<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p><b>models</b> option introduced in Junos OS Release 8.2.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.</p> <p>Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.</p>
<b>Description</b>	<p>Display a list of all Flexible PIC Concentrators (FPCs) and PICs installed in the router or switch chassis, including the hardware version level and serial number.</p> <p>In the EX Series switch command output, FPC refers to the following:</p> <ul style="list-style-type: none"> <li>On EX2200 switches, EX3200 switches, EX4200 standalone switches, and EX4500 switches—Refers to the switch; FPC <i>number</i> is always 0.</li> <li>On EX4200 switches in a Virtual Chassis configuration—Refers to the member of a Virtual Chassis; FPC <i>number</i> equals the member ID, from 0 through 9.</li> <li>On EX8208 and EX8216 switches—Refers to a line card; FPC <i>number</i> equals the slot number for the line card.</li> </ul> <p>On QFX3500 and QFX5100 standalone switches, both the FPC and FPC <i>number</i> are always 0.</p> <p>On T4000 Type 5 FPCs, there are no <b>top temperature sensor</b> or <b>bottom temperature sensor</b> parameters. Instead, <b>fan intake temperature sensor</b> and <b>fan exhaust temperature sensors</b> parameters are displayed.</p> <p>Starting from Junos OS Release 11.4, the output of the <b>show chassis hardware models</b> operational mode command displays the enhanced midplanes FRU model numbers (CHAS-BP3-MX240-S, CHAS-BP3-MX480-S or CHAS-BP3-MX960-S) based on the</p>

router. Prior to release 11.4, the FRU model numbers are left blank when the router has enhanced midplanes. Note that the enhanced midplanes are introduced through the Junos OS Release 13.3, but can be supported on all Junos OS releases.

Starting with Junos OS Release 14.1, the output of the **show chassis hardware detail | extensive | clei-models | models** operational mode command displays the new DC power supply module (PSM) and power distribution unit (PDU) that are added to provide power to the high-density FPC (FPC2-PTX-P1A) and other components in a PTX5000 Packet Transport Router.

**Options** **none**—Display information about hardware. For a TX Matrix router, display information about the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display information about the TX Matrix Plus router and its attached routers.

**clei-models**—(Optional) Display Common Language Equipment Identifier (CLEI) barcode and model number for orderable field-replaceable units (FRUs).

**detail**—(Optional) Include RAM and disk information in output.

**extensive**—(Optional) Display ID EEPROM information.

**all-members**—(MX Series routers only) (Optional) Display hardware-specific information for all the members of the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display hardware-specific information for the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus router only) (Optional) On a TX Matrix router, display hardware information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display hardware information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display hardware-specific information for the local Virtual Chassis members.

**member *member-id***—(MX Series routers and EX Series switches) (Optional) Display hardware-specific information for the specified member of the Virtual Chassis configuration. Replace *member-id* variable with a value 0 or 1.

**models**—(Optional) Display model numbers and part numbers for orderable FRUs and, for components that use ID EEPROM format v2, the CLEI code.

**node-device *name***—(QFabric systems only) (Optional) Display hardware-specific information for the Node device.

**scc**—(TX Matrix router only) (Optional) Display hardware information for the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus router only) (Optional) Display hardware information for the TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with 0.

**Additional Information** The **show chassis hardware detail** command now displays DIMM information for the following Routing Engines:

**Table 34: Routing Engines Displaying DIMM Information**

Routing Engines	Routers
RE-S-1800x2 and RE-S-1800x4	MX240, MX480, and MX960 routers
RE-A-1800x2	M120 and M320 routers

In Junos OS Release 11.4 and later, the output for the **show chassis hardware models** operational mode command for MX Series routers display the enhanced midplanes FRU model numbers—CHAS-BP3-MX240-S, CHAS-BP3-MX480-S, or CHAS-BP3-MX960-S—based on the router. In releases before Junos OS Release 11.4, the FRU model numbers are left blank when the router has enhanced midplanes. Note that the enhanced midplanes are introduced through Junos OS Release 13.3, but can be supported on all Junos OS releases.

**Output Fields**    [Table 35 on page 683](#) lists the output fields for the **show chassis hardware** command. Output fields are listed in the approximate order in which they appear.

Table 35: show chassis hardware Output Fields

Field Name	Field Description	Level of Output
<b>Item</b>	<p>Chassis component:</p> <ul style="list-style-type: none"> <li>(EX Series switches)—Information about the chassis, Routing Engine (SRE and Routing Engine modules in EX8200 switches), power supplies, fan trays, and LCD panel. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs). Information about the backplane, midplane, and SIBs (SF modules) is displayed for EX8200 switches. See <i>EX Series Switches Hardware and CLI Terminology Mapping</i>.</li> <li>(MX Series routers and EX Series switches)—Information about the backplane, Routing Engine, Power Entry Modules (PEMs), and fan trays. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs), Modular Port Concentrators (MPCs) and associated Modular Interface Cards (MICs), or Dense Port Concentrators (DPCs). MX80 routers have a single Routing Engine and a built-in Packet Forwarding Engine that attaches directly to MICs. The Packet Forwarding Engine has two “pseudo” FPCs (FPC 0 and FPC1). MX80 routers also have a Forwarding Engine Board (FEB). MX104 routers have a built-in Packet forwarding Engine and a Forwarding Engine Board (FEB). The Packet Forwarding Engine of the MX104 router has three “pseudo” FPCs (FPC0, FPC1, and FPC2).</li> <li>(M Series routers, except for the M320 router)—Information about the backplane; power supplies; fan trays; Routing Engine; maxicab (the connection between the Routing Engine and the backplane, for the M40 router only); SCB, SSB, SFM, or FEB; MCS and PCG (for the M160 router only); each FPC and PIC; and each fan, blower, and impeller.</li> <li>(M120, M320, and T Series routers)—Information about the backplane, power supplies, fan trays, midplane, FPM (craft interface), CIP, PEM, SCG, CB, FPC, PIC, SFP, SPMB, and SIB.</li> <li>(QFX Series)—Information about the chassis, Pseudo CB, Routing Engine, power supplies, fan trays, Interconnect devices, and Node devices. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs).</li> <li>(PTX Series)—Information about the chassis, midplane, craft interface (FPM), power distribution units (PDUs) and Power Supply Modules (PSMs), Centralized Clock Generators (CCGs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Flexible PIC Concentrators (FPCs), PICs, Switch Interface Boards (SIBs), and fan trays (vertical and horizontal).</li> <li>(MX2010 and MX2020 routers)—Information about the chassis, midplane, craft interface (FPM), power midplane (PMP), Power Supply Modules (PSMs), Power Distribution Modules (PDMs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Switch Fabric Boards (SFBs), Flexible PIC Concentrators (FPCs), PICs, adapter cards (ADCs) and fan trays.</li> </ul>	All levels
<b>Version</b>	Revision level of the chassis component.	All levels
<b>Part number</b>	Part number of the chassis component.	All levels
<b>Serial number</b>	Serial number of the chassis component. The serial number of the backplane is also the serial number of the router chassis. Use this serial number when you need to contact Juniper Networks Customer Support about the router or switch chassis.	All levels

Table 35: show chassis hardware Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Assb ID or Assembly ID</b>	( <b>extensive</b> keyword only) Identification number that describes the FRU hardware.	<b>extensive</b>
<b>Assembly Version</b>	( <b>extensive</b> keyword only) Version number of the FRU hardware.	<b>extensive</b>
<b>Assembly Flags</b>	( <b>extensive</b> keyword only) Flags.	<b>extensive</b>
<b>FRU model number</b>	( <b>clei-models</b> , <b>extensive</b> , and <b>models</b> keyword only) Model number of the FRU hardware component.	none specified
<b>CLEI code</b>	( <b>clei-models</b> and <b>extensive</b> keyword only) Common Language Equipment Identifier code. This value is displayed only for hardware components that use ID EEPROM format v2. This value is not displayed for components that use ID EEPROM format v1.	none specified
<b>EEPROM Version</b>	ID EEPROM version used by the hardware component: <b>0x00</b> (version 0), <b>0x01</b> (version 1), or <b>0x02</b> (version 2).	<b>extensive</b>
<b>Description</b>	<p>Brief description of the hardware item:</p> <ul style="list-style-type: none"> <li>Type of power supply.</li> <li>Type of PIC. If the PIC type is not supported on the current software release, the output states <b>Hardware Not Supported</b>.</li> <li>Type of FPC: <b>FPC Type 1</b>, <b>FPC Type 2</b>, <b>FPC Type 3</b>, <b>FPC Type 4</b>, or <b>FPC TypeOC192</b>.</li> </ul> <p>On EX Series switches, a brief description of the FPC.</p> <p>On the J Series routers, the FPC type corresponds to the Physical Interface Module (PIM). The following list shows the PIM abbreviation in the output and the corresponding PIM name.</p> <ul style="list-style-type: none"> <li><b>2x FE</b>—Either two built-in Fast Ethernet interfaces (fixed PIM) or dual-port Fast Ethernet PIM</li> <li><b>4x FE</b>—4-port Fast Ethernet ePIM</li> <li><b>1x GE Copper</b>—Copper Gigabit Ethernet ePIM (one 10-Mbps, 100-Mbps, or 1000-Mbps port)</li> <li><b>1x GE SFP</b>—SFP Gigabit Ethernet ePIM (one fiber port)</li> <li><b>4x GE Base PIC</b>—Four built-in Gigabit Ethernet ports on a J4350 or J6350 chassis (fixed PIM)</li> <li><b>2x Serial</b>—Dual-port serial PIM</li> <li><b>2x T1</b>—Dual-port T1 PIM</li> <li><b>2x E1</b>—Dual-port E1 PIM</li> <li><b>2x CTIE1</b>—Dual-port channelized T1/E1 PIM</li> <li><b>1x T3</b>—T3 PIM (one port)</li> <li><b>1x E3</b>—E3 PIM (one port)</li> <li><b>4x BRI S/T</b>—4-port ISDN BRI S/T PIM</li> <li><b>4x BRI U</b>—4-port ISDN BRI U PIM</li> <li><b>1x ADSL Annex A</b>—ADSL 2/2+ Annex A PIM (one port, for POTS)</li> <li><b>1x ADSL Annex B</b>—ADSL 2/2+ Annex B PIM (one port, for ISDN)</li> </ul>	All levels

Table 35: show chassis hardware Output Fields (*continued*)

Field Name	Field Description	Level of Output
	<ul style="list-style-type: none"> <li>• <b>2xSHDSL (ATM)</b>—G SHDSL PIM (2-port two-wire module or 1-port four-wire module)</li> <li>• <b>1x TGM550</b>—TGM550 Telephony Gateway Module (Avaya VoIP gateway module with one console port, two analog <b>LINE</b> ports, and two analog <b>TRUNK</b> ports)</li> <li>• <b>1x DS1 TIM510</b>—TIM510 E1/T1 Telephony Interface Module (Avaya VoIP media module with one E1 or T1 trunk termination port and ISDN PRI backup)</li> <li>• <b>4x FXS, 4x FXO, TIM514</b>—TIM514 Analog Telephony Interface Module (Avaya VoIP media module with four analog <b>LINE</b> ports and four analog <b>TRUNK</b> ports)</li> <li>• <b>4x BRI TIM521</b>—TIM521 BRI Telephony Interface Module (Avaya VoIP media module with four ISDN BRI ports)</li> <li>• <b>Crypto Accelerator Module</b>—For enhanced performance of cryptographic algorithms used in IP Security (IPsec) services</li> <li>• <b>MPC M 16x10GE</b>—16-port 10-Gigabit Module Port Concentrator that supports SFP+ optical transceivers. (Not on EX Series switches.)</li> <li>• For hosts, the Routing Engine type.</li> <li>• For small form-factor pluggable transceiver (SFP) modules, the type of fiber: <b>LX</b>, <b>SX</b>, <b>LH</b>, or <b>T</b>.</li> <li>• LCD description for EX Series switches (except EX2200 switches).</li> <li>• <b>MPC2</b>—1-port MPC2 that supports two separate slots for MICs.</li> <li>• <b>MPC3E</b>—1-port MPC3E that supports two separate slots for MICs (MIC-3D-1X100GE-CFP and MIC-3D-20GE-SFP) on MX960, MX480, and MX240 routers. The MPC3E maps one MIC to one PIC (1 MIC, 1 PIC), which differs from the mapping of legacy MPCs.</li> <li>• 100GBASE-LR4, pluggable CFP optics</li> <li>• Supports the Enhanced MX Switch Control Board with fabric redundancy and existing SCBs without fabric redundancy.</li> <li>• Interoperates with existing MX Series line cards, including Flexible Port Concentrators (FPC), Dense Port Concentrators (DPCs), and Modular Port Concentrators (MPCs).</li> <li>• <b>MPC4E</b>—Fixed configuration MPC4E that is available in two flavors: MPC4E-3D-32XGE-SFP and MPC4E-3D-2CGE-8XGE on MX2020, MX960, MX480, and MX240 routers.</li> <li>• LCD description for MX Series routers</li> </ul>	

## Sample Output

## show chassis in-service-upgrade

**Syntax** `show chassis in-service-upgrade`

**Release Information** Command introduced in Junos OS Release 9.0.  
 Command introduced in Junos OS Release 12.3R2, 13.1R2, and 13.2R1 for TX Matrix Plus routers.  
 Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.  
 Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.  
 Command introduced in Junos OS Release 13.2 for PTX5000 routers.  
 Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.

**Description** Display the status of Flexible PIC Concentrators (FPCs) and their corresponding PICs after the most recent unified in-service software upgrade (ISSU). This command must be issued on the master Routing Engine.

**NOTE:** Only Intelligent Queuing (IQ) PICs are displayed by this command output. Unified ISSU status for other PIC types is controlled internally by the FPC.

**Options** This command has no options.

**Required Privilege Level** view

**Related Documentation**

- *request system software abort*
- [request system software in-service-upgrade on page 436](#)
- *Unified ISSU Concepts*
- *Performing a Unified ISSU*

**List of Sample Output** [show chassis in-service-upgrade on page 852](#)  
[show chassis in-service-upgrade \(MX2010 Router\) on page 852](#)  
[show chassis in-service-upgrade \(MX2020 Router\) on page 852](#)  
[show chassis in-service-upgrade \(TX Matrix Plus Router\) on page 853](#)  
[show chassis in-service-upgrade \(QFX5100 Switch\) on page 854](#)

**Output Fields** [Table 36 on page 851](#) lists the output fields for the `show chassis in-service-upgrade` command. Output fields are listed in the approximate order in which they appear.

**Table 36: show chassis in-service-upgrade Output Fields**

Field Name	Field Description
Item	Flexible PIC Concentrator (FPC) slot number.

Table 36: show chassis in-service-upgrade Output Fields (*continued*)

Field Name	Field Description
<b>Status</b>	FPC and corresponding PIC state. State can be either of the following: <ul style="list-style-type: none"> <li>• <b>Online</b>—FPC is online and running.</li> <li>• <b>Offline</b>—FPC is powered down.</li> </ul>
<b>Reason</b>	Reason for the state (if offline).

## show chassis lcd

<b>List of Syntax</b>	<a href="#">show chassis lcd (EX Series) on page 855</a> <a href="#">show chassis lcd (QFX Series and QFabric Systems) on page 855</a>
<b>show chassis lcd (EX Series)</b>	<pre>show chassis lcd &lt;fpc-slot <i>fpc-slot-number</i>&gt; &lt;menu &lt;(all-members   local   member <i>member-id</i>)&gt;&gt;</pre>
<b>show chassis lcd (QFX Series and QFabric Systems)</b>	<pre>show chassis lcd &lt;fpc-slot <i>fpc-slot-number</i>&gt; &lt;interconnect-device <i>device-id</i>&gt; &lt;node-device <i>device-id</i>&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>menu</b> option introduced in Junos OS Release 10.2 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 13.1 for QFabric systems.</p>
<b>Description</b>	<p>Display the information that appears on the LCD panel of EX3200, EX3300, EX4200, EX4500, EX6200, and EX8200 switches, XRE200 External Routing Engines, QFX Series standalone switches, and Interconnect devices and Node devices within a QFabric system. Display the status of the currently selected port parameter of the Status LED for each network port on the device.</p>
<b>Options</b>	<p><b>none</b>—Display the information that appears on the LCD panel (for any EX Series member switch in a Virtual Chassis or for XRE200 External Routing Engines, display the information for all Virtual Chassis members). Display the status of the currently selected port parameter of the Status LED for each network port.</p> <p><b>fpc-slot &lt;<i>fpc-slot-number</i>&gt;</b>—(Optional) Display the information as follows:</p> <ul style="list-style-type: none"> <li>(EX3200, EX3300, EX4200, and EX4500 switches, or the QFX Series) Display the information that appears on the LCD panel for either an FPC slot with no <i>fpc-slot-number</i> value specified or for the FPC slot specified by <b>fpc-slot 0</b>. <b>fpc-slot</b> refers to the switch itself and <b>0</b> is the only valid value for <i>fpc-slot-number</i>. Output for these options is the same as for the <b>none</b> option.</li> </ul> <p>Also display the status of the currently selected port parameter of the Status LED for each network port.</p> <ul style="list-style-type: none"> <li>(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) If no <i>fpc-slot-number</i> value is specified, display the information that appears on the LCD panel for all members of the Virtual Chassis. Output for this option is the same as for the <b>none</b> option. If the <i>fpc-slot-number</i> value is specified (it equals the <i>member-id</i> value), display the information for the specified member.</li> </ul> <p>Also display the status of the currently selected port parameter of the Status LED for each network port.</p> <ul style="list-style-type: none"> <li>(EX6200 or EX8200 switches)—Display the information that appears on the LCD panel for the line card in the line-card slot specified by the <i>fpc-slot-number</i> value.</li> </ul>

Also display the status of the currently selected port parameter of the Status LED for each network port.

**interconnect-device *device-id***—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Interconnect device.

**menu**—(Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel.

**menu all-members**—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for all Virtual Chassis members.

**menu local**—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the Virtual Chassis member from which you issued the command.

**menu member *member-id***—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the specified Virtual Chassis member.

**node-device *device-id***—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Node device.

**Required Privilege Level**

**Output Fields** [Table 37 on page 857](#) lists the output fields for the **show chassis lcd** command. Output fields are listed in the approximate order in which they appear.

**Table 37: show chassis lcd Output Fields**

Field Name	Field Description
<b>membernumber</b> (XRE200 External Routing Engine)	Member ID of the device whose content is being displayed.
<b>Front panel contents for slot</b>	FPC slot number of the switch whose content is being displayed. The number is always <b>0</b> , except for EX4200 switches in a Virtual Chassis, where it is the member ID value.
<b>Front panel contents</b> (EX6200, EX8200 switch, XRE200 External Routing Engine, and QFX Series)	<p>On EX6200 switches, EX8200 switches, and XRE200 External Routing Engines, no slot number is displayed.</p> <p>On XRE200 External Routing Engines, this field appears under the <b>member number</b> field for each member device in the EX8200 Virtual Chassis.</p>
<b>LCD screen</b>	<p>The first line displays the hostname (for Virtual Chassis members, displays the member ID, the current role, and hostname; for EX8200 switches, displays <b>RE</b> and the hostname). The second line displays the currently selected port parameter of the Status LED and the alarms counter. The Status LED port parameters are:</p> <ul style="list-style-type: none"> <li>• <b>ADM</b>—Administrative</li> <li>• <b>SPD</b>—Speed</li> <li>• <b>DPX</b>—Duplex</li> <li>• <b>POE</b>—Power over Ethernet (EX3200 and EX4200 switches only)</li> </ul>
<b>LEDs status</b>	Current state of the Alarms, System, and Master LEDs (chassis status LEDs).
<b>Interface</b>	Names of the interfaces on the switch.
<b>LED (ADM/SPD/DPX/POE)</b>	<p>State of the currently selected port parameter of the Status LED for the interface. The Status LED port parameters are:</p> <p><b>NOTE:</b> The XRE200 External Routing Engine always displays the <b>NA</b> parameter. The QFX Series products do not have any of the port parameters listed below.</p> <ul style="list-style-type: none"> <li>• <b>ADM</b>—Administrative</li> <li>• <b>SPD</b>—Speed</li> <li>• <b>DPX</b>—Duplex</li> <li>• <b>NA</b>—Not applicable.</li> <li>• <b>POE</b>—Power over Ethernet</li> </ul>
<b>fpcx</b>	On standalone EX Series and QFX Series switches, always <b>0</b> . On EX Series Virtual Chassis member switches, member ID of the Virtual Chassis member whose LCD menu is displayed.

maintenance-menu factory-default

```

On an EX4200 switch in a Virtual Chassis, the output for the **show chassis lcd menu** **all-members** command is the same as the output for the **show chassis lcd menu** command.

#### show chassis lcd menu (EX8200 Switch)

```

user@switch> show chassis lcd menu
status-menu
status-menu sf-status1-menu
status-menu sf-status2-menu
status-menu psu-status1-menu

```

```
status-menu psu-status2-menu
status-menu environ-menu
status-menu show-version
maintenance-menu
maintenance-menu halt-menu
maintenance-menu system-reboot
maintenance-menu rescue-config
maintenance-menu factory-default
```

### show chassis lcd (QFX3500 Switches)

## show chassis led

---

<b>List of Syntax</b>	<a href="#">show chassis led (EX Series) on page 868</a> <a href="#">show chassis led (QFX Series) on page 868</a>
<b>show chassis led (EX Series)</b>	<code>show chassis led</code> <code>&lt;fpc-slot &lt;<i>fpc-slot-number</i>&gt;&gt;</code>
<b>show chassis led (QFX Series)</b>	<code>show chassis led</code> <code>&lt;fpc-slot &lt;<i>fpc-slot-number</i>&gt;&gt;</code> <code>interconnect-device <i>name</i></code> <code>node-device <i>name</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.1 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the status and colors of the chassis LEDs on the front panel of the switch. A major alarm (red) indicates a critical error condition that requires immediate action. A minor alarm (yellow) indicates a noncritical condition that requires monitoring or maintenance. A minor alarm that is left unchecked might cause interruption in service or performance degradation.
<b>Options</b>	<p><b>none</b>—Display the status of the chassis status LEDs (for EX4200 switches configured as a Virtual Chassis, display the information for all Virtual Chassis members).</p> <p><b>fpc-slot &lt;<i>fpc-slot-number</i>&gt;</b>—(Optional) (Not on EX2200 switches) Display the information as follows:</p> <ul style="list-style-type: none"><li>(EX3200, standalone EX4200, standalone QFX3500, and EX4500 switches) Display the status of the chassis status LEDs for either an FPC slot with no <i>fpc-slot-number</i> value specified or for the FPC slot specified by <b>fpc-slot 0</b>. <i>fpc-slot</i> refers to the switch itself and <b>0</b> is the only valid value for <i>fpc-slot-number</i>. Output for these options is the same as for the <b>none</b> option.</li><li>(EX4200 switches in a Virtual Chassis with two or more members) If no <i>fpc-slot-number</i> value is specified, display the status of the chassis status LEDs for all members of the Virtual Chassis. Output for this option is the same as for the <b>none</b> option. If the <i>fpc-slot-number</i> value is specified (it equals the <i>member-id</i> value), display the status of the chassis status LEDs for the specified member.</li><li>(EX8200 switches)—Display the status of the chassis status LEDs for the line card in the line-card slot specified by the <i>fpc-slot-number</i> value.</li></ul> <p><b>interconnect-device <i>name</i></b>—</p> <p>— (QFabric systems only) (Optional) Display the status of the chassis and interface status LEDs for the Interconnect device.</p> <p><b>node-device <i>name</i></b>— (QFabric systems only) (Optional) Display the status of the chassis and interface status LEDs for the Node device.</p>

**Output Fields** [Table 26 on page 509](#) lists the output fields for the **show chassis led** command. Output fields are listed in the approximate order in which they appear.

**Table 38: show chassis led Output Fields**

Field Name	Field Description
<b>Front panel contents for slot</b>	FPC slot number of the device whose content is being displayed. The number is always 0, except for EX4200 switches in a Virtual Chassis, where it is the member ID value.
<b>Front panel contents</b> (EX8200 Switches)	
<b>Front Panel Module Information</b> (QFabric system QFX3008-I Interconnect device)	On EX8200 switches, no slot number is displayed.
<b>Front panel contents for</b> (QFabric system Node devices and QFX3600-I Interconnect devices)	On QFabric system Node devices, the name of the Node device whose content is being displayed.

Table 38: show chassis led Output Fields (*continued*)

Field Name	Field Description
<b>Alarms LED</b>	<p>(EX Series switches only) Displays status of the ALM LED:</p> <ul style="list-style-type: none"> <li>• Off—No alarm has been configured.</li> <li>• Green—No alarm has been triggered.</li> <li>• Red—Major alarm.</li> <li>• Yellow—Minor alarm</li> </ul>
<b>System LED</b>	<p>(EX Series switches only) Displays status of the SYS LED:</p> <ul style="list-style-type: none"> <li>• Off—Switch is powered off.</li> <li>• Green—Switch is operating normally.</li> <li>• Yellow—Switch is booting.</li> </ul>
<b>Master LED:</b>	<p>Displays status of the MST LED (on EX3200, EX4200, and EX8200 switches):</p> <ul style="list-style-type: none"> <li>• Green—On an EX4200 Virtual Chassis switch, indicates the switch is the master in the Virtual Chassis configuration. On other switches, indicates that the Routing Engine is operational.</li> <li>• Off <ul style="list-style-type: none"> <li>• On an EX4200 Virtual Chassis switch, indicates that this switch is not the master in the Virtual Chassis configuration.</li> <li>• On EX3200, standalone EX4200, and EX8200 switches, indicates that the Routing Engine is not operational.</li> </ul> </li> </ul>
<b>Mode LED:</b>	<p>(EX Series switches only) On an EX2200 switch only, displays the currently selected port parameter of the Status LED:</p> <ul style="list-style-type: none"> <li>• <b>ADM</b>—Administrative</li> <li>• <b>SPD</b>—Speed</li> <li>• <b>DPX</b>—Duplex</li> <li>• <b>POE</b>—Power over Ethernet</li> </ul>
<b>Status/Beacon LED</b>	<p>(QFX Series only) Displays the system status as indicated by the Status LED on the chassis. For more information, see:</p> <ul style="list-style-type: none"> <li>• <i>Chassis Status LEDs on a QFX3500 Device</i></li> <li>• <i>Chassis Status LEDs in the QFX3600 and QFX3600-I Device</i></li> </ul>
<b>LINK/SPEED LED</b>	<p>(QFX Series only) Displays the link status and speed of a management port. For more information, see:</p> <ul style="list-style-type: none"> <li>• <i>Management Port LEDs on a QFX3500 Device</i></li> <li>• <i>Management Port LEDs in the QFX3600 and QFX3600-I Device</i></li> </ul>
<b>ACTIVITY LED</b>	<p>(QFX Series only) Displays the activity status of a management port. For more information, see:</p> <ul style="list-style-type: none"> <li>• <i>Management Port LEDs on a QFX3500 Device</i></li> <li>• <i>Management Port LEDs in the QFX3600 and QFX3600-I Device</i></li> </ul>

Table 38: show chassis led Output Fields (*continued*)

Field Name	Field Description
<b>STATUS LED</b>	<p>(QFX Series only) Displays the link status of an interface as indicated by the ST LED. For more information, see:</p> <ul style="list-style-type: none"> <li>• <i>Control Board LEDs on a QFX3008-I Interconnect Device</i></li> <li>• <i>Access Port and Uplink Port LEDs on a QFX3500 Device</i></li> <li>• <i>Access Port and Uplink Port LEDs on a QFX3600 or QFX3600-I Device</i></li> </ul>
<b>LINK/ACTIVITY LED</b>	<p>(QFX Series only) Displays link activity or faults on an interface as indicated by the LA LED. For more information, see:</p> <ul style="list-style-type: none"> <li>• <i>Access Port and Uplink Port LEDs on a QFX3500 Device</i></li> <li>• <i>Access Port and Uplink Port LEDs on a QFX3600 or QFX3600-I Device</i></li> </ul>
<b>Status LED</b>	<p>(QFX3008-I Interconnect device only)</p> <ul style="list-style-type: none"> <li>• Displays the system status as indicated by the STATUS LED on the front panel of the chassis. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</li> <li>• Displays the status of a Control Board as indicated by the STATUS LED on the Control Board. For more information, see <i>Control Board LEDs on a QFX3008-I Interconnect Device</i>.</li> </ul>
<b>Power LED</b>	<p>(QFX3008-I Interconnect device only) Displays the status of system power on the device. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</p>
<b>Major Alarm LED</b>	<p>(QFX3008-I Interconnect device only) Displays whether a critical error condition that requires immediate action exists on the device. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</p>
<b>Minor Alarm LED</b>	<p>(QFX3008-I Interconnect device only) Displays whether a noncritical condition that requires monitoring or maintenance exists on the device. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</p>
<b>Fan 0 LED</b>	<p>(QFX3008-I Interconnect device only) Displays the status of fan trays on the device. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</p>
<b>Fan 1 LED</b>	
<b>Fan 2 LED</b>	
<b>Fan 3 LED</b>	
<b>Fan 4 LED</b>	
<b>Fan 5 LED</b>	
<b>Fan 6 LED</b>	
<b>Fan 7 LED</b>	
<b>Fan 8 LED</b>	

Table 38: show chassis led Output Fields (*continued*)

Field Name	Field Description
PEM 0 LED	(QFX3008-I Interconnect device only) Displays the status of power supplies on the device. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i> .
PEM 1 LED	
PEM 2 LED	
PEM 3 LED	
PEM 4 LED	
LED info for	(QFX3008-I Interconnect device only) Displays the LED information for a Control Board.
Mastership LED	(QFX3008-I Interconnect device only) Displays status of the MASTER LED on a Control Board. For more information, see <i>Control Board LEDs on a QFX3008-I Interconnect Device</i> .
Interface	Names of the interfaces on the device.
LED (ADM/SPD/DPX/POE)	<p>(EX Series switches only) State of the currently selected port parameter of the Status LED for the interface. The Status LED port parameters are:</p> <p><b>NOTE:</b> EX4500 and EX8200 switches do not have the POE port parameter.</p> <ul style="list-style-type: none"> <li>• <b>ADM</b>—Administrative</li> <li>• <b>SPD</b>—Speed</li> <li>• <b>DPX</b>—Duplex</li> <li>• <b>POE</b>—Power over Ethernet</li> </ul>

<b>Syntax</b>	show chassis location
<b>Syntax (TX Matrix Router)</b>	show chassis location <fpc   interface (by-name <i>name</i>   by-slot fpc number lcc number)   lcc number   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show chassis location <fpc   interface (by-name <i>name</i>   by-slot fpc number lcc number)   lcc number   sfc number>
<b>Syntax (MX Series Router)</b>	show chassis location <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show chassis location <interconnect-device <i>name</i> > <node-device <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the physical location of the chassis. This command can only be used on the master Routing Engine.
<b>Options</b>	<b>none</b> —Display all information about the physical location of the chassis. On a TX Matrix router, display all information about the physical location of the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display all information about the physical location of the TX Matrix Plus router and its attached routers.  <b>all-members</b> —(MX Series routers only) (Optional) Display the physical location of the chassis for all the member routers in the Virtual Chassis configuration.  <b>fpc</b> —(TX Matrix router and TX Matrix Plus router only) (Optional) Display the physical location of all Flexible PIC Concentrators (FPCs).  <b>interconnect-device <i>name</i></b> —(QFabric systems only) (Optional) Display the physical location of the Interconnect device.  <b>interface by-name <i>name</i></b> —(TX Matrix and TX Matrix Plus routers only) (Optional) Display the physical location of a specified interface name. On a TX Matrix router, this option displays the FPC number and T640 router (line-card chassis) number associated

with the specified interface. On a TX Matrix Plus router, this option displays the FPC number and router (line-card chassis) number associated with the specified interface.

**interface by-slot fpc *number* lcc *number***—(TX Matrix and TX Matrix Plus router only)

(Optional) On a TX Matrix router, display the global FPC number of an interface by specifying its local FPC number and T640 router (line-card chassis) number. On a TX Matrix Plus router, display the global FPC number of an interface by specifying its local FPC number and router (line-card chassis) number.

- The global FPC number is the FPC slot number when all the FPC slots in the routing matrix are considered: **0** through **31**. On TX Matrix Plus router with 3D SIBs, the value is **0** through **63**. The local FPC number is the FPC slot number on a particular T640 router.
- For **fpc**, replace *number* with a value from **0** through **7**.
- For **lcc**, replace *number* with a value from **0** through **7**.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the physical location of a specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display the physical location of a specified router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display the physical location of the chassis for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display the physical location of the chassis for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display the physical location of the Node device.

**scc**—(TX Matrix routers only) (Optional) Display the physical location of the TX Matrix router (switch-card chassis).

**sfc**—(TX Matrix Plus routers only) (Optional) Display the physical location of the TX Matrix Plus router (or switch-fabric chassis).

**Required Privilege Level** view

**Output Fields** [Table 39 on page 880](#) lists the output fields for the **show chassis location** command. Output fields are listed in the approximate order in which they appear.

**Table 39: show chassis location Output Fields**

Field Name	Field Description
country-code	Country code information.
postal-code	Postal code information.
Building	Building information.
Floor	Floor information.
Global FPC	Global FPC number. The FPC slot number, when all FPC slots in the routing matrix are considered. The range of values is 0 through 31. On TX Matrix Plus router with 3D SIBs the value is 0 through 63.
LATA	Local access transport area information.
LCC	Line-card chassis number. On a TX Matrix router, the number of a particular T640 router connected to the TX Matrix router. On a TX Matrix Plus router, the number of a particular router connected to the TX Matrix Plus router.
Local FPC	Local FPC number. On a TX Matrix router, the FPC slot number on a particular T640 router. On a TX Matrix Plus router, the FPC slot number on a particular router.

## Sample Output

**show chassis location**

## show chassis nonstop-upgrade

<b>Syntax</b>	<b>show chassis nonstop-upgrade</b>
<b>Release Information</b>	Command introduced in Junos OS Release 10.4 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series.
<b>Description</b>	(EX6200 switches, EX8200 switches, EX8200 Virtual Chassis, QFX3500 and QFX3600 Virtual Chassis, and Virtual Chassis Fabric only) Display the status of the line cards or Virtual Chassis members in the linecard role after the most recent nonstop software upgrade (NSSU). This command must be issued on the master Routing Engine.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request system software nonstop-upgrade on page 449</a></li> <li>• <i>Upgrading Software on an EX6200 or EX8200 Standalone Switch Using Nonstop Software Upgrade (CLI Procedure)</i></li> <li>• <i>Upgrading Software on QFX3500, QFX3600, and QFX5100 Virtual Chassis Using Nonstop Software Upgrade</i></li> <li>• <a href="#">Upgrading Software on a Virtual Chassis Fabric Using Nonstop Software Upgrade on page 139</a></li> <li>• <i>Upgrading Software on an EX8200 Virtual Chassis Using Nonstop Software Upgrade (CLI Procedure)</i></li> </ul>

<b>Description</b>	Display status information about the PIC installed in the specified Flexible PIC Concentrator (FPC) and PIC slot.
<b>Options</b>	<b>fpc-slot <i>slot-number</i></b> —Display information about the PIC in this particular FPC slot:

- On a TX Matrix router, if you specify the number of the T640 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis pic fpc-slot 1 lcc 1 pic-slot 1
user@host> show chassis pic fpc-slot 9 pic-slot 1
```

- M120 routers only—Replace **slot-number** with a value from 0 through 5.
- MX80 routers only—Replace **slot-number** with a value from 0 through 1.
- MX104 routers only—Replace **slot-number** with a value from 0 through 2.
- MX240 routers only—Replace **slot-number** with a value from 0 through 2.
- MX480 routers only—Replace **slot-number** with a value from 0 through 5.
- MX960 routers only—Replace **slot-number** with a value from 0 through 11.
- MX2010 routers only—Replace **slot-number** with a value from 0 through 9.
- MX2020 routers only—Replace **slot-number** with a value from 0 through 19.
- Other routers—Replace **slot-number** with a value from 0 through 7.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace **slot-number** with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace **slot-number** with a value from 0 through 9 (switch's member ID).
  - EX8208 switches—Replace **slot-number** with a value from 0 through 7 (line card).
  - EX8216 switches—Replace **slot-number** with a value from 0 through 15 (line card).
- QFX Series:
  - QFX3500 and QFX5100 standalone switches—Replace **slot-number** with 0. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.
  - QFabric systems—Replace **slot-number** with any number between 0 and 15. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.

**all-members**—(MX Series routers and EX Series switches only) (Optional) Display PIC information for all member routers in the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display PIC information for a specified Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display PIC information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display PIC information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the local Virtual Chassis member.

**member *member-id***—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display PIC information for a specified Node device.

**pic-slot *slot-number***—Display information about the PIC in this particular PIC slot. For routers, replace *slot-number* with a value from 0 through 3. For EX3200 and EX4200 switches, replace *slot-number* with 0 for built-in network interfaces and 1 for interfaces on uplink modules. For EX8208 and EX8216 switches, replace *slot-number* with 0. For the QFX3500 standalone switch and the QFabric system, replace *slot-number* with 0 or 1.

**transport**—Display PIC information for optical transport network.

**Output Fields** Table 42 on page 893 lists the output fields for the **show chassis pic** command. Output fields are listed in the approximate order in which they appear.

**Table 42: show chassis pic Output Fields**

Field Name	Field Description
Type	<p>PIC type.</p> <p><b>NOTE:</b> On the 1-port OC192/STM64 MICs with the SDH framing mode, the type is displayed as <b>MIC-3D-1STM64-XFP</b> and with the SONET framing mode, the type is displayed as <b>MIC-3D-1OC192-XFP</b>. By default, the 1-port OC192/STM64 MICs displays the type as <b>MIC-3D-1OC192-XFP</b>.</p>
Account Layer2 Overhead	(MX Series routers) Indicates whether functionality to count the Layer 2 overhead bytes in the interface statistics at the PIC level is enabled or disabled.
ASIC type	Type of ASIC on the PIC.
State	<p>Status of the PIC. State is displayed only when a PIC is in the slot.</p> <ul style="list-style-type: none"> <li>• <b>Online</b>— PIC is online and running.</li> <li>• <b>Offline</b>—PIC is powered down.</li> </ul>
PIC version	PIC hardware version.
Uptime	How long the PIC has been online.
Package	(Multiservices PICs only) Services package supported: <b>Layer-2</b> or <b>Layer-3</b> .
Port Number	Port number for the PIC.
Cable Type	Type of cable connected to the port: <b>LH</b> , <b>LX</b> , or <b>SX</b> .
PIC Port Information (MX480 Router 100-Gigabit Ethernet CFP)	<p>Port-level information for the PIC.</p> <ul style="list-style-type: none"> <li>• Port—Port number</li> <li>• Cable type—Type of optical transceiver installed.</li> <li>• Fiber type—Type of fiber. SM is single-mode.</li> <li>• Xcvr vendor—Transceiver vendor name.</li> <li>• Xcvr vendor part number—Transceiver vendor part number.</li> <li>• Wavelength—Wavelength of the transmitted signal. Uplinks and downlinks are always 1550 nm. There is a separate fiber for each direction</li> </ul>

Table 42: show chassis pic Output Fields (*continued*)

Field Name	Field Description
<b>PIC Port Information (MX960 Router Bidirectional Optics )</b>	<p>Port-level information for the PIC.</p> <ul style="list-style-type: none"> <li>Port—Port number</li> <li>Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed. Uplink interfaces display -U. Down link interfaces display -D.</li> <li>Fiber type—Type of fiber. SM is single-mode.</li> <li>Xcvr vendor—Transceiver vendor name.</li> <li>Xcvr vendor part number—Transceiver vendor part number. <ul style="list-style-type: none"> <li>BX10-10-km bidirectional optics.</li> <li>BX40-40-km bidirectional optics.</li> <li>SFP-LX-40-km SFP optics.</li> </ul> </li> <li>Wavelength—Wavelength of the transmitted signal. Uplinks are always 1310 nm. Downlinks are either 1490 nm or 1550 nm.</li> </ul>
<b>PIC Port Information (Next-Generation SONET/SDH SFP)</b>	<p>Port-level information for the next-generation SONET/SDH SFP PIC.</p> <ul style="list-style-type: none"> <li>Port—Port number.</li> <li>Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed.</li> <li>Fiber type—Type of fiber: <b>SM</b> (single-mode) or <b>MM</b> (multimode).</li> <li>Xcvr vendor—Transceiver vendor name.</li> <li>Xcvr vendor part number—Transceiver vendor part number.</li> <li>Wavelength—Wavelength of the transmitted signal. Next-generation SONET/SDH SFPs use 1310 nm.</li> </ul>
<b>Pic port information (MX104 router)</b>	<p>Port-level information for the PIC.</p> <ul style="list-style-type: none"> <li>Port—Port number</li> <li>Cable type—Type of optical transceiver installed.</li> <li>Fiber type—Type of fiber. SM is single-mode.</li> <li>Xcvr vendor—Transceiver vendor name.</li> <li>Xcvr vendor part number—Transceiver vendor part number.</li> <li>Wavelength—Wavelength of the transmitted signal.</li> <li>Xcvr Firmware—Firmware version of the transceiver.</li> </ul>
<b>Multirate Mode</b>	Rate-selectability status for the MIC: <b>Enabled</b> or <b>Disabled</b> .
<b>Channelization</b>	Indicates whether channelization is enabled or disabled on the DS3/E3 MIC.

                                           <local>  
                                           <member *member-id*>

**Syntax (MX2010 3D Universal Edge Routers)**    show chassis routing-engine  
                                           <bios | *slot*>

**Syntax (MX2020 3D Universal Edge Routers)**    show chassis routing-engine  
                                           <bios | *slot*>

**Syntax (MX104 3D Universal Edge Routers)**    show chassis routing-engine

**Syntax (ACX Series Universal Access Routers)** `show chassis routing-engine`

**Release Information** Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
**sfc** option introduced for the TX Matrix Plus router in Junos OS Release in 9.6.  
Command introduced in Junos OS Release 11.1 for QFX Series.  
Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.  
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.  
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.  
Command introduced in Junos OS Release 13.2 for MX104 3D Univesral Edge Routers.

**Description** Display the status of the Routing Engine.

**Options** **none**—Display information about one or more Routing Engines. On a TX Matrix router, display information about all Routing Engines on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display information about all Routing Engines on the TX Matrix Plus router and its attached routers.

**all-members**—(MX Series routers only) (Optional) Display Routing Engine information for all members of the Virtual Chassis configuration.

**bios**—(Optional) Display the (BIOS) firmware version.

**interconnect-device *number***—(QFabric systems only) (Optional) Display Routing Engine information for a specified Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display Routing Engine information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display Routing Engine information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display Routing Engine information for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display Routing Engine information for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-device *number***—(QFabric systems only) (Optional) Display Routing Engine information for a specified Node device.

**scc**—(TX Matrix routers only) (Optional) Display Routing Engine information for the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display Routing Engine information for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**slot**—(Systems with multiple Routing Engines) (Optional) Display information for an individual Routing Engine. Replace *slot* with 0 or 1. For QFX3500 switches, there is only one Routing Engine, so you do not need to specify the slot number.

**Output Fields** [Table 43 on page 908](#) lists the output fields for the **show chassis routing-engine** command. Output fields are listed in the approximate order in which they appear.

**Table 43: show chassis routing-engine Output Fields**

Field Name	Field Description
<b>Slot</b>	(Systems with single and multiple Routing Engines) Slot number.
<b>Current state</b>	(Systems with multiple Routing Engines) Current state of the Routing Engine: <b>Master</b> , <b>Backup</b> , or <b>Disabled</b> .
<b>Election priority</b>	(Systems with multiple Routing Engines) Election priority for the Routing Engine: <b>Master</b> or <b>Backup</b> .
<b>Temperature</b>	Temperature of the air flowing past the Routing Engine.
<b>CPU Temperature</b>	Temperature of the CPU.
<b>DRAM</b>	Total DRAM available to the Routing Engine's processor.  Starting with Junos OS Release 12.3R1, the DRAM field displays both available memory and installed memory.
<b>Memory utilization</b>	Percentage of Routing Engine memory being used.
<b>CPU utilization</b>	Information about the Routing Engine's CPU utilization: <ul style="list-style-type: none"> <li>• <b>User</b>—Percentage of CPU time being used by user processes.</li> <li>• <b>Background</b>—Percentage of CPU time being used by background processes.</li> <li>• <b>Kernel</b>—Percentage of CPU time being used by kernel processes.</li> <li>• <b>Interrupt</b>—Percentage of CPU time being used by interrupts.</li> <li>• <b>Idle</b>—Percentage of CPU time that is idle.</li> </ul>
<b>Model</b>	Routing Engine model number.
<b>Serial ID</b>	(Systems with multiple Routing Engines) Identification number of the Routing Engine in this slot.
<b>Start time</b>	Time at which the Routing Engine started running.
<b>Uptime</b>	How long the Routing Engine has been running.
<b>Routing Engine BIOS Version</b>	BIOS version being run by the Routing Engine.

Table 43: show chassis routing-engine Output Fields (*continued*)

Field Name	Field Description
Last reboot reason	<p>Reason for last reboot, including:</p> <ul style="list-style-type: none"> <li><b>power cycle/failure</b>—Halt of the Routing Engine using the <b>halt</b> command, powering down using the power button on the chassis or any other method (such as removal of the control board or Routing Engine), and then powering back the Routing Engine. A halt of the operating system also occurs if you enter the <b>request system halt</b> command. You can enter this command to halt the system operations on the chassis or specific Routing Engines. To restart the software, press any key on the keyboard.</li> <li><b>watchdog</b>—Reboot due to a hardware watchdog. A watchdog is a hardware monitoring process that examines the health and performance of the router to enable the device to recover from failures. A watchdog checks for problems at certain intervals, and reboots the routing engine if a problem is encountered.</li> <li><b>reset-button reset</b>—(Not available on the J Series router or EX Series switch) Reboot due to pressing of the reset button on the Routing Engine.</li> <li><b>power-button hard power off</b>—Reboot due to pressing of the power button on the chassis. A powering down of the software also occurs if you enter the <b>request system power-off</b> command. You can enter this command to power down the chassis or specific Routing Engines; you can then restart the software.</li> <li><b>misc hardware reason</b>—Reboot due to miscellaneous hardware reasons.</li> <li><b>thermal shutdown</b>—Reboot due to the router or switch reaching a critical temperature at which point it is unsafe to continue operations.</li> <li><b>hard disk failure</b>—Reboot due to a hard disk or solid-state drive (SSD) failure.</li> <li><b>reset from debugger</b>—Reboot due to reset from the debugger.</li> <li><b>chassis control reset</b>—Restart the chassis process that manages PICs, FPCs, and other hardware components. The chassis control module that runs the Routing Engine performs management and monitoring functions, and it provides a single access point for operational and maintenance functions. A reset of the chassis management process occurs when you enter the <b>restart chassis-control</b> command.</li> <li><b>bios auto recovery reset</b>—Reboot due to a BIOS auto-recovery reset.</li> <li><b>could not be determined</b>—Reboot due to an undetermined reason.</li> <li><b>Router rebooted after a normal shutdown</b>—Reboot due to a normal shutdown. This reason is displayed if the Routing Engine is powered down by pushing and holding the online/offline button on the Routing Engine faceplate for 30 seconds, and then powered back. A reboot of the software also occurs if you enter the <b>request system reboot</b> command. You can enter this command to reboot the chassis or specific Routing Engines.</li> </ul>
Load averages	Routing Engine load averages for the last 1, 5, and 15 minutes.

## Sample Output

### show chassis routing-engine (M5 Router)

```

user@host> show chassis routing-engine
Routing Engine status:
  Temperature                25 degrees C / 77 degrees F
  DRAM                       768 MB
  Memory utilization         21 percent
  CPU utilization:
    User                      0 percent
    Background                0 percent
    Kernel                    0 percent
    Interrupt                  0 percent

```

Idle	100 percent
Model	RE-2.0
Serial ID	31000007349bf701
Start time	2003-12-04 09:42:17 PST
Uptime	26 days, 1 hour, 12 minutes, 27 seconds
Last reboot reason	Router rebooted after a normal shutdown
Load averages:	1 minute 5 minute 15 minute
	0.00 0.01 0.00

#### show chassis routing-engine (M10 Router)

```
user@host> show chassis routing-engine
Routing Engine status:
  Temperature      25 degrees C / 77 degrees F
  DRAM             768 MB
  Memory utilization 21 percent
  CPU utilization:
    User           0 percent
    Background     0 percent
    Kernel         0 percent
    Interrupt      0 percent
    Idle           100 percent
  Model            RE-2.0
  Serial ID        31000007349bf701
  Start time       2003-12-04 09:42:17 PST
  Uptime           26 days, 1 hour, 12 minutes, 27 seconds
  Last reboot reason Router rebooted after a normal shutdown
  Load averages:  1 minute 5 minute 15 minute
                  0.00      0.01      0.00
```

#### show chassis routing-engine (M20 Router)

```
user@host> show chassis routing-engine
Routing Engine status:
Slot 0:
  Current state      Master
  Election priority  Master (default)
  Temperature        29 degrees C / 84 degrees F
  DRAM               768 MB
  Memory utilization 20 percent
  CPU utilization:
    User             1 percent
    Background       0 percent
    Kernel           2 percent
    Interrupt        0 percent
    Idle             97 percent
  Model              RE-2.0
  Serial ID          58000007348d9a01
  Start time         2003-12-30 07:05:47 PST
  Uptime             3 hours, 41 minutes, 14 seconds
  Last reboot reason Router rebooted after a normal shutdown
  Load averages:    1 minute 5 minute 15 minute
                    0.00      0.02      0.00

Routing Engine status:
Slot 1:
  Current state      Backup
  Election priority  Backup (default)
  Temperature        29 degrees C / 84 degrees F
  DRAM               768 MB
  Memory utilization 0 percent
  CPU utilization:
```

```

User                0 percent
Background          0 percent
Kernel              1 percent
Interrupt           0 percent
Idle                99 percent
Model               RE-2.0
Serial ID            d800000734745701
Start time          2003-06-17 16:37:33 PDT
Uptime              195 days, 18 hours, 47 minutes, 9 seconds
Last reboot reason   Router rebooted after a normal shutdown

```

### show chassis routing-engine (M40 Router)

```

user@host> show chassis routing-engine
Routing Engine status:
  Temperature        25 degrees C / 77 degrees F
  DRAM                768 MB
  Memory utilization  21 percent
  CPU utilization:
    User              0 percent
    Background        0 percent
    Kernel            0 percent
    Interrupt         0 percent
    Idle              100 percent
  Model              RE-2.0
  Serial ID          31000007349bf701

## show chassis zones

<b>List of Syntax</b>	<a href="#">Syntax on page 927</a> <a href="#">Syntax (QFX Series) on page 927</a>
<b>Syntax</b>	show chassis zones <detail>
<b>Syntax (QFX Series)</b>	show chassis zones <detail> <interconnect-device <i>name</i> >
<b>Release Information</b>	<p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
<b>Description</b>	<p>(QFabric systems only) Display the status of the two cooling system zones on the Interconnect device. Zone 1 consists of eight (0 – 7) front cards, which are cooled by two fan trays. Zone 2 consists of two control boards and eight rear cards, which are cooled by eight (0 – 7) fan trays. On MX2010 and MX2020 routers, display the status of the cooling system zones of the chassis. Zone 0 consists of the Control Board, ten (0–9) FPCs, and their respective PICs, Switch Fabric Boards, and Adapter Cards. Zone 1 consists of the Routing Engine, Control Board, and Switch Processor Mezzanine Boards.</p>
<b>Options</b>	<p><b>detail</b>—(MX2010 and MX2020 routers only) (Optional) Display detailed status of the cooling system zones.</p> <p><b>detail <i>device-name</i></b>— (QFabric systems only) (Optional) Display detailed status of the two cooling systems on the Interconnect device.</p> <p><b>interconnect-device <i>name</i></b>— (QFabric systems only) (Optional) Display the status of the cooling zones on the Interconnect device.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request chassis beacon on page 382</a></li> <li>• <a href="#">show chassis fan on page 615</a></li> <li>• <a href="#">show chassis temperature-thresholds</a></li> </ul>

**Output Fields** Table 26 on page 509 lists the output fields for the **show chassis zones** command. Output fields are listed in the approximate order in which they appear.

**Table 44: show chassis zones Output Fields**

Field Name	Field Description
Slot	FPC slot number of the device whose content is being displayed. On QFX3500 standalone switches, the number is always 0.
Beacon State	Status of the beacon state: <ul style="list-style-type: none"> <li>Off—The beacon is <b>OFF</b>.</li> <li>On—The beacon is <b>ON</b>.</li> </ul>
show chassis zones command output fields for MX2020 and MX2010 routers:	
Driving FRU	Field replaceable unit (FRU).
Temperature	Temperature of the specified FRU in degrees Celsius and degrees Fahrenheit.
Condition	Condition of the specified FRU. Condition can be <b>HIGH TEMP</b> , <b>WARM TEMP</b> , <b>OK</b> , and <b>Offline</b> .
Num Fans Missing	Number of fans or fan trays missing.
Num Fans Failed	Number of fans or fan trays that have failed.
Fan Duty Cycle	Fan duty cycle value.
show chassis zones detail command output fields for MX2020 and MX2010 routers:	
Item	Chassis component: <ul style="list-style-type: none"> <li>Information about the chassis, Routing Engines, Control Boards (CBs), Switch Fabric Boards (SFBs), PICs, Flexible PIC Concentrators (FPCs), and Adapter Cards (ADCs).</li> </ul>
Measurement	Fan tray speed utilization in percentage.
Status	Status of the specified item. Status can be <b>OK</b> , <b>Absent</b> , or <b>Offline</b> .

## Sample Output

### show chassis zones interconnect-device (QFabric System)

```

user@switch> show chassis zones interconnect-device interconnect1
Slot          Beacon State
FPC           0          OFF

```

### show chassis zones (MX2010 Router)

```

user@host> show chassis zones

```

```

## show cli

<b>List of Syntax</b>	<a href="#">Syntax on page 933</a> <a href="#">Syntax (QFX Series) on page 933</a>
<b>Syntax</b>	show cli
<b>Syntax (QFX Series)</b>	show cli <authorization> <directory> <history <i>count</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display configured CLI settings.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show cli on page 934</a>
<b>Output Fields</b>	<a href="#">Table 45 on page 933</a> lists the output fields for the <b>show cli</b> command. Output fields are listed in the approximate order in which they appear.

**Table 45: show cli Output Fields**

Field Name	Field Description
CLI complete-on-space	Capability to complete a partial command entry when you type a space or a tab: <b>on</b> or <b>off</b> .
CLI idle-timeout	Maximum time that an individual session can be idle before the user is logged out from the router or switch. When this feature is enabled, the number of minutes is displayed. Otherwise, the state is <b>disabled</b> .
CLI restart-on-upgrade	CLI is set to prompt you to restart the router or switch after upgrading the software: <b>on</b> or <b>off</b> .
CLI screen-length	Number of lines of text that the terminal screen displays.
CLI screen-width	Number of characters in a line on the terminal screen.
CLI terminal	Terminal type.
CLI is operating in	Mode: <b>enhanced</b> .
CLI timestamp	Date and time format for the timestamp. If the timestamp is not set, the state is <b>disabled</b> .
CLI working directory	Pathname of the working directory.

## Sample Output

show cli

```
user@host> show cli
CLI complete-on-space set to on
CLI idle-timeout disabled
CLI restart-on-upgrade set to on
CLI screen-length set to 47
CLI screen-width set to 132
CLI terminal is 'vt100'
CLI is operating in enhanced mode
CLI timestamp disabled
CLI working directory is '/var/home/regress'
```

## show cli authorization

<b>Syntax</b>	show cli authorization
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the permissions for the current user.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show cli authorization on page 937</a>
<b>Output Fields</b>	<a href="#">Table 46 on page 935</a> lists the output fields for the <b>show cli authorization</b> command. In the table, all possible permissions are displayed and output fields are listed in alphabetical order.

**Table 46: show cli authorization Output Fields**

Field Name	Field Description
access	Can view access configuration information.
access-control	Can modify access configuration.
admin	Can view user account information.
admin-control	Can modify user account information.
clear	Can clear learned network information.
configure	Can enter configuration mode.
control	Can modify any configuration.
edit	Can edit configuration files.
field	Reserved for field (debugging) support.
firewall	Can view firewall configuration information.
firewall-control	Can modify firewall configuration information.
floppy	Can read from and write to removable media.
flow-tap	Can view flow-tap configuration information.

Table 46: show cli authorization Output Fields (*continued*)

Field Name	Field Description
<b>flow-tap-control</b>	Can configure flow-tap configuration information.
<b>idp-profiler-operation</b>	Can configure Profiler data.
<b>interface</b>	Can view interface configuration information.
<b>interface-control</b>	Can modify interface configuration information.
<b>maintenance</b>	Can perform system maintenance.
<b>network</b>	Can access the network by entering the <b>ping</b> , <b>ssh</b> , <b>telnet</b> , and <b>traceroute</b> commands.
<b>pgcp-session-mirroring</b>	Can view Packet Gateway Control Protocol session mirroring configuration.
<b>pgcp-session-mirroring-control</b>	Can modify Packet Gateway Control Protocol session mirroring configuration all-control.
<b>reset</b>	Can reset or restart interfaces and system processes.
<b>rollback</b>	Can roll back to previous configurations.
<b>routing</b>	Can view routing configuration information.
<b>routing-control</b>	Can modify routing configuration information.
<b>secret</b>	Can view passwords and authentication keys in the configuration.
<b>secret-control</b>	Can modify passwords and authentication keys in the configuration.
<b>security</b>	Can view security configuration information.
<b>security-control</b>	Can modify security configuration information.
<b>shell</b>	Can start a local shell.
<b>snmp</b>	Can view SNMP configuration information.
<b>snmp-control</b>	Can modify SNMP configuration information.
<b>system</b>	Can view system configuration information.
<b>system-control</b>	Can modify system configuration information.
<b>trace</b>	Can view trace file settings information.

Table 46: show cli authorization Output Fields (*continued*)

Field Name	Field Description
<b>trace-control</b>	Can modify trace file settings information.
<b>view</b>	Can view current values and statistics.
<b>view-configuration</b>	Can view all configuration information (not including secrets).

## Sample Output

### show cli authorization

```

user@host> show cli authorization
Current user: 'remote' login: 'user' class ''
Permissions:
  admin      -- Can view user accounts
  admin-control-- Can modify user accounts
  clear      -- Can clear learned network information
  configure  -- Can enter configuration mode
  control    -- Can modify any configuration
  edit       -- Can edit full files
  field      -- Special for field (debug) support
  floppy     -- Can read and write from the floppy
  interface  -- Can view interface configuration
  interface-control-- Can modify interface configuration
  network    -- Can access the network
  reset      -- Can reset/restart interfaces and daemons
  routing    -- Can view routing configuration
  routing-control-- Can modify routing configuration
  shell      -- Can start a local shell
  snmp       -- Can view SNMP configuration
  snmp-control-- Can modify SNMP configuration
  system     -- Can view system configuration
  system-control-- Can modify system configuration
  trace      -- Can view trace file settings
  trace-control-- Can modify trace file settings
  view       -- Can view current values and statistics
  maintenance -- Can become the super-user
  firewall   -- Can view firewall configuration
  firewall-control-- Can modify firewall configuration
  secret     -- Can view secret configuration
  secret-control-- Can modify secret configuration
  rollback   -- Can rollback to previous configurations
  security   -- Can view security configuration
  security-control-- Can modify security configuration
  access     -- Can view access configuration
  access-control-- Can modify access configuration
  view-configuration-- Can view all configuration (not including secrets)
  flow-tap   -- Can view flow-tap configuration
  flow-tap-control-- Can configure flow-tap service
Individual command authorization:
  Allow regular expression: none
  Deny regular expression: none
  Allow configuration regular expression: none
  Deny configuration regular expression: none

```

---

## show cli directory

---

<b>Syntax</b>	show cli directory
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the current working directory.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show cli directory on page 939</a>
<b>Output Fields</b>	<a href="#">Table 47 on page 939</a> lists the output fields for the <b>show cli directory</b> command. Output fields are listed in the approximate order in which they appear.

**Table 47: show cli directory Output Fields**

Field Name	Field Description
Current directory	Pathname of the current working directory.

## Sample Output

### show cli directory

```
user@host> show cli directory
Current directory: /var/home/regress
```

## show cli history

---

<b>Syntax</b>	<code>show cli history</code> <code>&lt;count&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display a list of previous CLI commands.
<b>Options</b>	<b>none</b> —Display all previous CLI commands.  <b>count</b> —(Optional) Maximum number of commands to display.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show cli history on page 940</a>
<b>Output Fields</b>	<a href="#">Table 48 on page 940</a> lists the output fields for the <b>show cli history</b> command. Output fields are listed in the approximate order in which they appear.

**Table 48: show cli history Output Fields**

Field Name	Field Description
<i>timestamp</i>	Time at which the command was entered.
<i>command-syntax</i>	Command that was entered.

## Sample Output

### show cli history

```
user@host> show cli history
11:14:14 -- show arp
11:22:10 -- show cli authorization
11:27:12 -- show cli history
```

---

## show host

---

<b>Syntax</b>	<code>show host <i>hostname</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display Domain Name System (DNS) hostname information.
<b>Options</b>	<i>hostname</i> —Hostname or address.
<b>Additional Information</b>	The <code>show host</code> command displays the raw data received from the DNS server.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show host on page 941</a>

### Sample Output

#### show host

```
user@host> show host snark
snark.boojum.net has address 192.168.1.254

user@host> show host 192.168.1.254
Name: snark.boojum.net
Address: 192.168.1.254
Aliases:
```

## show interfaces diagnostics optics

<b>Syntax</b>	<code>show interfaces diagnostics optics <i>interface-name</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Display diagnostics data and alarms for Gigabit Ethernet, 10-Gigabit Ethernet, and QSFP+ optical transceivers installed in a QFX Series product. The information provided by this command is known as digital optical monitoring (DOM) information.</p> <p>Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transponder vendors. Generally, a high alarm or low alarm indicates that the optics module is not operating properly. This information can be used to diagnose why a transceiver is not working.</p>
<b>Options</b>	<i>interface-name</i> —Name of the interface associated with the port in which the transceiver is installed.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Monitoring Interface Status and Traffic on page 335</a></li> <li>• <a href="#">Installing a Transceiver in a QFX Series Device</a></li> <li>• <a href="#">Removing a Transceiver from a QFX Series Device</a></li> <li>• <a href="#">Junos OS Network Interfaces Library for Routing Devices</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show interfaces diagnostics optics xe-0/0/1 (SFP+ Transceiver) on page 946</a> <a href="#">show interfaces diagnostics optics node1:xe-0/0/1 (SFP+ Transceiver) on page 947</a>
<b>Output Fields</b>	lists the output fields for the <code>show interfaces diagnostics optics</code> command. Output fields are listed in the approximate order in which they appear.

**Table 49: show interfaces diagnostics optics Output Fields**

Field Name	Field Description
Physical interface	Displays the name of the physical interface.
Laser bias current	Displays the magnitude of the laser bias power setting current, in milliamperes. The laser bias provides direct modulation of laser diodes and modulates currents.
Laser output power	Displays the laser output power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).
Module temperature	Displays the temperature, in Celsius and Fahrenheit.
Module voltage	Displays the voltage, in volts.
(Not available for XFP transceivers)	

Table 49: show interfaces diagnostics optics Output Fields (*continued*)

Field Name	Field Description
<b>Laser rx power</b> (Not available for SFP and SFP+ transceivers)	Displays the laser received optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).
<b>Receiver signal average optical power</b> (Not available for XFP transceivers)	Displays the receiver signal average optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).
<b>Laser bias current high alarm</b>	Displays whether the laser bias power setting high alarm is <b>On</b> or <b>Off</b> .
<b>Laser bias current low alarm</b>	Displays whether the laser bias power setting low alarm is <b>On</b> or <b>Off</b> .
<b>Laser bias current high warning</b>	Displays whether the laser bias power setting high warning is <b>On</b> or <b>Off</b> .
<b>Laser bias current low warning</b>	Displays whether the laser bias power setting low warning is <b>On</b> or <b>Off</b> .
<b>Laser output power high alarm</b>	Displays whether the laser output power high alarm is <b>On</b> or <b>Off</b> .
<b>Laser output power low alarm</b>	Displays whether the laser output power low alarm is <b>On</b> or <b>Off</b> .
<b>Laser output power high warning</b>	Displays whether the laser output power high warning is <b>On</b> or <b>Off</b> .
<b>Laser output power low warning</b>	Displays whether the laser output power low warning is <b>On</b> or <b>Off</b> .
<b>Module temperature high alarm</b>	Displays whether the module temperature high alarm is <b>On</b> or <b>Off</b> .
<b>Module temperature low alarm</b>	Displays whether the module temperature low alarm is <b>On</b> or <b>Off</b> .
<b>Module temperature high warning</b>	Displays whether the module temperature high warning is <b>On</b> or <b>Off</b> .
<b>Module temperature low warning</b>	Displays whether the module temperature low warning is <b>On</b> or <b>Off</b> .
<b>Module voltage high alarm</b> (Not available for XFP transceivers)	Displays whether the module voltage high alarm is <b>On</b> or <b>Off</b> .
<b>Module voltage low alarm</b> (Not available for XFP transceivers)	Displays whether the module voltage low alarm is <b>On</b> or <b>Off</b> .
<b>Module voltage high warning</b> (Not available for XFP transceivers)	Displays whether the module voltage high warning is <b>On</b> or <b>Off</b> .
<b>Module voltage low warning</b> (Not available for XFP transceivers)	Displays whether the module voltage low warning is <b>On</b> or <b>Off</b> .
<b>Laser rx power high alarm</b>	Displays whether the receive laser power high alarm is <b>On</b> or <b>Off</b> .

Table 49: show interfaces diagnostics optics Output Fields (*continued*)

Field Name	Field Description
Laser rx power low alarm	Displays whether the receive laser power low alarm is <b>On</b> or <b>Off</b> .
Laser rx power high warning	Displays whether the receive laser power high warning is <b>On</b> or <b>Off</b> .
Laser rx power low warning	Displays whether the receive laser power low warning is <b>On</b> or <b>Off</b> .
Laser bias current high alarm threshold	Displays the vendor-specified threshold for the laser bias current high alarm.
Module not ready alarm (Not available for SFP and SFP+ transceivers)	Displays whether the module not ready alarm is <b>On</b> or <b>Off</b> . When the output is <b>On</b> , the module has an operational fault.
Module power down alarm (Not available for SFP and SFP+ transceivers)	Displays whether the module power down alarm is <b>On</b> or <b>Off</b> . When the output is <b>On</b> , the module is in a limited power mode, low for normal operation.
Tx data not ready alarm (Not available for SFP and SFP+ transceivers)	Any condition leading to invalid data on the transmit path. Displays whether the Tx data not ready alarm is <b>On</b> or <b>Off</b> .
Tx not ready alarm (Not available for SFP and SFP+ transceivers)	Any condition leading to invalid data on the transmit path. Displays whether the Tx not ready alarm is <b>On</b> or <b>Off</b> .
Tx laser fault alarm (Not available for SFP and SFP+ transceivers)	Laser fault condition. Displays whether the Tx laser fault alarm is <b>On</b> or <b>Off</b> .
Tx CDR loss of lock alarm (Not available for SFP and SFP+ transceivers)	Transmit clock and data recovery (CDR) loss of lock. Loss of lock on the transmit side of the CDR. Displays whether the Tx CDR loss of lock alarm is <b>On</b> or <b>Off</b> .
Rx not ready alarm (Not available for SFP and SFP+ transceivers)	Any condition leading to invalid data on the receive path. Displays whether the Rx not ready alarm is <b>On</b> or <b>Off</b> .
Rx loss of signal alarm (Not available for SFP and SFP+ transceivers)	Receive loss of signal alarm. When <b>on</b> , indicates insufficient optical input power to the module. Displays whether the Rx loss of signal alarm is <b>On</b> or <b>Off</b> .
Rx CDR loss of lock alarm (Not available for SFP and SFP+ transceivers)	Receive CDR loss of lock. Loss of lock on the receive side of the CDR. Displays whether the Rx CDR loss of lock alarm is <b>On</b> or <b>Off</b> .
Laser bias current low alarm threshold	Displays the vendor-specified threshold for the laser bias current low alarm.
Laser bias current high warning threshold	Displays the vendor-specified threshold for the laser bias current high warning.

Table 49: show interfaces diagnostics optics Output Fields (*continued*)

Field Name	Field Description
Laser bias current low warning threshold	Displays the vendor-specified threshold for the laser bias current low warning.
Laser output power high alarm threshold	Displays the vendor-specified threshold for the laser output power high alarm.
Laser output power low alarm threshold	Displays the vendor-specified threshold for the laser output power low alarm.
Laser output power high warning threshold	Displays the vendor-specified threshold for the laser output power high warning.
Laser output power low warning threshold	Displays the vendor-specified threshold for the laser output power low warning.
Module temperature high alarm threshold	Displays the vendor-specified threshold for the module temperature high alarm.
Module temperature low alarm threshold	Displays the vendor-specified threshold for the module temperature low alarm.
Module temperature high warning threshold	Displays the vendor-specified threshold for the module temperature high warning.
Module temperature low warning threshold	Displays the vendor-specified threshold for the module temperature low warning.
Module voltage high alarm threshold (Not available for XFP transceivers)	Displays the vendor-specified threshold for the module voltage high alarm.
Module voltage low alarm threshold (Not available for XFP transceivers)	Displays the vendor-specified threshold for the module voltage low alarm.
Module voltage high warning threshold (Not available for XFP transceivers)	Displays the vendor-specified threshold for the module voltage high warning.
Module voltage low warning threshold (Not available for XFP transceivers)	Displays the vendor-specified threshold for the module voltage low warning.
Laser rx power high alarm threshold	Displays the vendor-specified threshold for the laser Rx power high alarm.
Laser rx power low alarm threshold	Displays the vendor-specified threshold for the laser Rx power low alarm.
Laser rx power high warning threshold	Displays the vendor-specified threshold for the laser Rx power high warning.

Table 49: show interfaces diagnostics optics Output Fields (*continued*)

Field Name	Field Description
Laser rx power low warning threshold	Displays the vendor-specified threshold for the laser Rx power low warning.

## show log

---

<b>List of Syntax</b>	<a href="#">Syntax on page 948</a> <a href="#">Syntax (QFabric System) on page 948</a> <a href="#">Syntax (TX Matrix Routers) on page 948</a>
<b>Syntax</b>	<code>show log</code> <code>&lt;filename   user &lt;username&gt;&gt;</code>
<b>Syntax (QFabric System)</b>	<code>show log filename</code> <code>&lt;device-type (device-id   device-alias)&gt;</code>
<b>Syntax (TX Matrix Routers)</b>	<code>show log</code> <code>&lt;all-lcc   lcc number   scc&gt;</code> <code>&lt;filename   user &lt;username&gt;&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Option <i>device-type (device-id   device-alias)</i> is introduced in Junos OS Release 13.1 for the QFX Series.
<b>Description</b>	List log files, display log file contents, or display information about users who have logged in to the router or switch.
<b>Options</b>	<b>none</b> —List all log files.  <b>&lt;all-lcc   lcc number   scc&gt;</b> —(TX Matrix routers only) (Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace <i>number</i> with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).  <b>device-type</b> —(QFabric system only) (Optional) Display log messages for only one of the following device types: <ul style="list-style-type: none"><li>• <b>director-device</b>—Display logs for Director devices.</li><li>• <b>infrastructure-device</b>—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).</li><li>• <b>interconnect-device</b>—Display logs for Interconnect devices.</li><li>• <b>node-device</b>—Display logs for Node devices.</li></ul>

**NOTE:** If you specify the *device-type* optional parameter, you must also specify either the *device-id* or *device-alias* optional parameter.

---

**(device-id | device-alias)**—If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

**filename**—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

**NOTE:** The *filename* parameter is mandatory for the QFabric system. If you did not configure a syslog filename, specify the default filename of messages.

**user <username>**—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include *username*, display logging information about the specified user.

**Required Privilege Level** trace

## show ntp associations

<b>Syntax</b>	<code>show ntp associations</code> <code>&lt;no-resolve&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display Network Time Protocol (NTP) peers and their state.
<b>Options</b>	<b>none</b> —Display NTP peers and their state.  <b>no-resolve</b> —(Optional) Suppress symbolic addressing.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ntp status on page 953</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ntp associations on page 952</a>
<b>Output Fields</b>	<a href="#">Table 50 on page 951</a> describes the output fields for the <b>show ntp associations</b> command. Output fields are listed in the approximate order in which they appear.

**Table 50: show ntp associations Output Fields**

Field Name	Field Description
<b>remote</b>	Address or name of the remote NTP peer.
<b>refid</b>	Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of <b>0.0.0.0</b> .
<b>st</b>	Stratum of the remote peer.
<b>t</b>	Type of peer: <b>b</b> (broadcast), <b>l</b> (local), <b>m</b> (multicast), or <b>u</b> (unicast).
<b>when</b>	When the last packet from the peer was received.
<b>poll</b>	Polling interval, in seconds.
<b>reach</b>	Reachability register, in octal.
<b>delay</b>	Current estimated delay of the peer, in milliseconds.
<b>offset</b>	Current estimated offset of the peer, in milliseconds.
<b>disp</b>	Current estimated dispersion of the peer, in milliseconds.

Table 50: show ntp associations Output Fields (*continued*)

Field Name	Field Description
<i>peer-name</i>	<p>Peer name and status of the peer in the clock selection process:</p> <ul style="list-style-type: none"> <li>• space—Discarded because of a high stratum value or failed sanity checks.</li> <li>• x—Designated "falseticker" by the intersection algorithm.</li> <li>• .—Culled from the end of the candidate list.</li> <li>• — —Discarded by the clustering algorithm.</li> <li>• +—Included in the final selection set.</li> <li>• #—Selected for synchronization, but the distance exceeds the maximum.</li> <li>• *—Selected for synchronization.</li> <li>• o—Selected for synchronization, but the packets-per-second (pps) signal is in use.</li> </ul>

## show ntp status

<b>Syntax</b>	<code>show ntp status</code> <code>&lt;no-resolve&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the values of internal variables returned by Network Time Protocol (NTP) peers.
<b>Options</b>	<b>none</b> —Display the values of internal variables returned by NTP peers.  <b>no-resolve</b> —(Optional) Suppress symbolic addressing.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ntp associations on page 951</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ntp status on page 954</a>
<b>Output Fields</b>	<a href="#">Table 51 on page 953</a> describes the output fields for the <b>show ntp status</b> command. Output fields are listed in the approximate order in which they appear.

**Table 51: show ntp status Output Fields**

Field Name	Field Description
<b>status</b>	System status word, a code representing the status items listed.
<b>leap_none</b>	Indicates a normal synchronized state with no leap seconds imminent. Other options could be <b>leap_add_sec</b> , <b>leap_del_sec</b> , or <b>leap_alarm</b> , indicating a leap second will be added, deleted, or a leap second requirement is upcoming.
<b>sync_ntp</b>	Indicates the current synchronization source, in this case, an NTP server. Other options include <b>sync_alarm</b> and <b>sync_unspec</b> , both indicating that the router has not been synched.
<b>x events</b>	Indicates the number of events that have occurred since that last code change. An event is often the receipt of an NTP polling message.
<b>event_peer/strat_chg</b>	Describes the most recent event, in this case, the stratum of the peer server changed.
<b>version</b>	A detailed description of the version of NTP being used.
<b>processor</b>	Indicates the current hardware platform and version of the processor.
<b>system</b>	Detailed description of the name and version of the operating system in use.
<b>leap</b>	The number of leap seconds in use.

Table 51: show ntp status Output Fields (*continued*)

Field Name	Field Description
<b>stratum</b>	The stratum of the peer server. Anything greater than 1 is a secondary reference source, and the number roughly represents the number of hops away from the stratum 1 server.. Stratum 1 is a primary reference, such as an atomic clock.
<b>precision</b>	The precision of the peer clock, how precisely the frequency and time can be maintained with this particular timekeeping system.
<b>rootdelay</b>	The total roundtrip delay to the primary reference source, in seconds.
<b>rootdispersion</b>	The maximum error relative to the primary reference source, in seconds.
<b>peer</b>	An identification number of the peer in use.
<b>refid</b>	Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of 0.0.0.0.
<b>reftime</b>	The local time, in timestamp format, when the local clock was last updated. If the local clock has never been synchronized, the value is zero.
<b>poll</b>	The NTP broadcast message polling interval, in seconds.
<b>clock</b>	The current time on the local router clock.
<b>state</b>	The current mode of NTP operation, where 1 is symmetric active, 2 is symmetric passive, 3 is client, 4 is server, and 5 is broadcast.
<b>offset</b>	Current estimated offset of the peer, in milliseconds. Indicates the time difference between the reference clock and the local clock.
<b>frequency</b>	The frequency of the clock.
<b>jitter</b>	Indicates the magnitude of jitter, in milliseconds, between several time queries.
<b>stability</b>	A measure of how well this clock can maintain a constant frequency.

## Sample Output

### show ntp status

```

user@host> show ntp status
assID=0 status=0544 leap_none, sync_local_proto, 4 events, event_peer/strat_chg,
version="ntpd 4.2.2p1@1.1570-o Tue May 19 13:57:55 UTC 2009 (1)",
processor="x86_64", system="Linux/2.6.18-164.el5", leap=00, stratum=4,
precision=-10, rootdelay=0.000, rootdispersion=11.974, peer=59475,
refid=LOCAL(0),
reftime=d495c32c.0e71eaf2 Mon, Jan 7 2013 13:57:00.056, poll=10,
clock=d495c32c.cebd43bd Mon, Jan 7 2013 13:57:00.807, state=4,
offset=0.000, frequency=0.000, jitter=0.977, noise=0.977,
stability=0.000, tai=0

```

## show subscribers

---

**Syntax**    `show subscribers`  
              `<detail | extensive | terse>`  
              `<aci-interface-set-name aci-interface-set-name>`  
              `<address address>`  
              `<agent-circuit-identifier agent-circuit-identifier-substring>`  
              `<client-type client-type>`  
              `<count>`  
              `<id>`  
              `<interface interface>`  
              `<logical-system logical-system>`  
              `<mac-address mac-address>`  
              `<physical-interface physical-interface-name>`  
              `<profile-name profile-name>`  
              `<routing-instance routing-instance>`  
              `<stacked-vlan-id stacked-vlan-id>`  
              `<subscriber-state subscriber-state>`  
              `<user-name user-name>`  
              `<vci vci-identifier>`  
              `<vpi vpi-identifier>`  
              `<vlan-id vlan-id>`

**Release Information**    Command introduced in Junos OS Release 9.3.  
                              Command introduced in Junos OS Release 9.3 for EX Series switches.  
                              **client-type**, **mac-address**, **subscriber-state**, and **extensive** options introduced in Junos OS Release 10.2.  
                              **count** option usage with other options introduced in Junos OS Release 10.2.  
                              Command introduced in Junos OS Release 11.1 for the QFX Series.  
                              Options **aci-interface-set-name** and **agent-circuit-identifier** introduced in Junos OS Release 12.2.  
                              The **physical-interface** and **user-name** options introduced in Junos OS Release 12.3.  
                              Options **vci** and **vpi** introduced in Junos OS Release 12.3R3 and supported in later 12.3Rx releases.  
                              Options **vci** and **vpi** supported in Junos OS Release 13.2 and later releases. (Not supported in Junos OS Release 13.1.)

