**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **disable**—Disable the tracing flag.
- **receive**—Trace the packets being received.
- **send**—Trace the packets being transmitted.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

## transmit-interval (BFD Liveness Detection)

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | <pre>transmit-interval {     minimum-interval milliseconds;     threshold milliseconds; }</pre>   |
| <b>Hierarchy Level</b>     | <pre>[edit logical-systems <i>logical-system-name</i> protocols bgp bfd-liveness-detection], [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i>   bfd-liveness-detection], [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>   bfd-liveness-detection], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp bfd-liveness-detection], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp group <i>group-name</i> bfd-liveness-detection], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection], [edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   l2vpn oam bfd-liveness-detection], [edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   vpls neighbor <i>neighbor-id</i> oam bfd-liveness-detection], [edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   vpls mesh-group <i>mesh-group-name</i> neighbor <i>neighbor-id</i> oam bfd-liveness-detection], [edit logical-system <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   vpls oam bfd-liveness-detection], [edit protocols bgp bfd-liveness-detection], [edit protocols bgp group <i>group-name</i> bfd-liveness-detection], [edit protocols bgp group <i>group-name</i> neighbor <i>address</i> bgp bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>   bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor   <i>address</i> bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols l2vpn oam bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols vpls neighbor <i>neighbor-id</i> oam   bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols vpls mesh-group <i>mesh-group-name</i>   neighbor <i>neighbor-id</i> oam bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols vpls oam bfd-liveness-detection]</pre> |
| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 8.2.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for BFD authentication introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2 for Layer 2 VPN and VPLS.</p>  |
| <b>Description</b>         | <p>Specify the transmit interval for the <b>bfd-liveness-detection</b> statement. The negotiated transmit interval for a peer is the interval between the sending of BFD packets to peers. The receive interval for a peer is the minimum time that it requires between packets sent from its peer; the receive interval is not negotiated between peers. To determine the transmit interval, each peer compares its configured minimum transmit interval with its</p>  |

peer's minimum receive interval. The larger of the two numbers is accepted as the transmit interval for that peer.

The remaining statements are explained separately.

- [Operational Commands on page 3749](#)

## Routine Monitoring

---

- [Monitoring BGP Routing Information on page 3749](#)

### Monitoring BGP Routing Information

**Purpose** Use the monitoring functionality to monitor BGP routing information on the routing device.

**Action** To view BGP routing information in the CLI, enter the following commands:

- **show bgp summary**
- **show bgp neighbor**

**Related Documentation**

- [show bgp neighbor on page 2344](#)
- [show bgp summary on page 3778](#)

## Operational Commands

---

- **clear bgp damping**
- **clear bgp neighbor**
- **clear bgp table**
- **show bgp bmp**
- **show bgp group**
- **show bgp neighbor**
- **show bgp summary**
- **show policy damping**
- **show route damping**
- **show route detail**

## clear bgp damping

**Table 298: show bgp bmp Output Fields**

| Field Name                          | Field Description  |
|-------------------------------------|--|
| <b>BMP station address/port</b>     | IP address and port number of the monitoring station to which BGP Monitoring Protocol (BMP) statistics are sent.   |
| <b>BMP session state</b>            | Status of the BMP session: <b>UP</b> or <b>DOWN</b> .  |
| <b>Memory consumed by BMP</b>       | Memory used by the active BMP session.   |
| <b>Statistics timeout</b>           | Amount of time, in seconds, between transmissions of BMP data to the monitoring station.   |
| <b>Memory limit</b>                 | Threshold, in bytes, at which the routing device stops collecting BMP data.  |
| <b>Memory-connect retry timeout</b> | Amount of time, in seconds, after which the routing device attempts to resume a BMP session that was ended after the configured memory threshold was exceeded. |

## Sample Output

### show bgp bmp

```

user@host> show bgp bmp
  BMP station address/port: 172.24.24.157+5454
  BMP session state: DOWN
  Memory consumed by BMP: 0
  Statistics timeout: 15
  Memory limit: 10485760
  Memory connect retry timeout: 600

```

## show bgp group

**Table 299: show bgp group Output Fields**

| Field Name                                | Field Description  | Level of Output             |
|---|--|-----------------------------|
| <b>Group Type or Group</b>                | Type of BGP group: <b>Internal</b> or <b>External</b> .  | All levels                  |
| <b>group-index</b>                        | Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels.  | <b>rtf detail</b>           |
| <b>AS</b>                                 | AS number of the peer. For internal BGP (IBGP), this number is the same as <b>Local AS</b> .   | <b>brief detail</b><br>none |
| <b>Local AS</b>                           | AS number of the local routing device.   | <b>brief detail</b><br>none |
| <b>Name</b>                               | Name of a specific BGP group.  | <b>brief detail</b><br>none |
| <b>Index</b>                              | Unique index number of a BGP group.  | <b>brief detail</b><br>none |
| <b>Flags</b>                              | Flags associated with the BGP group. This field is used by Juniper Networks customer support.  | <b>brief detail</b><br>none |
| <b>Remove-private options</b>             | Options associated with the <a href="#">remove-private</a> statement.  | <b>brief detail</b><br>none |
| <b>Holdtime</b>                           | Maximum number of seconds allowed to elapse between successive keepalive or update messages that BGP receives from a peer in the BGP group, after which the connection to the peer is closed and routing devices through that peer become unavailable. | <b>brief detail</b><br>none |
| <b>Export</b>                             | Export policies configured for the BGP group with the <b>export</b> statement.   | <b>brief detail</b><br>none |
| <b>MED tracks IGP metric update delay</b> | Time, in seconds, that updates to multiple exit discriminator (MED) are delayed. Also displays the time remaining before the interval is set to expire   | All levels                  |
| <b>Traffic Statistics Interval</b>        | Time between sample periods for labeled-unicast traffic statistics, in seconds.  | <b>brief detail</b><br>none |
| <b>Total peers</b>                        | Total number of peers in the group.  | <b>brief detail</b><br>none |

Table 299: show bgp group Output Fields (*continued*)

| Field Name                             | Field Description  | Level of Output |
|--|--|-----------------|
| <b>Established</b>                     | Number of peers in the group that are in the established state.  | All levels      |
| <b>Active/Received/Accepted/Damped</b> | <p>Multipurpose field that displays information about BGP peer sessions. The field's contents depend upon whether a session is established and whether it was established in the main routing device or in a routing instance.</p> <ul style="list-style-type: none"> <li>If a peer is not established, the field shows the state of the peer session: <b>Active</b>, <b>Connect</b>, or <b>Idle</b>.</li> <li>If a BGP session is established in the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the <b>inet.0</b> (main) and <b>inet.2</b> (multicast) routing tables. For example, <b>8/10/10/2</b> and <b>2/4/4/0</b> indicate the following: <ul style="list-style-type: none"> <li>8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the <b>inet.0</b> routing table.</li> <li>2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the <b>inet.2</b> routing table.</li> </ul> </li> </ul> | <b>summary</b>  |
| <b>ip-addresses</b>                    | List of peers who are members of the group. The address is followed by the peer's port number.   | All levels      |
| <b>Route Queue Timer</b>               | Number of seconds until queued routes are sent. If this time has already elapsed, this field displays the number of seconds by which the updates are delayed.  | <b>detail</b>   |
| <b>Route Queue</b>                     | Number of prefixes that are queued up for sending to the peers in the group.   | <b>detail</b>   |
| <b>inet.number</b>                     | <p>Number of active, received, accepted, and damped routes in the routing table. For example, <b>inet.0: 7/10/9/0</b> indicates the following:</p> <ul style="list-style-type: none"> <li>7 active routes, 10 received routes, 9 accepted routes, and no damped routes from a BGP peer appear in the <b>inet.0</b> routing table.</li> </ul>   | none            |

Table 299: show bgp group Output Fields (*continued*)

| Field Name               | Field Description   | Level of Output     |
|--------------------------|---|---------------------|
| <b>Table inet.number</b> | Information about the routing table. <ul style="list-style-type: none"> <li>• <b>Received prefixes</b>—Total number of prefixes from the peer, both active and inactive, that are in the routing table.</li> <li>• <b>Active prefixes</b>—Number of prefixes received from the peer that are active in the routing table.</li> <li>• <b>Suppressed due to damping</b>—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.</li> <li>• <b>Advertised prefixes</b>—Number of prefixes advertised to a peer.</li> <li>• <b>Received external prefixes</b>—Total number of prefixes from the external BGP (EBGP) peers, both active and inactive, that are in the routing table.</li> <li>• <b>Active external prefixes</b>—Number of prefixes received from the EBGP peers that are active in the routing table.</li> <li>• <b>Externals suppressed</b>—Number of routes received from EBGP peers currently inactive because of damping or other reasons.</li> <li>• <b>Received internal prefixes</b>—Total number of prefixes from the IBGP peers, both active and inactive, that are in the routing table.</li> <li>• <b>Active internal prefixes</b>—Number of prefixes received from the IBGP peers that are active in the routing table.</li> <li>• <b>Internals suppressed</b>—Number of routes received from IBGP peers currently inactive because of damping or other reasons.</li> <li>• <b>RIB State</b>—Status of the graceful restart process for this routing table: <b>BGP restart is complete</b>, <b>BGP restart in progress</b>, <b>VPN restart in progress</b>, or <b>VPN restart is complete</b>.</li> </ul> | <b>detail</b>       |
| <b>Groups</b>            | Total number of groups.   | All levels          |
| <b>Peers</b>             | Total number of peers.  | All levels          |
| <b>External</b>          | Total number of external peers.   | All levels          |
| <b>Internal</b>          | Total number of internal peers.   | All levels          |
| <b>Down peers</b>        | Total number of unavailable peers.  | All levels          |
| <b>Flaps</b>             | Total number of flaps that occurred.  | All levels          |
| <b>Table</b>             | Name of a routing table.  | <b>brief</b> , none |
| <b>Tot Paths</b>         | Total number of routes.   | <b>brief</b> , none |
| <b>Act Paths</b>         | Number of active routes.  | <b>brief</b> , none |
| <b>Suppressed</b>        | Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.  | <b>brief</b> , none |

Table 299: show bgp group Output Fields (*continued*)

| Field Name   | Field Description   | Level of Output |
|--------------|---|-----------------|
| History      | Number of withdrawn routes stored locally to keep track of damping history.   | brief, none     |
| Damp State   | Number of active routes with a figure of merit greater than zero, but lower than the threshold at which suppression occurs.   | brief, none     |
| Pending      | Routes being processed by the BGP import policy.  | brief, none     |
| Group        | Group the peer belongs to in the BGP configuration.   | detail          |
| Receive mask | Mask of the received target included in the advertised route.   | detail          |
| Entries      | Number of route entries received.   | detail          |
| Target       | Route target that is to be passed by route-target filtering. If a route advertised from the provider edge (PE) routing device matches an entry in the route-target filter, the route is passed to the peer. | detail          |
| Mask         | Mask which specifies that the peer receive routes with the given route target.  | detail          |

## Sample Output

### show bgp group

**Table 300: show bgp neighbor Output Fields**

| Field Name   | Field Description   |
|--------------|---|
| <b>Peer</b>  | Address of the BGP neighbor. The address is followed by the neighbor port number.   |
| <b>AS</b>    | AS number of the peer.  |
| <b>Local</b> | Address of the local routing device. The address is followed by the peer port number.   |
| <b>Type</b>  | Type of peer: <b>Internal</b> or <b>External</b> .  |
| <b>State</b> | Current state of the BGP session: <ul style="list-style-type: none"> <li>• <b>Active</b>—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message.</li> <li>• <b>Connect</b>—BGP is waiting for the transport protocol connection to be completed.</li> <li>• <b>Established</b>—The BGP session has been established, and the peers are exchanging update messages.</li> <li>• <b>Idle</b>—This is the first stage of a connection. BGP is waiting for a Start event.</li> <li>• <b>OpenConfirm</b>—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message.</li> <li>• <b>OpenSent</b>—BGP has sent an open message and is waiting to receive an open message from the peer.</li> </ul> |

Table 300: show bgp neighbor Output Fields (*continued*)

| Field Name        | Field Description   |
|-------------------|---|
| <b>Flags</b>      | <p>Internal BGP flags:</p> <ul style="list-style-type: none"> <li>• <b>Aggregate Label</b>—BGP has aggregated a set of incoming labels (labels received from the peer) into a single forwarding label.</li> <li>• <b>CleanUp</b>—The peer session is being shut down.</li> <li>• <b>Delete</b>—This peer has been deleted.</li> <li>• <b>Idled</b>—This peer has been permanently idled.</li> <li>• <b>ImportEval</b>—At the last commit operation, this peer was identified as needing to reevaluate all received routes.</li> <li>• <b>Initializing</b>—The peer session is initializing.</li> <li>• <b>SendRtn</b>—Messages are being sent to the peer.</li> <li>• <b>Sync</b>—This peer is synchronized with the rest of the peer group.</li> <li>• <b>TryConnect</b>—Another attempt is being made to connect to the peer.</li> <li>• <b>Unconfigured</b>—This peer is not configured.</li> <li>• <b>WriteFailed</b>—An attempt to write to this peer failed.</li> </ul>   |
| <b>Last state</b> | <p>Previous state of the BGP session:</p> <ul style="list-style-type: none"> <li>• <b>Active</b>—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message.</li> <li>• <b>Connect</b>—BGP is waiting for the transport protocol connection to be completed.</li> <li>• <b>Established</b>—The BGP session has been established, and the peers are exchanging update messages.</li> <li>• <b>Idle</b>—This is the first stage of a connection. BGP is waiting for a Start event.</li> <li>• <b>OpenConfirm</b>—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message.</li> <li>• <b>OpenSent</b>—BGP has sent an open message and is waiting to receive an open message from the peer.</li> </ul>   |
| <b>Last event</b> | <p>Last activity that occurred in the BGP session:</p> <ul style="list-style-type: none"> <li>• <b>Closed</b>—The BGP session closed.</li> <li>• <b>ConnectRetry</b>—The transport protocol connection failed, and BGP is trying again to connect.</li> <li>• <b>HoldTime</b>—The session ended because the hold timer expired.</li> <li>• <b>KeepAlive</b>—The local routing device sent a BGP keepalive message to the peer.</li> <li>• <b>Open</b>—The local routing device sent a BGP open message to the peer.</li> <li>• <b>OpenFail</b>—The local routing device did not receive an acknowledgment of a BGP open message from the peer.</li> <li>• <b>RecvKeepAlive</b>—The local routing device received a BGP keepalive message from the peer.</li> <li>• <b>RecvNotify</b>—The local routing device received a BGP notification message from the peer.</li> <li>• <b>RecvOpen</b>—The local routing device received a BGP open message from the peer.</li> <li>• <b>RecvUpdate</b>—The local routing device received a BGP update message from the peer.</li> <li>• <b>Start</b>—The peering session started.</li> <li>• <b>Stop</b>—The peering session stopped.</li> <li>• <b>TransportError</b>—A TCP error occurred.</li> </ul> |

Table 300: show bgp neighbor Output Fields (*continued*)

| Field Name                  | Field Description   |
|-----------------------------|---|
| Last error                  | <p>Last error that occurred in the BGP session:</p> <ul style="list-style-type: none"> <li>• <b>Cease</b>—An error occurred, such as a version mismatch, that caused the session to close.</li> <li>• <b>Finite State Machine Error</b>—In setting up the session, BGP received a message that it did not understand.</li> <li>• <b>Hold Time Expired</b>—The session's hold time expired.</li> <li>• <b>Message Header Error</b>—The header of a BGP message was malformed.</li> <li>• <b>Open Message Error</b>—A BGP open message contained an error.</li> <li>• <b>None</b>—No errors occurred in the BGP session.</li> <li>• <b>Update Message Error</b>—A BGP update message contained an error.</li> </ul>   |
| Export                      | Name of the export policy that is configured on the peer.   |
| Import                      | Name of the import policy that is configured on the peer.   |
| Options                     | <p>Configured BGP options:</p> <ul style="list-style-type: none"> <li>• <b>AddressFamily</b>—Configured address family: <b>inet</b> or <b>inet-vpn</b>.</li> <li>• <b>AuthKeyChain</b>—Authentication key change is enabled.</li> <li>• <b>DropPathAttributes</b>—Certain path attributes are configured to be dropped from neighbor updates during inbound processing.</li> <li>• <b>GracefulRestart</b>—Graceful restart is configured.</li> <li>• <b>HoldTime</b>—Hold time configured with the <b>hold-time</b> statement. The hold time is three times the interval at which keepalive messages are sent.</li> <li>• <b>IgnorePathAttributes</b>—Certain path attributes are configured to be ignored in neighbor updates during inbound processing.</li> <li>• <b>Local Address</b>—Address configured with the <b>local-address</b> statement.</li> <li>• <b>Multihop</b>—Allow BGP connections to external peers that are not on a directly connected network.</li> <li>• <b>NLRI</b>—Configured MBGP state for the BGP group: <b>multicast</b>, <b>unicast</b>, or both if you have configured <b>nlri any</b>.</li> <li>• <b>Peer AS</b>—Configured peer autonomous system (AS).</li> <li>• <b>Preference</b>—Preference value configured with the <b>preference</b> statement.</li> <li>• <b>Refresh</b>—Configured to refresh automatically when the policy changes.</li> <li>• <b>Rib-group</b>—Configured routing table group.</li> </ul> |
| Path-attributes dropped     | Path attribute codes that are dropped from neighbor updates.  |
| Path-attributes ignored     | Path attribute codes that are ignored during neighbor updates.  |
| Authentication key change   | (appears only if the <b>authentication-keychain</b> statement has been configured) Name of the authentication keychain enabled.   |
| Authentication algorithm    | (appears only if the <b>authentication-algorithm</b> statement has been configured) Type of authentication algorithm enabled: <b>hmac</b> or <b>md5</b> .   |
| Address families configured | Names of configured address families for the VPN.   |

Table 300: show bgp neighbor Output Fields (*continued*)

|--|---|
| Local Address                          | Address of the local routing device.  |
| Remove-private options                 | Options associated with the <code>remove-private</code> statement.  |
| Holdtime                               | Hold time configured with the <code>hold-time</code> statement. The hold time is three times the interval at which keepalive messages are sent.   |
| Flags for NLRI<br>inet-label-unicast   | Flags related to labeled-unicast: <ul style="list-style-type: none"> <li>• <b>TrafficStatistics</b>—Collection of statistics for labeled-unicast traffic is enabled.</li> </ul>   |
| Traffic statistics                     | Information about labeled-unicast traffic statistics: <ul style="list-style-type: none"> <li>• <b>Options</b>—Options configured for collecting statistics about labeled-unicast traffic.</li> <li>• <b>File</b>—Name and location of statistics log files.</li> <li>• <b>size</b>—Size of all the log files, in bytes.</li> <li>• <b>files</b>—Number of log files.</li> </ul> |
| Traffic Statistics<br>Interval         | Time between sample periods for labeled-unicast traffic statistics, in seconds.   |
| Preference                             | Preference value configured with the <code>preference</code> statement.   |
| Outbound Timer                         | Time for which the route is available in Junos OS routing table before it is exported to BGP. This field is displayed in the output only if the <code>out-delay</code> parameter is configured to a non-zero value.   |
| Number of flaps                        | Number of times the BGP session has gone down and then come back up.  |
| Peer ID                                | Router identifier of the peer.  |
| Group index                            | Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels.   |
| Peer index                             | Index that is unique within the BGP group to which the peer belongs.  |
| Local ID                               | Router identifier of the local routing device.  |
| Local Interface                        | Name of the interface on the local routing device.  |
| Active holdtime                        | Hold time that the local routing device negotiated with the peer.   |
| Keepalive Interval                     | Keepalive interval, in seconds.   |
| BFD                                    | Status of BFD failure detection.  |
| Local Address                          | Name of directly connected interface over which direct EBGP peering is established.   |
| NLRI for restart<br>configured on peer | Names of address families configured for restart.   |

Table 300: show bgp neighbor Output Fields (*continued*)

| Field Name                                      | Field Description   |
|---|---|
| NLRI advertised by peer                         | Address families supported by the peer: <b>unicast</b> or <b>multicast</b> .  |
| NLRI for this session                           | Address families being used for this session.   |
| Peer supports Refresh capability                | Remote peer's ability to send and request full route table readvertisement (route refresh capability). For more information, see RFC 2918, <i>Route Refresh Capability for BGP-4</i> .  |
| Restart time configured on peer                 | Configured time allowed for restart on the neighbor.  |
| Stale routes from peer are kept for             | When graceful restart is negotiated, the maximum time allowed to hold routes from neighbors after the BGP session has gone down.  |
| Peer does not support Restarter functionality   | Graceful restart restarter-mode is disabled on the peer.  |
| Peer does not support Receiver functionality    | Graceful restart helper-mode is disabled on the peer.   |
| Restart time requested by this peer             | Restart time requested by this neighbor during capability negotiation.  |
| Restart flag received from the peer             | When this field appears, the BGP speaker has restarted (Restarting), and this peer should not wait for the <b>end-of-rib</b> marker from the speaker before advertising routing information to the speaker.                               |
| NLRI that peer supports restart for             | Neighbor supports graceful restart for this address family.   |
| NLRI peer can save forwarding state             | Neighbor supporting this address family saves all forwarding states.  |
| NLRI that peer saved forwarding for             | Neighbor saves all forwarding states for this address family.   |
| NLRI that restart is negotiated for             | Router supports graceful restart for this address family.   |
| NLRI of received end-of-rib markers             | Address families for which end-of-routing-table markers are received from the neighbor.   |
| NLRI of all end-of-rib markers sent             | Address families for which end-of-routing-table markers are sent to the neighbor.   |
| Peer supports 4 byte AS extension (peer-as1)    | Peer understands 4-byte AS numbers in BGP messages. The peer is running Junos OS Release 9.1 or later.  |
| NLRIs for which peer can receive multiple paths | Appears in the command output of the local router if the downstream peer is configured to receive multiple BGP routes to a single destination, instead of only receiving the active route.<br><br>Possible value is <b>inet-unicast</b> . |

