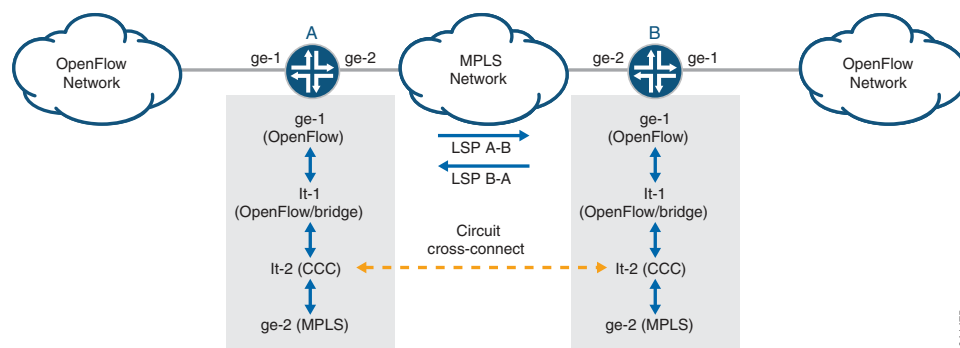

- Understanding OpenFlow Traffic Steering Across MPLS Networks Using MPLS LSP Tunnel Cross-Connects on page 2149
- Example: OpenFlow Traffic Steering Across MPLS Networks Using MPLS LSP Tunnel Cross-Connects on page 2150

## Understanding OpenFlow Traffic Steering Across MPLS Networks Using MPLS LSP Tunnel Cross-Connects

On MX Series devices that support OpenFlow, you can direct traffic from OpenFlow networks over MPLS networks by using logical tunnel interfaces and MPLS LSP tunnel cross-connects. Using logical tunnel interfaces, you can stitch an OpenFlow interface to an MPLS label-switched path (LSP), which enables you to direct traffic from the OpenFlow network onto the MPLS network. MPLS LSP tunnel cross-connects between interfaces and LSPs permit you to connect the OpenFlow network to a remote network by creating MPLS tunnels that use LSPs as the conduit.

The topology in [Figure 35 on page 2149](#) illustrates an MPLS LSP tunnel cross-connect that connects two remote OpenFlow networks through an MPLS network. Circuit cross-connect (CCC) enables you to establish an LSP tunnel between the two domains, through which you can tunnel the traffic from one OpenFlow network across the MPLS network to the second OpenFlow network.

**Figure 35: Connecting OpenFlow Networks Using MPLS LSP Tunnel Cross-Connects**

Router A and Router B are OpenFlow-enabled routers that have MPLS LSPs configured to route traffic across the MPLS network. LSP A-B routes traffic from Router A to Router B, and LSP B-A routes traffic from Router B to Router A.

Each router has an OpenFlow interface, ge-1, and an MPLS interface, ge-2. You can stitch the OpenFlow interface to the MPLS LSP by using two logical tunnel interfaces. You configure the first logical tunnel interface, lt-1, as a Layer 2 interface that participates in OpenFlow. The second logical tunnel interface, lt-2, uses CCC encapsulation. You configure lt-1 and lt-2 interfaces as peers, so that traffic entering one logical interface is automatically directed to the second logical interface.

On each router, MPLS LSP tunnel cross-connects are configured at the **[edit protocols connections remote-interface-switch]** hierarchy level. The cross-connects make an association between the CCC interface, lt-2, and the two LSPs, one for transmitting MPLS packets from the local device to the remote device and the other for receiving MPLS packets on the local device from the remote device.

For traffic flowing from Router A to Router B, the OpenFlow controller must install flow entries on Router A that direct the desired OpenFlow traffic from ge-1 as the OpenFlow ingress port to lt-1 as the output port. On Router B, the OpenFlow controller must install flow entries that direct the OpenFlow traffic from lt-1 as the OpenFlow ingress port to ge-1 as the output port. Similarly for traffic flowing from Router B to Router A, the OpenFlow controller must install flow entries on Router B that direct the desired OpenFlow traffic from ge-1 as the OpenFlow ingress port to lt-1 as the output port. On Router A, the OpenFlow controller must install flow entries that direct the OpenFlow traffic from lt-1 as the OpenFlow ingress port to ge-1 as the output port.

- [Troubleshooting on page 2166](#)

## Requirements

This example uses the following hardware and software components for the OpenFlow-enabled routers:

- MX240 routers running Junos OS Release 13.3 or a later release.
- OpenFlow software package with a software package release that matches the Junos OS release of the device on which it is installed
- TCP connection between the router and an OpenFlow controller
- Connection between the fxp0 management interface of the router and the management network, which is reachable from the controller IP address

## Overview

In this example, you configure MPLS LSP tunnel cross-connects to connect two remote OpenFlow networks that are separated by an MPLS network. [Figure 36 on page 2152](#) shows the topology used in this example.

This example has three routers: a provider router (P) and two provider edge routers (PE1 and PE2). Router P resides within an MPLS network. Routers PE1 and PE2 are OpenFlow-enabled routers, each with the ge-1/0/0.0 interface configured to accept and forward OpenFlow traffic and two MPLS interfaces that connect to Router P. The network uses OSPF as the IGP, and it has two LSPs: LSP 1-3 routes traffic from PE1 to PE2, and LSP 3-1 routes traffic from PE2 to PE1.

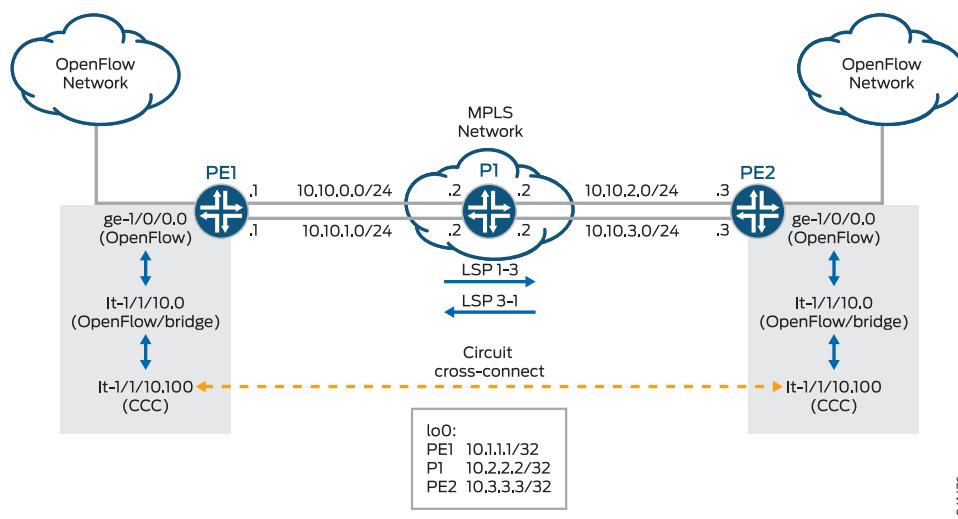

You stitch the OpenFlow interface to the MPLS LSP using two logical tunnel interfaces, lt-1/1/10.0 and lt-1/1/10.100. You configure the first logical tunnel interface, lt-1/1/10.0, as a Layer 2 interface with encapsulation **ethernet-bridge** and family **bridge**. This interface participates in OpenFlow. The second logical tunnel interface, lt-1/1/10.100, uses circuit cross-connect (CCC) encapsulation. You configure lt-1 and lt-2 interfaces as peers, so that traffic entering one logical interface is automatically directed to the second logical interface.

On the PE1 and PE2 routers, you configure an MPLS LSP tunnel cross-connect at the **[edit protocols connections remote-interface-switch]** hierarchy level using the logical tunnel interface with CCC encapsulation. This configuration makes an association between the CCC interface and two LSPs, one for transmitting MPLS packets from the local device to the remote device and the other for receiving MPLS packets on the local device from the remote device.

For traffic flowing from PE1 to PE2, the OpenFlow controller must install flow entries on PE1 that direct the desired OpenFlow traffic from ge-1/0/0.0 as the OpenFlow ingress port to lt-1/1/10.0 as the output port. On PE2, the OpenFlow controller must install flow entries that direct the OpenFlow traffic from lt-1/1/10.0 as the OpenFlow ingress port to ge-1/0/0.0 as the output port. Similarly, for traffic flowing from PE2 to PE1, the OpenFlow controller must install flow entries on PE2 that direct the desired OpenFlow traffic from ge-1/0/0.0 as the OpenFlow ingress port to lt-1/1/10.0 as the output port. On PE1, the OpenFlow controller must install flow entries that direct the OpenFlow traffic from lt-1/1/10.0 as the OpenFlow ingress port to ge-1/1/0.0 as the output port.

## Topology

- [Configuring the Egress Provider Edge Router \(PE2\) on page 2160](#)

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

#### Device PE1

```
set chassis fpc 1 pic 1 tunnel-services bandwidth 1g
set interfaces ge-1/0/0 encapsulation ethernet-bridge
set interfaces ge-1/0/0 unit 0 family bridge
set interfaces ge-1/1/0 unit 0 family inet address 10.10.0.1/24
set interfaces ge-1/1/0 unit 0 family mpls
set interfaces ge-1/1/1 unit 0 family inet address 10.10.1.1/24
set interfaces ge-1/1/1 unit 0 family mpls
set interfaces lt-1/1/10 unit 0 encapsulation ethernet-bridge
set interfaces lt-1/1/10 unit 0 peer-unit 100
set interfaces lt-1/1/10 unit 0 family bridge

---

### Configuring the Ingress Provider Edge Router (PE1)

---

#### Step-by-Step Procedure

To configure Router PE1:

1. Create tunnel interfaces by configuring the DPC and its corresponding PIC to use tunneling services.

[edit]

```
user@PE1# set chassis fpc 1 pic 1 tunnel-services bandwidth 1g
```

2. Configure the OpenFlow interface as a Layer 2 interface.

[edit interfaces]

```
user@PE1# set ge-1/0/0 encapsulation ethernet-bridge
```

```
user@PE1# set ge-1/0/0 unit 0 family bridge
```

3. Configure the OpenFlow virtual switch routing instance.

[edit]

```
user@PE1# set routing-instances r1 instance-type virtual-switch
```

```
user@PE1# set routing-instances r1 bridge-domains bd1 interface ge-1/0/0.0
```

```
user@PE1# set routing-instances r1 bridge-domains bd1 interface lt-1/1/10.0
```

4. Configure the OpenFlow controller.

[edit protocols openflow]

```
user@PE1# set switch s1 controller address 10.94.175.213
```

```
user@PE1# set switch s1 controller protocol tcp port 6633
```

5. Configure the interfaces participating in OpenFlow.

[edit protocols openflow]

```
user@PE1# set switch s1 interfaces ge-1/0/0.0 port-id 1
```

```
user@PE1# set switch s1 interfaces lt-1/1/10.0 port-id 2
```

6. Configure the loopback interface and router ID.

[edit]

```

user@PE1# set interfaces lo0 unit 0 family inet address 10.1.1.1/32
user@PE1# set routing-options router-id 10.1.1.1

```

7. Configure the MPLS interfaces.

```

[edit interfaces]
user@PE1# set ge-1/1/0 unit 0 family inet address 10.10.0.1/24
user@PE1# set ge-1/1/0 unit 0 family mpls
user@PE1# set ge-1/1/1 unit 0 family inet address 10.10.1.1/24
user@PE1# set ge-1/1/1 unit 0 family mpls

```

8. Configure the logical tunnel interface.

```

[edit interfaces]
user@PE1# set lt-1/1/10 unit 0 family bridge
user@PE1# set lt-1/1/10 unit 0 encapsulation ethernet-bridge
user@PE1# set lt-1/1/10 unit 0 peer-unit 100
user@PE1# set lt-1/1/10 unit 100 family ccc
user@PE1# set lt-1/1/10 unit 100 encapsulation ethernet-ccc
user@PE1# set lt-1/1/10 unit 100 peer-unit 0

```

9. Enable RSVP, MPLS, and OSPF on the interfaces connected to Router P.

```

[edit protocols]
user@PE1# set rsvp interface ge-1/1/0.0
user@PE1# set rsvp interface ge-1/1/1.0
user@PE1# set mpls interface ge-1/1/0.0
user@PE1# set mpls interface ge-1/1/1.0
user@PE1# set ospf area 0.0.0.0 interface ge-1/1/0.0
user@PE1# set ospf area 0.0.0.0 interface ge-1/1/1.0

```

10. Enable traffic engineering for OSPF.

```

[edit protocols]
user@PE1# set ospf traffic-engineering

```

11. Configure the MPLS LSP from PE1 to PE2.

```

[edit protocols]
user@PE1# set mpls label-switched-path 1-3 from 10.1.1.1
user@PE1# set mpls label-switched-path 1-3 to 10.3.3.3

```

12. Configure the MPLS LSP tunnel cross-connects.

```

[edit protocols]
user@PE1# set connections remote-interface-switch 1-3-ccc interface lt-1/1/10.100
user@PE1# set connections remote-interface-switch 1-3-ccc transmit-lsp 1-3
user@PE1# set connections remote-interface-switch 1-3-ccc receive-lsp 3-1

```

13. Commit the configuration.

```

[edit]
user@PE1# commit

```

**Results** From configuration mode, confirm your configuration by entering the **show** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it. For brevity, this **show** command output includes

only the configuration that is relevant to this example. Any other configuration on the system has been replaced with ellipses (...).

### Configuring the Provider Router (P)

---

#### Step-by-Step Procedure

To configure Router P:

1. Configure the loopback interface and router ID.

```
[edit]
user@P# set interfaces lo0 unit 0 family inet address 10.2.2.2/32
user@P# set routing-options router-id 10.2.2.2
```

2. Configure the MPLS interfaces.

```
[edit interfaces]
user@P# set ge-1/1/0 unit 0 family inet address 10.10.0.2/24
user@P# set ge-1/1/0 unit 0 family mpls
user@P# set ge-1/1/1 unit 0 family inet address 10.10.1.2/24
user@P# set ge-1/1/1 unit 0 family mpls
user@P# set ge-1/1/2 unit 0 family inet address 10.10.2.2/24
user@P# set ge-1/1/2 unit 0 family mpls
user@P# set ge-1/1/3 unit 0 family inet address 10.10.3.2/24
user@P# set ge-1/1/3 unit 0 family mpls
```

3. Enable RSVP, MPLS, and OSPF on the interfaces connected to PE1 and PE2.

```
[edit protocols]
user@P# set rsvp interface ge-1/1/0.0
user@P# set rsvp interface ge-1/1/1.0
user@P# set rsvp interface ge-1/1/2.0
user@P# set rsvp interface ge-1/1/3.0
user@P# set mpls interface lo0.0
user@P# set mpls interface ge-1/1/0.0
user@P# set mpls interface ge-1/1/1.0
user@P# set mpls interface ge-1/1/2.0
user@P# set mpls interface ge-1/1/3.0
user@P# set ospf area 0.0.0.0 interface fxp0.0 disable
user@P# set ospf area 0.0.0.0 interface ge-1/1/0.0
user@P# set ospf area 0.0.0.0 interface ge-1/1/1.0
user@P# set ospf area 0.0.0.0 interface ge-1/1/2.0
user@P# set ospf area 0.0.0.0 interface ge-1/1/3.0
user@P# set ospf area 0.0.0.0 interface lo0.0
```

4. Enable traffic engineering for OSPF.

```
[edit protocols]
user@P# set ospf traffic-engineering
```

5. Commit the configuration.

```
[edit]
user@P# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it. For brevity, this **show** command output includes

### Configuring the Egress Provider Edge Router (PE2)

---

#### Step-by-Step Procedure

To configure Router PE2:

1. Create tunnel interfaces by configuring the DPC and its corresponding PIC to use tunneling services.

```
[edit]
user@PE2# set chassis fpc 1 pic 1 tunnel-services bandwidth 1g

```

2. Configure the OpenFlow interface as a Layer 2 interface.

```
[edit interfaces]
user@PE2# set ge-1/0/0 encapsulation ethernet-bridge
user@PE2# set ge-1/0/0 unit 0 family bridge

```

3. Configure the OpenFlow virtual switch routing instance.

```
[edit]
user@PE2# set routing-instances r1 instance-type virtual-switch
user@PE2# set routing-instances r1 bridge-domains bd1 interface ge-1/0/0.0
user@PE2# set routing-instances r1 bridge-domains bd1 interface lt-1/1/10.0

```

4. Configure the OpenFlow controller.

```
[edit protocols openflow]
user@PE2# set switch s1 controller protocol tcp port 6633
user@PE2# set switch s1 controller address 10.94.175.213

```

5. Configure the interfaces participating in OpenFlow.

```
[edit protocols openflow]
user@PE2# set switch s1 interfaces ge-1/0/0.0 port-id 1
user@PE2# set switch s1 interfaces lt-1/1/10.0 port-id 2

```

6. Configure the loopback interface and router ID.

```
[edit]
user@PE2# set interfaces lo0 unit 0 family inet address 10.3.3.3/32
user@PE2# set routing-options router-id 10.3.3.3

```

7. Configure the MPLS interfaces.

```
[edit interfaces]
user@PE2# set ge-1/1/2 unit 0 family inet address 10.10.2.3/24
user@PE2# set ge-1/1/2 unit 0 family mpls
user@PE2# set ge-1/1/3 unit 0 family inet address 10.10.3.3/24
user@PE2# set ge-1/1/3 unit 0 family mpls
```

8. Configure the logical tunnel interface.

```
[edit interfaces]
user@PE2# set lt-1/1/10 unit 0 family bridge
user@PE2# set lt-1/1/10 unit 0 encapsulation ethernet-bridge
user@PE2# set lt-1/1/10 unit 0 peer-unit 100
user@PE2# set lt-1/1/10 unit 100 family ccc
user@PE2# set lt-1/1/10 unit 100 encapsulation ethernet-ccc
user@PE2# set lt-1/1/10 unit 100 peer-unit 0
```

9. Enable RSVP, MPLS, and OSPF on the interfaces connected to Router P.

```
[edit protocols]
user@PE2# set rsvp interface ge-1/1/2.0
user@PE2# set rsvp interface ge-1/1/3.0
user@PE2# set mpls interface ge-1/1/2.0
user@PE2# set mpls interface ge-1/1/3.0
user@PE2# set ospf area 0.0.0.0 interface ge-1/1/2.0
user@PE2# set ospf area 0.0.0.0 interface ge-1/1/3.0
```

10. Enable traffic engineering for OSPF.

```
[edit protocols]
user@PE2# set ospf traffic-engineering
```

11. Configure the MPLS LSP from PE2 to PE1.

```
[edit protocols]
user@PE2# set mpls label-switched-path 3-1 from 10.3.3.3
user@PE2# set mpls label-switched-path 3-1 to 10.1.1.1
```

12. Configure the MPLS LSP tunnel cross-connects.

```
[edit protocols]
user@PE2# set connections remote-interface-switch 3-1-ccc interface lt-1/1/10.100
user@PE2# set connections remote-interface-switch 3-1-ccc transmit-lsp 3-1
user@PE2# set connections remote-interface-switch 3-1-ccc receive-lsp 1-3
```

13. Commit the configuration.

```
[edit]
user@PE2# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it. For brevity, this **show** command output includes only the configuration that is relevant to this example. Any other configuration on the system has been replaced with ellipses (...).

## Verification

Confirm that the configuration is working properly.

- [Verifying that the OpenFlow Controller Connection is Up on page 2164](#)
- [Verifying that the OpenFlow Interfaces Are Up on page 2164](#)

- [Verifying that the MPLS LSP is Operational on page 2165](#)
- [Verifying that the MPLS LSP Cross-Connect is Operational on page 2165](#)
- [Verifying the Routes on page 2166](#)

### Verifying that the OpenFlow Controller Connection is Up

- Purpose** On each of the OpenFlow-enabled routers, verify that the connection state for the OpenFlow controller is **up**.
- Action** Issue the **show openflow controller** operational mode command, and verify that the controller connection state is **up**.
- ```
user@PE1> show openflow controller
Openflowd controller information:
Controller socket: 11
Controller IP address: 10.94.175.213
Controller protocol: tcp
Controller port: 6633
Controller connection state: up
Number of connection attempt: 1
Controller role: equal
```
- Meaning** The output shows that the connection state of the OpenFlow controller is **up**, in addition to other information about the controller.

### Verifying that the OpenFlow Interfaces Are Up

- Purpose** On each of the OpenFlow-enabled routers, verify that the OpenFlow interfaces are up.
- Action** Issue the **show openflow interfaces** operational mode command, and verify that the state of each interface is **Up**. For example, on PE1:
- ```
user@PE1> show openflow interfaces
Switch name: s1
Interface Name: ge-1/0/0.0
Interface port number: 1
Interface Hardware Address: 00:00:5e:00:53:b1
Interface speed: 1Gb Full-duplex
Interface Auto-Negotiation: Enabled
Interface media type: Fiber
Interface state: Up

Switch name: s1
Interface Name: lt-1/1/10.0
Interface port number: 2
Interface Hardware Address: 00:00:5e:00:53:be
Interface speed: 1Gb Full-duplex
Interface Auto-Negotiation: Disabled
Interface media type: Fiber
Interface state: Up
```
- Meaning** The output shows that the state of each OpenFlow interface is **Up**, in addition to other information about the interfaces.

### Verifying that the MPLS LSP is Operational

**Purpose** On each edge router, verify that the MPLS LSP state is **Up**.

**Action** Issue the **show mpls lsp** operational mode command, and verify that each LSP is operational.

```
user@PE1> show mpls lsp
Ingress LSP: 1 sessions
To          From          State Rt P    ActivePath    LSPName
10.3.3.3     10.1.1.1    Up    0 *
Total 1 displayed, Up 1, Down 0

Egress LSP: 1 sessions
To          From          State Rt Style Labelin Labelout LSPName
10.1.1.1     10.3.3.3    Up    0  1 FF  299776      - 3-1
Total 1 displayed, Up 1, Down 0

Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

```
user@PE2> show mpls lsp
Ingress LSP: 1 sessions
To          From          State Rt P    ActivePath    LSPName
10.1.1.1     10.3.3.3    Up    0 *
Total 1 displayed, Up 1, Down 0

Egress LSP: 1 sessions
To          From          State Rt Style Labelin Labelout LSPName
10.3.3.3     10.1.1.1    Up    0  1 FF  299840      - 1-3
Total 1 displayed, Up 1, Down 0

Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

**Meaning** The output shows that each LSP is operational.

### Verifying that the MPLS LSP Cross-Connect is Operational

**Purpose** Verify that the MPLS LSP circuit cross-connect is operational.

**Action** Issue the **show connections remote-interface-switch** operational mode command, and verify that the circuit cross-connect state is **Up**.

```
user@PE1> show connections remote-interface-switch
CCC and TCC connections [Link Monitoring On]
[...Output truncated...]

Connection/Circuit      Type      St      Time last up    # Up trans
1-3-ccc                 rmt-if    Up      Apr 18 22:30:54
1
  1t-1/1/10.100         intf      Up
  1-3                    tlsp      Up
  3-1                    rlsp      Up

user@PE2> show connections remote-interface-switch
```

CCC and TCC connections [Link Monitoring On]  
[...Output truncated...]

| Connection/Circuit | Type   | St | Time last up    | # Up trans |
|--------------------|--------|----|-----------------|------------|
| 3-1-ccc            | rmt-if | Up | Apr 18 15:07:04 |            |
| 1                  |        |    |                 |            |
| lt-1/1/10.100      | intf   | Up |                 |            |
| 3-1                | tlsp   | Up |                 |            |
| 1-3                | rlsp   | Up |                 |            |

**Meaning** The output from both routers indicates that the circuit cross-connect is operational.

### Verifying the Routes

**Purpose** Ensure that the routes from the CCC interface over the LSP are active.

**Action** Issue the **show route ccc lt-1/1/10.100** command.

```
user@PE1> show route ccc lt-1/1/10.100
```

```
mpls.0: 6 destinations, 6 routes (6 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
lt-1/1/10.100      *[CCC/7/1] 00:34:54, metric 2
                   > to 10.10.1.2 via ge-1/1/1.0, label-switched-path 1-3
```

```
user@PE2> show route ccc lt-1/1/10.100
```

```
mpls.0: 6 destinations, 6 routes (6 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
lt-1/1/10.100      *[CCC/7/1] 00:35:48, metric 2
                   > to 10.10.2.2 via ge-1/1/2.0, label-switched-path 3-1
```

**Meaning** The sample output shows that the circuit cross-connect uses the configured LSPs with the MPLS interface as the exit interface.

## Troubleshooting

### Troubleshooting the Circuit Cross-Connect

**Problem** The OpenFlow-enabled router does not route OpenFlow traffic to the remote OpenFlow network.

**Solution** In order to direct traffic from the local OpenFlow network to the remote OpenFlow network, the OpenFlow controller must install flow entries that select the appropriate traffic and forward it to the correct OpenFlow interface. For traffic flowing from PE1 to PE2, the OpenFlow controller must install flow entries on PE1 that direct OpenFlow traffic from ge-1/0/0.0 to lt-1/1/10.0, and it must install flow entries on PE2 that direct the OpenFlow traffic from lt-1/1/10.0 to ge-1/0/0.0. Similarly, for traffic flowing from PE2 to PE1, the OpenFlow controller must install flow entries on PE2 that direct the desired OpenFlow traffic from ge-1/0/0.0 to lt-1/1/10.0, and it must install flow entries on PE1 that direct the OpenFlow traffic from lt-1/1/10.0 to ge-1/1/0.0.

## port (Protocols OpenFlow)

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>port port;</code>   |
| <b>Hierarchy Level</b>          | [edit protocols <a href="#">openflow switch switch-name controller protocol protocol</a> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.3.<br>Statement introduced in Junos OS Release 13.3 for EX Series switches.<br>Statement introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.  |
| <b>Description</b>              | Specify the OpenFlow controller port to which the OpenFlow virtual switch connects.   |
| <b>Options</b>                  | <b>port</b> —Numeric value specifying the OpenFlow controller port to which the device should connect.<br><b>Range:</b> 1024 through 65,535<br><b>Default:</b> 6633   |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Understanding Support for OpenFlow on Devices Running Junos OS on page 2049</a></li><li>• <a href="#">address (Protocols OpenFlow) on page 2170</a></li><li>• <a href="#">controller (Protocols OpenFlow) on page 2171</a></li><li>• <a href="#">protocol (Protocols OpenFlow) on page 2177</a></li></ul> |

## protocol (Protocols OpenFlow)

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | protocol tcp {<br>port port;<br>}   |
| <b>Hierarchy Level</b>          | [edit protocols <a href="#">openflow switch switch-name controller</a> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.3.<br>Statement introduced in Junos OS Release 13.3 for EX Series switches.<br>Statement introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.  |
| <b>Description</b>              | Specify the connection protocol that the OpenFlow virtual switch uses to connect to the OpenFlow controller.  |
| <b>Options</b>                  | tcp—Establish a TCP connection to the controller.<br><br>The remaining statement is explained separately.   |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Understanding Support for OpenFlow on Devices Running Junos OS on page 2049</a></li> <li>• <a href="#">controller (Protocols OpenFlow) on page 2171</a></li> <li>• <a href="#">port (Protocols OpenFlow) on page 2176</a></li> </ul> |

## purge-flow-timer (Protocols OpenFlow)

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>purge-flow-timer seconds;</code>   |
| <b>Hierarchy Level</b>          | [edit protocols <b>openflow</b> <b>switch</b> <i>switch-name</i> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.3.<br>Statement introduced in Junos OS Release 13.3 for EX Series switches.<br>Statement introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.   |
| <b>Description</b>              | <p>For an OpenFlow virtual switch, specify the number of seconds after which an invalid OpenFlow flow entry is deleted from the flow table.</p> <p>If you do not configure the <b>purge-flow-timer</b> statement, the device purges invalid flows from hardware, but indefinitely retains the corresponding flow entries in the flow table. If you configure the <b>purge-flow-timer</b> statement, the device purges invalid flows from hardware, and after the specified number of seconds, the device deletes the invalid flow entries from the flow table. Configuring a value of 0 causes the device to immediately delete invalid flow entries from the flow table.</p> <div> <b>NOTE:</b> By default, if you remove an active OpenFlow interface from an existing OpenFlow configuration, flow entries that match on this interface as the ingress interface and flow entries that include this interface in their action list (for OpenFlow v1.0) or flow instructions (for OpenFlow v1.3.1) are invalid and are automatically purged from the flow table and from the hardware regardless of whether you configure the <b>purge-flow-timer</b> statement.</div> |
| <b>Options</b>                  | <p><b>seconds</b>—Number of seconds after which an invalid flow entry is deleted from the flow table.</p> <p><b>Range:</b> 0 through 300</p>   |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Understanding Support for OpenFlow on Devices Running Junos OS on page 2049</a></li><li>• <a href="#">Understanding OpenFlow Flow Entry Timers on Devices Running Junos OS on page 2062</a></li></ul>  |

## role (Protocols OpenFlow)

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | role equal;   |
| <b>Hierarchy Level</b>          | [edit protocols <a href="#">openflow switch switch-name controller</a> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.3.<br>Statement introduced in Junos OS Release 13.3 for EX Series switches.<br>Statement introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.  |
| <b>Description</b>              | Specify the role of each OpenFlow controller when configuring more than one controller for a virtual switch. A single controller configuration automatically puts the controller in active mode. In active mode, the virtual switch automatically initiates a connection to the controller. |
| <b>Options</b>                  | <b>equal</b> —Configure the controller as the active controller in a single controller configuration.   |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Understanding Support for OpenFlow on Devices Running Junos OS on page 2049</a></li> <li>• <a href="#">controller (Protocols OpenFlow) on page 2171</a></li> </ul>   |

## switch (Protocols OpenFlow)

---

**Syntax**    `switch switch-name {  
              controller {  
                  address address;  
                  id id;  
                  protocol tcp {  
                      port port;  
                  }  
                  role equal;  
              }  
              default-action (drop | packet-in);  
              interfaces {  
                  interface-name port-id port;  
              }  
              purge-flow-timer seconds;  
          }`

**Hierarchy Level**    [edit protocols [openflow](#)]

**Release Information**    Statement introduced in Junos OS Release 13.3.  
Statement introduced in Junos OS Release 13.3 for EX Series switches.  
Statement introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.

**Description**    Configure an OpenFlow virtual switch.

**Options**    *switch-name*—User-configured identifier for the OpenFlow virtual switch. The identifier must be 60 characters or less.

The remaining statements are explained separately.

**Required Privilege Level**    admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## traceoptions (Protocols OpenFlow)

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | <pre> traceoptions {     file &lt;filename&gt; &lt;files number&gt; &lt;match regular-expression&gt; &lt;size size&gt;     &lt;world-readable   no-world-readable&gt;;     flag flag;     no-remote-trace; } </pre>  |
| <b>Hierarchy Level</b>     | [edit protocols openflow]  |
| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 13.3.</p> <p>Statement introduced in Junos OS Release 13.3 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.</p>  |
| <b>Description</b>         | Define tracing operations for OpenFlow.  |
| <b>Default</b>             | If you do not include this statement, no OpenFlow-specific tracing operations are performed.   |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. All files are placed in the <code>/var/log</code> directory.</p> <p><b>Default:</b> <code>/var/log/ofd</code></p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <i>trace-file</i> reaches its maximum size, it is renamed and compressed to <i>trace-file.0.gz</i>. When <i>trace-file</i> again reaches its maximum size, <i>trace-file.0.gz</i> is renamed <i>trace-file.1.gz</i>, and <i>trace-file</i> is renamed and compressed to <i>trace-file.0.gz</i>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size by using the <b>size</b> option and also a filename.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 10 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—All OpenFlow events.</li> <li>• <b>barrier</b>—OpenFlow barrier events.</li> <li>• <b>configuration</b>—OpenFlow configuration events.</li> <li>• <b>filter</b>—OpenFlow filter events.</li> <li>• <b>flow</b>—OpenFlow flow events.</li> <li>• <b>function</b>—OpenFlow entry and exit events.</li> <li>• <b>group</b>—(Appears only for Juniper Networks devices running OpenFlow v1.3.1 or later) OpenFlow group events.</li> </ul> |

- **interface**—OpenFlow interface events.
- **nh**—OpenFlow next-hop events.
- **packet-io**—OpenFlow packet in and packet out events.
- **packets**—OpenFlow packet events.
- **statistics**—OpenFlow statistics request and reply events.
- **switch**—OpenFlow switch events including controller connection messages and keepalives, and packets sent to and received from the controller.

**match *regular-expression***—(Optional) Only log lines that match the regular expression.

**no-remote-trace**—(Optional) Disable tracing and logging operations that track normal operations, error conditions, and packets that are generated by or have passed through the Juniper Networks device.

**no-world-readable**—(Optional) Disable unrestricted file access, which restricts file access to the owner. This is the default.

**size *size***—(Optional) Maximum size of each trace file in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). If you do not specify a unit, the default is bytes. If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option and a filename.

**Syntax:** *size* to specify bytes, *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10,240 through 1,073,741,824 bytes

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

## OpenFlow Operational Mode Commands

[Table 188 on page 2183](#) summarizes the operational mode commands that you can use to monitor and troubleshoot OpenFlow operations on an OpenFlow-enabled device running Junos OS. Commands are listed in alphabetical order.

**Table 188: OpenFlow Operational Mode Commands**

| Command                                  | Task  |
|--|---|
| <a href="#">show openflow capability</a> | Display support information for OpenFlow features, actions, and match conditions on the device. |
| <a href="#">show openflow controller</a> | Display OpenFlow controller information and status.   |
| <a href="#">show openflow filters</a>    | Display information for filters bound to OpenFlow interfaces.                                   |

Table 188: OpenFlow Operational Mode Commands (*continued*)

| Command  | Task  |
|--|---|
| <code>show openflow flows</code>                 | Display OpenFlow flow information.  |
| <code>show openflow groups</code>                | Display information about OpenFlow groups.<br><br><i>NOTE:</i> This command is supported only on Juniper Networks devices running OpenFlow v1.3.1 or later. |
| <code>show openflow interfaces</code>            | Display physical characteristics and status information for interfaces participating in OpenFlow.   |
| <code>show openflow statistics flows</code>      | Display statistics for OpenFlow flow entries.   |
| <code>show openflow statistics groups</code>     | Display statistics for OpenFlow groups.<br><br><i>NOTE:</i> This command is supported only on Juniper Networks devices running OpenFlow v1.3.1 or later.    |
| <code>show openflow statistics interfaces</code> | Display statistics for interfaces participating in OpenFlow.  |
| <code>show openflow statistics packet</code>     | Display statistics for packet-in and packet-out actions.  |
| <code>show openflow statistics queue</code>      | Display statistics for OpenFlow queues in hardware.   |
| <code>show openflow statistics summary</code>    | Display summary statistics for all OpenFlow flows.  |
| <code>show openflow statistics tables</code>     | Display statistics for OpenFlow flow tables.  |
| <code>show openflow summary</code>               | Display summary information for OpenFlow flows.   |
| <code>show openflow switch</code>                | Display OpenFlow message statistics for OpenFlow virtual switches.  |

## show openflow capability

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <b>show openflow capability</b><br><action   feature   match-condition>  |
| <b>Release Information</b>      | Command introduced in Junos OS Release 13.3.<br>Command introduced in Junos OS Release 13.3 for EX Series switches.<br>Command introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.   |
| <b>Description</b>              | Display support information for OpenFlow features, actions, and match conditions on the device.  |
| <b>Options</b>                  | <b>none</b> —Display support information for all OpenFlow capabilities.<br><br><b>action</b> —(Optional) Display support information for OpenFlow actions.<br><br><b>feature</b> —(Optional) Display support information for OpenFlow features.<br><br><b>match-condition</b> —(Optional) Display support information for OpenFlow match conditions. |
| <b>Required Privilege Level</b> | admin  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">OpenFlow Operational Mode Commands on page 2183</a></li> <li>• <a href="#">OpenFlow Support on Devices Running Junos OS</a></li> </ul>  |
| <b>List of Sample Output</b>    | <a href="#">show openflow capability on page 2188</a><br><a href="#">show openflow capability (OpenFlow 1.3.1) on page 2188</a><br><a href="#">show openflow capability action on page 2189</a><br><a href="#">show openflow capability feature on page 2189</a><br><a href="#">show openflow capability match-condition on page 2190</a>            |
| <b>Output Fields</b>            | Table 189 on page 2185 lists the output fields for the <b>show openflow capability</b> command. Output fields are listed in the approximate order in which they appear.  |

**Table 189: show openflow capability Output Fields**

| Field Name  | Field Description   |
|---|---|
| Supported Features—Indicates Support for the Following OpenFlow Features                |   |
| Flow statistics   | Indicates whether the switch supports OpenFlow flow statistics.       |
| Table statistics  | Indicates whether the switch supports OpenFlow flow table statistics. |
| Port statistics   | Indicates whether the switch supports OpenFlow port statistics.       |
| Group statistics  | Indicates whether the switch supports OpenFlow group statistics.      |
| NOTE: This field appears only if the Junos OS device supports OpenFlow v1.3.1 or later. |   |

Table 189: show openflow capability Output Fields (*continued*)

| Field Name  | Field Description  |
|---|--|
| 802.1d spanning tree  | Indicates whether the switch supports the 802.1D Spanning Tree Protocol.   |
| Reassemble IP fragments   | Indicates whether the switch supports reassembling IP fragments.   |
| Queue statistics  | Indicates whether the switch supports OpenFlow queue statistics.   |
| Match IP addresses in ARP pkts  | Indicates whether the switch supports matching on IP addresses in ARP packets.   |
| <b>Supported Match Conditions—Indicates Support for the Following OpenFlow Match Conditions</b> |  |
| Switch input port   | Displays support for matching against the ingress switch port.   |
| VLAN vid  | Displays support for matching against the VLAN identifier in the outermost VLAN tag.   |
| Ethernet source address   | Displays support for matching against the Ethernet source address.   |
| Ethernet destination address  | Displays support for matching against the Ethernet destination address.  |
| Ethernet frame type   | Displays support for matching against the Ethernet frame type.   |
| IP protocol   | Displays support for matching against the IP protocol or lower 8 bits of the ARP opcode.   |
| TCP/UDP source port   | Displays support for matching against the TCP or UDP source port.  |
| TCP/UDP destination port  | Displays support for matching against the TCP or UDP destination port.   |
| IP(v4) source address   | Displays support for matching against the IPv4 source address.<br><br><b>NOTE:</b> <b>IPv4</b> appears only if the Junos OS device supports OpenFlow v1.3.1 or later.      |
| IP(v4) destination address  | Displays support for matching against the IPv4 destination address.<br><br><b>NOTE:</b> <b>IPv4</b> appears only if the Junos OS device supports OpenFlow v1.3.1 or later. |
| IPv6 source address   | Displays support for matching against the IPv6 source address.<br><br><b>NOTE:</b> This field appears only if the Junos OS device supports OpenFlow v1.3.1 or later.       |

Table 189: show openflow capability Output Fields (*continued*)

| Field Name  | Field Description   |
|---|---|
| IPv6 destination address  | Displays support for matching against the IPv6 destination address.<br><br><b>NOTE:</b> This field appears only if the Junos OS device supports OpenFlow v1.3.1 or later.                                     |
| VLAN priority   | Displays support for matching against the VLAN priority in the outermost VLAN tag.  |
| IP ToS (DSCP field)   | Displays support for matching against the IPv4 ToS bits.  |
| <b>Supported Actions—Indicates Support for the Following OpenFlow Actions</b> |   |
| Output to switch port   | Displays support for forwarding the packet to a specified port.   |
| Set the 802.1q VLAN id  | Displays support for the optional Modify-Field action to modify the existing 802.1Q VLAN ID of the outermost VLAN tag in the frame header or to add a new header with the VLAN ID if none exists.             |
| Set the 802.1q priority   | Displays support for the optional Modify-Field action to modify the existing 802.1Q VLAN priority of the outermost VLAN tag in the frame header or to add a new header with the VLAN priority if none exists. |
| Strip the 802.1q header   | Displays support for the optional Modify-Field action to remove the outermost VLAN header in the frame.   |
| Ethernet source address   | Displays support for the optional Modify-Field action to modify the Ethernet source address field in the frame header.  |
| Ethernet destination address  | Displays support for the optional Modify-Field action to modify the Ethernet destination address field in the frame header.   |
| IP source address   | Displays support for the optional Modify-Field action to modify the IP source address field and update the checksum in the packet header.   |
| IP destination address  | Displays support for the optional Modify-Field action to modify the IP destination address field and update the checksum in the packet header.  |
| IP ToS (DSCP)   | Displays support for the optional Modify-Field action to modify the IPv4 ToS field in the packet header.  |
| TCP/UDP source port   | Displays support for the optional Modify-Field action to modify the TCP or UDP source port field and update the checksum in the packet header.  |
| TCP/UDP destination port  | Displays support for the optional Modify-Field action to modify the TCP or UDP destination port field and update the checksum in the packet header.   |

Table 189: show openflow capability Output Fields (*continued*)

| Field Name      | Field Description   |
|-----------------|---|
| Output to queue | Displays support for the optional Enqueue action to set the queue ID for the packet.  |
| Execute group   | Displays support for a group action to be executed.<br><br><b>NOTE:</b> This field appears only if the Junos OS device supports OpenFlow v1.3.1 or later. |

## Sample Output

### show openflow capability

```

user@host> show openflow capability
Openflowd platform feature support:
Flow statistics:      Yes
Table statistics:     Yes
Port statistics:      Yes
802.1d spanning tree: No
Reassemble IP fragments: No
Queue statistics:     Yes
Match IP addresses in ARP pkts: No

Openflowd platform match condition support:
Switch input port:    Yes
VLAN vid:             Yes
Ethernet source address: Yes
Ethernet destination address: Yes
Ethernet frame type: Yes
IP protocol:          Yes
TCP/UDP source port:  Yes
TCP/UDP destination port: Yes
IP source address:     Yes
IP destination address: Yes
VLAN priority:         Yes
IP ToS (DSCP field):  Yes

Openflowd platform action support:
Output to switch port: Yes
Set the 802.1q VLAN id: Yes
Set the 802.1q priority: No
Strip the 802.1q header: Yes
Ethernet source address: No
Ethernet destination address: No
IP source address:     No
IP destination address: No
IP ToS (DSCP):         No
TCP/UDP source port:   No
TCP/UDP destination port: No
Output to queue:       No

```

### show openflow capability (OpenFlow 1.3.1)

```

user@host> show openflow capability
Openflowd platform feature support:
Flow statistics:      Yes

```

```

| <b>List of Sample Output</b>    | <a href="#">show openflow controller (OpenFlow 1.3.1) on page 2192</a><br><a href="#">show openflow controller address (OpenFlow 1.3.1) on page 2192</a><br><a href="#">show openflow controller switch (OpenFlow 1.3.1) on page 2192</a>  |
| <b>Output Fields</b>            | <a href="#">Table 190 on page 2191</a> lists the output fields for the <b>show openflow controller</b> command. Output fields are listed in the approximate order in which they appear.  |

**Table 190: show openflow controller Output Fields**

| Field Name                   | Field Description   |
|------------------------------|---|
| <b>Controller socket</b>     | Socket on the controller to which the OpenFlow virtual switch connects.   |
| <b>Controller IP address</b> | IP address of the OpenFlow controller.                                    |
| <b>Controller protocol</b>   | Protocol used by the switch to initiate a connection with the controller. |

Table 190: show openflow controller Output Fields (*continued*)

| Field Name                          | Field Description  |
|-------------------------------------|--|
| <b>Controller port</b>              | Port on the controller to which the OpenFlow virtual switch connects.  |
| <b>Controller connection state</b>  | Status of the connection between the OpenFlow virtual switch and the controller.   |
| <b>Number of connection attempt</b> | Number of connection attempts made by the virtual switch to the controller.  |
| <b>Controller role</b>              | User-configured role of the controller.  |
| <b>Negotiated version</b>           | <p>A numerical value that represents the OpenFlow version that is negotiated between the Junos OS device and the OpenFlow controller during the initial connection.</p> <p><b>NOTE:</b> This field appears only if the Junos OS device supports OpenFlow version 1.3.1 or later.</p> |

## Sample Output

### show openflow controller (OpenFlow 1.3.1)

```
user@host> show openflow controller
Openflowd controller information:
Controller socket: 15
Controller IP address: 198.51.100.174
Controller protocol: tcp
Controller port: 6633
Controller connection state: up
Number of connection attempt: 5
Controller role: equal
Negotiated version: 4
```

### show openflow controller address (OpenFlow 1.3.1)

```
user@host> show openflow controller address 198.51.100.174
Openflowd controller information:
Controller socket: 15
Controller IP address: 198.51.100.174
Controller protocol: tcp
Controller port: 6633
Controller connection state: up
Number of connection attempt: 5
Controller role: equal
Negotiated version: 4
```

### show openflow controller switch (OpenFlow 1.3.1)

```
user@host> show openflow controller switch OFswitch1
Openflowd controller information:
Controller socket: 15
Controller IP address: 198.51.100.174
Controller protocol: tcp
Controller port: 6633
```

```
Controller connection state: up  
Number of connection attempt: 5  
Controller role: equal  
Negotiated version: 4
```

## show openflow filters

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <b>show openflow filters</b><br><b>&lt;interface <i>interface-name</i>&gt;</b><br><b>&lt;switch <i>switch-name</i>&gt;</b>   |
| <b>Release Information</b>      | Command introduced in Junos OS Release 13.3.<br>Command introduced in Junos OS Release 13.3 for EX Series switches.<br>Command introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.   |
| <b>Description</b>              | Display information for filters bound to OpenFlow interfaces.  |
| <b>Options</b>                  | <p><b>none</b>—Display information for all filters that are bound to OpenFlow interfaces.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Display information for the filter bound to the specified OpenFlow interface. The interface name must include the logical unit number.</p> <p><b>switch <i>switch-name</i></b>—(Optional) Display information for filters bound to the interfaces configured under the specified OpenFlow virtual switch.</p> |
| <b>Required Privilege Level</b> | admin  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">OpenFlow Operational Mode Commands on page 2183</a></li> <li>• <a href="#">Understanding OpenFlow Flows and Filters on Devices Running Junos OS on page 2058</a></li> </ul>   |
| <b>List of Sample Output</b>    | <a href="#">show openflow filters on page 2195</a><br><a href="#">show openflow filters interface on page 2195</a><br><a href="#">show openflow filters switch on page 2195</a>  |
| <b>Output Fields</b>            | <a href="#">Table 191 on page 2194</a> lists the output fields for the <b>show openflow filters</b> command. Output fields are listed in the approximate order in which they appear.   |

**Table 191: show openflow filters Output Fields**

| Field Name        | Field Description   |
|-------------------|---|
| Switch Name       | User-configured identifier for the OpenFlow virtual switch associated with the interface to which the filter is bound.                            |
| Number of filters | Number of filters bound to OpenFlow interfaces on the virtual switch.   |
| Default action    | Default action executed for packets that do not match any existing flow entries. Values are <b>PACKET IN</b> or <b>DROP</b> .                     |
| Filter name       | Filter identifier consisting of the concatenation of the interface name (including the logical unit number) and an internally assigned switch ID. |
| Filter index      | Auto-generated string that identifies the filter.   |

Table 191: show openflow filters Output Fields (*continued*)

| Field Name           | Field Description   |
|----------------------|---|
| Number of terms      | Number of terms in the filter. Each term consists of match conditions and actions.  |
| Number of priorities | Number of unique active flow priorities in the filter.  |
| Term name            | Filter term identifier, which consists of the filter name (interface name and switch ID), the flow priority, and a sequence number. |
| Priority ID          | Flow entry priority. Higher priority terms are installed above lower priority terms.  |
| Flow ID              | Flow identifier associated with that flow entry.  |
| Number of packets    | Number of packets that have matched a filter term. A filter term is equivalent to a flow entry.                                     |
| Number of bytes      | Number of bytes that have matched a filter term. A filter term is equivalent to a flow entry.                                       |

## Sample Output

### show openflow filters

```
user@host> show openflow filters
```

| Switch Name | Filter Index | Number of terms | Number of priorities | Number of packets |
|-------------|--------------|-----------------|----------------------|-------------------|
| OFswitch1   | 96468992     | 0               | 0                    | 0                 |
|             | 96468993     | 0               | 0                    | 0                 |
|             | 96468994     | 0               | 0                    | 0                 |
|             | 96468995     | 0               | 0                    | 0                 |
|             | 96468996     | 1               | 1                    | 7928017621        |

### show openflow filters interface

```
user@host> show openflow filters interface ge-1/1/7.0
```

```
Switch Name: OFswitch1
```

```

| <b>Output Fields</b>            | Table 192 on page 2197 lists the output fields for the <b>show openflow flows</b> command. Output fields are listed in the approximate order in which they appear.  |

**Table 192: show openflow flows Output Fields**

| Field Name             | Field Description   |
|------------------------|---|
| <b>Switch Name</b>     | User-configured identifier for the OpenFlow virtual switch on which the flow resides. |
| <b>Number of flows</b> | Number of active flow entries associated with that OpenFlow virtual switch.           |
| <b>Flow name</b>       | Flow descriptor.  |

Table 192: show openflow flows Output Fields (*continued*)

| Field Name               | Field Description   |
|--------------------------|---|
| <b>Table ID</b>          | Identifier for the flow table from which the flow originated.   |
| <b>Flow ID</b>           | Flow identifier associated with that flow entry.  |
| <b>Number of packets</b> | Number of packets that have matched the flow entry.   |
| <b>Priority</b>          | Flow entry priority. Packets match higher priority entries before matching lower priority entries.  |
| <b>Idle timeout</b>      | Number of seconds after which the flow entry is removed from the flow table provided there are no matching packets.   |
| <b>Hard timeout</b>      | Number of seconds after which the flow entry is removed from the flow table regardless of the number of matching packets.   |
| <b>Cookie</b>            | An identifier, which is specified by the OpenFlow controller when the flow is installed in the flow table. Cookies are used to filter flows for flow modification and delete operations.<br><br><b>NOTE:</b> This field appears only if the Juniper Networks device supports OpenFlow version 1.3.1 or later. |
| <b>Match</b>             | Configured match conditions against which the incoming packet is compared.  |
| <b>Action</b>            | Set of actions (for OpenFlow v1.0) or flow instructions (for OpenFlow v1.3.1) applied to a packet when it matches the flow entry.   |
| <b>Number of match</b>   | Number of match conditions against which the incoming packet is compared.   |
| <b>Number of action</b>  | Number of actions (for OpenFlow v1.0) or flow instructions (for OpenFlow v1.3.1) that are applied to a packet when it matches the flow entry.   |

## Sample Output

### show openflow flows switch brief

```
user@host> show openflow flows switch OFswitch1 brief
```

| Switch Name | Flow ID  | Number of packets | Priority | Number of match | Number of action |
|-------------|----------|-------------------|----------|-----------------|------------------|
| OFswitch1   | 16842752 | 8075372509        | 32768    | 1               | 1                |

### show openflow flows detail (Specific Flow, OpenFlow 1.3.1)

```
user@host> show openflow flows 16842752 detail
```

```
Flow name: flow-16842752
Table ID: 1      Flow ID: 16842752
Priority: 32768  Idle timeout(in sec):0      Hard timeout(in sec): 0
Cookie: 0
Match: Input port: 45549
      Ethernet src addr: wildcard
      Ethernet dst addr: wildcard
      Input vlan id: wildcard      Input VLAN priority: wildcard
      Ether type: wildcard
      IP ToS: wildcard      IP protocol: wildcard
      IPv4 src addr: wildcard
      IPv4 dst addr: wildcard
      IPv6 src addr: none
      IPv6 dst addr: none
      Source port: wildcard      Destination port: wildcard
Action: Group 20,
```

#### show openflow flows summary (Specific Flow)

```
user@host> show openflow flows 16842752 summary
Flow name: flow-16842752
Number of packets: 8066495711
```

## show openflow groups

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | show openflow groups<br><brief   details   summary><br><group-id>  |
| <b>Release Information</b>      | Command introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.  |
| <b>Description</b>              | Display information about OpenFlow groups. Groups are supported only on Juniper Networks devices running OpenFlow v1.3.1 or later.   |
| <b>Options</b>                  | <p><b>none</b>—Display information for all groups.</p> <p><b>brief   detail   summary</b>—(Optional) Display the specified level of output.</p> <p><b>group-id</b>—(Optional) Display information about the specified group only.</p>  |
| <b>Required Privilege Level</b> | admin  |

| <b>Output Fields</b>            | <p><a href="#">Table 193 on page 2201</a> describes the output fields for the <b>show openflow groups</b> command.</p> <p><a href="#">Table 193 on page 2201</a> lists the output fields in the approximate order in which they are displayed in the sample output.</p>  |

**Table 193: show openflow groups Output Fields**

| Field Name               | Field Description   |
|--------------------------|---|
| Group ID                 | Unique identifier assigned to a group by the OpenFlow controller.           |
| Type                     | Group type, which can be either All or Indirect.                            |
| Number of Buckets        | Number of buckets for a particular group. A group can have 0 to 32 buckets. |
| Number of Flow Reference | Number of flow entries that point to a particular group.                    |

Table 193: show openflow groups Output Fields (*continued*)

| Field Name              | Field Description   |
|-------------------------|---|
| <b>Bucket</b>           | Information about each bucket for a particular group.                                 |
| <b>Actions</b>          | Set of action(s) applied to a packet when it matches the flow entry.                  |
| <b>Switch Name</b>      | User-configured identifier for the OpenFlow virtual switch on which the flow resides. |
| <b>Number of Groups</b> | Number of groups that currently exist in the OpenFlow virtual switch.                 |
| <b>Flow</b>             | Identifier associated with a particular flow entry.                                   |

## Sample Output

### show openflow groups

```
user@host> show openflow groups
```

| Group ID | Type     | Number of Buckets | Number of Flow Reference |
|----------|----------|-------------------|--------------------------|
| 50       | All      | 2                 | 1                        |
| 51       | All      | 2                 | 1                        |
| 60       | Indirect | 1                 | 0                        |

### show openflow groups brief

```
user@host> show openflow groups brief
```

| Group ID | Type     | Number of Buckets | Number of Flow Reference |
|----------|----------|-------------------|--------------------------|
| 50       | All      | 2                 | 1                        |
| 51       | All      | 2                 | 1                        |
| 60       | Indirect | 1                 | 0                        |

| <b>Output Fields</b>            | Table 195 on page 2208 lists the output fields for the <b>show openflow statistics flows</b> command. Output fields are listed in the approximate order in which they appear.   |

**Table 195: show openflow statistics flows Output Fields**

| Field Name        | Field Description   |
|-------------------|---|
| Switch Name       | User-configured identifier for the OpenFlow virtual switch on which the flow resides. |
| Table ID          | Identifier for the flow table from which the flow originated.                         |
| Flow ID           | OpenFlow flow entry identifier.   |
| Duration(in sec)  | Number of seconds the flow has been active.   |
| Duration(in nsec) | Number of nanoseconds the flow has been active beyond the <b>Duration(in sec)</b> .   |

Table 195: show openflow statistics flows Output Fields (*continued*)

| Field Name        | Field Description   |
|-------------------|---|
| Priority          | Flow entry priority. Packets match higher priority entries before matching lower priority entries.                        |
| Idle timeout      | Number of seconds after which the flow entry is removed from the flow table provided there are no matching packets.       |
| Hard timeout      | Number of seconds after which the flow entry is removed from the flow table regardless of the number of matching packets. |
| Number of packets | Number of packets that have matched the flow entry.   |
| Number of bytes   | Number of bytes that have matched the flow entry.   |
| Match             | Fields against which the incoming packet is compared.   |
| Action            | Set of actions applied to a packet when it matches the flow entry.  |

## Sample Output

### show openflow statistics flows

```

user@host> show openflow statistics flows
Switch Name: OFswitch1
Table ID: 1      Flow ID: 16842752
Duration(in sec): 58772      Duration(in nsec): 215702000
Priority: 32768  Idle timeout(in sec):0      Hard timeout(in sec): 0
Number of packets: 8745275026
Number of bytes:  524716501560
Match: IN_PORT,
Action: OUTPUT,

```

### show openflow statistics flows (Specific Flow)

```

user@host> show openflow statistics flows 16842752
Switch Name: OFswitch1
Table ID: 1      Flow ID: 16842752
Duration(in sec): 58803      Duration(in nsec): 4127548296
Priority: 32768  Idle timeout(in sec):0      Hard timeout(in sec): 0
Number of packets: 8749713419
Number of bytes:  524982805140
Match: IN_PORT,
Action: OUTPUT,

```

### show openflow statistics flows switch

```

user@host> show openflow statistics flows switch OFswitch1
Switch Name: OFswitch1
Table ID: 1      Flow ID: 16842752
Duration(in sec): 58829      Duration(in nsec): 4124448296
Priority: 32768  Idle timeout(in sec):0      Hard timeout(in sec): 0
Number of packets: 8752672358
Number of bytes:  525160341480

```

Match: IN\_PORT,  
Action: OUTPUT,

## show openflow statistics groups

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <b>show openflow statistics groups</b><br><b>&lt;group-id&gt;</b>  |
| <b>Release Information</b>      | Command introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.  |
| <b>Description</b>              | Display statistics for OpenFlow groups. Groups are supported only on Juniper Networks devices running OpenFlow v1.3.1 or later.  |
| <b>Options</b>                  | <b>none</b> —Display statistics for all groups defined on all OpenFlow virtual switches.<br><br><b>group-id</b> —(Optional) Display statistics only for the specified group.   |
| <b>Required Privilege Level</b> | admin  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Understanding How the OpenFlow Group Action Works on page 2061</a></li> <li>• <a href="#">OpenFlow Operational Mode Commands on page 2183</a></li> <li>• <a href="#">show openflow groups on page 2201</a></li> </ul> |
| <b>List of Sample Output</b>    | <a href="#">show openflow statistics group on page 2212</a><br><a href="#">show openflow statistics group (Specific Group) on page 2212</a>  |
| <b>Output Fields</b>            | <a href="#">Table 196 on page 2211</a> lists the output fields for the <b>show openflow statistics groups</b> command. Output fields are listed in the approximate order in which they appear.   |

**Table 196: show openflow statistics groups Output Fields**

| Field                      | Description   |
|----------------------------|---|
| Switch Name                | User-configured identifier for the OpenFlow virtual switch in which the groups resides. |
| Group ID                   | Unique identifier assigned to the group by the OpenFlow controller.                     |
| Ref Count                  | Number of flow entries that reference the group.  |
| Number of packets (group)  | Number of packets handled by the group.   |
| Number of bytes (group)    | Number of bytes handled by the group.   |
| Duration(in sec)           | Number of seconds the group has been active.  |
| Duration(in nsec)          | Number of nanoseconds the group has been active beyond the <b>Duration(in sec)</b>      |
| Bucket <i>number</i>       | Statistics for a particular bucket.   |
| Number of packets (bucket) | Number of packets handled by a bucket in the group.                                     |

Table 196: show openflow statistics groups Output Fields (*continued*)

| Field                           | Description                                       |
|---------------------------------|---|
| <b>Number of bytes</b> (bucket) | Number of bytes handled by a bucket in the group. |

For a group with the group type of all, the values specified in the **Number of packets** (group) and **Number of bytes** (group) fields are usually the same as those specified in the **Number of packets** (bucket) and **Number of bytes** (bucket) fields because all buckets in the group are executed.

## Sample Output

### show openflow statistics group

```

user@host> show openflow statistics groups

Switch Name: OF-ex92k
Group ID: 50                      Ref Count: 1

## show openflow statistics interfaces

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <b>show openflow statistics interfaces</b><br><b>&lt;switch <i>switch-name</i>&gt;</b>  |
| <b>Release Information</b>      | Command introduced in Junos OS Release 13.3.<br>Command introduced in Junos OS Release 13.3 for EX Series switches.<br>Command introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.  |
| <b>Description</b>              | Display statistics for interfaces participating in OpenFlow.  |
| <b>Options</b>                  | <b>none</b> —Display statistics for all interfaces participating in OpenFlow for all configured OpenFlow virtual switches.<br><br><b>switch <i>switch-name</i></b> —(Optional) Display statistics only for those interfaces on the specified OpenFlow virtual switch.   |
| <b>Required Privilege Level</b> | admin   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">OpenFlow Operational Mode Commands on page 2183</a></li> <li>• <a href="#">show openflow interfaces on page 2204</a></li> <li>• <a href="#">show openflow statistics flows on page 2208</a></li> <li>• <a href="#">show openflow statistics tables on page 2223</a></li> </ul> |
| <b>List of Sample Output</b>    | <a href="#">show openflow statistics interfaces on page 2214</a>  |

**Output Fields** Table 197 on page 2213 lists the output fields for the **show openflow statistics interfaces** command. Output fields are listed in the approximate order in which they appear.

**Table 197: show openflow statistics interfaces Output Fields**

| Field Name      | Field Description   |
|-----------------|---|
| Switch Name     | User-configured identifier for the OpenFlow virtual switch to which the interface is bound. |
| Interface Name  | Name of the logical interface.  |
| Port Number     | Port identifier associated with the OpenFlow interface.                                     |
| Num of rx pkts  | Number of packets received on the OpenFlow interface.                                       |
| Num of tx pkts  | Number of packets transmitted on the OpenFlow interface.                                    |
| Num of rx bytes | Number of bytes received on the OpenFlow interface.   |
| Num of tx bytes | Number of bytes transmitted on the OpenFlow interface.                                      |

Table 197: show openflow statistics interfaces Output Fields (*continued*)

| Field Name                      | Field Description                                   |
|---------------------------------|---|
| Num of rx error                 | Number of receive errors.                           |
| Num of tx error                 | Number of transmit errors.                          |
| Number of packets dropped by RX | Number of packets dropped by the ingress interface. |
| Number of packets dropped by TX | Number of packets dropped by the egress interface.  |
| Number of rx frame error        | Number of packets with frame alignment errors.      |
| Number of rx overrun error      | Number of packets with RX overrun.                  |
| Number of CRC error             | Number of CRC errors.                               |
| Number of collisions            | Number of Ethernet collisions.                      |

## Sample Output

### show openflow statistics interfaces

```

user@host> show openflow statistics interfaces
Switch Name: OFswitch1
Interface Name: ge-1/1/2.0      Port Number: 41507
Num of rx pkts: 0                Num of tx pkts: 1372301

Number of collisions: 0

## show openflow statistics packet

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <b>show openflow statistics packet (in   out)</b><br><b>&lt;switch switch-name&gt;</b>   |
| <b>Release Information</b>      | Command introduced in Junos OS Release 13.3.<br>Command introduced in Junos OS Release 13.3 for EX Series switches.<br>Command introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.             |
| <b>Description</b>              | Display statistics for packet-in and packet-out (send-packet) actions.   |
| <b>Options</b>                  | <b>none</b> —Display statistics for all OpenFlow virtual switches.<br><br><b>switch switch-name</b> —(Optional) Display statistics only for the specified OpenFlow virtual switch.                             |
| <b>Required Privilege Level</b> | admin  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">OpenFlow Operational Mode Commands on page 2183</a></li> </ul>  |
| <b>List of Sample Output</b>    | <a href="#">show openflow statistics packet in on page 2216</a><br><a href="#">show openflow statistics packet out on page 2217</a><br><a href="#">show openflow statistics packet out switch on page 2217</a> |
| <b>Output Fields</b>            | <a href="#">Table 198 on page 2216</a> lists the output fields for the <b>show openflow statistics packet</b> command. Output fields are listed in the approximate order in which they appear.                 |

**Table 198: show openflow statistics packet Output Fields**

| Field Name   | Field Description  |
|--------------|--|
| Switch Name  | User-configured identifier for the OpenFlow virtual switch.  |
| Rx packets   | Number of packets received by the OpenFlow virtual switch that have been sent to the OpenFlow controller. The switch includes the packet in the data portion of an OFPT_PACKET_IN message. |
| Tx packets   | Number of packets sent by the OpenFlow controller to an egress interface. The controller includes the packet in the data portion of an OFPT_PACKET_OUT message.                            |
| Drop packets | Number of dropped packets.   |

## Sample Output

### show openflow statistics packet in

```
user@host> show openflow statistics packet in
```

Openflow packet-in statistics information:

| Switch Name | Rx packets | Drop packets |
|-------------|------------|--------------|
| OFswitch1   | 1044137    | 0            |

#### show openflow statistics packet out

user@host> show openflow statistics packet out

Openflow packet-out statistics information:

| Switch Name | Tx packets | Drop packets |
|-------------|------------|--------------|
| OFswitch1   | 5260759    | 0            |

#### show openflow statistics packet out switch

user@host> show openflow statistics packet out switch OFswitch1

Openflow packet-out statistics information:

| Switch Name | Tx packets | Drop packets |
|-------------|------------|--------------|
| OFswitch1   | 5260759    | 0            |

## show openflow statistics queue

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <b>show openflow statistics queue</b><br><b>&lt;interface <i>interface-name</i>&gt;</b>   |
| <b>Release Information</b>      | Command introduced in Junos OS Release 13.3.<br>Command introduced in Junos OS Release 13.3 for EX Series switches.<br>Command introduced in Junos OS Release 14.1X53-D10 for QFX Series switches.  |
| <b>Description</b>              | Display statistics for hardware queues for interfaces participating in OpenFlow.  |
| <b>Options</b>                  | <b>none</b> —Display queue statistics for all interfaces participating in OpenFlow.<br><br><b>interface <i>interface-name</i></b> —(Optional) Display queue statistics only for the specified interface. Specify the interface name including the logical unit number—for example, ge-1/1/0.0 |
| <b>Required Privilege Level</b> | admin   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">OpenFlow Operational Mode Commands on page 2183</a></li> <li>• <a href="#">show openflow statistics flows on page 2208</a></li> <li>• <a href="#">show openflow statistics tables on page 2223</a></li> </ul>                            |
| <b>List of Sample Output</b>    | <a href="#">show openflow statistics queue on page 2219</a><br><a href="#">show openflow statistics queue interface on page 2219</a>  |
| <b>Output Fields</b>            | Table 199 on page 2218 lists the output fields for the <b>show openflow statistics queue</b> command. Output fields are listed in the approximate order in which they appear.   |

**Table 199: show openflow statistics queue Output Fields**

| Field Name  | Field Description   |
|-------------|---|
| Switch Name | User-configured identifier for the OpenFlow virtual switch. |
| Port No     | Port identifier associated with the OpenFlow interface.     |
| Queue Id    | Priority queue identifier.                                  |
| TX bytes    | Number of bytes transmitted through the queue.              |
| TX packets  | Number of packets transmitted through the queue.            |
| Tx errors   | Number of packets dropped by the queue due to overrun.      |

## Sample Output

### show openflow statistics queue

```

user@host> show openflow statistics queue
Openflow queue statistics information:
Switch Name      Port No Queue Id  TX bytes    TX packets  Tx errors
OFswitch1        41507  0      115327076   1372459     0

**Table 200: show openflow statistics summary Output Fields**

| Field Name                   | Field Description   |
|------------------------------|---|
| Switch Name                  | User-configured identifier for the OpenFlow virtual switch. |
| Port Number                  | Port identifier associated with the OpenFlow interface.     |
| Number of RX packets         | Number of packets received on the OpenFlow interface.       |
| Number of TX packets         | Number of packets transmitted on the OpenFlow interface.    |
| Num of packets dropped by RX | Number of packets dropped by the ingress interface.         |
| Flow ID                      | Flow identifier associated with that flow entry.            |
| Number of packets            | Number of packets that have matched the flow entry.         |
| Duration (in sec)            | Number of seconds the flow has been active.                 |

Table 200: show openflow statistics summary Output Fields (*continued*)

| Field Name   | Field Description   |
|--------------|---|
| Priority     | Flow entry priority. Packets match higher priority entries before matching lower priority entries.                        |
| Idle Timeout | Number of seconds after which the flow entry is removed from the flow table provided there are no matching packets.       |
| Hard Timeout | Number of seconds after which the flow entry is removed from the flow table regardless of the number of matching packets. |

## Sample Output

### show openflow statistics summary

```
user@host> show openflow statistics summary
```

| Switch Name | Port Number | Number of RX packets | Number of TX packets | Num of packets dropped by RX |
|-------------|-------------|----------------------|----------------------|------------------------------|
| OFswitch1   | 41507       | 0                    | 1372609              | 0                            |

### Understanding Graceful Routing Engine Switchover

This topic contains the following sections:

- [Graceful Routing Engine Switchover Concepts on page 2231](#)
- [Effects of a Routing Engine Switchover on page 2235](#)

#### Graceful Routing Engine Switchover Concepts

---

The graceful Routing Engine switchover (GRES) feature in Junos OS enables a routing platform with redundant Routing Engines to continue forwarding packets, even if one Routing Engine fails. GRES preserves interface and kernel information. Traffic is not interrupted. However, GRES does not preserve the control plane.

**NOTE:** On T Series routers, TX Matrix routers, and TX Matrix Plus routers, the control plane is preserved in case of GRES with nonstop active routing (NSR), and nearly 75 percent of line rate worth of traffic per Packet Forwarding Engine remains uninterrupted during GRES.

Neighboring routers detect that the router has experienced a restart and react to the event in a manner prescribed by individual routing protocol specifications.

To preserve routing during a switchover, GRES must be combined with either:

- Graceful restart protocol extensions
- Nonstop active routing

Any updates to the master Routing Engine are replicated to the backup Routing Engine as soon as they occur.

Mastership switches to the backup Routing Engine if:

- The master Routing Engine kernel stops operating.
- The master Routing Engine experiences a hardware failure.
- The administrator initiates a manual switchover,

**NOTE:** To quickly restore or to preserve routing protocol state information during a switchover, GRES must be combined with either graceful restart or nonstop active routing, respectively. For more information about graceful restart, see [“Graceful Restart Concepts” on page 2257](#). For more information about nonstop active routing, see [“Nonstop Active Routing Concepts” on page 2240](#).

If the backup Routing Engine does not receive a keepalive from the master Routing Engine after 2 seconds (4 seconds on M20 routers), it determines that the master Routing Engine has failed and: takes mastership.

The Packet Forwarding Engine:

- Seamlessly disconnects from the old master Routing Engine
- Reconnects to the new master Routing Engine
- Does not reboot
- Does not interrupt traffic

The new master Routing Engine and the Packet Forwarding Engine then become synchronized. If the new master Routing Engine detects that the Packet Forwarding Engine state is not up to date, it resends state update messages.

**NOTE:** If adjacencies between the restarting router and the neighboring peer 'helper' routers time out, graceful restart protocol extensions are unable to notify the peer 'helper' routers about the impending restart. Graceful restart can then stop and cause interruptions in traffic.

To ensure that these adjacencies are kept, change the [hold-time](#) for IS-IS protocols from the default of 27 seconds to a value higher than 40 seconds.

**NOTE:** Successive Routing Engine switchover events must be a minimum of 240 seconds (4 minutes) apart after both Routing Engines have come up.

If the router or switch displays a warning message similar to **Standby Routing Engine is not ready for graceful switchover. Packet Forwarding Engines that are not ready for graceful switchover might be reset**. Do not attempt switchover. If you choose to proceed with switchover, only the Packet Forwarding Engines that were not ready for graceful switchover are reset. None of the FPCs should spontaneously restart. We recommend that you wait until the warning no longer appears and then proceed with the switchover.

**NOTE:** In a routing matrix with TX Matrix Plus router with 3D SIBs, for successive Routing Engine switchover, events must be a minimum of 900 seconds (15 minutes) apart after both Routing Engines have come up.

GRES must be performed on one line-card chassis (LCC) (of a TX Matrix router with 3D SIBs) at a time to avoid synchronization issues.

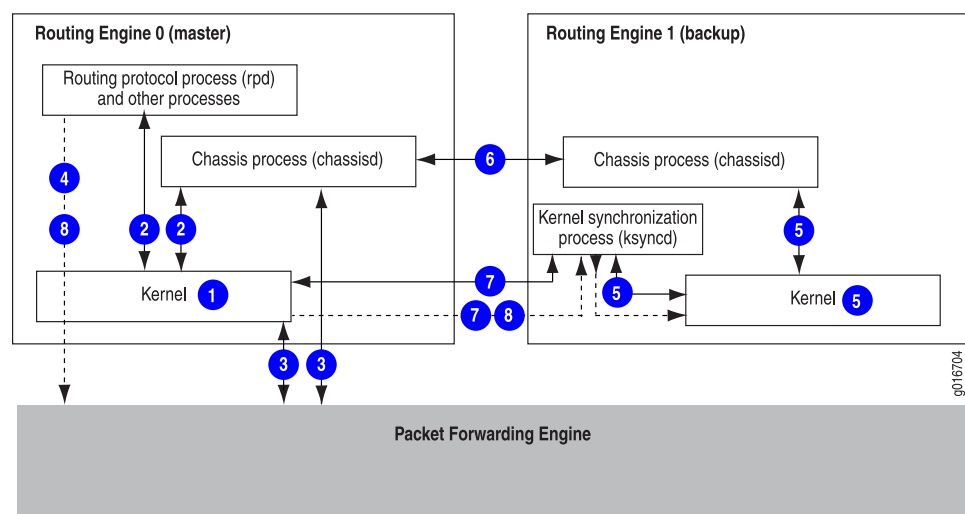

**NOTE:**

- We do *not* recommend performing a commit operation on the backup Routing Engine when GRES is enabled on the router or switch.
- We do *not* recommend enabling GRES on the backup Routing Engine in *any* scenario.

Figure 37 on page 2233 shows the system architecture of graceful Routing Engine switchover and the process a routing platform follows to prepare for a switchover.

**Figure 37: Preparing for a Graceful Routing Engine Switchover**

**NOTE:** Check GRES readiness by executing both:

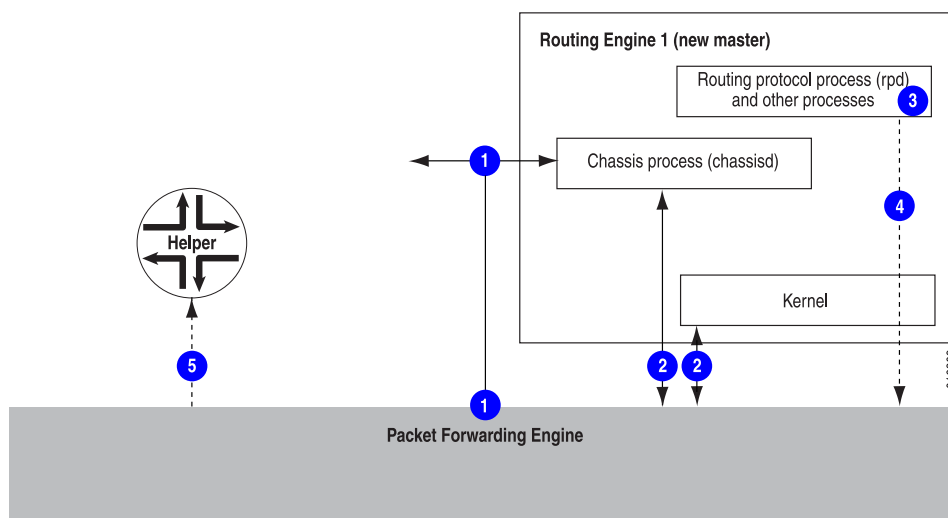

- The **request chassis routing-engine master switch check** command from the master Routing Engine
- The **show system switchover** command from the Backup Routing Engine

The switchover preparation process for GRES is as follows:

1. The master Routing Engine starts.
2. The routing platform processes (such as the chassis process [chassisd]) start.
3. The Packet Forwarding Engine starts and connects to the master Routing Engine.
4. All state information is updated in the system.
5. The backup Routing Engine starts.
6. The system determines whether GRES has been enabled.
7. The kernel synchronization process (ksyncd) synchronizes the backup Routing Engine with the master Routing Engine.
8. After ksyncd completes the synchronization, all state information and the forwarding table are updated.