**Description**    Display information for active subscribers.

**Options**    **detail | extensive | terse**—(Optional) Display the specified level of output.

**aci-interface-set-name**—(Optional) Display all dynamic subscriber sessions that use the specified agent circuit identifier (ACI) interface set. Use the ACI interface set name generated by the router, such as `aci-1003-ge-1/0/0.4001`, and not the actual ACI value found in the DHCP or PPPoE control packets.

**address**—(Optional) Display subscribers whose IP address matches the specified address. You must specify the IPv4 or IPv6 address prefix without a netmask (for example, `192.168.17.1`). If you specify the IP address as a prefix with a netmask (for example, `192.168.17.1/32`), the router displays a message that the IP address is invalid, and rejects the command.

**agent-circuit-identifier-substring**—(Optional) Display all dynamic subscriber sessions whose ACI value matches the specified substring.

**client-type**—(Optional) Display subscribers whose client type matches the specified client type (DHCP, L2TP, PPP, PPPOE, VLAN, or static).

**count**—(Optional) Display the count of total subscribers and active subscribers for any specified option. You can use the **count** option alone or with the **address**, **client-type**, **interface**, **logical-system**, **mac-address**, **profile-name**, **routing-instance**, **stacked-vlan-id**, **subscriber-state**, or **vlan-id** options.

**id**—(Optional) Display a specific subscriber session whose session id matches the specified subscriber ID. You can display subscriber IDs by using the **show subscribers extensive** or the **show subscribers interface extensive** commands.

**interface**—(Optional) Display subscribers whose interface matches the specified interface.

**logical-system**—(Optional) Display subscribers whose logical system matches the specified logical system.

**mac-address**—(Optional) Display subscribers whose MAC address matches the specified MAC address.

**physical-interface-name**—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose physical interface matches the specified physical interface.

**profile-name**—(Optional) Display subscribers whose dynamic profile matches the specified profile name.

**routing-instance**—(Optional) Display subscribers whose routing instance matches the specified routing instance.

**stacked-vlan-id**—(Optional) Display subscribers whose stacked VLAN ID matches the specified stacked VLAN ID.

**subscriber-state**—(Optional) Display subscribers whose subscriber state matches the specified subscriber state (ACTIVE, CONFIGURED, INIT, TERMINATED, or TERMINATING).

**user-name**—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose username matches the specified subscriber name.

**vci-identifier**—(MX Series routers with MPCs and ATM MICs with SFP only) (Optional) Display active ATM subscribers whose ATM virtual circuit identifier (VCI) matches the specified VCI identifier. The range of values is **0** through **255**.

**vpi-identifier**—(MX Series routers with MPCs and ATM MICs with SFP only) (Optional) Display active ATM subscribers whose ATM virtual path identifier (VPI) matches the specified VPI identifier. The range of values is **0** through **65535**.

**vlan-id**—(Optional) Display subscribers whose VLAN ID matches the specified VLAN ID.

**NOTE:** Due to display limitations, logical system and routing instance output values are truncated when necessary.

[show subscribers vlan-id detail on page 973](#)

[show subscribers vpi vci extensive \(PPPoE-over-ATM Subscriber Session\) on page 973](#)

**Output Fields** [Table 52 on page 959](#) lists the output fields for the **show subscribers** command. Output fields are listed in the approximate order in which they appear.

**Table 52: show subscribers Output Fields**

Field Name	Field Description
<b>Interface</b>	Interface associated with the subscriber. The router or switch displays subscribers whose interface matches or begins with the specified interface.  The * character indicates a continuation of addresses for the same session.
<b>IP Address/VLAN ID</b>	Subscriber IP address or VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i>  No IP address or VLAN ID is assigned to an L2TP tunnel-switched session. For these subscriber sessions the value is <b>Tunnel-switched</b> .
<b>User Name</b>	Name of subscriber.
<b>LS:RI</b>	Logical system and routing instance associated with the subscriber.
<b>Type</b>	Subscriber client type (DHCP, L2TP, PPP, PPPoE, STATIC-INTERFACE, VLAN).
<b>IP Address</b>	Subscriber IPv4 address.
<b>IP Netmask</b>	Subscriber IP netmask.
<b>Primary DNS Address</b>	IP address of primary DNS server.
<b>Secondary DNS Address</b>	IP address of secondary DNS server.
<b>Primary WINS Address</b>	IP address of primary WINS server.
<b>Secondary WINS Address</b>	IP address of secondary WINS server.
<b>IPv6 Address</b>	Subscriber IPv6 address, or multiple addresses.
<b>IPv6 Prefix</b>	Subscriber IPv6 prefix. If you are using DHCPv6 prefix delegation, this is the delegated prefix.
<b>IPv6 User Prefix</b>	IPv6 prefix obtained through ND/RA.
<b>IPv6 Address Pool</b>	Subscriber IPv6 address pool. The IPv6 address pool is used to allocate IPv6 prefixes to the DHCPv6 clients.
<b>IPv6 Network Prefix Length</b>	Length of the network portion of the IPv6 address.
<b>IPv6 Prefix Length</b>	Length of the subscriber IPv6 prefix.

Table 52: show subscribers Output Fields (*continued*)

Field Name	Field Description
<b>Logical System</b>	Logical system associated with the subscriber.
<b>Routing Instance</b>	Routing instance associated with the subscriber.
<b>Interface Type</b>	Whether the subscriber interface is <b>Static</b> or <b>Dynamic</b> .
<b>Interface Set</b>	Internally generated name of the dynamic ACI interface set used by the subscriber session.
<b>Interface Set Type</b>	Interface type of the ACI interface set: <b>Dynamic</b> . This is the only ACI interface set type currently supported.
<b>Interface Set Session ID</b>	Identifier of the dynamic ACI interface set entry in the session database.
<b>Underlying Interface</b>	Name of the underlying interface for the subscriber session.
<b>Dynamic Profile Name</b>	Dynamic profile used for the subscriber.
<b>Dynamic Profile Version</b>	Version number of the dynamic profile used for the subscriber.
<b>MAC Address</b>	MAC address associated with the subscriber.
<b>State</b>	Current state of the subscriber session ( <b>Init</b> , <b>Configured</b> , <b>Active</b> , <b>Terminating</b> , <b>Tunneled</b> ).
<b>L2TP State</b>	Current state of the L2TP session, <b>Tunneled</b> or <b>Tunnel-switched</b> . When the value is <b>Tunnel-switched</b> , two entries are displayed for the subscriber; the first entry is at the LNS interface on the LTS and the second entry is at the LAC interface on the LTS.
<b>Tunnel switch Profile Name</b>	Name of the L2TP tunnel switch profile that initiates tunnel switching.
<b>Local IP Address</b>	IP address of the local gateway (LAC).
<b>Remote IP Address</b>	IP address of the remote peer (LNS).
<b>VLAN Id</b>	VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .
<b>Stacked VLAN Id</b>	Stacked VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .
<b>RADIUS Accounting ID</b>	RADIUS accounting ID associated with the subscriber.
<b>Agent Circuit ID</b>	Option 82 agent circuit ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.
<b>Agent Remote ID</b>	Option 82 agent remote ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.
<b>DHCP Relay IP Address</b>	IP address used by the DHCP relay agent.

Table 52: show subscribers Output Fields (*continued*)

Field Name	Field Description
<b>ATM VPI</b>	(MX Series routers with MPCs and ATM MICs with SFP only) ATM virtual path identifier (VPI) on the subscriber's physical interface.
<b>ATM VCI</b>	(MX Series routers with MPCs and ATM MICs with SFP only) ATM virtual circuit identifier (VCI) for each VPI configured on the subscriber interface.
<b>Login Time</b>	Date and time at which the subscriber logged in.
<b>Effective shaping-rate</b>	Actual downstream traffic shaping rate for the subscriber, in kilobits per second.
<b>IPv4 rpf-check Fail Filter Name</b>	Name of the filter applied by the dynamic profile to IPv4 packets that fail the RPF check.
<b>IPv6 rpf-check Fail Filter Name</b>	Name of the filter applied by the dynamic profile to IPv6 packets that fail the RPF check.
<b>DHCP Options</b>	len = number of hex values in the message. The hex values specify the type, length, value (TLV) for DHCP options, as defined in RFC 2132.
<b>Session ID</b>	ID number for a subscriber service session.
<b>Underlying Session ID</b>	For DHCPv6 subscribers on a PPPoE network, displays the session ID of the underlying PPPoE interface.
<b>Service Sessions</b>	Number of service sessions (that is, a service activated using RADIUS CoA) associated with the subscribers.
<b>Service Session Name</b>	Service session profile name.
<b>Session Timeout (seconds)</b>	Number of seconds of access provided to the subscriber before the session is automatically terminated.
<b>Idle Timeout (seconds)</b>	Number of seconds subscriber can be idle before the session is automatically terminated.
<b>IPv6 Delegated Address Pool</b>	Name of the pool used for DHCPv6 prefix delegation.
<b>IPv6 Delegated Network Prefix Length</b>	Length of the prefix configured for the IPv6 delegated address pool.
<b>IPv6 Interface Address</b>	Address assigned by the Framed-Ipv6-Prefix AAA attribute.
<b>IPv6 Framed Interface Id</b>	Interface ID assigned by the Framed-Interface-Id AAA attribute.
<b>ADF IPv4 Input Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.

Table 52: show subscribers Output Fields (*continued*)

Field Name	Field Description
<b>ADF IPv4 Output Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>ADF IPv6 Input Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>ADF IPv6 Output Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>IPv4 Input Filter Name</b>	Name assigned to the IPv4 input filter (client or service session).
<b>IPv4 Output Filter Name</b>	Name assigned to the IPv4 output filter (client or service session).
<b>IPv6 Input Filter Name</b>	Name assigned to the IPv6 input filter (client or service session).
<b>IPv6 Output Filter Name</b>	Name assigned to the IPv6 output filter (client or service session).
<b>IFL Input Filter Name</b>	Name assigned to the logical interface input filter (client or service session).
<b>IFL Output Filter Name</b>	Name assigned to the logical interface output filter (client or service session).

## Sample Output

### show subscribers (IPv4)

```

user@host> show subscribers
Interface          IP Address/VLAN ID  User Name          LS:RI

## show system alarms

<b>Syntax</b>	show system alarms
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Display active system alarms.
<b>Options</b>	This command has no options.
<b>Additional Information</b>	<p>System alarms are preset. They include a <i>configuration</i> alarm that appears when no rescue configuration alarm is set and a <i>license</i> alarm that appears when a software feature is configured and no valid license is configured for the feature. On EX6200 switches, an alarm can be triggered by an internal link error. For more information about system alarms, see the <i>Junos OS Administration Library for Routing Devices</i>.</p> <p>In Junos OS release 11.1 and later, alarms for fans also show the slot number of the malfunctioning fans in the CLI output.</p> <p>Starting with Junos OS Release 13.2, you can view degraded fabric alarms on a routing matrix based on TX Matrix Plus router with 3D SIBs. The alarm indicates that the source FPC is running with a degraded fabric condition. This alarm is an early warning of a possible fabric black-hole condition. When the degraded fabric alarm is raised on the source FPC, you can take remedial action to avoid a fabric black-hole condition. The degraded fabric alarm is raised on the source FPC if both the following conditions are met:</p> <ul style="list-style-type: none"> <li>• The active Packet Forwarding Engine destinations are reachable on one or no active switching planes.</li> <li>• At least one of the inactive switching planes has a fault that causes the destination Packet Forwarding Engine to become unreachable.</li> </ul>
<b>Required Privilege Level</b>	admin
<b>List of Sample Output</b>	<p><a href="#">show system alarms on page 975</a></p> <p><a href="#">show system alarms (Fan Tray) on page 975</a></p> <p><a href="#">show system alarms (QFX Series) on page 975</a></p> <p><a href="#">show system alarms (EX6200) on page 975</a></p> <p><a href="#">show system alarms (TX Matrix Plus router with 3D SIBs) on page 975</a></p>
<b>Output Fields</b>	Table 53 on page 974 lists the output fields for the <b>show system alarms</b> command. Output fields are listed in the approximate order in which they appear.

**Table 53: show system alarms Output Fields**

Field Name	Field Description
Alarm time	Date and time the alarm was first recorded.

Table 53: show system alarms Output Fields (*continued*)

Field Name	Field Description
<b>Class</b>	Severity class for this alarm: <b>Minor</b> or <b>Major</b> .
<b>Description</b>	Information about the alarm.

## Sample Output

### show system alarms

```

user@host> show system alarms
2 alarms currently active
Alarm time          Class    Description
2005-02-24 17:29:34 UTC  Minor    IPsec VPN tunneling usage requires a
license
2005-02-24 17:29:34 UTC  Minor    Rescue configuration is not sent

```

### show system alarms (Fan Tray)

```

user@host> show system alarms
4 alarms currently active
Alarm time          Class    Description
2010-11-11 20:27:38 UTC  Major    Side Fan Tray 7 Failure
2010-11-11 20:27:13 UTC  Minor    Side Fan Tray 7 Overspeed
2010-11-11 20:27:13 UTC  Major    Side Fan Tray 5 Failure
2010-11-11 20:27:13 UTC  Major    Side Fan Tray 0 Failure

```

### show system alarms (QFX Series)

```

user@switch> show system alarms
2 alarms currently active
Alarm time Class Description
2005-02-24 17:29:34 UTC Minor Rescue configuration is not sent

```

### show system alarms (EX6200)

```

user@switch> show system alarms
2 alarms currently active
Alarm time          Class    Description
2013-04-05 16:51:41 PDT  Major    FPC 8 internal link errors detected
2013-04-04 18:05:35 PDT  Minor    Rescue configuration is not set

```

### show system alarms (TX Matrix Plus router with 3D SIBs)

```

user@router> show system alarms

sfc0-re0:
-----
2 alarms currently active
Alarm time          Class    Description
2013-05-08 18:13:58 UTC  Major    LCC 0 Major Errors
2013-05-08 17:48:46 UTC  Major    LCC 7 Major Errors

lcc0-re1:
-----
1 alarm currently active
Alarm time          Class    Description

```

2013-05-08 18:19:24 UTC Major FPC 1 degraded fabric condition detected

lcc7-re0:

-----  
1 alarm currently active

Alarm time	Class	Description
------------	-------	-------------

2013-05-08 18:19:24 UTC	Major	FPC 7 degraded fabric condition detected
-------------------------	-------	------------------------------------------

<b>Syntax (EX Series Switch and MX Series Router)</b>	show system audit <all-members> <local> <member <i>member-id</i> > <root-only>
<b>Syntax (TX Matrix Router)</b>	show system audit <all-lcc   lcc <i>number</i>   scc> <root-only>
<b>Syntax (TX Matrix Plus Router)</b>	show system audit <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <root-only>
<b>Syntax (QFX Series)</b>	show system audit <infrastructure <i>name</i>   interconnect-device <i>name</i>   node-group <i>name</i>   root-only>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Display the state and checksum values for file systems.
<b>Options</b>	<p><b>none</b>—Display the state and checksum values for all file systems.</p> <p><b>all-chassis</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display file system MD5 hash and permissions information for all of the chassis.</p> <p><b>all-lcc</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display file system MD5 hash and permissions information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display file system MD5 hash and permissions information for all T1600 or T4000 routers connected to the TX Matrix Plus router.</p> <p><b>all-members</b>—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on all members of the Virtual Chassis configuration.</p> <p><b>lcc <i>number</i></b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display file system MD5 hash and permissions information for a specific T640 router</p>

that is connected to the TX Matrix router. On a TX Matrix Plus router, display file system MD5 hash and permissions information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**infrastructure *name***—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for a fabric control Routing Engine or a fabric control Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for the Interconnect device.

**local**—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on the local Virtual Chassis member.

**member *member-id***—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for the Node group

**root-only**—(Optional) Check only the root (/) file system. On a QFabric system, you can check the root (/) file system on the infrastructure (fabric manager Routing Engine and fabric control Routing Engine), Interconnect device, or Node group.

**scc**—(TX Matrix routers only) (Optional) Display file system MD5 hash and permissions information for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display file system MD5 hash and permissions information for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**Additional Information** To redirect the output to a file, issue the following command:

***ssh device-name 'show system audit root-only' > output-file***

If you save the output of the **show system audit root-only** command to a file, you can compare it to subsequent output from the command to determine whether anything has changed.

By default, when you issue the **show system audit** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Required Privilege Level	admin

<b>Syntax</b>	show system boot-messages
<b>Syntax (EX Series Switches)</b>	show system boot-messages <all-members> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system boot-messages <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system boot-messages <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system boot-messages <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system boot-messages infrastructure <i>name</i>   interconnect-device <i>name</i>   node-group <i>name</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display initial messages generated by the system kernel upon startup. These messages are the contents of <code>/var/run/dmesg.boot</code> .
<b>Options</b>	<b>none</b> —Display all boot time messages.  <b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display boot time messages for all of the chassis.  <b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for all T640 routers connected to a TX Matrix router. On a TX Matrix Plus router, display boot time messages for all connected T1600 or T4000 LCCs.  <b>all-members</b> —(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on all members of the Virtual Chassis configuration.

**infrastructure *name***—(QFabric systems only) (Optional) Display boot time messages on the fabric control Routing Engine or fabric manager Routing engines.

**interconnect-device *name***—(QFabric systems only) (Optional) Display boot time messages on the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for a specific T640 router connected to a TX Matrix router. On a TX Matrix Plus router, display boot time messages for a specific router connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display boot time messages on the Node group.

**scc**—(TX Matrix routers only) (Optional) Display boot time messages for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display boot time messages for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system boot-messages** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

<b>List of Syntax</b>	<a href="#">Syntax on page 992</a> <a href="#">Syntax (EX Series) on page 992</a> <a href="#">Syntax (TX Matrix Router) on page 992</a> <a href="#">Syntax (TX Matrix Plus Router) on page 992</a> <a href="#">Syntax (MX Series Router) on page 992</a> <a href="#">Syntax (QFX Series) on page 992</a>
<b>Syntax</b>	show system buffers
<b>Syntax (EX Series)</b>	show system buffers <all-members> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system buffers <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system buffers <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system buffers <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system buffers <infrastructure <i>name</i>   interconnect-device <i>name</i>   node-group <i>name</i>   root-only (infrastructure <i>name</i>   interconnect-device <i>name</i>   node-group <i>name</i> )>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display information about the buffer pool that the Routing Engine uses for local traffic. Local traffic is the routing and management traffic that is exchanged between the Routing Engine and the Packet Forwarding Engine within the router or switch, as well as the routing and management traffic from IP (that is, from OSPF, BGP, SNMP, ping operations, and so on).
<b>Options</b>	<b>none</b> —Show all buffer statistics.  <b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show buffer statistics for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, show buffer statistics for all routers connected to the TX Matrix Plus router.  <b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show buffer statistics for all of the chassis.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for all members of the Virtual Chassis configuration.

**infrastructure *name***—(QFabric systems only) (Optional) Show buffer statistics for a fabric control Routing Engine or a fabric control Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Show buffer statistics for the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show buffer statistics for a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, show buffer statistics for a specific router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Show buffer statistics for the Node group

**sfc**—(TX Matrix Plus routers only) (Optional) Show buffer statistics for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system buffers** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

A special type of memory buffer called a *cluster* is 2 KB in size. For more information, see *The Design and Implementation of the 4.4BSD Operation System* by McKusic, Bostic, Karels, and Quarterman.

Output Fields	<a href="#">Table 54 on page 995</a> describes the output fields for the <b>show system buffers</b> command. Output fields are listed in the approximate order in which they appear.

Table 54: show system buffers Output Fields

Field Name	Field Description
<b>mbufs in use</b>	Memory buffers (mbufs) are 128-byte buffers that are used for various purposes inside the kernel. Each memory buffer has a type, and the output itemizes the amount allocated for each type. Types with no memory buffers allocated are not displayed.
<b>mbufs allocated to packet headers</b>	Number of memory buffers currently holding packet headers
<b>mbufs allocated to control blocks</b>	Number of memory buffers currently holding the state for sockets.
<b>mbufs allocated to send data</b>	Number of memory buffers currently holding socket send data.
<b>mbufs allocated to pfe refill data</b>	Number of memory buffers currently holding Packet Forwarding Engine refill data.
<b>mbufs allocated to fxp data</b>	Number of memory buffers currently holding fxp data.
<b>mbufs allocated to socket names and addresses</b>	Number of memory buffers currently holding addresses for sockets.
<b>mbuf clusters in use</b>	Allocation statistics for memory buffer clusters.
<b>allocated to network</b>	Total amount of memory in use by the networking and interprocess communication (IPC) code.
<b>requests for memory denied</b>	Number of times a memory allocation request within the IPC and networking code failed.
<b>requests for memory delayed</b>	Number of times a memory allocation request within the IPC and networking code was postponed.
<b>calls to protocol drain routines</b>	Number of times a memory allocation request within the IPC and networking code triggered a memory reclamation attempt.

## Sample Output

### show system buffers

```

user@host> show system buffers
397/893/1290 mbufs in use (current/cache/total)
395/331/726/30000 mbuf clusters in use (current/cache/total/max)
384/256 mbuf+clusters out of packet secondary zone in use (current/cache)
0/0/0/0 4k (page size) jumbo clusters in use (current/cache/total/max)
0/0/0/0 9k jumbo clusters in use (current/cache/total/max)
0/0/0/0 16k jumbo clusters in use (current/cache/total/max)
889K/885K/1774K bytes allocated to network (current/cache/total)
0/0/0 requests for mbufs denied (mbufs/clusters/mbuf+clusters)
0/0/0 requests for jumbo clusters denied (4k/9k/16k)
0/5/1024 sfbufs in use (current/peak/max)

```

```
0 requests for sbufs denied
0 requests for sbufs delayed
0 requests for I/O initiated by sendfile
0 calls to protocol drain routines
```

#### show system buffers scc (TX Matrix Router)

```
user@host> show system buffers scc
213 mbufs in use:
    11 mbufs allocated to packet headers
    26 mbufs allocated to socket names and addresses
    2 mbufs allocated to socket options
    17 mbufs allocated to socket send data
    2 mbufs allocated to pfe data
    155 mbufs allocated to fxp data (rx)
    511 mbufs allocated to <mbuf type 86>
    256 mbufs allocated to <mbuf type 92>
924/1162 mbuf clusters in use
2788 Kbytes allocated to network (75% in use)
0 requests for memory denied
0 requests for memory delayed
0 calls to protocol drain routines
```

#### show system buffers sfc (TX Matrix Plus Router)

```
user@host> show system buffers sfc 0

sfc0-re0:
-----
4363/2807/7170 mbufs in use (current/cache/total)

## show system certificate

<b>Syntax</b>	<code>show system certificate</code> <code>&lt;certificate-id&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	(Encryption interface on M Series, T Series routers, and QFX Series switches only) Display installed certificates signed by the Juniper Networks certificate authority.
<b>Options</b>	<b>none</b> —Display all installed certificates signed by the Juniper Networks certificate authority.  <b>certificate-id</b> —(Optional) Display the details of a particular certificate.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">show system certificate on page 1000</a> <a href="#">show system certificate (QFX Series) on page 1000</a>
<b>Output Fields</b>	<a href="#">Table 55 on page 999</a> lists the output fields for the <b>show system certificate</b> command. Output fields are listed in the approximate order in which they appear.

**Table 55: show system certificate Output Fields**

Field Name	Field Description
<b>Certificate identifier</b>	Unique identifier associated with a certificate. The certificate identifier is the common name of the subject.
<b>Issuer</b> <b>Subject</b>	Information about the certificate issuer and the distinguished name (DN) of the issuer, respectively: <ul style="list-style-type: none"> <li>• <b>Organization</b>—Name of the owner's organization.</li> <li>• <b>Organizational unit</b>—Name of the owner's department.</li> <li>• <b>Country</b>—Two-character country code in which the owner's system is located.</li> <li>• <b>State</b>—State in the USA in which the owner is using the certificate.</li> <li>• <b>Locality</b>—City in which the owner's system is located.</li> <li>• <b>Common name</b>—Name of the owner of the certificate.</li> <li>• <b>E-mail address</b>—E-mail address of the owner of the certificate.</li> </ul>
<b>Validity</b>	When a certificate is valid.
<b>Signature algorithm</b>	Encryption algorithm applied to the installed certificate.
<b>Public key algorithm</b>	Encryption algorithm applied to the public key.

## Sample Output

### show system certificate

```
user@host> show system certificate
Certificate identifier: Dallas-v3
Issuer:
Organization: Juniper Networks, Organizational unit: Juniper CA,
Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas CA,
E-mail address:ca@juniper.net
Subject:
Organization: Juniper Networks, Organizational unit: Juniper CA,
Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas-v3,
E-mail address:ca@juniper.net
Validity:
Not before: Mar 13 03:23:25 2004 GMT
Not after: Mar 24 03:23:25 2014 GMT
Signature algorithm: sha1WithRSAEncryption
Public key algorithm: dsaEncryption
```

### show system certificate (QFX Series)

```
user@host> show system certificate
Certificate identifier: Dallas-v3

```

## show system commit

<b>Syntax</b>	show system commit <revision> <server>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Option <b>server</b> introduced in Junos OS Release 12.1 for the PTX Series router. Option <b>revision</b> introduced in Junos OS Release 14.1.
<b>Description</b>	Display the system commit history and any pending commit operation.
<b>Options</b>	<p><b>none</b>—Display the last 50 commit operations listed, most recent to first.</p> <p><b>revision</b>—(Optional) Display the revision number of the active configuration of the Routing Engine(s).</p> <p><b>server</b>—(Optional) Display commit server status.</p>
	<div>  <p><b>NOTE:</b> By default, the status of the commit server is “Not running”. The commit server starts running only when a commit job is added to the batch.</p> </div>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">clear system commit on page 354</a></li> <li><a href="#">show system commit revision</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system commit on page 1003</a> <a href="#">show system commit (At a Particular Time) on page 1003</a> <a href="#">show system commit (At the Next Reboot) on page 1003</a> <a href="#">show system commit (Rollback Pending) on page 1003</a> <a href="#">show system commit (QFX Series) on page 1003</a>
<b>Output Fields</b>	Table 56 on page 1001 describes the output fields for the <b>show system commit</b> command. Output fields are listed in the approximate order in which they appear.

Table 56: show system commit Output Fields

Field Name	Field Description	Level of Output
<number>	Displays the last 50 commit operations listed, most recent to first. The identifier <number> designates a configuration created for recovery using the <b>request system configuration rescue save</b> command.	none

Table 56: show system commit Output Fields (*continued*)

Field Name	Field Description	Level of Output
<code>&lt;time-stamp&gt;</code>	Date and time of the commit operation.	none
<code>&lt;root&gt;/&lt;username&gt;</code>	User who executed the commit operation.	none
<code>&lt;method&gt;</code>	<p>Method used to execute the commit operation:</p> <ul style="list-style-type: none"> <li>• <b>CLI</b>—CLI interactive user performed the commit operation.</li> <li>• <b>Junos XML protocol</b>—Junos XML protocol client performed the commit operation.</li> <li>• <b>synchronize</b>—The <b>commit synchronize</b> command was performed on the other Routing Engine.</li> <li>• <b>snmp</b>—An SNMP <b>set</b> request caused the commit operation.</li> <li>• <b>button</b>—A button on the router or switch was pressed to commit a rescue configuration for recovery.</li> <li>• <b>autoinstall</b>—A configuration obtained through autoinstallation was committed.</li> <li>• <b>other</b>—When there is no login name associated with the session, the values for user and client default to root and other. For example, during a reboot after package installation, mgd commits the configuration as a system commit, and there is no login associated with the commit.</li> </ul>	none

## Sample Output

### show system commit

```
user@host> show system commit
0   2003-07-28 19:14:04 PDT by root via other

```

### show system commit (QFX Series)

```
user@switch> show system commit
0 2011-11-25 19:17:49 PST by root via cli
```

## show system configuration archival

---

**Syntax**    show system configuration archival

**Release Information**    Introduced in Junos OS Release 7.6.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Display directory and number of files queued for archival transfer.

**NOTE:** The [edit system configuration] hierarchy is not available on QFabric systems.

---

**Options**    This command has no options.

**Required Privilege Level**    maintenance

**List of Sample Output**    [show system configuration archival on page 1004](#)

### Sample Output

show system configuration archival

```
user@host> show system configuration archival

/var/transfer/config/:
total 8
```

## show system configuration rescue

<b>Syntax</b>	show system configuration rescue
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display a rescue configuration, if one exists.
<div>  <b>NOTE:</b> The [edit system configuration] hierarchy is not available on QFabric systems. </div>	
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show system configuration archival on page 1004</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system configuration rescue on page 1005</a>

## Sample Output

## show system connections

<b>List of Syntax</b>	<a href="#">Syntax on page 1007</a> <a href="#">Syntax (EX Series) on page 1007</a> <a href="#">Syntax (TX Matrix Router) on page 1007</a> <a href="#">Syntax (TX Matrix Plus Router) on page 1007</a> <a href="#">Syntax (MX Series Router) on page 1007</a> <a href="#">Syntax (QFX Series) on page 1007</a>
<b>Syntax</b>	<pre>show system connections &lt;extensive&gt; &lt;all-chassis   all-lcc   lcc <i>number</i>   scc&gt; &lt;inet   inet6&gt; &lt;show-routing-instances&gt;</pre>
<b>Syntax (EX Series)</b>	<pre>show system connections &lt;extensive&gt; &lt;all-members&gt; &lt;inet   inet6&gt; &lt;local&gt; &lt;member <i>member-id</i>&gt; &lt;show-routing-instances&gt;</pre>
<b>Syntax (TX Matrix Router)</b>	<pre>show system connections &lt;extensive&gt; &lt;all-chassis   all-lcc   lcc <i>number</i>   scc&gt; &lt;inet   inet6&gt; &lt;show-routing-instances&gt;</pre>
<b>Syntax (TX Matrix Plus Router)</b>	<pre>show system connections &lt;extensive&gt; &lt;all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i>&gt; &lt;inet   inet6&gt; &lt;show-routing-instances&gt;</pre>
<b>Syntax (MX Series Router)</b>	<pre>show system connections &lt;extensive&gt; &lt;all-members&gt; &lt;inet   inet6&gt; &lt;local&gt; &lt;member <i>member-id</i>&gt; &lt;show-routing-instances&gt;</pre>
<b>Syntax (QFX Series)</b>	<pre>show system connections &lt;extensive&gt; &lt;inet&gt; &lt;infrastructure <i>name</i>&gt; &lt;interconnect-device <i>name</i>&gt; &lt;node-group <i>name</i>&gt; &lt;show-routing-instances&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p>

**sfc** option introduced for the TX Matrix Plus router in Junos OS Release 9.6.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display information about the active IP sockets on the Routing Engine. Use this command to verify which servers are active on a system and what connections are currently in progress.

**Options** **none**—Display information about all active IP sockets on the Routing Engine.

**extensive**—(Optional) Display exhaustive system process information, which, for TCP connections, includes the TCP control block. This option is useful for debugging TCP connections.

**all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system connection activity for all the routers in the chassis.

**all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system connection activity for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system connection activity for all connected T1600 or T4000 LCCs

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for all members of the Virtual Chassis configuration.

**inet | inet6**—(Optional) Display IPv4 connections or IPv6 connections, respectively.

**infrastructure name**—(QFabric systems only) (Optional) Display system connection activity for the fabric control Routing Engines or fabric manager Routing Engines.

**interconnect-device name**—(QFabric systems only) (Optional) Display system connection activity for the Interconnect device.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system connection activity for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system connection activity for a specific router that is connected to the TX Matrix Plus router. Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display system connection activity for the Node group.

**scc**—(TX Matrix routers only) (Optional) Display system connection activity for the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix routers only) (Optional) Display system connection activity for the TX Matrix Plus router.

**show-routing-instances**—(Optional) Display routing instances.

**Additional Information** By default, when you issue the **show system connections** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** [Table 57 on page 1009](#) describes the output fields for the **show system connections** command. Output fields are listed in the approximate order in which they appear.

**Table 57: show system connections Output Fields**

Field Name	Field Description
<b>Proto</b>	Protocol of the socket: IP, TCP, or UDP for IPv4 or IPv6.
<b>Recv-Q</b>	Number of input packets received by the protocol and waiting to be processed by the application.
<b>Send-Q</b>	Number of output packets sent by the application and waiting to be processed by the protocol.

Table 57: show system connections Output Fields (*continued*)

Field Name	Field Description
Local Address	Local address and port of the socket, separated by a period. An asterisk (*) indicates that the bound address is the wildcard address. Server sockets typically have the wildcard address and a well-known port bound to them.
Foreign Address	Foreign address and port of the socket, separated by a period. An asterisk (*) indicates that the address or port is a wildcard.
Routing Instance	(Displayed only when the <b>show-routing-instance</b> option is used.) Routing instances associated with active IP sockets on the Routing Engine.
(state)	For TCP, the protocol state of the socket.

## Sample Output

<b>Release Information</b>	Command introduced before Junos OS Release 8.5. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. <b>re0</b> , <b>re1</b> , and <b>routing-engine</b> options introduced for dual routing engines in Junos OS Release 13.1.

**Description** Show core files on all routers or switches running Junos OS. You can use the **show system core-dumps** command to show a list of system core files created when the router or switch has failed. This command can be useful for diagnostic purposes. Each list item includes the file permissions, number of links, owner, group, size, modification date, and path and filename. If dual routing engines are present, you can view core-dump files for either routing engine or both routing engines together. On a QFabric system, you can view core-dump files on individual QFabric system devices as well as on the entire QFabric system.

You can use the option **core-filename** and its options **core-file-info**, **brief**, and **detail** to display more information about the specified core-dump files.

**Options** **none**—Display a list of all existing core-dump files.

**NOTE:** If dual routing engines are present, lists only the core-dump files for the active routing engine.

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a routing matrix based on a TX Matrix router, display system core files for the TX Matrix router switch-card chassis [SCC] and all the T640 routers [LCCs] connected to the TX Matrix router.

On a routing matrix based on a TX Matrix Plus router, display system core files for the TX Matrix Plus router (switch-fabric chassis [SFC]) and all the T1600 routers [LCCs] connected to the TX Matrix Plus router.

**<all-lcc | lcc number>**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a routing matrix based on the TX Matrix router, display core dump files for all T640 routers (line-card chassis [LCCs]) or a specific T640 router [LCC] connected to the TX Matrix router.

On a routing matrix based on the TX Matrix Plus router, display logging information for all T1600 routers (line-card chassis [LCCs]) or a specific T1600 router (LCC) connected to the TX Matrix Plus router. When using the **lcc number** option, replace **number** with a value from 0 through 3.

**NOTE:** The **all-chassis** option displays system core files for the SCC or SFC and the LCCs connected to the SCC or SFC in the routing matrix while the **all-lcc** option only displays system core files for the LCCs in the routing matrix.

**all-members**—(EX4200 switches) (Optional) Display system core files on all members of the Virtual Chassis configuration.

**brief**—(Optional) View details of a binary file.

**component** (*UUID | serial number | all*)—(QFabric systems only) (Optional) Display a list of core-dump files located on individual QFabric system device or on the entire QFabric system.

**core-file-info**—(Optional) Display the stack trace of a core file.

**core-filename**—(Optional) Name of a specific core file to display.

**detail**—(Optional) View stack trace with details of the binary file.

**display-order** (*timestamp-sort | alphanumeric-sort*)—(QFabric systems only) (Optional) Display list of debug artifacts generated within the specified period—for example, within the last hour, within the last 20 minutes, or within the last 32 seconds—or according to their filename.

**display-period** (*hours | minutes | seconds*)—(QFabric systems only) (Optional) Display core-dump files generated within the specified period—for example, within the last hour, within the last 20 minutes, or within the last 32 seconds.

**kernel-crashinfo component** (*UUID | serial number*)—(QFabric systems only) (Optional) Display kernel crash information from the EEPROM on a QFabric system device.

**local**—(EX4200 switches only) (Optional) Display system core files on the local Virtual Chassis member.

**member** *member-id*—(EX4200 switches only) (Optional) Display system core files on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

**re0**—(Dual routing engines only) Display the core-dump files on re0.

**re1**—(Dual routing engines only) Display the core-dump files on re1.

**repository** (*core | log*)—(QFabric systems only) (Optional) Specify either the core or log repository in which to view core-dump files.

**routing-engine** (*backup | both | local | master | other*)—(Dual routing engines only) Display a list of core-dump files for either the backup, local, master, or other routing engine or both routing engines.

**scc**—(TX Matrix routers only) (Optional) Display system core files on the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus routers only) (Optional) Display system core files on the TX Matrix Plus router (or switch-fabric chassis).

**Required Privilege Level**

**Output Fields** Table 58 on page 1029 describes the output fields for the **show system core-dumps** command. Output fields are listed in the approximate order in which they appear.

**Table 58: show system core-dumps Output Fields**

Field Name	Field Description
<i>Permissions</i>	Read/write permissions for the file named.
<i>Links</i>	Number of links to the file.
<i>Owner</i>	Name of the file owner.
<i>Group</i>	Name of the group with file access.
<i>File size</i>	File size in bytes.
<i>Modified</i>	Last file modification date and time.
<i>Path/filename</i>	File path where the file resides and the filename.
<b>Repository scope:</b>	Repository where core-dump files and log files are stored. The core-dump files are located in the <b>core</b> repository, and the log files are located in the <b>log</b> repository. The default <b>Repository scope</b> is shared since both the <b>core</b> and <b>log</b> repositories are shared by all of the QFabric system devices.
<b>Repository head:</b>	Path to the top-level repository location.
<b>Repository name:</b>	Name of the repository: <b>core</b> or <b>log</b> .
<b>List of nodes for core repository:</b>	List of core-dump files associated with a particular QFabric system device located in the core repository.
<b>Node Group</b>	Name of the QFabric system device.
<b>Node Identifier</b>	UUID or serial number of the QFabric system device.
<b>Num</b>	Number of core-dump and log files.

Table 58: show system core-dumps Output Fields (*continued*)

Field Name	Field Description
<b>Model</b>	Model number of the QFabric system device.
<b>Usage</b>	Usage of the repository in megabytes.
<b>Total usage of core repository:</b>	Total usage of core-dump files associated with a particular QFabric system device located in the core repository. Usage is specified in megabytes and as a percentage.
<b>Total usage of log repository:</b>	Total usage of log files associated with a particular QFabric system device located in the log repository. Usage is specified in megabytes and as a percentage.
<b>List of nodes for core repository:</b>	List of core-dump files associated with a particular QFabric system device located in the core repository.
<b>List of nodes for log repository:</b>	List of log files associated with a particular QFabric system device located in the log repository.
<b>Filename</b>	Name of the core-dump file.
<b>Date</b>	Last core-dump file modification date and time.
<b>Size</b>	Size of the core-dump file.
<b>Core filename</b>	Filename of the core-dump file.
<b>Process name</b>	Name of the process that is generating a core-dump file or log file.
<b>Release</b>	Junos OS release.
<b>Build server</b>	Junos OS build server.
<b>Build date</b>	Junos OS build date.
<b>Stack trace</b>	Stack trace of the core-dump file.

## Sample Output

### show system core-dumps

This example shows the command output if core files exist.

```
user@switch> show system core-dumps
-rw----- 1 root wheel 268369920 Jun 18 17:59 /var/crash/vmcore.0
-rw-rw---- 1 root field 3371008 Jun 18 17:53 /var/tmp/rpd.core.0
-rw-r--r-- 1 root wheel 27775914 Jun 18 17:59 /var/crash/kernel.0
```

### show system core-dumps

This example shows the command output if core files do not exist.

```
user@host> show system core-dumps
/var/crash/*core*: No such file or directory
/var/tmp/*core*: No such file or directory

<b>List of Syntax</b>	<a href="#">Syntax on page 1040</a> <a href="#">Syntax (EX Series) on page 1040</a> <a href="#">Syntax (TX Matrix Router) on page 1040</a> <a href="#">Syntax (TX Matrix Plus Router) on page 1040</a> <a href="#">Syntax (MX Series Router) on page 1040</a> <a href="#">Syntax (QFX Series) on page 1040</a>
<b>Syntax</b>	show system directory-usage <depth <i>number</i> > <path>
<b>Syntax (EX Series)</b>	show system directory-usage <all-members> <depth <i>number</i> > <local> <member <i>member-id</i> > <path>
<b>Syntax (TX Matrix Router)</b>	show system directory-usage <all-chassis   all-lcc   lcc <i>number</i>   scc> <depth <i>number</i> > <path>
<b>Syntax (TX Matrix Plus Router)</b>	show system directory-usage <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <depth <i>number</i> > <path>
<b>Syntax (MX Series Router)</b>	show system directory-usage <all-members> <depth <i>number</i> > <local> <member <i>member-id</i> > <path>
<b>Syntax (QFX Series)</b>	show system directory-usage <depth <i>number</i> > <path> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display directory usage information.
<b>Options</b>	none—Display all directory usage information.

**all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display directory usage information about all the T640 routers (in a routing matrix based on a TX Matrix router). Display directory usage information about all the T1600 or T4000 routers (in a routing matrix based on a TX Matrix Plus router) in the chassis.

**all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display directory information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display directory information for all connected T1600 or T4000 LCCs.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display directory information for all members of the Virtual Chassis configuration.

**depth *number***—(Optional) Depth of the directory to traverse. This option is useful when you want to limit the output shown for a large file system.

**infrastructure *name***— (QFabric systems only) (Optional) Display directory information for the fabric control Routing Engines and fabric manager Routing Engines.

**interconnect-device *name***— (QFabric systems only) (Optional) Display directory information for the Interconnect device.

**node-group *name***— (QFabric systems only) (Optional) Display directory information for the Node group.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display directory information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display directory information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display directory information for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display directory information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

***path***—(Optional) Path or root directory to traverse.

**scc**—(TX Matrix router only) (Optional) Display directory information for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display directory information for the TX Matrix Plus router. Replace *number* with 0.

```

## show system license

<b>Syntax</b>	<code>show system license</code> <code>&lt;installed   keys   usage&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 13.3 for the MX104 3D Universal Edge Routers.
<b>Description</b>	Display licenses and information about how they are used.
<b>Options</b>	<p><b>none</b>—Display all license information.</p> <p><b>installed</b>—(Optional) Display installed licenses only.</p> <p><b>keys</b>—(Optional) Display a list of license keys. Use this information to verify that each expected license key is present.</p> <p><b>usage</b>—(Optional) Display the state of licensed features.</p>
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">show system license on page 1045</a> <a href="#">show system license installed on page 1046</a> <a href="#">show system license keys on page 1046</a> <a href="#">show system license usage on page 1046</a> <a href="#">show system license (MX104 Routers) on page 1046</a> <a href="#">show system license installed (MX104 Routers) on page 1047</a> <a href="#">show system license keys (MX104 Routers) on page 1047</a> <a href="#">show system license usage (MX104 Routers) on page 1047</a> <a href="#">show system license (MX104 Routers) on page 1047</a> <a href="#">show system license installed (MX104 Routers) on page 1048</a> <a href="#">show system license keys (MX104 Routers) on page 1048</a> <a href="#">show system license usage (MX104 Routers) on page 1048</a> <a href="#">show system license (MX104 Routers) on page 1049</a> <a href="#">show system license installed (MX104 Routers) on page 1049</a> <a href="#">show system license keys (MX104 Routers) on page 1049</a> <a href="#">show system license usage (MX104 Routers) on page 1050</a> <a href="#">show system license (QFX Series) on page 1050</a>
<b>Output Fields</b>	Table 60 on page 1044 lists the output fields for the <b>show system license</b> command. Output fields are listed in the approximate order in which they appear.

Table 60: show system license Output Fields

Field Name	Field Description
<b>Feature name</b>	Name assigned to the configured feature. You use this information to verify that all the features for which you installed licenses are present.

Table 60: show system license Output Fields (*continued*)

Field Name	Field Description
<b>Licenses used</b>	<p>Number of licenses used by a router or switch. You use this information to verify that the number of licenses used matches the number configured. If a licensed feature is configured, the feature is considered used.</p> <p><b>NOTE:</b> In Junos OS Release 10.1 and later, the <b>Licenses used</b> column displays the actual usage count based on the number of active sessions or connections as reported by the corresponding feature daemons. This is applicable for scalable license-based features such as Subscriber Access (<b>scale-subscriber</b>), L2TP (<b>scale-l2tp</b>), Mobile IP (<b>scale-mobile-ip</b>), and so on.</p>
<b>Licenses installed</b>	<p>Information about the installed license key:</p> <ul style="list-style-type: none"> <li>• <b>License identifier</b>—Identifier associated with a license key.</li> <li>• <b>State</b>—State of the license key: <b>valid</b> or <b>invalid</b>. An <b>invalid</b> state indicates that the key was entered incorrectly or is not valid for the specific device.</li> <li>• <b>License version</b>—Version of a license. The version indicates how the license is validated, the type of signature, and the signer of the license key.</li> <li>• <b>Valid for device</b>—Device that can use a license key.</li> <li>• <b>Group defined</b>—Group membership of a device.</li> <li>• <b>Features</b>—Feature associated with a license, such as data link switching (DLSw).</li> </ul>
<b>Licenses needed</b>	Number of licenses required for features being used but not yet properly licensed.
<b>Expiry</b>	Amount of time left within the grace period before a license is required for a feature being used.

## Sample Output

### show system license

```
user@host> show system license
```

```
License usage:
```

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
subscriber-accounting	2	2	0	permanent
subscriber-authentication	1	2	0	permanent
subscriber-address-assignment	2	2	0	permanent
subscriber-vlan	2	2	0	permanent
subscriber-ip	0	2	0	permanent
scale-subscriber	2	3	0	permanent
scale-l2tp	4	5	0	permanent
scale-mobile-ip	1	2	0	permanent

```
Licenses installed:
```

```
License identifier: XXXXXXXXXX
```

```
License version: 2
```

```
Features:
```

```
subscriber-accounting - Per Subscriber Radius Accounting
permanent
subscriber-authentication - Per Subscriber Radius Authentication
permanent
subscriber-address-assignment - Radius/SRC Address Pool Assignment
permanent
subscriber-vlan - Dynamic Auto-sensed Vlan
```

```

permanent
subscriber-ip    - Dynamic and Static IP
permanent

```

### show system license installed

```

user@host> show system license installed
License identifier: XXXXXXXXXX
License version: 2
Features:
  subscriber-accounting - Per Subscriber Radius Accounting
  permanent
  subscriber-authentication - Per Subscriber Radius Authentication
  permanent
  subscriber-address-assignment - Radius/SRC Address Pool Assignment
  permanent
  subscriber-vlan - Dynamic Auto-sensed Vlan
  permanent
  subscriber-ip - Dynamic and Static IP
  permanent

```

### show system license keys

```

user@host> show system license keys
XXXXXXXXXX xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxx

```

### show system license usage

```

user@host> show system license usage
License usage:

```

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
subscriber-accounting	2	2	0	permanent
subscriber-authentication	1	2	0	permanent
subscriber-address-assignment	2	2	0	permanent
subscriber-vlan	2	2	0	permanent
subscriber-ip	0	2	0	permanent
scale-subscriber	2	3	0	permanent
scale-l2tp	4	5	0	permanent
scale-mobile-ip	1	2	0	permanent

### show system license (MX104 Routers)

In the following output, ports 0 and 1 are activated by installing the license to activate the first two built-in ports.

```

user@host> show system license
License usage:

```

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
scale-subscriber	0	1000	0	permanent
scale-l2tp	0	1000	0	permanent
scale-mobile-ip	0	1000	0	permanent
MX104-2x10Gig-port-0-1	0	1	0	permanent

```

Licenses installed:
License identifier: XXXXXXXXXX
License version: 2
Features:

```

```

MX104-2x10Gig-port-0-1 - MX104 2X10Gig Builtin Port(xe-2/0/0 & xe-2/0/1)
upgrade
    permanent

```

### show system license installed (MX104 Routers)

In the following output, ports 0 and 1 are activated by installing the license to activate the first two built-in ports.

```

user@host > show system license installed
License identifier: XXXXXXXXXX
License version: 2
Features:
MX104-2x10Gig-port-0-1 - MX104 2X10Gig Builtin Port(xe-2/0/0 & xe-2/0/1)
upgrade
    permanent

```

### show system license keys (MX104 Routers)

In the following output, ports 0 and 1 are activated by installing the license to activate the first two built-in ports.

```

user@host > show system license keys

XXXXXXXXXX xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxx

```

### show system license usage (MX104 Routers)

In the following output, ports 0 and 1 are activated by installing the license to activate the first two built-in ports.

```

user@host > show system license usage

```

Feature name	Licenses used	Licenses installed	Expiry needed	
scale-subscriber	0	1000	0	permanent
scale-l2tp	0	1000	0	permanent
scale-mobile-ip	0	1000	0	permanent
MX104-2x10Gig-port-0-1	0	1	0	permanent

### show system license (MX104 Routers)

In the following output, ports 2 and 3 are activated by installing the license to activate the next two built-in ports after installing the license to activate the first two built-in ports.

```

user@host > show system license
License usage:

```

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
scale-subscriber	0	1000	0	permanent
scale-l2tp	0	1000	0	permanent
scale-mobile-ip	0	1000	0	permanent
MX104-2x10Gig-port-0-1	0	1	0	permanent
MX104-2x10Gig-port-2-3	0	1	0	permanent

```

Licenses installed:
License identifier: XXXXXXXXXX
License version: 2

```

```

Features:
  MX104-2x10Gig-port-0-1 - MX104 2X10Gig Builtin Port(xe-2/0/0 & xe-2/0/1)
upgrade
  permanent

License identifier: XXXXXXXXXX
License version: 2
Features:
  MX104-2x10Gig-port-2-3 - MX104 2X10Gig Builtin Port(xe-2/0/2 & xe-2/0/3)
upgrade
  permanent

```

### show system license installed (MX104 Routers)

In the following output, ports 2 and 3 are activated by installing the license to activate the next two built-in ports after installing the license to activate the first two built-in ports.

```

user@host > show system license installed
License identifier: XXXXXXXXXX
License version: 2
Features:
  MX104-2x10Gig-port-0-1 - MX104 2X10Gig Builtin Port(xe-2/0/0 & xe-2/0/1)
upgrade
  permanent

License identifier: XXXXXXXXXX
License version: 2
Features:
  MX104-2x10Gig-port-2-3 - MX104 2X10Gig Builtin Port(xe-2/0/2 & xe-2/0/3)
upgrade

<wide>

<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Option <b>sfc</b> introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display information about software processes that are running on the router or switch and that have controlling terminals.
<b>Options</b>	<p><b>none</b>—Display standard information about system processes.</p> <p><b>brief   detail   extensive   summary</b>—(Optional) Display the specified level of detail.</p> <p><b>adaptive-services</b>—(Optional) Display the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.</p> <p><b>alarm-control</b>—(Optional) Display the process to configure the system alarm.</p> <p><b>all-chassis</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display standard system process information about all the T640 routers (in a routing matrix based on the TX Matrix router) or all the T1600 or T4000 routers (in a routing matrix based on the TX Matrix Plus router) in the chassis.</p> <p><b>all-lcc</b>—(TX Matrix routers and TX Matrix Plus router only) (Optional) Display standard system process information for all T640 routers (or line-card chassis) connected to the TX Matrix router. Display standard system process information for all connected T1600 or T4000 LCCs.</p> <p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for all members of the Virtual Chassis configuration.</p> <p><b>ancpd-service</b>—Display the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.</p> <p><b>application-identification</b>—Display the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.</p> <p><b>audit-process</b>—(Optional) Display the RADIUS accounting process.</p> <p><b>auto-configuration</b>—Display the Interface Auto-Configuration process.</p> <p><b>bootp</b>—Display the process that enables a router, switch, or interface to act as a Dynamic Host Configuration Protocol (DHCP) or bootstrap protocol (BOOTP) relay agent. DHCP relaying is disabled.</p> <p><b>captive-portal-content-delivery</b>—Display the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.</p>

- ce-l2tp-service**—(Optional) (M10, M10i, M7i, and MX Series routers only) Display the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.
- cfm**—Display Ethernet Operations, Administration, and Maintenance (OAM) connectivity fault management (CFM) process, which can be used to monitor the physical link between two switches.
- chassis-control**—(Optional) Display the chassis management process.
- class-of-service**—(Optional) Display the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.
- clksyncd-service**—Display the external clock synchronization process, which uses synchronous Ethernet (SyncE).
- craft-control**—Display the process for the I/O of the craft interface.
- database-replication**—(EX Series switches and MX Series routers only) (Optional) Display the database replication process.
- datapath-trace-service**—Display the packet path tracing process.
- dhcp-service**—(EX Series switches and MX Series routers only) (Optional) Display the Dynamic Host Configuration Protocol process, which enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.
- diameter-service**—(Optional) Display the diameter process.
- disk-monitoring**—(Optional) Display the disk monitoring process, which checks the health of the hard disk drive on the Routing Engine.
- dynamic-flow-capture**—(Optional) Display the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.
- ecc-error-logging**—(Optional) Display the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.
- ethernet-connectivity-fault-management**—Display the process that provides IEEE 802.1ag OAM connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.
- ethernet-link-fault-management**—(EX Series switches and MX Series routers only) (Optional) Display the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.
- event-processing**—(Optional) Display the event process (eventd).
- firewall**—(Optional) Display the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

**general-authentication-service**—(EX Series switches and MX Series routers only)  
(Optional) Display the general authentication process.

**health (pid *process-identifier* | process-name *process-name*)**—(Optional) Display process health information, either by process id (PID) or by process name.

**iccp-service**—Display the Inter-Chassis Communication Protocol (ICCP) process.

**idp-policy**—Display the intrusion detection and prevention (IDP) protocol process.

**ilmi**—Display the Integrated Local Management Interface (ILMI) protocol process, which provides bidirectional exchange of management information between two ATM interfaces across a physical connection.

**inet-process**—Display the IP multicast family process.

**init**—Display the process that initializes the USB modem.

**interface-control**—(Optional) Display the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

**kernel-replication**—(Optional) Display the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

**l2-learning**—(Optional) Display the Layer 2 address flooding and learning process.

**l2cpd-service**—Display the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

**lACP**—(Optional) Display the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display standard system process information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display standard system process information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for the local Virtual Chassis member.

**local-policy-decision-function**—Display the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

**logical-system-mux**—Display the logical router multiplexer process (lrmuxd), which manages the multiple instances of the routing protocols process (rpd) on a machine running logical routers.

**mac-validation**—Display the MAC validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**mib-process**—(Optional) Display the MIB II process, which provides the router's MIB II agent.

**mobile-ip**—(Optional) Display the Mobile IP process, which configures Junos OS Mobile IP features.

**mountd-service**—(EX Series switches and MX Series routers only) (Optional) Display the service for NFS mounts requests.

**mpls-traceroute**—(Optional) Display the MPLS Periodic Traceroute process.

**mspd**—(Optional) Display the Multiservice process.

**multicast-snooping**—(EX Series switches and MX Series routers only) (Optional) Display the multicast snooping process, which makes Layer 2 devices such as VLAN switches aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

**named-service**—(Optional) Display the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

**neighbor-liveness**—Display the process, which specifies the maximum length of time that the router waits for its neighbor to re-establish an LDP session.

**nfsd-service**—(Optional) Display the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

**ntp**—Display the Network Time Protocol (NTP) process, which provides the mechanisms to synchronize time and coordinate time distribution in a large, diverse network.

**packet-triggered-subscribers**—Display the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

**peer-selection-service**—(Optional) Display the Peer Selection Service process.

**periodic-packet-services**—Display the Periodic packet management process, which is responsible for processing a variety of time-sensitive periodic tasks so that other processes can more optimally direct their resources.

**pfe**—Display the Packet Forwarding Engine management process.

**pgcp-service**—(Optional) Display the pgcpd service process running on the Routing Engine.

**pgm**—Display the Pragmatic General Multicast (PGM) protocol process, which enables a reliable transport layer for multicast applications.

**pic-services-logging**—(Optional) Display the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

**ppp**—(Optional) Display the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

**ppp-service**—Display the Universal edge PPP process, which is the encapsulation protocol process for transporting IP traffic across universal edge routers.

**pppoe**—(Optional) Display the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

**process-monitor**—Display the process health monitor process (pmond).

**providers**—(Optional) Display provider processes.

**redundancy-interface-process**—(Optional) Display the ASP redundancy process.

**remote-operations**—(Optional) Display the remote operations process, which provides the ping and traceroute MIBs.

**resource-cleanup**—Display the resource cleanup process.

**resource-limits (brief | detail) process-name**—(Optional) Display process resource limits.

**routing**—(Optional) Display the routing protocol process.

**sampling**—(Optional) Display the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

**sbc-configuration-process**—Display the session border controller (SBC) process of the border signaling gateway (BSG).

**scc**—(TX Matrix routers only) (Optional) Display standard system process information for the TX Matrix router (or switch-card chassis).

**sdk-service**—Display the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

**secure-neighbor-discovery**—(EX Series switches and MX Series routers only) (Optional) Display the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

**send**—(Optional) Display the Secure Neighbor Discovery Protocol (SEND) process, which provides support for protecting Neighbor Discovery Protocol (NDP) messages.

**service-deployment**—(Optional) Display the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

**sfc number**—(TX Matrix Plus routers only) (Optional) Display system process information for the TX Matrix Plus router. Replace *number* with 0.

**snmp**—Display the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

**sonet-aps**—Display the SONET Automatic Protection Switching (APS) process, which monitors any SONET interface that participates in APS.

**static-subscribers**—(Optional) Display the Static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

**tunnel-oamd**—(Optional) Display the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

**vrrp**—(EX Series switches and MX Series routers only) (Optional) Display the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

**watchdog**—Display the watchdog timer process, which enables the watchdog timer when Junos OS encounters a problem.

**wide**—(Optional) Display process information that might be wider than 80 columns.

**Additional Information** By default, when you issue the **show system processes** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise,

if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields**

[Table 61 on page 1058](#) describes the output fields for the **show system processes** command. Output fields are listed in the approximate order in which they appear.

**Table 61: show system processes Output Fields**

Field Name	Field Description	Level of Output
last pid	Last process identifier assigned to the process.	brief extensive summary
load averages	Three load averages followed by the current time.	brief extensive summary
processes	Number of existing processes and the number of processes in each state ( <b>sleeping</b> , <b>running</b> , <b>starting</b> , <b>zombies</b> , and <b>stopped</b> ).	brief extensive summary
Mem	Information about physical and virtual memory allocation.	brief extensive summary
Swap	Information about physical and virtual memory allocation.	brief extensive summary
PID	Process identifier.	detail extensive summary
TT	Control terminal name.	none detail

Table 61: show system processes Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>STAT</b>	<p>Symbolic process state. The state is given by a sequence of letters. The first letter indicates the run state of the process:</p> <ul style="list-style-type: none"> <li>• <b>D</b>—In disk or other short-term, uninterruptible wait</li> <li>• <b>I</b>—Idle (sleeping longer than about 20 seconds)</li> <li>• <b>R</b>—Runnable</li> <li>• <b>S</b>—Sleeping for less than 20 seconds</li> <li>• <b>T</b>—Stopped</li> <li>• <b>Z</b>—Dead (zombie)</li> <li>• <b>+</b> —The process is in the foreground process group of its control terminal.</li> <li>• <b>&lt;</b>—The process has raised CPU scheduling priority.</li> <li>• <b>&gt;</b>—The process has specified a soft limit on memory requirements and is currently exceeding that limit; such a process is not swapped.</li> <li>• <b>A</b>—The process requested random page replacement.</li> <li>• <b>E</b>—The process is trying to exit.</li> <li>• <b>L</b>—The process has pages locked in core.</li> <li>• <b>N</b>—The process has reduced CPU scheduling priority.</li> <li>• <b>S</b>—The process requested first-in, first-out (FIFO) page replacement.</li> <li>• <b>s</b>—The process is a session leader.</li> <li>• <b>V</b>—The process is temporarily suspended.</li> <li>• <b>W</b>—The process is swapped out.</li> <li>• <b>X</b>—The process is being traced or debugged.</li> </ul>	none <b>detail</b>
<b>UID</b>	User identifier.	<b>detail</b>
<b>USERNAME</b>	Process owner.	<b>extensive summary</b>
<b>PPID</b>	Parent process identifier.	<b>detail</b>
<b>CPU</b>	<p>(D)—Short-term CPU usage.</p> <p>(E and S)—Raw (unweighted) CPU usage. The value of this field is used to sort the processes in the output.</p>	<b>detail extensive summary</b>
<b>RSS</b>	Resident set size.	<b>detail</b>
<b>WCHAN</b>	Symbolic name of the wait channel.	<b>detail</b>
<b>STARTED</b>	Local time when the process started running.	<b>detail</b>
<b>PRI</b>	Current priority of the process. A lower number indicates a higher priority.	<b>detail extensive summary</b>
<b>NI or NICE</b>	UNIX "niceness" value. A lower number indicates a higher priority.	<b>detail extensive summary</b>
<b>SIZE</b>	Total size of the process (text, data, and stack), in kilobytes.	<b>extensive summary</b>

Table 61: show system processes Output Fields (*continued*)

Field Name	Field Description	Level of Output
RES	Current amount of resident memory, in kilobytes.	extensive summary
STATE	Current state of the process (for example, <b>sleep</b> , <b>wait</b> , <b>run</b> , <b>idle</b> , <b>zombie</b> , or <b>stop</b> ).	extensive summary
TIME	(S)—Number of system and user CPU seconds that the process has used.  (None, D, and E)—Total amount of time that the command has been running.	detail extensive summary
WCPU	Weighted CPU usage.	extensive summary
COMMAND	Command that is currently running.	detail extensive summary
THR	Number of threads in the process	extensive

## show system reboot

---

<b>List of Syntax</b>	<a href="#">Syntax on page 1078</a> <a href="#">Syntax (EX Series Switches) on page 1078</a> <a href="#">Syntax (TX Matrix Router) on page 1078</a> <a href="#">Syntax (TX Matrix Plus Router) on page 1078</a> <a href="#">Syntax (MX Series Router) on page 1078</a> <a href="#">Syntax (QFX Series) on page 1078</a>
<b>Syntax</b>	show system reboot <both-routing-engines>
<b>Syntax (EX Series Switches)</b>	show system reboot <all-members> <both-routing-engines> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system reboot <all-chassis   all-lcc   lcc <i>number</i>   scc> <both-routing-engines>
<b>Syntax (TX Matrix Plus Router)</b>	show system reboot <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <both-routing-engines>
<b>Syntax (MX Series Router)</b>	show system reboot <all-members> <both-routing-engines> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system reboot <both-routing-engines> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-device <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display pending system reboots or halts.
<b>Options</b>	<b>none</b> —Display pending reboots or halts on the active Routing Engine.  <b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display halt or reboot request information for all the T640 routers in the chassis that are connected to the TX Matrix router. On a TX Matrix router, display halt or reboot request information for all the T1600 or T4000 routers in the chassis that are connected to the TX Matrix Plus router.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for all members of the Virtual Chassis configuration.

**all-lcc**—(TX Matrix routers and TX Matrix Plus router only) (Optional) On a TX Matrix router, display system halt or reboot request information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for all connected T1600 or T4000 LCCs.

**both-routing-engines**—(Systems with multiple Routing Engines) (Optional) Display halt or reboot request information on both Routing Engines.

**infrastructure *name***—(QFabric systems only) (Optional) Display reboot request information on the fabric manager Routing Engines and fabric control Routing Engines.

**interconnect-device *name***—(QFabric systems only) (Optional) Display reboot request information on the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display halt or reboot request information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display reboot request information on the Node group.

**scc**—(TX Matrix router only) (Optional) Display halt or reboot request information for the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus router only) (Optional) Display halt or reboot request information for the TX Matrix Plus router.

**Additional Information** By default, when you issue the **show system reboot** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

[process id 17885]
```

### [show system reboot all-lcc \(TX Matrix Router\)](#)

```
user@host> show system reboot all-lcc
lcc0-re0:
```

```
-----
No shutdown/reboot scheduled.
```

```
lcc2-re0:
```

```
-----
No shutdown/reboot scheduled.
```

### [show system reboot sfc \(TX Matrix Plus Router\)](#)

```
user@host> show system sfc 0
No shutdown/reboot scheduled.
```

### [show system reboot \(QFX3500 Switch\)](#)

```
user@switch> show system reboot
No shutdown/reboot scheduled.
```

## show system resource-cleanup processes

<b>Syntax</b>	show system resource-cleanup processes <detail> <pid <i>number</i> > <process-name <i>name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 9.3. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the list of processes that have been registered for resource cleanup services.
<b>Options</b>	<p><b>detail</b>—(Optional) Display the list of processes that have been registered for resource cleanup services, along with the resources that have been requested for cleanup.</p> <p><b>pid <i>number</i></b>—(Optional) Display a process that has been registered for resource cleanup services by specifying the Process Identifier number.</p> <p><b>process-name <i>name</i></b>—(Optional) Display a process that has been registered for resource cleanup services by name of the process.</p>
<b>Required Privilege Level</b>	view

**Table 62: show system resource-cleanup processes Output Fields**

Field Name	Field Description
<b>PID</b>	Process ID, a number that identifies a process.
<b>Process name</b>	String that identifies the process.
<b>Resources to clean</b>	Resources that have been registered to be cleaned up.

## Sample Output

### show system resource-cleanup processes

```
user@host> show system resource-cleanup processes
PID      Process name      Resources to clean
420      jnx-exampld       GENCFG, SYSV shared memory
```

### show system resource-cleanup processes detail

```
user@host> show system resource-cleanup processes detail
PID      Process name      Resources to clean
420      jnx-exampld        GENCFG blob major ID 0x8000, minor ID 0x0000
          SYSV shared memory ID 65536, key 1108955839
          SYSV shared memory ID 65537, key 1108955837
```

## show system rollback

<b>Syntax</b>	<code>show system rollback <i>number</i></code> <code>&lt;compare <i>number</i>&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the contents of a previously committed configuration, or the differences between two previously committed configurations.
<div>  <b>NOTE:</b> The <code>show system rollback</code> command is a purely operational mode command and cannot be issued with <code>run</code> from the configuration mode.         </div>	
<b>Options</b>	<p><b><i>number</i></b>—Number of a configuration to view. The output displays the configuration. The range of values is 0 through 49.</p> <p><b><code>compare <i>number</i></code></b>—(Optional) Number of another previously committed (rollback) configuration to compare to rollback <b><i>number</i></b>. The output displays the differences between the two configurations. The range of values is 0 through 49.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show system rollback compare on page 1083</a>

## Sample Output

### show system rollback compare

<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the Junos OS extensions loaded on your router or switch.
<b>Options</b>	<b>none</b> —Display standard information about all loaded Junos OS extensions.  <b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system software information for all the T640 routers (TX Matrix Router) or all the routers (TX Matrix Plus Router) in the chassis.  <b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system software information for all T640 routers connected to the

TX Matrix router. On a TX Matrix Plus router, display system software information for all connected T1600 or T4000 LCCs.

**all-members**—(EX4200 switches only) (Optional) Display the system software running on all members of the Virtual Chassis configuration.

**backup**—(J Series routers only) (Optional) Display the status of old system software packages only.

**detail**—(Optional) Display detailed information about available Junos OS extensions.

**infrastructure name**—(QFabric systems only) (Optional) Display the system software running on the fabric control Routing Engine and the fabric manager Routing Engine.

**interconnect-device name**—(QFabric systems only) (Optional) Display the system software running on the Interconnect device.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system software information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system software information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches only) (Optional) Display the system software running on the local Virtual Chassis member.

**member member-id**—(EX4200 switches only) (Optional) Display the system software running on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

**node-group name**—(QFabric systems only) (Optional) Display the system software running on the Node group.

**scc**—(Routing matrix only) (Optional) Display the system software running on a TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus routers only) (Optional) Display system software information for the TX Matrix Plus router.

**Required Privilege Level** maintenance

<b>List of Syntax</b>	<a href="#">Syntax on page 1094</a> <a href="#">Syntax (EX Series Switches) on page 1094</a> <a href="#">Syntax (TX Matrix Router) on page 1094</a> <a href="#">Syntax (TX Matrix Plus Router) on page 1094</a> <a href="#">Syntax (MX Series Router) on page 1094</a> <a href="#">Syntax (QFX Series) on page 1094</a>
<b>Syntax</b>	show system statistics
<b>Syntax (EX Series Switches)</b>	show system statistics <all-members> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system statistics <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system statistics <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system statistics <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system statistics
<b>Release Information</b>	Command introduced before JUNOS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in JUNOS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display system-wide protocol-related statistics.
<b>Options</b>	<b>none</b> —Display system statistics for all the following protocols: <ul style="list-style-type: none"><li>• <b>arp</b>—Address Resolution Protocol</li><li>• <b>bridge</b>—IEEE 802.1 Bridging</li><li>• <b>clns</b>—Connectionless Network Service</li><li>• <b>esis</b>—End System-to-Intermediate System</li><li>• <b>ethoamcfm</b>—Ethernet OAM protocol for connectivity fault management</li><li>• <b>ethoamlfm</b>—Ethernet OAM protocol for link fault management</li><li>• <b>icmp</b>—Internet Control Message Protocol</li><li>• <b>icmp6</b>—Internet Control Message Protocol version 6</li><li>• <b>igmp</b>—Internet Group Management Protocol</li></ul>

- **ip**—Internet Protocol version 4
- **ip6**—Internet Protocol version 6
- **mpls**—Multiprotocol Label Switching
- **rdp**—Reliable Datagram Protocol
- **tcp**—Transmission Control Protocol
- **tnp**—Trivial Network Protocol
- **ttp**—TNP Tunneling Protocol
- **tudp**—Trivial User Datagram Protocol
- **udp**—User Datagram Protocol
- **vpls**—Virtual Private LAN Service

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) Display system statistics for a protocol for all the routers in the chassis.

**all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for a protocol for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for a protocol for all routers (line-card chassis) connected to the TX Matrix Plus router

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for all members of the Virtual Chassis configuration.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for a protocol for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for a protocol for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for the local Virtual Chassis member.

**member member-id**—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for the specified member of the Virtual Chassis

configuration. For EX4200 switches, replace **member-id** with a value from 0 through 9. For an MX Series Virtual Chassis, replace **member-id** with a value of 0 or 1.

**scc**—(TX Matrix routers only) (Optional) Display system statistics for a protocol for the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Display system statistics for a protocol for the TX Matrix Plus router (or switch-fabric chassis). Replace **number** with 0.