Table 300: show bgp neighbor Output Fields (*continued*)

| Field Name   | Field Description   |
|--|---|
| NLRIs for which peer can send multiple paths: inet-unicast | Appears in the command output of the local router if the upstream peer is configured to send multiple BGP routes to a single destination, instead of only sending the active route.<br><br>Possible value is <b>inet-unicast</b> .  |
| Table inet.number  | Information about the routing table: <ul style="list-style-type: none"> <li>• <b>RIB State</b>—BGP is in the graceful restart process for this routing table: <b>restart is complete</b> or <b>restart in progress</b>.</li> <li>• <b>Bit</b>—Number that represents the entry in the routing table for this peer.</li> <li>• <b>Send state</b>—State of the BGP group: <b>in sync</b>, <b>not in sync</b>, or <b>not advertising</b>.</li> <li>• <b>Active prefixes</b>—Number of prefixes received from the peer that are active in the routing table.</li> <li>• <b>Received prefixes</b>—Total number of prefixes from the peer, both active and inactive, that are in the routing table.</li> <li>• <b>Accepted prefixes</b>—Total number of prefixes from the peer that have been accepted by a routing policy.</li> <li>• <b>Suppressed due to damping</b>—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.</li> </ul> |
| Last traffic (seconds)                                     | Last time any traffic was received from the peer or sent to the peer, and the last time the local routing device checked.   |
| Input messages   | Messages that BGP has received from the receive socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.   |
| Output messages  | Messages that BGP has written to the transmit socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.   |
| Input dropped path attributes                              | Information about dropped path attributes: <ul style="list-style-type: none"> <li>• <b>Code</b>—Path attribute code.</li> <li>• <b>Count</b>—Path attribute count.</li> </ul>   |
| Input ignored path attributes                              | Information about ignored path attributes: <ul style="list-style-type: none"> <li>• <b>Code</b>—Path attribute code.</li> <li>• <b>Count</b>—Path attribute count.</li> </ul>   |
| Output queue   | Number of BGP packets that are queued to be transmitted to a particular neighbor for a particular routing table. Output queue 0 is for unicast NLRIs, and queue 1 is for multicast NLRIs.<br><br>It also specifies the routing table name and the NLRI they represent in the format ( <b>routing table name, NLRI</b> ).<br><br><b>NOTE:</b> The output queues of routing tables that are not advertised, will only show up at <b>extensive</b> output level.   |
| Trace options  | Configured tracing of BGP protocol packets and operations.  |

Table 300: show bgp neighbor Output Fields (*continued*)

| Field Name              | Field Description   |
|-------------------------|---|
| Trace file              | Name of the file to receive the output of the tracing operation.  |
| Filter Updates rcv      | (orf option only) Number of outbound-route filters received for each configured address family.<br><br><b>NOTE:</b> The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.   |
| Immediate               | (orf option only) Number of route updates received with the immediate flag set. The immediate flag indicates that the BGP peer should readvertise the updated routes.<br><br><b>NOTE:</b> The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list. |
| Filter                  | (orf option only) Type of prefix filter received: <b>prefix-based</b> or <b>extended-community</b> .  |
| Received filter entries | (orf option only) List of received filters displayed.   |
| seq                     | (orf option only) Numerical order assigned to this prefix entry among all the received outbound route filter prefix entries.  |
| prefix                  | (orf option only) Address for the prefix entry that matches the filter.   |
| minlength               | (orf option only) Minimum prefix length, in bits, required to match this prefix.  |
| maxlength               | (orf option only) Maximum prefix length, in bits, required to match this prefix.  |
| match                   | (orf option only) For this prefix match, whether to <b>permit</b> or <b>deny</b> route updates.   |

## Sample Output

### show bgp neighbor

```

user@host > show bgp neighbor

| Output Fields                            | <a href="#">Table 301 on page 3779</a> describes the output fields for the <b>show bgp summary</b> command. Output fields are listed in the approximate order in which they appear.  |

Table 301: show bgp summary Output Fields

| Field Name          | Field Description  |
|---------------------|--|
| <b>Groups</b>       | Number of BGP groups.  |
| <b>Peers</b>        | Number of BGP peers.   |
| <b>Down peers</b>   | Number of down BGP peers.  |
| <b>Table</b>        | Name of routing table.   |
| <b>Tot Paths</b>    | Total number of paths.   |
| <b>Act Paths</b>    | Number of active routes.   |
| <b>Suppressed</b>   | Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols. |
| <b>History</b>      | Number of withdrawn routes stored locally to keep track of damping history.  |
| <b>Damp State</b>   | Number of routes with a figure of merit greater than zero, but still active because the value has not reached the threshold at which suppression occurs.               |
| <b>Pending</b>      | Routes in process by BGP import policy.  |
| <b>Peer</b>         | Address of each BGP peer. Each peer has one line of output.  |
| <b>AS</b>           | Peer's AS number.  |
| <b>InPkt</b>        | Number of packets received from the peer.  |
| <b>OutPkt</b>       | Number of packets sent to the peer.  |
| <b>OutQ</b>         | Number of BGP packets that are queued to be transmitted to a particular neighbor. It normally is 0 because the queue usually is emptied quickly.                       |
| <b>Flaps</b>        | Number of times the BGP session has gone down and then come back up.   |
| <b>Last Up/Down</b> | Last time since the neighbor transitioned to or from the established state.  |

Table 301: show bgp summary Output Fields (*continued*)

| Field Name  | Field Description  |
|---|--|
| <b>State #Active<br/>/Received/Accepted<br/>/Damped</b> | <p>Multipurpose field that displays information about BGP peer sessions. The field's contents depend upon whether a session is established and whether it was established on the main routing device or in a routing instance.</p> <ul style="list-style-type: none"> <li>If a peer is not established, the field shows the state of the peer session: <b>Active</b>, <b>Connect</b>, or <b>Idle</b>. In general, the Idle state is the first stage of a connection. BGP is waiting for a Start event. A session can be idle for other reasons as well. The reason that a session is idle is sometimes displayed. For example: <b>Idle (Removal in progress)</b> or <b>Idle (LicenseFailure)</b>.</li> <li>If a BGP session is established on the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the <b>inet.0</b> (main) and <b>inet.2</b> (multicast) routing tables. For example, <b>8/10/10/2</b> and <b>2/4/4/0</b> indicate the following: <ul style="list-style-type: none"> <li>8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the <b>inet.0</b> routing table.</li> <li>2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the <b>inet.2</b> routing table.</li> </ul> </li> <li>If a BGP session is established in a routing instance, the field indicates the established (<b>Establ</b>) state, identifies the specific routing table that receives BGP updates, and shows the number of active, received, and damped routes that are received from a neighbor. For example, <b>Establ VPN-AB.inet.0: 2/4/0</b> indicates the following: <ul style="list-style-type: none"> <li>The BGP session is established.</li> <li>Routes are received in the <b>VPN-AB.inet.0</b> routing table.</li> <li>The local routing device has two active routes, four received routes, and no damped routes from a BGP peer.</li> </ul> </li> </ul> <p>When a BGP session is established, the peers are exchanging update messages.</p> |

| <b>Description</b>                              | Display information about BGP route flap damping parameters.   |
| <b>Options</b>                                  | <b>none</b> —Display information about BGP route flap damping parameters.<br><br><b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.   |
| <b>Additional Information</b>                   | In the output from this command, figure-of-merit values correlate with the probability of future instability of a routing device. Routes with higher figure-of-merit values are suppressed for longer periods of time. The figure-of-merit value decays exponentially over time. A figure-of-merit value of zero is assigned to each new route. The value is increased each time the route is withdrawn or readvertised, or when one of its path attributes changes. |
| <b>Required Privilege Level</b>                 | view   |
| <b>Related Documentation</b>                    | <ul style="list-style-type: none"><li>• “Configuring BGP Flap Damping Parameters” in the <i>Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices</i></li><li>• <a href="#">clear bgp damping on page 3750</a></li><li>• <a href="#">show route damping on page 3098</a></li></ul>  |
| <b>List of Sample Output</b>                    | <a href="#">show policy damping on page 3785</a>   |
| <b>Output Fields</b>                            | <a href="#">Table 302 on page 3785</a> describes the output fields for the <b>show policy damping</b> command. Output fields are listed in the approximate order in which they appear.   |

Table 302: show policy damping Output Fields

| Field Name                   | Field Description  |
|------------------------------|--|
| <b>Halflife</b>              | Decay half-life, in minutes. The value represents the period during which the accumulated figure-of-merit value is reduced by half if the route remains stable. If a route has flapped, but then becomes stable, the figure-of-merit value for the route decays exponentially. For example, for a route with a figure-of-merit value of 1500, if no incidents occur, its figure-of-merit value is reduced to 750 after 15 minutes and to 375 after another 15 minutes. |
| <b>Reuse merit</b>           | Figure-of-merit value below which a suppressed route can be used again. A suppressed route becomes reusable when its figure-of-merit value decays to a value below a reuse threshold, and the route once again is considered usable and can be installed in the forwarding table and exported from the routing table.  |
| <b>Suppress/cutoff merit</b> | Figure-of-merit value above which a route is suppressed for use or inclusion in advertisements. When a route's figure-of-merit value reaches a particular level, called the cutoff or suppression threshold, the route is suppressed. When a route is suppressed, the routing table no longer installs the route into the forwarding table and no longer exports this route to any of the routing protocols.   |
| <b>Maximum suppress time</b> | Maximum hold-down time, in minutes. The value represents the maximum time that a route can be suppressed no matter how unstable it has been before this period of stability.   |
| <b>Computed values</b>       | <ul style="list-style-type: none"> <li>• <b>Merit ceiling</b>—Maximum merit that a flapping route can collect.</li> <li>• <b>Maximum decay</b>—Maximum decay half-life, in minutes.</li> </ul>   |

## Sample Output

| <b>Output Fields</b>                            | <a href="#">Table 280 on page 3099</a> lists the output fields for the <b>show route damping</b> command. Output fields are listed in the approximate order in which they appear.   |

Table 303: show route damping Output Fields

| Field Name                                   | Field Description   | Level of Output         |
|--|---|-------------------------|
| <i>routing-table-name</i>                    | Name of the routing table—for example, <b>inet.0</b> .  | All levels              |
| <b>destinations</b>                          | Number of destinations for which there are routes in the routing table.   | All levels              |
| <b>number routes</b>                         | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b></li> <li>• <b>holdddown</b> (routes that are in a pending state before being declared inactive)</li> <li>• <b>hidden</b> (the routes are not used because of a routing policy)</li> </ul>  | All levels              |
| <b>destination-prefix (entry, announced)</b> | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.   | <b>detail extensive</b> |
| <b>[protocol, preference]</b>                | Protocol from which the route was learned and the preference value for the route. <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p> | All levels              |
| <b>Next-hop reference count</b>              | Number of references made to the next hop.  | <b>detail extensive</b> |
| <b>Source</b>                                | IP address of the route source.   | <b>detail extensive</b> |
| <b>Next hop</b>                              | Network layer address of the directly reachable neighboring system.   | <b>detail extensive</b> |
| <b>via</b>                                   | Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b> .  | <b>detail extensive</b> |
| <b>Protocol next hop</b>                     | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.  | <b>detail extensive</b> |
| <b>Indirect next hop</b>                     | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.   | <b>detail extensive</b> |
| <b>State</b>                                 | Flags for this route. For a description of possible values for this field, see the output field table for the <a href="#">show route detail</a> command.  | <b>detail extensive</b> |

Table 303: show route damping Output Fields (*continued*)

| Field Name        | Field Description   | Level of Output  |
|-------------------|---|------------------|
| Local AS          | AS number of the local routing device.  | detail extensive |
| Peer AS           | AS number of the peer routing device.   | detail extensive |
| Age               | How long the route has been known.  | detail extensive |
| Metric            | Metric for the route.   | detail extensive |
| Task              | Name of the protocol that has added the route.  | detail extensive |
| Announcement bits | List of protocols that announce this route. <i>n-Resolve inet</i> indicates that the route is used for route resolution for next hops found in the routing table. <i>n</i> is an index used by Juniper Networks customer support only.  | detail extensive |
| AS path           | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• I—IGP.</li> <li>• E—EGP.</li> <li>• ?—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device or if AS path prepending is configured.</li> <li>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• ( )—Parentheses enclose a confederation.</li> <li>• ( [ ] )—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> | All levels       |
| to                | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.   | brief none       |
| via               | Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b> .  | brief none       |
| Communities       | Community path attribute for the route. See the output field table for the <a href="#">show route detail</a> command.   | detail extensive |
| Localpref         | Local preference value included in the route.   | All levels       |
| Router ID         | BGP router ID as advertised by the neighbor in the open message.  | detail extensive |

Table 303: show route damping Output Fields (*continued*)

| Field Name                     | Field Description  | Level of Output         |
|--------------------------------|--|-------------------------|
| <b>Merit (last update/now)</b> | Last updated and current figure-of-merit value.  | <b>detail extensive</b> |
| <b>damping-parameters</b>      | Name that identifies the damping parameters used, which is defined in the damping statement at the <b>[edit policy-options]</b> hierarchy level.                         | <b>detail extensive</b> |
| <b>Last update</b>             | Time of most recent change in path attributes.   | <b>detail extensive</b> |
| <b>First update</b>            | Time of first change in path attributes, which started the route damping process.  | <b>detail extensive</b> |
| <b>Flaps</b>                   | Number of times the route has gone up or down or its path attributes have changed.   | <b>detail extensive</b> |
| <b>Suppressed</b>              | ( <b>suppressed</b> keyword only) This route is currently suppressed. A suppressed route does not appear in the forwarding table and routing protocols do not export it. | All levels              |
| <b>Reusable in</b>             | ( <b>suppressed</b> keyword only) Time when a suppressed route will again be available.  | All levels              |
| <b>Preference will be</b>      | ( <b>suppressed</b> keyword only) Preference value that will be applied to the route when it is again active.  | All levels              |

## Sample Output

### show route damping decayed detail

```

user@host> show route damping decayed detail
inet.0: 173319 destinations, 1533668 routes (172625 active, 4 holddown, 108083
hidden)
10.0.111.0/24 (7 entries, 1 announced)

| <b>Output Fields</b>               | Table 281 on page 3103 describes the output fields for the <b>show route detail</b> command. Output fields are listed in the approximate order in which they appear.  |

**Table 304: show route detail Output Fields**

| Field Name                 | Field Description   |
|----------------------------|---|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).  |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.   |
| <i>number routes</i>       | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li><b>active</b> (routes that are active)</li> <li><b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li><b>hidden</b> (routes that are not used because of a routing policy)</li> </ul> |

Table 304: show route detail Output Fields (*continued*)

| Field Name                                     | Field Description   |
|--|---|
| <i>route-destination</i><br>(entry, announced) | <p>Route destination (for example:10.0.0.1/24). The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul> |
| <b>label stacking</b>                          | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>  |
| <b>[protocol, preference]</b>                  | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+—</b>A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>—</b>A hyphen indicates the last active route.</li> <li>• <b>*—</b>An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>   |
| <b>Level</b>                                   | <p>(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.</p>  |
| <b>Route Distinguisher</b>                     | IP subnet augmented with a 64-bit prefix.   |
| <b>PMSI</b>                                    | Provider multicast service interface (MVPN routing table).  |
| <b>Next-hop type</b>                           | Type of next hop. For a description of possible values for this field, see <a href="#">Table 282 on page 3108</a> .   |

Table 304: show route detail Output Fields (*continued*)

| Field Name   | Field Description   |
|--|---|
| <b>Next-hop reference count</b>                      | Number of references made to the next hop.  |
| <b>Flood nexthop branches exceed maximum message</b> | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.   |
| <b>Source</b>  | IP address of the route source.   |
| <b>Next hop</b>                                      | Network layer address of the directly reachable neighboring system.   |
| <b>via</b>   | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul> |
| <b>Label-switched-path<br/>lsp-path-name</b>         | Name of the LSP used to reach the next hop.   |
| <b>Label operation</b>                               | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).  |
| <b>Interface</b>                                     | (Local only) Local interface name.  |
| <b>Protocol next hop</b>                             | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.  |
| <b>Indirect next hop</b>                             | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.   |
| <b>State</b>   | State of the route (a route can be in more than one state). See <a href="#">Table 283 on page 3109</a> .  |
| <b>Local AS</b>                                      | AS number of the local routing device.  |
| <b>Age</b>   | How long the route has been known.  |
| <b>AIGP</b>  | Accumulated interior gateway protocol (AIGP) BGP attribute.   |
| <b>Metricn</b>                                       | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.   |

Table 304: show route detail Output Fields (*continued*)

| Field Name                 | Field Description   |
|----------------------------|---|
| <b>MED-plus-IGP</b>        | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.   |
| <b>TTL-Action</b>          | <p>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</p> <p>For sample output, see <a href="#">show route table</a>.</p>   |
| <b>Task</b>                | Name of the protocol that has added the route.  |
| <b>Announcement bits</b>   | List of protocols that announce this route. <b>n-Resolve inet</b> indicates that the route is used for route resolution for next hops found in the routing table. <b>n</b> is an index used by Juniper Networks customer support only.  |
| <b>AS path</b>             | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li><b>I</b>—IGP.</li> <li><b>E</b>—EGP.</li> <li><b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li><b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li><b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.</li> <li><b>[ ]</b>—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li><b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li><b>( )</b>—Parentheses enclose a confederation.</li> <li><b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| <b>validation-state</b>    | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li><b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li><b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li><b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li><b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>   |
| <b>FECs bound to route</b> | Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.   |

Table 304: show route detail Output Fields (*continued*)

| Field Name                | Field Description   |
|---------------------------|---|
| Primary Upstream          | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path. |
| RPF Nexthops              | When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.   |
| Label                     | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.                         |
| weight                    | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.  |
| VC Label                  | MPLS label assigned to the Layer 2 circuit virtual connection.  |
| MTU                       | Maximum transmission unit (MTU) of the Layer 2 circuit.   |
| VLAN ID                   | VLAN identifier of the Layer 2 circuit.   |
| Prefixes bound to route   | Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.  |
| Communities               | Community path attribute for the route. See <a href="#">Table 284 on page 3111</a> for all possible values for this field.  |
| Layer2-info: encaps       | Layer 2 encapsulation (for example, VPLS).  |
| control flags             | Control flags: <b>none</b> or <b>Site Down</b> .  |
| mtu                       | Maximum transmission unit (MTU) information.  |
| Label-Base, range         | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.  |
| status vector             | Layer 2 VPN and VPLS network layer reachability information (NLRI).   |
| Accepted Multipath        | Current active path when BGP multipath is configured.   |
| Accepted MultipathContrib | Path currently contributing to BGP multipath.   |
| Localpref                 | Local preference value included in the route.   |
| Router ID                 | BGP router ID as advertised by the neighbor in the open message.  |
| Primary Routing Table     | In a routing table group, the name of the primary routing table in which the route resides.   |
| Secondary Tables          | In a routing table group, the name of one or more secondary tables in which the route resides.  |

Table 282 on page 3108 describes all possible values for the Next-hop Types output field.

**Table 305: Next-hop Types Output Field Values**

| Next-Hop Type                   | Description  |
|---------------------------------|--|
| <b>Broadcast (bcast)</b>        | Broadcast next hop.  |
| <b>Deny</b>                     | Deny next hop.   |
| <b>Discard</b>                  | Discard next hop.  |
| <b>Flood</b>                    | Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast. |
| <b>Hold</b>                     | Next hop is waiting to be resolved into a unicast or multicast type.   |
| <b>Indexed (idxd)</b>           | Indexed next hop.  |
| <b>Indirect (indr)</b>          | Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.   |
| <b>Interface</b>                | Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.   |
| <b>Local (locl)</b>             | Local address on an interface. This next-hop type causes packets with this destination address to be received locally.   |
| <b>Multicast (mcst)</b>         | Wire multicast next hop (limited to the LAN).  |
| <b>Multicast discard (mdsc)</b> | Multicast discard.   |
| <b>Multicast group (mgrp)</b>   | Multicast group member.  |
| <b>Receive (recv)</b>           | Receive.   |
| <b>Reject (rjct)</b>            | Discard. An ICMP unreachable message was sent.   |
| <b>Resolve (rslv)</b>           | Resolving next hop.  |
| <b>Routed multicast (mcrt)</b>  | Regular multicast next hop.  |

Table 305: Next-hop Types Output Field Values (*continued*)

| Next-Hop Type         | Description  |
|-----------------------|--|
| <b>Router</b>         | <p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> <li>• Must not be a direct or local subnet for the routing device.</li> <li>• Must have a next hop that is directly connected to the routing device.</li> </ul> |
| <b>Table</b>          | Routing table next hop.  |
| <b>Unicast (ucst)</b> | Unicast.   |
| <b>Unilist (ulst)</b> | List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.  |

Table 283 on page 3109 describes all possible values for the State output field. A route can be in more than one state (for example, <Active NoReadvrt Int Ext>).

Table 306: State Output Field Values

| Value  | Description  |
|--|--|
| <b>Accounting</b>                            | Route needs accounting.  |
| <b>Active</b>                                | Route is active.   |
| <b>Always Compare MED</b>                    | Path with a lower multiple exit discriminator (MED) is available.                |
| <b>AS path</b>                               | Shorter AS path is available.  |
| <b>Cisco Non-deterministic MED selection</b> | Cisco nondeterministic MED is enabled, and a path with a lower MED is available. |
| <b>Clone</b>                                 | Route is a clone.  |
| <b>Cluster list length</b>                   | Length of cluster list sent by the route reflector.                              |
| <b>Delete</b>                                | Route has been deleted.  |
| <b>Ex</b>                                    | Exterior route.  |
| <b>Ext</b>                                   | BGP route received from an external BGP neighbor.                                |

Table 306: State Output Field Values (*continued*)

| Value  | Description  |
|--|--|
| <b>FlashAll</b>  | Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes. |
| <b>Hidden</b>  | Route not used because of routing policy.  |
| <b>IfCheck</b>   | Route needs forwarding RPF check.  |
| <b>IGP metric</b>  | Path through next hop with lower IGP metric is available.  |
| <b>Inactive reason</b>                                   | Flags for this route, which was not selected as best for a particular destination.   |
| <b>Initial</b>   | Route being added.   |
| <b>Int</b>   | Interior route.  |
| <b>Int Ext</b>   | BGP route received from an internal BGP peer or a BGP confederation peer.  |
| <b>Interior &gt; Exterior &gt; Exterior via Interior</b> | Direct, static, IGP, or EBGP path is available.  |
| <b>Local Preference</b>                                  | Path with a higher local preference value is available.  |
| <b>Martian</b>   | Route is a martian (ignored because it is obviously invalid).  |
| <b>MartianOK</b>   | Route exempt from martian filtering.   |
| <b>Next hop address</b>                                  | Path with lower metric next hop is available.  |
| <b>No difference</b>                                     | Path from neighbor with lower IP address is available.   |
| <b>NoReadvrt</b>   | Route not to be advertised.  |
| <b>NotBest</b>   | Route not chosen because it does not have the lowest MED.  |
| <b>Not Best in its group</b>                             | Incoming BGP AS is not the best of a group (only one AS can be the best).  |
| <b>NotInstall</b>  | Route not to be installed in the forwarding table.   |
| <b>Number of gateways</b>                                | Path with a greater number of next hops is available.  |
| <b>Origin</b>  | Path with a lower origin code is available.  |
| <b>Pending</b>   | Route pending because of a hold-down configured on another route.  |

Table 306: State Output Field Values (*continued*)

| Value                                 | Description   |
|---------------------------------------|---|
| <b>Release</b>                        | Route scheduled for release.  |
| <b>RIB preference</b>                 | Route from a higher-numbered routing table is available.  |
| <b>Route Distinguisher</b>            | 64-bit prefix added to IP subnets to make them unique.  |
| <b>Route Metric or MED comparison</b> | Route with a lower metric or MED is available.  |
| <b>Route Preference</b>               | Route with lower preference value is available  |
| <b>Router ID</b>                      | Path through a neighbor with lower ID is available.   |
| <b>Secondary</b>                      | Route not a primary route.  |
| <b>Unusable path</b>                  | Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> <li>• The route is damped.</li> <li>• The route is rejected by an import policy.</li> <li>• The route is unresolved.</li> </ul> |
| <b>Update source</b>                  | Last tiebreaker is the lowest IP address value.   |

Table 284 on page 3111 describes the possible values for the Communities output field.