Figure 38 on page 2234 shows the effects of a switchover on the routing (or switching) platform.

**Figure 38: Graceful Routing Engine Switchover Process**

When a switchover occurs, the switchover process is as follows:

1. When keepalives from the master Routing Engine are lost, the system switches over gracefully to the backup Routing Engine.
2. The Packet Forwarding Engine connects to the backup Routing Engine, which becomes the new master.
3. Routing platform processes that are not part of GRES (such as the routing protocol process [rpd]) restart.
4. State information learned from the point of the switchover is updated in the system.
5. If configured, graceful restart protocol extensions collect and restore routing information from neighboring peer *helper* routers.

**NOTE:** On T Series and M320 routers during GRES, the Switch Interface Boards (SIBs) are taken offline and restarted one by one. This is done to provide the Switch Processor Mezzanine Board (SPMB) that manages the SIB enough time to populate state information for its associated SIB. However, on a fully populated chassis where all FPCs are sending traffic at full line rate, there might be momentary packet loss during the switchover.

**NOTE:** When GRES is configured and the `restart chassis-control` command is executed on a TX Matrix Plus router with 3D SIBs, we cannot ascertain which Routing Engine becomes the master. This is because the `chassisd` process restarts with the execution of the `restart chassis-control` command. The `chassisd` process is responsible for maintaining and retaining mastership and when it is restarted, the new `chassisd` is processed based on the router or switch load. As a result, any one of the Routing Engines is made the master.

### Effects of a Routing Engine Switchover

Table 204 on page 2236 describes the effects of a Routing Engine switchover when different features are enabled:

- No high availability features
- Graceful Routing Engine switchover
- Graceful restart
- Nonstop active routing

Table 204: Effects of a Routing Engine Switchover

| Feature   | Benefits   | Considerations   |
|---|--|--|
| Dual Routing Engines only (no features enabled) | <ul style="list-style-type: none"> <li>When the switchover to the new master Routing Engine is complete, routing convergence takes place and traffic is resumed.</li> </ul>  | <ul style="list-style-type: none"> <li>All physical interfaces are taken offline.</li> <li>Packet Forwarding Engines restart.</li> <li>The standby Routing Engine restarts the routing protocol process (rpd).</li> <li>All hardware and interfaces are discovered by the new master Routing Engine.</li> <li>The switchover takes several minutes.</li> <li>All of the router's adjacencies are aware of the physical (interface alarms) and routing (topology) changes.</li> </ul> |
| GRES enabled                                    | <ul style="list-style-type: none"> <li>During the switchover, interface and kernel information is preserved.</li> <li>The switchover is faster because the Packet Forwarding Engines are not restarted.</li> </ul>   | <ul style="list-style-type: none"> <li>The new master Routing Engine restarts the routing protocol process (rpd).</li> <li>All hardware and interfaces are acquired by a process that is similar to a warm restart.</li> <li>All adjacencies are aware of the router's change in state.</li> </ul>   |
| GRES <i>and</i> nonstop active routing enabled  | <ul style="list-style-type: none"> <li>Traffic is not interrupted during the switchover.</li> <li>Interface and kernel information are preserved.</li> </ul>   | <ul style="list-style-type: none"> <li>Unsupported protocols must be refreshed using the normal recovery mechanisms inherent in each protocol.</li> </ul>  |
| GRES <i>and</i> graceful restart enabled        | <ul style="list-style-type: none"> <li>Traffic is not interrupted during the switchover.</li> <li>Interface and kernel information are preserved.</li> <li>Graceful restart protocol extensions quickly collect and restore routing information from the neighboring routers.</li> </ul> | <ul style="list-style-type: none"> <li>Neighbors are required to support graceful restart, and a wait interval is required.</li> <li>The routing protocol process (rpd) restarts.</li> <li>For certain protocols, a significant change in the network can cause graceful restart to stop.</li> <li>If adjacencies between the restarting router and the neighboring peer 'helper' routers time out, graceful restart can stop and cause interruptions in traffic.</li> </ul>         |

## Graceful Routing Engine Switchover System Requirements

Graceful Routing Engine switchover is supported on all routing (or switching) platforms that contain dual Routing Engines. All Routing Engines configured for graceful Routing Engine switchover must run the same Junos OS release. Hardware and software support for graceful Routing Engine switchover is described in the following sections:

- [Graceful Routing Engine Switchover Platform Support on page 2237](#)
- [Graceful Routing Engine Switchover Feature Support on page 2238](#)
- [Graceful Routing Engine Switchover DPC Support on page 2239](#)
- [Graceful Routing Engine Switchover and Subscriber Access on page 2239](#)
- [Graceful Routing Engine Switchover PIC Support on page 2239](#)

### Graceful Routing Engine Switchover Platform Support

To enable graceful Routing Engine switchover, your system must meet these minimum requirements:

- M20 and M40e routers—Junos OS Release 5.7 or later
- M10i router—Junos OS Release 6.1 or later
- M320 router—Junos OS Release 6.2 or later
- T320 router, T640 router, and TX Matrix router—Junos OS Release 7.0 or later
- M120 router—Junos OS Release 8.2 or later
- MX960 router—Junos OS Release 8.3 or later
- MX480 router—Junos OS Release 8.4 or later (8.4R2 recommended)
- MX240 router—Junos OS Release 9.0 or later
- PTX5000 router—Junos OS Release 12.1X48 or later
- Standalone T1600 router—Junos OS Release 8.5 or later
- Standalone T4000 router—Junos OS Release 12.1R2 or later
- TX Matrix Plus router—Junos OS Release 9.6 or later
- TX Matrix Plus router with 3D SIBs—Junos Release 13.1 or later
- EX Series switches with dual Routing Engines or in a Virtual Chassis — Junos OS Release 9.2 or later for EX Series switches
- QFX Series switches in a Virtual Chassis —Junos OS Release 13.2 or later for the QFX Series
- EX Series or QFX Series switches in a Virtual Chassis Fabric —Junos OS Release 13.2X51-D20 or later for the EX Series and QFX Series switches

For more information about support for graceful Routing Engine switchover, see the sections that follow.

### Graceful Routing Engine Switchover Feature Support

Graceful Routing Engine switchover supports most Junos OS features in Release 5.7 and later. Particular Junos OS features require specific versions of Junos OS. See [Table 205 on page 2238](#).

**Table 205: Graceful Routing Engine Switchover Feature Support**

| Application  | Junos OS Release               |
|--|--------------------------------|
| Aggregated Ethernet interfaces with Link Aggregation Control Protocol (LACP) and aggregated SONET interfaces   | 6.2                            |
| Asynchronous Transfer Mode (ATM) virtual circuits (VCs)  | 6.2                            |
| Logical systems  | 6.3                            |
| <b>NOTE:</b> In Junos OS Release 9.3 and later, the logical router feature is renamed to logical system.   |                                |
| Multicast  | 6.4 (7.0 for TX Matrix router) |
| Multilink Point-to-Point Protocol (MLPPP) and Multilink Frame Relay (MLFR)   | 7.0                            |
| Automatic Protection Switching (APS)—The current active interface (either the designated working or the designated protect interface) remains the active interface during a Routing Engine switchover. | 7.4                            |
| Point-to-multipoint Multiprotocol Label Switching MPLS LSPs (transit only)   | 7.4                            |
| Compressed Real-Time Transport Protocol (CRTP)   | 7.6                            |
| Virtual private LAN service (VPLS)   | 8.2                            |
| Ethernet Operation, Administration, and Management (OAM) as defined by IEEE 802.3ah  | 8.5                            |
| Extended DHCP relay agent  | 8.5                            |
| Ethernet OAM as defined by IEEE 802.1ag  | 9.0                            |
| Packet Gateway Control Protocol (PGCP) process (pgcpd) on Multiservices 500 PICs on T640 routers.  | 9.0                            |
| Subscriber access  | 9.4                            |
| Layer 2 Circuit and LDP-based VPLS pseudowire redundant configuration  | 9.6                            |

The following constraints apply to graceful Routing Engine switchover feature support:

- When graceful Routing Engine switchover and aggregated Ethernet interfaces are configured in the same system, the aggregated Ethernet interfaces must not be configured for fast-polling LACP. When fast polling is configured, the LACP polls time out at the remote end during the Routing Engine mastership switchover. When LACP polling times out, the aggregated link and interface are disabled. The Routing Engine mastership change is fast enough that standard and slow LACP polling do not time out during the procedure. However, note that this restriction does not apply to MX Series Routers that are running Junos OS Release 9.4 or later and have distributed periodic packet management (PPM) enabled—which is the default configuration—on them. In such cases, you can configure graceful Routing Engine switchover and have aggregated Ethernet interfaces configured for fast-polling LACP on the same device.
- When a graceful Routing Engine switchover occurs, the VRRP state does not change. VRRP is supported by graceful Routing Engine switchover only in the case that PPM delegation is enabled (which is the default) and that VRRP is not running on logical interfaces like aggregate-interface (ae) or integrated-routing-bridging-interfaces (irb).

### Graceful Routing Engine Switchover DPC Support

Graceful Routing Engine switchover supports all Dense Port Concentrators (DPCs) on the MX Series 3D Universal Edge Routers running the appropriate version of Junos OS as shown in “[Graceful Routing Engine Switchover Platform Support](#)” on page 2237. For more information about DPCs, see the *MX Series DPC Guide*.

### Graceful Routing Engine Switchover and Subscriber Access

Graceful Routing Engine switchover currently supports most of the features directly associated with dynamic DHCP and dynamic PPPoE subscriber access. Graceful Routing Engine switchover also supports the unified in-service software upgrade (ISSU) for the DHCP access model and the PPPoE access model used by subscriber access.

### Graceful Routing Engine Switchover PIC Support

Graceful Routing Engine switchover is supported on most PICs, except for the services PICs listed in this section. The PIC must be on a supported routing platform running the appropriate version of Junos OS. For information about FPC types, FPC/PIC compatibility, and the initial Junos OS Release in which an FPC supported a particular PIC, see the PIC guide for your router platform.

The following constraints apply to graceful Routing Engine switchover support for services PICs:

- You can include the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level on a router with Adaptive Services, Multiservices, and Tunnel Services PICs configured on it and successfully commit the configuration. However, all services on these PICs—except the Layer 2 service packages and extension-provider and SDK applications on Multiservices PICs—are reset during a switchover.
- Graceful Routing Engine switchover is not supported on any Monitoring Services PICs or Multilink Services PICs. If you include the **graceful-switchover** statement at the **[edit**

**chassis redundancy]** hierarchy level on a router with either of these PIC types configured on it and issue the **commit** command, the commit fails.

- Graceful Routing Engine switchover is not supported on Multiservices 400 PICs configured for monitoring services applications. If you include the **graceful-switchover** statement, the commit fails.

**NOTE:** When an unsupported PIC is online, you cannot enable graceful Routing Engine switchover. If graceful Routing Engine switchover is already enabled, an unsupported PIC cannot come online.

## Nonstop Active Routing Concepts

Nonstop active routing (NSR) uses the same infrastructure as graceful Routing Engine switchover (GRES) to preserve interface and kernel information. However, nonstop active routing also saves routing protocol information by running the routing protocol process (rpd) on the backup Routing Engine. By saving this additional information, nonstop active routing is self-contained and does not rely on helper routers (or switches) to assist the routing platform in restoring routing protocol information. Nonstop active routing is advantageous in networks where neighbor routers (or switches) do not support graceful restart protocol extensions. As a result of this enhanced functionality, nonstop active routing is a natural replacement for graceful restart.

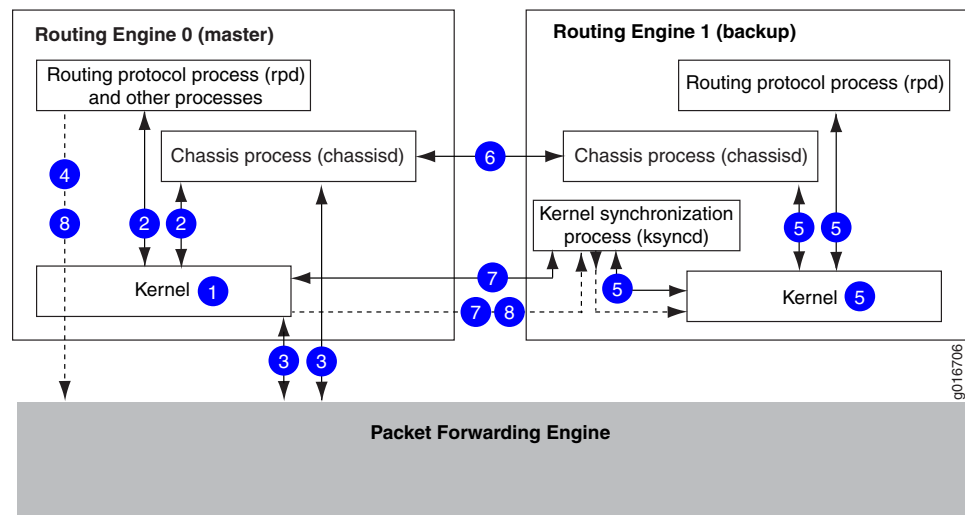

**NOTE:** To use nonstop active routing, you must first enable graceful Routing Engine switchover on your routing (or switching) platform. For more information about graceful Routing Engine switchover, see [“Understanding Graceful Routing Engine Switchover” on page 2231](#).

---

Figure 39 on page 2241 shows the system architecture of nonstop active routing and the process a routing (or switching) platform follows to prepare for a switchover.

**Figure 39: Nonstop Active Routing Switchover Preparation Process**

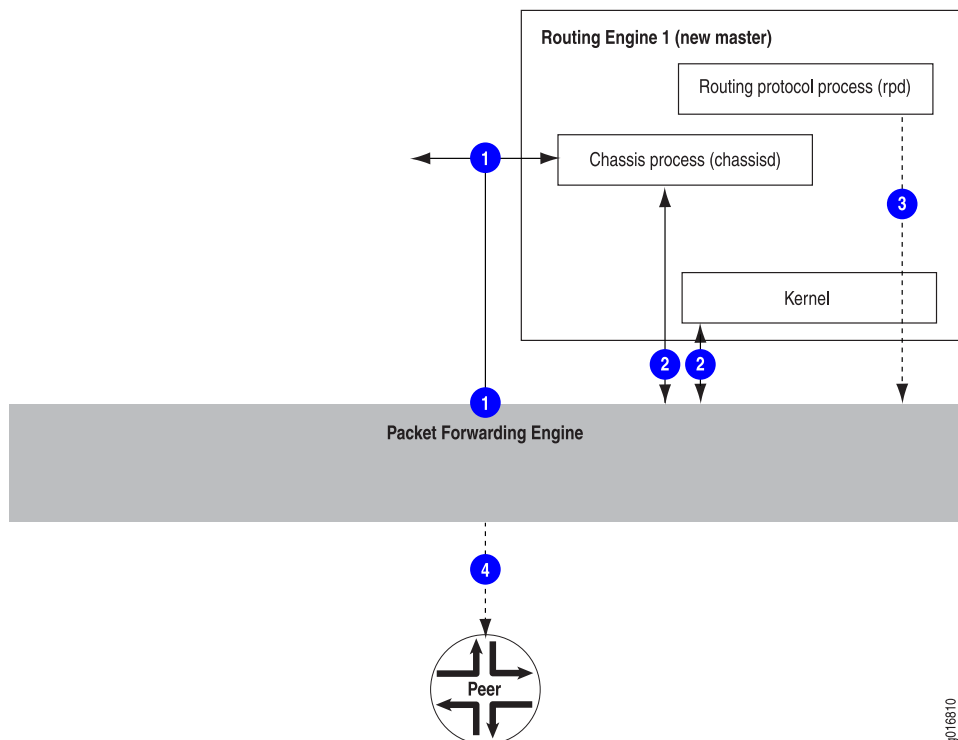

The switchover preparation process for nonstop active routing follows these steps:

1. The master Routing Engine starts.
2. The routing (or switching) platform processes on the master Routing Engine (such as the chassis process [chassisd] and the routing protocol process [rpd]) start.
3. The Packet Forwarding Engine starts and connects to the master Routing Engine.
4. All state information is updated in the system.
5. The backup Routing Engine starts, including the chassis process (chassisd) and the routing protocol process (rpd).
6. The system determines whether graceful Routing Engine switchover and nonstop active routing have been enabled.
7. The kernel synchronization process (ksyncd) synchronizes the backup Routing Engine with the master Routing Engine.
8. For supported protocols, state information is updated directly between the routing protocol processes on the master and backup Routing Engines.

Figure 40 on page 2242 shows the effects of a switchover on the routing platform.

Figure 40: Nonstop Active Routing During a Switchover

The switchover process follows these steps:

1. When keepalives from the master Routing Engine are lost, the system switches over gracefully to the backup Routing Engine.
2. The Packet Forwarding Engine connects to the backup Routing Engine, which becomes the new master. Because the routing protocol process (rpd) and chassis process (chassisd) are already running, these processes do not need to restart.
3. State information learned from the point of the switchover is updated in the system. Forwarding and routing are continued during the switchover, resulting in minimal packet loss.
4. Peer routers (or switches) continue to interact with the routing platform as if no change had occurred. Routing adjacencies and session state relying on underlying routing information are preserved and not reset.

**CAUTION:** We recommend that you do not restart Routing Protocol Process (rpd) on master Routing Engine after enabling nonstop active routing, as it disrupts the protocol adjacency/peering sessions, resulting in traffic loss.

### Nonstop Active Routing Platform and Switching Platform Support

[Table 206 on page 2243](#) lists the platforms that support nonstop active routing (NSR).

**Table 206: Nonstop Active Routing Platform Support**

| Platform                            | Junos OS Release |
|-------------------------------------|------------------|
| M10i router                         | 8.4 or later     |
| M20 router                          | 8.4 or later     |
| M40e router                         | 8.4 or later     |
| M120 router                         | 9.0 or later     |
| M320 router                         | 8.4 or later     |
| MX Series routers                   | 9.0 or later     |
| PTX Series Packet Transport Routers | 12.1R4 or later  |

#### NOTE:

Nonstop active routing (NSR) switchover on PTX series is supported only for the following MPLS and VPN protocols and applications using chained composite next hops:

- Labeled BGP
- Layer 2 VPNs excluding Layer 2 interworking (Layer 2 switching)
- Layer 3 VPNs
- LDP
- RSVP

Table 206: Nonstop Active Routing Platform Support (*continued*)

| For more information, see <a href="#">“Nonstop Active Routing PIM Support” on page 2249</a> .  | (for IPv6) 10.4 or later      |
| RIP and RIP next generation (RIPng)  | 9.0 or later                  |
| RSVP (PTX Series Packet Transport Routers only)  | 12.1R4 or later               |
| Nonstop active routing support for RSVP includes:  |                               |
| <ul style="list-style-type: none"> <li>Point-to-Multipoint LSPs <ul style="list-style-type: none"> <li>RSVP Point-to-Multipoint ingress, transit, and egress LSPs using existing non-chained next hop.</li> <li>RSVP Point-to-Multipoint transit LSPs using composite next hops for Point-to-Multipoint label routes.</li> </ul> </li> <li>Point-to-Point LSPs <ul style="list-style-type: none"> <li>RSVP Point-to-Point ingress, transit, and egress LSPs using non-chained next hops.</li> <li>RSVP Point-to-Point transit LSPs using chained composite next hops.</li> </ul> </li> </ul> |                               |
| RSVP-TE LSP  | 9.5 or later                  |
| For more information, see <a href="#">“Nonstop Active Routing Support for RSVP-TE LSPs” on page 2252</a> .   |                               |
| VPLS   | (LDP-based) 9.1 or later      |
|  | (RSVP-TE-based) 11.2 or later |
| VRRP   | 13.2 or later                 |
| VRRP   | 13.2 or later                 |

**NOTE:** Layer 3 VPN support does not include dynamic GRE tunnels, multicast VPNs, or BGP flow routes.

**NOTE:** If you configure a protocol that is not supported by nonstop active routing, the protocol operates as usual. When a switchover occurs, the state information for the unsupported protocol is not preserved and must be refreshed using the normal recovery mechanisms inherent in the protocol.

**NOTE:** On routers that have logical systems configured on them, only the master logical system supports nonstop active routing.

### Nonstop Active Routing BFD Support

Nonstop active routing supports the Bidirectional Forwarding Detection (BFD) protocol, which uses the topology discovered by routing protocols to monitor neighbors. The BFD protocol is a simple hello mechanism that detects failures in a network. Because BFD is streamlined to be efficient at fast liveness detection, when it is used in conjunction with routing protocols, routing recovery times are improved. With nonstop active routing enabled, BFD session states are not restarted when a Routing Engine switchover occurs.

**NOTE:** BFD session states are saved only for clients using aggregate or static routes or for BGP, IS-IS, OSPF/OSPFv3, or PIM.

When a BFD session is distributed to the Packet Forwarding Engine, BFD packets continue to be sent during a Routing Engine switchover. If nondistributed BFD sessions are to be kept alive during a switchover, you must ensure that the session failure detection time is greater than the Routing Engine switchover time. The following BFD sessions are not distributed to the Packet Forwarding Engine: multihop sessions, tunnel-encapsulated sessions, and sessions over integrated routing and bridging (IRB) interfaces.

**NOTE:** BFD is an intensive protocol that consumes system resources. Specifying a minimum interval for BFD less than 100 ms for Routing Engine-based sessions and 10 ms for distributed BFD sessions can cause undesired BFD flapping. The minimum-interval configuration statement is a BFD liveness detection parameter.

Depending on your network environment, these additional recommendations might apply:

- For large-scale network deployments with a large number of BFD sessions, specify a minimum interval of 300 ms for Routing Engine-based sessions, and 100 ms for distributed BFD sessions.
- For very large-scale network deployments with a large number of BFD sessions, contact Juniper Networks customer support for more information.
- For BFD sessions to remain up during a Routing Engine switchover event when nonstop active routing is configured, specify a minimum interval of 10 seconds for Routing Engine-based sessions. For distributed BFD sessions with nonstop active routing configured, the minimum interval recommendations are unchanged and depend only on your network deployment.

---

### Nonstop Active Routing BGP Support

---

Nonstop active routing BGP support is subject to the following conditions:

- You must include the **path-selection external-router-ID** statement at the **[edit protocols bgp]** hierarchy level to ensure consistent path selection between the master and backup Routing Engines during and after the nonstop active routing switchover.
- You must include the **advertise-from-main-vpn-tables** statement at the **[edit protocols bgp]** hierarchy level to prevent BGP sessions from going down when route reflector (RR) or autonomous system border router (ASBR) functionality is enabled or disabled on a routing device that has VPN address families configured.
- BGP session uptime and downtime statistics are not synchronized between the primary and backup Routing Engines during Nonstop Active Routing and ISSU. The backup Routing Engine maintains its own session uptime based on the time when the backup first becomes aware of the established sessions. For example, if the backup Routing Engine is rebooted (or if you run **restart routing** on the backup Routing Engine), the backup's uptime is a short duration, because the backup has just learned about the established sessions. If the backup is operating when the BGP sessions first come up on the primary, the uptime on the primary and the uptime on the backup are almost the same duration. After a Routing Engine switchover, the new master continues from the time left on the standby Routing Engine.
- If the BGP peer in the master Routing Engine has negotiated address-family capabilities that are not supported for nonstop active routing, then the corresponding BGP neighbor state on the backup Routing Engine shows as idle. On switchover, the BGP session is reestablished from the new master Routing Engine.

Only the following address families are supported for nonstop active routing.

**NOTE:** Address families are supported only on the main instance of BGP. Only unicast is supported on VRF instances.

- inet unicast
- inet labeled-unicast
- inet multicast
- inet6 labeled-unicast
- inet6 multicast
- inet6 unicast
- route-target
- l2vpn signaling
- inet6-vpn unicast
- inet-vpn unicast
- inet-mdt
- iso-vpn
- BGP route dampening does not work on the backup Routing Engine when nonstop active routing is enabled.

### Nonstop Active Routing Layer 2 Circuit and VPLS Support

Nonstop active routing supports Layer 2 circuit and VPLS on both LDP-based and RSVP-TE-based networks. Nonstop active routing support enables the backup Routing Engine to track the label advertised by Layer 2 circuit and VPLS on the primary Routing Engine, and to use the same label after the Routing Engine switchover.

in Junos OS Release 9.6 and later, nonstop active routing support is extended to the Layer 2 circuit and LDP-based VPLS pseudowire redundant configurations.

### Nonstop Active Routing PIM Support

Nonstop active routing supports Protocol Independent Multicast (PIM) with stateful replication on backup Routing Engines. State information replicated on the backup Routing Engine includes information about neighbor relationships, join and prune events, rendezvous point (RP) sets, synchronization between routes and next hops, multicast session states, and the forwarding state between the two Routing Engines.

**NOTE:** Nonstop active routing for PIM is supported for IPv4 on Junos OS Release 9.3 and later, and for IPv6 on Junos OS Release 10.4 and later. Starting with Release 11.1, Junos OS also supports nonstop active routing for PIM on devices that have both IPv4 and IPv6 configured on them.

To configure nonstop active routing for PIM, include the same statements in the configuration as for other protocols: the **nonstop-routing** statement at the **[edit routing-options]** hierarchy level and the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level. To trace PIM nonstop active routing events, include the **flag nsr-synchronization** statement at the **[edit protocols pim traceoptions]** hierarchy level.

**NOTE:** The **clear pim join**, **clear pim register**, and **clear pim statistics** operational mode commands are not supported on the backup Routing Engine when nonstop active routing is enabled.

Nonstop active routing support varies for different PIM features. The features fall into the following three categories: supported features, unsupported features, and incompatible features.

**Supported features:**

- Auto-RP

**NOTE:** Nonstop active routing PIM support on IPv6 does not support auto-RP because IPv6 does not support auto-RP.

- Bootstrap router (BSR)
- Static RPs
- Embedded RP on non-RP IPv6 routers
- Local RP

**NOTE:** RP set information synchronization is supported for local RP and BSR (on IPv4 and IPv6), autoRP (on IPv4), and embedded RP (on IPv6).

- BFD
- Dense mode
- Sparse mode
- Source-specific multicast (SSM)
- Draft Rosen multicast VPNs (MVPNs)
- Anycast RP (anycast RP set information synchronization and anycast RP register state synchronization on IPv4 and IPv6 configurations)
- Flow maps
- Unified ISSU
- Policy features such as neighbor policy, bootstrap router export and import policies, scope policy, flow maps, and reverse path forwarding (RPF) check policies

- Upstream assert synchronization
- PIM join load balancing

Starting with Release 12.2, Junos OS extends the nonstop active routing PIM support to draft Rosen MVPNs. Nonstop active routing PIM support for draft Rosen MVPNs enables nonstop active routing-enabled devices to preserve draft Rosen MPVN-related information—such as default and data multicast distribution tree (MDT) states—across switchovers. In releases earlier than 12.2, nonstop active routing PIM configuration was incompatible with draft Rosen MPVN configuration.

The backup Routing Engine sets up the default MDT based on the configuration and the information it receives from the master Routing Engine, and keeps updating the default MDT state information.

However, for data MDTs, the backup Routing Engine relies on the master Routing Engine to provide updates when data MDTs are created, updated, or deleted. The backup Routing Engine neither monitors data MDT flow rates nor triggers a data MDT switchover based on variations in flow rates. Similarly, the backup Routing Engine does not maintain the data MDT delay timer or timeout timer. It does not send MDT join TLV packets for the data MDTs until it takes over as the master Routing Engine. After the switchover, the new master Routing Engine starts sending MDT join TLV packets for each data MDT, and also resets the data MDT timers. Note that the expiration time for the timers might vary from the original values on the previous master Routing Engine.

Starting with Release 12.3, Junos OS extends the Protocol Independent Multicast (PIM) nonstop active routing support to IGMP-only interfaces.

In Junos OS releases earlier than 12.3, the PIM joins created on IGMP-only interfaces were not replicated on the backup Routing Engine. Thus, the corresponding multicast routes were marked as pruned (meaning discarded) on the backup Routing Engine. Because of this limitation, after a switchover, the new master Routing Engine had to wait for the IGMP module to come up and start receiving reports to create PIM joins and to install multicast routes. This caused traffic loss until the multicast joins and routes were reinstated.

However, in Junos OS Release 12.3 and later, the multicast joins on the IGMP-only interfaces are mapped to PIM states, and these states are replicated on the backup Routing Engine. If the corresponding PIM states are available on the backup, the multicast routes are marked as forwarding on the backup Routing Engine. This enables uninterrupted traffic flow after a switchover. This enhancement covers IGMPv2, IGMPv3, MLDv1, and MLDv2 reports and leaves.

**Unsupported features:** You can configure the following PIM features on a router along with nonstop active routing, but they function as if nonstop active routing is not enabled. In other words, during Routing Engine switchover and other outages, their state information is not preserved, and traffic loss is to be expected.

- Internet Group Management Protocol (IGMP) exclude mode
- IGMP snooping

Nonstop active routing is not supported for next-generation MVPNs with PIM provider tunnels. The commit operation fails if the configuration includes both nonstop active routing and next-generation MVPNs with PIM provider tunnels.

Junos OS provides a configuration statement that disables nonstop active routing for PIM only, so that you can activate incompatible PIM features and continue to use nonstop active routing for the other protocols on the router. Before activating an incompatible PIM feature, include the **nonstop-routing disable** statement at the **[edit protocols pim]** hierarchy level. Note that in this case, nonstop active routing is disabled for all PIM features, not just incompatible features.

### Nonstop Active Routing MSDP Support

---

Starting with Release 12.1, Junos OS extends nonstop active routing support to the Multicast Source Discovery Protocol (MSDP).

Nonstop active routing support for MSDP preserves the following MSDP-related information across the switchover:

- MSDP configuration and peer information
- MSDP peer socket information
- Source-active and related information

However, note that the following restrictions or limitations apply to nonstop active routing MSDP support:

- Because the backup Routing Engine learns the active source information by processing the source-active messages from the network, synchronizing of source active information between the master and backup Routing Engines might take up to 60 seconds. So, no planned switchover is allowed within 60 seconds of the initial replication of the sockets.
- Similarly, Junos OS does not support two planned switchovers within 240 seconds of each other.

Junos OS enables you to trace MSDP nonstop active routing events by including the **flag nsr-synchronization** statement at the **[edit protocols msdp traceoptions]** hierarchy level.

### Nonstop Active Routing Support for RSVP-TE LSPs

---

Junos OS extends nonstop active routing support to label-switching routers (LSRs) and Layer 2 Circuits that are part of an RSVP-TE LSP. Nonstop active routing support on LSRs ensures that the master to backup Routing Engine switchover on an LSR remains transparent to the network neighbors and that the LSP information remains unaltered during and after the switchover.

You can use the **show rsvp version** command to view the nonstop active routing mode and state on an LSR. Similarly, you can use the **show mpls lsp** and **show rsvp session** commands on the standby Routing Engine to view the state recreated on the standby Routing Engine.

The Junos OS nonstop active routing feature is also supported on RSVP point-to-multipoint LSPs. Nonstop active routing support for RSVP point-to-multipoint egress and transit LSPs was added in Junos OS Release 11.4, and for ingress LSPs in Release 12.1. During the switchover, the LSP comes up on the backup Routing Engine that shares and synchronizes the state information with the master Routing Engine before and after the switchover. Nonstop active routing support for point-to-multipoint transit and egress LSPs ensures that the switchover remains transparent to the network neighbors, and preserves the LSP information across the switchover.

However, Junos OS nonstop active routing support for RSVP point-to-multipoint LSPs does not include support for dynamically created point-to-multipoint LSPs, such as VPLS.

Starting with Release 14.1, Junos OS extends nonstop active routing support to the next-generation multicast VPNs.

The **show rsvp session detail** command enables you to check the point-to-multipoint LSP remerge state information (**P2MP LSP re-merge**; possible values are **head**, **member**, and **none**).

However, Junos OS does not support nonstop active routing for the following features:

- Generalized Multiprotocol Label Switching (GMPLS) and LSP hierarchy
- Interdomain or loose-hop expansion LSPs
- BFD liveness detection

Nonstop active routing support for RSVP-TE LSPs is subject to the following limitations and restrictions:

- Detour LSPs are not maintained across a switchover and so, detour LSPs might fail to come back online after the switchover.
- Control plane statistics corresponding to the **show rsvp statistics** and **show rsvp interface detail | extensive** commands are not maintained across Routing Engine switchovers.
- Statistics from the backup Routing Engine are not reported for **show mpls lsp statistics** and **monitor mpls label-switched-path** commands. However, if a switchover occurs, the backup Routing Engine, after taking over as the master, starts reporting statistics. Note that the **clear statistics** command issued on the old master Routing Engine does not have any effect on the new master Routing Engine, which reports statistics, including any uncleared statistics.
- State timeouts might take additional time during nonstop active routing switchover. For example, if a switchover occurs after a neighbor has missed sending two hello messages to the master, the new master Routing Engine waits for another three hello periods before timing out the neighbor.
- On the RSVP ingress router, if you configure auto-bandwidth functionality, the bandwidth adjustment timers are set in the new master after the switchover. This causes a one-time increase in the length of time required for the bandwidth adjustment after the switchover occurs.

- RSVP ingress LSPs that have BFD liveness detection enabled on them do not come up on the backup Routing Engine during the switchover. Such BFD-enabled LSPs have to be reestablished after the switchover.
- Backup LSPs —LSPs that are established between the point of local repair (PLR) and the merge point after a node or link failure—are not preserved during a Routing Engine switchover.
- When nonstop active routing is enabled, graceful restart is not supported. However, graceful restart helper mode is supported.

## Nonstop Bridging Concepts

Nonstop bridging uses the same infrastructure as graceful Routing Engine switchover (GRES) to preserve interface and kernel information. However, nonstop bridging also saves Layer 2 Control Protocol (L2CP) information by running the Layer 2 Control Protocol process (l2cpd) on the backup Routing Engine.

**NOTE:** To use nonstop bridging, you must first enable graceful Routing Engine switchover on your routing (or switching) platform. For more information about graceful Routing Engine switchover, see [“Understanding Graceful Routing Engine Switchover” on page 2231](#).

Figure 41 on page 2255 shows the system architecture of nonstop bridging and the process a routing (or switching) platform follows to prepare for a switchover.

**Figure 41: Nonstop Bridging Switchover Preparation Process**

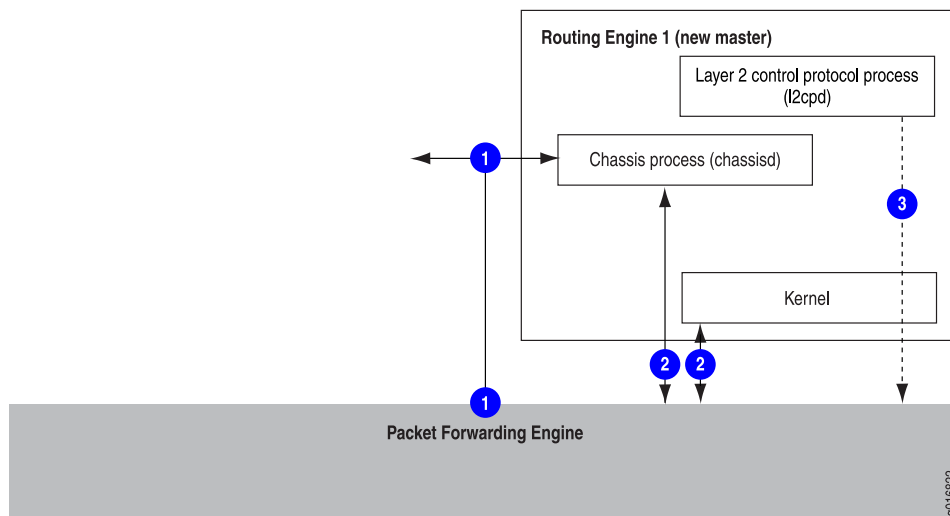

The switchover preparation process for nonstop bridging follows these steps:

1. The master Routing Engine starts.
2. The routing platform processes on the master Routing Engine (such as the chassis process [chassisd] and the Layer 2 Control Protocol process [l2cpd]) start.
3. The Packet Forwarding Engine starts and connects to the master Routing Engine.
4. All state information is updated in the system.
5. The backup Routing Engine starts, including the chassis process (chassisd) and the Layer 2 Control Protocol process (l2cpd).
6. The system determines whether graceful Routing Engine switchover and nonstop bridging have been enabled.
7. The kernel synchronization process (ksyncd) synchronizes the backup Routing Engine with the master Routing Engine.
8. For supported protocols, state information is updated directly between the l2cpds on the master and backup Routing Engines.

Figure 42 on page 2256 shows the effects of a switchover on the routing platform.

Figure 42: Nonstop Bridging During a Switchover

The switchover process follows these steps:

1. When keepalives from the master Routing Engine are lost, the system switches over gracefully to the backup Routing Engine.
2. The Packet Forwarding Engine connects to the backup Routing Engine, which becomes the new master. Because the Layer 2 Control Protocol process (l2cpd) and chassis process (chassisd) are already running, these processes do not need to restart.
3. State information learned from the point of the switchover is updated in the system. Forwarding and bridging are continued during the switchover, resulting in minimal packet loss.

## Nonstop Bridging System Requirements

This topic contains the following sections:

- [Platform Support on page 2256](#)
- [Protocol Support on page 2257](#)

### Platform Support

Nonstop bridging is supported on MX Series 3D Universal Edge Routers. Your system must be running Junos OS Release 8.4 or later.

Nonstop bridging is supported on EX Series switches with redundant Routing Engines in a Virtual Chassis or in a Virtual Chassis Fabric.

Nonstop bridging is supported on QFX Series switches in a Virtual Chassis, EX4600 switches in a Virtual Chassis, or in a Virtual Chassis Fabric. Limited support for NSB is also provided on a QFX5100 and EX4600 standalone switches, but NSB is enabled *only* during an ISSU.

**NOTE:** If you are using a QFX5100 or EX4600 standalone switch and you want to use ISSU, configure Graceful Routing Engine switchover (GRES), NSB and nonstop active routing (NSR). You must configure NSB, GRES, and NSR in order to run ISSU. However, GRES, NSB and NSR are enabled *only* during the upgrade. During an ISSU, the Junos OS runs in two separate virtual machines (VMs)—one VM is in the master role acting as the master Routing Engine, and the other VM is in the backup role acting as the backup Routing Engine. The Junos OS is upgraded on the backup VM. After a successful software upgrade, the backup VM then becomes the master VM, and the original master VM is no longer needed and is shut down.

For a list of the EX Series switches and Layer 2 protocols that support nonstop bridging, see *EX Series Switch Software Features Overview*.

**NOTE:** All Routing Engines configured for nonstop bridging must be running the same Junos OS release.

## Protocol Support

Nonstop bridging is supported for the following Layer 2 control protocols:

- Spanning Tree Protocol (STP)
- Rapid Spanning Tree Protocol (RSTP)
- Multiple Spanning Tree Protocol (MSTP)

## Graceful Restart Concepts

With routing protocols, any service interruption requires that an affected router recalculate adjacencies with neighboring routers, restore routing table entries, and update other protocol-specific information. An unprotected restart of a router can result in forwarding delays, route flapping, wait times stemming from protocol reconvergence, and even dropped packets. The main benefits of graceful restart are uninterrupted packet forwarding and temporary suppression of all routing protocol updates. Graceful restart enables a router to pass through intermediate convergence states that are hidden from the rest of the network.

Three main types of graceful restart are available on Juniper Networks routing platforms:

- Graceful restart for aggregate and static routes and for routing protocols—Provides protection for aggregate and static routes and for Border Gateway Protocol (BGP), End System-to-Intermediate System (ES-IS), Intermediate System-to-Intermediate System (IS-IS), Open Shortest Path First (OSPF), Routing Information Protocol (RIP), next-generation RIP (RIPng), and Protocol Independent Multicast (PIM) sparse mode routing protocols.
- Graceful restart for MPLS-related protocols—Provides protection for Label Distribution Protocol (LDP), Resource Reservation Protocol (RSVP), circuit cross-connect (CCC), and translational cross-connect (TCC).
- Graceful restart for virtual private networks (VPNs)—Provides protection for Layer 2 and Layer 3 VPNs.

Graceful restart works similarly for routing protocols and MPLS protocols and combines components of these protocol types to enable graceful restart in VPNs. The main benefits of graceful restart are uninterrupted packet forwarding and temporary suppression of all routing protocol updates. Graceful restart thus enables a router to pass through intermediate convergence states that are hidden from the rest of the network.

Most graceful restart implementations define two types of routers—the restarting router and the helper router. The restarting router requires rapid restoration of forwarding state information so it can resume the forwarding of network traffic. The helper router assists the restarting router in this process. Graceful restart configuration statements typically affect either the restarting router or the helper router.

## **Understanding VRRP**

Juniper Networks QFX Series and EX4600 switches support the Virtual Router Redundancy Protocol (VRRP) and VRRPv3 (for IPv6). This topic covers:

- [Overview of VRRP on page 2259](#)
- [Sample VRRP Topology on page 2259](#)

## Overview of VRRP

Configuring end hosts on your network with static default routes minimizes configuration effort and complexity and reduces processing overhead on the end hosts. When hosts are configured with static routes, the failure of the default gateway normally results in a catastrophic event, isolating all hosts that are unable to detect available alternate paths to their gateway. Using Virtual Router Redundancy Protocol (VRRP) enables you to dynamically provide alternative gateways for end hosts if the primary gateway fails.

VRRP (defined in RFC 3768) provides dynamic failover of IP addresses from one router to another in the event of failure. You can implement VRRP to provide a highly available default path to a gateway without needing to configure dynamic routing or router discovery protocols on end hosts.

Switches configured with VRRP share a virtual IP address, which is the address you configure as the default route on the hosts. At any time, one of the switches is the VRRP master, meaning that it owns the virtual IP address and is the active default gateway. The other devices are backups. The switches dynamically assign master and backup roles based on priorities that you configure (1 **through 255**). If the master fails, the backup switch with the highest priority becomes the master within a few seconds. This is done without any interaction with the hosts.

In VRRP operation, the master sends advertisements to the backup switches at regular intervals. The default interval is 1 second. If the backup switches do not receive an advertisement for a set period, the backup with the highest priority takes over as master within a few seconds and begins forwarding packets. This is done without any interaction with the hosts.

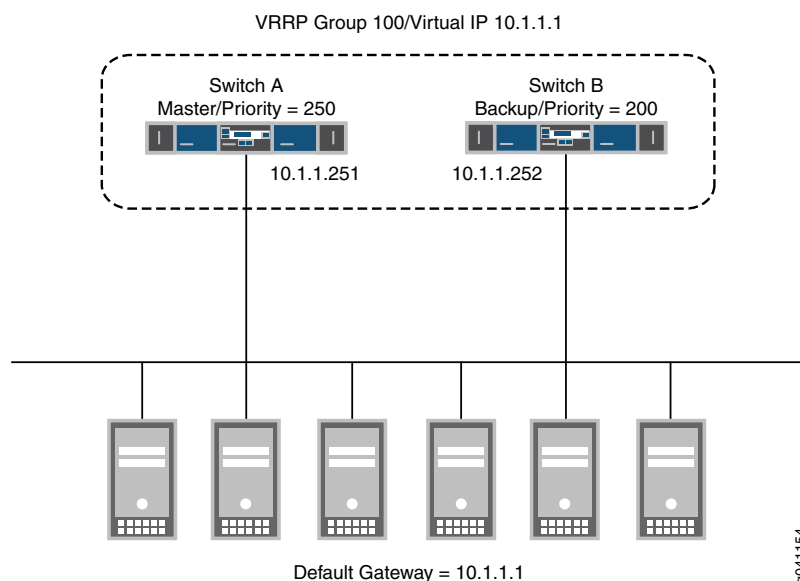

**NOTE:** Priority 255 cannot be set for routed VLAN interfaces (RVIs).

You can configure two QFabric systems to participate in a VRRP configuration as if they were two standalone switches. One benefit of this configuration is if you use VMware's vMotion, virtual machines can transition between hosts connected to the QFabric systems without updating their default gateway information. For example, a virtual machine running on a host connected to a QFabric system in data center A can transition to a host connected to a QFabric system in data center B without needing to resolve a new gateway IP address and MAC address.

## Sample VRRP Topology

Figure 43 on page 2260 illustrates a basic VRRP topology. In this example, switches A and B are running VRRP and share the virtual IP address 10.1.1.1. The default gateway for each of the clients is 10.1.1.1.

**Figure 43: Basic VRRP Topology**

The following illustrates basic VRRP behavior using [Figure 43 on page 2260](#) for reference:

1. When any of the servers wants to send traffic out of the LAN, it sends the traffic to the default gateway address of 10.1.1.1. This is a virtual IP address (VIP) owned by VRRP group 100. Because switch A is the master of the group, the VIP is associated with the “real” address 10.1.1.251 on switch A, and traffic from the servers is actually sent to this address. (Switch A is the master because it has been configured with a higher priority value.)
2. If there is a failure on switch A that prevents it from forwarding traffic to or from the servers—for example, if the interface connected to the LAN fails—switch B becomes the master and assumes ownership of the VIP. The servers continue to send traffic to the VIP, but because the VIP is now associated with the “real” address 10.1.1.252 on switch B (because of change of master), the traffic is sent to switch B instead of switch A.
3. If the problem that caused the failure on switch A is corrected, switch A becomes the master again and reasserts ownership of the VIP. In this case, the servers resume sending traffic to switch A.

Notice that no configuration changes are required on the servers for them to switch between sending traffic to switch A and switch B. When the VIP moves between 10.1.1.251 and 10.1.1.252, the change is detected by normal TCP-IP behavior and no configuration or intervention is required on the servers.

- [Tracking Graceful Restart Events on page 2267](#)

## Enabling Graceful Restart

---

By default, graceful restart is disabled. To enable graceful restart, include the **graceful-restart** statement at the **[edit routing-instance *instance-name* routing-options]** or **[edit routing-options]** hierarchy level.

For example:

```
routing-options {  
  graceful-restart;  
}
```

To configure the duration of the graceful restart period, include the **restart-duration** at the **[edit routing-options graceful-restart]** hierarchy level.

**NOTE:** Helper mode (the ability to assist a neighboring router attempting a graceful restart) is enabled by default when you start the routing platform, even if graceful restart is not enabled. You can disable helper mode on a per-protocol basis.

```
[edit]  
routing-options {  
  graceful-restart {  
    disable;  
    restart-duration seconds;  
  }  
}
```

To disable graceful restart globally, include the **disable** statement at the **[edit routing-options graceful-restart]** hierarchy level.

When graceful restart is enabled for all routing protocols at the **[edit routing-options graceful-restart]** hierarchy level, you can disable graceful restart on a per-protocol basis.

**NOTE:** If you configure graceful restart after a BGP or LDP session has been established, the BGP or LDP session restarts and the peers negotiate graceful restart capabilities. Also, the BGP peer routing statistics are reset to zero.

## Configuring Graceful Restart Options for BGP

---

To configure the duration of the BGP graceful restart period, include the **restart-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level. To set the length of time the router waits to receive messages from restarting neighbors before declaring them down, include the **stale-routes-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level.

```
[edit]  
protocols {  
  bgp {  
    graceful-restart {  
      disable;  
    }  
  }  
}
```

```

        restart-time seconds;
        stale-routes-time seconds;
    }
}
routing-options {
    graceful-restart;
}

```

To disable BGP graceful restart capability for all BGP sessions, include the **disable** statement at the **[edit protocols bgp graceful-restart]** hierarchy level.

**NOTE:** To set BGP graceful restart properties or disable them for a group, include the desired statements at the **[edit protocols bgp group group-name graceful-restart]** hierarchy level.

To set BGP graceful restart properties or disable them for a specific neighbor in a group, include the desired statements at the **[edit protocols bgp group group-name neighbor ip-address graceful-restart]** hierarchy level.

**NOTE:** Configuring graceful restart for BGP resets the BGP peer routing statistics to zero. Also, existing BGP sessions restart, and the peers negotiate graceful restart capabilities.

### Configuring Graceful Restart Options for ES-IS

On J Series Services Routers, to configure the duration of the ES-IS graceful restart period, include the **restart-duration** statement at the **[edit protocols esis graceful-restart]** hierarchy level.

```

[edit]
protocols {
    esis {
        graceful-restart {
            disable;
            restart-duration seconds;
        }
    }
}
routing-options {
    graceful-restart;
}

```

To disable ES-IS graceful restart capability, include the **disable** statement at the **[edit protocols esis graceful-restart]** hierarchy level.

### Configuring Graceful Restart Options for IS-IS

To configure the duration of the IS-IS graceful restart period, include the **restart-duration** statement at the **[edit protocols isis graceful-restart]** hierarchy level.

```

[edit]

```

```

protocols {
  isis {
    graceful-restart {
      disable;
      helper-disable;
      restart-duration seconds;
    }
  }
}
routing-options {
  graceful-restart;
}

```

To disable IS-IS graceful restart helper capability, include the **helper-disable** statement at the **[edit protocols isis graceful-restart]** hierarchy level. To disable IS-IS graceful restart capability, include the **disable** statement at the **[edit protocols isis graceful-restart]** hierarchy level.

**NOTE:** If you configure Bidirectional Forwarding Detection (BFD) and graceful restart for IS-IS, graceful restart might not work as expected.

**NOTE:** If adjacencies between the Routing Engine and the neighboring peer 'helper' routers time out, graceful restart protocol extensions are unable to notify the peer 'helper' routers about the impending restart. Graceful restart can then stop and cause interruptions in traffic.

To ensure that these adjacencies are kept, change the hold-time for IS-IS protocols from the default of 27 seconds to a value higher than 40 seconds. See *Example: Configuring IS-IS for GRES with Graceful Restart* for more information.

**NOTE:** You can also track graceful restart events with the **traceoptions** statement at the **[edit protocols isis]** hierarchy level. For more information, see [“Tracking Graceful Restart Events” on page 2267](#).

### Configuring Graceful Restart Options for OSPF and OSPFv3

To configure the duration of the OSPF/OSPFv3 graceful restart period, include the **restart-duration** statement at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level. To specify the length of time for which the router notifies helper routers that it has completed graceful restart, include the **notify-duration** at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level. Strict OSPF link-state advertisement (LSA) checking results in the termination of graceful restart by a helping router. To disable strict LSA checking, include the **no-strict-lsa-checking** statement at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level.

```

[edit]
protocols {

```

```
ospf | ospfv3{
  graceful-restart {
    disable;
    helper-disable
    no-strict-lsa-checking;
    notify-duration seconds;
    restart-duration seconds;
  }
}
routing-options {
  graceful-restart;
}
```

To disable OSPF/OSPFv3 graceful restart, include the **disable** statement at the **[edit protocols (ospf | ospfv3) graceful-restart]** hierarchy level.

Starting with Release 11.3, the Junos OS supports both the standard (based on RFC 3623, *Graceful OSPF Restart*) and the restart signaling-based (as specified in RFC 4811, RFC 4812, and RFC 4813) helper modes for OSPF version 2 graceful restart configurations. Both the standard and restart signaling-based helper modes are enabled by default. To disable the helper mode for OSPF version 2 graceful restart configurations, include the **helper-disable <both | restart-signaling | standard>** statement at the **[edit protocols ospf graceful-restart]** hierarchy level. Note that the last committed statement always takes precedence over the previous one.

```
[edit protocols ospf]
  graceful-restart {
    helper-disable <both | restart-signaling | standard>
  }
```

To reenabling the helper mode, delete the **helper-disable** statement from the configuration by using the **delete protocols ospf graceful-restart helper-disable <restart-signaling | standard | both>** command. In this case also, the last executed command takes precedence over the previous ones.

#### NOTE:

Restart signaling-based helper mode is not supported for OSPFv3 configurations. To disable helper mode for OSPFv3 configurations, include the **helper-disable** statement at the **[edit protocols ospfv3 graceful-restart]** hierarchy level.

**TIP:** You can also track graceful restart events with the **traceoptions** statement at the **[edit protocols (ospf | ospfv3)]** hierarchy level. For more information, see [“Tracking Graceful Restart Events” on page 2267](#).

**NOTE:** You cannot enable OSPFv3 graceful restart between a routing platform running Junos OS Release 7.5 and earlier and a routing platform running Junos OS Release 7.6 or later. As a workaround, make sure both routing platforms use the same Junos OS version.

**NOTE:** If you configure BFD and graceful restart for OSPF, graceful restart might not work as expected.

---

### Configuring Graceful Restart Options for RIP and RIPng

---

To configure the duration of the RIP or RIPng graceful restart period, include the **restart-time** statement at the **[edit protocols (rip | ripng) graceful-restart]** hierarchy level.

```
[edit]
protocols {
  (rip | ripng) {
    graceful-restart {
      disable;
      restart-time seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable RIP or RIPng graceful restart capability, include the **disable** statement at the **[edit protocols (rip | ripng) graceful-restart]** hierarchy level.

---

### Configuring Graceful Restart Options for PIM Sparse Mode

---

PIM sparse mode continues to forward existing multicast packet streams during a graceful restart, but does not forward new streams until after the restart is complete. After a restart, the routing platform updates the forwarding state with any updates that were received from neighbors and occurred during the restart period. For example, the routing platform relearns the join and prune states of neighbors during the restart, but does not apply the changes to the forwarding table until after the restart.

PIM sparse mode-enabled routing platforms generate a unique 32-bit random number called a generation identifier. Generation identifiers are included by default in PIM hello messages, as specified in the IETF Internet draft *Protocol Independent Multicast - Sparse Mode (PIM-SM): Protocol Specification (Revised)*. When a routing platform receives PIM hellos containing generation identifiers on a point-to-point interface, Junos OS activates an algorithm that optimizes graceful restart.

Before PIM sparse mode graceful restart occurs, each routing platform creates a generation identifier and sends it to its multicast neighbors. If a PIM sparse mode-enabled routing platform restarts, it creates a new generation identifier and sends it to its neighbors. When a neighbor receives the new identifier, it resends multicast updates to the restarting

router to allow it to exit graceful restart efficiently. The restart phase completes when either the PIM state becomes stable or when the restart interval timer expires.

If a routing platform does not support generation identifiers or if PIM is enabled on multipoint interfaces, the PIM sparse mode graceful restart algorithm does not activate, and a default restart timer is used as the restart mechanism.

To configure the duration of the PIM graceful restart period, include the **restart-duration** statement at the **[edit protocols pim graceful-restart]** hierarchy level:

```
[edit]
protocols {
  pim {
    graceful-restart {
      disable;
      restart-duration seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable PIM sparse mode graceful restart capability, include the **disable** statement at the **[edit protocols pim graceful-restart]** hierarchy level.

**NOTE:** Multicast forwarding can be interrupted in two ways. First, if the underlying routing protocol is unstable, multicast reverse-path-forwarding (RPF) checks can fail and cause an interruption. Second, because the forwarding table is not updated during the graceful restart period, new multicast streams are not forwarded until graceful restart is complete.

### Tracking Graceful Restart Events

To track the progress of a graceful restart event, you can configure graceful restart trace options flags for IS-IS and OSPF/OSPFv3. To configure graceful restart trace options, include the **graceful-restart** statement at the **[edit protocols protocol traceoptions flag]** hierarchy level:

```
[edit protocols]
isis {
  traceoptions {
    flag graceful-restart;
  }
}
(ospf | ospf3) {
  traceoptions {
    flag graceful-restart;
  }
}
```

- [Synchronizing the Routing Engine Configuration on page 2269](#)
- [Verifying Graceful Routing Engine Switchover Operation on page 2269](#)

#### Enabling Graceful Routing Engine Switchover

---

By default, graceful Routing Engine switchover (GRES) is disabled. To configure GRES, include the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level.

```
[edit chassis redundancy]
graceful-switchover;
```

When you enable GRES, the command-line interface (CLI) indicates which Routing Engine you are using. For example:

```
{master} [edit]
user@host#
```

To disable GRES, delete the **graceful-switchover** statement from the **[edit chassis redundancy]** hierarchy level.

#### Configuring Graceful Routing Engine Switchover with Graceful Restart

---

When using GRES with Graceful Restart, if adjacencies between the Routing Engine and the neighboring peer 'helper' routers time out, graceful restart protocol extensions are unable to notify the peer 'helper' routers about the impending restart. Graceful restart can then stop and cause interruptions in traffic.

To ensure that these adjacencies are kept, change the **hold-time** for IS-IS protocols from the default of 27 seconds to a value higher than 40 seconds.

## Synchronizing the Routing Engine Configuration

**NOTE:** A newly inserted backup Routing Engine automatically synchronizes its configuration with the master Routing Engine configuration.

When you configure GRES, you can bring the backup Routing Engine online after the master Routing Engine is already running. There is no requirement to start the two Routing Engines simultaneously.

## Verifying Graceful Routing Engine Switchover Operation

To verify whether GRES is enabled on the backup Routing Engine, issue the **show system switchover** command. When the output of the command indicates that the **Graceful switchover** field is set to , GRES is operational. The status of the kernel database and configuration database synchronization between Routing Engines is also provided. For example:

```
Graceful switchover: On
Configuration database: Ready
Kernel database: Ready
Peer state: Steady state
```

**NOTE:** You must issue the **show system switchover** command on the backup Routing Engine. This command is not supported on the master Routing Engine.

For more information about the **show system switchover** command, see the [CLI Explorer](#).

## Configuring Graceful Routing Engine Switchover in a Virtual Chassis (CLI Procedure)

In a Virtual Chassis, one member switch is assigned the master role and has the master Routing Engine. Another member switch is assigned the backup role and has the backup Routing Engine. Graceful Routing Engine switchover (GRES) enables the master and backup Routing Engines in a Virtual Chassis configuration to switch from the master to backup without interruption to packet forwarding. When you configure graceful Routing Engine switchover, the backup Routing Engine automatically synchronizes with the master Routing Engine to preserve kernel state information and the forwarding state.

To set up the Virtual Chassis configuration to use graceful Routing Engine switchover (GRES):

1. Set up a minimum of two switches in a Virtual Chassis configuration with mastership priority of 255:

```
[edit]
user@switch# set virtual-chassis member 0 mastership-priority 255
[edit]
user@switch# set virtual-chassis member 1 mastership-priority 255
```

2. Set up graceful Routing Engine switchover:

```
[edit]
user@switch# set chassis redundancy graceful-switchover
```

Commit the configuration.

**NOTE:** We recommend that you use the `commit synchronize` command to save any configuration changes that you make to a multimember Virtual Chassis.

## Resetting Local Statistics

When you enable graceful Routing Engine switchover, the master Routing Engine configuration is copied and loaded to the backup Routing Engine. User files, accounting information, and trace options information are not replicated to the backup Routing Engine.

When a graceful Routing Engine switchover occurs, local statistics such as process statistics and networking statistics are displayed as a cumulative value from the time the process first came online. Because processes on the master Routing Engine can start at different times from the processes on the backup Routing Engine, the statistics on the two Routing Engines for the same process might differ. After a graceful Routing Engine

switchover, we recommend that you issue the **clear interface statistics** (*interface-name* | **all**) command to reset the cumulative values for local statistics. Forwarding statistics are not affected by graceful Routing Engine switchover.

For information about how to use the **clear** command to clear statistics and protocol database information, see the [CLI Explorer](#).

**NOTE:** The **clear firewall** command cannot be used to clear the Routing Engine filter counters on a backup Routing Engine that is enabled for graceful Routing Engine switchover.

## Configuration Tasks for Nonstop Bridging

- [Configuring Nonstop Bridging on Switches \(CLI Procedure\) on page 2272](#)
- [Resetting Local Statistics on page 2273](#)

## Configuring Nonstop Bridging on Switches (CLI Procedure)

**NOTE:** This task uses switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring Nonstop Bridging on EX Series Switches (CLI Procedure)*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 43.

You can configure nonstop bridging (NSB) to provide resilience for Layer 2 protocol sessions on a Juniper Networks EX Series switch with multiple Routing Engines or an EX Series or QFX Series switch in a Virtual Chassis or Virtual Chassis Fabric configuration. Limited support for NSB is also provided on QFX5100 and EX4600 standalone switches, but NSB is enabled *only* during an ISSU.

NSB operates by synchronizing all protocol information for NSB-supported Layer 2 protocols between the master and backup Routing Engines. If the switch has a Routing Engine switchover, the NSB-supported Layer 2 protocol sessions remain active because they are already synchronized on the backup Routing Engine. The Routing Engine switchover is transparent to neighbor devices, which do not detect any changes related to the Layer 2 protocol sessions. The neighboring devices and other devices on the network do not, therefore, have to resynchronize their Layer 2 protocol states to respond to the downtime on the switch—a process that adds network overhead and risks disrupting network performance—when a Routing Engine switchover occurs when NSB is enabled.

**NOTE:** If you are using a QFX5100 or EX4600 standalone switch and you want to use ISSU, configure Graceful Routing Engine switchover (GRES), NSB and nonstop active routing (NSR). You must configure NSB, GRES, and NSR in order to run ISSU. However, GRES, NSB and NSR are enabled *only* during the upgrade. During an ISSU, the Junos OS runs in two separate virtual machines (VMs)—one VM is in the master role acting as the master Routing Engine, and the other VM is in the backup role acting as the backup Routing Engine. The Junos OS is upgraded on the backup VM. After a successful software upgrade, the backup VM then becomes the master VM, and the original master VM is no longer needed and is shut down.

To configure NSB:

1. Enable graceful Routing Engine switchover (GRES):

```
[edit chassis redundancy]
user@switch# set graceful-switchover
```

2. Enable NSB:

```
[edit protocols layer2-control]
user@switch# set nonstop-bridging
```

3. Synchronize configuration changes between the Routing Engines:

```
[edit system]
user@switch# set commit synchronize
```

If you try to commit a configuration that includes NSB without including the **commit synchronize** statement, the commit fails.

**NOTE:** There is no requirement to start the two Routing Engines simultaneously. If the backup Routing Engine is not up when you use the **commit synchronize** statement, the candidate configuration is committed in the master Routing Engine. When the backup Routing Engine comes online, its configuration is automatically synchronized with that of the master.

**BEST PRACTICE:** After a graceful Routing Engine switchover, we recommend that you issue the **clear interface statistics (*interface-name* | all)** command to reset the cumulative values for local statistics on the new master Routing Engine.

## Configuration Example for Nonstop Active Routing

---

- [Example: Configuring Nonstop Active Routing on Switches on page 2274](#)

### Example: Configuring Nonstop Active Routing on Switches

Nonstop active routing (NSR) provides high availability for Routing Engines by enabling transparent switchover of the Routing Engines without necessitating restart of supported routing protocols. Both Routing Engines are fully active in processing protocol sessions, and so each can take over for the other. The switchover is transparent to neighbors.

This example describes how to configure nonstop active routing on switches with multiple Routing Engines or on an EX Series or a QFX series switch in a Virtual Chassis or Virtual Chassis Fabric configuration.

- [Requirements on page 2274](#)
- [Overview and Topology on page 2274](#)
- [Configuration on page 2275](#)
- [Verification on page 2276](#)
- [Troubleshooting on page 2276](#)

#### Requirements

---

This example uses the following hardware and software components:

- An EX Series with multiple Routing Engines or on an EX Series or a QFX series switch in a Virtual Chassis or Virtual Chassis Fabric configuration
- Junos OS Release 10.4 or later for EX Series switches
- Junos OS Release 13.2X51-D20 or later for QFX Series switches

#### Overview and Topology

---

Configure nonstop active routing on any EX Series with multiple Routing Engines or on an EX Series or a QFX series switch in a Virtual Chassis or Virtual Chassis Fabric configuration. Nonstop active routing is advantageous in networks where neighbor routing devices do not support graceful restart protocol extensions.

The topology used in this example consists of an EX8200 switch with redundant Routing Engines connected to neighbor routing devices that are not configured to support graceful restart of protocols.

## Configuration

- CLI Quick Configuration** To quickly configure nonstop active routing, copy the following commands and paste them into the switch terminal window:
- ```
[edit]
set chassis redundancy graceful-switchover
set routing-options nonstop-routing
set system commit synchronize
```
- Step-by-Step Procedure** To configure nonstop active routing on a switch:
1. Enable graceful Routing Engine switchover (GRES):
 

```
[edit chassis redundancy]
user@switch# set graceful-switchover
```
  2. Enable nonstop active routing (by default, nonstop active routing is disabled):
 

```
[edit routing-options]
user@switch# set nonstop-routing
```
  3. Synchronize configuration changes between the Routing Engines:
 

```
[edit system]
user@switch# set commit synchronize
```

If you try to commit the nonstop active routing configuration without including the **commit synchronize** statement, the commit fails.

**NOTE:** If the backup Routing Engine is down when you issue the commit, a warning is displayed and the candidate configuration is committed in the master Routing Engine. When the backup Routing Engine comes up, its configuration is automatically synchronized with that of the master. If you subsequently insert or bring up a backup Routing Engine, it automatically synchronizes its configuration with the master Routing Engine configuration.

## Results

Check the results of the configuration:

```
[edit]
user@switch# show
chassis {
  redundancy {
    graceful-switchover;
  }
}
routing-options {
  nonstop-routing;
}
system {
  commit synchronize;
}
```

## Verification

---

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That Nonstop Active Routing Is Working Correctly on the Switch on page 2276](#)

### *Verifying That Nonstop Active Routing Is Working Correctly on the Switch*

**Purpose** Verify that nonstop active routing is enabled.

**Action** Issue the [show task replication](#) command:

```
user@switch# show task replication
Stateful Replication: Enabled
RE mode: Master
```

Protocol	Synchronization Status
OSPF	Complete
RIP	Complete
PIM	Complete
RSVP	Complete

**Meaning** This output shows that nonstop active routing (Stateful Replication) is enabled on master routing engine. If nonstop routing is not enabled, instead of the output shown above:

- On the backup routing engine the following error message is displayed: **“error: the routing subsystem is not running.”**
- On the master routing engine, the following output is displayed if nonstop routing is not enabled:

```
Stateful Replication: Disabled
RE mode: Master
```

## Troubleshooting

---

To troubleshoot nonstop active routing, perform these tasks:

- [Investigating Problems with Synchronization of Routing Engines When NSR Is Enabled on page 2276](#)

### *Investigating Problems with Synchronization of Routing Engines When NSR Is Enabled*

**Problem** A protocol loses connectivity with neighbors after a graceful Routing Engine switchover (GRES) occurs with nonstop active routing (NSR) enabled.

**Solution** Use trace options to help isolate the problem and gather troubleshooting information. Using the information gathered from trace options, you can confirm or eliminate the synchronization of the Routing Engines as the cause of the loss of connectivity for the protocol. See [“Tracing Nonstop Active Routing Synchronization Events” on page 2278](#).

**Related Documentation**

- [Configuring Nonstop Active Routing on Switches on page 2277](#)
- [Tracing Nonstop Active Routing Synchronization Events on page 2278](#)

- [Understanding Nonstop Active Routing on EX Series Switches](#)
- [Nonstop Active Routing Concepts on page 2240](#)

## Configuration Tasks for Nonstop Active Routing

- [Configuring Nonstop Active Routing on Switches on page 2277](#)
- [Tracing Nonstop Active Routing Synchronization Events on page 2278](#)

### Configuring Nonstop Active Routing on Switches

Nonstop active routing (NSR) provides a mechanism for transparent switchover of the Routing Engines without necessitating restart of supported routing protocols. Both Routing Engines are fully active in processing protocol sessions, and so each can take over for the other. The switchover is transparent to neighbors.

You can configure NSR on an on a Juniper Networks EX Series switch with multiple Routing Engines or an EX Series or QFX Series switch in a Virtual Chassis or Virtual Chassis Fabric configuration.

To configure nonstop active routing:

1. Enable graceful Routing Engine switchover (GRES):  

```
[edit chassis redundancy]
user@switch# set graceful-switchover
```
2. Enable nonstop active routing (by default, nonstop active routing is disabled):  

```
[edit routing-options]
user@switch# set nonstop-routing
```
3. Synchronize configuration changes between the Routing Engines:  

```
[edit system]
user@switch# set commit synchronize
```

If you try to commit the nonstop active routing configuration without including the **commit synchronize** statement, the commit fails.

**NOTE:** There is no requirement to start the two Routing Engines simultaneously. If the backup Routing Engine is not up when you issue the **commit synchronize** command, the candidate configuration is committed in the master Routing Engine. When the backup Routing Engine is inserted or comes online, its configuration is automatically synchronized with that of the master.

**BEST PRACTICE:** After a graceful Routing Engine switchover, we recommend that you issue the clear interface statistics (*interface-name* | all) command to reset the cumulative values for local statistics on the new master Routing Engine.

To disable nonstop active routing:

```
[edit routing-options]
user@switch# delete nonstop-routing
```

**Related  
Documentation**

- [Example: Configuring Nonstop Active Routing on Switches on page 2274](#)
- [Tracing Nonstop Active Routing Synchronization Events on page 2278](#)
- [Understanding Nonstop Active Routing on EX Series Switches](#)
- [Nonstop Active Routing Concepts on page 2240](#)

## Tracing Nonstop Active Routing Synchronization Events

To track the progress of nonstop active routing synchronization between Routing Engines, you can configure nonstop active routing trace options flags for each supported protocol and for BFD sessions and record these operations to a log file.

To configure nonstop active routing trace options for supported routing protocols, include the **nsr-synchronization** statement at the **[edit protocols protocol-name traceoptions flag]** hierarchy level and optionally specify one or more of the **detail**, **disable**, **receive**, and **send** options:

```
[edit protocols]
bgp {
  traceoptions {
    flag nsr-synchronization <detail> <disable> <receive> <send>;
  }
}
isis {
  traceoptions {
    flag nsr-synchronization <detail> <disable> <receive> <send>;
  }
}
ldp {
  traceoptions {
    flag nsr-synchronization <detail> <disable> <receive> <send>;
  }
}
mpls {
  traceoptions {
    flag nsr-synchronization;
    flag nsr-synchronization-detail;
  }
}
msdp {
  traceoptions {
    flag nsr-synchronization <detail> <disable> <receive> <send>;
  }
}
(ospf | ospf3) {
  traceoptions {
    flag nsr-synchronization <detail> <disable> <receive> <send>;
  }
}
```

```

rip {
  traceoptions {
    flag nsr-synchronization <detail> <disable> <receive> <send>;
  }
}
ripng {
  traceoptions {
    flag nsr-synchronization <detail> <disable> <receive> <send>;
  }
}
pim {
  traceoptions {
    flag nsr-synchronization <detail> <disable> <receive> <send>;
  }
}

```

To configure nonstop active routing trace options for BFD sessions, include the **nsr-synchronization** and **nsr-packet** statements at the **[edit protocols bfd traceoptions flag]** hierarchy level.

```

[edit protocols]
bfd {
  traceoptions {
    flag nsr-synchronization;
    flag nsr-packet;
  }
}

```

To trace the Layer 2 VPN signaling state replicated from routes advertised by BGP, include the **nsr-synchronization** statement at the **[edit routing-options traceoptions flag]** hierarchy level. This flag also traces the label and logical interface association that VPLS receives from the kernel replication state.

```

[edit routing-options]
traceoptions {
  flag nsr-synchronization;
}

```

#### Related Documentation

- [Configuring Nonstop Active Routing](#)

## Configuration Example for VRRP

- [Example: Configuring VRRP for Load Sharing on page 2279](#)

### Example: Configuring VRRP for Load Sharing

If you do not want to dedicate a switch to be a VRRP backup (and therefore leave it idle unless the master fails), you can create a load-sharing configuration in which each participating switch simultaneously acts as a master and a backup.

One reason to use a load-sharing (active-active) configuration is that you are more likely to actively monitor and maintain both switches and notice if a problem occurs on either of them. If you use a configuration in which one switch is only a backup (an active-backup configuration), you might be less likely to pay attention to the backup switch while it is idle. In the worst case, this could lead to the backup switch developing an undetected problem and not being able to perform adequately when a failover occurs.

- [Requirements on page 2280](#)
- [Overview and Topology on page 2280](#)
- [Configuring VRRP on Both Switches on page 2281](#)
- [Verification on page 2283](#)

## Requirements

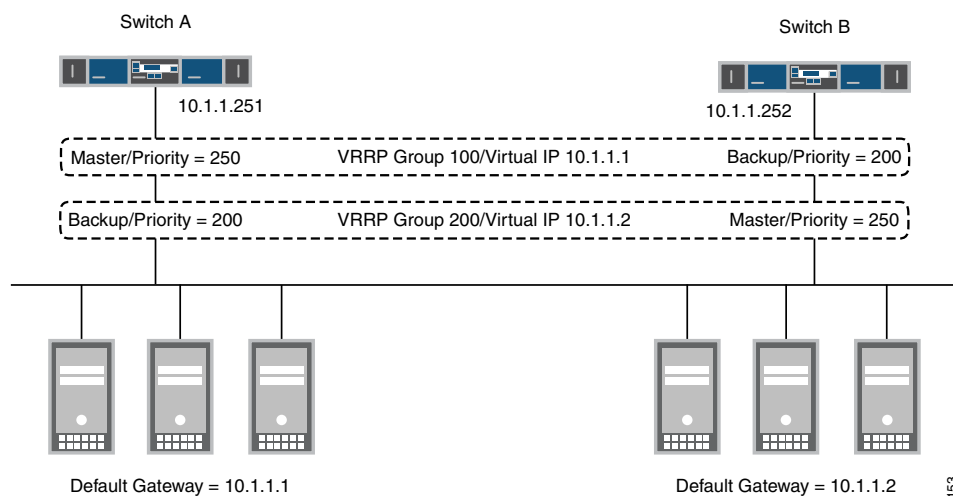

This example uses the following hardware and software components:

- Two QFX3500 switches
- Junos OS Release 11.3 or later
- Static routing or a dynamic routing protocol enabled on both switches.

## Overview and Topology

This example uses two VRRP groups, each of which has its own virtual IP address. Devices on the LAN use one of these virtual IP addresses as their default gateway. If one of the switches fails, the other switch takes over for it. In the topology shown in [Figure 44 on page 2280](#), for example, Switch A is the master for VRRP group 100. If Switch A fails, Switch B takes over and forwards traffic that the end devices send to the default gateway address 10.1.1.1.

**Figure 44: VRRP Load-Sharing Configuration**

9041153

This example shows a simple configuration to illustrate the basic steps for configuring two switches running VRRP to back each other up. [Table 208 on page 2281](#) lists VRRP settings for each switch.