**Additional Information** By default, when you issue the **show system statistics** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

**Required Privilege Level** view

## Sample Output

### show system statistics

```
user@host> show system statistics
ip:
    3682087 total packets received
    0 bad header checksums
    0 with size smaller than minimum
    0 with data size < data length
    0 with header length < data size
    0 with data length < header length
    0 with incorrect version number
    0 packets destined to dead next hop
    0 fragments received
    0 fragments dropped (dup or out of space)
    0 fragments dropped (queue overflow)
    0 fragments dropped after timeout
    0 fragments dropped due to over limit
    0 packets reassembled ok
    3664774 packets for this host
    17316 packets for unknown/unsupported protocol
    0 packets forwarded
    0 packets not forwardable
    0 redirects sent
    6528 packets sent from this host
    0 packets sent with fabricated ip header
    0 output packets dropped due to no bufs
    0 output packets discarded due to no route
```

```

0 output datagrams fragmented
0 fragments created
0 datagrams that can't be fragmented
0 packets with bad options
1123 packets with options handled without error
0 strict source and record route options
0 loose source and record route options
0 record route options
0 timestamp options
0 timestamp and address options
0 timestamp and prespecified address options
0 option packets dropped due to rate limit
1123 router alert options
0 multicast packets dropped (no iflist)
0 packets dropped (src and int don't match)
icmp:
0 drops due to rate limit
0 calls to icmp_error
0 errors not generated because old message was icmp
Output histogram:
    echo reply: 75
0 messages with bad code fields
0 messages less than the minimum length
0 messages with bad checksum
0 messages with bad source address
0 messages with bad length
0 echo drops with broadcast or multicast destination address
0 timestamp drops with broadcast or multicast destination address
Input histogram:
    echo: 75
    router advertisement: 130
75 message responses generated
tcp:
3844 packets sent
    3618 data packets (1055596 bytes)
    0 data packets (0 bytes) retransmitted
    0 resends initiated by MTU discovery
    205 ack-only packets (148 packets delayed)
    0 URG only packets
    0 window probe packets
    0 window update packets
    1079 control packets
5815 packets received
    3377 acks (for 1055657 bytes)
    24 duplicate acks
    0 acks for unsent data
    2655 packets (15004 bytes) received in-sequence
    1 completely duplicate packet (0 bytes)
    0 old duplicate packets
    0 packets with some dup. data (0 bytes duped)
    0 out-of-order packets (0 bytes)
    0 packets (0 bytes) of data after window
    0 window probes
    7 window update packets
    0 packets received after close
    0 discarded for bad checksums
    0 discarded for bad header offset fields
    0 discarded because packet too short
1 connection request
32 connection accepts
0 bad connection attempts

```

```
0 listen queue overflows
33 connections established (including accepts)
30 connections closed (including 0 drops)
    27 connections updated cached RTT on close
    27 connections updated cached RTT variance on close
    0 connections updated cached ssthresh on close
0 embryonic connections dropped
3374 segments updated rtt (of 3220 attempts)
0 retransmit timeouts
    0 connections dropped by rexmit timeout
0 persist timeouts
    0 connections dropped by persist timeout
344 keepalive timeouts
    0 keepalive probes sent
    0 connections dropped by keepalive
1096 correct ACK header predictions
1314 correct data packet header predictions
32 syncache entries added
    0 retransmitted
    0 dupsyn
    0 dropped
    32 completed
    0 bucket overflow
    0 cache overflow
    0 reset
    0 stale
    0 aborted
    0 badack
    0 unreach
    0 zone failures
0 cookies sent
0 cookies received
0 ACKs sent in response to in-window but not exact RSTs
0 ACKs sent in response to in-window SYNs on established connections
0 rcv packets dropped by TCP due to bad address
0 out-of-sequence segment drops due to insufficient memory
1058 RST packets
0 ICMP packets ignored by TCP
0 send packets dropped by TCP due to auth errors
0 rcv packets dropped by TCP due to auth errors

udp:
3658884 datagrams received
0 with incomplete header
0 with bad data length field
0 with bad checksum
3657342 dropped due to no socket
3657342 broadcast/multicast datagrams dropped due to no socket
0 dropped due to full socket buffers
0 not for hashed pcb
4291311496 delivered
1551 datagrams output

ipsec:
0 inbound packets processed successfully
0 inbound packets violated process security policy
0 inbound packets with no SA available
0 invalid inbound packets
0 inbound packets failed due to insufficient memory
0 inbound packets failed getting SPI
0 inbound packets failed on AH replay check
0 inbound packets failed on ESP replay check
0 inbound AH packets considered authentic
```

```
0 inbound AH packets failed on authentication
0 inbound ESP packets considered authentic
0 inbound ESP packets failed on authentication
0 outbound packets processed successfully
0 outbound packets violated process security policy
0 outbound packets with no SA available
0 invalid outbound packets
0 outbound packets failed due to insufficient memory
0 outbound packets with no route

igmp:
17186 messages received
0 messages received with too few bytes
0 messages received with bad checksum
0 membership queries received
0 membership queries received with invalid field(s)
0 membership reports received
0 membership reports received with invalid field(s)
0 membership reports received for groups to which we belong
0 membership reports sent

arp:
44181302 datagrams received
2 ARP requests received
2028 ARP replies received
3156 resolution requests received
0 unrestricted proxy requests
0 received proxy requests
0 proxy requests not proxied
0 with bogus interface
787 with incorrect length
712 for non-IP protocol
0 with unsupported op code
0 with bad protocol address length
0 with bad hardware address length
0 with multicast source address
7611 with multicast target address
0 with my own hardware address
14241699 for an address not on the interface
0 with a broadcast source address
0 with source address duplicate to mine
29929250 which were not for me
0 packets discarded waiting for resolution
6 packets sent after waiting for resolution
17812 ARP requests sent
2 ARP replies sent
0 requests for memory denied
0 requests dropped on entry
0 requests dropped during retry

ip6:
0 total packets received
0 with size smaller than minimum
0 with data size < data length
0 with bad options
0 with incorrect version number
0 fragments received
0 fragments dropped (dup or out of space)
0 fragments dropped after timeout
0 fragments that exceeded limit
0 packets reassembled ok
0 packets for this host
0 packets forwarded
0 packets not forwardable
```

```
0 redirects sent
0 packets sent from this host
0 packets sent with fabricated ip header
0 output packets dropped due to no bufs, etc.
0 output packets discarded due to no route
0 output datagrams fragmented
0 fragments created
0 datagrams that can't be fragmented
0 packets that violated scope rules
0 multicast packets which we don't join
Mbuf statistics:
0 packets whose headers are not continuous
0 tunneling packets that can't find gif
0 packets discarded due to too may headers
0 failures of source address selection
0 forward cache hit
0 forward cache miss
0 packets destined to dead next hop
0 option packets dropped due to rate limit
0 packets dropped (src and int don't match)
0 packets dropped due to bad protocol

icmp6:
0 calls to icmp_error
0 errors not generated because old message was icmp error or so
0 errors not generated because rate limitation
0 messages with bad code fields
0 messages < minimum length
0 bad checksums
0 messages with bad length
Histogram of error messages to be generated:
    0 no route
    0 administratively prohibited
    0 beyond scope
    0 address unreachable
    0 port unreachable
    0 packet too big
    0 time exceed transit
    0 time exceed reassembly
    0 erroneous header field
    0 unrecognized next header
    0 unrecognized option
    0 redirect
    0 unknown
0 message responses generated
0 messages with too many ND options

ipsec6:
0 inbound packets processed successfully
0 inbound packets violated process security policy
0 inbound packets with no SA available
0 invalid inbound packets
0 inbound packets failed due to insufficient memory
0 inbound packets failed getting SPI
0 inbound packets failed on AH replay check
0 inbound packets failed on ESP replay check
0 inbound AH packets considered authentic
0 inbound AH packets failed on authentication
0 inbound ESP packets considered authentic
0 inbound ESP packets failed on authentication
0 outbound packets processed successfully
0 outbound packets violated process security policy
0 outbound packets with no SA available
```

```
0 invalid outbound packets
0 outbound packets failed due to insufficient memory
0 outbound packets with no route

c1n1:
0 total packets received
0 packets delivered
0 too small
0 bad header length
0 bad checksum
0 bad version
0 unknown or unsupported protocol
0 bogus sdl size
0 no free memory in socket buffer
0 send packets discarded
0 sbappend failure
0 mcopy failure
0 address fields were not reasonable
0 segment information forgotten
0 forwarded packets
0 total packets sent
0 output packets discarded
0 non-forwarded packets
0 packets fragmented
0 fragments sent
0 fragments discarded
0 fragments timed out
0 fragmentation prohibited
0 packets reconstructed
0 packets destined to dead nexthop
0 packets discarded due to no route
0 Error pdu rate drops
0 ER pdu generation failure

esis:
0 total pkts received
0 total packets consumed by protocol
0 pdus received with bad checksum
0 pdus received with bad version number
0 pdus received with bad type field
0 short pdus received
0 bogus sdl size
0 bad header length
0 unknown or unsupported protocol
0 no free memory in socket buffer
0 send packets discarded
0 sbappend failure
0 mcopy failure
0 ISO family not configured

tnp:
146776365 unicast packets received
0 broadcast packets received
0 fragmented packets received
0 hello packets dropped
0 fragments dropped
0 fragment reassembly queue flushes
0 hello packets received
0 control packets received
49681642 rdp packets received
337175 udp packets received
96757548 tunnel packets received
0 input packets discarded with no protocol
98397591 unicast packets sent
```

```
0 broadcast packets sent
0 fragmented packets sent
0 hello packets dropped
0 fragments dropped
0 hello packets sent
0 control packets sent
49681642 rdp packets sent
337175 udp packets sent
48378774 tunnel packets sent
0 packets sent with unknown protocol

rdp:
49681642 input packets
0 discards for bad checksum
0 discards bad sequence number
0 refused connections
2031964 acks received
0 dropped due to full socket buffers
49692 retransmits
49681642 output packets
24815968 acks sent
28 connects
0 closes
22783990 keepalives received
22783990 keepalives sent

tudp:
337175 datagrams received
0 with incomplete header
0 with bad data length field
0 with bad checksum
0 dropped due to no socket
0 broadcast/multicast datagrams dropped due to no socket
0 dropped due to full socket buffers
337175 delivered
337175 datagrams output

ttp:
398749 packets sent
0 packets sent while unconnected
0 packets sent while interface down
0 packets sent couldn't get buffer
0 packets sent couldn't find neighbor
44696687 L2 packets received
0 unknown L3 packets received
3682087 IPv4 L3 packets received
0 MPLS L3 packets received
0 MPLS->IPv4 L3 packets received
0 IPv4->MPLS L3 packets received
0 IPv6 L3 packets received
0 ARP L3 packets received
0 CLNP L3 packets received
0 TNP L3 packets received
0 NULL L3 packets received
0 cyclotron cycle L3 packets received
0 cyclotron send L3 packets received
0 packets received while unconnected
0 packets received from unknown ifl
0 input packets couldn't get buffer
0 input packets with bad type
0 input packets with discard type
0 Input packets with too many tlvs
0 Input packets with bad tlv header
70633 Input packets with bad tlv type
```

```

68877 Input packets dropped based on tlv result
0 input packets for which rt lookup is bypassed

mpls:
0 total mpls packets received
0 packets forwarded
0 packets dropped
0 with header too small
0 after tagging, can't fit link MTU
0 with IPv4 explicit NULL tag
0 with IPv4 explicit NULL cksum errors
0 with router alert tag
0 lsp ping packets (ttl-expired/router alert)
0 with ttl expired
0 with tag encoding error
0 packets discarded, no route

vpls:
0 total packets received
0 with size smaller than minimum
0 with incorrect version number
0 packets for this host
0 packets with no logical interface
0 packets with no family
0 packets with no route table
0 packets with no auxiliary table
0 packets with no corefacing entry
0 packets with no CE-facing entry
0 mac route learning requests
0 mac routes learnt
0 requests to learn an existing route
0 learning requests while learning disabled on interface
0 learning requests over capacity
0 mac routes moved
0 requests to move static route
0 mac route aging requests
0 mac routes aged
0 bogus address in aging requests
0 requests to age static route
0 requests to re-ageout aged route
0 requests involving multiple peer FEs
0 aging acks from PFE
0 aging non-acks from PFE
0 aging requests timed out waiting on FEs
0 aging requests over max-rate
0 errors finding peer FEs

```

#### show system statistics (QFX Series)

```

user@switch> show system statistics
Tcp:
571779 packets sent
21517 data packets (1797102 bytes)
2 data packets retransmitted (20 bytes)
0 resends initiated by MTU discovery
3708 ack only packets (531 packets delayed)
0 URG only packets
1 window probe packets
1 window update packets
1093063 control packets
1132541 packets received
20961 acks(for 1796102 bytes)
5861 duplicate acks
0 acks for unsent data
19556 packets received in-sequence(232079 bytes)
3018 completely duplicate packets(0 bytes)
0 old duplicate packets
4 packets with some duplicate data(4 bytes duped)
2 out-of-order packets(2 bytes)
0 packets of data after window(0 bytes)
0 window probes
39 window update packets
0 packets received after close
0 discarded for bad checksums
0 discarded for bad header offset fields
0 discarded because packet too short
546519 connection requests
78 connection accepts
0 bad connection attempts
0 listen queue overflows
100 connections established (including accepts)

```

```
546596 connections closed (including 6 drops)
47 connections updated cached RTT on close
47 connections updated cached RTT variance on close
0 connections updated cached ssthresh on close
546497 embryonic connections dropped
20453 segments updated rtt(of 566914 attempts)
2 retransmit timeouts
0 connections dropped by retransmit timeout
0 persist timeouts
0 connections dropped by persist timeout
3028 keepalive timeouts
3027 keepalive probes sent
1 connections dropped by keepalive
7515 correct ACK header predictions
12258 correct data packet header predictions
78 syncache entries added

## show system storage

<b>List of Syntax</b>	<a href="#">Syntax on page 1129</a> <a href="#">Syntax (EX Series Switches) on page 1129</a> <a href="#">Syntax (MX Series Router) on page 1129</a> <a href="#">Syntax (QFX Series) on page 1129</a> <a href="#">Syntax (SRX Series) on page 1129</a> <a href="#">Syntax (TX Matrix Router) on page 1129</a> <a href="#">Syntax (TX Matrix Plus Router and TX Matrix Plus Router with 3D SIBs) on page 1129</a>
<b>Syntax</b>	<pre>show system storage &lt;detail&gt; &lt;invoke-on (all-routing-engines   other-routing-engine)&gt;</pre>
<b>Syntax (EX Series Switches)</b>	<pre>show system storage &lt;detail&gt; &lt;all-members&gt; &lt;local&gt; &lt;member member-id&gt; &lt;invoke-on (all-routing-engines   other-routing-engine)&gt;</pre>
<b>Syntax (MX Series Router)</b>	<pre>show system storage &lt;detail&gt; &lt;all-members&gt; &lt;local&gt; &lt;member member-id&gt; &lt;invoke-on (all-routing-engines   other-routing-engine)&gt;</pre>
<b>Syntax (QFX Series)</b>	<pre>show system storage &lt;detail&gt; &lt;infrastructure name&gt; &lt;interconnect-device name&gt; &lt;node-group name&gt; &lt;invoke-on (all-routing-engines   other-routing-engine)&gt;</pre>
<b>Syntax (SRX Series)</b>	<pre>show system storage &lt;detail&gt; &lt;partitions&gt; &lt;invoke-on (all-routing-engines   other-routing-engine)&gt;</pre>
<b>Syntax (TX Matrix Router)</b>	<pre>show system storage &lt;detail&gt; &lt;all-chassis   all-lcc   lcc number   scc&gt; &lt;invoke-on (all-routing-engines   other-routing-engine)&gt;</pre>
<b>Syntax (TX Matrix Plus Router and TX Matrix Plus Router with 3D SIBs)</b>	<pre>show system storage &lt;detail&gt; &lt;all-chassis   all-lcc   lcc number   sfc number&gt; &lt;invoke-on (all-routing-engines   other-routing-engine)&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p>

**sfc** option introduced for the TX Matrix Plus router in JUNOS Release 9.6.

Command introduced in Junos OS Release 11.1 for the QFX Series.

Option **invoke-on (all-routing-engines | other-routing-engine)** introduced in Junos OS Release 14.1

<b>Description</b>	Display statistics about the amount of free disk space in the router's or switch's file systems.
<b>Options</b>	<p><b>none</b>—Display standard information about the amount of free disk space in the router's or switch's file systems.</p> <p><b>detail</b>—(Optional) Display detailed output.</p> <p><b>invoke-on all-routing-engines</b>—(Optional) Display the system storage information on all master and backup Routing Engines on a routing matrix based on the TX Matrix or TX Matrix Plus router or on a router that has dual Routing Engines.</p> <p><b>invoke-on other-routing-engines</b>—(Optional) Display the system storage information on the other Routing Engine. For example, if you issue this command on the master Routing Engine on an M320 router, the JUNOS Software displays the system storage information on the backup Routing Engine. On a routing matrix based on the TX Matrix or TX Matrix Plus router, if you issue this command on the TX Matrix or TX Matrix Plus router's master Routing Engine, the JUNOS Software displays all the system storage information on all the backup Routing Engines.</p> <p><b>all-chassis</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system storage statistics for all the routers in the chassis.</p> <p><b>all-lcc</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system storage statistics for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system storage statistics for all routers connected to the TX Matrix Plus router.</p> <p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for all members of the Virtual Chassis configuration.</p> <p><b>infrastructure <i>name</i></b>—(QFabric systems only) (Optional) Display system storage statistics for the fabric control Routing Engines or fabric manager Routing Engines.</p> <p><b>interconnect-device <i>name</i></b>—(QFabric systems only) (Optional) Display system storage statistics for the Interconnect device.</p> <p><b>lcc <i>number</i></b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system storage statistics for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system storage statistics for a specific router that is connected to the TX Matrix Plus router.</p>

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display system storage statistics for the Node group.

**scc**—(TX Matrix routers only) (Optional) Display system storage statistics for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display system storage statistics for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system storage** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** Table 64 on page 1132 describes the output fields for the **show system storage** command. Output fields are listed in the approximate order in which they appear.

**Table 64: show system storage Output Fields**

Field Name	Field Description
<b>Filesystem</b>	Name of the filesystem.
<b>Size</b>	Size of the filesystem.
<b>Used</b>	Amount of space used in the filesystem.
<b>Avail</b>	Amount of space available in the filesystem.
<b>Capacity</b>	Percentage of the filesystem space that is being used.
<b>Mounted on</b>	Directory in which the filesystem is mounted.

## Sample Output

### show system storage

```

## show system uptime

<b>List of Syntax</b>	<a href="#">Syntax on page 1137</a> <a href="#">Syntax (EX Series Switches) on page 1137</a> <a href="#">Syntax (QFX Series) on page 1137</a> <a href="#">Syntax (TX Matrix Router) on page 1137</a> <a href="#">Syntax (TX Matrix Plus Router) on page 1137</a> <a href="#">Syntax (MX Series Router) on page 1137</a>
<b>Syntax</b>	show system uptime
<b>Syntax (EX Series Switches)</b>	show system uptime <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system uptime <director-group <i>name</i> > <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
<b>Syntax (TX Matrix Router)</b>	show system uptime <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system uptime <detail> <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system uptime <all-members> <invoke-on> <local> <member <i>member-id</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in JUNOS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the current time and information about how long the router or switch, router or switch software, and routing protocols have been running.
<b>Options</b>	<b>none</b> —Show time since the system rebooted and processes started.  <b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started on all the routers in the chassis.  <b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus

router, show time since the system rebooted and processes started for all connected T1600 or T4000 LCCs.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on all members of the Virtual Chassis configuration.

**director-group *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Director group.

**infrastructure *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the fabric control Routing Engine and fabric manager Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Interconnect device.

**invoke-on**—(MX Series routers only) (Optional) Display the time since the system rebooted and processes started on the master Routing Engine, backup Routing Engine, or both, on a router with two Routing Engines.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, show time since the system rebooted and processes started for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Node group.

**scc**—(TX Matrix routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system uptime** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** [Table 65 on page 1139](#) describes the output fields for the **show system uptime** command. Output fields are listed in the approximate order in which they appear.

**Table 65: show system uptime Output Fields**

Field Name	Field Description
<b>Current time</b>	Current system time in UTC.
<b>System booted</b>	Date and time when the Routing Engine on the router or switch was last booted and how long it has been running.
<b>Protocols started</b>	Date and time when the routing protocols were last started and how long they have been running.
<b>Last configured</b>	Date and time when a configuration was last committed. Also shows the name of the user who issued the last <b>commit</b> command.
<b>time and up</b>	Current time, in the local time zone, and how long the router or switch has been operational.
<b>users</b>	Number of users logged in to the router or switch.
<b>load averages</b>	Load averages for the last 1 minute, 5 minutes, and 15 minutes.

## Sample Output

### show system uptime

```
user@host> show system uptime
Current time:      1998-10-13 19:45:47 UTC
System booted:     1998-10-12 20:51:41 UTC (22:54:06 ago)
Protocols started: 1998-10-13 19:33:45 UTC (00:12:02 ago)
Last configured:   1998-10-13 19:33:45 UTC (00:12:02 ago) by abc
12:45PM up 22:54, 2 users, load averages: 0.07, 0.02, 0.01
```

### show system uptime all-lcc (TX Matrix Router)

```
user@host> show system uptime all-lcc
lcc0-re0:
-----
Current time: 2004-09-13 09:55:35 PDT

## show system users

---

<b>List of Syntax</b>	<a href="#">Syntax on page 1142</a> <a href="#">Syntax (TX Matrix Router) on page 1142</a> <a href="#">Syntax (TX Matrix Plus Router) on page 1142</a> <a href="#">Syntax (MX Series Router) on page 1142</a>
<b>Syntax</b>	show system users <no-resolve>
<b>Syntax (TX Matrix Router)</b>	show system users <all-chassis   all-lcc   lccnumber   scc> <no-resolve>
<b>Syntax (TX Matrix Plus Router)</b>	show system users <detail> <all-chassis   all-lcc   lcc number   sfc number> <no-resolve>
<b>Syntax (MX Series Router)</b>	show system users <all-members> <local> <member member-id> <no-resolve>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in JUNOS OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	List information about the users who are currently logged in to the router or switch.

**NOTE:** The `show system users` command lists the information about administrative users that are logged in to a router or switch using the CLI, J-Web, or an SSH client. The output does not list information about web users or automated users that are logged in from a remote client application using Junos XML APIs, such as NETCONF.

---

- Options**    **none**—List information about the users who are currently logged in to the router or switch.
- all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show users currently logged in to all the routers in the chassis.
- all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to all connected T1600 or T4000 LCCs.
- all-members**—(MX Series routers only) (Optional) Display users currently logged in to all members of the Virtual Chassis configuration.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display users currently logged in to the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display users currently logged in to the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**no-resolve**—(Optional) Do not attempt to resolve IP addresses to hostnames.

**scc**—(TX Matrix routers only) (Optional) Show users currently logged in to the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Show users currently logged in to the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system users** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** Table 66 on page 1144 describes the output fields for the **show system users** command. Output fields are listed in the approximate order in which they appear.

**Table 66: show system users Output Fields**

Field Name	Field Description
<b>time and up</b>	Current time, in the local time zone, and how long the router or switch has been operational.
<b>users</b>	Number of users logged in to the router or switch.
<b>load averages</b>	Load averages for the last 1 minute, 5 minutes, and 15 minutes.
<b>USER</b>	Username.
<b>TTY</b>	Terminal through which the user is logged in.
<b>FROM</b>	System from which the user has logged in. A hyphen indicates that the user is logged in through the console.
<b>LOGIN@</b>	Time when the user logged in.
<b>IDLE</b>	How long the user has been idle.
<b>WHAT</b>	Processes that the user is running.

## show system virtual-memory

<b>List of Syntax</b>	<a href="#">Syntax on page 1147</a> <a href="#">Syntax (EX Series) on page 1147</a> <a href="#">Syntax (TX Matrix Router) on page 1147</a> <a href="#">Syntax (TX Matrix Plus Router) on page 1147</a> <a href="#">Syntax (MX Series Router) on page 1147</a> <a href="#">Syntax (QFX Series) on page 1147</a>
<b>Syntax</b>	show system virtual-memory
<b>Syntax (EX Series)</b>	show system virtual-memory <all-members> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system virtual-memory <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system virtual-memory <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system virtual-memory <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system virtual-memory <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the usage of Junos OS kernel memory listed first by size of allocation and then by type of usage. Use the <b>show system virtual-memory</b> command for troubleshooting with Juniper Networks Customer Support.
<b>Options</b>	<b>none</b> —Display kernel dynamic memory usage information.  <b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display kernel dynamic memory usage information for all chassis.  <b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display kernel dynamic memory usage information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display kernel dynamic memory usage information for all connected T1600 or T4000 LCCs.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for all members of the Virtual Chassis configuration.

**infrastructure *name***—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the fabric control Routing Engine and fabric manager Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display kernel dynamic memory usage information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display kernel dynamic memory usage information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the Node group.

**scc**—(TX Matrix routers only) (Optional) Display kernel dynamic memory usage information for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display kernel dynamic memory usage information for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system virtual-memory** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix

or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**NOTE:** The `show system virtual-memory` command with the `| display XML` pipe option now displays XML output for the command in the parent tags: `<vmstat-memstat-malloc>`, `<vmstat-memstat-zone>`, `<vmstat-sumstat>`, `<vmstat-intr>`, and `<vmstat-kernel-state>` with each child element as a separate XML tag. In Junos OS Releases 10.1 and earlier, the `| display XML` option for this command does not have an XML API element and the entire output is displayed in a single `<output>` tag element.

Output Fields	<p><a href="#">Table 67 on page 1150</a> lists the output fields for the <code>show system virtual-memory</code> command. Output fields are listed in the approximate order in which they appear.</p>

Table 67: show system virtual-memory Output Fields

Field Name	Field Description
<b>Memory statistics by bucket size</b>	
<b>Size</b>	Memory block size (bytes). The kernel memory allocator appropriates blocks of memory whose size is exactly a power of 2.
<b>In Use</b>	Number of memory blocks of this size that are in use (bytes).
<b>Free</b>	Number of memory blocks of this size that are free (bytes).
<b>Requests</b>	Number of memory allocation requests made.
<b>HighWater</b>	Maximum value the free list can have. Once the system starts reclaiming physical memory, it continues until the free list is increased to this value.
<b>Couldfree</b>	Total number of times that the free elements for a bucket size exceed the high-water mark for that bucket size.
<b>Memory usage type by bucket size</b>	
<b>Size</b>	Memory block size (bytes).
<b>Type(s)</b>	Kernel modules that are using these memory blocks. For a definition of each type, refer to a FreeBSD book.
<b>Memory statistics by type</b>	
<b>Type</b>	Kernel module that is using dynamic memory.
<b>InUse</b>	Number of memory blocks used by this type. The number is rounded up.
<b>MemUse</b>	Amount of memory in use, in kilobytes (KB).
<b>HighUse</b>	Maximum memory ever used by this type.
<b>Limit</b>	Maximum memory that can be allocated to this type.
<b>Requests</b>	Total number of dynamic memory allocation requests this type has made.
<b>Type Limit</b>	Number of times requests were blocked for reaching the maximum limit.
<b>Kern Limit</b>	Number of times requests were blocked for the kernel map.
<b>Size(s)</b>	Memory block sizes this type is using.
<b>Memory Totals</b>	
<b>In Use</b>	Total kernel dynamic memory in use (bytes, rounded up).
<b>Free</b>	Total kernel dynamic memory free (bytes, rounded up).

Table 67: show system virtual-memory Output Fields (*continued*)

Field Name	Field Description
<b>Requests</b>	Total number of memory allocation requests.
<b>ITEM</b>	Kernel module that is using memory.
<b>Size</b>	Memory block size (bytes).
<b>Limit</b>	Maximum memory that can be allocated to this type.
<b>Used</b>	Number of memory blocks used by this type. The number is rounded up.
<b>Free</b>	Number of memory blocks available to this type.
<b>Requests</b>	Total number of memory allocation requests this type has made.
<b>interrupt</b>	Timer events and scheduling interruptions.
<b>total</b>	Total number of interruptions for each type.
<b>rate</b>	Interruption rate.
<b>Total</b>	Total for all interruptions.

## Sample Output

### show system virtual-memory

```

user@host> show system virtual-memory

<b>Syntax (QFX Series)</b>	<pre>show version &lt;brief   detail&gt; &lt;component component-name   all&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Display the hostname and version information about the software running on the router or switch.</p> <p>Beginning in Junos OS Release 13.3, the <b>show version</b> command output includes the <b>Junos</b> field that displays the Junos OS version running on the device. This field provides a consistent means of identifying the Junos OS version, rather than extracting that information from the list of installed sub-packages.</p>
<b>Options</b>	<p><b>none</b>—Display standard information about the hostname and version of the software running on the router or switch.</p>

**brief | detail**—(Optional) Display the specified level of output.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on all members of the Virtual Chassis configuration.

**component all**—(QFabric systems only) (Optional) Display the host name and version information about the software running on all the components on the QFabric system.

**component *component-name***—(QFabric systems only) (Optional) Display the host name and version information about the software running on a specific QFabric system component. Replace *component-name* with the name of the QFabric system component. The *component-name* can be the name of a diagnostics Routing Engine, Director group, fabric control Routing Engine, fabric manager Routing Engine, Interconnect device, or Node group.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**scc**—(TX Matrix routers only) (Optional) Display the hostname and version information about the software running on the TX Matrix router (or switch-card chassis).

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the host name and version information about the software running on for a specified T640 router (line-card chassis or LCC) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the host name and version information about the software running for a specified T1600 or T4000 router (LCC) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display the hostname and version information about the software running on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**Additional Information** By default, when you issue the **show version** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 or T4000 (in a routing matrix based on a TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 or T4000 (in a routing matrix based on a TX Matrix Plus router) backup Routing Engines that are connected to it.

## Sample Output

### show version (Devices Running Junos OS Release 13.3 and Later)

The following output is from the MX240 Router and shows the **Junos** field introduced in Junos OS 13.3. Depending on the platform running Junos OS 13.3, you might see different installed sub-packages, but the **Junos** field is common across all platforms that run Junos OS 13.3 and later.

## start shell

---

<b>Syntax</b>	<code>start shell (csh   sh)</code> <code>&lt;user username&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Exit from the CLI environment and create a UNIX-level shell. To return to the CLI, type <b>exit</b> from the shell.
<div> <b>NOTE:</b><ul style="list-style-type: none"><li>To issue this command, the user must have the required login access privileges configured by including the <b>permissions</b> statement at the <b>[edit system login class <i>class-name</i>]</b> hierarchy level.</li><li>UNIX wheel group membership or permissions are no longer required to issue this command.</li></ul></div>	
<b>Options</b>	<b>csh</b> —Create a UNIX C shell.  <b>sh</b> —Create a UNIX Bourne shell.  <b>user <i>username</i></b> —(Optional) Start the shell as another user.
<b>Additional Information</b>	When you are in the shell, the shell prompt has the following format:  <code>username@hostname%</code> An example of the prompt is:  <code>root@host%</code>
<b>Required Privilege Level</b>	shell and maintenance
<b>List of Sample Output</b>	<a href="#">start shell csh on page 1218</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### start shell csh

```
user@host> start shell csh
%
exit
%
```

```
username@hostname% start shell sh
%

exit
user@host>
```

## test configuration

---

<b>Syntax</b>	<code>test configuration filename</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Verify that the syntax of a configuration file is correct. If the configuration contains any syntax or commit check errors, a message is displayed to indicate the line number and column number in which the error was found. This command only accepts text files.
<b>Options</b>	<b>filename</b> —Name of the configuration file.  <b>syntax-only</b> —Check the syntax of a partial configuration file, without checking for commit errors. This option introduced in Junos OS Release 12.1.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">test configuration on page 1220</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### test configuration

```
user@host> test configuration terminal
[Type ^D to end input]
system {
host-name bluesky;
paris-23;
login;
}
terminal:3:(8) syntax error: paris
[edit system]
    'paris-23;'
      syntax error
terminal:4:(11) statement must contain additional statements: ;
[edit system login]
    'login ;'
      statement must contain additional statements
configuration syntax failed
```

## traceroute

**List of Syntax**   [Syntax on page 1221](#)  
                               [Syntax \(QFX Series\) on page 1221](#)

**Syntax**   `traceroute host`  
                   `<as-number-lookup>`  
                   `<bypass-routing>`  
                   `<clns>`  
                   `<gateway address>`  
                   `<inet | inet6>`  
                   `<interface interface-name>`  
                   `<logical system logical-system-name>`  
                   `<monitor host>`  
                   `<mpls (ldp FEC address | rsvp label-switched-path-name)>`  
                   `<no-resolve>`  
                   `<propagate-ttl>`  
                   `<routing-instance routing-instance-name>`  
                   `<source source-address>`  
                   `<tos value>`  
                   `<ttl value>`  
                   `<wait seconds>`

**Syntax (QFX Series)**   `traceroute host`  
                               `<as-number-lookup>`  
                               `<bypass-routing>`  
                               `<gateway address>`  
                               `<inet>`  
                               `<interface interface-name>`  
                               `<monitor host>`  
                               `<no-resolve>`  
                               `<routing-instance routing-instance-name>`  
                               `<source source-address>`  
                               `<tos value>`  
                               `<ttl value>`  
                               `<wait seconds>`

**Release Information**   Command introduced before Junos OS Release 7.4.  
                               Command introduced in Junos OS Release 9.0 for EX Series switches.  
                               **mpls** option introduced in Junos OS Release 9.2.  
                               Command introduced in Junos OS Release 11.1 for the QFX Series.  
                               **propagate-ttl** option introduced in Junos OS Release 12.1.

**Description**   Display the route that packets take to a specified network host. Use **traceroute** as a debugging tool to locate points of failure in a network.

**Options**   **host**—IP address or name of remote host.

**as-number-lookup**—(Optional) Display the autonomous system (AS) number of each intermediate hop on the path from the host to the destination.

**bypass-routing**—(Optional) Bypass the normal routing tables and send requests directly to a system on an attached network. If the system is not on a directly attached

network, an error is returned. Use this option to display a route to a local system through an interface that has no route through it.

**clns**—(Optional) Trace the route belonging to the Connectionless Network Service (CLNS).

**gateway address**—(Optional) Address of a router or switch through which the route transits.

**inet | inet6**—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.

**interface interface-name**—(Optional) Name of the interface over which to send packets.

**logical-system logical-system-name**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**monitor host**—(Optional) Display real-time monitoring information for the specified host.

**mpls (ldp FEC address | rsvp label-switched-path name)**—(Optional) See [traceroute mpls ldp](#) and [traceroute mpls rsvp](#).

**no-resolve**—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

**propagate-ttl**—(Optional) On the PE routing device, use this option to view locally generated Routing Engine transit traffic. This is applicable for MPLS L3VPN traffic only.

Use for troubleshooting, when you want to view hop-by-hop information from the local provider router to the remote provider router, when TTL decrementing is disabled on the core network using the **no-propagate-ttl** configuration statement.

**NOTE:** Using **propagate-ttl** with **traceroute** on the CE router does not show hop-by-hop information.

---

**routing-instance routing-instance-name**—(Optional) Name of the routing instance for the traceroute attempt.

**source source-address**—(Optional) Source address of the outgoing traceroute packets.

**tos value**—(Optional) Value to include in the IP type-of-service (ToS) field. The range of values is 0 through 255.

**ttl value**—(Optional) Maximum time-to-live value to include in the traceroute request. The range of values is 0 through 128.

**wait seconds**—(Optional) Maximum time to wait for a response to the traceroute request.

**Required Privilege Level**    network

Table 68: traceroute Output Fields

Field Name	Field Description
<b>traceroute to</b>	IP address of the receiver.
<b>hops max</b>	Maximum number of hops allowed.
<b>byte packets</b>	Size of packets being sent.
<i>number-of-hops</i>	Number of hops from the source to the named router or switch.
<i>router-name</i>	Name of the router or switch for this hop.
<i>address</i>	Address of the router or switch for this hop.
<b>Round trip time</b>	Average round-trip time, in milliseconds (ms).

## Sample Output

### traceroute

```

user@host> traceroute santacruz
traceroute to green.company.net (10.156.169.254), 30 hops max, 40 byte packets
 1 blue23 (10.168.1.254)    2.370 ms  2.853 ms  0.367 ms
 2 red14 (10.168.255.250)  0.778 ms  2.937 ms  0.446 ms
 3 yellow (10.156.169.254) 7.737 ms  89.905 ms 0.834 ms

```

### traceroute as-number-lookup host

```

user@host> traceroute as-number-lookup 10.100.1.1
traceroute to 10.100.1.1 (10.100.1.1), 30 hops max, 40 byte packets
 1 10.39.1.1 (10.39.1.1) 0.779 ms 0.728 ms 0.562 ms
 2 10.39.1.6 (10.39.1.6) [AS 32] 0.657 ms 0.611 ms 0.617 ms
 3 10.100.1.1 (10.100.1.1) [AS 10, 40, 50] 0.880 ms 0.808 ms 0.774 ms

```

### traceroute no-resolve

```

user@host> traceroute santacruz no-resolve

```

```
traceroute to green.company.net (10.156.169.254), 30 hops max, 40 byte packets
 1  10.168.1.254  0.458 ms  0.370 ms  0.365 ms
 2  10.168.255.250  0.474 ms  0.450 ms  0.444 ms
 3  10.156.169.254  0.931 ms  0.876 ms  0.862 ms
```

### traceroute propagate-ttl

```
user@host> traceroute propagate-ttl 100.200.2.2 routing-instance VPN-A
traceroute to 100.200.2.2 (100.200.2.2) from 1.1.0.2, 30 hops max, 40 byte packets

 1  1.2.0.2 (1.2.0.2)  2.456 ms  1.753 ms  1.672 ms
    MPLS Label=299776 CoS=0 TTL=1 S=0
    MPLS Label=299792 CoS=0 TTL=1 S=1
 2  1.3.0.2 (1.3.0.2)  1.213 ms  1.225 ms  1.166 ms
    MPLS Label=299792 CoS=0 TTL=1 S=1
 3  100.200.2.2 (100.200.2.2)  1.422 ms  1.521 ms  1.443 ms
```

### traceroute (Between CE Routers, Layer 3 VPN)

```
user@host> traceroute vpn09
traceroute to vpn09.skybank.net (10.255.14.179), 30 hops max, 40
byte packets
 1  10.39.10.21 (10.39.10.21)  0.598 ms  0.500 ms  0.461 ms
 2  10.39.1.13 (10.39.1.13)  0.796 ms  0.775 ms  0.806 ms
    MPLS Label=100006 CoS=0 TTL=1 S=1
 3  vpn09.skybank.net (10.255.14.179)  0.783 ms  0.716 ms  0.686
```

### traceroute (Through an MPLS LSP)

```
user@host> traceroute mpls1
traceroute to 10.168.1.224 (10.168.1.224), 30 hops max, 40 byte packets
 1  mpls1-sr0.company.net (10.168.200.101)  0.555 ms  0.393 ms  0.367 ms
    MPLS Label=1024 CoS=0 TTL=1
 2  mpls5-lo0.company.net (10.168.1.224)  0.420 ms  0.394 ms  0.401 ms
```

## traceroute monitor

<b>List of Syntax</b>	<a href="#">Syntax on page 1225</a> <a href="#">Syntax (QFX Series) on page 1225</a>
<b>Syntax</b>	<pre>traceroute monitor <i>host</i> &lt;count <i>value</i>&gt; &lt;inet   inet6&gt; &lt;interval <i>seconds</i>&gt; &lt;no resolve&gt; &lt;size <i>value</i>&gt; &lt;source <i>source-address</i>&gt; &lt;summary&gt;</pre>
<b>Syntax (QFX Series)</b>	<pre>traceroute monitor <i>host</i> &lt;count <i>value</i>&gt; &lt;inet&gt; &lt;interval <i>seconds</i>&gt; &lt;no resolve&gt; &lt;size <i>value</i>&gt; &lt;source <i>source-address</i>&gt; &lt;summary&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 8.0</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Display live monitoring of each hop in the route that packets take to a specified network host. Use as a debugging tool to locate points of failure in a network.
<b>Options</b>	<p><b><i>host</i></b>—IP address or name of remote host.</p> <p><b><i>count value</i></b>—Number of ping requests, in packets, to send in summary mode. The default value is <b>10</b>.</p> <p><b><i>inet   inet6</i></b>—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.</p> <p><b><i>interval seconds</i></b>—(Optional) Number of seconds to wait before sending ping requests. The default value is <b>1</b>.</p> <p><b><i>no resolve</i></b>—(Optional) Do not attempt to display addresses symbolically.</p> <p><b><i>size value</i></b>—(Optional) Receive the specified number of bytes for each packet. The range is <b>0</b> through <b>65468</b> bytes. The default value is <b>64</b>.</p> <p><b><i>source source-address</i></b>—(Optional) Source address of the outgoing ping packets.</p> <p><b><i>summary</i></b>—(Optional) Generate and display a summary of live monitoring of each hop on the route that packets take to a specified network host.</p>
<b>Required Privilege Level</b>	network
<b>List of Sample Output</b>	<a href="#">traceroute monitor on page 1226</a>

**Output Fields** Table 69 on page 1226 describes the output fields for the **traceroute monitor** command. Output fields are listed in the approximate order in which they appear.

**Table 69: traceroute monitor Output Fields**

Field Name	Field Description
<b>Host</b>	Hostname or IP address of the router at each hop.
<b>Loss%</b>	Percent of packet loss. The number of ping responses divided by the number of ping requests, specified as a percentage.
<b>Snt</b>	Number of ping requests sent to the router at this hop.
<b>Last</b>	Most recent round-trip time, in milliseconds, to the router at this hop.
<b>Avg</b>	Average round-trip time, in milliseconds, to the router at this hop.
<b>Best</b>	Shortest round-trip time, in milliseconds, to the router at this hop.
<b>Wrst</b>	Longest round-trip time, in milliseconds, to the router at this hop.
<b>StDev</b>	Standard deviation of round-trip times, in milliseconds, to the router at this hop.

## Sample Output

### traceroute monitor

```
user@host> traceroute monitor 10.16.0.1
```

	Loss%	Snt	Last	Avg	Best	Wrst	StDev
Host							
1. 10.17.41.254	0.0%	17	0.7	1.0	0.6	5.4	1.2
2. secret.net	0.0%	17	0.6	1.0	0.6	6.6	1.4
3. top-secret.net	0.0%	17	0.6	0.6	0.6	0.6	0.0

### Creating an Emergency Boot Device

If Junos OS on the device is damaged in some way that prevents the software from loading properly, you can use an emergency boot device to repartition the primary disk and load a fresh installation of Junos OS. Use the following procedure to create an emergency boot device.

Before you begin, you need to download the installation media image for your device and Junos OS release from <http://www.juniper.net/customers/support/>.

**NOTE:** In the following procedure, we assume that you are creating the emergency boot device on a QFX device or EX4600 device. You can create the emergency boot device on another Juniper Networks switch or router, or any PC or laptop that supports Linux. The steps you take to create the emergency boot device vary, depending on the device.

To create an emergency boot device:

1. Use FTP to copy the installation media image into the **/var/tmp** directory on the device.
2. Insert a USB device into the USB port.
3. From the Junos OS command-line interface (CLI), start the shell:

```
user@device> start shell
```

```
%
```

4. Switch to the root account using the **su** command:

```
% su
```

```
Password: password
```

**NOTE:** The password is the root password for the device. If you logged in to the device as root, you do not need to perform this step.

5. Enter the following command on the QFX3500, QFX3600, and QFX3600-I devices:

```
root@device% dd if=/var/tmp/filename of=/dev/da1 bs=16k
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/install-media-qfx3500.junos_11.1 of=/dev/da1 bs=16k
11006+1 records in
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

6. Enter the following command on the QFX5100 and EX4600 devices:

```
root@device% dd if=/var/tmp/filename of=/dev/da0 bs=1048576
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/jinstall-vjunos-usb-13.2.img of=/dev/da0 bs=1048576
11006+1 records in
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

7. Log out of the shell:

```
root@device% exit
```

```
% exit
```

```
user@device>
```

#### Related Documentation

- [Performing a Recovery Installation on page 118](#)

## Performing a Recovery Installation

If Junos OS on your device is damaged in some way that prevents the software from loading correctly, you may need to perform a recovery installation using an emergency boot device (for example, a USB flash drive) to restore the default factory installation. Once you have recovered the software, you need to restore the device configuration. You can either create a new configuration as you did when the device was shipped from the factory, or if you saved the previous configuration, you can simply restore that file to the device.

If at all possible, you should try to perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device to use during the installation. See [“Creating an Emergency Boot Device” on page 176](#) for information on how to create an emergency boot device.
2. Copy the existing configuration in the file `/config/juniper.conf.gz` from the device to a remote system, such as a server, or to an emergency boot device. For extra safety, you can also copy the backup configurations (the files named `/config/juniper.conf.n`, where *n* is a number from 0 through 9) to a remote system or to an emergency boot device.

**WARNING:** The recovery installation process completely overwrites the entire contents of the internal flash storage.

3. Copy any other stored files to a remote system as desired.

To reinstall Junos OS:

1. Insert the emergency boot device into the QFX Series device.
2. Reboot the QFX Series device.

**NOTE:** Do not power off the device if it is already on.

```
[edit system]
user@device> request system reboot
```

If you do not have access to the CLI, power cycle the QFX Series device.

The emergency boot device (external USB install media) is detected. At this time, you can load the Junos OS from the emergency boot device onto the internal flash storage.

3. The software prompts you with the following options:

```
External USB install media detected.
You can load Junos from this media onto an internal drive.
Press 'y' to proceed, 'f' to format and install, or 'n' to abort.
Do you wish to continue ([y]/f/n)? f
```

4. Type **f** to format the internal flash storage and install the Junos OS on the emergency boot device onto the internal flash storage.

If you do not want to format the internal flash storage, type **y**.

The following messages are displayed:

```
Installing packages from external USB drive da1
Packages will be installed to da0, media size: 8G
```

```
Processing format options
Fri September  4 01:18:44 UTC 2012
```

```
-- IMPORTANT INFORMATION --
Installer has detected settings to format system boot media.
This operation will erase all data from your system.
```

```
Formatting installation disk .. this will take a while, please wait
Disabling platform watchdog - threshold 12 mins
```

```
Determining installation slice
Fri September  4 01:27:07 UTC 2012
```

5. The device copies the software from the emergency boot device, occasionally displaying status messages. Copying the software can take up to 12 minutes.

When the device is finished copying the software, you are presented with the following prompt:

```
*** Fri September  4 01:19:00 UTC 2012***
Installation successful..
Please select one of the following options:
Reboot to installed Junos after removing install media (default) ... 1
Reboot to installed Junos by disabling install media ..... 2
Exit to installer debug shell ..... 3
Install Junos to alternate slice ..... 4
Your choice: 4
NOTE: System installer will now install Junos to alternate slice
Do not power off or remove the external installer media or
interrupt the installation mechanism.
```

6. Select **4** to install Junos OS to the alternate slice of the partition, and then press Enter.
7. Remove the emergency boot device when prompted and then press Enter. The device then reboots from the internal flash storage on which the software was just installed. When the reboot is complete, the device displays the login prompt.
8. Create a new configuration as you did when the device was shipped from the factory, or restore the previously saved configuration file to the device.

**Related Documentation**

- [Creating an Emergency Boot Device on page 176](#)

## Rebooting and Halting a Device

To reboot the switch, issue the **request system reboot** command.

```
user@switch> request system reboot ?
Possible completions:
<[Enter]>          Execute this command
```

```

all-members      Reboot all virtual chassis members
at               Time at which to perform the operation
both-routing-engines Reboot both the Routing Engines
fast-boot        Enable fast reboot
in               Number of minutes to delay before operation
local            Reboot local virtual chassis member
member           Reboot specific virtual chassis member (0..9)
message          Message to display to all users
other-routing-engine Reboot the other Routing Engine
|               Pipe through a command
{master:0}

user@switch> request system reboot
Reboot the system ? [yes,no] (no) yes
Rebooting switch

```

**NOTE:** Not all options shown in the preceding command output are available on all QFX Series and EX4600 devices. For example, the `fast-boot` option is available only on QFX5100. See the documentation for the [request system reboot](#) command for details about options.

Similarly, to halt the switch, issue the `request system halt` command.

**CAUTION:** Before entering this command, you must have access to the switch's console port in order to bring up the Routing Engine.

```

user@switch> request system halt ?
Possible completions:
<[Enter]>        Execute this command
all-members      Halt all virtual chassis members
at               Time at which to perform the operation
backup-routing-engine Halt backup Routing Engine
both-routing-engines Halt both Routing Engines
in               Number of minutes to delay before operation
local            Halt local virtual chassis member
member           Halt specific virtual chassis member (0..9)
message          Message to display to all users
other-routing-engine Halt other Routing Engine
|               Pipe through a command

```

**NOTE:** When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the `member` option. You cannot issue this command from the QFabric CLI.

Issuing the `request system halt` command on the switch halts the Routing Engine. To reboot a Routing Engine that has been halted, you must connect through the console.

- Related Documentation**
- [clear system reboot on page 355](#)
  - [request system reboot on page 415](#)
  - [request system halt on page 400](#)
  - [request system power-off on page 410](#)
  - *Connecting a QFX Series Device to a Management Console*

## Recovering from a Failed Software Installation

**Problem Description:** If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

**Solution** If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

**Hit [Enter] to boot immediately, or space bar for command prompt.**

Press the Spacebar to enter the manual loader. The **loader>** prompt appears.

3. Enter the following command:

```
loader> install [- --format] [- --external] source
```

where:

- **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
- **external**—Installs the installation package onto external media (a USB stick, for example).
- **source**—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
  - Network address of the server and the path on the server; for example, **tftp://192.171.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
  - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**.

The installation now proceeds normally and ends with a login prompt.

## Recovering the Root Password

If you forget the root password, you can use the password recovery procedure to reset the root password.

**NOTE:** The root password cannot be recovered on a QFabric system.

**NOTE:** You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the device's power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the device into the RJ-45-to-DB-9 serial port adapter supplied with the device.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the device.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
  - Bits per second: 9600
  - Data bits: 8
  - Parity: None
  - Stop bits: 1
  - Flow control: None
9. Power on the device by (if necessary) plugging the power cords into the device's power supply, or turning on the power to the device by switching on the AC power outlet the device is plugged into.

The terminal emulation screen on your management device displays the device's boot sequence.

10. When the following prompt appears, press the Spacebar to access the device's bootstrap loader command prompt:

```
Hit [Enter] to boot immediately, or space bar for command prompt.
Booting [kernel] in 9 seconds...
```

11. At the following prompt, enter **boot -s** to start up the system in single-user mode.  

```
ok boot -s
```
12. At the following prompt, enter **recovery** to start the root password recovery procedure.  

```
Enter full pathname of shell or 'recovery' for root password recovery or RETURN for /bin/sh: recovery
```
13. Enter configuration mode in the CLI.
14. Set the root password. For example:  

```
user@switch# set system root-authentication plain-text-password
```
15. At the following prompt, enter the new root password. For example:  

```
New password: juniper1
Retype new password:
```
16. At the second prompt, reenter the new root password.
17. After you have finished configuring the password, commit the configuration.  

```
root@host# commit
commit complete
```
18. Exit configuration mode in the CLI.
19. Exit operational mode in the CLI.
20. At the prompt, enter **y** to reboot the device.  

```
Reboot the system? [y/n] y
```

## Troubleshooting Network Interfaces

### The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down

**Problem** **Description:** The QFX Series has an SFP or SFP+ module installed. The interface on the port in which an SFP or SFP+ transceiver is installed is down.

**Symptoms:** When you check the status with the CLI command **show interfaces *interface-name***, the disabled port is not listed.

**Cause** By default, the SFP or SFP+ module operates in the 10-Gigabit Ethernet mode and supports only SFP or SFP+ transceivers. The operating mode for the module is incorrectly set.

**Solution** Only SFP or SFP+ transceivers can be installed in SFP or SFP+ modules. You must configure the operating mode of the SFP or SFP+ module to match the type of transceiver you want to use. For SFP+ transceivers, configure 10-Gigabit Ethernet operating mode.

## Troubleshooting an Aggregated Ethernet Interface

**Problem** **Description:** The **show interfaces terse** command shows that the LAG is down.

**Solution** Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet-switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.
- Verify that the LAG members belong to the same switch.

## Configuration File Terms

[Table 3 on page 11](#) lists the various configuration file terms and their definitions.

**Table 70: Configuration File Terms**

Term	Definition
active configuration	Current committed configuration of a switch.
candidate configuration	Working copy of the configuration that allows users to make configurational changes without causing any operational changes until this copy is committed.
configuration group	Group of configuration statements that can be inherited by the rest of the configuration.
commit a configuration	Check configuration for proper syntax, activate and mark as the current configuration file running on the switching platform.
configuration hierarchy	Junos OS configuration consists of a hierarchy of statements. There are two types of statements: container statements, which contain other statements, and leaf statements, which do not contain other statements. All the container and leaf statements together form the configuration hierarchy.
default configuration	Default configuration contains the initial values set for each configuration parameter when a switch is shipped.
rescue configuration	Well-known configuration that recovers a switch from a configuration that denies management access. You set a current committed configuration to be the rescue configuration through the CLI.
roll back a configuration	Return to a previously committed configuration.

- [Understanding Configuration Files on page 1242](#)
- [Understanding How the Junos OS Configuration Is Stored on page 1243](#)

### Forms of the configure Command

The Junos OS supports three forms of the **configure** command: **configure**, **configure private**, and **configure exclusive**. These forms control how users edit and commit configurations and can be useful when multiple users configure the software. See [Table 71 on page 1240](#).

**Table 71: Forms of the configure Command**

Command	Edit Access	Commit Access
<b>configure</b>	<ul style="list-style-type: none"><li>• No one can lock the configuration. All users can make configuration changes.</li></ul> <p>When you enter configuration mode, the CLI displays the following information:</p> <ul style="list-style-type: none"><li>• A list of other users editing the configuration.</li><li>• Hierarchy levels the users are viewing or editing.</li><li>• Whether the configuration has been changed, but not committed.</li><li>• When multiple users enter conflicting configurations, the most recent change to be entered takes precedence.</li></ul>	<ul style="list-style-type: none"><li>• No one can lock the configuration. All users can commit all changes to the configuration.</li><li>• If you and another user make changes and the other user commits changes, your changes are committed as well.</li></ul>

---

Table 71: Forms of the configure Command (*continued*)

Command	Edit Access	Commit Access
<b>configure exclusive</b>	<ul style="list-style-type: none"> <li>One user locks the configuration and makes changes without interference from other users.</li> <li>Other users can enter and exit configuration mode, but they cannot commit the configuration.</li> <li>If you enter configuration mode while another user has locked the configuration (with the <b>configure exclusive</b> command), the CLI displays the user and the hierarchy level the user is viewing or editing.</li> <li>If you enter configuration mode while another user has locked the configuration, you can forcibly log out that user with the <b>request system logout</b> operational mode command. For details, see the <a href="#">CLI Explorer</a>.</li> </ul>	
<b>configure private</b>	<ul style="list-style-type: none"> <li>Multiple users can edit the configuration at the same time.</li> <li>Each user has a private candidate configuration to edit independently of other users.</li> <li>When multiple users enter conflicting configurations, the first commit operation takes precedence over subsequent commit operations.</li> </ul>	<ul style="list-style-type: none"> <li>When you commit the configuration, the router verifies that the operational (running) configuration has not been modified by another user before accepting your private candidate configuration as the new operational configuration.</li> <li>If the configuration has been modified by another user, you can merge the modifications into your private candidate configuration and attempt to commit again.</li> </ul>

## Junos OS Commit Model for Router or Switch Configuration

The router or switch configuration is saved using a commit model—a candidate configuration is modified as desired and then committed to the system. When a configuration is committed, the router or switch checks the configuration for syntax errors, and if no errors are found, the configuration is saved as **juniper.conf.gz** and activated. The formerly active configuration file is saved as the first rollback configuration file (**juniper.conf.1.gz**), and any other rollback configuration files are incremented by 1. For example, **juniper.conf.1.gz** is incremented to **juniper.conf.2.gz**, making it the second rollback configuration file. The router or switch can have a maximum of 49 rollback configurations (numbered 1 through 49) saved on the system.

On the router or switch, the active configuration file and the first three rollback files (**juniper.conf.gz.1**, **juniper.conf.gz.2**, **juniper.conf.gz.3**) are located in the **/config** directory. If the file **rescue.conf.gz** is saved on the system, this file should also be saved in the **/config** directory. The factory default files are located in the **/etc/config** directory.

There are two mechanisms used to propagate the configurations between Routing Engines within a router or switch:

- Synchronization—Propagates a configuration from one Routing Engine to a second Routing Engine within the same router or switch chassis.

**NOTE:** The QFX3500 switch has only one Routing Engine.

To synchronize configurations, use the **commit synchronize** CLI command. If one of the Routing Engines is locked, the synchronization fails. If synchronization fails because of a locked configuration file, you can use the **commit synchronize force** command. This command overrides the lock and synchronizes the configuration files.

- Distribution—Propagates a configuration across the routing plane on a multichassis router or switch. Distribution occurs automatically. There is no user command available to control the distribution process. If a configuration is locked during a distribution of a configuration, the locked configuration does not receive the distributed configuration file, so the synchronization fails. You need to clear the lock before the configuration and resynchronize the routing planes.

**NOTE:** When you use the **commit synchronize force** CLI command on a multichassis platform, the forced synchronization of the configuration files does not affect the distribution of the configuration file across the routing plane. If a configuration file is locked on a router or switch remote from the router or switch where the command was issued, the synchronization fails on the remote router or switch. You need to clear the lock and reissue the **synchronization** command.

## Understanding Configuration Files

A configuration file stores the complete configuration of a switch. The current configuration of a switch is called the active configuration. You can alter this current configuration and you can also return to a previous configuration or to a rescue configuration.

Juniper Networks Junos OS saves the 50 most recently committed configuration files on a switch so that you can return to a previous configuration. The configuration files are named:

- **juniper.conf.gz**—The current active configuration.
- **juniper.conf.1.gz** to **juniper.conf.49.gz**—Rollback configurations.

To make changes to the configuration file, you have to work in the configuration mode in the CLI. When making changes to a configuration file, you are viewing and changing the candidate configuration file. The candidate configuration allows you to make configuration changes without causing operational changes to the active configuration or causing potential damage to your current network operations. Once you commit the changes made to the candidate configuration, the system updates the active configuration.

## Understanding How the Junos OS Configuration Is Stored

When you edit a configuration, you work in a copy of the current configuration to create a candidate configuration. The changes you make to the candidate configuration are visible in the CLI immediately, so if multiple users are editing the configuration at the same time, all users can see all changes.

To have a candidate configuration take effect, you *commit* the changes. At this point, the candidate file is checked for proper syntax, activated, and marked as the current, operational software configuration file. If multiple users are editing the configuration, when you commit the candidate configuration, all changes made by all the users take effect.

In addition to saving the current configuration, the CLI saves the current operational version and the previous 49 versions of committed configurations. The most recently committed configuration is version 0, which is the current operational version and the default configuration that the system returns to if you roll back to a previous configuration. The oldest saved configuration is version 49.

By default, the Junos OS saves the current configuration and three previous versions of the committed configuration on the CompactFlash card. The currently operational Junos OS configuration is stored in the file **juniper.conf.gz**, and the last three committed configurations are stored in the files **juniper.conf.1.gz**, **juniper.conf.2.gz**, and **juniper.conf.3.gz**. These four files are located in the router or switch's CompactFlash card in the directory **/config**.

The remaining 46 previous versions of committed configurations, the files **juniper.conf.4** through **juniper.conf.49**, are stored in the directory **/var/db/config** on the hard disk.

### Comparing Configuration Changes with a Prior Version

In configuration mode only, when you have made changes to the configuration and want to compare the candidate configuration with a prior version, you can use the **compare** command to display the configuration. The **compare** command compares the candidate configuration with either the current committed configuration or a configuration file and displays the differences between the two configurations. To compare configurations, specify the **compare** command after the pipe:

[edit]

```
user@host# show | compare (filename| rollback n)
```

**filename** is the full path to a configuration file. The file must be in the proper format: a hierarchy of statements.

**n** is the index into the list of previously committed configurations. The most recently saved configuration is number 0, and the oldest saved configuration is number 49. If you do not specify arguments, the candidate configuration is compared against the active configuration file (`/config/juniper.conf`).

The comparison output uses the following conventions:

- Statements that are only in the candidate configuration are prefixed with a plus sign (+).
- Statements that are only in the comparison file are prefixed with a minus sign (-).
- Statements that are unchanged are prefixed with a single blank space ( ).

The following example shows various changes, then a comparison of the candidate configuration with the active configuration, showing only the changes made at the **[edit protocols bgp]** hierarchy level:

```
[edit]
user@host# edit protocols bgp
[edit protocols bgp]
user@host# show
group my-group {
  type internal;
  hold-time 60;
  advertise-inactive;
  allow 1.1.1.1/32;
}
group fred {
  type external;
  peer-as 33333;
  allow 2.2.2.2/32;
}
group test-peers {
  type external;
  allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# set group my-group hold-time 90
[edit protocols bgp]
user@host# delete group my-group advertise-inactive
[edit protocols bgp]
user@host# set group fred advertise-inactive
[edit protocols bgp]
user@host# delete group test-peers
[edit protocols bgp]
user@host# show | compare
[edit protocols bgp group my-group]
-hold-time 60;
+hold-time 90;
-advertise-inactive;
```

```
[edit protocols bgp group fred]
+advertise-inactive;
[edit protocols bgp]
-group test-peers {
  -type external;
  -allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# show
group my-group {
  type internal;
  hold-time 90;
  allow 1.1.1.1/32;
}
group fred {
  type external;
  advertise-inactive;
  peer-as 3333;
  allow 2.2.2.2/32;
}
```

## Compressing the Current Configuration File

By default, the current operational configuration file is compressed, and is stored in the file **juniper.conf.gz**, in the **/config** file system, along with the last three committed versions of the configuration. If you have large networks, the current configuration file might exceed the available space in the **/config** file system. Compressing the current configuration file enables the file to fit in the file system, typically reducing the size of the file by 90 percent. You might want to compress your current operation configuration files when they reach 3 megabytes (MB) in size.

When you compress the current configuration file, the names of the configuration files change. To determine the size of the files in the **/config** file system, issue the **file list /config detail** command.

**NOTE:** We recommend that you compress the configuration files (this is the default) to minimize the amount of disk space that they require.

- If you want to compress the current configuration file, include the **compress-configuration-files** statement at the **[edit system]** hierarchy level:

```
[edit system]
compress-configuration-files;
```

Commit the current configuration file to include the **compression-configuration-files** statement. Commit the configuration again to compress the current configuration file:

```
[edit system]
user@host# set compress-configuration-files
user@host# commit
```

```
commit complete
user@host# commit
commit complete
```

- If you do not want to compress the current operational configuration file, include the **no-compress-configuration-files** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-compression-configuration-files;
```

Commit the current configuration file to include the **no-compress-configuration-files** statement. Commit the configuration again to uncompress the current configuration file:

```
[edit system]
user@host# commit
commit complete
user@host# commit
commit complete
```

## Creating and Returning to a Rescue Configuration

A *rescue configuration* allows you to define a known working configuration or a configuration with a known state that you can roll back to at any time. This alleviates the necessity of having to remember the rollback number with the **rollback** command. You use the rescue configuration when you need to roll back to a known configuration or as a last resort if your router or switch configuration and the backup configuration files become damaged beyond repair.

To save the most recently committed configuration as the rescue configuration so that you can return to it at any time, issue the **request system configuration rescue save** command:

```
user@host> request system configuration rescue save
```

To return to the rescue configuration, use the **rollback rescue** configuration mode command:

```
[edit]
user@host# rollback rescue
load complete
```

**NOTE:** If the rescue configuration does not exist, or if the rescue configuration is not a complete, viable configuration, the **rollback** command fails, an error message appears, and the current configuration remains active.

To activate the rescue configuration that you have loaded, use the **commit** command:

```
[edit]
user@host# rollback rescue
```

```
load complete
[edit]
user@host# commit
```

To delete an existing rescue configuration, issue the **request system configuration rescue delete** command:

```
user@host> request system configuration rescue delete
user@host>
```

For more information about the **request system configuration rescue delete** and **request system configuration rescue save** commands, see the [CLI Explorer](#).

- [Comparing Configuration Changes with a Prior Version on page 1245](#)
  - [Saving a Configuration to a File on page 1257](#)

## Loading a Configuration from a File

You can create a file, copy the file to the local router, and then load the file into the CLI. After you have loaded the file, you can commit it to activate the configuration on the router, or you can edit the configuration interactively using the CLI and commit it at a later time.

You can also create a configuration while typing at the terminal and then load it. Loading a configuration from the terminal is generally useful when you are cutting existing portions of the configuration and pasting them elsewhere in the configuration.

To load an existing configuration file that is located on the router, use the **load** configuration mode command:

```
[edit]
user@host# load (factory-default | merge | override | patch | replace | set | update)
filename <relative>
```

For information about specifying the filename, see *Viewing Files and Directories on a Device Running Junos OS*.

To load a configuration from the terminal, use the following version of the **load** configuration mode command. Press Ctrl-d to end input.

```
[edit]
user@host# load (factory-default | merge | override | patch | replace | set | update)
terminal <relative>
```

To replace an entire configuration, specify the **override** option at any level of the hierarchy. A **load override** operation completely replaces the current candidate configuration with the file you are loading. Thus, if you saved a complete configuration, use this option.

An **override** operation discards the current candidate configuration and loads the configuration in **filename** or the configuration that you type at the terminal. When you use the **override** option and commit the configuration, all system processes reparse the configuration. For an example, see [Figure 13 on page 1277](#).

To replace portions of a configuration, specify the **replace** option. The **load replace** operation looks for **replace:** tags that you added to the loaded file, and replaces the parts of the candidate configuration with whatever is specified after the tag. This is useful when you want more control over exactly what is being changed. For this operation to work, you must include **replace:** tags in the file or configuration you type at the terminal. The software searches for the **replace:** tags, deletes the existing statements of the same name, if any, and replaces them with the incoming configuration. If there is no existing statement of the same name, the **replace** operation adds to the configuration the statements marked with the **replace:** tag. For an example, see [Figure 14 on page 1278](#).

If, in an **override** or **merge** operation, you specify a file or type text that contains **replace:** tags, the **replace:** tags are ignored and the **override** or **merge** operation is performed.

If you are performing a **replace** operation and the file you specify or text you type does not contain any **replace:** tags, the **replace** operation is effectively equivalent to a **merge** operation. This might be useful if you are running automated scripts and cannot know in advance whether the scripts need to perform a **replace** or a **merge** operation. The scripts can use the **replace** operation to cover either case.

The **load merge** operation adds the saved file to the existing candidate configuration. This is useful if you are adding new configuration sections. For example, suppose that you are adding a BGP configuration to the **[edit protocols]** hierarchy level, where there was no BGP configuration before, you can use the **load merge** operation to combine the saved file configuration to the existing candidate configuration. If the existing configuration and the incoming configuration contain conflicting statements, the statements in the incoming configuration override those in the existing configuration.

To replace only the configuration that has changed, specify the **update** option at any level of the hierarchy. The **load update** operation compares the candidate configuration and the file you are loading, and only changes the parts of the candidate configuration that are different from the new configuration. You would use this, for example, if there is an existing BGP configuration and the file you are loading changes it in some way.

To change part of the configuration with a patch file, specify the **patch** option. The **load patch** operation loads a file or terminal input that contains configuration changes. First, on a device that already has the configuration changes, you type the **show | compare** command to output the differences between two configurations. Then you can load the differences on another router. The advantage of the **load patch** command is that it saves you from having to copy snippets from different hierarchy levels into a text file prior to loading them into the target device. This might be a useful time saver if you are configuring several devices with the same options. For example, suppose that you configure a routing policy on Device router1 and you want to replicate the policy configuration on Device router2, router3, and router4, you can use the **load patch** operation.

First, run the **show | compare** command.

```
user@router1# show | compare rollback 3
[edit protocols ospf]
+ export default-static;
- export static-default
[edit policy-options]
+ policy-statement default-static {
```

```
+      from protocol static;
+      then accept;
+  }
```

Copy the output of the **show | compare** command to the clipboard, making sure to include the hierarchy levels. On Device router2, router3, and router4, type **load patch terminal** and paste the output. Press Enter and then press Ctrl-d to end the operation. If the patch input specifies different values for an existing statement, the patch input overrides the existing statement.

To use the **merge**, **replace**, **set**, or **update** option without specifying the full hierarchy level, specify the **relative** option. For example:

```
[edit system]
user@host# show static-host-mapping
bob sysid 987.654.321ab
[edit system]
user@host# load replace terminal relative
[Type ^D at a new line to end input]
replace: static-host-mapping {
  bob sysid 0123.456.789bc;
}
load complete
[edit system]
user@host# show static-host-mapping
bob sysid 0123.456.789bc;
```

To load a configuration that contains the **set** configuration mode command, specify the **set** option. This option executes the configuration instructions line by line as they are stored in a file or from a terminal. The instructions can contain any configuration mode command, such as **set**, **edit**, **exit**, and **top**. For an example, see [Figure 17 on page 1279](#).

To copy a configuration file from another network system to the local router, you can use the SSH and Telnet utilities, as described in the [CLI Explorer](#).

**NOTE:** If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

```
load merge
load replace
load override
load update
```

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*.

#### Related Documentation

- [Examples: Loading a Configuration from a File on page 1277](#)

## Loading a Previous Configuration File

You can use the **rollback** <*number*> command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

### Syntax

**rollback** <*number*>

### Options

- **none**—Return to the most recently saved configuration.
- **number**—Configuration to return to.
  - **Range:** 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default:** 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
user@switch# commit
```

**Related Documentation**

- [Configuration File Terms on page 11](#)

## Returning to the Most Recently Committed Junos OS Configuration

To return to the most recently committed configuration and load it into configuration mode without activating it, use the **rollback** configuration mode command:

```
[edit]
user@host# rollback

load complete
```

To activate the configuration to which you rolled back, use the **commit** command:

```
[edit]
user@host# rollback
load complete
[edit]
user@host# commit
```

- Related Documentation**

  - [Returning to a Previously Committed Junos OS Configuration on page 1253](#)
  - [Understanding How the Junos OS Configuration Is Stored on page 1243](#)

## Returning to a Previously Committed Junos OS Configuration

This topic explains how you can return to a configuration prior to the most recently committed one, and contains the following sections:

- [Returning to a Configuration Prior to the One Most Recently Committed on page 1253](#)
- [Displaying Previous Configurations on page 1253](#)
- [Comparing Configuration Changes with a Prior Version on page 1254](#)
- [Creating and Returning to a Rescue Configuration on page 1256](#)
- [Saving a Configuration to a File on page 1257](#)

### Returning to a Configuration Prior to the One Most Recently Committed

To return to a configuration prior to the most recently committed one, include the configuration number, 0 through 49, in the **rollback** command. The most recently saved configuration is number 0 (which is the default configuration to which the system returns), and the oldest saved configuration is number 49.

```
[edit]
user@host# rollback number
load complete
```

### Displaying Previous Configurations

To display previous configurations, including the rollback number, date, time, the name of the user who committed changes, and the method of commit, use the **rollback ?** command.

```
[edit]
user@host# rollback ?

|Pipe through a command
[edit]
```

---

### Comparing Configuration Changes with a Prior Version

In configuration mode only, when you have made changes to the configuration and want to compare the candidate configuration with a prior version, you can use the **compare** command to display the configuration. The **compare** command compares the candidate configuration with either the current committed configuration or a configuration file and displays the differences between the two configurations. To compare configurations, specify the **compare** command after the pipe:

```
[edit]
user@host# show | compare (filename) rollback n)
```

***filename*** is the full path to a configuration file. The file must be in the proper format: a hierarchy of statements.

*n* is the index into the list of previously committed configurations. The most recently saved configuration is number 0, and the oldest saved configuration is number 49. If you do not specify arguments, the candidate configuration is compared against the active configuration file (`/config/juniper.conf`).

The comparison output uses the following conventions:

- Statements that are only in the candidate configuration are prefixed with a plus sign (+).
- Statements that are only in the comparison file are prefixed with a minus sign (-).
- Statements that are unchanged are prefixed with a single blank space ( ).

The following example shows various changes, then a comparison of the candidate configuration with the active configuration, showing only the changes made at the **[edit protocols bgp]** hierarchy level:

```
[edit]
user@host# edit protocols bgp
[edit protocols bgp]
user@host# show
group my-group {
    type internal;
    hold-time 60;
    advertise-inactive;
    allow 1.1.1.1/32;
}
group fred {
    type external;
    peer-as 33333;
    allow 2.2.2.2/32;
}
group test-peers {
    type external;
    allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# set group my-group hold-time 90
[edit protocols bgp]
user@host# delete group my-group advertise-inactive
[edit protocols bgp]
user@host# set group fred advertise-inactive
[edit protocols bgp]
user@host# delete group test-peers
[edit protocols bgp]
user@host# show | compare
[edit protocols bgp group my-group]
-hold-time 60;
+hold-time 90;
-advertise-inactive;
[edit protocols bgp group fred]
+advertise-inactive;
[edit protocols bgp]
-group test-peers {
```

```
-type external;  
-allow 3.3.3.3/32;  
}  
[edit protocols bgp]  
user@host# show  
group my-group {  
  type internal;  
  hold-time 90;  
  allow 1.1.1.1/32;  
}  
group fred {  
  type external;  
  advertise-inactive;  
  peer-as 3333;  
  allow 2.2.2.2/32;  
}
```

---

### Creating and Returning to a Rescue Configuration

A *rescue configuration* allows you to define a known working configuration or a configuration with a known state that you can roll back to at any time. This alleviates the necessity of having to remember the rollback number with the **rollback** command. You use the rescue configuration when you need to roll back to a known configuration or as a last resort if your router or switch configuration and the backup configuration files become damaged beyond repair.

To save the most recently committed configuration as the rescue configuration so that you can return to it at any time, issue the **request system configuration rescue save** command:

```
user@host> request system configuration rescue save
```

To return to the rescue configuration, use the **rollback rescue** configuration mode command:

```
[edit]  
user@host# rollback rescue  
load complete
```

**NOTE:** If the rescue configuration does not exist, or if the rescue configuration is not a complete, viable configuration, the rollback command fails, an error message appears, and the current configuration remains active.

---

To activate the rescue configuration that you have loaded, use the **commit** command:

```
[edit]  
user@host# rollback rescue  
load complete  
[edit]  
user@host# commit
```

To delete an existing rescue configuration, issue the **request system configuration rescue delete** command:

```
user@host> request system configuration rescue delete
user@host>
```

For more information about the **request system configuration rescue delete** and **request system configuration rescue save** commands, see the [CLI Explorer](#).

### Saving a Configuration to a File

Save the Junos OS configuration to a file so that you can edit it with a text editor of your choice. You can save your current configuration to an ASCII file, which saves the configuration in its current form, including any uncommitted changes. If more than one user is modifying the configuration, all changes made by all users are saved.

To save software configuration changes to an ASCII file, use the **save** configuration mode command:

```
[edit]
user@host# save filename
[edit]
user@host#
```

The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.

By default, the configuration is saved to a file in your home directory, which is on the flash drive.

When you issue this command from anywhere in the hierarchy (except the top level), a **replace** tag is automatically included at the beginning of the file. You can use the **replace** tag to control how a configuration is loaded from a file.

```
user@host> file show /var/home/user/myconf
replace:
protocols {
  bgp {
    disable;
    group int {
      type internal;
    }
  }
  isis {
    disable;
    interface all {
      level 1 disable;
    }
    interface fxp0.0 {
      disable;
    }
  }
  ospf {
    traffic-engineering;
    reference-bandwidth 4g;
    ...
  }
}
```

## Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. 

```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

- Related Documentation**
- [Understanding Configuration Files on page 1242](#)
  - [Loading a Previous Configuration File on page 1252](#)
  - [Reverting to the Rescue Configuration on page 189](#)

## Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a device and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

```
[edit]
user@switch# load override filename
```
2. Commit your changes.

```
[edit]
user@switch# commit filename
```

- Related Documentation**
- [Setting or Deleting the Rescue Configuration on page 1261](#)
  - [Reverting to the Default Factory Configuration on page 188](#)

## Rolling Back Junos OS Configuration Changes

This topic shows how to use the **rollback** command to return to the most recently committed Junos OS configuration. The **rollback** command is useful if you make configuration changes and then decide not to keep the changes.

The following procedure shows how to configure an SNMP health monitor on a device running Junos OS and then return to the most recently committed configuration that does not include the health monitor. When configured, the SNMP health monitor provides the network management system (NMS) with predefined monitoring for file system usage, CPU usage, and memory usage on the device.

1. Enter configuration mode:

```
user@host> configure
entering configuration mode
[edit]
user@host#
```

2. Show the current configuration (if any) for SNMP:

```
[edit]
user@host# show snmp
```

No **snmp** statements appear because SNMP has not been configured on the device.

3. Configure the health monitor:

```
[edit]
user@host# set snmp health-monitor
```

4. Show the new configuration:

```
[edit]
user@host# show snmp
health-monitor;
```

The **health-monitor** statement indicates that SNMP health monitoring is configured on the device.

5. Enter the **rollback** configuration mode command to return to the most recently committed configuration:

```
[edit]
user@host# rollback
load complete
```

6. Show the configuration again to make sure your change is no longer present:

```
[edit]
user@host# show snmp
```

No **snmp** configuration statements appear. The health monitor is no longer configured.

7. Enter the **commit** command to activate the configuration to which you rolled back:

```
[edit]
```

```
user@host# commit
```

8. Exit configuration mode:

```
[edit]
user@host# exit
Exiting configuration mode
```

You can also use the **rollback** command to return to earlier configurations.

## Saving a Configuration to a File

Save the Junos OS configuration to a file so that you can edit it with a text editor of your choice. You can save your current configuration to an ASCII file, which saves the configuration in its current form, including any uncommitted changes. If more than one user is modifying the configuration, all changes made by all users are saved.

To save software configuration changes to an ASCII file, use the **save** configuration mode command:

```
[edit]
user@host# save filename
[edit]
user@host#
```

The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.

By default, the configuration is saved to a file in your home directory, which is on the flash drive.

When you issue this command from anywhere in the hierarchy (except the top level), a **replace** tag is automatically included at the beginning of the file. You can use the **replace** tag to control how a configuration is loaded from a file.

```
user@host> file show /var/home/user/myconf
replace:
protocols {
  bgp {
    disable;
    group int {
      type internal;
    }
  }
  isis {
    disable;
    interface all {
      level 1 disable;
    }
    interface fxp0.0 {
      disable;
    }
  }
}
```

```

    }
    ospf {
        traffic-engineering;
        reference-bandwidth 4g;
        ...
    }
}

```

## Setting or Deleting the Rescue Configuration

A rescue configuration is user-defined configuration that restores connectivity to the device. You set a current committed configuration to be the rescue configuration through the CLI. If someone inadvertently commits a configuration that denies management access to a device and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration. We recommend that the rescue configuration include the IP address (accessible from the network) for the management port.

To set the current active configuration as the rescue configuration:

```
user@switch> request system configuration rescue save
```

To delete an existing rescue configuration:

```
user@switch> request system configuration rescue delete
```

- [Configuration File Terms on page 11](#)
- [CLI Explorer](#)

## Uploading a Configuration File

You can create a configuration file on your local system, copy the file to the switch, and then load the file into the CLI. After you have loaded the configuration file, you can commit it to activate the configuration on the switch. You can also edit the configuration interactively using the CLI and commit it at a later time.

To upload a configuration file from your local system:

1. Create the configuration file using a text editor such as Notepad, making sure that the syntax of the configuration file is correct. For more information about testing the syntax of a configuration file see the *Junos OS System Basics and Services Command Reference* at <http://www.juniper.net/techpubs/software/junos/index.html>.
2. In the configuration text file, use an option to perform the required action when the file is loaded. [Table 72 on page 1262](#) lists and describes some options for the **load** command.

Table 72: Options for the load Command

Options	Description
<b>merge</b>	Combines the current active configuration and the configuration in the filename you specify or the one that you type at the terminal. A <b>merge</b> operation is useful when you are adding a new section to an existing configuration. If the active configuration and the incoming configuration contain conflicting statements, the statements in the incoming configuration override those in the active configuration.
<b>override</b>	Discards the current candidate configuration and loads the configuration in the filename you specify or the one that you type at the terminal. When you use the <b>override</b> option and commit the configuration, all system processes reparse the configuration. You can use the <b>override</b> option at any level of the hierarchy.
<b>replace</b>	Searches for the <b>replace</b> tags, deletes the existing statements of the same name, if any, and replaces them with the incoming configuration. If there is no existing statement of the same name, the <b>replace</b> operation adds the statements marked with the <b>replace</b> tag to the active configuration.  <b>NOTE:</b> For this operation to work, you must include <b>replace</b> tags in the text file or in the configuration you type at the terminal.

- Press Ctrl+a to select all the text in the configuration file.
- Press Ctrl+c to copy the contents of the configuration text file to the Clipboard.
- Log in to the switch using your username and password.
- To enter configuration mode:  
user@switch> **configure**  
  
You will see this output, with the hash or pound mark indicating configuration mode.  
Entering configuration mode  
[edit]  
user@switch#
- Load the configuration file:  
[edit]  
user@switch# **load merge terminal**
- At the cursor, paste the contents of the Clipboard using the mouse and the Paste icon:  
[edit]  
user@switch# **load merge terminal**  
[Type ^D at a new line to end input]  
>Cursor is here. Paste the contents of the clipboard here<
- Press Enter.
- Press Ctrl+d to set the end-of-file marker.

To view results of the configuration steps before committing the configuration, type the **show** command at the user prompt.

To commit these changes to the active configuration, type the **commit** command at the user prompt. You can also edit the configuration interactively using the CLI and commit it at a later time.

## Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site

You can configure a router or switch to transfer its configuration to an archive file periodically. The following tasks describe how to transfer the configuration to an archive site:

1. [Configuring the Router or Switch to Transfer Its Currently Active Configuration to an Archive on page 1263](#)
2. [Configuring the Transfer Interval for Periodic Transfer of the Active Configuration to an Archive Site on page 1263](#)
3. [Configuring Transfer of the Current Active Configuration When a Configuration Is Committed on page 1264](#)
4. [Configuring Archive Sites for Transfer of Active Configuration Files on page 1264](#)

### Configuring the Router or Switch to Transfer Its Currently Active Configuration to an Archive

If you want to back up your device's current configuration to an archive site, you can configure the router or switch to transfer its currently active configuration by FTP or secure copy (SCP) periodically or after each commit.

To configure the router or switch to transfer its currently active configuration to an archive site, include statements at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
archive-sites {
  ftp://username<:password>@host-address<:port>/url-path;
  scp://username<:password>@host-address<:port>/url-path;
}
transfer-interval interval;
transfer-on-commit;
```

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (") and enclose the IPv6 host address in brackets ([ ]). For example, "ftp://username<:password>@[ipv6-host-address]<:port>/url-path"

### Configuring the Transfer Interval for Periodic Transfer of the Active Configuration to an Archive Site

To configure the router or switch to periodically transfer its currently active configuration to an archive site, include the **transfer-interval** statement at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
transfer-interval interval;
```

The *interval* is a period of time ranging from 15 through 2880 minutes.

## Configuring Transfer of the Current Active Configuration When a Configuration Is Committed

To configure the router or switch to transfer its currently active configuration to an archive site each time you commit a candidate configuration, include the **transfer-on-commit** statement at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
transfer-on-commit;
```

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (") and enclose the IPv6 host address in brackets ( [ ]). For example,  
`"scp://username<:password>@[ipv6-host-address]<:port>/url-path"`

## Configuring Archive Sites for Transfer of Active Configuration Files

When you configure the router or switch to transfer its configuration files, you specify an archive site to which the files are transferred. If you specify more than one archive site, the router or switch attempts to transfer files to the first archive site in the list, moving to the next site only if the transfer fails.

When you use the **archive-sites** statement, you can specify a destination as an FTP URL, or SCP-style remote file specification. The URL type **file://** is also supported.

To configure the archive site, include the **archive-sites** statement at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
archive-sites {
  ftp://username@host:<port>url-path password password;
  scp://username@host:<port>url-path password password;
  file://<path>/<filename>;
}
```

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (") and enclose the IPv6 host address in brackets ( [ ]). For example,  
`"scp://username<:password>@[ipv6-host-address]<:port>/url-path"`

When you specify the archive site, do not add a forward slash (/) to the end of the URL.

The destination filename is saved in the following format, where *n* corresponds to the number of the compressed configuration rollback file that has been archived:

```
<router-name>_juniper.conf.n.gz_YYYYMMDD_HHMMSS
```

.....

**NOTE:** The time included in the destination filename is always in Coordinated Universal Time (UTC) regardless of whether the time on the router is configured as UTC or the local time zone. The default time zone on the router or switch is UTC.

.....

## transfer-interval (Configuration)

---

<b>Syntax</b>	<code>transfer-interval <i>interval</i>;</code>
<b>Hierarchy Level</b>	[edit system archival configuration]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the router or switch to periodically transfer its currently active configuration to an archive site.

**NOTE:** The `edit system archival` hierarchy is not available on QFabric systems.

---

**Options** *interval*—Interval at which to transfer the current configuration to an archive site.  
**Range:** 15 through 2880 minutes

**NOTE:** The `[edit system archival]` hierarchy is not available on QFabric systems.

---

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## transfer-on-commit

<b>Syntax</b>	transfer-on-commit;
<b>Hierarchy Level</b>	[edit system archival configuration]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the router or switch to transfer its currently active configuration to an archive site each time you commit a candidate configuration.

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (") and enclose the IPv6 host address in brackets ([ ]). For example, "ftp://username<:password>@[ipv6-host-address]<:port>/url-path".

**NOTE:** The [edit system archival] hierarchy is not available on QFabric systems.

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Transfer of the Current Active Configuration When a Configuration Is Committed on page 1264</a></li> <li>• <a href="#">archive on page 6780</a></li> <li>• <a href="#">configuration on page 1269</a></li> <li>• <a href="#">transfer-interval on page 1270</a></li> </ul>

## Default Configurations

- [QFX3500 Switch Default Configuration on page 1271](#)

### QFX3500 Switch Default Configuration

Each QFX Series product is programmed with a factory default configuration that contains the values set for each configuration parameter when a switch is shipped. The default configuration file sets values for system parameters such as **syslog** and **commit**, configures storm control and Ethernet switching on all interfaces, and enables IGMP snooping, RSTP, and LLDP protocols.

When you commit changes to the configuration, a new configuration file is created, which becomes the active configuration. You can always revert to the factory default configuration if you need to.

The following factory default configuration file is for a QFX3500 switch with 48 ports:

**NOTE:** In this example, xe-0/0/0 through xe-0/0/47 are the network interface ports.

```
protocols {
  igmp-snooping {
    vlan all;
  }
  rstp;
  lldp {
    interface all;
  }
}
interfaces {
  xe-0/0/0 {

## clear log

---

<b>Syntax</b>	<code>clear log <i>filename</i></code> <code>&lt;all&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Remove contents of a log file.
<b>Options</b>	<i>filename</i> —Name of the specific log file to delete.  <code>all</code> —(Optional) Delete the specified log file and all archived versions of it.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show log on page 948</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear log on page 1282</a>
<b>Output Fields</b>	See <a href="#">file list</a> for an explanation of output fields.