Table 307: Communities Output Field Values

| Value   | Description   |
|---|---|
| <i>area-number</i>                                      | 4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.  |
| <b>bandwidth: local AS number:link-bandwidth-number</b> | Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute. |
| <b>domain-id</b>  | Unique configurable number that identifies the OSPF domain.   |
| <b>domain-id-vendor</b>                                 | Unique configurable number that further identifies the OSPF domain.   |
| <i>link-bandwidth-number</i>                            | Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second).   |
| <i>local AS number</i>                                  | Local AS number: from 1 through 65,535.   |
| <i>options</i>  | 1 byte. Currently this is only used if the route type is 5 or 7. Setting the least significant bit in the field indicates that the route carries a type 2 metric.   |

Table 307: Communities Output Field Values (*continued*)

| Value                                | Description   |
|--------------------------------------|---|
| <b>origin</b>                        | (Used with VPNs) Identifies where the route came from.  |
| <b>ospf-route-type</b>               | 1 byte, encoded as 1 or 2 for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); 3 for summary routes; 5 for external routes (area number must be 0); 7 for NSSA routes; or 129 for sham link endpoint addresses. |
| <b>route-type-vendor</b>             | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x8000</b> . The format is <b>area-number:ospf-route-type:options</b> .  |
| <b>rte-type</b>                      | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x0306</b> . The format is <b>area-number:ospf-route-type:options</b> .  |
| <b>target</b>                        | Defines which VPN the route participates in; <b>target</b> has the format <b>32-bit IP address:16-bit number</b> . For example, 10.19.0.0:100.  |
| <b>unknown IANA</b>                  | Incoming IANA codes with a value between <b>0x1</b> and <b>0x7fff</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.  |
| <b>unknown OSPF vendor community</b> | Incoming IANA codes with a value above <b>0x8000</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.   |

## IS-IS Overview

The IS-IS protocol is an interior gateway protocol (IGP) that uses link-state information to make routing decisions.

IS-IS is a link-state IGP that uses the shortest-path-first (SPF) algorithm to determine routes. IS-IS evaluates the topology changes and determines whether to perform a full SPF recalculation or a partial route calculation (PRC). This protocol originally was developed for routing International Organization for Standardization (ISO) Connectionless Network Protocol (CLNP) packets.

Like OSPF routing, IS-IS uses hello packets that allow network convergence to occur quickly when network changes are detected. IS-IS uses the SPF algorithm to determine routes. Using SPF, IS-IS evaluates network topology changes and determines if a full or partial route calculation is required.

**NOTE:** Because IS-IS uses ISO addresses, the configuration of IP version 6 (IPv6) and IP version 4 (IPv4) implementations of IS-IS is identical.

**NOTE:** See *Platforms/FPCs That Cannot Forward TCC Encapsulated ISO Traffic* to find a list of those devices and FPC configurations that cannot pass ISO traffic when encapsulated in TCC format.

This section discusses the following topics:

- [IS-IS Terminology on page 3812](#)
- [ISO Network Addresses on page 3813](#)
- [IS-IS Packets on page 3814](#)
- [Persistent Route Reachability on page 3815](#)

- [Installing a Default Route to the Nearest Routing Device That Operates at Both IS-IS Levels on page 3816](#)

---

### IS-IS Terminology

An IS-IS network is a single autonomous system (AS), also called a *routing domain*, that consists of *end systems* and *intermediate systems*. End systems are network entities that send and receive packets. Intermediate systems send and receive packets and relay (forward) packets. (Intermediate system is the Open System Interconnection [OSI] term for a router.) ISO packets are called network PDUs.

In IS-IS, a single AS can be divided into smaller groups called *areas*. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring *Level 1* and *Level 2* intermediate systems. Level 1 systems route within an area; when the destination is

outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs. No IS-IS area functions strictly as a backbone.

Level 1 routers share intra-area routing information, and Level 2 routers share interarea information about IP addresses available within each area. Uniquely, IS-IS routers can act as both Level 1 and Level 2 routers, sharing intra-area routes with other Level 1 routers and interarea routes with other Level 2 routers.

The propagation of link-state updates is determined by the level boundaries. All routers within a level maintain a complete link-state database of all other routers in the same level. Each router then uses the Dijkstra algorithm to determine the shortest path from the local router to other routers in the link-state database.

### ISO Network Addresses

IS-IS uses ISO network addresses. Each address identifies a point of connection to the network, such as a router interface, and is called a *network service access point (NSAP)*.

IS-IS supports multiple NSAP addresses on the loopback lo0 interface.

An end system can have multiple NSAP addresses, in which case the addresses differ only by the last byte (called the *n-selector*). Each NSAP represents a service that is available at that node. In addition to having multiple services, a single node can belong to multiple areas.

Each network entity also has a special network address called a *network entity title (NET)*. Structurally, an NET is identical to an NSAP address but has an n-selector of 00. Most end systems and intermediate systems have one NET. Intermediate systems that participate in multiple areas can have multiple NETs.

The following ISO addresses illustrate the IS-IS address format:

```
49.0001.00a0.c96b.c490.00
49.0001.2081.9716.9018.00
```

NETs take several forms, depending on your network requirements. NET addresses are hexadecimal and range from 8 octets to 20 octets in length. Generally, the format consists of an authority and format Identifier (AFI), a domain ID, an area ID, a system identifier, and a selector. The simplest format omits the domain ID and is 10 octets long. For example, the NET address 49.0001.1921.6800.1001.00 consists of the following parts:

- 49—AFI
- 0001—Area ID
- 1921.6800.1001—System identifier
- 00—Selector

The system identifier must be unique within the network. For an IP-only network, we recommend using the IP address of an interface on the router. Configuring a loopback NET address with the IP address is helpful when troubleshooting is required on the network.

The first portion of the address is the area number, which is a variable number from 1 through 13 bytes. The first byte of the area number (49) is the authority and format indicator (AFI). The next bytes are the assigned domain (area) identifier, which can be from 0 through 12 bytes. In the examples above, the area identifier is 0001.

The next six bytes form the system identifier. The system identifier can be any six bytes that are unique throughout the entire domain. The system identifier commonly is the media access control (MAC) address (as in the first example, 00a0.c96b.c490) or the IP address expressed in binary-coded decimal (BCD) (as in the second example, 2081.9716.9018, which corresponds to IP address 208.197.169.18). The last byte (00) is the n-selector.

**NOTE:** The system identifier cannot be 0000.0000.0000. All 0s is an illegal setting, and the adjacency is not formed with this setting.

To provide help with IS-IS debugging, the Junos® operating system (Junos OS) supports dynamic mapping of ISO system identifiers to the hostname. Each system can be configured with a hostname, which allows the system identifier-to-hostname mapping to be carried in a dynamic hostname type, length, and value (TLV) tuple in IS-IS link-state PDUs. This enables intermediate systems in the routing domain to learn about the ISO system identifier of a particular intermediate system.

---

### IS-IS Packets

---

Each IS-IS PDU shares a common header. IS-IS uses the following PDUs to exchange protocol information:

- IS-IS hello (IIH) PDUs—Broadcast to discover the identity of neighboring IS-IS systems and to determine whether the neighbors are Level 1 or Level 2 intermediate systems.

IS-IS hello PDUs establish adjacencies with other routers and have three different formats: one for point-to-point hello packets, one for Level 1 broadcast links, and one for Level 2 broadcast links. Level 1 routers must share the same area address to form an adjacency, while Level 2 routers do not have this limitation. The request for adjacency is encoded in the Circuit type field of the PDU.

Hello PDUs have a preset length assigned to them. The IS-IS router does not resize any PDU to match the maximum transmission unit (MTU) on a router interface. Each interface supports the maximum IS-IS PDU of 1492 bytes, and hello PDUs are padded to meet the maximum value. When the hello is sent to a neighboring router, the connecting interface supports the maximum PDU size.

- Link-state PDUs—Contain information about the state of adjacencies to neighboring IS-IS systems. Link-state PDUs are flooded periodically throughout an area.

Also included is metric and IS-IS neighbor information. Each link-state PDU must be refreshed periodically on the network and is acknowledged by information within a sequence number PDU.

On point-to-point links, each link-state PDU is acknowledged by a partial sequence number PDU (PSNP), but on broadcast links, a complete sequence number PDU

(CSNP) is sent out over the network. Any router that finds newer link-state PDU information in the CSNP then purges the out-of-date entry and updates the link-state database.

Link-state PDUs support variable-length subnet mask addressing.

- Complete sequence number PDUs (CSNPs)—Contain a complete list of all link-state PDUs in the IS-IS database. CSNPs are sent periodically on all links, and the receiving systems use the information in the CSNP to update and synchronize their link-state PDU databases. The designated router multicasts CSNPs on broadcast links in place of sending explicit acknowledgments for each link-state PDU.

Contained within the CSNP is a link-state PDU identifier, a lifetime, a sequence number, and a checksum for each entry in the database. Periodically, a CSNP is sent on both broadcast and point-to-point links to maintain a correct database. Also, the advertisement of CSNPs occurs when an adjacency is formed with another router. Like IS-IS hello PDUs, CSNPs come in two types: Level 1 and Level 2.

When a device receives a CSNP, it checks the database entries against its own local link-state database. If it detects missing information, the device requests specific link-state PDU details using a partial sequence number PDU (PSNP).

- Partial sequence number PDUs (PSNPs)—Sent multicast by a receiver when it detects that it is missing a link-state PDU (when its link-state PDU database is out of date). The receiver sends a PSNP to the system that transmitted the CSNP, effectively requesting that the missing link-state PDU be transmitted. That routing device, in turn, forwards the missing link-state PDU to the requesting routing device.

A PSNP is used by an IS-IS router to request link-state PDU information from a neighboring router. A PSNP can also explicitly acknowledge the receipt of a link-state PDU on a point-to-point link. On a broadcast link, a CSNP is used as implicit knowledge. Like hello PDUs and CSNPs, the PSNP also has two types: Level 1 and Level 2.

When a device compares a CSNP to its local database and determines that a link-state PDU is missing, the router issues a PSNP for the missing link-state PDU, which is returned in a link-state PDU from the router sending the CSNP. The received link-state PDU is then stored in the local database, and an acknowledgment is sent back to the originating router.

### Persistent Route Reachability

IPv4 and IPv6 route reachability information in IS-IS link-state PDUs is preserved when you commit a configuration. IP prefixes are preserved with their original packet fragment upon link-state PDU regeneration.

### IS-IS Support for Multipoint Network Clouds

IS-IS does not support multipoint configurations. Therefore, when configuring Frame Relay or Asynchronous Transfer Mode (ATM) networks, you must configure them as collections of point-to-point links, not as multipoint clouds.

### Installing a Default Route to the Nearest Routing Device That Operates at Both IS-IS Levels

When a routing device that operates as both a Level 1 and Level 2 router (Router B) determines that it can reach at least one area other than its own (for example, in Area Y), it sets the ATTACHED bit in its Level 1 link-state PDU. Thereafter, the Level 1 router (Router A) introduces a default route pointing to the nearest attached routing device that operates as both a Level 1 and Level 2 router (Router B). See [Figure 98 on page 3816](#).

**Figure 98: Install Default Route to Nearest Routing Device That Operates at Both Level 1 and Level 2**

- [IS-IS Feature Guide for Routing Devices](#)

### Understanding BFD Authentication for IS-IS

Bidirectional Forwarding Detection (BFD) enables rapid detection of communication failures between adjacent systems. By default, authentication for BFD sessions is disabled. However, when running BFD over Network Layer protocols, the risk of service attacks can be significant. We strongly recommend using authentication if you are running BFD over multiple hops or through insecure tunnels. Beginning with Junos OS Release 9.6, Junos OS supports authentication for BFD sessions running over IS-IS. BFD authentication is only supported in the domestic image and is not available in the export image.

You authenticate BFD sessions by specifying an authentication algorithm and keychain, and then associating that configuration information with a security authentication keychain using the keychain name.

The following sections describe the supported authentication algorithms, security keychains, and level of authentication that can be configured:

- [BFD Authentication Algorithms on page 3817](#)
- [Security Authentication Keychains on page 3817](#)
- [Strict Versus Loose Authentication on page 3818](#)

## BFD Authentication Algorithms

Junos OS supports the following algorithms for BFD authentication:

- **simple-password**—Plain-text password. One to 16 bytes of plain text are used to authenticate the BFD session. One or more passwords might be configured. This method is the least secure and should be used only when BFD sessions are not subject to packet interception.
- **keyed-md5**—Keyed Message Digest 5 hash algorithm for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed MD5 uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than or equal to the last sequence number received. Although more secure than a simple password, this method is vulnerable to replay attacks. Increasing the rate at which the sequence number is updated can reduce this risk.
- **meticulous-keyed-md5**—Meticulous keyed Message Digest 5 hash algorithm. This method works in the same manner as keyed MD5, but the sequence number is updated with every packet. Although more secure than keyed MD5 and simple passwords, this method might take additional time to authenticate the session.
- **keyed-sha-1**—Keyed Secure Hash Algorithm I for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed SHA uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. The key is not carried within the packets. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than the last sequence number received.
- **meticulous-keyed-sha-1**—Meticulous keyed Secure Hash Algorithm I. This method works in the same manner as keyed SHA, but the sequence number is updated with every packet. Although more secure than keyed SHA and simple passwords, this method might take additional time to authenticate the session.

**NOTE:** Nonstop active routing (NSR) is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

## Security Authentication Keychains

The security authentication keychain defines the authentication attributes used for authentication key updates. When the security authentication keychain is configured and associated with a protocol through the keychain name, authentication key updates can occur without interrupting routing and signaling protocols.

The authentication keychain contains one or more keychains. Each keychain contains one or more keys. Each key holds the secret data and the time at which the key becomes valid. The algorithm and keychain must be configured on both ends of the BFD session,

and they must match. Any mismatch in configuration prevents the BFD session from being created.

BFD allows multiple clients per session, and each client can have its own keychain and algorithm defined. To avoid confusion, we recommend specifying only one security authentication keychain.

### Strict Versus Loose Authentication

---

By default, strict authentication is enabled and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure *loose checking*. When loose checking is configured, packets are accepted without authentication being checked at each end of the session. This feature is intended for transitional periods only.

**Related Documentation** • [Example: Configuring BFD Authentication for IS-IS on page 3855](#)

## Understanding Hitless Authentication Key Rollover for IS-IS

IS-IS protocol exchanges can be authenticated to guarantee that only trusted routing devices participate in routing. By default, authentication is disabled. The authentication algorithm creates an encoded checksum that is included in the transmitted packet. The receiving routing device uses an authentication key (password) to verify the packet's checksum.

If you configure authentication for all peers, each peer in that group inherits the group's authentication.

You can update authentication keys without resetting any IS-IS neighbor sessions. This is referred to as *hitless authentication key rollover*.

Hitless authentication key rollover uses authentication keychains, which consist of the authentication keys that are being updated. The keychain includes multiple keys. Each key in the keychain has a unique start time. At the next key's start time, a rollover occurs from the current key to the next key, and the next key becomes the current key.

You can choose the algorithm through which authentication is established. You can configure MD5 or SHA-1 authentication. You associate a keychain and the authentication algorithm with an IS-IS neighboring session. Each key contains an identifier and a secret password.

The sending peer chooses the active key based on the system time and the start times of the keys in the keychain. The receiving peer determines the key with which it authenticates based on the incoming key identifier.

You can configure either RFC 5304-based encoding or RFC 5310-based encoding for the IS-IS protocol transmission encoding format.

**Related Documentation** • [Example: Configuring Hitless Authentication Key Rollover for IS-IS on page 3837](#)

## Understanding Loop-Free Alternate Routes for IS-IS

In Junos OS Release 9.5 and later, support for IS-IS loop-free alternate routes enables IP fast-reroute capability for IS-IS. Junos OS precomputes loop-free backup routes for all IS-IS routes. These backup routes are preinstalled in the Packet Forwarding Engine, which performs a local repair and implements the backup path when the link for a primary next hop for a particular route is no longer available. With local repair, the Packet Forwarding Engine can correct a path failure before it receives recomputed paths from the Routing Engine. Local repair reduces the amount of time needed to reroute traffic to less than 50 milliseconds. In contrast, global repair can take up to 800 milliseconds to compute a new route. Local repair and global repair are thus complementary. Local repair enables traffic to continue to be routed using a backup path until global repair is able to calculate a new route.

A loop-free path is one that does not forward traffic back through the routing device to reach a given destination. That is, a neighbor whose shortest path to the destination traverses the routing device is not used as a backup route to that destination. To determine loop-free alternate paths for IS-IS routes, Junos OS runs shortest-path-first (SPF) calculations on each one-hop neighbor. You can enable support for alternate loop-free routes on any IS-IS interface. Because it is common practice to enable LDP on an interface for which IS-IS is already enabled, this feature also provides support for LDP label-switched paths (LSPs).

**NOTE:** If you enable support for alternate loop-free routes on an interface configured for both LDP and IS-IS, you can use the `traceroute` command to trace the active path to the primary next hop.

The level of backup coverage available through IS-IS routes depends on the actual network topology and is typically less than 100 percent for all destinations on any given routing device. You can extend backup coverage to include RSVP LSPs.

Junos OS provides two mechanisms for route redundancy for IS-IS through alternate loop-free routes: link protection and node-link protection. When you enable link protection or node-link protection on an IS-IS interface, Junos OS creates a single alternate path to the primary next hop for all destination routes that traverse a protected interface. Link protection offers per-link traffic protection. Use link protection when you assume that only a single link might become unavailable but that the neighboring node on the primary path would still be available through another interface.

Node-link protection establishes an alternate path through a different routing device altogether. Use node-link protection when you assume that access to a node is lost when a link is no longer available. As a result, Junos OS calculates a backup path that avoids the primary next-hop routing device. In Junos OS Release 9.4 and earlier, only the RSVP protocol supports Packet Forwarding Engine local repair and fast reroute as well as link protection and node protection.

In [Figure 99 on page 3820](#), Case 2 shows how link protection allows source Router A to switch to Link B when the primary next hop Link A to destination Router C fails. However,

if Router B fails, Link B also fails, and the protected Link A is lost. If node-link protection is enabled, Router A is able to switch to Link D on Router D and bypass the failed Router B altogether. As shown in Case 1, with node-link protection enabled, Router A has a node-link protection alternate path available through Router D to destination Router C. That means that if Router B fails, Router A can still reach Router C because the path from Router A to Link D remains available as an alternate backup path.

**Figure 99: Link Protection and Node-Link Protection Comparison for IS-IS Routes**

The Junos OS implementation of support for loop-free alternate paths for IS-IS routes is based on the following standards:

- RFC 5286, *Basic Specification for IP Fast-Reroute: Loop-free Alternates*
- RFC 5714, *IP Fast Reroute Framework*

### Configuring Link Protection for IS-IS

You can configure link protection on any interface for which IS-IS is enabled. When you enable link protection, Junos OS creates one alternate path to the primary next hop for all destination routes that traverse a protected interface. Link protection assumes that only a single link becomes unavailable but that the neighboring node would still be available through another interface.

**NOTE:** You must also configure a per-packet load-balancing routing policy to ensure that the routing protocol process installs all the next hops for a given route in the routing table.

To enable link protection, include the **link-protection** statement at the **[edit protocols isis interface *interface-name*]** hierarchy level:

```
[edit]
protocols {
  isis {
    interface interface-name {
      link-protection;
    }
  }
}
```

### Configuring Node-Link Protection for IS-IS

You can configure node-link protection on any interface for which IS-IS is enabled. Node-link protection establishes an alternate path through a different routing device altogether for all destination routes that traverse a protected interface. Node-link protection assumes that the entire routing device, or node, has failed. Junos OS therefore calculates a backup path that avoids the primary next-hop routing device.

**NOTE:** You must also configure a per-packet load-balancing routing policy to ensure that the routing protocol process installs all the next hops for a given route in the routing table.

To enable node-link protection, include the **node-link-protection** statement at the **[edit protocols isis interface *interface-name*]** hierarchy level:

```
[edit]
protocols {
  isis {
    interface interface-name {
      node-link-protection;
    }
  }
}
```

### Excluding an IS-IS Interface as a Backup for Protected Interfaces

By default, all IS-IS interfaces that belong to the master instance or a specific routing instance are eligible as backup interfaces for protected interfaces. You can specify that any IS-IS interface be excluded from functioning as a backup interface to protected interfaces. To exclude an IS-IS interface as a backup interface, include the **no-eligible-backup** statement at the **[edit protocols isis interface *interface-name*]** hierarchy level:

```
[edit]
protocols {
  isis {
    interface interface-name {
      no-eligible-backup;
    }
  }
}
```

### Configuring RSVP Label-Switched Paths as Backup Paths for IS-IS

---

Relying on the shortest-path-first (SPF) calculation of backup paths for one-hop neighbors might result in less than 100 percent backup coverage for a specific network topology. You can enhance coverage of IS-IS and LDP label-switched paths (LSPs) by configuring RSVP LSPs as backup paths. To configure a specific RSVP LSP as a backup path, include the **backup** statement at the **[edit protocols mpls label-switched-path *lsp-name*]** hierarchy level:

```
[edit]
protocols {
  mpls {
    label-switched-path lsp-name {
      backup;
      to ip-address;
    }
  }
}
```

When configuring an LSP, you must specify the IP address of the egress routing device with the **to** statement. For detailed information about configuring LSPs and RSVP, see the *RSVP Feature Guide for Routing Devices*.