**Table 208: Settings for VRRP Load-Sharing Example**

Switch A	Switch B
VRRP Group 100: <ul style="list-style-type: none"> <li>Interface address: 10.1.1.251</li> <li>VIP: 10.1.1.1</li> <li>Priority: 250</li> </ul>	VRRP Group 100: <ul style="list-style-type: none"> <li>Interface address: 10.1.1.252</li> <li>VIP: 10.1.1.1</li> <li>Priority: 200</li> </ul>
VRRP Group 200: <ul style="list-style-type: none"> <li>Interface address: 10.1.1.251</li> <li>VIP: 10.1.1.2</li> <li>Priority: 200</li> </ul>	VRRP Group 200: <ul style="list-style-type: none"> <li>Interface address: 10.1.1.252</li> <li>VIP: 10.1.1.2</li> <li>Priority: 250</li> </ul>

In addition to configuring the two switches as shown, you must configure your end devices so that some of them use one of the virtual IP addresses as their default gateway and the remaining end devices use the other virtual IP address as their default gateway.

Note that if a failover occurs, the remaining switch might be unable to handle all of the traffic, depending on the demand.

### Configuring VRRP on Both Switches

#### CLI Quick Configuration

Enter the following on Switch A:

```
[edit]
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 virtual-address 10.1.1.1
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 priority 250
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 200 virtual-address 10.1.1.2
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 200 priority 200
```

Enter the following on Switch B:

```
[edit]
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 virtual-address 10.1.1.1
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 priority 200
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 200 virtual-address 10.1.1.2
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 200 priority 250
```

#### Step-by-Step Procedure

Configure the VRRP groups and priorities on Switch A:

1. Create VRRP group 100 on Switch A and configure the virtual IP address for the group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 virtual-address 10.1.1.1
```

2. Assign the VRRP priority for this interface in this group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group
100 priority 250
```

3. Create VRRP group 200 on Switch A and configure the virtual IP address for the group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group
200 virtual-address 10.1.1.2
```

4. Assign the VRRP priority for this interface in this group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group
100 priority 200
```

#### Step-by-Step Procedure

Configure the VRRP groups and priorities on Switch B:

1. Create VRRP group 100 on Switch B and configure the virtual IP address for the group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group
100 virtual-address 10.1.1.1
```

2. Assign the VRRP priority for this interface in this group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group
100 priority 200
```

Switch A remains the master for group 100 because it has the highest priority for this group.

3. Create VRRP group 200 on Switch A and configure the virtual IP address for the group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group
200 virtual-address 10.1.1.2
```

4. Assign the VRRP priority for this interface in this group:

```
[edit]
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group
100 priority 250
```

Switch B becomes the master for group 200 because it has the highest priority for this group.

**Results** Display the results of the configuration on Switch A:

```
user@switch> show configuration
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 10.1.1.251 {
          vrrp-group 100 {
            virtual address 10.1.1.1
            priority 250
          }
        }
      }
    }
  }
}
```

```

        vrrp-group 200 {
            virtual address 10.1.1.2
            priority 200
        }
    }
}

```

Display the results of the configuration on Switch B:

```

user@switch> show configuration
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 10.1.1.252 {
          vrrp-group 100 {
            virtual address 10.1.1.1
            priority 200
          }
          vrrp-group 200 {
            virtual address 10.1.1.2
            priority 250
          }
        }
      }
    }
  }
}

```

## Verification

- [Verifying that VRRP is Working on Switch A on page 2283](#)
- [Verifying that VRRP is Working on Switch B on page 2284](#)

### Verifying that VRRP is Working on Switch A

**Purpose** Verify that VRRP is active on Switch A and that the master and backup roles are correct.

**Action** Use the following command to verify that VRRP is active on Switch A and that the switch is master for group 100 and backup for group 200.

```

user@switch> show vrrp

```

Interface Address	State	Group	VR state	Timer	Type
xe-0/0/0.0	up	100	master	A .0327 1c1	10.1.1.251 vip 10.1.1.1
xe-0/0/0.0	up	200	backup	A .0327 1c1	10.1.1.251 vip 10.1.1.2

**Meaning** The `show vrrp` command displays fundamental information about the VRRP configuration. This output shows that both VRRP groups are active and that this switch has assumed the correct master and backup roles. The `lcl` address is the physical address of the

interface and the **vip** address is the virtual address shared by both switches. The **Timer** value (**A .0327**) indicates the remaining time (in seconds) in which this switch expects to receive a VRRP advertisement from the other switch. If an advertisement for group 200 does not arrive before the timer expires, Switch A asserts itself as the master for this group.

#### ***Verifying that VRRP is Working on Switch B***

**Purpose** Verify that VRRP is active on Switch B and that the master and backup roles are correct.

**Action** Use the following command to verify that VRRP is active on Switch B and that the switch is backup for group 100 and master for group 200.

```
user@switch> show vrrp
```

Interface Address	State	Group	VR state	Timer	Type
xe-0/0/0.0	up	100	backup	A .0327 1c1 10.1.1.252 vip 10.1.1.1	
xe-0/0/0.0	up	200	master	A .0327 1c1 10.1.1.252 vip 10.1.1.2	

**Meaning** The **show vrrp** command displays fundamental information about the VRRP configuration. This output shows that both VRRP groups are active and that this switch has assumed the correct master and backup roles. The **lcl** address is the physical address of the interface and the **vip** address is the virtual address shared by both switches. The **Timer** value (**A .0327**) indicates the remaining time (in seconds) in which this switch expects to receive a VRRP advertisement from the other switch. If an advertisement for group 100 does not arrive before the timer expires, Switch B asserts itself as the master for this group.

## Configuring Basic VRRP Support

To configure basic VRRP support, configure VRRP groups on interfaces by including the **vrrp-group** statement:

```
vrrp-group group-id {
  priority number;
  virtual-address [ addresses ];
}
```

An interface can be a member of multiple VRRP groups.

You can include this statement at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address*]**

For each interface, you must configure the following:

- Group identifier—Assign a value from 0 through 255. You must use the same identifier for each switch in the VRRP group.
- Priority—Assign a value from 1 through 255. The switch with the highest priority becomes the VRRP master. Assign different priorities to each switch in the VRRP group. If there are two or more switches with the same priority, the switch with the VRRP interface that has the highest IP address becomes the master.
- Virtual IP address—Normally, you configure only one address per group, but you can configure as many as eight addresses. Do not include a prefix length in a virtual IP address. The following considerations apply to configuring a virtual IP address:
  - You must configure the same address on all the switches in the VRRP group.
  - If you configure a virtual IP address to be the same as a physical interface address, the switch with that interface becomes the master for the group. You must configure the priority to be 255, and you must configure preemption by including the **preempt** statement.
  - If the virtual IP address is not the same as the physical interface address, you must ensure that the address does not appear anywhere else in the switch configuration. For example, verify that you do not use this address for another interface (including an aggregated Ethernet interface) or for a static ARP entry.

**NOTE:** If you enable MAC source address filtering on an interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the **source-address-filter** statement at the **[edit interfaces *interface-name*]** hierarchy. MAC addresses ranging from 00:00:5e:00:01:00 through 00:00:5e:00:01:ff are reserved for VRRP, as defined in RFC 3768. The VRRP group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.

  - [Configuring the Startup Period for VRRP Operations on page 2287](#)
  - [Configuring VRRP Authentication \(IPv4 Only\) on page 2286](#)

## Configuring VRRP Authentication (IPv4 Only)

VRRP (IPv4 only) protocol exchanges can be authenticated to guarantee that only trusted switches participate in a VRRP group. By default, VRRP authentication is disabled. You can configure one of the following authentication methods for a group, and each switch in the same group must use the same method:

- Simple authentication—Uses a text password included in the transmitted packet. The receiving switch uses an authentication key (password) to verify the packet.
- Message Digest 5 (MD5) algorithm—Adds an authentication header (AH) to the IP packet that encapsulates the VRRP packet. You create an authentication key that is used to create a hash of the packet, and the hash is stored in the AH. A receiving switch recalculates the hash on the incoming packet and compares the hashes. If they are identical, the packet is valid and is accepted. Otherwise the switch drops the incoming packet.

To enable authentication and specify an authentication method, include the **authentication-type** statement.

**authentication-type** *authentication*;

**authentication** can be **simple** or **md5**. The authentication type must be the same for all the switches in the VRRP group.

You can include this statement at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]

If you include the **authentication-type** statement, you can configure a key (password) on each interface by including the **authentication-key** statement:

**authentication-key** *key*;

**key** (the password) is an ASCII string. For simple authentication, it can be from 1 through 8 characters long. For MD5 authentication, it can be from 1 through 16 characters long. If you include spaces, enclose all characters in quotation marks (" ").

**NOTE:** The key must be the same for all switches in the VRRP group.

---

You can include this statement at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]

- [Configuring Basic VRRP Support on page 2285](#)

## Configuring the Startup Period for VRRP Operations

Configure the startup-silent period interval to avoid alarms caused by the delay or interruption of the incoming VRRP advertisement packets while an interface is coming online. The period starts when the state of a VRRP interface is changed from down to up. During this period, Master Down Events are ignored.

To configure the startup period for VRRP operations, include the **startup-silent-period** statement at the [edit protocols vrrp] hierarchy level:

```
[edit protocols vrrp]
  startup-silent-period seconds;
```

**Related  
Documentation**

- [Understanding VRRP on page 2258](#)
- [Configuring Basic VRRP Support on page 2285](#)
- [Example: Configuring VRRP for Load Sharing on page 2279](#)

## Configuring the Advertisement Interval for the VRRP Master

By default, the master switch sends VRRP advertisement packets every second to all members of the VRRP group. These packets indicate that the master switch is still operational. If the master switch fails or becomes unreachable, the backup switch with the highest priority value becomes the new master switch.

You can modify the advertisement interval in seconds or in milliseconds; the interval must be the same for all routing platforms in the VRRP group.

This topic contains the following sections:

- [Modifying the Advertisement Interval in Seconds on page 2287](#)
- [Modifying the Advertisement Interval in Milliseconds on page 2288](#)

### Modifying the Advertisement Interval in Seconds

To modify the time, in seconds, between the sending of VRRP advertisement packets, include the **advertise-interval** statement:

```
advertise-interval seconds;
```

The interval can be from 1 through 255 seconds.

You can include this statement at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]

### Modifying the Advertisement Interval in Milliseconds

---

To modify the time, in milliseconds, between the sending of VRRP advertisement packets, include the **fast-interval** statement:

**fast-interval** *milliseconds*;

The interval can be from 100 through 999 milliseconds.

You can include this statement at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family (inet | inet6) address *address* (vrrp-group | vrrp-inet6-group) *group-id*]

**NOTE:** Junos OS sets the advertisement interval to 0 in VRRP packets. When you configure VRRP with other vendors' equipment, the **fast-interval** statement works correctly only when the other equipment also has the advertisement interval set to 0 in the VRRP packet. Otherwise, Junos OS interprets other routers' settings as advertisement timer errors.

---

## Configuring VRRP Preemption and Hold Time

- [Configuring VRRP Preemption on page 2288](#)
- [Configuring the Preemption Hold Time on page 2289](#)
- [Overriding the Hold Time on page 2289](#)

### Configuring VRRP Preemption

---

By default, a higher-priority VRRP backup switch preempts a lower-priority master switch. To explicitly enable this behavior, include the following statement:

**preempt**;

To prohibit a higher-priority VRRP backup switch from preempting a lower-priority master switch, include the following statement on the lower-priority switch:

**no-preempt**;

You can include these statements at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]

### Configuring the Preemption Hold Time

You can also configure a preemption hold time, which is the number of seconds a higher-priority backup router that has just started up waits before preempting the master router. You might want to configure a hold time so that routing protocols or other Junos OS components converge before preemption occurs.

The hold time is applied only on startup. By default, the hold-time value is 0 seconds, meaning that preemption can occur immediately after the backup router starts up.

To modify the preemption hold-time value, configure the following statement:

**hold-time** *seconds*;

The hold time can be from 0 through 3600 seconds.

You can include this statement at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address vrrp-group *group-id*] preempt

### Overriding the Hold Time

You can use the **asymmetric-hold-time** statement to configure a VRRP master to fail over to the backup immediately—without waiting for the preemption hold time to expire—when a tracked route goes down. Otherwise, the master waits for the hold time to expire before it initiates a failover when a tracked route goes down.

When the tracked route comes up again, the new backup (original master) router waits for the preemption hold time to expire before it reasserts mastership.

You can include this statement at the following hierarchy level:

- [edit protocols vrrp]

#### Related Documentation

- [Configuring Basic VRRP Support on page 2285](#)
- [Example: Configuring VRRP for Load Sharing on page 2279](#)

## Configuring a Route to Be Tracked

A VRRP master can track a route and dynamically trigger a new master router election if the route becomes unreachable. To enable this behavior, you must configure a cost that will be subtracted from the priority of the master if the tracked route becomes unreachable. The new priority must be less than the priority of one of the backups so that the backup becomes the new master.

To configure a route to be tracked, include the following statements:

```
track {  
  priority-hold-time seconds;  
  route prefix/prefix-length routing-instance default priority-cost priority;  
}
```

You can include these statements at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]

The **prefix** and **prefix-length** values specify the route to be tracked. The **priority-hold-time** statement is the minimum length of time that must elapse between priority changes. If the priority of the master changes because of a tracking event, the priority hold timer begins. If another tracking event or manual configuration change occurs while the timer is running, the new priority update is postponed until the timer expires. You might configure the **priority-hold-time** statement to prevent problems that could occur if there were multiple VRRP transitions in a short period of time.

The **priority-cost** option is the value to be subtracted from the VRRP priority when the tracked route goes down. The value can be 1 through 254. The sum of the costs for all tracked interfaces and routes must be less than or equal to the configured priority (so that subtracting all the costs results in a priority equal to or greater than 0).

#### Related Documentation

- [Understanding VRRP on page 2258](#)
- [Configuring Basic VRRP Support on page 2285](#)
- [Example: Configuring VRRP for Load Sharing on page 2279](#)
- [Configuring a Logical Interface to Be Tracked on page 2290](#)

## Configuring a Logical Interface to Be Tracked

VRRP can track whether a logical interface is up, down, or not present, and can change the priority of the switch based on the state of the interface, which might trigger a new master election. VRRP can also track the operational speed of a logical interface and update the priority of the switch when the speed crosses a configured threshold. For each VRRP group, you can track as many as 10 logical interfaces.

When interface tracking is enabled on a switch, you cannot assign the switch a priority of 255 to make it the master for the group.

To configure a logical interface to be tracked, include the following statements:

```
track {  
  interface interface-name {  
    bandwidth-threshold bits-per-second priority-cost priority;  
    priority-cost priority;  
  }  
  priority-hold-time seconds;  
}
```

You can include these statements at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* *vrrp-group group-id*]

The interface specified is the interface to be tracked for the VRRP group. The **priority-hold-time** statement is the minimum length of time that must elapse between priority changes. If the priority changes because of a tracking event, the priority hold timer begins. If another tracking event or manual configuration change occurs while the timer is running, the new priority update is postponed until the timer expires. You might configure the **priority-hold-time** statement to prevent problems that could occur if there were multiple VRRP transitions in a short period of time.

The **bandwidth-threshold** statement specifies a threshold for the tracked interface. If the bandwidth of the tracked interface drops below the threshold value, the system subtracts the bandwidth threshold **priority-cost** value from the VRRP priority for the switch. You can create as many as five **bandwidth-threshold** statements for each tracked interface.

The interface **priority-cost** statement is the value to be subtracted from the VRRP priority when the tracked route goes down. The value can be 1 through 254. The sum of the costs for all tracked interfaces and routes must be less than or equal to the configured priority (so that subtracting all the costs results in a priority equal to or greater than 0).

**WARNING:** On a QFabric system, do not apply interface tracking to a multichassis link aggregation group (MC-LAG) that includes an interface belonging to a network Node group device and an interface belonging to a server Node group device. If you do apply interface tracking to an MC-LAG configured in this way, a priority update will not occur if the state of the MC-LAG interface changes.

If you configure tracking for more than one interface, Junos OS subtracts the sum of the priority costs for the tracked interfaces from the VRRP priority if all the tracked interfaces fail. However, if you configure the interface **priority-cost** statement and the bandwidth threshold **priority-cost** statement, they are not added together. The switch uses only one priority cost for a tracked interface, as indicated in [Table 209 on page 2291](#):

**Table 209: Interface State and Priority Cost Usage**

Tracked Interface State	Priority Cost Usage
Down	<b>priority cost</b> <i>priority</i>
Not down; media speed below one or more bandwidth thresholds	Priority-cost of the lowest applicable bandwidth threshold

You must configure an interface priority cost only if you do not configure any bandwidth thresholds. If you do not configure an interface **priority-cost** value and the interface fails, Junos OS subtracts the bandwidth threshold **priority-cost** value of the lowest bandwidth threshold from the priority of the switch.

## Configuring a Backup to Accept Packets Destined for the Virtual IP Address

By default, a switch configured to be a VRRP backup but acting as the master does not process packets sent to the virtual IP address—that is, packets in which the destination address is the virtual IP address. To configure a backup switch to process packets sent to the virtual IP address while it is acting as the master, include the **accept-data** statement on the backup:

```
accept-data;
```

You can include this statement at the following hierarchy level:

- `[edit interfaces interface-name unit logical-unit-number family inet address address vrrp-group] group-id`

To explicitly prohibit the backup from accepting packets destined for the virtual IP address while acting as master, include the **no-accept-data** statement:

```
no-accept-data;
```

If you include the **accept-data** statement, configure the connected hosts so that they:

- Process gratuitous ARP requests.
- Do not use packets other than ARP replies to update their ARP cache.

This statement is disabled by default. If you enable it, your configuration does not comply with RFC 3768.

To restrict incoming IP packets to ICMP only, you must configure firewall filters to accept only ICMP packets.

- Related Documentation**
- [Understanding VRRP on page 2258](#)
  - [Configuring Basic VRRP Support on page 2285](#)
  - [Example: Configuring VRRP for Load Sharing on page 2279](#)

## Configuring Passive ARP Learning for VRRP Backups

By default, VRRP backup switches drop ARP requests for the MAC address of the VRRP IP. This means that backups do not learn the ARP mappings (IP address to MAC address mappings) for the hosts sending the requests. If it becomes the master, the configured backup must learn all the entries that were present in the ARP cache of the original master. In environments with many directly attached hosts, the number of ARP entries to learn can be very large. This can cause a significant delay while the backup transitions

to the master state, during which traffic transmitted to some of the hosts might be dropped.

Passive ARP learning enables the ARP cache in the backup to learn approximately the same contents as the ARP cache in the master, thus preventing the problem of needing to learn many ARP entries quickly. To enable passive ARP learning, include the **passive-learning** statement at the **[edit system arp]** hierarchy level:

```
[edit system arp]
passive-learning;
```

We recommend setting passive learning on both the backup and master VRRP switches. Doing so prevents the need to manually configure a master that fails and becomes a backup. While a switch operates as the master, the passive learning configuration has no impact. The configuration takes effect only when a switch operates as a backup.

- Related Documentation**
- [Understanding VRRP on page 2258](#)
  - [Configuring Basic VRRP Support on page 2285](#)
  - [Example: Configuring VRRP for Load Sharing on page 2279](#)

## Configuring the Silent Period

When the state of a VRRP interface changes from down to up, a silent period begins. During this period, any master down events are ignored. Configure the silent period interval to avoid problems that can be caused if incoming VRRP advertisement packets are delayed or interrupted while an interface starts up.

To configure the silent period, include the **startup-silent-period** statement at the **[edit protocols vrrp]** hierarchy level:

```
[edit protocols vrrp]
startup-silent-period seconds;
```

- Related Documentation**
- [Understanding VRRP on page 2258](#)
  - [Configuring Basic VRRP Support on page 2285](#)
  - [Example: Configuring VRRP for Load Sharing on page 2279](#)

## Configuring Inheritance for a VRRP Group

Junos OS enables you to configure VRRP groups on the various subnets of a VLAN to inherit the state and configuration of one of the groups, which is known as the *active VRRP group*. By configuring inheritance, you can prevent VRRP groups other than the active group from sending out VRRP advertisements. When the **vrrp-inherit-from** configuration statement is included in the configuration, only the active VRRP group from which the other VRRP groups are inheriting the state sends out VRRP advertisements; the groups inheriting the state do not send any VRRP advertisements, because the state is maintained only on the group from which the state is inherited.

If the **vrrp-inherit-from** statement is not configured, each of the VRRP master groups in the various subnets on the VLAN sends out separate VRRP advertisements and adds to the traffic on the VLAN.

To configure inheritance for a VRRP group, include the **vrrp-inherit-from** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]**:

```
[edit interfaces interface-name unit logical-unit-number family inet address address
  vrrp-group group-id]
  vrrp-inherit-from vrrp-group;
```

When you configure a group to inherit a state from another group, note the following conditions:

- Both inheriting groups and active groups must be on the same physical interface and logical system. However, the groups need not necessarily be on the same VLAN or logical interface.
- Both inheriting groups and active groups must be on the same routing instances; however, this limitation does not apply for groups on the integrated routing and bridging (IRB) interfaces.

When you include the **vrrp-inherit-from** statement for a VRRP group, the VRRP group inherits the following parameters from the active group:

- **advertise-interval**
- **authentication-key**
- **authentication-type**
- **fast-interval**
- **preempt | no-preempt**
- **priority**
- **track interfaces**
- **track route**

However, you can configure the **accept-data | no-accept-data** statement for the group to specify whether the interface should accept packets destined for the virtual IP address.

## graceful-restart (Enabling Globally)

<b>Syntax</b>	<pre> graceful-restart {   disable;   helper-disable;   maximum-helper-recovery-time <i>seconds</i>;   maximum-helper-restart-time <i>seconds</i>;   notify-duration <i>seconds</i>;   recovery-time <i>seconds</i>;   restart-duration <i>seconds</i>;   stale-routes-time <i>seconds</i>; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-options], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options], [edit routing-options], [edit routing-instances <i>routing-instance-name</i> routing-options]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure graceful restart globally to enable the feature. You cannot enable graceful restart for specific protocols unless graceful restart is also enabled globally. You can, optionally, modify the global settings at the individual protocol level.

### NOTE:

- For VPNs, the `graceful-restart` statement allows a router whose VPN control plane is undergoing a restart to continue to forward traffic while recovering its state from neighboring routers.
- For BGP, if you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.
- LDP sessions flap when `graceful-restart` configurations change.

<b>Default</b>	Graceful restart is disabled by default.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Enabling Graceful Restart</a></li> <li>• <a href="#">Configuring Routing Protocols Graceful Restart on page 2261</a></li> </ul>

## graceful-restart (Protocols BGP)

<b>Syntax</b>	<pre> graceful-restart {   disable;   restart-time seconds;   stale-routes-time seconds; } </pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],  [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],  [edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],  [edit protocols bgp],  [edit protocols bgp <b>group</b> <i>group-name</i>],  [edit protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.  Statement introduced in Junos OS Release 9.0 for EX Series switches.  Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure graceful restart for BGP. Graceful restart allows a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition. Graceful restart is disabled by default.</p> <p>To configure the duration of the BGP graceful restart period, include the <b>restart-time</b> statement at the [edit protocols bgp graceful-restart] hierarchy level. To set the length of time the router waits to receive messages from restarting neighbors before declaring them down, include the <b>stale-routes-time</b> statement at the [edit protocols bgp graceful-restart] hierarchy level.</p> <hr/> <div>  <p><b>NOTE:</b> If you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.</p> </div> <hr/> <p>Configure graceful restart globally at the [edit routing-options] or [edit routing-instances <i>instance-name</i> routing-options] hierarchy level to enable the feature. You cannot enable graceful restart for specific protocols unless graceful restart is also enabled globally. You can, optionally, modify the global settings at the individual protocol level.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.  routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Graceful Restart Options for BGP on page 2262</a></li> <li>• <i>Configuring Graceful Restart for QFabric Systems</i></li> <li>• <i>Junos OS High Availability Library for Routing Devices</i></li> </ul>

## graceful-restart (Protocols OSPF)

---

<b>Syntax</b>	<pre>graceful-restart {   disable;   helper-disable (standard   restart-signaling   both);   no-strict-lsa-checking;   notify-duration <i>seconds</i>;   restart-duration <i>seconds</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit logical-systems <i>logical-system-name</i> protocols (<b>ospf</b>   ospf3)], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   (<b>ospf</b>   ospf3)], [edit protocols (<b>ospf</b>   ospf3)], [edit routing-instances <i>routing-instance-name</i> protocols ospf]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Support for the <b>no-strict-lsa-checking</b> statement introduced in Junos OS Release 8.5.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the helper mode <b>standard</b>, <b>restart-signaling</b>, and <b>both</b> options introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure graceful restart for OSPF.</p> <p>Graceful restart allows a routing device to restart with minimal effects to the network, and is enabled for all routing protocols at the <b>[edit routing-options]</b> hierarchy level.</p>
<b>Options</b>	<p><b>disable</b>—Disable graceful restart for OSPF.</p> <p><b>helper-disable (standard   restart-signaling   both)</b>—Disable helper mode for graceful restart. When helper mode is disabled, a device cannot help a neighboring device that is attempting to restart. Beginning with Junos OS Release 11.4, you can configure restart signaling-based helper mode for OSPFv2 graceful restart configurations. The <b>standard</b>, <b>restart-signaling</b>, and <b>both</b> options are only supported for OSPFv2. Specify <b>standard</b> to disable helper mode for standard graceful restart (based on RFC 3623). Specify <b>restart-signaling</b> to disable helper mode for restart signaling-based graceful restart (based on RFC 4811, RFC 4812, and RFC 4813). Specify <b>both</b> to disable helper mode for both standard and restart signaling-based graceful restart. The last committed statement takes precedence over the previously configured statement.</p> <p><b>Default:</b> Helper mode is enabled by default. For OSPFv2, both standard and restart-signaling based helper modes are enabled by default.</p> <p><b>no-strict-lsa-checking</b>—Disable strict OSPF link-state advertisement (LSA) checking to prevent the termination of graceful restart by a helping router. LSA checking is enabled by default.</p>

**NOTE:** The **helper-disable** statement and the **no-strict-lsa-checking** statement cannot be configured at the same time. If you attempt to configure both

statements at the same time, the routing device displays a warning message when you enter the `show protocols (ospf | ospf3)` command.

**notify-duration seconds**—Estimated time needed to send out purged grace LSAs over all the interfaces.

**Range:** 1 through 3600 seconds

**Default:** 30 seconds

**restart-duration seconds**—Estimated time needed to reacquire a full OSPF neighbor from each area.

**Range:** 1 through 3600 seconds

**Default:** 180 seconds

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## helper-disable (OSPF)

---

<b>Syntax</b>	helper-disable < both   restart-signaling   standard >;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ospf <a href="#">graceful-restart</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf <a href="#">graceful-restart</a> ], [edit protocols ospf <a href="#">graceful-restart</a> ], [edit routing-instances <i>routing-instance-name</i> protocols ospf <a href="#">graceful-restart</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Options <b>both</b> , <b>restart-signaling</b> , and <b>standard</b> introduced in Junos OS Release 11.4. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Disable helper mode for graceful restart. When helper mode is disabled, a router cannot help a neighboring router that is attempting to restart. The last committed statement takes precedence over the previously configured statement.
<b>Default</b>	Helper mode is enabled by default for OSPF.
<b>Options</b>	<b>both</b> —(Optional) Disable helper mode for both standard and restart signaling-based graceful restart.  <b>restart-signaling</b> —(Optional) Disable helper mode for restart signaling-based graceful restart (based on RFC 4811, RFC 4812, and RFC 4813).  ..... <div> <b>NOTE:</b> Restart signaling-based helper mode is not supported for OSPFv3 configurations.</div> ..... <b>standard</b> —(Optional) Disable helper mode for standard graceful restart (based on RFC 3623).
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Routing Protocols Graceful Restart on page 2261</a></li><li>• <i>Configuring Graceful Restart for MPLS-Related Protocols</i></li></ul>

---

## no-strict-lsa-checking

---

<b>Syntax</b>	no-strict-lsa-checking;
<b>Hierarchy Level</b>	[edit protocols (ospf   ospf3) <a href="#">graceful-restart</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Disable strict OSPF link-state advertisement (LSA) checking to prevent the termination of graceful restart by a helping router or switch.
<b>Default</b>	By default, LSA checking is enabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Graceful Restart Options for OSPF and OSPFv3 on page 2264</a></li><li>• <i>Configuring Graceful Restart for QFabric Systems</i></li><li>• <a href="#">maximum-neighbor-recovery-time on page 4550</a></li><li>• <i>recovery-time</i></li></ul>

## notify-duration

---

<b>Syntax</b>	<code>notify-duration <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit protocols (ospf   ospf3) <a href="#">graceful-restart</a> ], [edit logical-systems <i>logical-system-name</i> protocols (ospf   ospf3) <a href="#">graceful-restart</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>instance-name</i> protocols (ospf   ospf3) <a href="#">graceful-restart</a> ], [edit routing-instances <i>instance-name</i> protocols (ospf   ospf3) <a href="#">graceful-restart</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify the length of time the router or switch notifies helper OSPF routers that it has completed graceful restart.
<b>Options</b>	<b><i>seconds</i></b> —Length of time in the router notifies helper OSPF routers that it has completed graceful restart. <b>Range:</b> 1 through 3600 <b>Default:</b> 30
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Graceful Restart Options for OSPF and OSPFv3 on page 2264</a></li><li>• <a href="#">Configuring Graceful Restart for QFabric Systems</a></li><li>• <a href="#">restart-duration on page 2306</a></li></ul>

## redundancy (Graceful Switchover)

<b>Syntax</b>	<pre> redundancy {   failover {     on-disk-failure;     on-loss-of-keepalives;   }   graceful-switchover; } </pre>
<b>Hierarchy Level</b>	[edit chassis]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Enable redundant Routing Engines on a Virtual Chassis with two or more member switches or on a Virtual Chassis Fabric, on a standalone EX6200 or EX8200 switch with more than one Routing Engine.</p> <p>The remaining statements are explained separately.</p>
<b>Default</b>	Redundancy is enabled for the Routing Engines.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">graceful-switchover on page 2309</a></li> <li>• <a href="#">Configuring Graceful Routing Engine Switchover in a Virtual Chassis (CLI Procedure) on page 2270</a></li> <li>• <a href="#">Configuring Graceful Routing Engine Switchover on page 2268</a></li> <li>• <a href="#">Installing Software on an EX Series Switch with Redundant Routing Engines (CLI Procedure)</a></li> <li>• <a href="#">High Availability Features for EX Series Switches Overview</a></li> </ul>

## restart-duration

---

<b>Syntax</b>	<code>restart-duration <i>seconds</i>;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols (isis   ospf   ospf3   pim) graceful-restart],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3   pim) graceful-restart],</code> <code>[edit protocols (esis   isis   ospf   ospf3   pim) graceful-restart],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3   pim) graceful-restart],</code> <code>[edit routing-options graceful-restart]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Configure the grace period for graceful restart globally.</p> <p>Additionally, you can individually configure the duration of the graceful restart period for the End System-to-Intermediate System (ES-IS), Intermediate System-to-Intermediate System (IS-IS), Open Shortest Path First (OSPF), and OSPFv3 protocols and for Protocol Independent Multicast (PIM) sparse mode.</p>
<b>Options</b>	<p><b><i>seconds</i></b>—Time for the graceful restart period.</p> <p><b>Range:</b></p> <p>The range of values varies according to whether the graceful restart period is being set globally or for a particular protocol:</p> <ul style="list-style-type: none"><li>• <b>[edit routing-options graceful-restart]</b> (global setting)—120 through 900</li><li>• ES-IS—30 through 300</li><li>• IS-IS—30 through 300</li><li>• OSPF/OSPFv3—1 through 3600</li><li>• PIM—30 through 300</li></ul> <p><b>Default:</b></p> <p>The default value varies according to whether the graceful restart period is being set globally or for a particular protocol:</p> <ul style="list-style-type: none"><li>• <b>[edit routing-options graceful-restart]</b> (global setting)—300</li><li>• ES-IS—180</li><li>• IS-IS—210</li><li>• OSPF/OSPFv3—180</li><li>• PIM—60</li></ul>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

## restart-time (BGP Graceful Restart)

<b>Syntax</b>	<code>restart-time seconds;</code>
<b>Hierarchy Level</b>	<p>[edit protocols (bgp   rip   ripng) <a href="#">graceful-restart</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols (bgp   rip   ripng) <a href="#">graceful-restart (Enabling Globally)</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <a href="#">graceful-restart</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <a href="#">graceful-restart</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.3.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Configure the duration of the BGP, RIP, or next-generation RIP (RIPng) graceful restart period.
<b>Options</b>	<p><b>seconds</b>—Length of time for the graceful restart period.</p> <p><b>Range:</b> 1 through 600 seconds</p> <p><b>Default:</b> Varies by protocol:</p> <ul style="list-style-type: none"> <li>• BGP—120 seconds</li> <li>• RIP and RIPng—60 seconds</li> </ul>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Graceful Restart Options for BGP on page 2262</a></li> <li>• <a href="#">Configuring Graceful Restart Options for RIP and RIPng on page 2266</a></li> <li>• <i>Configuring Graceful Restart for QFabric Systems</i></li> <li>• <a href="#">stale-routes-time on page 2308</a></li> </ul>

## stale-routes-time

---

<b>Syntax</b>	<code>stale-routes-time seconds;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-routing-name</i> protocols bgp <a href="#">graceful-restart</a> ], [edit logical-systems <i>logical-routing-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <a href="#">graceful-restart</a> ], [edit protocols bgp <a href="#">graceful-restart</a> ], [edit routing-instances <i>routing-instance-name</i> protocols bgp <a href="#">graceful-restart</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify the maximum time that stale routes are kept during a restart. The <b>stale-routes-time</b> statement allows you to set the length of time the routing device waits to receive messages from restarting neighbors before declaring them down.
<b>Options</b>	<b>seconds</b> —Time the router device waits to receive messages from restarting neighbors before declaring them down. <b>Range:</b> 1 through 600 seconds <b>Default:</b> 300 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Graceful Restart Options for BGP on page 2262</a></li><li>• <a href="#">Configuring Graceful Restart for QFabric Systems</a></li><li>• <a href="#">restart-time (BGP Graceful Restart) on page 2307</a></li></ul>

## Configuration Statement for Graceful Switchover

---

- [graceful-switchover on page 2309](#)
- [redundancy \(Graceful Switchover\) on page 2310](#)

## graceful-switchover

---

<b>Syntax</b>	graceful-switchover;
<b>Hierarchy Level</b>	[edit chassis <a href="#">redundancy</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2 for EX Series switches. Statement introduced in Junos OS Release 13.2 for the QFX Series.
<b>Description</b>	For switches with more than one Routing Engine, including those in a Virtual Chassis or a Virtual Chassis Fabric, configure the master Routing Engine to switch over gracefully to a backup Routing Engine without interruption to packet forwarding.
<b>Default</b>	Graceful Routing Engine switchover (GRES) is disabled.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Nonstop Active Routing on Switches on page 2274</a></li> <li>• <a href="#">Configuring Graceful Routing Engine Switchover on page 2268</a></li> <li>• <a href="#">Configuring Graceful Routing Engine Switchover in a Virtual Chassis (CLI Procedure) on page 2270</a></li> <li>• <a href="#">Configuring Nonstop Active Routing on Switches on page 2277</a></li> <li>• <a href="#">Installing Software on an EX Series Switch with Redundant Routing Engines (CLI Procedure)</a></li> </ul>

## redundancy (Graceful Switchover)

---

<b>Syntax</b>	<pre>redundancy {     failover {         on-disk-failure;         on-loss-of-keepalives;     }     graceful-switchover; }</pre>

## Configuration Statement for Nonstop Bridging

---

- [nonstop-bridging on page 2311](#)

## nonstop-bridging

---

<b>Syntax</b>	nonstop-bridging;
<b>Hierarchy Level</b>	[edit protocols layer2-control]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.4.
<b>Description</b>	For platforms with two Routing Engines, configure a master Routing Engine to switch over gracefully to a backup Routing Engine and preserve Layer 2 Control Protocol (L2CP) information.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Synchronizing the Routing Engine Configuration</i></li> <li>• <i>Configuring Nonstop Bridging</i></li> <li>• For information about configuring NSB on EX Series switches that do not support the Enhanced Layer 2 Software (ELS) CLI style, see <i>Configuring Nonstop Bridging on EX Series Switches (CLI Procedure)</i></li> <li>• For information about configuring NSB on switches that support ELS, see <a href="#">Configuring Nonstop Bridging on Switches (CLI Procedure) on page 2272</a></li> </ul>

## Configuration Statements for Nonstop Routing

---

- [nonstop-routing on page 2312](#)
- [synchronize on page 2313](#)
- [traceoptions \(Routing Options\) on page 2315](#)

## nonstop-routing

---

<b>Syntax</b>	nonstop-routing;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-options], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options], [edit routing-instances <i>routing-instance-name</i> routing-options], [edit routing-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.4. Statement introduced in Junos OS Release 10.4 for EX Series switches. Statement introduced in Junos OS Release 12.3 for ACX Series routers. Statement introduced in Junos OS Release 13.2X51-D20 for QFX Series switches
<b>Description</b>	For routing platforms with two Routing Engines, configure a master Routing Engine to switch over gracefully to a backup Routing Engine and to preserve routing protocol information.
<b>Default</b>	disabled
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Nonstop Active Routing</a></li><li>• <a href="#">Configuring Nonstop Active Routing on Switches on page 2277</a></li><li>• <a href="#">Example: Configuring Nonstop Active Routing on Switches on page 2274</a></li><li>• <a href="#">Example: Configuring Nonstop Active Routing on Switches on page 2274</a></li></ul>

## synchronize

<b>Syntax</b>	synchronize;
<b>Hierarchy Level</b>	[edit system commit]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 10.4 for EX Series switches.
<b>Description</b>	For devices with multiple Routing Engines only. Configure the <b>commit</b> command to automatically perform a <b>commit synchronize</b> action between dual Routing Engines within the same chassis. The Routing Engine on which you execute the <b>commit</b> command (the requesting Routing Engine) copies and loads its candidate configuration to the other (the responding) Routing Engine. Each Routing Engine then performs a syntax check on the candidate configuration file being committed. If no errors are found, the configuration is activated and becomes the current operational configuration on both Routing Engines.

**NOTE:** When you configure nonstop active routing (NSR), you must configure the **commit synchronize** statement. Otherwise, the commit operation fails.

On the TX Matrix router, synchronization only occurs between the Routing Engines within the same chassis. When synchronization is complete, the new configuration is then distributed to the Routing Engines on the T640 routers. That is, the master Routing Engine on the TX Matrix router distributes the configuration to the master Routing Engine on each T640 router. Likewise, the backup Routing Engine on the TX Matrix router distributes the configuration to the backup Routing Engine on each T640 router.

On the TX Matrix Plus router, synchronization only occurs between the Routing Engines within the switch-fabric chassis and when synchronization is complete, the new configuration is then distributed to the Routing Engines on the line-card chassis (LCC). That is, the master Routing Engine on the TX Matrix Plus router distributes the configuration to the master Routing Engine on each LCC. Likewise, the backup Routing Engine on the TX Matrix Plus router distributes the configuration to the backup Routing Engine on each LCC.

In EX Series Virtual Chassis configurations:

- On EX4200 switches in Virtual Chassis, synchronization occurs between the switch in the master role and the switch in the backup role.
- On EX8200 switches in a Virtual Chassis, synchronization occurs only between the master and backup XRE200 External Routing Engines.

<b>Options</b>	<b>and-quit</b> —(Optional) Quit configuration mode if the commit synchronization succeeds.
	<b>at</b> —(Optional) Time at which to activate configuration changes.
	<b>comment</b> —(Optional) Write a message to the commit log.

**force**—(Optional) Force a commit synchronization on the other Routing Engine (ignore warnings).

**scripts**—(Optional) Push scripts to the other Routing Engine.

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
---------------------------------	-------------------------------------------------------------------------------------------------------------------

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Synchronizing the Routing Engine Configuration</i></li><li>• <i>Configuring Multiple Routing Engines to Synchronize Committed Configurations Automatically</i></li></ul>
------------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## traceoptions (Routing Options)

<b>Syntax</b>	<pre> traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;disable&gt;; } </pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options multicast],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options multicast],</p> <p>[edit routing-options],</p> <p>[edit routing-options flow],</p> <p>[edit routing-options multicast]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p><b>nsr-synchronization</b> flag for BGP, IS-IS, LDP, and OSPF added in Junos OS Release 8.4.</p> <p><b>nsr-synchronization</b> and <b>nsr-packet</b> flags for BFD sessions added in Junos OS Release 8.5.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>nsr-synchronization</b> flag for RIP and RIPng added in Junos OS Release 9.0.</p> <p><b>nsr-synchronization</b> flag for Layer 2 VPNs and VPLS added in Junos OS Release 9.1.</p> <p><b>nsr-synchronization</b> flag for PIM added in Junos OS Release 9.3.</p> <p><b>nsr-synchronization</b> flag for MPLS added in Junos OS Release 10.1.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p><b>nsr-synchronization</b> flag for MSDP added in Junos OS Release 12.1.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p>
<b>Description</b>	<p>Define tracing operations that track all routing protocol functionality in the routing device.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>
<b>Default</b>	If you do not include this statement, no global tracing operations are performed.
<b>Options</b>	<p><b>Values:</b></p> <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place global routing protocol tracing output in the file <b>routing-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and</p>

so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 10 files

**flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. These are the global routing protocol tracing options:

- **all**—All tracing operations
- **condition-manager**—Condition-manager events
- **config-internal**—Configuration internals
- **general**—All normal operations and routing table changes (a combination of the **normal** and **route** trace operations)
- **graceful-restart**—Graceful restart operations
- **normal**—All normal operations
- **nsr-packet**—Detailed trace information for BFD nonstop active routing only
- **nsr-synchronization**—Tracing operations for nonstop active routing
- **nsr-synchronization-detail**—(MPLS only) Tracing operations for nonstop active routing in detail
- **parse**—Configuration parsing
- **policy**—Routing policy operations and actions
- **regex-parse**—Regular-expression parsing
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

<b>Required Privilege Level</b>	routing and trace—To view this statement in the configuration. routing-control and trace-control—To add this statement to the configuration.

## accept-data

<b>Syntax</b>	(accept-data   no-accept-data);
<b>Hierarchy Level</b>	<p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>],</p> <p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS 11.3 for the QFX Series.</p>
<b>Description</b>	<p>In a Virtual Router Redundancy Protocol (VRRP) configuration, determine whether or not a router that is acting as the master router accepts all packets destined for the virtual IP address.</p> <ul style="list-style-type: none"> <li>• <b>accept-data</b>—Enable the master router to accept all packets destined for the virtual IP address.</li> <li>• <b>no-accept-data</b>—Prevent the master router from accepting packets other than the ARP packets destined for the virtual IP address.</li> </ul>
<b>Default</b>	<p>If the router acting as the master router is the IP address owner or has its priority set to 255, the master router, by default, responds to all packets sent to the virtual IP address. However, if the router acting as the master router does not own the IP address or has its priority set to a value less than 255, the master router responds only to ARP requests.</p>
<div>  <b>NOTE:</b> <ul style="list-style-type: none"> <li>• If you want to restrict the incoming IP packets to ICMP packets only, you must configure firewall filters to accept only ICMP packets.</li> <li>• If you include the <b>accept-data</b> statement, your routing platform configuration does not comply with RFC 3768 (see section 6.4.3 of RFC 3768, <i>Virtual Router Redundancy Protocol (VRRP)</i>).</li> </ul> </div>	
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring an Interface to Accept All Packets Destined for the Virtual IP Address of a VRRP Group</i></li> </ul>

## advertise-interval

<b>Syntax</b>	<code>advertise-interval seconds;</code>
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series.
<b>Description</b>	Configure the interval between Virtual Router Redundancy Protocol (VRRP) IPv4 advertisement packets.  All routers in the VRRP group must use the same advertisement interval.
<div>  <p><b>NOTE:</b> When VRRPv3 is enabled, the <code>advertise-interval</code> statement cannot be used to configure advertisement intervals. Instead, use the <code>fast-interval</code> statement to configure advertisement intervals.</p> </div>	
<b>Options</b>	<i>seconds</i> —Interval between advertisement packets. <b>Range:</b> 1 through 255 seconds <b>Default:</b> 1 second
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the Advertisement Interval for the VRRP Master Router</i></li> <li>• <a href="#">fast-interval on page 2325</a></li> <li>• <i>inet6-advertise-interval</i></li> <li>• <i>version-3</i></li> </ul>

## asymmetric-hold-time

---

<b>Syntax</b>	asymmetric-hold-time;
<b>Hierarchy Level</b>	[edit protocols vrrp]
<b>Release Information</b>	Statement introduced in Junos OS 11.3 for the QFX Series.
<b>Description</b>	<p>Configure a VRRP master to fail over to a backup immediately—without waiting for the preemption hold time to expire—when a tracked route goes down. Otherwise, the master waits for the hold time to expire before it initiates a failover when a tracked route goes down.</p> <p>When the tracked route comes up again, the new backup (original master) router waits for the preemption hold time to expire before it reasserts mastership.</p>
<b>Default</b>	asymmetric-hold-time is disabled.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring VRRP Preemption and Hold Time on page 2288</a></li></ul>

## authentication-key

<b>Syntax</b>	<code>authentication-key key;</code>
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series.
<b>Description</b>	Configure a Virtual Router Redundancy Protocol (VRRP) IPv4 authentication key. You also must specify a VRRP authentication scheme by including the <b>authentication-type</b> statement.  All routers in the VRRP group must use the same authentication scheme and password.
<div>  <b>NOTE:</b> When VRRPv3 is enabled, the <b>authentication-type</b> and <b>authentication-key</b> statements cannot be configured for any VRRP groups. </div>	
<b>Options</b>	<b>key</b> —Authentication password. For simple authentication, it can be 1 through 8 characters long. For Message Digest 5 (MD5) authentication, it can be 1 through 16 characters long. If you include spaces, enclose all characters in quotation marks (" ").
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring VRRP Authentication (IPv4 Only)</i></li> <li>• <a href="#">Configuring VRRP Authentication (IPv4 Only) on page 2286</a></li> <li>• <a href="#">authentication-type on page 2322</a></li> <li>• <i>version-3</i></li> </ul>

## authentication-type

---

<b>Syntax</b>	<code>authentication-type <i>authentication</i>;</code>
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series.
<b>Description</b>	Enable Virtual Router Redundancy Protocol (VRRP) IPv4 authentication and specify the authentication scheme for the VRRP group. If you enable authentication, you must specify a password by including the <b>authentication-key</b> statement.  All routers in the VRRP group must use the same authentication scheme and password.

**NOTE:** When VRRPv3 is enabled, the **authentication-type** and **authentication-key** statements cannot be configured for any VRRP groups.

<b>Options</b>	<b><i>authentication</i></b> —Authentication scheme: <ul style="list-style-type: none"><li>• <b>simple</b>—Use a simple password. The password is included in the transmitted packet, so this method of authentication is relatively insecure.</li><li>• <b>md5</b>—Use the MD5 algorithm to create an encoded checksum of the packet. The encoded checksum is included in the transmitted packet. The receiving routing platform uses the authentication key to verify the packet, discarding it if the digest does not match. This algorithm provides a more secure authentication scheme.</li></ul> <b>Default:</b> none (no authentication is performed).
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring VRRP Authentication (IPv4 Only)</a></li><li>• <a href="#">Configuring VRRP Authentication (IPv4 Only) on page 2286</a></li><li>• <a href="#">authentication-key on page 2321</a></li><li>• <a href="#">version-3</a></li></ul>

## bandwidth-threshold

<b>Syntax</b>	<code>bandwidth-threshold <i>bits-per-second</i> priority-cost <i>priority</i>;</code>
<b>Hierarchy Level</b>	<p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i> <b>track interface</b> <i>interface-name</i>],</p> <p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i> <b>track interface</b> <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i> <b>track interface</b> <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i> <b>track interface</b> <i>interface-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS 11.3 for the QFX Series.</p>
<b>Description</b>	Specify the bandwidth threshold for Virtual Router Redundancy Protocol (VRRP) logical interface tracking.
<b>Options</b>	<p><b><i>bits-per-second</i></b>—Bandwidth threshold for the tracked interface. When the bandwidth of the tracked interface drops below the specified value, the VRRP group uses the bandwidth threshold priority cost value. You can include up to five bandwidth threshold statements for each interface you track.</p> <p><b>Range:</b> 1 through 10000000000000 bits per second</p> <p><b><i>priority-cost priority</i></b>—The value subtracted from the configured VRRP priority when the tracked interface or route is down to force a new master router election. The sum of all the costs for all interfaces or routes that are tracked must be less than or equal to the configured priority of the VRRP group.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring a Logical Interface to Be Tracked for a VRRP Group</a></li> <li>• <a href="#">Configuring a Logical Interface to Be Tracked on page 2290</a></li> </ul>

## failover-delay

---

<b>Syntax</b>	<code>failover-delay <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	[edit protocols vrrp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	<p>If you configure multiple VRRP groups on an interface (using multiple VLANs), traffic for some of the groups might be briefly dropped if a failover occurs. This can happen because the new master must send gratuitous ARP replies for each VRRP group to update the ARP tables in the connected devices, and there is a short delay between each gratuitous ARP reply. Traffic sent by devices that have not yet received the gratuitous ARP reply is dropped (until the device receives the reply and learns the MAC address of the new master).</p> <p>If you configure a failover delay, the new master delays sending gratuitous ARP replies for the period that you set. This allows the new master to send the ARP replies for all of the VRRP groups simultaneously.</p>
<b>Options</b>	<p><i>milliseconds</i>—Specify the failover delay time, in milliseconds.</p> <p><b>Range:</b> 50 through 2000</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Troubleshooting VRRP on page 2385</a></li><li>• <a href="#">show vrrp on page 2374</a></li></ul>

## fast-interval

<b>Syntax</b>	<code>fast-interval milliseconds;</code>
<b>Hierarchy Level</b>	<p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>],</p> <p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Configure the interval, in milliseconds, between Virtual Router Redundancy Protocol (VRRP) advertisement packets.</p> <p>All routers in the VRRP group must use the same advertisement interval.</p>
<b>Options</b>	<p><i>milliseconds</i>—Interval between advertisement packets.</p> <p><b>Range:</b> 10 through 40,950 milliseconds (range extended from 100–999 to 10–40,950 in Junos OS Release 12.2).</p>

**NOTE:** When configuring VRRP for IPv4, if you have chosen not to enable VRRPv3, you cannot set a value less than 100 for *fast-interval*. Commit check fails if a value less than 100 is configured.

**Default:** 1 second

<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the Advertisement Interval for the VRRP Master Router</i></li> <li>• <a href="#">Configuring the Advertisement Interval for the VRRP Master on page 2287</a></li> <li>• <a href="#">advertise-interval on page 2319</a></li> <li>• <a href="#">advertise-interval on page 2319</a></li> <li>• <i>inet6-advertise-interval</i></li> <li>• <i>version-3</i></li> </ul>

## hold-time (VRRP)

---

<b>Syntax</b>	<code>hold-time seconds;</code>
<b>Hierarchy Level</b>	<code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id preempt</i>],</code> <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id preempt</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id preempt</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id preempt</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series.
<b>Description</b>	In a Virtual Router Redundancy Protocol (VRRP) configuration, set the hold time before a higher-priority backup router preempts the master router.
<b>Default</b>	VRRP preemption is not timed.
<b>Options</b>	<b><i>seconds</i></b> —Hold-time period. <b>Range:</b> 0 through 3600 seconds <b>Default:</b> 0 seconds (VRRP preemption is not timed.)
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring a Backup Router to Preempt the VRRP Master Router</a></li><li>• <a href="#">Configuring VRRP Preemption and Hold Time on page 2288</a></li></ul>

## interface (VRRP Group)

<b>Syntax</b>	<pre>interface <i>interface-name</i> {     <b>bandwidth-threshold</b> <i>bits-per-second</i> <i>priority-cost</i> <i>priority</i>;     <b>priority-cost</b> <i>priority</i>; }</pre>
<b>Hierarchy Level</b>	<p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <b>vrrp-group</b> <i>group-id</i> <b>track</b>],</p> <p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <b>vrrp-inet6-group</b> <i>group-id</i> <b>track</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <b>vrrp-group</b> <i>group-id</i> <b>track</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <b>vrrp-inet6-group</b> <i>group-id</i> <b>track</b>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p><b>bandwidth-threshold</b> statement added in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS 11.3 for the QFX Series.</p>
<b>Description</b>	Enable logical interface tracking for a Virtual Router Redundancy Protocol (VRRP) group.

**WARNING:** On a QFabric system, do not apply interface tracking to a multichassis link aggregation group (MC-LAG) that includes an interface belonging to a network Node group device and an interface belonging to a server Node group device. If you do apply interface tracking to an MC-LAG configured in this way, a priority update will not occur if the state of the MC-LAG interface changes.

<b>Options</b>	<p><b>interface-name</b>—Interface to be tracked for this VRRP group.</p> <p><b>Range:</b> 1 through 10 interfaces</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring a Logical Interface to Be Tracked for a VRRP Group</i></li> <li>• <i>Configuring a Logical Interface to Be Tracked on page 2290</i></li> <li>• <i>Junos OS Services Interfaces Library for Routing Devices</i></li> </ul>

## preempt (VRRP)

<b>Syntax</b>	(preempt   no-preempt) { hold-time seconds; }
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i> ], [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series.
<b>Description</b>	In a Virtual Router Redundancy Protocol (VRRP) configuration, determine whether or not a backup router can preempt a master router: <ul style="list-style-type: none"> <li>• <b>preempt</b>—Allow the master router to be preempted.</li> </ul> <p>.....</p> <div>  <p><b>NOTE:</b> By default, a higher-priority backup router can preempt a lower-priority master router.</p> <p>.....</p> </div> <ul style="list-style-type: none"> <li>• <b>no-preempt</b>—Prohibit the preemption of the master router. When <b>no-preempt</b> is configured, the backup router cannot preempt the master router even if the backup router has a higher priority.</li> </ul> <p>The remaining statement is explained separately.</p>
<b>Default</b>	By default the <b>preempt</b> statement is enabled, and a higher-priority backup router preempts a lower-priority master router even if the <b>preempt</b> statement is not explicitly configured.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring a Backup Router to Preempt the VRRP Master Router</a></li> <li>• <a href="#">Configuring VRRP Preemption and Hold Time on page 2288</a></li> </ul>

## priority (Protocols VRRP)

<b>Syntax</b>	<code>priority <i>priority</i>;</code>
<b>Hierarchy Level</b>	<p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>],</p> <p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS 11.3 for the QFX Series.</p>
<b>Description</b>	Configure a Virtual Router Redundancy Protocol (VRRP) router's priority for becoming the master default router. The router with the highest priority within the group becomes the master.
<b>Options</b>	<p><b>priority</b>—Router's priority for being elected to be the master router in the VRRP group. A larger value indicates a higher priority for being elected.</p> <p><b>Range:</b> 1 through 255</p> <p><b>Default:</b> 100 (for backup routers)</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Basic VRRP Support</a></li> <li>• <a href="#">Configuring Basic VRRP Support on page 2285</a></li> </ul>

## priority-cost (VRRP)

---

<b>Syntax</b>	<code>priority-cost priority;</code>
<b>Hierarchy Level</b>	<code>[edit interfaces interface-name unit logical-unit-number family inet address address vrrp-group group-id track interface interface-name],</code> <code>[edit interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id track interface interface-name],</code> <code>[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet address address vrrp-group group-id track interface interface-name],</code> <code>[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id track interface interface-name]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series. Statement introduced in Junos OS Release 12.2 for ACX2000 Universal Access Routers.
<b>Description</b>	Configure a Virtual Router Redundancy Protocol (VRRP) router's priority cost for becoming the master default router. The router with the highest priority within the group becomes the master.
<b>Options</b>	<b>priority</b> —The value subtracted from the configured VRRP priority when the tracked interface or route is down to force a new master router election. The sum of all the costs for all interfaces or routes that are tracked must be less than or equal to the configured priority of the VRRP group. <b>Range:</b> 1 through 254
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring a Logical Interface to Be Tracked for a VRRP Group</a></li><li>• <a href="#">Configuring a Logical Interface to Be Tracked on page 2290</a></li></ul>

## priority-hold-time

<b>Syntax</b>	<code>priority-hold-time seconds;</code>
<b>Hierarchy Level</b>	<p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <a href="#">vrrp-group group-id track</a>],</p> <p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <a href="#">vrrp-inet6-group group-id track</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <a href="#">vrrp-group group-id track</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <a href="#">vrrp-inet6-group group-id track</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Configure a Virtual Router Redundancy Protocol (VRRP) router's priority hold time to define the minimum length of time that must elapse between dynamic priority changes. If the dynamic priority changes because of a tracking event, the priority hold timer begins running. If another tracking event or manual configuration change occurs while the timer is running, the new dynamic priority update is postponed until the timer expires.</p>
<div>  <p><b>NOTE:</b> When the track feature is configured, and if VRRP should pre-empt due to the tracking interface or route transition, any configured pre-empt hold time will be ignored. VRRP master will pre-empt according to the configuration of the priority-hold time.</p> </div>	
<b>Options</b>	<p><b>seconds</b>—Minimum length of time that must elapse between dynamic priority changes.</p> <p><b>Range:</b> 0through 3600 seconds</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring a Logical Interface to Be Tracked for a VRRP Group</a></li> <li>• <a href="#">Configuring a Logical Interface to Be Tracked on page 2290</a></li> </ul>

## route (Interfaces)

---

<b>Syntax</b>	<code>route <i>prefix</i> routing-instance <i>instance-name</i> priority-cost <i>priority</i>;</code>
<b>Hierarchy Level</b>	<code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id track</i>],</code> <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id track</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id track</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id track</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0. Statement introduced in Junos OS 11.3 for QFX Series. Statement introduced in Junos OS 12.1 for EX Series switches.
<b>Description</b>	Enable route tracking for a Virtual Router Redundancy Protocol (VRRP) group.
<b>Options</b>	<p><b><i>prefix</i></b>—Route to be tracked for this VRRP group.</p> <p><b><i>priority-cost priority</i></b>—The value subtracted from the configured VRRP priority when the tracked interface or route is down, forcing a new master router election. The sum of all the costs for all interfaces or routes that are tracked must be less than or equal to the configured priority of the VRRP group.</p> <p><b><i>routing-instance instance-name</i></b>—Routing instance in which the route is to be tracked. If the route is in the default, or global, routing instance, the value for <b><i>instance-name</i></b> must be <b>default</b>.</p>
<b>Required Privilege Level</b>	<b>interface</b> —To view this statement in the configuration. <b>interface-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring a Route to Be Tracked for a VRRP Group</a></li><li>• <a href="#">Configuring a Route to Be Tracked on page 2289</a></li></ul>

---

## startup-silent-period

---

<b>Syntax</b>	startup-silent-period <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit protocols vrrp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series.
<b>Description</b>	Instruct the system to ignore the Master Down Event when an interface transitions from the down state to the up state. This statement is used to avoid incorrect error alarms caused by the delay or interruption of incoming Virtual Router Redundancy Protocol (VRRP) advertisement packets during the interface startup phase.
<b>Options</b>	<b>seconds</b> —Number of seconds for the startup period. <b>Default:</b> 4 seconds <b>Range:</b> 1 through 2000 seconds
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Startup Period for VRRP Operations</i></li><li>• <a href="#">Configuring the Startup Period for VRRP Operations on page 2287</a></li></ul>

## traceoptions

---

**Syntax**    traceoptions {  
              file <filename> <files number> <match regular-expression> <microsecond-stamp>  
                  <size size> <world-readable | no-world-readable>;  
              flag flag;  
              no-remote-trace;  
              }

**Hierarchy Level**    [edit protocols vrrp]

**Release Information**    Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**    Define tracing operations for the Virtual Router Redundancy Protocol (VRRP) process.

To specify more than one tracing operation, include multiple **flag** statements.

By default, VRRP logs the error, dcd configuration, and routing socket events in a file in the directory **/var/log**.

**NOTE:** The traceoptions statement is not supported on a QFabric system.

---

**Default**    If you do not include this statement, no VRRP-specific tracing operations are performed.

**Options**    **filename filename**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. By default, VRRP tracing output is placed in the file **vrrpd**.

**files number**—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. When the maximum number is reached, the oldest trace file is overwritten.

**Range:** 0 through 4,294,967,296 files

**Default:** 3 files

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. These are the VRRP-specific tracing options:

- **all**—All VRRP tracing operations
- **database**—Database changes
- **general**—General events
- **interfaces**—Interface changes

- **normal**—Normal events
- **packets**—Packets sent and received
- **state**—State transitions
- **timer**—Timer events

**match *regex***—(Optional) Refine the output to include only those lines that match the given regular expression.

**microsecond-stamp**—(Optional) Provide a timestamp with microsecond granularity.

**no-world-readable**—Restrict users from reading the log file.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes, megabytes, or gigabytes. When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file.0***. When the ***trace-file*** again reaches its maximum size, ***trace-file.0*** is renamed ***trace-file.1*** and ***trace-file*** is renamed ***trace-file.0***. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through the maximum file size supported on your routing platform

**Default:** 1 MB

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**world-readable**—Allow users to read the log file.

<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Tracing VRRP Operations</i></li> </ul>

## track (VRRP)

---

<b>Syntax</b>	<pre>track {   interface <i>interface-name</i> {     bandwidth-threshold <i>bits-per-second</i> priority-cost <i>priority</i>;     priority-cost <i>priority</i>;   }   priority-hold-time <i>seconds</i>;   route <i>prefix/prefix-length</i> routing-instance <i>instance-name</i> priority-cost <i>priority</i>; }</pre>
<b>Hierarchy Level</b>	<p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>],</p> <p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 address <i>address</i> <i>vrrp-inet6-group group-id</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p><b>priority-hold-time</b> statement added in Junos OS Release 8.1.</p> <p><b>route</b> statement added in Junos OS Release 9.0.</p> <p>Statement introduced in Junos OS 11.3 for the QFX Series.</p>
<b>Description</b>	Enable logical interface tracking, route tracking, or both, for a Virtual Router Redundancy Protocol (VRRP) group.
<b>Options</b>	The remaining statements are described separately.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring a Logical Interface to Be Tracked for a VRRP Group</a></li><li>• <a href="#">Configuring a Route to Be Tracked for a VRRP Group</a></li><li>• <a href="#">Configuring a Logical Interface to Be Tracked on page 2290</a></li><li>• <a href="#">Configuring a Route to Be Tracked on page 2289</a></li></ul>

## virtual-address

---

<b>Syntax</b>	<code>virtual-address [ <i>addresses</i> ];</code>
<b>Hierarchy Level</b>	<p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS 11.3 for the QFX Series.</p>
<b>Description</b>	Configure the addresses of the virtual routers in a Virtual Router Redundancy Protocol (VRRP) IPv4 or IPv6 group. You can configure up to eight addresses.
<b>Options</b>	<b><i>addresses</i></b> —Addresses of one or more virtual routers. Do not include a prefix length. If the address is the same as the interface's physical address, the interface becomes the master virtual router for the group.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Basic VRRP Support</a></li> <li>• <a href="#">Configuring Basic VRRP Support on page 2285</a></li> </ul>

## vrrp-group

<b>Syntax</b>	<pre> vrrp-group <i>group-id</i> {   (<b>accept-data</b>   <b>no-accept-data</b>);   <b>advertise-interval</b> <i>seconds</i>;   <b>advertisements-threshold</b> <i>number</i>;   <b>authentication-key</b> <i>key</i>;   <b>authentication-type</b> <i>authentication</i>;   <b>fast-interval</b> <i>milliseconds</i>;   (<b>preempt</b>   <b>no-preempt</b>) {     <b>hold-time</b> <i>seconds</i>;   }   <b>priority</b> <i>number</i>;   <b>track</b> {     <b>interface</b> <i>interface-name</i> {       <b>bandwidth-threshold</b> <i>bits-per-second</i> <b>priority-cost</b> <i>priority</i>;       <b>priority-cost</b> <i>priority</i>;     }     <b>priority-hold-time</b> <i>seconds</i>;     <b>route</b> <i>prefix/prefix-length</i> <b>routing-instance</b> <i>instance-name</i> <b>priority-cost</b> <i>priority</i>;   }   <b>virtual-address</b> [ <i>addresses</i> ];   <b>vrrp-inherit-from</b> <i>vrrp-group</i>; } </pre>
<b>Hierarchy Level</b>	<p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i>],  [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.  Statement introduced in Junos OS 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Configure a Virtual Router Redundancy Protocol (VRRP) IPv4 group. As of Junos OS Release 13.2, VRRP nonstop active routing (NSR) is enabled only when you configure the <b>nonstop-routing</b> statement at the [edit routing-options] or [edit logical system logical-system-name routing-options] hierarchy level.</p>
<b>Options</b>	<p><b><i>group-id</i></b>—VRRP group identifier. If you enable MAC source address filtering on the interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the <b>source-address-filter</b> statement. MAC addresses ranging from 00:00:5e:00:01:00 through 00:00:5e:00:01:ff are reserved for VRRP, as defined in RFC 2338. The VRRP group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.</p> <p><b>Range:</b> 0 through 255</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.  interface-control—To add this statement to the configuration.</p>

## CHAPTER 31

# Administration

- [Operational Mode Commands for Graceful Restart on page 2341](#)
- [Operational Mode Command for Graceful Switchover on page 2365](#)
- [Operational Mode Command for Nonstop Routing on page 2371](#)
- [Operational Mode Commands for VRRP on page 2373](#)

### Operational Mode Commands for Graceful Restart

---

- [Verifying Graceful Restart Operation on page 2341](#)
- [show bgp neighbor](#)
- [show log](#)
- [show \(ospf | ospf3\) overview](#)

### Verifying Graceful Restart Operation

This topic contains the following sections:

- [Graceful Restart Operational Mode Commands on page 2341](#)
- [Verifying BGP Graceful Restart on page 2342](#)
- [Verifying IS-IS and OSPF Graceful Restart on page 2342](#)
- [Verifying CCC and TCC Graceful Restart on page 2343](#)

### Graceful Restart Operational Mode Commands

---

To verify proper operation of graceful restart, use the following commands:

- **show bgp neighbor** (for BGP graceful restart)
- **show log** (for IS-IS and OSPF/OSPFv3 graceful restart)
- **show (ospf | ospfv3) overview** (for OSPF/OSPFv3 graceful restart)
- **show rsvp neighbor detail** (for RSVP graceful restart—helper router)
- **show rsvp version** (for RSVP graceful restart—restarting router)
- **show ldp session detail** (for LDP graceful restart)
- **show connections** (for CCC and TCC graceful restart)

- **show route instance detail** (for Layer 3 VPN graceful restart and for any protocols using graceful restart in a routing instance)
- **show route protocol l2vpn** (for Layer 2 VPN graceful restart)

For more information about these commands and a description of their output fields, see the [CLI Explorer](#).

### Verifying BGP Graceful Restart

To view graceful restart information for BGP sessions, use the **show bgp neighbor** command:

```
user@PE1> show bgp neighbor 192.255.10.1
Peer: 192.255.10.1+179 AS 64595 Local: 192.255.5.1+1106 AS 64595
  Type: Internal   State: Established   Flags: <>
  Last State: OpenConfirm   Last Event: RecvKeepAlive
  Last Error: None
  Export: [ static ]
  Options:<Preference LocalAddress HoldTime GracefulRestart Damping PeerAS Refresh>

  Local Address: 192.255.5.1 Holdtime: 90 Preference: 170
  IPsec SA Name: hope
  Number of flaps: 0
  Peer ID: 192.255.10.1      Local ID: 192.255.5.1      Active Holdtime: 90
  Keepalive Interval: 30
  NLRI for restart configured on peer: inet-unicast
  NLRI advertised by peer: inet-unicast
  NLRI for this session: inet-unicast
  Peer supports Refresh capability (2)
  Restart time configured on the peer: 180
  Stale routes from peer are kept for: 180
  Restart time requested by this peer: 300
  NLRI that peer supports restart for: inet-unicast
  NLRI that peer saved forwarding for: inet-unicast
  NLRI that restart is negotiated for: inet-unicast
  NLRI of received end-of-rib markers: inet-unicast
  NLRI of all end-of-rib markers sent: inet-unicast
  Table inet.0 Bit: 10000
  RIB State: restart is complete
  Send state: in sync
  Active prefixes: 0
  Received prefixes: 0
  Suppressed due to damping: 0
  Last traffic (seconds): Received 19   Sent 19   Checked 19
  Input messages: Total 2      Updates 1      Refreshes 0      Octets 42
  Output messages: Total 3      Updates 0      Refreshes 0      Octets 116
  Output Queue[0]: 0
```

### Verifying IS-IS and OSPF Graceful Restart

To view graceful restart information for IS-IS and OSPF, configure traceoptions (see [“Tracking Graceful Restart Events” on page 2267](#)).

Here is the output of a traceoptions log from an OSPF restarting router:

```
Oct  8 05:20:12 Restart mode - sending grace lsas
Oct  8 05:20:12 Restart mode - estimated restart duration timer triggered
Oct  8 05:20:13 Restart mode - Sending more grace lsas
```

Here is the output of a traceoptions log from an OSPF helper router:

```
Oct  8 05:20:14 Helper mode for neighbor 192.255.5.1
Oct  8 05:20:14 Received multiple grace lsa from 192.255.5.1
```

### Verifying CCC and TCC Graceful Restart

To view graceful restart information for CCC and TCC connections, use the **show connections** command. The following example assumes four remote interface CCC connections between CE1 and CE2:

```
user@PE1> show connections
CCC and TCC connections [Link Monitoring On]
Legend for status (St)
UN -- uninitialized
NP -- not present
WE -- wrong encapsulation
DS -- disabled
Dn -- down
-> -- only outbound conn is up
<- -- only inbound conn is up
Up -- operational
RmtDn -- remote CCC down
Restart -- restarting

Legend for connection types
if-sw: interface switching
rmt-if: remote interface switching
lsp-sw: LSP switching