## Sample Output

### clear log

The following sample commands list log file information, clear the contents of a log file, and then display the updated log file information:

```
user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r-----  1 root  wheel          26450 Jun 23 18:47 /var/log/sampled
total 1

user@host> clear log lcc0-re0:sampled
lcc0-re0:
-----

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r-----  1 root  wheel           57 Sep 15 03:44 /var/log/sampled
total 1
```

## clear system commit

---

<b>Syntax</b>	clear system commit
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear any pending commit operation.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	maintenance (or the actual user who scheduled the commit)
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show system commit on page 1001</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear system commit on page 1283</a> <a href="#">clear system commit (None Pending) on page 1283</a> <a href="#">clear system commit (User Does Not Have Required Privilege Level) on page 1283</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### clear system commit

```
user@host> clear system commit
Pending commit cleared.
```

#### clear system commit (None Pending)

```
user@host> clear system commit
No commit scheduled.
```

#### clear system commit (User Does Not Have Required Privilege Level)

```
user@host> clear system commit
error: Permission denied
```

## file archive

---

<b>Syntax</b>	<code>file archive destination <i>destination</i> source <i>source</i> &lt;compress&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.
<b>Options</b>	<p><b>destination <i>destination</i></b>—Destination of the archived file or files. Specify the destination as a URL or filename. The Junos OS adds one of the following suffixes if the destination filename does not already have it:</p> <ul style="list-style-type: none"><li>• For archived files—The suffix <b>.tar</b></li><li>• For archived and compressed files—The suffix <b>.tgz</b></li></ul> <p><b>source <i>source</i></b>—Source of the original file or files. Specify the source as a URL or filename.</p> <p><b>compress</b>—(Optional) Compress the archived file with the GNU zip (gzip) compression utility. The compressed files have the suffix <b>.tgz</b>.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Format for Specifying Filenames and URLs in Junos OS CLI Commands on page 42</a></li></ul>
<b>List of Sample Output</b>	<a href="#">file archive (Multiple Files) on page 1284</a> <a href="#">file archive (Single File) on page 1284</a> <a href="#">file archive (with Compression) on page 1285</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file archive (Multiple Files)

The following sample command archives all message files in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host>
```

### file archive (Single File)

The following sample command archives one message file in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host
```

### file archive (with Compression)

The following sample command archives and compresses all message files in the local directory **/var/log/messages** as the single file **messages-archive.tgz**.

```
user@host> file archive compress source /var/log/messages* destination
/var/log/messages-archive.tgz
/usr/bin/tar: Removing leading / from absolute path names in the archive.
```

## file checksum md5

---

<b>Syntax</b>	<code>file checksum md5 &lt;pathname&gt; filename</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Calculate the Message Digest 5 (MD5) checksum of a file.
<b>Options</b>	<b>pathname</b> —(Optional) Path to a filename.  <b>filename</b> —Name of a local file for which to calculate the MD5 checksum.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Checksum Hashes for a Commit Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Configuring Checksum Hashes for an Event Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Configuring Checksum Hashes for an Op Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Executing an Op Script from a Remote Site</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <a href="#">file checksum sha-256 on page 365</a></li><li>• <a href="#">file checksum sha1 on page 364</a></li><li>• <i>op</i></li></ul>
<b>List of Sample Output</b>	<a href="#">file checksum md5 on page 1286</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### file checksum md5

```
user@host> file checksum md5 jbundle-5.3R2.4-export-signed.tgz
MD5 (jbundle-5.3R2.4-export-signed.tgz) = 2a3b69e43f9bd4893729cc16f505a0f5
```

## file checksum sha1

<b>Syntax</b>	<code>file checksum sha1 &lt;pathname&gt; filename</code>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.5.</p> <p>Command introduced in Junos OS Release 9.5 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Calculate the Secure Hash Algorithm (SHA-1) checksum of a file.
<b>Options</b>	<p><b>pathname</b>—(Optional) Path to a filename.</p> <p><b>filename</b>—Name of a local file for which to calculate the SHA-1 checksum.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Checksum Hashes for a Commit Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• <i>Configuring Checksum Hashes for an Event Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• <i>Configuring Checksum Hashes for an Op Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• <i>Executing an Op Script from a Remote Site</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• <a href="#">file checksum md5 on page 363</a></li> <li>• <a href="#">file checksum sha-256 on page 365</a></li> <li>• <i>op</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">file checksum sha1 on page 1287</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file checksum sha1

```
user@host> file checksum sha1 /var/db/scripts/opscript.slax
```

```
SHA1 (/var/db/scripts/commitscript.slax) = ba9e47120c7ce55cff29afd73eacd370e162c676
```

## file checksum sha-256

---

<b>Syntax</b>	<code>file checksum sha-256 &lt;pathname&gt; filename</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.5. Command introduced in Junos OS Release 9.5 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Calculate the Secure Hash Algorithm 2 family (SHA-256) checksum of a file.
<b>Options</b>	<b>pathname</b> —(Optional) Path to a filename.  <b>filename</b> —Name of a local file for which to calculate the SHA-256 checksum.
<b>Required Privilege Level</b>	maintenance view view-configuration
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Checksum Hashes for a Commit Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Configuring Checksum Hashes for an Event Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Configuring Checksum Hashes for an Op Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Executing an Op Script from a Remote Site</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <a href="#">file checksum md5 on page 363</a></li><li>• <a href="#">file checksum sha1 on page 364</a></li><li>• <i>op</i></li></ul>
<b>List of Sample Output</b>	<a href="#">file checksum sha-256 on page 1288</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### file checksum sha-256

```
user@host> file checksum sha-256 /var/db/scripts/commitscript.slax

SHA256 (/var/db/scripts/commitscript.slax) =
94c2b061fb55399e15babd2529453815601a602b5c98e5c12ed929c9d343dd71
```

## file compare

<b>Syntax</b>	<pre>file compare (files <i>filename filename</i>) &lt;context   unified&gt; &lt;ignore-white-space&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Compare two local files and describe the differences between them in default, context, or unified output styles:</p> <ul style="list-style-type: none"> <li>• <b>Default</b>—In the first line of output, <b>c</b> means lines were changed between the two files, <b>d</b> means lines were deleted between the two files, and <b>a</b> means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (&lt;) in front of output lines refers to the first file. A right angle bracket (&gt;) in front of output lines refers to the second file.</li> <li>• <b>Context</b>—The display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (!) have changed. Additions are marked with a plus sign (+), and deletions are marked with a minus sign (-).</li> <li>• <b>Unified</b>—The display is preceded by the line number from the first and the second file (xx,xxx,x). Before the line number, additions to the file are marked with a plus sign (+), and deletions to the file are marked with a minus sign (-). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.</li> </ul>
<b>Options</b>	<p><b>files <i>filename</i></b>—Names of two local files to compare.</p> <p><b>context</b>—(Optional) Display output in context format.</p> <p><b>ignore-white-space</b>—(Optional) Ignore changes in the amount of white space.</p> <p><b>unified</b>—(Optional) Display output in unified format.</p>
<b>Required Privilege Level</b>	none
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Format for Specifying Filenames and URLs in Junos OS CLI Commands on page 42</a></li> <li>• <a href="#">Viewing Core Files from Junos OS Processes on page 196</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">file compare files on page 1290</a></p> <p><a href="#">file compare files context on page 1290</a></p> <p><a href="#">file compare files unified on page 1290</a></p> <p><a href="#">file compare files unified ignore-white-space on page 1290</a></p>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file compare files

```
user@host> file compare files /tmp/one /tmp/two
100c100
<          full-name "File 1";
---
>          full-name "File 2";
102c102
<          class foo; # 'foo' is not defined
---

## file delete

---

<b>Syntax</b>	<code>file delete <i>filename</i></code> <code>&lt;purge&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Delete a file on the local router or switch.
<b>Options</b>	<b><i>filename</i></b> —Name of the file to delete. For a routing matrix, include chassis information in the filename if the file to be deleted is not local to the Routing Engine from which the command is issued.  <b><i>purge</i></b> —(Optional) Overwrite regular files before deleting them.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file delete on page 1292</a> <a href="#">file delete (Routing Matrix) on page 1292</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file delete

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete /var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

### file delete (Routing Matrix)

```
user@host> file list lcc0-re0:/var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete lcc0-re0:/var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

## file list

<b>Syntax</b>	file list <detail   recursive> <filename>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display a list of files on the local router or switch.
<b>Options</b>	<p><b>none</b>—Display a list of all files for the current directory.</p> <p><b>detail   recursive</b>—(Optional) Display detailed output or descend recursively through the directory hierarchy, respectively.</p> <p><b>filename</b>—(Optional) Display a list of files. For a routing matrix, the filename must include the chassis information.</p>
<b>Additional Information</b>	The default directory is the home directory of the user logged in to the router or switch. To view available directories, enter a space and then a backslash (/) after the <b>file list</b> command. To view files within a specific directory, include a backslash followed by the directory and, optionally, subdirectory name after the <b>file list</b> command.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file list on page 1293</a> <a href="#">file list (Routing Matrix) on page 1293</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file list

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core
```

### file list (Routing Matrix)

```
user@host> file list lcc0-re0:var/tmp
lcc0-re0:
-----
/var/tmp/:

## file rename

<b>Syntax</b>	<code>file rename <i>source destination</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Rename a file on the local router or switch.
<b>Options</b>	<i>destination</i> —New name for the file.  <i>source</i> —Original name of the file. For a routing matrix, the filename must include the chassis information.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file rename on page 1295</a> <a href="#">file rename (Routing Matrix) on page 1295</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file rename

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

### file rename (Routing Matrix)

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:
-----

/var/tmp:
.pccardd
sartre.conf
snmpd
syslogd.core-tarball.0.tgz
```

```
user@host> file rename lcc0-re0:/var/tmp/snmpd /var/tmp/snmpd.rr
```

```
user@host> file list lcc0-re1:/var/tmp
```

```
lcc0-re1:
```

```
-----
```

```
/var/tmp:
```

```
.pccardd
```

```
sartre.conf
```

```
snmpd.rr
```

```
syslogd.core-tarball.0.tgz
```

## file show

<b>Syntax</b>	<code>file show <i>filename</i></code> <code>&lt;encoding (base64   raw)&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the contents of a file.
<b>Options</b>	<b><i>filename</i></b> —Name of a file. For a routing matrix, the filename must include the chassis information.  <b><code>encoding (base64   raw)</code></b> —(Optional) Encode file contents with base64 encoding or show raw text.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file show on page 1297</a> <a href="#">file show (Routing Matrix) on page 1297</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file show

```
user@host> file show /var/log/messages
Apr 13 21:00:08 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:00:40 romney /kernel: so-1/1/2: loopback suspected; going to standby.

terminal:4:(11) statement must contain additional statements: ;
[edit system login]
    'login ;'
      statement must contain additional statements
configuration syntax failed

```

## CHAPTER 10

# Troubleshooting

- [Troubleshooting Procedures on page 1311](#)

## Troubleshooting Procedures

---

- [Loading a Previous Configuration File on page 1311](#)
- [Reverting to the Default Factory Configuration on page 1312](#)
- [Reverting to the Rescue Configuration on page 1312](#)

### Loading a Previous Configuration File

You can use the **rollback** *<number>* command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

#### Syntax

**rollback** *<number>*

#### Options

- **none**—Return to the most recently saved configuration.
- **number**—Configuration to return to.
  - **Range:** 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default:** 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
```

```
user@switch# commit
```

- Related Documentation**
- [Configuration File Terms on page 11](#)

## Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. 

```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

- Related Documentation**
- [Understanding Configuration Files on page 1242](#)
  - [Loading a Previous Configuration File on page 1252](#)
  - [Reverting to the Rescue Configuration on page 189](#)

## Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a device and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

```
[edit]
user@switch# load override filename
```
2. Commit your changes.

```
[edit]
user@switch# commit filename
```

## Software Overview

---

- [Understanding Software Infrastructure and Processes on page 1315](#)

## Understanding Software Infrastructure and Processes

Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the switch.

Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

Using the Junos OS command-line interface (CLI), you configure switching features and set the properties of network interfaces. After activating a software configuration, use either the Junos Space or CLI user interface to monitor, manage operations, and diagnose protocol and network connectivity problems.

- [Routing Engine and Packet Forwarding Engine on page 1315](#)
- [Junos OS Processes on page 1316](#)

## Routing Engine and Packet Forwarding Engine

---

A switch has two primary software processing components:

- **Packet Forwarding Engine**—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- **Routing Engine**—Provides three main functions:
  - Creates the packet forwarding switch, which provides route lookup, filtering, and switching on incoming data packets, and then directs outbound packets to the appropriate interface for transmission to the network.
  - Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.

- Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

### Junos OS Processes

Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS for added flexibility.

Table 7 on page 30 describes the primary Junos OS processes.

**Table 74: Junos OS Processes**

Process	Name	Description
Chassis process	chassisd	<p>Detects hardware on the system that is used to configure network interfaces.</p> <p>Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered.</p> <p>Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</p>
DNS Server process	named-service	Resolves hostnames into addresses.
Dynamic Host Configuration Protocol (DHCP) process	dhcp-service	Enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.
Ethernet switching process	eswd	<p>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree Protocol, and access port security.</p> <p>Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</p>
Firewall management process	firewall	Manages the firewall configuration and helps accept or reject packets that are transiting an interface on a switch.
Forwarding process	pfem	Defines how routing protocols operate on the partition. The overall performance of the partition is largely determined by the effectiveness of the forwarding process.
Interface process	dcd	Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.
Integrated Local Management Interface (ILMI) process	ilmi	Provides bidirectional exchange of management information between two ATM interfaces across a physical connection.
Link Management Protocol (LMP) process	link-management	Establishes and maintains LMP control channels.

Table 74: Junos OS Processes (*continued*)

Process	Name	Description
Management process	mgd	<p>Provides communication between the other processes and an interface to the configuration database.</p> <p>Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured.</p> <p>Interacts with the other processes when commands are issued through one of the user interfaces on the partition.</p> <p>If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</p>
Multicast snooping process	<del>multicast</del> snooping	Makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.
Secure Neighbor Discovery (SEND) Protocol process	send	Protects Neighbor Discovery Protocol (NDP) messages.
Simple Network Management Protocol (SNMP) process	snmp	Enables the monitoring of network devices from a central location and provides the switch's SNMP master agent.
Tunnel OAM process	tunnel-oamd	Enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.
Virtual Router Redundancy Protocol (VRRP) process	vrrp	Enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

## Overview of Template Accounts for RADIUS and TACACS+ Authentication

When you use local password authentication, you must create a local user account for every user who wants to access the system. However, when you are using RADIUS or TACACS+ authentication, you can create single accounts (for authorization purposes) that are shared by a set of users. You create these accounts using the remote and local user template accounts. When a user is using a template account, the command-line interface (CLI) username is the login name; however, the privileges, file ownership, and effective user ID are inherited from the template account.

## Understanding Login Authentication

You can control access to your network using several different authentication methods—media access control (MAC) RADIUS, for example. Authentication prevents unauthorized devices and users from gaining access to your LAN. For MAC RADIUS authentication, end devices must be authenticated before they receive an IP address from a DHCP server.

You can enable end devices to access the network without authenticating on the RADIUS server by configuring the MAC address of the end device in the static MAC bypass list by configuring the MAC address using the **authentication-whitelist** statement.

You can configure one or more authentication methods on a single interface and thereby enable fallback to the next method if the first or second method is unsuccessful.

On a single interface you can configure one or a combination of several authentication methods.

This topic covers:

- [MAC RADIUS Authentication on page 1319](#)

## MAC RADIUS Authentication

You can configure MAC RADIUS authentication on interfaces that are connected to end devices.

The EAP method supported for MAC RADIUS authentication is EAP-MD5.

When you configure the **mac-radius restrict** option, the switch immediately attempts a MAC- RADIUS authentication by sending a request to the RADIUS server for authentication of the MAC address of the end device. If MAC address of the end device is configured for RADIUS authentication, LAN access between the two switches is created.

## Understanding LLDP

The device uses Link Layer Discovery Protocol (LLDP) to learn and distribute device information on network links. The information enables the switch to identify a variety of devices quickly. This quick identification results in a LAN that interoperates smoothly and efficiently.

LLDP-capable devices transmit information in type, length, and value (TLV) messages to neighbor devices. Device information can include specifics, such as chassis and port identification and system name and system capabilities. The TLVs leverage this information from parameters that have already been configured in Junos OS.

The device supports the following basic TLVs:

- **Chassis Identifier**—The MAC address associated with the local system.
- **Port Identifier**—The port identification for the specified port in the local system.
- **Port Description**—The user-configured port description. The port description can be a maximum of 256 characters.
- **System Name**—The user-configured name of the local system. The system name can be a maximum of 256 characters.
- **System Description**—The system description containing information about the software and current image running on the system. This information cannot be configured, but is taken from the software.
- **System Capabilities**—The primary function performed by the system. The capabilities that system supports are defined; for example, bridge or router. This information cannot be configured, but is based on the model of the product.
- **Management Address**—The IP management address of the local system.

The device supports the following 802.3 TLVs:

- **Power via MDI**—A TLV that advertises media dependent interface (MDI) power support, power source equipment (PSE) power pair, and power class information.
- **MAC/PHY Configuration Status**—A TLV that advertises information about the physical interface, such as autonegotiation status and support and MAU type. The information cannot be configured, but is based on the physical interface structure.
- **Link Aggregation**—A TLV that advertises whether the port is aggregated and its aggregated port ID.
- **Maximum Frame Size**—A TLV that advertises the Maximum Transmission Unit (MTU) of the interface sending LLDP frames.
- **Port Vlan**—A TLV that advertises the VLAN name configured on the interface.

**Related  
Documentation**

- [Configuring LLDP on page 1345](#)

## Understanding RADIUS Accounting

Devices support IETF RFC 2866, *RADIUS Accounting*. Configuring RADIUS accounting on the device supports collecting statistical data about users logging in to or out from a LAN and sending the data to a RADIUS accounting server. The statistical data gathered can be used for general network monitoring, analyzing and tracking usage patterns, or billing a user based upon the amount of time or type of services accessed.

To configure RADIUS accounting, specify one or more RADIUS accounting servers to receive the statistical data from the device, and select the type of accounting data to be collected.

The RADIUS accounting server you specify can be the same server used for RADIUS authentication, or it can be a separate RADIUS server. You can specify a list of RADIUS accounting servers. If the primary server (the first one configured) is unavailable, each RADIUS server in the list is tried in the order in which they are configured in the Junos OS.

The RADIUS accounting process between the device and a RADIUS server works like this:

1. A RADIUS accounting server listens for User Datagram Protocol (UDP) packets on a specific port. For example, on FreeRADIUS, the default port is 1813.
2. The device forwards an *accounting-request* packet containing an event record to the accounting server. The event record associated with this supplicant contains an *Acct-Status-Type* attribute whose value indicates the beginning of user service for this supplicant. When the supplicant's session ends, the accounting request contains an *Acct-Status-Type* attribute value indicating the end of user service. The RADIUS accounting server records this as a stop-accounting record containing session information and the length of the session.
3. The RADIUS accounting server logs these events in a file as start-accounting or stop-accounting records. On FreeRADIUS, the filename is the server's address; for example, 122.69.1.250.

4. The accounting server sends an *accounting-response* packet back to the device confirming it has received the accounting request.
5. If the device does not receive a response from the server, it continues to send accounting requests until an accounting response is returned from the accounting server.

The statistics collected through this process can be displayed from the RADIUS server; to see those statistics, the user accesses the log file configured to receive them.

**Related Documentation**

- [Configuring RADIUS System Accounting on page 1349](#)

## Understanding VSAs

Devices support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific attributes (VSAs) and are described in RFC 2138, *Remote Authentication Dial In User Service (RADIUS)*.

Through VSAs, you can configure port-filtering attributes on the RADIUS server. VSAs are cleartext fields sent from the RADIUS server to the device as a result of authentication success or failure. Authentication prevents unauthorized user access by blocking a supplicant at the port until the device is authenticated by the RADIUS server. The VSA attributes are interpreted by the device during authentication, and the device takes appropriate actions. Implementing port-filtering attributes with authentication on the RADIUS server provides a central location for controlling LAN access for supplicants.

These port-filtering attributes specific to Juniper Networks are encapsulated in a RADIUS server VSA with the vendor ID set to the Juniper Networks ID number, 2636.

As well as configuring port-filtering attributes through VSAs, you can apply a port firewall filter that has already been configured on the device directly to the RADIUS server. Like port-filtering attributes, the filter is applied during the authentication process, and its actions are applied at the device port. Adding a port firewall filter to a RADIUS server eliminates the need to add the filter to multiple ports and devices.

## Juniper Networks Vendor-Specific RADIUS Attributes

Junos OS supports the configuration of Juniper Networks RADIUS vendor-specific attributes (VSAs). These VSAs are encapsulated in a RADIUS vendor-specific attribute with the vendor ID set to the Juniper Networks ID number, 2636. [Table 75 on page 1322](#) lists the Juniper Networks VSAs you can configure.

Table 75: Juniper Networks Vendor-Specific RADIUS Attributes

Name	Description	Type	Length	String
Juniper-Local-User-Name	Indicates the name of the user template used by this user when logging in to a device. This attribute is used only in Access-Accept packets.	1	≥3	One or more octets containing printable ASCII characters.
Juniper-Allow-Commands	Contains an extended regular expression that enables the user to run operational mode commands in addition to the commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	2	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">“Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands”</a> on page 1339.
Juniper-Deny-Commands	Contains an extended regular expression that denies the user permission to run operation mode commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	3	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">“Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands”</a> on page 1339.
Juniper-Allow-Configuration	Contains an extended regular expression that enables the user to run configuration mode commands in addition to the commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	4	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">“Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies”</a> on page 1338.
Juniper-Deny-Configuration	Contains an extended regular expression that denies the user permission to run configuration commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	5	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">“Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies”</a> on page 1338.
Juniper-Interactive-Command	Indicates the interactive command entered by the user. This attribute is used only in Accounting-Request packets.	8	≥3	One or more octets containing printable ASCII characters.

Table 75: Juniper Networks Vendor-Specific RADIUS Attributes (*continued*)

Name	Description	Type	Length	String
Juniper-Configuration-Change	Indicates the interactive command that results in a configuration (database) change. This attribute is used only in Accounting-Request packets.	9	≥3	One or more octets containing printable ASCII characters.
Juniper-User-Permissions	<p>Contains information the server uses to specify user permissions. This attribute is used only in Access-Accept packets.</p> <p><b>NOTE:</b> When the <b>Juniper-User-Permissions</b> attribute is configured to grant the Junos OS <b>maintenance</b> or <b>all</b> permissions on a RADIUS server, the UNIX wheel group membership is not automatically added to a user's list of group memberships. Some operations such as running the <b>su root</b> command from a local shell require wheel group membership permissions. However, when a user is configured locally with the permissions <b>maintenance</b> or <b>all</b>, the user is automatically granted membership to the UNIX wheel group. Therefore, we recommend that you create a template user account with the required permissions and associate individual user accounts with the template user account.</p>	10	≥3	<p>One or more octets containing printable ASCII characters.</p> <p>The string is a list of permission flags separated by a space. The exact name of each flag must be specified in its entirety. See <a href="#">Table 77 on page 1326</a>.</p>
Juniper-Authentication-Type	Indicates the authentication method (local database, or RADIUS server) used to authenticate a user. If the user is authenticated using a local database, the attribute value shows 'local'. If the user is authenticated using RADIUS server, the attribute value shows 'remote'.	11	≥5	One or more octets containing printable ASCII characters.
Juniper-Session-Port	Indicates the source port number of the established session.	12	size of integer	Integer

For more information about the VSAs, see RFC 2138, *Remote Authentication Dial In User Service (RADIUS)*.

## Juniper Networks Vendor-Specific TACACS+ Attributes

Junos OS supports the configuration of Juniper Networks TACACS+ vendor-specific attributes (VSAs). These VSAs are encapsulated in a TACACS+ vendor-specific attribute with the vendor ID set to the Juniper Networks ID number, 2636. [Table 76 on page 1324](#) lists the Juniper Networks VSAs you can configure.

**Table 76: Juniper Networks Vendor-Specific TACACS+ Attributes**

Name	Description	Length	String
<b>local-user-name</b>	Indicates the name of the user template used by this user when logging in to a device.	≥3	One or more octets containing printable ASCII characters.
<b>allow-commands</b>	Contains an extended regular expression that enables the user to run operational mode commands in addition to those commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">Table 81 on page 1339</a> .
<b>allow-configuration</b>	Contains an extended regular expression that enables the user to run configuration mode commands in addition to those commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">"Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies" on page 1338</a> .
<b>deny-commands</b>	Contains an extended regular expression that denies the user permission to run operational mode commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">Table 81 on page 1339</a> .
<b>deny-configuration</b>	Contains an extended regular expression that denies the user permission to run configuration mode commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">Table 80 on page 1338</a> .

Table 76: Juniper Networks Vendor-Specific TACACS+ Attributes (*continued*)

Name	Description	Length	String
<b>user-permissions</b>	<p>Contains information the server uses to specify user permissions.</p> <p><b>NOTE:</b> When the <b>user-permissions</b> attribute is configured to grant the Junos OS <b>maintenance</b> or <b>all</b> permissions on an IPv4 or IPv6 TACACS+ server, the UNIX wheel group membership is not automatically added to a user's list of group memberships. Some operations such as running the <b>su root</b> command from a local shell require wheel group membership permissions. However, when a user is configured locally with the permissions <b>maintenance</b> or <b>all</b>, the user is automatically granted membership to the UNIX wheel group. Therefore, we recommend that you create a template user account with the required permissions and associate individual user accounts with the template user account.</p>	≥3	One or more octets containing printable ASCII characters. See <a href="#">Table 77 on page 1326</a> .
<b>authentication-type</b>	Indicates the authentication method (local database, or TACACS+ server) used to authenticate a user. If the user is authenticated using a local database, the attribute value shows 'local'. If the user is authenticated using TACACS+ server, the attribute value shows 'remote'.	≥5	One or more octets containing printable ASCII characters.
<b>session-port</b>	Indicates the source port number of the established session.	size of integer	Integer

## Understanding Junos OS Access Privilege Levels

Each top-level command-line interface (CLI) command and each configuration statement have an access privilege level associated with them. Users can execute only those commands and configure and view only those statements for which they have access privileges. The access privileges for each login class are defined by one or more *permission flags*.

For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

The following sections provide additional information about permissions:

- [Junos OS Login Class Permission Flags on page 1326](#)
- [Allowing or Denying Individual Commands for Junos OS Login Classes on page 1329](#)

## Junos OS Login Class Permission Flags

The **permissions** statement specifies one or more of the permission flags listed in [Table 77 on page 1326](#). Permission flags are not cumulative, so for each class you must list all the permission flags needed, including **view** to display information and **configure** to enter configuration mode. Two forms of permissions control for individual parts of the configuration are:

- "Plain" form—Provides read-only capability for that permission type. An example is **interface**.
- Form that ends in **-control**—Provides read and write capability for that permission type. An example is **interface-control**.

[Table 77 on page 1326](#) lists the Junos® operating system (Junos OS) login class permission flags that you can configure by including the **permissions** statement at the **[edit system login class *class-name*]** hierarchy level.

**Table 77: Login Class Permission Flags**

Permission Flag	Description
<b>access</b>	Can view the access configuration in configuration mode and with the <b>show configuration</b> operational mode command.
<b>access-control</b>	Can view and configure access information at the <b>[edit access]</b> hierarchy level.
<b>admin</b>	Can view user account information in configuration mode and with the <b>show configuration</b> operational mode command.
<b>admin-control</b>	Can view user accounts and configure them at the <b>[edit system login]</b> hierarchy level.
<b>all-control</b>	Can access all operational mode commands and configuration mode commands. Can modify configuration in all the configuration hierarchy levels.
<b>clear</b>	Can clear (delete) information learned from the network that is stored in various network databases by using the <b>clear</b> commands.
<b>configure</b>	Can enter configuration mode by using the <b>configure</b> command.
<b>control</b>	Can perform all control-level operations—all operations configured with the <b>-control</b> permission flags.
<b>field</b>	Can view field debug commands. Reserved for debugging support.
<b>firewall</b>	Can view the firewall filter configuration in configuration mode.

Table 77: Login Class Permission Flags (*continued*)

Permission Flag	Description
<b>firewall-control</b>	Can view and configure firewall filter information at the <b>[edit firewall]</b> hierarchy level.
<b>floppy</b>	Can read from and write to the removable media.
<b>flow-tap</b>	Can view the flow-tap configuration in configuration mode.
<b>flow-tap-control</b>	Can view the flow-tap configuration in configuration mode and can configure flow-tap configuration information at the <b>[edit services flow-tap]</b> hierarchy level.
<b>flow-tap-operation</b>	<p>Can make flow-tap requests to the router or switch. For example, a Dynamic Tasking Control Protocol (DTCP) client must have <b>flow-tap-operation</b> permission to authenticate itself to the Junos OS as an administrative user.</p> <p><b>NOTE:</b> The <b>flow-tap-operation</b> option is not included in the <b>all-control</b> permissions flag.</p>
<b>idp-profiler-operation</b>	Can view profiler data.
<b>interface</b>	Can view the interface configuration in configuration mode and with the <b>show configuration</b> operational mode command.
<b>interface-control</b>	<p>Can view chassis, class of service (CoS), groups, forwarding options, and interfaces configuration information. Can edit configuration at the following hierarchy levels:</p> <ul style="list-style-type: none"> <li>• <b>[edit chassis]</b></li> <li>• <b>[edit class-of-service]</b></li> <li>• <b>[edit groups]</b></li> <li>• <b>[edit forwarding-options]</b></li> <li>• <b>[edit interfaces]</b></li> </ul>
<b>maintenance</b>	Can perform system maintenance, including starting a local shell on the router and becoming the superuser in the shell by using the <b>su root</b> command, and can halt and reboot the router by using the <b>request system</b> commands.
<b>network</b>	Can access the network by using the <b>ping</b> , <b>ssh</b> , <b>telnet</b> , and <b>traceroute</b> commands.
<b>pgcp-session-mirroring</b>	Can view the <b>pgcp</b> session mirroring configuration.
<b>pgcp-session-mirroring-control</b>	Can modify the <b>pgcp</b> session mirroring configuration.
<b>reset</b>	Can restart software processes by using the <b>restart</b> command and can configure whether software processes are enabled or disabled at the <b>[edit system processes]</b> hierarchy level.

Table 77: Login Class Permission Flags (*continued*)

Permission Flag	Description
<b>rollback</b>	Can use the <b>rollback</b> command to return to a previously committed configuration other than the most recently committed one.
<b>routing</b>	Can view general routing, routing protocol, and routing policy configuration information in configuration and operational modes.
<b>routing-control</b>	Can view general routing, routing protocol, and routing policy configuration information and can configure general routing at the <b>[edit routing-options]</b> hierarchy level, routing protocols at the <b>[edit protocols]</b> hierarchy level, and routing policy at the <b>[edit policy-options]</b> hierarchy level.
<b>secret</b>	Can view passwords and other authentication keys in the configuration.
<b>secret-control</b>	Can view passwords and other authentication keys in the configuration and can modify them in configuration mode.
<b>security</b>	Can view security configuration in configuration mode and with the <b>show configuration</b> operational mode command.
<b>security-control</b>	Can view and configure security information at the <b>[edit security]</b> hierarchy level.
<b>shell</b>	Can start a local shell on the router or switch by using the <b>start shell</b> command.
<b>snmp</b>	Can view Simple Network Management Protocol (SNMP) configuration information in configuration and operational modes.
<b>snmp-control</b>	Can view SNMP configuration information and can modify SNMP configuration at the <b>[edit snmp]</b> hierarchy level.
<b>system</b>	Can view system-level information in configuration and operational modes.
<b>system-control</b>	Can view system-level configuration information and configure it at the <b>[edit system]</b> hierarchy level.
<b>trace</b>	Can view trace file settings and configure trace file properties.
<b>trace-control</b>	Can modify trace file settings and configure trace file properties.
<b>view</b>	Can use various commands to display current system-wide, routing table, and protocol-specific values and statistics. Cannot view the secret configuration.

Table 77: Login Class Permission Flags (*continued*)

Permission Flag	Description
<b>view-configuration</b>	Can view all of the configuration excluding secrets, system scripts, and event options.  <b>NOTE:</b> Only users with the <b>maintenance</b> permission can view commit script, op script, or event script configuration.

### Allowing or Denying Individual Commands for Junos OS Login Classes

By default, all top-level CLI commands have associated access privilege levels. Users can execute only those commands and view only those statements for which they have access privileges. For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

Permission flags are used to grant a user access to operational mode commands and configuration hierarchy levels and statements. By specifying a specific permission flag on the user's login class at the **[edit system login class]** hierarchy level, you grant the user access to the corresponding commands and configuration hierarchy levels and statements. To grant access to all commands and configuration statements, use the **all** permissions flag. For permission flags that grant access to configuration hierarchy levels and statements, the flags grant read-only privilege to that configuration. For example, the **interface** permissions flag grants read-only access to the **[edit interfaces]** hierarchy level. The **-control** form of the flag grants read-write access to that configuration. Using the preceding example, **interface-control** grants read-write access to the **[edit interfaces]** hierarchy level.

- The **all** login class permission bits take precedence over extended regular expressions when a user issues **rollback** command with **rollback** permission flag enabled.
- Expressions used to allow and deny commands for users on RADIUS and TACACS+ servers have been simplified. Instead of a single, long expression with multiple commands (**allow-commands=cmd1 cmd2 ... cmdn**), you can specify each command as a separate expression. This new syntax is valid for **allow-configuration**, **deny-configuration**, **allow-commands**, **deny-commands**, and all user permission bits.
- Users cannot issue the **load override** command when specifying an extended regular expression. Users can only issue the **merge**, **replace**, and **patch** configuration commands.
- If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by the **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.
- Regular expressions for **allow-commands** and **deny-commands** can also include the **commit**, **load**, **rollback**, **save**, **status**, and **update** commands.
- If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize** and it is specified for **allow-commands**.

## Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication

Using the **authentication-order** statement, you can prioritize the order in which the Junos OS tries the different authentication methods when verifying user access to a router or switch.

If the **authentication-order** is remote-server then local, Junos OS will retry the local server if the remote-server is unreachable or has timed out. However, if the remote-server rejects the authentication, Junos OS will not retry the authentication.

If none of the configured authentication methods accept the login credentials and if a reject response is received, the login attempt fails. If no response is received from any configured authentication method, the Junos OS consults local password authentication as a last resort.

### Using RADIUS or TACACS+ Authentication

---

You can configure the Junos OS to be both a RADIUS and TACACS+ authentication client.

If an authentication method included in the **[authentication-order]** statement is not available, or if the authentication is available but returns a reject response, the Junos OS tries the next authentication method included in the **authentication-order** statement.

The RADIUS or TACACS+ server authentication might fail because of the following reasons:

- The authentication method is configured, but the corresponding authentication servers are not configured. For instance, the RADIUS and TACACS+ authentication methods are included in the **authentication-order** statement, but the corresponding RADIUS or TACACS+ servers are not configured at the respective **[edit system radius-server]** and **[edit system tacplus-server]** hierarchy levels.
- The RADIUS or TACACS+ server does not respond within the timeout period configured at the **[edit system radius-server]** or **[edit system tacplus-server]** hierarchy levels.
- The RADIUS or TACACS+ server is not reachable because of a network problem.

The RADIUS or TACACS+ server authentication might return a reject response because of the following reasons:

- The user profiles of users accessing a router or switch might not be configured on the RADIUS or TACACS+ server.
- The user enters incorrect logon credentials.

### Using Local Password Authentication

You can explicitly configure the password authentication method or use this method as a fallback mechanism when remote authentication servers fail. The password authentication method consults the local user profiles configured at the **[edit system login]** hierarchy level. Users can log in to a router or switch using their local username and password in the following scenarios:

- The password authentication method (password) is explicitly configured as one of the authentication methods in the **[authentication-order authentication-methods]** statement. In this case, the password authentication method is tried if no previous authentication accepts the logon credentials. This is true whether the previous authentication method fails to respond or returns a reject response because of an incorrect username or password.
- The password authentication method is not explicitly configured as one of the authentication methods in the **authentication-order authentication-methods** statement. In this case, the password authentication method is tried only if all configured authentication methods fail to respond. It is not consulted if any configured authentication method returns a reject response because of an incorrect username or password.

### Order of Authentication Attempts

Table 78 on page 1331 describes how the **authentication-order** statement at the **[edit system]** hierarchy level determines the procedure that the Junos OS uses to authenticate users for access to a router or switch.

**Table 78: Order of Authentication Attempts**

Syntax	Order of Authentication Attempts
<b>authentication-order radius;</b>	<ol style="list-style-type: none"> <li>1. Try configured RADIUS authentication servers.</li> <li>2. If RADIUS server is available and authentication is accepted, grant access.</li> <li>3. If RADIUS server is available but authentication is rejected, deny access.</li> <li>4. If RADIUS servers are not available, try password authentication.</li> </ol> <p><b>NOTE:</b> If a RADIUS server is available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>

Table 78: Order of Authentication Attempts (*continued*)

Syntax	Order of Authentication Attempts
<b>authentication-order [ radius password ];</b>	<ol style="list-style-type: none"> <li>1. Try configured RADIUS authentication servers.</li> <li>2. If RADIUS servers fail to respond or return a reject response, try password authentication, because it is explicitly configured in the authentication order.</li> </ol>
<b>authentication-order [ radius tacplus ];</b>	<ol style="list-style-type: none"> <li>1. Try configured RADIUS authentication servers.</li> <li>2. If RADIUS server is available and authentication is accepted, grant access.</li> <li>3. If RADIUS servers fail to respond or return a reject response, try configured TACACS+ servers.</li> <li>4. If TACACS+ server is available and authentication is accepted, grant access.</li> <li>5. If TACACS+ server is available but authentication is rejected, deny access.</li> <li>6. If both RADIUS and TACACS+ servers are not available, try password authentication.</li> </ol> <p><b>NOTE:</b> If either RADIUS or TACACS+ servers are available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>
<b>authentication-order [ radius tacplus password ];</b>	<ol style="list-style-type: none"> <li>1. Try configured RADIUS authentication servers.</li> <li>2. If RADIUS server is available and authentication is accepted, grant access.</li> <li>3. If RADIUS servers fail to respond or return a reject response, try configured TACACS+ servers.</li> <li>4. If TACACS+ server is available and authentication is accepted, grant access.</li> <li>5. If TACACS+ servers fail to respond or return a reject response, try password authentication, because it is explicitly configured in the authentication order.</li> </ol>
<b>authentication-order tacplus;</b>	<ol style="list-style-type: none"> <li>1. Try configured TACACS+ authentication servers.</li> <li>2. If TACACS+ server is available and authentication is accepted, grant access.</li> <li>3. If TACACS+ server is available but authentication is rejected, deny access.</li> <li>4. If TACACS+ servers are not available, try password authentication.</li> </ol> <p><b>NOTE:</b> If a TACACS+ server is available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>

Table 78: Order of Authentication Attempts (*continued*)

Syntax	Order of Authentication Attempts
<b>authentication-order [ tacplus password ];</b>	<ol style="list-style-type: none"> <li>1. Try configured TACACS+ authentication servers.</li> <li>2. If TACACS+ servers fail to respond or return a reject response, try password authentication, because it is explicitly configured in the authentication order.</li> </ol>
<b>authentication-order [ tacplus radius ];</b>	<ol style="list-style-type: none"> <li>1. Try configured TACACS+ authentication servers.</li> <li>2. If TACACS+ server is available and authentication is accepted, grant access.</li> <li>3. If TACACS+ servers fail to respond or return a reject response, try configured RADIUS servers.</li> <li>4. If RADIUS server is available and authentication is accepted, grant access.</li> <li>5. If RADIUS server is available but authentication is rejected, deny access.</li> <li>6. If both TACACS+ and RADIUS servers are not available, try password authentication.</li> </ol> <p><b>NOTE:</b> If either TACACS+ or RADIUS servers are available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>
<b>authentication-order [ tacplus radius password ];</b>	<ol style="list-style-type: none"> <li>1. Try configured TACACS+ authentication servers.</li> <li>2. If TACACS+ server is available and authentication is accepted, grant access.</li> <li>3. If TACACS+ servers fail to respond or return a reject response, try configured RADIUS servers.</li> <li>4. If RADIUS server is available and authentication is accepted, grant access.</li> <li>5. If RADIUS servers fail to respond or return a reject response try password authentication, because it is explicitly configured in the authentication order.</li> </ol>
<b>authentication-order password;</b>	<ol style="list-style-type: none"> <li>1. Try to authenticate the user, using the password configured at the <b>[edit system login]</b> hierarchy level.</li> <li>2. If the authentication is accepted, grant access.</li> <li>3. If the authentication is rejected, deny access.</li> </ol>

**NOTE:** If SSH public keys are configured, SSH user authentication first tries to perform public key authentication before using the authentication methods configured in the authentication-order statement. If you want SSH logins to use the authentication methods configured in the authentication-order statement without first trying to perform public key authentication, do not configure SSH public keys.

In a routing matrix based on a TX Matrix router, the authentication order must be configured only at the configuration groups `re0` and `re1`. The authentication order must not be configured at the `[edit system]` hierarchy. This is because the authentication order for the routing matrix is controlled on the switch-card chassis (or TX Matrix router) or switch-fabric chassis (for TX Matrix Plus router) only.

In Junos OS Release 10.0 and later, the superuser (belonging to the super-user login class) is also authenticated based on the authentication order that is configured for TACACS+, RADIUS, or password authentication using the authentication-order statement. For example, if the only configured authentication order is TACACS+, the superuser can only be authenticated by the TACACS+ server and password authentication cannot be used as an alternative. However, in Junos OS Release 9.6 and earlier, the superuser can use password authentication to login, even if password authentication is not configured explicitly using the authentication-order statement.

## Junos OS User Authentication Methods

The Junos OS supports three methods of user authentication: local password authentication, Remote Authentication Dial-In User Service (RADIUS), and Terminal Access Controller Access Control System Plus (TACACS+).

With local password authentication, you configure a password for each user allowed to log in to the router or switch.

RADIUS and TACACS+ are authentication methods for validating users who attempt to access the router or switch using telnet. They are both distributed client-server systems—the RADIUS and TACACS+ clients run on the router or switch, and the server runs on a remote network system.

You can configure the router or switch to be both a RADIUS and TACACS+ client, and you can also configure authentication passwords in the Junos OS configuration file. You can prioritize the methods to configure the order in which the software tries the different authentication methods when verifying user access.

## Junos OS User Accounts Overview

User accounts provide one way for users to access the switch. (Users can access the switch without accounts if you configured RADIUS or TACACS+ servers, as described in [“Junos OS User Authentication Methods” on page 1334](#).) For each account, you define the login name for the user and, optionally, information that identifies the user. After you have created an account, the software creates a home directory for the user.

For each user account, you can define the following:

- Username—(Optional) Name that identifies the user. It must be unique within the switch. Do not include spaces, colons, or commas in the username. The username can be up to 64 characters long.
- User’s full name—(Optional) If the full name contains spaces, enclose it in quotation marks. Do not include colons or commas.
- User identifier (UID)—(Optional) Numeric identifier that is associated with the user account name. The identifier must be in the range from 100 through 64,000 and must be unique within the switch. If you do not assign a UID to a username, the software assigns one when you commit the configuration, preferring the lowest available number.
- You must ensure that the UID is unique. However, it is possible to assign the same UID to different users. If you do this, the CLI displays a warning when you commit the configuration and then assigns the duplicate UID.
- User’s access privilege—(Required) One of the login classes you defined in the **class** statement at the **[edit system login]** hierarchy level, or one of the default classes listed in [“Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies” on page 1338](#).
- Authentication method or methods and passwords that the user can use to access the switch—(Optional) You can use SSH or a Message Digest 5 (MD5) password, or you can enter a plain-text password that Junos OS encrypts using MD5-style encryption before entering it in the password database. For each method, you can specify the user’s password. If you configure the **plain-text-password** option, you are prompted to enter and confirm the password:

```
[edit system login user user-name]
user@switch# set authentication plain-text-password
New password: type password here
Retype new password: retry password here
```

The default requirements for plain-text passwords are:

- The password must be between 6 and 128 characters long
- You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
- Valid passwords must contain at least one change of case or character class.

For each user account and for root logins, you can configure more than one public RSA or DSA key for user authentication. When a user logs in using a user account or as root, the configured public keys are referenced to determine whether the private key matches any of them.

For SSH authentication, you can also copy the contents of an SSH key file into the configuration.

To load an SSH key file, use the **load-key-file** statement. This statement loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys.

If you load the SSH keys file, the contents of the file are copied into the configuration immediately after you enter the **load-key-file** statement. To view the SSH key entries, use the configuration mode **show** command. For example:

```
[edit system login user boojum]
user@switch# set authentication load-key-file my-host:.ssh/identity.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
[edit system]
user@switch# show
root-authentication {
  ssh-rsa "1024 35 9727638204084251055468226757249864241630322
207404962528390382038690141584534964170019610608358722961563
475784918273603361276441874265946893207739108344813125957722
625461667999278316123500438660915866283822489746732605661192
181489539813862940327687806538169602027491641637359132693963
44008443 boojum@juniper.net"; # SECRET-DATA
}
```

An account for the user **root** is always present in the configuration. You configure the password for **root** using the **root-authentication** statement, as described in [“Configuring the Root Password” on page 1354](#).

Junos-FIPS and Common Criteria have special password requirements. FIPS and Common Criteria passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the switch, you cannot configure passwords unless they meet this standard.

- Related Documentation**
- [Configuring Junos OS User Accounts on page 1344](#)
  - [Junos OS Login Classes Overview on page 1337](#)

## Junos OS Login Classes Overview

All users who can log in to the router or switch must be in a login class. With login classes, you define the following:

- Access privileges that users have when they are logged in to the router or switch
- Commands and statements that users can and cannot specify
- How long a login session can be idle before it times out and the user is logged out

You can define any number of login classes and then apply one login class to an individual user account.

The Junos operating system (Junos OS) contains a few predefined login classes, which are listed in [Table 79 on page 1337](#). The predefined login classes cannot be modified.

**Table 79: Predefined System Login Classes**

Login Class	Permission Flag Set
operator	clear, network, reset, trace, and view
read-only	view
superuser or super-user	all
unauthorized	None

### NOTE:

- You cannot modify a predefined login class name. If you issue the `set` command on a predefined class name, the Junos OS appends `-local` to the login class name. The following message also appears:  

```
warning: '<class-name>' is a predefined class name; changing to '<class-name>-local'
```
- You cannot issue the `rename` or `copy` command on a predefined login class. Doing so results in the following error message:  

```
error: target '<class-name>' is a predefined class
```

## Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies

Use extended regular expressions to specify which configuration mode hierarchies are denied or allowed. You specify these regular expressions in the **allow/deny-configuration-regexps** and **allow/deny-configuration** statements at the **[edit system login class]** hierarchy level, or by specifying Juniper Networks vendor-specific TACACS+ or RADIUS attributes in your authentication server's configuration. If regular expressions are received during TACACS+ or RADIUS authentication, they merge with any regular expressions configured on the local router or switch.

[Table 80 on page 1338](#) lists common regular expression operators that you can use for allowing or denying configuration mode .

Command regular expressions implement the extended (modern) regular expressions, as defined in POSIX 1003.2.

**Table 80: Configuration Mode Hierarchies—Common Regular Expression Operators**

Operator	Match
	One of two or more terms separated by the pipe. Each term must be a complete standalone expression enclosed in parentheses ( ), with no spaces between the pipe and the adjacent parentheses. For example, <b>(show system alarms) (show system software)</b> .
^	At the beginning of an expression, used to denote where the command begins, where there might be some ambiguity.
\$	Character at the end of a command. Used to denote a command that must be matched exactly up to that point. For example, <b>allow-commands "show interfaces\$"</b> means that the user can issue the <b>show interfaces</b> command but cannot issue <b>show interfaces detail</b> or <b>show interfaces extensive</b> .
[ ]	Range of letters or digits. To separate the start and end of a range, use a hyphen ( - ).
( )	A group of commands, indicating a complete, standalone expression to be evaluated; the result is then evaluated as part of the overall expression. Parentheses must be used in conjunction with pipe operators as explained .
*	Zero or more terms.
+	One or more terms.
.	Any character except for a space " " .

### Related Documentation

- *Specifying Access Privileges for Junos OS Configuration Mode Hierarchies*
- [Specifying Access Privileges for Junos OS Configuration Mode Hierarchies on page 1371](#)

## Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands

Use extended regular expressions to specify which operational mode commands are denied or allowed. [Table 81 on page 1339](#) lists common regular expression operators that can be used in the operational mode commands. Command regular expressions implement the extended (modern) regular expressions as defined in POSIX 1003.2.

**Table 81: Common Regular Expression Operators to Allow or Deny Operational Mode Commands**

Operator	Match
	One of two or more terms separated by the pipe ( ) symbol. Each term must be a complete standalone expression enclosed in parentheses ( ), with no spaces between the pipe and the adjacent parentheses. For example, <b>(show system alarms) (show system software)</b> .
^	At the beginning of an expression, used to denote where the command begins, and where there might be some ambiguity.
\$	Character at the end of a command. Used to denote a command that must be matched exactly up to that point. For example, <b>allow-commands "show interfaces\$"</b> means that the user can issue the <b>show interfaces</b> command but cannot issue the <b>show interfaces detail</b> or <b>show interfaces extensive</b> command.
[ ]	Range of letters or digits. To separate the start and end of a range, use a hyphen ( - ).
( )	A group of commands, indicating a complete, standalone expression to be evaluated; the result is then evaluated as part of the overall expression. Parentheses must always be used in conjunction with pipe operators as explained above.

If a regular expression contains a syntax error, it becomes invalid, and although the user can log in, the permission granted or denied by the regular expression does not take effect. When regular expressions configured on TACACS+ or RADIUS servers merge with regular expressions configured on the router or switch, if the final expression has a syntax error, the overall result is an invalid regular expression. If a regular expression does not contain any operators, all varieties of the command are allowed. For example, if the following statement is included in the configuration, the user can issue the commands **show interfaces detail** and **show interfaces extensive** in addition to showing an individual interface:

```
allow-commands "show interfaces";
```

## Special Requirements for Junos OS Plain-Text Passwords

Junos OS has special requirements when you create plain-text passwords on a router or switch. [Table 82 on page 1340](#) shows the default requirements.

Table 82: Special Requirements for Plain-Text Passwords

Junos OS	Junos-FIPS
The password must be between 6 and 128 characters long.	FIPS passwords must be between 10 and 20 characters long
You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.	You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
Valid passwords must contain at least one change of case or character class.	Passwords must use at least three of the five defined character classes (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters).

You can change the requirements for plain-text passwords.

Junos OS supports the following five character classes for plain-text passwords:

- Lowercase letters
- Uppercase letters
- Numbers
- Punctuation
- Special characters: ! @ # \$ % ^ & \*, + < > ; ;

Control characters are not recommended.

You can include the **plain-text-password** statement at the following hierarchy levels:

- [edit system diag-port-authentication]
- [edit system pic-console-authentication]
- [edit system root-authentication]
- [edit system login user *username* authentication]

The **change-type** statement specifies whether the password is checked for the following:

- The total number of character sets used (**character-set**)
- The total number of character set changes (**set-transitions**)

For example, the following password:

```
MyPassWd@2
```

has four character sets (uppercase letters, lowercase letters, special characters, and numbers) and seven character set changes (**M-y**, **y-P**, **P-a**, **s-W**, **W-d**, **d-@**, and **@-2**).

The **change-type** statement is optional. If you omit the **change-type** option, Junos-FIPS plain-text passwords are checked for character sets, and Junos OS plain-text passwords are checked for character set changes.

The **minimum-changes** statement specifies how many character sets or character set changes are required for the password. This statement is optional. If you do not use the **minimum-changes** statement, character sets are not checked for Junos OS. If the **change-type** statement is configured for the **character-set** option, then the **minimum-changes** value must be 5 or less, because Junos OS only supports five character sets.

The **format** statement specifies the hash algorithm (**md5**, **sha1**, **sha256**, **sha512** or **des**) for authenticating plain-text passwords. This statement is optional. For Junos OS, the default format is **md5**. For Junos-FIPS, only **sha1** is supported.

**NOTE:** Starting with Junos OS Release 13.3, the **sha1** does not enable secure, protected specification of passwords and we recommend that you do not use the **sha1** algorithm to configure passwords. Instead, you can use the **sha256** or **sha512** to specify passwords by using the 256-bit and 512-bit cryptographic hash algorithm respectively for a robust and reliable operation.

The **maximum-length** statement specifies the maximum number of characters allowed in a password. This statement is optional. By default, Junos OS passwords have no maximum; however, only the first 128 characters are significant. Junos-FIPS passwords must be 20 characters or less. The range for Junos OS maximum-length passwords is from 20 to 128 characters.

The **minimum-length** statement specifies the minimum number of characters required for a password. This statement is optional. By default, Junos OS passwords must be at least 6 characters long, and Junos-FIPS passwords must be at least 10 characters long. The range is from 6 to 20 characters.

Changes to password requirements do not take effect until the configuration is committed. When requirements change, only newly created, plain-text passwords are checked; existing passwords are not checked against the new requirements.

The default configuration for Junos OS plain-text passwords is:

```
[edit system login]
passwords {
  change-type character-sets;
  format md5;
  minimum-changes 1;
  minimum-length 6;
}
```

The default configuration for Junos-FIPS plain-text passwords is:

```
[edit system login]
passwords {
  change-type set-transitions;
  format sha1;
```

```
maximum-length 20;  
minimum-changes 3;  
minimum-length 10;  
}
```

**NOTE:** Transitioning to FIPS mode is allowed only when the encrypted password is a FIPS-compliant hash algorithm. Also, configuring passwords that are not FIPS-compliant is not allowed when you are in FIPS mode.

## Configuring Access Privilege Levels

Each top-level command-line interface (CLI) command and each configuration statement have an access privilege level associated with it. Users can execute only those commands and configure and view only those statements for which they have access privileges.

To configure access privilege levels, include the **permissions** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
permissions [ permissions ];
```

### Related Documentation

- [Understanding Junos OS Access Privilege Levels on page 1325](#)
- [Specifying Access Privileges for Junos OS Operational Mode Commands on page 192](#)
- *permissions*

## Configuring Login Tips

The Junos OS CLI provides the option of configuring login tips for the user. By default, the **tip** command is not enabled when a user logs in.

- To enable tips, include the **login-tip** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
login-tip;
```

Adding this statement enables the **tip** command for the class specified, provided the user logs in using the CLI.

### Related Documentation

## Configuring Junos OS User Accounts

User accounts provide one way for users to access the router or switch. For each account, you define the login name for the user and, optionally, information that identifies the user. After you have created an account, the software creates a home directory for the user.

To create user accounts, include the **user** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
user username {
  class class-name;
  class {
    (encrypted-password "password" | plain-text-password);
    ssh-rsa "public-key";
    ssh-dsa "public-key";
  }
  full-name complete-name;
  uid uid-value;
  class class-name;
}
```

## Configuring LLDP

Devices use Link Layer Discovery Protocol (LLDP) and Link Layer Discovery Protocol Media Endpoint Discovery (LLDP-MED) to learn and distribute device information on network links. The information allows the device to identify a variety of devices quickly. The result is a LAN that interoperates smoothly and efficiently.

The LLDP protocol cannot be enabled by issuing the **set protocols lldp** statement at the **[edit]** hierarchy level. Enable the LLDP protocol by configuring it on all interfaces or on specific interfaces.

To configure basic LLDP options using the CLI:

1. Configure the advertisement interval in seconds:

```
[edit protocols lldp]
user@switch# set advertisement-interval 45
```

2. Specify the multiplier used in combination with the **advertisement-interval** value to determine the length of time LLDP information is held before it is discarded:

```
[edit protocols lldp]
user@switch# set hold-multiplier 5
```

3. Configure LLDP on all interfaces or on a specific interface:

```
[edit protocols lldp]
user@switch# set interface (LLDP) all
```

4. Configure tracing operations for the LLDP protocol:

```
[edit protocols lldp]
user@switch# set traceoptions file lldptrace
```

#### Related Documentation

## Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and Local Password Authentication

Using the **authentication-order** statement, you can prioritize the order in which the Junos OS tries the different authentication methods when verifying user access to a router or switch.

To configure the authentication order, include the **authentication-order** statement at the **[edit system]** hierarchy level:

```
[edit system]
authentication-order [ authentication-methods ];
```

Specify one or more of the following authentication methods in the preferred order, from first tried to last tried:

- **radius**—Verify the user using RADIUS authentication services
- **tacplus**—Verify the user using TACACS+ authentication services.
- **password**—Verify the user using the username and password configured locally by including the authentication statement at the **[edit system login user]** hierarchy level.

The CHAP authentication sequence cannot take more than 30 seconds. If it takes longer to authenticate a client, the authentication is abandoned and a new sequence is initiated.

For example, if you configure three RADIUS servers so that the router or switch attempts to contact each server three times, and with each retry the server times out after 3 seconds, then the maximum time given to the RADIUS authentication method before CHAP considers it a failure is 27 seconds. If you add more RADIUS servers to this configuration, they might not be contacted because the authentication process might be abandoned before these servers are tried.

The Junos OS enforces a limit on the number of standing authentication server requests that the CHAP authentication can have at one time. Thus, an authentication server method—RADIUS, for example—might fail to authenticate a client when this limit is exceeded. If it fails, the authentication sequence is reinitiated by the router or switch until authentication succeeds and the link is brought up. However, if the RADIUS servers are not available and if additional authentication methods such as **tacplus** or **password** are configured along with **radius**, the next authentication method is tried.

The following example shows how to configure **radius** and **password** authentication:

```
[edit system]
user@switch# authentication-order [ radius password ];
```

The following example shows how to delete the **radius** statement from the authentication order:

```
[edit system]
user@switch# delete authentication-order radius
```

The following example shows how to insert the **tacplus** statement after the **radius** statement:

```
[edit system]
user@switch# insert authentication-order tacplus after radius
```

- *authentication-order*

## Configuring Local User Template Accounts for User Authentication

You use local user template accounts when you need different types of templates for authentication. Each template can define a different set of permissions appropriate for the group of users who use that template. These templates are defined locally on the router or switch and referenced by the TACACS+ and RADIUS authentication servers.

When you configure local user templates and a user logs in, Junos OS issues a request to the authentication server to authenticate the user's login name. If a user is authenticated, the server returns the local username to Junos OS, which then determines whether a local username is specified for that login name (**local-username** for TACACS+, **Juniper-Local-User** for RADIUS). If so, Junos OS selects the appropriate local user template locally configured on the router or switch. If a local user template does not exist for the authenticated user, the router or switch defaults to the **remote** template.

To configure different access privileges for users who share the local user template account, include the **allow-commands** and **deny-commands** commands in the authentication server configuration file.

To configure a local user template, include the **user local-username** statement at the **[edit system login]** hierarchy level and specify the privileges you want to grant to the local users to whom the template applies:

```
[edit system login]
user local-username {
  full-name "Local user account";
  uid uid-value;
  class class-name;
}
```

This example configures the **sales** and **engineering** local user templates:

```
[edit]
system {
  login {
    user sales {
      uid uid-value;
```

```
        class class-name;
    }
    user engineering {
        uid uid-value;
        class class-name;
    }
}

user = simon {
    ...
    service = junos-exec {
        local-user-name = sales
        allow-commands = "configure"
        deny-commands = "shutdown"
    }
}
user = rob {
    ...
    service = junos-exec {
        local-user-name = sales
        allow-commands = "(request system) | (show rip neighbor)"
        deny-commands = "clear"
    }
}
user = harold {
    ...
    service = junos-exec {
        local-user-name = engineering
        allow-commands = "monitor | help | show | ping | traceroute"
        deny-commands = "configure"
    }
}
user = jim {
    ...
    service = junos-exec {
        local-user-name = engineering
        allow-commands = "show bgp neighbor"
        deny-commands = "telnet | ssh"
    }
}
```

When the login users Simon and Rob are authenticated, the router or switch applies the sales local user template. When login users Harold and Jim are authenticated, the router or switch applies the engineering local user template.

Documentation**

- [Overview of Template Accounts for RADIUS and TACACS+ Authentication on page 1318](#)
- [user \(Access\)](#)
- [user \(Access\) on page 332](#)

## Configuring Management Access

To define the management access settings for the routing platform:

1. Next to Allow Telnet Access, select the check box to allow remote Telnet access to the routing platform.
2. Next to Allow SSH Access, selected the check box to allow remote SSH access to the routing platform.
3. Click **Apply** to apply the configuration.

### Related Documentation

- [Specifying Access Privileges for Junos OS Operational Mode Commands on page 192](#)
- [Example: Configuring Access Privilege Levels on page 1381](#)

## Configuring RADIUS System Accounting

With RADIUS accounting enabled, Juniper Networks routers or switches, acting as RADIUS clients, can notify the RADIUS server about user activities such as software logins, configuration changes, and interactive commands. The framework for RADIUS accounting is described in RFC 2866.

Tasks for configuring RADIUS system accounting are:

1. [Configuring Auditing of User Events on a RADIUS Server on page 1349](#)
2. [Specifying RADIUS Server Accounting and Auditing Events on page 1350](#)
3. [Configuring RADIUS Server Accounting on page 1350](#)

### Configuring Auditing of User Events on a RADIUS Server

To audit user events, include the following statements at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [ events ];
destination {
  radius {
    server {
      server-address {
        accounting-port port-number;
        secret password;
        source-address address;
        retry number;
        timeout seconds;
      }
    }
  }
}
```

### Specifying RADIUS Server Accounting and Auditing Events

---

To specify the events you want to audit when using a RADIUS server for authentication, include the **events** statement at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [ events ];
```

**events** is one or more of the following:

- **login**—Audit logins
- **change-log**—Audit configuration changes
- **interactive-commands**—Audit interactive commands (any command-line input)

### Configuring RADIUS Server Accounting

---

To configure RADIUS server accounting, include the **server** statement at the **[edit system accounting destination radius]** hierarchy level:

```
server {
  server-address {
    accounting-port port-number;
    secret password;
    source-address address;
    retry number;
    timeout seconds;
  }
}
```

**server-address** specifies the address of the RADIUS server. To configure multiple RADIUS servers, include multiple **server** statements.

**NOTE:** If no RADIUS servers are configured at the **[edit system accounting destination radius]** statement hierarchy level, the Junos OS uses the RADIUS servers configured at the **[edit system radius-server]** hierarchy level.

**accounting-port *port-number*** specifies the RADIUS server accounting port number.

The default port number is 1813.

**NOTE:** If you enable RADIUS accounting at the **[edit access profile *profile-name* accounting-order]** hierarchy level, accounting is triggered on the default port of 1813 even if you do not specify a value for the **accounting-port** statement.

You must specify a secret (password) that the local router or switch passes to the RADIUS client by including the **secret** statement. If the password contains spaces, enclose the entire password in quotation marks (" ").

In the **source-address** statement, specify a source address for the RADIUS server. Each RADIUS request sent to a RADIUS server uses the specified source address. The source address is a valid IPv4 address configured on one of the router or switch interfaces.

Optionally, you can specify the number of times that the router or switch attempts to contact a RADIUS authentication server by including the **retry** statement. By default, the router or switch retries three times. You can configure the router or switch to retry from 1 through 10 times.

Optionally, you can specify the length of time that the local router or switch waits to receive a response from a RADIUS server by including the **timeout** statement. By default, the router or switch waits 3 seconds. You can configure the timeout to be from 1 through 90 seconds.

If you use the **enhanced-accounting** statement at the **[edit system radius-options]** hierarchy level, the RADIUS attributes such as access method, remote port, and access privileges can be audited. You can limit the number of attribute values to be displayed for auditing by using the **enhanced-avs-max <number>** statement at the **[edit system accounting]** hierarchy level.

```
[edit system radius-options]
enhanced-accounting;

[edit system accounting]
enhanced-avs-max <number>;
```

## Configuring RADIUS Authentication (QFX Series)

RADIUS authentication is a method of authenticating users who attempt to access the router or switch. Tasks to configure RADIUS authentication are:

**NOTE:** The **source-address** statement is not supported at the **[edit system radius-options]** or **[edit system-radius-server name]** hierarchies on the QFabric system.

- [Configuring RADIUS Server Details on page 1351](#)
- [Configuring MS-CHAPv2 for Password-Change Support on page 1352](#)
- [Specifying a Source Address for the Junos OS to Access External RADIUS Servers on page 1353](#)

### Configuring RADIUS Server Details

To use RADIUS authentication on the router or switch, configure information about one or more RADIUS servers on the network by including one **radius-server** statement at the **[edit system]** hierarchy level for each RADIUS server:

```
[edit system]
radius-server server-address {
  accounting-port port-number;
  port number;
  retry number;
```

```
secret password;  
source-address source-address;  
timeout seconds;  
}
```

**server-address** is the address of the RADIUS server.

You can specify a port on which to contact the RADIUS server. By default, port number **1812** is used (as specified in RFC 2865). You can also specify an accounting port to send accounting packets. The default is **1813** (as specified in RFC 2866).

You must specify a password in the **secret password** statement. If the password contains spaces, enclose it in quotation marks. The secret used by the local router or switch must match that used by the server.

Optionally, you can specify the amount of time that the local router or switch waits to receive a response from a RADIUS server (in the **timeout** statement) and the number of times that the router or switch attempts to contact a RADIUS authentication server (in the **retry** statement). By default, the router or switch waits 3 seconds. You can configure this to be a value from 1 through 90 seconds. By default, the router or switch retries connecting to the server three times. You can configure this to be a value from 1 through 10 times.

You can use the **source-address** statement to specify a logical address for individual or multiple RADIUS servers.

To configure multiple RADIUS servers, include multiple **radius-server** statements.

To configure a set of users that share a single account for authorization purposes, you create a template user. To do this, include the **user** statement at the **[edit system login]** hierarchy level, as described in [“Overview of Template Accounts for RADIUS and TACACS+ Authentication” on page 1318](#).

You can also configure RADIUS authentication at the **[edit access]** and **[edit access profile]** hierarchy level. Junos OS uses the following search order to determine which set of servers are used for authentication:

1. **[edit access profile profile-name radius-server server-address]**
2. **[edit access radius-server server-address]**
3. **[edit system radius-server server-address]**

---

### Configuring MS-CHAPv2 for Password-Change Support

You can configure the Microsoft implementation of the Challenge Handshake Authentication Protocol version 2 (MS-CHAPv2) on the router or switch to support changing of passwords. This feature provides users accessing a router or switch the option of changing the password when the password expires, is reset, or is configured to be changed at the next login.

Before you configure MS-CHAPv2 for password-change support, ensure that you:

- Configure the RADIUS server authentication parameters

- Set the **authentication-order** to use the RADIUS server for the initial password attempt

To configure MS-CHAP-v2, include the following statements at the **[edit system radius-options]** hierarchy level:

```
[edit system radius-options]
password-protocol mschap-v2;
```

The following example shows statements for configuring the MS-CHAPv2 password protocol, password authentication order, and user accounts:

```
[edit]
system {
  authentication-order [ radius password ];
  radius-server {
    192.168.69.149 secret "$9$G-j.5Qz6tpBk.1hrlXxUjiq5Qn/C"; ## SECRET-DATA
  }
  radius-options {
    password-protocol mschap-v2;
  }
  login {
    user bob {
      class operator;
    }
  }
}
```

### Specifying a Source Address for the Junos OS to Access External RADIUS Servers

You can specify which source address Junos OS uses when accessing your network to contact an external RADIUS server for authentication. You can also specify which source address Junos OS uses when contacting a RADIUS server for sending accounting information.

To specify a source address for a RADIUS server, include the **source-address** statement at the **[edit system radius-server server-address]** hierarchy level:

```
[edit system radius-server server-address]
source-address source-address;
```

**source-address** is a valid IP address configured on one of the router or switch interfaces.

## Configuring Remote Template Accounts for User Authentication

By default, the Junos OS uses remote template accounts for user authentication when:

- The authenticated user does not exist locally on the router or switch.
- The authenticated user's record in the authentication server specifies local user, or the specified local user does not exist locally on the router or switch.

To configure the remote template account, include the **user remote** statement at the **[edit system login]** hierarchy level and specify the privileges you want to grant to remote users:

```
[edit system login]
user remote {
  full-name "All remote users";
  uid uid-value;
  class class-name;
}
```

To configure different access privileges for users who share the remote template account, include the **allow-commands** and **deny-commands** statements in the authentication server configuration file.

## Configuring the Root Password

Junos OS is preinstalled on the router or switch. When the router or switch is powered on, it is ready to be configured. Initially, you log in as the user "root" with no password.

**NOTE:** If you configure a blank password using the **encrypted-password** statement at the **[edit system root-authentication]** hierarchy level for root authentication, you can commit a configuration, but you are *not* able to log in as superuser and gain root level access to the router or switch.

After you log in, you should configure the root (superuser) password by including the **root-authentication** statement at the **[edit system]** hierarchy level:

```
[edit system]
root-authentication {
  (encrypted-password "password" | load-key-password URL | plain-text-password);
  ssh-dsa "public-key";
  ssh-rsa "public-key";
}
```

If you configure the **plain-text-password** option, you are prompted to enter and confirm the password:

```
[edit system]
user@switch# set root-authentication plain-text-password
New password: type password here
Retype new password: retry password here
```

To load an SSH key file, enter the **load-key-file** statement. This statement loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys.

You can also configure SSH RSA keys and SSH DSA keys to authenticate root logins. You can configure more than one public RSA or DSA key for SSH authentication of root logins as well as for user accounts. When a user logs in as root, the public keys are referenced to determine whether the private key matches any of them.

If you load the SSH keys file, the contents of the file are copied into the configuration immediately after you enter the **load-key-file** statement. To view the SSH keys entries, use the configuration mode **show** command. For example:

```
[edit system]
user@switch# set root-authentication load-key-file my-host:.ssh/identity.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
[edit system]
user@switch# show
root-authentication {
  ssh-rsa "1024 35 9727638204084251055468226757249864241630322
20740496252839038203869014158453496417001961060835872296
15634757491827360336127644187426594689320773910834481012
68312595772262546166799927831612350043866091586628382248
97467326056611921489539813965561563786211940327687806538
16960202749164163735913269396344008443 boojum@juniper.net"; #
  SECRET-DATA
}
```

Junos-FIPS software has special password requirements. FIPS passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the router or switch, you cannot configure passwords unless they meet this standard. If you use the **encrypted-password** option, then a null-password (empty) is not permitted.

You cannot configure a blank password for **encrypted-password** using blank quotation marks (" "). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.

#### Related Documentation

## Configuring SNMP

SNMP is implemented in the Junos OS Software running on the QFX Series products. By default, SNMP is not enabled. To enable SNMP, you must include the SNMP configuration statements at the **[edit]** hierarchy level.

To configure the minimum requirements for SNMP, include the following statements at the **[edit]** hierarchy level of the configuration:

```
[edit]
snmp {
  community public;
}
```

To configure complete SNMP features, include the following statements at the **[edit]** hierarchy level of the configuration:

```
snmp {
  client-list client-list-name {
    ip-addresses;
  }
  community community-name {
    authorization authorization;
    client-list-name client-list-name;
    clients {
      address restrict;
    }
    logical-system logical-system-name {
      routing-instance routing-instance-name {
        clients {
          addresses;
        }
      }
    }
    routing-instance routing-instance-name {
      clients {
        addresses;
      }
    }
    view view-name;
  }
  contact contact;
  description description;
  filter-duplicates;
  filter-interfaces;
  health-monitor {
    falling-threshold integer;
    interval seconds;
    rising-threshold integer;
  }
  interface [ interface-names ];
  location location;
  name name;
  nonvolatile {
    commit-delay seconds;
  }
}
```

```

}
rmon {
  alarm index {
    description description;
    falling-event-index index;
    falling-threshold integer;
    falling-threshold-interval seconds;
    interval seconds;
    request-type;
    rising-event-index index;
    rising-threshold integer;
    sample-type (absolute-value | delta-value);
    startup-alarm (falling-alarm | rising-alarm | rising-or-falling alarm);
    syslog-subtag syslog-subtag;
    variable oid-variable;
  }
  event index {
    community community-name;
    description description;
    type type;
  }
  history history-index {
    bucket-size number;
    interface interface-name;
    interval seconds;
    owner owner-name;
  }
}

## Configuring SSH Host Keys for Secure Copying of Data

Secure Shell (SSH) uses encryption algorithms to generate a host, server, and session key system that ensures secure data transfer. You can configure SSH host keys to support secure copy (SCP) as an alternative to FTP for the background transfer of data such as configuration archives and event logs. To configure SSH support for SCP, you must complete the following tasks:

- Specify SSH known hosts by including hostnames and host key information in the Routing Engine configuration hierarchy.
- Set an SCP URL to specify the host from which to receive data. Setting this attribute automatically retrieves SSH host key information from the SCP server.
- Verify that the host key is authentic.
- Accept the secure connection. Accepting this connection automatically stores host key information in the local host key database. Storing host key information in the configuration hierarchy automates the secure handshake and allows background data transfer using SCP.

Tasks to configure SSH host keys for secure copying of data are:

1. [Configuring SSH Known Hosts on page 1360](#)
2. [Configuring Support for SCP File Transfer on page 1360](#)
3. [Updating SSH Host Key Information on page 1361](#)

---

### Configuring SSH Known Hosts

To configure SSH known hosts, include the **host** statement, and specify hostname and host key options for trusted servers at the **[edit security ssh-known-hosts]** hierarchy level:

```
[edit security ssh-known-hosts]
host corporate-archive-server, ip-address {
    dsa-key key;
}
host archive-server-url {
    rsa-key key;
}
host server-with-ssh-version-1, ip-address {
    rsa1-key key;
}
```

Host keys are one of the following:

- **dsa-key**—Base64 encoded Digital Signature Algorithm (DSA) key.
- **rsa-key**—Base64 encoded RSA public key algorithm, which supports encryption and digital signatures.
- **rsa1-key**—Base64 encoded RSA public key algorithm, which supports encryption and digital signatures for SSH version 1 and SSH version 2.

---

### Configuring Support for SCP File Transfer

To configure a known host to support background SCP file transfers, include the **archive-sites** statement at the **[edit system archival configuration]** hierarchy level.

```
[edit system archival configuration]
archive-sites {
    scp://username<:password>@host<:port>/url-path;
}
```

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (") and enclose the IPv6 host address in brackets ([ ]). For example, "scp://username<:password>@[host]<:port>/url-path";

Setting the **archive-sites** statement to point to an SCP URL triggers automatic host key retrieval. At this point, Junos OS connects to the SCP host to fetch the SSH public key, displays the host key message digest or fingerprint as output to the console, and terminates the connection to the server.

```
user@switch# set system archival configuration archive-sites "<scp-url-path>"
The authenticity of host <my-archive-server (<server-ip-address>)> can't be established.
RSA key fingerprint is <ascii-text key>. Are you sure you want to continue connecting
(yes/no)?
```

To verify that the host key is authentic, compare this fingerprint with a fingerprint that you obtain from the same host using a trusted source. If the fingerprints are identical, accept the host key by entering **yes** at the prompt. The host key information is then stored in the Routing Engine configuration and supports background data transfers using SCP.

### Updating SSH Host Key Information

Typically, SSH host key information is automatically retrieved when you set a URL attribute for SCP using the **archival configuration archive-sites** statement at the **[edit system]** hierarchy level. However, if you need to manually update the host key database, use one of the following methods.

1. [Retrieving Host Key Information Manually on page 1361](#)
2. [Importing Host Key Information from a File on page 1361](#)

#### *Retrieving Host Key Information Manually*

To manually retrieve SSH public host key information, use the **fetch-from-server** option with the **set security ssh-known-hosts** command. You must include a hostname attribute with the **set security ssh-known-hosts fetch-from-server** command to specify the host from which to retrieve the SSH public key.

```
user@switch# set security ssh-known-hosts fetch-from-server <hostname>
```

#### *Importing Host Key Information from a File*

To manually import SSH host key information from the known-hosts file located at **/var/tmp/known-hosts** on the server, include the **load-key-file** option with the **set security ssh-known-hosts** command. You must include the path to the **known-hosts** file with the **set security ssh-known-hosts load-key-file** command to specify the location from which to import host key information.

```
user@switch# set security ssh-known-hosts load-key-file /var/tmp/known-hosts
```

## Configuring SSH Service for Remote Access to the Router or Switch

To configure the router or switch to accept SSH as an access service, include the **ssh** statement at the **[edit system services]** hierarchy level:

```
[edit system services]
ssh {
  ciphers [ cipher-1 cipher-2 cipher-3 ...]
  client-alive-count-max number;
  client-alive-interval seconds;
  connection-limit limit;
  hostkey-algorithm <algorithm | no-algorithm>;
  key-exchange algorithm;
  macs algorithm;
  max-sessions-per-connection number;
  no-passwords;
  no-tcp-forwarding;
  protocol-version [v1 v2];
  rate-limit limit;
  root-login <allow | deny | deny-password>;
}
```

By default, the router or switch supports a limited number of simultaneous SSH sessions and connection attempts per minute. Use the following statements to change the defaults:

- **connection-limit *limit***—Maximum number of simultaneous connections per protocol (IPv4 and IPv6). The range is a value from 1 through 250. The default is 75. When you configure a connection limit, the limit is applicable to the number of SSH sessions per protocol (IPv4 and IPv6). For example, a connection limit of 10 allows 10 IPv6 SSH sessions and 10 IPv4 SSH sessions.
- **max-sessions-per-connection *number***—Include this statement to specify the maximum number of SSH sessions allowed per single SSH connection. This allows you to limit the number of cloned sessions tunneled within a single SSH connection. The default value is 10.
- **rate-limit *limit***—Maximum number of connection attempts accepted per minute (a value from 1 through 250). The default is 150. When you configure a rate limit, the limit is applicable to the number of connection attempts per protocol (IPv4 and IPv6). For example, a rate limit of 10 allows 10 IPv6 SSH session connection attempts per minute and 10 IPv4 SSH session connection attempts per minute.

By default, a user can create an SSH tunnel over a CLI session to a router running Junos OS via SSH. This type of tunnel could be used to forward TCP traffic, bypassing any firewall filters or ACLs, allowing access to resources beyond the router. Use the **no-tcp-forwarding** option to prevent a user from creating an SSH tunnel to a router via SSH.

For information about other configuration settings, see the following topics:

- [Configuring the Root Login Through SSH on page 1363](#)
- [Configuring the SSH Protocol Version on page 1363](#)
- [Configuring the Client Alive Mechanism on page 1363](#)

### Configuring the Root Login Through SSH

By default, users are allowed to log in to the router or switch as **root** through SSH. To control user access through SSH, include the **root-login** statement at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
root-login (allow | deny | deny-password);
```

**allow**—Allows users to log in to the router or switch as root through SSH. The default is **allow**.

**deny**—Disables users from logging in to the router or switch as root through SSH.

**deny-password**—Allows users to log in to the router or switch as root through SSH when the authentication method (for example, RSA) does not require a password.

### Configuring the SSH Protocol Version

By default, both version 1 and version 2 of the SSH protocol are enabled. To configure the router or switch to use only version 1 of the SSH protocol, include the **protocol-version** statement and specify **v1** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v1 ];
```

To configure the router or switch to use only version 2 of the SSH protocol, include the **protocol-version** statement and specify **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v2 ];
```

To explicitly configure the router or switch to use version 1 and 2 of the SSH protocol, include the **protocol-version** statement and specify **v1** and **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v1 v2 ];
```

For J Series Services Routers, the export license software supports SSH version 1 only.

### Configuring the Client Alive Mechanism

The client alive mechanism is valuable when the client or server depends on knowing when a connection has become inactive. It differs from the standard keepalive mechanism because the client alive messages are sent through the encrypted channel. The client alive mechanism is not enabled at default. To enable it, configure the **client-alive-count-max** and the **client-alive-interval**. This option applies to SSH protocol version 2 only.

In the following example, unresponsive SSH clients will be disconnected after approximately 100 seconds (20 x 5).