### Using Operational Mode Commands to Monitor Protected IS-IS Routes

---

You can issue operational mode commands that provide more details about your link-protected and node-link-protected IS-IS routes. The following guidelines explain the type of information available from the output of each command:

- **show isis backup label-switched-path**—Displays which MPLS LSPs have been designated as backup paths and the current status of those LSPs.
- **show isis backup spf results**—Displays SPF calculations for each neighbor for a given destination. Indicates whether a specific interface or node has been designated as a backup path and why. Use the **no-coverage** option to display only those nodes that do not have backup coverage.
- **show isis backup coverage**—Displays the percentage of nodes and prefixes for each type of address family that is protected.
- **show isis interface detail**—Displays the type of protection (link or node-link) applied to each protected interface.

## Configuration Guidelines

---

- [Example: Configuring IS-IS on page 3823](#)

### Example: Configuring IS-IS

This example shows how to configure IS-IS.

- [Requirements on page 3823](#)
- [Overview on page 3823](#)
- [Configuration on page 3824](#)
- [Verification on page 3826](#)

#### Requirements

---

No special configuration beyond device initialization is required before configuring this example.

#### Overview

---

In this example, you configure the two IS-IS routing devices in a single area. The devices have NET addresses 49.0002.0192.0168.0001.00 and 49.0002.0192.0168.0002.00 on the lo0 interfaces. Additionally, you configure the ISO family on the IS-IS interfaces.

For Junos OS security devices only, you configure the **mode packet-based** statement at the **[edit security forwarding-options family iso]** hierarchy level.

[Figure 100 on page 3824](#) shows the topology used in this example.

Figure 100: Simple IS-IS Topology

“CLI Quick Configuration” on page 3824 shows the configuration for both of the devices in Figure 100 on page 3824. The section “Step-by-Step Procedure” on page 3824 describes the steps on Device R1.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set security forwarding-options family iso mode packet-based
set interfaces ge-1/2/0 unit 0 description to-R2
set interfaces ge-1/2/0 unit 0 family inet address 10.0.0.1/30
set interfaces ge-1/2/0 unit 0 family iso
set interfaces lo0 unit 0 family inet address 192.168.0.1/32
set interfaces lo0 unit 0 family iso address 49.0002.0192.0168.0001.00
set protocols isis interface ge-1/2/0.0
set protocols isis interface lo0.0

```

**Device R2**

```

set security forwarding-options family iso mode packet-based
set interfaces ge-1/2/0 unit 0 description to-R1
set interfaces ge-1/2/0 unit 0 family inet address 10.0.0.2/30
set interfaces ge-1/2/0 unit 0 family iso
set interfaces lo0 unit 0 family inet address 192.168.0.2/32
set interfaces lo0 unit 0 family iso address 49.0002.0192.0168.0002.00
set protocols isis interface ge-1/2/0.0
set protocols isis interface lo0.0

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IS-IS:

1. Enable IS-IS if your router is in secure context.
 

```

[edit security forwarding-options family iso]
user@R1# set mode packet-based
      
```
2. Create the interface that connects to Device R2, and configure the ISO family on the interface.
 

```

[edit interfaces ge-1/2/0 unit 0]
user@R1# set description to-R2
user@R1# set family inet address 10.0.0.1/30
user@R1# set family iso
      
```

3. Create the loopback interface, set the IP address, and set the NET address.

```
[edit interfaces lo0 unit 0]
user@R1# set family inet address 192.168.0.1/32
user@R1# set family iso address 49.0002.0192.0168.0001.00
```

4. Enable IS-IS on the interfaces.

```
[edit protocols isis]
user@R1# set interface ge-1/2/0.0
user@R1# set interface lo0.0
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show security** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show security
forwarding-options {
  family iso {
    mode packet-based;
  }
}

user@R1# show interfaces
ge-1/2/0 {
  unit 0 {
    description to-R2;
    family inet {
      address 10.0.0.1/30;
    }
    family iso;
  }
}
lo0 {
  unit 0 {
    family inet {
      address 192.168.0.1/32;
    }
    family iso {
      address 49.0002.0192.0168.0001.00;
    }
  }
}

user@R1# show protocols
isis {
  interface ge-1/2/0.0;
  interface lo0.0;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying IS-IS Interface Configuration on page 3826](#)
- [Verifying IS-IS Interface Configuration in Detail on page 3826](#)
- [Verifying IS-IS Adjacencies on page 3827](#)
- [Verifying IS-IS Adjacencies in Detail on page 3827](#)

### Verifying IS-IS Interface Configuration

**Purpose** Verify the status of the IS-IS-enabled interfaces.

**Action** From operational mode, enter the **show isis interface brief** command.

```
user@R1> show isis interface brief
IS-IS interface database:
Interface          L CirID Level 1 DR          Level 2 DR          L1/L2 Metric
lo0.0              3  0x1 Passive                Passive              0/0
ge-1/2/0.0         3  0x1 R2.02                  R2.02                10/10
```

**Meaning** Verify that the output shows the intended configuration of the interfaces on which IS-IS is enabled.

### Verifying IS-IS Interface Configuration in Detail

**Purpose** Verify the details of IS-IS-enabled interfaces.

**Action** From operational mode, enter the **show isis interface detail** command.

```
user@R1> show isis interface detail
IS-IS interface database:
lo0.0
  Index: 75, State: 0x6, Circuit id: 0x1, Circuit type: 0
  LSP interval: 100 ms, CSNP interval: disabled
  Adjacency advertisement: Advertise
  Level Adjacencies Priority Metric Hello (s) Hold (s) Designated Router
    1              0      64      0 Passive
    2              0      64      0 Passive
ge-1/2/0.0
  Index: 77, State: 0x6, Circuit id: 0x1, Circuit type: 3
  LSP interval: 100 ms, CSNP interval: 10 s
  Adjacency advertisement: Advertise
  Level Adjacencies Priority Metric Hello (s) Hold (s) Designated Router
    1              1      64     10    9.000    27 R2.02 (not us)
    2              1      64     10    9.000    27 R2.02 (not us)
```

**Meaning** Check the following output fields and verify that the output shows the intended configuration of IS-IS-enabled interfaces:

- Interface—Interface configured for IS-IS.
- State—Internal implementation information.
- Circuit id—Circuit identifier.

- Circuit type—Configured level of IS-IS:
  - 1—Level 1 only
  - 2—Level 2 only
  - 3—Level 1 and Level 2
- link-state PDU interval—Time between IS-IS information messages.
- L or Level—Type of adjacency:
  - 1—Level 1 only
  - 2—Level 2 only
  - 3—Level 1 and Level 2
- Adjacencies—Adjacencies established on the interface.
- Priority—Priority value established on the interface.
- Metric—Metric value for the interface.
- Hello(s)—Intervals between hello PDUs.
- Hold(s)—Hold time on the interface.

### *Verifying IS-IS Adjacencies*

**Purpose** Display brief information about IS-IS neighbors.

**Action** From operational mode, enter the **show isis adjacency brief** command.

```
user@R1> show isis adjacency brief
Interface      System      L State      Hold (secs) SNPA
ge-1/2/0.0     R2          1 Up          6  0:5:85:8f:c8:bd
ge-1/2/0.0     R2          2 Up          6  0:5:85:8f:c8:bd
```

**Meaning** Verify the adjacent routers in the IS-IS database.

### *Verifying IS-IS Adjacencies in Detail*

**Purpose** Display extensive information about IS-IS neighbors.

**Action** From operational mode, enter the **show isis adjacency extensive** command.

```
user@R1> show isis adjacency extensive
R2
Interface: ge-1/2/0.0, Level: 1, State: Up, Expires in 6 secs
Priority: 64, Up/Down transitions: 1, Last transition: 00:40:28 ago
Circuit type: 3, Speaks: IP, IPv6, MAC address: 0:5:85:8f:c8:bd
Topologies: Unicast
Restart capable: Yes, Adjacency advertisement: Advertise
LAN id: R2.02, IP addresses: 10.0.0.2
Transition log:
When              State      Event              Down reason
Thu May 31 11:18:48 Up          Seenself
```

R2

```
Interface: ge-1/2/0.0, Level: 2, State: Up, Expires in 8 secs
Priority: 64, Up/Down transitions: 1, Last transition: 00:40:28 ago
Circuit type: 3, Speaks: IP, IPv6, MAC address: 0:5:85:8f:c8:bd
Topologies: Unicast
Restart capable: Yes, Adjacency advertisement: Advertise
LAN id: R2.02, IP addresses: 10.0.0.2
Transition log:
When                State      Event      Down reason
Thu May 31 11:18:48  Up        SeenseIf
```

**Meaning** Check the following fields and verify the adjacency information about IS-IS neighbors:

- Interface—Interface through which the neighbor is reachable.
- L or Level—Configured level of IS-IS:
  - 1—Level 1 only
  - 2—Level 2 only
  - 3—Level 1 and Level 2

An exclamation point before the level number indicates that the adjacency is missing an IP address.

- State—Status of the adjacency: **Up**, **Down**, **New**, **One-way**, **Initializing**, or **Rejected**.
- Event—Message that identifies the cause of a state.
- Down reason—Reason the adjacency is down.
- Restart capable—A neighbor is configured for graceful restart.
- Transition log—List of transitions including **When**, **State**, and **Reason**.

- [Verification on page 3834](#)

---

### Requirements

No special configuration beyond device initialization is required before configuring this example.

---

### Overview

Like OSPF, the IS-IS protocol supports the partitioning of a routing domain into multiple areas with levels that control interarea flooding. The use of multiple levels improves protocol scalability, as Level 2 (backbone) link-state PDUs are normally not flooded into a Level 1 area.

An IS-IS Level 2 area is analogous to the OSPF backbone area (0), while a Level 1 area operates much like an OSPF totally stubby area, in that a default route is normally used to reach both inter-level and AS external routes.

Unlike OSPF, IS-IS area boundaries occur between routers, such that a given routing device is always wholly contained within a particular area. Level 1 adjacencies can be formed between routers that share a common area number, while a Level 2 adjacency can be formed between routers that might or might not share an area number.

[Figure 101 on page 3830](#) shows the topology used in this example.

### Figure 101: IS-IS Multi-Level Topology

“CLI Quick Configuration” on page 3830 shows the configuration for all of the devices in Figure 101 on page 3830. The section “Step-by-Step Procedure” on page 3832 describes the steps on Device R5.

This example has the following characteristics:

- Device R5 functions as a Level 1/Level 2 router to interconnect the Level 2 backbone area 49.001 and the Level 1 area 49.002 containing Device R6 and Device R7.
- The system ID is based on the devices' IPv4 lo0 addresses.
- Loss of any individual interface does not totally disrupt the IS-IS operation.
- The IPv4 lo0 addresses of all routers are reachable through IS-IS.
- The link between Device R3 and Device S1 appears in area 49.001 as an intra-area route. No IS-IS adjacencies can be established on this interface. This is accomplished by configuring the **passive** statement on Device R3's interface to Device S1.
- The loopback addresses of Level 2 devices do not appear in a Level 1 area.
- There is only one adjacency for each device pairing.

## Configuration

## CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

## Device R3

```
set interfaces fe-1/2/0 unit 0 description to-R4
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.17/30
set interfaces fe-1/2/0 unit 0 family iso
set interfaces fe-1/2/1 unit 0 description to-R5
set interfaces fe-1/2/1 unit 0 family inet address 10.0.0.21/30
set interfaces fe-1/2/1 unit 0 family iso
set interfaces fe-1/2/2 unit 0 family inet address 10.0.0.41/30
```

```

set interfaces fe-1/2/2 unit 0 description to-S1
set interfaces lo0 unit 0 family inet address 192.168.0.3/32
set interfaces lo0 unit 0 family iso address 49.001.0192.0168.0003.00
set protocols isis interface fe-1/2/0.0 level 1 disable
set protocols isis interface fe-1/2/1.0 level 1 disable
set protocols isis interface lo0.0 level 1 disable
set protocols isis interface fe-1/2/2.0 passive

```

**Device R4**

```

set interfaces fe-1/2/0 unit 0 description to-R3
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.18/30
set interfaces fe-1/2/0 unit 0 family iso
set interfaces fe-1/2/1 unit 0 description to-R5
set interfaces fe-1/2/1 unit 0 family inet address 10.0.0.25/30
set interfaces fe-1/2/1 unit 0 family iso
set interfaces lo0 unit 0 family inet address 192.168.0.4/32
set interfaces lo0 unit 0 family iso address 49.001.0192.0168.0004.00
set protocols isis interface fe-1/2/0.0 level 1 disable
set protocols isis interface fe-1/2/1.0 level 1 disable
set protocols isis interface lo0.0 level 1 disable

```

**Device R5**

```

set interfaces fe-1/2/0 unit 0 description to-R3
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.22/30
set interfaces fe-1/2/0 unit 0 family iso
set interfaces fe-1/2/1 unit 0 description to-R4
set interfaces fe-1/2/1 unit 0 family inet address 10.0.0.26/30
set interfaces fe-1/2/1 unit 0 family iso
set interfaces fe-1/2/2 unit 0 description to-R6
set interfaces fe-1/2/2 unit 0 family inet address 10.0.0.29/30
set interfaces fe-1/2/2 unit 0 family iso
set interfaces fe-1/2/3 unit 0 description to-R7
set interfaces fe-1/2/3 unit 0 family inet address 10.0.0.38/30
set interfaces fe-1/2/3 unit 0 family iso
set interfaces lo0 unit 0 family inet address 192.168.0.5/32
set interfaces lo0 unit 0 family iso address 49.002.0192.0168.0005.00
set protocols isis interface fe-1/2/0.0 level 1 disable
set protocols isis interface fe-1/2/1.0 level 1 disable
set protocols isis interface fe-1/2/2.0 level 2 disable
set protocols isis interface fe-1/2/3.0 level 2 disable
set protocols isis interface lo0.0 level 1 disable

```

**Device R6**

```

set interfaces fe-1/2/0 unit 0 description to-R5
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.30/30
set interfaces fe-1/2/0 unit 0 family iso
set interfaces fe-1/2/1 unit 0 description to-R7
set interfaces fe-1/2/1 unit 0 family inet address 10.0.0.33/30
set interfaces fe-1/2/1 unit 0 family iso
set interfaces lo0 unit 0 family inet address 192.168.0.6/32
set interfaces lo0 unit 0 family iso address 49.002.0192.0168.0006.00
set protocols isis interface fe-1/2/0.0 level 2 disable
set protocols isis interface fe-1/2/1.0 level 2 disable
set protocols isis interface lo0.0 level 2 disable

```

**Device R7**

```

set interfaces fe-1/2/0 unit 0 description to-R6
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.34/30
set interfaces fe-1/2/0 unit 0 family iso

```

```
set interfaces fe-1/2/1 unit 0 description to-R5
set interfaces fe-1/2/1 unit 0 family inet address 10.0.0.37/30
set interfaces fe-1/2/1 unit 0 family iso
set interfaces lo0 unit 0 family inet address 192.168.0.7/32
set interfaces lo0 unit 0 family iso address 49.002.0192.0168.0007.00
set protocols isis interface fe-1/2/0.0 level 2 disable
set protocols isis interface fe-1/2/1.0 level 2 disable
set protocols isis interface lo0.0 level 2 disable
```

**Device S1**      `set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.42/30`  
`set interfaces fe-1/2/0 unit 0 description to-R3`

**Step-by-Step Procedure**      The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure multi-level IS-IS:

1.      Configure the network interfaces.

Enable IS-IS on the interfaces by including the ISO address family on each interface.

```
[edit interfaces]
user@R5# set fe-1/2/0 unit 0 description to-R3
user@R5# set fe-1/2/0 unit 0 family inet address 10.0.0.22/30
user@R5# set fe-1/2/0 unit 0 family iso
user@R5# set fe-1/2/1 unit 0 description to-R4
user@R5# set fe-1/2/1 unit 0 family inet address 10.0.0.26/30
user@R5# set fe-1/2/1 unit 0 family iso
user@R5# set fe-1/2/2 unit 0 description to-R6
user@R5# set fe-1/2/2 unit 0 family inet address 10.0.0.29/30
user@R5# set fe-1/2/2 unit 0 family iso
user@R5# set fe-1/2/3 unit 0 description to-R7
user@R5# set fe-1/2/3 unit 0 family inet address 10.0.0.38/30
user@R5# set fe-1/2/3 unit 0 family iso
```

2.      Configure two loopback interface addresses.

One address is for IPv4.

The other is for the IS-IS area 49.002 so that Device R5 can form adjacencies with the other Level 1 devices in area 49.002. Even though Device R5's NET identifies itself as belonging to the Level 1 area 49.002, its loopback interface is not configured as a Level 1 interface. Doing so would cause the route to Device R5's loopback to be injected into the Level 1 area.

```
[edit interfaces lo0 unit 0]
user@R5# set family inet address 192.168.0.5/32
user@R5# set family iso address 49.002.0192.0168.0005.00
```

3.      Specify the IS-IS level on a per-interface basis.

Device R5 becomes adjacent to the other routing devices on the same level on each link.

By default, IS-IS is enabled for IS-IS areas on all interfaces on which the ISO protocol family is enabled (at the `[edit interfaces interface-name unit logical-unit-number]`

hierarchy level). To disable IS-IS at any particular level on an interface, include the **disable** statement.

Device R5's loopback interface is configured to run Level 2 only. If Level 1 operation were enabled on lo0.0, Device R5 would include its loopback address in its Level 1 link-state PDU, which is incorrect for this example in which the loopback addresses of Level 2 devices must not appear in a Level 1 area.

Unlike OSPF, you must explicitly list the router's lo0 interface at the **[edit protocols isis]** hierarchy level, because this interface is the source of the router's NET, and therefore must be configured as an IS-IS interface. In IS-IS, the lo0 interface operates in the passive mode by default, which is ideal because adjacency formation can never occur on a virtual interface.

```
[edit protocols isis]
user@R5# set interface fe-1/2/0.0 level 1 disable
user@R5# set interface fe-1/2/1.0 level 1 disable
user@R5# set interface fe-1/2/0.0 level 2 disable
user@R5# set interface fe-1/2/3.0 level 2 disable
user@R5# set interface lo0.0 level 1 disable
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces** and **show protocols** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R5# show interfaces
fe-1/2/0 {
  unit 0 {
    description to-R3;
    family inet {
      address 10.0.0.22/30;
    }
    family iso;
  }
}
fe-1/2/1 {
  unit 0 {
    description to-R4;
    family inet {
      address 10.0.0.26/30;
    }
    family iso;
  }
}
fe-1/2/2 {
  unit 0 {
    description to-R6;
    family inet {
      address 10.0.0.29/30;
    }
    family iso;
  }
}
fe-1/2/3 {
  unit 0 {
```

```
description to-R7;
family inet {
    address 10.0.0.38/30;
}
family iso;
}
}
lo0 {
    unit 0 {
        family inet {
            address 192.168.0.5/32;
        }
        family iso {
            address 49.002.0192.0168.0005.00;
        }
    }
}
```

user@R5# show protocols

```
isis {
    interface fe-1/2/0.0 {
        level 1 disable;
    }
    interface fe-1/2/1.0 {
        level 1 disable;
    }
    interface fe-1/2/0.0 {
        level 2 disable;
    }
    interface fe-1/2/3.0 {
        level 2 disable;
    }
    interface lo0.0 {
        level 1 disable;
    }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

---

## Verification

Confirm that the configuration is working properly.

- [Checking Interface-to-Area Associations on page 3834](#)
- [Verifying IS-IS Adjacencies on page 3835](#)
- [Examining the IS-IS Database on page 3836](#)

### *Checking Interface-to-Area Associations*

**Purpose** Make sure that the interface-to-area associations are configured as expected.

**Action** From operational mode, enter the **show isis interface** command.

```
user@R5> show isis interface
IS-IS interface database:
Interface          L CirID Level 1 DR      Level 2 DR      L1/L2 Metric
```

|            |   |              |          |       |
|------------|---|--------------|----------|-------|
| lo0.0      | 3 | 0x1 Disabled | Passive  | 0/0   |
| fe-1/2/0.0 | 2 | 0x3 Disabled | R5.03    | 10/10 |
| fe-1/2/1.0 | 2 | 0x2 Disabled | R5.02    | 10/10 |
| fe-1/2/0.0 | 1 | 0x1 R6.02    | Disabled | 10/10 |
| fe-1/2/3.0 | 1 | 0x4 R5.04    | Disabled | 10/10 |

**Meaning** The output shows that Device R5's interfaces have been correctly configured with the ISO family, and that the interfaces have been placed into the correct levels.

You can also see that Device R5 has elected itself as the designated intermediate system (DIS) on its broadcast-capable IS-IS interfaces.

### *Verifying IS-IS Adjacencies*

**Purpose** Verify that the expected adjacencies have formed between Device R5 and its IS-IS neighbors.

**Action** From operational mode, enter the **show isis adjacency detail** command.

```
user@R5> show isis adjacency detail
```

R3

```
Interface: fe-1/2/0.0, Level: 2, State: Up, Expires in 25 secs
Priority: 64, Up/Down transitions: 1, Last transition: 03:19:31 ago
Circuit type: 2, Speaks: IP, IPv6, MAC address: 0:5:85:8f:c8:bc
Topologies: Unicast
Restart capable: Yes, Adjacency advertisement: Advertise
LAN id: R5.03, IP addresses: 10.0.0.21
```

R4

```
Interface: fe-1/2/1.0, Level: 2, State: Up, Expires in 24 secs
Priority: 64, Up/Down transitions: 1, Last transition: 03:19:36 ago
Circuit type: 2, Speaks: IP, IPv6, MAC address: 0:5:85:8f:c8:bc
Topologies: Unicast
Restart capable: Yes, Adjacency advertisement: Advertise
LAN id: R5.02, IP addresses: 10.0.0.25
```

R6

```
Interface: fe-1/2/0.0, Level: 1, State: Up, Expires in 6 secs
Priority: 64, Up/Down transitions: 1, Last transition: 03:20:24 ago
Circuit type: 1, Speaks: IP, IPv6, MAC address: 0:5:85:8f:c8:bd
Topologies: Unicast
Restart capable: Yes, Adjacency advertisement: Advertise
LAN id: R6.02, IP addresses: 10.0.0.30
```

R7

```
Interface: fe-1/2/3.0, Level: 1, State: Up, Expires in 21 secs
Priority: 64, Up/Down transitions: 1, Last transition: 03:19:29 ago
Circuit type: 1, Speaks: IP, IPv6, MAC address: 0:5:85:8f:c8:bc
Topologies: Unicast
Restart capable: Yes, Adjacency advertisement: Advertise
LAN id: R5.04, IP addresses: 10.0.0.37
```

**Meaning** These results confirm that Device R5 has two Level 2 adjacencies and two Level 1 adjacencies.

**Examining the IS-IS Database**

**Purpose** Because Device R5 is a L1/L2 attached router, examine the Level 1 link-state database associated with area 49.002 to confirm that loopback addresses from backbone routers are not being advertised into the Level 1 area.