Legend for circuit types
intf -- interface
tlsp -- transmit LSP
rlsp -- receive LSP
```

#### CCC Graceful restart : Restarting

Connection/Circuit	Type	St	Time last up	# Up trans
CE1-CE2-0	rmt-if	Restart	-----	0
fe-1/1/0.0	intf	Up		
PE1-PE2-0	tlsp	Up		
PE2-PE1-0	rlsp	Up		
CE1-CE2-1	rmt-if	Restart	-----	0
fe-1/1/0.1	intf	Up		
PE1-PE2-1	tlsp	Up		
PE2-PE1-1	rlsp	Up		
CE1-CE2-2	rmt-if	Restart	-----	0
fe-1/1/0.2	intf	Up		
PE1-PE2-2	tlsp	Up		
PE2-PE1-2	rlsp	Up		
CE1-CE2-3	rmt-if	Restart	-----	0
fe-1/1/0.3	intf	Up		
PE1-PE2-3	tlsp	Up		
PE2-PE1-3	rlsp	Up

**Output Fields** [Table 210 on page 2345](#) describes the output fields for the **show bgp neighbor** command. Output fields are listed in the approximate order in which they appear.

**Table 210: show bgp neighbor Output Fields**

Field Name	Field Description
<b>Peer</b>	Address of the BGP neighbor. The address is followed by the neighbor port number.
<b>AS</b>	AS number of the peer.
<b>Local</b>	Address of the local routing device. The address is followed by the peer port number.
<b>Type</b>	Type of peer: <b>Internal</b> or <b>External</b> .
<b>State</b>	<p>Current state of the BGP session:</p> <ul style="list-style-type: none"> <li>• <b>Active</b>—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message.</li> <li>• <b>Connect</b>—BGP is waiting for the transport protocol connection to be completed.</li> <li>• <b>Established</b>—The BGP session has been established, and the peers are exchanging update messages.</li> <li>• <b>Idle</b>—This is the first stage of a connection. BGP is waiting for a Start event.</li> <li>• <b>OpenConfirm</b>—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message.</li> <li>• <b>OpenSent</b>—BGP has sent an open message and is waiting to receive an open message from the peer.</li> </ul>

Table 210: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
<b>Flags</b>	<p>Internal BGP flags:</p> <ul style="list-style-type: none"> <li>• <b>Aggregate Label</b>—BGP has aggregated a set of incoming labels (labels received from the peer) into a single forwarding label.</li> <li>• <b>CleanUp</b>—The peer session is being shut down.</li> <li>• <b>Delete</b>—This peer has been deleted.</li> <li>• <b>Idled</b>—This peer has been permanently idled.</li> <li>• <b>ImportEval</b>—At the last commit operation, this peer was identified as needing to reevaluate all received routes.</li> <li>• <b>Initializing</b>—The peer session is initializing.</li> <li>• <b>SendRtn</b>—Messages are being sent to the peer.</li> <li>• <b>Sync</b>—This peer is synchronized with the rest of the peer group.</li> <li>• <b>TryConnect</b>—Another attempt is being made to connect to the peer.</li> <li>• <b>Unconfigured</b>—This peer is not configured.</li> <li>• <b>WriteFailed</b>—An attempt to write to this peer failed.</li> </ul>
<b>Last state</b>	<p>Previous state of the BGP session:</p> <ul style="list-style-type: none"> <li>• <b>Active</b>—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message.</li> <li>• <b>Connect</b>—BGP is waiting for the transport protocol connection to be completed.</li> <li>• <b>Established</b>—The BGP session has been established, and the peers are exchanging update messages.</li> <li>• <b>Idle</b>—This is the first stage of a connection. BGP is waiting for a Start event.</li> <li>• <b>OpenConfirm</b>—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message.</li> <li>• <b>OpenSent</b>—BGP has sent an open message and is waiting to receive an open message from the peer.</li> </ul>
<b>Last event</b>	<p>Last activity that occurred in the BGP session:</p> <ul style="list-style-type: none"> <li>• <b>Closed</b>—The BGP session closed.</li> <li>• <b>ConnectRetry</b>—The transport protocol connection failed, and BGP is trying again to connect.</li> <li>• <b>HoldTime</b>—The session ended because the hold timer expired.</li> <li>• <b>KeepAlive</b>—The local routing device sent a BGP keepalive message to the peer.</li> <li>• <b>Open</b>—The local routing device sent a BGP open message to the peer.</li> <li>• <b>OpenFail</b>—The local routing device did not receive an acknowledgment of a BGP open message from the peer.</li> <li>• <b>RecvKeepAlive</b>—The local routing device received a BGP keepalive message from the peer.</li> <li>• <b>RecvNotify</b>—The local routing device received a BGP notification message from the peer.</li> <li>• <b>RecvOpen</b>—The local routing device received a BGP open message from the peer.</li> <li>• <b>RecvUpdate</b>—The local routing device received a BGP update message from the peer.</li> <li>• <b>Start</b>—The peering session started.</li> <li>• <b>Stop</b>—The peering session stopped.</li> <li>• <b>TransportError</b>—A TCP error occurred.</li> </ul>

Table 210: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
Last error	<p>Last error that occurred in the BGP session:</p> <ul style="list-style-type: none"> <li>• <b>Cease</b>—An error occurred, such as a version mismatch, that caused the session to close.</li> <li>• <b>Finite State Machine Error</b>—In setting up the session, BGP received a message that it did not understand.</li> <li>• <b>Hold Time Expired</b>—The session's hold time expired.</li> <li>• <b>Message Header Error</b>—The header of a BGP message was malformed.</li> <li>• <b>Open Message Error</b>—A BGP open message contained an error.</li> <li>• <b>None</b>—No errors occurred in the BGP session.</li> <li>• <b>Update Message Error</b>—A BGP update message contained an error.</li> </ul>
Export	Name of the export policy that is configured on the peer.
Import	Name of the import policy that is configured on the peer.
Options	<p>Configured BGP options:</p> <ul style="list-style-type: none"> <li>• <b>AddressFamily</b>—Configured address family: <b>inet</b> or <b>inet-vpn</b>.</li> <li>• <b>AuthKeyChain</b>—Authentication key change is enabled.</li> <li>• <b>DropPathAttributes</b>—Certain path attributes are configured to be dropped from neighbor updates during inbound processing.</li> <li>• <b>GracefulRestart</b>—Graceful restart is configured.</li> <li>• <b>HoldTime</b>—Hold time configured with the <b>hold-time</b> statement. The hold time is three times the interval at which keepalive messages are sent.</li> <li>• <b>IgnorePathAttributes</b>—Certain path attributes are configured to be ignored in neighbor updates during inbound processing.</li> <li>• <b>Local Address</b>—Address configured with the <b>local-address</b> statement.</li> <li>• <b>Multihop</b>—Allow BGP connections to external peers that are not on a directly connected network.</li> <li>• <b>NLRI</b>—Configured MBGP state for the BGP group: <b>multicast</b>, <b>unicast</b>, or both if you have configured <b>nlri any</b>.</li> <li>• <b>Peer AS</b>—Configured peer autonomous system (AS).</li> <li>• <b>Preference</b>—Preference value configured with the <b>preference</b> statement.</li> <li>• <b>Refresh</b>—Configured to refresh automatically when the policy changes.</li> <li>• <b>Rib-group</b>—Configured routing table group.</li> </ul>
Path-attributes dropped	Path attribute codes that are dropped from neighbor updates.
Path-attributes ignored	Path attribute codes that are ignored during neighbor updates.
Authentication key change	(appears only if the <b>authentication-keychain</b> statement has been configured) Name of the authentication keychain enabled.
Authentication algorithm	(appears only if the <b>authentication-algorithm</b> statement has been configured) Type of authentication algorithm enabled: <b>hmac</b> or <b>md5</b> .
Address families configured	Names of configured address families for the VPN.

Table 210: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
Local Address	Address of the local routing device.
Remove-private options	Options associated with the <code>remove-private</code> statement.
Holdtime	Hold time configured with the <code>hold-time</code> statement. The hold time is three times the interval at which keepalive messages are sent.
Flags for NLRI inet-label-unicast	Flags related to labeled-unicast: <ul style="list-style-type: none"> <li>• <b>TrafficStatistics</b>—Collection of statistics for labeled-unicast traffic is enabled.</li> </ul>
Traffic statistics	Information about labeled-unicast traffic statistics: <ul style="list-style-type: none"> <li>• <b>Options</b>—Options configured for collecting statistics about labeled-unicast traffic.</li> <li>• <b>File</b>—Name and location of statistics log files.</li> <li>• <b>size</b>—Size of all the log files, in bytes.</li> <li>• <b>files</b>—Number of log files.</li> </ul>
Traffic Statistics Interval	Time between sample periods for labeled-unicast traffic statistics, in seconds.
Preference	Preference value configured with the <code>preference</code> statement.
Outbound Timer	Time for which the route is available in Junos OS routing table before it is exported to BGP. This field is displayed in the output only if the <code>out-delay</code> parameter is configured to a non-zero value.
Number of flaps	Number of times the BGP session has gone down and then come back up.
Peer ID	Router identifier of the peer.
Group index	Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels.
Peer index	Index that is unique within the BGP group to which the peer belongs.
Local ID	Router identifier of the local routing device.
Local Interface	Name of the interface on the local routing device.
Active holdtime	Hold time that the local routing device negotiated with the peer.
Keepalive Interval	Keepalive interval, in seconds.
BFD	Status of BFD failure detection.
Local Address	Name of directly connected interface over which direct EBGP peering is established.
NLRI for restart configured on peer	Names of address families configured for restart.

Table 210: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
NLRI advertised by peer	Address families supported by the peer: <b>unicast</b> or <b>multicast</b> .
NLRI for this session	Address families being used for this session.
Peer supports Refresh capability	Remote peer's ability to send and request full route table readvertisement (route refresh capability). For more information, see RFC 2918, <i>Route Refresh Capability for BGP-4</i> .
Restart time configured on peer	Configured time allowed for restart on the neighbor.
Stale routes from peer are kept for	When graceful restart is negotiated, the maximum time allowed to hold routes from neighbors after the BGP session has gone down.
Peer does not support Restarter functionality	Graceful restart restarter-mode is disabled on the peer.
Peer does not support Receiver functionality	Graceful restart helper-mode is disabled on the peer.
Restart time requested by this peer	Restart time requested by this neighbor during capability negotiation.
Restart flag received from the peer	When this field appears, the BGP speaker has restarted (Restarting), and this peer should not wait for the <b>end-of-rib</b> marker from the speaker before advertising routing information to the speaker.
NLRI that peer supports restart for	Neighbor supports graceful restart for this address family.
NLRI peer can save forwarding state	Neighbor supporting this address family saves all forwarding states.
NLRI that peer saved forwarding for	Neighbor saves all forwarding states for this address family.
NLRI that restart is negotiated for	Router supports graceful restart for this address family.
NLRI of received end-of-rib markers	Address families for which end-of-routing-table markers are received from the neighbor.
NLRI of all end-of-rib markers sent	Address families for which end-of-routing-table markers are sent to the neighbor.
Peer supports 4 byte AS extension (peer-as1)	Peer understands 4-byte AS numbers in BGP messages. The peer is running Junos OS Release 9.1 or later.
NLRIs for which peer can receive multiple paths	Appears in the command output of the local router if the downstream peer is configured to receive multiple BGP routes to a single destination, instead of only receiving the active route.  Possible value is <b>inet-unicast</b> .

Table 210: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
NLRIs for which peer can send multiple paths: inet-unicast	Appears in the command output of the local router if the upstream peer is configured to send multiple BGP routes to a single destination, instead of only sending the active route.  Possible value is <b>inet-unicast</b> .
Table inet.number	Information about the routing table: <ul style="list-style-type: none"> <li>• <b>RIB State</b>—BGP is in the graceful restart process for this routing table: <b>restart is complete</b> or <b>restart in progress</b>.</li> <li>• <b>Bit</b>—Number that represents the entry in the routing table for this peer.</li> <li>• <b>Send state</b>—State of the BGP group: <b>in sync</b>, <b>not in sync</b>, or <b>not advertising</b>.</li> <li>• <b>Active prefixes</b>—Number of prefixes received from the peer that are active in the routing table.</li> <li>• <b>Received prefixes</b>—Total number of prefixes from the peer, both active and inactive, that are in the routing table.</li> <li>• <b>Accepted prefixes</b>—Total number of prefixes from the peer that have been accepted by a routing policy.</li> <li>• <b>Suppressed due to damping</b>—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.</li> </ul>
Last traffic (seconds)	Last time any traffic was received from the peer or sent to the peer, and the last time the local routing device checked.
Input messages	Messages that BGP has received from the receive socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.
Output messages	Messages that BGP has written to the transmit socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.
Input dropped path attributes	Information about dropped path attributes: <ul style="list-style-type: none"> <li>• <b>Code</b>—Path attribute code.</li> <li>• <b>Count</b>—Path attribute count.</li> </ul>
Input ignored path attributes	Information about ignored path attributes: <ul style="list-style-type: none"> <li>• <b>Code</b>—Path attribute code.</li> <li>• <b>Count</b>—Path attribute count.</li> </ul>
Output queue	Number of BGP packets that are queued to be transmitted to a particular neighbor for a particular routing table. Output queue 0 is for unicast NLRIs, and queue 1 is for multicast NLRIs.  It also specifies the routing table name and the NLRI they represent in the format ( <b>routing table name, NLRI</b> ).  <b>NOTE:</b> The output queues of routing tables that are not advertised, will only show up at <b>extensive</b> output level.
Trace options	Configured tracing of BGP protocol packets and operations.

Table 210: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
Trace file	Name of the file to receive the output of the tracing operation.
Filter Updates rcv	(orf option only) Number of outbound-route filters received for each configured address family.  <b>NOTE:</b> The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.
Immediate	(orf option only) Number of route updates received with the immediate flag set. The immediate flag indicates that the BGP peer should readvertise the updated routes.  <b>NOTE:</b> The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.
Filter	(orf option only) Type of prefix filter received: <b>prefix-based</b> or <b>extended-community</b> .
Received filter entries	(orf option only) List of received filters displayed.
seq	(orf option only) Numerical order assigned to this prefix entry among all the received outbound route filter prefix entries.
prefix	(orf option only) Address for the prefix entry that matches the filter.
minlength	(orf option only) Minimum prefix length, in bits, required to match this prefix.
maxlength	(orf option only) Maximum prefix length, in bits, required to match this prefix.
match	(orf option only) For this prefix match, whether to <b>permit</b> or <b>deny</b> route updates.

## Sample Output

### show bgp neighbor

<b>List of Syntax</b>	<a href="#">Syntax on page 2358</a> <a href="#">Syntax (QFabric System) on page 2358</a> <a href="#">Syntax (TX Matrix Routers) on page 2358</a>
<b>Syntax</b>	<code>show log</code> <code>&lt;filename   user &lt;username&gt;&gt;</code>
<b>Syntax (QFabric System)</b>	<code>show log filename</code> <code>&lt;device-type (device-id   device-alias)&gt;</code>
<b>Syntax (TX Matrix Routers)</b>	<code>show log</code> <code>&lt;all-lcc   lcc number   scc&gt;</code> <code>&lt;filename   user &lt;username&gt;&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Option <i>device-type (device-id   device-alias)</i> is introduced in Junos OS Release 13.1 for the QFX Series.
<b>Description</b>	List log files, display log file contents, or display information about users who have logged in to the router or switch.
<b>Options</b>	<b>none</b> —List all log files.  <b>&lt;all-lcc   lcc number   scc&gt;</b> —(TX Matrix routers only) (Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace <i>number</i> with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).  <b>device-type</b> —(QFabric system only) (Optional) Display log messages for only one of the following device types: <ul style="list-style-type: none"><li>• <b>director-device</b>—Display logs for Director devices.</li><li>• <b>infrastructure-device</b>—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).</li><li>• <b>interconnect-device</b>—Display logs for Interconnect devices.</li><li>• <b>node-device</b>—Display logs for Node devices.</li></ul>

**NOTE:** If you specify the **device-type** optional parameter, you must also specify either the **device-id** or **device-alias** optional parameter.

---

**(device-id | device-alias)**—If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

**filename**—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

**NOTE:** The *filename* parameter is mandatory for the QFabric system. If you did not configure a syslog filename, specify the default filename of messages.

**user <username>**—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include *username*, display logging information about the specified user.

**Required Privilege Level** trace

<b>Release Information</b>	<p>Command introduced in Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>realm</b> option introduced in Junos OS Release 9.2.</p> <p>Database protection introduced in Junos 10.2.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Display Open Shortest Path First (OSPF) overview information.
<b>Options</b>	<p><b>none</b>—Display standard information about all OSPF neighbors for all routing instances.</p> <p><b>brief   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display all OSPF interfaces under the named routing instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>realm (ipv4-multicast   ipv4-unicast   ipv6-multicast)</b>—(Optional) (OSPFv3 only) Display information about the specified OSPFv3 realm, or address family. Use the <b>realm</b> option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show ospf overview on page 2363</a> <a href="#">show ospf overview (With Database Protection) on page 2364</a> <a href="#">show ospf3 overview (With Database Protection) on page 2364</a> <a href="#">show ospf overview extensive on page 2364</a>
<b>Output Fields</b>	<p><a href="#">Table 211 on page 2362</a> lists the output fields for the <b>show ospf overview</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 211: show ospf overview Output Fields

Field name	Field Description	Level of Output
<b>Instance</b>	OSPF routing instance.	All levels
<b>Router ID</b>	Router ID of the routing device.	All levels
<b>Route table index</b>	Route table index.	All levels
<b>Configured overload</b>	Overload capability is enabled. If the overload timer is also configured, display the time that remains before it is set to expire. This field is not displayed after the timer expires.	All levels
<b>Topology</b>	Topology identifier.	All levels
<b>Prefix export count</b>	Number of prefixes exported into OSPF.	All levels
<b>Full SPF runs</b>	Number of complete Shortest Path First calculations.	All levels
<b>SPF delay</b>	Delay before performing consecutive Shortest Path First calculations.	All levels
<b>SPF holddown</b>	Delay before performing additional Shortest Path First (SPF) calculations after the maximum number of consecutive SPF calculations is reached.	All levels
<b>SPF rapid runs</b>	Maximum number of Shortest Path First calculations that can be performed in succession before the hold-down timer begins.	All levels
<b>LSA refresh time</b>	Refresh period for link-state advertisement (in minutes).	All levels
<b>Database protection state</b>	Current state of database protection.	All levels
<b>Warning threshold</b>	Threshold at which a warning message is logged (percentage of maximum LSA count).	All levels
<b>Non self-generated LSAs</b>	Number of LSAs whose router ID is not equal to the local router ID: <b>Current</b> , <b>Warning</b> (threshold), and <b>Allowed</b> .	All levels
<b>Ignore time</b>	How long the database has been in the ignore state.	All levels
<b>Reset time</b>	How long the database must stay out of the ignore or isolated state before it returns to normal operations.	All levels
<b>Ignore count</b>	Number of times the database has been in the ignore state: <b>Current</b> and <b>Allowed</b> .	All levels
<b>Restart</b>	Graceful restart capability: <b>enabled</b> or <b>disabled</b> .	All levels
<b>Restart duration</b>	Time period for complete reacquisition of OSPF neighbors.	All levels
<b>Restart grace period</b>	Time period for which the neighbors should consider the restarting routing device as part of the topology.	All levels

Table 211: show ospf overview Output Fields (*continued*)

Field name	Field Description	Level of Output
Graceful restart helper mode	(OSPFv2) Standard graceful restart helper capability (based on RFC 3623): <b>enabled</b> or <b>disabled</b> .	All levels
Restart-signaling helper mode	(OSPFv2) Restart signaling-based graceful restart helper capability (based on RFC 4811, RFC 4812, and RFC 4813): <b>enabled</b> or <b>disabled</b> .	All levels
Helper mode	(OSPFv3) Graceful restart helper capability: <b>enabled</b> or <b>disabled</b> .	All levels
Trace options	OSPF-specific trace options.	<b>extensive</b>
Trace file	Name of the file to receive the output of the tracing operation.	<b>extensive</b>
Area	Area number. Area 0.0.0.0 is the backbone area.	All levels
Stub type	Stub type of area: <b>Normal Stub</b> , <b>Not Stub</b> , or <b>Not so Stubby Stub</b> .	All levels
Authentication Type	Type of authentication: <b>None</b> , <b>Password</b> , or <b>MD5</b> .  <b>NOTE:</b> The <b>Authentication Type</b> field refers to the authentication configured at the <code>[edit protocols ospf area area-id]</code> level. Any authentication configured for an interface in this area will not affect the value of this field.	All levels
Area border routers	Number of area border routers.	All levels
Neighbors	Number of autonomous system boundary routers.	All levels

## Sample Output

### show ospf overview

```

user@host> show ospf overview
Instance: master
  Router ID: 10.255.245.6
  Route table index: 0
  Configured overload, expires in 118 seconds
  LSA refresh time: 50 minutes
  Restart: Enabled

<b>Syntax (MX Series Router)</b>	show system switchover <all-members> <local> <member <i>member-id</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 13.2X51-D20 for QFX Series switches.
<b>Description</b>	Display whether graceful Routing Engine switchover is configured, the state of the kernel replication (ready or synchronizing), any replication errors, and whether the primary and standby Routing Engines are using compatible versions of the kernel database.

**NOTE:** Issue the `show system switchover` command *only* on the backup Routing Engine. This command is *not* supported on the master Routing Engine, because the kernel-replication process daemon does not run on the master Routing Engine. This process runs only on the backup Routing Engine.

Beginning Junos OS Release 9.6, the `show system switchover` command has been deprecated on the master Routing Engine on all routers other than a TX Matrix (switch-card chassis) or a TX Matrix Plus (switch-fabric chassis) router.

However, in a routing matrix, if you issue the `show system switchover` command on the master Routing Engine of the TX Matrix router (or switch-card chassis), the CLI displays graceful switchover information for the master Routing Engine of the T640 routers (or line-card chassis) in the routing matrix. Likewise, if you issue the `show system switchover` command on the master Routing Engine of a TX Matrix Plus router (or switch-fabric chassis), the CLI displays output for the master Routing Engine of T1600 or T4000 routers in the routing matrix.

---

**Options** **all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for all Routing Engines on the TX Matrix router and the T640 routers configured in the routing matrix. On a TX Matrix Plus router, display graceful Routing Engine switchover information for all Routing Engines on the TX Matrix Plus router and the T1600 or T4000 routers configured in the routing matrix.

**all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display graceful Routing Engine switchover information for all connected T1600 or T4000 LCCs.

Note that in this instance, packets get dropped. The LCCs perform GRES on their own chassis (GRES cannot be handled by one particular chassis for the entire router) and synchronization is not possible as the LCC plane bringup time varies for each LCC. Therefore, when there is traffic on these planes, there may be a traffic drop.

**all-members**—(MX Series routers only) (Optional) Display graceful Routing Engine switchover information for all Routing Engines on all members of the Virtual Chassis configuration.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for a specific T640 router connected to the TX Matrix router. On a TX Matrix Plus router, display graceful Routing Engine switchover information for a specific router connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display graceful Routing Engines switchover information for all Routing Engines on the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display graceful Routing Engine switchover information for all Routing Engines on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**scc**—(TX Matrix router only) (Optional) Display graceful Routing Engine switchover information for the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus routers only) (Optional) Display graceful Routing Engine switchover information for the TX Matrix Plus router.

<b>Additional Information</b>	<p>If you issue the <b>show system switchover</b> command on a TX Matrix backup Routing Engine, the command is broadcast to all the T640 backup Routing Engines that are connected to it.</p> <p>Likewise, if you issue the <b>show system switchover</b> command on a TX Matrix Plus backup Routing Engine, the command is broadcast to all the T1600 or T4000 backup Routing Engines that are connected to it.</p> <p>If you issue the <b>show system switchover</b> command on the active Routing Engine in the master router of an MX Series Virtual Chassis, the router displays an error message that graceful Routing Engine switchover (GRES) is not enabled on this member.</p>

<b>Output Fields</b>	<p>Table 212 on page 2368 describes the output fields for the <b>show system switchover</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 212: show system switchover Output Fields

Field Name	Field Description
<b>Graceful switchover</b>	<p>Display graceful Routing Engine switchover status:</p> <ul style="list-style-type: none"> <li>• <b>On</b>—Indicates <b>graceful-switchover</b> is specified for the <b>routing-options</b> configuration command.</li> <li>• <b>Off</b>—Indicates <b>graceful-switchover</b> is not specified for the <b>routing-options</b> configuration command.</li> </ul>
<b>Configuration database</b>	<p>State of the configuration database:</p> <ul style="list-style-type: none"> <li>• <b>Ready</b>—Configuration database has synchronized.</li> <li>• <b>Synchronizing</b>—Configuration database is synchronizing. Displayed when there are updates within the last 5 seconds.</li> <li>• <b>Synchronize failed</b>—Configuration database synchronize process failed.</li> </ul>
<b>Kernel database</b>	<p>State of the kernel database:</p> <ul style="list-style-type: none"> <li>• <b>Ready</b>—Kernel database has synchronized.</li> <li>• <b>Synchronizing</b>—Kernel database is synchronizing. Displayed when there are updates within the last 5 seconds.</li> <li>• <b>Version incompatible</b>—The primary and standby Routing Engines are running incompatible kernel database versions.</li> <li>• <b>Replication error</b>—An error occurred when the state was replicated from the primary Routing Engine. Inspect <b>Steady State</b> for possible causes, or notify Juniper Networks customer support.</li> </ul>
<b>Peer state</b>	<p>Routing Engine peer state:</p> <ul style="list-style-type: none"> <li>• <b>Steady State</b>—Peer completed switchover transition.</li> <li>• <b>Peer Connected</b>—Peer in switchover transition.</li> </ul>

## Sample Output

### show system switchover (Backup Routing Engine)

```
user@host> show system switchover
Graceful switchover: On
Configuration database: Ready
Kernel database: Ready
Peer state: Steady State
```

### show system switchover all-lcc (Routing Matrix)

```
user@host> show system switchover all-lcc
```

```
lcc0-re0:
```

```
-----
Multichassis replication: On
Configuration database: Ready
Kernel database: Ready
Peer state: Steady State
```

```
lcc2-re0:
```

```
-----
Multichassis replication: On
Configuration database: Ready
Kernel database: Ready
Peer state: Steady State
```

## show task replication

<b>Syntax</b>	<b>show task replication</b>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 8.5.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 13.2X51-D20 for QFX Series switches.</p> <p>Support for logical systems introduced in Junos OS Release 13.3</p>
<b>Description</b>	Displays nonstop active routing (NSR) status. When you issue this command on the master Routing Engine, the status of nonstop active routing synchronization is also displayed.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show task replication (Issued on the Master Routing Engine) on page 2370</a> <a href="#">show task replication (Issued on the Backup Routing Engine) on page 2371</a>
<b>Output Fields</b>	<a href="#">Table 213 on page 2370</a> lists the output fields for the <b>show task replication</b> command. Output fields are listed in the approximate order in which they appear.

**Table 213: show task replication Output Fields**

Field Name	Field Description
<b>Stateful replication</b>	Displays whether or not graceful Routing Engine switchover is configured. The status can be <b>Enabled</b> or <b>Disabled</b> .
<b>RE mode</b>	Displays the Routing Engine on which the command is issued: <b>Master</b> , <b>Backup</b> , or <b>Not applicable</b> (when the router has only one Routing Engine).
<b>Protocol</b>	Protocols that are supported by nonstop active routing.
<b>Synchronization Status</b>	Nonstop active routing synchronization status for the supported protocols. States are <b>NotStarted</b> , <b>InProgress</b> , and <b>Complete</b> .

## Sample Output

### show task replication (Issued on the Master Routing Engine)

```

user@host> show task replication
  Stateful Replication: Enabled
      RE mode: Master

  Protocol              Synchronization Status
  ---
  OSPF                  NotStarted
  BGP                   Complete
  IS-IS                 NotStarted

```

LDP	Complete
PIM	Complete

#### show task replication (Issued on the Backup Routing Engine)

```
user@host> show task replication
Stateful Replication: Enabled
RE mode: Backup
```

### Operational Mode Command for Nonstop Routing

---

- `show task replication`

## show task replication

<b>Syntax</b>	<b>show task replication</b>

## Operational Mode Commands for VRRP

---

- `show vrrp`

## show vrrp

<b>Syntax</b>	<pre>show vrrp &lt;brief   detail   extensive   summary&gt; &lt;interface <i>interface-name</i>&gt; &lt;track interfaces&gt;</pre>
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Display information and status about VRRP groups.
<b>Options</b>	<p><b>none</b>—(Same as brief) Display brief status information about all VRRP interfaces.</p> <p><b>brief   detail   extensive   summary</b>—(Optional) Display the specified level of output.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Display information and status about the specified VRRP interface.</p> <p><b>track interfaces</b>—(Optional) Display information and status about VRRP track interfaces.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Configuring VRRP for IPv6 (CLI Procedure)</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show vrrp on page 2379</a> <a href="#">show vrrp brief on page 2379</a> <a href="#">show vrrp detail (IPv6) on page 2379</a> <a href="#">show vrrp detail (Route Track) on page 2380</a> <a href="#">show vrrp extensive on page 2380</a> <a href="#">show vrrp interface on page 2381</a> <a href="#">show vrrp summary on page 2382</a> <a href="#">show vrrp track detail on page 2382</a> <a href="#">show vrrp track summary on page 2383</a>
<b>Output Fields</b>	Table 215 on page 2374 lists the output fields for the <b>show vrrp</b> command. Output fields are listed in the approximate order in which they appear.

**Table 215: show vrrp Output Fields**

Field Name	Field Description	Level of Output
<b>Interface</b>	Name of the logical interface.	<b>none, brief, extensive, summary</b>
<b>Interface index</b>	Physical interface index number, which reflects its initialization sequence.	<b>extensive</b>
<b>Groups</b>	Total number of VRRP groups configured on the interface.	<b>extensive</b>

Table 215: show vrrp Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Active</b>	Total number of VRRP groups that are active (that is, whose interface state is either up or down).	<b>extensive</b>
<b>Interface VRRP PDU statistics</b>	Nonerrored statistics for the logical interface: <ul style="list-style-type: none"> <li>• <b>Advertisement sent</b>—Number of VRRP advertisement protocol data units (PDUs) that the interface has transmitted.</li> <li>• <b>Advertisement received</b>—Number of VRRP advertisement PDUs received by the interface.</li> <li>• <b>Packets received</b>—Number of VRRP packets received for VRRP groups on the interface.</li> <li>• <b>No group match received</b>—Number of VRRP packets received for VRRP groups that do not exist on the interface.</li> </ul>	<b>extensive</b>
<b>Interface VRRP PDU error statistics</b>	Errored statistics for the logical interface: <ul style="list-style-type: none"> <li>• <b>Invalid IPAH next type received</b>—Number of packets received that use the IP Authentication Header protocol (IPAH) and that do not encapsulate VRRP packets.</li> <li>• <b>Invalid VRRP ttl value received</b>—Number of packets received whose IP time-to-live (TTL) value is not 255.</li> <li>• <b>Invalid VRRP version received</b>—Number of packets received whose VRRP version is not 2.</li> <li>• <b>Invalid VRRP pdu type received</b>—Number of packets received whose VRRP PDU type is not 1.</li> <li>• <b>Invalid VRRP authentication type received</b>—Number of packets received whose VRRP authentication is not none, simple, or md5.</li> <li>• <b>Invalid VRRP IP count received</b>—Number of packets received whose VRRP IP count exceeds 8.</li> <li>• <b>Invalid VRRP checksum received</b>—Number of packets received whose VRRP checksum does not match the calculated value.</li> </ul>	<b>extensive</b>
<b>Physical interface</b>	Name of the physical interface.	<b>detail, extensive</b>
<b>Unit</b>	Logical unit number.	All levels
<b>Address</b>	Address of the physical interface.	<b>none, brief, detail, extensive</b>
<b>Index</b>	Physical interface index number, which reflects its initialization sequence.	<b>detail, extensive</b>
<b>SNMP ifIndex</b>	SNMP index number for the physical interface.	<b>detail, extensive</b>
<b>VRRP-Traps</b>	Status of VRRP traps: <b>Enabled</b> or <b>Disabled</b> .	<b>detail, extensive</b>

Table 215: show vrrp Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Type and Address</b>	Identifier for the address and the address itself: <ul style="list-style-type: none"> <li>• <b>lcl</b>—Configured local interface address.</li> <li>• <b>mas</b>—Address of the master virtual router. This address is displayed only when the local interface is acting as a backup router.</li> <li>• <b>vip</b>—Configured virtual IP addresses.</li> </ul>	none, brief, summary
<b>Interface state or Int state</b>	State of the physical interface: <ul style="list-style-type: none"> <li>• <b>down</b>—The device is present and the link is unavailable.</li> <li>• <b>not present</b>—The interface is configured, but no physical device is present.</li> <li>• <b>unknown</b>—The VRRP process has not had time to query the kernel about the state of the interface.</li> <li>• <b>up</b>—The device is present and the link is established.</li> </ul>	none, brief, extensive, summary
<b>Group</b>	VRRP group number.	none, brief, extensive, summary
<b>State</b>	VRRP state: <ul style="list-style-type: none"> <li>• <b>backup</b>—The interface is acting as the backup router interface.</li> <li>• <b>bringup</b>—VRRP is just starting, and the physical device is not yet present.</li> <li>• <b>idle</b>—VRRP is configured on the interface and is disabled. This can occur when VRRP is first enabled on an interface whose link is established.</li> <li>• <b>initializing</b>—VRRP is initializing.</li> <li>• <b>master</b>—The interface is acting as the master router interface.</li> <li>• <b>transition</b>—The interface is changing between being the backup and being the master router.</li> </ul>	extensive
<b>Priority</b>	Configured VRRP priority for the interface.	detail, extensive
<b>Advertisement interval</b>	Configured VRRP advertisement interval.	detail, extensive
<b>Authentication type</b>	Configured VRRP authentication type: <b>none</b> , <b>simple</b> , or <b>md5</b> .	detail, extensive
<b>Preempt</b>	Whether preemption is allowed on the interface: <b>yes</b> or <b>no</b> .	detail, extensive
<b>Accept-data mode</b>	Whether the interface is configured to accept packets destined for the virtual IP address: <b>yes</b> or <b>no</b> .	detail, extensive
<b>VIP count</b>	Number of virtual IP addresses that have been configured on the interface.	detail, extensive
<b>VIP</b>	List of virtual IP addresses configured on the interface.	detail, extensive
<b>Advertisement timer</b>	Time until the advertisement timer expires.	detail, extensive

Table 215: show vrrp Output Fields (*continued*)

Field Name	Field Description	Level of Output
Master router	IP address of the interface that is acting as the master. If the VRRP interface is down, the output is <b>N/A</b> .	detail, extensive
Virtual router uptime	Time that the virtual router has been up.	detail, extensive
Master router uptime	Time that the master router has been up.	detail, extensive
Virtual MAC	MAC address associated with the virtual IP address.	detail, extensive
Tracking	Whether tracking is <b>enabled</b> or <b>disabled</b> .	detail, extensive
Current priority	Current operational priority for being the VRRP master.	detail, extensive
Configured priority	Configured base priority for being the VRRP master.	detail, extensive
Priority hold-time	Minimum time interval, in seconds, between successive changes to the current priority. <b>Disabled</b> indicates no minimum interval.	detail, extensive
Remaining-time	( <b>track</b> option only) Displays the time remaining in the priority hold-time interval.	detail
Interface tracking	Whether interface tracking is enabled or disabled. When enabled, the output also displays the number of tracked interfaces.	detail extensive
Interface/Tracked interface	Name of the tracked interface.	detail extensive
Int state/Interface state	Current operational state of the tracked interface: <b>up</b> or <b>down</b> .	detail, extensive
Int speed/Speed	Current operational speed, in bits per second, of the tracked interface.	detail, extensive
Incurred priority cost	Operational priority cost incurred due to the state and speed of this tracked interface. This cost is applied to the configured priority to obtain the current priority.	detail, extensive
Threshold	Speed below which the corresponding priority cost is incurred. In other words, when the speed of the interface drops below the threshold speed, the corresponding priority cost is incurred.  An entry of <b>down</b> means that the corresponding priority cost is incurred when the interface is down.	detail, extensive
Route tracking	Whether route tracking is enabled or disabled. When enabled, the output also displays the number of tracked routes.	detail, extensive
Route count	The number of routes being tracked.	detail, extensive

Table 215: show vrrp Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Route</b>	The IP address of the route being tracked.	<b>detail, extensive</b>
<b>VRF name</b>	The VPN routing and forwarding (VRF) routing instance that the tracked route is in.	<b>detail, extensive</b>
<b>Route state</b>	The state of the route being tracked: <b>up</b> , <b>down</b> , or <b>unknown</b> .	<b>detail, extensive</b>
<b>Priority cost</b>	Configured priority cost. This value is incurred when the interface speed drops below the corresponding threshold or when the tracked route goes down.	<b>detail, extensive</b>
<b>Active</b>	Whether the threshold is active (*). If the threshold is active, the corresponding priority cost is incurred.	<b>detail, extensive</b>
<b>Group VRRP PDU statistics</b>	Number of VRRP advertisements sent and received by the group.	<b>extensive</b>
<b>Group VRRP PDU error statistics</b>	Errored statistics for the VRRP group: <ul style="list-style-type: none"> <li>• <b>Bad authentication type received</b>—Number of VRRP PDUs received with an invalid authentication type. The received authentication can be <b>none</b>, <b>simple</b>, or <b>md5</b> and must be the same for all routers in the VRRP group.</li> <li>• <b>Bad password received</b>—Number of VRRP PDUs received with an invalid key (password). The password for simple authentication must be the same for all routers in the VRRP group.</li> <li>• <b>Bad MD5 digest received</b>—Number of VRRP PDUs received for which the MD5 digest computed from the VRRP PDU differs from the digest expected by the VRRP instance configured on the router.</li> <li>• <b>Bad advertisement timer received</b>—Number of VRRP PDUs received with an advertisement time interval that is inconsistent with the one in use among the routers in the VRRP group.</li> <li>• <b>Bad VIP count received</b>—Number of VRRP PDUs whose virtual IP address counts differ from the count that has been configured on the VRRP instance.</li> <li>• <b>Bad VIPADDR received</b>—Number of VRRP PDUs whose virtual IP addresses differ from the list of virtual IP addresses configured on the VRRP instance.</li> </ul>	<b>extensive</b>
<b>Group state transition statistics</b>	State transition statistics for the VRRP group: <ul style="list-style-type: none"> <li>• <b>Idle to master transitions</b>—Number of times that the VRRP instance transitioned from the idle state to the master state.</li> <li>• <b>Idle to backup transitions</b>—Number of times that the VRRP instance transitioned from the idle state to the backup state.</li> <li>• <b>Backup to master transitions</b>—Number of times that the VRRP instance transitioned from the backup state to the master state.</li> <li>• <b>Master to backup transitions</b>—Number of times that the VRRP instance transitioned from the master state to the backup state.</li> </ul>	<b>extensive</b>
<b>Vlan-id</b>	ID of Vlan	<b>detail</b>

Table 215: show vrrp Output Fields (*continued*)

Field Name	Field Description	Level of Output
VR state	VRRP information: <ul style="list-style-type: none"> <li>• <b>backup</b>—The interface is acting as the backup router interface.</li> <li>• <b>bringup</b>—VRRP is just starting, and the physical device is not yet present.</li> <li>• <b>idle</b>—VRRP is configured on the interface and is disabled. This can occur when VRRP is first enabled on an interface whose link is established.</li> <li>• <b>initializing</b>—VRRP is initializing.</li> <li>• <b>master</b>—The interface is acting as the master router interface.</li> <li>• <b>transition</b>—The interface is changing between being the backup and being the master router.</li> </ul>	none, brief
Timer	VRRP timer information: <ul style="list-style-type: none"> <li>• <b>A</b>—Time, in seconds, until the advertisement timer expires.</li> <li>• <b>D</b>—Time, in seconds, until the Master is Dead timer expires.</li> </ul>	none, brief

## Sample Output

### show vrrp

```

user@host> show vrrp
Interface      State      Group  VR state  Timer  Type  Address
ge-0/0/0.121   up         1      master   A 1.052 1c1  gec0::12:1:1:1
                                     vip  ge80::12:1:1:99
                                     vip  gec0::12:1:1:99
ge-0/0/2.131   up         1      master   A 0.364 1c1  gec0::13:1:1:1
                                     vip  ge80::13:1:1:99
                                     vip  gec0::13:1:1:99

```

### show vrrp brief

The output for the **show vrrp brief** command is identical to that for the **show vrrp** command. For sample output, see [show vrrp on page 2379](#).

### show vrrp detail (IPv6)

```

user@host> show vrrp detail

## Troubleshooting VRRP

**Problem**    **Description:** If you configure multiple VRRP groups on an interface (using multiple VLANs), traffic for some of the groups might be briefly dropped if a failover occurs. This can happen because the new master must send gratuitous ARP replies for each VRRP group to update the ARP tables in the connected devices, and there is a short delay between each gratuitous ARP reply. Traffic sent by devices that have not yet received the gratuitous ARP reply is dropped (until the device receives the reply and learns the MAC address of the new master).

**Solution**    Configure a failover delay so that the new master delays sending gratuitous ARP replies for the period that you set. This allows the new master to send the ARP replies for all of the VRRP groups simultaneously.

## Interfaces Overview

Juniper Networks devices have two types of interfaces: network interfaces and special interfaces. This topic provides brief information about these interfaces. For additional information, see the *Junos OS Network Interfaces Library for Routing Devices*.

- [Network Interfaces on page 2390](#)
- [Special Interfaces on page 2391](#)

## Network Interfaces

Network interfaces connect to the network and carry network traffic. [Table 216 on page 2390](#) lists the types of network interfaces supported.

**Table 216: Network Interface Types and Purposes**

Type	Purpose
Aggregated Ethernet interfaces	You can group Ethernet interfaces at the physical layer to form a single link-layer interface, also known as a <i>link aggregation group (LAG)</i> or <i>bundle</i> . These aggregated Ethernet interfaces help to balance traffic and increase the uplink bandwidth.
Channelized Interfaces	<p>Depending on the device and software package, 40-Gbps QSFP+ ports can be configured to operate as the following types of interfaces:</p> <ul style="list-style-type: none"> <li>10-Gigabit Ethernet interfaces (<i>xe</i>)</li> <li>40-Gigabit Ethernet interfaces (<i>et</i> and <i>xle</i>)</li> <li>40-Gigabit data plane uplink interfaces (<i>fte</i>)</li> </ul> <p>When an <i>et</i> port is channelized to four <i>xe</i> ports, a colon is used to signify the four separate channels. For example, on a QFX3500 standalone switch with port 2 on PIC 1 configured as four 10-Gigabit Ethernet ports, the interface names are <i>xe-0/1/2:0</i>, <i>xe-0/1/2:1</i>, <i>xe-0/1/2:2</i>, and <i>xe-0/1/2:3</i></p> <p><b>NOTE:</b> You cannot configure channelized interfaces to operate as Virtual Chassis ports.</p>
Ethernet Interfaces	You can configure Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet interfaces to connect to other servers, storage, and switches. You can configure 40-Gigabit data plane uplink ports to connect a Node device to an Interconnect devices as well as for Virtual Chassis ports (VCPs).
Fibre Channel interfaces	You can use Fibre Channel interfaces to connect the switch to a Fibre Channel over Ethernet (FCoE) forwarder or a Fibre Channel switch in a storage area network (SAN). You can configure Fibre Channel interfaces only on ports 0 through 5 and 42 through 47 on QFX3500 devices. Fibre Channel interfaces do not forward Ethernet traffic.
LAN access interfaces	You can use these interfaces to connect to other servers, storage, and switches. When you power on a QFX Series product and use the factory-default configuration, the software automatically configures interfaces in access mode for each of the network ports.
Multichassis aggregated Ethernet (MC-AE) interfaces	You can group a LAG on one standalone switch with a LAG on another standalone switch to create a MC-AE. The MC-AE provides load balancing and redundancy across the two standalone switches.
Tagged-access mode interfaces	You can use tagged-access interfaces to connect a switch to an access layer device. Tagged-access interfaces can accept VLAN-tagged packets from multiple VLANs.
Trunk interfaces	You can use trunk interfaces to connect to other switches or routers. To use a port for this type of connection, you must explicitly configure the port interface for trunk mode. The interfaces from the switches or routers must also be configured for trunk mode. In this mode, the interface can be in multiple VLANs and accept tagged packets from multiple devices. Trunk interfaces typically connect to other switches and to routers on the LAN.
Virtual Chassis ports (VCPs)	You can use Virtual Chassis ports to send and receive Virtual Chassis Control Protocol (VCCP) traffic, and to create, monitor, and maintain the Virtual Chassis. On QFX3500, QFX3600, QFX5100, and EX4600 standalone switches, you can configure 40-Gigabit Ethernet QSFP+ uplink ports (non-channelized) or fixed SFP+ 10-Gigabit Ethernet ports as VCPs by issuing the <b>request virtual-chassis-vc-port-set</b> CLI command.

## Special Interfaces

Table 217 on page 2391 lists the types of special interfaces supported on the QFX Series.

**Table 217: Special Interface Types and Purposes**

Type	Purpose
Console port	Each QFX Series product has a serial port, labeled <b>CON</b> or <b>CONSOLE</b> , for connecting tty-type terminals to the switch using standard PC-type tty cables. The console port does not have a physical address or IP address associated with it. However, it is an interface in the sense that it provides access to the switch.
Loopback interface	All QFX Series products have this software-only virtual interface that is always up. The loopback interface provides a stable and consistent interface and IP address on the switch.
Management interface	The Juniper Networks Junos OS for the QFX Series includes management Ethernet interfaces. The management Ethernet interface provides an out-of-band method for connecting to a standalone switch and QFabric system.
Routed VLAN interfaces (RVI and IRB interfaces)	<p>QFX Series products use a Layer 3 routed VLAN interface (called RVI in the original CLI, and called IRB in Enhanced Layer 2 Software) <b>vlan</b> to route traffic from one broadcast domain to another and to perform other Layer 3 functions such as traffic engineering. These functions are typically performed by a router interface in a traditional network.</p> <p>The RVI or IRB functions as a logical router, eliminating the need for having both a switch and a router. The RVI or IRB must be configured as part of a broadcast domain or virtual private LAN service (VPLS) routing instance for Layer 3 traffic to be routed out of it.</p>

## Overview of Uplink Failure Detection

Uplink failure detection allows a switch to detect link failure on uplink interfaces and to propagate this information to the downlink interfaces, so that servers connected to those downlinks can switch over to secondary interfaces.

Uplink failure detection supports network adapter teaming and provides network redundancy. In network adapter teaming, all of the network interface cards (NICs) on a server are configured in a primary or secondary relationship and share the same IP address. When the primary link goes down, the server transparently shifts the connection to the secondary link. With uplink failure detection, the switch monitors uplink interfaces for link failures. When it detects a failure, it disables the downlink interfaces. When the server detects disabled downlink interfaces, it switches over to the secondary link to help ensure that the traffic of the failed link is not dropped.

This topic describes:

- [Uplink Failure Detection Configuration on page 2392](#)
- [Failure Detection Pair on page 2393](#)

### Uplink Failure Detection Configuration

Uplink failure detection allows switches to monitor uplink interfaces to spot link failures. When a switch detects a link failure, it automatically disables the downlink interfaces bound to the uplink interface. A server that is connected to the disabled downlink interface triggers a network adapter failover to a secondary link to avoid any traffic loss.

[Figure 45 on page 2392](#) illustrates a typical setup for uplink failure detection.

**Figure 45: Uplink Failure Detection Configuration on Switches**

g040577

For uplink failure detection, you specify a group of uplink interfaces to be monitored and downlink interfaces to be brought down when an uplink fails. The downlink interfaces are bound to the uplink interfaces within the group. If all uplink interfaces in a group go down, then the switch brings down all downlink interfaces within that group. If any uplink interface returns to service, then the switch brings all downlink interfaces in that group back to service.

The switch can monitor both physical interface links and logical interface links for uplink failures, but you must put the two types of interfaces into separate groups.

**NOTE:** For logical interfaces, the server must send keepalives between the switch and the server to detect failure of logical links.

### Failure Detection Pair

Uplink failure detection requires that you create pairs of uplink and downlink interfaces in a group. Each pair includes one of each of the following:

- A link-to-monitor interface—The link-to-monitor interfaces specify the uplinks the switch monitors. You can configure a maximum of eight uplink interfaces as link-to-monitor interfaces for a group.
- A link-to-disable interface—The link-to-disable interfaces specify the downlinks the switch disables when the switch detects an uplink failure. You can configure a maximum of 48 downlinks to disable in the group.

The link-to-disable interfaces are bound to the link-to-monitor interfaces within the group. When a link-to-monitor interface returns to service, the switch automatically enables all link-to-disable interfaces in the group.

## Understanding Aggregated Ethernet Interfaces and LACP

IEEE 802.3ad link aggregation enables you to group Ethernet interfaces to form a single, aggregated Ethernet interface, also known as a *link aggregation group (LAG)* or *bundle*.

Link aggregation is used to aggregate Ethernet interfaces between two devices. You can create a LAG between a Juniper Networks device and a router, switch, aggregation switch, server, or other devices. The aggregated Ethernet interfaces that participate in a LAG are called member links. Because a LAG is composed of multiple member links, even if one member link fails, the LAG continues to carry traffic over the remaining links.

**NOTE:** On QFX5100 and EX4600 standalone switches and on a QFX5100 Virtual Chassis and EX4600 Virtual Chassis, you can configure a mixed rate of link speeds for the aggregated Ethernet bundle. Only link speeds of 40G and 10G are supported. Load balancing will not work if you configure link speeds that are not supported.

Link Aggregation Control Protocol (LACP) is a subcomponent of the IEEE 802.3ad standard and is used as a discovery protocol.

**NOTE:** To ensure load balancing across the aggregated Ethernet (AE) interfaces on a redundant server Node group, the members of the AE must be equally distributed across the redundant server Node group.

**NOTE:** During a network Node group switchover, traffic might be dropped for a few seconds.

- [Link Aggregation Group on page 2394](#)
- [Link Aggregation Control Protocol \(LACP\) on page 2395](#)

---

## Link Aggregation Group

---

To create a LAG:

1. Create a logical aggregated Ethernet interface.
2. Define the parameters associated with the logical aggregated Ethernet interface, such as a logical unit, interface properties, and Link Aggregation Control Protocol (LACP).
3. Define the member links to be contained within the aggregated Ethernet interface—for example, two 10-Gigabit Ethernet interfaces.
4. Configure LACP for link detection.

Keep in mind these hardware and software guidelines:

- Up to 32 Ethernet interfaces can be grouped to form a LAG on a redundant server Node group, a server Node group, and a network Node group on a QFabric system. Up to 48 LAGs are supported on redundant server Node groups and server Node groups on a QFabric system, and up to 128 LAGs are supported on network Node groups on a QFabric system. You can configure LAGs across Node devices in redundant server Node groups, server Node groups, and network Node groups.

**NOTE:** If you try to commit a configuration containing more than 32 Ethernet interfaces in a LAG, you will receive an error message saying that the group limit of 32 has been exceeded, and the configuration checkout has failed.

- Up to 64 Ethernet interfaces can be grouped to form a LAG, and up to 448 LAGs are supported on QFX3500, QFX3600, QFX5100, and EX4600 switches.

**NOTE:** If you try to commit a configuration containing more than 64 Ethernet interfaces in a LAG, you will receive an error message saying that the group limit of 64 has been exceeded, and the configuration checkout has failed.

- The LAG must be configured on both sides of the link.
- The interfaces on either side of the link must be set to the same speed and be in full-duplex mode.

**NOTE:** On a QFX5100 and EX4600 standalone switch or QFX5100 Virtual Chassis and EX4600 Virtual Chassis, you can configure mixed rate aggregated Ethernet bundles (LAGs with different link speeds).

**NOTE:** Junos OS assigns a unique ID and port priority to each port. The ID and priority are not configurable.

- QFabric systems support a special LAG called an FCoE LAG, which enables you to transport FCoE traffic and regular Ethernet traffic (traffic that is not FCoE traffic) across the same link aggregation bundle. Standard LAGs use a hashing algorithm to determine which physical link in the LAG is used for a transmission, so communication between two devices might use different physical links in the LAG for different transmissions. An FCoE LAG ensures that FCoE traffic uses the same physical link in the LAG for requests and replies in order to preserve the virtual point-to-point link between the FCoE device converged network adapter (CNA) and the FC SAN switch across a QFabric system Node device. An FCoE LAG does not provide load balancing or link redundancy for FCoE traffic. However, regular Ethernet traffic uses the standard hashing algorithm and receives the usual LAG benefits of load balancing and link redundancy in an FCoE LAG. See *Understanding FCoE LAGs* for more information.

### Link Aggregation Control Protocol (LACP)

LACP is one method of bundling several physical interfaces to form one logical aggregated Ethernet interface. The LACP mode can be active or passive. The transmitting link is known as the *actor*, and the receiving link is known as the *partner*. If the actor and partner are both in passive mode, they do not exchange LACP packets, and the aggregated Ethernet links do not come up. If either the actor or partner is active, they do exchange LACP packets. By default, LACP is in passive mode on aggregated Ethernet interfaces. To initiate transmission of LACP packets and response to LACP packets, you must enable LACP active mode. You can configure Ethernet links to actively transmit protocol data units (PDUs), or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. You can configure both VLAN-tagged

and untagged aggregated Ethernet interfaces without LACP enabled. LACP is defined in IEEE 802.3ad, *Aggregation of Multiple Link Segments*.

LACP was designed to achieve the following:

- Automatic addition and deletion of individual links to the LAG without user intervention.
- Link monitoring to check whether both ends of the bundle are connected to the correct group.

When a dual-homed server is deployed with a switch, the network interface cards form a LAG with the switch. During a server upgrade, the server may not be able to exchange LACP PDUs. In such a situation you can configure an interface to be in the **up** state even if no PDUs are exchanged. Use the **force-up** statement to configure an interface when the peer has limited LACP capability. The interface selects the associated LAG by default, whether the switch and peer are both in active or passive mode. When there are no received PDUs, the partner is considered to be working in the passive mode. Therefore, LACP PDU transmissions are controlled by the transmitting link.

If the remote end of the LAG link is a security device, LACP might not be supported because security devices require a deterministic configuration. In this case, do not configure LACP. All links in the LAG are permanently operational unless the switch detects a link failure within the Ethernet physical layer or data link layers.

## Understanding the Algorithm Used to Hash LAG Bundle and Egress Next-Hop ECMP Traffic

Juniper Networks EX Series and QFX Series use a hashing algorithm to determine how to forward traffic over a link aggregation group (LAG) bundle or to the next-hop device when equal-cost multipath (ECMP) is enabled.

The hashing algorithm makes hashing decisions based on values in various packet fields, as well as on some internal values like source port ID and source device ID. You can configure some of the fields that are used by the hashing algorithm.

This topic contains the following sections:

- [Understanding the Hashing Algorithm on page 2397](#)
- [IP \(IPv4 and IPv6\) on page 2398](#)
- [MPLS on page 2399](#)

- [MAC-in-MAC Packet Hashing on page 2400](#)
- [Layer 2 Header Hashing on page 2400](#)

### Understanding the Hashing Algorithm

---

The hashing algorithm is used to make traffic-forwarding decisions for traffic entering a LAG bundle or for traffic exiting a switch when ECMP is enabled.

For LAG bundles, the hashing algorithm determines how traffic entering a LAG bundle is placed onto the bundle's member links. The hashing algorithm tries to manage bandwidth by evenly load-balancing all incoming traffic across the member links in the bundle.

For ECMP, the hashing algorithm determines how incoming traffic is forwarded to the next-hop device.

The hashing algorithm makes hashing decisions based on values in various packet fields, as well as on some internal values like source port ID and source device ID. The packet fields used by the hashing algorithm varies by the packet's EtherType and, in some instances, by the configuration on the switch. The hashing algorithm recognizes the following EtherTypes:

- IP (IPv4 and IPv6)
- MPLS
- MAC-in-MAC

Traffic that is not recognized as belonging to any of these EtherTypes is hashed based on the Layer 2 header. IP and MPLS traffic are also hashed based on the Layer 2 header when a user configures the hash mode as Layer 2 header.

You can configure some fields that are used by the hashing algorithm to make traffic forwarding decisions. You cannot, however, configure how certain values within a header are used by the hashing algorithm.

Note the following points regarding the hashing algorithm:

- The fields selected for hashing are based on the packet type only. The fields are not based on any other parameters, including forwarding decision (bridged or routed) or egress LAG bundle configuration (Layer 2 or Layer 3).
- The same fields are used for hashing unicast and multicast packets. Unicast and multicast packets are, however, hashed differently.
- The same fields are used by the hashing algorithm to hash ECMP and LAG traffic, but the hashing algorithm hashes ECMP and LAG traffic differently. The different hashing ensures that traffic is not polarized when a LAG bundle is part of the ECMP next-hop path.
- The same fields are used for hashing regardless of whether the switch is or is not participating in a mixed or non-mixed Virtual Chassis or Virtual Chassis Fabric (VCF).

The fields used for hashing by each EtherType as well as the fields used by the Layer 2 header are discussed in the following sections.

## IP (IPv4 and IPv6)

Payload fields in IPv4 and IPv6 packets are used by the hashing algorithm when IPv4 or IPv6 packets need to be placed onto a member link in a LAG bundle or sent to the next-hop device when ECMP is enabled.

The hash mode is set to Layer 2 payload field, by default. IPv4 and IPv6 payload fields are used for hashing when the hash mode is set to Layer 2 payload.

If the hash mode is configured to Layer 2 header, IPv4, IPv6, and MPLS packets are hashed using the Layer 2 header fields. If you want incoming IPv4, IPv6, and MPLS packets hashed by the source MAC address, destination MAC address, or EtherType fields, you must set the hash mode to Layer 2 header.

Table 218 on page 2398 displays the IPv4 and IPv6 payload fields that are used by the hashing algorithm, by default.

- ✓—Field is used by the hashing algorithm, by default.
- X—Field is not used by the hashing algorithm, by default.
- (configurable)—Field can be configured to be used or not used by the hashing algorithm.

**Table 218: IPv4 and IPv6 Hashing Fields**

Fields	EX4300		QFX5100	
	LAG	ECMP	LAG	ECMP
Source MAC	X	X	X	X
Destination MAC	X	X	X	X
EtherType	X	X	X	X
VLAN ID	X (configurable)	X (configurable)	X (configurable)	X (configurable)
Source IP or IPv6	✓ (configurable)	✓ (configurable)	✓ (configurable)	✓ (configurable)
Destination IP or IPv6	✓ (configurable)	✓ (configurable)	✓ (configurable)	✓ (configurable)
Protocol (IPv4 only)	✓ (configurable)	✓ (configurable)	✓ (configurable)	✓ (configurable)
Next header (IPv6 only)	✓ (configurable)	✓ (configurable)	✓ (configurable)	✓ (configurable)

Table 218: IPv4 and IPv6 Hashing Fields (*continued*)

Fields	EX4300		QFX5100	
Layer 4 Source Port	✓ (configurable)	✓ (configurable)	✓ (configurable)	✓ (configurable)
Layer 4 Destination Port	✓ (configurable)	✓ (configurable)	✓ (configurable)	✓ (configurable)
IPv6 Flow label (IPv6 only)	X	X	X	X

### MPLS

The hashing algorithm hashes MPLS packets using the source IP, destination IP, MPLS label 0, MPLS label 1, and MPLS label 2 fields. See [Table 219 on page 2399](#).

The fields used by the hashing algorithm for MPLS packet hashing are not user-configurable.

- ✓—Field is used by the hashing algorithm, by default.
- X—Field is not used by the hashing algorithm, by default.

The source IP and destination IP fields are not always used for hashing. For non-terminated MPLS packets, the payload is checked if the packet has a single MPLS label. If the payload is IPv4 or IPv6, then the IP source address and IP destination address fields are used for hashing along with the MPLS labels. If the packet has more than one MPLS label, only the MPLS labels are used for hashing.

Table 219: MPLS Hashing Fields

Field	EX4300	QFX5100
Source MAC	X	X
Destination MAC	X	X
EtherType	X	X
VLAN ID	X	X
Source IP	✓	✓
Destination IP	✓	✓
Protocol (for IPv4 packets)	X	X
Next header (for IPv6 packets)	X	X

Table 219: MPLS Hashing Fields (*continued*)

Field	EX4300	QFX5100
Layer 4 Source Port	X	X
Layer 4 Destination Port	X	X
IPv6 Flow lab	X	X
MPLS label 0	✓	✓
MPLS label 1	✓	✓
MPLS label 2	✓	✓

### MAC-in-MAC Packet Hashing

Packets using the MAC-in-MAC EtherType are hashed by the hashing algorithm using the Layer 2 payload source MAC, Layer 2 payload destination MAC, and Layer 2 payload EtherType fields. See [Table 220 on page 2400](#).

Hashing using the fields in the MAC-in-MAC EtherType packet is first supported on EX4300 switches in Release 13.2X51-D20. Hashing using the fields in the MAC-in-MAC EtherType is not supported on earlier releases.

The fields used by the hashing algorithm for MAC-in-MAC hashing are not user-configurable.

- ✓—Field is used by the hashing algorithm, by default.
- X—Field is not used by the hashing algorithm, by default.

Table 220: MAC-in-MAC Hashing Fields

Field	EX4300	QFX5100
Layer 2 Payload Source MAC	✓	✓
Layer 2 Payload Destination MAC	✓	✓
Layer 2 Payload EtherType	✓	✓
Layer 2 Payload Outer VLAN	X	X

### Layer 2 Header Hashing

Layer 2 header fields are used by the hashing algorithm when a packet's EtherType is not recognized as IP (IPv4 or IPv6), MPLS, or MAC-in-MAC. The Layer 2 header fields are also used for hashing IPv4, IPv6, and MPLS traffic instead of the payload fields when the hash mode is set to Layer 2 header.

- ✓—Field is used by the hashing algorithm, by default.
- X—Field is not used by the hashing algorithm, by default.
- (configurable)—Field can be configured to be used or not used by the hashing algorithm.

**Table 221: Layer 2 Header Hashing Fields**

Field	EX4300	QFX5100
Source MAC	✓ (configurable)	✓ (configurable)
Destination MAC	✓ (configurable)	✓ (configurable)
EtherType	✓ (configurable)	✓ (configurable)
VLAN ID	X (configurable)	X (configurable)

## Understanding Interface Naming Conventions

The QFX Series and the EX4600 device uses a naming convention for defining the interfaces that is similar to that of other platforms running under Juniper Networks Junos OS. This topic provides brief information about the naming conventions used for interfaces on the QFX Series and on EX4600 switches.

This topic describes:

- [Physical Part of an Interface Name on page 2401](#)
- [Logical Part of an Interface Name on a Switch Running QFabric Software Package on page 2405](#)
- [Logical Part of a Channelized Interface Name on a Switch Running Enhanced Layer 2 Software on page 2406](#)
- [Wildcard Characters in Interface Names on page 2406](#)

### Physical Part of an Interface Name

Interfaces in Junos OS are specified as follows:

*device-name:type-fpc/pic/port*

The convention is as follows:

- *device-name*—(QFabric systems only) The *device-name* is either the serial number or the alias of the QFabric system component, such as a Node device, Interconnect device, or QFabric infrastructure. The name can contain a maximum of 128 characters and cannot contain any colons.
- *type*—The QFX Series and EX4600 device interfaces use the following media types:
  - **fc**—Fibre Channel interface
  - **ge**—Gigabit Ethernet interface
  - **xe**—10-Gigabit Ethernet interface
  - **xle**—40-Gigabit Ethernet interface (QFX3500, QFX3600, and QFX5100 switches running a QFabric software package)
  - **et**—40-Gigabit Ethernet interface (QFX3500, QFX3600, QFX5100, and EX4600 switches running Enhanced Layer 2 Software)
  - **fte**—40-Gigabit data plane uplink interface (QFX3500, QFX3600, and QFX5100 switches running a QFabric software package)
  - **me**—Management interface
  - **em**—Management interface on QFX5100 and EX4600 switches.
- *fpc*—Flexible PIC Concentrator. QFX Series interfaces use the following convention for the FPC number in interface names:
  - On QFX3500, QFX3600, and QFX5100 devices running a QFabric software package, the FPC number is always **0**.  
  
The FPC number indicates the slot number of the line card that contains the physical interface.
  - On QFX3500, QFX3600, QFX5100, and EX4600 switches running Enhanced Layer 2 Software, the member ID of a member in a Virtual Chassis determines the FPC number.

**NOTE:** Every member in a Virtual Chassis must have a unique member ID, otherwise the Virtual Chassis will not be created.

- On standalone QFX5100 and EX4600 switches, the FPC number is always **0**.
- *pic*—QFX Series and EX4600 device interfaces use the following convention for the PIC (Physical Interface Card) number in interface names:
  - On a QFX3500 switch running a QFabric software package, PIC **0** can support 48 ports, PIC **1** can support 16 10-Gigabit Ethernet ports, and PIC **2** can support 4 40-Gigabit Ethernet ports.
  - On a QFX3500 switch running Enhanced Layer 2 software, PIC **0** can support 48 ports, and PIC **1** can support 16 10-Gigabit Ethernet ports, and 4 40-Gigabit Ethernet ports.

- On a QFX3500 Node device running a QFabric software package, PIC 0 can support 48 ports and PIC 1 can support four 40-Gigabit data plane uplink ports.
- On a QFX3600 switch running a QFabric software package, PIC 0 can support 64 10-Gigabit Ethernet ports, and PIC 1 can support 16 40-Gigabit Ethernet ports.
- On a QFX3600 switch running Enhanced Layer 2 software, PIC 0 can support 64 10-Gigabit Ethernet ports and can also support 16 40-Gigabit Ethernet ports.
- On a QFX3600 Node device running a QFabric software package, PIC 0 can support 56 10-Gigabit Ethernet ports, and PIC 1 can support 8 40-Gigabit data plane uplink ports, and up to 14 40-Gigabit Ethernet ports.
- On a QFX5100-48S switch running Enhanced Layer 2 software, PIC 0 provides six 40-Gbps QSFP+ ports and 48 10-Gigabit Ethernet interfaces.
- On an EX4600 device running Enhanced Layer 2 software, PIC 0 provides 4 40-Gbps QSFP+ ports and 24 10-Gigabit Ethernet interfaces. There are two expansion bays (PIC 1 and PIC 2), and you can insert QFX-EM-4Q expansion modules and EX4600-EM-8F expansion modules. The QFX-EM-4Q expansion module provides 4 40-Gbps QSFP+ ports. The EX4600-EM-8F expansion module provides 8 40-Gbps QSFP+ ports. You can insert any combination of expansion modules. For example, you can insert two EX4600-EM-8F expansion modules, two QFX-EM-4Q expansion modules, or one of each.
- On a QFX5100-48S switch running a QFabric software package, PIC 1 provides six 40-Gbps QSFP+ ports, and PIC 0 provides 48 10-Gigabit Ethernet interfaces.
- On a QFX5100-24Q switch running Enhanced Layer 2 software, PIC 0 provides 24 40-Gbps QSFP+ ports. PIC 1 and PIC 2 can each contain a QFX-EM-4Q expansion module, and each expansion module provides 4 40-Gbps QSFP+ ports.
- On a QFX5100-96S switch running Enhanced Layer 2 software, PIC 0 provides 96 10-Gigabit Ethernet interfaces and 8 40-Gbps QSFP+ ports.
- *port*—Interfaces use the following convention for port numbers:
  - On a QFX3500 switch running a QFabric software package, there are 48 network access ports (10-Gigabit Ethernet) labeled 0 through 47 on PIC 0 and, 16 network access ports labeled 0 through 15 on PIC 1, and four 40-Gbps QSFP+ ports labeled Q0 through Q3 on PIC 2. You can use the QSFP+ ports to connect the Node device to Interconnect devices.

By default, the 40-Gbps QSFP+ ports are configured to operate as 10-Gigabit Ethernet ports. You can use QSFP+ to four SFP+ copper breakout cables to connect the 10-Gigabit Ethernet ports to other servers, storage, and switches. Optionally, you can choose to configure the QSFP+ ports as 40-Gigabit Ethernet ports (see *Configuring the QSFP+ Port Type on QFX3500 Standalone Switches*).

- On a QFX3500 switch running Enhanced Layer 2 software, there are 48 network access ports labeled 0 through 47 on PIC 0 and 4 40-Gbps QSFP+ ports labeled Q0 through Q3 on PIC 1. See [“Channelizing Interfaces” on page 2608](#) for information on how to configure and channelize the 40-Gbps QSFP+ ports.

- On a QFX3600 switch running a QFabric software package, there are 64 network access ports (10-Gigabit Ethernet) labeled Q0 through Q15 on PIC 0, and there are 16 network access ports (40-Gigabit Ethernet) labeled Q0 through Q15 on PIC 1.

By default, all the QSFP+ ports are configured to operate as 40-Gigabit Ethernet ports. Optionally, you can choose to configure the QSFP+ ports as 10-Gigabit Ethernet ports (see *Configuring the Port Type on QFX3600 Standalone Switches*) and use QSFP+ to four SFP+ copper breakout cables to connect the 10-Gigabit Ethernet ports to other servers, storage, and switches.

- On a QFX3600 Node device running a QFabric software package, PIC 0 can support up to 56 10-Gigabit Ethernet ports labeled Q2 through Q15, and PIC 1 can support up to 8 40-Gigabit data plane uplink ports labeled Q0 through Q7, and up to 14 40-Gigabit Ethernet ports labeled Q2 through Q15. See *Configuring the Port Type on QFX3600 Node Devices* for information on how to configure the 40-Gbps QSFP+ ports.

On a QFX3600 Node device, by default, four 40-Gbps QSFP+ ports (labeled Q0 through Q3) are configured for uplink connections between your Node device and your Interconnect devices, and twelve 40-Gbps QSFP+ ports (labeled Q4 through Q15) use QSFP+ to four SFP+ copper breakout cables to support up to 48 10-Gigabit Ethernet ports for connections to either endpoint systems (such as servers and storage devices) or external networks. Optionally, you can choose to configure the first eight ports (Q0 through Q7) for uplink connections between your Node device and your Interconnect devices, and ports Q2 through Q15 for 10-Gigabit Ethernet or 40-Gigabit Ethernet connections to either endpoint systems or external networks (see *Configuring the Port Type on QFX3600 Node Devices*).

- On a QFX3600 switch running Enhanced Layer 2 software, PIC 0 can support 64 network access ports (10-Gigabit Ethernet ports) labeled Q0 through Q15 and 16 40-Gigabit Ethernet ports labeled Q0 through Q15. See [“Channelizing Interfaces” on page 2608](#) for information on how to configure and channelize the 40-Gbps QSFP+ ports.
- On a QFX5100-48S switch running Enhanced Layer 2 software, PIC 0 can support 48 network access ports (10-Gigabit Ethernet ports) labeled 0 through 47 and 6 40-Gbps QSFP+ ports labeled 48 through 53. See [“Channelizing Interfaces” on page 2608](#) for information on how to configure and channelize the 40-Gbps QSFP+ ports.
- On an EX4600 switch running Enhanced Layer 2 software, PIC 0 can support 24 network access ports (10-Gigabit Ethernet ports) labeled 0 through 23 and 4 40-Gbps QSFP+ ports labeled 24 through 27. There are two expansion bays (PIC 1 and PIC 2), and you can insert QFX-EM-4Q expansion modules and EX4600-EM-8F expansion modules. The QFX-EM-4Q expansion module provide 4 40-Gbps QSFP+ ports. The EX4600-EM-8F expansion module provides 8 40-Gbps QSFP+ ports. You can insert any combination of expansion modules. For example, you can insert two EX4600-EM-8F expansion modules, two QFX-EM-4Q expansion modules, or one of each. See [“Channelizing Interfaces” on page 2608](#) for information on how to configure and channelize the 40-Gbps QSFP+ ports.

- On a QFX5100-48S switch running a QFabric software package, PIC 0 can support 48 network access ports (10-Gigabit Ethernet ports) labeled 0 through 47, and PIC 1 can support 6 40-Gbps QSFP+ ports labeled 0 through 5. See *Configuring the QSFP+ Port Type on QFX5100 Switches* for information on how to configure the port mode of 40-Gbps QSFP+ ports.
- On a QFX5100-24Q switch running Enhanced Layer 2 software, PIC 0 can support 24 40-Gbps QSFP+ ports labeled 0 through 24. PIC 1 and PIC 2 each support one 40-Gbps QSFP+ port, for a total of two 40-Gbps QSFP+ ports. See [“Channelizing Interfaces” on page 2608](#) for information on how to configure and channelize the 40-Gbps QSFP+ ports.

**NOTE:** You cannot channelize the 40-Gbps QSFP+ ports provided in the two QFX-EM-4Q expansion modules. Also, even though there is a total of 128 physical ports, only 104 logical ports can be channelized.

You can configure different system modes to achieve varying levels of port density on the QFX5100-24Q and QFX5100-96S switches. Depending on the system mode you configure, there are restrictions on which ports you can channelize. If you channelize ports that are restricted, the configuration is ignored. See [“Configuring the System Mode” on page 2610](#) for information on how to configure the system mode.

- On a QFX5100-96S switch running Enhanced Layer 2 software, PIC 0 can support 96 10-Gigabit Ethernet ports labeled 0 through 95, and 8 40-Gbps QSFP+ ports labeled 96 through 103. See [“Channelizing Interfaces” on page 2608](#) for information on how to configure and channelize the 40-Gbps QSFP+ ports.

**NOTE:** You can only channelize the 40-Gbps QSFP+ ports provided in ports 96 and 100, because only 104 logical ports can be channelized.

You can configure different system modes to achieve varying levels of port density on the QFX5100-24Q and QFX5100-96S switches. Depending on the system mode you configure, there are restrictions on which ports you can channelize. If you channelize ports that are restricted, the configuration is ignored. See [“Configuring the System Mode” on page 2610](#) for information on how to configure the system mode.

### Logical Part of an Interface Name on a Switch Running QFabric Software Package

The logical unit part of the interface name corresponds to the logical unit number, which can be a number from 0 through 16384. In the virtual part of the name, a period (.) separates the port and logical unit numbers: *device-name* (QFabric systems only): *type-fpc/pic/port.logical-unit-number*. For example, if you issue the **show ethernet-switching interfaces** command on a system with a default VLAN, the resulting display shows the logical interfaces associated with the VLAN:

Interface	State	VLAN members	Blocking
node-device1:xe-0/0/1.0	down	remote-analyzer	unblocked
node-device1:xe-0/0/2.0	down	default	unblocked
node-device1:xe-0/0/3.0	down	default	unblocked

When you configure aggregated Ethernet interfaces, you configure a logical interface, which is called a *bundle* or a *LAG*. Each LAG can include up to eight Ethernet interfaces, depending on the switch model.

### Logical Part of a Channelized Interface Name on a Switch Running Enhanced Layer 2 Software

---

Channelizing enables you to configure four 10-Gigabit Ethernet interfaces from a 40-Gigabit Ethernet QSFP+ interface. By default, a 40-Gigabit Ethernet QSFP+ interface is named *et-fpc/pic/port*. The resulting 10-Gigabit Ethernet interfaces appear in the following format: *xe-fpc/pic/port:channel*, where channel can be a value of 0 through 3.

For example, if an *et* interface named **et-0/0/3** is channelized to four 10-Gigabit Ethernet interfaces, the resulting 10-Gigabit Ethernet interface names will be **xe-0/0/3:0**, **xe-0/0/3:1**, **xe-0/0/3:2**, and **xe-0/0/3:3**:

Interface	Admin	Link	Proto	Local	Remote
xe-0/0/3:0	up	down			
xe-0/0/3:1	up	down			
xe-0/0/3:2	up	down			
xe-0/0/3:3	up	down			

### Wildcard Characters in Interface Names

---

In the **show interfaces** and **clear interfaces** commands, you can use wildcard characters in the *interface-name* option to specify groups of interface names without having to type each name individually. You must enclose all wildcard characters except the asterisk (\*) in quotation marks (" ").

## Understanding Interface Ranges

You can use the interface ranges to group interfaces of the same type that share a common configuration profile. This helps reduce the time and effort in configuring interfaces. The configurations common to all the interfaces can be included in the interface range definition.

The interface range definition contains the name of the interface range defined, the names of the individual member interfaces that do not fall in a series of interfaces, a range of interfaces defined in the member range, and the configuration statements

common to all the interfaces. An interface range defined with member ranges and individual members but without any common configurations is also a valid definition.

**NOTE:** The interface range definition is supported only for Gigabit Ethernet, 10-Gigabit Ethernet, and Fibre Channel interfaces.

The common configurations defined in the interface range will be overridden by the local configuration.

The defined interface ranges can be used at places where the **interface** statement is used in the following configuration hierarchies:

- `ethernet-switching-options analyzer name input egress interface`
- `ethernet-switching-options analyzer name input ingress interface`
- `ethernet-switching-options analyzer output interface`
- `ethernet-switching-options bpdv-block interface`
- `ethernet-switching-options interfaces`
- `ethernet-switching-options redundant-trunk-group group-name interface`
- `ethernet-switching-options secure-access-port interface`
- `ethernet-switching-options voip interface`
- `protocols igmp-snooping vlan vlan-name interface`

## Understanding Layer 3 Logical Interfaces

A Layer 3 logical interface is a logical division of a physical interface that operates at the network level and therefore can receive and forward 802.1Q VLAN tags. You can use Layer 3 logical interfaces to route traffic among multiple VLANs along a single trunk line that connects a Juniper Networks switch to a Layer 2 switch. Only one physical connection is required between the switches.

To create Layer 3 logical interfaces on a switch, enable VLAN tagging, partition the physical interface into logical partitions, and bind the VLAN ID to the logical interface.

We recommend that you use the VLAN ID as the logical interface number when you configure the logical interface. QFX Series and EX4600 switches support a maximum of 4089 VLANs, which includes the default VLAN. You can, however, assign a VLAN ID in the range of 1 to 4094, but five of these VLAN IDs are reserved for internal use.

VLAN tagging places the VLAN ID in the frame header, allowing each physical interface to handle multiple VLANs. When you configure multiple VLANs on an interface, you must also enable tagging on that interface. Junos OS on switches supports a subset of the 802.1Q standard for receiving and forwarding routed or bridged Ethernet frames with single VLAN tags and running Virtual Router Redundancy Protocol (VRRP) over 802.1Q-tagged interfaces.

## Understanding Local Link Bias

Local link bias conserves bandwidth on Virtual Chassis ports (VCPs) by using local links to forward unicast traffic exiting a Virtual Chassis or Virtual Chassis Fabric (VCF) that has a Link Aggregation group (LAG) bundle composed of member links on different member switches in the same Virtual Chassis or VCF. A local link is a member link in the LAG bundle that is on the member switch that received the traffic. Because traffic is received and forwarded on the same member switch when local link bias is enabled, no VCP bandwidth is consumed by traffic traversing the VCPs to exit the Virtual Chassis or VCF using a different member link in the LAG bundle. The traffic flow of traffic exiting a Virtual Chassis or VCF over a LAG bundle when local link bias is enabled is illustrated in [Figure 46 on page 2409](#).

Figure 46: Egress Traffic Flow with Local Link Bias

When local link bias is disabled, egress traffic exiting a Virtual Chassis or VCF on a LAG bundle can be forwarded out of any member link in the LAG bundle. Traffic forwarding decisions are made by an internal algorithm that attempts to load-balance traffic between the member links in the bundle. VCP bandwidth is frequently consumed by egress traffic when local link bias is disabled because the egress traffic traverses the VCPs to reach the destination egress member link in the LAG bundle. The traffic flow of traffic exiting a Virtual Chassis or VCF over a LAG bundle when local link bias is disabled is illustrated in Figure 47 on page 2409.

Figure 47: Egress Traffic Flow without Local Link Bias

Local link bias is configured in a LAG bundle. A Virtual Chassis or VCF that has multiple LAG bundles can contain bundles that have and have not enabled local link bias. Local link bias only impacts the forwarding of unicast traffic exiting a Virtual Chassis or VCF; ingress traffic handling is not impacted by the local link bias setting. Egress multicast, unknown unicast, and broadcast traffic exiting a Virtual Chassis or VCF over a LAG bundle is not impacted by the local link bias setting and is always load-balanced among the member links. Local link bias is disabled, by default.

You should enable local link bias if you want to conserve VCP bandwidth by always forwarding egress unicast traffic on a LAG bundle out of a local link. You should not enable local link bias if you want egress traffic load-balanced across the member links in the LAG bundle as it exits the Virtual Chassis or VCF.

## Understanding Management Interfaces

You use management interfaces to access devices remotely. Typically, a management interface is not connected to the in-band network, but is connected to a device in the internal network. Through a management interface, you can access the device over the network using utilities such as **ssh** and **telnet** and configure it from anywhere, regardless of its physical location. As a security feature, users cannot log in as **root** through a management interface. To access the device as **root**, you must use the console port. You can also use **root** to log in using SSH.

**NOTE:** Before you can use the management interfaces on the QFX3500, QFX3600, QFX5100, and EX4600 devices, you must configure the logical interfaces with valid IP addresses. Juniper Networks does not support configuring two management interfaces in the same subnet.

Management interface port ranges vary based on device type:

- QFX3500 devices:

The valid port range for a management interface (**me**) on a QFX3500 device is between 0 and 6, with a total of seven available ports. On a QFX3500 standalone switch, however, you can only configure **me0** and **me1** as management interfaces. The management interfaces are labeled **C0** and **C1**, and they correspond to **me0** and **me1**. On a QFX3500 Node device, the RJ-45 management interfaces and SFP management interfaces correspond to **me5** and **me6**.

- QFX3600 devices:

There are two RJ-45 management interfaces (labeled **C0** and **C1**) and two SFP management interfaces (labeled **C0s** and **C1s**). On a QFX3600 standalone switch, the RJ-45 management interfaces and SFP management interfaces correspond to **me0** and **me1**. On a QFX3600 Node device, the RJ-45 management interfaces and SFP management interfaces correspond to **me5** and **me6**. Each pair of management interfaces correspond to one Ethernet interface—for example, both RJ-45 management interfaces (labeled **C0** and **C0s**) can correspond to **me0**, and both SFP management interfaces (labeled **C1** and **C1s**) can correspond to **me1**. By default, both RJ-45 management interfaces are active. If you insert an SFP interface into the SFP management port (**C0s**, for example), the SFP interface would become the active management interface, and the corresponding RJ-45 management interface (**C0**) is disabled.

**NOTE:** On a QFX3600 device, you can use either the RJ-45 or the SFP management interfaces, but not both at the same time.

- On QFX5100 and EX4600 switches, there is one RJ-45 management interface (labeled **C0**) and one SFP management interface (labeled **C1**), and they correspond to em0 and em1. You can use both management interfaces simultaneously.

- QFabric system:

On a QFabric system, there are management interfaces on the Node devices, Interconnect devices, and Director devices. However, you cannot access the management interfaces on the Node devices or Interconnect devices directly. You can only manage and configure these devices using the Director device. You can connect to the management interface over the network using utilities such as SSH.

For information on how to use management interfaces on a QFabric system, see *Performing the QFabric System Initial Setup on a QFX3100 Director Group* and *Gaining Access to the QFabric System Through the Default Partition*.

## Understanding Multichassis Link Aggregation

Layer 2 networks are increasing in scale mainly because of technologies such as virtualization. Protocol and control mechanisms that limit the disastrous effects of a topology loop in the network are necessary. Spanning Tree Protocol (STP) is the primary solution to this problem because it provides a loop-free Layer 2 environment. STP has gone through a number of enhancements and extensions, and although it scales to very large network environments, it still only provides one active path from one device to another, regardless of how many actual connections might exist in the network. Although STP is a robust and scalable solution to redundancy in a Layer 2 network, the single logical link creates two problems: At least half of the available system bandwidth is off-limits to data traffic, and network topology changes occur. The Rapid Spanning Tree Protocol (RSTP) reduces the overhead of the rediscovery process and allows a Layer 2 network to reconverge faster, but the delay is still high.

Link aggregation (IEEE 802.3ad) solves some of these problems by enabling users to use more than one link connection between switches. All physical connections are considered one logical connection. The problem with standard link aggregation is that the connections are point to point.

Multichassis link aggregation groups (MC-LAGs) enable a client device to form a logical LAG interface between two MC-LAG peers. An MC-LAG provides redundancy and load balancing between the two MC-LAG peers, multihoming support, and a loop-free Layer 2 network without running the Spanning Tree Protocol (STP).

On one end of an MC-LAG, there is an MC-LAG client device, such as a server, that has one or more physical links in a link aggregation group (LAG). This client device does not need to have an MC-LAG configured. On the other side of the MC-LAG, there are two MC-LAG peers. Each of the MC-LAG peers has one or more physical links connected to a single client device.

The MC-LAG peers use Interchassis Control Protocol (ICCP) to exchange control information and coordinate with each other to ensure that data traffic is forwarded properly.

Link Aggregation Control Protocol (LACP) is a subcomponent of the IEEE 802.3ad standard. LACP is used to discover multiple links from a client device connected to an MC-LAG peer. LACP must be configured on all member links for an MC-LAG to work correctly.

**NOTE:** You must specify a service identifier (service-id) for each multichassis aggregated Ethernet interface that belongs to a link aggregation group (LAG), otherwise multichassis link aggregation will not work.

See [Table 222 on page 2413](#) for information about ICCP failure scenarios.

The following sections provide an overview of the terms and features associated with MC-LAG:

---

### Active-Active Mode

In active-active mode, all member links are active on the MC-LAG. In this mode, MAC addresses learned on one MC-LAG peer are propagated to the other MC-LAG peer. Active-active mode is the only mode supported at this time.

### ICCP and ICL-PL

ICCP replicates control traffic and forwarding states across the MC-LAG peers and communicates the operational state of the MC-LAG members. Because ICCP uses TCP/IP to communicate between the peers, the two peers must be connected to each other. ICCP messages exchange MC-LAG configuration parameters and ensure that both peers use the correct LACP parameters.

The interchassis link-protection link (ICL-PL) provides redundancy when a link failure (for example, an MC-LAG trunk failure) occurs on one of the active links. The ICL-PL can be either a 10-Gigabit Ethernet interface or an aggregated Ethernet interface. You can configure only one ICL-PL between the two peers, although you can configure multiple MC-LAGs between them.

### Failure Handling

Configuring ICCP adjacency over aggregated links mitigates the possibility of a split-brain state. A split brain state occurs when the ICL-PL configured between the MC-LAG peers goes down. To work around this problem, enable backup liveness detection. With backup liveness enabled, the MC-LAG peers can communicate through the keepalive link.

During a split-brain state, the standby peer brings down local members in the MC-LAG links by changing the LACP system ID. When the ICCP connection is active, both of the MC-LAG peers use the configured LACP system ID. If the LACP system ID is changed during failures, the server that is connected over the MC-LAG removes these links from the aggregated Ethernet bundle.

When the ICL-PL is operationally down and the ICCP connection is active, the LACP state of the links with status control configured as standby is set to the standby state. When the LACP state of the links is changed to standby, the server that is connected over the MC-LAG makes these links inactive and does not use them for sending data.

[Table 222 on page 2413](#) describes the different ICCP failure scenarios. The dash means that the item is not applicable.

**Table 222: ICCP Failure Scenarios**

ICCP Connection Status	ICL-PL Status	Backup Liveness Peer Status	Action on Multichassis Aggregated Ethernet (MC-AE) Interface with Status Set to Standby
Down	Down or Up	Not configured	LACP system ID is changed to default value.
Down	Down or Up	Active	LACP system ID is changed to default value.
Down	Down or Up	Inactive	No change in LACP system ID.
Up	Down	–	LACP state is set to standby. MUX state moves to waiting state.

Split-brain states bring down the MC-LAG link completely if the primary peer members are also down for other reasons. Recovery from the split-brain state occurs automatically when the ICCP adjacency comes up between the MC-LAG peers.

### Multichassis Link Protection

---

Multichassis link protection provides link protection between the two MC-LAG peers hosting an MC-LAG. If the ICCP connection is up and the ICL-PL comes up, the peer configured as standby brings up the multichassis aggregated Ethernet (MC-AE) interfaces shared with the peer. Multichassis protection must be configured on each MC-LAG peer that is hosting an MC-LAG.

### MC-LAG Packet Forwarding

---

To prevent the server from receiving multiple copies from both of the MC-LAG peers, a block mask is used to prevent forwarding of traffic received on the ICL-PL toward the MC-AE interface. Preventing forwarding of traffic received on the ICL-PL interface toward the MC-AE interface ensures that traffic received on MC-LAG links is not forwarded back to the same link on the other peer. The forwarding block mask for a given MC-LAG link is cleared if all of the local members of the MC-LAG link go down on the peer. To achieve faster convergence, if all local members of the MC-LAG link are down, outbound traffic on the MC-LAG is redirected to the ICL-PL interface on the data plane.

### Layer 3 Routing

---

To provide Layer 3 routing functions to downstream clients, configure the same gateway address on both MC-LAG network peers. To upstream routers, the MC-LAG network peers could be viewed as either equal-cost multipath (ECMP) or two routes with different preference values.

Junos OS supports active-active MC-LAGs by using Virtual Router Redundancy Protocol (VRRP) over routed VLAN interfaces (RVIs). Junos OS also supports active-active MC-LAGs by using RVI MAC address synchronization. You must configure the RVI using the same IP address across MC-LAG peers.

### Spanning Tree Protocol (STP) Guidelines

---

- Enable STP globally.

STP might detect local miswiring loops within the peer or across MC-LAG peers.

STP might not detect network loops introduced by MC-LAG peers.

- Disable STP on ICL-PL links; otherwise, it might block ICL-PL ports and disable protection.
- Do not enable bridge protocol data unit (BPDU) block on interfaces connected to aggregation switches.

For more information about BPDU block, see [“Understanding BPDU Protection for STP, RSTP, and MSTP” on page 1558](#).

## MC-LAG Upgrade Guidelines

Upgrade the MC-LAG peers according to the following guidelines. See “[Upgrading Software](#)” on page 134 for exact details about how to perform a software upgrade.

**NOTE:** After a reboot, the MC-AE interfaces come up immediately and might start receiving packets from the server. If routing protocols are enabled, and the routing adjacencies have not been formed, packets might be dropped.

To prevent this scenario, issue the `set interfaces interface-name aggregated-ether-options mc-ae init-delay-time time` to set a time by which the routing adjacencies are formed.

1. Make sure that both of the MC-LAG peers (node1 and node2) are in the active-active state using the following command on any one of the MC-LAG peers:

```
user@switch> show interfaces mc-ae id 1
Member Link           : ae0
Current State Machine's State: mcae active state
Local Status          : active<<<<<<<<
Local State           : up
Peer Status           : active<<<<<<<<
Peer State            : up
  Logical Interface    : ae0.0
  Topology Type        : bridge
  Local State          : up
  Peer State           : up
  Peer Ip/MCP/State    : 20.1.1.2 ae2.0 up
```

2. Upgrade node1 of the MC-LAG.

When node1 is upgraded it is rebooted, and all traffic is sent across the available LAG interfaces of node2, which is still up. The amount of traffic lost depends on how quickly the neighbor devices detect the link loss and rehash the flows of the LAG.

3. Verify that node1 is running the software you just installed. Issue the `show version` command.
4. Make sure that both nodes of the MC-LAG (node1 and node2) are in the active-active state after the reboot of node1.
5. Upgrade node2 of the MC-LAG.

Repeat step 1 through step 3 to upgrade node2.

## Layer 2 Unicast Features Supported

The following Layer 2 unicast features are supported:

- L2 unicast: learning and aging

- Learned MAC addresses are propagated across MC-LAG peers for all of the VLANs that are spawned across the peers.
- Aging of MAC addresses occurs when the MAC address is not seen on both of the peers.
- MAC learning is disabled on the ICL-PL automatically.
- MAC addresses learned on single-homed links are propagated across all of the VLANs that have MC-LAG links as members.

---

## Layer 2 Multicast Features Supported

The following Layer 2 multicast features are supported:

- L2 multicast: unknown unicast and IGMP snooping
  - Flooding happens on all links across peers if both peers have virtual LAN membership. Only one of the peers forwards traffic on a given MC-LAG link.
  - Known and unknown multicast packets are forwarded across the peers by adding the ICL-PL port as a multicast router port.
  - IGMP membership learned on MC-LAG links is propagated across peers.
  - During an MC-LAG peer reboot, known multicast traffic is flooded until the IGMP snooping state is synced with the peer.

---

## IGMP Snooping on an Active-Active MC-LAG

IGMP snooping controls multicast traffic in a switched network. When IGMP snooping is not enabled, the Layer 2 device broadcasts multicast traffic out of all of its ports, even if the hosts on the network do not want the multicast traffic. With IGMP snooping enabled, a Layer 2 device monitors the IGMP join and leave messages sent from each connected host to a multicast router. This enables the Layer 2 device to keep track of the multicast groups and associated member ports. The Layer 2 device uses this information to make intelligent decisions and to forward multicast traffic to only the intended destination hosts. IGMP uses Protocol Independent Multicast (PIM) to route the multicast traffic. PIM uses distribution trees to determine which traffic is forwarded.

In an active-active MC-LAG configuration, IGMP snooping replicates the Layer 2 multicast routes so that each MC-LAG peer has the same routes. If a device is connected to an MC-LAG peer by way of a single-homed interface, IGMP snooping replicates join message to its IGMP snooping peer. If a multicast source is connected to an MC-LAG by way of a Layer 3 device, the Layer 3 device passes this information to the RVI that is configured on the MC-LAG. The first hop DR is responsible for sending the register and register-stop messages for the multicast group. The last hop DR is responsible for sending PIM join and leave messages toward the rendezvous point and source for the multicast group. The routing device with the smallest preference metric forwards traffic on transit LANs.

Configure the ICL-PL interface as a router-facing interface. For the scenario in which traffic arrives by way of a Layer 3 interface, PIM and IGMP must be enabled on the RVI interface configured on the MC-LAG peers.

---

### Layer 3 Unicast Features Supported

---

The following Layer 3 unicast features are supported:

- VRRP active-standby support enables Layer 3 routing over MC-AE interfaces.
- Routed VLAN interface (RVI) MAC address synchronization enables MC-LAG peers to forward Layer 3 packets arriving on MC-AE interfaces with either its own RVI MAC address or its peer's RVI MAC address.
- Address Resolution Protocol (ARP) synchronization enables ARP resolution on both of the MC-LAG peers.
- DHCP Relay with option 82 enables option 82 on the MC-LAG peers. Option 82 provides information about the network location of DHCP clients. The DHCP server uses this information to implement IP addresses or other parameters for the client.

---

### VRRP Active-Standby Support

---

VRRP in active-standby mode enables Layer 3 routing over the MC-AE interfaces on the MC-LAG peers. In this mode, the MC-LAG peers act as virtual routers. The virtual routers share the virtual IP address that corresponds to the default route configured on the host or server connected to the MC-LAG. This virtual IP address, known as a routed VLAN interface (RVI), maps to either of the VRRP MAC addresses or the logical interfaces of the MC-LAG peers. The host or server uses the VRRP MAC address to send any Layer 3 upstream packets. At any time, one of the VRRP routers is the master (active), and the other is a backup (standby). Both VRRP active and VRRP backup routers forward Layer 3 traffic arriving on the MC-AE interface. If the master router fails, all the traffic shifts to the MC-AE link on the backup router.

**NOTE:** You must configure VRRP on both MC-LAG peers in order for both the active and standby members to accept and route packets. Additionally, configure the VRRP backup router to send and receive ARP requests.

Routing protocols run on the primary IP address of the RVI, and both of the MC-LAG peers run routing protocols independently. The routing protocols use the primary IP address of the RVI and the RVI MAC address to communicate with the MC-LAG peers. The RVI MAC address of each MC-LAG peer is replicated on the other MC-LAG peer and is installed as a MAC address that has been learned on the ICL-PL.

---

### Routed VLAN Interface (RVI) MAC Address Synchronization

---

Routed VLAN interface (RVI) MAC address synchronization enables MC-LAG peers to forward Layer 3 packets arriving on MC-AE interfaces with either its own RVI MAC address or its peer's RVI MAC address. Each MC-LAG peer installs its own RVI MAC address as well as the peer's RVI MAC address in the hardware. Each MC-LAG peer treats the packet as if it were its own packet. If RVI MAC address synchronization is not enabled, the RVI MAC address is installed on the MC-LAG peer as if it was learned on the ICL-PL.

**NOTE:** If you need routing capability, configure both VRRP and routing protocols on each MC-LAG peer.

Control packets destined for a particular MC-LAG peer that arrive on an MC-AE interface of its MC-LAG peer are not forwarded on the ICL-PL interface. Additionally, using the gateway IP address as a source address when you issue either a ping, traceroute, telnet, or FTP request is not supported.

To enable RVI MAC address synchronization, issue the **set vlan *vlan-name* l3\_interface *rvi-name* mcae-mac-synchronize** on each MC-LAG peer. Configure the same IP address on both MC-LAG peers. This IP address is used as the default gateway for the MC-LAG servers or hosts.

### Address Resolution Protocol (ARP)

---

Address Resolution Protocol (ARP) maps IP addresses to MAC addresses. Without synchronization, if one MC-LAG peer sends an ARP request, and the other MC-LAG peer receives the response, ARP resolution is not successful. With synchronization, the MC-LAG peers synchronize the ARP resolutions by sniffing the packet at the MC-LAG peer receiving the ARP response and replicating this to the other MC-LAG peer. This ensures that the entries in ARP tables on the MC-LAG peers are consistent.

When one of the MC-LAG peers restarts, the ARP destinations on its MC-LAG peer are synchronized. Because the ARP destinations are already resolved, its MC-LAG peer can forward Layer 3 packets out of the MC-AE interface.

**NOTE:** For integrated routing and bridging (IRB) interfaces, static ARP configuration is required on the MC-LAG IRB peer for any routing protocol to come up over that IRB interface.

### DHCP Relay with Option 82

---

DHCP relay with option 82 provides information about the network location of DHCP clients. The DHCP server uses this information to implement IP addresses or other parameters for the client. With DHCP relay enabled, DHCP request packets might take the path to the DHCP server through either of the MC-LAG peers. Because the MC-LAG peers have different host names, chassis MAC addresses, and interface names, you need to observe these requirements when you configure DHCP relay with option 82:

- Use the interface description instead of the interface name.
- Do not use the hostname as part of the circuit ID or remote ID strings.
- Do not use the chassis MAC address as part of the remote ID string.
- Do not enable the vendor ID.
- If the ICL-PL interface receives DHCP request packets, the packets are dropped to avoid duplicate packets in the network.

A counter called *Due to received on ICL interface* has been added to the **show helper statistics** command, which tracks the packets that the ICL-PL interface drops.

An example of the CLI output follows:

```
user@switch> show helper statistics
BOOTP:
  Received packets: 6
  Forwarded packets: 0
  Dropped packets: 6
    Due to no interface in DHCP Relay database: 0
    Due to no matching routing instance: 0
    Due to an error during packet read: 0
    Due to an error during packet send: 0
    Due to invalid server address: 0
    Due to no valid local address: 0
    Due to no route to server/client: 0
    Due to received on ICL interface: 6
```

The output shows that six packets received on the ICL-PL interface have been dropped.

### Private VLAN (PVLAN)

Private VLANs allow you to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a VLAN inside of a VLAN. A PVLAN can span multiple peers on an MC-LAG.

When configuring a PVLAN, you must configure the ICL-PL interface as the PVLAN trunk interface for the PVLAN. This is essential for traffic to be switched to the required primary and secondary ports of the PVLAN across the MC-LAG peers.

### Layer 3 Multicast

- [PIM Operation With Normal Mode DR Election on page 2419](#)
- [PIM Operation with Dual-DR Mode on page 2420](#)
- [Configuration Guidelines and Caveats on page 2420](#)

Protocol Independent Multicast (PIM) and Internet Group Management Protocol (IGMP) provide support for Layer 3 multicast. In addition to the standard mode of PIM operation, there is a special mode called PIM dual DR (designated router). PIM dual DR minimizes traffic loss in case of failures.

#### ***PIM Operation With Normal Mode DR Election***

In normal mode DR election, the RVI interfaces on both of the MC-LAG peers are configured with PIM enabled. In this mode, one of the MC-LAG peers becomes the DR through the PIM DR election mechanism. The elected DR maintains the rendezvous-point tree (RPT) and shortest-path tree (SPT) so it can receive data from the source device. The elected DR participates in periodic PIM join and prune activities toward the rendezvous point (RP) or the source.

The trigger for initiating these join and prune activities is the IGMP membership reports that are received from interested receivers. IGMP reports received over MC-AE interfaces (potentially hashing on either of the MC-LAG peers) and single-homed links are synchronized to the MC-LAG peer through ICCP.

Both MC-LAG peers receive traffic on their incoming interface (IIF). The non-DR receives traffic by way of the ICL-PL interface, which acts as a multicast router (mrouter) interface.

If the DR fails, the non-DR has to build the entire forwarding tree (RPT and SPT), which can cause multicast traffic loss.

#### ***PIM Operation with Dual-DR Mode***

In this mode, both of MC-LAG peers act as DRs (active and backup) and send periodic join and prune messages upstream towards the RP, or source, and eventually join the RPT or SPT.

The primary MC-LAG peer forwards the multicast traffic to the receiver devices even if the standby MC-LAG peer has a smaller preference metric.

The standby MC-LAG peer also joins the forwarding tree and receives the multicast data. The standby MC-LAG peer drops the data because it has an empty outgoing interface list (OIL). When the standby MC-LAG peer detects the primary MC-LAG peer failure, it adds the receiver VLAN to the OIL, and starts to forward the multicast traffic

To enable a multicast dual DR, issue the **set protocols pim interface interface-name dual-dr** command on the VLAN interfaces of each MC-LAG peer.

#### ***Configuration Guidelines and Caveats***

- Configure the IP address on the active MC-LAG peer with a high IP address or a high DR priority. To ensure that the active MC-LAG peer retains the DR membership designation if PIM neighborship with the peer goes down.
- Using Bidirectional Forwarding Detection (BFD) and RVI MAC synchronization together is not supported because ARP fails.
- When using RVI MAC synchronization, make sure that you configure the primary IP address on both MC-LAG peers. Doing this ensures that both MC-LAG peers cannot become assert winners.
- The number of BFD sessions on RVIs with PIM enabled is restricted to 100. Also, if you have more than 100 RVIs configured, do not configure BFD, and make sure that the hello interval is 2 seconds.

## Understanding Port Ranges and System Modes

QFX Series devices and EX4600 switches can support different port ranges depending on the device, media type of the interface, the software that is running on the device, and the system mode.

This topic describes:

- [Port Ranges for Different Media Types on page 2421](#)
- [Supported System Modes on page 2444](#)

### Port Ranges for Different Media Types

The following media types support the following port ranges:

- On a QFX3500 device:
  - The valid port range for a Fibre Channel (fc) interface is **0** through **5** and **42** through **47** on PIC **0**, with a total of 12 available Fibre Channel ports.

**NOTE:** Fibre Channel ports are not supported on QFX3500, QFX3600, and QFX5100 switches running Enhanced Layer 2 software.

- The valid port range for a Gigabit Ethernet (ge) interface is **6** through **41** on PIC **0** because the ports between **0** and **5** and **42** and **47** are reserved as Fibre Channel ports. The total number of available Gigabit Ethernet ports is 36, because 12 of the remaining 48 ports are reserved for Fibre Channel and 10-Gigabit Ethernet interfaces. Fibre Channel ports cannot be configured as Gigabit Ethernet ports.
- The valid port range for a 10-Gigabit Ethernet (xe) interface is **0** through **47** on PIC **0**. The valid port range for a 10-Gigabit Ethernet (xe) interface is **0** through **15** on PIC **1**. The total number of available 10-Gigabit Ethernet ports is 64.
- The valid port range for a 40-Gigabit data plane uplink interface is **0** through **3** on PIC **1**
- The valid port range for a 40-Gigabit Ethernet interface is **0** through **3** on PIC **2**. There are four available ports.
- On a QFX3600 Node device:
  - The valid port range for a 10-Gigabit Ethernet interface is **8** through **63** on PIC **0**. There are 56 available ports.
  - The valid port range for a 40-Gigabit Ethernet interface is **2** through **15** on PIC **1**. There are 14 available ports.
  - The valid port range for a 40-Gigabit data plane uplink interface is **0** through **7** on PIC **1**. There are eight available ports.

See [Table 225 on page 2430](#) for physical port to logical port mappings.

- On a QFX3600 switch running Enhanced Layer 2 Software:

- The valid port range for a 10-Gigabit Ethernet interface is **0** through **63** on PIC **0**. There are 64 available ports.
- The valid port range for a 40-Gigabit Ethernet interface is **0** through **15** on PIC **0**. There are 16 available ports.

See [Table 226 on page 2433](#) for physical port to logical port mappings.

- On QFX5100-48S and QFX5100-48T switches running Enhanced Layer 2 Software:
  - The valid port range for a 10-Gigabit Ethernet interface is **0** through **47** on PIC **0**. There are 48 available ports. When you channelize the 6 40-Gbps QSFP+ ports on **0** through **5** on PIC **1**, there are 72 available ports.

**NOTE:** On PIC 1, ports 0 and 1 are reserved for fte ports. You cannot convert these fte ports to xe or xle ports.

- The valid port range for a 40-Gbps QSFP+ port is **0** through **5** on PIC **1**. There are six available ports.

See [Table 228 on page 2438](#) for physical port to logical port mappings.

- On EX4600 switches running Enhanced Layer 2 Software:
  - The valid port range for a 10-Gigabit Ethernet interface is **0** through **23** on PIC **0**. There are 24 available ports. When you channelize the 4 40-Gbps QSFP+ ports on **24** through **27** on PIC **0**. There are 40 available ports.

See [Table 228 on page 2438](#) for physical port to logical port mappings.

- On QFX5100-48S and QFX5100-48T switches running a QFabric software package:
  - The valid port range for a 10-Gigabit Ethernet interface is **0** through **47** on PIC **0**. There are 48 available ports.
  - The valid port range for a 40-Gbps QSFP+ port is **0** through **5** on PIC **1**. There are six available ports.

**NOTE:** On PIC 1, ports 0 and 1 are reserved for fte ports. You cannot convert these fte ports to xe or xle ports.

See [Table 229 on page 2441](#) for physical port to logical port mappings.

- For QFX5100-24Q and QFX5100-96S switches running Enhanced Layer 2 Software, see [Table 230 on page 2445](#) for physical port to logical port mappings for different system modes.

Table 223: Valid Port Ranges on QFX3500 Switches Running QFabric Software Package

Port Number	Fibre Channel Interfaces (On PIC 0)	Gigabit Ethernet Interfaces (On PIC 0)	10-Gigabit Ethernet Interfaces (On PIC 0 and 1)	40-Gigabit Data Plane Uplink Interfaces (On PIC 1)	40-Gigabit Ethernet Interfaces (On PIC 2)
0	fc-0/0/0	Not supported on this port	xe-0/0/0	Not supported on this port	Not supported on this port
1	fc-0/0/1	Not supported on this port	xe-0/0/1	Not supported on this port	Not supported on this port
2	fc-0/0/2	Not supported on this port	xe-0/0/2	Not supported on this port	Not supported on this port
3	fc-0/0/3	Not supported on this port	xe-0/0/3	Not supported on this port	Not supported on this port
4	fc-0/0/4	Not supported on this port	xe-0/0/4	Not supported on this port	Not supported on this port

### Supported System Modes

*NOTE:* There are restrictions on the ports you can channelize on the QFX5100-24Q and QFX5100-96S switches depending on the system mode you configure. If you try to channelize ports that are restricted, the configuration is ignored.

The following system modes are available on the QFX5100-24Q switch:

- Default mode
- Mode-104-port
- Flexi-PIC mode
- Non-oversubscribed mode

See [Table 230 on page 2445](#) for more information regarding the supported system modes for your switch.

The following system modes are available on the QFX5100-96S switch:

- Default-mode
- Non-oversubscribed mode

See [Table 230 on page 2445](#) for more information regarding the supported system modes for your switch.

**Table 230: System Modes Supported on QFX5100 Switches Running Enhanced Layer 2 Software**

	Default-mode	Mode-104port	Flexi-pic-mode	Non-oversubscribed-mode
QFX5100-48S and QFX5100-48T	Not supported	Not supported	Not supported	Not supported
QFX5100-24Q	Supported  You do not need to configure the switch to be in this mode. On PIC 0, you can channelize all 24 40-Gbps QSFP+ ports. On PIC 1 and PIC 2, the 40-Gbps QSFP+ ports in the expansion modules are supported but cannot be channelized. In this mode, you can have one of two port combinations: 32 40-Gbps QSFP+ ports, or 96 10-Gigabit Ethernet ports plus 8 40-Gbps QSFP+ ports.	Supported  On PIC 0, all 24 40-Gbps QSFP+ ports are channelized by default, which provides 96 10-Gigabit Ethernet ports. 40-Gbps QSFP+ ports contained in an expansion module on PIC 1 are supported. On PIC 1, ports 0 and 2 are channelized by default, and ports 1 and 3 are disabled. If 40-Gbps QSFP+ ports contained in an expansion module are detected on PIC 2, they are ignored.	Supported  On PIC 0, the first four ports (ports 0 through 3) cannot be channelized. 40-Gbps QSFP+ ports contained in expansion modules on PIC 1 and PIC 2 are supported but cannot be channelized.	Supported  All 24 40-Gbps QSFP+ ports on PIC 0 can be channelized to 96 10-Gigabit Ethernet ports. 40-Gbps QSFP+ ports contained in the expansion modules on PIC 1 and PIC 2 are not supported and cannot be channelized. There is no packet loss for packets of any size in this mode.

**Table 230: System Modes Supported on QFX5100 Switches Running Enhanced Layer 2 Software (*continued*)**

	Default-mode	Mode-104port	Flexi-pic-mode	Non-oversubscribed-mode
QFX5100-96S	Supported  You do not need to configure the switch to be in this mode. On PIC 0, all 96 10-Gigabit Ethernet ports are supported. You can only channelize the 40-Gbps QSFP+ interfaces to 10-Gigabit Ethernet interfaces on ports 96 and 100. When you channelize the interfaces on ports 96 and 100, ports 97, 98, 99, 101, 102 and 103 are disabled.	Not supported	Not supported	Supported  On PIC 0, all 96 10-Gigabit Ethernet ports are supported. However, the eight 40-Gbps QSFP+ ports are not supported and cannot be channelized. There is no packet loss for packets of any size in this mode.

## Understanding Redundant Trunk Links

In a typical enterprise network composed of distribution and access layers, a redundant trunk link provides a simple solution for network recovery when a trunk port on a switch goes down. In that case, traffic is routed to another trunk port, keeping network convergence time to a minimum.

To configure a redundant trunk link, create a redundant trunk group. The redundant trunk group is configured on the access switch and contains two links: a primary or active link, and a secondary link. If the active link fails, the secondary link automatically starts forwarding data traffic without waiting for normal spanning-tree protocol convergence.

Data traffic is forwarded only on the active link. Data traffic on the secondary link is dropped and shown as dropped packets when you issue the operational mode command **show interfaces *interface-name* extensive**.

While data traffic is blocked on the secondary link, Layer 2 control traffic is still permitted. For example, an LLDP session can be run between two switches on the secondary link.

Rapid Spanning Tree Protocol (RSTP) is enabled by default on the switches to create a loop-free topology, but an interface is not allowed to be in both a redundant trunk group and in a spanning-tree protocol topology at the same time. You must disable RSTP on an interface if a redundant trunk group is configured on that interface. For example, in [Figure 48 on page 2448](#), in addition to disabling RSTP on the Switch 3 interfaces, you must also disable RSTP on the Switch 1 and Switch 2 interfaces connected to Switch 3. Spanning-tree protocols can, however, continue operating on other interfaces on those switches—for example on the link between Switch 1 and Switch 2.

[Figure 48 on page 2448](#) shows three switches in a basic topology for redundant trunk links. Switch 1 and Switch 2 make up the distribution layer, and Switch 3 makes up the access layer. Switch 3 is connected to the distribution layer through trunk ports ge-0/0/9.0 (Link 1) and ge-0/0/10.0 (Link 2). Link 1 and Link 2 are in a redundant trunk group called group1. Link 1 is designated as the primary link. Traffic flows between Switch 3 in the access layer and Switch 1 in the distribution layer through Link 1. While Link 1 is active, Link 2 blocks traffic.

Figure 48: Redundant Trunk Group, Link 1 Active

Figure 49 on page 2448 illustrates how the redundant trunk link topology works when the primary link goes down.

Figure 49: Redundant Trunk Group, Link 2 Active

When Link 1 between Switch 1 and Switch 3 goes down, Link 2 takes over as the active link. Traffic between the access layer and the distribution layer is then automatically switched to Link 2 between Switch 1 and Switch 2.

## Understanding Generic Routing Encapsulation

Generic routing encapsulation (GRE) provides a private, secure path for transporting packets through an otherwise public network by encapsulating (or tunneling) the packets.

This topic describes:

- [Overview of GRE on page 2449](#)
- [GRE Tunneling on page 2449](#)
- [Using a Firewall Filter to De-encapsulate GRE Traffic on a QFX5100 Switch on page 2451](#)
- [Configuration Limitations on page 2452](#)

### Overview of GRE

GRE encapsulates data packets and redirects them to a device that de-encapsulates them and routes them to their final destination. This allows the source and destination switches to operate as if they have a virtual point-to-point connection with each other (because the outer header applied by GRE is transparent to the encapsulated payload packet). For example, GRE tunnels allow routing protocols such as RIP and OSPF to forward data packets from one switch to another switch across the Internet. In addition, GRE tunnels can encapsulate multicast data streams for transmission over the Internet.

GRE is described in RFC 2784 (obsoletes earlier RFCs 1701 and 1702). The switches support RFC 2784, but not completely. (For a list of limitations, see [“Configuration Limitations” on page 2452.](#))

As a *tunnel source router*, the switch encapsulates a payload packet for transport through the tunnel to a destination network. The payload packet is first encapsulated in a GRE packet, and then the GRE packet is encapsulated in a delivery protocol. The switch performing the role of a *tunnel remote router* extracts the tunneled packet and forwards the packet to its destination. Note that you can use one firewall term to terminate many GRE tunnels on a QFX5100 switch.

### GRE Tunneling

Data is routed by the system to the GRE endpoint over routes established in the route table. (These routes can be statically configured or dynamically learned by routing protocols such as RIP or OSPF.) When a data packet is received by the GRE endpoint, it is de-encapsulated and routed again to its destination address.

GRE tunnels are *stateless*—that is, the endpoint of the tunnel contains no information about the state or availability of the remote tunnel endpoint. Therefore, the switch

operating as a tunnel source router cannot change the state of the GRE tunnel interface to down if the remote endpoint is unreachable.

For details about GRE tunneling, see:

- [Encapsulation and De-Encapsulation on the Switch on page 2450](#)
- [Number of Source and Destination Tunnels Allowed on a Switch on page 2450](#)
- [Class of Service on GRE Tunnels on page 2450](#)
- [Applying Firewall Filters to GRE Traffic on page 2451](#)

### ***Encapsulation and De-Encapsulation on the Switch***

Encapsulation—A switch operating as a tunnel source router encapsulates and forwards GRE packets as follows:

1. When a switch receives a data packet (payload) to be tunneled, it sends the packet to the tunnel interface.
2. The tunnel interface encapsulates the data in a GRE packet and adds an outer IP header.
3. The IP packet is forwarded on the basis of the destination address in the outer IP header.

De-encapsulation—A switch operating as a tunnel remote router handles GRE packets as follows:

1. When the destination switch receives the IP packet from the tunnel interface, the outer IP header and GRE header are removed.
2. The packet is routed based on the inner IP header.

### ***Number of Source and Destination Tunnels Allowed on a Switch***

QFX5100 switches support as many as 512 GRE tunnels, including tunnels created with a firewall filter. That is, you can create a total of 512 GRE tunnels, regardless of which method you use.

EX switches support as many as 500 GRE tunnels between switches transmitting IPv4 or IPv6 payload packets over GRE. If a passenger protocol in addition to IPv4 and IPv6 is used, you can configure up to 333 GRE tunnels between the switches.

An EX switch can have a maximum of 20 tunnel source IP addresses configured, and each tunnel source IP can be configured with up to 20 destination IP addresses on a second switch. As a result, the two connected switches can have a maximum of 400 GRE tunnels. If the first switch is also connected to a third switch, the possible maximum number of tunnels is 500.

### ***Class of Service on GRE Tunnels***

When a network experiences congestion and delay, some packets might be dropped. Junos OS class of service (CoS) divides traffic into classes to which you can apply different levels of throughput and packet loss when congestion occurs and thereby set rules for packet loss. For details about CoS, see [Junos OS CoS for EX Series Switches Overview](#).

The following CoS components are available on a switch operating as a GRE tunnel source router or GRE tunnel remote router:

- At the GRE tunnel source—On a switch operating as a tunnel source router, you can apply CoS classifiers on an *ingress port* or on a *GRE port*, with the following results on CoS component support on tunneled packets:
  - Schedulers only—Based on the CoS classification on the ingress port, you can apply CoS schedulers on a GRE port of the switch to define output queues and control the transmission of packets through the tunnel after GRE encapsulation. However, you cannot apply CoS rewrite rules to these packets.
  - Schedulers and rewrite rules—Depending on the CoS classification on the GRE port, you can apply both schedulers and rewrite rules to the encapsulated packets transmitted through the tunnel.
- At the GRE tunnel endpoint—When the switch is a tunnel remote router, you can apply CoS classifiers on the GRE port and schedulers and rewrite rules on the egress port to control the transmission of a de-encapsulated GRE packet out from the egress port.

#### ***Applying Firewall Filters to GRE Traffic***

Firewall filters provide rules that define whether to permit, deny, or forward packets that are transiting an interface on a switch. (For details, see [Firewall Filters for EX Series Switches Overview](#).) Because of the encapsulation and de-encapsulation performed by GRE, you are constrained as to where you can apply a firewall filter to filter tunneled packets and which header will be affected. [Table 231 on page 2451](#) identifies these constraints.

**Table 231: Firewall Filter Application Points for Tunneled Packets**

Endpoint Type	Ingress Interface	Egress Interface
Source (encapsulating)	inner header	outer header
Remote (de-encapsulating)	Cannot filter packets on ingress interface	inner header

#### **Using a Firewall Filter to De-encapsulate GRE Traffic on a QFX5100 Switch**

You can also use a firewall filter to de-encapsulate GRE traffic on a QFX5100 switch. This feature provides significant benefits in terms of scalability, performance, and flexibility because you don't need to create a tunnel interface to perform the de-encapsulation. For example, you can terminate many tunnels from multiple source IP addresses with one firewall term. See [“Configuring a Firewall Filter to De-encapsulate GRE Traffic on a QFX5100 Switch” on page 5301](#) for information about how to configure a firewall filter for this purpose.

## Configuration Limitations

Table 232 on page 2452 lists features that are not supported with GRE.

**Table 232: Features Not Supported with GRE**

EX Switches	QFX Switches
MPLS over GRE tunnels	MPLS over GRE tunnels
GRE keepalives	GRE keepalives
GRE keys, payload packet fragmentation, and sequence numbers for fragmented packets	GRE keys, payload packet fragmentation, and sequence numbers for fragmented packets
BGP dynamic tunnels	BGP dynamic tunnels
Outer IP address must be IPv4	Outer IP address must be IPv4
Virtual routing instances	
Bidirectional Forwarding Detection (BFD) protocol over GRE distributed mode	
<p>OSPF limitation—Enabling OSPF on a GRE interface creates two equal-cost routes to the destination: one through the Ethernet network or uplink interface and the other through the tunnel interface. If data is routed through the tunnel interface, the tunnel might fail. To keep the interface operational, we recommend that you use a static route, disable OSPF on the tunnel interface, or configure the peer not to advertise the tunnel destination over the tunnel interface.</p>

## Understanding Ethernet OAM Link Fault Management

Juniper Networks Junos operating system (Junos OS) for Juniper Networks switches allows the Ethernet interfaces on these switches to support the IEEE 802.3ah standard for the Operation, Administration, and Maintenance (OAM) of Ethernet in access networks. The standard defines OAM link fault management (LFM). You can configure IEEE 802.3ah OAM LFM on point-to-point Ethernet links that are connected either directly or through Ethernet repeaters. The IEEE 802.3ah standard meets the requirement for OAM capabilities even as Ethernet moves from being solely an enterprise technology to a WAN and access technology, and the standard remains backward-compatible with existing Ethernet technology.

Ethernet OAM provides the tools that network management software and network managers can use to determine how a network of Ethernet links is functioning. Ethernet OAM should:

- Rely only on the media access control (MAC) address or virtual LAN identifier for troubleshooting.
- Work independently of the actual Ethernet transport and function over physical Ethernet ports or a virtual service such as pseudowire.
- Isolate faults over a flat (or single operator) network architecture or nested or hierarchical (or multiprovider) networks.

The following OAM LFM features are supported on switches:

- Discovery and Link Monitoring

The discovery process is triggered automatically when OAM is enabled on the interface. The discovery process permits Ethernet interfaces to discover and monitor the peer on the link if it also supports the IEEE 802.3ah standard. You can specify the discovery mode used for IEEE 802.3ah OAM support. In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality. In passive mode, the peer initiates the discovery process. After the discovery process has been initiated, both sides participate in discovery. The switch performs link monitoring by sending periodic OAM protocol data units (PDUs) to advertise OAM mode, configuration, and capabilities.

You can specify the number of OAM PDUs that an interface can miss before the link between peers is considered down.

- Remote Fault Detection

Remote fault detection uses flags and events. Flags are used to convey the following: Link Fault means a loss of signal, Dying Gasp means an unrecoverable condition such as a power failure, and Critical Event means an unspecified vendor-specific critical event. You can specify the periodic OAM PDU sending interval for fault detection. The EX Series switch uses the Event Notification OAM PDU to notify the remote OAM device when a problem is detected. You can specify the action to be taken by the system when the configured link-fault event occurs.

- Remote Loopback Mode

Remote loopback mode ensures link quality between the switch and a remote peer during installation or troubleshooting. In this mode, when the interface receives a frame that is not an OAM PDU or a pause frame, it sends it back on the same interface on which it was received. The link appears to be in the active state. You can use the returned loopback acknowledgement to test delay, jitter, and throughput.

Junos OS can place a remote DTE into loopback mode (if remote loopback mode is supported by the remote DTE). When you place a remote DTE into loopback mode, the interface receives the remote loopback request and puts the interface into remote loopback mode. When the interface is in remote loopback mode, all frames except OAM PDUs are looped back without any changes made to the frames. OAM PDUs continue to be sent and processed.

## Understanding the Use of Resilient Hashing to Minimize Flow Remapping in Trunk/ECMP Groups

You use resilient hashing to minimize flow remapping across members of a trunk/ECMP group in a load-balanced system. You can configure resilient hashing in link aggregation groups (LAGs) and in equal cost multipath (ECMP) groups.

- [Why You Might Want to Use Resilient Hashing and How It Works with Static Hashing on page 2454](#)
- [Limitations and Caveats for Resilient Hashing on page 2455](#)
- [Resilient Hashing on LAGs on page 2455](#)
- [Resilient Hashing on ECMP on page 2456](#)

### Why You Might Want to Use Resilient Hashing and How It Works with Static Hashing

---

Resilient hashing works in conjunction with the default static hashing algorithm. When members are added to or deleted from a trunk/ECMP group, the static hashing algorithm might remap destination paths. Resilient hashing distributes traffic across all members of a group by tracking the flow's member utilization. When a flow is affected by a member change, the Packet Forwarding Engine rebalances the flow by reprogramming the flow set table.

Resilient hashing thus provides the following benefits:

- Minimizes traffic-distribution imbalances among members of a trunk/ECMP group when members are added to or deleted from the group.
- Minimizes the impact on flows bound to unaffected members when a new member is added or an existing member is deleted from the group.

In normal hash-based load balancing, with the static hashing algorithm used alone, flows are assigned to members through the mathematical mod (%) operation. Any increase or decrease in the number of group members results in a complete remapping of flows to member IDs, as shown in the following example:

- Member ID = Hash (key) mod (number of members in group)
- Example:
  - Hash (key) = 10
  - $10 \bmod 5 = 0$  (member with ID 0 is selected for flow)
  - $10 \bmod 4 = 2$  (member with ID 2 is selected for the same flow when the number of members is decreased by 1)

Resilient hashing minimizes the destination path remapping when a member in the trunk/ECMP group is added or deleted.

When the flow is affected by a member change in the group, resilient hashing rebalances the flow by reprogramming the flow set table.

**Table 233: Destination Path Results for Static Hashing and for Resilient Hashing When Members Are Added to or Deleted from Trunk Groups**

Trunk Group Size	Normal (Static) Hashing Result	Resilient Hashing Result	Notes
4	Hash(10) % 4 = 2 Flow is assigned to member ID 2.	Flow is assigned to one of four group members based on flow set table entries.	Original trunk/ECMP group size is 4.
3	Hash(10) % 3 = 1 Flow is assigned to member ID 1.	Flow is assigned to same member as in the previous case.	Delete one member from original trunk/ECMP group. Trunk/ECMP group size is 3.
5	Hash(10) % 5 = 0 Flow is assigned to member ID 0.	There is minimal redistribution of flows from other members to this newly added member.	Add one member to original trunk group. Trunk/ECMP group size is 5.

### Limitations and Caveats for Resilient Hashing

Notice the following limitation and caveats for the resilient hashing feature:

- Resilient hashing applies only to unicast traffic.
- Resilient hashing supports a maximum of 1024 trunk groups, with each group having a maximum of 256 members.
- Resilient hashing does not guarantee that traffic distribution is even across all group members—it depends on the traffic pattern and on the organization of the resilient hashing flow set table in hardware. Resilient hashing *minimizes* remapping of flows to destination links when members are added to or deleted from the group.
- If resilient hashing is enabled on a trunk group or ECMP group and if **set forwarding-options enhanced-hash-key** with one of the options **hash-mode**, **inet**, **inet6**, or **layer2** is used, some flows might change destination links, because the new hash parameters might generate new hash indexes for the flows, and hence the new destination links.
- Resilient hashing is not supported on Virtual Chassis port (VCP) links.

### Resilient Hashing on LAGs

A LAG combines Ethernet interfaces (members) to form a logical point-to-point link that increases bandwidth, provides reliability, and allows load balancing. Resilient hashing minimizes destination remapping behavior when a new member is added or deleted from the LAG.

A resilient hashing configuration on LAGs is per-aggregated-Ethernet-interface-based.

### Resilient Hashing on ECMP

---

An ECMP group for a route contains multiple next-hop equal cost addresses for the same destination in the routing table. (Routes of equal cost have the same preference and metric values.)

Junos OS uses the static hashing algorithm to choose one of the next-hop addresses in the ECMP group to install in the forwarding table. Resilient hashing enhances ECMPs by minimizing destination remapping behavior when a new member is added or deleted from the ECMP group.

A resilient hashing configuration on ECMP is global—it applies to all ECMP groups.

### Example: Configuring Interfaces for Uplink Failure Detection

Uplink failure detection allows a switch to detect link failure on uplink interfaces and to propagate the failure information to the downlink interfaces. All of the network interface cards (NICs) on a server are configured as being either the primary link or the secondary link and share the same IP address. When the primary link goes down, the server transparently shifts the connection to the secondary link to ensure that the traffic on the failed link is not dropped.

This example describes:

- [Requirements on page 2458](#)
- [Overview and Topology on page 2458](#)
- [Configuring Uplink Failure Detection on Both Switches on page 2459](#)
- [Verification on page 2460](#)

---

## Requirements

This example uses the following software and hardware components:

- Junos OS Release 12.1 or later for the QFX Series
- Two QFX3500 switches
- Two aggregation switches
- One dual-homed server

---

## Overview and Topology

The topology in this example illustrates how to configure uplink failure detection on Switch A and Switch B. Switch A and Switch B are both configured with a link-to-monitor interface (the uplink interface to the aggregation switch) and a link-to-disable interface (the downlink interface to the server). For simplicity, only one group of link-to-monitor interfaces and link-to-disable interfaces is configured for each switch. The server is dual-homed to both Switch A and Switch B. In this scenario, if the link-to-monitor interface to Switch A is disabled, the server uses the link-to-monitor interface to Switch B instead.

**NOTE:** This example does not describe how to configure the dual-homed server or the aggregation switches. Please refer to the documentation for each of these devices for more information.

---

[Figure 45 on page 2392](#) illustrates a typical setup for uplink failure detection.

Figure 50: Uplink Failure Detection Configuration on Switches

Table 234 on page 2459 lists uplink failure settings for each QFX3500 switch.

Table 234: Settings for Uplink Failure Protection Example

Switch A	Switch B
<ul style="list-style-type: none"> <li>Group name: Group1</li> <li>Link-to-monitor interface: <b>xe-0/0/0</b></li> <li>Link-to-disable interface: <b>xe-0/0/1</b></li> </ul>	<ul style="list-style-type: none"> <li>Group name: Group2</li> <li>Link-to-monitor interface: <b>xe-0/0/0</b></li> <li>Link-to-disable interface: <b>xe-0/0/1</b></li> </ul>

### Configuring Uplink Failure Detection on Both Switches

To configure uplink failure detection on both switches, perform these tasks:

#### CLI Quick Configuration

To quickly configure uplink failure protection on Switch A and Switch B, copy the following commands and paste them into the switch terminal window:

```
[edit protocols]
set uplink-failure-detection group group1
set uplink-failure-detection group group2
set uplink-failure-detection group group1 link-to-monitor xe-0/0/0
set uplink-failure-detection group group2 link-to-monitor xe-0/0/0
set uplink-failure-detection group group1 link-to-disable xe-0/0/1
set uplink-failure-detection group group2 link-to-disable xe-0/0/1
```

#### Step-by-Step Procedure

To configure uplink failure protection on both switches:

- Specify a name for the uplink failure detection group on Switch A:
 

```
[edit protocols]
user@switch# set uplink-failure-detection group group1
```
- Add an uplink interface to the group on Switch A:
 

```
[edit protocols]
user@switch# set uplink-failure-detection group group1 link-to-monitor xe-0/0/0
```

3. Add a downlink interface to the group on Switch A:  

```
[edit protocols]
user@switch# set uplink-failure-detection group group1 link-to-disable xe-0/0/1
```
4. Specify a name for the uplink failure detection group on Switch B:  

```
[edit protocols]
user@switch# set uplink-failure-detection group group2
```
5. Add an uplink interface to the group on Switch B:  

```
[edit protocols]
user@switch# set uplink-failure-detection group group2 link-to-monitor xe-0/0/0
```
6. Add a downlink interface to the group on Switch B:  

```
[edit protocols]
user@switch# set uplink-failure-detection group group2 link-to-disable xe-0/0/1
```

**Results** Display the results of the configuration:

```
uplink-failure-detection {
  group {
    group1 {
      link-to-monitor {
        xe-0/0/0;
      }
      link-to-disable {
        xe-0/0/1;
      }
    }
    group2 {
      link-to-monitor {
        xe-0/0/0;
      }
      link-to-disable {
        xe-0/0/1;
      }
    }
  }
}
```

---

### Verification

To verify that uplink failure detection is working correctly, perform the following tasks on Switch A and Switch B:

- [Verifying That Uplink Failure Detection is Working Correctly on page 2460](#)

#### ***Verifying That Uplink Failure Detection is Working Correctly***

**Purpose** Verify that the switch disables the downlink interface when it detects an uplink failure.

- Action** 1. View the current uplink failure detection status:

```
user@switch> show uplink-failure-detection
Group                : group1
Uplink               : xe-0/0/0*
Downlink             : xe-0/0/1*
Failure Action       : Inactive
```

**NOTE:** The asterisk (\*) indicates that the link is up.

2. Disable the uplink interface:

```
[edit]
user@switch# set interface xe-0/0/0 disable
```

3. Save the configuration on the switch.

4. View the current uplink failure detection status:

```
user@switch> show uplink-failure-detection
Group                : group1
Uplink               : xe-0/0/0
Downlink             : xe-0/0/1
Failure Action       : Active
```

**Meaning** The output in Step 1 shows that the uplink interface is up, and hence that the downlink interface is also up, and that the status of **Failure Action** is **Inactive**.

The output in Step 4 shows that both the uplink and downlink interfaces are down (there are no asterisks after the interface name) and that the status of **Failure Action** is changed to **Active**. This output shows that uplink failure detection is working.

  - [Verifying That Uplink Failure Detection Is Working Correctly](#)

## Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch

A QFX Series product allows you to combine multiple Ethernet links into one logical interface for higher bandwidth and redundancy. The ports that are combined in this manner are referred to as a link aggregation group (LAG) or bundle. The number of Ethernet links you can combine into a LAG depends on your QFX Series product model. You can configure LAGs to connect a QFX Series product to other switches, like aggregation switches, servers, or routers. This example describes how to configure LAGs to connect a QFX3500, QFX3600, or QFX5100 switch to an aggregation switch.

- [Requirements on page 2462](#)
- [Overview and Topology on page 2462](#)
- [Configuration on page 2463](#)
- [Verification on page 2465](#)
- [Troubleshooting on page 2466](#)

---

### Requirements

This example uses the following software and hardware components:

- Junos OS Release 11.1 or later for the QFX3500 and QFX3600 switches, and Junos OS 13.2 or later for the QFX5100 switch.
- One QFX3500, QFX3600, or QFX5100 switch.

---

### Overview and Topology

In this example, the switch has one LAG comprising two 10-Gigabit Ethernet interfaces. This LAG is configured in port mode trunk so that the switch and the VLAN to which it has been assigned can send and receive traffic.

Configuring the Ethernet interfaces as LAGs has the following advantages:

- If one physical port is lost for any reason (a cable is unplugged or a switch port fails), the logical port transparently continues to function over the remaining physical port.
- Link Aggregation Control Protocol (LACP) can optionally be configured for link monitoring and automatic addition and deletion of individual links without user intervention.

**NOTE:** If the remote end of the LAG link is a security device, LACP might not be supported because security devices require a deterministic configuration. In this case, do not configure LACP. All links in the LAG are permanently operational unless the switch detects a link failure within the Ethernet physical layer or data link layers.

---

The topology used in this example consists of one switch with a LAG configured between two of its 10-Gigabit Ethernet interfaces. The switch is connected to an aggregation switch.

Table 235 on page 2463 details the topology used in this configuration example.

**Table 235: Components of the Topology for Configuring a LAG Between a QFX3500 Switch and Aggregation Switch**

Hostname	Base Hardware	Trunk Port
switch	QFX3500, QFX3600, or QFX5100 switch	ae0 is configured as a trunk port and combines the following two interfaces: xe-0/0/2 and xe-0/0/3 .

### Configuration

To configure a LAG between two 10-Gigabit Ethernet interfaces:

#### CLI Quick Configuration

To quickly configure a LAG between two 10-Gigabit Ethernet interfaces on a switch, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring a LAG on the QFX5100 switch, use the interface-mode statement instead of the port-mode statement. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 43.

```
[edit]
set chassis aggregated-devices ethernet device-count 1
set interfaces ae0 aggregated-ether-options minimum-links 1
set interfaces ae0 aggregated-ether-options link-speed 10g
set interfaces ae0 unit 0 family ethernet-switching vlan members green
set interfaces xe-0/0/2 ether-options 802.ad ae0
set interfaces xe-0/0/3 ether-options 802.ad ae0
set interfaces ae0 unit 0 family ethernet-switching port-mode trunk
set interfaces ae0 aggregated-ether-options lacp active
set interfaces ae0 aggregated-ether-options lacp periodic fast
```

#### Step-by-Step Procedure

To configure a LAG between a QFX Series switch and an aggregation switch:

- Specify the number of LAGs to be created on the switch:  
[edit chassis]  
user@switch# **set aggregated-devices ethernet device-count 1**
- Specify the number of links that need to be present for the ae0 LAG interface to be up:

- ```
[edit interfaces]
user@switch# set ae0 aggregated-ether-options minimum-links 1
```
3. Specify the media speed of the ae0 link:
 

```
[edit interfaces]
user@switch# set ae0 aggregated-ether-options link-speed 10g
```
  4. Specify the members to be included within the aggregated Ethernet bundle:
 

```
[edit interfaces]
user@switch# set interfaces xe-0/0/2 ether-options 802.ad ae0
[edit interfaces]
user@switch# set interfaces xe-0/0/3 ether-options 802.ad ae0
```
  5. Assign a port mode of trunk to the ae0 link:

**NOTE:** If you are configuring a LAG on the QFX5100 switch, use the `interface-mode` statement instead of the `port-mode` statement. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 43](#).

- ```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk
or
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk
```
6. Assign the LAG to a VLAN:
 

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching vlan members green vlan-id 200
```
  7. (Optional): Designate one side of the LAG as active for LACP:
 

```
[edit interfaces]
user@switch# set ae0 aggregated-ether-options lacp active
```
  8. (Optional): Designate the interval and speed at which the interfaces send LACP packets:
 

```
[edit interfaces]
user@switch# set ae0 aggregated-ether-options lacp periodic fast
```

## Results

Display the results of the configuration on a QFX3500 or QFX3600 switch:

```
[edit]
chassis {
  aggregated-devices {
    ethernet {
      device-count 1;
    }
  }
}
green {
  vlan-id 200;
}
}
interfaces {
```

```

ae0 {
  aggregated-ether-options {
    link-speed 10g;
    minimum-links 1;
  }
  unit 0 {
    family ethernet-switching {
      port-mode trunk;
      vlan {
        members green;
      }
    }
  }
  xe-0/0/2 {
    ether-options {
      802.ad ae0;
    }
  }
  xe-0/0/3 {
    ether-options {
      802.ad ae0;
    }
  }
}

```

### Verification

To verify that switching is operational and one LAG has been created, perform these tasks:

- [Verifying That LAG ae0.0 Has Been Created on page 2465](#)
- [Verifying That LAG ae0 Has Been Created on page 2465](#)

#### *Verifying That LAG ae0.0 Has Been Created*

**Purpose** Verify that LAG ae0.0 has been created on the switch.

**Action** show interfaces ae0 terse

Interface	Admin	Link	Proto	Local	Remote
ae0	up	up			
ae0.0	up	up	eth-switch		

**Meaning** The output confirms that the ae0.0 link is up and shows the **family** and IP address assigned to this link.

#### *Verifying That LAG ae0 Has Been Created*

**Purpose** Verify that LAG ae0 has been created on the switch

**Action** show interfaces ae0 terse

Interface	Admin	Link	Proto	Local	Remote
ae0	up	down			
ae0.0	up	down	eth-switch		

**Meaning** The output shows that the **ae0.0** link is down.

### [Troubleshooting](#)

---

#### *Troubleshooting a LAG That Is Down*

**Problem** The **show interfaces terse** command shows that the LAG is **down**.

**Solution** Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.

**Related  
Documentation**

- [Configuring Link Aggregation on page 2593](#)
- [Verifying the Status of a LAG Interface on page 2750](#)
- [Verifying That LACP Is Configured Correctly and Bundle Members Are Exchanging LACP Protocol Packets on page 2751](#)
- [Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch on page 2466](#)
- [Example: Configuring an FCoE LAG on a Redundant Server Node Group](#)
- [show lacp statistics interfaces \(View\) on page 2875](#)

### **Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch**

QFX Series products allow you to combine multiple Ethernet links into one logical interface for higher bandwidth and redundancy. The ports that are combined in this manner are referred to as a link aggregation group (LAG) or bundle. The number of Ethernet links you can combine into a LAG depends on your QFX Series product model. On a standalone switch, you can group up to 32 Ethernet interfaces to form a LAG. On a QFabric system, you can group up to 8 Ethernet interfaces to form a LAG. QFX Series products allow you to further enhance these links by configuring Link Aggregation Control Protocol (LACP).

This example describes how to overlay LACP on the LAG configurations that were created in [“Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch” on page 2462](#):

- [Requirements on page 2467](#)
- [Overview and Topology on page 2467](#)
- [Configuring LACP for the LAG on the QFX Series on page 2467](#)

- [Verification on page 2468](#)
- [Troubleshooting on page 2469](#)

## Requirements

This example uses the following software and hardware components:

- Junos OS Release 11.1 or later for the QFX3500 switch, Junos OS Release 12.1 or later for the QFX3600 switch, and Junos OS 13.2 or later for the QFX5100 switch.
- One QFX3500, QFX3600, or QFX5100 switch.

Before you configure LACP, be sure you have:

- Configured the ports on the switches as trunk ports.
- Configured the LAG.

## Overview and Topology

The topology in this example is exactly the same as the topology used in the [Configuring a LAG Between a QFX Switch and an Aggregation Switch](#) example. This example shows how to use LACP to enhance the LAG functionality.

LACP exchanges are made between *actors* (the transmitting link) and *partners* (the receiving link). The LACP mode can be either active or passive.

**NOTE:** If the actor and partner are both in passive mode, they do not exchange LACP packets, which results in the aggregated Ethernet links not coming up. By default, LACP is in passive mode. To initiate transmission of LACP packets and responses to LACP packets, you must enable LACP in active mode.

By default, the actor and partner send LACP packets every second. You can configure the interval at which the interfaces send LACP packets by including the **periodic** statement at the **[edit interfaces *interface-name* aggregated-ether-options lacp]** hierarchy level.

The interval can be fast (every second) or slow (every 30 seconds).

## Configuring LACP for the LAG on the QFX Series

To configure LACP for a QFX Series LAG, perform these tasks:

### CLI Quick Configuration

To quickly configure LACP for the access switch LAGs, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ae0 aggregated-ether-options lacp active periodic fast
```

**Step-by-Step Procedure**

To configure LACP for LAG ae0 :

1. Specify the aggregated Ethernet options for the LAG:

```
[edit interfaces]
user@switch# set ae0 aggregated-ether-options lacp active periodic fast
```

**Results** Display the results of the configuration:

```
[edit interfaces]
user@switch# show
ae0 {
  aggregated-ether-options {
    lacp {
      active;
      periodic fast;
    }
  }
}
```

---

**Verification**

To verify that LACP packets are being exchanged, perform the following tasks:

- [Verifying the LACP Settings on page 2468](#)
- [Verifying That the LACP Packets Are Being Exchanged on page 2468](#)

**Verifying the LACP Settings**

**Purpose** Verify that LACP has been set up correctly.

**Action** Use the `show lacp interfaces interface-name` command to check that LACP has been enabled as active on one end.

```
user@switch> show lacp interfaces xe-0/0/2
```

Aggregated interface: ae0

LACP state:	Role	Exp	Def	Dist	Col	Syn	Aggr	Timeout	Activity
xe-0/0/2	Actor	No	Yes	No	No	No	Yes	Fast	Active
xe-0/0/2	Partner	No	Yes	No	No	No	Yes	Fast	Passive
LACP protocol:	Receive State		Transmit State		Mux State				
xe-0/0/2	Defaulted		Fast periodic		Detached				

**Meaning** The output indicates that LACP has been set up correctly and is active at one end.

**Verifying That the LACP Packets Are Being Exchanged**

**Purpose** Verify that LACP packets are being exchanged.

**Action** Use the **show interfaces aex statistics** command to display LACP information.

```
user@switch> show interfaces ae0 statistics
```

```
Physical interface: ae0, Enabled, Physical link is Down
Interface index: 153, SNMP ifIndex: 30
Link-level type: Ethernet, MTU: 1514, Speed: Unspecified, Loopback: Disabled,
Source filtering: Disabled, Flow control: Disabled, Minimum links needed: 1,
Minimum bandwidth needed: 0
Device flags   : Present Running
Interface flags: Hardware-Down SNMP-Traps Internal: 0x0
Current address: 02:19:e2:50:45:e0, Hardware address: 02:19:e2:50:45:e0
Last flapped   : Never
Statistics last cleared: Never
  Input packets : 0
  Output packets: 0
Input errors: 0, Output errors: 0

Logical interface ae0.0 (Index 71) (SNMP ifIndex 34)
Flags: Hardware-Down Device-Down SNMP-Traps Encapsulation: ENET2
Statistics      Packets      pps      Bytes      bps
Bundle:
  Input :           0           0           0           0
  Output:           0           0           0           0
Protocol inet

```

**Meaning** The output here shows that the link is down and that no PDUs are being exchanged.

### Troubleshooting

To troubleshoot a nonworking LACP link, perform these tasks:

- [Troubleshooting a Nonworking LACP Link on page 2469](#)

#### ***Troubleshooting a Nonworking LACP Link***

**Problem** The LACP link is not working.

**Solution** Check the following:

- Remove the LACP configuration and verify whether the static LAG is up.
- Verify that LACP is configured at both ends.
- Verify that LACP is not passive at both ends.
- Verify whether LACP protocol data units (PDUs) are being exchanged by running the **monitor traffic-interface lag-member detail** command.

- Related Documentation**

- [show lacp statistics interfaces \(View\) on page 2875](#)

## Example: Configuring Multichassis Link Aggregation

**NOTE:** Multichassis Link Aggregation (MC-LAG) is supported on QFX3500 and QFX3600 standalone switches running the original CLI and QFX5100 standalone switches and EX4600 switches running Enhanced Layer 2 Software.

Multichassis link aggregation groups (MC-LAGs) enable a client device to form a logical LAG interface between two switches. An MC-LAG provides redundancy and load balancing between the two switches, multihoming support, and a loop-free Layer 2 network without running Spanning Tree Protocol (STP).

The peers in an MC-LAG use an interchassis control link-protection link (ICL-PL) to replicate forwarding information across the peers. The Interchassis Control Protocol (ICCP) exchanges the control information between two MC-LAG switches. Additionally, ICCP propagates the operational state of MC-LAG members through the ICL-PL.

On one end of an MC-LAG is an MC-LAG client device, such as a server, that has one or more physical links in a link aggregation group (LAG). This client device does not need to detect the MC-LAG. On the other side of an MC-LAG are two MC-LAG switches. Each of the switches has one or more physical links connected to a single client device. The switches coordinate with each other to ensure that data traffic is forwarded properly.

- [Configuration on page 2473](#)
- [Verification on page 2490](#)
- [Troubleshooting on page 2493](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.2 or later for the QFX3500 and QFX3600 standalone switches and Junos OS Release 13.2X51-D10 or later for the QFX5100 standalone switches.
- Two QFX3500 or QFX3600 standalone switches, or two QFX5100 standalone switches.

Before you configure an MC-LAG, be sure that you understand how to:

- Configure aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch” on page 2462](#).
- Configure the Link Aggregation Control Protocol (LACP) on aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch” on page 2466](#).

## Overview

In this example, you configure an MC-LAG across two switches, consisting of two aggregated Ethernet interfaces, an interchassis control link-protection link (ICL-PL), multichassis protection link for the ICL-PL, ICCP for the peers hosting the MC-LAG, and Layer 3 connectivity between MC-LAG peers. Layer 3 connectivity is required for ICCP.

## Topology

The topology used in this example consists of two switches hosting an MC-LAG. The two switches are connected to a server. [Figure 51 on page 2472](#) shows the topology of this example.

**Figure 51: Configuring a Multichassis LAG Between Switch A and Switch B**

[Table 235 on page 2463](#) details the topology used in this configuration example.

**Table 236: Components of the Topology for Configuring a Multichassis LAG Between Two Switches**

Hostname	Base Hardware	Multichassis Link Aggregation Group
Switch A	QFX3500 or QFX3600 standalone switch, or QFX5100 standalone switch	<b>ae0</b> is configured as an aggregated Ethernet interface, and is used as an ICL-PL. The following interfaces are part of <b>ae0</b> : <b>xe-0/0/12</b> and <b>xe-0/0/13</b> on Switch A and <b>xe-0/0/12</b> and <b>xe-0/0/13</b> on Switch B.  <b>ae1</b> is configured as an MC-LAG, and the following two interfaces are part of <b>ae1</b> : <b>xe-0/0/44</b> on Switch A and <b>xe-0/0/46</b> on Switch B.
Switch B	QFX3500 or QFX3600 standalone switch, or QFX5100 standalone switch	

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and paste the commands into the CLI at the **[edit]** hierarchy level of Switch A.

**NOTE:** This example shows how to configure MC-LAG using both the original CLI and Enhanced Layer 2 Software (ELS).

In ELS, there are three different statements and one different option from the original CLI:

- The `port-mode` statement in the `[edit interfaces interface-name unit number family ethernet-switching]` hierarchy is not supported. Use the `interface-mode` statement instead.
- The `vlan` statement in the `[edit interfaces interface-name]` hierarchy is not supported. Use the `irb` statement instead.
- The `vlan.logical-interface-number` option in the `[edit vlans vlan-name l3-interface]` option is not supported. Use the `irb.logical-interface-number` option instead.
- The `service-id` statement in the `[edit switch-options]` hierarchy is required in the ELS CLI.

### Original CLI

```
set chassis aggregated-devices ethernet device-count 2
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0
set interfaces xe-0/0/44 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching port-mode trunk
set interfaces ae0 unit 0 family ethernet-switching vlan members v500
set interfaces ae1 aggregated-ether-options lacp active
set interfaces ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
set interfaces ae1 aggregated-ether-options lacp admin-key 3
set interfaces ae1 aggregated-ether-options mc-ae mc-ae-id 3
set interfaces ae1 aggregated-ether-options mc-ae chassis-id 0
set interfaces ae1 aggregated-ether-options mc-ae mode active-active
set interfaces ae1 aggregated-ether-options mc-ae status-control active
set ae1 aggregated-ether-options mc-ae init-delay-time 240
set interfaces ae1 unit 0 family ethernet-switching port-mode trunk
set interfaces ae1 unit 0 family ethernet-switching vlan members v100
set interfaces vlan unit 500 family inet address 3.3.3.2/24
set vlans v100 vlan-id 100
set vlans v500 vlan-id 500
set vlans v500 l3-interface vlan.500
set protocols iccp local-ip-addr 3.3.3.2
set protocols iccp peer 3.3.3.1 session-establishment-hold-time 50
set protocols iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip 10.207.64.233
set protocols iccp peer 3.3.3.1 liveness-detection minimum-receive-interval 1000
```

```
set protocols iccp peer 3.3.3.1 liveness-detection transmit-interval minimum-interval 1000
set protocols rstp interface ae0.0 disable
set protocols rstp interface ae1.0 edge
set protocols rstp interface all mode point-to-point
set protocols rstp bpdu-block-on-edge
set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
```

## ELS

```
set chassis aggregated-devices ethernet device-count 2
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0
set interfaces xe-0/0/44 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching interface-mode trunk
set interfaces ae0 unit 0 family ethernet-switching vlan members v500
set interfaces ae1 aggregated-ether-options lacp active
set interfaces ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
set interfaces ae1 aggregated-ether-options lacp admin-key 3
set interfaces ae1 aggregated-ether-options mc-ae mc-ae-id 3
set interfaces ae1 aggregated-ether-options mc-ae chassis-id 0
set interfaces ae1 aggregated-ether-options mc-ae mode active-active
set interfaces ae1 aggregated-ether-options mc-ae status-control active
set ae1 aggregated-ether-options mc-ae init-delay-time 240
set interfaces ae1 unit 0 family ethernet-switching interface-mode trunk
set interfaces ae1 unit 0 family ethernet-switching vlan members v100
set interfaces irb unit 500 family inet address 3.3.3.2/24
set vlans v100 vlan-id 100
set vlans v500 vlan-id 500
set vlans v500 l3-interface irb.500
set protocols iccp local-ip-addr 3.3.3.2
set protocols iccp peer 3.3.3.1 session-establishment-hold-time 50
set protocols iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip 10.207.64.233
set protocols iccp peer 3.3.3.1 liveness-detection minimum-receive-interval 1000
set protocols iccp peer 3.3.3.1 liveness-detection transmit-interval minimum-interval 1000
set protocols rstp interface ae0.0 disable
set protocols rstp interface ae1.0 edge
set protocols rstp interface all mode point-to-point
set protocols rstp bpdu-block-on-edge
set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
set switch-options service-id 10
```

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and paste the commands into the CLI at the **[edit]** hierarchy level of Switch B.

**NOTE:** This example shows how to configure MC-LAG using both the original CLI and Enhanced Layer 2 Software (ELS).

In ELS, there are three different statements and one different option from the original CLI:

- The port-mode statement in the [edit interfaces *interface-name* unit *number* family ethernet-switching] hierarchy is not supported. Use the interface-mode statement instead.
- The vlan statement in the [edit interfaces *interface-name*] hierarchy is not supported. Use the irb statement instead.
- The vlan.logical-interface-number option in the [edit vlans *vlan-name* l3-interface] option is not supported. Use the irb.logical-interface-number option instead.
- The service-id statement in the [edit switch-options] hierarchy is required in the ELS CLI.

#### Original CLI

```
set chassis aggregated-devices ethernet device-count 2
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0
set interfaces xe-0/0/46 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching port-mode trunk
set interfaces ae0 unit 0 family ethernet-switching vlan members v500
set interfaces ae1 aggregated-ether-options lacp active
set interfaces ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
set interfaces ae1 aggregated-ether-options lacp admin-key 3
set interfaces ae1 aggregated-ether-options mc-ae mc-ae-id 3
set interfaces ae1 aggregated-ether-options mc-ae chassis-id 1
set interfaces ae1 aggregated-ether-options mc-ae mode active-active
set interfaces ae1 aggregated-ether-options mc-ae status-control standby
set ae1 aggregated-ether-options mc-ae init-delay-time 240
set interfaces ae1 unit 0 family ethernet-switching port-mode trunk
set interfaces ae1 unit 0 family ethernet-switching vlan members v100
set interfaces vlan unit 500 family inet address 3.3.3.1/24
set vlans v100 vlan-id 100
set vlans v500 vlan-id 500
set vlans v500 l3-interface vlan.500
set protocols iccp local-ip-addr 3.3.3.1
set protocols iccp peer 3.3.3.2 session-establishment-hold-time 50
set protocols iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip 10.207.64.233
set protocols iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 1000
set protocols iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval 1000
set protocols rstp interface ae0.0 disable
set protocols rstp interface ae1.0 edge
set protocols rstp interface all mode point-to-point
set protocols rstp bpdu-block-on-edge
set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0
```

#### ELS

```
set chassis aggregated-devices ethernet device-count 2
```

```
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0

set interfaces ae1 unit 0 family ethernet-switching vlan members v100
set interfaces irb unit 500 family inet address 3.3.3.1/24
set vlans v100 vlan-id 100
set vlans v500 vlan-id 500
set vlans v500 l3-interface irb.500
set protocols iccp local-ip-addr 3.3.3.1
set protocols iccp peer 3.3.3.2 session-establishment-hold-time 50
set protocols iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip 10.207.64.233
set protocols iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 1000
set protocols iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval 1000
set protocols rstp interface ae0.0 disable
set protocols rstp interface ae1.0 edge
set protocols rstp interface all mode point-to-point
set protocols rstp bpdu-block-on-edge
set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0
set switch-options service-id 10
```

### ***Configuring MC-LAG on Two Switches***

#### **Step-by-Step Procedure**

To enable multichassis protection link between MC-LAG peers:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the number of LAGs on both Switch A and Switch B.  

```
[edit chassis]
user@switch# set aggregated-devices ethernet device-count 2
```
2. Add member interfaces to the aggregated Ethernet interfaces on both Switch A and Switch B.  