```
[edit system services ssh]
```

```
client-alive-count-max 5;  
client-alive-interval 20;
```

## Configuring TACACS+ Authentication (QFX Series)

TACACS+ authentication is a method of authenticating users who attempt to access the router or switch. Tasks to configure TACACS+ configuration are:

- [Configuring TACACS+ Server Details on page 1364](#)
- [Specifying a Source Address for the Junos OS to Access External TACACS+ Servers on page 1365](#)
- [Configuring the Same Authentication Service for Multiple TACACS+ Servers on page 1365](#)
- [Configuring Juniper Networks Vendor-Specific TACACS+ Attributes on page 1366](#)

---

### Configuring TACACS+ Server Details

To use TACACS+ authentication on the router or switch, configure information about one or more TACACS+ servers on the network by including the **tacplus-server** statement at the **[edit system]** hierarchy level:

```
[edit system]  
tacplus-server server-address {  
  port port-number;  
  secret password;  
  single-connection;  
  timeout seconds;  
}
```

**server-address** is the address of the TACACS+ server.

**port-number** is the TACACS+ server port number.

You must specify a secret (password) by using the **secret** statement. The local router or switch passes the **secret** to the TACACS+ client. If the password included spaces, enclose the password in quotation marks. The secret used by the local router or switch must match that used by the server.

Optionally, you can specify the length of time that the local router or switch waits to receive a response from a TACACS+ server by including the **timeout** statement. By default, the router or switch waits 3 seconds. You can configure this to be a value in the range from 1 through 90 seconds.

Optionally, you can use the **single-connection** statement to have the software maintain one open Transmission Control Protocol (TCP) connection to the server for multiple requests, rather than opening a connection for each connection attempt.

**NOTE:** Early versions of the TACACS+ server do not support the **single-connection** option. If you specify this option and the server does not support it, Junos OS will be unable to communicate with that TACACS+ server.

---

To configure multiple TACACS+ servers, include multiple **tacplus-server** statements.

On a TX Matrix router, TACACS+ accounting should be configured only under the groups **re0** and **re1**.

**NOTE:** Accounting should not be configured at the **[edit system]** hierarchy level; on a TX Matrix router, control is done under the switch-card chassis only.

To configure a set of users that share a single account for authorization purposes, you create a template user. To do this, include the **user** statement at the **[edit system login]** hierarchy level.

### Specifying a Source Address for the Junos OS to Access External TACACS+ Servers

You can specify which source address Junos OS uses when accessing your network to contact an external TACACS+ server for authentication. You can also specify which source address Junos OS uses when contacting a TACACS+ server for sending accounting information.

To specify a source address for a TACACS+ server for authentication, include the **source-address** statement at the **[edit system tacplus-server server-address]** hierarchy level:

```
[edit system tacplus-server server-address]
source-address source-address;
```

**source-address** is a valid IP address configured on one of the router or switch interfaces.

To specify a source address for a TACACS+ server for system accounting, include the **source-address** statement at the **[edit system accounting destination tacplus server server-address]** hierarchy level:

```
[edit system accounting destination tacplus server server-address]
source-address source-address;
```

**source-address** is a valid IP address configured on one of the router or switch interfaces.

### Configuring the Same Authentication Service for Multiple TACACS+ Servers

To configure the same authentication service for multiple TACACS+ servers, include statements at the **[edit system tacplus-server]** and **[edit system tacplus-options]** hierarchy levels. For information about how to configure a TACACS+ server at the **[edit system tacplus-server]** hierarchy level.

To assign the same authentication service to multiple TACACS+ servers, include the **service-name** statement at the **[edit system tacplus-options]** hierarchy level:

```
[edit system tacplus-options]
service-name service-name;
```

**service-name** is the name of the authentication service. By default, the service name is set to **junos-exec**.

The following example shows how to configure the same authentication service for multiple TACACS+ servers:

```
[edit system]
tacplus-server {
  10.2.2.2 secret "$9$2dgoJGDiqP5ZG9A"; ## SECRET-DATA
  10.3.3.3 secret "$9$2dgoJGDiqP5ZG9A"; ## SECRET-DATA
}
tacplus-options {
  service-name bob;
}
```

### Configuring Juniper Networks Vendor-Specific TACACS+ Attributes

---

The Juniper Networks vendor-specific TACACS+ attributes enable you to configure access privileges for users on a TACACS+ server. They are specified in the TACACS+ server configuration file on a per-user basis. Junos OS retrieves these attributes through an authorization request of the TACACS+ server after authenticating a user. You do not need to configure these attributes to run Junos OS with TACACS+.

To specify these attributes, include a **service** statement of the following form in the TACACS+ server configuration file:

```
service = junos-exec {
  local-user-name = <username-local-to-router>
  allow-commands = "<allow-commands-regex>"
  allow-configuration = "<allow-configuration-regex>"
  deny-commands = "<deny-commands-regex>"
  deny-configuration = "<deny-configuration-regex>"
}
```

This **service** statement can appear in a **user** or **group** statement.

#### Related Documentation

- [Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands on page 1375](#)
- [Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication on page 1387](#)
- [Juniper Networks Vendor-Specific TACACS+ Attributes on page 1324](#)
- [Overview of Template Accounts for RADIUS and TACACS+ Authentication on page 1318](#)
- [Junos OS User Authentication Methods on page 1334](#)

### Configuring TACACS+ System Accounting

You can use TACACS+ to track and log software logins, configuration changes, and interactive commands. To audit these events, include the following statements at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [ events ];
destination {
  tacplus {
    server {
```

```

server-address {
  port port-number;
  secret password;
  single-connection;
  timeout seconds;
}
}
}
}

```

Tasks for configuring TACACS+ system accounting are:

1. [Specifying TACACS+ Auditing and Accounting Events on page 1367](#)
2. [Configuring TACACS+ Server Accounting on page 1367](#)

### Specifying TACACS+ Auditing and Accounting Events

To specify the events you want to audit when using a TACACS+ server for authentication, include the **events** statement at the **[edit system accounting]** hierarchy level:

```

[edit system accounting]
events [ events ];

```

**events** is one or more of the following:

- **login**—Audit logins
- **change-log**—Audit configuration changes
- **interactive-commands**—Audit interactive commands (any command-line input)

### Configuring TACACS+ Server Accounting

To configure TACACS+ server accounting, include the **server** statement at the **[edit system accounting destination tacplus]** hierarchy level:

```

[edit system accounting destination tacplus]
server {
  server-address {
    port port-number;
    secret password;
    single-connection;
    timeout seconds;
  }
}

```

**server-address** specifies the address of the TACACS+ server. To configure multiple TACACS+ servers, include multiple **server** statements.

**NOTE:** If no TACACS+ servers are configured at the **[edit system accounting destination tacplus]** statement hierarchy level, Junos OS uses the TACACS+ servers configured at the **[edit system tacplus-server]** hierarchy level.

**port-number** specifies the TACACS+ server port number.

You must specify a secret (password) by using the **secret** statement. The local router or switch passes the **secret** to the TACACS+ client. If the password contains spaces, enclose the entire password in quotation marks (" "). The password used by the local router or switch must match that used by the server.

Optionally, you can specify the length of time that the local router or switch waits to receive a response from a TACACS+ server by including the **timeout** statement. By default, the router or switch waits 3 seconds. You can configure this to be a value in the range from 1 through 90 seconds.

Optionally, you can maintain one open TCP connection to the server for multiple requests, rather than opening a connection for each connection attempt, by including the **single-connection** statement.

To ensure that start and stop requests for accounting of login events are correctly logged in the Accounting file instead of the Administration log file on a TACACS+ server, include either the **no-cmd-attribute-value** statement or the **exclude-cmd-attribute** at the **[edit system tacplus-options]** hierarchy level.

If you use the **no-cmd-attribute-value** statement, the value of the **cmd** attribute is set to a null string in the start and stop requests. If you use the **exclude-cmd-attribute** statement, the **cmd** attribute is totally excluded from the start and stop requests. Both statements support the correct logging of accounting requests in the Accounting file, instead of the Administration file.

```
[edit system tacplus-options]
(no-cmd-attribute-value | exclude-cmd-attribute);
```

**Related Documentation** • [Configuring TACACS+ Authentication \(QFX Series\) on page 1364](#)

## Defining Junos OS Login Classes

To define a login class and its access privileges, include the **class** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
class class-name {
  allow-commands "regular-expression";
  allow-configuration "regular-expression";
  deny-commands "regular-expression";
  deny-configuration "regular-expression";
  idle-timeout minutes;
  permissions [ permissions ];
}
```

**Related Documentation** • [Junos OS Login Classes Overview on page 1337](#)  
• [Junos OS User Accounts Overview on page 1335](#)  
• [Example: Creating Login Classes with Specific Privileges on page 1389](#)  
• [Configuring the Junos OS to Display a System Login Announcement on page 163](#)

## Limiting the Number of User Login Attempts for SSH and Telnet Sessions

You can limit the number of times a user can attempt to enter a password while logging in through SSH or Telnet. The connection is terminated if a user fails to log in after the number of attempts specified. You can also specify a delay, in seconds, before a user can try to enter a password after a failed attempt. In addition, you can specify the threshold for the number of failed attempts before the user experiences a delay in being able to enter a password again.

To specify the number of times a user can attempt to enter a password while logging in, include the **retry-options** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
retry-options {
  tries-before-disconnect number;
  backoff-threshold number;
  backoff-factor seconds;
  maximum-time seconds
  minimum-time seconds;
}
```

You can configure the following options:

- **tries-before-disconnect**—Number of times a user can attempt to enter a password when logging in. The connection closes if a user fails to log in after the number specified. The range is from 1 through 10, and the default is 10.
- **backoff-threshold**—Threshold for the number of failed login attempts before the user experiences a delay in being able to enter a password again. Use the **backoff-factor** option to specify the length of the delay in seconds. The range is from 1 through 3, and the default is 2.
- **backoff-factor**—Length of time, in seconds, before a user can attempt to log in after a failed attempt. The delay increases by the value specified for each subsequent attempt after the threshold. The range is from 5 through 10, and the default is 5 seconds.
- **maximum-time *seconds***—Maximum length of time, in seconds, that the connection remains open for the user to enter a username and password to log in. If the user remains idle and does not enter a username and password within the **maximum-time** value, the connection is closed. The range is from 20 through 300 seconds, and the default is 120 seconds.
- **minimum-time**—Minimum length of time, in seconds, that a connection remains open while a user is attempting to enter a correct password. The range is from 20 through 60, and the default is 40.

## Recovering the Root Password

If you forget the root password, you can use the password recovery procedure to reset the root password.

**NOTE:** The root password cannot be recovered on a QFabric system.

**NOTE:** You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the device's power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the device into the RJ-45-to-DB-9 serial port adapter supplied with the device.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the device.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
  - Bits per second: 9600
  - Data bits: 8
  - Parity: None
  - Stop bits: 1
  - Flow control: None
9. Power on the device by (if necessary) plugging the power cords into the device's power supply, or turning on the power to the device by switching on the AC power outlet the device is plugged into.

The terminal emulation screen on your management device displays the device's boot sequence.

10. When the following prompt appears, press the Spacebar to access the device's bootstrap loader command prompt:

Hit [Enter] to boot immediately, or space bar for command prompt.  
Booting [kernel] in 9 seconds...

11. At the following prompt, enter **boot -s** to start up the system in single-user mode.

```
ok boot -s
```

12. At the following prompt, enter **recovery** to start the root password recovery procedure.

```
Enter full pathname of shell or 'recovery' for root password recovery or RETURN
for /bin/sh: recovery
```

13. Enter configuration mode in the CLI.

14. Set the root password. For example:

```
user@switch# set system root-authentication plain-text-password
```

15. At the following prompt, enter the new root password. For example:

```
New password: juniper1
Retype new password:
```

16. At the second prompt, reenter the new root password.

17. After you have finished configuring the password, commit the configuration.

```
root@host# commit
commit complete
```

18. Exit configuration mode in the CLI.

19. Exit operational mode in the CLI.

20. At the prompt, enter **y** to reboot the device.

```
Reboot the system? [y/n] y
```

**Related Documentation**

- [Configuring the Root Password on page 1354](#)

## Specifying Access Privileges for Junos OS Configuration Mode Hierarchies

You can specify extended regular expressions with the **allow-configuration** and **deny-configuration** statements to define user access privileges to parts of the configuration hierarchy. Doing so overrides login class permission bits set for a user. You can also use wildcards to restrict access. When you define access privileges to parts of the configuration hierarchy, do the following tasks:

- Specify the full paths in the extended regular expressions with the **allow-configuration** and **deny-configuration** statements.
- Put parentheses around an extended regular expression that connects two or more expressions with the pipe **|** symbol. For example:

```
[edit system login class class-name]
user@switch# set deny-configuration "(system login class) | (system services)"
```

**NOTE:** Each expression separated by a pipe (**|**) symbol must be a complete standalone expression, and must be enclosed in parentheses (**()**). Do not use spaces between regular expressions separated with parentheses and connected with the pipe (**|**) symbol. You cannot define access to keywords such as **set**, **edit**, or **activate**.

When you explicitly provide access to configuration mode hierarchies or regular expressions using the **allow-configuration** statement, you add to the regular permissions set with the **permissions** statement. If you explicitly deny access to configuration mode hierarchies or regular expressions using the **deny-configuration** statement, you remove permissions for the specified configuration mode hierarchy from the default permissions provided by the **permissions** statement.

To explicitly provide access to an individual configuration mode hierarchy that would otherwise be denied, include the **allow-configuration** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
  allow-configuration "regular-expression";
```

To explicitly deny access to an individual configuration hierarchy that would otherwise be supported, include the **deny-configuration** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
  deny-configuration "regular-expression";
```

You can include one **deny-configuration** and one **allow-configuration** statement in each login class.

If you allow and deny the same set of configuration hierarchy levels, regular expressions, or commands, the **allow-configuration** statement permissions take precedence over the permissions specified by the **deny-configuration** statement. For example, if you include **allow-configuration "system services"** and **deny-configuration "system services"**, the login class user can continue to edit the configuration or issue commands at the **edit system services** hierarchy level.

#### Related Documentation

- [Defining Access Privileges Using allow/deny-configuration Statements on page 1390](#)
- [Configuring Access Privilege Levels on page 1344](#)

## Specifying Access Privileges for Junos OS Operational Mode Commands

You can specify extended regular expressions by using the **allow-commands** and **deny-commands** statements to define a user's access privileges to individual operational mode commands. Doing so takes precedence over a login class permissions bit set for a user. You can include one **deny-commands** and one **allow-commands** statement in each login class.

To explicitly provide use of an individual operational mode command that would otherwise be denied, include the **allow-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
  allow-commands "regular-expression";
```

To explicitly deny access to an individual operational mode command that would otherwise be supported, include the **deny-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
deny-commands "regular-expression";
```

If the regular expression contains any spaces, operators, or wildcard characters, enclose the expression in quotation marks. Regular expressions are not case-sensitive.

```
allow-commands "show interfaces";
```

**NOTE:** Modifiers are not supported within the regular expression string to be matched. If a modifier is used, then nothing is matched.

For example, the deny command **set protocols** does not match anything, whereas **protocols** matches *protocols*.

Explicitly providing access to operational mode commands using the **allow-commands** statement adds to the regular permissions set using the **permissions** statement. Likewise, explicitly denying access to operational mode commands using the **deny-commands** statement removes permissions for the specified commands from the default permissions provided by the **permissions** statement.

For example, if a login class has the permission **view** and the **allow-commands** statement includes the **request system software add** command, the specified login class user can install software, in addition to the permissions specified by the **view** permissions flag. Likewise, if a login class has the permission **all** and the **deny-commands** statement includes the **request system software add** command, the specified login class user can perform all operations allowed by the **all** permissions flag, except installing software using the **request system software add** command.

If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.

If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **deny-commands**.

Anchors are required when specifying complex regular expressions with **allow-commands** or **deny-commands** statements. For example, when specifying multiple commands using the pipe (|) symbol for **allow-commands**, the following syntax is incorrect:

**allow-commands = "(monitor.\*)"|(ping.\*)"|(show.\*)"|(exit)"** . Instead, you must specify the expression using the following syntax: **allow-commands = "(^monitor) | (^ping) | (^show) | (^exit)"** OR **allow-commands = "^ (monitor | ping | show | exit)"**

**Related  
Documentation**

- [Example: Configuring Access Privileges for Operational Mode Commands on page 1381](#)
- [Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands on page 1339](#)
- *allow-commands*
- *deny-commands*

## Using Junos OS to Configure Logical System Administrators

Using Junos OS, you can partition a single router or switch into multiple logical devices that perform independent routing or switching tasks. When creating logical systems, you must configure logical system administrators and interfaces, assign logical interfaces to logical systems, and configure various other logical system statements.

The master administrator can assign one or more logical system administrators to each logical system. Once assigned to a logical system, administrators are restricted to viewing only configurations of the logical system to which they are assigned and accessing only the operational commands that apply to that particular logical system. This restriction means that these administrators cannot access global configuration statements, and all command output is restricted to the logical system to which the administrators are assigned.

To configure logical system administrators, include the **logical-system *logical-system-name*** statement at the **[edit system login class *class-name*]** hierarchy level and apply the class to the user. For example:

```
[edit]
system {
  login {
    class admin1 {
      permissions all;
      logical-system logical-system-LS1;
    }
    class admin2 {
      permissions view; # Gives users assigned to class admin2 the ability to view
                        # but not to change the configuration.
      logical-system logical-system-LS2;
    }
    user user1 {
      class admin1;
    }
    user user2 {
      class admin2;
    }
  }
}
```

```
}
}
```

Fully implementing logical systems requires that you also configure any protocols, routing statements, switching statements, and policy statements for the logical system.

## Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands

Use regular expressions to specify which operational or configuration mode commands are allowed or denied when you use a RADIUS or TACACS+ server for user authentication. You can specify the regular expressions using the appropriate Juniper Networks vendor-specific RADIUS or TACACS+ attributes in your authentication server configuration.

You can specify **allow-configuration**, **deny-configuration**, **allow-commands**, or **deny-commands** in a single extended regular expression, enclosing multiple commands in parentheses and separating them using the pipe symbol. For example, you can specify multiple **allow-commands** parameters using: **allow-commands= (cmd1 | cmd2 | cmdn)**. You can specify **user-permissions** as a list of comma-separated values, and not as a regular expression.

On a RADIUS or TACACS+ server, you can also use a simplified version for regular expressions where you specify each individual expression on a separate line. The simplified version is valid for **allow-commands**, **deny-commands**, **allow-configuration**, **deny-configuration**, and **permissions** vendor-specific attributes.

For a RADIUS server, specify the individual regular expressions using the following syntax:

```
Juniper-Allow-Commands+= "cmd1"
Juniper-Allow-Commands+= "cmd2"
Juniper-Allow-Commands+= "cmdn"
Juniper-Deny-Commands+= "cmd1"
Juniper-Deny-Commands+= "cmd2"
Juniper-Deny-Commands+= "cmdn"
Juniper-Allow-Configuration+= "regex1"
Juniper-Allow-Configuration+= "regex2"
Juniper-Allow-Configuration+= "regexn"
Juniper-Deny-Configuration+= "regex1"
Juniper-Deny-Configuration+= "regex2"
Juniper-Deny-Configuration+= "regexn"
Juniper-User-Permissions+= "permission-flag1"
Juniper-User-Permissions+= "permission-flag2"
Juniper-User-Permissions+= "permission-flagn"
```

For TACACS+ server, specify the individual regular expressions using the following syntax:

```
allow-commands1= "cmd1"
allow-commands2= "cmd2"
allow-commandsn= "cmdn"
deny-commands1= "cmd1"
```

```
deny-commands2="cmd2"  
deny-commandsn="cmdn"  
allow-configuration1="regex1"  
allow-configuration2="regex2"  
allow-configurationn="regexn"  
deny-configuration1="regex1"  
deny-configuration2="regex2"  
deny-configurationn="regexn"  
user-permissions1="permission-flag1"  
user-permissions2="permission-flag2"  
user-permissionsn="permission-flagn "
```

**NOTE:**

- Numeric values 1 to *n* in the syntax (for TACACS+ server) must be unique but need not be sequential. For example, the following syntax is valid:

```
allow-commands1="cmd1"  
allow-commands3="cmd3"  
allow-commands2="cmd2"  
deny-commands3="cmd3"  
deny-commands2="cmd2"  
deny-commands1="cmd1"
```

- The limit on the number of lines of individual regular expressions is imposed by the TACACS+ or RADIUS server.
- When you issue the `show cli authorization` command, the command output displays the regular expression in a single line, even if you specify each individual expression on a separate line.

---

For more information about Juniper Networks vendor-specific RADIUS and TACACS+ attributes, see [“Juniper Networks Vendor-Specific RADIUS Attributes” on page 1321](#) and [“Juniper Networks Vendor-Specific TACACS+ Attributes” on page 1324](#).

**NOTE:** When RADIUS or TACACS+ authentication is configured for a router, regular expressions configured on the RADIUS or TACACS+ server merge with any regular expressions configured on the local router at the `[edit system login class]` hierarchy level using the `allow-commands`, `deny-commands`, `allow-configuration`, `deny-configuration`, or `permissions` statements. If the final expression has a syntax error, the overall result is an invalid regular expression.

## VSA Match Conditions and Actions

Devices support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific attributes (VSAs). They are configured on RADIUS servers and work in combination with 802.1X authentication. Using VSAs, you

can apply port firewall filter attributes as a subset of match conditions and actions sent from the RADIUS server to the switch as a result of successful 802.1X authentication.

Each term in a VSA configured through the RADIUS server consists of *match conditions* and an *action*. Match conditions are the values or fields that the packet must contain. You can define single, multiple, or no match conditions. If no match conditions are specified for the term, the packet is accepted by default. The action is the action that the switch takes if a packet matches the match conditions for the specific term. Allowed actions are to accept a packet or to discard a packet.

The following guidelines apply when you specify match conditions and actions for VSAs:

- Both **match** and **action** statements are mandatory.
- Any or all options (separated by commas) may be included in each **match** and **action** statement.
- Fields separated by commas will be ANDed if they are of a different type. The same types cannot be repeated.
- For OR cases (for example, match 10.1.1.0/24 OR 11.1.1.0/24), apply multiple VSAs to the 802.1X supplicant.
- In order for the **forwarding-class** option to be applied, the forwarding class must be configured on the switch. If it is not configured on the switch, this option is ignored.

[Table 83 on page 1377](#) describes the match conditions you can specify when configuring a VSA using the **match** command on the RADIUS server. The string that defines a match condition is called a *match statement*.

**Table 83: Match Conditions**

Option	Description
<b>destination-mac</b> <i>mac-address</i>	Destination media access control (MAC) address of the packet.
<b>source-vlan</b> <i>source-vlan</i>	Name of the source VLAN.
<b>source-dot1q-tag</b> <i>tag</i>	Tag value in the 802.1Q header, in the range 0 through 4095.
<b>destination-ip</b> <i>ip-address</i>	Address of the final destination node.
<b>ip-protocol</b> <i>protocol-id</i>	IPv4 protocol value. In place of the numeric value, you can specify one of the following text synonyms:  <b>ah</b> , <b>egp</b> (8), <b>esp</b> (50), <b>gre</b> (47), <b>icmp</b> (1), <b>igmp</b> (2), <b>ipip</b> (4), <b>ipv6</b> (41), <b>ospf</b> (89), <b>pim</b> (103), <b>rsvp</b> (46), <b>tcp</b> (6), or <b>udp</b> (17)
<b>source-port</b> <i>port</i>	TCP or User Datagram Protocol (UDP) source port field. Normally, you specify this match statement in conjunction with the <b>ip-protocol</b> match statement to determine which protocol is being used on the port. In place of the numeric field, you can specify one of the text options listed under <b>destination-port</b> .

Table 83: Match Conditions (*continued*)

Option	Description
<b>destination-port</b> <i>port</i>	<p>TCP or UDP destination port field. Normally, you specify this match in conjunction with the <b>ip-protocol</b> match statement to determine which protocol is being used on the port. In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed):</p> <p>afs (1483), bgp (179), biff (512), bootpc (68), bootps (67), cvspserver (2401), cmd (514), dhcp (67), domain (53), eklogin (2105), ekshell (2106), exec (512), finger (79), ftp (21), ftp-data (20), http (80), https (443), ident (113), imap (143), kerberos-sec (88), klogin (543), kpasswd (761), krb-prop (754), krbupdate (760), kshell (544), ldap (389), login (513), mobileip-agent (434), mobilip-mn (435), msdp (639), netbios-dgm (138), netbios-ns (137), netbios-ssn (139), nfsd (2049), nntp (119), ntalk (518), ntp (123), pop3 (110), pptp (1723), printer (515), radacct (1813), radius (1812), rip (520), rkinit (2108), smtp (25), snmp (161), snmptrap (162), snpp (444), socks (1080), ssh (22), sunrpc (111), syslog (514), telnet (23), tacacs-ds (65), talk (517), tftp (69), timed (525), who (513), xdmcp (177), zephyr-clt (2103), zephyr-hm (2104)</p>

When you define one or more terms that specify the filtering criteria, you also define the action to take if the packet matches all criteria. [Table 84 on page 1378](#) shows the actions that you can specify in a term.

Table 84: Actions for VSAs

Option	Description
(allow   deny)	Accept a packet or discard a packet silently without sending an Internet Control Message Protocol (ICMP) message.
<b>forwarding-class</b> <i>class-of-service</i>	<p>(Optional) Classify the packet in one of the following forwarding classes:</p> <ul style="list-style-type: none"> <li>assured-forwarding</li> <li>best-effort</li> <li>expedited-forwarding</li> <li>network-control</li> </ul>
<b>loss-priority</b> (low   medium   high)	(Optional) Set the packet loss priority (PLP) to <b>low</b> , <b>medium</b> , or <b>high</b> . Specify both the forwarding class and loss priority.

## Example: Changing the Requirements for Junos OS Plain-Text Passwords

This example shows how to set various maximum and minimum requirements for plain-text passwords to increase password strength.

- [Requirements on page 1379](#)
- [Overview on page 1379](#)
- [Configuration on page 1379](#)

### Requirements

This example requires a device running Junos 12.2 or greater. The **minimum-length** and **maximum-length** password requirements statements are available in earlier releases, however, you must have Junos OS Release 12.2 or greater to configure **minimum-lower-cases**, **minimum-numeric**, **minimum-punctuations**, or **minimum-upper-cases**.

### Overview

You can use a variety of requirements to strengthen plain-text passwords for greater security. Junos OS provides a number of possible configurations at the **[edit system login password]** hierarchy level that allow you to require users to create plain-text passwords that conform to a particular set of requirements that may include such things as length, number of changes, type of characters, numbers, or letter case.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system login password minimum-length 12
```

```
set system login password maximum-length 22
```

```
set system login password minimum-numeric 1
```

```
set system login password minimum-upper-cases 1
```

```
set system login password minimum-lower-cases 1
```

```
set system login password minimum-punctuations 1
```

### *Configuring Requirements for Plain-Text Passwords*

**Step-by-Step Procedure** This example configures password requirements that require the user to create a password that has a minimum length of 12 characters, a maximum length of 22 characters, and that includes at least one lower-case letter, at least one upper-case letter, at least one punctuation character, and at least one numeric character.

1. Navigate to configuration mode in the [system login password] hierarchy level.  

```
user@host> edit
[edit]
user@host# edit system login password
```
2. Set a minimum length requirement of 12 characters and a maximum length requirement of 22 characters for user passwords.  

```
[edit system login password]
user@host# set minimum-length 12
[edit system login password]
user@host# set maximum-length 22
```
3. Require users to set a password that has at least one lower-case letter and at least one upper-case letter.  

```
[edit system login password]
user@host# set minimum-lower-cases 1
[edit system login password]
user@host# set minimum-upper-cases 1
```
4. Require users to set a password that has at least one punctuation-class character and at least one number.  

```
[edit system login password]
user@host# set minimum-punctuations 1
[edit system login password]
user@host# set minimum-numeric 1
```

### *Results*

From configuration mode, confirm your configuration by entering the show command at the edit system login password hierarchy level. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit system login password]
user@host# show
  minimum-length 12;
  maximum-length 22;
```

```

minimum-numeric 1;
minimum-upper-cases 1;
minimum-lower-cases 1;

```

- Related Documentation**
- [Special Requirements for Junos OS Plain-Text Passwords on page 1339](#)
  - *password (Login)*

## Example: Configuring Access Privilege Levels

Create two access privilege classes on the router or switch, one for configuring and viewing user accounts only and the second for configuring and viewing SNMP parameters only:

```

[edit]
system {
  login {
    class user-accounts {
      permissions [ configure admin admin-control ];
    }
    class network-mgmt {
      permissions [ configure snmp snmp-control ];
    }
  }
}

```

- Related Documentation**
- [Configuring Access Privilege Levels on page 1344](#)

## Example: Configuring Access Privileges for Operational Mode Commands

The following example shows how to configure access privileges for different login classes for individual operational mode commands:

```

[edit]
system {
  # This login class has operator privileges and the additional ability
  # to reboot the router.
  login {
    # This login class has operator privileges and the additional ability to reboot the
    # router or switch.
    class operator-and-boot {
      permissions [ clear network reset trace view ];
      allow-commands "request system reboot";
    }
    # This login class has operator privileges but can't use any commands beginning
    # with "set".
    # This login class has operator privileges
    # but cannot use any commands beginning with "set"
    class operator-no-set {
      permissions [ clear network reset trace view ];
      deny-commands "^set";
    }
    # This login class has operator privileges and can install software but not view
    # BGP information, and can issue the show route command, without specifying
    # commands or arguments under it.

```

```
class operator-and-install-but-no-bgp {  
  permissions [ clear network reset trace view ];  
  allow-commands "(request system software add)|(show route$)";  
  deny-commands "show bgp";  
}  
}  
}
```

**Related  
Documentation**

- [Specifying Access Privileges for Junos OS Operational Mode Commands on page 192](#)

## Example: Configuring a Plain-Text Password for Root Logins

This example shows how to configure the authentication methods for the root-level user, whose username is “root”.

- [Requirements on page 1382](#)
- [Overview on page 1382](#)
- [Configuration on page 1382](#)
- [Verification on page 1383](#)

### Requirements

---

No special configuration beyond device initialization is required before configuring this example.

Make sure you understand the requirements for a valid plain-text password. For Junos OS, the The default requirements for plain-text passwords are as follow:

- The password must be between 6 and 128 characters long.
- You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
- Valid passwords must contain at least one change of case or character class.

### Overview

---

Junos OS is preinstalled on the router. When the router is powered on, it is ready to be configured. Initially, you log in as the user “root” with no password. To set the root password, you have several options. This example shows you how to enter a plain-text password that Junos OS then encrypts for you.

### Configuration

---

**CLI Quick  
Configuration**

```
[edit system]  
set root-authentication plain-text-password  
New password: new-password  
Retype new password: new-password
```

**Configuring [item]**

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the Junos OS CLI User Guide.

To configure a plain-text password:

1. Type the set command for plain-text password and press Enter.  

```
[edit]
user@host# set system root-authentication plain-text-password
New password:
```
2. Type the new password next to the **New password:** prompt and press Enter.  

```
user@host# new-password
Retype new password:
```
3. Retype the same password next to the next prompt and press Enter.

**Results**

From configuration mode, confirm your configuration by entering the **show** command. It should look something like this:

```
root-authentication {
  encrypted-password "$1$ASwBkGYd$YUcEwgd0IO4QkRzzlQdmT/"; ## SECRET-DATA
}
```

If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

After you have confirmed that the interfaces are configured, enter the **commit** command in configuration mode.

**Verification**

- [Verifying the Configuration of a Plain-Text Password for Root Logins on page 1383](#)

**Verifying the Configuration of a Plain-Text Password for Root Logins**

**Purpose** Verify the configuration of a plain-text password.

**Action** From operational mode, confirm your configuration by entering the **show configuration system** command.

```
user@host> show configuration system
root-authentication {
  encrypted-password "$1$ASwBkGYd$YUcEwgd0IO4QkRzzlQdmT/"; ## SECRET-DATA
}
```

**Meaning** If you use a clear-text password, Junos OS displays the password as an encrypted string so that users viewing the configuration cannot see it. As you enter the password in plain text, Junos OS encrypts it immediately. You do not have to configure Junos OS to encrypt

the password as in some other systems. Plain-text passwords are hidden and marked as ## SECRET-DATA in the configuration.

**Related  
Documentation**

- *root-authentication*
- [Special Requirements for Junos OS Plain-Text Passwords on page 1339](#)
- *Configuring Special Requirements for Plain-Text Passwords*
- *Changing the Requirements for Junos OS Plain-Text Passwords*

## Example: Configuring RADIUS Authentication

The Junos OS supports two protocols for central authentication of users on multiple routers: RADIUS and TACACS+. We recommend RADIUS because it is a multivendor IETF standard, and its features are more widely accepted than those of TACACS+ or other proprietary systems. In addition, we recommend using a one-time-password system for increased security, and all vendors of these systems support RADIUS.

The Junos OS uses one or more template accounts to perform user authentication. You create the template account or accounts, and then configure the user access to use that account. If the RADIUS server is unavailable, the fallback is for the login process to use the local account that set up on the router or switch.

The following example shows how to configure RADIUS authentication:

```
[edit]
system {
  authentication-order [ radius password ];
  root-authentication {
    encrypted-password "$9$aH1j8gqQ1gjyjjhgjgiiii"; # SECRET-DATA
  }
  name-server {
    10.1.1.1;
    10.1.1.2;
  }
}
```

The following example shows how to enable RADIUS authentication and define the shared secret between the client and the server. The secret enables the client and server to determine that they are talking to the trusted peer.

Define a timeout value for each server, so that if there is no response within the specified number of seconds, the router can try either the next server or the next authentication mechanism.

```
[edit]
system {
  radius-server {
    10.1.2.1 {
      secret "$9$aH1j8gqQ1sdjerrhser"; # SECRET-DATA
      timeout 5;
    }
    10.1.2.2 {
```

```

        secret "$9$aH1j8gqQ1csdoiuardwefoiud"; # SECRET-DATA
        timeout 5;
    }
}

```

## Example: Configuring RADIUS System Accounting

The following example shows three servers (10.5.5.5, 10.6.6.6, and 10.7.7.7) configured for RADIUS accounting.

```

system {
  accounting {
    events [ login change-log interactive-commands ];
    destination {
      radius {
        server {
          10.5.5.5 {
            accounting-port 3333;
            secret $9$dkafeqwrew;
            source-address 10.1.1.1;
            retry 3;
            timeout 3;
          }
          10.6.6.6 secret $9$fe3erqwrez;
          10.7.7.7 secret $9$f34929ftby;
        }
      }
    }
  }
}

```

## Example: Configuring User Accounts

The following example shows how to create accounts for four router or switch users, and create an account for the template user **remote**. All users use one of the default system login classes. User **alexander** also has two digital signal algorithm (DSA) public keys configured for SSH authentication.

```
[edit]
system {
  login {
    user philip {
      full-name "Philip of Macedonia";
      uid 1001;
      class super-user;
      authentication {
        encrypted-password "$1$poPPeY";
      }
    }
    user alexander {
      full-name "Alexander the Great";
      uid 1002;
      class view;
      authentication {
        encrypted-password "$1$14c5.$sBopasdFFdssdfFFdsdfs0";
        ssh-dsa "8924 37 5678 5678@gaugamela.per";
        ssh-dsa "6273 94 9283@boojum.per";
      }
    }
    user darius {
      full-name "Darius King of Persia";
      uid 1003;
      class operator;
      authentication {
        ssh-rsa "1024 37 12341234@ecbatana.per";
      }
    }
  }
}
```

```

    }
    user anonymous {
        class unauthorized;
    }
    user remote {
        full-name "All remote users";
        uid 9999;
        class read-only;
    }
}
}

```

- Related Documentation**
- *Junos OS User Accounts Overview*
  - *Limiting the Number of User Login Attempts for SSH and Telnet Sessions*

### Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication

The following example shows how to configure system authentication for RADIUS, TACACS+, and password authentication.

In this example, only the user Philip and users authenticated by a remote RADIUS server can log in. If a user logs in and is not authenticated by the RADIUS server, the user is denied access to the router or switch. If the RADIUS server is not available, the user is authenticated using the **password** authentication method and allowed access to the router or switch. For more information about the password authentication method, see [“Using Local Password Authentication” on page 1331](#).

When Philip tries to log in to the system, if the RADIUS server authenticates him, he is given access and privileges for the **super-user** class. Local accounts are not configured for other users. When they log in to the system and the RADIUS server authenticates them, they are given access using the same user ID (UID) 9999 and the privileges associated with the **operator** class.

```

[edit]
system {
    authentication-order radius;
    login {
        user philip {
            full-name "Philip";
            uid 1001;
            class super-user;
        }
        user remote {
            full-name "All remote users";
            uid 9999;
            class operator;
        }
    }
}
}

```

**NOTE:** For authorization purposes, you can use a template account to create a single account that can be shared by a set of users at the same time. For example, when you create a remote template account, a set of remote users can concurrently share a single UID. For more information about template accounts, see [“Overview of Template Accounts for RADIUS and TACACS+ Authentication”](#) on page 1318.

When a user logs in to a device, the user's login name is used by the RADIUS or TACACS+ server for authentication. If the user is authenticated successfully by the authentication server and the user is not configured at the `[edit system login user]` hierarchy level, the device uses the default remote template user account for the user, provided a remote template account is configured at the `edit system login user remote` hierarchy level. The remote template account serves as a default template user account for all users that are authenticated by the authentication server but not having a locally configured user account on the device. Such users share the same login class and UID.

To configure an alternate template user, specify the **user-name** parameter returned in the RADIUS authentication response packet. Not all RADIUS servers allow you to change this parameter. The following shows a sample Junos OS configuration:

```
[edit]
system {
  authentication-order radius;
  login {
    user philip {
      full-name "Philip";
      uid 1001;
      class super-user;
    }
    user operator {
      full-name "All operators";
      uid 9990;
      class operator;
    }
    user remote {
      full-name "All remote users";
      uid 9999;
      class read-only;
    }
  }
}
```

Assume your RADIUS server is configured with the following information:

- User Philip with password “olympia”
- User Alexander with password “bucephalus” and username “operator”
- User Darius with password “redhead” and username “operator”
- User Roxane with password “athena”

Philip would be given access as a superuser (**super-user**) because he has his own local user account. Alexander and Darius share UID 9990 and have access as operators. Roxane has no template-user override, so she shares access with all the other remote users, getting read-only access.

## Example: Creating Login Classes with Specific Privileges

The following example shows how to create several user classes, each with specific privileges. In this example, you configure timeouts to disconnect the class members after a period of inactivity. Users' privilege levels, and therefore the classes of which they are members, should be dependent on their responsibilities within the organization, and the permissions shown here are only examples.

The first class of users (called "observation") can only view statistics and configuration. They are not allowed to modify any configuration. The second class of users (called "operation") can view and modify the configuration. The third class of users (called "engineering") has unlimited access and control.

```
[edit]
system {
  login {
    class observation {
      idle-timeout 5;
      permissions [ view ];
    }
    class operation {
      idle-timeout 5;
      permissions [ admin clear configure interface interface-control network
        reset routing routing-control snmp snmp-control trace-control
        firewall-control rollback ];
    }
    class engineering {
      idle-timeout 5;
      permissions all;
    }
  }
}
```

- Related Documentation**
- [Defining Junos OS Login Classes](#)

## Example: Configuring User Login Accounts

The following example shows how to configure the local administrator account (**user admin**). If RADIUS fails or becomes unreachable, the login process reverts to password authentication on the local accounts on the router or switch.

```
[edit]
system {
  login {
```

```
user admin {  
  uid 1000;  
  class engineering;  
  authentication {  
    encrypted-password "<PASSWORD>"; # SECRET-DATA  
  }  
}  
}
```

**Related Documentation** • [Configuring Junos OS User Accounts](#)

### Example: Configuring RADIUS Template Accounts

The following example shows how to configure RADIUS template accounts for different users or groups of users:

```
[edit]  
system {  
  login {  
    user observation {  
      uid 1001;  
      class observation;  
    }  
    user operation {  
      uid 1002;  
      class operation;  
    }  
    user engineering {  
      uid 1003;  
      class engineering;  
    }  
  }  
}
```

**Related Documentation** • [Overview of Template Accounts for RADIUS and TACACS+ Authentication on page 1318](#)

### Defining Access Privileges Using allow/deny-configuration Statements

The following examples show how to configure access privileges for individual configuration mode hierarchy levels.

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot configure telnet parameters:

```
[edit system login class class-name]  
user@switch# set deny-configuration "system services telnet"
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot issue login class commands within any login class whose name begins with "m":

```
[edit system login class class-name]  
user@switch# set deny-configuration "system login class m.*"
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot edit a configuration or issue commands (such as **commit**) at the login class or system services hierarchy levels:

```
[edit system login class class-name]
user@switch# set deny-configuration "(system login class) | (system services)"
```

The following example shows how to configure permissions for individual configuration mode hierarchies:

```
[edit]
system {
  login { # This login class has operator privileges and the additional ability to edit
    # configuration at the system services hierarchy level.
    class only-system-services {
      permissions [ configure ];
      allow-configuration "system services";
    }
    # services commands.
    class all-except-system-services { # This login class has operator privileges but
      # cannot edit any system services configuration.
      permissions [ all ];
      deny-configuration "system services";
    }
  }
}
```

## Example: Limiting the Number of Login Attempts for SSH and Telnet Sessions

The following example shows how to limit the user to four attempts when the user enters a password while logging in through SSH or Telnet. Set the **backoff-threshold** to 2, the **back-off-factor** to 5 seconds, and the **minimum-time** to 40 seconds. The user experiences a delay of 5 seconds after the second attempt to enter a correct password fails. After each subsequent failed attempt, the delay increases by 5 seconds. After the fourth and final failed attempt to enter a correct password, the user experiences an additional 10-second delay, and the connection closes after a total of 40 seconds.

The additional variables **maximum-time** and **lockout-period** are not set in this example.

```
[edit]
system {
  login {
    retry-options {
      backoff-threshold 2;
      backoff-factor 5;
      minimum-time 40;
      tries-before-disconnect 4;
    }
    password {
    }
  }
}
```

}

**NOTE:** This sample only shows the portion off the [edit system login] hierarchy level being modified.

<b>Hierarchy Level</b>	[edit]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure options for accounting statistics collection.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding RADIUS Accounting on page 1320</a></li> <li>• <a href="#">Understanding VSAs on page 1321</a></li> <li>• <a href="#">Configuring RADIUS System Accounting on page 1349</a></li> <li>• <a href="#">Configuring Remote Template Accounts for User Authentication on page 1354</a></li> <li>• <a href="#">Configuring Local User Template Accounts for User Authentication on page 1347</a></li> </ul>

## accounting-server

---

<b>Syntax</b>	accounting-server[ <i>server-addresses</i> ];
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> radius]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the Remote Authentication Dial-In User Service (RADIUS) server for authentication. To configure multiple RADIUS servers, include multiple server addresses. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.
<b>Default</b>	Not enabled
<b>Options</b>	<i>server-addresses</i> —One or more addresses of RADIUS authentication servers.

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

---

<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>show network-access aaa statistics authentication</i></li><li>• <i>Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch</i></li><li>• <i>Understanding 802.1X and RADIUS Accounting on EX Series Switches</i></li><li>• <a href="#">Understanding RADIUS Accounting on page 1320</a></li></ul>

## accounting-stop-on-access-deny

<b>Syntax</b>	accounting-stop-on-access-deny;
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> accounting]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the authentication order for authentication, authorization, and accounting (AAA) services to send an Acct-Stop message if the AAA server denies access to a supplicant.

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

<b>Default</b>	Not enabled
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch</i></li> <li>• <i>Configuring 802.1X RADIUS Accounting (CLI Procedure)</i></li> <li>• <i>show network-access aaa statistics authentication</i></li> <li>• <i>Configuring RADIUS Accounting</i></li> </ul>

## accounting-stop-on-failure

---

<b>Syntax</b>	accounting-stop-on-failure;
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> accounting]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure authentication order for authentication, authorization, and accounting (AAA) services to send an Acct-Stop message if a supplicant fails AAA authorization, but the RADIUS server grants access. For example, a supplicant might fail AAA authentication because of an internal error such as a timeout.
<div> <b>NOTE:</b> The [edit access] hierarchy is not available on QFabric systems.</div>	
<b>Default</b>	Not enabled
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch</i></li><li>• <i>Configuring 802.1X RADIUS Accounting (CLI Procedure)</i></li><li>• <i>Understanding 802.1X and RADIUS Accounting on EX Series Switches</i></li><li>• <i>Configuring RADIUS Accounting</i></li><li>• <a href="#">Understanding RADIUS Accounting on page 1320</a></li></ul>

## advertisement-interval

<b>Syntax</b>	<code>advertisement-interval seconds;</code>
<b>Hierarchy Level</b>	[edit protocols lldp], [edit routing-instances <i>routing-instance-name</i> protocols lldp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6 for MX Series and T Series routers. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>For MX Series and T Series routers and EX Series switches, configure an interval for LLDP advertisement.</p> <p>For switches configured for Link Layer Discovery Protocol, configure the frequency at which LLDP advertisements are sent.</p> <p>The <b>advertisement-interval</b> value must be greater than or equal to four times the <b>transmit-delay</b> value, or an error will be returned when you attempt to commit the configuration.</p>
	<div>  <p><b>NOTE:</b> The default value of <b>transmit-delay</b> is 2 seconds. If you configure the <b>advertisement-interval</b> as less than 8 seconds and you do not configure a value for <b>transmit-delay</b>, the default value of <b>transmit-delay</b> is automatically changed to 1 second in order to satisfy the requirement that the <b>advertisement-interval</b> value must be greater than or equal to four times the <b>transmit-delay</b> value.</p> </div>
<b>Default</b>	Disabled.
<b>Options</b>	<p><b>seconds</b>—Interval between LLDP advertisement.</p> <p><b>Default:</b> 30</p> <p><b>Range:</b> 5 through 32768</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring LLDP</i></li> <li>• <a href="#">show lldp on page 1486</a></li> <li>• <i>Configuring LLDP (CLI Procedure)</i></li> <li>• <i>Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches</i></li> <li>• <i>transmit-delay</i></li> <li>• <a href="#">Understanding LLDP on page 1319</a></li> </ul>

## agent-address

---

<b>Syntax</b>	agent-address outgoing-interface;
<b>Hierarchy Level</b>	[edit snmp trap-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the agent address of all SNMPv1 traps generated by this router or switch. Currently, the only option is <b>outgoing-interface</b> , which sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.
<b>Options</b>	<b>outgoing-interface</b> —Value of the agent address of all SNMPv1 traps generated by this router or switch. The <b>outgoing-interface</b> option sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap. <b>Default:</b> Disabled (the agent address is not specified in SNMPv1 traps).
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Agent Address for SNMP Traps</i></li></ul>

## archival

<b>Syntax</b>	<pre> archival {   configuration {     archive-sites {       file://&lt;path&gt;/&lt;filename&gt;;       ftp://username@host:&lt;port&gt;url-path password password;       http://username@host:&lt;port&gt;url-path password password;       pasvftp://username@host:&lt;port&gt;url-path password password;       scp://username@host:&lt;port&gt;url-path password password;     }     transfer-interval interval;     transfer-on-commit;   } } </pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Configure copying of the currently active configuration to an archive site. An archive site can be a file, or an FTP or SCP location.
<div>  <b>NOTE:</b> The <code>edit system archival</code> hierarchy is not available on QFabric systems. </div>	
<b>Options</b>	The remaining statements are explained separately.
<div>  <b>NOTE:</b> The <code>[edit system archival]</code> hierarchy is not available on QFabric systems. </div>	
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site on page 1263</li> </ul>

## archive-sites (Configuration File)

<b>Syntax</b>	<pre>archive-sites {     file://&lt;path&gt;/&lt;filename&gt;;     ftp://username@host:&lt;port&gt;url-path password password;     http://username@host:&lt;port&gt;url-path password password;     pasvftp://username@host:&lt;port&gt;url-path password password;     scp://username@host:&lt;port&gt;url-path password password; }</pre>
<b>Hierarchy Level</b>	[edit system archival configuration]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Specify where to transfer the current configuration files. When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks ( " ") and enclose the IPv6 host address in brackets ( [ ] ). For example,</p> <pre>"scp://username&lt;:password&gt;@[ipv6-host-address]&lt;:port&gt;/url-path"</pre> <p>If you specify more than one archive site, the router or switch attempts to transfer the configuration files to the first archive site in the list, moving to the next only if the transfer fails.</p> <p>The destination filename is saved in the following format, where <i>n</i> corresponds to the number of the compressed configuration rollback file that has been archived:</p> <pre>router-name_juniper.conf.n.gz_YYYYMMDD_HHMMSS.</pre> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> The time included in the destination filename is always in Coordinated Universal Time (UTC) regardless of whether the time on the router or switch is configured as UTC or the local time zone. The default time zone on the router or switch is UTC.</p> </div> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> The [edit system archival] hierarchy is not available on QFabric systems.</p> </div>
<b>Options</b>	<p>The prefix used in the configuration statement determines the form of transfer:</p> <p><b>file://</b> —transfer on a path to a named file</p> <p><b>ftp://</b> —transfer using active FTP server</p> <p><b>pasvftp://</b> —transfer to a device that only accepts passive FTP services</p>

**scp://** —transfer to a known host using background SCP file transfers

<b>Required Privilege Level</b>	system—To view this statement in the configuration.
	system-control—To add this statement to the configuration.
<b>Related Documentation</b>	• <a href="#">Configuring Archive Sites for Transfer of Active Configuration Files on page 1264</a>
	• <a href="#">Junos OS Commit Model for Router or Switch Configuration on page 14</a>
	• <a href="#">configuration on page 1269</a>
	• <a href="#">transfer-on-commit on page 1271</a>

## authentication-order

<b>Syntax</b>	authentication-order [none   password   radius];
<b>Hierarchy Level</b>	[edit <a href="#">access profile</a> <i>profile-name</i> ], [edit <a href="#">system</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the order of authentication, authorization, and accounting (AAA) servers to use while sending authentication messages.
<b>Default</b>	Not enabled
<b>Options</b>	<b>none</b> —No authentication for specified subscribers.
	<b>password</b> —Password authentication.
	<b>radius</b> —RADIUS authentication.

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

<b>Required Privilege Level</b>	admin—To view this statement in the configuration.
	admin-control—To add this statement to the configuration.

## authentication-server

---

<b>Syntax</b>	<code>authentication-server [server-addresses];</code>
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> radius]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the RADIUS server for authentication. To configure multiple RADIUS servers, include multiple server addresses. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.
<b>Options</b>	<b>server-addresses</b> —Configure one or more RADIUS server addresses.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch</i></li><li>• <i>show network-access aaa statistics authentication</i></li></ul>

## authorization

---

<b>Syntax</b>	<code>authorization <i>authorization</i>;</code>
<b>Hierarchy Level</b>	[edit snmp community <i>community-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the access authorization for SNMP <b>Get</b> , <b>GetBulk</b> , <b>GetNext</b> , and <b>Set</b> requests.
<b>Options</b>	<p><b><i>authorization</i></b>—Access authorization level:</p> <ul style="list-style-type: none"> <li><b>read-only</b>—Enable <b>Get</b>, <b>GetNext</b>, and <b>GetBulk</b> requests.</li> <li><b>read-write</b>—Enable all requests, including <b>Set</b> requests. You must configure a view to enable <b>Set</b> requests.</li> </ul>
	<div>  <p><b>NOTE:</b> The read-write option is not supported on the QFX3000 QFabric system.</p> </div>
	<b>Default:</b> read-only
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Configuring the SNMP Community String on page 6601</a></li> </ul>

## categories

---

<b>Syntax</b>	<pre>categories {     category; }</pre>
<b>Hierarchy Level</b>	[edit snmp trap-group <i>group-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define the types of traps that are sent to the targets of the named trap group.
<b>Default</b>	If you omit the <b>categories</b> statement, all trap types are included in trap notifications.
<b>Options</b>	<b>category</b> —Name of a trap type: <b>authentication</b> , <b>chassis</b> , <b>configuration</b> , <b>link</b> , <b>remote-operations</b> , <b>rmon-alarm</b> , or <b>startup</b> .
<b>Required Privilege Level</b>	<b>snmp</b> —To view this statement in the configuration. <b>snmp-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring SNMP Trap Groups on page 6602</a></li></ul>

## client-list

---

<b>Syntax</b>	<pre>client-list <i>client-list-name</i> {     <i>ip-addresses</i>; }</pre>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define a list of SNMP clients.
<b>Options</b>	<b>client-list-name</b> —Name of the client list.  <b>ip-addresses</b> —IP addresses of the SNMP clients to be added to the client list,
<b>Required Privilege Level</b>	<b>snmp</b> —To view this statement in the configuration. <b>snmp-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Adding a Group of Clients to an SNMP Community on page 6603</a></li></ul>

## client-list-name

---

<b>Syntax</b>	<code>client-list-name <i>client-list-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp community <i>community-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Add a client list or prefix list to an SNMP community.
<b>Options</b>	<i>client-list-name</i> —Name of the client list or prefix list.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Adding a Group of Clients to an SNMP Community on page 6603</a></li> </ul>

## clients

---

<b>Syntax</b>	<pre>clients {     address &lt;restrict&gt;; }</pre>
<b>Hierarchy Level</b>	<code>[edit snmp community <i>community-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the IPv4 or IPv6 addresses of the SNMP client hosts that are authorized to use this community.
<b>Default</b>	If you omit the <b>clients</b> statement, all SNMP clients using this community string are authorized to access the switch.
<b>Options</b>	<p><b>address</b>—Address of an SNMP client that is authorized to access this switch. You must specify an address, not a hostname. To specify more than one client, include multiple <b>address</b> options.</p> <p><b>restrict</b>—(Optional) Do not allow the specified SNMP client to access the switch.</p>
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring SNMP Communities</a></li> </ul>

## commit-delay

---

<b>Syntax</b>	commit-delay <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit snmp nonvolatile]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the timer for the SNMP <b>Set</b> reply and start of the commit.
<b>Options</b>	<b>seconds</b> —Delay between an affirmative SNMP <b>Set</b> reply and start of the commit operation. <b>Default:</b> 5 seconds
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Commit Delay Timer</i></li></ul>

## community (SNMP)

<b>Syntax</b>	<pre>community <i>community-name</i> {   authorization <i>authorization</i>;   client-list-name <i>client-list-name</i>;   clients {     address restrict;   }   view <i>view-name</i>; }</pre>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Define an SNMP community. An SNMP community authorizes SNMP clients based on the source IP address of incoming SNMP request packets. A community also defines which MIB objects are available and the operations (read-only or read-write) allowed on those objects.</p>
	<p> <b>NOTE:</b> The <b>authorization read-write</b> option is not supported on the QFX3000 QFabric system.</p>
	<p>The SNMP client application specifies an SNMP community name in <b>Get</b>, <b>GetBulk</b>, <b>GetNext</b>, and <b>Set</b> SNMP requests.</p>
<b>Default</b>	If you omit the <b>community</b> statement, all SNMP requests are denied.
<b>Options</b>	<p><b><i>community-name</i></b>—Community string. If the name includes spaces, enclose it in quotation marks (" ").</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the SNMP Community String on page 6601</a></li> </ul>

## configuration

---

**Syntax**    configuration {  
              transfer-interval *interval*;  
              transfer-on-commit;  
              archive-sites {  
                  file://<path>/<filename>;  
                  ftp://username@host:<port>url-path password password;  
                  http://username@host:<port>url-path password password;  
                  pasvftp://username@host:<port>url-path password password;  
                  scp://username@host:<port>url-path password password;  
              }  
          }

**Hierarchy Level**    [edit system archival]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                              Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure the router or switch to periodically transfer its currently active configuration (or after each commit).

**NOTE:** The [edit system archival] hierarchy is not available on QFabric systems.

---

**Options**    The remaining statements are explained separately.

**Required Privilege Level**    system—To view this statement in the configuration.  
                                  system-control—To add this statement to the configuration.

## connection-limit

<b>Syntax</b>	<code>connection-limit <i>limit</i>;</code>
<b>Hierarchy Level</b>	<code>[edit system services finger],</code> <code>[edit system services ftp],</code> <code>[edit system services netconf ssh],</code> <code>[edit system services ssh],</code> <code>[edit system services telnet],</code> <code>[edit system services xnm-clear-text],</code> <code>[edit system services xnm-ssl]</code>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Configure the maximum number of connections sessions for each type of system services (finger, ftp, ssh, telnet, xnm-clear-text, or xnm-ssl) per protocol (either IPv6 or IPv4).
<b>Options</b>	<p><b>limit</b>—(Optional) Maximum number of established connections per protocol (either IPv6 or IPv4).</p> <p><b>Range:</b> 1 through 250</p> <p><b>Default:</b> 75</p>

**NOTE:** The actual number of maximum connections depends on the availability of system resources, and might be fewer than the configured `connection-limit` value if the system resources are limited.

<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring clear-text or SSL Service for Junos XML Protocol Client Applications</i></li> <li>• <i>Configuring DTCP-over-SSH Service for the Flow-Tap Application</i></li> <li>• <i>Configuring Finger Service for Remote Access to the Router</i></li> <li>• <i>Configuring FTP Service for Remote Access to the Router or Switch</i></li> <li>• <a href="#">Configuring SSH Service for Remote Access to the Router or Switch on page 1361</a></li> <li>• <i>Configuring Telnet Service for Remote Access to a Router or Switch</i></li> </ul>

## contact

---

<b>Syntax</b>	<code>contact contact;</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define the value of the MIB II <b>sysContact</b> object, which is the contact person for the managed system.
<b>Options</b>	<b>contact</b> —Name of the contact person. If the name includes spaces, enclose it in quotation marks (" ").
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the System Contact on a Device Running Junos OS</i></li></ul>

## disable (LLDP)

---

<b>Syntax</b>	<code>disable;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">lldp</a> ], [edit protocols <a href="#">interface lldp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Disable the LLDP configuration on the switch or on one or more interfaces.
<b>Default</b>	If you do not configure LLDP, it is disabled on the switch and on specific switch interfaces.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show lldp on page 1486</a></li><li>• <i>Configuring LLDP (CLI Procedure)</i></li><li>• <i>Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches</i></li><li>• <a href="#">Configuring LLDP on page 1345</a></li><li>• <a href="#">Understanding LLDP on page 1319</a></li></ul>

## falling-threshold (Health Monitor)

---

<b>Syntax</b>	<code>falling-threshold <i>percentage</i>;</code>
<b>Hierarchy Level</b>	<code>[edit snmp health-monitor]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the lower threshold for the monitored object when you configure a health monitor alarm. By setting a rising and a falling threshold for a monitored variable, you can be alerted whenever the value of the variable falls outside the allowable operational range.
<b>Options</b>	<p><b><i>percentage</i></b>—Lower threshold for the alarm entry.</p> <p><b>Range:</b> 1 through 100</p> <p><b>Default:</b> 70 percent of the maximum possible value</p>
<b>Required Privilege Level</b>	<p><code>snmp</code>—To view this statement in the configuration.</p> <p><code>snmp-control</code>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">rising-threshold on page 1451</a></li> <li>• <a href="#">Configuring Health Monitoring on page 6609</a></li> </ul>

## filter-duplicates

---

<b>Syntax</b>	<code>filter-duplicates;</code>
<b>Hierarchy Level</b>	<code>[edit snmp]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Filter duplicate <b>Get</b> , <b>GetNext</b> , or <b>GetBulk</b> SNMP requests.
<b>Required Privilege Level</b>	<p><code>snmp</code>—To view this statement in the configuration.</p> <p><code>snmp-control</code>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding the Implementation of SNMP on the QFabric System on page 6516</a></li> <li>• <a href="#">Example: Configuring SNMP on page 6575</a></li> </ul>

## full-name

---

<b>Syntax</b>	<code>full-name <i>complete-name</i>;</code>
<b>Hierarchy Level</b>	[edit system login user]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the complete name of a user.
<b>Options</b>	<i>complete-name</i> —Full name of the user. If the name contains spaces, enclose it in quotation marks.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Junos OS User Accounts</i></li><li>• <i>user</i></li><li>• <a href="#">user on page 332</a></li></ul>

## health-monitor

---

<b>Syntax</b>	<pre>health-monitor {     falling-threshold <i>percentage</i>;     interval <i>seconds</i>;     rising-threshold <i>percentage</i>; }</pre>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure health monitoring.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Health Monitoring on page 6609</a></li><li>• <a href="#">Understanding Health Monitoring on page 6529</a></li></ul>

## hold-multiplier

---

<b>Syntax</b>	hold-multiplier <i>number</i> ;
<b>Hierarchy Level</b>	[edit protocols <a href="#">lldp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for QFX Series.
<b>Description</b>	Specify the multiplier used in combination with the <a href="#">advertisement-interval</a> value to determine the length of time LLDP information is held before it is discarded. The default value is 4 (or 120 seconds).
<b>Default</b>	Disabled.
<b>Options</b>	<i>number</i> —A number used as a multiplier. <b>Range:</b> 2 through 10 <b>Default:</b> 4 (or 120 seconds)
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show lldp on page 1486</a></li> <li>• <i>Configuring LLDP (CLI Procedure)</i></li> <li>• <i>Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches</i></li> <li>• <a href="#">Configuring LLDP on page 1345</a></li> <li>• <a href="#">Understanding LLDP on page 1319</a></li> </ul>

## idle-timeout (Access)

---

<b>Syntax</b>	<code>idle-timeout seconds;</code>
<b>Hierarchy Level</b>	<code>[edit access group-profile <i>profile-name</i> ppp],</code> <code>[edit access profile <i>profile-name</i> client <i>client-name</i> ppp]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure the idle timeout for a user. The router might consider a PPP session to be idle because of the following reasons:</p> <ul style="list-style-type: none"><li>• There is no ingress traffic on the PPP session.</li><li>• There is no egress traffic.</li><li>• There is neither ingress or egress traffic on the PPP session.</li><li>• There is no ingress or egress PPP control traffic. This is applicable only if keepalives are enabled.</li></ul>
<b>Options</b>	<p><b>seconds</b>—Number of seconds a user can remain idle before the session is terminated.</p> <p><b>Range:</b> 0 through 4,294,967,295 seconds</p> <p><b>Default:</b> 0</p>
<hr/> <div> <b>NOTE:</b> The [edit access] hierarchy is not available on QFabric systems.</div> <hr/>	
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Group Profile for Defining L2TP Attributes</i></li><li>• <i>Configuring PPP Properties for a Client-Specific Profile</i></li><li>• <i>Applying PPP Attributes to L2TP LNS Subscribers with a User Group Profile</i></li></ul>

## interface (LLDP)

<b>Syntax</b>	interface (all   <i>interface-name</i> ) { disable; power-negotiation { disable; } }
<b>Hierarchy Level</b>	[edit protocols <a href="#">lldp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure Link Layer Discovery Protocol (LLDP) on all interfaces or on a specific interface.

**NOTE:** On EX4300 switches, LLDP cannot be configured on the me0 or vme interface. Issuing the command `set protocols lldp interface me0` generates the following error message:

```
error: name: 'me0': Invalid interface
error: statement creation failed: interface
```

Issuing the command `set protocols lldp interface vme` generates the following error message:

```
error: name: 'vme': Invalid interface
error: statement creation failed: interface
```

<b>Default</b>	None
<b>Options</b>	<p><b>all</b>—All interfaces on the switch.</p> <p><b><i>interface-name</i></b>—Name of a specific interface.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring LLDP (CLI Procedure)</a></li> <li>• <a href="#">Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches</a></li> <li>• <a href="#">Configuring LLDP on page 1345</a></li> <li>• <a href="#">Understanding LLDP on page 1319</a></li> </ul>

## interval (Health Monitor)

---

<b>Syntax</b>	interval <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit snmp health-monitor]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the interval between sampling of the object being monitored by the health monitor.
<b>Options</b>	<p><i>seconds</i>—Time between samples, in seconds.</p> <p><b>Range:</b> 1 through 2147483647 seconds</p> <p><b>Default:</b> 300 seconds</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Health Monitoring on page 6609</a></li></ul>

## lldp

```
Syntax  lldp {
    advertisement-interval seconds;
    disable;
    hold-multiplier number;
    interface (all | [interface-name]) {
        disable;
        power-negotiation {
            disable;
        }
    }
    lldp-configuration-notification-interval seconds;
    management-address ip-management-address;
    netbios-snooping;
    ptopo-configuration-maximum-hold-time seconds;
    ptopo-configuration-trap-interval seconds;
    traceoptions {
        file filename <files number> <size size> <world-readable | no-world-readable>
        <no-stamp> <replace>;
        flag flag <disable>;
    }
    transmit-delay seconds;
}
```

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for QFX Series.

**Description** Configure Link Layer Discovery Protocol (LLDP). The switch uses LLDP to advertise its identity and capabilities on a LAN, as well as to receive information about other network devices. LLDP is defined in the IEEE standard 802.1AB-2005.

The remaining statements are explained separately.

**NOTE:** The `transmit-delay` and `netbios-snooping` options are not available on QFabric systems.

**NOTE:** On EX4300 switches, LLDP cannot be configured on the `me0` or `vme` interface. Issuing the command `set protocols lldp interface me0` generates the following error message:

```
error: name: 'me0': Invalid interface
error: statement creation failed: interface
```

Issuing the command `set protocols lldp interface vme` generates the following error message:

```
error: name: 'vme': Invalid interface
error: statement creation failed: interface
.....
```

<b>Default</b>	LLDP is enabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show lldp on page 1486</a></li><li>• <i>Configuring LLDP (CLI Procedure)</i></li><li>• <i>Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches</i></li><li>• <a href="#">Configuring LLDP on page 1345</a></li><li>• <a href="#">Understanding LLDP on page 1319</a></li></ul>

---

## lldp-configuration-notification-interval

---

<b>Syntax</b>	lldp-configuration-notification-interval <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit protocols <a href="#">lldp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify how often SNMP trap notifications are generated as a result of LLDP database changes. If the interval value is 0, trap notifications of database changes are disabled.
<b>Default</b>	SNMP trap notifications of LLDP database changes are disabled.
<b>Options</b>	<b>seconds</b> —Interval between trap notifications about LLDP database changes. <b>Range:</b> 0 through 3600
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show lldp on page 1486</a></li></ul>

---

## location

---

<b>Syntax</b>	<code>location <i>location</i>;</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define the value of the MIB II <b>sysLocation</b> object, which is the physical location of the managed system.
<b>Options</b>	<b><i>location</i></b> —Location of the local system. You must enclose the name within quotation marks (" ").
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the System Location for a Device Running Junos OS</i></li></ul>

## management-address

---

<b>Syntax</b>	<code>management-address <i>ip-management-address</i>;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">lldp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the management address of the switch to be used in the LLDP Management type, length, and value (TLV). The Management Address TLV typically contains the IPv4 or IPv6 management address of the local system. Only out-of-band management addresses must be used for the management-address. Other remote managers can use this address to obtain information related to the local device.
<div> <b>NOTE:</b> Ensure that the interface with the configured management address has LLDP enabled using the <code>set protocols lldp interface</code> command. If you configure a customized management address for LLDP on an interface that has LLDP disabled, the <code>show lldp local-information</code> command output will not display the correct interface information.</div>	
<b>Default</b>	The LLDP Management Address TLV uses the IP address of the switch's management Ethernet interface ( <b>me0</b> ), or the IP address of the virtual management Ethernet (VME) interface if the switch is a Virtual Chassis member.
<b>Options</b>	<i>ip-management-address</i> —You can specify either an IPv4 or an IPv6 management address for the switch.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show lldp on page 1486</a></li><li>• <i>Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches</i></li><li>• <i>EX Series Switches Interfaces Overview</i></li><li>• <a href="#">Understanding LLDP on page 1319</a></li></ul>

## name

---

<b>Syntax</b>	<code>name <i>name</i>;</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the system name from the command-line interface.
<b>Options</b>	<i>name</i> —System name override.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the System Name</a></li> </ul>

## nas-ip-address

---

<b>Syntax</b>	<code>nas-ip-address <i>ip-address</i>;</code>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the NAS-IP address for outgoing RADIUS packets.
<b>Options</b>	<i>ip-address</i> —IP address of the network access server (NAS) that requests user authentication.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring RADIUS Authentication</a></li> <li>• <a href="#">Configuring RADIUS Authentication (QFX Series) on page 1351</a></li> </ul>

## nonvolatile

---

<b>Syntax</b>	<code>nonvolatile {     <a href="#">commit-delay</a> <i>seconds</i>; }</code>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure options for SNMP <b>Set</b> requests.  The statement is explained separately.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Commit Delay Timer</i></li><li>• <i>commit-delay</i></li></ul>

## oid

---

<b>Syntax</b>	<code>oid <i>object-identifier</i> (exclude include);</code>
<b>Hierarchy Level</b>	[edit snmp view <i>view-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify an object identifier (OID) used to represent a subtree of MIB objects.
<b>Options</b>	<b>exclude</b> —Exclude the subtree of MIB objects represented by the specified OID.  <b>include</b> —Include the subtree of MIB objects represented by the specified OID.  <b><i>object-identifier</i></b> —OID used to represent a subtree of MIB objects. All MIB objects represented by this statement have the specified OID as a prefix. You can specify the OID using either a sequence of dotted integers or a subtree name.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring MIB Views on page 6605</a></li></ul>

## order

---

<b>Syntax</b>	<code>order (radius   [ <i>accounting-order-data-list</i> ] );</code>
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> accounting]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the order of authentication, authorization, and accounting (AAA) servers to use while sending accounting messages and updates.
<b>Default</b>	No order specified
<b>Options</b>	<p><b>radius</b>—RADIUS accounting for specified subscribers.</p> <p><b>[ <i>accounting-order-data-list</i> ]</b>— Set of data listing the authentication order to be used, enclosed by brackets. This can be any combination of the authentication methods, up to and including a full list of the entire authentication order.</p>

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

---

<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch</i></li> <li>• <i>Configuring 802.1X RADIUS Accounting (CLI Procedure)</i></li> <li>• <i>Configuring RADIUS Accounting</i></li> </ul>

## port (RADIUS Server)

---

<b>Syntax</b>	<code>port <i>port-number</i>;</code>
<b>Hierarchy Level</b>	[edit system radius-server <i>address</i> ], [edit system accounting destination radius server <i>address</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the port number on which to contact the RADIUS server.
<b>Options</b>	<i>number</i> —Port number on which to contact the RADIUS server. <b>Default:</b> 1812 (as specified in RFC 2865)

**NOTE:** The [edit system accounting] hierarchy is not available on QFabric systems.

---

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
---------------------------------	-------------------------------------------------------------------------------------------------------------------

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring RADIUS Authentication</i></li><li>• <a href="#">Configuring RADIUS Authentication (QFX Series) on page 1351</a></li></ul>
------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## profile

**Syntax**    `profile profile-name {  
                   accounting (Access Profile) {  
                     accounting-stop-on-access-deny;  
                     accounting-stop-on-failure;  
                     order ( radius | [ accounting-order-data-list ] );  
                   }  
                   authentication-order [authentication-method];  
                   radius {  
                     accounting-server [server-addresses];  
                     authentication-server [server-addresses];  
                   }  
                 }`

**Hierarchy Level**    [edit access]

**Release Information**    Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                                 Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure an access profile. The access profile contains the entire authentication, authorization, and accounting (AAA) configuration that aids in handling AAA requests, including the authentication method and order, AAA server addresses, and AAA accounting.

**Default**    Not enabled

**Options**    *profile-name*—Profile name of up to 32 characters.  
                   The remaining statements are explained separately.

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

**Required Privilege Level**    admin—To view this statement in the configuration.  
                                         admin-control—To add this statement to the configuration.

Hierarchy Level [edit]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure protocols.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

- Related Documentation**
- [Junos OS Routing Protocols Configuration Guide](#)

## protocol-version

---

<b>Syntax</b>	<code>protocol-version <i>version</i>;</code>
<b>Hierarchy Level</b>	[edit system services ssh]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the secure shell (SSH) protocol version.
<b>Default</b>	v2—SSH protocol version 2 is the default, introduced in Junos OS Release 11.4.
<b>Options</b>	<i>version</i> —SSH protocol version: v1, v2, or both.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the SSH Protocol Version on page 1363</a></li> </ul>

## ptopo-configuration-maximum-hold-time

---

<b>Syntax</b>	<code>ptopo-configuration-maximum-hold-time <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">lldp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure how long to maintain the physical topology database entries. The physical topology identifies the devices on the network and their physical interconnections.
<b>Options</b>	<i>seconds</i> —Time to maintain physical topology database entries. <b>Default:</b> 300 <b>Range:</b> 1 through 2147483647
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show lldp on page 1486</a></li> <li>• <a href="#">Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches</a></li> <li>• <a href="#">Understanding LLDP on page 1319</a></li> </ul>

## ptopo-configuration-trap-interval

---

<b>Syntax</b>	<code>ptopo-configuration-trap-interval <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">lldp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify how often SNMP trap notifications are sent regarding changes in physical topology global statistics.
<b>Default</b>	SNMP trap notifications of changes in physical topology global statistics are disabled.
<b>Options</b>	<b><i>seconds</i></b> —Interval between SNMP trap notifications about physical topology global statistics. <b>Range:</b> 0 through 3600
<b>Required Privilege Level</b>	<b>routing</b> —To view this statement in the configuration. <b>routing-control</b> —To add this statement to the configuration.

## radius

<b>Syntax</b>	radius { accounting-server [server-addresses]; authentication-server [server-addresses]; }
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure the RADIUS servers for authentication and for accounting. To configure multiple RADIUS servers, include multiple <b>radius</b> statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.</p> <p>The statements are explained separately.</p>
<div>  <b>NOTE:</b> The [edit access] hierarchy is not available on QFabric systems. </div>	
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch</i></li> <li>• <i>Configuring 802.1X RADIUS Accounting (CLI Procedure)</i></li> <li>• <i>Filtering 802.1X Supplicants Using RADIUS Server Attributes</i></li> <li>• <i>Configuring RADIUS Accounting</i></li> </ul>

## radius-options (edit system)

---

Syntax	<pre>radius-options {   attributes {     nas-ip-address <i>ip-address</i>;   }   enhanced-accounting;   password-protocol <i>mschap-v2</i>; }</pre>
Hierarchy Level	[edit system]
Release Information	<p>Statement introduced in Junos OS Release 8.3.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>MS-CHAPv2 password protocol configuration option introduced in Junos OS Release 9.2.</p> <p>MS-CHAPv2 password protocol configuration option introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<hr/>	
<div> <b>NOTE:</b> The <code>radius-options</code> statement is not available on QFabric systems.</div> <hr/>	
<p><b>enhanced-accounting</b> statement introduced in Junos OS Release 14.1.</p>	
Description	Configure RADIUS options for the NAS-IP address for outgoing RADIUS packets and password protocol used in RADIUS packets.
Options	<p><b>enhanced-accounting</b>—View the attribute values of a logged in user.</p> <p><b>nas-ip-address <i>ip-address</i></b>—IP address of the network access server (NAS) that requests user authentication.</p> <p><b>password-protocol <i>mschap-v2</i></b>—Protocol MS-CHAPv2, used for password authentication and password changing.</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"><li>• <i>Configuring MS-CHAPv2 for Password-Change Support</i></li><li>• <a href="#">Configuring RADIUS Authentication (QFX Series) on page 1351</a></li><li>• <a href="#">Configuring RADIUS System Accounting on page 1349</a></li><li>• <i>enhanced-accounting</i></li></ul>

## radius-server

<b>Syntax</b>	<pre>radius-server server-address {     accounting-port port-number;     port number;     retry number;     secret password;     source-address source-address;     timeout seconds; }</pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Configure a RADIUS server for Point-to-Point Protocol (PPP).</p> <p>To configure multiple RADIUS servers, include multiple <b>radius-server</b> statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.</p>
<b>Options</b>	<p><b>server-address</b>—Address of the RADIUS authentication server.</p> <p>The remaining statements are explained separately.</p>
<div>  <p><b>NOTE:</b> The <b>accounting-port</b> and <b>source-address</b> options are not available on QFabric systems.</p> </div>	
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring RADIUS Authentication (QFX Series) on page 1351</a></li> <li>• <a href="#">accounting-port on page 249</a></li> <li>• <a href="#">port on page 1428</a></li> <li>• <a href="#">retry on page 301</a></li> <li>• <a href="#">secret on page 305</a></li> <li>• <a href="#">source-address on page 308</a></li> <li>• <a href="#">timeout on page 322</a></li> </ul>

## rate-limit

---

<b>Syntax</b>	<code>rate-limit <i>limit</i>;</code>
<b>Hierarchy Level</b>	[edit system services finger], [edit system services ftp], [edit system services netconf ssh], [edit system services ssh], [edit system services telnet], [edit system services xnm-clear-text], [edit system services xnm-ssl]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the maximum number of connections attempts per protocol (either IPv6 or IPv4) on an access service.
<b>Default</b>	150 connections
<b>Options</b>	<b>rate-limit <i>limit</i></b> —(Optional) Maximum number of connection attempts allowed per minute, per IP protocol (either IPv4 or IPv6). <b>Range:</b> 1 through 250 <b>Default:</b> 150
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring clear-text or SSL Service for Junos XML Protocol Client Applications</i></li></ul>

## remote-debug-permission

<b>Syntax</b>	remote-debug-permission (qfabric-admin   qfabric-operator   qfabric-user);
<b>Hierarchy Level</b>	[edit system login user <i>username</i> authentication] [edit system root-authentication]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	(QFabric systems only) Configure authentication classes that permit or deny user access to individual components of the QFabric system.
<b>Default</b>	qfabric-user
<b>Options</b>	<p><b>qfabric-admin</b>—Permits a user to log in to individual QFabric system components, view operations, and change component configurations.</p> <p><b>qfabric-operator</b>—Permits a user to log in to individual QFabric system components and view component operations.</p> <p><b>qfabric-user</b>—Prevents a user from logging in to individual QFabric system components.</p>
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring QFabric System Login Classes</i></li> <li>• <a href="#">request component login on page 1480</a></li> <li>• <i>Understanding QFabric System Login Classes</i></li> </ul>

## retry

---

<b>Syntax</b>	<code>retry number;</code>
<b>Hierarchy Level</b>	[edit system radius server <i>server-address</i> ], [edit system accounting destination radius server <i>server-address</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Number of times the router or switch is allowed to try to contact a RADIUS authentication or accounting server.
<b>Options</b>	<i>number</i> —Number of retries allowed for contacting a RADIUS server. <b>Range:</b> 1 through 10 <b>Default:</b> 3

**NOTE:** The [edit system accounting] hierarchy is not available on QFabric systems.

---

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring RADIUS Authentication (QFX Series) on page 1351</a></li><li>• <a href="#">Configuring RADIUS Accounting</a></li><li>• <a href="#">timeout on page 322</a></li></ul>

---

## rising-threshold (Health Monitor)

---

<b>Syntax</b>	<code>rising-threshold <i>percentage</i>;</code>
<b>Hierarchy Level</b>	[edit snmp health-monitor]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Set the upper threshold for the monitored object when you configure a health monitor alarm. By setting a rising and a falling threshold for a monitored object, you can be alerted whenever the value of the variable falls outside the allowable operational range.
<b>Options</b>	<p><b><i>percentage</i></b>—Upper threshold for the alarm entry.</p> <p><b>Range:</b> 1 through 100</p> <p><b>Default:</b> 80 percent of the maximum possible value</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Health Monitoring on page 6609</a></li><li>• <a href="#">falling-threshold on page 1415</a></li></ul>

## root-login

---

<b>Syntax</b>	root-login (allow   deny   deny-password);
<b>Hierarchy Level</b>	[edit system services ssh]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Control user access through SSH.
<b>Default</b>	Allow user access through SSH.
<b>Options</b>	<b>allow</b> —Allow users to log in to the router or switch as root through SSH. <b>deny</b> —Disable users from logging in to the router or switch as root through SSH. <b>deny-password</b> —Allow users to log in to the router or switch as root through SSH when the authentication method (for example, RSA authentication) does not require a password.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Root Login Through SSH on page 1363</a></li></ul>

---

## services (Switches)

---

**Syntax**

```
services {
  service-deployment {
    servers address {
      port-number port-number;
    }
    source-address address;
  }
  ssh {
    connection-limit limit;
    protocol-version [v1 v2];
    rate-limit limit;
    root-login (allow | deny | deny-password);
  }
}
```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the switch so that users on remote systems can access the local switch through SSH.