**Action** From operational mode, enter the **show isis database detail** command.

```
user@R5> show isis database detail
```

```
IS-IS level 1 link-state database:
```

  IS neighbor: R5.00                      Metric:      0

```

**Meaning** This display indicates that Device R5's loopback interface is correctly configured to run Level 2 only. Had Level 1 operation been enabled on lo0.0, Device R5 would have then included its loopback address in its Level 1 link-state PDU.

You can also see that Device R5 has Level 2 link-state PDUs, received from its adjacent neighbors.

Like an OSPF totally stubby area, no backbone (Level 2) or external prefixes are leaked into a Level 1 area, by default. Level 1 prefixes are leaked up into the IS-IS backbone, however, as can be seen in Device R5's Level 2 link-state PDU.

## Example: Configuring Hitless Authentication Key Rollover for IS-IS

This example shows how to configure hitless authentication key rollover for IS-IS.

- [Requirements on page 3837](#)
- [Overview on page 3838](#)
- [Configuration on page 3839](#)
- [Verification on page 3842](#)

### Requirements

No special configuration beyond device initialization is required before configuring hitless authentication key rollover for IS-IS.

## Overview

Authentication guarantees that only trusted routers participate in routing updates. This keychain authentication method is referred to as hitless because the keys roll over from one to the next without resetting any peering sessions or interrupting the routing protocol. Junos OS supports both RFC 5304, *IS-IS Cryptographic Authentication* and RFC 5310, *IS-IS Generic Cryptographic Authentication*.

This example includes the following statements for configuring the keychain:

- **algorithm**—For each key in the keychain, you can specify an encryption algorithm. The algorithm can be SHA-1 or MD-5.
- **key**—A keychain can have multiple keys. Each key within a keychain must be identified by a unique integer value. The range of valid identifier values is from 0 through 63.
- **key-chain**—For each keychain, you must specify a name. This example defines two keychains: **base-key-global** and **base-key-inter**.
- **options**—For each key in the keychain, you can specify the encoding for the message authentication code: **isis-enhanced** or **basic**. The basic (RFC 5304) operation is enabled by default.

When you configure the **isis-enhanced** option, Junos OS sends RFC 5310-encoded routing protocol packets and accepts both RFC 5304-encoded and RFC 5310-encoded routing protocol packets that are received from other devices.

When you configure **basic** (or do not include the **options** statement in the key configuration), Junos OS sends and receives RFC 5304-encoded routing protocols packets, and drops 5310-encoded routing protocol packets that are received from other devices.

Because this setting is for IS-IS only, the TCP and the BFD protocols ignore the encoding option configured in the key.

- **secret**—For each key in the keychain, you must set a secret password. This password can be entered in either encrypted or plain text format in the **secret** statement. It is always displayed in encrypted format.
- **start-time**—Each key must specify a start time in UTC format. Control gets passed from one key to the next. When a configured start time arrives (based on the routing device's clock), the key with that start time becomes active. Start times are specified in the local time zone for a routing device and must be unique within the key chain.

You can apply a keychain globally to all interfaces or more granularly to specific interfaces.

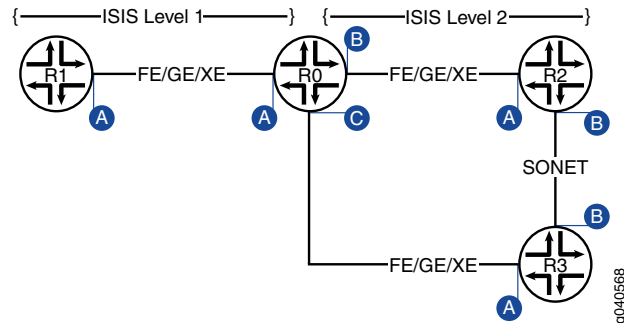

This example includes the following statements for applying the keychain to all interfaces or to particular interfaces:

- **authentication-key-chain**—Enables you to apply a keychain at the global IS-IS level for all Level 1 or all Level 2 interfaces.
- **hello-authentication-key-chain**—Enables you to apply a keychain at the individual IS-IS interface level. The interface configuration overrides the global configuration.

Figure 102 on page 3839 shows the topology used in the example.

Figure 102: Hitless Authentication Key Rollover for IS-IS

This example shows the configuration for Router R0.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level.

```
set interfaces ge-0/0/0 unit 0 description "interface A"
set interfaces ge-0/0/0 unit 0 family inet address 10.0.0.1/30
set interfaces ge-0/0/0 unit 0 family iso
set interfaces ge-0/0/0 unit 0 family inet6 address fe80::200:f8ff:fe21:67cf/128
set interfaces ge-0/0/1 unit 0 description "interface B"
set interfaces ge-0/0/1 unit 0 family inet address 10.0.0.5/30
set interfaces ge-0/0/1 unit 0 family iso
set interfaces ge-0/0/1 unit 0 family inet6 address 10FB::C:ABC:1FOC:44DA/128
set interfaces ge-0/0/2 unit 0 description "interface C"
set interfaces ge-0/0/2 unit 0 family inet address 10.0.0.9/30
set interfaces ge-0/0/2 unit 0 family iso
set interfaces ge-0/0/2 unit 0 family inet6 address ff06::c3/128
set security authentication-key-chains key-chain base-key-global key 63 secret
"$9$jfkqfTQnCpBDiCt"
set security authentication-key-chains key-chain base-key-global key 63 start-time
"2011-8-6.06:54:00-0700"
set security authentication-key-chains key-chain base-key-global key 63 algorithm
hmac-sha-1
set security authentication-key-chains key-chain base-key-global key 63 options
isis-enhanced
set security authentication-key-chains key-chain base-key-inter key 0 secret

set protocols isis interface ge-0/0/0.0 level 1 hello-authentication-key-chain
base-key-inter
```

### Step-by-Step Procedure

To configure hitless authentication key rollover for IS-IS:

1. Configure the Router R0 interfaces.

```
[edit interfaces ge-0/0/0 unit 0]
user@R0# set description "interface A"
user@R0# set family inet address 10.0.0.1/30
user@R0# set family iso
user@R0# set family inet6 address fe80::200:f8ff:fe21:67cf/128
[edit interfaces ge-0/0/1 unit 0]
user@R0# set interfaces ge-0/0/1 unit 0 description "interface B"
user@R0# set interfaces ge-0/0/1 unit 0 family inet address 10.0.0.5/30
user@R0# set interfaces ge-0/0/1 unit 0 family iso
user@R0# set interfaces ge-0/0/1 unit 0 family inet6 address
10fb::c:abc:1f0c:44da/128
[edit interfaces ge-0/0/2 unit 0]
user@R0# set description "interface C"
user@R0# set family inet address 10.0.0.9/30
user@R0# set interfaces ge-0/0/2 unit 0 family iso
user@R0# set interfaces ge-0/0/2 unit 0 family inet6 address ff06::c3/128
```

2. Configure one or more authentication keys.

```
[edit security authentication-key-chains key-chain base-key-global]
user@R0# set key 63 secret "$9$jkqfTQnCpBDiCt"
user@R0# set key 63 start-time "2011-8-6.06:54:00-0700"
user@R0# set key 63 algorithm hmac-sha-1
user@R0# set key 63 options isis-enhanced
[edit security authentication-key-chains key-chain base-key-inter]
user@R0# set key 0 secret "$9$8sgx7Vws4ZDkWLGD"
user@R0# set key 0 start-time "2011-8-6.06:54:00-0700"
user@R0# set key 0 algorithm md5
user@R0# set key 0 options basic
```

3. Apply the base-key-global keychain to all Level 1 IS-IS interfaces on Router R0.

```
[edit protocols isis level 1]
user@R0# set authentication-key-chain base-key-global
```

4. Apply the base-key-inter keychain to the ge-0/0/0.0 interface on Router R0.

```
[edit protocols isis interface ge-0/0/0.0 level 1]
user@R0# set hello-authentication-key-chain base-key-inter
```

5. If you are done configuring the device, commit the configuration.

```
user@R0# commit
```

### Results

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show security** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R0# show interfaces
ge-0/0/0 {
  unit 0 {
    description "interface A";
```

```

        family inet {
            address 10.0.0.1/30;
        }
        family iso;
        family inet6 {
            address fe80::200:f8ff:fe21:67cf/128;
        }
    }
}
ge-0/0/1 {
    unit 0 {
        description "interface B";
        family inet {
            address 10.0.0.5/30;
        }
        family iso;
        family inet6 {
            address 10FB::C:ABC:1F0C:44DA/128;
        }
    }
}
ge-0/0/2 {
    unit 0 {
        description "interface C";
        family inet {
            address 10.0.0.9/30;
        }
        family iso;
        family inet6 {
            address ff06::c3/128;
        }
    }
}
}

user@R0# show protocols
isis {
    level 1 authentication-key-chain base-key-global;
    interface ge-0/0/0.0 {
        level 1 hello-authentication-key-chain base-key-inter;
    }
}

user@R0# show security
authentication-key-chains {
    key-chain base-key-global {
        key 63 {
            secret "$9$jfkqfTQnCpBDiCt"; ## SECRET-DATA
            start-time "2011-8-6.06:54:00-0700";
            algorithm hmac-sha-1;
            options isis-enhanced;
        }
    }
    key-chain base-key-inter {
        key 0 {
            secret "$9$8sgx7Vws4ZDkWLGD"; ## SECRET-DATA
            start-time "2011-8-6.06:54:00-0700";
            algorithm md5;
        }
    }
}

```

```
        options basic;  
    }  
}  
}
```

---

### Verification

To verify the configuration, run the following commands:

- [show isis authentication](#)
- [show security keychain](#)

### Related Documentation

- [Understanding Hitless Authentication Key Rollover for IS-IS on page 3818](#)

## Example: Redistributing OSPF Routes into IS-IS

This example shows how to redistribute OSPF routes into an IS-IS network.

- [Requirements on page 3842](#)
- [Overview on page 3842](#)
- [Configuration on page 3843](#)
- [Verification on page 3848](#)

---

### Requirements

No special configuration beyond device initialization is required before configuring this example.

---

### Overview

Export policy can be applied to IS-IS to facilitate route redistribution.

Junos OS does not support the application of import policy for link-state routing protocols like IS-IS because such policies can lead to inconsistent link-state database (LSDB) entries, which in turn can result in routing inconsistencies.

In this example, OSPF routes 192.168.0/24 through 192.168.3/24 are redistributed into IS-IS area 49.0002 from Device R2.

In addition, policies are configured to ensure that Device R1 can reach destinations on the 10.0.0.44/30 network, and that Device R3 can reach destinations on the 10.0.0.36/30 network. This enables end-to-end reachability.

[Figure 103 on page 3843](#) shows the topology used in this example.

Figure 103: IS-IS Route Redistribution Topology

“CLI Quick Configuration” on page 3843 shows the configuration for all of the devices in Figure 103 on page 3843. The section “Step-by-Step Procedure” on page 3844 describes the steps on Device R2. “Step-by-Step Procedure” on page 3845 describes the steps on Device R3.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```
set interfaces fe-1/2/0 unit 0 description to-R7
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.38/30
set interfaces fe-1/2/0 unit 0 family iso
set interfaces lo0 unit 0 family inet address 172.16.3.5/32
set interfaces lo0 unit 0 family iso address 49.0002.0172.0016.0305.00
set protocols isis interface fe-1/2/0.38
set protocols isis interface lo0.0
```

**Device R2**

```
set interfaces fe-1/2/1 unit 0 description to-R5
set interfaces fe-1/2/1 unit 0 family inet address 10.0.0.37/30
set interfaces fe-1/2/1 unit 0 family iso
set interfaces fe-1/2/0 unit 0 description to-OSPF-network
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.45/30
set interfaces lo0 unit 0 family inet address 172.16.9.7/32
set interfaces lo0 unit 0 family iso address 49.0002.0172.0016.0907.00
set protocols isis export ospf-isis
set protocols isis export send-direct-to-isis-neighbors
set protocols isis interface fe-1/2/1.0
set protocols isis interface lo0.0
```

```
set protocols ospf export send-direct-to-ospf-neighbors
set protocols ospf area 0.0.0.1 interface fe-1/2/0.0
set protocols ospf area 0.0.0.1 interface lo0.0 passive
set policy-options policy-statement ospf-isis term 1 from protocol ospf
set policy-options policy-statement ospf-isis term 1 from route-filter 192.168.0.0/22
  longer
set policy-options policy-statement ospf-isis term 1 then accept
set policy-options policy-statement send-direct-to-isis-neighbors from protocol direct
set policy-options policy-statement send-direct-to-isis-neighbors from route-filter
  10.0.0.44/30 exact
set policy-options policy-statement send-direct-to-isis-neighbors then accept
set policy-options policy-statement send-direct-to-ospf-neighbors from protocol direct
set policy-options policy-statement send-direct-to-ospf-neighbors from route-filter
  10.0.0.36/30 exact
set policy-options policy-statement send-direct-to-ospf-neighbors then accept
```

**Device R3**

```
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.46/30
set interfaces lo0 unit 0 family inet address 192.168.1.1/32
set interfaces lo0 unit 0 family inet address 192.168.2.1/32
set interfaces lo0 unit 0 family inet address 192.168.3.1/32
set interfaces lo0 unit 0 family inet address 192.168.0.1/32
set protocols ospf export ospf
set protocols ospf area 0.0.0.1 interface fe-1/2/0.0
set protocols ospf area 0.0.0.1 interface lo0.0 passive
set policy-options policy-statement ospf term 1 from protocol static
set policy-options policy-statement ospf term 1 then accept
set routing-options static route 192.168.0.0/24 discard
set routing-options static route 192.168.1.0/24 discard
set routing-options static route 192.168.3.0/24 discard
set routing-options static route 192.168.2.0/24 discard
```

#### Step-by-Step Procedure

To configure Device R2:

1. Configure the network interfaces.  

```
[edit interfaces]
user@R2# set fe-1/2/1 unit 0 description to-R5
user@R2# set fe-1/2/1 unit 0 family inet address 10.0.0.37/30
user@R2# set fe-1/2/1 unit 0 family iso
user@R2# set fe-1/2/0 unit 0 description to-OSPF-network
user@R2# set fe-1/2/0 unit 0 family inet address 10.0.0.45/30
user@R2# set lo0 unit 0 family inet address 172.16.9.7/32
user@R2# set lo0 unit 0 family iso address 49.0002.0172.0016.0907.00
```
2. Configure IS-IS on the interface facing Device R1 and the loopback interface.  

```
[edit protocols isis]
user@R2# set interface fe-1/2/1.0
user@R2# set interface lo0.0
```
3. Configure the policy that enables Device R1 to reach the 10.0.0.44/30 network.  

```
[edit policy-options policy-statement send-direct-to-isis-neighbors]
user@R2# set from protocol direct
user@R2# set from route-filter 10.0.0.44/30 exact
user@R2# set then accept
```
4. Apply the policy that enables Device R1 to reach the 10.0.0.44/30 network.

```
[edit protocols isis]
user@R2# set export send-direct-to-isis-neighbors
```

5. Configure OSPF on the interfaces.

```
[edit protocols ospf]
user@R2# set area 0.0.0.1 interface fe-1/2/0.0
user@R2# set area 0.0.0.1 interface lo0.0 passive
```

6. Configure the OSPF route redistribution policy.

```
[edit policy-options policy-statement ospf-isis term 1]
user@R2# set from protocol ospf
user@R2# set from route-filter 192.168.0.0/22 longer
user@R2# set then accept
```

7. Apply the OSPF route redistribution policy to the IS-IS instance.

```
[edit protocols isis]
user@R2# set export ospf-isis
```

8. Configure the policy that enables Device R3 to reach the 10.0.0.36/30 network.

```
[edit policy-options policy-statement send-direct-to-ospf-neighbors]
user@R2# set from protocol direct
user@R2# set from route-filter 10.0.0.36/30 exact
user@R2# set then accept
```

9. Apply the policy that enables Device R3 to reach the 10.0.0.36/30 network.

```
[edit protocols ospf]
user@R2# set export send-direct-to-ospf-neighbors
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure multi-level IS-IS:

1. Configure the network interfaces.

Multiple addresses are configured on the loopback interface to simulate multiple route destinations.

```
[edit interfaces]
user@R3# set fe-1/2/0 unit 0 family inet address 10.0.0.46/30
user@R3# set lo0 unit 0 family inet address 192.168.1.1/32
user@R3# set lo0 unit 0 family inet address 192.168.2.1/32
user@R3# set lo0 unit 0 family inet address 192.168.3.1/32
user@R3# set lo0 unit 0 family inet address 192.168.0.1/32
```

2. Configure static routes to the loopback interface addresses.

These are the routes that are redistributed into IS-IS.

```
[edit routing-options static]
user@R3# set route 192.168.0.0/24 discard
user@R3# set route 192.168.1.0/24 discard
user@R3# set route 192.168.3.0/24 discard
user@R3# set route 192.168.2.0/24 discard
```

3. Configure OSPF on the interfaces.  

```
[edit protocols ospf area 0.0.0.1]
user@R3# set interface fe-1/2/0.0
user@R3# set interface lo0.0 passive
```
4. Configure the OSPF policy to export the static routes.  

```
[edit policy-options policy-statement ospf term 1]
user@R3# set from protocol static
user@R3# set then accept
```
5. Apply the OSPF export policy.  

```
[edit protocols ospf]
user@R3# set export ospf
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

**Device R2**

```
user@R2# show interfaces
fe-1/2/1 {
  unit 0 {
    description to-R5;
    family inet {
      address 10.0.0.37/30;
    }
    family iso;
  }
}
fe-1/2/0 {
  unit 0 {
    description to-OSPF-network;
    family inet {
      address 10.0.0.45/30;
    }
  }
}
lo0 {
  unit 0 {
    family inet {
      address 172.16.9.7/32;
    }
    family iso {
      address 49.0002.0172.0016.0907.00;
    }
  }
}

user@R2# show protocols
isis {
  export [ ospf-isis send-direct-to-isis-neighbors ];
  interface fe-1/2/1.0;
  interface lo0.0;
}
```

```

ospf {
  export send-direct-to-ospf-neighbors;
  area 0.0.0.1 {
    interface fe-1/2/0.0;
    interface lo0.0 {
      passive;
    }
  }
}

user@R2# show policy-options
policy-statement ospf-isis {
  term 1 {
    from {
      protocol ospf;
      route-filter 192.168.0.0/22 longer;
    }
    then accept;
  }
}
policy-statement send-direct-to-isis-neighbors {
  from {
    protocol direct;
    route-filter 10.0.0.44/30 exact;
  }
  then accept;
}
policy-statement send-direct-to-ospf-neighbors {
  from {
    protocol direct;
    route-filter 10.0.0.36/30 exact;
  }
  then accept;
}

```

**Device R3**

```

user@R3# show interfaces
fe-1/2/0 {
  unit 0 {
    family inet {
      address 10.0.0.46/30;
    }
  }
}
lo0 {
  unit 0 {
    family inet {
      address 192.168.1.1/32;
      address 192.168.2.1/32;
      address 192.168.3.1/32;
      address 192.168.0.1/32;
    }
  }
}

user@R3# show protocols
ospf {

```

```
export ospf;
area 0.0.0.1 {
    interface fe-1/2/0.0;
    interface lo0.0 {
        passive;
    }
}

user@R3# show policy-options
policy-statement ospf {
    term 1 {
        from protocol static;
        then accept;
    }
}

user@R3# show routing-options
static {
    route 192.168.0.0/24 discard;
    route 192.168.1.0/24 discard;
    route 192.168.3.0/24 discard;
    route 192.168.2.0/24 discard;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

---

## Verification

Confirm that the configuration is working properly.

- [Verifying OSPF Route Advertisement on page 3848](#)
- [Verifying Route Redistribution on page 3849](#)
- [Verifying Connectivity on page 3849](#)

### *Verifying OSPF Route Advertisement*

**Purpose** Make sure that the expected routes are advertised by OSPF.

**Action** From operational mode on Device R2, enter the **show route protocol ospf** command.

```
user@R2> show route protocol ospf
```

```
inet.0: 15 destinations, 15 routes (15 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
192.168.0.0/24      *[OSPF/150] 03:54:21, metric 0, tag 0
                   > to 10.0.0.46 via fe-1/2/0.0
192.168.0.1/32     *[OSPF/10] 03:54:21, metric 1
                   > to 10.0.0.46 via fe-1/2/0.0
192.168.1.0/24     *[OSPF/150] 03:54:21, metric 0, tag 0
                   > to 10.0.0.46 via fe-1/2/0.0
192.168.1.1/32     *[OSPF/10] 03:54:21, metric 1
                   > to 10.0.0.46 via fe-1/2/0.0
192.168.2.0/24     *[OSPF/150] 03:54:21, metric 0, tag 0
                   > to 10.0.0.46 via fe-1/2/0.0
```

```

192.168.2.1/32      *[OSPF/10] 03:54:21, metric 1
                   > to 10.0.0.46 via fe-1/2/0.0
192.168.3.0/24     *[OSPF/150] 03:54:21, metric 0, tag 0
                   > to 10.0.0.46 via fe-1/2/0.0
192.168.3.1/32     *[OSPF/10] 03:54:21, metric 1
                   > to 10.0.0.46 via fe-1/2/0.0
224.0.0.5/32       *[OSPF/10] 03:56:03, metric 1
                   MultiRecv

iso.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)

```

**Meaning** The 192.168/16 routes are advertised by OSPF.

### *Verifying Route Redistribution*

**Purpose** Make sure that the expected routes are redistributed from OSPF into IS-IS.

**Action** From operational mode on Device R1, enter the **show route protocol isis** command.

```
user@R1> show route protocol isis
```

```

inet.0: 13 destinations, 13 routes (13 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.44/30       *[IS-IS/160] 03:45:24, metric 20
                   > to 10.0.0.37 via fe-1/2/0.0
172.16.9.7/32      *[IS-IS/15] 03:49:46, metric 10
                   > to 10.0.0.37 via fe-1/2/0.0
192.168.0.0/24     *[IS-IS/160] 03:49:46, metric 10
                   > to 10.0.0.37 via fe-1/2/0.0
192.168.0.1/32     *[IS-IS/160] 03:49:46, metric 11, tag2 1
                   > to 10.0.0.37 via fe-1/2/0.0
192.168.1.0/24     *[IS-IS/160] 03:49:46, metric 10
                   > to 10.0.0.37 via fe-1/2/0.0
192.168.1.1/32     *[IS-IS/160] 03:49:46, metric 11, tag2 1
                   > to 10.0.0.37 via fe-1/2/0.0
192.168.2.0/24     *[IS-IS/160] 03:49:46, metric 10
                   > to 10.0.0.37 via fe-1/2/0.0
192.168.2.1/32     *[IS-IS/160] 03:49:46, metric 11, tag2 1
                   > to 10.0.0.37 via fe-1/2/0.0
192.168.3.0/24     *[IS-IS/160] 03:49:46, metric 10
                   > to 10.0.0.37 via fe-1/2/0.0
192.168.3.1/32     *[IS-IS/160] 03:49:46, metric 11, tag2 1
                   > to 10.0.0.37 via fe-1/2/0.0

iso.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)

```

**Meaning** The 192.168/16 routes are redistributed into IS-IS.

### *Verifying Connectivity*

**Purpose** Check that Device R1 can reach the destinations on Device R3.

**Action** From operational mode, enter the **ping** command.

```
user@R1> ping 192.168.1.1
```

```

PING 192.168.1.1 (192.168.1.1): 56 data bytes
64 bytes from 192.168.1.1: icmp_seq=0 ttl=63 time=2.089 ms
64 bytes from 192.168.1.1: icmp_seq=1 ttl=63 time=1.270 ms
64 bytes from 192.168.1.1: icmp_seq=2 ttl=63 time=2.135 ms

```

**Meaning** These results confirm that Device R1 can reach the destinations in the OSPF network.

## Example: Configuring BFD for IS-IS

This example describes how to configure the Bidirectional Forwarding Detection (BFD) protocol to detect failures in an IS-IS network.