```
[edit interfaces]
user@switch# set xe-0/0/12 ether-options 802.3ad ae0
[edit interfaces]
user@switch# set xe-0/0/13 ether-options 802.3ad ae0
[edit interfaces]
user@switch# set xe-0/0/44 ether-options 802.3ad ae1
[edit interfaces]
user@switch# set xe-0/0/46 ether-options 802.3ad ae1
```
3. Configure a trunk interface between Switch A and Switch B.

**NOTE:** The `port-mode` statement is not supported on Enhanced Layer 2 Software (ELS). If you are running ELS, use the `interface-mode` statement.

Original CLI:

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk
or
```

ELS:

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk
```

4. Configure a multichassis protection link between Switch A and Switch B.

Switch A:

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0
```

Switch B:

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
```

#### Step-by-Step Procedure

To enable ICCP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the local IP address to be in the ICCP connection on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.2
```

Switch B:

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.1
```

2. Configure the peer IP address and minimum receive interval for a (BFD) session for ICCP on Switch A and Switch B.

**NOTE:** Configure at least 1000ms as the minimum receive interval.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 liveness-detection minimum-receive-interval 1000
```

Switch B:

```
[edit protocols]
```

```
user@switch# set iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 1000
```

3. Configure the peer IP address and minimum transmit interval for Bidirectional Forwarding Detection (BFD) session for ICCP on Switch A and Switch B.

**NOTE:** Configure at least 1000ms as the transmit interval minimum interval.

Switch A:

```
[edit protocols]
```

```
user@switch# set iccp peer 3.3.3.1 liveness-detection transmit-interval minimum-interval 1000
```

Switch B:

```
[edit protocols]
```

```
user@switch# set iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval 1000
```

4. (Optional) Configure the time during which an ICCP connection must succeed between MC-LAG peers on Switch A and Switch B.

**NOTE:** Configuring session establishment hold time helps in faster ICCP connection establishment. The recommended value is 50 seconds.

Switch A:

```
[edit protocols]
```

```
user@switch# set iccp peer 3.3.3.1 session-establishment-hold-time 50
```

Switch B:

```
[edit protocols]
```

```
user@switch# set iccp peer 3.3.3.2 session-establishment-hold-time 50
```

5. (Optional) Configure the backup IP address to be used for backup liveness detection on both Switch A and Switch B.

**NOTE:** By default, backup liveness detection is not enabled. Configuring a backup IP address helps achieve sub-second traffic loss during a MC-LAG peer reboot.

Switch A:

```
[edit protocols]
```

```
user@switch# set iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip 10.207.64.233
```

Switch B:

- ```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip 10.207.64.232
```
6. Configure Layer 3 connectivity between the MC-LAG peers on both Switch A and Switch B.
- ```
[edit vlans]
user@switch# set v500 vlan-id 500
[edit vlans]
user@switch# set v500 l3-interface vlan.500
[edit vlans]
user@switch# set v500 l3-interface irb.500
```

**NOTE:** The port-mode statement is not supported on Enhanced Layer 2 Software (ELS). If you are running ELS, use the interface-mode statement.

Original CLI:

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk vlan members
v500
```

or

ELS:

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk vlan members
v500
```

### Step-by-Step Procedure

To enable the MC-LAG interface:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable LACP on the MC-LAG interface on Switch A and Switch B.

**NOTE:** At least one end needs to be active. The other end can be either active or passive.

- ```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp active
```
2. Specify the same multichassis aggregated Ethernet identification number on both MC-LAG peers on Switch A and Switch B.
- ```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae mc-ae-id 3
```
3. Specify the same service ID on Switch A and Switch B.
- ELS:
- ```
[edit]
```

```
user@switch# set switch-options service-id 10
```

4. Specify a unique chassis ID for the MC-LAG on the MC-LAG peers on Switch A and Switch B.

Switch A:

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options mc-ae chassis-id 0
```

Switch B:

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options mc-ae chassis-id 1
```

5. Specify the operating mode of the MC-LAG on both Switch A and Switch B.

**NOTE:** Only active-active mode is supported at this time.

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options mc-ae mode active-active
```

6. Specify the status control for MC-LAG on Switch A and Switch B.

**NOTE:** You must configure status control on both Switch A and Switch B hosting the MC-LAG. If one peer is in active mode, the other must be in standby mode.

Switch A:

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options mc-ae status-control active
```

Switch B:

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options mc-ae status-control standby
```

7. Specify the number of seconds by which the bring-up of the MC-AE interface should be deferred after you reboot Switch A and Switch B.

**NOTE:** The recommended value for maximum VLAN configuration (for example, 4,000 VLANs) is 240 seconds. If IGMP snooping is enabled on all of the VLANs, the recommended value is 420 seconds.

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options mc-ae init-delay-time 240
```

8. Specify the same LACP system ID for the MC-LAG on Switch A and Switch B.

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options lacp system-ID 00:01:02:03:04:05
```

9. Specify the same LACP administration key on both Switch A and Switch B.

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options lacp admin-key 3
```

10. Enable a VLAN on the MC-LAG on Switch A and Switch B.

**NOTE:** The `port-mode` statement is not supported on Enhanced Layer 2 Software (ELS). If you are running ELS, use the `interface-mode` statement.

Original CLI:

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching port-mode trunk
or
```

ELS:

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching interface-mode trunk
[edit]
user@switch# set vlans v100 vlan-id 100
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching vlan members v100
```

11. (Optional) Enable a private VLAN on the MC-LAG on Switch A and Switch B.

```
[edit]
user@switch# set vlans vlan100 pvlan isolation-vlan-id 200
extend-secondary-vlan-id
[edit]
user@switch# set vlans vlan100 interface ae0.0 pvlan-trunk
```

#### Step-by-Step Procedure

To enable RSTP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable RSTP globally on all interfaces on Switch A and Switch B.
 

```
[edit]
user@switch# set protocols rstp interface all mode point-to-point
```
2. Disable RSTP on the ICL-PL interfaces on Switch A and Switch B:
 

```
[edit]
user@switch# set protocols rstp interface ae0.0 disable
```
3. Configure the MC-LAG interfaces as edge ports on Switch A and Switch B.

**NOTE:** The `ae1` interface is a downstream interface. This is why RSTP and `bpdu-block-on-edge` need to be configured.

```
[edit]
user@switch# set protocols rstp interface ae1.0 edge
```

4. Enable BPDU blocking on all interfaces except for the ICL-PL interfaces on Switch A and Switch B.

**NOTE:** The ae1 interface is a downstream interface. This is why RSTP and bpdu-block-on-edge need to be configured.

[edit]

```
user@switch# set protocols rstp bpdu-block-on-edge
```

### Results

Display the results of the configuration on Switch A using the original CLI.

```

## Verification

---

To verify that the MC-LAG group has been created and is working properly, perform these tasks:

- [Verifying That ICCP Is Working on Switch A on page 2490](#)
- [Verifying That ICCP Is Working on Switch B on page 2490](#)
- [Verifying That LACP Is Active on Switch A on page 2491](#)
- [Verifying That LACP Is Active on Switch B on page 2491](#)
- [Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch A on page 2491](#)
- [Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch B on page 2492](#)
- [Verifying that MAC Learning Is Occurring on Switch A on page 2492](#)
- [Verifying that MAC Learning Is Occurring on Switch B on page 2492](#)

### *Verifying That ICCP Is Working on Switch A*

**Purpose** Verify that ICCP is running on Switch A.

**Action** [edit]  
user@switch# show iccp  
Redundancy Group Information for peer 3.3.3.1  
TCP Connection : Established  
Liveliness Detection : Up  
  
Client Application: MCSNOOPD  
  
Client Application: eswd

**Meaning** This output shows that the TCP connection between the peers hosting the MC-LAG is up, liveness detection is up, and MCSNOOPD and ESWD client applications are running.

### *Verifying That ICCP Is Working on Switch B*

**Purpose** Verify that ICCP is running on Switch B.

**Action** show iccp  
[edit]  
user@switch# show iccp

```

Redundancy Group Information for peer 3.3.3.2
TCP Connection      : Established
Liveliness Detection : Up

```

```
Client Application: MCSNOOPD
```

```
Client Application: eswd
```

**Meaning** This output shows that the TCP connection between the peers hosting the MC-LAG is up, liveness detection is up, and MCSNOOPD and ESWD client applications are running.

#### *Verifying That LACP Is Active on Switch A*

**Purpose** Verify that LACP is active on Switch A.

```

Action [edit]
user@switch# show lacp interfaces
Aggregated interface: ae1
  LACP state:      Role  Exp  Def  Dist  Col  Syn  Aggr  Timeout  Activity
  xe-0/0/46       Actor No   No   Yes   Yes  Yes  Yes   Fast    Active
  xe-0/0/46       Partner No   No   Yes   Yes  Yes  Yes   Fast    Active
  LACP protocol:   Receive State Transmit State Mux State
  xe-0/0/46       Current Fast periodic Collecting distributing

```

**Meaning** This output shows that Switch A is participating in LACP negotiation.

#### *Verifying That LACP Is Active on Switch B*

**Purpose** Verify that LACP is active on Switch B

```

Action [edit]
user@switch# show lacp interfaces
Aggregated interface: ae1
  LACP state:      Role  Exp  Def  Dist  Col  Syn  Aggr  Timeout  Activity
  xe-0/0/44       Actor No   No   Yes   Yes  Yes  Yes   Fast    Active
  xe-0/0/44       Partner No   No   Yes   Yes  Yes  Yes   Fast    Active
  LACP protocol:   Receive State Transmit State Mux State
  xe-0/0/44       Current Fast periodic Collecting distributing

```

**Meaning** This output shows that Switch B is participating in LACP negotiation.

#### *Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch A*

**Purpose** Verify that the MC-AE and ICL-PL interfaces are up on Switch A.

**Action** [edit]  
user@switch# **show interfaces mc-ae**  
Member Link : ae1  
Current State Machine's State: mcae active state  
Local Status : active  
Local State : up  
Peer Status : active  
Peer State : up  
Logical Interface : ae1.0  
Topology Type : bridge  
Local State : up  
Peer State : up  
Peer Ip/MCP/State : 3.3.3.1 ae0.0 up

**Meaning** This output shows that the MC-AE interface on Switch A is up and active.

***Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch B***

**Purpose** Verify that the MC-AE and ICL-PL interfaces are up on Switch B.

**Action** [edit]  
user@switch# **show interfaces mc-ae**  
Member Link : ae1  
Current State Machine's State: mcae active state  
Local Status : active  
Local State : up  
Peer Status : active  
Peer State : up  
Logical Interface : ae1.0  
Topology Type : bridge  
Local State : up  
Peer State : up  
Peer Ip/MCP/State : 3.3.3.2 ae0.0 up

**Meaning** This output shows that the MC-AE interface on Switch B is up and active.

***Verifying that MAC Learning Is Occurring on Switch A***

**Purpose** Verify that MAC learning is working on Switch A.

**Action** [edit]  
user@switch# **show ethernet-switching table**  
Ethernet-switching table: 10 entries, 4 learned, 0 persistent entries  

| VLAN | MAC address       | Type     | Age | Interfaces   |
|------|-------------------|----------|-----|--------------|
| V100 | *                 | Flood    | -   | All-members  |
| V100 | 00:10:94:00:00:05 | Learn(L) | 33  | ae0.0 (MCAE) |

**Meaning** The output shows four learned MAC addresses entries.

***Verifying that MAC Learning Is Occurring on Switch B***

**Purpose** Verify that MAC learning is working on Switch B.

**Action** [edit]  
 user@switch# **show ethernet-switching table**  
 Ethernet-switching table: 10 entries, 4 learned, 0 persistent entries

| VLAN | MAC address       | Type     | Age | Interfaces    |
|------|-------------------|----------|-----|---------------|
| V100 | *                 | Flood    |     | - All-members |
| V100 | 00:10:94:00:00:05 | Learn(L) | 33  | ae0.0 (MCAE)  |

**Meaning** The output shows four learned MAC addresses entries.

## Troubleshooting

### *Troubleshooting a LAG That Is Down*

**Problem** The **show interfaces terse** command shows that the MC-LAG is **down**

**Solution** Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that the MC-LAG is part of family Ethernet switching (Layer 2 LAG).
- Verify that the MC-LAG member is connected to the correct MC-LAG member at the other end.

**Related Documentation**

- [Understanding Multichassis Link Aggregation on page 2411](#)
- [Configuring Multichassis Link Aggregation on page 2597](#)

## Example: Configuring Multichassis Link Aggregation for Layer 3 Multicast Using VRRP

**NOTE:** Multichassis Link Aggregation (MC-LAG) is supported on QFX3500 and QFX3600 standalone switches running the original CLI and QFX5100 standalone switches running Enhanced Layer 2 Software (ELS).

There are two methods for enabling Layer 3 multicast functionality across a multichassis link aggregation group (MC-LAG). You can choose either to configure Virtual Router Redundancy Protocol (VRRP) or synchronize the MAC addresses for the Layer 3 interfaces of the switches participating in the MC-LAG. The procedure to configure VRRP for use in a Layer 3 multicast MC-LAG is included in this example.

- [Requirements on page 2494](#)
- [Overview on page 2494](#)
- [Configuration on page 2496](#)
- [Verification on page 2529](#)

## Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 12.3 or later for the QFX3500 and QFX3600 standalone switches and Junos OS Release 13.2X51-D10 or later for the QFX5100 standalone switches.
- Two QFX3500 or QFX3600 standalone switches, or two QFX5100 standalone switches.

Before you configure an MC-LAG for Layer 3 multicast using VRRP, be sure that you understand how to:

- Configure aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch”](#) on page 2462.
- Configure the Link Aggregation Control Protocol (LACP) on aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch”](#) on page 2466.

## Overview

---

In this example, you configure two MC-LAGs across two switches, consisting of two aggregated Ethernet interfaces (ae1 and ae2). To support the MC-LAG, create a third aggregated Ethernet interface (ae0) for the interchassis control link-protection link (ICL-PL). Configure a multichassis protection link for the ICL-PL, Interchassis Control Protocol (ICCP) for the peers hosting the MC-LAG, and Layer 3 connectivity between MC-LAG peers.

**NOTE:** Layer 3 connectivity is required for ICCP.

To complete the configuration, enable VRRP by completing the following steps for each MC-LAG:

- Create a routed VLAN interface (RVI)
- Create a VRRP group and assign a virtual IP address that is shared between each switch in the VRRP group
- Enable a member of a VRRP group to accept all packets destined for the virtual IP address if it is the master in the VRRP group
- Configure Layer 3 connectivity between the VRRP groups

## Topology

The topology used in this example consists of two switches hosting two MC-LAGs—ae1 and ae2. The two switches are connected to a multicast source (Server 1) over the MC-LAG ae1, and a multicast receiver (Server 2) over the MC-LAG ae2. [Figure 52 on page 2495](#) shows the topology of this example.

Figure 52: Configuring a Multichassis LAG for Layer 3 Multicast Using VRRP

g041361

Table 237 on page 2495 details the topology used in this configuration example.

Table 237: Components of the Topology for Configuring a Multichassis LAG for Layer 3 Multicast Using VRRP

| Hostname | Base Hardware  | Multichassis Link Aggregation Group   |
|----------|--|---|
| Switch A | QFX3500 or QFX3600 standalone switch, or QFX5100 standalone switch | <ul style="list-style-type: none"> <li>ae0 is configured as an aggregated Ethernet interface, and is used as an ICL-PL. The following two interfaces are part of ae0: xe-0/0/12 and xe-0/0/13 on Switch A and xe-0/0/12 and xe-0/0/13 on Switch B.</li> <li>ae1 is configured as an MC-LAG for the multicast source (Server 1), and the following two interfaces are part of ae1: xe-0/0/44 on Switch A and xe-0/0/46 on Switch B.</li> <li>ae2 is configured as an MC-LAG for the multicast receiver (Server 2), and the following two interfaces are part of ae2: xe-0/0/45 on Switch A and xe-0/0/47 on Switch B.</li> </ul> |
| Switch B | QFX3500 or QFX3600 standalone switch, or QFX5100 standalone switch |   |

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and paste the commands into the CLI at the **[edit]** hierarchy level of Switch A.

**NOTE:** This example shows how to configure MC-LAG using both the original CLI and Enhanced Layer 2 Software (ELS).

In ELS, there are three different statements and one different option from the original CLI:

- The `port-mode` statement in the `[edit interfaces interface-name unit number family ethernet-switching]` hierarchy is not supported. Use the `interface-mode` statement instead.
- The `vlan` statement in the `[edit interfaces interface-name]` hierarchy is not supported. Use the `irb` statement instead.
- The `vlan.logical-interface-number` option in the `[edit vlans vlan-name l3-interface]` option is not supported. Use the `irb.logical-interface-number` option instead.
- The `service-id` statement in the `[edit switch-options]` hierarchy is required in the ELS CLI.

### Original CLI:

```
set chassis aggregated-devices ethernet device-count 3
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0

### *Configuring MC-LAG for Layer 3 Multicast Using VRRP on Two Switches*

#### **Step-by-Step Procedure**

To enable multichassis protection link between MC-LAG peers:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the number of LAGs on both Switch A and Switch B.

```
[edit chassis]
user@switch# set aggregated-devices ethernet device-count 3
```

2. Add member interfaces to the aggregated Ethernet interfaces on both Switch A and Switch B.

#### Switch A and Switch B

```
[edit interfaces]
user@switch# set xe-0/0/12 ether-options 802.3ad ae0
user@switch# set xe-0/0/13 ether-options 802.3ad ae0
```

#### Switch A

```
[edit interfaces]
user@switch# set xe-0/0/44 ether-options 802.3ad ae1
user@switch# set xe-0/0/45 ether-options 802.3ad ae2
```

#### Switch B

```
[edit interfaces]
user@switch# set xe-0/0/46 ether-options 802.3ad ae1
user@switch# set xe-0/0/47 ether-options 802.3ad ae2
```

3. Configure ae0 as the trunk interface between Switch A and Switch B.

#### Switch A and Switch B

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk
```

#### Switch A and Switch B Using ELS

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk
```

4. Configure ae0 as the multichassis protection link between Switch A and Switch B.

#### Switch A

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
```

#### Switch B

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0
```

#### Step-by-Step Procedure

To enable ICCP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the local IP address to be in the ICCP connection on Switch A and Switch B.

#### Switch A

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.2
```

**Switch B**

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.1
```

2. Configure the peer IP address, minimum receive interval, and minimum transmit interval for a Bidirectional Forwarding Detection (BFD) session for ICCP on Switch A and Switch B.

**Switch A**

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 liveness-detection minimum-receive-interval
1000
user@switch# set iccp peer 3.3.3.1 liveness-detection transmit-interval
minimum-interval 1000
```

**Switch B**

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection minimum-receive-interval
1000
user@switch# set iccp peer 3.3.3.2 liveness-detection transmit-interval
minimum-interval 1000
```

3. (Optional) Configure the time during which an ICCP connection must succeed between MC-LAG peers on Switch A and Switch B.

**NOTE:** Configuring session establishment hold time helps in faster ICCP connection establishment. The recommended value is 50 seconds.

**Switch A**

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 session-establishment-hold-time 50
```

**Switch B**

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 session-establishment-hold-time 50
```

4. (Optional) Configure the backup IP address to be used for backup liveness detection on both Switch A and Switch B.

**NOTE:** By default, backup liveness detection is not enabled. Configuring a backup IP address helps achieve sub-second traffic loss during a MC-LAG peer reboot.

**Switch A**

```
[edit protocols]
```

```
user@switch# set iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip
10.207.64.233
```

#### Switch B

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip
10.207.64.232
```

5. Configure Layer 3 connectivity between the MC-LAG peers on both Switch A and Switch B.

**NOTE:** In ELS, use the *irb.logical-interface-number* instead.

#### Switch A and Switch B

```
[edit vlans]
user@switch# set v500 vlan-id 500
user@switch# set v500 l3-interface vlan.500
```

#### Switch A and Switch B Using ELS

```
[edit vlans]
user@switch# set v500 vlan-id 500
user@switch# set v500 l3-interface irb.500
```

#### Switch A and Switch B

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching vlan members v500
```

#### Switch A

```
[edit interfaces]
user@switch# set vlan unit 500 family inet address 3.3.3.2/24
```

#### Switch A Using ELS

```
[edit interfaces]
user@switch# set irbunit 500 family inet address 3.3.3.2/24
```

#### Switch B

```
[edit interfaces]
user@switch# set vlan unit 500 family inet address 3.3.3.1/24
```

#### Switch B Using ELS

```
[edit interfaces]
user@switch# set irb unit 500 family inet address 3.3.3.1/24
```

**Step-by-Step Procedure** To enable the ae1 and ae2 MC-LAG interfaces:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable LACP on the MC-LAG interfaces on Switch A and Switch B.

**NOTE:** At least one end needs to be active. The other end can be either active or passive.

[edit interfaces]

```
user@switch# set ae1 aggregated-ether-options lacp active
```

```
user@switch# set ae2 aggregated-ether-options lacp active
```

2. Specify the same multichassis aggregated Ethernet (MC-AE) identification number for each MC-LAG peer on Switch A and Switch B.

[edit interfaces]

```
user@switch# set ae1 aggregated-ether-options mc-ae mc-ae-id 3
```

```
user@switch# set ae2 aggregated-ether-options mc-ae mc-ae-id 4
```

3. Specify the same service ID on Switch A and Switch B.

**ELS:**

[edit]

```
set switch-options service-id 10
```

4. Specify a unique chassis ID for the MC-LAG on the MC-LAG peers on Switch A and Switch B.

**Switch A**

[edit interfaces]

```
user@switch# set ae1 aggregated-ether-options mc-ae chassis-id 0
```

```
user@switch# set ae2 aggregated-ether-options mc-ae chassis-id 0
```

**Switch B**

[edit interfaces]

```
user@switch# set ae1 aggregated-ether-options mc-ae chassis-id 1
```

```
user@switch# set ae2 aggregated-ether-options mc-ae chassis-id 1
```

5. Specify the operating mode of the MC-LAGs on both Switch A and Switch B.

**NOTE:** Only active-active mode is supported at this time.

[edit interfaces]

```
user@switch# set ae1 aggregated-ether-options mc-ae mode active-active
```

```
user@switch# set ae2 aggregated-ether-options mc-ae mode active-active
```

6. Specify the status control for the MC-LAGs on Switch A and Switch B.

**NOTE:** You must configure status control on both Switch A and Switch B hosting the MC-LAGs. If one peer is in active mode, the other must be in standby mode.

#### Switch A

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae status-control active
user@switch# set ae2 aggregated-ether-options mc-ae status-control active
```

#### Switch B

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae status-control standby
user@switch# set ae2 aggregated-ether-options mc-ae status-control standby
```

7. Specify the number of seconds by which the bring-up of the MC-LAG interfaces should be deferred after you reboot Switch A or Switch B.

**NOTE:** The recommended value for maximum VLAN configuration (for example, 4,000 VLANs) is 240 seconds. If IGMP snooping is enabled on all of the VLANs, the recommended value is 420 seconds.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae init-delay-time 420
user@switch# set ae2 aggregated-ether-options mc-ae init-delay-time 420
```

8. Specify the same LACP system ID for each MC-LAG on Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp system-ID 00:01:02:03:04:05
user@switch# set ae2 aggregated-ether-options lacp system-ID 00:01:02:03:04:06
```

9. Specify the same LACP administration key on both Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp admin-key 3
user@switch# set ae2 aggregated-ether-options lacp admin-key 3
```

10. Enable a VLAN for each MC-LAG on Switch A and Switch B.

```
[edit vlans]
user@switch# set v100 vlan-id 100
user@switch# set v200 vlan-id 200
```

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching vlan members v100
user@switch# set ae2 unit 0 family ethernet-switching vlan members v200
```

11. Configure ae1 and ae2 as trunk interfaces between Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching port-mode trunk
```

```
user@switch# set ae2 unit 0 family ethernet-switching port-mode trunk
```

ELS:

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching interface-mode trunk
user@switch# set ae2 unit 0 family ethernet-switching interface-mode trunk
```

#### Step-by-Step Procedure

To enable VRRP on the MC-LAGs on Switch A and Switch B:

1. Create a routed VLAN interface (RVI) for each MC-LAG, assign a virtual IP address that is shared between each switch in the VRRP groups, and assign an individual IP address for each switch in the VRRP groups.

##### Switch A

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 10.1.1.11/24 vrrp-group 1
virtual-address 10.1.1.1
user@switch# set vlan unit 200 family inet address 10.1.1.21/24 vrrp-group 2
virtual-address 10.1.1.2
```

##### Switch A Using ELS

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 10.1.1.11/24 vrrp-group 1
virtual-address 10.1.1.1
user@switch# set irb unit 200 family inet address 10.1.1.21/24 vrrp-group 2
virtual-address 10.1.1.2
```

##### Switch B

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 10.1.1.10/24 vrrp-group 1
virtual-address 10.1.1.1
user@switch# set vlan unit 200 family inet address 10.1.1.20/24 vrrp-group 2
virtual-address 10.1.1.2
```

##### Switch B Using ELS

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 10.1.1.10/24 vrrp-group 1
virtual-address 10.1.1.1
user@switch# set irb unit 200 family inet address 10.1.1.20/24 vrrp-group 2
virtual-address 10.1.1.2
```

2. Assign the priority for each switch in the VRRP groups:

**NOTE:** The switch configured with the highest priority is the master.

##### Switch A

```
[edit interfaces]
```

```

user@switch# set vlan unit 100 family inet address 10.1.1.11/24 vrrp-group 1 priority
200
user@switch# set vlan unit 200 family inet address 10.1.1.21/24 vrrp-group 2 priority
200

```

#### Switch A Using ELS

```

[edit interfaces]
user@switch# set irb unit 100 family inet address 10.1.1.11/24 vrrp-group 1 priority
200
user@switch# set irb unit 200 family inet address 10.1.1.21/24 vrrp-group 2 priority
200

```

#### Switch B

```

[edit interfaces]
user@switch# set vlan unit 100 family inet address 10.1.1.10/24 vrrp-group 1 priority
150
user@switch# set vlan unit 200 family inet address 10.1.1.20/24 vrrp-group 2 priority
150

```

#### Switch B Using ELS

```

[edit interfaces]
user@switch# set irb unit 100 family inet address 10.1.1.10/24 vrrp-group 1 priority
150
user@switch# set irb unit 200 family inet address 10.1.1.20/24 vrrp-group 2 priority
150

```

3. Enable the switch to accept all packets destined for the virtual IP address if it is the master in a VRRP group:

#### Switch A

```

[edit interfaces]
user@switch# set vlan unit 100 family inet address 10.1.1.11/24 vrrp-group 1
accept-data
user@switch# set vlan unit 200 family inet address 10.1.1.21/24 vrrp-group 2
accept-data

```

#### Switch A Using ELS

```

[edit interfaces]
user@switch# set irb unit 100 family inet address 10.1.1.11/24 vrrp-group 1 accept-data
user@switch# set irb unit 200 family inet address 10.1.1.21/24 vrrp-group 2
accept-data

```

#### Switch B

```

[edit interfaces]
user@switch# set vlan unit 100 family inet address 10.1.1.10/24 vrrp-group 1
accept-data
user@switch# set vlan unit 200 family inet address 10.1.1.20/24 vrrp-group 2
accept-data

```

#### Switch B Using ELS

```

[edit interfaces]

```

```
user@switch# set irb unit 100 family inet address 10.1.1.10/24 vrrp-group 1
accept-data
user@switch# set irb unit 200 family inet address 10.1.1.20/24 vrrp-group 2
accept-data
```

4. Configure Layer 3 connectivity between Switch A and Switch B.

```
[edit interfaces]
user@switch# set v100 l3-interface vlan.100
user@switch# set v200 l3-interface vlan.200
```

ELS:

```
[edit interfaces]
user@switch# set v100 l3-interface irb.100
user@switch# set v200 l3-interface irb.200
```

#### Step-by-Step Procedure

To enable IGMP snooping:

1. Enable IGMP snooping for all VLANs on Switch A and Switch B.

```
[edit protocols]
user@switch# set igmp-snooping vlan all
```

#### Step-by-Step Procedure

To configure OSPF as the Layer 3 protocol:

1. Configure an OSPF area on Switch A and Switch B.

```
[edit protocols ospf]
user@switch# set area 0.0.0.0
```

2. Assign the VLAN interfaces for the MC-LAGs as interfaces to the OSPF area on Switch A and Switch B.

```
[edit protocols ospf area 0.0.0.0]
user@switch# set interface vlan.100
user@switch# set interface vlan.200
```

3. Configure the minimum receive interval, minimum transmit interval, and transmit interval threshold for a Bidirectional Forwarding Detection (BFD) session for the OSPF interfaces on Switch A and Switch B.

**NOTE:** On a QFX5100 switch, the minimum transmit interval must be 1000 milliseconds or greater. Sub-second timers are not supported in Junos OS 13.2X51-D10 and later. If you configure the minimum transmit interval timer lower than 1000 milliseconds, the state of the MC-LAG can be affected.

---

```
[edit protocols ospf area 0.0.0.0]
user@switch# set interface vlan.100 bfd-liveness-detection
minimum-receive-interval 700
user@switch# set interface vlan.100 bfd-liveness-detection transmit-interval
minimum-interval 350
```

```

user@switch# set interface vlan.100 bfd-liveness-detection transmit-interval
threshold 500
user@switch# set interface vlan.200 bfd-liveness-detection
minimum-receive-interval 700
user@switch# set interface vlan.200 bfd-liveness-detection transmit-interval
minimum-interval 350
user@switch# set interface vlan.200 bfd-liveness-detection transmit-interval
threshold 500

```

### Step-by-Step Procedure

To configure PIM as the multicast protocol:

1. Configure a static rendezvous point (RP) address on Switch A and Switch B.  

```

[edit protocols pim]
user@switch# set rp static address 1.0.0.3

```
2. Configure the address ranges of the multicast groups for which Switch A and Switch B can be a rendezvous point (RP).  

```

[edit protocols pim rp static address 1.0.0.3]
user@switch# set group-ranges 239.0.0.0/8

```
3. Enable PIM on the VLAN interfaces for the MC-LAGs on Switch A and Switch B.  

```

[edit protocols pim]
user@switch# set interface vlan.100 dual-dr
user@switch# set interface vlan.200 dual-dr

```
4. Configure each PIM interface's priority for being selected as the designated router (DR).

An interface with a higher priority value has a higher probability of being selected as the DR.

#### Switch A

```

[edit protocols pim]
user@switch# set interface vlan.100 priority 200
user@switch# set interface vlan.200 priority 600

```

#### Switch B

```

[edit protocols pim]
user@switch# set interface vlan.100 priority 100
user@switch# set interface vlan.200 priority 500

```

5. Configure the minimum receive interval, minimum transmit interval, and transmit interval threshold for a Bidirectional Forwarding Detection (BFD) session for the PIM interfaces on Switch A and Switch B.

```

[edit protocols pim]
user@switch# set interface vlan.100 bfd-liveness-detection
minimum-receive-interval 700
user@switch# set interface vlan.100 bfd-liveness-detection transmit-interval
minimum-interval 350
user@switch# set interface vlan.100 bfd-liveness-detection transmit-interval
threshold 500
user@switch# set interface vlan.200 bfd-liveness-detection
minimum-receive-interval 700

```

```
user@switch# set interface vlan.200 bfd-liveness-detection transmit-interval
minimum-interval 350
```

```
user@switch# set interface vlan.200 bfd-liveness-detection transmit-interval
threshold 500
```

**Step-by-Step  
Procedure**

To enable RSTP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable RSTP globally on all interfaces on Switch A and Switch B.

```
[edit protocols rstp]
user@switch# set interface all mode point-to-point
```

2. Disable RSTP on the ICL-PL interfaces on Switch A and Switch B.

```
[edit protocols rstp]
user@switch# set interface ae0.0 disable
```

3. Configure the MC-LAG interfaces as edge ports on Switch A and Switch B.

**NOTE:** The ae1 and ae2 interfaces are downstream interfaces. This is why RSTP and bpd-block-on-edge need to be configured.

```
[edit protocols rstp]
user@switch# set interface ae1.0 edge
user@switch# set interface ae2.0 edge
```

4. Enable BPDU blocking on all interfaces except for the ICL-PL interfaces on Switch A and Switch B.

**NOTE:** The ae1 and ae2 interfaces are downstream interfaces. This is why RSTP and bpd-block-on-edge need to be configured.

```
[edit protocols rstp]
user@switch# set bpd-block-on-edge
```

**Results**

From configuration mode on Switch A, confirm your configuration by entering the **show chassis**, **show interfaces**, **show multi-chassis**, **show protocols**, and **show vlans** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

**Original CLI:**

```
chassis {
  aggregated-devices {
    ethernet {
      device-count 3;
    }
  }
}
```

```

    }
  }

From configuration mode on Switch B, confirm your configuration by entering the **show chassis**, **show interfaces**, **show multi-chassis**, **show protocols**, and **show vlans** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

### Verification

To verify that the MC-LAG group has been created and is working properly, perform these tasks:

- [Verifying That Switch A is the Master Designated Router on page 2529](#)
- [Verifying That Switch B is the Backup Designated Router on page 2529](#)

#### *Verifying That Switch A is the Master Designated Router*

**Purpose** Verify that Switch A is the master designated router (DR).

**Action** From operational mode, enter the `show pim interfaces` command.

```
user@switch> show pim interfaces
```

Stat = Status, V = Version, NbrCnt = Neighbor Count,

S = Sparse, D = Dense, B = Bidirectional,

DR = Designated Router, P2P = Point-to-point link,

Active = Bidirectional is active, NotCap = Not Bidirectional Capable

| Name      | Stat | Mode | IP | V | State         | NbrCnt | JoinCnt(sg/*g) | DR | address   |
|-----------|------|------|----|---|---------------|--------|----------------|----|-----------|
| pim.32769 | Down | S    | 4  | 2 | P2P,NotCap    | 0      | 0/0            |    |           |
| vlan.100  | Up   | S    | 4  | 2 | DDR-DR,NotCap | 1      | 0/0            |    | 10.1.1.11 |
| vlan.200  | Up   | S    | 4  | 2 | DDR-DR,NotCap | 2      | 0/0            |    | 10.1.1.21 |

**Meaning** The DDR-DR state of the VLAN interfaces in the output shows that Switch A is the master designated router.

#### *Verifying That Switch B is the Backup Designated Router*

**Purpose** Verify that Switch B is the backup designated router (BDR).

**Action** From operational mode, enter the `show pim interfaces` command.

```
user@switch> show pim interfaces
```

Stat = Status, V = Version, NbrCnt = Neighbor Count,

S = Sparse, D = Dense, B = Bidirectional,

DR = Designated Router, P2P = Point-to-point link,

Active = Bidirectional is active, NotCap = Not Bidirectional Capable

| Name      | Stat | Mode | IP | V | State          | NbrCnt | JoinCnt(sg/*g) | DR | address   |
|-----------|------|------|----|---|----------------|--------|----------------|----|-----------|
| pim.32769 | Down | S    | 4  | 2 | P2P,NotCap     | 0      | 0/0            |    |           |
| vlan.100  | Up   | S    | 4  | 2 | DDR-BDR,NotCap | 1      | 0/0            |    | 10.1.1.11 |
| vlan.200  | Up   | S    | 4  | 2 | DDR-BDR,NotCap | 2      | 0/0            |    | 10.1.1.21 |

**Meaning** The DDR-BDR state of the VLAN interfaces in the output shows that Switch B is the backup designated router.

**Related Documentation**

- [Understanding Multichassis Link Aggregation on page 2411](#)
- [Configuring Multichassis Link Aggregation on page 2597](#)

## Example: Configuring Multichassis Link Aggregation with Layer 3 MAC Address Synchronization

**NOTE:** Multichassis Link Aggregation (MC-LAG) is supported on QFX3500 and QFX3600 standalone switches running the original CLI and QFX5100 standalone switches running Enhanced Layer 2 Software.

**NOTE:** Issuing a PING request on an MC-LAG with MAC synchronization enabled does not work.

There are 2 methods for enabling Layer 3 unicast functionality across a multichassis link aggregation group (MC-LAG). You can choose either to synchronize the MAC addresses between the switches for the participating MC-LAG interfaces, or you can configure Virtual Router Redundancy Protocol (VRRP). The procedure to configure MAC address synchronization is included in this example. For more information on configuring VRRP for use in a Layer 3 unicast MC-LAG, see “[Example: Configuring Multichassis Link Aggregation for Layer 3 Unicast Using Virtual Router Redundancy Protocol \(VRRP\)](#)” on page 2551.

### Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 12.3 or later for the QFX3500 and QFX3600 standalone switches and Junos OS Release 13.2X51-D10 or later for the QFX5100 standalone switches.
- Two QFX3500 or QFX3600 standalone switches, or two QFX5100 standalone switches.

Before you configure an MC-LAG for Layer 3 unicast, be sure that you understand how to:

- Configure aggregated Ethernet interfaces on a switch. See “[Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch](#)” on page 2462.

- Configure the Link Aggregation Control Protocol (LACP) on aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch”](#) on page 2466.

## Overview

In this example, you configure an MC-LAG across two switches, consisting of two aggregated Ethernet interfaces, an interchassis control link-protection link (ICL-PL), multichassis protection link for the ICL-PL, ICCP for the peers hosting the MC-LAG, and Layer 3 connectivity between MC-LAG peers. Layer 3 connectivity is required for ICCP.

## Topology

The topology used in this example consists of two switches hosting an MC-LAG. The two switches are connected to a server. [Figure 51 on page 2472](#) shows the topology of this example.

**Figure 53: Configuring a Multichassis LAG Between Switch A and Switch B**

g041294

[Table 235 on page 2463](#) details the topology used in this configuration example.

Table 238: Components of the Topology for Configuring a Multichassis LAG Between Two Switches

| Hostname | Base Hardware  | Multichassis Link Aggregation Group   |
|----------|--|---|
| Switch A | QFX3500 or QFX3600 standalone switch, or QFX5100 standalone switch | <b>ae0</b> is configured as an aggregated Ethernet interface, and is used as an ICL-PL. The following interfaces are part of <b>ae0</b> : <b>xe-0/0/12</b> and <b>xe-0/0/13</b> on Switch A and <b>xe-0/0/12</b> and <b>xe-0/0/13</b> on Switch B.<br><br><b>ae1</b> is configured as an MC-LAG, and the following two interfaces are part of <b>ae1</b> : <b>xe-0/0/44</b> on Switch A and <b>xe-0/0/46</b> on Switch B. |
| Switch B | QFX3500 or QFX3600 standalone switch, or QFX5100 standalone switch |   |

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and paste the commands into the CLI at the **[edit]** hierarchy level of Switch A.

**NOTE:** This example shows how to configure MC-LAG using both the original CLI and Enhanced Layer 2 Software (ELS).

In ELS, there are three different statements and one different option from the original CLI:

- The `port-mode` statement in the `[edit interfaces interface-name unit number family ethernet-switching]` hierarchy is not supported. Use the `interface-mode` statement instead.
- The `vlan` statement in the `[edit interfaces interface-name]` hierarchy is not supported. Use the `irb` statement instead.
- The `vlan.logical-interface-number` option in the `[edit vlans vlan-name l3-interface]` option is not supported. Use the `irb.logical-interface-number` option instead.
- The `service-id` statement in the `[edit switch-options]` hierarchy is required in the ELS CLI.

#### Original CLI on Switch A:

```
set chassis aggregated-devices ethernet device-count 2
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0
set interfaces xe-0/0/44 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching port-mode trunk
set interfaces ae0 unit 0 family ethernet-switching vlan members v500
set interfaces ae1 aggregated-ether-options lacp active
```

```

set interfaces ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
set interfaces ae1 aggregated-ether-options lacp admin-key 3
set interfaces ae1 aggregated-ether-options mc-ae mc-ae-id 3
set interfaces ae1 aggregated-ether-options mc-ae chassis-id 0
set interfaces ae1 aggregated-ether-options mc-ae mode active-active
set interfaces ae1 aggregated-ether-options mc-ae status-control active
set ae1 aggregated-ether-options mc-ae init-delay-time 240
set interfaces ae1 unit 0 family ethernet-switching port-mode trunk
set interfaces ae1 unit 0 family ethernet-switching vlan members v100
set interfaces vlan unit 500 family inet address 3.3.3.2/24
set vlans v100 vlan-id 100
set vlans v500 vlan-id 500
set vlans v500 l3-interface vlan.500
set protocols iccp local-ip-addr 3.3.3.2
set protocols iccp peer 3.3.3.1 session-establishment-hold-time 50
set protocols iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip 10.207.64.233
set protocols iccp peer 3.3.3.1 liveness-detection minimum-receive-interval 1000
set protocols iccp peer 3.3.3.1 liveness-detection transmit-interval minimum-interval 1000
set protocols rstp interface ae0.0 disable
set protocols rstp interface ae1.0 edge
set protocols rstp interface all mode point-to-point
set protocols rstp bpdu-block-on-edge
set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0

```

#### ELS on Switch A:

```

set chassis aggregated-devices ethernet device-count 2
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0
set interfaces xe-0/0/44 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching interface-mode trunk
set interfaces ae0 unit 0 family ethernet-switching vlan members v500
set interfaces ae1 aggregated-ether-options lacp active
set interfaces ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
set interfaces ae1 aggregated-ether-options lacp admin-key 3
set interfaces ae1 aggregated-ether-options mc-ae mc-ae-id 3
set interfaces ae1 aggregated-ether-options mc-ae chassis-id 0
set interfaces ae1 aggregated-ether-options mc-ae mode active-active
set interfaces ae1 aggregated-ether-options mc-ae status-control active
set ae1 aggregated-ether-options mc-ae init-delay-time 240
set interfaces ae1 unit 0 family ethernet-switching interface-mode trunk
set interfaces ae1 unit 0 family ethernet-switching vlan members v100
set interfaces irb unit 500 family inet address 3.3.3.2/24
set vlans v100 vlan-id 100
set vlans v500 vlan-id 500
set vlans v500 l3-interface irb.500
set protocols iccp local-ip-addr 3.3.3.2
set protocols iccp peer 3.3.3.1 session-establishment-hold-time 50
set protocols iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip 10.207.64.233
set protocols iccp peer 3.3.3.1 liveness-detection minimum-receive-interval 1000
set protocols iccp peer 3.3.3.1 liveness-detection transmit-interval minimum-interval 1000
set protocols rstp interface ae0.0 disable
set protocols rstp interface ae1.0 edge
set protocols rstp interface all mode point-to-point
set protocols rstp bpdu-block-on-edge
set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
set switch-options service-id 10

```

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network

configuration, and paste the commands into the CLI at the **[edit]** hierarchy level of Switch B.

#### Original CLI on Switch B:

```
set chassis aggregated-devices ethernet device-count 2
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0
set interfaces xe-0/0/46 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching port-mode trunk
set interfaces ae0 unit 0 family ethernet-switching vlan members v500
set interfaces ae1 aggregated-ether-options lacp active
set interfaces ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
set interfaces ae1 aggregated-ether-options lacp admin-key 3
set interfaces ae1 aggregated-ether-options mc-ae mc-ae-id 3
set interfaces ae1 aggregated-ether-options mc-ae chassis-id 1
set interfaces ae1 aggregated-ether-options mc-ae mode active-active
set interfaces ae1 aggregated-ether-options mc-ae status-control standby
set ae1 aggregated-ether-options mc-ae init-delay-time 240
set interfaces ae1 unit 0 family ethernet-switching port-mode trunk
set interfaces ae1 unit 0 family ethernet-switching vlan members v100
set interfaces vlan unit 500 family inet address 3.3.3.1/24
set vlans v100 vlan-id 100
set vlans v500 vlan-id 500
set vlans v500 l3-interface vlan.500
set protocols iccp local-ip-addr 3.3.3.1
set protocols iccp peer 3.3.3.2 session-establishment-hold-time 50
set protocols iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip 10.207.64.233
set protocols iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 1000
set protocols iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval 1000
set protocols rstp interface ae0.0 disable
set protocols rstp interface ae1.0 edge
set protocols rstp interface all mode point-to-point
set protocols rstp bpdu-block-on-edge
set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0
```

#### ELS on Switch B:

```
set chassis aggregated-devices ethernet device-count 2
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0
set interfaces xe-0/0/46 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching interface-mode trunk
set interfaces ae0 unit 0 family ethernet-switching vlan members v500
set interfaces ae1 aggregated-ether-options lacp active
set interfaces ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
set interfaces ae1 aggregated-ether-options lacp admin-key 3
set interfaces ae1 aggregated-ether-options mc-ae mc-ae-id 3
set interfaces ae1 aggregated-ether-options mc-ae chassis-id 1
set interfaces ae1 aggregated-ether-options mc-ae mode active-active
set interfaces ae1 aggregated-ether-options mc-ae status-control standby
set ae1 aggregated-ether-options mc-ae init-delay-time 240
set interfaces ae1 unit 0 family ethernet-switching port-mode trunk
set interfaces ae1 unit 0 family ethernet-switching vlan members v100

set protocols rstp interface ae1.0 edge
set protocols rstp interface all mode point-to-point
set protocols rstp bpdu-block-on-edge
set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0
set switch-options service-id 10

```

### Configuring MC-LAG on Two Switches

#### Step-by-Step Procedure

To enable multichassis protection link between MC-LAG peers:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the number of LAGs on both Switch A and Switch B.

```

[edit chassis]
user@switch# set aggregated-devices ethernet device-count 2

```

2. Add member interfaces to the aggregated Ethernet interfaces on both Switch A and Switch B.

```

[edit interfaces]
user@switch# set xe-0/0/12 ether-options 802.3ad ae0
[edit interfaces]
user@switch# set xe-0/0/13 ether-options 802.3ad ae0
[edit interfaces]
user@switch# set xe-0/0/44 ether-options 802.3ad ae1
[edit interfaces]
user@switch# set xe-0/0/46 ether-options 802.3ad ae1

```

3. Configure a trunk interface between Switch A and Switch B.

```

[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk

```

4. Configure a multichassis protection link between Switch A and Switch B.

Switch A:

```

[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0

```

Switch B:

```

[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0

```

**Step-by-Step  
Procedure**

To enable ICCP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the local IP address to be in the ICCP connection on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.2
```

Switch B:

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.1
```

2. Configure the peer IP address and minimum receive interval for a (BFD) session for ICCP on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 liveness-detection minimum-receive-interval 1000
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 1000
```

3. Configure the peer IP address and minimum transmit interval for Bidirectional Forwarding Detection (BFD) session for ICCP on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 liveness-detection transmit-interval minimum-interval 1000
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval 1000
```

4. (Optional) Configure the time during which an ICCP connection must succeed between MC-LAG peers on Switch A and Switch B.

**NOTE:** Configuring session establishment hold time helps in faster ICCP connection establishment. The recommended value is 50 seconds.

---

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 session-establishment-hold-time 50
```

Switch B:

```
[edit protocols]
```

- user@switch# **set iccp peer 3.3.3.2 session-establishment-hold-time 50**
5. (Optional) Configure the backup IP address to be used for backup liveness detection on both Switch A and Switch B.

**NOTE:** By default, backup liveness detection is not enabled. Configuring a backup IP address helps achieve sub-second traffic loss during a MC-LAG peer reboot.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip 10.207.64.233
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip 10.207.64.232
```

6. Configure Layer 3 connectivity between the MC-LAG peers on both Switch A and Switch B using the original CLI:

```
[edit vlans]
user@switch# set v500 vlan-id 500
[edit vlans]
user@switch# set v500 l3-interface vlan.500
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk vlan members v500
```

7. Configure Layer 3 connectivity between the MC-LAG peers on both Switch A and Switch B using ELS:

```
[edit vlans]
user@switch# set v500 vlan-id 500
[edit vlans]
user@switch# set v500 l3-interface irb.500
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk vlan members v500
```

**Step-by-Step Procedure**

To enable the MC-LAG interface:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable LACP on the MC-LAG interface on Switch A and Switch B.

**NOTE:** At least one end needs to be active. The other end can be either active or passive.

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options lacp active**

2. Specify the same multichassis aggregated Ethernet identification number on both MC-LAG peers on Switch A and Switch B.

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae mc-ae-id 3**

3. Specify the same service ID on Switch A and Switch B.

ELS:

[edit]

user@switch# **set switch-options service-id 10**

4. Specify a unique chassis ID for the MC-LAG on the MC-LAG peers on Switch A and Switch B.

Switch A:

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae chassis-id 0**

Switch B:

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae chassis-id 1**

5. Specify the operating mode of the MC-LAG on both Switch A and Switch B.

**NOTE:** Only active-active mode is supported at this time.

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae mode active-active**

6. Specify the status control for MC-LAG on Switch A and Switch B.

**NOTE:** You must configure status control on both Switch A and Switch B hosting the MC-LAG. If one peer is in active mode, the other must be in standby mode.

Switch A:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae status-control active
```

Switch B:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae status-control standby
```

7. Specify the number of seconds by which the bring-up of the MC-AE interface should be deferred after you reboot Switch A and Switch B.

**NOTE:** The recommended value for maximum VLAN configuration (for example, 4,000 VLANs) is 240 seconds. If IGMP snooping is enabled on all of the VLANs, the recommended value is 420 seconds.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae init-delay-time 240
```

8. Specify the same LACP system ID for the MC-LAG on Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp system-ID 00:01:02:03:04:05
```

9. Specify the same LACP administration key on both Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp admin-key 3
```

10. Enable a VLAN on the MC-LAG on Switch A and Switch B using the original CLI:

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching port-mode trunk
[edit]
```

```
user@switch# set vlans v100 vlan-id 100
```

```
[edit interfaces]
```

```
user@switch# set ae1 unit 0 family ethernet-switching vlan members v100
```

11. Enable a VLAN on the MC-LAG on Switch A and Switch B using ELS:

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching interface-mode trunk
[edit]
```

```
user@switch# set vlans v100 vlan-id 100
```

```
[edit interfaces]
```

```
user@switch# set ae1 unit 0 family ethernet-switching vlan members v100
```

### Step-by-Step Procedure

To enabled RSTP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable RSTP globally on all interfaces on Switch A and Switch B.

```
[edit]
user@switch# set protocols rstp interface all mode point-to-point
```

2. Disable RSTP on the ICL-PL interfaces on Switch A and Switch B:

```
[edit]
user@switch# set protocols rstp interface ae0.0 disable
```

3. Configure the MC-LAG interfaces as edge ports on Switch A and Switch B.

```
[edit]
```

- ```
user@switch# set protocols rstp interface ae1.0 edge
```
4. Enable BPDU blocking on all interfaces except for the ICL-PL interfaces on Switch A and Switch B.

```
[edit]
```

```
user@switch# set protocols rstp bpdv-block-on-edge
```

### Results

Display the results of the configuration on Switch A using the original CLI.

### Verification

To verify that the MC-LAG group has been created and is working properly, perform these tasks:

- [Verifying That ICCP Is Working on Switch A on page 2548](#)
- [Verifying That ICCP Is Working on Switch B on page 2548](#)
- [Verifying That LACP Is Active on Switch A on page 2549](#)
- [Verifying That LACP Is Active on Switch B on page 2549](#)
- [Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch A on page 2549](#)
- [Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch B on page 2550](#)
- [Verifying that MAC Learning Is Occurring on Switch A and Switch B on page 2550](#)

#### ***Verifying That ICCP Is Working on Switch A***

**Purpose** Verify that ICCP is running on Switch A.

**Action** [edit]  
user@switch# show iccp  
Redundancy Group Information for peer 3.3.3.1  
TCP Connection : Established  
Liveliness Detection : Up  
  
Client Application: MCSNOOPD  
  
Client Application: eswd

**Meaning** This output shows that the TCP connection between the peers hosting the MC-LAG is up, liveness detection is up, and MCSNOOPD and ESWD client applications are running.

#### ***Verifying That ICCP Is Working on Switch B***

**Purpose** Verify that ICCP is running on Switch B.

**Action** show iccp  
  
[edit]  
user@switch# show iccp  
Redundancy Group Information for peer 3.3.3.2  
TCP Connection : Established  
Liveliness Detection : Up

Client Application: MCSNOOPD

Client Application: eswd

**Meaning** This output shows that the TCP connection between the peers hosting the MC-LAG is up, liveness detection is up, and MCSNOOPD and ESWD client applications are running.

#### *Verifying That LACP Is Active on Switch A*

**Purpose** Verify that LACP is active on Switch A.

**Action** [edit]  
 user@switch# show lacp interfaces  
 Aggregated interface: ae1

LACP state:	Role	Exp	Def	Dist	Col	Syn	Aggr	Timeout	Activity
xe-0/0/46	Actor	No	No	Yes	Yes	Yes	Yes	Fast	Active
xe-0/0/46	Partner	No	No	Yes	Yes	Yes	Yes	Fast	Active
LACP protocol:	Receive State	Transmit State	Mux State						
xe-0/0/46	Current	Fast periodic	Collecting distributing						

**Meaning** This output shows that Switch A is participating in LACP negotiation.

#### *Verifying That LACP Is Active on Switch B*

**Purpose** Verify that LACP is active on Switch B

**Action** [edit]  
 user@switch# show lacp interfaces  
 Aggregated interface: ae1

LACP state:	Role	Exp	Def	Dist	Col	Syn	Aggr	Timeout	Activity
xe-0/0/44	Actor	No	No	Yes	Yes	Yes	Yes	Fast	Active
xe-0/0/44	Partner	No	No	Yes	Yes	Yes	Yes	Fast	Active
LACP protocol:	Receive State	Transmit State	Mux State						
xe-0/0/44	Current	Fast periodic	Collecting distributing						

**Meaning** This output shows that Switch B is participating in LACP negotiation.

#### *Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch A*

**Purpose** Verify that the MC-AE and ICL-PL interfaces are up on Switch A.

**Action** [edit]  
user@switch# **show interfaces mc-ae**  
Member Link : ae1  
Current State Machine's State: mcae active state  
Local Status : active  
Local State : up  
Peer Status : active  
Peer State : up  
Logical Interface : ae1.0  
Topology Type : bridge  
Local State : up  
Peer State : up  
Peer Ip/MCP/State : 3.3.3.1 ae0.0 up

**Meaning** This output shows that the MC-AE interface on Switch A is up and active.

***Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch B***

**Purpose** Verify that the MC-AE and ICL-PL interfaces are up on Switch B.

**Action** [edit]  
user@switch# **show interfaces mc-ae**  
Member Link : ae1  
Current State Machine's State: mcae active state  
Local Status : active  
Local State : up  
Peer Status : active  
Peer State : up  
Logical Interface : ae1.0  
Topology Type : bridge  
Local State : up  
Peer State : up  
Peer Ip/MCP/State : 3.3.3.2 ae0.0 up

**Meaning** This output shows that the MC-AE interface on Switch B is up and active.

***Verifying that MAC Learning Is Occurring on Switch A and Switch B***

**Purpose** Verify that MAC learning is working on Switch A and B.

**Action** [edit]  
user@switch# **show ethernet-switching table**  
Ethernet-switching table: 10 entries, 4 learned, 0 persistent entries

VLAN	MAC address	Type	Age	Interfaces
v222	*	Flood	-	All-members
v222	00:00:5e:00:01:01	Static	-	Router
v222	00:10:94:00:00:05	Learn(L)	33	ae0.0 (MCAE)
v222	84:18:88:df:ac:ae	Learn(R)	0	ae2.0

**Meaning** The output shows four learned MAC addresses entries.

## Troubleshooting

---

### *Troubleshooting a LAG That Is Down*

**Problem** The `show interfaces terse` command shows that the MC-LAG is **down**

**Solution** Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that the MC-LAG is part of family Ethernet switching (Layer 2 LAG).
- Verify that the MC-LAG member is connected to the correct MC-LAG member at the other end.

**Related Documentation**

- [Understanding Multichassis Link Aggregation on page 2411](#)
- [Configuring Multichassis Link Aggregation on page 2597](#)
- [Example: Configuring Multichassis Link Aggregation for Layer 3 Multicast Using VRRP on page 2493](#)

### Example: Configuring Multichassis Link Aggregation for Layer 3 Unicast Using Virtual Router Redundancy Protocol (VRRP)

There are two methods for enabling Layer 3 unicast functionality across a multichassis link aggregation group (MC-LAG). You can choose either to configure Virtual Router Redundancy Protocol (VRRP) or synchronize the MAC addresses for the Layer 3 interfaces of the switches participating in the MC-LAG. The procedure to configure VRRP for use in a Layer 3 unicast MC-LAG is included in this example. For more information on configuring MAC address synchronization, see *Example: Configuring Multichassis Link Aggregation for Layer 3 Unicast using MAC Address Synchronization*.

- [Requirements on page 2551](#)
- [Overview on page 2552](#)
- [Configuration on page 2553](#)
- [Verification on page 2572](#)
- [Troubleshooting on page 2577](#)

## Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 12.3 or later for the QFX Series
- Two QFX3500 or QFX3600 or QFX5100 switches

Before you configure an MC-LAG, be sure that you understand how to:

- Configure aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch”](#) on page 2462.
- Configure the Link Aggregation Control Protocol (LACP) on aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch”](#) on page 2466.
- Configure Virtual Router Redundancy Protocol (VRRP) on a switch. See [“Configuring Basic VRRP Support”](#) on page 2285.

---

## Overview

In this example, you configure an MC-LAG across two switches by including interfaces from both switches in an aggregated Ethernet interface (ae1). To support the MC-LAG, create a second aggregated Ethernet interface (ae0) for the interchassis control link-protection link (ICL-PL). Configure a multichassis protection link for the ICL-PL, Interchassis Control Protocol (ICCP) for the peers hosting the MC-LAG, and Layer 3 connectivity between MC-LAG peers.

**NOTE:** Layer 3 connectivity is required for ICCP.

---

To complete the configuration, enable VRRP by completing the following steps:

- Create a routed VLAN interface (RVI)
- Create a VRRP group and assign a virtual IP address that is shared between each switch in the VRRP group
- Enable a member of a VRRP group to accept all packets destined for the virtual IP address if it is the master in the VRRP group
- Configure Layer 3 connectivity between the VRRP groups

## Topology

The topology used in this example consists of two switches hosting an MC-LAGs. The two switches are connected to a server. [Figure 54 on page 2553](#) shows the topology of this example.

Figure 54: Configuring a Multichassis LAG Between Switch A and Switch B

Table 235 on page 2463 details the topology used in this configuration example.

Table 239: Components of the Topology for Configuring a Multichassis LAG Between Two Switches

Hostname	Base Hardware	Multichassis Link Aggregation Group
Switch A	QFX3500, QFX3600, or QFX5100 switch	<b>ae0</b> is configured as an aggregated Ethernet interface, and is used as an ICL-PL. The following interfaces are part of <b>ae0</b> : <b>xe-0/0/12</b> and <b>xe-0/0/13</b> on Switch A and <b>xe-0/0/12</b> and <b>xe-0/0/13</b> on Switch B.  <b>ae1</b> is configured as an MC-LAG, and the following two interfaces are part of <b>ae1</b> : <b>xe-0/0/44</b> on Switch A and <b>xe-0/0/46</b> on Switch B.
Switch B		

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and paste the commands into the CLI at the **[edit]** hierarchy level of Switch A.

**NOTE:** This example shows how to configure MC-LAG using both the original CLI and Enhanced Layer 2 Software (ELS).

In ELS, there are three different statements and one different option from the original CLI:

- The port-mode statement in the [edit interfaces *interface-name* unit *number* family ethernet-switching] hierarchy is not supported. Use the interface-mode statement instead.
- The vlan statement in the [edit interfaces *interface-name*] hierarchy is not supported. Use the irb statement instead.
- The vlan.logical-interface-number option in the [edit vlans *vlan-name* l3-interface] option is not supported. Use the irb.logical-interface-number option instead.
- The service-id statement in the [edit switch-options] hierarchy is required in the ELS CLI.

#### Original CLI:

```
set chassis aggregated-devices ethernet device-count 2
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0

### Configuring MC-LAG on Two Switches

#### Step-by-Step Procedure

To enable multichassis protection link between MC-LAG peers:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the number of LAGs on both Switch A and Switch B.  

```
[edit chassis]
user@switch# set aggregated-devices ethernet device-count 2
```
2. Add member interfaces to the aggregated Ethernet interfaces on both Switch A and Switch B.  

```
[edit interfaces]
user@switch# set xe-0/0/12 ether-options 802.3ad ae0
[edit interfaces]
user@switch# set xe-0/0/13 ether-options 802.3ad ae0
[edit interfaces]
user@switch# set xe-0/0/44 ether-options 802.3ad ae1
[edit interfaces]
user@switch# set xe-0/0/46 ether-options 802.3ad ae1
```
3. Configure a trunk interface between Switch A and Switch B using the original CLI.  

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk
```
4. Configure a trunk interface between Switch A and Switch B using ELS.  

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk
```
5. Configure a multichassis protection link between Switch A and Switch B.  

Switch A:

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0
```

Switch B:

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
```

**Step-by-Step  
Procedure**

To enable ICCP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the local IP address to be in the ICCP connection on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.2
```

Switch B:

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.1
```

2. Configure the peer IP address and minimum receive interval for a (BFD) session for ICCP on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 liveness-detection minimum-receive-interval 1000
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 1000
```

3. Configure the peer IP address and minimum transmit interval for Bidirectional Forwarding Detection (BFD) session for ICCP on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 liveness-detection transmit-interval minimum-interval 1000
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval 1000
```

4. (Optional) Configure the time during which an ICCP connection must succeed between MC-LAG peers on Switch A and Switch B.

**NOTE:** Configuring session establishment hold time helps in faster ICCP connection establishment. The recommended value is 50 seconds.

---

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 session-establishment-hold-time 50
```

Switch B:

```
[edit protocols]
```

- user@switch# **set iccp peer 3.3.3.2 session-establishment-hold-time 50**
5. (Optional) Configure the backup IP address to be used for backup liveness detection on both Switch A and Switch B.

**NOTE:** By default, backup liveness detection is not enabled. Configuring a backup IP address helps achieve sub-second traffic loss during a MC-LAG peer reboot.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip 10.207.64.233
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip 10.207.64.232
```

6. Configure Layer 3 connectivity between the MC-LAG peers on both Switch A and Switch B using the original CLI.

```
[edit vlans]
user@switch# set v500 vlan-id 500
[edit vlans]
user@switch# set v500 l3-interface vlan.500
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk vlan members v500 v100
```

7. Configure Layer 3 connectivity between the MC-LAG peers on both Switch A and Switch B using ELS.

```
[edit vlans]
user@switch# set v500 vlan-id 500
[edit vlans]
user@switch# set v500 l3-interface irb.500
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk vlan members v500 v100
```

**Step-by-Step Procedure**

To enable the MC-LAG interface:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable LACP on the MC-LAG interface on Switch A and Switch B.

**NOTE:** At least one end needs to be active. The other end can be either active or passive.

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options lacp active**

2. Specify the same multichassis aggregated Ethernet identification number on both MC-LAG peers on Switch A and Switch B.

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae mc-ae-id 3**

3. Specify the same service ID on Switch A and Switch B.

ELS:

[edit]

user@switch# **set switch-options service-id 10**

4. Specify a unique chassis ID for the MC-LAG on the MC-LAG peers on Switch A and Switch B.

Switch A:

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae chassis-id 0**

Switch B:

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae chassis-id 1**

5. Specify the operating mode of the MC-LAG on both Switch A and Switch B.

**NOTE:** Only active-active mode is supported at this time.

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae mode active-active**

6. Specify the status control for MC-LAG on Switch A and Switch B.

**NOTE:** You must configure status control on both Switch A and Switch B hosting the MC-LAG. If one peer is in active mode, the other must be in standby mode.

Switch A:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-aether-options status-control active
```

Switch B:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-aether-options status-control standby
```

7. Specify the number of seconds by which the bring-up of the MC-AE interface should be deferred after you reboot Switch A and Switch B.

**NOTE:** The recommended value for maximum VLAN configuration (for example, 4,000 VLANs) is 240 seconds. If IGMP snooping is enabled on all of the VLANs, the recommended value is 420 seconds.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-aether-options init-delay-time 240
```

8. Specify the same LACP system ID for the MC-LAG on Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
```

9. Specify the same LACP administration key on both Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp admin-key 3
```

10. Enable a VLAN on the MC-LAG on Switch A and Switch B using the original CLI.

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching port-mode trunk
[edit]
```

```
user@switch# set vlans v100 vlan-id 100
```

```
[edit interfaces]
```

```
user@switch# set ae1 unit 0 family ethernet-switching vlan members v100
```

11. Enable a VLAN on the MC-LAG on Switch A and Switch B using ELS.

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching interface-mode trunk
[edit]
```

```
user@switch# set vlans v100 vlan-id 100
```

```
[edit interfaces]
```

```
user@switch# set ae1 unit 0 family ethernet-switching vlan members v100
```

12. Enable VRRP on the MC-LAG on Switch A and Switch B:

- Create a routed VLAN interface (RVI), assign a virtual IP address that is shared between each switch in the VRRP group, and assign an individual IP address for each switch in the VRRP group:

Switch A:

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 100.1.1.1/24 vrrp-group 1
virtual-address 100.1.1.1
```

Switch B:

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 100.1.1.10/24 vrrp-group 1
virtual-address 100.1.1.1
```

- Assign the priority for each switch in the VRRP group:

**NOTE:** The switch configured with the highest priority is the master.

Switch A:

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 100.1.1.11/24 vrrp-group 1 priority 200
```

Switch B:

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 100.1.1.10/24 vrrp-group 1 priority 150
```

- Enable the switch to accept all packets destined for the virtual IP address if it is the master in the VRRP group:

Switch A:

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 100.1.1.11/24 vrrp-group 1 accept-data
```

Switch B:

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 100.1.1.10/24 vrrp-group 1 accept-data
```

- Configure Layer 3 connectivity between Switch A and Switch B.

```
[edit interfaces]
user@switch# set vlans v100 l3-interface vlan.100
```

13. Enable VRRP on the MC-LAG on Switch A and Switch B using ELS:

- Create a routed VLAN interface (RVI), assign a virtual IP address that is shared between each switch in the VRRP group, and assign an individual IP address for each switch in the VRRP group:

Switch A:

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 100.1.1.11/24 vrrp-group 1 virtual-address 100.1.1.1
```

Switch B:

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 100.1.1.10/24 vrrp-group 1 virtual-address 100.1.1.1
```

- Assign the priority for each switch in the VRRP group:

**NOTE:** The switch configured with the highest priority is the master.

Switch A:

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 100.1.1.11/24 vrrp-group 1 priority 200
```

Switch B:

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 100.1.1.10/24 vrrp-group 1 priority 150
```

- Enable the switch to accept all packets destined for the virtual IP address if it is the master in the VRRP group:

Switch A:

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 100.1.1.11/24 vrrp-group 1 accept-data
```

Switch B:

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 100.1.1.10/24 vrrp-group 1 accept-data
```

- Configure Layer 3 connectivity between Switch A and Switch B.

```
[edit interfaces]
user@switch# set irb v100 l3-interface irb.100
```

### Step-by-Step Procedure

To enable RSTP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable RSTP globally on all interfaces on Switch A and Switch B.

```
[edit]
user@switch# set protocols rstp interface all mode point-to-point
```

2. Disable RSTP on the ICL-PL interfaces on Switch A and Switch B:

```
[edit]
user@switch# set protocols rstp interface ae0.0 disable
```

3. Configure the MC-LAG interfaces as edge ports on Switch A and Switch B.

**NOTE:** The ae1 interface is a downstream interface. This is why RSTP and bpdu-block-on-edge need to be configured.

```
[edit]
user@switch# set protocols rstp interface ae1.0 edge
```

4. Enable BPDU blocking on all interfaces except for the ICL-PL interfaces on Switch A and Switch B.

**NOTE:** The ae1 interface is a downstream interface. This is why RSTP and bpdu-block-on-edge need to be configured.

```
[edit]
user@switch# set protocols rstp bpdu-block-on-edge
```

### Results

Display the results of the configuration on Switch A using the original CLI.

## Verification

To verify that the MC-LAG group has been created and is working properly, perform these tasks:

- [Verifying That ICCP Is Working on Switch A on page 2573](#)
- [Verifying That ICCP Is Working on Switch B on page 2573](#)

- [Verifying That LACP Is Active on Switch A on page 2574](#)
- [Verifying That LACP Is Active on Switch B on page 2574](#)
- [Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch A on page 2574](#)
- [Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch B on page 2574](#)
- [Verifying that MAC Learning Is Occurring on Switch A on page 2575](#)
- [Verifying that MAC Learning Is Occurring on Switch B on page 2575](#)
- [Verifying that Switch A is the Master in the VRRP Group on page 2576](#)
- [Verifying that Switch B is the Backup Member in the VRRP Group on page 2576](#)
- [Verifying that the Virtual IP Address is Attached to an Individual Address on Switch A on page 2577](#)
- [Verifying that the Virtual IP Address is Attached to an Individual Address on Switch B on page 2577](#)

### ***Verifying That ICCP Is Working on Switch A***

**Purpose** Verify that ICCP is running on Switch A.

**Action** [edit]  
 user@switch# **show iccp**  
 Redundancy Group Information for peer 3.3.3.1  
     TCP Connection : Established  
     Liveliness Detection : Up  
  
 Client Application: MCSNOOPD  
  
 Client Application: eswd

**Meaning** This output shows that the TCP connection between the peers hosting the MC-LAG is up, liveness detection is up, and MCSNOOPD and ESWD client applications are running.

### ***Verifying That ICCP Is Working on Switch B***

**Purpose** Verify that ICCP is running on Switch B.

**Action** **show iccp**  
  
 [edit]  
 user@switch# **show iccp**  
 Redundancy Group Information for peer 3.3.3.2  
     TCP Connection : Established  
     Liveliness Detection : Up  
  
 Client Application: MCSNOOPD  
  
 Client Application: eswd

**Meaning** This output shows that the TCP connection between the peers hosting the MC-LAG is up, liveness detection is up, and MCSNOOPD and ESWD client applications are running.

**Verifying That LACP Is Active on Switch A**

**Purpose** Verify that LACP is active on Switch A.

**Action** [edit]  
user@switch# show lacp interfaces  
Aggregated interface: ae1

LACP state:	Role	Exp	Def	Dist	Col	Syn	Aggr	Timeout	Activity
xe-0/0/46	Actor	No	No	Yes	Yes	Yes	Yes	Fast	Active
xe-0/0/46	Partner	No	No	Yes	Yes	Yes	Yes	Fast	Active

LACP protocol:                      Receive State      Transmit State                      Mux State  
xe-0/0/46                                      Current      Fast periodic      Collecting      distributing

**Meaning** This output shows that Switch A is participating in LACP negotiation.

**Verifying That LACP Is Active on Switch B**

**Purpose** Verify that LACP is active on Switch B

**Action** [edit]  
user@switch# show lacp interfaces  
Aggregated interface: ae1

LACP state:	Role	Exp	Def	Dist	Col	Syn	Aggr	Timeout	Activity
xe-0/0/44	Actor	No	No	Yes	Yes	Yes	Yes	Fast	Active
xe-0/0/44	Partner	No	No	Yes	Yes	Yes	Yes	Fast	Active

LACP protocol:                      Receive State      Transmit State                      Mux State  
xe-0/0/44                                      Current      Fast periodic      Collecting      distributing

**Meaning** This output shows that Switch B is participating in LACP negotiation.

**Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch A**

**Purpose** Verify that the MC-AE and ICL-PL interfaces are up on Switch A.

**Action** [edit]  
user@switch# show interfaces mc-ae

```
Member Link                : ae1
Current State Machine's State: mcae active state
Local Status                : active
Local State                  : up
Peer Status                  : active
Peer State                   : up
  Logical Interface          : ae1.0
  Topology Type               : bridge
  Local State                 : up
  Peer State                  : up
  Peer Ip/MCP/State           : 3.3.3.1 ae0.0 up
```

**Meaning** This output shows that the MC-AE interface on Switch A is up and active.

**Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch B**

**Purpose** Verify that the MC-AE and ICL-PL interfaces are up on Switch B.

**Action** [edit]  
 user@switch# **show interfaces mc-ae**  
 Member Link : ae1  
 Current State Machine's State: mcae active state  
 Local Status : active  
 Local State : up  
 Peer Status : active  
 Peer State : up  
 Logical Interface : ae1.0  
 Topology Type : bridge  
 Local State : up  
 Peer State : up  
 Peer Ip/MCP/State : 3.3.3.2 ae0.0 up

**Meaning** This output shows that the MC-AE interface on Switch B is up and active.

#### *Verifying that MAC Learning Is Occurring on Switch A*

**Purpose** Verify that MAC learning is working on Switch A.

**Action** [edit]  
 user@switch# **show ethernet-switching table**  
 Ethernet-switching table: 6 entries, 1 learned, 0 persistent entriesC

VLAN	MAC address	Type	Age	Interfaces
v100	*	Flood		- All-members
v100	00:00:5e:00:01:01	Static		- Router
v100	78:fe:3d:5a:07:42	Static		- Router
v100	78:fe:3d:5b:ad:c2	Learn(R)	0	ae0.0
v500	*	Flood		- All-members
v500	78:fe:3d:5a:07:42	Static		- Router

**Meaning** The output shows two static MAC address in VLAN v100 and one static MAC address in VLAN v500. These addresses belong to the Layer 3 RVI addresses on both Switch A and Switch B that you configured in the MC-LAG. The ICL-PL interface configured on the VRRP master member learned the VLAN v100 Learn (R) MAC address of the VRRP backup member.

#### *Verifying that MAC Learning Is Occurring on Switch B*

**Purpose** Verify that MAC learning is working on Switch B.

**Action** [edit]user@switch# **show ethernet-switching table**

Ethernet-switching table: 7 entries, 1 learned, 0 persistent entries

VLAN	MAC address	Type	Age	Interfaces
v100	*	Flood		- All-members
v100	00:00:5e:00:01:01	Static		- Router
v100	78:fe:3d:5a:07:42	Learn(R)	0	ae0.0
v100	78:fe:3d:5b:ad:c2	Static		- Router
v200	78:fe:3d:5b:ad:c2	Static		- Router
v500	*	Flood		- All-members
v500	78:fe:3d:5b:ad:c2	Static		- Router

**Meaning** The output shows two static MAC address in VLAN v100 and one static MAC address in VLAN v500. These addresses belong to the Layer 3 RVI addresses on both Switch A and Switch B that you configured in the MC-LAG. The ICL-PL interface configured on the VRRP backup member learned the VLAN v100 Learn (R) MAC address of the VRRP master member.

*Verifying that Switch A is the Master in the VRRP Group*

**Purpose** Verify that Switch A is the master member in the VRRP group.

**Action** [edit]user@switch# **show vrrp**

Interface	State	Group	VR state	VR Mode	Timer	Type	Address
vlan.100	up	1	master	Active	A 0.605	lcl	100.1.1.11
						vip	100.1.1.1

**Meaning** The output shows that Switch A is the master member in the VRRP group.

*Verifying that Switch B is the Backup Member in the VRRP Group*

**Purpose** Verify that Switch B is the backup member in the VRRP group.

**Action** [edit]user@switch# **show vrrp**

Interface	State	Group	VR state	VR Mode	Timer	Type	Address
vlan.100	up	1	backup	Active	A 0.605	lcl	100.1.1.10
						vip	100.1.1.1

**Meaning** The output shows that Switch B is the backup member in the VRRP group.

*Verifying that the Virtual IP Address is Attached to an Individual Address on Switch A*

**Action** [edit]  
 user@switch# run show interfaces terse vlan

Interface	Admin	Link	Proto	Local	Remote
vlan	up	up			
vlan.100	up	up	inet	100.1.1.1/24	100.1.1.11/24
vlan.500	up	up	inet	3.3.3.2/24	

**Meaning** The output shows that the virtual IP address (100.1.1.1/24) is bound to the individual IP address (100.1.1.11/24) on Switch A.