The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## snmp

---

Hierarchy Level [\[edit\]](#)

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure system management properties.

**NOTE:** The `radius-server source-address` and `radius-options` statements are not available on the QFabric system.

**Required Privilege** system—To view this statement in the configuration.

**Level** system-control—To add this statement to the configuration.

## tacplus-options

<b>Syntax</b>	<pre> tacplus-options {   (exclude-cmd-attribute   no-cmd-attribute-value);   enhanced-accounting;   service-name <i>service-name</i>;   timestamp-and-timezone; } </pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>no-cmd-attribute-value</b> and <b>exclude-cmd-attribute</b> options introduced in Junos OS Release 9.3.</p> <p>Statement introduced in Junos OS Release 11.1 for QFX Series.</p> <p><b>timestamp-and-timezone</b> option introduced in Junos OS Release 12.2.</p> <p><b>enhanced-accounting</b> option introduced in Junos OS Release 14.1.</p>
<b>Description</b>	Configure TACACS+ options for authentication and accounting.
<b>Options</b>	<p><b>enhanced-accounting</b>—View the attribute values of a logged in user.</p> <p><b>exclude-cmd-attribute</b>—Exclude the <b>cmd</b> attribute value completely from start and stop accounting records to enable logging of accounting records in the correct log file on a TACACS+ server.</p> <p><b>no-cmd-attribute-value</b>—Set the <b>cmd</b> attribute value to an empty string in the TACACS+ accounting start and stop requests to enable logging of accounting records in the correct log file on a TACACS+ server.</p> <p><b>service-name <i>service-name</i></b>—Name of the authentication service used when you configure multiple TACACS+ servers to use the same authentication service.</p> <p><b>Default:</b> junos-exec</p> <p><b>timestamp-and-timezone</b>—Include this statement if you want start time, stop time, and timezone attributes included in start/stop accounting records.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring TACACS+ Authentication</i></li> <li>• <i>Configuring TACACS+ System Accounting</i></li> <li>• <a href="#">Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication on page 1330</a></li> <li>• <i>enhanced-accounting</i></li> </ul>

## targets

---

<b>Syntax</b>	<code>targets {     <i>address</i>; }</code>
<b>Hierarchy Level</b>	<code>[edit snmp trap-group <i>group-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure one or more systems to receive SNMP traps.
<b>Options</b>	<b><i>address</i></b> —IPv4 or IPv6 address of the system to receive traps. You must specify an address, not a hostname.
<b>Required Privilege Level</b>	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring SNMP Trap Groups on page 6602</a></li></ul>

## traceoptions (LLDP)

**Syntax** `traceoptions {  
     file filename <files number> <size size> <world-readable | no-world-readable> <no-stamp>  
     <replace>;  
     flag flag <disable>;  
}`

**Hierarchy Level** [edit protocols [lldp](#)]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Define tracing operations for the Link Layer Discovery Protocol (LLDP). You can trace messages under LLDP for LLDP and PTOPO MIBs.

**NOTE:** The `traceoptions` statement is not supported on the QFX3000 QFabric system.

**Default** Tracing operations are disabled.

**Options** **file *filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

**files *number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000

**Default:** 3 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **all**—All tracing operations.
- **configuration**—Trace configuration operations.
- **interface**—Trace interface update events.
- **netbios**—Trace NetBIOS events.
- **packet**—Trace packet events.
- **rtsock**—Trace routing socket operations.
- **snmp**—Trace SNMP configuration operations.

- **vlan**—Trace VLAN update events.

**no-stamp**—(Optional) Do not timestamp the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**replace**—(Optional) Replace an existing trace file if there is one rather than appending output to it.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**world-readable**—(Optional) Enable unrestricted file access.

**NOTE:** The **traceoptions** statement is not supported on the QFX3000 QFabric system.

---

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## transfer-interval (Configuration)

<b>Syntax</b>	<code>transfer-interval <i>interval</i>;</code>
<b>Hierarchy Level</b>	[edit system archival configuration]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the router or switch to periodically transfer its currently active configuration to an archive site.

**NOTE:** The `edit system archival` hierarchy is not available on QFabric systems.

**Options** *interval*—Interval at which to transfer the current configuration to an archive site.  
**Range:** 15 through 2880 minutes

**NOTE:** The `[edit system archival]` hierarchy is not available on QFabric systems.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**

## transfer-on-commit

---

<b>Syntax</b>	transfer-on-commit;
<b>Hierarchy Level</b>	[edit system archival configuration]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the router or switch to transfer its currently active configuration to an archive site each time you commit a candidate configuration.

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (") and enclose the IPv6 host address in brackets ([ ]). For example, "ftp://username<:password>@[ipv6-host-address]<:port>/url-path".

---

**NOTE:** The [edit system archival] hierarchy is not available on QFabric systems.

---

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

## trap-group

<b>Syntax</b>	<pre> trap-group <i>group-name</i> {     categories {         <i>category</i>;     }     destination-port <i>port-number</i>;     routing-instance <i>instance</i>;     targets {         <i>address</i>;     }     version (all   v1   v2); } </pre>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	Create a named group of hosts to receive the specified trap notifications. The name of the trap group is embedded in SNMP trap notification packets as one variable binding (varbind) known as the community name. At least one trap group must be configured for SNMP traps to be sent.
<b>Options</b>	<p><b><i>group-name</i></b>—Name of the trap group. If the name includes spaces, enclose it in quotation marks (" ").</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring SNMP Trap Groups</i></li> </ul>

## trap-options

---

<b>Syntax</b>	<pre>trap-options {     agent-address outgoing-interface;     source-address address; }</pre>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Using SNMP trap options, you can set the source address of every SNMP trap packet sent by the router or switch to a single address, regardless of the outgoing interface. In addition, you can set the agent address of each SNMPv1 trap. For more information about the contents of SNMPv1 traps, see RFC 1157.</p> <p>The remaining statements are explained separately.</p>
<b>Default</b>	Disabled
<b>Required Privilege Level</b>	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring SNMP Trap Options</i></li></ul>

## user (Access)

<b>Syntax</b>	<pre> user username {   authentication {     (encrypted-password "password"   plain-text-password);     load-key-file URL;     remote-debug-permission (qfabric-admin   qfabric-operator   qfabric-user);     ssh-dsa "public-key" &lt;from hostname&gt;;     ssh-rsa "public-key" &lt;from hostname&gt;;   }   class class-name;   full-name "complete-name";   uid uid-value; }</pre>
<b>Hierarchy Level</b>	[edit system login]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure access permission for individual users.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Junos OS User Accounts on page 1344</a></li> <li>• <a href="#">class on page 262</a></li> </ul>

## version

---

<b>Syntax</b>	version (all   v1   v2);
<b>Hierarchy Level</b>	[edit snmp trap-group <i>group-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the version number of SNMP traps.
<b>Default</b>	all—Send an SNMPv1 and SNMPv2 trap for every trap condition.
<b>Options</b>	all—Send an SNMPv1 and SNMPv2 trap for every trap condition.  v1—Send SNMPv1 traps only.  v2—Send SNMPv2 traps only.
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring SNMP Trap Groups on page 6602</a></li></ul>

# Administration

- [Routine Monitoring on page 1475](#)
- [Monitoring Commands on page 1476](#)

## Routine Monitoring

---

- [Monitoring SNMP on page 1475](#)

### Monitoring SNMP

There are several commands that you can access in Junos OS operational mode to monitor SNMP information. Some of the commands are:

- **show snmp health-monitor**, which displays the health monitor log and alarm information.
- **show snmp mib**, which displays information from the MIBs, such as device and system information.
- **show snmp statistics**, which displays SNMP statistics such as the number of packets, silent drops, and invalid output values.
- **show snmp rmon**, which displays the RMON alarm, event, history, and log information

The following example provides sample output from the **show snmp health-monitor** command:

```
user@switch> show snmp health-monitor
```

Alarm			
Index	Variable description	Value	State
32768	Health Monitor: root file system utilization jnxHrStoragePercentUsed.1	58	active
32769	Health Monitor: /config file system utilization jnxHrStoragePercentUsed.2	0	active
32770	Health Monitor: RE 0 CPU utilization jnxOperatingCPU.9.1.0.0	0	active
32773	Health Monitor: RE 0 Memory utilization jnxOperatingBuffer.9.1.0.0	35	active
32775	Health Monitor: jkernel daemon CPU utilization Init daemon	0	active

Chassis daemon	50 active
Firewall daemon	0 active
Interface daemon	5 active
SNMP daemon	11 active
MIB2 daemon	42 active
...	

The following example provides sample output from the **show snmp mib** command:

```
user@switch> show snmp mib walk system
```

```
sysDescr.0    = Juniper Networks, Inc. qfx3500s internet router, kernel  
JUNOS 11.1-20100926.0 #0: 2010-09-26 06:17:38 UTC builder@abc.juniper.net:  
/volume/build/junos/11.1/production/20100926.0/obj-xlr/bsd/sys/compile/JUNIPER-xxxxx
```

```
Build date: 2010-09-26 06:00:10 U  
sysObjectID.0 = jnxProductQFX3500  
sysUpTime.0   = 24444184  
sysContact.0  = J Smith  
sysName.0     = Lab QFX3500  
sysLocation.0 = Lab  
sysServices.0 = 4
```

The following example provides sample output from the **show snmp statistics** command:

```
user@switch> show snmp statistics
```

SNMP statistics:

Input:

```
Packets: 0, Bad versions: 0, Bad community names: 0,  
Bad community uses: 0, ASN parse errors: 0,  
Too bigs: 0, No such names: 0, Bad values: 0,  
Read onlys: 0, General errors: 0,  
Total request varbinds: 0, Total set varbinds: 0,  
Get requests: 0, Get nexts: 0, Set requests: 0,  
Get responses: 0, Traps: 0,  
Silent drops: 0, Proxy drops: 0, Commit pending drops: 0,  
Throttle drops: 0, Duplicate request drops: 0
```

Output:

```
Packets: 0, Too bigs: 0, No such names: 0,  
Bad values: 0, General errors: 0,  
Get requests: 0, Get nexts: 0, Set requests: 0,  
Get responses: 0, Traps: 0
```

## Monitoring Commands

- [clear lldp neighbors](#)
- [clear lldp statistics](#)
- [request component login](#)
- [show ethernet-switching interfaces](#)

- `show lldp`
- `show lldp local-information`
- `show lldp neighbors`
- `show lldp statistics`
- `show route instance`
- `show snmp statistics`
- `ssh`

## clear lldp neighbors

---

<b>Syntax</b>	<code>clear lldp neighbors &lt;interface <i>interface</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear the learned remote neighbor information on all or selected interfaces.
<b>Options</b>	<b>none</b> —Clear the remote neighbor information on all interfaces.  <b>interface <i>interface</i></b> —(Optional) Clear the remote neighbor information from the selected interface.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show lldp</a></li><li>• <a href="#">Configuring LLDP on page 1345</a></li><li>• <a href="#">Understanding LLDP on page 1319</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear lldp neighbors on page 1478</a> <a href="#">clear lldp neighbors interface on page 1478</a>

### Sample Output

#### clear lldp neighbors

```
user@switch> clear lldp neighbors
```

#### clear lldp neighbors interface

```
user@switch> clear lldp neighbors interface ge-0/1/1.0
```

## clear lldp statistics

---

<b>Syntax</b>	<code>clear lldp statistics</code> <code>&lt;interface <i>interface</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear LLDP statistics on one or more interfaces.
<b>Options</b>	<b>none</b> —Clears LLDP statistics on all interfaces.  <b>interface <i>interface-names</i></b> —(Optional) Clear LLDP statistics on an interface.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring LLDP on page 1345</a></li> <li>• <a href="#">Understanding LLDP on page 1319</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear lldp statistics on page 1479</a> <a href="#">clear lldp statistics interface on page 1479</a>

### Sample Output

#### clear lldp statistics

```
user@switch> clear lldp statistics
```

#### clear lldp statistics interface

```
user@switch> clear lldp statistics interface ge-0/1/1.0
```

## request component login

---

<b>Syntax</b>	<code>request component login <i>component-name</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	(QFabric systems only) Log in to a QFabric system component. To gain access to individual components by way of the <b>request component login</b> command, you must first provide the <b>qfabric-admin</b> or <b>qfabric-operator</b> class privilege to your user (for more information, see: <a href="#">remote-debug-permission</a> ).
<b>Options</b>	<b><i>component-name</i></b> —Specify the QFabric system component to which you wish to log in.
<b>Required Privilege Level</b>	admin
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Configuring QFabric System Login Classes</i></li><li>• <a href="#">remote-debug-permission on page 1449</a></li><li>• <i>Understanding QFabric System Login Classes</i></li></ul>
<b>List of Sample Output</b>	<a href="#">request component login (with qfabric-admin Privileges) on page 1480</a> <a href="#">request component login (with qfabric-operator Privileges) on page 1481</a> <a href="#">request component login (with qfabric-user Privileges) on page 1481</a>

## Sample Output

The three sample output displays show the results of attempts to log in to Node device EE3093. The results differ depending on the privilege level assigned to the user.

### request component login (with qfabric-admin Privileges)

```
admin@qfabric> request component login EE3093
Warning: Permanently added 'qfabric-node-ee3093,169.254.128.41' (RSA) to the list
of known hosts.

xe-0/0/0.0  down    default         unblocked
```

## show lldp

**Syntax** `show lldp`  
`<detail>`

**Release Information** Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display information about Link Layer Discovery Protocol (LLDP) and Link Level Discovery Protocol—Media Endpoint Discovery (LLDP-MED) configuration and capabilities on the switch. LLDP and LLDP-MED are used to learn about and to distribute device information on network links.

**NOTE:** LLDP-MED is not available on the QFX Series.

**Options** **none**—Display LLDP information for all interfaces.  
**detail**—(Optional) Display detailed LLDP information for all interfaces.

**Required Privilege Level** view

**Related Documentation**

**List of Sample Output** [show lldp \(EX3200 switches\) on page 1489](#)  
[show lldp \(EX4300 switches\) on page 1489](#)  
[show lldp detail \(EX4300 switches\) on page 1490](#)

**Output Fields** [Table 86 on page 1486](#) lists the output fields for the **show lldp** command. Output fields are listed in the approximate order in which they appear.

**Table 86: show lldp Output Fields**

Field Name	Field Description	Level of Output
LLDP	LLDP operating state. The state can be <b>enabled</b> or <b>disabled</b> .  <b>NOTE:</b> If a VLAN that has been configured for untagged packets on an interface also has Layer 2 protocol tunneling (L2PT) enabled for LLDP, the LLDP operating state for that interface is displayed as <b>disabled</b> .	All levels

Table 86: show lldp Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Advertisement interval</b>	Frequency, in seconds, at which LLDP advertisements are sent.  This value is set by the <code>advertisement-interval</code> configuration statement.	All levels
<b>Transmit delay</b>	Seconds of delay before advertisements are sent to neighbors following a change to a TLV (type, length, or value) element in the LLDP protocol or to the state of the local system, such as a change in hostname or management address. You can set this value to reduce the delay in notifying neighbors of a change in the local system.  This value is set by the <code>transmit-delay</code> configuration statement.	All levels
<b>Hold timer</b>	On EX4300 switches, the hold timer shows the length of time LLDP information is held before it is discarded. The hold timer value is equal to the advertisement interval multiplied by the hold multiplier.  On all other switches, the hold timer shows the value of the hold multiplier.  The hold multiplier value is set by the <code>hold-multiplier</code> configuration statement.	All levels
<b>Notification interval</b>	How often LLDP trap notifications are generated as a result of LLDP database changes. If the interval value is 0, LLDP trap notifications on database changes are disabled.  This value is set by the <code>lldp-configuration-notification-interval</code> configuration statement.	All levels
<b>Config Trap Interval</b>	How often LLDP trap notifications are generated as a result of changes in topology—for example, when an endpoint connects or disconnects. If the interval value is 0, LLDP trap notifications on topology changes are disabled.  This value is set by the <code>ptopo-configuration-trap-interval</code> configuration statement.	All levels
<b>Connection Hold timer</b>	Amount of time the system maintains dynamic topology entries.  This value is set by the <code>ptopo-configuration-maximum-hold-time</code> configuration statement.	All levels
<b>LLDP-MED</b>	LLDP-MED operating state. The state can be <b>Enabled</b> or <b>Disabled</b> .	All levels
<b>MED fast start count</b>	Number of advertisements sent from a switch to a device, such as a VoIP telephone, when the device is first detected by the switch. These increased advertisements are temporary. After a device and a switch exchange information and can communicate, advertisements are reduced to one per second.  This value is set by using the <code>fast-start</code> configuration statement.  <b>NOTE:</b> <code>fast-start</code> is not available on the QFX Series.	All levels
<b>Interface</b>	Name of the interface for which LLDP configuration information is being reported.	All levels
<b>Parent Interface</b>	Name of the aggregated Ethernet interface, if any, to which the interface belongs.	All levels

Table 86: show lldp Output Fields (*continued*)

Field Name	Field Description	Level of Output
LLDP	LLDP operating state. The state can be <b>Enabled</b> or <b>Disabled</b> .	All levels
Power Negotiation	LLDP power negotiation operating state. The state can be <b>Enabled</b> or <b>Disabled</b> .	All levels
Neighbor count	Total number of new LLDP neighbors detected since the last switch reboot.	<b>detail</b>
Interface	Name of the interface that is advertising VLAN information.	All levels
Vlan-id	VLAN tag associated with the interface sending LLDP frames. If the interface is not a member of a VLAN, the VLAN ID is advertised as 0.	<b>detail</b>
Vlan-name	VLAN name associated with the VLAN ID.	<b>detail</b>
LLDP basic TLVs supported	<p>Basic TLVs supported on the switch:</p> <ul style="list-style-type: none"> <li>• <b>Chassis identifier</b>—TLV that advertises the MAC address associated with the local system.</li> <li>• <b>Port identifier</b>—TLV that advertises the port identification for the specified port in the local system.</li> <li>• <b>Port description</b>—Interface name for the port.</li> <li>• <b>System name</b>—TLV that advertises the user-configured name of the local system.</li> <li>• <b>System description</b>—TLV that advertises the system description containing information about the software and current image running on the system. This information is taken from the software and is not configurable.</li> <li>• <b>System capabilities</b>—TLV that advertises the primary functions performed by the system—for example, bridge or router.</li> <li>• <b>Management address</b>—TLV that advertises the IP management address of the local system.</li> </ul>	<b>detail</b>
Supported LLDP 802 TLVs	<p>802.3 TLVs supported on the switch:</p> <ul style="list-style-type: none"> <li>• <b>MAC/PHY configuration status</b>—TLV that advertises information about the physical interface, such as autonegotiation status and support and MAU type. The information is based on the physical interface structure and is not configurable.</li> <li>• <b>Power via MDI</b>—TLV that advertises MDI power support, PSE power pair, and power class information.</li> <li>• <b>Link aggregation</b>—TLV that advertises if the interface is aggregated and its aggregated interface ID.</li> <li>• <b>Maximum frame size</b>—TLV that advertises the maximum transmission unit (MTU) of the interface sending LLDP frames.</li> <li>• <b>Port VLAN tag</b>—TLV that advertises the VLAN tag configured on the interface.</li> <li>• <b>Port VLAN name</b>—TLV that advertises the VLAN name configured on the interface.</li> </ul>	<b>detail</b>

Table 86: show lldp Output Fields (*continued*)

Field Name	Field Description	Level of Output
Supported LLDP MED TLVs	<p>LLDP-MED TLVs supported on the switch:</p> <ul style="list-style-type: none"> <li>• <b>LLDP MED capabilities</b>—TLV that advertises the primary function of the port. The capabilities values range from 0 through 15: <ul style="list-style-type: none"> <li>• 0—Capabilities</li> <li>• 1—Network Policy</li> <li>• 2—Location Identification</li> <li>• 3—Extended Power via MDI-PSE</li> <li>• 4—Inventory</li> <li>• 5–15—Reserved</li> </ul> </li> <li>• <b>Network policy</b>—TLV that advertises the port VLAN configuration and associated Layer 2 and Layer 3 attributes. Attributes include the policy identifier, application types—such as voice or streaming video—802.1Q VLAN tagging, and 802.1p priority bits and DiffServ code points.</li> <li>• <b>Endpoint location</b>—TLV that advertises the physical location of the endpoint.</li> <li>• <b>Extended power Via MDI</b>—TLV that advertises the power type, power source, power priority, and power value of the port. It is the responsibility of the PSE device (network connectivity device) to advertise the power priority on a port.</li> </ul>	detail

## Sample Output

### show lldp (EX3200 switches)

```

user@switch> show lldp

**LLDP basic TLVs supported:**

Chassis identifier, Port identifier, Port description, System name, System description, System capabilities, Management address.

**Supported LLDP 802 TLVs:**

MAC/PHY configuration/status, Power via MDI, Link aggregation, Maximum frame size, Port VLAN tag, Port VLAN name.

**Supported LLDP MED TLVs:**

LLDP MED capabilities, Network policy, Endpoint location, Extended power Via MDI.

## show lldp local-information

<b>Syntax</b>	show lldp local-information
<b>Release Information</b>	Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the information that the switch provides in Link Layer Discovery Protocol (LLDP) advertisements to its neighbors.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring LLDP (CLI Procedure)</i></li> <li>• <i>Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches</i></li> <li>• <a href="#">management-address on page 1424</a></li> <li>• <a href="#">Configuring LLDP on page 1345</a></li> <li>• <a href="#">Understanding LLDP on page 1319</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show lldp local-information (EX Series Switch) on page 1492</a>
<b>Output Fields</b>	<a href="#">Table 87 on page 1491</a> lists the output fields for the <b>show lldp local-information</b> command. Output fields are listed in the approximate order in which they appear.

**Table 87: show lldp local-information Output Fields**

Field Name	Field Description
<b>LLDP Local Information details</b>	<p>Information about the local system (the switch):</p> <ul style="list-style-type: none"> <li>• <b>Chassis ID</b>—MAC address associated with the switch.</li> <li>• <b>System name</b>—User-configured name of the switch.</li> <li>• <b>System descr</b>—System description containing information about the switch model and the current software image running on the switch. This information is taken from the software and is not configurable.</li> </ul>
<b>System Capabilities</b>	Capabilities (such as <b>bridge</b> or <b>router</b> ) that are supported or enabled on the system.
<b>Management Information</b>	<p>Details of the management information: <b>Port Name</b>, <b>Port Address</b> (such as 10.204.34.35), <b>Address Type</b> (such as ipv4 or ipv6), <b>Port ID</b> (SNMP interface index), <b>Port ID Subtype</b>, and <b>Port Subtype</b>.</p> <p>The <b>Port Subtype</b> displays:</p> <ul style="list-style-type: none"> <li>• <b>ifindex(2)</b>—IP address of the switch's management Ethernet interface (<b>me0</b>) or virtual management Ethernet (<b>VME</b>) interface address (for a virtual chassis) is used to manage the switch.</li> <li>• <b>unknown(1)</b>—IP management address has been configured with set <b>protocols lldp management-address</b>.</li> </ul>

Table 87: show lldp local-information Output Fields (*continued*)

Field Name	Field Description
<b>Interface name</b>	Name of the local interface which is configured for either LLDP or LLDP-MED.
<b>Parent Interface</b>	Name of the aggregated Ethernet interface, if any, to which the local interface belongs.
<b>SNMP Index</b>	SNMP interface index.
<b>Interface description</b>	User-configured port description.
<b>Status</b>	Administrative status of the interface: either <b>up</b> or <b>down</b> .
<b>Tunneling</b>	Status of tunneling on the interface: either <b>enabled</b> or <b>disabled</b> .

## Sample Output

### show lldp local-information (EX Series Switch)

```
user@switch> show lldp local-information
```

#### LLDP Local Information details

```
Chassis ID   : 00:1d:b5:aa:b9:f0
System name  : switch

## show lldp neighbors

**Syntax** <show lldp *neighbors*>  
<interface *interface-ids*>

**Release Information** Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display learned information about Link Layer Discovery Protocol (LLDP) on all neighboring interfaces or on selected interfaces.

**Options** **none**—Display learned LLDP information on all neighboring interfaces and devices.

**interface *interface-ids***—(Optional) Display learned LLDP information on the selected interfaces or devices.

**NOTE:** When a port with DCBX enabled begins to exchange type, length, and value (TLV) entries, optional LLDP TLVs on that port are not advertised to neighbors in order to interoperate with a wider variety of converged network adapters (CNAs). As a result, information for those ports will not be listed in the output for this command.

[show lldp neighbors interface on page 1496](#)

**Output Fields** [Table 88 on page 1493](#) lists the output fields for the **show lldp neighbors** command. Output fields are listed in the approximate order in which they appear.

**Table 88: show lldp neighbors Output Fields**

Field Name	Field Description
Local Interface	List of local interfaces for which neighbor information is available.
Parent Interface	List of aggregated Ethernet interfaces, if any, to which the local interfaces belong.
Chassis ID	List of chassis identifiers for neighbors.
Port info	List of port information gathered from neighbors. This could be the port identifier or port description.
System name	List of system names gathered from neighbors.

Table 88: show lldp neighbors Output Fields (*continued*)

Field Name	Field Description
<b>LLDP Neighbor Information</b>	Information about both the local system (the switch) and a neighbor system on the interface (appears when the <b>interface</b> option is used).
<b>Local Information</b>	Information about the local system (appears when the <b>interface</b> option is used).
<b>Index</b>	Local interface index (appears when the <b>interface</b> option is used).
<b>Time to live</b>	Number of seconds for which this information is valid (appears when the <b>interface</b> option is used).
<b>Time mark</b>	Date and timestamp of information (appears when the <b>interface</b> option is used).
<b>Local Interface</b>	Name of the local physical interface (appears when the <b>interface</b> option is used).
<b>Parent Interface</b>	Name of the aggregated Ethernet interface, if any, to which the interface belongs (appears when the <b>interface</b> option is used).
<b>Local Port ID</b>	Local interface SNMP index (appears when the <b>interface</b> option is used).
<b>Ageout Count</b>	Number of times the complete set of information advertised by the neighbor has been deleted from LLDP neighbor information maintained by the local system because the information timeliness interval has expired (appears when the <b>interface</b> option is used).
<b>Neighbor Information</b>	Information about a neighbor system on the interface (appears when the <b>interface</b> option is used).
<b>Chassis type</b>	Type of chassis identifier supplied, such as <b>MAC address</b> (appears when the <b>interface</b> option is used).
<b>Chassis ID</b>	Chassis identifier of the chassis type listed (appears when the <b>interface</b> option is used).
<b>Port type</b>	Type of port identifier supplied, such as <b>locally assigned</b> (appears when the <b>interface</b> option is used).
<b>Port ID</b>	Port identifier of the port type listed (appears when the <b>interface</b> option is used).
<b>Port description</b>	Port description (appears when the <b>interface</b> option is used).
<b>System name</b>	Name supplied by the system on the interface (appears when the <b>interface</b> option is used).
<b>System Description</b>	Description supplied by the system on the interface (appears when the <b>interface</b> option is used).

Table 88: show lldp neighbors Output Fields (*continued*)

Field Name	Field Description
System capabilities	Capabilities (such as <b>Bridge</b> , <b>Router</b> , and <b>Telephone</b> ) that are supported or enabled by the system on the interface (appears when the <b>interface</b> option is used).
Management Info	<p>Details of management information: <b>Type</b> (such as <b>ipv4</b> or <b>ipv6</b>), <b>Address</b> (such as <b>10.204.34.35</b>), <b>Port ID</b>, <b>Subtype</b>, <b>Interface Subtype</b>, and organization identifier (<b>OID</b>) (appears when the <b>interface</b> option is used).</p> <p>The <b>Interface Subtype</b> displays:</p> <ul style="list-style-type: none"> <li>• <b>ifindex(2)</b>— IP address of the neighbor's management Ethernet interface (<b>me0</b>) or virtual management Ethernet (<b>VME</b>) interface address (for a virtual chassis) is used to manage the switch.</li> <li>• <b>unknown(1)</b>—Neighbor's IP management address has been configured with set <b>protocols lldp management-address</b>.</li> </ul>
Media Info	Additional details about the endpoint device appear when a device that supports LLDP-MED is attached to the interface. The specific details depend upon the capabilities of the device. Details might include <b>Media endpoint class</b> (such as Class 3 for communication devices such as IP phones), <b>MED Hardware revision</b> , <b>MED Firmware revision</b> , <b>MED Software revision</b> , <b>MED Serial number</b> , <b>MED Manufacturer name</b> , or <b>MED Model name</b> .
Organization Info	One or more entries listing remote information by organizationally unique identifier ( <b>OUI</b> ), <b>Subtype</b> , <b>Index</b> , and <b>Info</b> (appears when the <b>interface</b> option is used).
Age	How long the neighbor has been identified (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).
Local Interface	Name of the local physical interface (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).
Chassis ID	Chassis identifier of the chassis type listed (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).
Port description	Port description (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).
System name	NetBIOS name of the host (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).

## show route instance

<b>Syntax</b>	show route instance <brief   detail   summary> <instance-name> <operational>
<b>Release Information</b>	Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	(QFabric systems only) Display routing instance information.
<b>Options</b>	<p><b>none</b>—(Same as <b>brief</b>) Display standard information about all routing instances.</p> <p><b>brief   detail   summary</b>—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to <b>brief</b>. (These options are not available with the <b>operational</b> keyword.)</p> <p><b>instance-name</b>—(Optional) Display information for a specified routing instance.</p> <p><b>operational</b>—(Optional) Display operational routing instances.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show route instance on page 1500</a> <a href="#">show route instance detail on page 1500</a> <a href="#">show route instance operational on page 1501</a> <a href="#">show route instance summary on page 1501</a>
<b>Output Fields</b>	Table 90 on page 1499 lists the output fields for the <b>show route instance</b> command. Output fields are listed in the approximate order in which they appear.

Table 90: show route instance Output Fields

Field Name	Field Description	Level of Output
Instance or <i>instance-name</i>	Name of the routing instance.	All levels
Operational Routing Instances	( <b>operational</b> keyword only) Names of all operational routing instances.	—
Type	Type of routing instance: <b>forwarding</b> or <b>virtual-router</b> .	All levels
State	State of the routing instance: <b>active</b> or <b>inactive</b> .	<b>detail</b>
Interfaces	Name of interfaces belonging to this routing instance.	<b>detail</b>
Tables	Tables (and number of routes) associated with this routing instance.	<b>detail</b>
Router ID	Identifier for the router.	<b>detail</b>

Table 90: show route instance Output Fields (*continued*)

Field Name	Field Description	Level of Output
Primary RIB	Primary table for this routing instance.	<b>brief none summary</b>
Active/holddown/hidden	Number of active, hold-down, and hidden routes.	All levels

## Sample Output

## show snmp statistics

<b>Syntax</b>	show snmp statistics
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display statistics about Simple Network Management Protocol (SNMP) packets sent and received by the router or switch.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear snmp statistics on page 6857</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show snmp statistics on page 1506</a>
<b>Output Fields</b>	<a href="#">Table 91 on page 1503</a> describes the output fields for the <b>show snmp statistics</b> command. Output fields are listed in the approximate order in which they appear.

Table 91: show snmp statistics Output Fields

Field Name	Field Description
<b>Input</b>	<p>Information about received packets:</p> <ul style="list-style-type: none"> <li>• <b>Packets(snmplnPkts)</b>—Total number of messages delivered to the SNMP entity from the transport service.</li> <li>• <b>Bad versions—(snmplnBadVersions)</b> Total number of messages delivered to the SNMP entity that were for an unsupported SNMP version.</li> <li>• <b>Bad community names—(snmplnBadCommunityNames)</b> Total number of messages delivered to the SNMP entity that used an SNMP community name not known to the entity.</li> <li>• <b>Bad community uses—(snmplnBadCommunityUses)</b> Total number of messages delivered to the SNMP entity that represented an SNMP operation that was not allowed by the SNMP community named in the message.</li> <li>• <b>ASN parse errors—(snmplnASNParseErrs)</b> Total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.</li> <li>• <b>Too big—(snmplnTooBigs)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>tooBig</b>.</li> <li>• <b>No such names—(snmplnNoSuchNames)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>noSuchName</b>.</li> <li>• <b>Bad values—(snmplnBadValues)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>badValue</b>.</li> <li>• <b>Read only—(snmplnReadOnlys)</b> Total number of valid SNMP PDUs delivered to the SNMP entity with an error status field of <b>readOnly</b>. Only incorrect implementations of SNMP generate this error.</li> </ul>

Table 91: show snmp statistics Output Fields (*continued*)

Field Name	Field Description
Input (continued)	<ul style="list-style-type: none"> <li>• <b>General errors—(snmpInGenErrs)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>genErr</b>.</li> <li>• <b>Total requests varbinds—(snmpInTotalReqVars)</b> Total number of MIB objects retrieved successfully by the SNMP entity as a result of receiving valid SNMP <b>GetRequest</b> and <b>GetNext</b> PDUs.</li> <li>• <b>Total set varbinds—(snmpInSetVars)</b> Total number of MIB objects modified successfully by the SNMP entity as a result of receiving valid SNMP <b>SetRequest</b> PDUs.</li> <li>• <b>Get requests—(snmpInGetRequests)</b> Total number of SNMP <b>GetRequest</b> PDUs that have been accepted and processed by the SNMP entity.</li> <li>• <b>Get nexts—(snmpInGetNexts)</b> Total number of SNMP <b>GetNext</b> PDUs that have been accepted and processed by the SNMP entity.</li> <li>• <b>Set requests—(snmpInSetRequests)</b> Total number of SNMP <b>SetRequest</b> PDUs that have been accepted and processed by the SNMP entity.</li> <li>• <b>Get responses—(snmpInGetResponses)</b> Total number of SNMP <b>GetResponse</b> PDUs that have been accepted and processed by the SNMP entity.</li> <li>• <b>Traps—(snmpInTraps)</b> Total number of SNMP traps generated by the SNMP entity.</li> <li>• <b>Silent drops—(snmpSilentDrops)</b> Total number of <b>GetRequest</b>, <b>GetNextRequest</b>, <b>GetBulkRequest</b>, <b>SetRequests</b>, and <b>InformRequest</b> PDUs delivered to the SNMP entity that were silently dropped because the size of a reply containing an alternate response PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the requests.</li> <li>• <b>Proxy drops—(snmpProxyDrops)</b> Total number of <b>GetRequest</b>, <b>GetNextRequest</b>, <b>GetBulkRequest</b>, <b>SetRequests</b>, and <b>InformRequest</b> PDUs delivered to the SNMP entity that were silently dropped because the transmission of the message to a proxy target failed in such a way (other than a timeout) that no response PDU could be returned.</li> <li>• <b>Commit pending drops</b>—Number of SNMP packets for <b>Set</b> requests dropped because of a previous pending SNMP <b>Set</b> request on the committed configuration.</li> <li>• <b>Throttle drops</b>—Number of SNMP packets for any requests dropped reaching the throttle limit.</li> </ul>

Table 91: show snmp statistics Output Fields (*continued*)

Field Name	Field Description
V3 Input	<p>Information about SNMP version 3 packets:</p> <ul style="list-style-type: none"> <li>• <b>Unknown security models—(snmpUnknownSecurityModels)</b> Total number of packets received by the SNMP engine that were dropped because they referenced a security model that was not known to or supported by the SNMP engine.</li> <li>• <b>Invalid messages—(snmpInvalidMsgs)</b> Number of packets received by the SNMP engine that were dropped because there were invalid or inconsistent components in the SNMP message.</li> <li>• <b>Unknown pdu handlers—(snmpUnknownPDUHandlers)</b> Number of packets received by the SNMP engine that were dropped because the PDU contained in the packet could not be passed to an application responsible for handling the PDU type.</li> <li>• <b>Unavailable contexts—(snmpUnavailableContexts)</b> Number of requests received for a context that is known to the SNMP engine, but is currently unavailable.</li> <li>• <b>Unknown contexts—(snmpUnknownContexts)</b> Total number of requests received for a context that is unknown to the SNMP engine.</li> <li>• <b>Unsupported security levels—(usmStatsUnsupportedSecLevels)</b> Total number of packets received by the SNMP engine that were dropped because they requested a security level unknown to the SNMP engine (or otherwise unavailable).</li> <li>• <b>Not in time windows—(usmStatsNotInTimeWindows)</b> Total number of packets received by the SNMP engine that were dropped because they appeared outside the authoritative SNMP engine's window.</li> <li>• <b>Unknown user names—(usmStatsUnknownUserNames)</b> Total number of packets received by the SNMP engine that were dropped because they referenced a user that was not known to the SNMP engine.</li> <li>• <b>Unknown engine ids—(usmStatsUnknownEngineIDs)</b> Total number of packets received by the SNMP engine that were dropped because they referenced an SNMP engine ID that was not known to the SNMP engine.</li> <li>• <b>Wrong digests—(usmStatsWrongDigests)</b> Total number of packets received by the SNMP engine that were dropped because they did not contain the expected digest value.</li> <li>• <b>Decryption errors—(usmStatsDecryptionErrors)</b> Total number of packets received by the SNMP engine that were dropped because they could not be decrypted.</li> </ul>

Table 91: show snmp statistics Output Fields (*continued*)

Field Name	Field Description
<b>Output</b>	<p>Information about transmitted packets:</p> <ul style="list-style-type: none"> <li>• <b>Packets—(snmpOutPkts)</b> Total number of messages passed from the SNMP entity to the transport service.</li> <li>• <b>Too big—(snmpOutTooBig)</b> Total number of SNMP PDUs generated by the SNMP entity with an error status field of <b>tooBig</b>.</li> <li>• <b>No such names—(snmpOutNoSuchNames)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>noSuchName</b>.</li> <li>• <b>Bad values—(snmpOutBadValues)</b> Total number of SNMP PDUs generated by the SNMP entity with an error status field of <b>badValue</b>.</li> <li>• <b>General errors—(snmpOutGenErrs)</b> Total number of SNMP PDUs generated by the SNMP entity with an error status field of <b>genErr</b>.</li> <li>• <b>Get requests—(snmpOutGetRequests)</b> Total number of SNMP <b>GetRequest</b> PDUs generated by the SNMP entity.</li> <li>• <b>Get nexts—(snmpOutGetNexts)</b> Total number of SNMP <b>GetNext</b> PDUs generated by the SNMP entity.</li> <li>• <b>Set requests—(snmpOutSetRequests)</b> Total number of SNMP <b>SetRequest</b> PDUs generated by the SNMP entity.</li> <li>• <b>Get responses—(snmpOutGetResponses)</b> Total number of SNMP <b>GetResponse</b> PDUs generated by the SNMP entity.</li> <li>• <b>Traps—(snmpOutTraps)</b> Total number of SNMP traps generated by the SNMP entity.</li> </ul>

## Sample Output

### show snmp statistics

```

user@host> show snmp statistics

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                   Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                   Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Use the SSH program to open a connection between a local router or switch and a remote system and execute commands on the remote system. You can issue the **ssh** command from the Junos OS CLI to log in to a remote system or from a remote system to log in to the local router or switch. When executing this command, you include one or more CLI commands by enclosing them in quotation marks and separating the commands with semicolons:

```
ssh address 'cli-command1 ; cli-command2 '
```

**Options**    **host**—Name or address of the remote system.

**bypass-routing**—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

**inet | inet6**—(Optional) Create an IPv4 or IPv6 connection, respectively.

**interface interface-name**—(Optional) Interface name for the SSH session. (This option does not work when **default-address-selection** is configured at the **[edit system]** hierarchy level, because this configuration uses the loopback interface as the source address for all locally generated IP packets.)

**logical-system logical-system-name**—(Optional) Name of a particular logical system for the SSH attempt.

**routing-instance** *routing-instance-name*—(Optional) Name of the routing instance for the SSH attempt.

**source address**—(Optional) Source address of the SSH connection.

**v1 | v2**—(Optional) Use SSH version 1 or 2, respectively, when connecting to a remote host.

**Additional Information** To configure an SSH (version 1) key for your user account, include the **authentication ssh-rsa** statement at the **[edit system login user *user-name*]** hierarchy level. To configure an SSH (version 2) key for your user account, include the **authentication dsa-rsa** statement at the **[edit system login user *user-name*]** hierarchy level.

You can limit the number of times a user can attempt to enter a password while logging in through SSH. To specify the number of times a user can attempt to enter a password to log in through SSH, include the **retry-options** statement at the **[edit system login]** hierarchy level. For details, see the .

**Required Privilege Level** network

### Understanding Enhanced Layer 2 Software Support

---

Enhanced Layer 2 software (ELS) is automatically supported if your device is running a Junos OS release that supports it. You do not need to take any action to enable ELS, and you cannot disable ELS.

ELS is available on the following EX Series switches and QFX Series devices.

Table 92: ELS Support

Device	Initial ELS Release
EX4300 switches	13.2X50-D10
EX4600 switches	13.2X51-D25
EX9200 switches	12.3R2
QFX3500 switches	13.2X50-D15
QFX3600 switches	13.2X50-D15
QFX5100 switches	13.2X51-D10

ELS is supported on the EX4300, EX4600, and EX9200 switches for all Junos OS releases, starting with the initial releases shown in [Table 8 on page 44](#).

ELS support was introduced on QFX3500 and QFX3600 switches in Junos OS Release 13.2X50-D15. ELS is only supported on the software package that supports Virtual Chassis (the **jinstall-qfx-3-\*** software package) for QFX3500 and QFX3600 switches.

For QFX5100 switches, ELS support was introduced in Junos OS Release 13.2X51-D10 and is supported on the **jinstall-qfx-5-\*** software package.

**NOTE:** ELS is not supported on software packages that can be installed in a QFabric system.

### Using the ELS Translator Tool

The ELS Translator is a web-based tool that converts Junos OS Layer 2 configurations to Enhanced Layer 2 Software (ELS) configurations. This conversion tool supports all Juniper Networks EX Series, MX Series, and QFX Series platforms with ELS installed. The ELS Translator is hosted on Juniper Networks Customer Support website for EX Series switches, MX Series Universal Edge routers, and QFX Series switches and is available to registered users, internal users, partners, and premium service contract customers. You need to login using your Juniper Networks user name and password to access the ELS Translator tool.

[Click](#) to access the ELS translator tool.

If you are upgrading from a version of Junos OS that does not support ELS to a version of Junos OS that supports ELS, we recommend updating your configuration with the ELS Translator Tool using the following procedure:

1. Log onto your device using the console port.

**NOTE:** Only perform this procedure from the console port. You will lose connectivity to your device if you perform this procedure from a management port or any other interface.

2. Copy your entire existing configuration into another file. Save the file to a remote location. See [“Saving a Configuration to a File” on page 1257](#).
3. Retain the portion of your existing configuration related to management network connectivity (such as `[edit system]`). Delete all other top-level configuration hierarchy levels (such as `[edit interfaces]`, `[edit protocols]`, and `[edit vlans]`). Issue a **commit** operation to remove the deleted configuration hierarchy levels.
4. Perform the software upgrade. Reboot your device to complete the upgrade. See [“Software Installation Overview” on page 122](#)

**NOTE:** Maintain your console port connection during the reboot.

5. [Click](#) to access the ELS translator tool in a web browser. Follow the instructions on the page to update your configuration.
6. Return to your console port connection. When the switch has rebooted to complete the software upgrade, copy the configuration from the ELS Translator Tool onto your switch. See [“Uploading a Configuration File” on page 1261](#).
7. Commit the new configuration.

**NOTE:** It is possible a script might not translate correctly, so review translated scripts carefully before loading the converted configuration on your switch or other device.

## Configuring a VLAN

You can configure one or more VLANs to perform Layer 2 bridging. The Layer 2 bridging functions include integrated routing and bridging (IRB) for support for Layer 2 bridging and Layer 3 IP routing on the same interface. EX Series and QFX Series switches can function as Layer 2 switches, each with multiple bridging, or broadcast, domains that participate in the same Layer 2 network. You can also configure Layer 3 routing support for a VLAN.

To configure a VLAN:

1. Create the VLAN by setting the unique VLAN name and configuring the VLAN ID:

```
[edit]
user@host# set vlans vlan-name vlan-id vlan-id-number
```

2. Assign at least one interface to the VLAN:

```
[edit]
user@host# set interface interface-name family ethernet-switching vlan members vlan-name
```

---

### Configuring the Native VLAN Identifier

EX Series and QFX Series switches support receiving and forwarding routed or bridged Ethernet frames with 802.1Q VLAN tags. Typically, trunk ports, which connect switches to each other, accept untagged control packets but do not accept untagged data packets. You can enable a trunk port to accept untagged data packets by configuring a native VLAN ID on the interface on which you want the untagged data packets to be received.

To configure the native VLAN ID:

1. On the interface on which you want untagged data packets to be received, set the interface mode to trunk, which specifies that the interface is in multiple VLANs and can multiplex traffic between different VLANs.

```
[edit interfaces]
user@host# set interface-name unit logical-unit-number family ethernet-switching
interface-mode trunk
```

2. Configure the native VLAN ID:

```
[edit interfaces]
user@host# set interface-name native-vlan-id number
```

3. Assign the interface to the native VLAN ID:

```
[edit interfaces]
user@host# set interface-name unit logical-unit-number family ethernet-switching vlan
members native-vlan-id-number
```

---

### Configuring Layer 2 Interfaces

To ensure that your high-traffic network is tuned for optimal performance, explicitly configure some settings on the switch's network interfaces.

To configure a Gigabit Ethernet interface or 10-Gigabit Ethernet interface for trunk interface mode:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family ethernet-switching
interface-mode trunk
```

To configure a Gigabit Ethernet interface or 10-Gigabit Ethernet interface for access interface mode:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family ethernet-switching
interface-mode access
```

---

### Configuring Layer 3 Interfaces

To configure a Layer 3 interface, you must assign an IP address to the interface. You assign an address to an interface by specifying the address when configuring the protocol family. For the inet or inet6 family, configure the interface IP address.

You can configure interfaces with a 32-bit IP version 4 (IPv4) address and optionally with a destination prefix, sometimes called a subnet mask. An IPv4 address utilizes a 4-octet dotted decimal address syntax (for example, 192.16.1.1). An IPv4 address with destination prefix utilizes a 4-octet dotted decimal address syntax with a destination prefix appended (for example, 192.16.1.1/30).

To specify an IP address for the logical unit using IPv4:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family inet address ip-address
```

You represent IP version 6 (IPv6) addresses in hexadecimal notation using a colon-separated list of 16-bit values. You assign a 128-bit IPv6 address to an interface.

To specify an IP address for the logical unit using IPv6:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family inet6 address ip-address
```

### Configuring an IRB Interface

Integrated routing and bridging (IRB) provides support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route packets to another routed interface or to another VLAN that has a Layer 3 protocol configured. IRBs allow the device to recognize packets that are being sent to local addresses so that they are bridged (switched) whenever possible and are routed only when necessary. Whenever packets can be switched instead of routed, several layers of processing are eliminated. An interface named *irb* functions as a logical router on which you can configure a Layer 3 logical interface for VLAN. For redundancy, you can combine an IRB interface with implementations of the Virtual Router Redundancy Protocol (VRRP) in both bridging and virtual private LAN service (VPLS) environments.

To configure an IRB interface:

1. Create a Layer 2 VLAN by assigning it a name and a VLAN ID:

```
[edit]
user@host# set vlans vlan-name vlan-id vlan-id
```

2. Create an IRB logical interface:

```
[edit]
user@host# set interface irb unit logical-unit-number family inet address ip-address
```

3. Associate the IRB interface with the VLAN:

```
[edit]
user@host# set vlans vlan-name l3-interface irb.logical-unit-number
```

### Configuring an Aggregated Ethernet Interface and Configuring LACP on That Interface

Use the link aggregation feature to aggregate one or more links to form a virtual link or link aggregation group (LAG). The MAC client can treat this virtual link as if it were a single link to increase bandwidth, provide graceful degradation as failure occurs, and increase availability.

To configure an aggregated Ethernet interface:

1. Specify the number of aggregated Ethernet interfaces to be created:

```
[edit chassis]
user@host# set aggregated-devices ethernet device-count number
```

2. Specify the name of the link aggregation group interface:

```
[edit interfaces]
user@host# set interfaces aex
```

3. Specify the minimum number of links for the aggregated Ethernet interface (*aex*), that is, the defined bundle, to be labeled “up”:

```
[edit interfaces]
user@host# set aex aggregated-ether-options minimum-links number
```

4. Specify the link speed for the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set aex aggregated-ether-options link-speed link-speed
```

5. Specify the members to be included within the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set interface-name ether-options 802.3ad aex
user@host# set interface-name ether-options 802.3ad aex
```

6. Specify an interface family for the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set aex unit 0 family inet address ip-address
```

For aggregated Ethernet interfaces on the device, you can configure the Link Aggregation Control Protocol (LACP). LACP bundles several physical interfaces to form one logical interface. You can configure aggregated Ethernet with or without LACP enabled.

When LACP is enabled, the local and remote sides of the aggregated Ethernet links exchange protocol data units (PDUs), containing information about the state of the link. You can configure Ethernet links to actively transmit PDUs, or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. One side of the link must be configured as active for the link to be up.

To configure LACP:

1. Enable one side of the aggregated Ethernet link as active:

```
[edit interfaces]
user@host# set aex aggregated-ether-options lacp active
```

2. Specify the interval at which the interfaces send LACP packets:

```
[edit interfaces]
user@host# set aex aggregated-ether-options lacp periodic interval
```

---

### Enhanced Layer 2 CLI Configuration Statement and Command Changes

The enhanced Layer 2 Command Line Interface (CLI) feature is introduced in Junos OS Release 12.3R2. The enhanced Layer 2 CLI feature changes the CLI for some Layer 2 features on EX Series switches. This enhanced CLI will be used to configure Layer 2 features on future EX Series hardware platforms, and also to configure Layer 2 features on other Juniper Networks products.

**NOTE:** When configuring xSTP on EX4300 switches, you must add all the interfaces in the applied VLANs in configurations. For MSTP, configure all interfaces in all VLANs at the [edit protocols mstp interface] hierarchy level.

The following tables provide a list of existing commands that were moved to new hierarchies or changed on EX Series switches as part of this CLI enhancement effort. The table is provided as a high-level reference only. For detailed information about these commands, use the links to the configuration statements provided in the table or see the technical documentation.

**Table 93: Enhanced Layer 2 CLI Changes**

Original Hierarchy	Changed Hierarchy	Change Description
<pre> ethernet-switching-options {   analyzer {     name {       ...     }   } } </pre>	<pre> forwarding-options {   analyzer {     name {       ...     }   } } </pre>	Statements moved to different hierarchy.
<pre> ethernet-switching-options {   authentication-whitelist {     ...   } } </pre>	<pre> switch-options {   ...   authentication-whitelist {     ...   } } </pre>	Hierarchy renamed.
<pre> ethernet-switching-options {   bpdu-block {     ...   } } </pre>	<pre> protocols {   layer2-control {     bpdu-block {       ...     }   } } </pre>	Statement moved to different hierarchy.

## Ethernet Ring Protection Switching Overview

*Ethernet ring protection switching* (ERPS) helps achieve high reliability and network stability. Links in the ring will never form loops that fatally affect the network operation and services availability. The basic idea of an Ethernet ring is to use one specific link to protect the whole ring. This special link is called a *ring protection link (RPL)*. If no failure happens in other links of the ring, the RPL blocks the traffic and is not used. The RPL is controlled by a special node called an *RPL owner*. There is only one RPL owner in a ring. The RPL owner is responsible for blocking traffic over the RPL. Under ring failure conditions, the RPL owner is responsible for unblocking traffic over the RPL. A ring failure results in protection switching of the RPL traffic. An automatic protection switching (APS) protocol is used to coordinate the protection actions over the ring. Protection switching blocks traffic on the failed link and unblocks the traffic on the RPL. When the failure clears, revertive protection switching blocks traffic over the RPL and unblocks traffic on the link on which the failure is cleared.

The following standards provide detailed information on Ethernet ring protection switching:

- IEEE 802.1Q - 1998
- IEEE 802.1D - 2004
- IEEE 802.1Q - 2003

- Draft ITU-T Recommendation G.8032/Y.1344, *Ethernet Ring protection switching*
- ITU-T Y.1731, *OAM functions and mechanisms for Ethernet-based networks*

For additional information on configuring Ethernet ring protection switching on EX Series switches, see *Example: Configuring Ethernet Ring Protection Switching on EX Series Switches*.

For additional information on configuring Ethernet ring protection switching on MX Series routers, see the *Layer 2 Configuration Guide* for a complete example of Ethernet rings and information about STP loop avoidance and prevention.

## Layer 2 Learning and Forwarding for VLANs Overview

When you configure a VLAN, Layer 2 address learning is enabled by default. The VLAN learns unicast media access control (MAC) addresses to avoid flooding the packets to all the ports in the VLAN. Each VLAN creates a source MAC entry in its source and destination MAC tables for each source MAC address learned from packets received on the ports that belong to the VLAN.

**NOTE:** Traffic is not flooded back onto the interface on which it was received. However, because this “split horizon” occurs at a late stage, the packet statistics displayed by commands such as `show interfaces queue` will include flood traffic.

You can optionally disable MAC learning either for the entire device or for a specific VLAN or logical interface. You can also configure the following Layer 2 learning and forwarding properties:

- Static MAC entries for logical interfaces only
- Limit to the number of MAC addresses learned from a specific logical interface or from all the logical interfaces in a VLAN
- Size of the MAC address table for the VLAN
- MAC accounting for a VLAN

## Understanding Bridging and VLANs

Network switches use Layer 2 bridging protocols to discover the topology of their LAN and to forward traffic toward destinations on the LAN. This topic explains the following concepts regarding bridging and VLANs:

- [History of VLANs on page 1527](#)
- [How Bridging of VLAN Traffic Works on page 1527](#)
- [Packets Are Either Tagged or Untagged on page 1529](#)
- [Switch Interface Modes—Access, Trunk, or Tagged Access on page 1529](#)
- [Additional Advantages of Using VLANs on page 1531](#)
- [Maximum VLANs and VLAN Members Per Switch on page 1532](#)
- [A Default VLAN Is Configured on Most Switches on page 1532](#)
- [Assigning Traffic to VLANs on page 1533](#)
- [Forwarding VLAN Traffic on page 1533](#)
- [VLANs Communicate with Integrated Routing and Bridging Interfaces or Routed VLAN Interfaces on page 1534](#)

### History of VLANs

Ethernet LANs were originally designed for small, simple networks that primarily carried text. However, over time, the type of data carried by LANs grew to include voice, graphics, and video. This more complex data, when combined with the ever-increasing speed of transmission, eventually became too much of a load for the original Ethernet LAN design. Multiple packet collisions were significantly slowing down the larger LANs.

The IEEE 802.1D-2004 standard helped evolve Ethernet LANs to cope with the higher data and transmission requirements by defining the concept of *transparent bridging* (generally called simply *bridging*). Bridging divides a single physical LAN (now called a single *broadcast domain*) into two or more virtual LANs, or VLANs. Each VLAN is a collection of some of the LAN nodes grouped together to form individual broadcast domains.

When VLANs are grouped logically by function or organization, a significant percentage of data traffic stays within the VLAN. This relieves the load on the LAN because all traffic no longer has to be forwarded to all nodes on the LAN. A VLAN first transmits packets within the VLAN, thereby reducing the number of packets transmitted on the entire LAN. Because packets whose origin and destination are in the same VLAN are forwarded only within the local VLAN, packets that are not destined for the local VLAN are the only ones forwarded to other broadcast domains. This way, bridging and VLANs limit the amount of traffic flowing across the entire LAN by reducing the possible number of collisions and packet retransmissions within VLANs and on the LAN as a whole.

### How Bridging of VLAN Traffic Works

Because the objective of the IEEE 802.1D-2004 standard was to reduce traffic and therefore reduce potential transmission collisions for Ethernet, a system was implemented to reuse information. Instead of having a switch go through a location process every time

a frame is sent to a node, the transparent bridging protocol allows a switch to record the location of known nodes. When packets are sent to nodes, those destination node locations are stored in address-lookup tables called *Ethernet switching tables*. Before sending a packet, a switch using bridging first consults the switching tables to see if that node has already been located. If the location of a node is known, the frame is sent directly to that node.

Transparent bridging uses five mechanisms to create and maintain Ethernet switching tables on the switch:

- Learning
- Forwarding
- Flooding
- Filtering
- Aging

The key bridging mechanism used by LANs and VLANs is *learning*. When a switch is first connected to an Ethernet LAN or VLAN, it has no information about other nodes on the network. As packets are sent, the switch learns the embedded MAC addresses of the sending nodes and stores them in the Ethernet switching table, along with two other pieces of information—the interface (or port) on which the traffic was received on the destination node and the time the address was learned.

Learning allows switches to then do *forwarding*. By consulting the Ethernet switching table to see whether the table already contains the frame's destination MAC address, switches save time and resources when forwarding packets to the known MAC addresses. If the Ethernet switching table does not contain an entry for an address, the switch uses flooding to learn that address.

*Flooding* finds a particular destination MAC address without using the Ethernet switching table. When traffic originates on the switch and the Ethernet switching table does not yet contain the destination MAC address, the switch first floods the traffic to all other interfaces within the VLAN. When the destination node receives the flooded traffic, it can send an acknowledgment packet back to the switch, allowing it to learn the MAC address of the node and add the address to its Ethernet switching table.

*Filtering*, the fourth bridging mechanism, is how broadcast traffic is limited to the local VLAN whenever possible. As the number of entries in the Ethernet switching table grows, the switch pieces together an increasingly complete picture of the VLAN and the larger LAN—it learns which nodes are in the local VLAN and which are on other network segments. The switch uses this information to filter traffic. Specifically, for traffic whose source and destination MAC addresses are in the local VLAN, filtering prevents the switch from forwarding this traffic to other network segments.

To keep entries in the Ethernet switching table current, the switch uses a fifth bridging mechanism, *aging*. Aging is the reason that the Ethernet switching table entries include timestamps. Each time the switch detects traffic from a MAC address, it updates the timestamp. A timer on the switch periodically checks the timestamp, and if it is older than a user-configured value, the switch removes the node's MAC address from the

Ethernet switching table. This aging process eventually flushes unavailable network nodes out of the Ethernet switching table.

### Packets Are Either Tagged or Untagged

---

When an Ethernet LAN is divided into VLANs, each VLAN is identified by a unique 802.1Q ID. The number of available VLANs and VLAN IDs are listed below:

- On a switch running ELS software, you can configure 4093 VLANs.
- On a switch running non-ELS software, you can configure 4091 VLANs.

Ethernet packets include a tag protocol identifier (TPID) EtherType field, which identifies the protocol being transported. When a device within a VLAN generates a packet, this field includes a value of 0x8100, which indicates that the packet is a VLAN-tagged packet. The packet also has a VLAN ID field that includes the unique 802.1Q ID, which identifies the VLAN to which the packet belongs.

In addition to the TPID EtherType value of 0x8100, switches that run Junos OS that does not support the Enhanced Layer 2 Software (ELS) configuration style also support values of 0x88a8 (Provider Bridging and Shortest Path Bridging) and 0x9100 (Q-inQ).

For a simple network that has only a single VLAN, all packets include a default 802.1Q tag, which is the only VLAN membership that does not mark the packet as tagged. These packets are untagged packets.

### Switch Interface Modes—Access, Trunk, or Tagged Access

---

Ports, or interfaces, on a switch operate in one of three modes:

- Access mode
- Trunk mode
- Tagged-access mode

#### **Access Mode**

An interface in access mode connects a switch to a single network device, such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. Access interfaces accept only untagged packets.

By default, when you boot a switch that runs Junos OS that does not support ELS and use the factory default configuration, or when you boot such a switch and do not explicitly configure a port mode, all interfaces on the switch are in access mode and accept only untagged packets from the VLAN named **default**. You can optionally configure another VLAN and use that VLAN instead of **default**.

On a switch that runs Junos OS that supports ELS, the VLAN named **default** is not supported. Therefore, on such switches, you must explicitly configure at least one VLAN, even if your network is simple and you want only one broadcast domain to exist. After you assign an interface to a VLAN, the interface functions in access mode.

For switches that run either type of software, you can also configure a trunk port or interface to accept untagged packets from a user-configured VLAN. For details about this concept (native VLAN), see [“Trunk Mode and Native VLAN” on page 1530](#).

### **Trunk Mode**

Trunk mode interfaces are generally used to connect switches to one another. Traffic sent between switches can then consist of packets from multiple VLANs, with those packets multiplexed so that they can be sent over the same physical connection. Trunk interfaces usually accept only tagged packets and use the VLAN ID tag to determine both the packets' VLAN origin and VLAN destination.

On a switch that runs software that does not support ELS, an untagged packet is not recognized on a trunk port unless you configure additional settings on that port.

On a switch that runs Junos OS that supports ELS, a trunk port recognizes untagged control packets for protocols such as the Link Aggregation Control Protocol (LACP) and the Link Layer Discovery Protocol (LLDP). However, the trunk port does not recognize untagged data packets unless you configure additional settings on that port.

In the rare case where you want untagged packets to be recognized by a trunk port on switches that run either type of software, you must configure the single VLAN on a trunk port as a *native VLAN*. For more information about native VLANs, see [“Trunk Mode and Native VLAN” on page 1530](#).

### **Trunk Mode and Native VLAN**

On a switch that runs Junos OS that does not support ELS, a trunk port does not recognize packets that do not include VLAN tags, which are also known as untagged packets. On a switch that runs Junos OS that supports ELS, a trunk port recognizes untagged control packets, but it does not recognize untagged data packets. With native VLAN configured, untagged packets that a trunk port normally does not recognize are sent over the trunk interface. In a situation where packets pass from a device, such as an IP phone or printer, to a switch in access mode, and you want those packets sent from the switch over a trunk port, use native VLAN mode. Create a native VLAN by configuring a VLAN ID for it, and specify that the trunk port is a member of the native VLAN.

The switch's trunk port will then treat those packets differently than the other tagged packets. For example, if a trunk port has three VLANs, 10, 20, and 30, assigned to it with VLAN 10 being the native VLAN, packets on VLAN 10 that leave the trunk port on the other end have no 802.1Q header (tag).

There is another native VLAN option for switches that do not support ELS. You can have the switch add and remove tags for untagged packets. To do this, you first configure the single VLAN as a native VLAN on a port attached to a device on the edge. Then, assign a VLAN ID tag to the single native VLAN on the port connected to a device. Last, add the VLAN ID to the trunk port. Now, when the switch receives the untagged packet, it adds the ID you specified and sends and receives the tagged packets on the trunk port configured to accept that VLAN.

### Tagged-Access Mode

Only switches that run Junos OS that does not use the ELS configuration style support tagged-access mode. Tagged-access mode accommodates cloud computing, specifically scenarios including virtual machines or virtual computers. Because several virtual computers can be included on one physical server, the packets generated by one server can contain an aggregation of VLAN packets from different virtual machines on that server. To accommodate this situation, tagged-access mode reflects packets back to the physical server on the same downstream port when the destination address of the packet was learned on that downstream port. Packets are also reflected back to the physical server on the downstream port when the destination has not yet been learned. Therefore, the third interface mode, tagged access, has some characteristics of access mode and some characteristics of trunk mode:

- Like access mode, tagged-access mode connects the switch to an access layer device. Unlike access mode, tagged-access mode is capable of accepting VLAN tagged packets.
- Like trunk mode, tagged-access mode accepts VLAN tagged packets from multiple VLANs. Unlike trunk port interfaces, which are connected at the core/distribution layer, tagged-access port interfaces connect devices at the access layer.

Like trunk mode, tagged-access mode also supports native VLAN.

**NOTE:** Control packets are never reflected back on the downstream port.

### Additional Advantages of Using VLANs

In addition to reducing traffic and thereby speeding up the network, VLANs have the following advantages:

- VLANs provide segmentation services traditionally provided by routers in LAN configurations, thereby reducing hardware equipment costs.
- Packets coupled to a VLAN can be reliably identified and sorted into different domains. You can contain broadcasts within parts of the network, thereby freeing up network resources. For example, when a DHCP server is plugged into a switch and starts broadcasting its presence, you can prevent some hosts from accessing it by using VLANs to split up the network.
- For security issues, VLANs provide granular control of the network because each VLAN is identified by a single IP subnetwork. All packets passing in and out of a VLAN are consistently tagged with the VLAN ID of that VLAN, thereby providing easy identification, because a VLAN ID on a packet cannot be altered. (For a switch that runs Junos OS that does not support ELS, we recommend that you avoid using 1 as a VLAN ID, because that ID is a default value.)
- VLANs react quickly to host relocation—this is also due to the persistent VLAN tag on packets.
- On an Ethernet LAN, all network nodes must be physically connected to the same network. In VLANs, the physical location of nodes is not important—you can group

network devices in any way that makes sense for your organization, such as by department or business function, types of network nodes, or physical location.

### Maximum VLANs and VLAN Members Per Switch

---

The number of VLANs supported per switch varies for each switch. Use the configuration-mode command **set vlans *vlan-name* *vlan-id* ?** to determine the maximum number of VLANs allowed on a switch. You cannot exceed this VLAN limit because you have to assign a specific ID number when you create a VLAN—you could overwrite one of the numbers, but you cannot exceed the limit.

You can, however, exceed the recommended VLAN member maximum for a switch.

On a switch that runs Junos OS that does not support the ELS configuration style, the maximum number of VLAN members allowed on the switch is eight times the maximum number of VLANs that the switch supports (vmember limit =  $\text{vlan max} * 8$ ). If the configuration of the switch exceeds the recommended VLAN member maximum, a warning message appears when you commit the configuration. If you commit the configuration despite the warning, the commit succeeds, but there is a risk of the Ethernet switching process (eswd) failing as a result of memory allocation failure.

On a switch that runs Junos OS that supports ELS, the maximum number of VLAN members allowed on the switch is 24 times the maximum number of VLANs that the switch supports (vmember limit =  $\text{vlan max} * 24$ ). If the configuration of the switch exceeds the recommended VLAN member maximum, a warning message appears in the system log (syslog).

A QFabric system supports up to 131,008 VLAN members (vmembers) on a single network node group, server node group, or redundant server node group. The number of vmembers is calculated by multiplying the maximum number of VLANs by 32.

For example, to calculate how many interfaces are required to support 4,000 VLANs, divide the maximum number of vmembers (128,000) by the number of configured VLANs (4,000). In this case, 32 interfaces are required.

On network Node groups and server Node groups, you can configure link aggregation groups (LAGs) across multiple interfaces. Each LAG and VLAN combination is considered a vmember.

### A Default VLAN Is Configured on Most Switches

---

Some switches that run Junos OS that do not support the ELS configuration style are preconfigured with a VLAN named **default** that does not tag packets and operates only with untagged packets. On these switches, each interface already belongs to the VLAN named **default** and all traffic uses this VLAN until you configure more VLANs and assign traffic to those VLANs.

**NOTE:** When a Juniper Networks QFX3500 or QFX3600 switch is interconnected with other switches in a Virtual Chassis configuration, each individual switch that is included as a member of the configuration is identified with a member ID. The member ID functions as an FPC slot number. When you are configuring interfaces for a Virtual Chassis configuration, you specify the appropriate member ID (0 through 9) as the slot element of the interface name. The default factory settings for a Virtual Chassis configuration include FPC 0 as a member of the default VLAN because FPC 0 is configured as part of the ethernet-switching family. In order to include FPC 1 through FPC 9 in the default VLAN, add the ethernet-switching family to the configurations for those interfaces.

### Assigning Traffic to VLANs

You can assign traffic on any switch to a particular VLAN by referencing either the interface port of the traffic or the MAC addresses of devices sending traffic.

#### ***Assign VLAN Traffic According to the Interface Port Source***

This method is most commonly used to assign traffic to VLANs. In this case, you specify that all traffic received on a particular switch interface is assigned to a specific VLAN. You configure this VLAN assignment when you configure the switch, by using either the VLAN number (called a VLAN ID) or by using the VLAN name, which the switch then translates into a numeric VLAN ID. This method is referred to simply as creating a VLAN because it is the most commonly used method.

#### ***Assign VLAN Traffic According to the Source MAC Address***

In this case, all traffic received from a specific MAC address is forwarded to a specific egress interface (next hop) on the switch. MAC-based VLANs are either static (named MAC addresses configured one at a time) or dynamic (configured using a RADIUS server).

To configure a static MAC-based VLAN on a switch that supports ELS, see *Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)*. To configure a static MAC-based VLAN on a switch that does not support ELS, see *Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)*.

### Forwarding VLAN Traffic

To pass traffic within a VLAN, the switch uses Layer 2 forwarding protocols, including IEEE 802.1Q spanning-tree protocols.

To pass traffic between two VLANs, the switch uses standard Layer 3 routing protocols, such as static routing, OSPF, and RIP. The same interfaces that support Layer 2 bridging protocols also support Layer 3 routing protocols, providing multilayer switching.

To pass traffic from a single device on an access port to a switch and then pass those packets on a trunk port, use the native mode configuration previously discussed under [“Trunk Mode” on page 1530](#).

## VLANs Communicate with Integrated Routing and Bridging Interfaces or Routed VLAN Interfaces

---

Traditionally, switches sent traffic to hosts that were part of the same broadcast domain (VLAN) but routers were needed to route traffic from one broadcast domain to another. Also, only routers performed other Layer 3 functions such as traffic engineering.

Switches that run Junos OS that supports the ELS configuration style perform inter-VLAN routing functions using an integrated routing and bridging (IRB) interface named `irb`, while switches that run Junos OS that does not support ELS perform these functions using a routed VLAN interface (RVI) named `vlan`. These interfaces detect both MAC addresses and IP addresses and route data to Layer 3 interfaces, thereby frequently eliminating the need to have both a switch and a router.

## Acronyms

---

The following acronyms are used in the discussion about Ethernet ring protection switching:

- MA—Maintenance association
- MEP—Maintenance association end point
- OAM—Operations, administration, and management (Ethernet ring protection switching uses connectivity fault management daemon)
- FDB—MAC forwarding database
- STP—Spanning Tree Protocol
- RAPS—Ring automatic protection switching
- WTR—Wait to restore
- RPL—Ring protection link

## Ring Nodes

---

Multiple nodes are used to form a ring. There are two different node types:

- Normal node—The node has no special role on the ring.
- RPL owner node—The node owns the RPL and blocks or unblocks traffic over the RPL. This node also initiates the RAPS message.

## Ring Node States

---

There are three different states for each node of a specific ring:

- init—Not a participant of a specific ring.
- idle—No failure on the ring; the node is performing normally. For a normal node, traffic is unblocked on both ring ports. For the RPL owner, traffic is blocked on the ring port that connects to the RPL and unblocked on the other ring port.
- protection—A failure occurred on the ring. For a normal node, traffic is blocked on the ring port that connects to the failing link and unblocked on working ring ports. For the RPL owner, traffic is unblocked on both ring ports if they connect to non-failure links.

There can be only one RPL owner for each ring. The user configuration must guarantee this, because the APS protocol cannot check this.

## Failure Detection

---

Ethernet ring operation depends on quick and accurate failure detection. The failure condition *signal failure (SF)* is supported. For SF detection, an Ethernet continuity check MEP must be configured for each ring link. For fast protection switching, a 10-ms transmission period for this MEP group is supported. OAM monitors the MEP group's MA and reports SF or SF clear events to the Ethernet ring control module. For this MEP group,

the action profile must be configured to update the interface device IFF\_LINKDOWN flag. OAM updates the IFF\_LINKDOWN flag to notify the Ethernet ring control module.

### Logical Ring

This feature currently supports only the physical ring, which means that two adjacent nodes of a ring must be physically connected and the ring must operate on the physical interface, not the VLAN.

### FDB Flush

When ring protection switching occurs, normally an *FDB flush* is executed. The Ethernet ring control module uses the same mechanism as the STP to trigger the FDB flush. The Ethernet ring control module controls the ring port physical interface's default STP index to execute the FDB flush.

### Traffic Blocking and Forwarding

Ethernet ring control uses the same mechanism as the STP to control forwarding or discarding of user traffic. The Ethernet ring control module sets the ring port physical interface default STP index state to forwarding or discarding in order to control user traffic.

### RAPS Message Blocking and Forwarding

The router or switch treats the ring automatic protection switching (RAPS) message the same as it treats user traffic for forwarding RAPS messages between two ring ports. The ring port physical interface default STP index state also controls forwarding RAPS messages between the two ring ports. Other than forwarding RAPS messages between the two ring ports, as shown in [Figure 18 on page 1536](#), the system also needs to forward the RAPS message between the CPU (Ethernet ring control module) and the ring port. This type of forwarding does not depend on the ring port physical interfaces' STP index state. The RAPS message is always sent by the router or switch through the ring ports, as shown in [Figure 19 on page 1536](#). A RAPS message received from a discarding ring port is sent to the Ethernet ring control module, but is not sent to the other ring port.

**Figure 18: Protocol Packets from the Network to the Router**

**Figure 19: Protocol Packets from the Router or Switch to the Network**

Juniper Networks switches and Juniper Networks routers use different methods to achieve these routes.

The switches use forwarding database entries to direct the RAPS messages. The forwarding database entry (keyed by the RAPS multicast address and VLAN) has a composite next hop associated with it—the composite next hop associates the two ring interfaces with the forwarding database entry and uses the split horizon feature to prevent sending the packet out on the interface that it is received on. This is an example of the forwarding database entry relating to the RAPS multicast MAC (a result of the **show ethernet-switching table detail** command):

```
VLAN: v1, Tag: 101, MAC: 01:19:a7:00:00:01, Interface: ERP
Interfaces:      ge-0/0/9.0, ge-0/0/3.0
Type: Static
Action: Mirror
Nexthop index: 1333
```

The routers use an implicit filter to achieve ERP routes. Each implicit filter binds to a bridge domain. Therefore, the east ring port control channel and the west ring port control channel of a particular ring instance must be configured to the same bridge domain. For each ring port control channel, a filter term is generated to control RAPS message forwarding. The filter number is the same as the number of bridge domains that contain the ring control channels. If a bridge domain contains control channels from multiple rings, the filter related to this bridge domain will have multiple terms and each term will relate to a control channel. The filter has command parts and control-channel related parts, as follows:

- Common terms:
  - term 1: if [Ethernet type is not OAM Ethernet type (0x8902)]  
          { accept packet }
  - term 2: if [source MAC address belongs to this bridge]  
          { drop packet, our packet loop through the ring and come back to home }
  - term 3: if [destination is the RAPS PDU multicast address(0x01,0x19,0xa7,0x00,0x00,0x01) AND[ring port STP status is DISCARDING]  
          { send to CPU }
- Control channel related terms:
  - if [destination is the RAPS PDU multicast address(0x01,0x19,0xa7,0x00,0x00,0x01) AND[ring port STP status is FORWARDING] AND [Incoming interface IFL equal to control channel IFL]  
      { send packet to CPU and send to the other ring port }
  - default term: accept packet.

### Dedicated Signaling Control Channel

For each ring port, a dedicated signaling control channel with a dedicated VLAN ID must be configured. In Ethernet ring configuration, only this control logical interface is configured and the underlying physical interface is the physical ring port. Each ring requires that two control physical interfaces be configured. These two logical interfaces must be configured in a bridge domain for routers (or the same VLAN for switches) in order to forward RAPS protocol data units (PDUs) between the two ring control physical interfaces. If the router control channel logical interface is not a trunk port, only control logical interfaces will be

configured in ring port configuration. If this router control channel logical interface is a trunk port, in addition to the control channel logical interfaces, a dedicated VLAN ID must be configured for routers. For switches, always specify either a VLAN name or VLAN ID for all links.

### **RAPS Message Termination**

---

The RAPS message starts from the originating node, travels through the entire ring, and terminates in the originating node unless a failure is present in the ring. The originating node must drop the RAPS message if the source MAC address in the RAPS message belongs to itself. The source MAC address is the node's node ID.

### **Multiple Rings**

---

The Ethernet ring control module supports multiple rings in each node (two logical interfaces are part of each ring). However, interconnection of multiple rings is not supported in this release. The interconnection of two rings means that two rings may share the same link or share the same node.

### **Node ID**

---

For each node in the ring, a unique *node ID* identifies each node. The node ID is the node's MAC address.

For routers only, you can configure this node ID when configuring the ring on the node or automatically select an ID such as STP. In most cases, you will not configure this and the router will select a node ID, like STP does. It should be the manufacturing MAC address. The ring node ID should not be changed, even if you change the manufacturing MAC address. Any MAC address can be used if you make sure each node in the ring has a different node ID. The node ID on switches is selected automatically and is not configurable.

### **Bridge Domains with the Ring Port (MX Series Routers Only)**

---

On the routers, the protection group is seen as an abstract logical port that can be configured to any bridge domain. Therefore, if you configure one ring port or its logical interface in a bridge domain, you must configure the other related ring port or its logical interface to the same bridge domain. The bridge domain that includes the ring port acts as any other bridge domain and supports the IRB Layer 3 interface.

## Understanding Integrated Routing and Bridging

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs). VLANs limit the amount of traffic flowing across the entire LAN, reducing the possible number of collisions and packet retransmissions within the LAN. For example, you might want to create a VLAN that includes the employees in a department and the resources that they use often, such as printers, servers, and so on.

Of course, you also want to allow these employees to communicate with people and resources in other VLANs. To forward packets between VLANs, you normally you need a router that connects the VLANs. However, you can accomplish this forwarding on a switch without using a router by configuring an integrated routing and bridging (IRB) interface. (These interfaces are also called routed VLAN interfaces, or RVIs). Using this approach reduces complexity and avoids the costs associated with purchasing, installing, managing, powering, and cooling another device.

An IRB is a special type of Layer 3 virtual interface named **vlan**. Like normal Layer 3 interfaces, the **vlan** interface needs a logical unit number with an IP address. In fact, to be useful an IRB needs at least two logical units and two IP addresses—you must create units with addresses in each of the subnets associated with the VLANs between which you want traffic to be routed. That is, if you have two VLANs (for example, VLAN **red** and VLAN **blue**) with corresponding subnets, your IRB must have a logical unit with an address in the subnet for **red** and a logical unit with an address in the subnet for **blue**. The switch automatically creates direct routes to these subnets and uses these routes to forward traffic between VLANs.