- [Requirements on page 3850](#)
- [Overview on page 3850](#)
- [Configuration on page 3850](#)
- [Verification on page 3853](#)

### Requirements

Before you begin, configure IS-IS on both routers. See [“Example: Configuring IS-IS” on page 3823](#) for information about the required IS-IS configuration.

This example uses the following hardware and software components:

- Junos OS Release 7.3 or later
- M Series, MX Series, and T Series routers

### Overview

This example shows two routers connected to each other. A loopback interface is configured on each router. IS-IS and BFD protocols are configured on both routers.

[Figure 104 on page 3850](#) shows the sample network.

**Figure 104: Configuring BFD for IS-IS**

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Router R1**

```

set protocols isis interface so-0/0/0 bfd-liveness-detection detection-time threshold 5
set protocols isis interface so-0/0/0 bfd-liveness-detection minimum-interval 2
set protocols isis interface so-0/0/0 bfd-liveness-detection minimum-receive-interval 1
set protocols isis interface so-0/0/0 bfd-liveness-detection no-adaptation
set protocols isis interface so-0/0/0 bfd-liveness-detection transmit-interval threshold 3
set protocols isis interface so-0/0/0 bfd-liveness-detection transmit-interval
  minimum-interval 1
set protocols isis interface so-0/0/0 bfd-liveness-detection multiplier 2
set protocols isis interface so-0/0/0 bfd-liveness-detection version automatic

```

**Router R2**

```

set protocols isis interface so-0/0/0 bfd-liveness-detection detection-time threshold 6
set protocols isis interface so-0/0/0 bfd-liveness-detection minimum-interval 3
set protocols isis interface so-0/0/0 bfd-liveness-detection minimum-receive-interval 1
set protocols isis interface so-0/0/0 bfd-liveness-detection no-adaptation
set protocols isis interface so-0/0/0 bfd-liveness-detection transmit-interval threshold 4
set protocols isis interface so-0/0/0 bfd-liveness-detection transmit-interval
  minimum-interval 1
set protocols isis interface so-0/0/0 bfd-liveness-detection multiplier 2
set protocols isis interface so-0/0/0 bfd-liveness-detection version automatic

```

**Step-by-Step  
Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

**NOTE:** To simply configure BFD for IS-IS, only the `minimum-interval` statement is required. The BFD protocol selects default parameters for all the other configuration statements when you use the `bfd-liveness-detection` statement without specifying any parameters.

**NOTE:** You can change parameters at any time without stopping or restarting the existing session. BFD automatically adjusts to the new parameter value. However, no changes to BFD parameters take place until the values resynchronize with each BFD peer.

To configure BFD for IS-IS on Routers R1 and R2:

1. Enable BFD failure detection for IS-IS.
 

```

[edit protocols isis]
user@R1# set interface so-0/0/0 bfd-liveness-detection

[edit protocols isis]
user@R2# set interface so-0/0/0 bfd-liveness-detection

```
2. Configure the threshold for the adaptation of the detection time, which must be greater than the multiplier number multiplied by the minimum interval.

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R1# set detection-time threshold 5
```

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R2# set detection-time threshold 6
```

3. Configure the minimum transmit and receive intervals for failure detection.

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R1# set minimum-interval 2
```

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R2# set minimum-interval 3
```

4. Configure only the minimum receive interval for failure detection.

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R1# set minimum-receive-interval 1
```

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R2# set minimum-receive-interval 1
```

5. Disable BFD adaptation.

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R1# set no-adaptation
```

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R2# set no-adaptation
```

6. Configure the threshold for the transmit interval, which must be greater than the minimum transmit interval.

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R1# set transmit-interval threshold 3
```

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R2# set transmit-interval threshold 4
```

7. Configure the minimum transmit interval for failure detection.

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R1# set transmit-interval minimum-interval 1
```

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R2# set transmit-interval minimum-interval 1
```

8. Configure the multiplier number, which is the number of hello packets not received by the neighbor that causes the originating interface to be declared down.

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R1# set multiplier 2
```

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R2# set multiplier 2
```

9. Configure the BFD version used for detection.

The default is to have the version detected automatically.

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R1# set version automatic
```

```
[edit protocols isis interface so-0/0/0 bfd-liveness-detection]
user@R2# set version automatic
```

## Results

From configuration mode, confirm your configuration by issuing the **show protocols isis interface** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

user@R1# **show protocols isis interface so-0/0/0**

```

bfd-liveness-detection {
  version automatic;
  minimum-interval 2;
  minimum-receive-interval 1;
  multiplier 2;
  no-adaptation;
  transmit-interval {
    minimum-interval 1;
    threshold 3;
  }
  detection-time {
    threshold 5;
  }
}
...

```

user@R2# **show protocols isis interface so-0/0/0**

```

bfd-liveness-detection {
  version automatic;
  minimum-interval 3;
  minimum-receive-interval 1;
  multiplier 2;
  no-adaptation;
  transmit-interval {
    minimum-interval 1;
    threshold 4;
  }
  detection-time {
    threshold 6;
  }
}
...

```

## Verification

Confirm that the configuration is working properly.

- [Verifying the Connection Between Routers R1 and R2 on page 3853](#)
- [Verifying That IS-IS Is Configured on page 3854](#)
- [Verifying That BFD Is configured on page 3855](#)

### *Verifying the Connection Between Routers R1 and R2*

**Purpose** Make sure that Routers R1 and R2 are connected to each other.

**Action** Ping the other router to check the connectivity between the two routers as per the network topology.

```
user@R1> ping 10.0.0.2
```

```
PING 10.0.0.2 (10.0.0.2): 56 data bytes
64 bytes from 10.0.0.2: icmp_seq=0 ttl=64 time=1.367 ms
64 bytes from 10.0.0.2: icmp_seq=1 ttl=64 time=1.662 ms
64 bytes from 10.0.0.2: icmp_seq=2 ttl=64 time=1.291 ms
^C
--- 10.0.0.2 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.291/1.440/1.662/0.160 ms
```

```
user@R2> ping 10.0.0.1
```

```
PING 10.0.0.1 (10.0.0.1): 56 data bytes
64 bytes from 10.0.0.1: icmp_seq=0 ttl=64 time=1.287 ms
64 bytes from 10.0.0.1: icmp_seq=1 ttl=64 time=1.310 ms
64 bytes from 10.0.0.1: icmp_seq=2 ttl=64 time=1.289 ms
^C
--- 10.0.0.1 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.287/1.295/1.310/0.010 ms
```

**Meaning** Routers R1 and R2 are connected to each other.

### *Verifying That IS-IS Is Configured*

**Purpose** Make sure that the IS-IS instance is running on both routers.

**Action** Use the **show isis database** statement to check if the IS-IS instance is running on both routers, R1 and R2.

```
user@R1> show isis database
```

```
IS-IS level 1 link-state database:
LSP ID      Sequence Checksum Lifetime Attributes
R1.00-00    0x4a571  0x30c5    1195 L1 L2
R2.00-00    0x4a586  0x4b7e    1195 L1 L2
R2.02-00    0x330ca1 0x3492    1196 L1 L2
  3 LSPs
```

```
IS-IS level 2 link-state database:
LSP ID      Sequence Checksum Lifetime Attributes
R1.00-00    0x4a856  0x5db0    1194 L1 L2
R2.00-00    0x4a89d  0x149b    1194 L1 L2
R2.02-00    0x1fb2ff 0xd302    1194 L1 L2
  3 LSPs
```

```
user@R2> show isis database
```

```
IS-IS level 1 link-state database:
LSP ID      Sequence Checksum Lifetime Attributes
R1.00-00    0x4b707  0xcc80    1195 L1 L2
R2.00-00    0x4b71b  0xeb37    1198 L1 L2
R2.02-00    0x33c2ce 0xb52d    1198 L1 L2
  3 LSPs
```

IS-IS level 2 link-state database:

| LSP ID   | Sequence | Checksum | Lifetime | Attributes |
|----------|----------|----------|----------|------------|
| R1.00-00 | 0x4b9f2  | 0xee70   | 1192     | L1 L2      |
| R2.00-00 | 0x4ba41  | 0x9862   | 1197     | L1 L2      |
| R2.02-00 | 0x3      | 0x6242   | 1198     | L1 L2      |

3 LSPs

**Meaning** IS-IS is configured on both routers, R1 and R2.

### *Verifying That BFD Is configured*

**Purpose** Make sure that the BFD instance is running on both routers, R1 and R2.

**Action** Use the **show bfd session detail** statement to check if BFD instance is running on the routers.

user@R1> show bfd session detail

| Address  | State | Interface | Detect Time | Transmit Interval | Multiplier |
|----------|-------|-----------|-------------|-------------------|------------|
| 10.0.0.2 | Up    | so-0/0/0  | 2.000       | 1.000             | 2          |

Client ISIS R2, TX interval 0.001, RX interval 0.001  
 Client ISIS R1, TX interval 0.001, RX interval 0.001  
 Session down time 00:00:00, previous up time 00:00:15  
 Local diagnostic NbrSignal, remote diagnostic NbrSignal  
 Remote state AdminDown, version 1  
 Router 3, routing table index 17

1 sessions, 2 clients

Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps

user@R2> show bfd session detail

| Address  | State | Interface | Detect Time | Transmit Interval | Multiplier |
|----------|-------|-----------|-------------|-------------------|------------|
| 10.0.0.1 | Up    | so-0/0/0  | 2.000       | 1.000             | 2          |

Client ISIS R2, TX interval 0.001, RX interval 0.001  
 Session down time 00:00:00, previous up time 00:00:05  
 Local diagnostic NbrSignal, remote diagnostic NbrSignal  
 Remote state AdminDown, version 1  
 Router 2, routing table index 15

1 sessions, 1 clients

Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps

**Meaning** BFD is configured on Routers R1 and R2 for detecting failures in the IS-IS network.

## Example: Configuring BFD Authentication for IS-IS

This example shows how to configure BFD authentication for IS-IS.

- [Requirements on page 3856](#)
- [Overview on page 3856](#)

- [Configuration on page 3856](#)
- [Verification on page 3858](#)

## Requirements

Before you begin, configure IS-IS on both routers. See [“Example: Configuring IS-IS” on page 3823](#) for information about the required IS-IS configuration.

## Overview

In this example, a BFD authentication keychain is configured with meticulous keyed MD5 authentication.

[Figure 105 on page 3856](#) shows the topology used in this example.

**Figure 105: IS-IS BFD Authentication Topology**

[“CLI Quick Configuration” on page 3856](#) shows the configuration for both of the devices in [Figure 105 on page 3856](#). The section [“Step-by-Step Procedure” on page 3857](#) describes the steps on Device R1.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

|                  |  |
|------------------|--|
| <b>Device R1</b> | <pre> set security authentication-key-chains key-chain secret123 description for-isis-bfd set security authentication-key-chains key-chain secret123 key 1 secret "\$9\$cW-yrv" set security authentication-key-chains key-chain secret123 key 1 start-time   "2012-5-31.13:00:00 -0700" set security authentication-key-chains key-chain secret123 key 2 secret "\$9\$m5T3" set security authentication-key-chains key-chain secret123 key 2 start-time   "2013-5-31.13:00:00 -0700" set security authentication-key-chains key-chain secret123 key 3 secret "\$9\$mTQn" set security authentication-key-chains key-chain secret123 key 3 start-time   "2014-5-31.13:00:00 -0700" set protocols isis interface ge-1/2/0.0 bfd-liveness-detection minimum-interval 100 set protocols isis interface ge-1/2/0.0 bfd-liveness-detection authentication key-chain   secret123 set protocols isis interface ge-1/2/0.0 bfd-liveness-detection authentication algorithm   meticulous-keyed-md5 </pre> |
| <b>Device R2</b> | <pre> set security authentication-key-chains key-chain secret123 description for-isis-bfd set security authentication-key-chains key-chain secret123 key 1 secret "\$9\$cW-yrv" set security authentication-key-chains key-chain secret123 key 1 start-time   "2012-5-31.13:00:00 -0700" set security authentication-key-chains key-chain secret123 key 2 secret "\$9\$m5T3" </pre>  |

```

set security authentication-key-chains key-chain secret123 key 2 start-time
"2013-5-31.13:00:00 -0700"
set security authentication-key-chains key-chain secret123 key 3 secret "$9$mTQn"
set security authentication-key-chains key-chain secret123 key 3 start-time
"2014-5-31.13:00:00 -0700"
set protocols isis interface ge-1/2/0.0 bfd-liveness-detection minimum-interval 100

secret123
set protocols isis interface ge-1/2/0.0 bfd-liveness-detection authentication algorithm
meticulous-keyed-md5

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IS-IS BFD authentication:

1. Configure the authentication keychain.
 

```

[edit security authentication-key-chains key-chain secret123]
user@R1# set description for-isis-bfd
user@R1# set key 1 secret "$9$cW-yrv"
user@R1# set key 1 start-time "2012-5-31.13:00:00 -0700"
user@R1# set key 2 secret "$9$m5T3"
user@R1# set key 2 start-time "2013-5-31.13:00:00 -0700"
user@R1# set key 3 secret "$9$mTQn"
user@R1# set key 3 start-time "2014-5-31.13:00:00 -0700"

```
2. Enable BFD.
 

```

[edit protocols isis interface ge-1/2/0.0 bfd-liveness-detection]
user@R1# set minimum-interval 100

```
3. Apply the authentication keychain.
 

```

[edit protocols isis interface ge-1/2/0.0 bfd-liveness-detection]
user@R1# set authentication key-chain secret123

```
4. Set the authentication type.
 

```

[edit protocols isis interface ge-1/2/0.0 bfd-liveness-detection]
user@R1# set authentication algorithm meticulous-keyed-md5

```

**Results** From configuration mode, confirm your configuration by entering the **show protocols** and **show security** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R1# show protocols
isis {
  interface ge-1/2/0.0 {
    bfd-liveness-detection {
      minimum-interval 100;
      authentication {
        key-chain secret123;
        algorithm meticulous-keyed-md5;
      }
    }
  }
}

```

```

    }
  }
  user@R1# show security
  authentication-key-chains {
    key-chain secret123 {
      description for-isis-bfd;
      key 1 {
        secret "$9$cW-yrv"; ## SECRET-DATA
        start-time "2012-5-31.13:00:00 -0700";
      }
      key 2 {
        secret "$9$m5T3"; ## SECRET-DATA
        start-time "2013-5-31.13:00:00 -0700";
      }
      key 3 {
        secret "$9$mTQn"; ## SECRET-DATA
        start-time "2014-5-31.13:00:00 -0700";
      }
    }
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

#### Verifying IS-IS BFD Authentication

**Purpose** Verify the status of IS-IS BFD authentication.

**Action** From operational mode, enter the **show bfd session extensive** command.

```

user@R1> show bfd session extensive

```

| Address  | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|----------|-------|------------|-------------|-------------------|------------|
| 10.0.0.2 | Down  | ge-1/2/0.0 | 0.300       | 1.000             | 3          |

```

Client ISIS L1, TX interval 0.100, RX interval 0.100, Authenticate
  keychain secret123, algo meticulous-keyed-md5, mode strict
Client ISIS L2, TX interval 0.100, RX interval 0.100, Authenticate

## Example: Configuring IS-IS IPv4 and IPv6 Unicast Topologies

- [Understanding IS-IS IPv4 and IPv6 Unicast Topologies on page 3859](#)
- [Example: Configuring IS-IS IPv4 and IPv6 Unicast Topologies on page 3859](#)

### Understanding IS-IS IPv4 and IPv6 Unicast Topologies

You can configure IS-IS to calculate an alternate IPv6 unicast topology, in addition to the normal IPv4 unicast topology, and add the corresponding routes to inet6.0. The IS-IS interface metrics for the IPv4 topology can be configured independently of the IPv6 metrics. You can also selectively disable interfaces from participating in the IPv6 topology while continuing to participate in the IPv4 topology. This enables you to exercise control over the paths that unicast data takes through a network.

A topology is the set of joined nodes. IS-IS evaluates all the paths in a single topology for each IS-IS level and uses the shortest-path-first (SPF) algorithm to determine the best path among all the feasible paths. Topology discovery and SPF calculation is performed in a protocol-neutral fashion because it is done at Layer 2 of the OSI model. If you load the topology with reachability information for a certain protocol (for example, IP), the assumption is that the circuits that are supposed to provide reachability between routing devices can carry the protocol. The SPF algorithm has a per-link orientation, not a per-address family or per-protocol orientation.

Multitopology routing enables you to override this default behavior by enabling a per-address family, per-protocol SPF calculation.

The additional CPU load associated with multiple runs of the SPF algorithm is generally not an issue with the processing power available on today's routing device control planes.

The multitopology extensions alter existing type, length, and value (TLV) tuples by adding a topology ID. Each routing device in a given topology maintains its adjacencies and runs a per-topology SPF calculation.

### Example: Configuring IS-IS IPv4 and IPv6 Unicast Topologies

This example shows how to configure IS-IS to calculate an alternate IPv6 unicast topology, in addition to the normal IPv4 unicast topology.

- [Requirements on page 3860](#)
- [Overview on page 3860](#)
- [Configuration on page 3861](#)
- [Verification on page 3865](#)

### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

This example focuses on IPv4 and IPv6 unicast topologies. The IS-IS interface metrics for the IPv4 topology can be configured independently of the IPv6 metrics. You can also selectively disable interfaces from participating in the IPv6 topology while continuing to participate in the IPv4 topology. This enables you to exercise control over the paths that unicast data takes through a network.

To enable an IPv6 unicast topology for IS-IS, include the **ipv6-unicast** statement:

```
isis {  
  topologies {  
    ipv6-unicast;  
  }  
}
```

To configure a metric for the IPv6 unicast topology, include the **ipv6-unicast-metric** statement:

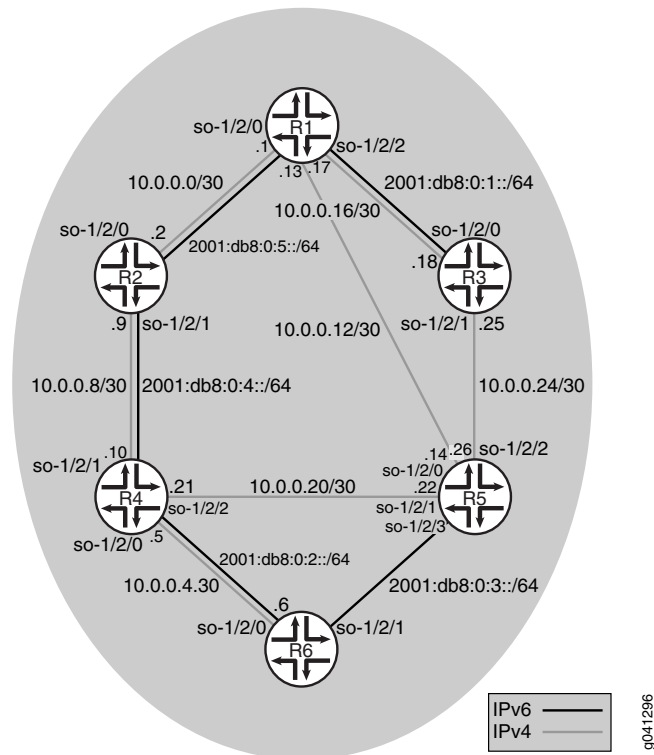

```
isis {  
  interface interface-name {  
    level level-number {  
      ipv6-unicast-metric number;  
    }  
  }  
}
```

To exclude an interface from the IPv6 unicast topologies for IS-IS, include the **no-ipv6-unicast** statement:

```
isis {  
  interface interface-name {  
    no-ipv6-unicast;  
  }  
}
```

[Figure 106 on page 3861](#) shows the topology used in this example. The black lines indicate link membership in the IPv6 topology. The gray lines indicate membership to the IPv4 topology. Using regular TLVs, it would not be possible to build multiple topologies and run an SPF calculation based on them. The multitopology extensions describe an extension to carry the set of supported protocols in the hello packet. After activating multitopology routing support on a link, the link carries all the topologies that the underlying circuit is able to relay.

Figure 106: IS-IS IPv4 and IPv6 Unicast Topologies

“CLI Quick Configuration” on page 3861 shows the configuration for all of the devices in Figure 106 on page 3861. The section “Step-by-Step Procedure” on page 3863 describes the steps on Device R1.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

#### Device R1