*Verifying that the Virtual IP Address is Attached to an Individual Address on Switch B*

**Action** [edit]  
 user@switch# run show interfaces terse vlan

Interface	Admin	Link	Proto	Local	Remote
vlan	up	up			
vlan.100	up	up	inet	100.1.1.1/24	100.1.1.10/24
vlan.500	up	up	inet	3.3.3.1/24	

**Meaning** The output shows that the virtual IP address (100.1.1.1/24) is bound to the individual IP address (100.1.1.10/24) on Switch B.

**Troubleshooting***Troubleshooting a LAG That Is Down*

**Problem** The show interfaces terse command shows that the MC-LAG is down

**Solution** Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that the MC-LAG is part of family Ethernet switching (Layer 2 LAG).
- Verify that the MC-LAG member is connected to the correct MC-LAG member at the other end.

## Example: Configuring Redundant Trunk Links for Faster Recovery

**NOTE:** This example uses Junos OS for EX Series switches or QFX Series with support for the Enhanced Layer 2 Software (ELS) configuration style. If your EX Series switch runs software that does not support ELS, see *Example: Configuring Redundant Trunk Links for Faster Recovery*. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 43.

You can manage network convergence by configuring both a primary link and a secondary link on a switch; this is called a redundant trunk group (RTG). If the primary link in a redundant trunk group fails, it passes its known MAC address locations to the secondary link, which automatically takes over after one minute.

This example describes how to create a redundant trunk group with a primary and a secondary link:

- [Requirements on page 2578](#)
- [Overview and Topology on page 2578](#)
- [Disabling RSTP on Switches 1 and 2 on page 2581](#)
- [Configuring Redundant Trunk Links on Switch 3 on page 2581](#)
- [Verification on page 2582](#)

### Requirements

---

This example uses the following hardware and software components:

- Two EX Series or QFX Series distribution switches
- One EX Series or QFX Series access switch
- The appropriate software release for your platform:
  - For EX Series switches: Junos OS Release 13.2X50-D10 or later
  - For the QFX Series: Junos OS Release 13.2X50-D15 or later

Before you configure the redundant trunk links network on the access and distribution switches, be sure you have:

- Configured interfaces ge-0/0/9 and ge-0/0/10 on the access switch, Switch 3, as trunk interfaces. .
- Configured one trunk interface on each distribution switch, Switch 1 and Switch 2.
- Connected the three switches as shown in the topology for this example (see [Figure 55 on page 2580](#)).

### Overview and Topology

---

In a typical enterprise network composed of distribution and access layers, a redundant trunk link provides a simple solution for trunk interface network recovery. When a trunk

interface fails, data traffic is routed to another trunk interface after one minute, thereby keeping network convergence time to a minimum.

This example shows the configuration of a redundant trunk group that includes one primary link (and its interface) and one unspecified link (and its interface) that serves as the secondary link.

A second type of redundant trunk group, not illustrated in the example, consists of two unspecified links (and their interfaces); in this case, neither of the links is primary. The software selects an active link by comparing the port numbers of the two links and activating the link with the higher port number. For example, if the two link interfaces use interfaces ge-0/1/0 and ge-0/1/1, the software activates ge-0/1/1. (In the interface names, the final number is the port number.)

The two links in a redundant trunk group generally operate the same way, whether they are configured as primary/unspecified or unspecified/unspecified. Data traffic initially passes through the active link but is blocked on the inactive link. While data traffic is blocked on the secondary link, note that Layer 2 control traffic is still permitted if the link is active. For example, an LLDP session can be run between two switches on the secondary link. If the active link either goes down or is disabled administratively, it broadcasts a list of its known MAC addresses for data traffic; the other link immediately picks up and adds the MAC addresses to its address table, becomes active, and begins forwarding traffic.

The one difference in operation between the two types of redundant trunk groups occurs when a primary link is active, goes down, is replaced by the secondary link, and then reactivates. When a primary link is re-enabled like this while the secondary link is active, the primary link waits 2 minutes (you can change the time interval by using the preempt cutover timer to accommodate your network) and then takes over as the active link. In other words, the primary link has priority and is always activated if it is available. This differs from the behavior of two unspecified links, both of which act as equals. Because the unspecified links are equal, the active link remains active until it either goes down or is disabled administratively; this is the only time that the other unspecified link learns the MAC addresses and immediately becomes active.

The example given here illustrates a primary/unspecified configuration for a redundant trunk group because that configuration gives you more control and is more commonly used.

**NOTE:** Rapid Spanning Tree Protocol (RSTP) is enabled by default on the switches to create a loop-free topology, but an interface is not allowed to be in both a redundant trunk group and in a spanning-tree protocol topology at the same time. You will need to disable RSTP on the two distribution switches in the example, Switch 1 and Switch 2. Spanning-tree protocols can, however, continue operating in other parts of the network—for example, between the distribution switches and also in links between distribution switches and the enterprise core.

Figure 55 on page 2580 displays an example topology containing three switches. Switch 1 and Switch 2 make up the distribution layer, and Switch 3 makes up the access layer.

Switch 3 is connected to the distribution layer through trunk interfaces ge-0/0/9.0 (Link 1) and ge-0/0/10.0 (Link 2).

Table 240 on page 2580 lists the components used in this redundant trunk group.

Because RSTP and RTGs cannot operate simultaneously on a switch, you disable RSTP on Switch 1 and Switch 2 in the first configuration task, and you disable RSTP on Switch 3 in the second task.

The second configuration task creates a redundant trunk group called example 1 on Switch 3. The trunk interfaces ge-0/0/9.0 and ge-0/0/10.0 are the two links configured in the second configuration task. You configure the trunk interface ge-0/0/9.0 as the primary link. You configure the trunk interface ge-0/0/10.0 as an unspecified link, which becomes the secondary link by default.

Figure 55: Topology for Configuring the Redundant Trunk Links

Table 240: Components of the Redundant Trunk Link Topology

Property	Settings
Switch hardware	<ul style="list-style-type: none"> <li>Switch 1—1 EX Series or QFX Series distribution switch</li> <li>Switch 2—1 EX Series or QFX Series distribution switch</li> <li>Switch 3—1 EX Series or QFX Series access switch</li> </ul>
Trunk interfaces	On Switch 3 (access switch): ge-0/0/9.0 and ge-0/0/10.0
Redundant trunk group	example1

### Disabling RSTP on Switches 1 and 2

To disable RSTP on Switch 1 and Switch 2, perform this task on each switch:

**CLI Quick Configuration** To quickly disable RSTP on Switch 1 and Switch 2, copy the following command and paste it into each switch terminal window:

```
[edit]
set protocols rstp disable
```

**Step-by-Step Procedure** To disable RSTP on Switch 1 and Switch 2:

1. Disable RSTP on Switch 1 and Switch 2:
- ```
[edit]
user@switch# set protocols rstp disable
```

**Results** Check the results of the configuration:

```
[edit]
user@switch# show
protocols {
  rstp {
    disable;
  }
}
```

### Configuring Redundant Trunk Links on Switch 3

To configure redundant trunk links on Switch 3, perform this task:

**CLI Quick Configuration** To quickly configure the redundant trunk group example1 on Switch 3, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols rstp disable
set switch-options redundant-trunk-group group example1 interface ge-0/0/9.0 primary
set switch-options redundant-trunk-group group example1 interface ge-0/0/10.0
set redundant-trunk-group group example1 preempt-cutover-timer 60
```

**Step-by-Step Procedure** Configure the redundant trunk group example1 on Switch 3.

1. Turn off RSTP:
 

```
[edit]
user@switch# set protocols rstp disable
```
2. Name the redundant trunk group example1 while configuring trunk interface ge-0/0/9.0 as the primary link and ge-0/0/10 as an unspecified link to serve as the secondary link:
 

```
[edit switch-options]
user@switch# set redundant-trunk-group group example1 interface ge-0/0/9.0 primary
user@switch# set redundant-trunk-group group example1 interface ge-0/0/10.0
```
3. (Optional) Change the time interval (from the default 120 seconds) that a re-enabled primary link waits to take over for an active secondary link:
 

```
[edit switch-options]
user@switch# set redundant-trunk-group group example1 preempt-cutover-timer 60
```

**Results** Check the results of the configuration:

```
[edit]
user@switch# show
switch-options
  redundant-trunk-group {
    group example1 {
      preempt-cutover-timer 60;
      interface ge-0/0/9.0 {
        primary;
      }
      interface ge-0/0/10.0;
    }
  }
protocols {
  rstp {
    disable;
  }
}
```

---

### Verification

To confirm that the configuration is set up correctly, perform this task:

- [Verifying That a Redundant Trunk Group Was Created on page 2582](#)

#### *Verifying That a Redundant Trunk Group Was Created*

**Purpose** Verify that the redundant trunk group example1 has been created on Switch 1 and that trunk interfaces are members of the redundant trunk group.

**Action** List all redundant trunk groups configured on the switch:

```
user@switch> show redundant-trunk-group
```

| Group name | Interface   | State  | Time of last flap | Flap count |
|------------|-------------|--------|-------------------|------------|
| example1   | ge-0/0/9.0  | Up/Pri | Never             | 0          |
|            | ge-0/0/10.0 | Up     | Never             | 0          |

**Meaning** The **show redundant-trunk-group** command lists all redundant trunk groups configured on the switch as well as the interface names and their current states (up or down for an unspecified link, and up or down and primary for a primary link). For this configuration example, the output shows that the redundant trunk group example1 is configured on the switch. The **Up** beside the interfaces indicates that both link cables are physically connected. The **Pri** beside trunk interface ge-0/0/9.0 indicates that it is configured as the primary link.

## Example: Configuring Ethernet OAM Link Fault Management on EX Series Switches

Junos OS for switches allows the Ethernet interfaces on these switches to support the IEEE 802.3ah standard for the Operation, Administration, and Maintenance (OAM) of Ethernet in access networks. The standard defines OAM link fault management (LFM). You can configure IEEE 802.3ah OAM LFM on point-to-point Ethernet links that are connected either directly or through Ethernet repeaters.

This example describes how to enable and configure OAM LFM on a Gigabit Ethernet interface:

- [Requirements on page 2583](#)
- [Overview and Topology on page 2583](#)

- [Verification on page 2585](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.4 or later for EX Series switches
- Two EX3200 or EX4200 switches connected directly

### Overview and Topology

Junos OS for EX Series switches allows the Ethernet interfaces on these switches to support the IEEE 802.3ah standard for the Operation, Administration, and Maintenance (OAM) of Ethernet in access networks. The standard defines OAM link fault management (LFM). You can configure IEEE 802.3ah OAM LFM on point-to-point Ethernet links that are connected either directly or through Ethernet repeaters.

This example uses two EX4200 switches connected directly. Before you begin configuring Ethernet OAM LFM on two switches, connect the two switches directly through a trunk interface.

### Configuring Ethernet OAM Link Fault Management on Switch 1

**CLI Quick Configuration** To quickly configure Ethernet OAM LFM, copy the following commands and paste them into the switch terminal window:

```
[edit protocols oam ethernet link-fault-management]
set interface ge-0/0/0
set interface ge-0/0/0 link-discovery active
set interface ge-0/0/0 pdu-interval 800
set interface ge-0/0/0 remote-loopback
```

**Step-by-Step Procedure** To configure Ethernet OAM LFM on switch 1:

1. Enable IEEE 802.3ah OAM support on an interface:
 

```
[edit protocols oam ethernet link-fault-management]
user@switch1# set interface (OAM LFM) ge-0/0/0
```

2. Specify that the interface initiates the discovery process by configuring the link discovery mode to **active**:  

```
[edit protocols oam ethernet link-fault-management]  
user@switch1# set interface ge-0/0/0 link-discovery active
```
3. Set the periodic OAM PDU-sending interval (in milliseconds) to 800 on switch 1:  

```
[edit protocols oam ethernet link-fault-management]  
user@switch1# set interface pdu-interval 800
```
4. Set a remote interface into loopback mode so that all frames except OAM PDUs are looped back without any changes made to the frames. Ensure that the remote DTE supports remote loopback mode. To set the remote DTE in loopback mode  

```
[edit protocols oam ethernet link-fault-management]  
user@switch1# set interface ge-0/0/0.0 remote-loopback
```

### Results

Check the results of the configuration:

```
[edit]  
user@switch1# show  
  
protocols {  
  oam {  
    ethernet {  
      link-fault-management {  
        interface ge-0/0/0 {  
          pdu-interval 800;  
          link-discovery active;  
          remote-loopback;  
        }  
      }  
    }  
  }  
}
```

---

### Configuring Ethernet OAM Link Fault Management on Switch 2

**CLI Quick Configuration** To quickly configure Ethernet OAM LFM on switch 2, copy the following commands and paste them into the switch terminal window:

```
[edit protocols oam ethernet link-fault-management ]  
set interface ge-0/0/1  
set interface ge-0/0/1 negotiation-options allow-remote-loopback
```

**Step-by-Step Procedure** To configure Ethernet OAM LFM on switch 2:

1. Enable OAM on the peer interface on switch 2:  

```
[edit protocols oam ethernet link-fault-management]  
user@switch2# set interface ge-0/0/1
```
2. Enable remote loopback support for the local interface:  

```
[edit protocols oam ethernet link-fault-management]  
user@switch2# set interface ge-0/0/1 negotiation-options allow-remote-loopback
```

**Results** Check the results of the configuration:

```
[edit]
```

```

user@switch2# show

protocols {
  oam {
    ethernet {
      link-fault-management {
        interface ge-0/0/1 {
          negotiation-options {
            allow-remote-loopback;
          }
        }
      }
    }
  }
}

```

### Verification

#### *Verifying That OAM LFM Has Been Configured Properly*

**Purpose** Verify that OAM LFM has been configured properly.

**Action** Use the `show oam ethernet link-fault-management` command:

```
user@switch1#show oam ethernet link-fault-management
```

### Sample Output

```

Interface: ge-0/0/0.0
Status: Running, Discovery state: Send Any
Peer address: 00:19:e2:50:3b:e1
Flags:Remote-Stable Remote-State-Valid Local-Stable 0x50
Remote entity information:
Remote MUX action: forwarding, Remote parser action: forwarding
Discovery mode: active, Unidirectional mode: unsupported
Remote loopback mode: supported, Link events: supported
Variable requests: unsupported

```

**Meaning** When the output displays the MAC address and the discover state is **Send Any**, it means that OAM LFM has been configured properly.

## Configuring Gigabit and 10-Gigabit Ethernet Interfaces

Devices include a factory default configuration that:

- Enables all 10-Gigabit Ethernet network interfaces on the switch
- Sets a default port mode (access)
- Sets default link settings
- Specifies a logical unit (**unit 0**) and assigns it to **family ethernet-switching**
- Configures Storm Control on all 10-Gigabit Ethernet network interfaces
- Provides basic Rapid Spanning Tree Protocol (RSTP) and Link Layer Discovery Protocol (LLDP) configuration

This topic describes:

- [Configuring Port Mode on page 2586](#)
- [Configuring the Link Settings for Gigabit Ethernet and 10-Gigabit Ethernet Interfaces on page 2587](#)
- [Configuring the Speed of Gigabit Ethernet Copper SFP Interfaces on page 2588](#)
- [Configuring the IP Options on page 2588](#)

### Configuring Port Mode

---

If you are connecting a switch to other switches and to routers on the LAN, you need to assign the interface to a logical port and you need to configure the logical port as a trunk port.

To configure a Gigabit Ethernet or 10-Gigabit interface for trunk port mode on the original CLI:

```
[edit]
user@switch# set interfaces interface-name unit logical-unit-number family ethernet-switching
port-mode trunk
```

To configure a Gigabit Ethernet or 10-Gigabit interface for trunk port mode on the Enhanced Layer 2 software (ELS):

```
[edit]
user@switch# set interfaces interface-name unit logical-unit-number family ethernet-switching
interface-mode trunk
```

### Configuring the Link Settings for Gigabit Ethernet and 10-Gigabit Ethernet Interfaces

Devices include a factory default configuration that enables Gigabit Ethernet and 10-Gigabit Ethernet and interfaces with applicable link settings.

The following default configurations are available on Gigabit Ethernet interfaces:

- The speed for Gigabit Ethernet interfaces is set to 1000 Mbps by default. The speed for 1-Gigabit Ethernet Copper SFP interfaces is 1 Gbps by default.
- Gigabit Ethernet interfaces operate in full-duplex mode.
- Autonegotiation is not supported.

To enable autonegotiation, issue the **set interfaces *name* ether-options auto-negotiate** command.

To disable autonegotiation, issue the **delete interfaces *name* ether-options auto-negotiate** command.

**NOTE:** Do not use the **set interface *name* ether-options no-auto-negotiate** command to remove the autonegotiation configuration.

The following default configurations are available on 10-Gigabit Ethernet interfaces:

- The speed for 10-Gigabit Ethernet interfaces is set to 10 Gbps by default. The speed cannot be configured.
- 10-Gigabit Ethernet interfaces operate in full-duplex mode by default.
- Autonegotiation is not supported.

To enable autonegotiation, issue the **set interfaces *name* ether-options auto-negotiate** command.

To disable autonegotiation, issue the **delete interfaces *name* ether-options auto-negotiate** command.

**NOTE:** Do not use the **set interface *name* ether-options no-auto-negotiate** command to remove the autonegotiation configuration.

The **ether-options** statement enables you to modify the following options:

- **802.3ad**—Specify an aggregated Ethernet bundle for both Gigabit Ethernet and 10-Gigabit Ethernet interfaces.
- **autonegotiation**—Enable or disable autonegotiation of flow control, link mode, and speed for Gigabit Ethernet interfaces.
- **link-mode**—Specify **full-duplex**, **half-duplex**, or **automatic** for Gigabit Ethernet interfaces.
- **loopback**—Enable or disable a loopback interface for both Gigabit Ethernet and 10-Gigabit Ethernet interfaces.

To set **ether-options** for both Gigabit Ethernet and 10-Gigabit Ethernet interfaces:

```
[edit]
user@switch# set interfaces interface-name ether-options
```

---

### Configuring the Speed of Gigabit Ethernet Copper SFP Interfaces

You can configure the speed of Gigabit Ethernet copper SFP interfaces on the EX4600 and QFX5100 devices. The default speed is 1Gbps.

**NOTE:** Autonegotiation is not supported on EX4600 and QFX5100 devices.

---

1. Configure the speed of the interface:

```
[edit]
user@switch# set interfaces interface-name speed speed
```

For example, to configure a speed of 100Mbps on the **ge-0/1/0** interface:

```
[edit]
user@switch# set interfaces ge-0/1/0 speed 100m
```

2. To delete the speed of the interface:

```
[edit]
user@switch# delete interfaces interface-name speed speed
```

For example, to delete a speed of 100Mbps on the **ge-0/1/0** interface:

```
[edit]
user@switch# delete interfaces ge-0/1/0 speed 100m
```

---

### Configuring the IP Options

To specify an IP address for the logical unit:

```
[edit]
user@switch# set interfaces interface-name unit logical-unit-number family inet address ip-address
```

## Configuring Aggregated Ethernet LACP

For aggregated Ethernet interfaces, you can configure the Link Aggregation Control Protocol (LACP). LACP is one method of bundling several physical interfaces to form one logical interface. You can configure aggregated Ethernet with or without LACP enabled.

Before you configure LACP, be sure you have configured the aggregated Ethernet bundles—also known as link aggregation groups (LAGs).

When LACP is enabled, the local and remote sides of the aggregated Ethernet links exchange protocol data units (PDUs), containing information about the state of the link. You can configure Ethernet links to actively transmit PDUs, or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. One side of the link must be configured as **active** for the link to be up.

**NOTE:** Do not add LACP to a LAG if the remote end of the LAG link is a security device, unless the security device supports LACP. Security devices often do not support LACP because they require a deterministic configuration.

To configure LACP:

1. Enable the LACP mode:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lacp mode
```

For example, to specify the mode as active, execute the following command:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lacp active
```

2. Specify the interval and speed at which the interfaces send LACP packets:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lacp periodic interval
```

For example, to specify the interval as fast, execute the following command:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lacp periodic fast
```

## Configuring Ethernet Loopback Capability

To place an interface in loopback mode, include the **loopback** statement:

```
loopback;
```

To return to the default—that is, to disable loopback mode—delete the **loopback** statement from the configuration:

```
[edit]
user@switch# delete interfaces interface-name ether-options loopback
```

To explicitly disable loopback mode, include the **no-loopback** statement:

```
no-loopback;
```

You can include the **loopback** and **no-loopback** statements at the following hierarchy levels:

- **[edit interfaces *interface-name* aggregated-ether-options]**
- **[edit interfaces *interface-name* ether-options]**

## Configuring the Fields in the Algorithm Used To Hash LAG Bundle and ECMP Traffic (CLI Procedure)

Juniper Networks EX Series and QFX Series switches use a hashing algorithm to determine how to forward traffic over a Link Aggregation group (LAG) bundle or to the next-hop device when equal-cost multipath (ECMP) is enabled.

The hashing algorithm makes hashing decisions based on values in various packet fields, as well as on some internal values like source port ID and source device ID. You can configure some of the fields that are used by the hashing algorithm.

Configuring the fields used by the hashing algorithm is useful in scenarios where most of the traffic entering the bundle is similar and the traffic needs to be managed in the LAG bundle. For instance, if the only difference in the IP packets for all incoming traffic is the source and destination IP address, you can tune the hashing algorithm to make hashing decisions more efficiently by configuring the algorithm to make hashing decisions using only those fields.

- [Configuring the Hashing Algorithm to Use Fields in the Layer 2 Header for Hashing on page 2590](#)
- [Configuring the Hashing Algorithm to Use Fields in the IP Payload for Hashing on page 2591](#)
- [Configuring the Hashing Algorithm to Use Fields in the IPv6 Payload for Hashing on page 2591](#)

### Configuring the Hashing Algorithm to Use Fields in the Layer 2 Header for Hashing

To configure the hashing algorithm to use fields in the Layer 2 header for hashing:

1. Configure the hash mode to Layer 2 header:

```
[edit forwarding-options enhanced-hash-key]  
user@switch# set hash-mode layer2-header
```

The default hash mode is Layer 2 payload. Therefore, this step must be performed if you have not previously configured the hash mode.

2. Configure the fields in the Layer 2 header that the hashing algorithm uses for hashing:

```
[edit forwarding-options enhanced-hash-key]  
user@switch# set layer2 {no-destination-mac-address | no-ether-type |  
no-source-mac-address | vlan-id}
```

By default, the hashing algorithm uses the values in the destination MAC address, Ethertype, and source MAC address fields in the header to hash traffic on the LAG.

You can configure the hashing algorithm to not use the values in these fields by configuring **no-destination-mac-address**, **no-ether-type**, or **no-source-mac-address**.

You can also configure the hashing algorithm to include the VLAN ID field in the header by configuring the **vlan-id** option.

If you want the hashing algorithm to not use the Ethertype field for hashing:

```
[edit forwarding-options enhanced-hash-key]
user@switch# set layer2 no-ether-type
```

### Configuring the Hashing Algorithm to Use Fields in the IP Payload for Hashing

To configure the hashing algorithm to use fields in the IP payload for hashing:

1. Configure the hash mode to Layer 2 payload:

```
[edit forwarding-options enhanced-hash-key]
user@switch# set hash-mode layer2-payload
```

The IP payload is not checked by the hashing algorithm unless the hash mode is set to Layer 2 payload. The default hash mode is Layer 2 payload.

2. Configure the fields in the IP payload that the hashing algorithm uses for hashing:

```
[edit forwarding-options enhanced-hash-key]
user@switch# set inet {no-ipv4-destination-address | no-ipv4-source-address |
no-l4-destination-port | no-l4-source-port | no-protocol | vlan-id}
```

For instance, if you want the hashing algorithm to ignore the Layer 4 destination port, Layer 4 source port, and protocol fields and instead hash traffic based only on the IPv4 source and destination addresses:

```
[edit forwarding-options enhanced-hash-key]
user@switch# set inet no-l4-destination-port no-l4-source-port no-protocol
```

### Configuring the Hashing Algorithm to Use Fields in the IPv6 Payload for Hashing

To configure the hashing algorithm to use fields in the IPv6 payload for hashing:

1. Configure the hash mode to Layer 2 payload:

```
[edit forwarding-options enhanced-hash-key]
user@switch# set hash-mode layer2-payload
```

The IPv6 payload is not checked by the hashing algorithm unless the hash mode is set to Layer 2 payload. The default hash mode is Layer 2 payload.

2. Configure the fields in the IPv6 payload that the hashing algorithm uses for hashing:

```
[edit forwarding-options enhanced-hash-key]
user@switch# set inet6 {no-ipv6-destination-address | no-ipv6-source-address |
no-l4-destination-port | no-l4-source-port | no-next-header | vlan-id}
```

For instance, if you want the hashing algorithm to ignore the Layer 4 destination port, Layer 4 source port, and the Next Header fields and instead hash traffic based only on the IPv6 source and IPv6 destination address fields only:

```
[edit forwarding-options enhanced-hash-key]
user@switch# set inet6 no-l4-destination-port no-l4-source-port no-next-header
```

## Configuring Interfaces for Uplink Failure Detection

You can configure uplink failure detection to help ensure balanced traffic flow. Using this feature, switches can monitor and detect link failure on uplink interfaces and can propagate the failure information to downlink interfaces, so that servers connected to those downlinks can switch over to secondary interfaces.

Follow these configuration guidelines:

- Configure an interface in only one group.
- Configure a maximum of eight groups for each switch.
- Configure a maximum of eight uplinks to monitor and a maximum of 48 downlinks to disable in each group.
- Configure physical links and logical links in separate groups.

To configure uplink failure detection on a switch:

1. Specify a name for an uplink failure detection group:

```
[edit protocols]
user@switch# set uplink-failure-detection group group-name
```

2. Add an uplink interface to the group:

```
[edit protocols]
user@switch# set uplink-failure-detection group group-name link-to-monitor interface-name
```

3. Repeat Step 2 for each uplink interface you add to the group.

4. Add a downlink interface to the group:

```
[edit protocols]
user@switch# set uplink-failure-detection group group-name link-to-disable interface-name
```

5. Repeat Step 4 for each downlink interface you add to the group.

**NOTE:** After you have configured an uplink failure detection group, use the `show uplink-failure-detection group (Uplink Failure Detection) group-name` command to verify that all interfaces in the group are up. If the interfaces are down, uplink failure detection does not work.

## Configuring a Layer 3 Logical Interface

Devices use Layer 3 logical interfaces to divide a physical interface into multiple logical interfaces, each corresponding to a VLAN. Layer 3 logical interfaces route traffic between subnets.

To configure Layer 3 logical interfaces, enable VLAN tagging and partition one or more physical ports into multiple logical interfaces, each corresponding to a VLAN ID.

Before you begin, make sure you set up your VLANs. See *Configuring VLANs*.

To configure Layer 3 logical interfaces:

1. Enable VLAN tagging:

```
[edit interfaces interface-name]
user@switch# set vlan-tagging
```

2. Bind each VLAN ID to a logical interface:

```
[edit interfaces interface-name]
user@switch# set unit logical-unit-number vlan-id vlan-id-number
```

### Related Documentation

- [Understanding Layer 3 Logical Interfaces on page 2408](#)
- [Verifying That Layer 3 Logical Interfaces Are Working on page 2750](#)

## Configuring Link Aggregation

Use the link aggregation feature to aggregate one or more links to form a virtual link or aggregation group. The MAC client can treat this virtual link as if it were a single link. Link aggregation increases bandwidth, provides graceful degradation as failure occurs, and increases link availability.

**NOTE:** An interface with an already configured IP address cannot form part of the aggregation group.

**NOTE:** On QFX5100 and EX4600 standalone switches and on QFX5100 Virtual Chassis and EX4600 Virtual Chassis, you can configure a mixed rate of link speeds for the aggregated Ethernet bundle. Only link speeds of 40G and 10G are supported. Load balancing will not work if you configure link speeds that are not supported.

1. [Creating an Aggregated Ethernet Interface on page 2594](#)
2. [Configuring the VLAN Name and VLAN ID Number on page 2594](#)
3. [Configuring Aggregated Ethernet LACP on page 2594](#)

## Creating an Aggregated Ethernet Interface

---

To create an aggregated Ethernet interface:

1. Specify the number of aggregated Ethernet interfaces to be created:

```
[edit chassis]
user@switch# set aggregated-devices interfaces device-count device-count
```

For example, to specify 5:

```
[edit chassis]
user@switch# set aggregated-devices interfaces device-count
```

2. Specify the minimum number of links for the aggregated Ethernet interface (aex), that is, the defined bundle, to be labeled “up”:

**NOTE:** By default only one link must be up for the bundle to be labeled “up”.

```
[edit interfaces]
user@switch# set interface-name aggregated-ether-options minimum-links minimum-links
```

For example, to specify 5:

```
[edit interfaces]
user@switch# set interface-name aggregated-ether-options minimum-links 5
```

3. Specify the link speed for the aggregated Ethernet bundle:

```
[edit interfaces]
user@switch# set interface-name aggregated-ether-options link-speed link-speed
```

For example, to specify 10g:

```
[edit interfaces]
user@switch# set interface-name aggregated-ether-options link-speed 10g
```

4. Specify the members to be included within the aggregated Ethernet bundle:

```
[edit interfaces]
user@switch# set interface-name ether-options 802.3ad aex
user@switch# set interface-name ether-options 802.3ad aex
```

## Configuring the VLAN Name and VLAN ID Number

---

```
[edit vlans]
user@switch# set vlan-name vlan-id vlan-id-number
```

For example, 100.

## Configuring Aggregated Ethernet LACP

---

For aggregated Ethernet interfaces, you can configure the Link Aggregation Control Protocol (LACP). LACP is one method of bundling several physical interfaces to form one logical interface. You can configure aggregated Ethernet with or without LACP enabled.

Before you configure LACP, be sure you have configured the aggregated Ethernet bundles—also known as link aggregation groups (LAGs).

When LACP is enabled, the local and remote sides of the aggregated Ethernet links exchange protocol data units (PDUs), containing information about the state of the link. You can configure Ethernet links to actively transmit PDUs, or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. One side of the link must be configured as **active** for the link to be up.

**NOTE:** Do not add LACP to a LAG if the remote end of the LAG link is a security device, unless the security device supports LACP. Security devices often do not support LACP because they require a deterministic configuration.

To configure LACP:

1. Enable the LACP mode:

```
[edit interfaces]
```

```
user@switch# set aex aggregated-ether-options lacp mode
```

For example, to specify the mode as active, execute the following command:

```
[edit interfaces]
```

```
user@switch# set aex aggregated-ether-options lacp active
```

2. Specify the interval and speed at which the interfaces send LACP packets:

```
[edit interfaces]
```

```
user@switch# set aex aggregated-ether-options lacp periodic interval
```

For example, to specify the interval as fast, execute the following command:

```
[edit interfaces]
```

```
user@switch# set aex aggregated-ether-options lacp periodic fast
```

## Configuring Local Link Bias (CLI Procedure)

Local link bias is used to conserve bandwidth on Virtual Chassis ports (VCPs) by using local links to forward unicast traffic exiting a Virtual Chassis or Virtual Chassis Fabric (VCF) that has a Link Aggregation group (LAG) bundle composed of member links on different member switches in the same Virtual Chassis or VCF. A local link is a member link in the LAG bundle that is on the member switch that received the traffic. Because traffic is received and forwarded on the same member switch when local link bias is enabled, no VCP bandwidth is consumed by traffic traversing the VCPs to exit the Virtual Chassis or VCF on a different member link in the LAG bundle.

You should enable local link bias if you want to conserve VCP bandwidth by always forwarding egress unicast traffic on a LAG out of a local link. You should not enable local link bias if you want egress traffic load-balanced as it exits the Virtual Chassis or VCF.

To enable local link bias on a LAG bundle:

```
[edit]
user@switch# set interface aex aggregated-ether-options local-bias
where aex is the name of the aggregated Ethernet link bundle.
```

For instance, to enable local link bias on aggregated Ethernet interface ae0:

```
[edit]
user@switch# set interface ae0 aggregated-ether-options local-bias
```

### Related Documentation

- [Understanding Local Link Bias on page 2408](#)

## Configuring Multichassis Link Aggregation

**NOTE:** Multichassis Link Aggregation (MC-LAG) is supported on QFX3500 and QFX3600 standalone switches running the original CLI, and on QFX5100 and EX4600 standalone switches running Enhanced Layer 2 Software.

Multichassis link aggregation groups (MC-LAGs) enable a client device to form a logical LAG interface between two switches. An MC-LAG provides redundancy and load balancing between the two switches, multihoming support, and a loop-free Layer 2 network without running the Spanning Tree Protocol (STP).

The MC-LAG switches use the Interchassis Control Protocol (ICCP) to exchange the control information between two MC-LAG switches.

On one end of an MC-LAG is an MC-LAG client device, such as a server, that has one or more physical links in a link aggregation group (LAG). This client device does not need to detect the MC-LAG. On the other side of MC-LAG are two MC-LAG switches. Each of the switches has one or more physical links connected to a single client device. The switches coordinate with each other to ensure that data traffic is forwarded properly.

**NOTE:** An interface with an already configured IP address cannot form part of the aggregated Ethernet interface or multichassis aggregated Ethernet interface group.

Perform the following steps on each switch that is hosting an MC-LAG:

1. Specify the same multichassis aggregated Ethernet identification number for the MC-LAG that the aggregated Ethernet interface belongs to on each switch.

```
[edit interfaces]
user@switch# set aeX aggregated-ether-options mc-ae mc-ae-id number
```

For example:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae mc-ae-id 3
```

2. Specify a unique chassis ID for the MC-LAG that the aggregated Ethernet interface belongs to on each switch.

```
[edit interfaces]
user@switch# set aeX aggregated-ether-options mc-ae chassis-id number
```

For example:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae chassis-id 0
```

3. Specify the mode of the MC-LAG the aggregated Ethernet interface belongs to.

**NOTE:** Only active-active mode is supported at this time.

```
[edit interfaces]
```

```
user@switch# set aeX aggregated-ether-options mc-ae mode mode
```

For example:

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options mc-ae mode active-active
```

4. Specify whether the aggregated Ethernet interface participating in the MC-LAG is primary or secondary. Primary is **active**, and secondary is **standby**.

**NOTE:** You must configure status control on both switches hosting the MC-LAG. If one switch is in active mode, the other must be in standby mode.

```
[edit interfaces]
```

```
user@switch# set aeX aggregated-ether-options mc-ae status-control (active | standby)
```

For example:

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options mc-ae status-control active
```

5. Specify the same LACP system ID on each switch.

```
[edit interfaces]
```

```
user@switch# set aeX aggregated-ether-options lacp system-id mac-address
```

For example:

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
```

6. Specify the same LACP administration key on each switch.

```
[edit interfaces]
```

```
user@switch# set aeX aggregated-ether-options lacp admin-key number
```

For example:

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options lacp admin-key 3
```

7. Configure ICCP by doing the following on each switch hosting the MC-LAG:

- a. Configure the local IP address to be used by all switches hosting the MC-LAG.

```
[edit protocols]
```

```
user@switch# set iccp local-ip-addr local-ip-address
```

For example:

```
[edit protocols]
```

```
user@switch# set iccp local-ip-addr 3.3.3.1
```

- b. (Optional) Configure the IP address of the switch and the time during which an ICCP connection must succeed between the switches hosting the MC-LAG.

Configured session establishment hold time results in faster ICCP connection establishment. The recommended value is 50 seconds.

```
[edit protocols]
```

```
user@switch# set iccp peer peer-ip-address session-establishment-hold-time seconds
```

For example:

```
[edit protocols]
```

```
user@switch# set iccp peer 3.3.3.2 session-establishment-hold-time 50
```

- c. (Optional) Configure the IP address to be used for backup liveness detection:

**NOTE:** By default, backup liveness detection is not enabled. Configure backup liveness detection if you require minimal traffic loss during a reboot. Backup liveness detection helps achieve sub-second traffic loss during an MC-LAG reboot.

```
[edit protocols]
user@switch# set iccp peer peer-ip-address backup-liveness-detection backup-peer-ip
ip-address
```

For example:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip
10.207.64.232
```

- d. Configure the minimum interval at which the switch must receive a reply from the other switch with which it has established a Bidirectional Forwarding Detection (BFD) session.

**NOTE:** Configuring the minimum receive interval is required to enable BFD.

```
[edit protocols]
user@switch# set iccp peer peer-ip-address liveness-detection minimum-receive-interval
seconds
```

For example:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 1000
```

- e. Configure the minimum transmit interval during which a switch must receive a reply from a switch with which it has established a BFD session.

```
[edit protocols]
user@switch# set iccp peer peer-ip-address liveness-detection transmit-interval
minimum-interval seconds
```

For example:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval
1000
```

8. Configure a multichassis protection link between the switches.

```
[edit]
user@switch# set multi-chassis multi-chassis-protection peer-ip-address interface
interface-name
```

For example:

```
[edit protocols]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
```

9. If you are using ELS, configure the **service-id** on both switches.

The **service-id** must be the same number on both switches.

```
[edit]
user@switch# set switch-options service-id number
```

For example:

```
[edit]
user@switch# set switch-options service-id 10
```

10. Enable RSTP globally on all interfaces.

```
[edit]
user@switch# set protocols rstp interface all mode point-to-point
```

11. Disable RSTP on the ICL-PL interfaces on both switches.

```
[edit]
user@switch# set protocols rstp interface interface-name disable
```

For example:

```
[edit]
user@switch# set protocols rstp interface ae0.0 disable
```

12. Configure the MC-LAG interfaces as edge ports on both switches.

```
set protocols rstp interface interface-name
```

For example:

```
[edit]
user@switch# set protocols rstp interface ae1.0
```

13. Enable BPDU block on all interfaces except for the ICL-PL interfaces on both switches.

```
[edit]
user@switch# set protocols rstp bpdu-block-on-edge
```

For example:

```
[edit]
user@switch# set protocols rstp bpdu-block-on-edge
```

## Configuring Generic Routing Encapsulation Tunneling

Generic routing encapsulation (GRE) provides a private, secure path for transporting packets through an otherwise public network by encapsulating (or tunneling) the packets. GRE tunneling is accomplished through tunnel endpoints that encapsulate or de-encapsulate traffic.

You can also use a firewall filter to de-encapsulate GRE traffic on a QFX5100 switch. This feature provides significant benefits in terms of scalability, performance, and flexibility because you don't need to create a tunnel interface to perform the de-encapsulation.

For example, you can terminate many tunnels from multiple source IP addresses with one firewall term. For more information on this feature, see [“Configuring a Firewall Filter to De-encapsulate GRE Traffic on a QFX5100 Switch” on page 5301](#).

This topic describes:

1. [Configuring a GRE Tunnel on page 2601](#)

## Configuring a GRE Tunnel

To configure a GRE tunnel interface:

1. Create a GRE interface with a unit number and address:

[edit interfaces]

user@switch# set gr-0/0/0 unit *number* family inet *address*

**NOTE:** The base name of the interface must be gr-0/0/0.

This is a pseudo interface, and the address you specify can be any IP address. The routing table must specify **gr-0/0/0.x** as the outgoing interface for any packets that will be tunneled.

If you configure a GRE interface on a QFX5100 switch that is a member of a Virtual Chassis and later change the Virtual Chassis member number of the switch, the name of the GRE interface does not change in any way (because it is a pseudo interface). For example, if you change the member number from **0** to **5**, the GRE interface name does *not* change from **gr-0/0/0.x** to **gr-5/0/0.x**.

2. Specify the tunnel source address for the logical interface:

[edit interfaces]

user@switch# set gr-0/0/0 unit *number* tunnel source *source-address*

3. Specify the destination address:

[edit interfaces]

user@switch# set gr-0/0/0 unit *number* tunnel destination *destination-address*

The destination address must be reachable through static or dynamic routing. If you use static routing, you must get the destination MAC address (for example, by using **ping**) before user traffic can be forwarded through the tunnel.

## Configuring the LPM Table With Junos OS 13.2x51-D10

In addition to choosing a profile, you can further optimize memory allocation for LPM table entries by configuring how many IPv6 addresses with prefixes in the range /65 through /127 you want to store. If you want to use more than 16 IPv6 addresses with prefixes in this range, you must enter and commit the following statement:

[edit]

```
user@switch# set chassis forwarding-options profile-name num-65-127-prefix value
```

in which *value* can be a value in the range 1 through 128. Each increment adds support for 16 IPv6 addresses with prefixes between /65 and /127, for a maximum of 2048 such addresses (16 x 128 = 2048). The system supports 16 of these addresses by default, so to increase the number of supported addresses, you must enter a value of 2 or greater. For example, if you enter **2**, the system will support 32 IPv6 addresses with prefixes in the range /65 through /127.

**NOTE:** When you configure the `num-65-127-prefix` value, all the data interfaces on the switch restart. The management interfaces are unaffected.

The LPM table is shared, and each increment that you add for IPv6 addresses with prefixes in the range /65 through /127 reduces the number of forwarding table entries that are available for IPv4 addresses and IPv6 addresses with prefixes less than /65.

[Table 110 on page 1700](#) provides examples of valid combinations that the LPM table can store, also using the **l2-profile-one** profile. Once again, each row in the table represents a case in which the table is full and cannot accommodate any more entries.

**Table 241: Example LPM Table Combinations Using l2-profile-one With Junos OS 13.2X51-D10**

| IPv4 entries | IPv6 Entries (prefix <= 64) | IPv6 Entries (prefix >= 65) | num-65-127-prefix |
|--------------|-----------------------------|-----------------------------|-------------------|
| 16K          | 0K                          | 16                          | 1 (default)       |
| 0K           | 8K                          | 16                          | 1 (default)       |
| 8K           | 4K                          | 16                          | 1 (default)       |
| 4K           | 4K                          | 1K                          | <b>64</b>         |
| 2K           | 5K                          | 1K                          | <b>64</b>         |
| 0K           | 6K                          | 1K                          | <b>64</b>         |
| 4K           | 2K                          | 2K                          | <b>128</b>        |
| 2K           | 3K                          | 2K                          | <b>128</b>        |
| 0K           | 4K                          | 2K                          | <b>128</b>        |

[Table 242 on page 2604](#) provides examples of valid combinations that the LPM table can store when you use the **lpm-profile** profile. As before, each row represents a case in which the table is full and cannot accommodate any more entries.

Table 242: Example LPM Table Combinations Using lpm-profile With Junos OS 13.2X51-D10

| IPv4 entries | IPv6 Entries (prefix <= 64) | IPv6 Entries (prefix >= 65) | num-65-127-prefix |
|--------------|-----------------------------|-----------------------------|-------------------|
| 128K         | 0K                          | 16                          | 1 (default)       |
| 0K           | 8K                          | 16                          | 1 (default)       |
| 8K           | 4K                          | 16                          | 1 (default)       |
| 4K           | 4K                          | 1K                          | 64                |
| 2K           | 5K                          | 1K                          | 64                |
| 0K           | 6K                          | 1K                          | 64                |
| 4K           | 2K                          | 2K                          | 128               |
| 2K           | 3K                          | 2K                          | 128               |
| 0K           | 4K                          | 2K                          | 128               |

## Configuring Ethernet OAM Link Fault Management (CLI Procedure)

Ethernet OAM link fault management (LFM) can be used for physical link-level fault detection and management. The IEEE 802.3ah LFM works across point-to-point Ethernet links either directly or through repeaters.

To configure Ethernet OAM LFM using the CLI:

1. Enable IEEE 802.3ah OAM support on an interface:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name
```

**NOTE:** You can configure Ethernet OAM LFM on aggregated interfaces.

**NOTE:** The remaining steps are optional. You can choose which of these features to configure for Ethernet OAM LFM on your switch.

2. Specify whether the interface or the peer initiates the discovery process by configuring the link discovery mode to **active** or **passive** (**active** = interface initiates; **passive** = peer initiates):

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name link-discovery active
```

3. Configure a periodic OAM PDU-sending interval (in milliseconds) for fault detection:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name pdu-interval interval
```

4. Specify the number of OAM PDUs that an interface can miss before the link between peers is considered down:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name pdu-threshold threshold-value
```

5. Configure event threshold values on an interface for the local errors that trigger the sending of link event TLVs:

- Set the threshold value (in seconds) for sending frame-error events or taking the action specified in the action profile:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name event-thresholds frame-error count
```

- Set the threshold value (in seconds) for sending frame-period events or taking the action specified in the action profile:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name event-thresholds frame-period count
```

- Set the threshold value (in seconds) for sending frame-period-summary events or taking the action specified in the action profile:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name event-thresholds frame-period-summary count
```

- Set the threshold value (in seconds) for sending symbol-period events or taking the action specified in the action profile:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name event-thresholds symbol-period count
```

**NOTE:** You can disable the sending of link event TLVs.

To disable the sending of link event TLVs:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name negotiation-options no-allow-link-events
```

6. Create an action profile to define event fault flags and thresholds to be taken when the link fault event occurs. Then apply the action profile to one or more interfaces. (You can also apply multiple action profiles to a single interface.)

- a. Name the action profile:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set action-profile profile-name
```

- b. Specify actions to be taken by the system when the link fault event occurs:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set action-profile profile-name action syslog
user@switch# set action-profile profile-name action link-down
```

- c. Specify events for the action profile:

```
[edit protocols oam ethernet link-fault-management]
user@switch# set action-profile profile-name event link-adjacency-loss
```

**NOTE:** For each action profile, you must specify at least one link event and one action. The actions are taken only when all of the events in the action profile are true. If more than one action is specified, all actions are executed. You can set a low threshold for a specific action such as logging the error and set a high threshold for another action such as system logging.

7. Set a remote interface into loopback mode so that all frames except OAM PDUs are looped back without any changes made to the frames. Set the remote DTE in loopback mode (the remote DTE must support remote-loopback mode) and then enable remote loopback support for the local interface.

```
[edit protocols oam ethernet link-fault-management]
user@switch# set interface interface-name remote-loopback
user@switch# set interface interface-name negotiation-options allow-remote-loopback
```

## Forcing MC-LAG Links or Interfaces with Limited LACP Capability to Be Up

In an MC-LAG topology, a link without Link Access Control Protocol (LACP) configuration remains down and cannot be accessed by the provider edge (PE) devices in the topology.

To ensure that the peer with limited LACP capability is up and accessible on the MC-LAG network, configure one of the aggregated Ethernet links or interfaces on a PE device to be up by using the **force-up** statement at the **[edit interfaces *interface-name* aggregated-ether-options lacp]** hierarchy level.

You can configure the *force-up* feature on either the PE device in active mode or in standby mode, or on both. However, in order to prevent duplicate traffic and packet drops, you can configure the force-up feature only on one aggregated Ethernet link of the PE device in an MC-LAG topology. If multiple aggregated Ethernet links are up on the PE device that has the force-up feature configured, then the device selects the link based on the LACP port ID and port priority. The port with the lowest priority is given preference. In case of two ports with the same priority, the one with the lowest port ID is given preference.

**NOTE:** If LACP comes up partially in the MC-LAG topology—that is, it comes up on one of the PE devices and does not come up on the other PE devices—the force-up feature is disabled.

## Configuring Resilient Hashing for Trunk/ECMP Groups

You use resilient hashing to minimize flow remapping across members of a trunk/ECMP group in a load-balanced system. You can configure resilient hashing in link aggregation groups (LAGs) and in equal cost multipath (ECMP) sets.

This topic includes:

1. [Configuring Resilient Hashing on LAGs on page 2607](#)
2. [Configuring Resilient Hashing on ECMP Groups on page 2607](#)

---

### Configuring Resilient Hashing on LAGs

To enable resilient hashing for a LAG:

- Configure resilient hashing on the aggregated Ethernet interface:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options resilient-hash
```

---

### Configuring Resilient Hashing on ECMP Groups

To enable resilient hashing for ECMP groups:

- Configure resilient hashing for ECMP:

```
[edit forwarding-options]
user@switch# set enhanced-hash-key ecmp-resilient-hash
```

#### Related Documentation

## Configuration Tasks

- [Channelizing Interfaces on page 2608](#)
- [Configuring the System Mode on page 2610](#)

## Channelizing Interfaces

The QFX3500, QFX3600, QFX5100, and EX4600 switches provide 40-Gbps QSFP+ ports that can be channelized. Channelization allows you to configure 40-Gbps QSFP+ ports to operate as four 10-Gigabit Ethernet (xe) interfaces. You can use QSFP+ to four SFP+ breakout cables or QSFP+ transceivers with fiber breakout cables to connect the 10-Gigabit Ethernet ports to other servers, storage, and switches. By default, the four 40-Gbps QSFP+ ports operate as 40-Gigabit Ethernet (et) ports. When an et port is channelized to four xe ports, a colon is used to signify the four separate channels. For example, on a QFX3500 standalone switch with port 2 on PIC 1 configured as four 10-Gigabit Ethernet ports, the interface names are *xe-0/1/2:0*, *xe-0/1/2:1*, *xe-0/1/2:2*, and *xe-0/1/2:3*.

By default, the 40-Gbps QSFP+ ports on EX4600 and QFX5100 switches are channelized automatically (auto-channelized) if any of the four channels on a 40-Gbps QSFP+ port receive data, unless you have configured channelization either at the chassis level or at the port level. Auto-channelization is not supported on interfaces contained in expansion modules or on Virtual Chassis ports.

You can disable auto-channelization by including the **disable-auto-speed-detection** statement at the **[edit chassis fpc slot-number pic pic-number (port port-number | port-range port-range-low port-range-high) channel-speed]** hierarchy.

There are restrictions on the ports you can channelize on the QFX5100-24Q and QFX5100-96S switches, depending on the system mode you enable. If you try to channelize ports that are restricted, the configuration is ignored. See [“Configuring the System Mode” on page 2610](#) for more information.

**CAUTION:** The Packet Forwarding Engine on the switch is restarted when you configure or delete a port. As a result, you might experience packet loss on the device. When you channelize a 40-Gbps QSFP+ port on the master of a Virtual Chassis, traffic might be disrupted on the master as well as on the line card members, and a mastership switchover occurs.

The following steps describe how to configure a block of ports or an individual port to operate as 10-Gigabit Ethernet ports.

1. To configure a block of 40-Gigabit Ethernet (et) ports to operate as 10-Gigabit Ethernet ports, specify a port range and channel speed:

```
[edit chassis fpc fpc-slot pic pic-slot]
user@switch# set port-range port-range-low port-range-high channel-speed speed
```

For example, to configure ports 0 through 3 on PIC 1 to operate as 10-Gigabit Ethernet ports:

```
[edit chassis fpc 0 pic 1]
user@switch# set port-range 0 3 channel-speed 10g
```

2. To configure an individual 40-Gigabit Ethernet (et) port to operate as 10-Gigabit Ethernet (xe) ports, specify a port number and channel speed:

```
[edit chassis fpc 0 pic 0]
user@switch# set port port-number channel-speed speed
```

For example, to configure port 2 to operate as 10-Gigabit Ethernet ports:

```
[edit chassis fpc 0 pic 0]
user@switch# set port 2 channel-speed 10g
```

3. Review your configuration and issue the **commit** command.

```
[edit]
user@switch# commit
commit complete
```

4. To return a range of ports to the default 40-Gigabit Ethernet configuration, delete the 10g statement:

```
[edit chassis fpc 0 pic 1]
user@switch# delete port-range port-range-low port-range-high channel-speed speed
```

For example, to return ports 0 through 3 to the default 40-Gigabit Ethernet configuration:

```
[edit chassis fpc 0 pic 1]
user@switch# delete port-range 0 3 channel-speed 10g
```

5. Review your configuration and issue the **commit** command.

```
[edit]
user@switch# commit
commit complete
```

6. To return a port to the default 40-Gigabit Ethernet configuration, delete the 10g statement:

```
[edit chassis fpc 0 pic 0]
user@switch# delete port port-number channel-speed speed
```

For example, to return port 2 to the default 40-Gigabit Ethernet configuration:

```
[edit chassis fpc 0 pic 0]
user@switch# delete port 2 channel-speed 10g
```

7. Review your configuration and issue the **commit** command.

```
[edit]
user@switch# commit
commit complete
```

The following steps describe how to disable auto-channelization at the port level.

1. To disable auto-channelization at the port level, include the **disable** statement:

```
[edit]
user@switch# set chassis fpc slot-number pic pic-number (port port-number |
  port-range port-range-low port-range-high) channel-speed
  disable-auto-speed-detection
```

For example, to disable auto-channelization for one port:

```
[edit]
```

```
user@switch# set chassis fpc 0 pic 0 port 2 channel-speed  
disable-auto-speed-detection
```

For example, to disable auto-channelization for a range of ports:

```
[edit]  
user@switch# set chassis fpc 0 pic 0 port-range 2 4 channel-speed  
disable-auto-speed-detection
```

2. Review your configuration and issue the **commit** command.

```
[edit]  
user@switch# commit  
commit complete
```

- [pic on page 2723](#)

## Configuring the System Mode

You can configure different system modes to achieve varying levels of port density on the QFX5100-24Q and QFX5100-96S switches. Depending on the system mode you configure, there are restrictions on which ports you can channelize. If you channelize ports that are restricted, the configuration is ignored. By default, all QSFP+ interfaces are auto-channelized. Auto-channelization is not supported on interfaces contained in expansion modules or on Virtual Chassis ports. To disable auto-channelization, see [“Channelizing Interfaces” on page 2608](#) for more information.

**NOTE:** When you request the system mode change, you must reboot for the system mode to take effect.

**CAUTION:** The Packet Forwarding Engine on the switch is restarted when you issue system mode changes. As a result, you might experience packet loss on the switch.

The following system modes are available on the QFX5100-24Q switch:

- Default-mode
- Mode-104-port
- Flexi-PIC mode
- Non-oversubscribed mode

The following system modes are available on the QFX5100-96S switch:

- Default-mode
- Non-oversubscribed mode

See [Table 243 on page 2611](#) for more information regarding the supported system modes for your switch.

**Table 243: System Modes Supported on QFX5100 Switches Running Enhanced Layer 2 Software**

|             | Default-mode   | Mode-104port   | Flexi-pic-mode  | Non-oversubscribed-mode   |
|-------------|--|--|---|---|
| QFX5100-48S | Not supported  | Not supported  | Not supported   | Not supported   |
| QFX5100-24Q | Supported<br><br>You do not need to configure the switch to be in this mode. On PIC 0, you can channelize all 24 40-Gbps QSFP+ ports. On PIC 1 and PIC 2, the 40-Gbps QSFP+ ports in the expansion modules are supported but cannot be channelized. In this mode, you can have one of two port combinations: 32 40-Gbps QSFP+ ports, or 96 10-Gigabit Ethernet ports plus 8 40-Gbps QSFP+ ports. | Supported<br><br>On PIC 0, all 24 40-Gbps QSFP+ ports are channelized by default, which provides 96 10-Gigabit Ethernet ports. 40-Gbps QSFP+ ports contained in an expansion module on PIC 1 are supported. On PIC 1, ports 0 and 2 are channelized by default, and ports 1 and 3 are disabled. If 40-Gbps QSFP+ ports contained in an expansion module are detected on PIC 2, they are ignored. | Supported<br><br>On PIC 0, the first four ports (ports 0 through 3) cannot be channelized. 40-Gbps QSFP+ ports contained in expansion modules on PIC 1 and PIC 2 are supported but cannot be channelized. | Supported<br><br>All 24 40-Gbps QSFP+ ports on PIC 0 can be channelized to 96 10-Gigabit Ethernet ports. 40-Gbps QSFP+ ports contained in the expansion modules on PIC 1 and PIC 2 are not supported and cannot be channelized. There is no packet loss for packets of any size in this mode. |
| QFX5100-96S | Supported<br><br>You do not need to configure the switch to be in this mode. On PIC 0, all 96 10-Gigabit Ethernet ports are supported. You can only channelize the 40-Gbps QSFP+ interfaces to 10-Gigabit Ethernet interfaces on ports 96 and 100. When you channelize the interfaces on ports 96 and 100, ports 97, 98, 99, 101, 102 and 103 are disabled.                                      | Not supported  | Not supported   | Supported<br><br>On PIC 0, all 96 10-Gigabit Ethernet ports are supported. However, the eight 40-Gbps QSFP+ ports are not supported and cannot be channelized. There is no packet loss for packets of any size in this mode.  |

The following steps describe how to change the system mode.

1. To change the system mode, issue the following operational command:

```
{master:0}
```

```
root> request chassis system-mode mode
```

For example:

```
{master:0}
```

```
root> request chassis system-mode non-oversubscribed-mode
```

2. To return to the default mode (default-mode), issue the following operational command:

```
{master:0}
```

```
root> request chassis system-mode default-mode
```

3. To see which system mode is configured, issue the following operational command:

```
{master:0}
```

```
root> show chassis system-mode
```

## [edit interfaces et] Configuration Statement Hierarchy on the QFX Series

This topic lists supported and unsupported configuration statements in the **[edit interfaces et]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific QFX Series platforms, see *QFX Series Virtual Chassis Software Features Overview*.

This topic lists:

- [Supported Statements in the \[edit interfaces et\] Hierarchy Level on page 2616](#)
- [Unsupported Statements in the \[edit interfaces et\] Hierarchy Level on page 2620](#)

### Supported Statements in the [edit interfaces et] Hierarchy Level

The following hierarchy shows the **[edit interfaces et]** configuration statements supported on EX Series switches.

```
interfaces {
  et-fpc/pic/port {
    accounting-profile name;
    description text;
    disable;
    encapsulation type;
    ether-options {
      802.3ad {
        aex;
        (backup | primary);
        lacp {
          force-up;
          port-priority number;
        }
      }
    }
    ethernet-switch-profile {
      tag-protocol-id [tpids];
    }
    (flow-control | no-flow-control);
    (loopback | no-loopback);
    no-auto-mdix;
  }
  flexible-vlan-tagging;
  (gratuitous-arp-reply | no-gratuitous-arp-reply);
  hold-time up milliseconds down milliseconds;
  mtu bytes;
  native-vlan-id
```

```

no-gratuitous-arp-request;
traceoptions {
    flag flag;
}
(traps | no-traps);
unit logical-unit-number {
    accounting-profile name;
    bandwidth rate;
    description text;
    disable;
    encapsulation type;
    family ccc;
    filter {
        group group-number;
        input filter-name;
        input-list [filter-names];
        output filter-name;
        output-list [filter-names];
    }
    policer {
        input policer-name;
        output policer-name;
    }
}
family ethernet-switching {

}

```

### Unsupported Statements in the [edit interfaces et] Hierarchy Level

All statements in the [edit interfaces et] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented with the following exceptions:

**Table 244: Unsupported [edit interfaces et] Configuration Statements for the QFX Series**

| Statement                 | Hierarchy   |
|---------------------------|---|
| passive-monitor-mode      | [edit interfaces et]                                |

## action-profile

---

**Syntax**    `action-profile profile-name;`  
              `action {`  
                  `syslog;`  
                  `link-down;`  
                  `}`  
              `event {`  
                  `link-adjacency-loss;`  
                  `link-event-rate {`  
                      `frame-error count;`  
                      `frame-period count;`  
                      `frame-period-summary count;`  
                      `symbol-period count;`  
                      `}`  
                  `}`  
              `}`

**Hierarchy Level**    `[edit protocols oam ethernet link-fault-management]`

**Release Information**    Statement introduced in Junos OS Release 9.4 for EX Series switches.

**Description**    Configure an Ethernet OAM link fault management (LFM) action profile by specifying a profile name.

The remaining statements are explained separately.

**Options**    *profile-name*—Name of the action profile.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

 [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*  
 family *family*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the interface address.

**Options** *address*—Address of the interface.

- In Junos OS Release 13.3 and later, when you configure an IPv6 host address and an IPv6 subnet address on an interface, the commit operation fails.
- In releases earlier than Junos OS Release 13.3, when you use the same configuration on an interface, the commit operation succeeds, but only one of the IPv6 addresses that was entered is assigned to the interface. The other address is not applied.

The remaining statements are explained separately.

**NOTE:** The `edit logical-systems` hierarchy is not available on QFabric systems.

## allow-remote-loopback

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | allow-remote-loopback;  |
| <b>Hierarchy Level</b>          | [edit protocols <a href="#">oam</a> <a href="#">ethernet</a> <a href="#">link-fault-management</a> <a href="#">interface</a> <i>interface-name</i> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.4 for EX Series switches.  |
| <b>Description</b>              | Advertise that the interface is capable of getting into loopback mode. Enable remote loopback in Ethernet OAM link fault management (LFM) on all Ethernet interfaces or the specified interface on the EX Series switch.  |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Ethernet OAM Link Fault Management on EX Series Switches on page 2583</a></li> <li>• <a href="#">Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2604</a></li> </ul> |

## authentication-key (ICCP)

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | authentication-key <i>key</i> ;  |
| <b>Hierarchy Level</b>          | [edit protocols <a href="#">iccp</a> <a href="#">peer</a> < <i>peer-IP-address</i> >],<br>[edit protocols <a href="#">iccp</a> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.0 for MX Series routers.<br>Statement introduced in Junos OS Release 12.2 for the QFX Series.  |
| <b>Description</b>              | Specify the authentication key (password). The QFX3500 and MX Series device uses this password to verify the authenticity of packets sent from the peers hosting a multichassis link aggregation group (MC-LAG). Peer-level authentication takes precedence over global-level authentication.<br><br>Interchassis Control Protocol (ICCP) uses MD5 authentication. |
| <b>Options</b>                  | <b>key</b> —Authentication password. It can be 1 through 16 contiguous digits or letters. Separate decimal digits with periods. Separate hexadecimal digits with periods and precede the string with 0x. If you include spaces in the password, enclose the entire password in quotation marks (" ").  |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.  |

## auto-negotiation

---

|  |   |
|--|---|
| <b>Syntax</b>  | (auto-negotiation   no-auto-negotiation);   |
| <b>Hierarchy Level</b>   | [edit <a href="#">interfaces</a> <i>interface-name</i> <a href="#">ether-options</a> ]  |
| <b>Release Information</b>   | Statement introduced in Junos OS Release 11.1 for the QFX Series.   |
| <b>Description</b>   | <p>Explicitly enable or disable autonegotiation.</p> <ul style="list-style-type: none"><li>• <b>auto-negotiation</b>—Enable autonegotiation.</li><li>• <b>no-auto-negotiation</b>—Disable autonegotiation. When autonegotiation is disabled, you must explicitly configure link mode and speed options.</li></ul> |
| <b>Default</b>   | Autonegotiation is automatically enabled for Gigabit Ethernet interfaces. Autonegotiation is not an option for 10-Gigabit Ethernet interfaces. No explicit action is taken after the autonegotiation is complete or if the negotiation fails.   |
| <hr/> <div> <b>NOTE:</b> Autonegotiation is not supported on QFX5100 devices.</div> <hr/> |   |
| <b>Required Privilege Level</b>  | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>   | <ul style="list-style-type: none"><li>• <a href="#">speed on page 2732</a></li><li>• <a href="#">Configuring Gigabit and 10-Gigabit Ethernet Interfaces on page 2586</a></li><li>• <i>Junos OS Network Interfaces Library for Routing Devices</i></li></ul>   |

## backup-liveness-detection

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>backup-liveness-detection {<br/>    <a href="#">backup-peer-ip ip4-address</a></code>  |
| <b>Hierarchy Level</b>          | [edit protocols <a href="#">iccp peer</a> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2 for the QFX Series.<br>Statement introduced in Junos OS Release 13.2R1 for EX Series switches.   |
| <b>Description</b>              | Backup liveness detection determines the peer status (whether it is up or down) by exchanging keep alive messages (UDP-based packets) over the management link between the two Interchassis Control Protocol (ICCP) peers. When an ICCP connection is operationally down, the status of the peers hosting a multichassis link aggregation group (MC-LAG) is detected by sending liveness detection requests to each other. Peers must respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, the liveness detection check fails, and a failure action is implemented. Backup liveness detection must be configured on both peers hosting the MC-LAG. |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.  |

## backup-peer-ip

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>backup-peer-ip <i>ip4-address</i>;</code>  |
| <b>Hierarchy Level</b>          | [edit protocols <a href="#">iccp peer backup-liveness-detection</a> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2 for the QFX Series.<br>Statement introduced in Junos OS Release 13.2R1 for EX Series switches. |
| <b>Description</b>              | Specify the IP address of the peer being used as a backup peer in the Bidirectional Forwarding Detection (BFD) configuration.                |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                          |

## channel-speed

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | channel-speed (10g; disable-auto-speed-detection) ;  |
| <b>Hierarchy Level</b>          | [edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> (port <i>port-number</i>   port-range <i>port-range-low</i> <i>port-range-high</i> )]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2 for the QFX Series.  |
| <b>Description</b>              | (QFX3500, QFX3600, and QFX5100 standalone switches running Enhanced Layer 2 Software only)—Enable the specified port on the Physical Interface Card (PIC) to perform in the specified channel speed. Additionally, you can disable auto-speed detection. |
| <b>Default</b>                  | 40g (40-Gigabit Ethernet).   |
| <b>Options</b>                  | <b>10g</b> —Set the channel speed to 10g (10-Gigabit Ethernet).<br><br><b>disable-auto-speed-detection</b> —Disable auto-speed detection.  |

      }

**Hierarchy Level**    [edit forwarding-options]

**Release Information**    Statement introduced in Junos OS Release 13.2X51-D15 for EX Series switches.  
                              Statement introduced in Junos OS Release 13.2X51-D20 for QFX Series devices.  
                              The **fabric-load-balance** statement introduced in Junos OS Release 14.1X53-D10.

**Description**    Configure the hashing key used to hash link aggregation group (LAG) and equal-cost multipath (ECMP) traffic, or enable adaptive load balancing (ALB) in a Virtual Chassis Fabric (VCF).

The hashing algorithm is used to make traffic-forwarding decisions for traffic entering a LAG bundle or for traffic exiting a switch when ECMP is enabled.

For LAG bundles, the hashing algorithm determines how traffic entering a LAG bundle is placed onto the bundle's member links. The hashing algorithm tries to manage bandwidth by evenly load-balancing all incoming traffic across the member links in the bundle.

When ECMP is enabled, the hashing algorithm determines how incoming traffic is forwarded to the next-hop device.

The remaining statements are explained separately.

## flow-control

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | (flow-control   no-flow-control);  |
| <b>Hierarchy Level</b>          | [edit <b>interfaces</b> <i>interface-name</i> <b>ether-options</b> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.  |
| <b>Description</b>              | <p>Explicitly enable or disable symmetric Ethernet PAUSE flow control, which regulates the flow of packets from the switch to the remote side of the connection by pausing all traffic flows on a link during periods of network congestion. Symmetric flow control means that Ethernet PAUSE is enabled in both directions. The interface generates and sends Ethernet PAUSE messages when the receive buffers fill to a certain threshold and the interface responds to PAUSE messages received from the connected peer. By default, flow control is disabled.</p> <p>You can configure asymmetric flow control by including the <b>configured-flow-control</b> statement at the [edit <b>interfaces</b> <i>interface-name</i> <b>ether-options</b> hierarchy level. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).</p> <p>Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.</p> </div> <ul style="list-style-type: none"> <li>• <b>flow-control</b>—Enable flow control; flow control is useful when the remote device is a Gigabit Ethernet switch.</li> <li>• <b>no-flow-control</b>—Disable flow control.</li> </ul> |
| <b>Default</b>                  | Flow control is disabled.  |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.  |

## hold-time (Physical Interface)

---

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | hold-time up <i>milliseconds</i> down <i>milliseconds</i> ;   |
| <b>Hierarchy Level</b>     | [edit <a href="#">interfaces</a> <i>interface-name</i> ],<br>[edit <a href="#">interfaces</a> <a href="#">interface-range</a> <i>interface-range-name</i> ]   |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 10.4R5 for EX Series switches.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.<br>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.   |
| <b>Description</b>         | Specify the <b>hold-time</b> value to use to damp shorter interface transitions milliseconds.<br>When an interface goes from up to down, it is not advertised to the rest of the system as being down until it has remained down for the hold-time period. Similarly, an interface is not advertised as being up until it has remained up for the hold-time period. |

### NOTE:

- We recommend that you configure the hold-time value after determining an appropriate value by performing repeated tests in the actual hardware environment. This is because the appropriate value for hold-time depends on the hardware (XFP, SFP, SR, ER, or LR) used in the networking environment.
  - The hold-time option is not available for controller interfaces.

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 10.0 for MX Series routers.  
Statement introduced in Junos OS Release 12.2 for the QFX Series.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** Configure Interchassis Control Protocol (ICCP) between the multichassis link aggregation group (MC-LAG) peers. ICCP replicates forwarding information, validates configurations, and propagates the operational state of the MC-LAG members.

**NOTE:** Backup liveness detection is not supported on MX Series routers.

The remaining statement are explained separately.

## inet (enhanced-hash-key)

---

**Syntax**    `inet {  
              no-ipv4-destination-address;  
              no-ipv4-source-address;  
              no-l4-destination-port;  
              no-l4-source-port;  
              no-protocol;  
              vlan-id;  
          }`

**Hierarchy Level**    [edit forwarding-options [enhanced-hash-key](#)]

**Release Information**    Statement introduced in Junos OS Release 13.2X51-D15 for EX Series switches.  
Statement introduced in Junos OS Release 13.2X51-D20 for QFX Series devices.

**Description**    Select the payload fields in IPv4 traffic used by the hashing algorithm to make hashing decisions.

When IPv4 traffic enters a LAG and the hash mode is set to Layer 2 payload, the hashing algorithm checks the fields configured using the **inet** statement and uses the information in the fields to decide how to place traffic onto the LAG bundle's member links or how to forward traffic to the next hop device when ECMP is enabled.

The hashing algorithm, when used to hash LAG bundle traffic, always tries to manage bandwidth by evenly load-balancing all incoming traffic across the member links in the bundle.

The hashing algorithm only inspects the IPv4 fields in the payload to make hashing decisions when the hash mode is set to **layer2-payload**. The hash mode is set to Layer 2 payload by default. You can set the hash mode to Layer 2 payload using the **set forwarding-options enhanced-hash-key hash-mode layer2-payload** statement.

**Default**    The following fields are used by the hashing algorithm to make hashing decisions for IPv4 traffic:

- IP destination address
- IP source address
- Layer 4 destination port
- Layer 4 source port
- Protocol

**Options**    **no-ipv4-destination-address**—Exclude the IPv4 destination address field from the hashing algorithm.

**no-ipv4-source-address**—Exclude the IPv4 source address field from the hashing algorithm.

**no-l4-destination-port**—Exclude the Layer 4 destination port field from the hashing algorithm.

**no-l4-source-port**—Exclude the Layer 4 source port field from the hashing algorithm.

**no-protocol**—Exclude the protocol field from the hashing algorithm.

**vlan-id**—Include the VLAN ID field in the hashing algorithm.

**Required Privilege** interface—To view this statement in the configuration.

**Level** interface-control—To add this statement to the configuration.

## inet6 (interfaces)

**Syntax**

```
inet6 {
    address address {
        eui-64
        preferred
        primary;
        filter input filter-name;
        filter output filter-name;
    }
}
```

**Hierarchy Level** [edit [interfaces interface-name unit logical-unit-number](#) family],  
[edit [interfaces interface-range interface-name unit logical-unit-number](#) family]

**Release Information** Statement introduced in Junos OS Release 12.2 for the QFX Series.

**Description** Configure the primary IP address for the logical interface.

**Default** You must configure a logical interface to be able to use the physical device.

**Options** The remaining statements are explained separately.—

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Select the payload fields in an IPv6 packet used by the hashing algorithm to make hashing decisions.</p> <p>When IPv6 traffic enters a LAG and the hash mode is set to Layer 2 payload, the hashing algorithm checks the fields configured using this statement and uses the information in the fields to decide how to place traffic onto the LAG bundle's member links or to forward traffic to the next hop device when ECMP is enabled.</p> <p>The hashing algorithm, when used to hash LAG traffic, always tries to manage bandwidth by evenly load-balancing all incoming traffic across the member links in the bundle.</p> <p>The hashing algorithm only inspects the IPv6 fields in the payload to make hashing decisions when the hash mode is set to Layer 2 payload. The hash mode is set to Layer 2 payload by default. You can set the hash mode to Layer 2 payload using the <b>set forwarding-options enhanced-hash-key hash-mode layer2-payload</b> statement.</p> |
| <b>Default</b>             | <p>The data in the following fields are used by the hashing algorithm to make hashing decisions for IPv6 traffic:</p> <ul style="list-style-type: none"><li>• IP destination address</li><li>• IP source address</li><li>• Layer 4 destination port</li><li>• Layer 4 source port</li><li>• Next header</li></ul>  |
| <b>Options</b>             | <p><b>no-ipv6-destination-address</b>—Exclude the IPv6 destination address field from the hashing algorithm.</p> <p><b>no-ipv6-source-address</b>—Exclude the IPv6 source address field from the hashing algorithm.</p> <p><b>no-l4-destination-port</b>—Exclude the Layer 4 destination port field from the hashing algorithm.</p>  |

**no-l4-source-port**—Exclude the Layer 4 source port field from the hashing algorithm.

**no-next-header**—Exclude the Next Header field from the hashing algorithm.

**vlan-id**—Include the VLAN ID field in the hashing algorithm.

**Required Privilege** interface—To view this statement in the configuration.

**Level** interface-control—To add this statement to the configuration.

## interface (Multichassis Protection)

**Syntax** interface *interface-name*;

**Hierarchy Level** [edit [multi-chassis multi-chassis-protection peer](#)]

**Release Information** Statement introduced in Junos OS Release 9.6 for MX Series routers.  
Statement introduced in Junos OS Release 12.2 for the QFX Series.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** Specify the name of the interface that is being used as an interchassis link-protection link (ICL-PL). The two switches hosting a multichassis link aggregation group (MC-LAG) use this link to pass Interchassis Control Protocol (ICCP) and data traffic.

**Required Privilege** interface—To view this statement in the configuration.

**Level** interface-control—To add this statement to the configuration.

## interface (OAM LFM)

---

**Syntax**    `interface interface-name {  
          link-discovery (active | passive);  
          pdu-interval interval;  
          pdu-threshold threshold-value;  
          remote-loopback;  
          event-thresholds {  
              frame-error count;  
              frame-period count;  
              frame-period-summary count;  
              symbol-period count;  
          }  
          negotiation-options {  
              allow-remote-loopback;  
              no-allow-link-events;  
          }  
          }  
          }`

**Hierarchy Level**    [edit protocols [oam](#) [ethernet](#) [link-fault-management](#)]

**Release Information**    Statement introduced in Junos OS Release 9.4 for EX Series switches.

**Description**    Configure Ethernet OAM link fault management (LFM) for all interfaces or for specific interfaces.

The remaining statements are explained separately.