**NOTE:** If you are using a version of Junos OS that supports Enhanced Layer 2 Software (ELS), you can also create a Layer 3 virtual interface named **irb** instead of **vlan**—that is, both statements are supported by ELS

Table 94 on page 1539 shows values you might use when configuring an IRB:

**Table 94: Sample IRB Values**

Property	Settings
VLAN names and tags (IDs)	<b>blue</b> , ID 100 <b>red</b> , ID 200
Subnets associated with VLANs	<b>blue</b> : 192.0.2.0/25 (addresses 192.0.2.1 through 192.0.2.126) <b>red</b> : 192.0.2.128/25 (addresses 192.0.2.129 through 192.0.2.254)
IRB name	interface <b>irb</b>
IRB units and addresses	logical unit 100: 192.0.2.1/25 logical unit 200: 192.0.2.129/25

For the sake of consistency and to avoid confusion, Table 94 on page 1539 shows IRB logical unit numbers that match the IDs of the corresponding VLANs. However, you do not have

to assign logical unit numbers that match the VLAN IDs—you can use any values for the units. To bind the logical units of the IRB to the appropriate VLANs, you use the [l3-interface](#) statement.

Because IRBs operate at Layer 3, you can use Layer 3 services such as firewall filters or CoS rewriting with them.

[Table 95 on page 1540](#) shows the number of IRBs/RVIs that each QFX platform supports.

**Table 95: Number of Supported IRBs/RVIs by Platform**

Platform	Number of Supported IRBs/RVIs
QFX3500	1200
QFX3000-G	1024
QFX3000-M	1024

## Understanding MAC Learning

*MAC learning* is the process of obtaining the MAC addresses of all the nodes on a network.

When a node is first connected to an Ethernet LAN or VLAN, it has no information about the other nodes on the network. As data is sent through the network, data packets include a data frame listing their source and destination MAC addresses. The data frame is forwarded to a target port, which is connected to the second device. The MAC address is learned locally at the target port, which facilitates communications for frames that later enter the target port and contain addresses previously learned from a received frame.

MAC learning can also be enabled on a per-VLAN basis. See [Example: Disabling MAC Learning in a VLAN](#) for further information.

By default, MAC learning is enabled on the QFX Series.

## Introduction to the Media Access Control (MAC) Layer 2 Sublayer

This topic provides an introduction to the MAC sublayer of the data link layer (Layer 2).

In Layer 2 of a network, the Media Access Control (MAC) sublayer provides addressing and channel access control mechanisms that enable several terminals or network nodes to communicate in a network.

The MAC sublayer acts as an interface between the logical link control (LLC) Ethernet sublayer and Layer 1 (the physical layer). The MAC sublayer emulates a full-duplex logical communication channel in a multipoint network. This channel may provide unicast, multicast, or broadcast communication service. The MAC sublayer uses MAC protocols to prevent collisions.

In Layer 2, multiple devices on the same physical link can uniquely identify one another at the data link layer, by using the MAC addresses that are assigned to all ports on a switch. A MAC algorithm accepts as input a secret key and an arbitrary-length message to be authenticated, and outputs a MAC address.

A MAC address is a 12-digit hexadecimal number (48 bits in long). MAC addresses are usually written in one of these formats:

- MM:MM:MM:SS:SS:SS
- MM-MM-MM-SS-SS-SS

The first half of a MAC address contains the ID number of the adapter manufacturer. These IDs are regulated by an Internet standards body. The second half of a MAC address represents the serial number assigned to the adapter by the manufacturer.

Contrast MAC addressing, which works at Layer 2, with IP addressing, which runs at Layer 3 (networking and routing). One way to remember the difference is that the MAC addresses apply to a physical or virtual node, whereas IP addresses apply to the software implementation of that node. MAC addresses are typically fixed on a per-node basis, whereas IP addresses change when the node moves from one part of the network to another.

IP networks maintain a mapping between the IP and MAC addresses of a node using the Address Resolution Protocol (ARP) table. DHCP also typically uses MAC addresses when assigning IP addresses to nodes.

## Overview of Layer 2 Networking

Layer 2, also known as the Data Link Layer, is the second level in the seven-layer OSI reference model for network protocol design. Layer 2 is equivalent to the link layer (the lowest layer) in the TCP/IP network model. Layer 2 is the network layer used to transfer data between adjacent network nodes in a wide area network or between nodes on the same local area network.

A *frame* is a protocol data unit, the smallest unit of bits on a Layer 2 network. Frames are transmitted to and received from devices on the same local area network (LAN). Unlike bits, frames have a defined structure and can be used for error detection, control plane activities and so forth. Not all frames carry user data. The network uses some frames to control the data link itself..

At Layer 2, *unicast* refers to sending frames from one node to a single other node, whereas *multicast* denotes sending traffic from one node to multiple nodes, and *broadcasting* refers to the transmission of frames to all nodes in a network. A *broadcast domain* is a logical division of a network in which all nodes of that network can be reached at Layer 2 by a broadcast.

Segments of a LAN can be linked at the frame level using *bridges*. Bridging creates separate broadcast domains on the LAN, creating VLANs, which are independent logical networks that group together related devices into separate network segments. The grouping of devices on a VLAN is independent of where the devices are physically located in the LAN. Without bridging and VLANs, all devices on the Ethernet LAN are in a single broadcast domain, and all the devices detect all the packets on the LAN.

*Forwarding* is the relaying of packets from one network segment to another by nodes in the network. On a VLAN, a frame whose origin and destination are in the same VLAN are forwarded only within the local VLAN. A network segment is a portion of a computer network wherein every device communicates using the same physical layer.

Layer 2 contains two sublayers:

- Logical link control (LLC) sublayer, which is responsible for managing communications links and handling frame traffic.
- Media access control (MAC) sublayer, which governs protocol access to the physical network medium. By using the MAC addresses that are assigned to all ports on a switch, multiple devices on the same physical link can uniquely identify one another.

The ports, or interfaces, on a switch operate in either access mode, tagged-access, or trunk mode:

- *Access mode* ports connect to a network device such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. The port itself belongs to a single VLAN. The frames transmitted over an access interface are normal Ethernet frames. By default, all ports on a switch are in access mode.
- *Tagged-Access mode* ports connect to a network device such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. The port itself belongs to a single VLAN. The frames transmitted over an access interface are normal

Ethernet frames. By default, all ports on a switch are in access mode. Tagged-access mode accommodates cloud computing, specifically scenarios including virtual machines or virtual computers. Because several virtual computers can be included on one physical server, the packets generated by one server can contain an aggregation of VLAN packets from different virtual machines on that server. To accommodate this situation, tagged-access mode reflects packets back to the physical server on the same downstream port when the destination address of the packet was learned on that downstream port. Packets are also reflected back to the physical server on the downstream port when the destination has not yet been learned. Therefore, the third interface mode, tagged access, has some characteristics of access mode and some characteristics of trunk mode:

- *Trunk mode* ports handle traffic for multiple VLANs, multiplexing the traffic for all those VLANs over the same physical connection. Trunk interfaces are generally used to interconnect switches to other devices or switches.

With native VLAN configured, frames that do not carry VLAN tags are sent over the trunk interface. If you have a situation where packets pass from a device to a switch in access mode, and you want to then send those packets from the switch over a trunk port, use native VLAN mode. Configure the single VLAN on the switch's port (which is in access mode) as a native VLAN. The switch's trunk port will then treat those frames differently than the other tagged packets. For example, if a trunk port has three VLANs, 10, 20, and 30, assigned to it with VLAN 10 being the native VLAN, frames on VLAN 10 that leave the trunk port on the other end have no 802.1Q header (tag). There is another native VLAN option. You can have the switch add and remove tags for untagged packets. To do this, you first configure the single VLAN as a native VLAN on a port attached to a device on the edge. Then, assign a VLAN ID tag to the single native VLAN on the port connected to a device. Last, add the VLAN ID to the trunk port. Now, when the switch receives the untagged packet, it adds the ID you specified and sends and receives the tagged packets on the trunk port configured to accept that VLAN.

Including the sublayers, Layer 2 on the QFX Series supports the following functionality:

- Unicast, multicast, and broadcast traffic.
- Bridging.
- VLAN 802.1Q—Also known as *VLAN tagging*, this protocol allows multiple bridged networks to transparently share the same physical network link by adding VLAN tags to an Ethernet frame.
- Extension of Layer 2 VLANs across multiple switches using Spanning Tree Protocol (STP) prevents looping across the network.
- *MAC learning*, including per-VLAN MAC learning and Layer 2 learning suppression—This process obtains the MAC addresses of all the nodes on a network
- Link aggregation—This process groups of Ethernet interfaces at the physical layer to form a single link layer interface, also known as a *link aggregation group (LAG)* or LAG bundle

- Storm control on the physical port for unicast, multicast, and broadcast
- STP support, including 802.1d, RSTP, MSTP, and Root Guard

## Understanding Layer 2 Broadcasting

In a Layer 2 network, *broadcasting* refers to sending traffic to all nodes on a network.

Layer 2 broadcast traffic stays within a local area network (LAN) boundary; known as the *broadcast domain*. Layer 2 broadcast traffic is sent to the broadcast domain using a MAC address of FF:FF:FF:FF:FF:FF. Every device in the broadcast domain recognizes this MAC address and passes the broadcast traffic on to other devices in the broadcast domain, if applicable. Broadcasting can be compared to unicasting (sending traffic to a single node) or multicasting (delivering traffic to a group of nodes simultaneously).

Layer 3 broadcast traffic, however, is sent to all devices in a network using a broadcast network address. For example, if your network address is 192.0.0.0, the broadcast network address is 192.255.255.255. In this case, only devices that belong to the 192.0.0.0 network receive the Layer 3 broadcast traffic. Devices that do not belong to this network drop the traffic.

Broadcasting is used in the following situations:

- Address Resolution Protocol (ARP) uses broadcasting to map MAC addresses to IP addresses. ARP dynamically binds the IP address (the logical address) to the correct MAC address. Before IP unicast packets can be sent, ARP discovers the MAC address used by the Ethernet interface where the IP address is configured.
- Dynamic Host Configuration Protocol (DHCP) uses broadcasting to dynamically assign IP addresses to hosts on a network segment or subnet.
- Routing protocols use broadcasting to advertise routes.

Excessive broadcast traffic can sometimes create a broadcast storm. A broadcast storm occurs when messages are broadcast on a network and each message prompts a receiving node to respond by broadcasting its own messages on the network. This, in turn, prompts further responses that create a snowball effect. The LAN is suddenly flooded with packets, creating unnecessary traffic that leads to poor network performance or even a complete loss of network service.

**Related  
Documentation**

- [Overview of Layer 2 Networking on page 1542](#)
- [Understanding Storm Control on page 5272](#)
- *Understanding Bridging and VLANs*
- [Understanding Bridging and VLANs on page 1527](#)

## Understanding Unicast

*Unicasting* is the act of sending data from one node of the network to another. In contrast, multicast transmissions send traffic from one data node to multiple other data nodes.

*Unknown unicast* traffic consists of unicast frames with unknown destination MAC addresses. By default, the switch floods these unicast frames that are traveling in a VLAN to all interfaces that are members of the VLAN. Forwarding this type of traffic to interfaces on the switch can trigger a security issue. The LAN is suddenly flooded with packets, creating unnecessary traffic that leads to poor network performance or even a complete loss of network service. This is known as a traffic storm.

To prevent a storm, you can disable the flooding of unknown unicast packets to all interfaces by configuring one VLAN or all VLANs to forward any unknown unicast traffic to a specific trunk interface. (This channels the unknown unicast traffic to a single interface.)

## Understanding the Unified Forwarding Table

- [Using the Unified Forwarding Table to Optimize Address Storage on page 1545](#)
- [MAC Address and Host Address Memory Allocation on page 1545](#)
- [LPM Table Memory Allocation on page 1546](#)

### Using the Unified Forwarding Table to Optimize Address Storage

On QFX5100 and EX4600 switches, you can control the allocation of forwarding table memory available to store the following:

- MAC addresses.
- Layer 3 host entries.
- Longest prefix match (LPM) table entries.

**NOTE:** Starting with Junos OS 13.2X51-D15, you can allocate more memory to store prefixes in the range /65 to /127 range.

This feature gives you the flexibility to configure your switch to match the needs of your particular network environment.

### MAC Address and Host Address Memory Allocation

There are several profiles that allocate memory differently for MAC addresses and host addresses. You configure the mix that best meets your needs by choosing the appropriate profile. [Table 96 on page 1546](#) lists the profiles you can choose and the associated maximum values for the MAC address and host table entries.

Table 96: Unified Forwarding Table Profiles

Profile Name	MAC Table	Host Table (unicast and multicast addresses)					
	MAC Addresses	IPv4 unicast	IPv6 unicast	IPv4 (*, G)	IPv4 (S, G)	IPv6 (*, G)	IPv6 (S, G)
<b>l2-profile-one</b>	288K	16K	8K	8K	8K	4K	4K
<b>l2-profile-two</b>	224K	80K	40K	40K	40K	20K	20K
<b>l2-profile-three (default)</b>	160K	144K	72K	72K	72K	36K	36K
<b>l3-profile</b>	96K	208K	104K	104K	104K	52K	52K
<b>lpm-profile</b>	32K	16K	8K	8K	8K	4K	4K

Note that all entries in the host table share the same memory space. If the host table stores the maximum number of entries for any given type, the entire shared table is full and is unable to accommodate *any* entries of any other type. As you can see, different entry types occupy different amounts of memory. For example, an IPv6 unicast address occupies twice as much memory as an IPv4 unicast address, and an IPv6 multicast address occupies four times as much memory as an IPv4 unicast address.

[Table 97 on page 1546](#) lists various valid combinations that the host table can store if you use the **l2-profile-one** profile. Each row in the table represents a case in which the host table is full and cannot accommodate any more entries. .

Table 97: Example Host Table Combinations Using l2-profile-one

IPv4 unicast	IPv6 unicast	IPv4 multicast (*, G)	IPv4 multicast (S, G)	IPv6 multicast (*, G)	IPv6 multicast (S, G)
16K	0	0	0	0	0
12K	2K	0	0	0	0
12K	0	2K	2K	0	0
8K	4K	0	0	0	0
4K	2K	2K	2K	0	0
0	4K	0	0	1K	1K

#### LPM Table Memory Allocation

You configure the memory allocation for LPM table entries differently depending on which version of Junos OS you use. To learn how to configure memory allocation for LPM table entries see [“Configuring the Unified Forwarding Table” on page 1697](#).

- Related Documentation**
- [Configuring the Unified Forwarding Table on page 1697](#)

## Understanding Q-in-Q Tunneling

---

- [Understanding Q-in-Q Tunneling on page 1547](#)

### Understanding Q-in-Q Tunneling

**NOTE:** This topic applies to Junos OS switches with support for the Enhanced Layer 2 Software (ELS) configuration style. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 43](#).

Q-in-Q tunneling enables service providers on Ethernet access networks to extend a Layer 2 Ethernet connection between two customer sites. Using Q-in-Q tunneling, providers can also segregate or bundle customer traffic into fewer VLANs or different VLANs by adding another layer of 802.1Q tags. Q-in-Q tunneling is useful when customers have overlapping VLAN IDs because customers' VLAN (C-VLAN) tags are prepended by the service-provider VLAN (S-VLAN) tag, which allows you to preserve each customers' VLAN IDs without conflict. The Juniper Networks Junos operating system (Junos OS) implementation of Q-in-Q tunneling supports the IEEE 802.1ad standard.

This topic describes:

- [How Q-in-Q Tunneling Works on page 1547](#)
- [How VLAN Translation Works on page 1548](#)
- [Sending and Receiving Untagged Packets on page 1548](#)
- [Disabling MAC Address Learning on page 1549](#)
- [Mapping C-VLANs to S-VLANs on page 1549](#)
- [Constraints for Q-in-Q Tunneling and VLAN Translation on page 1550](#)

#### How Q-in-Q Tunneling Works

---

In Q-in-Q tunneling, as a packet travels from a C-VLAN to an S-VLAN, a service-provider-specific 802.1Q tag is added to the packet. This additional tag is used to segregate traffic into S-VLANs. The original customer 802.1Q tag of the packet is retained and is transmitted transparently, passing through the service provider's network. As the packet leaves the S-VLAN in the downstream direction, the additional 802.1Q tag is removed.

When Q-in-Q tunneling is enabled, trunk interfaces are assumed to be part of the service provider or data center network. Access interfaces are assumed to be customer-facing and accept both tagged and untagged frames. This topic refers to trunk interfaces as S-VLAN interfaces. This type of interface is also sometimes known as a network-to-network interface (NNI). The topic refers to access interfaces as C-VLAN interfaces. This type of interface is also sometimes known as a user-network interface (UNI).

An interface can be a member of multiple S-VLANs. You can map one C-VLAN to one S-VLAN (1:1) or many C-VLANs to many S-VLANs (N:N). C-VLAN and S-VLAN tags are unique—for instance, you can have both a C-VLAN tag of 101 and an S-VLAN tag of 101. You can limit the set of accepted customer tags to a range of tags or to discrete values. Class-of-service (CoS) values of C-VLANs are unchanged in the downstream direction. You may copy ingress priority and CoS settings to the S-VLAN.

C-VLAN and S-VLAN interfaces accept priority-tagged packets without any configuration.

### How VLAN Translation Works

---

VLAN translation replaces an incoming C-VLAN tag with an S-VLAN tag instead of adding an additional tag. The C-VLAN tag is therefore lost, so a single-tagged packet is normally untagged when it leaves the S-VLAN (at the other end of the link). If an incoming packet has had Q-in-Q tunneling applied in advance, VLAN translation replaces the outer tag and the inner tag is retained when the packet leaves the S-VLAN at the other end of the link.

To configure VLAN translation, use the *mapping swap* statement at the **[edit vlans interface]** hierarchy level.

**NOTE:** You can configure VLAN translation on access ports only. You cannot configure it on trunk ports, and you cannot configure Q-in-Q tunneling on the same access port.

---

### Sending and Receiving Untagged Packets

---

To enable an interface to send and receive untagged packets, you must specify a native VLAN for a physical interface. When the interface receives an untagged packet, it adds the VLAN ID of the native VLAN to the packet and sends the newly tagged packet to the mapped interface.

To specify a native VLAN, use the **native-vlan-id** statement at the **[edit interfaces interface-name]** hierarchy level. The native VLAN ID must match the C-VLAN or S-VLAN ID or be included in the VLAN ID list specified on the logical interface.

For example, on a logical interface for a C-VLAN interface, you might specify a C-VLAN ID list of 100-200. Then, on the C-VLAN physical interface, you could specify a native VLAN ID of 150. This configuration would work because the native VLAN of 150 is included in the C-VLAN ID list of 100-200.

We recommend configuring a native VLAN when using any of the approaches to map C-VLANs to S-VLANs. If you do not configure a native VLAN on an interface, untagged packets received by the interface are discarded. See the Mapping C-VLANs to S-VLANs section in this topic for information about the methods of mapping C-VLANs to S-VLANs.

### Disabling MAC Address Learning

In a Q-in-Q deployment, customer packets interfaces are transported without any changes to source and destination MAC addresses. You can disable MAC address learning at the global, interface, and VLAN levels:

- To disable learning globally, disable MAC address learning for the switch.
- To disable learning for an interface, disable MAC address learning for all VLANs of which the specified interface is a member.
- To disable learning for a VLAN, disable MAC address learning for a specified VLAN.

### Mapping C-VLANs to S-VLANs

There are three ways to map C-VLANs to S-VLANs:

- [All-in-One Bundling on page 1549](#)
- [Many-to-Many Bundling on page 1549](#)
- [Mapping a Specific Interface on page 1550](#)

If you configure multiple mapping methods, the switch gives priority to mapping a specific interface, then to many-to-many bundling, and last to all-in-one bundling. However, for a particular mapping method, setting up overlapping rules for the same C-VLAN is not supported.

#### *All-in-One Bundling*

All-in-one bundling maps all packets from all C-VLAN interfaces to an S-VLAN.

The C-VLAN interface accepts untagged and single-tagged packets. An S-VLAN 802.1Q tag is then added to these packets, and the packets are sent to the S-VLAN interface, which accepts untagged, single-tagged, and double-tagged packets.

**NOTE:** The C-VLAN and S-VLAN interfaces accept untagged packets provided that the `native-vlan-id` statement is configured on these interfaces.

#### *Many-to-Many Bundling*

Many-to-many bundling is used to specify which C-VLANs are mapped to which S-VLANs.

Use many-to-many bundling when you want a subset of the C-VLANs on the access switch to be part of multiple S-VLANs. With many-to-many bundling, the C-VLAN interfaces accept untagged and single-tagged packets. An S-VLAN 802.1Q tag is then added to these packets, and the packets are sent to the S-VLAN interfaces, which accept untagged, single-tagged, and double-tagged packets.

**NOTE:** The C-VLAN and S-VLAN interfaces accept untagged packets provided that the `native-vlan-id` statement is configured on these interfaces.

### **Mapping a Specific Interface**

Use specific interface mapping when you want to assign an S-VLAN to a specific C-VLAN on an interface. The configuration applies only to the specific interface, not to all access interfaces.

Specific interface mapping has two suboptions: **push** and **swap**. When traffic that is mapped to a specific interface is pushed, the packet retains its original tag as it moves from the C-VLAN to the S-VLAN and an additional S-VLAN tag is added to the packet. When traffic that is mapped to a specific interface is swapped, the incoming tag is replaced with a new VLAN tag. This is sometimes known as VLAN rewriting or VLAN translation.

Typically, this method is used to keep data from different customers separate or to provide individualized treatment of the packets on a certain interface. You might also use this method to map VLAN traffic from different customers to a single S-VLAN.

When using specific interface mapping, the C-VLAN interfaces accept untagged and single-tagged packets, while the S-VLAN interfaces accept untagged, single-tagged, and double-tagged packets.

**NOTE:** The C-VLAN and S-VLAN interfaces accept untagged packets provided that the `native-vlan-id` statement is configured on these interfaces.

---

### **Constraints for Q-in-Q Tunneling and VLAN Translation**

---

Be aware of the following constraints when configuring Q-in-Q tunneling and VLAN translation:

- With releases of Junos OS 13.2X51 previous to 13.2X51-D20, you cannot create a regular VLAN on an interface if you have created an S-VLAN or C-VLAN on that interface for Q-in-Q tunneling. This means that you cannot create an integrated routing and bridging (IRB) interface on that interface because regular VLANs are a required part of IRB configuration. With Junos OS 13.2X51-D25, you can create a regular VLAN on a trunk interface that has an S-VLAN, which means that you can also create an IRB interface on the trunk. In this case, the regular VLAN and S-VLAN on the same trunk interface cannot share the same VLAN ID. Junos OS 13.2X51-D25 does not allow you to create a regular VLAN on an access interface that has a C-VLAN.
- Most access port security features are not supported with Q-in-Q tunneling and VLAN translation.
- Configuring Q-in-Q tunneling and VLAN rewriting/VLAN translation on the same port is not supported.
- You can configure at most one VLAN rewrite/VLAN translation for a given VLAN and interface. For example, you can create no more than one translation for VLAN 100 on interface xe-0/0/0.
- The combined total of VLANs and rules for Q-in-Q tunneling and VLAN translation cannot exceed 6000. For example, you can configure and commit 4000 VLANs and

2000 rules for Q-in-Q tunneling and VLAN translation. However, you cannot configure 4000 VLANs and 2500 rules for Q-in-Q tunneling and VLAN translation. If you try to commit a configuration that exceeds the limit, you see CLI and syslog errors that inform you about the problem.

- MAC addresses are learned from S-VLANs, not C-VLANs.
- Broadcast, unknown unicast, and multicast traffic is forwarded to all members in the S-VLAN.
- The following features are not supported with Q-in-Q tunneling:
  - DHCP relay
  - Fibre Channel over Ethernet
  - IP Source Guard
- The following features are not supported with VLAN rewriting/VLAN translation:
  - Fibre Channel over Ethernet
  - Firewall filter applied to a port or VLAN in the output direction
  - Private VLANs
  - VLAN Spanning Tree Protocol
  - Reflective relay

**Related  
Documentation**

---

## Proxy ARP

- [Understanding Proxy ARP on page 1551](#)

### Understanding Proxy ARP

You can configure proxy Address Resolution Protocol (ARP) to enable the switch to respond to ARP queries for network addresses by offering its own Ethernet media access control (MAC) address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

Proxy ARP is useful in situations where hosts are on different physical networks and you do not want to use subnet masking. Because ARP broadcasts are not propagated between hosts on different physical networks, hosts will not receive a response to their ARP request if the destination is on a different subnet. Enabling the switch to act as an ARP proxy allows the hosts to transparently communicate with each other through the switch. Proxy ARP can help hosts on a subnet reach remote subnets without your having to configure routing or a default gateway.

- [What Is ARP? on page 1552](#)
- [Proxy ARP Overview on page 1552](#)
- [Best Practices for Proxy ARP on page 1552](#)

## What Is ARP?

Ethernet LANs use ARP to map Ethernet MAC addresses to IP addresses. Each device maintains a cache containing a mapping of MAC addresses to IP addresses. The switch maintains this mapping in a cache that it consults when forwarding packets to network devices. If the ARP cache does not contain an entry for the destination device, the host (the DHCP client) broadcasts an ARP request for that device's address and stores the response in the cache.

## Proxy ARP Overview

When proxy ARP is enabled, if the switch receives an ARP request for which it has a route to the target (destination) IP address, the switch responds by sending a proxy ARP reply packet containing its own MAC address. The host that sent the ARP request then sends its packets to the switch, which forwards them to the intended host.

**NOTE:** For security reasons, the source address in an ARP request must be on the same subnet as the interface on which the ARP request is received.

You can configure proxy ARP for each interface. You can also configure proxy ARP for a VLAN by using a routed VLAN interface (RVI).

Two modes of proxy ARP are supported: restricted and unrestricted. Both modes require that the switch have an active route to the destination address of the ARP request.

- **Restricted**—The switch responds to ARP requests in which the physical networks of the source and target are different and does not respond if the source and target IP addresses are on the same subnet. In this mode, hosts on the same subnet communicate without proxy ARP. We recommend that you use this mode on the switch.
- **Unrestricted**—The switch responds to all ARP requests for which it has a route to the destination. This is the default mode (because it is the default mode in Juniper Networks Junos operating system (Junos OS) configurations other than those on the switch). We recommend using restricted mode on the switch.

## Best Practices for Proxy ARP

We recommend these best practices for configuring proxy ARP on the switches:

- Set proxy ARP to restricted mode.
- Use restricted mode when configuring proxy ARP on RVIs.
- If you set proxy ARP to unrestricted, disable gratuitous ARP requests on each interface enabled for proxy ARP.

## Reflective Relay

---

- [Understanding Reflective Relay for Use with VEPA Technology on page 1553](#)

### Understanding Reflective Relay for Use with VEPA Technology

Virtual Ethernet Port Aggregator (VEPA) technology aggregates packets generated by virtual machines located on the same server and relays them to a physical switch. The physical switch then provides connectivity between the virtual machines located on the server, so the virtual machines do not communicate with one another. Offloading switching activities from a virtual switch to a physical switch reduces the computing overhead on the virtual servers and takes advantage of the security, filtering, and management features of the physical switch. Reflective relay, also known as “hairpin turn,” enables the physical switch to receive aggregated packets from the virtual machines hosted on the server through the VEPA on the downstream port and send those packets out the same downstream port from which the physical switch received them.

- [VEPA on page 1553](#)
- [Reflective Relay on page 1553](#)

#### VEPA

---

Even though virtual machines are capable of sending packets directly to one another, it is more efficient to pass these aggregated packets from the VEPA to a physical switch. The switch can then send any packets destined for a virtual machine located on the same server to the VEPA.

#### Reflective Relay

---

Reflective relay, also known as a “hairpin turn” or “hairpin mode,” returns aggregated packets to the VEPA by using the same downstream port that initially delivered the aggregated packets from the VEPA to the switch. Reflective relay must be configured on the interface located on the physical switch that receives aggregated packets, such as VEPA packets, because some of these packets might need to be sent back to the server if they are destined for another virtual machine on the same server.

Reflective relay only occurs in two situations:

- When the destination address of the packet was learned on that downstream port
- When the destination has not yet been learned

Reflective relay does not otherwise change the operation of the switch. If the interface to which the virtual machine is connected and the MAC address of the virtual machine packet are not yet included in the Ethernet switching table for the virtual machine's associated VLAN, an entry is added. If the source MAC address of an incoming packet under the respective VLAN is not yet present in the Ethernet switching table, the switch floods the packet on all the other ports that are members of the same VLAN, including the port on which the packet arrived.

## Spanning Trees

---

- [Overview of Spanning-Tree Protocols on page 1554](#)
- [Understanding MSTP on page 1555](#)
- [Understanding RSTP on page 1556](#)
- [Understanding VSTP on page 1557](#)
- [Understanding BPDU Protection for STP, RSTP, and MSTP on page 1558](#)
- [Understanding Loop Protection for STP, RSTP, VSTP, and MSTP on page 1559](#)
- [Understanding Root Protection for STP, RSTP, VSTP, and MSTP on page 1560](#)

### Overview of Spanning-Tree Protocols

QFX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and VLAN Spanning Tree Protocol (VSTP). The default spanning-tree protocol on the QFX Series is RSTP. RSTP provides faster convergence times than STP. However, some legacy networks require the slower convergence times of basic STP.

The STP support provided for the QFX Series includes:

- IEEE 802.1d
- 802.1w RSTP
- 802.1s MSTP

If your network includes IEEE 802.1D 1998 bridges, you can remove RSTP and explicitly configure STP. See [“Configuring STP” on page 1704](#). When you explicitly configure STP, the QFX Series products use the IEEE 802.1D 2004 specification, force version 0. This configuration runs a version of RSTP that is compatible with the classic, basic STP. If you use virtual LANs (VLANs), you should enable VSTP and use it on your network. See [“Understanding VSTP” on page 1557](#).

You can use the same operational commands (**show spanning-tree bridge** and **show spanning-tree interface**) to check the status of your spanning-tree configuration, regardless of which spanning-tree protocol has been configured.

STP uses bridge protocol data unit (BPDU) packets to exchange information with other switches. BPDUs send hello packets out at regular intervals to exchange information across bridges and detect loops in a network topology. There are two types of BPDUs:

- Configuration BPDUs—These BPDUs contain configuration information about the transmitting switch and its ports, including switch and port MAC addresses, switch priority, port priority, and port cost.

- Topology change notification (TCN) BPDUs—When a bridge needs to signal a topology change, it starts to send TCNs on its root port. The designated bridge receives the TCN, acknowledges it, and generates another one for its own root port. The process continues until the TCN reaches the root bridge.

STP uses the information provided by the BPDUs to elect a root bridge, identify root ports for each switch, identify designated ports for each physical LAN segment, and prune specific redundant links to create a loop-free tree topology. All leaf devices calculate the best path to the root device and place their ports in blocking or forwarding states based on the best path to the root. The resulting tree topology provides a single active Layer 2 data path between any two end stations.

### Understanding Spanning Tree Protocols on a QFabric System

Although there is no need to run STP in a QFabric system, you can connect a QFabric system to another Layer 2 device and use STP. STP traffic can only be processed on network Node groups. Other Node groups, such as redundant server Node groups and server Node groups, discard the STP bridge protocol data units (BPDUs) traffic and disable the interface automatically. Server Node groups only process host-facing protocols, whereas Network Node groups process all supported protocols.

#### Related Documentation

- [Understanding BPDUs for STP, RSTP, and MSTP on page 1558](#)
- [Understanding MSTP on page 1555](#)
- [Understanding RSTP on page 1556](#)
- [Understanding VSTP on page 1557](#)

## Understanding MSTP

Although RSTP provides faster convergence time than STP does, it still does not solve a problem inherent in STP: all VLANs within a LAN must share the same spanning tree. To solve this problem, the QFX Series products use Multiple Spanning Tree Protocol (MSTP) to create a loop-free topology in networks with multiple spanning-tree regions.

An MSTP region allows a group of bridges to be modeled as a single bridge. An MSTP region contains multiple spanning-tree instances (MSTIs). MSTIs provide different paths for different VLANs. This functionality facilitates more efficient load sharing across redundant links.

An MSTP region can support up to 64 MSTIs, and each instance can support from 1 through 4094 VLANs.

#### Related Documentation

- [Overview of Spanning-Tree Protocols on page 1554](#)
- [Understanding RSTP on page 1556](#)
- [Example: Configuring Network Regions for VLANs with MSTP on page 1624](#)

## Understanding RSTP

Juniper Networks QFX Series products use Rapid Spanning Tree Protocol (RSTP) on the network side of the QFX Series to provide quicker convergence time than the base Spanning Tree Protocol (STP) does. RSTP identifies certain links as point to point. When a point-to-point link fails, the alternate link can transition to the forwarding state, which speeds up convergence.

Although STP provides basic loop prevention functionality, it does not provide fast network convergence when there are topology changes. The STP process to determine network state transitions is slower than the RSTP process because it is timer-based. A device must reinitialize every time a topology change occurs. The device must start in the listening state and transition to the learning state and eventually to a forwarding or blocking state. When default values are used for the maximum age (20 seconds) and forward delay (15 seconds), it takes 50 seconds for the device to converge. RSTP converges faster because it uses a handshake mechanism based on point-to-point links instead of the timer-based process used by STP.

For networks with virtual LANs (VLANs), you can use VLAN Spanning Tree Protocol (VSTP), which takes the paths of each VLAN into account when calculating routes. VSTP uses RSTP by default.

An RSTP domain running from the edge outward on a QFX Series product has the following components:

- A *root port*, which is the “best path” to the root device.
- A *designated port*, which indicates that the switch is the designated bridge for the other switch connecting to this port.
- An *alternate port*, which provides an alternate root port.
- A *backup port*, which provides an alternate designated port.

Port assignments change through messages exchanged throughout the domain. An RSTP device generates configuration messages once per hello time interval. If an RSTP device does not receive a configuration message from its neighbor after an interval of three hello times, it determines that the connection with the neighbor is lost. When a *root port* or a *designated port* fails on a device, the device generates a configuration message with the proposal bit set. Once its neighbor device receives this message, it verifies that this configuration message is valid for that port and starts a *synchronizing* operation to ensure that all of its ports are in sync with the new information.

Similar sets of messages propagate through the network, restoring the connectivity very quickly after a topology change (in a well-designed network that uses RSTP, network convergence can take as little as 0.5 seconds). If a device does not receive an agreement to a proposal message it has sent, it returns to the original IEEE 802.D convention.

RSTP was originally defined in the IEEE 802.1w draft specification and later incorporated into the IEEE 802.1D-2004 specification.

VSTP and RSTP can be configured at the same time. If you configure VSTP and RSTP at the same time and the switch has more than 253 VLANs, VSTP is configured only for the first 253 VLANs. For the remaining VLANs, only RSTP is configured. RSTP and VSTP are the only spanning-tree protocols that can be configured at the same time on the QFX Series.

## Understanding VSTP

VLAN Spanning Tree Protocol (VSTP) enables Juniper Networks switches to run one or more Spanning Tree Protocol (STP) or Rapid Spanning Tree Protocol (RSTP) instances for each VLAN on which VSTP is enabled. For networks with multiple VLANs, VSTP improves intelligent tree spanning by defining best paths within the VLANs instead of within the entire network.

You can configure VSTP for a maximum of 509 VLANs.

VSTP and RSTP can be configured at the same time. If you configure VSTP and RSTP at the same time and the switch has more than 253 VLANs, VSTP is configured only for the first 253 VLANs. For the remaining VLANs, only RSTP is configured. RSTP and VSTP are the only spanning-tree protocols that can be configured at the same time on a switch.

**NOTE:** We recommend that you enable VSTP on all VLANs that could receive VSTP bridge protocol data units (BPDUs).

## Understanding BPDU Protection for STP, RSTP, and MSTP

**NOTE:** Using the original CLI, you can disable BPDU protection on interfaces by issuing the **set ethernet-switching-options bpdu-block *interface-name* disable** command.

A Juniper Networks device Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). Bridge protocol data unit (BPDU) protection can help prevent STP misconfigurations that can lead to network outages.

A loop-free network is supported through the exchange of a special type of frame called a BPDU. Receipt of BPDUs on certain interfaces in an STP, RSTP, VSTP, or MSTP topology, however, can lead to network outages. Enable BPDU protection on those interfaces to prevent these outages.

Peer STP applications running on the device interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic and which interfaces become root ports and forward traffic.

However, a user bridge application running on a device connected to the device can also generate BPDUs. If these BPDUs are picked up by STP applications running on the device, they can trigger STP miscalculations, and those miscalculations can lead to network outages.

Enable BPDU protection on device interfaces connected to user devices or on interfaces on which no BPDUs are expected, such as edge ports. If BPDUs are received on a protected interface, the interface is disabled and stops forwarding frames.

Not only can you configure BPDU protection on a device with a spanning tree, but also on a device without a spanning tree. This type of topology typically consists of a non-STP device connected to an STP device through a trunk interface.

To configure BPDU protection on a device with a spanning tree, include the **bpdu-block-on-edge** statement at the **[edit protocols (stp | mstp | rstp)]** hierarchy level. To configure BPDU protection on a device without a spanning tree, include the **bpdu-block** statement at the **[edit ethernet-switching-options interface *interface-name*]** hierarchy level.

If BPDUs are sent to an interface (indicating that the misconfiguration has been corrected), the interface can be unblocked in one of two ways:

- If the **disable-timeout** statement has been included in the BPDU configuration, the interface automatically returns to service after the timer expires.
- Use the operational mode command **clear ethernet-switching bpdu-error**.

Disabling the BPDU protection configuration does not unblock the interface.

## Understanding Loop Protection for STP, RSTP, VSTP, and MSTP

A Juniper Networks device provides Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). Loop protection increases the efficiency of STP, RSTP, and MSTP by preventing ports from entering a forwarding state that would cause a loop to open in the network.

A loop-free network in spanning-tree topologies is supported through the exchange of a special type of frame called a bridge protocol data unit (BPDU). Peer STP applications running on the device interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic (preventing loops) and which interfaces become root ports and forward traffic.

However, a blocking interface can mistakenly transition to the forwarding state if the interface stops receiving BPDUs from its designated port on the segment. Such a transition error can occur when there is a hardware error on the device or software configuration error between the device and its neighbor.

When loop protection is enabled, the spanning-tree topology detects root ports and blocked ports and ensures that both keep receiving BPDUs. If a loop-protection-enabled interface stops receiving BPDUs from its designated port, it reacts as it would react to a problem with the physical connection on this interface. It does not transition the interface to a forwarding state, but instead transitions it to a loop-inconsistent state. The interface recovers and it transitions back to the spanning-tree blocking state as soon as it receives a BPDU.

We recommend that you enable loop protection on all device interfaces that have a chance of becoming root or designated ports. Loop protection is most effective when enabled in the entire switched network. When you enable loop protection, you must configure at least one action (**alarm**, **block**, or both).

An interface can be configured for either loop protection or root protection, but not for both.

## Understanding Root Protection for STP, RSTP, VSTP, and MSTP

A Juniper Networks device provides Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). A loop-free network is supported through the exchange of a special type of frame called a bridge protocol data unit (BPDU). Peer STP applications running on the device interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic and which interfaces become root ports and forward traffic.

You can also see BPDUs generated when you run a bridge application on a device attached to the device. This can interfere with root port election, which may sometimes lead to the wrong root port being elected through the above process. Root protection allows you to manually enforce the root bridge placement in the network.

Enable root protection on interfaces that should not receive higher-priority BPDUs from the root bridge and should not be elected as the root port. These interfaces become designated ports and are typically located on an administrative boundary. If the bridge receives more STP BPDUs on a port that has root protection enabled, that port transitions to a root-prevented STP state (inconsistency state), and the interface is blocked. This blocking prevents a bridge that should not be the root bridge from being elected the root bridge. After the bridge stops receiving more STP BPDUs on the interface with root protection, the interface returns to a listening state, followed by a learning state, and ultimately back to a forwarding state. Recovery back to the forwarding state is automatic.

When root protection is enabled on an interface, it is enabled for all the STP instances on that interface. The interface is blocked only for instances for which it receives more BPDUs. Otherwise, it participates in the spanning-tree topology.

An interface can be configured for either root protection or loop protection, but not for both.

- [Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 1588](#)

#### Example: Configuring Ethernet Ring Protection Switching on EX Series Switches and QFX Switches

You can configure Ethernet ring protection switching (ERPS) on connected EX Series or QFX Series switches to prevent fatal loops from disrupting a network. ERPS is similar to

the Spanning Tree Protocol, but ERPS is more efficient because it is customized for ring topologies. You must configure at least three switches to form a ring.

This example shows how to configure Ethernet ring protection switching on four switches that are connected to one another on a dedicated link in a ring topology.

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Example: Configuring Ethernet Ring Protection Switching on EX Series Switches*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 43](#). This example will also work with QFX Series switches.

- [Requirements on page 1564](#)
- [Overview and Topology on page 1564](#)
- [Configuration on page 1565](#)
- [Verification on page 1575](#)

---

## Requirements

This example uses the following hardware and software components:

- Four connected EX Series switches, that support the Enhanced Layer 2 Software (ELS), that will function as nodes in the ring topology.
- Junos OS Release 13.2X50-D10 or later for EX Series switches.
- Junos OS Release 14.1X53-D10 or later for QFX Series.

Before you begin, be sure you have:

- Configured two trunk interfaces on each of the four switches. See [Table 98 on page 1565](#) for a list of the interface names used in this example.
- Configured a VLAN (with name **erp-control-vlan-1** and ID **100**) on all four switches and associated two network interfaces from each of the four switches with the VLAN. See *Configuring VLANs for the QFX Series OR Configuring VLANs for EX Series Switches (CLI Procedure)*. See [Table 98 on page 1565](#) for a list of the interface names used in this example.
- Configured two more VLANs (one with name **erp-data-1** and vlan ID **101** and a second vlan with the name **erp-data-2** and vlan ID **102**) on all four switches and associated both the east and west interfaces on each switch.

---

## Overview and Topology

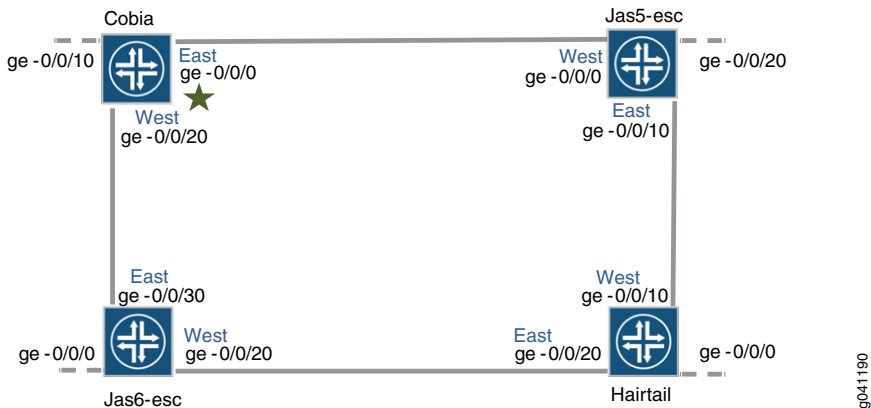

ERPS uses a dedicated physical link, including a control VLAN for trunk ports, between all of the switches to protect the active links. ERPS VLANs are all located on this link and are also blocked by default. When traffic between the switches is flowing with no problems, the active links take care of all traffic. Only if an error occurs on one of the data links would the ERPS control channel take over and start forwarding traffic.

**NOTE:** Trunk ports on switches use a VLAN to create individual control channels for ERPS. When multiple ERPS instances are configured for a ring, there are multiple sets of ring protection links (RPLs) and RPL owners on the ERPS link, and a different channel is blocked for each instance. Nontrunk ports use the physical link as the control channel and protocol data units (PDUs) are untagged, with no VLAN information in the packet.

This example creates one protection ring (called a node ring) named erp1 on four switches connected in a ring by trunk ports as shown in Figure 20 on page 1565. Because the links are trunk ports, VLAN 100 is used for erp1 traffic. The east interface of each switch is connected with the west interface of an adjacent switch. Cobia is the RPL owner, with interface ge-0/0/0 configured as an RPL end interface. The interface ge-0/0/0 of Jas5-esc is configured as the RPL neighbor interface. In the idle state, the RPL end blocks the control VLAN and data channel VLAN for this particular ERP instance—the blocked port on Cobia is marked with a star in Figure 20 on page 1565.

Figure 20: Ethernet Ring Protection Switching Example

In this example, we configure the four switches with the interfaces indicated in both Figure 20 on page 1565 and Table 98 on page 1565.

Table 98: Components to Configure for This Example

Interfaces	Cobia	Jas5-esc	Jas6-esc	Hairtail
East	ge-0/0/0	ge-0/0/10	ge-0/0/30	ge-0/0/20
West	ge-0/0/20	ge-0/0/0	ge-0/0/20	ge-0/0/10
Third	ge-0/0/10	ge-0/0/20	ge-0/0/0	ge-0/0/0

Configuration

- Configuring ERPS on Cobia, the RPL Owner Node on page 1566
- Configuring ERPS on Jas5-esc on page 1568

- [Configuring ERPS on Hairtail on page 1571](#)
- [Configuring ERPS on Jas6-esc on page 1573](#)

### *Configuring ERPS on Cobia, the RPL Owner Node*

#### CLI Quick Configuration

To quickly configure Cobia, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**NOTE:** RSTP and ERPS cannot both be configured on a ring port, and RSTP is configured by default. Therefore, in this example, RSTP is disabled on each ring port before configuring ERPS.

```
set protocols rstp interface ge-0/0/0 disable
set protocols rstp interface ge-0/0/20 disable
set protocols protection-group ethernet-ring erp1
set protocols protection-group ethernet-ring erp1 ring-protection-link-owner
set protocols protection-group ethernet-ring erp1 data-channel 101
set protocols protection-group ethernet-ring erp1 data-channel 102
set protocols protection-group ethernet-ring erp1 control-vlan 100
set protocols protection-group ethernet-ring erp1 east-interface control-channel vlan
  100 ge-0/0/0.0
set protocols protection-group ethernet-ring erp1 east-interface ring-protection-link-end
set protocols protection-group ethernet-ring erp1 west-interface control-channel vlan
  100 ge-0/0/20.0
set protocols protection-group ethernet-ring erp1 west-interface control-channel vlan
  100 ge-0/0/20.0
set protocols protection-group ethernet-ring erp1 east-interface control-channel vlan
  100 ge-0/0/20.0 vlan 100
```

#### Step-by-Step Procedure

To configure ERPS on Cobia:

1. Disable RSTP on the two ports that will use ERPS:
 

```
[edit protocols]
user@switch# set rstp interface ge-0/0/0 disable
user@switch# set rstp interface ge-0/0/20 disable
```
2. Create a node ring named erp1:
 

```
[edit protocols]
user@switch# set protection-group ethernet-ring erp1
```
3. Designate Cobia as the RPL owner node:
 

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set ring-protection-link-owner
```
4. Configure the VLANs 101 and 102 as data channels:
 

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set data-channel 101
user@switch# set data-channel 102
```
5. Configure the control vlan 100 for this ERP instance on the trunk interface:

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set control-vlan 100
```

6. Configure the east interface of the node ring erp1 with the control channel ge-0/0/0.0 vlan 100 and indicate that this particular ring protection link ends here:

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set east-interface control-channel vlan 100 ge-0/0/0.0
user@switch# set east-interface ring-protection-link-end
```

7. Configure the west interface of the node ring erp1 with the control channel vlan 100 ge-0/0/20.0 :

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set west-interface control-channel vlan 100 ge-0/0/20.0
```

8. Every ring instance on a trunk port has one control VLAN in which ERP packets traverse. The control VLAN also controls data VLANs, if any are configured. Assign 100 as the control VLAN on both interfaces:

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set west-interface control-channel vlan 100 ge-0/0/20.0
user@switch# set east-interface control-channel vlan 100 ge-0/0/20.0
```

**Results** In configuration mode, check your ERPS configuration by entering the **show protocols** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@switch# show protocols
rstp {
  interface ge-0/0/20.0 {
    disable;
  }
  interface ge-0/0/0.0 {
    disable;
  }
}
protection-group {
  ethernet-ring erp1 {
    ring-protection-link-owner;
    east-interface {
      control-channel {
        vlan 100
        ge-0/0/0.0;
      }
      ring-protection-link-end;
    }
    west-interface {
      control-channel {
        vlan 100
        ge-0/0/20.0;
      }
    }
  }
  control-vlan 100;
  data-channel {
    vlan 101-102;
  }
}
```

```
}  
}
```

In configuration mode, check your VLAN configuration by entering the **show vlans** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

In configuration mode, check your interface configurations by entering the **show interfaces** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]  
user@switch# show interfaces  
ge-0/0/0 {  
  unit 0 {  
    family ethernet-switching {  
      interface-mode trunk;  
    }  
  }  
}  
ge-0/0/10 {  
  unit 0 {  
    family ethernet-switching {  
      interface-mode trunk;  
    }  
  }  
}  
ge-0/0/20 {  
  unit 0 {  
    family ethernet-switching {  
      interface-mode trunk;  
    }  
  }  
}
```

If you are finished configuring the device, enter **commit** in configuration mode.

### *Configuring ERPS on Jas5-esc*

#### **CLI Quick Configuration**

To quickly configure Jas5-esc, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set protocols rstp interface ge-0/0/10 disable  
set protocols rstp interface ge-0/0/0 disable  
set protocols protection-group ethernet-ring erp1  
set protocols protection-group ethernet-ring erp1 data-channel 101  
set protocols protection-group ethernet-ring erp1 data-channel 102  
set protocols protection-group ethernet-ring erp1 control-vlan 100  
set protocols protection-group ethernet-ring erp1 east-interface control-channel vlan  
100 ge-0/0/10.0  
set protocols protection-group ethernet-ring erp1 east-interface control-channel vlan  
100 ge-0/0/0.0  
set protocols protection-group ethernet-ring erp1 west-interface control-channel vlan  
100 ge-0/0/0.0
```

```
set protocols protection-group ethernet-ring erp1 west-interface control-channel vlan
100 ge-0/0/10.0
```

### Step-by-Step Procedure

To configure ERPS on Jas5-esc:

1. Disable RSTP on the two ports that will use ERPS:  

```
[edit protocols]
user@switch# set rstp interface ge-0/0/10 disable
user@switch# set rstp interface ge-0/0/0 disable
```
2. Create a node ring named erp1:  

```
[edit protocols]
user@switch# set protection-group ethernet-ring erp1
```
3. Configure a control VLAN with ID 100 for the node ring erp1:  

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set control-vlan 100
```
4. Configure two data channels named erp-data-1 and erp-data-2 to define a set of VLAN IDs that belong to a ring instance.  

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set data-channel vlan 101
user@switch# set data-channel vlan 102
```
5. Configure the east interface of the node ring erp1 with the control channel ge-0/0/10.0:  

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set east-interface control-channel ge-0/0/10.0 vlan 100
```
6. Configure the west interface of the node ring erp1 with the control channel ge-0/0/0.0 vlan 100:  

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set west-interface control-channel ge-0/0/0.0 vlan 100
```
7. Every ring instance on a trunk port has one control VLAN in which ERP packets traverse. The control VLAN also controls data VLANs, if any are configured. Assign vlan # 100 as the control VLAN:  

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set west-interface control-channel ge-0/0/0.0 vlan 100
user@switch# set east-interface control-channel ge-0/0/10.0 vlan 100
```

**Results** In configuration mode, check your ERPS configuration by entering the **show protocols** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@switch# show protocols
rstp {
  interface ge-0/0/10.0 {
    disable;
  }
  interface ge-0/0/0.0 {
```

```
        disable;
    }
}
protection-group {
    east-interface {
        control-channel {
            ge-0/0/10.0;
            vlan 100;
        }
    }
    west-interface {
        control-channel {
            ge-0/0/0.0;
            vlan 100;
        }
    }
}
control-vlan 100;
data-channel
    vlan 101-102
}
```

In configuration mode, check your VLAN configuration by entering the **show vlans** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

In configuration mode, check your interface configurations by entering the **show interfaces** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@switch# show interfaces
ge-0/0/0 {
    unit 0 {
        family ethernet-switching {
            interface-mode trunk;
        }
    }
}
ge-0/0/10 {
    unit 0 {
        family ethernet-switching {
            interface-mode trunk;
        }
    }
}
ge-0/0/20 {
    unit 0 {
        family ethernet-switching {
            interface-mode trunk;
        }
    }
}
```

If you are finished configuring the device, enter **commit** in configuration mode.

*Configuring ERPS on Hairtail*

**CLI Quick Configuration** To quickly configure Hairtail, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set protocols rstp interface ge-0/0/10 disable
set protocols rstp interface ge-0/0/20 disable
set protocols protection-group ethernet-ring erp1
set protocols protection-group ethernet-ring erp1 data-channel 101
set protocols protection-group ethernet-ring erp1 data-channel 102
set protocols protection-group ethernet-ring erp1 control-vlan 100
set protocols protection-group ethernet-ring erp1 east-interface control-channel
ge-0/0/20.0 vlan 100
set protocols protection-group ethernet-ring erp1 west-interface control-channel
ge-0/0/10.0 vlan 100
set protocols protection-group ethernet-ring erp1 west-interface control-channel
ge-0/0/20.0 vlan 100
set protocols protection-group ethernet-ring erp1 east-interface control-channel
ge-0/0/10.0 vlan 100
```

**Step-by-Step Procedure** To configure ERPS on Hairtail:

1. Disable RSTP on the two ports that will use ERPS:  

```
[edit protocols]
user@switch# set rstp interface ge-0/0/10 disable
user@switch# set rstp interface ge-0/0/20 disable
```
2. Create a node ring named erp1:  

```
[edit protocols]
user@switch# set protection-group ethernet-ring erp1
```
3. Configure the control vlan 100 for the node ring erp1:  

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set control-vlan 100
```
4. Configure two data channels numbered 101 and 102 to define a set of VLAN IDs that belong to a ring instance:  

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set data-channel vlan 101
user@switch# set data-channel vlan 102
```
5. Configure the east interface of the node ring erp1 with the control channel ge-0/0/20.0 vlan 100, and indicate that it connects to a ring protection link:  

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set east-interface control-channel ge-0/0/20.0 vlan 100
```
6. Configure the west interface of the node ring erp1 with the control channel ge-0/0/10.0 vlan 100 and indicate that it connects to a ring protection link:  

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set west-interface control-channel ge-0/0/10.0 vlan 100
```

7. Every ring instance on a trunk port has one control VLAN in which ERP packets traverse. The control VLAN also controls data VLANs, if any are configured. Assign 100 as the control VLAN:

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set west-interface control-channel ge-0/0/10.0 vlan 100
user@switch# set east-interface control-channel ge-0/0/20.0 vlan 100
```

**Results** In configuration mode, check your ERPS configuration by entering the **show protocols** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@switch# show protocols
rstp {
  interface ge-0/0/10.0 {
    disable;
  }
  interface ge-0/0/20.0 {
    disable;
  }
}
protection-group {
  ethernet-ring erp1 {
    east-interface {
      control-channel {
        ge-0/0/20.0;
        vlan 100;
      }
    }
    west-interface {
      control-channel {
        ge-0/0/10.0;
        vlan 100;
      }
    }
    control-vlan 100;
    data-channel {
      vlan 101-102;
    }
  }
}
```

In configuration mode, check your VLAN configuration by entering the **show vlans** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

In configuration mode, check your interface configurations by entering the **show interfaces** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@switch# show interfaces
ge-0/0/0 {
  unit 0 {
```

```

        family ethernet-switching {
            interface-mode trunk;
        }
    }
}
ge-0/0/10 {
    unit 0 {
        family ethernet-switching {
            interface-mode trunk;
        }
    }
ge-0/0/20 {
    unit 0 {
        family ethernet-switching {
            interface-mode trunk;
        }
    }
}

```

If you are finished configuring the device, enter **commit** in configuration mode.

### Configuring ERPS on Jas6-esc

#### CLI Quick Configuration

To quickly configure Jas6-esc, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

set protocols rstp interface ge-0/0/30 disable
set protocols rstp interface ge-0/0/20 disable
set protocols protection-group ethernet-ring erp1
set protocols protection-group ethernet-ring erp1 data-channel 101
set protocols protection-group ethernet-ring erp1 data-channel 102
set protocols protection-group ethernet-ring erp1 control-vlan 100
set protocols protection-group ethernet-ring erp1 east-interface control-channel
ge-0/0/30.0 vlan 100
set protocols protection-group ethernet-ring erp1 west-interface control-channel
ge-0/0/20.0 vlan 100
set protocols protection-group ethernet-ring erp1 west-interface control-channel
ge-0/0/20.0 vlan 100
set protocols protection-group ethernet-ring erp1 east-interface control-channel
ge-0/0/30.0 vlan 100

```

#### Step-by-Step Procedure

To configure ERPS on Jas6-esc:

1. Disable RSTP on the two ports that will use ERPS:
 

```

[edit protocols]
user@switch# set rstp interface ge-0/0/30 disable
user@switch# set rstp interface ge-0/0/20 disable

```
2. Create a node ring named erp1:
 

```

[edit protocols]
user@switch# set protection-group ethernet-ring erp1

```
3. Configure the control vlan 100 for the node ring erp1:
 

```

[edit protocols protection-group ethernet-ring erp1]
user@switch# set control-vlan 100

```

4. Configure two data channels numbered 101 and 102 to define VLAN IDs that belong to a ring instance.

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set data-channel 101
user@switch# set data-channel 102
```

5. Configure the east interface of the node ring erp1 with the control channel ge-0/0/30.0 :

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set east-interface control-channel ge-0/0/30.0 vlan 100
```

6. Configure the west interface of the node ring erp1 with the control channel ge-0/0/20.0 vlan 100:

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set west-interface control-channel ge-0/0/20.0 vlan 100
```

7. Every ring instance on a trunk port has one control VLAN in which ERP packets traverse. The control VLAN also controls data VLANs, if any are configured. Assign vlan number 100 as the control VLAN:

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set west-interface control-channel ge-0/0/20.0 vlan 100
user@switch# set east-interface control-channel ge-0/0/30.0 vlan 100
```

**Results** In configuration mode, check your ERPS configuration by entering the **show protocols** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@switch# show protocols
  rstp {
    interface ge-0/0/20.0 {
      disable;
    }
    interface ge-0/0/30.0 {
      disable;
    }
  }
  protection-group {
    ethernet-ring erp1 {
      east-interface {
        control-channel {
          vlan 100;
          ge-0/0/30.0;
        }
      }
      west-interface {
        control-channel {
          vlan 100;
          ge-0/0/20.0;
        }
      }
    }
    control-vlan erp-control-vlan-1;
    data-channel {
```

```

        vlan 101-102;
    }
}

```

In configuration mode, check your VLAN configuration by entering the **show vlans** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

In configuration mode, check your interfaces configuration by entering the **show interfaces** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]
user@switch# show interfaces
ge-0/0/0 {
  unit 0 {
    family ethernet-switching {
      interface-mode trunk;
    }
  }
}
ge-0/0/20 {
  unit 0 {
    family ethernet-switching {
      interface-mode trunk;
    }
  }
}
ge-0/0/30 {
  unit 0 {
    family ethernet-switching {
      interface-mode trunk;
    }
  }
}

```

## Verification

Verify that ERPS is working correctly.

### Verifying That ERPS Is Working Correctly

**Purpose** Verify that ERPS is working on the four EX switches that function as nodes in the ring topology.

**Action** Check the state of the ring links in the output of the **show protection-group ethernet-ring interface** command. When the ring is configured but not being used (no error exists on the data links), one ERP interface is forwarding traffic and one is discarding traffic. Discarding blocks the ring.

```

user@switch> show protection-group ethernet-ring interface
Ethernet ring port parameters for protection group erp1
Interface  Forward State  RPL End  Signal Failure  Admin State
ge-0/0/2.0  discarding     yes      clear           ready
ge-0/0/0.0  forwarding     no       clear           ready

```

To find out what has occurred since the last restart, check the RPS statistics for ring-blocked events. **NR** is a No Request ring block, which means that the switch is not blocking either of the two ERP interfaces. **NR-RB** is a No Request Ring Blocked event, which means that the switch is blocking one of its ERP interfaces and sending a packet out to notify the other switches.

```
user@switch> show protection-group ethernet-ring statistics
Ring Name Local SF Remote SF NR Event NR-RB Event
erp1      2      1      2      3
```

**Meaning** The **show protection-group ethernet-ring interface** command output from the RPL owner node indicates that one interface is forwarding traffic and one is discarding traffic, meaning that the ERP is ready but not active. If at least one interface in the ring is not forwarding, the ring is blocked and therefore ERP is working.

The **show protection-group ethernet-ring statistics** command output indicates that, since the last reboot, both local and remote signal failures have occurred (**Local SF** and **Remote SF**).

The **NR Event** count is 2, indicating that the NR state was entered into twice. **NR** stands for No Request. This means that the switch either originated NR PDUs or received an NR PDU from another switch and stopped blocking the interface to allow ERP to function.

The three **NR-RB** events indicate that on three occasions, this switch either sent out NR-RB PDUs or received NR-RB PDUs from another switch. This occurs when a network problem is resolved and the switch once again blocks the ERP link at one end.

## Example: Configuring Routing Between VLANs on One Switch

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs). For example, you might want to create a VLAN that includes the employees in a department and the resources that they use often, such as printers, servers, and so on.

Of course, you also want to allow these employees to communicate with people and resources in other VLANs. To forward packets between VLANs you normally you need a router that connects the VLANs. However, you can accomplish this on a Juniper Networks switch without using a router by configuring an integrated routing and bridging (IRB) interface (also known as a routed VLAN interface—or RVI—in versions of Junos OS that do not support Enhanced Layer 2 Software). Using this approach reduces complexity and avoids the costs associated with purchasing, installing, managing, powering, and cooling another device.

- [Requirements on page 1577](#)
- [Overview and Topology on page 1577](#)

- [Configure Layer 2 switching for two VLANs on page 1578](#)
- [Verification on page 1580](#)

Requirements

This example uses the following hardware and software components:

- One switch
- Junos OS Release 11.1 or later

Overview and Topology

This example uses an IRB to route traffic between two VLANs on the same switch. The topology is shown in [Figure 21 on page 1577](#).

Figure 21: IRB with One Switch

This example shows a simple configuration to illustrate the basic steps for creating two VLANs on a single switch and configuring an IRB to enable routing between the VLANs. One VLAN, called **blue**, is for the sales and marketing group, and a second, called **red**, is for the customer support team. The sales and support groups each have their own file servers and wireless access points. Each VLAN must have a unique name, tag (VLAN ID), and distinct IP subnet. [Table 99 on page 1577](#) lists the components of the sample topology.

Table 99: Components of the Multiple VLAN Topology

Property	Settings
VLAN names and tag IDs	<b>blue</b> , ID 100 <b>red</b> , ID 200
Subnets associated with VLANs	<b>blue</b> : 192.0.2.0/25 (addresses 192.0.2.1 through 192.0.2.126) <b>red</b> : 192.0.2.128/25 (addresses 192.0.2.129 through 192.0.2.254)
Interfaces in VLAN <b>blue</b>	Sales server port: <b>xe-0/0/4</b> Sales wireless access points: <b>xe-0/0/6</b>
Interfaces in VLAN <b>red</b>	Support server port: <b>xe-0/0/0</b> Support wireless access points: <b>xe-0/0/2</b>
IRB name	interface <b>irb</b>
IRB units and addresses	logical unit 100: 192.0.2.1/25 logical unit 200: 192.0.2.129/25

This configuration example creates two IP subnets, one for the blue VLAN and the second for the red VLAN. The switch bridges traffic within the VLANs. For traffic passing between

two VLANs, the switch routes the traffic using an IRB on which you have configured addresses in each IP subnet.

To keep the example simple, the configuration steps show only a few interfaces and VLANs. Use the same configuration procedure to add more interfaces and VLANs. By default, all interfaces are in access mode, so you do not have to configure the port mode.

### Configure Layer 2 switching for two VLANs

#### CLI Quick Configuration

To quickly configure Layer 2 switching for the two VLANs (**blue** and **red**) and to quickly configure Layer 3 routing of traffic between the two VLANs, copy the following commands and paste them into the switch terminal window:

**NOTE:** The following example uses a version of Junos OS that supports Enhanced Layer 2 Software (ELS). When you use ELS, you create a Layer 3 virtual interface named **irb**. If you are using a version of Junos OS that does not support ELS, you create a Layer 3 virtual interface named **vlan**.

```
[edit]
set interfaces xe-0/0/4 unit 0 description "Sales server port"
set interfaces xe-0/0/4 unit 0 family ethernet-switching vlan members blue
set interfaces xe-0/0/6 unit 0 description "Sales wireless access point port"
set interfaces xe-0/0/6 unit 0 family ethernet-switching vlan members blue
set interfaces xe-0/0/0 unit 0 description "Support servers"
set interfaces xe-0/0/0 unit 0 family ethernet-switching vlan members red
set interfaces xe-0/0/2 unit 0 description "Support wireless access point port"
set interfaces xe-0/0/2 unit 0 family ethernet-switching vlan members red
set interfaces irb unit 100 family inet address 192.0.2.1/25
set interfaces irb unit 200 family inet address 192.0.2.129/25
set vlans blue l3-interface irb.100
set vlans blue vlan-id 100
set vlans red vlan-id 200
set vlans red l3-interface irb.200
```

#### Step-by-Step Procedure

To configure the switch interfaces and the VLANs to which they belong:

1. Configure the interface for the sales server in the blue VLAN:
 

```
[edit interfaces xe-0/0/4 unit 0]
user@switch# set description "Sales server port"
user@switch# set family ethernet-switching vlan members blue
```
2. Configure the interface for the wireless access point in the blue VLAN:
 

```
[edit interfaces xe-0/0/6 unit 0]
user@switch# set description "Sales wireless access point port"
user@switch# set family ethernet-switching vlan members blue
```
3. Configure the interface for the support server in the red VLAN:
 

```
[edit interfaces xe-0/0/0 unit 0]
user@switch# set description "Support server port"
user@switch# set family ethernet-switching vlan members red
```
4. Configure the interface for the wireless access point in the red VLAN:
 

```
[edit interfaces xe-0/0/2 unit 0]
user@switch# set description "Support wireless access point port"
```

```
user@switch# set family ethernet-switching vlan members red
```

**Step-by-Step Procedure** Now create the VLANs and the IRB. The IRB will have logical units in the broadcast domains of both VLANs.

1. Create the red and blue VLANs by configuring the VLAN IDs for them:  

```
[edit vlans]
user@switch# set blue vlan-id 100
user@switch# set red vlan-id 200
```
2. Create the interface named **irb** with a logical unit in the sales broadcast domain (blue VLAN):  

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 192.0.2.1/25
```

The unit number is arbitrary and does not have to match the VLAN tag ID. However, configuring the unit number to match the VLAN ID can help avoid confusion.
3. Add a logical unit in the support broadcast domain (red VLAN) to the **irb** interface:  

```
[edit interfaces]
user@switch# set irb unit 200 family inet address 192.0.2.129/25
```
4. Complete the IRB configuration by binding the red and blue VLANs (Layer 2) with the appropriate logical units of the **irb** interface (Layer 3):  

```
[edit vlans]
user@switch# set blue l3-interface irb.100
user@switch# set red l3-interface irb.200
```

Display the results of the configuration:

```
user@switch> show configuration
interfaces {
  xe-0/0/4 {
    unit 0 {
      description "Sales server port";
      family ethernet-switching {
        vlan members blue;
      }
    }
  }
  xe-0/0/6 {
    unit 0 {
      description "Sales wireless access point port";
      family ethernet-switching {
        vlan members blue;
      }
    }
  }
  xe-0/0/0 {
    unit 0 {
      description "Support server port";
      family ethernet-switching {
        vlan members red;
      }
    }
  }
}
```

```
xe-0/0/2 {
  unit 0 {
    description "Support wireless access point port";
    family ethernet-switching {
      vlan members red;
    }
  }
}
irb {
  unit 100 {
    family inet address 192.0.2.1/25;
  }
  unit 200 {
    family inet address 192.0.2.129/25;
  }
}
}
vllans {
  blue {
    vlan-id 100;
    interface xe-0/0/4.0;
    interface xe-0/0/6.0;
    l3-interface irb 100;
  }
  red {
    vlan-id 200;
    interface xe-0/0/0.0;
    interface xe-0/0/2.0;
    l3-interface irb 200;
  }
}
```

**TIP:** To quickly configure the blue and red VLAN interfaces, issue the `load merge terminal` command, copy the hierarchy, and paste it into the switch terminal window.

---

## Verification

To verify that the **blue** and **red** VLANs have been created and are operating properly, perform these tasks:

- [Verifying That the VLANs Have Been Created and Associated with the Correct Interfaces on page 1580](#)
- [Verifying That Traffic Can Be Routed Between the Two VLANs on page 1581](#)

### *Verifying That the VLANs Have Been Created and Associated with the Correct Interfaces*

**Purpose** Verify that the VLANs **blue** and **red** have been created on the switch and that all connected interfaces on the switch are members of the correct VLAN.

**Action** List all VLANs configured on the switch:

```
user@switch> show vlans
Name      Tag      Interfaces
default   100      xe-0/0/0.0, xe-0/0/2.0, xe-0/0/4.0, xe-0/0/6.0,
blue      100      xe-0/0/4.0, xe-0/0/6.0,
red       200      xe-0/0/0.0, xe-0/0/2.0, *
mgmt      me0.0*
```

**Meaning** The **show vlans** command lists all VLANs configured on the switch and which interfaces are members of each VLAN. This command output shows that the **blue** and **red** VLANs have been created. The **blue** VLAN has a tag ID of 100 and is associated with interfaces **xe-0/0/4.0** and **xe-0/0/6.0**. VLAN **red** has a tag ID of 200 and is associated with interfaces **xe-0/0/0.0** and **xe-0/0/2.0**.

### *Verifying That Traffic Can Be Routed Between the Two VLANs*

**Purpose** Verify routing between the two VLANs.

**Action** Verify that the IRB logical units are up:

```
user@switch> show interfaces terse
irb.100          up    up    inet    192.0.2.1/25
irb.200          up    up    inet    192.0.2.129/25
```

**NOTE:** At least one port (access or trunk) with an appropriate VLAN assigned to it must be up for the irb interface to be up.

Verify that switch has created routes that use the IRB logical units:

```
user@switch> show route
192.0.2.0/25      *[Direct/0] 1d 03:26:45
                  > via irb.100
192.0.2.1/32      *[Local/0] 1d 03:26:45
                  Local via irb.100
192.0.2.128/25    *[Direct/0] 1d 03:26:45
                  > via irb.200
192.0.2.129/32    *[Local/0] 1d 03:26:45
                  Local via irb.200
```

List the Layer 3 routes in the switch's Address Resolution Protocol (ARP) table:

```
user@switch> show arp
MAC Address      Address      Name      Flags
00:00:0c:06:2c:0d 192.0.2.7    irb.100    None
00:13:e2:50:62:e0 192.0.2.132  irb.200    None
```

**Meaning** The output of the **show interfaces** and **show route** commands show that the Layer 3 IRB logical units are working and the switch has used them to create direct routes that it will use to forward traffic between the VLAN subnets. The **show arp** command displays

the mappings between the IP addresses and MAC addresses for devices on both **irb.100** (associated with VLAN **blue**) and **irb.200** (associated with VLAN **red**). These two devices can communicate.

  - [irb \(Interfaces\) on page 1787](#)
  - [l3-interface on page 1790](#)

## Example: Disabling MAC Learning

By default, MAC learning is enabled on the QFX Series. This topic provides examples for disabling, enabling, and verifying the operation of MAC learning on the QFX Series. These examples require that you be logged in as the root user to the switch on which you wish to modify MAC learning.

**NOTE:** This task uses Junos OS for QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Example: Disabling MAC Learning*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 43](#).

- To disable MAC learning in a VLAN:

```
[edit]
user@switch# set vlans vlan10 switch-options interface xe-0/0/0.0 no-mac-learning
```

- To reenab MAC learning:

```
[edit] vlans vlan10 switch-options interface xe-0/0/0.0
user@switch# delete no-mac-learning
```

- To verify the status of MAC learning on the QFX Series:

```
user@switch> show ethernet-switching table
Learning stats: 10 learn msg rcvd, 2 error, 0 forced update
Interface          Local pkts  Transit pkts  Error
xe-0/0/0.0          0           6             1
xe-0/0/22.0          0           0             0
xe-0/0/1.0           0           4             1
xe-0/0/2.0           0           0             0
xe-0/0/3.0           0           0             0
xe-0/0/4.0           0           0             0
xe-0/0/19.0          0           0             0
xe-0/0/18.0          0           0             0
xe-0/0/9.0           0           0             0
```

- Related Documentation**

  - [Disabling MAC Learning on page 1681](#)
  - *no-mac-learning*

## Example: Setting Up Bridging with Multiple VLANs

The QFX Series products use bridging and virtual LANs (VLANs) to connect network devices in a LAN—storage devices, file servers, and other network components—and to segment the LAN into smaller bridging domains.

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs) on a switch. Each VLAN is a collection of network nodes. When you use VLANs, frames whose origin and destination are in the same VLAN are forwarded only within the local VLAN, and only frames not destined for the local VLAN are forwarded to other broadcast domains. VLANs thus limit the amount of traffic flowing across the entire LAN, reducing the possible number of collisions and packet retransmissions within the LAN.

This example describes how to configure bridging for the QFX Series and how to create two VLANs to segment the LAN:

**NOTE:** This task supports the Enhanced Layer 2 Software (ELS) configuration style. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 43](#). If your switch runs software that does not support ELS, see *Example: Setting Up Bridging with Multiple VLANs*.

- [Requirements on page 1583](#)

### Requirements

This example uses the following hardware and software components:

- A configured and provisioned QFX3500 switch
- Junos OS Release 13.2X50-D15 or later for the QFX Series

### Overview and Topology

Switches connect all devices in an office or data center into a single LAN to provide sharing of common resources such as file servers. The default configuration creates a single VLAN, and all traffic on the switch is part of that broadcast domain. Creating separate network segments reduces the span of the broadcast domain and enables you to group related users and network resources without being limited by physical cabling or by the location of a network device in the building or on the LAN.

This example shows a simple configuration to illustrate the basic steps for creating two VLANs on a single switch. One VLAN, called **sales**, is for the sales and marketing group, and a second, called **support**, is for the customer support team. The sales and support groups each have their own dedicated file servers and other resources. For the switch ports to be segmented across the two VLANs, each VLAN must have its own broadcast

domain, identified by a unique name and tag (VLAN ID). In addition, each VLAN must be on its own distinct IP subnet.

The topology used in this example consists of a single QFX3500 switch, with a total of 48 10-Gbps Ethernet ports. (For the purposes of this example, the QSFP+ ports Q0-Q3, which are ports xe-0/1/0 through xe-0/1/15, are excluded.)

**Table 100: Components of the Multiple VLAN Topology**

Property	Settings
Switch hardware	QFX3500 switch configured with 48 10-Gbps Ethernet ports (xe-0/0/0 through xe-0/0/47)
VLAN names and tag IDs	<b>sales</b> , tag 100 <b>support</b> , tag 200
VLAN subnets	<b>sales</b> : 192.0.2.0/25 (addresses 192.0.2.1 through 192.0.2.126) <b>support</b> : 192.0.2.128/25 (addresses 192.0.2.129 through 192.0.2.254)
Interfaces in VLAN <b>sales</b>	File servers: <b>xe-0/0/20</b> and <b>xe-0/0/21</b>
Interfaces in VLAN <b>support</b>	File servers: <b>xe-0/0/46</b> and <b>xe-0/0/47</b>
Unused interfaces	<b>xe-0/0/2</b> and <b>xe-0/0/25</b>

This configuration example creates two IP subnets, one for the sales VLAN and the second for the support VLAN. The switch bridges traffic within a VLAN. For traffic passing between two VLANs, the switch routes the traffic using a Layer 3 routing interface on which you have configured the address of the IP subnet.

To keep the example simple, the configuration steps show only a few devices in each of the VLANs. Use the same configuration procedure to add more LAN devices.