```
set interfaces so-1/2/0 unit 0 family inet address 10.0.0.1/30
set interfaces so-1/2/0 unit 0 family iso
set interfaces so-1/2/0 unit 0 family inet6 address 2001:db8:0:5::/64 eui-64
set interfaces so-1/2/1 unit 0 family inet address 10.0.0.13/30
set interfaces so-1/2/1 unit 0 family iso
set interfaces so-1/2/2 unit 0 family inet address 10.0.0.17/30
set interfaces so-1/2/2 unit 0 family iso
set interfaces so-1/2/2 unit 0 family inet6 address 2001:db8:0:1::/64 eui-64
set interfaces lo0 unit 0 family inet address 192.168.0.1/32
set interfaces lo0 unit 0 family iso address 49.0002.0192.0168.0001.00
set interfaces lo0 unit 0 family inet6 address 2001:db8::1/128
set protocols isis topologies ipv6-unicast
set protocols isis interface so-1/2/0.0
set protocols isis interface so-1/2/1.0 no-ipv6-unicast
set protocols isis interface so-1/2/2.0
set protocols isis interface lo0.0
```

**Device R2**

```
set interfaces so-1/2/0 unit 0 family inet address 10.0.0.2/30
set interfaces so-1/2/0 unit 0 family iso
set interfaces so-1/2/0 unit 0 family inet6 address 2001:db8:0:5::/64 eui-64
set interfaces so-1/2/1 unit 0 family inet address 10.0.0.9/30
set interfaces so-1/2/1 unit 0 family iso
set interfaces so-1/2/1 unit 0 family inet6 address 2001:db8:0:4::/64 eui-64
set interfaces lo0 unit 0 family inet address 192.168.0.2/32
set interfaces lo0 unit 0 family iso address 49.0002.0192.0168.0002.00
set interfaces lo0 unit 0 family inet6 address 2001:db8::2/128
set protocols isis topologies ipv6-unicast
set protocols isis interface so-1/2/0.2
set protocols isis interface so-1/2/1.0
set protocols isis interface lo0.0
```

**Device R3**

```
set interfaces so-1/2/0 unit 0 family inet address 10.0.0.18/30
set interfaces so-1/2/0 unit 0 family iso
set interfaces so-1/2/0 unit 0 family inet6 address 2001:db8:0:1::/64 eui-64
set interfaces so-1/2/1 unit 0 family inet address 10.0.0.25/30
set interfaces so-1/2/1 unit 0 family iso
set interfaces lo0 unit 0 family inet address 192.168.0.3/32
set interfaces lo0 unit 0 family iso address 49.0002.0192.0168.0003.00
set interfaces lo0 unit 0 family inet6 address 2001:db8::3/128
set protocols isis topologies ipv6-unicast
set protocols isis interface so-1/2/0.0
set protocols isis interface so-1/2/1.0 no-ipv6-unicast
set protocols isis interface lo0.0
```

**Device R4**

```
set interfaces so-1/2/0 unit 0 family inet address 10.0.0.5/30
set interfaces so-1/2/0 unit 0 family iso
set interfaces so-1/2/0 unit 0 family inet6 address 2001:db8:0:2::/64 eui-64
set interfaces so-1/2/1 unit 0 family inet address 10.0.0.10/30
set interfaces so-1/2/1 unit 0 family iso
set interfaces so-1/2/1 unit 0 family inet6 address 2001:db8:0:1::/64 eui-64
set interfaces so-1/2/2 unit 0 family inet address 10.0.0.21/30
set interfaces so-1/2/2 unit 0 family iso
set interfaces lo0 unit 0 family inet address 192.168.0.4/32
set interfaces lo0 unit 0 family iso address 49.0002.0192.0168.0004.00
set interfaces lo0 unit 0 family inet6 address 2001:db8::4/128
set protocols isis topologies ipv6-unicast
set protocols isis interface so-1/2/0.0
set protocols isis interface so-1/2/1.0
set protocols isis interface so-1/2/2.0 no-ipv6-unicast
set protocols isis interface lo0.0
```

**Device R5**

```
set interfaces so-1/2/0 unit 0 family inet address 10.0.0.14/30
set interfaces so-1/2/0 unit 0 family iso
set interfaces so-1/2/1 unit 0 family inet address 10.0.0.22/30
set interfaces so-1/2/1 unit 0 family iso
set interfaces so-1/2/2 unit 0 family inet address 10.0.0.26/30
set interfaces so-1/2/2 unit 0 family iso
set interfaces so-1/2/3 unit 0 family iso
set interfaces so-1/2/3 unit 0 family inet6 address 2001:db8:0:3::/64 eui-64
set interfaces lo0 unit 0 family inet address 192.168.0.5/32
set interfaces lo0 unit 0 family iso address 49.0002.0192.0168.0005.00
set interfaces lo0 unit 0 family inet6 address 2001:db8::5/128
```

```

set protocols isis topologies ipv6-unicast
set protocols isis interface so-1/2/0.0 no-ipv6-unicast
set protocols isis interface so-1/2/1.0 no-ipv6-unicast
set protocols isis interface so-1/2/2.0 no-ipv6-unicast
set protocols isis interface so-1/2/3.0
set protocols isis interface lo0.0

```

**Device R6**

```

set interfaces so-1/2/0 unit 0 family inet address 10.0.0.6/30
set interfaces so-1/2/0 unit 0 family iso
set interfaces so-1/2/0 unit 0 family inet6 address 2001:db8:0:2::/64 eui-64
set interfaces so-1/2/1 unit 0 family iso
set interfaces so-1/2/1 unit 0 family inet6 address 2001:db8:0:3::/64 eui-64
set interfaces lo0 unit 0 family inet address 192.168.0.6/32
set interfaces lo0 unit 0 family iso address 49.0002.0192.0168.0006.00
set interfaces lo0 unit 0 family inet6 address 2001:db8::6/128
set protocols isis topologies ipv6-unicast
set protocols isis interface so-1/2/0.0
set protocols isis interface so-1/2/1.0
set protocols isis interface lo0.0

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure an alternate IPv6 unicast topology:

1. Configure the interfaces.

```

[edit interfaces]
user@R1# set so-1/2/0 unit 0 family inet address 10.0.0.1/30
user@R1# set so-1/2/0 unit 0 family iso
user@R1# set so-1/2/0 unit 0 family inet6 address 2001:db8:0:5::/64 eui-64
user@R1# set so-1/2/1 unit 0 family inet address 10.0.0.13/30
user@R1# set so-1/2/1 unit 0 family iso
user@R1# set so-1/2/2 unit 0 family inet address 10.0.0.17/30
user@R1# set so-1/2/2 unit 0 family iso
user@R1# set so-1/2/2 unit 0 family inet6 address 2001:db8:0:1::/64 eui-64
user@R1# set lo0 unit 0 family inet address 192.168.0.1/32
user@R1# set lo0 unit 0 family iso address 49.0002.0192.0168.0001.00
user@R1# set lo0 unit 0 family inet6 address 2001:db8::1/128

```

2. Enable IS-IS on the interfaces.

```

[edit protocols isis]
user@R1# set interface so-1/2/0.0
user@R1# set interface so-1/2/1.0
user@R1# set interface so-1/2/2.0
user@R1# set interface lo0.0

```

3. Enable multitopology routing on the IS-IS interfaces.

The **ipv6-unicast** statement enables multitopology IS-IS routing on all interfaces that have **family iso** and **family inet6** configured and are listed at the **[edit protocols isis interface]** hierarchy level.

```

[edit protocols isis]
user@R1# set topologies ipv6-unicast

```

4. Disable IPv6 unicast support on a given interface.

If you do not want to run multiprotocol IS-IS routing for IPv6 on a given interface, you can disable multiprotocol routing by including the **no-ipv6-unicast** statement in the IS-IS interface configuration.

```
[edit protocols isis]
user@R1# set interface so-1/2/1.0 no-ipv6-unicast
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces** and **show protocols** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
so-1/2/0 {
  unit 0 {
    family inet {
      address 10.0.0.1/30;
    }
    family iso;
    family inet6 {
      address 2001:db8:0:5::/64 {
        eui-64;
      }
    }
  }
}
so-1/2/1 {
  unit 0 {
    family inet {
      address 10.0.0.13/30;
    }
    family iso;
  }
}
so-1/2/2 {
  unit 0 {
    family inet {
      address 10.0.0.17/30;
    }
    family iso;
    family inet6 {
      address 2001:db8:0:1::/64 {
        eui-64;
      }
    }
  }
}
lo0 {
  unit 0 {
    family inet {
      address 192.168.0.1/32;
    }
    family iso {
      address 49.0002.0192.0168.0001.00;
```

```

    }
    family inet6 {
        address 2001:db8::1/128;
    }
}

user@R1# show protocols
isis {
    topologies ipv6-unicast;
    interface so-1/2/0.0;
    interface so-1/2/1.0 {
        no-ipv6-unicast;
    }
    interface so-1/2/2.0;
    interface lo0.0;
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Checking the Topologies on Neighbors on page 3865](#)
- [Checking the IS-IS SPF Calculations on page 3866](#)
- [Checking the Tcpdump Output on page 3867](#)

### Checking the Topologies on Neighbors

**Purpose** Determine what topologies are supported on neighboring IS-IS devices.

**Action** From operational mode, enter the **show isis adjacency detail** command.

```
user@R1> show isis adjacency detail
```

R2

```

Interface: so-1/2/0.0, Level: 3, State: Up, Expires in 24 secs
Priority: 0, Up/Down transitions: 1, Last transition: 05:28:16 ago
Circuit type: 3, Speaks: IP, IPv6
Topologies: Unicast, IPV6-Unicast
Restart capable: Yes, Adjacency advertisement: Advertise
IP addresses: 10.0.0.2
IPv6 addresses: fe80::2a0:a514:0:24c

```

R5

```

Interface: so-1/2/1.0, Level: 3, State: Up, Expires in 21 secs
Priority: 0, Up/Down transitions: 1, Last transition: 05:27:47 ago
Circuit type: 3, Speaks: IP, IPv6
Topologies: Unicast
Restart capable: Yes, Adjacency advertisement: Advertise
IP addresses: 10.0.0.14

```

R3

```

Interface: so-1/2/2.0, Level: 3, State: Up, Expires in 22 secs
Priority: 0, Up/Down transitions: 1, Last transition: 05:27:25 ago
Circuit type: 3, Speaks: IP, IPv6
Topologies: Unicast, IPV6-Unicast

```

```
Restart capable: Yes, Adjacency advertisement: Advertise
IP addresses: 10.0.0.18
IPv6 addresses: fe80::2a0:a514:0:124c
```

**Meaning** As expected, the adjacency with Device R5 only supports the IPv4 unicast topology, while the adjacencies with Device R2 and Device R3 support both the IPv4 and IPv6 topologies.

### *Checking the IS-IS SPF Calculations*

**Purpose** Verify that separate SPF calculations are being run for IPv4 and IPv6.

**Action** From operational mode, enter the **show isis spf brief** command.

```
user@R1> show isis spf brief
```

#### **IPv4 Unicast IS-IS level 1 SPF results:**

| Node  | Metric | Interface  | NH      | Via | SNPA |
|-------|--------|------------|---------|-----|------|
| R6.00 | 20     | so-1/2/1.0 | IPV4 R5 |     |      |
| R4.00 | 20     | so-1/2/0.0 | IPV4 R2 |     |      |
| R5.00 | 10     | so-1/2/1.0 | IPV4 R5 |     |      |
| R3.00 | 10     | so-1/2/2.0 | IPV4 R3 |     |      |
| R2.00 | 10     | so-1/2/0.0 | IPV4 R2 |     |      |
| R1.00 | 0      |            |         |     |      |

6 nodes

#### **IPv4 Unicast IS-IS level 2 SPF results:**

```

**Meaning** The IS-IS hello (IIH) packet shows that IPv4 and IPv6 are supported. The hello packet lists valid IPv4 and IPv6 addresses, and therefore the routing device can create valid next-hop entries. The supported protocols are listed in the multitopology TLV #229.

## IS-IS Multicast Topologies Overview

Most multicast routing protocols perform a reverse-path forwarding (RPF) check on the source of multicast data packets. If a packet comes in on the interface that is used to send data to the source, the packet is accepted and forwarded to one or more downstream interfaces. Otherwise, the packet is discarded and a notification is sent to the multicast routing protocol running on the interface.

In certain instances, the unicast routing table used for the RPF check is also the table used for forwarding unicast data packets. Thus, unicast and multicast routing are congruent. In other cases, where it is preferred that multicast routing be independent of unicast routing, the multicast routing protocols are configured to perform the RPF check using an alternate unicast routing table `inet.2`.

You can configure IS-IS to calculate an alternate IPv4 multicast topology, in addition to the normal IPv4 unicast topology, and add the corresponding routes to `inet.2`. The IS-IS interface metrics for the multicast topology can be configured independently of the unicast metrics. You can also selectively disable interfaces from participating in the multicast topology while continuing to participate in the regular unicast topology. This enables you to exercise control over the paths that multicast data takes through a network so that it is independent of unicast data paths. You can also configure IS-IS to calculate an alternate IPv6 multicast topology, in addition to the normal IPv6 unicast topology.

**NOTE:** IS-IS only starts advertising the routes when the interface routes are in `inet.2`.

Table 308 on page 3868 lists the various IPv4 statements you can use to configure IS-IS topologies.

**Table 308: IPv4 Statements**

| Statement  | Description   |
|--|---|
| <code>ipv4-multicast</code>                      | Enables an alternate IPv4 multicast topology.                             |
| <code>ipv4-multicast-metric</code> <i>number</i> | Configures the multicast metric for an alternate IPv4 multicast topology. |
| <code>no-ipv4-multicast</code>                   | Excludes an interface from the IPv4 multicast topology.                   |
| <code>no-unicast-topology</code>                 | Excludes an interface from the IPv4 unicast topologies.                   |

Table 309 on page 3868 lists the various IPv6 statements you can use to configure IS-IS topologies.

**Table 309: IPv6 Statements**

| Statement                   | Description                                   |
|-----------------------------|---|
| <code>ipv6-multicast</code> | Enables an alternate IPv6 multicast topology. |

Table 309: IPv6 Statements (*continued*)

| Statement  | Description   |
|--|---|
| <code>ipv6-multicast-metric <i>number</i></code> | Configures the multicast metric for an alternate IPv6 multicast topology. |
| <code>ipv6-unicast-metric <i>number</i></code>   | Configures the unicast metric for an alternate IPv6 multicast topology.   |
| <code>no-ipv6-multicast</code>                   | Excludes an interface from the IPv6 multicast topology.                   |
| <code>no-ipv6-unicast</code>                     | Excludes an interface from the IPv6 unicast topologies.                   |

For a list of hierarchy levels at which you can include these statements, see the statement summary sections for these statements.

### Example: Configuring IS-IS Multicast Topology

This example shows how to configure a multicast topology for an IS-IS network.

- [Requirements on page 3869](#)
- [Overview on page 3869](#)
- [Configuration on page 3870](#)
- [Verification on page 3874](#)

#### Requirements

Before you begin, configure IS-IS on all routers. See [“Example: Configuring IS-IS” on page 3823](#) for information about the required IS-IS configuration.

This example uses the following hardware and software components:

- Junos OS Release 7.3 or later
- M Series, MX Series, and T Series routers

#### Overview

This example shows an IS-IS multicast topology configuration. Three routers are connected to each other. A loopback interface is configured on each router.

[Figure 107 on page 3870](#) shows the sample network.

Figure 107: Configuring IS-IS Multicast Topology

g040922

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

#### Router R1

```
set protocols isis traceoptions file isis size 5m world-readable
set protocols isis traceoptions flag error
set protocols isis topologies ipv4-multicast
set protocols isis interface so-0/0/0 level 1 metric 15
set protocols isis interface so-0/0/0 level 1 ipv4-multicast-metric 18
set protocols isis interface so-0/0/0 level 2 metric 20
set protocols isis interface so-0/0/0 level 2 ipv4-multicast-metric 14
set protocols isis interface so-1/0/0 level 1 metric 13
set protocols isis interface so-1/0/0 level 1 ipv4-multicast-metric 12
set protocols isis interface so-1/0/0 level 2 metric 29
set protocols isis interface so-1/0/0 level 2 ipv4-multicast-metric 23
set protocols isis interface fxp0.0 disable
```

#### Router R2

```
set protocols isis traceoptions file isis size 5m world-readable
set protocols isis traceoptions flag error
set protocols isis topologies ipv4-multicast
set protocols isis interface so-0/0/0 level 1 metric 13
set protocols isis interface so-0/0/0 level 1 ipv4-multicast-metric 12
set protocols isis interface so-0/0/0 level 2 metric 29
```

```

set protocols isis interface so-0/0/0 level 2 ipv4-multicast-metric 23
set protocols isis interface so-1/0/0 level 1 metric 14
set protocols isis interface so-1/0/0 level 1 ipv4-multicast-metric 18
set protocols isis interface so-1/0/0 level 2 metric 32
set protocols isis interface so-1/0/0 level 2 ipv4-multicast-metric 26
set protocols isis interface fxp0.0 disable

```

### Router R3

```

set protocols isis traceoptions file isis size 5m world-readable
set protocols isis traceoptions flag error
set protocols isis topologies ipv4-multicast
set protocols isis interface so-0/0/0 level 1 metric 19
set protocols isis interface so-0/0/0 level 1 ipv4-multicast-metric 11
set protocols isis interface so-0/0/0 level 2 metric 27
set protocols isis interface so-0/0/0 level 2 ipv4-multicast-metric 21
set protocols isis interface so-1/0/0 level 1 metric 16
set protocols isis interface so-1/0/0 level 1 ipv4-multicast-metric 26
set protocols isis interface so-1/0/0 level 2 metric 30
set protocols isis interface so-1/0/0 level 2 ipv4-multicast-metric 20
set protocols isis interface fxp0.0 disable

```

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IS-IS multicast topologies:

1. Enable the multicast topology for IS-IS by using the **ipv4-multicast** statement.

### Routers R1, R2, and R3

```

[edit protocols isis]
user@host# set traceoptions file isis size 5m world-readable
user@host# set traceoptions flag error
user@host# set topologies ipv4-multicast

```

2. Enable multicast metrics on the first SONET/SDH Interface by using the **ipv4-multicast-metric** statement.

### Router R1

```

[edit protocols isis interface so-0/0/0 ]
user@R1# set level 1 metric 15
user@R1# set level 1 ipv4-multicast-metric 18
user@R1# set level 2 metric 20
user@R1# set level 2 ipv4-multicast-metric 14

```

### Router R2

```

[edit protocols isis interface so-0/0/0]
user@R2# set level 1 metric 13
user@R2# set level 1 ipv4-multicast-metric 12
user@R2# set level 2 metric 29
user@R2# set level 2 ipv4-multicast-metric 23

```

### Router R3

```

[edit protocols isis interface so-0/0/0]

```

```
user@R3# set level 1 metric 19
user@R3# set level 1 ipv4-multicast-metric 11
user@R3# set level 2 metric 27
user@R3# set level 2 ipv4-multicast-metric 21
```

3. Enable multicast metrics on a second sonet Interface by using the **ipv4-multicast-metric** statement.

#### Router R1

```
[edit protocols isis interface so-1/0/0]
user@R1# set level 1 metric 13
user@R1# set level 1 ipv4-multicast-metric 12
user@R1# set level 2 metric 29
user@R1# set level 2 ipv4-multicast-metric 23
```

#### Router R2

```
[edit protocols isis interface so-1/0/0]
user@R2# set level 1 metric 14
user@R2# set level 1 ipv4-multicast-metric 18
user@R2# set level 2 metric 32
user@R2# set level 2 ipv4-multicast-metric 26
```

#### Router R3

```
[edit protocols isis interface so-1/0/0]
user@R3# set level 1 metric 16
user@R3# set level 1 ipv4-multicast-metric 26
user@R3# set level 2 metric 30
user@R3# set level 2 ipv4-multicast-metric 20
```

4. Disable the out-of-band management port, fxp0.

#### Routers R1, R2, and R3

```
[edit protocols isis]
user@host# set interface fxp0.0 disable
```

5. If you are done configuring the routers, commit the configuration.

#### Routers R1, R2, and R3

```
[edit]
user@host# commit
```

**Results** From configuration mode, confirm your configuration by using the **show protocols isis** statement. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

#### Router R1

```
user@R1# show protocols isis

traceoptions {
  file isis size 5m world-readable;
  flag error;
}
topologies ipv4-multicast;
interface so-0/0/0 {
  level 1 {
```

```

        metric 15;
        ipv4-multicast-metric 18;
    }
    level 2 {
        metric 20;
        ipv4-multicast-metric 14;
    }
}
interface so-1/0/0 {
    level 1 {
        metric 13;
        ipv4-multicast-metric 12;
    }
    level 2 {
        metric 29;
        ipv4-multicast-metric 23;
    }
}
interface fxp0.0 {
    disable;
}

```

### Router R2

user@R2# show protocols isis

```

traceoptions {
    file isis size 5m world-readable;
    flag error;
}
topologies ipv4-multicast;
interface so-0/0/0 {
    level 1 {
        metric 13;
        ipv4-multicast-metric 12;
    }
    level 2 {
        metric 29;
        ipv4-multicast-metric 23;
    }
}
interface so-1/0/0 {
    level 1 {
        metric 14;
        ipv4-multicast-metric 18;
    }
    level 2 {
        metric 32;
        ipv4-multicast-metric 26;
    }
}
interface fxp0.0 {
    disable;
}

```

### Router R3

user@R3# show protocols isis

```

traceoptions {
    file isis size 5m world-readable;
    flag error;
}

```

```
}
topologies ipv4-multicast;
interface so-0/0/0 {
    level 1 {
        metric 19;
        ipv4-multicast-metric 11;
    }
    level 2 {
        metric 27;
        ipv4-multicast-metric 21;
    }
}
interface so-1/0/0 {
    level 1 {
        metric 16;
        ipv4-multicast-metric 26;
    }
    level 2 {
        metric 30;
        ipv4-multicast-metric 20;
    }
}
interface fxp0.0 {
    disable;
}
```

### **Verification**

Confirm that the configuration is working properly.