**Options**    *interface-name*—Name of the interface to be enabled for IEEE 802.3ah OAM link fault management (LFM) support.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

## interface (Redundant Trunk Groups)

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <pre>interface <i>interface-name</i> &lt;primary&gt;; interface <i>interface-name</i>;</pre>  |
| <b>Hierarchy Level</b>          | <p>For platforms with ELS:</p> <pre>[edit switch-options <b>redundant-trunk-group</b> <i>group name</i>]</pre> <p>For platforms without ELS:</p> <pre>[edit ethernet-switching-options <b>redundant-trunk-group</b> <i>group name</i>]</pre>  |
| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Hierarchy level <b>[edit switch-options]</b> introduced in Junos OS Release 13.2X50-D10 (ELS). (See <a href="#">“Getting Started with Enhanced Layer 2 Software” on page 43</a> for information about ELS.)</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p>  |
| <b>Description</b>              | <p>Configure a primary link and secondary link on trunk ports. If the primary link fails, the secondary link automatically takes over as the primary link without waiting for normal STP convergence.</p>   |
| <b>Options</b>                  | <p><b>interface <i>interface-name</i></b>—A logical interface or an aggregated interface containing multiple ports.</p> <p><b>primary</b>—(Optional) Specify one of the interfaces in the redundant group as the primary link. The interface without this option is the secondary link in the redundant group. If a link is not specified as <b>primary</b>, the software compares the two links and selects the link with the highest port number as the active link. For example, if the two interfaces are <b>ge-0/1/0</b> and <b>ge-0/1/1</b>, the software assigns <b>ge-0/1/1</b> as the active link.</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Redundant Trunk Links for Faster Recovery</a></li> <li>• <a href="#">Example: Configuring Redundant Trunk Links for Faster Recovery on page 2578</a></li> <li>• <a href="#">Understanding Redundant Trunk Links on page 2447</a></li> </ul>   |

## interface-mode

|                          |  |
|--------------------------|--|
| Syntax                   | interface-mode (access   trunk);   |
| Hierarchy Level          | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family bridge],<br>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family ethernet-switching],<br>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family bridge]   |
| Release Information      | Statement introduced in Junos OS Release 9.2.<br>Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.<br>Statement introduced in Junos OS Release 13.2 for the QFX Series.   |
| Description              | <p> <b>NOTE:</b> This statement supports the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see <a href="#">port-mode</a>. For ELS details, see “<a href="#">Getting Started with Enhanced Layer 2 Software</a>” on page 43.</p> <p>(QFX Series 3500 and 3600 standalone switches)—Determine whether the logical interface accepts or discards packets based on VLAN tags. Specify the <b>trunk</b> option to accept packets with a VLAN ID that matches the list of VLAN IDs specified in the <b>vlan-id</b> or <b>vlan-id-list</b> statement, then forward the packet within the bridge domain or VLAN configured with the matching VLAN ID. Specify the <b>access</b> option to accept packets with no VLAN ID, then forward the packet within the bridge domain or VLAN configured with the VLAN ID that matches the VLAN ID specified in the <b>vlan-id</b> statement.</p> <p> <b>NOTE:</b> On MX Series routers, if you want IGMP snooping to be functional for a bridge domain, then you should not configure <b>interface-mode</b> and <b>irb</b> for that bridge. Such a configuration commit succeeds, but IGMP snooping is not functional, and a message informing the same is displayed. For more information, see <i>Configuring a Trunk Interface on a Bridge Network</i>.</p> |
| Options                  | <p><b>access</b>—Configure a logical interface to accept untagged packets. Specify the VLAN to which this interface belongs using the <b>vlan-id</b> statement.</p> <p><b>trunk</b>—Configure a single logical interface to accept packets tagged with any VLAN ID specified with the <b>vlan-id</b> or <b>vlan-id-list</b> statement.</p>   |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>   |
| Related Documentation    | <ul style="list-style-type: none"> <li>Configuring a Logical Interface for Access Mode</li> <li>Configuring a Logical Interface for Trunk Mode</li> </ul>  |

- *Example: Connecting Access Switches to a Distribution Switch*

## interface-range

**Syntax** `interface-range interface-range-name {`  
     `disable;`  
     `description text;`  
     `ether-options {`  
         `802.3ad aex {`  
             `lacp {`  
                 `force-up;`  
             `}`  
         `}`  
     `(auto-negotiation | no-auto-negotiation);`  
     `(flow-control | no-flow-control);`  
     `link-mode mode;`  
     `speed (auto-negotiation | speed);`  
     `}`  
     `hold-time milliseconds down milliseconds;`  
     `member interface-name;`  
     `member-range starting-interface-name to ending-interface-name;`  
     `mtu bytes;`  
     `unit logical-unit-number {`  
         `description text;`  
         `disable;`  
         `family family-name {...}`  
         `(traps | no traps);`  
         `vlan-id vlan-id-number;`  
     `}`  
     `}`

**Hierarchy Level** [edit [interfaces](#)]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX series.

**Description** Group interfaces that share a common configuration profile.

**NOTE:** The interface range definition is supported only for Gigabit Ethernet, 10-Gigabit Ethernet, and Fibre Channel interfaces.

**Options** `interface-range-name`—Name of the interface range.

**NOTE:** You can use regular expressions and wildcards to specify the interfaces in the member range configuration. Do not use wildcards for interface types.

The remaining statements are explained separately.

**Required Privilege Level** `interface`—To view this statement in the configuration.  
     `interface-control`—To add this statement to the configuration.

## lacp (802.3ad)

---

**Syntax**    `lacp {  
              force-up;  
              (primary | backup);  
              port-priority;  
          }`

**Hierarchy Level**    [edit [interfaces interface-name ether-options 802.3ad](#)]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure the Link Aggregation Control Protocol (LACP) parameters for interfaces. The remaining statement is explained separately.

**NOTE:** The port-priority statement is not supported on QFabric systems.

---

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

**Related Documentation**

## larp (Aggregated Ethernet)

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>larp (active   passive) {<br/>    admin-key <i>key</i>;<br/>    periodic <i>interval</i><br/>    system-ID <i>mac-address</i>;<br/>    force-up;<br/>}</code>  |
| <b>Hierarchy Level</b>          | [edit <a href="#">interfaces interface-name</a> <a href="#">aggregated-ether-options</a> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.  |
| <b>Description</b>              | Configure the Link Aggregation Control Protocol (LACP) parameters for interfaces. The remaining statement is explained separately.   |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Configuring Link Aggregation on page 2593</a></li><li>• <a href="#">Configuring Aggregated Ethernet LACP on page 2589</a></li><li>• <a href="#">Understanding Aggregated Ethernet Interfaces and LACP on page 2393</a></li></ul> |

## layer2 (enhanced-hash-key)

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | <pre> layer2 {     no-destination-mac-address;     no-ether-type;     no-source-mac-address;     vlan-id; } </pre>  |
| <b>Hierarchy Level</b>     | [edit forwarding-options <b>enhanced-hash-key</b> ]   |
| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 13.2X51-D15 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X51-D20 for QFX Series devices.</p>   |
| <b>Description</b>         | <p>Select the fields in the Layer 2 header that are used by the hashing algorithm to make hashing decisions.</p> <p>When traffic enters a link aggregation group (LAG) bundle, the hashing algorithm checks the fields configured using this statement and uses the information in the fields to decide how to place traffic onto the LAG bundle's member links. The hashing algorithm always tries to manage bandwidth by evenly load-balancing all incoming traffic across the member links in the bundle.</p> <p>When traffic is exiting a device that has enabled ECMP, the hashing algorithm checks the fields configured using this statement and uses the information in the fields to decide how to forward traffic to the next hop device.</p> <p>The hashing algorithm only inspects the fields in the Layer 2 header when the hash mode is set to Layer 2 header. You can set the hash mode to Layer 2 header using the <b>set forwarding-options enhanced-hash-key hash-mode layer2-header</b> statement.</p> |
| <b>Default</b>             | <p>The hash mode of the hashing algorithm is set to Layer 2 payload, by default. When the hash mode is set to Layer 2 payload, the hashing algorithm does not use fields in the Layer 2 header to make hashing decisions.</p> <p>The following fields are used by the hashing algorithm when the hash mode of the hashing algorithm is set to Layer 2 header, by default:</p> <ul style="list-style-type: none"> <li>• Destination MAC address</li> <li>• Ethertype</li> <li>• Source MAC address</li> </ul>  |
| <b>Options</b>             | <p><b>no-destination-mac-address</b>—Exclude the destination MAC address field from the hashing algorithm.</p> <p><b>no-ether-type</b>—Exclude the Ethertype field from the hashing algorithm.</p> <p><b>no-source-mac-address</b>—Exclude the source MAC address field from the hashing algorithm.</p>   |

**vlan-id**—Include the VLAN ID field in the hashing algorithm.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## link-mode

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>link-mode mode;</code>   |
| <b>Hierarchy Level</b>          | [edit <a href="#">interfaces</a> <i>interface-name</i> <a href="#">ether-options</a> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.  |
| <b>Description</b>              | Set the device's link-connection characteristic.   |
| <b>Default</b>                  | The <b>full-duplex</b> mode is enabled.  |
| <b>Options</b>                  | <p><b>mode</b>—Link characteristic:</p> <ul style="list-style-type: none"><li>• <b>full-duplex</b>—Connection is full duplex.</li><li>• <b>half-duplex</b>—Connection is half duplex.</li><li>• <b>automatic</b>—Link mode is negotiated.</li></ul> <p>If <b>no-auto-negotiation</b> is specified in the <b>ether-options</b> option, you can select only <b>full-duplex</b> or <b>half-duplex</b>. If <b>auto-negotiation</b> is specified in the <b>ether-options</b> option, you can select any mode.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Configuring Gigabit and 10-Gigabit Ethernet Interfaces on page 2586</a></li><li>• <i>Junos OS Network Interfaces Library for Routing Devices</i></li></ul>   |

## link-speed

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | link-speed <i>speed</i> ;  |
| <b>Hierarchy Level</b>          | [edit interfaces aex <a href="#">aggregated-ether-options</a> ]  |
| <b>Release Information</b>      | Command introduced in Junos OS Release 11.1 for the QFX Series.  |
| <b>Description</b>              | For aggregated Ethernet interfaces only, set the required link speed.  |
| <b>Options</b>                  | <p><b>speed</b>—For aggregated Ethernet links, you can specify the speed in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).</p> <p>On QFX5100 standalone switches, you can configure <b>mixed</b> as the link speed. The <b>mixed</b> option allows you to configure mixed rate aggregated Ethernet bundles on a QFX5100 standalone switch with link speeds of 40G and 10G only. Load balancing will not work if you configure link speeds that are not supported.</p> <p>Aggregated Ethernet links on the QFX Series can have one of the following speed values:</p> <ul style="list-style-type: none"> <li>• <b>100g</b>—Links are 100 Gbps.</li> <li>• <b>100m</b>—Links are 100 Mbps.</li> <li>• <b>10g</b>—Links are 10 Gbps.</li> <li>• <b>1g</b>—Links are 1 Gbps.</li> <li>• <b>40g</b>—Links are 40 Gbps.</li> <li>• <b>50g</b>—Links are 50 Gbps.</li> <li>• <b>80g</b>—Links are 80 Gbps.</li> <li>• <b>8g</b>—Links are 8 Gbps.</li> <li>• <b>0c192</b>—Links are OC-192.</li> <li>• <b>mixed</b>—Links are 10 Gbps and 40Gbps.</li> </ul> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Configuring Link Aggregation on page 2593</a></li> </ul>  |

## liveness-detection

---

**Syntax**

```
liveness-detection {  
  detection-time {  
    threshold milliseconds;  
  }  
  minimum-interval milliseconds;  
  minimum-receive-interval milliseconds;  
  multiplier number;  
  no-adaptation;  
  transmit-interval {  
    minimum-interval milliseconds;  
    threshold milliseconds;  
  }  
  version (1 | automatic);  
}
```

**Hierarchy Level** [edit protocols *iccp* *peer*]

**Release Information** Statement introduced in Junos OS Release 10.0 for MX Series routers.  
Statement introduced in Junos OS Release 12.2 for the QFX Series.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** Enable Bidirectional Forwarding Detection (BFD). BFD enables rapid detection of communication failures between peers.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## local-bias

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>local-bias;</code>   |
| <b>Hierarchy Level</b>          | <code>[edit interfaces aex aggregated-ether-options]</code>  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2X51-D20 for EX Series switches and QFX Series devices.  |
| <b>Description</b>              | <p>Enable local link bias for all links in the aggregated Ethernet interface.</p> <p>Local link bias conserves bandwidth on Virtual Chassis ports (VCPs) by using local links to forward unicast traffic exiting a Virtual Chassis or Virtual Chassis Fabric (VCF) that has a Link Aggregation group (LAG) bundle composed of member links on different member switches in the same Virtual Chassis or VCF. A local link is a member link in the LAG bundle that is on the member switch that received the traffic.</p> <p>You should enable local link bias if you want to conserve VCP bandwidth by always forwarding egress unicast traffic on a LAG bundle out of a local link. You should not enable local link bias if you want egress traffic load-balanced as it exits the Virtual Chassis or VCF.</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Configuring Local Link Bias (CLI Procedure) on page 2596</a></li> <li>• <a href="#">Understanding Local Link Bias on page 2408</a></li> </ul>   |

## local-ip-addr (ICCP)

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>local-ip-addr <i>local-ip-address</i>;</code>   |
| <b>Hierarchy Level</b>          | <p><code>[edit protocols <a href="#">iccp</a>],</code><br/> <code>[edit protocols <a href="#">iccp</a> <a href="#">peer</a> <i>peer-IP-address</i>]</code></p>  |
| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 10.0 for MX Series routers.</p> <p>Statement introduced in Junos OS Release 12.2 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> |
| <b>Description</b>              | Specify the local IP address of the interchassis link (ICL) interface that Interchassis Control Protocol (ICCP) uses to communicate to the peers that host a multichassis link aggregation group (MC-LAG).                          |
| <b>Options</b>                  | <b><i>local-ip-address</i></b> —Default local IP address to be used by all peers.   |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>  |

## loopback (Aggregated Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet)

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | (loopback   no-loopback);  |
| <b>Hierarchy Level</b>          | [edit interfaces <i>interface-name</i> aggregated-ether-options],<br>[edit interfaces <i>interface-name</i> ether-options] |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.  |
| <b>Description</b>              | For aggregated Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces, enable or disable loopback mode.            |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.    |

## mc-ae

**Syntax** `mc-ae {  
     chassis-id chassis-id;  
     mc-ae-id mc-ae-id;  
     mode (active-active);  
     status-control (active | standby);  
 }`

**Hierarchy Level** [edit [interfaces aggregated-ether-options](#)]

**Release Information** Statement introduced in Junos OS Release 12.2 for the QFX Series.

**Description** Specify the multichassis aggregated Ethernet interface configuration.

**Options** **chassis-id**—Specify the chassis ID for LACP to calculate the port number of the MC-LAG physical member links.

**mc-ae-id**—Specify the identification number of MC-LAG device. The two MC-LAG QFX3500 devices that manage a given MC-LAG must have the same **mc-lag-id**.

**mode (active | active)**—Specify that the MC-LAG is in active-active mode. In this mode, if a member interface of the MC-LAG goes down, traffic can still be forwarded to the QFX3500 devices hosting the MC-LAG using the interchassis link-protection link (ICL-PL). The links from the client-device connected to both of the QFX3500 devices will remain active. Only active-active mode is supported at this time.

**status-control (active | standby)**—Specify if a peer is in active or standby mode. In active mode, the peer is considered the primary device, and in standby mode it is considered the secondary device. If the ICL-PL goes down, the peer in standby mode will bring its member links to standby state. If the Interchassis Control Protocol (ICCP) connection goes down, the peer in standby mode will change the LACP system ID to the default value on its member links.

**NOTE:** You cannot have both peers hosting an MC-LAG be in active or standby mode. One peer must be in active mode, and the other peer must be in standby mode.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

## mc-ae-id

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>mc-ae-id <i>mc-ae-id</i>;</code>  |
| <b>Hierarchy Level</b>          | [edit <a href="#">interfaces aggregated-ether-options mc-ae</a> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2 for the QFX Series.<br>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.  |
| <b>Description</b>              | Specify the multichassis aggregated Ethernet (MC-AE) identification number of the MC-AE that a given aggregated Ethernet interface belongs to. The two peers that host a given multichassis link aggregation group (MC-LAG) must have the same multichassis aggregated Ethernet ID. |
| <b>Options</b>                  | <b>Range:</b> 1 through 65535.  |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.   |

## minimum-interval (Liveness Detection)

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>minimum-interval <i>milliseconds</i>;</code>   |
| <b>Hierarchy Level</b>          | [edit protocols <a href="#">iccp peer liveness-detection</a> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.0 for MX Series routers.<br>Statement introduced in Junos OS Release 12.2 for the QFX Series.<br>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.   |
| <b>Description</b>              | Configure simultaneously the minimum interval at which the peer transmits liveness detection requests and the minimum interval at which the peer expects to receive a reply from a peer with which it has established a Bidirectional Forwarding Detection (BFD) session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately by using the <b>transmit-interval</b> <b>minimal-interval</b> and <b>minimum-receive-interval</b> statements, respectively. |
| <b>Options</b>                  | <b><i>milliseconds</i></b> —Specify the minimum interval value for Bidirectional Forwarding Detection (BFD).<br><b>Range:</b> 1 through 255,000  |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.  |

## minimum-links

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>minimum-links <i>number</i>;</code>   |
| <b>Hierarchy Level</b>          | [edit interfaces <code>aex</code> <a href="#">aggregated-ether-options</a> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.   |
| <b>Description</b>              | For an aggregated Ethernet interface, set the minimum number of links that must be up for the bundle to be labeled up.                              |
| <b>Options</b>                  | <i>number</i> —Number of links.<br><b>Range:</b> 1 through 8<br><b>Default:</b> 1   |
| <b>Required Privilege Level</b> | <code>interface</code> —To view this statement in the configuration.<br><code>interface-control</code> —To add this statement to the configuration. |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Configuring Link Aggregation on page 2593</a></li></ul>   |

## minimum-receive-interval (Liveness Detection)

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>minimum-receive-interval <i>milliseconds</i>;</code>   |
| <b>Hierarchy Level</b>          | [edit protocols <code>iccp</code> <code>peer</code> <a href="#">liveness-detection</a> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.0 for MX Series routers.<br>Statement introduced in Junos OS Release 12.2 for the QFX Series.<br>Statement introduced in Junos OS Release 12.3R2 for EX Series switches. |
| <b>Description</b>              | Configure the minimum interval at which the peer must receive a reply from a peer with which it has established a Bidirectional Forwarding Detection (BFD) session.  |
| <b>Options</b>                  | <i>milliseconds</i> —Specify the minimum interval value.<br><b>Range:</b> 1 through 255,000  |
| <b>Required Privilege Level</b> | <code>routing</code> —To view this statement in the configuration.<br><code>routing-control</code> —To add this statement to the configuration.  |

## mode (QFX Series)

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>mode active-active ;</code>   |
| <b>Hierarchy Level</b>          | [edit <a href="#">interfaces aggregated-ether-options mc-ae</a> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2 for the QFX Series.<br>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.  |
| <b>Description</b>              | Configure the multichassis link aggregation group (MC-LAG) to be in active-active mode. In active-active mode, all of the members of the MC-LAG will be active on both routing or switching devices. Only active-active mode is supported at this time. |
| <b>Options</b>                  | <b>active-active</b> —Specify that all of the members of the MC-LAG will be active on both routing or switching devices.  |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    |   |

## multi-chassis

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <pre>multi-chassis {   multi-chassis-protection peer-ip-address {     interface interface-name;   } }</pre>   |
| <b>Hierarchy Level</b>          | [edit]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6 for MX Series routers.<br>Statement introduced in Junos OS Release 12.2 for the QFX Series.<br>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.                                   |
| <b>Description</b>              | Configure an interchassis link-protection link (ICL-PL) between the two peers that host a multichassis link aggregation group (MC-LAG). You can configure either an aggregated Ethernet interface or a 10-Gigabit Ethernet interface to be an ICL-PL. |
| <b>Options</b>                  | <b>interface interface-name</b> —Specify the logical interface name of the peer.<br><br>The remaining statements are explained separately.  |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.   |

## multi-chassis-protection

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>multi-chassis-protection <i>peer-ip-address</i> {<br/>    <b>interface</b> <i>interface-name</i>;<br/>}</code>  |
| <b>Hierarchy Level</b>          | [edit <a href="#">multi-chassis</a> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6 for MX Series routers.<br>Statement introduced in Junos OS Release 12.2 for the QFX Series.<br>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.   |
| <b>Description</b>              | Configure multichassis link protection between the two peers that host a multichassis link aggregation group (MC-LAG). If the Interchassis Control Protocol (ICCP) connection is up and the interchassis link (ICL) comes up, the peer configured as standby brings up the multichassis aggregated Ethernet (MC-AE) interfaces shared with the peer. Multichassis protection must be configured on one interface for each peer.<br><br>The remaining statements are explained separately. |
| <b>Options</b>                  | <b>interface <i>interface-name</i></b> —Specify the logical interface name of the peer.<br><br>The remaining statements are explained separately.   |
| <b>Required Privilege Level</b> | <b>interface</b> —To view this statement in the configuration.<br><b>interface-control</b> —To add this statement to the configuration.   |

## multiplier (Liveness Detection)

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>multiplier <i>number</i>;</code>  |
| <b>Hierarchy Level</b>          | [edit protocols <a href="#">iccp</a> peer <a href="#">liveness-detection</a> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2 for the QFX Series.   |
| <b>Description</b>              | Configure the number of liveness detection requests not received by the peer before Bidirectional Forwarding Detection (BFD) declares the peer is down. |
| <b>Options</b>                  | <b>number</b> —Maximum allowable number of liveness detection requests missed by the peer.<br><b>Range:</b> 1 through 255<br><b>Default:</b> 3          |
| <b>Required Privilege Level</b> | <b>routing</b> —To view this statement in the configuration.<br><b>routing-control</b> —To add this statement to the configuration.                     |
| <b>Related Documentation</b>    |   |

## mtu

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>mtu bytes;</code>   |
| <b>Hierarchy Level</b>          | [edit <b>interfaces</b> <i>interface-name</i> ],<br>[edit <b>interfaces</b> <i>interface-range</i> <i>interface-name</i> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.   |
| <b>Description</b>              | <p>Specify the maximum transmission unit (MTU) size for the media. Changing the media MTU size causes an interface to be deleted and added again. On a QFX3500, QFX3600, and QFX5100 switch, either standalone or as part of the QFabric system, the maximum MTU value on an untagged packet transiting through an ingress Gigabit Ethernet interface must be no more than the currently configured MTU value plus four, whereas the maximum MTU value on a tagged packet transiting through an ingress Gigabit Ethernet interface must be no more than the currently configured MTU value plus eight. The maximum MTU value on an untagged or tagged packet transiting through an ingress 10-Gigabit Ethernet interface must be no more than the currently configured MTU value plus eight.</p> <p>Keep the following points in mind if you are configuring MTU size for jumbo frames on these special types of interfaces:</p> <ul style="list-style-type: none"> <li>• <b>For LAG interfaces</b>—Configuring the jumbo MTU size on a link aggregation group (LAG) interface (<b>aex</b>) automatically configures the jumbo MTU size on the member links.</li> <li>• <b>For RVIs</b>—Jumbo frames of up to 9216 bytes are supported on the routed VLAN interface (RVI), which is named <b>vlan</b>. The RVI functions as a logical router. To route jumbo data packets on the RVI, you must configure the jumbo MTU size on the member physical interfaces of the RVI and not on the RVI itself (the <b>vlan</b> interface). However, for jumbo control packets—for example, to ping the RVI with a packet size of 6000 bytes or more—you must explicitly configure the jumbo MTU size on the interface named <b>vlan</b> (the RVI). On a QFX5100 switch, jumbo frames on the RVI are configured on the basis of the interface MTU.</li> </ul> |
|                                 | <div>  <p><b>CAUTION:</b> Setting or deleting the jumbo MTU size on the RVI (the <b>vlan</b> interface) while the switch is transmitting packets might result in dropped packets.</p> </div>   |
| <b>Options</b>                  | <p><b>bytes</b> —MTU size.</p> <p><b>Range:</b> 64 through 9216 bytes</p> <p><b>Default:</b> 1514 bytes</p>   |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>  |

## on-loss-of-keepalives

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | on-loss-of-keepalives;   |
| <b>Hierarchy Level</b>          | [edit chassis <b>redundancy</b> failover]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.2 for EX Series switches.<br>Statement introduced in Junos OS Release 11.1 for the QFX Series.  |
| <b>Description</b>              | Instruct the backup router to take mastership if it detects a loss of keepalive signal from the master Routing Engine.   |
| <b>Default</b>                  | <p>The <b>on-loss-of-keepalives</b> statement must be included at the [edit chassis <b>redundancy failover</b>] hierarchy level for failover to occur.</p> <p>When the <b>on-loss-of-keepalives</b> statement is included but graceful Routing Engine switchover <i>is not</i> configured, failover occurs after 300 seconds (5 minutes).</p> <p>When the <b>on-loss-of-keepalives</b> statement is included and graceful Routing Engine switchover <i>is</i> configured, the keepalive signal is automatically enabled and the failover time is set to 2 seconds.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">graceful-switchover on page 2309</a></li> <li>• <i>keepalive-time</i></li> <li>• <i>Installing Software on an EX Series Switch with Redundant Routing Engines (CLI Procedure)</i></li> <li>• <i>High Availability Features for EX Series Switches Overview</i></li> </ul>   |

## pdu-interval

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>pdu-interval <i>interval</i>;</code>   |
| <b>Hierarchy Level</b>          | [edit protocols <a href="#">oam</a> <a href="#">ethernet</a> <a href="#">link-fault-management</a> <a href="#">interface</a> <i>interface-name</i> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.4 for EX Series switches.   |
| <b>Description</b>              | Specify the periodic OAM PDU sending interval for fault detection. It is used for IEEE 802.3ah Operation, Administration, and Maintenance (OAM) link fault management (LFM) support.   |
| <b>Options</b>                  | <i>interval</i> —Periodic OAM PDU sending interval.<br><b>Range:</b> 400 through 1000 milliseconds<br><b>Default:</b> 1000 milliseconds  |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Ethernet OAM Link Fault Management on EX Series Switches on page 2583</a></li><li>• <a href="#">Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2604</a></li></ul> |

## pdu-threshold

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>pdu-threshold <i>threshold-value</i>;</code>   |
| <b>Hierarchy Level</b>          | [edit protocols <a href="#">oam</a> <a href="#">ethernet</a> <a href="#">link-fault-management</a> <a href="#">interface</a> <i>interface-name</i> ]                               |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.4 for EX Series switches.   |
| <b>Description</b>              | Configure how many protocol data units (PDUs) are missed before declaring the peer lost in Ethernet OAM link fault management (LFM) for all interfaces or for specific interfaces. |
| <b>Options</b>                  | <i>threshold-value</i> —Number of PDUs missed before declaring the peer lost.<br><b>Range:</b> 3 through 10 PDUs<br><b>Default:</b> 3 PDUs   |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2604</a></li></ul>                                      |

## peer (ICCP)

**Syntax**

```
peer ip-address {
    authentication-key string;
    backup-liveness-detection {
        backup-peer-ip ip-address;
    }
    liveness-detection {
        detection-time {
            threshold milliseconds;
        }
        minimum-interval milliseconds;
        minimum-receive-interval milliseconds;
        multiplier number;
        no-adaptation;
        transmit-interval {
            minimum-interval milliseconds;
            threshold milliseconds;
        }
        version (1 | automatic);
    }
    local-ip-address ipv4-address;
    session-establishment-hold-time seconds;
}
```

**Hierarchy Level** [edit protocols [iccp](#)]

**Release Information** Statement introduced in Junos OS Release 10.0 for MX Series routers.  
Statement introduced in Junos OS Release 12.2 for the QFX Series.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** Configure the peers that host a multichassis link aggregation group (MC-LAG). You must configure Interchassis Control Protocol (ICCP) for both peers that host the MC-LAG.

**NOTE:** Backup liveness detection is not supported on MX Series routers.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## peer (Multichassis)

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>peer ip-address {<br/>    interface interface-name;<br/>}</code>   |
| <b>Hierarchy Level</b>          | [edit <a href="#">multi-chassis</a> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6 for MX Series routers.<br>Statement introduced in Junos OS Release 12.2 for the QFX Series.   |
| <b>Description</b>              | Configure the IP address of the peer that is part of the interchassis link-protection link (ICL-PL). If the Interchassis Control Connection Protocol (ICCP) is up and the interchassis link (ICL) comes up, the peer configured as standby will bring up the MC-AE interfaces shared with the active peer specified by the <b>peer</b> statement. You must specify the physical interface of the peer. |
| <b>Options</b>                  | <code>interface interface-name</code> —Specify the logical interface name of the peer.   |
| <b>Required Privilege Level</b> | <code>interface</code> —To view this statement in the configuration.<br><code>interface-control</code> —To add this statement to the configuration.  |

## periodic

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>periodic (fast   slow);</code>   |
| <b>Hierarchy Level</b>          | [edit <a href="#">interfaces aex aggregated-ether-options lacp</a> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.  |
| <b>Description</b>              | Configure the interval for periodic transmission of LACP packets.  |
| <b>Default</b>                  | <code>fast</code>  |
| <b>Options</b>                  | <code>interval</code> —Interval at which to periodically transmit LACP packets: <ul style="list-style-type: none"><li>• <code>fast</code>—Receive packets every second. This is the default.</li><li>• <code>slow</code>—Receive packets every 30 seconds.</li></ul> |
| <b>Required Privilege Level</b> | <code>interface</code> —To view this statement in the configuration.<br><code>interface-control</code> —To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Understanding Aggregated Ethernet Interfaces and LACP on page 2393</a></li><li>• <i>Junos OS Network Interfaces Library for Routing Devices</i></li></ul>  |

## pic

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <pre> pic <i>pic-number</i> {     tunnel-port <i>port-number</i> tunnel-services;     port <i>port-number</i> {         channel-speed (<i>speed</i> disable-auto-speed-detection) ;     }     port-range <i>port-range-low</i> <i>port-range-high</i> {         channel-speed (<i>speed</i> disable-auto-speed-detection) ;     } } </pre>   |
| <b>Hierarchy Level</b>          | [edit chassis fpc slot]  |
| <b>Release Information</b>      | Option <b>channel-speed</b> introduced in Junos OS Release 13.2 for the QFX Series.  |
| <b>Description</b>              | (QFX3500, QFX3600, and QFX5100 standalone switches running Enhanced Layer 2 Software only)—Configure a specific port or a range of ports to operate as 10-Gigabit Ethernet ports or 40-Gigabit Ethernet ports.   |
| <b>Options</b>                  | <p><b>pic <i>pic-number</i></b>—(QFX3500 standalone switch only) Number of the physical interface card (PIC) on which you want to configure port types. Specify <b>1</b> to configure 10-Gigabit Ethernet or 40-Gigabit Ethernet type ports.</p> <p>(QFX3600 standalone switch only) Number of the physical interface card (PIC) on which you want to configure port types. Specify <b>0</b> to configure 10-Gigabit Ethernet or 40-Gigabit Ethernet type ports.</p> <p><b>port <i>physical-port-number</i></b>—Port number on which you want to configure the port type.</p> <p><b>port-range-low</b>—Lowest-numbered port in the range of ports.</p> <p><b>port-range-high</b>—Highest-numbered port in the range of ports.</p> <p><b>channel-speed (<i>speed</i>  disable-auto-speed-detection)</b> —Configure <i>10g</i> for 10-Gigabit Ethernet type ports, and configure <i>disable-auto-speed-detection</i> to disable auto-channelization.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Channelizing Interfaces on page 2608</a></li> </ul>   |

## preempt-cutover-timer

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>preempt-cutover-timer seconds;</code>  |
| <b>Hierarchy Level</b>          | <ul style="list-style-type: none"><li>For platforms with ELS:<br/>[edit switch-options <b>redundant-trunk-group</b> group name]</li><li>For platforms without ELS:<br/>[edit ethernet-switching-options <b>redundant-trunk-group</b> group name]</li></ul>   |
| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 11.1 for EX Series switches.</p> <p>Hierarchy level [edit switch-options] introduced in Junos OS Release 13.2X50-D10 (ELS). (See “<a href="#">Getting Started with Enhanced Layer 2 Software</a>” on page 43 for information about ELS.)</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> |
| <b>Description</b>              | Change the length of time that a re-enabled primary link waits to take over from an active secondary link in a redundant trunk group.  |
| <b>Default</b>                  | If you do not change the time with the <b>preempt-cutover-timer</b> statement, a re-enabled primary link takes over from the active secondary link after 120 seconds.  |
| <b>Options</b>                  | <p><b>seconds</b>—Number of seconds that the primary link waits to take over from the active secondary link.</p> <p><b>Range:</b> 1 through 600 seconds</p>  |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li><i>Example: Configuring Redundant Trunk Links for Faster Recovery</i></li><li><a href="#">Example: Configuring Redundant Trunk Links for Faster Recovery on page 2578</a></li><li><a href="#">Understanding Redundant Trunk Links on page 2447</a></li></ul>   |

## redundancy (Graceful Switchover)

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <pre> redundancy {   failover {     on-disk-failure;     on-loss-of-keepalives;   }   graceful-switchover; } </pre>  |
| <b>Hierarchy Level</b>          | [edit chassis]   |
| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>   |
| <b>Description</b>              | <p>Enable redundant Routing Engines on a Virtual Chassis with two or more member switches or on a Virtual Chassis Fabric, on a standalone EX6200 or EX8200 switch with more than one Routing Engine.</p> <p>The remaining statements are explained separately.</p>   |
| <b>Default</b>                  | Redundancy is enabled for the Routing Engines.   |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>   |

## remote-loopback

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | remote-loopback;  |
| <b>Hierarchy Level</b>          | [edit protocols <a href="#">oam</a> <a href="#">ethernet</a> <a href="#">link-fault-management</a> <a href="#">interface</a> <i>interface-name</i> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.4 for EX Series switches.  |
| <b>Description</b>              | Set the data terminal equipment (DTE) in loopback mode. Remove the statement from the configuration to take the DTE out of loopback mode. It is used for IEEE 802.3ah Operation, Administration, and Maintenance (OAM) link fault management (LFM) support.           |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Ethernet OAM Link Fault Management on EX Series Switches on page 2583</a></li> <li>• <a href="#">Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2604</a></li> </ul> |

## resilient-hash

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | resilient-hash;  |
| <b>Hierarchy Level</b>          | [edit interfaces <a href="#">aex</a> <a href="#">aggregated-ether-options</a> ]]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series.   |
| <b>Description</b>              | Enable resilient hashing for a LAG, to minimize remapping of destination paths.  |
| <b>Required Privilege Level</b> | system—To view this statement in the configuration.<br>system-control—To add this statement to the configuration.                    |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Configuring Resilient Hashing for Trunk/ECMP Groups on page 2607</a></li> </ul> |

## rx-buffers

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | rx-buffers (on   off);  |
| <b>Hierarchy Level</b>          | [edit <a href="#">interfaces interface-name ether-options configured-flow-control</a> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.1 for the QFX Series.   |
| <b>Description</b>              | <p>Enable or disable an interface to generate and send Ethernet PAUSE messages. If you enable the receive buffers to generate and send PAUSE messages, when the receive buffers reach a certain level of fullness, the interface sends a PAUSE message to the connected peer. If the connected peer is properly configured, it stops transmitting frames to the interface on the entire link. When the interface receive buffer empties below a certain threshold, the interface sends a message to the connected peer to resume sending frames.</p> <p>Ethernet PAUSE prevents buffers from overflowing and dropping packets during periods of network congestion. If the other devices in the network are also configured to support PAUSE, PAUSE supports lossless operation. Use the <b>rx-buffers</b> statement with the <b>tx-buffers</b> statement to configure asymmetric Ethernet PAUSE on an interface. (Use the <b>flow-control</b> statement to enable symmetric PAUSE and the <b>no-flow-control</b> statement to disable symmetric PAUSE on an interface. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.)</p> |
|                                 | <p> <b>NOTE:</b> Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).</p> <p>Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.</p>   |
| <b>Default</b>                  | Flow control is disabled. You must explicitly configure Ethernet PAUSE flow control on interfaces.  |
| <b>Options</b>                  | <b>on   off</b> —Enable or disable an interface to generate and send Ethernet PAUSE messages.   |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">flow-control on page 2659</a></li> <li>• <a href="#">tx-buffers on page 2742</a></li> </ul>  |

## routing-engine

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <pre> routing-engine {   on-disk-failure {     disk-failure-action (halt   reboot);   } } </pre>   |
| <b>Hierarchy Level</b>          | <p>[edit chassis]<br/> [edit chassis interconnect-device <i>name</i>],<br/> [edit chassis node-group <i>name</i>]</p>  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.  |
| <b>Description</b>              | Configure a Routing Engine to halt or reboot automatically when a hard disk error occurs. A hard disk error may cause a Routing Engine to enter a state in which it responds to local pings and interfaces remain up, but no other processes are responding. Rebooting or halting prevents this. |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.<br/> interface-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <i>Configuring the Junos OS to Enable a Routing Engine to Reboot on Hard Disk Errors</i></li> <li>• <i>Junos OS High Availability Library for Routing Devices</i></li> </ul>  |

## service-id

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>service-id number;</code>  |
| <b>Hierarchy Level</b>          | <code>[edit switch-options]</code><br><code>[edit vlans <i>vlan-name</i>]</code>   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3R2 for EX Series switches and MX Series routers.<br>Statement introduced in Junos OS Release 13.2 for the QFX Series. |
| <b>Description</b>              | Specify a service identifier for each multichassis aggregated Ethernet interface that belongs to a link aggregation group (LAG).                                   |
| <b>Options</b>                  | <b>number</b> —A number that identifies a particular service.<br><b>Range:</b> 1 through 65535   |
| <b>Required Privilege Level</b> | <b>system</b> —To view this statement in the configuration.<br><b>system control</b> —To add this statement to the configuration.                                  |

## session-establishment-hold-time

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>session-establishment-hold-time <i>seconds</i>;</code>   |
| <b>Hierarchy Level</b>          | <code>[edit protocols <a href="#">iccp peer</a>],</code><br><code>[edit protocols <a href="#">iccp</a>]</code>   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.0 for MX Series routers.<br>Statement introduced in Junos OS Release 12.2 for the QFX Series.<br>Statement introduced in Junos OS Release 12.3R2 for EX Series switches. |
| <b>Description</b>              | Specify the time during which an Interchassis Control Protocol (ICCP) connection must be established between peers.  |
| <b>Options</b>                  | <b>seconds</b> —Time (in seconds) within which a successful ICCP connection must be established.   |
| <b>Required Privilege Level</b> | <b>routing</b> —To view this statement in the configuration.<br><b>routing-control</b> —To add this statement to the configuration.  |

## source

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>source <i>source-address</i>;</code>  |
| <b>Hierarchy Level</b>          | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> tunnel]  |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.1 for EX Series switches.<br>Statement introduced in Junos OS Release 13.2 for the QFX Series. |
| <b>Description</b>              | Specify the source address of the tunnel.   |
| <b>Default</b>                  | If you do not specify a source address, the tunnel uses the unit's primary address as the source address of the tunnel.   |
| <b>Options</b>                  | <b><i>source-address</i></b> —Address of the local side of the tunnel. This is the address that is placed in the outer IP header's source field.  |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <i>Configuring Generic Routing Encapsulation Tunneling (CLI Procedure)</i></li> </ul>  |

## speed

---

|  |  |
|--|--|
| <b>Syntax</b>  | (speed 100m   1g);   |
| <b>Hierarchy Level</b>   | [edit <a href="#">interfaces</a> <i>interface-name</i> ]   |
| <b>Release Information</b>   | Statement introduced in Junos OS Release 11.1 for the QFX Series.  |
| <b>Description</b>   | Configure the speed of the interface. On QFX5100 devices using 1-Gigabit Ethernet Copper SFP interfaces, you can configure the speed to be 100 Mbps. To return to the default speed of 1 Gbps, delete the <b>100m</b> . statement at the <b>[edit interfaces <i>interface-name</i> speed]</b> CLI hierarchy. |
| <div> <b>NOTE:</b> Autonegotiation is not supported on QFX5100 devices.</div> |  |
| <b>Default</b>   | The speed for 1-Gigabit Ethernet Copper SFP interfaces is set to 1 Gbps by default, but you can configure the speed to be 100 Mbps. The speed for 10-Gigabit Ethernet interfaces is set to 10 Gbps by default and cannot be configured to operate in a different speed.                                      |
| <b>Options</b>   | <ul style="list-style-type: none"><li>• <b>100m</b>—100 Mbps</li><li>• <b>1g</b>—1 Gbps</li></ul>  |
| <b>Required Privilege Level</b>  | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.  |
| <b>Related Documentation</b>   | <ul style="list-style-type: none"><li>• <a href="#">auto-negotiation on page 2632</a></li><li>• <a href="#">Configuring Gigabit and 10-Gigabit Ethernet Interfaces on page 2586</a></li><li>• <i>Junos OS Network Interfaces Library for Routing Devices</i></li></ul>                                       |

## status-control

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | status-control (active   standby);  |
| <b>Hierarchy Level</b>          | [edit <a href="#">interfaces aggregated-ether-options</a> <i>mc-ae</i> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2 for the QFX Series.<br>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.                              |
| <b>Description</b>              | Specify whether a peer hosting a multichassis link aggregation group (MC-LAG) is primary or secondary. Primary is considered active, and secondary is considered standby. |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.   |

## symbol-period

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>symbol-period count;</code>   |
| <b>Hierarchy Level</b>          | [edit protocols <a href="#">oam ethernet link-fault-management action-profile</a> <i>profile-name</i> ; <a href="#">event link-event-rate</a> ] ,<br>[edit protocols <a href="#">oam ethernet link-fault-management interface</a> <i>interface-name</i> <a href="#">event-thresholds</a> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.4 for EX Series switches.  |
| <b>Description</b>              | Configure the threshold for sending symbol period events or taking the action specified in the action profile.<br><br>Symbol code errors occur on the underlying physical layer. The symbol period threshold is reached when the number of symbol errors reaches the configured value within the period. You cannot configure the default value to a different value. |
| <b>Options</b>                  | <i>count</i> —Threshold count in seconds for symbol period events.<br><b>Range:</b> 1 through 100 seconds   |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2604</a></li> </ul>   |

## syslog (OAM LFM)

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>syslog;</code>  |
| <b>Hierarchy Level</b>          | [edit protocols <a href="#">oam ethernet link-fault-management action-profile</a> <i>profile-name</i> ; <a href="#">action</a> ]                |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.4 for EX Series switches.  |
| <b>Description</b>              | Generate a system log message for the Ethernet Operation, Administration, and Maintenance (OAM) link fault management (LFM) event.              |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                             |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2604</a></li> </ul> |

## targeted-broadcast

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | targeted-broadcast;   |
| <b>Hierarchy Level</b>          | [edit <b>interfaces</b> <i>interface-name</i> <b>unit</b> <i>logical-unit-number</i> family inet],<br>[edit <b>interfaces</b> <i>interface-range</i> <i>interface-range-name</i> <b>unit</b> <i>logical-unit-number</i> family inet]                                      |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.   |
| <b>Description</b>              | Specify whether the IP packets destined for a Layer 3 broadcast need to be forwarded to both an egress interface and the Routing Engine, or to an egress interface only. The packets are broadcast only if the egress interface is a LAN interface.                       |
| <b>Default</b>                  | When this statement is not included, broadcast packets are sent to the Routing Engine only.   |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <i>Example: Configuring IP Directed Broadcast on an EX Series Switch</i></li><li>• <i>Configuring IP Directed Broadcast (CLI Procedure)</i></li><li>• <i>Understanding IP Directed Broadcast for EX Series Switches</i></li></ul> |

## threshold (Detection Time)

---

|  |  |
|--|--|
| <b>Syntax</b>  | threshold <i>milliseconds</i> ;  |
| <b>Hierarchy Level</b>   | [edit protocols <b>iccp</b> <i>peer</i> <b>liveness-detection</b> <i>detection-time</i> ]  |
| <b>Release Information</b>   | Statement introduced in Junos OS Release 10.0 for MX Series routers.<br>Statement introduced in Junos OS Release 12.2 for the QFX Series.  |
| <b>Description</b>   | Specify the threshold for the adaptation of the detection time for a Bidirectional Forwarding Detection (BFD) session. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent. |
| <div> <b>NOTE:</b> The threshold time must be greater than or equal to the <b>minimum-interval</b> or the <b>minimum-receive-interval</b> values.</div> |  |
| <b>Options</b>   | <b>milliseconds</b> — Value for the detection time adaptation threshold.<br><b>Range:</b> 1 through 255,000  |
| <b>Required Privilege Level</b>  | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.  |

## traceoptions (ICCP)

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | <pre>traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;disable&gt;; }</pre>  |
| <b>Hierarchy Level</b>     | [edit <a href="#">protocols iccp</a> ]   |
| <b>Release Information</b> | Statement introduced in Junos OS Release 10.0 for MX Series routers.<br>Statement introduced in Junos OS Release 12.2 for the QFX Series.  |
| <b>Description</b>         | Set Interchassis Control Protocol (ICCP) tracing options.  |
| <b>Default</b>             | Tracing operations are disabled.   |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>name</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. By default, the log file is stored in <b>/var/log/</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b><i>trace-file</i></b> reaches its maximum size, it is renamed <b><i>trace-file.0</i></b>, then <b><i>trace-file.1</i></b>, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 1 trace file only</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p>The following are the tracing options:</p> <ul style="list-style-type: none"> <li><b>all</b>—All tracing operations</li> <li><b>config-internal</b>—Trace configuration internals.</li> <li><b>general</b>—Trace general events.</li> <li><b>normal</b>—All normal events.</li> </ul> <p><b>Default:</b> If you do not specify this option, only unusual or abnormal operations are traced.</p> <ul style="list-style-type: none"> <li><b>parse</b>—Trace configuration parsing.</li> <li><b>policy</b>—Trace policy operations and actions.</li> </ul> |

- **route**—Trace routing table changes.
- **state**—Trace state transitions.
- **task**—Trace protocol task processing.
- **timer**—Trace protocol task timer processing.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

|                                 |   |
|---------------------------------|---|
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.        |
|                                 | routing-control—To add this statement to the configuration. |

---

## transmit-interval (Liveness Detection)

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <pre>transmit-interval {<br/>    minimum-interval <i>milliseconds</i>;<br/>    threshold <i>milliseconds</i>;<br/>}</pre>   |
| <b>Hierarchy Level</b>          | [edit protocols <i>iccp</i> peer <i>liveness-detection</i> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.0 for MX Series routers.<br>Statement introduced in Junos OS Release 12.2 for the QFX Series.<br>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.  |
| <b>Description</b>              | <p>Configure the Bidirectional Forwarding Detection (BFD) transmit interval. The negotiated transmit interval for a peer is the interval between the sending of BFD liveness detection requests to peers. The receive interval for a peer is the minimum interval between receiving packets sent from its peer; the receive interval is not negotiated between peers. To determine the transmit interval, each peer compares its configured minimum transmit interval with its peer's minimum receive interval. The larger of the two numbers is accepted as the transmit interval for that peer.</p> <p>The remaining statements are explained separately.</p> |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.   |

## traceoptions (Individual Interfaces)

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <pre>traceoptions {<br/>    flag <i>flag</i>;<br/>}</pre>   |
| <b>Hierarchy Level</b>          | [edit interfaces <i>interface-name</i> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.   |
| <b>Description</b>              | <p>Define tracing operations for individual interfaces.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p>The <b>traceoptions</b> statement for interfaces does not support a trace file. The logging is done by the kernel, so the tracing information is placed in the system <b>syslog</b> file in the directory <b>/var/log</b>.</p>   |
|                                 | <div> <b>NOTE:</b> The <b>traceoptions</b> statement is not supported on the QFX3000 QFabric system.</div>   |
| <b>Default</b>                  | If you do not include this statement, no interface-specific tracing operations are performed.   |
| <b>Options</b>                  | <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. The following are the interface-specific tracing options.</p> <ul style="list-style-type: none"><li>• <b>all</b>—All interface tracing operations</li><li>• <b>event</b>—Interface events</li><li>• <b>ipc</b>—Interface interprocess communication (IPC) messages</li><li>• <b>media</b>—Interface media changes</li><li>• <b>q921</b>—ISDN Q.921 frames</li><li>• <b>q931</b>—ISDN Q.931 frames</li></ul> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <i>Tracing Operations of an Individual Router or Switch Interface</i></li></ul>   |

## traceoptions (OAM LFM)

**Syntax** traceoptions {  
     file *filename* <files *number*> <match *regex*> <size *size*> <world-readable |  
         no-world-readable>;  
     flag *flag* ;  
     no-remote-trace;  
 }

**Release Information** Statement introduced in JUNOS Release 10.2 for EX Series switches.

**Description** Configure tracing options the link fault management.

**Options** file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory */var/log*.

files *number*—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000

**Default:** 3 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **action-profile**—Trace action profile invocation events.
- **all**—Trace all events.
- **configuration**—Trace configuration events.
- **protocol**—Trace protocol processing events.
- **routing socket**—Trace routing socket events.

match—(Optional) Refine the output to log only those lines that match the given regular expression.

no-world-readable—(Optional) Restrict file access to the user who created the file.

no-remote-trace—(Optional) Disable the remote trace.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**world-readable**—(Optional) Enable unrestricted file access.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

---

## traps

---

**Syntax** (traps | no-traps);

**Hierarchy Level** [edit interfaces *interface-name*],  
[edit interfaces *interface-name* *unit* *logical-unit-number*],  
[edit interfaces *interface-range* *interface-range-name*]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Enable or disable the sending of SNMP notifications when the state of the connection changes.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

- *Enabling or Disabling SNMP Notifications on Physical Interfaces*
- *Enabling or Disabling SNMP Notifications on Logical Interfaces*

## tunnel

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <pre>tunnel {   destination destination-address;   source source-address;   ttl number; }</pre>  |
| <b>Hierarchy Level</b>          | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.1 for EX Series switches.<br>Statement introduced in Junos OS Release 13.2 for the QFX Series.   |
| <b>Description</b>              | <p>Configure a tunnel. You can use the tunnel for unicast and multicast traffic or just for multicast traffic. You can also use tunnels for encrypted traffic.</p> <p>The remaining statements are explained separately.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>   |

## tx-buffers

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | tx-buffers (on   off);   |
| <b>Hierarchy Level</b>          | [edit <a href="#">interfaces</a> <i>interface-name</i> <a href="#">ether-options</a> <a href="#">configured-flow-control</a> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.1 for the QFX Series.  |
| <b>Description</b>              | <p>Enable or disable an interface to respond to received Ethernet PAUSE messages. If you enable the transmit buffers to respond to PAUSE messages, when the interface receives a PAUSE message from the connected peer, the interface stops transmitting frames on the entire link. When the receive buffer on the connected peer empties below a certain threshold, the peer interface sends a message to the paused interface to resume sending frames.</p> <p>Ethernet PAUSE prevents buffers from overflowing and dropping packets during periods of network congestion. If the other devices in the network are also configured to support PAUSE, PAUSE supports lossless operation. Use the <b>tx-buffers</b> statement with the <b>rx-buffers</b> statement to configure asymmetric Ethernet PAUSE on an interface. (Use the <b>flow-control</b> statement to enable symmetric PAUSE and the <b>no-flow-control</b> statement to disable symmetric PAUSE on an interface. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.)</p> |
|                                 | <div> <b>NOTE:</b> Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).</div> <p>Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.</p>  |
| <b>Default</b>                  | Flow control is disabled. You must explicitly configure Ethernet PAUSE flow control on interfaces.   |
| <b>Options</b>                  | <b>on   off</b> —Enable or disable an interface to respond to an Ethernet PAUSE message.   |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">flow-control on page 2659</a></li><li>• <a href="#">rx-buffers on page 2728</a></li></ul>  |

## version (Liveness Detection)

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | version (1   automatic);   |
| <b>Hierarchy Level</b>          | [edit protocols <a href="#">iccp peer liveness-detection</a> ]   |
| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 10.0 for MX Series routers.</p> <p>Statement introduced in Junos OS Release 12.2 for the QFX Series.</p> |
| <b>Description</b>              | Configure the Bidirectional Forwarding Detection (BFD) protocol version to detect.   |
| <b>Options</b>                  | <p>1—Use BFD protocol version 1.</p> <p><b>automatic</b>—Autodetect the BFD protocol version.</p>  |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                       |

## vlan-id

---

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | <code>vlan-id <i>vlan-id-number</i>;</code>   |
| <b>Hierarchy Level</b>     | [edit <a href="#">interfaces</a> <i>interface-name</i> <a href="#">unit</a> <i>logical-unit-number</i> ]            |
| <b>Release Information</b> | Statement introduced in Junos OS Release 11.1 for the QFX Series.   |
| <b>Description</b>         | For 10-Gigabit Ethernet and aggregated Ethernet interfaces only, bind an 802.1Q VLAN tag ID to a logical interface. |

**NOTE:** The VLAN tag ID cannot be configured on logical interface unit 0. The logical unit number must be 1 or higher.

|                                 |   |
|---------------------------------|---|
| <b>Options</b>                  | <i>vlan-id-number</i> —Valid VLAN identifier.<br><b>Range:</b> 1 through 4094   |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">vlan-tagging on page 1813</a></li><li>• <a href="#">Configuring Gigabit and 10-Gigabit Ethernet Interfaces on page 2586</a></li><li>• <a href="#">Configuring a Layer 3 Logical Interface on page 2593</a></li><li>• <i>Junos OS Network Interfaces Library for Routing Devices</i></li></ul> |

## vlan-tagging

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>vlan-tagging;</code>  |
| <b>Hierarchy Level</b>          | [edit <a href="#">interfaces</a> <i>interface-name</i> ]<br>[edit <a href="#">interfaces</a> <a href="#">interface-range</a> <i>interface-range-name</i> ]            |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.3 for the QFX Series.   |
| <b>Description</b>              | Enable VLAN tagging. The platform receives and forwards single-tag frames with 802.1Q VLAN tags.  |
| <b>Default</b>                  | VLAN tagging is disabled by default.  |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">vlan-id on page 2746</a></li><li>• <a href="#">Configuring a Layer 3 Logical Interface on page 2593</a></li></ul> |

# Administration

## Monitoring System Process Information

**Purpose** View the processes running on the device.

**Action** To view the software processes running on the device:  
[edit system]

user@switch> [show system processes](#)

**Meaning** [Table 22 on page 333](#) summarizes the output fields in the system process information display.

The display includes the total CPU load and total memory utilization.

**Table 245: Summary of System Process Information Output Fields**

| Field | Values                     |
|-------|----------------------------|
| PID   | Identifier of the process. |
| Name  | Owner of the process.      |

Table 245: Summary of System Process Information Output Fields (*continued*)

| Field              | Values   |
|--------------------|--|
| State              | Current state of the process.                            |
| CPU Load           | Percentage of the CPU that is being used by the process. |
| Memory Utilization | Amount of memory that is being used by the process.      |
| Start Time         | Time of day when the process started.                    |

- Related Documentation**

  - [show system uptime on page 1137](#)

## Monitoring System Properties

**Purpose** View system properties such as the name, IP address, and resource usage.

**Action** To monitor system properties in the CLI, enter the following commands:

- [show system uptime](#)
- [show system users](#)
- [show system storage](#)

**Meaning** [Table 23 on page 334](#) summarizes key output fields in the system properties display.

Table 246: Summary of Key System Properties Output Fields

| Field                      | Values  | Additional Information                                 |
|----------------------------|---|--|
| <b>General Information</b> |   |  |
| Serial Number              | Serial number of device.  |  |
| Junos OS Version           | Version of Junos OS active on the switch, including whether the software is for domestic or export use. | Export software is for use outside the USA and Canada. |
| Hostname                   | Name of the device.   |  |
| IP Address                 | IP address of the device.   |  |
| Loopback Address           | Loopback address.   |  |
| Domain Name Server         | Address of the domain name server.  |  |
| Time Zone                  | Time zone on the device.  |  |

Table 246: Summary of Key System Properties Output Fields (*continued*)

| Field                          | Values   | Additional Information   |
|--------------------------------|--|--|
| <b>Time</b>                    |  |  |
| Current Time                   | Current system time, in Coordinated Universal Time (UTC).  |  |
| System Booted Time             | Date and time when the device was last booted and how long it has been running.  |  |
| Protocol Started Time          | Date and time when the protocols were last started and how long they have been running.  |  |
| Last Configured Time           | Date and time when a configuration was last committed. This field also shows the name of the user who issued the last <b>commit</b> command. |  |
| Load Average                   | CPU load average for 1, 5, and 15 minutes.   |  |
| <b>Storage Media</b>           |  |  |
| Internal Flash Memory          | Usage details of internal flash memory.  |  |
| External Flash Memory          | Usage details of external USB flash memory.  |  |
| <b>Logged in Users Details</b> |  |  |
| User                           | Username of any user logged in to the switch.  |  |
| Terminal                       | Terminal through which the user is logged in.  |  |
| From                           | System from which the user has logged in. A hyphen indicates that the user is logged in through the console.                                 |  |
| Login Time                     | Time when the user logged in.  | This is the <b>user@switch</b> field in <b>show system users</b> command output. |
| Idle Time                      | How long the user has been idle.   |  |

- Related Documentation**
- [Monitoring System Process Information on page 333](#)
  - [show system processes on page 1051](#)

## Monitoring Interface Status and Traffic

**Purpose** View interface status to monitor interface bandwidth utilization and traffic statistics.

**Action** • To view interface status for all the interfaces, enter [show interfaces xe](#).

- To view status and statistics for a specific interface, enter **show interfaces xe interface-name**.
- To view status and traffic statistics for all interfaces, enter either **show interfaces xe detail** or **show interfaces xe extensive**.

**Meaning** For details about output from the CLI commands, see [show interfaces xe](#).

## Verifying That Layer 3 Logical Interfaces Are Working

**Purpose** After configuring Layer 3 logical interfaces, verify that they are set up properly and transmitting data.

- Action** 1. To determine if you have successfully created the logical interfaces and the links are up:

```
[edit interfaces]
user@switch> show interfaces interface-name terse
```

| Interface      | Admin | Link | Proto | Local      | Remote |
|----------------|-------|------|-------|------------|--------|
| ge-0/0/0       | up    | up   |       |            |        |
| ge-0/0/0.0     | up    | up   | inet  | 1.1.1.1/24 |        |
| ge-0/0/0.1     | up    | up   | inet  | 2.1.1.1/24 |        |
| ge-0/0/0.2     | up    | up   | inet  | 3.1.1.1/24 |        |
| ge-0/0/0.3     | up    | up   | inet  | 4.1.1.1/24 |        |
| ge-0/0/0.4     | up    | up   | inet  | 5.1.1.1/24 |        |
| ge-0/0/0.32767 | up    | up   |       |            |        |

2. Use the **ping** command from a device on one subnet to an address on another subnet to determine if packets were transmitted correctly on the logical interface VLANs:

```
user@switch> ping ip-address
PING 1.1.1.1 (1.1.1.1): 56 data bytes
64 bytes from 1.1.1.1: icmp_seq=0 ttl=64 time=0.157 ms
64 bytes from 1.1.1.1: icmp_seq=1 ttl=64 time=0.238 ms
64 bytes from 1.1.1.1: icmp_seq=2 ttl=64 time=0.255 ms
64 bytes from 1.1.1.1: icmp_seq=3 ttl=64 time=0.128 ms
--- 1.1.1.1 ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
```

**Meaning** The output confirms that the logical interfaces have been created and the links are up.

**Related Documentation**

- [Configuring a Layer 3 Logical Interface on page 2593](#)

## Verifying the Status of a LAG Interface

**Purpose** Verify that a link aggregation group (LAG) (**ae0**) has been created on the switch.

- Action** To verify that the **ae0** LAG has been created:

```
[edit interfaces]
show interfaces ae0 terse
```

| Interface | Admin | Link | Proto | Local | Remote |
|-----------|-------|------|-------|-------|--------|
|-----------|-------|------|-------|-------|--------|

```

ae0                up      up
ae0.0              up      up      inet      10.10.10.2/24

```

**Meaning** The output confirms that the **ae0** link is up and shows the family and IP address assigned to this link.

- Related Documentation**
- [Configuring Link Aggregation on page 2593](#)
  - [Verifying That LACP Is Configured Correctly and Bundle Members Are Exchanging LACP Protocol Packets on page 2751](#)
  - [Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch on page 2462](#)
  - [Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch on page 2466](#)
  - [show lacp statistics interfaces \(View\) on page 2875](#)

## Verifying That LACP Is Configured Correctly and Bundle Members Are Exchanging LACP Protocol Packets

Verify that LACP has been set up correctly and that the bundle members are transmitting LACP protocol packets.

1. [Verifying the LACP Setup on page 2751](#)
2. [Verifying That LACP Packets Are Being Exchanged on page 2751](#)

### Verifying the LACP Setup

**Purpose** Verify that the LACP has been set up correctly.

**Action** To verify that LACP has been enabled as active on one end:

```

user@switch>show lacp interfaces xe-0/0/0
Aggregated interface: ae0
LACP state:
xe-0/1/0      Actor No Yes No No No Yes Fast Active
xe-0/1/0      PartnerNo Yes No No No Yes Fast Passive
LACP protocol: Receive State Transmit State Mux State
xe-0/1/0      Defaulted Fast periodic Detached

```

**Meaning** This example shows that LACP has been configured with one side as active and the other as passive. When LACP is enabled, one side must be set as active in order for the bundled link to be up.

### Verifying That LACP Packets Are Being Exchanged

**Purpose** Verify that LACP packets are being exchanged between interfaces.

**Action** Use the `show lacp statistics interfaces interface-name` command to display LACP BPDU exchange information.

```
show lacp statistics interfaces ae0
```

```
Aggregated interface: ae0
```

| LACP Statistics: | LACP Rx | LACP Tx | Unknown Rx | Illegal Rx |
|------------------|---------|---------|------------|------------|
| xe-0/0/2         | 1352    | 2035    | 0          | 0          |
| xe-0/0/3         | 1352    | 2056    | 0          | 0          |

**Meaning** The output here shows that the link is up and that PDUs are being exchanged.

## Verifying That Generic Routing Encapsulation Tunneling Is Working Correctly

**Purpose** Verify that the generic routing encapsulation (GRE) interface is sending tunneled traffic.

**Action** Display status information about the specified GRE interface by using the command `show interfaces`.

```
user@switch> show interfaces gr-0/0/0.0
Physical interface: gr-0/0/0, Enabled, Physical link is Up
Interface index: 132, SNMP ifIndex: 26
Type: GRE, Link-level type: GRE, MTU: Unlimited, Speed: 800mbps
Device flags : Present Running
Interface flags: Point-To-Point SNMP-Traps
Input rate : 0 bps (0 pps)
Output rate : 0 bps (0 pps)

Logical interface gr-0/0/0.0 (Index 68) (SNMP ifIndex 47)
Flags: Point-To-Point SNMP-Traps 16384
IP-Header 1.1.1.2:1.1.1.1:47:df:64:0000000000000000 Encapsulation: GRE-NULL
Input packets : 0
Output packets: 0
Protocol inet, MTU: 1476
Flags: None
Addresses, Flags: Is-Primary
Local: 1.10.1.1
```

**Meaning** The output indicates that the GRE interface gr-0/0/0 is up. The output displays the name of the physical interface and the traffic statistics for this interface---the number of and the rate at which input and output bytes and packets are received and transmitted on the physical interface.

## monitor interface

**Syntax**    `monitor interface`  
               `<interface-name> | traffic <detail>>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                               Command introduced in Junos OS Release 9.0 for EX Series switches.  
                               Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Display real-time statistics about interfaces, updating the statistics every second. Check for and display common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors.

**NOTE:** This command is not supported on the QFX3000 QFabric system.

**Options**    **none**—Display real-time statistics for all interfaces.

**detail**—(Optional) With traffic option only, display detailed output.

**interface-name**—(Optional) Display real-time statistics for the specified interface. In a TX Matrix or TX Matrix Plus router, display real-time statistics for the physical interfaces on the specified line-card chassis (LCC) only.

**traffic**—(Optional) Display traffic data for all active interfaces. In a TX Matrix or TX Matrix Plus router, display real-time statistics for the physical interfaces on the specified LCC only.

**Additional Information**    The output of this command shows how much each field has changed since you started the command or since you cleared the counters by pressing the **c** key. For a description of the statistical information provided in the output of this command, see the **show interfaces extensive** command for a particular interface type in the [CLI Explorer](#). To control the output of the **monitor interface** command while it is running, use the keys listed in [Table 247 on page 2754](#). The keys are not case-sensitive.

**Table 247: Output Control Keys for the monitor interface Command**

| Key | Action   |
|-----|--|
| c   | Clears (returns to zero) the delta counters since <b>monitor interface</b> was started. This does not clear the accumulative counter. To clear the accumulative counter, use the <b>clear interfaces interval</b> command. |
| f   | Freezes the display, halting the display of updated statistics and delta counters.   |
| i   | Displays information about a different interface. The command prompts you for the name of a specific interface.  |

**Table 247: Output Control Keys for the monitor interface Command** *(continued)*

| Key      | Action   |
|----------|--|
| n        | Displays information about the next interface. The <b>monitor interface</b> command displays the physical or logical interfaces in the same order as the <b>show interfaces terse</b> command. |
| q or Esc | Quits the command and returns to the command prompt.   |
| t        | Thaws the display, resuming the update of the statistics and delta counters.   |

To control the output of the **monitor interface traffic** command while it is running, use the keys listed in [Table 248 on page 2755](#). The keys are not case-sensitive.

**Table 248: Output Control Keys for the monitor interface traffic Command**

| Key      | Action   |
|----------|--|
| b        | Displays the statistics in units of bits and bits per second (bps).  |
| c        | Clears (return to 0) the delta counters in the <b>Current Delta</b> column. The statistics counters are not cleared. |
| d        | Displays the <b>Current Delta</b> column (instead of the rate column) in Bps or packets per second (pps).            |
| p        | Displays the statistics in units of packets and packets per second (pps).  |
| q or Esc | Quits the command and returns to the command prompt.   |
| r        | Displays the rate column (instead of the <b>Current Delta</b> column) in Bps and pps.                                |

**Output Fields** [Table 249 on page 2756](#) describes the output fields for the **monitor interface** command. Output fields are listed in the approximate order in which they appear.

Table 249: monitor interface Output Fields

| Field Name               | Field Description  | Level of Output |
|--------------------------|--|-----------------|
| <b>routerl</b>           | Hostname of the router.  | All levels      |
| <b>Seconds</b>           | How long the monitor interface command has been running or how long since you last cleared the counters.   | All levels      |
| <b>Time</b>              | Current time (UTC).  | All levels      |
| <b>Delay x/y/z</b>       | Time difference between when the statistics were displayed and the actual clock time. <ul style="list-style-type: none"> <li>• <b>x</b>—Time taken for the last polling (in milliseconds).</li> <li>• <b>y</b>—Minimum time taken across all pollings (in milliseconds).</li> <li>• <b>z</b>—Maximum time taken across all pollings (in milliseconds).</li> </ul>  | All levels      |
| <b>Interface</b>         | Short description of the interface, including its name, status, and encapsulation.   | All levels      |
| <b>Link</b>              | State of the link: <b>Up</b> , <b>Down</b> , or <b>Test</b> .  | All levels      |
| <b>Current delta</b>     | Cumulative number for the counter in question since the time shown in the Seconds field, which is the time since you started the command or last cleared the counters.   | All levels      |
| <b>Local Statistics</b>  | (Logical interfaces only) Number and rate of bytes and packets destined to the router or switch through the specified interface. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> | All levels      |
| <b>Remote Statistics</b> | (Logical interfaces only) Statistics for traffic transiting the router or switch. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>  | All levels      |

Table 249: monitor interface Output Fields (*continued*)

| Field Name         | Field Description  | Level of Output |
|--------------------|--|-----------------|
| Traffic statistics | <p>Total number of bytes and packets received and transmitted on the interface. These statistics are the sum of the local and remote statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> | All levels      |
| Description        | With the <b>traffic</b> option, displays the interface description configured at the <b>[edit interfaces <i>interface-name</i>]</b> hierarchy level.   | detail          |

## Sample Output

### monitor interface (Physical)

```

user@host> monitor interface so-0/0/0
router1                               Seconds: 19                      Time: 15:46:29

Interface: so-0/0/0, Enabled, Link is Up
Encapsulation: PPP, Keepalives, Speed: 0C48
Traffic statistics:
    Input packets:                6045 (0 pps)
    Input bytes:                  6290065 (0 bps)
    Output packets:               10376 (0 pps)
    Output bytes:                 10365540 (0 bps)
Encapsulation statistics:
    Input keepalives:             1901
    Output keepalives:            1901
    NCP state: Opened
    LCP state: Opened
Error statistics:
    Input errors:                 0
    Input drops:                 0
    Input framing errors:         0
    Policed discards:            0
    L3 incompletes:              0
    L2 channel errors:           0
    L2 mismatch timeouts:        0
    Carrier transitions:          1
    Output errors:               0
    Output drops:                0
    Aged packets:                0
Active alarms : None
Active defects: None
SONET error counts/seconds:
    LOS count                    1
    LOF count                    1
    SEF count                    1
    ES-S                         0
    SES-S                        0
SONET statistics:

Z4      : 0x00 S1(cmp) : 0x00

```

## Transmitted SONET overhead:

```

F1      : 0x00 J0      : 0x01 K1      : 0x00
K2      : 0x00 S1      : 0x00 C2      : 0xcf
F2      : 0x00 Z3      : 0x00 Z4      : 0x00

```

Next='n', Quit='q' or ESC, Freeze='f', Thaw='t', Clear='c', Interface='i'

## monitor interface (OTN Interface)

```
user@host> monitor interface ge-7/0/0
```

```
Interface: ge-7/0/0, Enabled, Link is Up
Encapsulation: Ethernet, Speed: 10000mbps
```

## Traffic statistics:

```

Input bytes:                0 (0 bps)
Output bytes:               0 (0 bps)
Input packets:              0 (0 pps)
Output packets:             0 (0 pps)

```

## Error statistics:

```

Input errors:               0
Input drops:                0
Input framing errors:       0
Policed discards:          0
L3 incompletes:             0
L2 channel errors:          0
L2 mismatch timeouts:       0
Carrier transitions:         5
Output errors:              0
Output drops:               0
Aged packets:               0

```

Active alarms : None

Active defects: None

## Input MAC/Filter statistics:

```

Unicast packets            0
Broadcast packets          0
Multicast packets          0
Oversized frames           0
Packet reject count        0
DA rejects                 0
SA rejects                 0

```

## Output MAC/Filter Statistics:

```

Unicast packets            0
Broadcast packets          0
Multicast packets          0
Packet pad count           0
Packet error count         0

```

## show forwarding-options enhanced-hash-key

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <b>show forwarding-options enhanced-hash-key</b>   |
| <b>Release Information</b>      | <p>Command introduced in Junos OS Release 13.2X51-D15 for EX Series switches.</p> <p>Command introduced in Junos OS Release 13.2X51-D20 for QFX Series devices.</p> <p><b>Fabric Load Balancing Options</b> output fields introduced in Junos OS Release 14.1X53-D10.</p>  |
| <b>Description</b>              | <p>Display information about which packet fields are used by the hashing algorithm to make hashing decisions.</p> <p>You can configure the fields that are inspected by the hashing algorithm to make hashing decisions for traffic entering a LAG bundle using the <b>forwarding-options enhanced-hash-key</b> statement.</p>   |
| <b>Required Privilege Level</b> | view   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Configuring the Fields in the Algorithm Used To Hash LAG Bundle and ECMP Traffic (CLI Procedure) on page 2590</a></li> <li>• <a href="#">Understanding the Algorithm Used to Hash LAG Bundle and Egress Next-Hop ECMP Traffic on page 2396</a></li> <li>• <a href="#">enhanced-hash-key on page 2644</a></li> </ul> |
| <b>List of Sample Output</b>    | <p><a href="#">show forwarding-options enhanced-hash-key (Layer 2 Payload Hash Mode) on page 2764</a></p> <p><a href="#">show forwarding-options enhanced-hash-key (Layer 2 Header Hash Mode) on page 2765</a></p> <p><a href="#">show forwarding-options enhanced-hash-key (Fabric Load Balancing Options) on page 2765</a></p>   |
| <b>Output Fields</b>            | <p><a href="#">Table 250 on page 2763</a> lists the output fields for the <b>show forwarding-options enhanced-hash-key</b> command. Output fields are listed in the approximate order in which they first appear.</p>  |

**Table 250: show forwarding-options enhanced-hash-key Output Fields**

| Field Name                   | Field Description  |
|------------------------------|--|
| <b>Hash-Mode</b>             | Current hash mode: Layer 2 header or Layer 2 payload.  |
| <b>Protocol</b>              | Indicates whether the Protocol field is or is not used by the hashing algorithm: Yes or No.              |
| <b>Destination L4 Port</b>   | Indicates whether the Destination L4 Port field is or is not used by the hashing algorithm: Yes or No.   |
| <b>Source L4 Port</b>        | Indicates whether the Source L4 Port field is or is not used by the hashing algorithm: Yes or No.        |
| <b>Destination IPv4 Addr</b> | Indicates whether the Destination IPv4 Addr field is or is not used by the hashing algorithm: Yes or No. |

Table 250: show forwarding-options enhanced-hash-key Output Fields (*continued*)

| Field Name                     | Field Description  |
|--------------------------------|--|
| <b>Source IPv4 Addr</b>        | Indicates whether the Source IPv4 Addr field is or is not used by the hashing algorithm: Yes or No.  |
| <b>Vlan id</b>                 | Indicates whether the Vlan id field is or is not used by the hashing algorithm: Yes or No.   |
| <b>Next Hdr</b>                | Indicates whether the Next Hdr field is or is not used by the hashing algorithm: Yes or No.  |
| <b>Destination IPv6 Addr</b>   | Indicates whether the Destination IPv6 Addr field is or is not used by the hashing algorithm: Yes or No.   |
| <b>Source IPv6 Addr</b>        | Indicates whether the Source IPv6 Addr field is or is not used by the hashing algorithm: Yes or No.  |
| <b>Ether Type</b>              | Indicates whether the Ether Type field is or is not used by the hashing algorithm: Yes or No.  |
| <b>Destination MAC Address</b> | Indicates whether the Destination MAC Address field is or is not used by the hashing algorithm: Yes or No.   |
| <b>Source MAC Address</b>      | Indicates whether the Source MAC Address field is or is not used by the hashing algorithm: Yes or No.  |
| <b>Load Balancing Method</b>   | Indicates the load balancing method for adaptive load balancing (ALB): flowlet or per-packet.<br><br>The load balancing method is flowlet by default, and can be configured using the <a href="#">fabric-load-balance</a> statement. |
| <b>Fabric Link Scale</b>       | Indicates the fabric link scale, in mbps.  |
| <b>Inactivity Interval</b>     | Indicates the fabric load balance inactivity interval, in microseconds (us).<br><br>The inactivity interval is 16 microseconds by default, and can be configured using the <a href="#">inactivity-interval</a> statement.            |
| <b>Hash Region Size/Trunk</b>  | Indicates the hash region size, in buckets per fabric trunk.   |

## Sample Output

### show forwarding-options enhanced-hash-key (Layer 2 Payload Hash Mode)