### Configuration

#### CLI Quick Configuration

To quickly configure Layer 2 switching for the two VLANs (**sales** and **support**) and to quickly configure Layer 3 routing of traffic between the two VLANs, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces xe-0/0/0 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/22 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/20 unit 0 description "Sales file server port"
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/24 unit 0 family ethernet-switching vlan members support
set interfaces xe-0/0/26 unit 0 family ethernet-switching vlan members support
set interfaces xe-0/0/44 unit 0 family ethernet-switching vlan members support
set interfaces xe-0/0/46 unit 0 description "Support file server port"
set interfaces xe-0/0/46 unit 0 family ethernet-switching vlan members support
set interfaces vlan unit 0 family inet address 192.0.2.0/25
set interfaces vlan unit 1 family inet address 192.0.2.128/25
```

```

set vlans sales l3-interface irb.0
set vlans sales vlan-id 100
set vlans support vlan-id 200
set vlans support l3-interface irb.1

```

**Step-by-Step Procedure** Configure the switch interfaces and the VLANs to which they belong. By default, all interfaces are in access mode, so you do not have to configure the port mode.

1. Configure the interface for the file server in the **sales** VLAN:  

```

[edit interfaces xe-0/0/20 unit 0]
user@switch# set description "Sales file server port"
user@switch# set family ethernet-switching vlan members sales

```
2. Configure the interface for the file server in the **support** VLAN:  

```

[edit interfaces xe-0/0/46 unit 0]
user@switch# set description "Support file server port"
user@switch# set family ethernet-switching vlan members support

```
3. Create the subnet for the **sales** broadcast domain:  

```

[edit interfaces]
user@switch# set vlan unit 0 family inet address 192.0.2.1/25

```
4. Create the subnet for the **support** broadcast domain:  

```

[edit interfaces]
user@switch# set vlan unit 1 family inet address 192.0.2.129/25

```
5. Configure the VLAN tag IDs for the **sales** and **support** VLANs:  

```

[edit vlans]
user@switch# set sales vlan-id 100
user@switch# set support vlan-id 200

```
6. To route traffic between the **sales** and **support** VLANs, define the interfaces that are members of each VLAN and associate a Layer 3 interface:  

```

[edit vlans]
user@switch# set sales l3-interface irb.0
user@switch# set support l3-interface irb.1

```

Display the results of the configuration:

```

user@switch> show configuration
interfaces {
  xe-0/0/20 {
    unit 0 {
      description "Sales file server port";
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  xe-0/0/46 {
    unit 0 {
      description "Support file server port";
      family ethernet-switching {
        vlan members support;
      }
    }
  }
  vlans {
    unit 0 {

```

```

        family inet address 192.0.2.1/25;
    }
    unit 1 {
        family inet address 192.0.2.129/25;
    }
}
}
}
vlands {
    sales {
        vlan-id 100;
        interface xe-0/0/0.0;
        interface xe-0/0/3.0;
        interface xe-0/0/20.0;
        interface xe-0/0/22.0;
        l3-interface irb0;
    }
    support {
        vlan-id 200;
        interface xe-0/0/24.0;
        interface xe-0/0/26.0;
        interface xe-0/0/44.0;
        interface xe-0/0/46.0;
        l3-interface irb1;
    }
}
}

```

**TIP:** To quickly configure the sales and support VLAN interfaces, issue the **load merge terminal** command. Then copy the hierarchy and paste it into the switch terminal window.

## Verification

Verify that the **sales** and **support** VLANs have been created and are operating properly, perform these tasks:

- [Verifying That the VLANs Have Been Created and Associated with the Correct Interfaces on page 1586](#)
- [Verifying That Traffic Is Being Routed Between the Two VLANs on page 1587](#)
- [Verifying That Traffic Is Being Switched Between the Two VLANs on page 1587](#)

### *Verifying That the VLANs Have Been Created and Associated with the Correct Interfaces*

**Purpose** Verify that the **sales** and **support** VLANs have been created on the switch and that all connected interfaces on the switch are members of the correct VLAN.

**Action** To list all VLANs configured on the switch, use the **show vlans** command:

```

user@switch> show vlans
Name      Tag      Interfaces
default
                                xe-0/0/1.0, xe-0/0/2.0, xe-0/0/4.0, xe-0/0/5.0,

```

```

xe-0/0/6.0, xe-0/0/7.0, xe-0/0/8.0, xe-0/0/9.0,
xe-0/0/10.0*, xe-0/0/11.0, xe-0/0/12.0, xe-0/0/13.0*,
xe-0/0/14.0, xe-0/0/15.0, xe-0/0/16.0, xe-0/0/17.0,
xe-0/0/18.0, xe-0/0/19.0, xe-0/0/21.0, xe-0/0/23.0*,
xe-0/0/25.0, xe-0/0/27.0, xe-0/0/28.0, xe-0/0/29.0,
xe-0/0/30.0, xe-0/0/31.0, xe-0/0/32.0, xe-0/0/33.0,
xe-0/0/34.0, xe-0/0/35.0, xe-0/0/36.0, xe-0/0/37.0,
xe-0/0/38.0, xe-0/0/39.0, xe-0/0/40.0, xe-0/0/41.0,
xe-0/0/42.0, xe-0/0/43.0, xe-0/0/45.0, xe-0/0/47.0,
xe-0/1/0.0*, xe-0/1/1.0*, xe-0/1/2.0*, xe-0/1/3.0*

sales      100
           xe-0/0/0.0*, xe-0/0/3.0, xe-0/0/20.0, xe-0/0/22.0

support    200
           xe-0/0/0.24, xe-0/0/26.0, xe-0/0/44.0, xe-0/0/46.0*

mgmt
           me0.0*

```

**Meaning** The **show vlans** command lists all VLANs configured on the switch and which interfaces are members of each VLAN. This command output shows that the **sales** and **support** VLANs have been created. The **sales** VLAN has a tag ID of 100 and is associated with interfaces **xe-0/0/0.0**, **xe-0/0/3.0**, **xe-0/0/20.0**, and **xe-0/0/22.0**. VLAN **support** has a tag ID of 200 and is associated with interfaces **xe-0/0/24.0**, **xe-0/0/26.0**, **xe-0/0/44.0**, and **xe-0/0/46.0**.

#### *Verifying That Traffic Is Being Routed Between the Two VLANs*

**Purpose** Verify routing between the two VLANs.

**Action** List the Layer 3 routes in the switch Address Resolution Protocol (ARP) table:

```

user@switch> show arp
MAC Address      Address      Name      Flags
00:00:0c:06:2c:0d 192.0.2.3    vlan.0    None
00:13:e2:50:62:e0 192.0.2.11   vlan.1    None

```

**Meaning** Sending IP packets on a multiaccess network requires mapping from an IP address to a MAC address (the physical or hardware address). The ARP table displays the mapping between the IP address and MAC address for both **vlan.0** (associated with **sales**) and **vlan.1** (associated with **support**). These VLANs can route traffic to each other.

#### *Verifying That Traffic Is Being Switched Between the Two VLANs*

**Purpose** Verify that learned entries are being added to the Ethernet switching table.

**Action** List the contents of the Ethernet switching table:

```

user@switch> show ethernet-switching table

Ethernet-switching table: 8 entries, 5 learned
VLAN      MAC address  Type  Age  Interfaces
default   *           Flood  -   All-members

```

default	00:00:05:00:00:01	Learn	- xe-0/0/10.0
default	00:00:5e:00:01:09	Learn	- xe-0/0/13.0
default	00:19:e2:50:63:e0	Learn	- xe-0/0/23.0
sales	*	Flood	- All-members
sales	00:00:5e:00:07:09	Learn	- xe-0/0/0.0
support	*	Flood	- All-members
support	00:00:5e:00:01:01	Learn	- xe-0/0/46.0

**Meaning** The output shows that learned entries for the **sales** and **support** VLANs have been added to the Ethernet switching table, and are associated with interfaces **xe-0/0/0.0** and **xe-0/0/46.0**. Even though the VLANs were associated with more than one interface in the configuration, these interfaces are the only ones that are currently operating.

- [Understanding Bridging and VLANs on page 1527](#)

## Example: Setting Up Basic Bridging and a VLAN on the QFX Series

The QFX Series products use bridging and virtual LANs (VLANs) to connect network devices—storage devices, file servers, and other LAN components—in a LAN and to segment the LAN into smaller bridging domains.

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs) on a switch. Each VLAN is a collection of network nodes. When you use VLANs, frames whose origin and destination are in the same VLAN are forwarded only within the local VLAN, and only frames not destined for the local VLAN are forwarded to other broadcast domains. VLANs thus limit the amount of traffic flowing across the entire LAN, reducing the possible number of collisions and packet retransmissions within the LAN.

This example describes how to configure basic bridging and VLANs for the QFX Series:

- [Requirements on page 1588](#)
- [Overview and Topology on page 1588](#)
- [Configuration on page 1589](#)
- [Verification on page 1598](#)

### Requirements

---

This example uses the following software and hardware components:

- Junos OS Release 11.1 or later for the QFX Series
- A configured and provisioned QFX Series product

### Overview and Topology

---

To use a switch to connect network devices on a LAN, you must at a minimum configure bridging and VLANs. By default, bridging is enabled on all switch interfaces, all interfaces are in access mode, and all interfaces belong to a VLAN called **employee-vlan**, which is

automatically configured. When you plug in access devices—such as desktop computers, file servers, and printers—they are joined immediately into the **employee-vlan** VLAN, and the LAN is up and running.

The topology used in this example consists of a single QFX3500 switch, with a total of 48 10-Gbps Ethernet ports. (For the purposes of this example, the QSFP+ ports Q0-Q3, which are ports xe-0/1/0 through xe-0/1/15, are excluded.) You use the ports to connect devices that have their own power sources. Table 1 details the topology used in this configuration example.

**Table 101: Components of the Basic Bridging Configuration Topology**

Property	Settings
Switch hardware	QFX3500 switch, with 48 10-Gbps Ethernet ports
VLAN name	<b>employee-vlan</b>
VLAN ID	10
Connections to file servers	<b>xe-0/0/17</b> and <b>xe-0/0/18</b>
Direct connections to desktop PCs and laptops	<b>xe-0/0/0</b> through <b>xe-0/0/16</b>
Connections to integrated printer/fax/copier machines	<b>xe-0/0/19</b> through <b>xe-0/0/40</b>
Unused ports	<b>xe-0/0/41</b> through <b>xe-0/0/47</b>

### Configuration

#### CLI Quick Configuration

To quickly configure a VLAN, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans employee-vlan vlan-id 10
set interfaces xe-0/0/0 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/1 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/2 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/3 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/4 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/5 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/6 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/7 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/8 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/9 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/10 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/12 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/13 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/14 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/15 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/16 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/17 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/18 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/19 unit 0 family ethernet-switching vlan members employee-vlan
```

```

set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/22 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/23 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/24 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/25 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/26 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/27 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/28 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/29 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/30 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/31 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/32 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/33 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/34 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/35 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/36 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/37 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/38 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/39 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/40 unit 0 family ethernet-switching vlan members employee-vlan

```

### Step-by-Step Procedure

To set up basic bridging and a VLAN:

1. Create a VLAN named employee-vlan and specify the VLAN ID of 10 for it:

```

[edit vlans]
user@switch# set employee-vlan vlan-id 10

```

2. Assign interfaces xe-0/0/0 through xe-0/0/40 to the employee-vlan VLAN:

```

[edit interface]
user@switch# set xe-0/0/0 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/1 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/2 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/3 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/4 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/5 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/6 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/7 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/8 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/9 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/10 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/11 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/12 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/13 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/14 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/15 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/16 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/17 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/18 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/19 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/20 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/21 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/22 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/23 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/24 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/25 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/26 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/27 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/28 unit 0 family ethernet-switching vlan members employee-vlan

```

```
user@switch# set xe-0/0/29 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/30 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/31 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/32 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/33 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/34 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/35 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/36 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/37 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/38 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/39 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/40 unit 0 family ethernet-switching vlan members employee-vlan
```

3. Connect the two file servers to ports xe-0/0/17 and xe-0/0/18.
4. Connect the desktop PCs and laptops to ports xe-0/0/0 through xe-0/0/16.
5. Connect the integrated printer/fax/copier machines to ports xe-0/0/19 through xe-0/0/40.

**Results** Check the results of the configuration:

```
user@switch> show configuration
xe-0/0/0 {
  unit 0 {
    family ethernet-switching {
      vlan {
        members employee-vlan;
      }
    }
  }
}
xe-0/0/1 {
  unit 0 {
    family ethernet-switching {
      vlan {
        members employee-vlan;
      }
    }
  }
}
xe-0/0/2 {
  unit 0 {
    family ethernet-switching {
      vlan {
        members employee-vlan;
      }
    }
  }
}
xe-0/0/3 {
  unit 0 {
    family ethernet-switching {
      vlan {
        members employee-vlan;
      }
    }
  }
}
xe-0/0/4 {
  unit 0 {
    family ethernet-switching {
      vlan {
        members employee-vlan;
      }
    }
  }
}
xe-0/0/5 {
  unit 0 {
    family ethernet-switching {
      vlan {
        members employee-vlan;
      }
    }
  }
}
xe-0/0/6 {
  unit 0 {
    family ethernet-switching {
```

```
        vlan {
            members employee-vlan;
        }
    }
}
xe-0/0/7 {
    unit 0 {
        family ethernet-switching {
            vlan {
                members employee-vlan;
            }
        }
    }
}
xe-0/0/8 {
    unit 0 {
        family ethernet-switching {
            vlan {
                members employee-vlan;
            }
        }
    }
}
xe-0/0/9 {
    unit 0 {
        family ethernet-switching {
            vlan {
                members employee-vlan;
            }
        }
    }
}
xe-0/0/10 {
    unit 0 {
        family ethernet-switching {
            vlan {
                members employee-vlan;
            }
        }
    }
}
xe-0/0/11 {
    unit 0 {

---

### Verification

To verify that switching is operational and that **employee-vlan** has been created, perform these tasks:

- [Verifying That the VLAN Has Been Created on page 1598](#)
- [Verifying That Interfaces Are Associated with the Proper VLANs on page 1599](#)

#### ***Verifying That the VLAN Has Been Created***

**Purpose** Verify that the VLAN named **employee-vlan** has been created on the switch.

**Action** List all VLANs configured on the switch:

```

user@switch> show vlans
Routing instance      VLAN name      Tag      Interfaces
default-switch        employee-vlan   10
                      xe-0/0/0.0
                      xe-0/0/1.0
                      xe-0/0/2.0
                      xe-0/0/3.0
                      xe-0/0/4.0
                      xe-0/0/5.0
                      xe-0/0/6.0
                      xe-0/0/7.0
                      xe-0/0/8.0
                      xe-0/0/9.0
                      xe-0/0/10.0
                      xe-0/0/11.0
                      xe-0/0/12.0
                      xe-0/0/13.0
                      xe-0/0/14.0
                      xe-0/0/15.0
                      xe-0/0/16.0
                      xe-0/0/17.0
                      xe-0/0/18.0
                      xe-0/0/19.0
                      xe-0/0/20.0
                      xe-0/0/21.0
                      xe-0/0/22.0
                      xe-0/0/23.0
                      xe-0/0/24.0
                      xe-0/0/25.0
                      xe-0/0/26.0
                      xe-0/0/27.0
                      xe-0/0/28.0
                      xe-0/0/29.0
                      xe-0/0/30.0
                      xe-0/0/31.0
                      xe-0/0/32.0
                      xe-0/0/33.0
                      xe-0/0/34.0
                      xe-0/0/35.0
                      xe-0/0/36.0
                      xe-0/0/37.0
                      xe-0/0/38.0
                      xe-0/0/39.0
                      xe-0/0/40.0
...

```

**Meaning** The `show vlans` command lists the VLANs configured on the switch. This output shows that the VLAN `employee-vlan` has been created.

#### *Verifying That Interfaces Are Associated with the Proper VLANs*

**Purpose** Verify that Ethernet switching is enabled on switch interfaces and that all interfaces are included in the VLAN.

**Action** List all interfaces on which switching is enabled:

```

user@switch> show ethernet-switching interfaces
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop,
                        LH - MAC limit hit, DN - interface down )

...

```

**Meaning** The `show ethernet-switching interfaces` command lists all interfaces on which switching is enabled (in the **Logical interface** column), along with the VLANs that are active on the interfaces (in the **VLAN members** column). The output in this example shows all the connected interfaces, xe-0/0/0 through xe-0/0/40, are all part of VLAN **employee-vlan**. Notice that the interfaces listed are the logical interfaces, not the physical interfaces. For example, the output shows xe-0/0/0.0 instead of xe-0/0/0. This is because Junos OS creates VLANs on logical interfaces, not directly on physical interfaces.

## Reflective Relay Configuration Example

- [Example: Configuring Reflective Relay for Use with VEPA Technology on page 1605](#)

### Example: Configuring Reflective Relay for Use with VEPA Technology

Reflective relay must be configured on a switch that receives virtual machine aggregated packets, such as Virtual Ethernet Port Aggregator (VEPA) packets, because some of these packets might be sent back to the server destined for another virtual machine on the same server. Reflective relay returns those packets to the original device using the same downstream port that delivered the packets to the switch.

**NOTE:** This example uses Junos OS for QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Example: Configuring Reflective Relay for Use with VEPA Technology*. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 43.

This example shows how to configure a switch port interface to return packets sent by VEPA on the downstream interface back to the server using the same downstream interface:

- [Requirements on page 1606](#)
- [Overview and Topology on page 1606](#)
- [Configuration on page 1608](#)
- [Verification on page 1608](#)

### Requirements

---

This example uses the following hardware and software components:

- One QFX3500 switch
- One server
- Junos OS Release 12.1 or later for the QFX Series

Before you configure reflective relay on a switch port, be sure you have:

- Configured a server with six virtual machines, VM 1 through VM 6.
- Configured the server with three VLANs named VLAN\_Purple, VLAN\_Orange, and VLAN\_Blue and added two virtual machines to each VLAN.
- Configured the same three VLANs named VLAN\_Purple, VLAN\_Orange, and VLAN\_Blue on one interface.
- Installed and configured VEPA to aggregate the virtual machine packets.

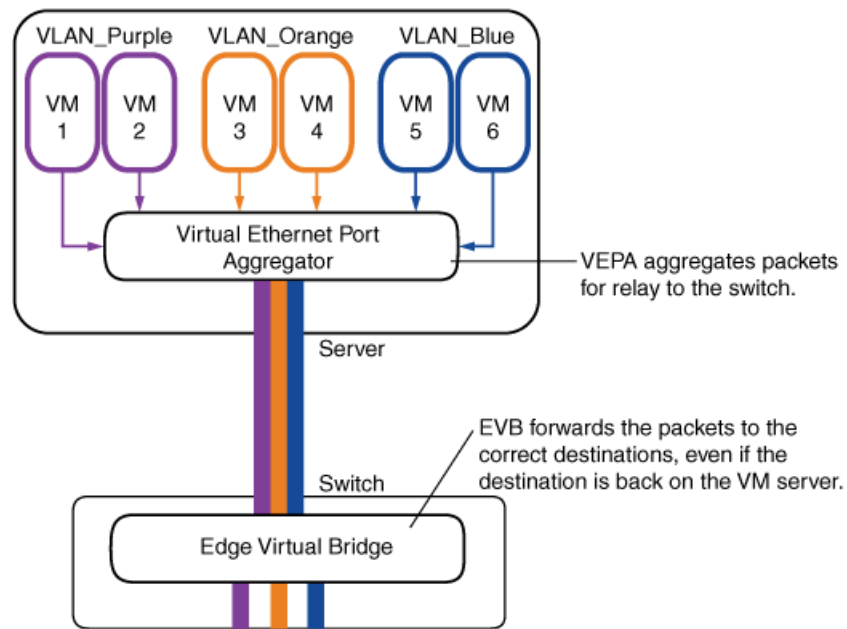

### Overview and Topology

---

In this example, illustrated in [Figure 22 on page 1607](#), a switch is connected to one server that is hosting six virtual machines and is configured with a VEPA for aggregating packets. The server's six virtual machines are VM1 through VM 6, and each virtual machine belongs to one of the three server VLANs, VLAN\_Purple, VLAN\_Orange, or VLAN\_Blue. Instead of the server directly passing packets between virtual machines, packets from any of the three VLANs that are destined for another one of the three VLANs are aggregated using VEPA technology and passed to the switch for processing. You must configure the switch port to accept these aggregated packets on the downstream interface and to return appropriate packets to the server on the same downstream interface after they are processed. [Figure 22 on page 1607](#) shows the topology for this example.

Figure 22: Reflective Relay Topology

g020996

In this example, you configure the physical Ethernet switch port interface for trunk interface mode and reflective relay. Configuring trunk port mode allows the interface to accept VLAN tagged packets. Configuring reflective relay allows the downstream port to return those packets on the same interface. [Table 102 on page 1607](#) shows the components used in this example.

Table 102: Components of the Topology for Configuring Reflective Relay

Component	Description
QFX3500 switch	Switch that supports reflective relay. For a list of switches that support this feature, see <i>QFX Series Software Features Overview</i> .
xe-0/0/2	Switch interface to the server.
Server	Server with virtual machines and VEPA technology.
Virtual machines	Six virtual machines located on the server: V1, V2, V3, V4, V5, and V6.
VLANs	Three VLANs: VLAN_Purple, VLAN_Orange, and VLAN_Blue. Each VLAN has two virtual machine members.
VEPA	Virtual Ethernet port aggregator that aggregates virtual machine packets on the server before the resulting single stream is transmitted to the switch.

## Configuration

---

To configure reflective relay, perform these tasks:

- [Configuring Reflective Relay on the Port on page 1608](#)

### *Configuring Reflective Relay on the Port*

#### CLI Quick Configuration

To quickly configure reflective relay, copy the following commands and paste them into the switch window:

```
[edit]
set interfaces xe-0/0/2 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/2 unit 0 family ethernet-switching reflective-relay
set interfaces xe-0/0/2 unit 0 family ethernet-switching vlan members [VLAN_Blue VLAN_Orange VLAN_Purple]
```

#### Step-by-Step Procedure

To configure reflective relay:

1. Configure the trunk interface mode on the interface:

```
[edit]
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching interface-mode trunk
```

2. Configure reflective relay on the interface to allow it to both accept and send packets:

```
[edit]
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching reflective-relay
```

3. Configure the interface for the three VLANs on the server:

```
[edit]
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching vlan members [VLAN_Purple VLAN_Orange VLAN_Blue]
```

#### Results

Check the results of the configuration:

```
[edit interfaces xe-0/0/2]
user@switch# show
unit 0 {
    family ethernet-switching {
        interface-mode trunk;
        reflective-relay;
        vlan {
            members [ VLAN_Purple VLAN_Orange VLAN_Blue ];
        }
    }
}
```

## Verification

---

To confirm that reflective relay is enabled and working correctly, perform these tasks:

- [Verifying That Reflective Relay Is Enabled and Working Correctly on page 1608](#)

### *Verifying That Reflective Relay Is Enabled and Working Correctly*

#### Purpose

Verify that reflective relay is enabled and working correctly.

**Action** Use the `show ethernet-switching interfaces detail` command to display the reflective relay status:

```
user@switch> show ethernet-switching interfaces xe-0/0/2 detail
Interface: xe-0/0/2, Index: 66, State: down, Interface mode: Trunk
Reflective Relay Status: Enabled
Ether type for the interface: 0x8100
VLAN membership:
  VLAN_Purple, 802.1Q Tag: 450, tagged, unblocked
  VLAN_Orange, 802.1Q Tag: 460, tagged, unblocked
  VLAN_Blue, 802.1Q Tag: 470, tagged, unblocked
Number of MACs learned on IFL: 0
```

Confirm that reflective relay is working by sending a Layer 2 broadcast message from one virtual machine to another virtual machine located on the same VLAN. Check the switch to verify that the switch sends the packets back on the same interface on which they were received. One way to check this is to set up port mirroring on the switch interface, connect a traffic generator to the mirrored interface, and use the traffic generator to examine packets.

Alternatively, if you do not have a traffic generator available, you can send traffic between two virtual machines with FTP, Telnet, or SSH, while running the `tcpdump` utility on the receiver virtual machine port to capture reflected packets.

**Meaning** The reflective relay status is **Enabled**, meaning that interface `xe-0/0/2` is configured for the trunk interface mode, which accepts VLAN-tagged packets, and for reflective relay, which accepts and returns packets on the same interface.

When the traffic generator shows packets arriving at the switch and returning to the server on the same interface, reflective relay is working.

## STP Configuration Examples

- [Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 1610](#)
- [Example: Configuring Network Regions for VLANs with MSTP on page 1624](#)
- [Example: Connecting an Access Switch to a Distribution Switch on page 1647](#)
- [Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations on page 1656](#)

- [Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree on page 1660](#)
- [Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees on page 1664](#)

## Example: Configuring Faster Convergence and Improving Network Stability with RSTP

The QFX Series products use Rapid Spanning Tree Protocol (RSTP) to provide a loop-free topology. RSTP identifies certain links as point to point. When a point-to-point link fails, the alternate link can transition to the forwarding state. RSTP provides quicker reconvergence time than original STP because it uses protocol handshake messages rather than fixed timeouts. Eliminating the need to wait for timers to expire makes RSTP more efficient than STP.

This example describes how to configure RSTP on four QFX3500 switches:

- [Requirements on page 1610](#)
- [Overview and Topology on page 1610](#)
- [Configuring RSTP on Switch 1 on page 1612](#)
- [Configuring RSTP on Switch 2 on page 1615](#)
- [Configuring RSTP on Switch 3 on page 1617](#)
- [Configuring RSTP on Switch 4 on page 1620](#)
- [Verification on page 1622](#)

### Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 11.1 for the QFX3500 switches
- Four QFX3500 switches

### Overview and Topology

---

In this example, QFX3500 switches are connected in the topology displayed in [Figure 23 on page 1611](#) to create a loop-free topology.

Figure 23: Network Topology for RSTP

The interfaces shown in [Table 103 on page 1611](#) will be configured for RSTP.

**NOTE:** You can configure RSTP on logical or physical interfaces. This example shows RSTP configured on logical interfaces.

Table 103: Topology for Configuring RSTP on the QFX Series

Components	Settings
Switch 1	<p>The following ports on Switch 1 are connected in this way:</p> <ul style="list-style-type: none"><li>• xe-0/0/9 is connected to Switch 2</li><li>• xe-0/0/13 is connected to Switch 4</li><li>• xe-0/0/11 is connected to Switch 3</li></ul>
Switch 2	<p>The following ports on Switch 2 are connected in this way:</p> <ul style="list-style-type: none"><li>• xe-0/0/14 is connected to Switch 1</li><li>• xe-0/0/18 is connected to Switch 3</li></ul>
Switch 3	<p>The following ports on Switch 3 are connected in this way:</p> <ul style="list-style-type: none"><li>• xe-0/0/26 is connected to Switch 1</li><li>• xe-0/0/28 is connected to Switch 2</li><li>• xe-0/0/24 is connected to Switch 4</li></ul>

Table 103: Topology for Configuring RSTP on the QFX Series (*continued*)

Components	Settings
Switch 4	<p>The following ports on Switch 4 are connected in this way:</p> <ul style="list-style-type: none"> <li>• <b>xe-0/0/19</b> is connected to Switch 1</li> <li>• <b>xe-0/0/23</b> is connected to Switch 3</li> </ul>
VLAN names and tag IDs	<p><b>sales-vlan</b>, tag 10</p> <p><b>engineering-vlan</b>, tag 20</p> <p><b>publications-vlan</b>, tag 30</p> <p><b>support-vlan</b>, tag 40</p>

This configuration example creates a loop-free topology between four switches using RSTP.

An RSTP topology contains ports that have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.
- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.
- The *backup port* is a backup port for the designated port. When a designated port goes down, the backup port becomes the active designated port and starts forwarding data.

### Configuring RSTP on Switch 1

#### CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 1, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the *interface-mode* statement instead of the *port-mode* statement. The *port-mode* statement has been replaced with the *interface-mode* statement.

```
[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/13 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/9 unit 0 family ethernet-switching port-mode trunk
```

```

set interfaces xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 16k
set protocols rstp interface xe-0/0/13.0 cost 1000
set protocols rstp interface xe-0/0/13.0 mode point-to-point
set protocols rstp interface xe-0/0/9.0 cost 1000
set protocols rstp interface xe-0/0/9.0 mode point-to-point
set protocols rstp interface xe-0/0/11.0 cost 1000
set protocols rstp interface xe-0/0/11.0 mode point-to-point

```

### Step-by-Step Procedure

To configure interfaces and RSTP on Switch 1:

1. Configure the VLANs **sales-vlan**, **engineering-vlan** and **publications-vlan**, and **support-vlan**:  
  

```

[edit vlans]
user@switch1# set sales-vlan description "Sales VLAN"
user@switch1# set sales-vlan vlan-id 10
user@switch1# set engineering-vlan description "Engineering VLAN"
user@switch1# set engineering-vlan vlan-id 20
user@switch1# set publications-vlan description "Publications VLAN"
user@switch1# set publications-vlan vlan-id 30

```
2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:  
  

```

[edit interfaces]
user@switch1# set xe-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch1# set xe-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch1# set xe-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]

```
3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the interface-mode statement instead of the port-mode statement. The port-mode statement has been replaced with the interface-mode statement.

- ```

[edit interfaces]
user@switch1# set xe-0/0/13 unit 0 family ethernet-switching port-mode trunk
user@switch1# set xe-0/0/9 unit 0 family ethernet-switching port-mode trunk
user@switch1# set xe-0/0/11 unit 0 family ethernet-switching port-mode trunk

```
4. Configure RSTP on the switch:  
  

```

[edit protocols]
user@switch1# rstp bridge-priority 16k
user@switch1# rstp interface xe-0/0/13.0 cost 1000
user@switch1# rstp interface xe-0/0/13.0 mode point-to-point
user@switch1# rstp interface xe-0/0/9.0 cost 1000
user@switch1# rstp interface xe-0/0/9.0 mode point-to-point
user@switch1# rstp interface xe-0/0/11.0 cost 1000
user@switch1# rstp interface xe-0/0/11.0 mode point-to-point

```

**Results** Check the results of the configuration:

```
user@switch1> show configuration
```

```
interfaces {
  xe-0/0/13 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;

}

```

### Configuring RSTP on Switch 2

#### CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 2, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```

[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/18 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 32k
set protocols rstp interface xe-0/0/14.0 cost 1000
set protocols rstp interface xe-0/0/14.0 mode point-to-point
set protocols rstp interface xe-0/0/18.0 cost 1000
set protocols rstp interface xe-0/0/18.0 mode point-to-point

```

#### Step-by-Step Procedure

To configure interfaces and RSTP on Switch 2:

1. Configure the VLANs `sales-vlan`, `engineering-vlan` and `publications-vlan`, and `support-vlan`:

```

[edit vlans]
user@switch2# set sales-vlan description "Sales VLAN"
user@switch2# set sales-vlan vlan-id 10
user@switch2# set engineering-vlan description "Engineering VLAN"
user@switch2# set engineering-vlan vlan-id 20
user@switch2# set publications-vlan description "Publications VLAN"
user@switch2# set publications-vlan vlan-id 30
user@switch2# set support-vlan vlan-description "Support VLAN"
user@switch2# set publications-vlan vlan-id 40

```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```
[edit interfaces]
user@switch2# set xe-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch2# set xe-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the interface-mode statement instead of the port-mode statement. The port-mode statement has been replaced with the interface-mode statement.

```
[edit interfaces]
user@switch2# set xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
user@switch2# set xe-0/0/18 unit 0 family ethernet-switching port-mode trunk
```

4. Configure RSTP on the switch:

```
[edit protocols]
user@switch2# rstp bridge-priority 32k
user@switch2# rstp interface xe-0/0/14.0 cost 1000
user@switch2# rstp interface xe-0/0/14.0 mode point-to-point
user@switch2# rstp interface xe-0/0/18.0 cost 1000
user@switch2# rstp interface xe-0/0/18.0 mode point-to-point
```

**Results** Check the results of the configuration:

```
user@switch2> show configuration
interfaces {
  xe-0/0/14 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
  xe-0/0/18 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
}
protocols {
  rstp {
    bridge-priority 32k;
    interface xe-0/0/14.0 {
      cost 1000;
    }
  }
}
```

```

        mode point-to-point;
    }
    interface xe-0/0/18.0 {
        cost 1000;
        mode point-to-point;
    }
}
}
vllans {
    sales-vlan {
        vlan-id 10;
    }
    engineering-vlan {
        vlan-id 20;
    }
    publications-vlan {
        vlan-id 30;
    }
    support-vlan {
        vlan-id 40;
    }
}
}

```

### Configuring RSTP on Switch 3

#### CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 3, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the interface-mode statement instead of the port-mode statement. The port-mode statement has been replaced with the interface-mode statement.

```

[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/26 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/28 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/24 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 8k
set protocols rstp interface xe-0/0/26.0 cost 1000
set protocols rstp interface xe-0/0/26.0 mode point-to-point
set protocols rstp interface xe-0/0/28.0 cost 1000

```

```

set protocols rstp interface xe-0/0/28.0 mode point-to-point
set protocols rstp interface xe-0/0/24.0 cost 1000
set protocols rstp interface xe-0/0/24.0 mode point-to-point

```

### Step-by-Step Procedure

To configure interfaces and RSTP on Switch 3:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```

[edit vlans]
user@switch3# set sales-vlan description "Sales VLAN"
user@switch3# set sales-vlan vlan-id 10
user@switch3# set engineering-vlan description "Engineering VLAN"
user@switch3# set engineering-vlan vlan-id 20
user@switch3# set publications-vlan description "Publications VLAN"
user@switch3# set publications-vlan vlan-id 30
user@switch3# set support-vlan description "Support VLAN"
user@switch3# set publications-vlan vlan-id 40

```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```

[edit interfaces]
user@switch3# set xe-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set xe-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set xe-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]

```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```

[edit interfaces]
user@switch3# set xe-0/0/26 unit 0 family ethernet-switching port-mode trunk
user@switch3# set xe-0/0/28 unit 0 family ethernet-switching port-mode trunk
user@switch3# set xe-0/0/24 unit 0 family ethernet-switching port-mode trunk

```

4. Configure RSTP on the switch:

```

[edit protocols]
user@switch3# rstp bridge-priority 8k
user@switch3# rstp interface xe-0/0/26.0 cost 1000
user@switch3# rstp interface xe-0/0/26.0 mode point-to-point
user@switch3# rstp interface xe-0/0/28.0 cost 1000
user@switch3# rstp interface xe-0/0/28.0 mode point-to-point
user@switch3# rstp interface xe-0/0/24.0 cost 1000
user@switch3# rstp interface xe-0/0/24.0 mode point-to-point

```

**Results** Check the results of the configuration:

```

user@switch3> show configuration
interfaces {
  xe-0/0/26 {
    unit 0 {
      family ethernet-switching {

```

```

        port-mode trunk;
        vlan {
            members [10 20 30 40];
        }
    }
}
xe-0/0/28 {
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members [10 20 30 40];
            }
        }
    }
}
xe-0/0/24 {
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members [10 20 30 40];
            }
        }
    }
}
}
}
protocols {
    rstp {
        bridge-priority 8k;
        interface xe-0/0/26.0 {
            cost 1000;
            mode point-to-point;
        }
        interface xe-0/0/28.0 {
            cost 1000;
            mode point-to-point;
        }
        interface xe-0/0/24.0 {
            cost 1000;
            mode point-to-point;
        }
    }
    bridge-priority 8k;
}
}
vllans {
    sales-vlan {
        vlan-id 10;
    }
    engineering-vlan {
        vlan-id 20;
    }
}

```

```

}
publications-vlan {
  vlan-id 30;
}
support-vlan {
  vlan-id 40;
}
}

```

### Configuring RSTP on Switch 4

#### CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 4, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the interface-mode statement instead of the port-mode statement. The port-mode statement has been replaced with the interface-mode statement.

```

[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/23 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/19 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 16k
set protocols rstp interface xe-0/0/23.0 cost 1000
set protocols rstp interface xe-0/0/23.0 mode point-to-point
set protocols rstp interface xe-0/0/19.0 cost 1000
set protocols rstp interface xe-0/0/19.0 mode point-to-point

```

#### Step-by-Step Procedure

To configure interfaces and RSTP on Switch 4:

1. Configure the VLANs **sales-vlan**, **engineering-vlan**, **publications-vlan**, and **support-vlan**:

```

[edit vlans]
user@switch4# set sales-vlan description "Sales VLAN"
user@switch4# set sales-vlan vlan-id 10
user@switch4# set engineering-vlan description "Engineering VLAN"
user@switch4# set engineering-vlan vlan-id 20
user@switch4# set publications-vlan description "Publications VLAN"
user@switch4# set publications-vlan vlan-id 30
user@switch4# set support-vlan description "Support VLAN"
user@switch4# set support-vlan vlan-id 40

```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```

[edit interfaces]

```

```

user@switch4# set xe-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch4# set xe-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]

```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```

[edit interfaces]
user@switch4# set xe-0/0/23 unit 0 family ethernet-switching port-mode trunk
user@switch4# set xe-0/0/19 unit 0 family ethernet-switching port-mode trunk

```

4. Configure RSTP on the switch:

```

[edit protocols]
user@switch4# rstp bridge-priority 16k
user@switch4# rstp interface all cost 1000
user@switch4# rstp interface xe-0/0/23.0 cost 1000
user@switch4# rstp interface xe-0/0/23.0 mode point-to-point
user@switch4# rstp interface xe-0/0/19.0 cost 1000
user@switch4# rstp interface xe-0/0/19.0 mode point-to-point

```

**Results** Check the results of the configuration:

```

user@switch4> show configuration
interfaces {
  xe-0/0/23 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
  xe-0/0/19 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
}
protocols {
  rstp {
    bridge-priority 16k;
    interface xe-0/0/23.0 {
      cost 1000;
    }
  }
}

```

```

        mode point-to-point;
    }
    interface xe-0/0/19.0 {
        cost 1000;
        mode point-to-point;
    }
}
}
vllans {
    sales-vlan {
        vlan-id 10;
    }
    engineering-vlan {
        vlan-id 20;
    }
    publications-vlan {
        vlan-id 30;
    }
    support-vlan {
        vlan-id 40;
    }
}
}

```

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying RSTP Configuration on Switch 1 on page 1622](#)
- [Verifying RSTP Configuration on Switch 2 on page 1623](#)
- [Verifying RSTP Configuration on Switch 3 on page 1623](#)
- [Verifying RSTP Configuration on Switch 4 on page 1623](#)

### Verifying RSTP Configuration on Switch 1

**Purpose** Verify that the RSTP configuration on Switch 1 is correct.

**Action** In operational mode, issue the **show spanning-tree interface** command:

```
user@switch1> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/13.0 | 128:527 | 128:525               | 16384.0019e25040e0      | 1000         | BLK   | ALT  |
| xe-0/0/9.0  | 128:529 | 128:513               | 32768.0019e2503d20      | 1000         | BLK   | ALT  |
| xe-0/0/11.0 | 128:531 | 128:513               | 8192.0019e25051e0       | 1000         | FWD   | ROOT |

**Meaning** See the topology in [Figure 23 on page 1611](#). The operational mode command **show spanning-tree interface** shows that **xe-0/0/13.0** is in a forwarding state. The other interfaces on Switch 1 are blocked.

**Verifying RSTP Configuration on Switch 2**

**Purpose** Verify that the RSTP configuration on Switch 2 is correct.

**Action** In operational mode issue the **show spanning-tree interface** command:

```
user@switch2> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/14.0 | 128:513 | 128:513               | 32768.0019e2503d20      | 1000         | BLK   | DESC |
| xe-0/0/18.0 | 128:519 | 128:515               | 8192.0019e25051e0       | 1000         | FWD   | ROOT |

**Meaning** See the topology in [Figure 23 on page 1611](#). The operational mode command **show spanning-tree interface** shows that interface **xe-0/0/18.0** is in a forwarding state and the root port. The other interface on Switch 2 is blocked.

**Verifying RSTP Configuration on Switch 3**

**Purpose** Verify that the RSTP configuration on Switch 3 is correct.

**Action** In operational mode, issue the **show spanning-tree interface** command:

```
user@switch3> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/26.0 | 128:513 | 128:513               | 8192.0019e25051e0       | 1000         | FWD   | DESC |
| xe-0/0/28.0 | 128:515 | 128:515               | 8192.0019e25051e0       | 1000         | FWD   | DESC |
| xe-0/0/24.0 | 128:517 | 128:517               | 8192.0019e25051e0       | 1000         | FWD   | DESC |

**Meaning** See the topology in [Figure 23 on page 1611](#). The operational mode command **show spanning-tree interface** shows that no interface is the root interface.

**Verifying RSTP Configuration on Switch 4**

**Purpose** Verify the RSTP configuration on Switch 4.

**Action** In operational mode, issue the **show spanning-tree interface** command:

```
user@switch4> show spanning-tree interface
Spanning tree interface parameters for instance 0
```

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/23.0 | 128:523 | 128:517               | 8192.0019e25051e0       | 1000         | FWD   | ROOT |
| xe-0/0/19.0 | 128:525 | 128:525               | 16384.0019e25040e0      | 1000         | FWD   | DESG |

**Meaning** See the topology in [Figure 23 on page 1611](#). The operational mode command **show spanning-tree interface** shows that interface **xe-0/0/23.0** is the root interface and is in the forwarding state.

- [Understanding RSTP on page 1556](#)

## Example: Configuring Network Regions for VLANs with MSTP

Multiple Spanning Tree Protocol (MSTP) is used to create a loop-free topology in networks using multiple spanning-tree regions, each region containing multiple spanning-tree instances (MSTIs). MSTIs provide different paths for different VLANs. This functionality facilitates more efficient load sharing across redundant links.

You can create up to 64 MSTI instances for QFX Series products, and each MSTI supports up to 4094 VLANs.

This example describes how to configure MSTP on four QFX3500 switches:

- [Requirements on page 1624](#)
- [Overview and Topology on page 1625](#)
- [Configuring MSTP on Switch 1 on page 1627](#)
- [Configuring MSTP on Switch 2 on page 1630](#)
- [Configuring MSTP on Switch 3 on page 1633](#)
- [Configuring MSTP on Switch 4 on page 1636](#)
- [Verification on page 1639](#)

---

### Requirements

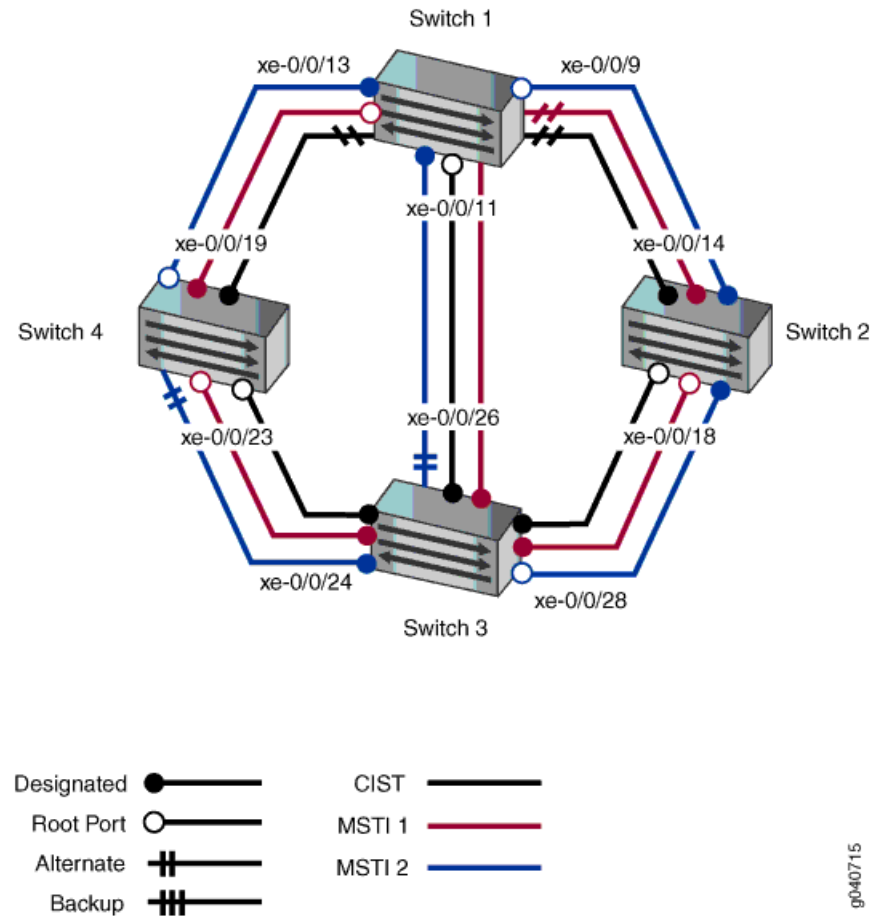

This example uses the following hardware and software components:

- Junos OS Release 11.1 for the QFX3500 switches
- Four QFX3500 switches

## Overview and Topology

When the number of VLANs grows in a network, MSTP provides a more faster way of creating a loop-free topology using MSTIs. Each MSTI in the spanning-tree domain maintains its own tree. Each tree can be mapped to different links, utilizing bandwidth that would be unavailable to a single tree. MSTIs reduce demand on system resources.

Figure 24: Network Topology for MSTP

The interfaces shown in [Table 104 on page 1626](#) will be configured for MSTP.

**NOTE:** You can configure MSTP on logical or physical interfaces. This example shows MSTP configured on logical interfaces.

Table 104: Topology for Configuring MSTP on the QFX Series

| Components             | Settings  |
|------------------------|---|
| Switch 1               | <p>The following ports on Switch 1 are connected in this way:</p> <ul style="list-style-type: none"> <li>• <b>xe-0/0/9</b> is connected to Switch 2</li> <li>• <b>xe-0/0/13</b> is connected to Switch 4</li> <li>• <b>xe-0/0/11</b> is connected to Switch 3</li> </ul>  |
| Switch 2               | <p>The following ports on Switch 2 are connected in this way:</p> <ul style="list-style-type: none"> <li>• <b>xe-0/0/14</b> is connected to Switch 1</li> <li>• <b>xe-0/0/18</b> is connected to Switch 3</li> </ul>  |
| Switch 3               | <p>The following ports on Switch 3 are connected in this way:</p> <ul style="list-style-type: none"> <li>• <b>xe-0/0/26</b> is connected to Switch 1</li> <li>• <b>xe-0/0/28</b> is connected to Switch 2</li> <li>• <b>xe-0/0/24</b> is connected to Switch 4</li> </ul> |
| Switch 4               | <p>The following ports on Switch 4 are connected in this way:</p> <ul style="list-style-type: none"> <li>• <b>xe-0/0/19</b> is connected to Switch 1</li> <li>• <b>xe-0/0/23</b> is connected to Switch 3</li> </ul>  |
| VLAN names and tag IDs | <b>sales-vlan</b> , tag 10<br><b>engineering-vlan</b> , tag 20<br><b>publications-vlan</b> , tag 30<br><b>support-vlan</b> , tag 40   |
| MSTIs                  | 1<br>2  |

The topology in [Figure 24 on page 1625](#) shows a Common Internal Spanning Tree (CIST). The CIST is a single spanning tree connecting all devices in the network. The switch with the highest priority is elected as the root bridge of the CIST.

Also in an MSTP topology are ports that have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.
- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.
- The *backup port* is a backup port for the designated port. When a designated port goes down, the backup port becomes the active designated port and starts forwarding data.

In this example, one MSTP region, **region1**, contains Switch 1, Switch 2, Switch 3, and Switch 4. Within the region, four VLANs are created:

- The **sales-vlan** supports sales traffic and has a VLAN tag identifier of 10.
- The **engineering-vlan** supports data traffic and has a VLAN tag identifier of 20.
- The **publications-vlan** supports publications VLAN traffic (for supplicants that fail 802.1X authentication) and has a VLAN tag identifier of 30.
- The **support-vlan** supports video traffic and has a VLAN tag identifier of 40.

The VLANs are associated with specific interfaces on each of the four switches. Two MSTIs, 1 and 2, are then associated with the VLAN tag identifiers, and some MSTP parameters, such as cost, are configured on each switch.

### Configuring MSTP on Switch 1

#### CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 1, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```
[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/13 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/9 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 16k
set protocols mstp interface xe-0/0/13.0 cost 1000
set protocols mstp interface xe-0/0/13.0 mode point-to-point
set protocols mstp interface xe-0/0/9.0 cost 1000
set protocols mstp interface xe-0/0/9.0 mode point-to-point
set protocols mstp interface xe-0/0/11.0 cost 1000
set protocols mstp interface xe-0/0/11.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 16k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 1 interface xe-0/0/11.0 cost 4000
set protocols mstp msti 2 bridge-priority 8k
set protocols mstp msti 2 vlan [30 40]
```

### Step-by-Step Procedure

To configure interfaces and MSTP on Switch 1:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```
[edit vlans]
user@switch1# set sales-vlan description "Sales VLAN"
user@switch1# set sales-vlan vlan-id 10
user@switch1# set engineering-vlan description "Engineering VLAN"
user@switch1# set engineering-vlan vlan-id 20
user@switch1# set publications-vlan description "Publications VLAN"
user@switch1# set publications-vlan vlan-id 30
user@switch1# set support-vlan description "Support VLAN"
user@switch1# set publications-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```
[edit interfaces]
user@switch1# set xe-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch1# set xe-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch1# set xe-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```
[edit interfaces]
user@switch1# set xe-0/0/13 unit 0 family ethernet-switching port-mode trunk
user@switch1# set xe-0/0/9 unit 0 family ethernet-switching port-mode trunk
user@switch1# set xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch1# mstp configuration-name region1
user@switch1# mstp bridge-priority 16k
user@switch1# mstp interface xe-0/0/13.0 cost 1000
user@switch1# mstp interface xe-0/0/13.0 mode point-to-point
user@switch1# mstp interface xe-0/0/9.0 cost 1000
user@switch1# mstp interface xe-0/0/9.0 mode point-to-point
user@switch1# mstp interface xe-0/0/11.0 cost 4000
user@switch1# mstp interface xe-0/0/11.0 mode point-to-point
user@switch1# mstp msti 1 bridge-priority 16k
user@switch1# mstp msti 1 vlan [10 20]
user@switch1# mstp msti 1 interface xe-0/0/11.0 cost 4000
user@switch1# mstp msti 2 bridge-priority 8k
user@switch1# mstp msti 2 vlan [30 40]
```

### Results

Check the results of the configuration:

```
user@switch1> show configuration
interfaces {
  xe-0/0/13 {
```

```

    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members 10;
                members 20;
                members 30;
                members 40;
            }
        }
    }
}
xe-0/0/9 {
    unit 0 {

            port-mode trunk;
            vlan {
                members 10;
                members 20;
                members 30;
                members 40;
            }
        }
    }
}
xe-0/0/11 {
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members 10;
                members 20;
                members 30;
                members 40;
            }
        }
    }
}
}
protocols {
    mstp {
        configuration-name region1;
        bridge-priority 16k;
        interface xe-0/0/13.0 {
            cost 1000;
            mode point-to-point;
        }
        interface xe-0/0/9.0 {
            cost 1000;
            mode point-to-point;
        }
        interface xe-0/0/11.0 {
            cost 4000;
            mode point-to-point;
        }
    }
    msti 1 {

```

```
    bridge-priority 16k;
    vlan [ 10 20 ];
    interface xe-0/0/11.0 {
        cost 4000;
    }
}
msti 2 {
    bridge-priority 8k;
    vlan [ 30 40 ];
}
}
vlangs {
    sales-vlan {
        vlan-id 10;
    }
    engineering-vlan {
        vlan-id 20;
    }
    publications-vlan {
        vlan-id 30;
    }
    support-vlan {
        vlan-id 40;
    }
}
```

### Configuring MSTP on Switch 2

#### CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 2, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the interface-mode statement instead of the port-mode statement. The port-mode statement has been replaced with the interface-mode statement.

```
[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/18 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 32k
set protocols mstp interface xe-0/0/14.0 cost 1000
set protocols mstp interface xe-0/0/14.0 mode point-to-point
```

```

set protocols mstp interface xe-0/0/18.0 cost 1000
set protocols mstp interface xe-0/0/18.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 32k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 4k
set protocols mstp msti 2 vlan [30 40]

```

### Step-by-Step Procedure

To configure interfaces and MSTP on Switch 2:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```

[edit vlans]
user@switch2# set sales-vlan description "Sales VLAN"
user@switch2# set sales-vlan vlan-id 10
user@switch2# set engineering-vlan description "Engineering VLAN"
user@switch2# set engineering-vlan vlan-id 20
user@switch2# set publications-vlan description "Publications VLAN"
user@switch2# set publications-vlan vlan-id 30
user@switch2# set support-vlan vlan-description "Support VLAN"
user@switch2# set publications-vlan vlan-id 40

```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```

[edit interfaces]
user@switch2# set xe-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch2# set xe-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]

```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```

[edit interfaces]
user@switch2# set xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
user@switch2# set xe-0/0/18 unit 0 family ethernet-switching port-mode trunk

```

4. Configure MSTP on the switch, including the two MSTIs:

```

[edit protocols]
user@switch2# mstp configuration-name region1
user@switch2# mstp bridge-priority 32k
user@switch2# mstp interface xe-0/0/14.0 cost 1000
user@switch2# mstp interface xe-0/0/14.0 mode point-to-point
user@switch2# mstp interface xe-0/0/18.0 cost 1000
user@switch2# mstp interface xe-0/0/18.0 mode point-to-point
user@switch2# mstp interface all cost 1000
user@switch2# mstp msti 1 bridge-priority 32k
user@switch2# mstp msti 1 vlan [10 20]
user@switch2# mstp msti 2 bridge-priority 4k
user@switch2# mstp msti 2 vlan [30 40]

```

**Results** Check the results of the configuration:

```
user@switch2> show configuration
```

```
interfaces {
  xe-0/0/14 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
  xe-0/0/18 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
}
protocols {
  mstp {
    configuration-name region1;
    bridge-priority 32k;
    interface xe-0/0/14.0 {
      cost 1000;
      mode point-to-point;
    }
    interface xe-0/0/18.0 {
      cost 1000;
      mode point-to-point;
    }
    msti 1 {
      bridge-priority 32k;
      vlan [ 10 20 ];
    }
    msti 2 {
      bridge-priority 4k;
      vlan [ 30 40 ];
    }
  }
}
vlangs {
  sales-vlan {
    vlan-id 10;
  }
  engineering-vlan {
    vlan-id 20;
  }
}
```

```

    }
    publications-vlan {
        vlan-id 30;
    }
    support-vlan {
        vlan-id 40;
    }
}

```

### Configuring MSTP on Switch 3

#### CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 3, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```

[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/26 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/28 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/24 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 8k
set protocols mstp interface xe-0/0/26.0 cost 1000
set protocols mstp interface xe-0/0/26.0 mode point-to-point
set protocols mstp interface xe-0/0/28.0 cost 1000
set protocols mstp interface xe-0/0/28.0 mode point-to-point
set protocols mstp interface xe-0/0/24.0 cost 1000
set protocols mstp interface xe-0/0/24.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 4k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 16k
set protocols mstp msti 2 vlan [30 40]

```

### Step-by-Step Procedure

To configure interfaces and MSTP on Switch 3:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```
[edit vlans]
user@switch3# set sales-vlan description "Sales VLAN"
user@switch3# set sales-vlan vlan-id 10
user@switch3# set engineering-vlan description "Engineering VLAN"
user@switch3# set engineering-vlan vlan-id 20
user@switch3# set publications-vlan description "Publications VLAN"
user@switch3# set publications-vlan vlan-id 30
user@switch3# set support-vlan description "Support VLAN"
user@switch3# set publications-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```
[edit interfaces]
user@switch3# set xe-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set xe-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set xe-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```
[edit interfaces]
user@switch3# set xe-0/0/26 unit 0 family ethernet-switching port-mode trunk
user@switch3# set xe-0/0/28 unit 0 family ethernet-switching port-mode trunk
user@switch3# set xe-0/0/24 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch3# mstp configuration-name region1
user@switch3# mstp bridge-priority 8k
user@switch3# mstp interface xe-0/0/26.0 cost 1000
user@switch3# mstp interface xe-0/0/26.0 mode point-to-point
user@switch3# mstp interface xe-0/0/28.0 cost 1000
user@switch3# mstp interface xe-0/0/28.0 mode point-to-point
user@switch3# mstp interface xe-0/0/24.0 cost 1000
user@switch3# mstp interface xe-0/0/24.0 mode point-to-point
user@switch3# mstp interface all cost 1000
user@switch3# mstp msti 1 bridge-priority 4k
user@switch3# mstp msti 1 vlan [10 20]
user@switch3# mstp msti 2 bridge-priority 16k
user@switch3# mstp msti 2 vlan [30 40]
```

### Results

Check the results of the configuration:

```
user@switch3> show configuration
interfaces {
  xe-0/0/26 {
```

```

    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members 10;
                members 20;
                members 30;
                members 40;
            }
        }
    }
}
xe-0/0/28 {
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members 10;
                members 20;
                members 30;
                members 40;
            }
        }
    }
}
xe-0/0/24 {
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members 10;
                members 20;
                members 30;
                members 40;
            }
        }
    }
}
}
protocols {
    mstp {
        configuration-name region1;
        bridge-priority 8k;
        interface xe-0/0/26.0 {
            cost 1000;
            mode point-to-point;
        }
        interface xe-0/0/28.0 {
            cost 1000;
            mode point-to-point;
        }
        interface xe-0/0/24.0 {
            cost 1000;
            mode point-to-point;
        }
    }
}

```

```

msti 1 {
    bridge-priority 4k;
    vlan [ 10 20 ];
}
msti 2 {
    bridge-priority 16k;
    vlan [ 30 40 ];
}
}
}
vlangs {
    sales-vlan {
        vlan-id 10;
    }
    engineering-vlan {
        vlan-id 20;
    }
    publications-vlan {
        vlan-id 30;
    }
    support-vlan {
        vlan-id 40;
    }
}
}

```

#### Configuring MSTP on Switch 4

##### CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 4, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the interface-mode statement instead of the port-mode statement. The port-mode statement has been replaced with the interface-mode statement.

```

[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/23 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/19 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 16k
set protocols mstp interface xe-0/0/23.0 cost 1000
set protocols mstp interface xe-0/0/23.0 mode point-to-point
set protocols mstp interface xe-0/0/19.0 cost 1000

```

```

set protocols mstp interface xe-0/0/19.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 16k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 32k
set protocols mstp msti 2 vlan [30 40]

```

### Step-by-Step Procedure

To configure interfaces and MSTP on Switch 4:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```

[edit vlans]
user@switch4# set sales-vlan description "Sales VLAN"
user@switch4# set sales-vlan vlan-id 10
user@switch4# set engineering-vlan description "Engineering VLAN"
user@switch4# set engineering-vlan vlan-id 20
user@switch4# set publications-vlan description "Publications VLAN"
user@switch4# set publications-vlan vlan-id 30
user@switch4# set support-vlan description "Support VLAN"
user@switch4# set support-vlan vlan-id 40

```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```

[edit interfaces]
user@switch4# set xe-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch4# set xe-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]

```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```

[edit interfaces]
user@switch4# set ge-0/0/23 unit 0 family ethernet-switching port-mode trunk
user@switch4# set ge-0/0/19 unit 0 family ethernet-switching port-mode trunk

```

4. Configure MSTP on the switch, including the two MSTIs:

```

[edit protocols]
user@switch4# mstp configuration-name region1
user@switch4# mstp bridge-priority 16k
user@switch4# mstp interface all cost 1000
user@switch4# mstp interface xe-0/0/23.0 cost 1000
user@switch4# mstp interface xe-0/0/23.0 mode point-to-point
user@switch4# mstp interface xe-0/0/19.0 cost 1000
user@switch4# mstp interface xe-0/0/19.0 mode point-to-point
user@switch4# mstp msti 1 bridge-priority 16k
user@switch4# mstp msti 1 vlan [10 20]
user@switch4# mstp msti 2 bridge-priority 32k
user@switch4# mstp msti 2 vlan [30 40]

```

**Results** Check the results of the configuration:

```

user@switch4> show configuration
interfaces {

```

```
xe-0/0/23 {
  unit 0 {
    family ethernet-switching {
      port-mode trunk;
      vlan {
        members 10;
        members 20;
        members 30;
        members 40;
      }
    }
  }
}
xe-0/0/19 {
  unit 0 {
    family ethernet-switching {
      port-mode trunk;
      vlan {
        members 10;
        members 20;
        members 30;
        members 40;
      }
    }
  }
}
}
protocols {
  mstp {
    configuration-name region1;
    bridge-priority 16k;
    interface xe-0/0/23.0 {
      cost 1000;
      mode point-to-point;
    }
    interface xe-0/0/19.0 {
      cost 1000;
      mode point-to-point;
    }
  }
  msti 1 {
    bridge-priority 16k;
    vlan [ 10 20 ];
  }
  msti 2 {
    bridge-priority 32k;
    vlan [ 30 40 ];
  }
}
vlands {
  sales-vlan {
    vlan-id 10;
  }
  engineering-vlan {
    vlan-id 20;
  }
}
```

```
publications-vlan {  
    vlan-id 30;  
}  
support-vlan {  
    vlan-id 40;  
}  
}
```

---

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying MSTP Configuration on Switch 1 on page 1639](#)
- [Verifying MSTP Configuration on Switch 2 on page 1641](#)
- [Verifying MSTP Configuration on Switch 3 on page 1643](#)
- [Verifying MSTP Configuration on Switch 4 on page 1645](#)

#### *Verifying MSTP Configuration on Switch 1*

**Purpose** Verify the MSTP configuration on Switch 1.

**Action** Use the operational mode commands:

```
user@switch1> show spanning-tree interface
```

```
Spanning tree interface parameters for instance 0
```

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/13.0 | 128:527 | 128:525               | 16384.0019e25040e0      | 1000         | FWD   | ROOT |
| xe-0/0/9.0  | 128:529 | 128:513               | 32768.0019e2503d20      | 1000         | BLK   | ALT  |
| xe-0/0/11.0 | 128:531 | 128:513               | 8192.0019e25051e0       | 4000         | BLK   | ALT  |

```
Spanning tree interface parameters for instance 1
```

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/13.0 | 128:527 | 128:525               | 16385.0019e25040e0      | 1000         | FWD   | ROOT |
| xe-0/0/9.0  | 128:529 | 128:513               | 32769.0019e2503d20      | 1000         | BLK   | ALT  |
| xe-0/0/11.0 | 128:531 | 128:513               | 4097.0019e25051e0       | 4000         | BLK   | ALT  |

```
Spanning tree interface parameters for instance 2
```

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|

  Extended system ID        : 0
  Internal instance ID      : 2

```

**Meaning** The operational mode command **show spanning-tree interface** displays spanning-tree domain information such as the designated port and the port roles.

The operational mode command **show spanning-tree bridge** displays the spanning-tree domain information at either the bridge level or the interface level. If the optional interface name is omitted, all interfaces in the spanning-tree domain are displayed.

#### *Verifying MSTP Configuration on Switch 2*

**Purpose** Verify the MSTP configuration on Switch 2.

**Action** Use the operational mode commands:

```
user@switch2> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |

```

**Meaning** The operational mode command **show spanning-tree interface** displays spanning-tree domain information such as the designated port and the port roles.

The operational mode command **show spanning-tree bridge** displays the spanning-tree domain information at either the bridge level or the interface level. If the optional interface name is omitted, all interfaces in the spanning-tree domain are displayed.

## Example: Connecting an Access Switch to a Distribution Switch

In large local area networks (LANs), you commonly need to aggregate traffic from a number of access switches into a distribution switch.

This example describes how to connect an access switch to a distribution switch:

- [Requirements on page 1647](#)
- [Overview and Topology on page 1648](#)
- [Configuring the Access Switch on page 1648](#)
- [Configuring the Distribution Switch on page 1652](#)
- [Verification on page 1654](#)

### Requirements

This example uses the following hardware and software components:

- For the distribution switch, one EX 4200-24F switch. This model is designed to be used as a distribution switch for aggregation or collapsed core network topologies and in space-constrained data centers. It has twenty-four 1-Gigabit Ethernet fiber SFP ports and an EX-UM-2XFP uplink module with two 10-Gigabit Ethernet XFP ports.
- For the access switch, one EX 3200-24P, which has twenty-four 1-Gigabit Ethernet ports, all of which support Power over Ethernet (PoE), and an uplink module with four 1-Gigabit Ethernet ports.

- Junos OS Release 11.1 or later for the QFX Series

### Overview and Topology

In a large office that is spread across several floors or buildings, or in a data center, you commonly aggregate traffic from a number of access switches into a distribution switch. This configuration example shows a simple topology to illustrate how to connect a single access switch to a distribution switch.

In the topology, the LAN is segmented into two VLANs, one for the sales department and the second for the support team. One 1-Gigabit Ethernet port on the access switch's uplink module connects to the distribution switch, to one 1-Gigabit Ethernet port on the distribution switch.

[Table 105 on page 1648](#) explains the components of the example topology. The example shows how to configure one of the three access switches. The other access switches could be configured in the same manner.

**Table 105: Components of the Topology for Connecting an Access Switch to a Distribution Switch**

| Property   | Settings  |
|--|---|
| Access switch hardware   | EX 3200-24P, 24 1-Gigabit Ethernet ports, all PoE-enabled ( <b>ge-0/0/0</b> through <b>ge-0/0/23</b> ); one 4-port 1-Gigabit Ethernet uplink module (EX-UM-4SFP)  |
| Distribution switch hardware                                     | EX 4200-24F, 24 1-Gigabit Ethernet fiber SPF ports ( <b>ge-0/0/0</b> through <b>ge-0/0/23</b> ); one 2-port 10-Gigabit Ethernet XFP uplink module (EX-UM-4SFP)  |
| VLAN names and tag IDs   | <b>sales</b> , tag 100 <b>support</b> , tag 200   |
| VLAN subnets   | <b>sales</b> : 192.0.2.0/25 (addresses 192.0.2.1 through 192.0.2.126) <b>support</b> : 192.0.2.128/25 (addresses 192.0.2.129 through 192.0.2.254)   |
| Trunk port interfaces  | On the access switch: <b>ge-0/1/0</b> On the distribution switch: <b>ge-0/0/0</b>   |
| Access port interfaces in VLAN <b>sales</b> (on access switch)   | Avaya IP telephones: <b>ge-0/0/3</b> through <b>ge-0/0/19</b> Wireless access points: <b>ge-0/0/0</b> and <b>ge-0/0/1</b> Printers: <b>ge-0/0/22</b> and <b>ge-0/0/23</b> File servers: <b>ge-0/0/20</b> and <b>ge-0/0/21</b> |
| Access port interfaces in VLAN <b>support</b> (on access switch) | Avaya IP telephones: <b>ge-0/0/25</b> through <b>ge-0/0/43</b> Wireless access points: <b>ge-0/0/24</b> Printers: <b>ge-0/0/44</b> and <b>ge-0/0/45</b> File servers: <b>ge-0/0/46</b> and <b>ge-0/0/47</b>                   |
| Unused interfaces on access switch                               | <b>ge-0/0/2</b> and <b>ge-0/0/25</b>  |

### Configuring the Access Switch

To configure the access switch:

#### CLI Quick Configuration

To quickly configure the access switch, copy the following commands and paste them into the switch terminal window:

[edit]

```

set interfaces ge-0/0/0 unit 0 description "Sales Wireless access point port"
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/3 unit 0 description "Sales phone port"
set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/22 unit 0 description "Sales printer port"
set interfaces ge-0/0/22 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/20 unit 0 description "Sales file server port"
set interfaces ge-0/0/20 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/24 unit 0 description "Support wireless access point port"
set interfaces ge-0/0/24 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/26 unit 0 description "Support phone port"
set interfaces ge-0/0/26 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/44 unit 0 description "Support printer port"
set interfaces ge-0/0/44 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/46 unit 0 description "Support file server port"
set interfaces ge-0/0/46 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/1/0 unit 0 description "Uplink module port connection to distribution switch"
set interfaces ge-0/1/0 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/1/0 unit 0 family ethernet-switching native-vlan-id 1
set interfaces ge-0/1/0 unit 0 family ethernet-switching vlan members [sales support]
set interfaces vlan unit 0 family inet address 192.0.2.1/25
set interfaces vlan unit 1 family inet address 192.0.2.129/25
set vlans sales interface ge-0/0/0.0
set vlans sales interface ge-0/0/3.0
set vlans sales interface ge-0/0/22.0
set vlans sales interface ge-0/0/20.0
set vlans sales l3-interface vlan.0
set vlans sales vlan-id 100
set vlans sales vlan-description "Sales VLAN"
set vlans support interface ge-0/0/24.0
set vlans support interface ge-0/0/26.0
set vlans support interface ge-0/0/44.0
set vlans support interface ge-0/0/46.0
set vlans support vlan-id 200
set vlans support l3-interface vlan.1
set vlans support vlan-description "Support VLAN"

```

#### Step-by-Step Procedure

To configure the access switch:

1. Configure the 1-Gigabit Ethernet interface on the uplink module to be the trunk port that connects to the distribution switch:  

```
[edit interfaces ge-0/1/0 unit 0]user@access-switch# set description "Uplink module port connection to distribution switch"
user@access-switch# set ethernet-switching port-mode trunk
```
2. Specify the VLANs to be aggregated on the trunk port:  

```
[edit interfaces ge-0/1/0 unit 0]user@access-switch# set ethernet-switching vlanmembers [ sales support ]
```
3. Configure the VLAN ID to use for packets that are received with no dot1q tag (untagged packets):  

```
[edit interfaces ge-0/1/0 unit 0]user@access-switch# set ethernet-switching native-vlan-id 1
```
4. Configure the sales VLAN:  

```
[edit vlans sales]user@access-switch# set vlan-description "Sales VLAN"
user@access-switch# set vlan-id (VLANs) 100
user@access-switch# set l3-interface (VLAN) vlan.0
```
5. Configure the support VLAN:

- ```
[edit vlans support]user@access-switch# set vlan-description "Support
VLAN"user@access-switch# set vlan-id (VLANs) 200user@access-switch# set
l3-interface (VLAN) vlan.1
```
6. Create the subnet for the sales broadcast domain:
 

```
[edit interfaces]user@access-switch# set vlan unit 0 family inet address 192.0.2.1/25
```
  7. Create the subnet for the support broadcast domain:
 

```
[edit interfaces]user@access-switch# set vlan unit 1 family inet address 192.0.2.129/25
```
  8. Configure the interfaces in the sales VLAN:
 

```
[edit interfaces]user@access-switch# set ge-0/0/0 unit 0 description "Sales wireless
access point port"user@access-switch# set ge-0/0/0 unit 0 family ethernet-switching
vlan members salesuser@access-switch# set ge-0/0/3 unit 0 description "Sales phone
port"user@access-switch# set ge-0/0/3 unit 0 family ethernet-switching vlan members
salesuser@access-switch# set ge-0/0/20 unit 0 description "Sales file server
port"user@access-switch# set ge-0/0/20 unit 0 family ethernet-switching vlan members
salesuser@access-switch# set ge-0/0/22 unit 0 description "Sales printer
port"user@access-switch# set ge-0/0/22 unit 0 family ethernet-switching vlan members
sales
```
  9. Configure the interfaces in the support VLAN:
 

```
[edit interfaces]user@access-switch# set ge-0/0/24 unit 0 description "Support
wireless access point port"user@access-switch# set ge-0/0/24 unit 0 family
ethernet-switching vlan members supportuser@access-switch# set ge-0/0/26 unit 0
description "Support phone port"user@access-switch# set ge-0/0/26 unit 0 family
ethernet-switching vlan members supportuser@access-switch# set ge-0/0/44 unit 0
description "Support printer port"user@access-switch# set ge-0/0/44 unit 0 family
ethernet-switching vlan members supportuser@access-switch# set ge-0/0/46 unit 0
description "Support file server port"user@access-switch# set ge-0/0/46 unit 0 family
ethernet-switching vlan members support
```
  10. Configure descriptions and VLAN tag IDs for the sales and support VLANs:
 

```
[edit vlans]user@access-switch# set sales vlan-description "Sales
VLAN"user@access-switch# set sales vlan-id 100user@access-switch# set support
vlan-description "Support VLAN"user@access-switch# set support vlan-id 200
```
  11. To route traffic between the sales and support VLANs and associate a Layer 3 interface with each VLAN:
 

```
[edit vlans]user@access-switch# set sales l3-interface vlan.0user@access-switch#
set support l3-interface vlan.1
```

**Results** Display the results of the configuration:

```
user@access-switch> show
interfaces {
  ge-0/0/0 {
    unit 0 {
      description "Sales wireless access point port";
      family ethernet-switching {

    description "Support file server port";
    family ethernet-switching {
      vlan members support;
    }
  }
}
ge-0/1/0 {
  unit 0 {
    description "Uplink module port connection to distribution switch";
    family ethernet-switching {
      port-mode trunk;
    }
  }
}

```

```
        vlan members [ sales support ];
        native-vlan-id 1;
    }
}
vlan {
    unit 0 {
        family inet address 192.0.2.1/25;
    }
    unit 1 {
        family inet address 192.0.2.129/25;
    }
}
vlands {
    sales {
        vlan-id 100;
        vlan-description "Sales VLAN";
        l3-interface vlan.0;
    }
    support {
        vlan-id 200;
        vlan-description "Support VLAN";
        l3-interface vlan.1;
    }
}
```

**TIP:** To quickly configure the distribution switch, issue the load merge terminal command, then copy the hierarchy and paste it into the switch terminal window.

---

### Configuring the Distribution Switch

To configure the distribution switch:

#### CLI Quick Configuration

To quickly configure the distribution switch, copy the following commands and paste them into the switch terminal window:

```
set interfaces ge-0/0/0 description "Connection to access switch"
set interfaces ge-0/0/0 ethernet-switching port-mode trunk
set interfaces ge-0/0/0 ethernet-switching vlan members [ sales support ]
set interfaces vlan unit 0 family inet address 192.0.2.2/25
set interfaces vlan unit 1 family inet address 192.0.2.130/25
set vlans sales vlan-description "Sales VLAN"
set vlans sales vlan-id 100
set vlans sales l3-interface vlan.0
set vlans support vlan-description "Support VLAN"
set vlans support vlan-id 200
set vlans support l3-interface vlan.1
```

**Step-by-Step  
Procedure**

To configure the distribution switch:

1. Configure the interface on the switch to be the trunk port that connects to the access switch:  
  

```
[edit interfaces ge-0/0/0 unit 0]user@distribution-switch# set description "Connection to access switch"
user@distribution-switch# set ethernet-switching port-mode trunk
```
2. Specify the VLANs to be aggregated on the trunk port:  
  

```
[edit interfaces ge-0/0/0 unit 0]user@distribution-switch# set ethernet-switching vlan-members [ sales support ]
```
3. Configure the VLAN ID to use for packets that are received with no dot1q tag (untagged packets):  
  

```
[edit interfaces]user@distribution-switch# set ge-0/0/0 ethernet-switching native-vlan-id 1
```
4. Configure the sales VLAN:  
  

```
[edit vlans sales]user@distribution-switch# set vlan-description "Sales VLAN"
user@distribution-switch# set vlan-id (VLANs) 100
user@distribution-switch# set l3-interface (VLAN) vlan.0
```
5. Configure the support VLAN:  
  

```
[edit vlans support]user@distribution-switch# set vlan-description "Support VLAN"
user@distribution-switch# set vlan-id (VLANs) 200
user@distribution-switch# set l3-interface (VLAN) vlan.1
```
6. Create the subnet for the sales broadcast domain:  
  

```
[edit interfaces]user@distribution-switch# set vlan unit 0 family inet address 192.0.2.2/25
```
7. Create the subnet for the support broadcast domain:  
  

```
[edit interfaces] user@distribution-switch# set vlan unit 1 family inet address 192.0.2.130/25
```

**Results** Display the results of the configuration:

```
user@distribution-switch> show
interfaces {
  ge-0/0/0 {
    description "Connection to access switch";
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan members [ sales support ];
        native-vlan-id 1;
      }
    }
  }
}
vlan {
  unit 0 {
    family inet address 192.0.2.2/25;
  }
  unit 1 {
    family inet address 192.0.2.130/25;
  }
}
}
```

```
vlan {  
  sales {  
    vlan-id 100;  
    vlan-description "Sales VLAN";  
    l3-interface vlan.0;  
  }  
  support {  
    vlan-id 200;  
    vlan-description "Support VLAN";  
    l3-interface vlan.1;  
  }  
}
```

**TIP:** To quickly configure the distribution switch, issue the **load merge terminal** command, then copy the hierarchy and paste it into the switch terminal window.

---

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying the VLAN Members and Interfaces on the Access Switch on page 1654](#)
- [Verifying the VLAN Members and Interfaces on the Distribution Switch on page 1655](#)

### *Verifying the VLAN Members and Interfaces on the Access Switch*

**Purpose** Verify that the **sales** and **support** have been created on the switch.

**Action** List all VLANs configured on the switch:

```
user@switch> show vlans
```

Name	Tag	Interfaces
default		ge-0/0/1.0, ge-0/0/2.0, ge-0/0/4.0, ge-0/0/5.0, ge-0/0/6.0, ge-0/0/7.0, ge-0/0/8.0*, ge-0/0/9.0,  ge-0/0/10.0, ge-0/0/11.0*, ge-0/0/12.0, ge-0/0/13.0, ge-0/0/14.0, ge-0/0/15.0, ge-0/0/16.0, ge-0/0/17.0, ge-0/0/18.0, ge-0/0/19.0*, ge-0/0/21.0, ge-0/0/23.0, ge-0/0/25.0, ge-0/0/27.0*, ge-0/0/28.0, ge-0/0/29.0, ge-0/0/30.0, ge-0/0/31.0*, ge-0/0/32.0, ge-0/0/33.0, ge-0/0/34.0, ge-0/0/35.0*, ge-0/0/36.0, ge-0/0/37.0, ge-0/0/38.0, ge-0/0/39.0*, ge-0/0/40.0, ge-0/0/41.0, ge-0/0/42.0, ge-0/0/43.0*, ge-0/0/45.0, ge-0/0/47.0, ge-0/1/1.0*, ge-0/1/2.0*, ge-0/1/3.0*
sales	100	ge-0/0/0.0*, ge-0/0/3.0, ge-0/0/20.0, ge-0/0/22.0, ge-0/1/0.0*,
support	200	ge-0/0/24.0*, ge-0/0/26.0, ge-0/0/44.0, ge-0/0/46.0,
mgmt		me0.0*

**Meaning** The output shows the **sales** and **support** VLANs and the interfaces associated with them.

### *Verifying the VLAN Members and Interfaces on the Distribution Switch*

**Purpose** Verify that the **sales** and **support** have been created on the switch.

**Action** List all VLANs configured on the switch:

```
user@switch> show vlans
```

Name	Tag	Interfaces
default		ge-0/0/1.0, ge-0/0/2.0, ge-0/0/3.0, ge-0/0/4.0, ge-0/0/5.0, ge-0/0/6.0, ge-0/0/7.0*, ge-0/0/8.0,  ge-0/0/9.0, ge-0/0/10.0*, ge-0/0/11.0, ge-0/0/12.0, ge-0/0/13.0, ge-0/0/14.0, ge-0/0/15.0, ge-0/0/16.0, ge-0/0/17.0, ge-0/0/18.0*, ge-0/0/19.0, ge-0/0/20.0, ge-0/0/21.0, ge-0/0/22.0*, ge-0/0/23.0, ge-0/1/1.0*, ge-0/1/2.0*, ge-0/1/3.0*
sales	100	ge-0/0/0.0*
support	200	ge-0/0/0.0*
mgmt		me0.0*

**Meaning** The output shows the **sales** and **support** VLANs associated to interface **ge-0/0/0.0**. Interface **ge-0/0/0.0** is the trunk interface connected to the access switch.

- [Example: Setting Up Bridging with Multiple VLANs](#)
- [Understanding Bridging and VLANs](#)

## Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations

The QFX Series products provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Configure BPDU protection on interfaces to prevent them from receiving BPDUs that could result in STP misconfigurations, which could lead to network outages.

This example describes how to configure BPDU protection on access interfaces in QFX Series products in an RSTP topology:

- [Requirements on page 1656](#)
- [Overview and Topology on page 1657](#)
- [Configuration on page 1658](#)
- [Verification on page 1658](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.1 or later for the QFX Series

- Two edged-linked switches in an RSTP topology

**NOTE:** By default, RSTP is enabled on the QFX Series.

### Overview and Topology

A loop-free network is supported through the exchange of a special type of frame called a bridge protocol data unit (BPDU). However, receipt of BPDUs on certain interfaces in an STP, RSTP, or MSTP topology. It can lead to network outages by triggering an STP misconfiguration. To prevent such outages, enable BPDU protection on those interfaces that should not receive BPDUs.

Enable BPDU protection on switch interfaces connected to user devices or on interfaces on which no BPDUs are expected, such as edge ports. If a BPDU is received on a BPDU-protected interface, the interface is disabled and stops forwarding frames.

Two switches are displayed in [Figure 25 on page 1657](#). In this example, Switch 1 and Switch 2 are configured for RSTP and create a loop-free topology. The interfaces on Switch 2 are access ports.

This example shows you how to configure interface **xe-0/0/5** and interface **xe-0/0/6** as edge ports and how to configure BPDU protection. When BPDU protection is enabled, the interfaces transition to a blocking state when they receive BPDUs.

**Figure 25: BPDU Protection Topology**

g020153

[Table 106 on page 1658](#) shows the components that will be configured for BPDU protection.

**Table 106: Components of the Topology for Configuring BPDU Protection on the QFX Series**

Component	Settings
Switch 1 (Distribution Layer)	Switch 1 is connected to Switch 2 on a trunk interface.
Switch 2 (Access Layer)	Switch 2 has these access ports that require BPDU protection: <ul style="list-style-type: none"> <li>• <code>xe-0/0/5</code></li> <li>• <code>xe-0/0/6</code></li> </ul>

This configuration example uses an RSTP topology. You also can configure BPDU protection for STP or MSTP topologies at the `[edit protocols (mstp | stp)]` hierarchy level.

### Configuration

#### CLI Quick Configuration

To quickly configure BPDU protection on Switch 2, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols rstp interface xe-0/0/5 edge
set protocols rstp interface xe-0/0/6 edge
set protocols rstp bpdu-block-on-edge
```

#### Step-by-Step Procedure

To configure BPDU protection:

1. Configure interface `xe-0/0/5` and interface `xe-0/0/6` on Switch 2 as edge ports:

```
[edit protocols rstp]
user@switch# set interface xe-0/0/5 edge