- [Verifying the Connection Between Routers R1, R2, and R3 on page 3874](#)
- [Verifying That IS-IS Is Configured on page 3876](#)
- [Verifying the Configured Multicast Metric Values on page 3878](#)
- [Verifying the Configuration of the Multicast Topology on page 3879](#)

### **Verifying the Connection Between Routers R1, R2, and R3**

**Purpose** Make sure that Routers R1, R2, and R3 are connected to each other.

**Action** Ping the other two routers from any router, to check the connectivity between the three routers as per the network topology.

```
user@R1> ping 10.0.3.9
```

```
PING 10.0.3.9 (10.0.3.9): 56 data bytes
64 bytes from 10.0.3.9: icmp_seq=0 ttl=64 time=1.299 ms
64 bytes from 10.0.3.9: icmp_seq=1 ttl=64 time=52.304 ms
64 bytes from 10.0.3.9: icmp_seq=2 ttl=64 time=1.271 ms
64 bytes from 10.0.3.9: icmp_seq=3 ttl=64 time=1.343 ms
64 bytes from 10.0.3.9: icmp_seq=4 ttl=64 time=1.434 ms

round-trip min/avg/max/stddev = 1.300/1.394/1.499/0.071 ms

```

**Meaning** Routers R1, R2, and R3 have a peer relationship with each other.

### *Verifying That IS-IS Is Configured*

**Purpose** Make sure that the IS-IS instance is running on Routers R1, R2, and R3, and that they are adjacent to each other.

**Action** Use the **show isis adjacency detail** command to check the adjacency between the routers.

#### **Router R1**

```
user@R1> show isis adjacency detail
```

R2

```
Interface: so-0/0/0, Level: 1, State: Up, Expires in 8 secs

### Understanding Loop-Free Alternate Routes for IS-IS

In Junos OS Release 9.5 and later, support for IS-IS loop-free alternate routes enables IP fast-reroute capability for IS-IS. Junos OS precomputes loop-free backup routes for all IS-IS routes. These backup routes are preinstalled in the Packet Forwarding Engine, which performs a local repair and implements the backup path when the link for a primary next hop for a particular route is no longer available. With local repair, the Packet Forwarding Engine can correct a path failure before it receives recomputed paths from the Routing Engine. Local repair reduces the amount of time needed to reroute traffic to less than 50 milliseconds. In contrast, global repair can take up to 800 milliseconds to compute a new route. Local repair and global repair are thus complementary. Local repair enables traffic to continue to be routed using a backup path until global repair is able to calculate a new route.

A loop-free path is one that does not forward traffic back through the routing device to reach a given destination. That is, a neighbor whose shortest path to the destination traverses the routing device is not used as a backup route to that destination. To determine

loop-free alternate paths for IS-IS routes, Junos OS runs shortest-path-first (SPF) calculations on each one-hop neighbor. You can enable support for alternate loop-free routes on any IS-IS interface. Because it is common practice to enable LDP on an interface for which IS-IS is already enabled, this feature also provides support for LDP label-switched paths (LSPs).

**NOTE:** If you enable support for alternate loop-free routes on an interface configured for both LDP and IS-IS, you can use the `traceroute` command to trace the active path to the primary next hop.

The level of backup coverage available through IS-IS routes depends on the actual network topology and is typically less than 100 percent for all destinations on any given routing device. You can extend backup coverage to include RSVP LSPs.

Junos OS provides two mechanisms for route redundancy for IS-IS through alternate loop-free routes: link protection and node-link protection. When you enable link protection or node-link protection on an IS-IS interface, Junos OS creates a single alternate path to the primary next hop for all destination routes that traverse a protected interface. Link protection offers per-link traffic protection. Use link protection when you assume that only a single link might become unavailable but that the neighboring node on the primary path would still be available through another interface.

Node-link protection establishes an alternate path through a different routing device altogether. Use node-link protection when you assume that access to a node is lost when a link is no longer available. As a result, Junos OS calculates a backup path that avoids the primary next-hop routing device. In Junos OS Release 9.4 and earlier, only the RSVP protocol supports Packet Forwarding Engine local repair and fast reroute as well as link protection and node protection.

In [Figure 99 on page 3820](#), Case 2 shows how link protection allows source Router A to switch to Link B when the primary next hop Link A to destination Router C fails. However, if Router B fails, Link B also fails, and the protected Link A is lost. If node-link protection is enabled, Router A is able to switch to Link D on Router D and bypass the failed Router B altogether. As shown in Case 1, with node-link protection enabled, Router A has a node-link protection alternate path available through Router D to destination Router C. That means that if Router B fails, Router A can still reach Router C because the path from Router A to Link D remains available as an alternate backup path.

**Figure 108: Link Protection and Node-Link Protection Comparison for IS-IS Routes**

The Junos OS implementation of support for loop-free alternate paths for IS-IS routes is based on the following standards:

- RFC 5286, *Basic Specification for IP Fast-Reroute: Loop-free Alternates*
- RFC 5714, *IP Fast Reroute Framework*

### Configuring Link Protection for IS-IS

You can configure link protection on any interface for which IS-IS is enabled. When you enable link protection, Junos OS creates one alternate path to the primary next hop for all destination routes that traverse a protected interface. Link protection assumes that only a single link becomes unavailable but that the neighboring node would still be available through another interface.

**NOTE:** You must also configure a per-packet load-balancing routing policy to ensure that the routing protocol process installs all the next hops for a given route in the routing table.

To enable link protection, include the **link-protection** statement at the **[edit protocols isis interface *interface-name*]** hierarchy level:

```
[edit]
protocols {
  isis {
    interface interface-name {
```

```

    link-protection;
  }
}

```

### Configuring Node-Link Protection for IS-IS

You can configure node-link protection on any interface for which IS-IS is enabled. Node-link protection establishes an alternate path through a different routing device altogether for all destination routes that traverse a protected interface. Node-link protection assumes that the entire routing device, or node, has failed. Junos OS therefore calculates a backup path that avoids the primary next-hop routing device.

**NOTE:** You must also configure a per-packet load-balancing routing policy to ensure that the routing protocol process installs all the next hops for a given route in the routing table.

To enable node-link protection, include the **node-link-protection** statement at the **[edit protocols isis interface *interface-name*]** hierarchy level:

```

[edit]
protocols {
  isis {
    interface interface-name {
      node-link-protection;
    }
  }
}

```

### Excluding an IS-IS Interface as a Backup for Protected Interfaces

By default, all IS-IS interfaces that belong to the master instance or a specific routing instance are eligible as backup interfaces for protected interfaces. You can specify that any IS-IS interface be excluded from functioning as a backup interface to protected interfaces. To exclude an IS-IS interface as a backup interface, include the **no-eligible-backup** statement at the **[edit protocols isis interface *interface-name*]** hierarchy level:

```

[edit]
protocols {
  isis {
    interface interface-name {
      no-eligible-backup;
    }
  }
}

```

### Configuring RSVP Label-Switched Paths as Backup Paths for IS-IS

Relying on the shortest-path-first (SPF) calculation of backup paths for one-hop neighbors might result in less than 100 percent backup coverage for a specific network topology. You can enhance coverage of IS-IS and LDP label-switched paths (LSPs) by configuring RSVP LSPs as backup paths. To configure a specific RSVP LSP as a backup

path, include the **backup** statement at the `[edit protocols mpls label-switched-path lsp-name]` hierarchy level:

```
[edit]
protocols {
  mpls {
    label-switched-path lsp-name {
      backup;
      to ip-address;
    }
  }
}
```

When configuring an LSP, you must specify the IP address of the egress routing device with the **to** statement. For detailed information about configuring LSPs and RSVP, see the *RSVP Feature Guide for Routing Devices*.

### **Using Operational Mode Commands to Monitor Protected IS-IS Routes**

You can issue operational mode commands that provide more details about your link-protected and node-link-protected IS-IS routes. The following guidelines explain the type of information available from the output of each command:

- **show isis backup label-switched-path**—Displays which MPLS LSPs have been designated as backup paths and the current status of those LSPs.
- **show isis backup spf results**—Displays SPF calculations for each neighbor for a given destination. Indicates whether a specific interface or node has been designated as a backup path and why. Use the **no-coverage** option to display only those nodes that do not have backup coverage.
- **show isis backup coverage**—Displays the percentage of nodes and prefixes for each type of address family that is protected.
- **show isis interface detail**—Displays the type of protection (link or node-link) applied to each protected interface.

### **Example: Configuring Node-Link Protection for IS-IS Routes in a Layer 3 VPN**

Node-link protection establishes an alternate path through a different routing device. Use node-link protection when you assume that access to a node is lost when a link is no longer available. Junos OS calculates a backup path that avoids the primary next-hop routing device.

- [Requirements on page 3887](#)
- [Overview on page 3888](#)
- [Configuration on page 3888](#)
- [Verification on page 3895](#)

### **Requirements**

This example requires Junos OS Release 9.5 or later.

No special configuration beyond device initialization is required before configuring this example.

### Overview

In this example, core-facing interfaces are enabled for IS-IS Level 2, LDP, and RSVP. Node-link protection is enabled on all the core-facing interfaces, which means that if the primary next hop for any destination that traverses the interfaces becomes unavailable, Junos OS uses a backup link that avoids the next-hop router altogether if necessary.

You also need to configure a routing policy that requires all traffic to use per-packet load balancing in order to enable Packet Forwarding Engine local repair. With local repair, the Packet Forwarding Engine can correct a path failure and implement a backup loop-free alternate route before it receives recomputed paths from the Routing Engine.

Figure 109 on page 3888 shows the topology used in this example.

Figure 109: IS-IS Node-Link Protection Topology

On Device PE1, an RSVP LSP is configured as a backup path for IS-IS. Relying on the shortest-path-first (SPF) calculation of backup paths for one-hop neighbors might result in less than 100 percent backup coverage for a specific network topology. You can enhance coverage of IS-IS and LDP LSPs by configuring RSVP LSPs as backup paths. To configure a specific RSVP LSP as a backup path, include the **backup** statement at the **[edit protocols mpls label-switched-path *lsp-name*]** hierarchy level.

“CLI Quick Configuration” on page 3888 shows the configuration for all of the devices in Figure 109 on page 3888. The section “Step-by-Step Procedure” on page 3892 describes the steps on Device P1.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device CE1**      **set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.1/30**  
                      **set interfaces lo0 unit 0 family inet address 10.255.1.1/32**

**Device PE1**      **set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.2/30**  
                      **set interfaces fe-1/2/0 unit 0 family iso**  
                      **set interfaces fe-1/2/0 unit 0 family mpls**

```

set interfaces fe-1/2/1 unit 0 family inet address 10.0.0.5/30
set interfaces fe-1/2/1 unit 0 family iso
set interfaces fe-1/2/1 unit 0 family mpls
set interfaces fe-1/2/2 unit 0 family inet address 10.0.0.21/30
set interfaces fe-1/2/2 unit 0 family iso
set interfaces fe-1/2/2 unit 0 family mpls
set interfaces lo0 unit 0 family inet address 10.255.2.2/32
set interfaces lo0 unit 0 family iso address 49.0001.0010.0000.0202.00
set protocols rsvp interface fe-1/2/2.0
set protocols rsvp interface fe-1/2/1.0
set protocols rsvp interface lo0.0
set protocols rsvp interface fxp0.0 disable
set protocols mpls label-switched-path to-p2 backup
set protocols mpls label-switched-path to-p2 to 10.255.4.4
set protocols mpls label-switched-path to-p2 ldp-tunneling
set protocols mpls interface fe-1/2/2.0
set protocols mpls interface fe-1/2/1.0
set protocols mpls interface lo0.0
set protocols mpls interface fxp0.0 disable
set protocols bgp group l3vpn type internal

set protocols ldp deaggregate
set protocols ldp interface fe-1/2/0.0
set protocols ldp interface fe-1/2/2.0
set protocols ldp interface fxp0.0 disable
set protocols ldp interface lo0.0
set policy-options policy-statement ecmp term 1 then load-balance per-packet
set routing-instances VPN-A instance-type vrf
set routing-instances VPN-A interface fe-1/2/1.0
set routing-instances VPN-A route-distinguisher 65534:1234
set routing-instances VPN-A vrf-target target:65534:1234
set routing-instances VPN-A routing-options static route 10.255.1.1/32 next-hop 10.0.0.18
set routing-options autonomous-system 65534
set routing-options forwarding-table export ecmp

```

**Device CE2**      **set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.18/30**  
**set interfaces lo0 unit 0 family inet address 10.255.6.6/32**

**Step-by-Step Procedure**    The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure multi-level IS-IS:

1.    Configure the interfaces.

Enable IS-IS and MPLS.

```
[edit interfaces]
user@P1# set fe-1/2/0 unit 0 family inet address 10.0.0.6/30
user@P1# set fe-1/2/0 unit 0 family iso
user@P1# set fe-1/2/0 unit 0 family mpls
user@P1# set fe-1/2/1 unit 0 family inet address 10.0.0.9/30
user@P1# set fe-1/2/1 unit 0 family iso
user@P1# set fe-1/2/1 unit 0 family mpls
user@P1# set fe-1/2/2 unit 0 family inet address 10.0.0.25/30
user@P1# set fe-1/2/2 unit 0 family iso
user@P1# set fe-1/2/2 unit 0 family mpls
user@P1# set lo0 unit 0 family inet address 10.255.3.3/32
user@P1# set lo0 unit 0 family iso address 49.0001.0010.0000.0303.00
```

2.    Configure the IS-IS interfaces for Level 2.

```
[edit protocols]
user@P1# set isis interface all level 2 metric 10
user@P1# set isis interface all level 1 disable
user@P1# set isis interface fxp0.0 disable
user@P1# set isis interface lo0.0 level 2 metric 0
```

3.    Enable IS-IS node-link protection, which also automatically extends backup coverage to all LDP LSPs.

```
[edit protocols]
user@P1# set isis interface all node-link-protection
```

4.    (Optional) Configure a 1000-millisecond time interval between the detection of a topology change and when the SPF algorithm runs.

```
[edit protocols]
user@P1# set isis spf-options delay 1000
```

5.    Configure MPLS to use both RSVP and LDP label-switched paths (LSPs).

```
[edit protocols]
user@P1# set mpls interface all
user@P1# set mpls interface fxp0.0 disable
user@P1# set rsvp interface all
user@P1# set rsvp interface fxp0.0 disable
user@P1# set ldp interface all
user@P1# set ldp interface fxp0.0 disable
```

6.    (Optional) For LDP, enable forwarding equivalence class (FEC) deaggregation, which results in faster global convergence.

```
[edit protocols]
user@P1# set ldp deaggregate
```

7. To enable Packet Forwarding Engine local repair, establish a policy that forces the routing protocol process to install all the next hops for a given route.

This policy ensures that the backup route is installed in the forwarding table used by the Packet Forwarding Engine to forward traffic to a given destination.

```
[edit policy-options policy-statement ecmp term 1]
user@P1# set then load-balance per-packet
```

8. Apply the policy to the forwarding table of the local router with the **export** statement.

```
[edit routing-options forwarding-table]
user@P1# set export ecmp
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@P1# show interfaces
fe-1/2/0 {
  unit 0 {
    family inet {
      address 10.0.0.6/30;
    }
    family iso;
    family mpls;
  }
}
fe-1/2/1 {
  unit 0 {
    family inet {
      address 10.0.0.9/30;
    }
    family iso;
    family mpls;
  }
}
fe-1/2/2 {
  unit 0 {
    family inet {
      address 10.0.0.25/30;
    }
    family iso;
    family mpls;
  }
}
lo0 {
  unit 0 {
    family inet {
      address 10.255.3.3/32;
    }
    family iso {
```

```
        address 49.0001.0010.0000.0303.00;
    }
}

user@P1# show protocols
rsvp {
    interface all;
    interface fxp0.0 {
        disable;
    }
}
mpls {
    interface all;
    interface fxp0.0 {
        disable;
    }
}
isis {
    spf-options delay 1000;
    interface all {
        node-link-protection;
        level 2 metric 10;
        level 1 disable;
    }
    interface fxp0.0 {
        disable;
    }
    interface lo0.0 {
        level 2 metric 0;
    }
}
ldp {
    deaggregate;
    interface all;
    interface fxp0.0 {
        disable;
    }
}

user@P1# show policy-options
policy-statement ecmp {
    term 1 {
        then {
            load-balance per-packet;
        }
    }
}

user@P1# show routing-options
forwarding-table {
    export ecmp;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

**Verification**

Confirm that the configuration is working properly.

- [Checking the MPLS LSP Backup Path on page 3895](#)
- [Checking Which Next-Hop Neighbors Are Designated as Backup Paths to the Destination Node on page 3895](#)
- [Checking the Backup Coverage on page 3896](#)
- [Checking the Type of Protection Configured on page 3897](#)

**Checking the MPLS LSP Backup Path**

|                |   |
|----------------|---|
| <b>Purpose</b> | Display information about the MPLS label-switched-paths (LSPs) designated as the backup route for the IS-IS routes.   |
| <b>Action</b>  | <p>On Device PE1, from operational mode, enter the <b>show isis backup label-switched-path</b> command.</p> <pre> user@PE1&gt; show isis backup label-switched-path Backup MPLS LSPs: to-p2, Egress: 10.255.4.4, Status: up, Last change: 01:17:45 TE-metric: 19, Metric: 0, Refcount: 1 </pre> |
| <b>Meaning</b> | The output shows that the backup path is up and operational.  |

**Checking Which Next-Hop Neighbors Are Designated as Backup Paths to the Destination Node**

|                |   |
|----------------|---|
| <b>Purpose</b> | Display SPF calculations for each neighbor for a given destination.   |
| <b>Action</b>  | <p>On Device PE1, from operational mode, enter the <b>show isis backup spf results</b> command.</p> <pre> user@PE1&gt; show isis backup spf results  IS-IS level 1 SPF results: 0 nodes  IS-IS level 2 SPF results: PE2.00 Primary next-hop: fe-1/2/2.0, IPV4, P3, SNPA: 0:5:85:8f:c8:bd Root: P2, Root Metric: 20, Metric: 10, Root Preference: 0x0 track-item: P2.00-00 Eligible, Backup next-hop: fe-1/2/1.0, LSP, to-p2 Root: P3, Root Metric: 10, Metric: 10, Root Preference: 0x0 Not eligible, Reason: Interface is already covered Root: P1, Root Metric: 10, Metric: 20, Root Preference: 0x0 track-item: P3.00-00 Not eligible, Reason: Interface is already covered P2.00 Primary next-hop: fe-1/2/1.0, IPV4, P1, SNPA: 0:5:85:8f:c8:bd Root: P2, Root Metric: 20, Metric: 0, Root Preference: 0x0 track-item: P2.00-00 Not eligible, Reason: Primary next-hop link fate sharing Root: P1, Root Metric: 10, Metric: 10, Root Preference: 0x0 Not eligible, Reason: Primary next-hop link fate sharing Root: P3, Root Metric: 10, Metric: 20, Root Preference: 0x0 </pre> |

    Not eligible, Reason: Primary next-hop link fate sharing
    Root: P1, Root Metric: 10, Metric: 0, Root Preference: 0x0
    Not eligible, Reason: Primary next-hop link fate sharing
    Root: P3, Root Metric: 10, Metric: 10, Root Preference: 0x0
    track-item: P1.00-00
    Eligible, Backup next-hop: fe-1/2/2.0, IPV4, P3, SNPA: 0:5:85:8f:c8:bd
4 nodes

```

**Meaning** The output indicates whether a specific interface or node has been designated as a backup path and why.

### *Checking the Backup Coverage*

**Purpose** Check the percentage of protected nodes and prefixes.

**Action** From operational mode, enter the **show isis backup coverage** command.

```
user@PE1> show isis backup coverage
```

```
Backup Coverage:
```

| Topology     | Level | Node   | IPv4   | IPv6  | CLNS  |
|--------------|-------|--------|--------|-------|-------|
| IPV4 Unicast | 1     | 0.00%  | 0.00%  | 0.00% | 0.00% |
| IPV4 Unicast | 2     | 75.00% | 87.50% | 0.00% | 0.00% |

```
user@P1> show isis backup coverage
```

```
Backup Coverage:
```

| Topology     | Level | Node   | IPv4   | IPv6  | CLNS  |
|--------------|-------|--------|--------|-------|-------|
| IPV4 Unicast | 1     | 0.00%  | 0.00%  | 0.00% | 0.00% |
| IPV4 Unicast | 2     | 75.00% | 71.43% | 0.00% | 0.00% |

```
user@P2> show isis backup coverage
```

```
Backup Coverage:
```

| Topology     | Level | Node   | IPv4   | IPv6  | CLNS  |
|--------------|-------|--------|--------|-------|-------|
| IPV4 Unicast | 1     | 0.00%  | 0.00%  | 0.00% | 0.00% |
| IPV4 Unicast | 2     | 50.00% | 37.50% | 0.00% | 0.00% |

```
user@P3> show isis backup coverage
```

```
Backup Coverage:
```

| Topology     | Level | Node   | IPv4   | IPv6  | CLNS  |
|--------------|-------|--------|--------|-------|-------|
| IPV4 Unicast | 1     | 0.00%  | 0.00%  | 0.00% | 0.00% |
| IPV4 Unicast | 2     | 75.00% | 71.43% | 0.00% | 0.00% |

```

user@PE2> show isis backup coverage
Backup Coverage:
Topology      Level  Node   IPv4   IPv6   CLNS
IPv4 Unicast  1     0.00%  0.00%  0.00%  0.00%
IPv4 Unicast  2     50.00% 37.50%  0.00%  0.00%

```

**Meaning** The level of backup coverage available through IS-IS routes depends on the actual network topology and is typically less than 100 percent for all destinations on any given routing device. You can extend backup coverage to include RSVP LSPs.

### *Checking the Type of Protection Configured*

**Purpose** On all nodes in the IS-IS domain, check the percentage of protected nodes and prefixes.

**Action** From operational mode, enter the **show isis interface detail** command.

```

user@PE1> show isis interface detail

IS-IS interface database:
lo0.0
  Index: 76, State: 0x6, Circuit id: 0x1, Circuit type: 0
  LSP interval: 100 ms, CSNP interval: disabled
  Adjacency advertisement: Advertise
  Level Adjacencies Priority Metric Hello (s) Hold (s) Designated Router
    1           0       64      0 Passive
    2           0       64      0 Passive
fe-1/2/2.0
  Index: 79, State: 0x6, Circuit id: 0x1, Circuit type: 2
  LSP interval: 100 ms, CSNP interval: 10 s
  Adjacency advertisement: Advertise
  Protection Type: Node Link
  Level Adjacencies Priority Metric Hello (s) Hold (s) Designated Router

No special configuration beyond device initialization is required before configuring this example.

## Overview

This example shows a logical system redistributing a default route to other logical systems. All logical systems are running IS-IS. A common reason for a default route is to provide a path for sending traffic destined outside the IS-IS domain.

In this example, the default route is not used for forwarding traffic. The **no-install** statement prevents the route from being installed in the forwarding table of Logical System LS3. If you configure a route so it is not installed in the forwarding table, the route is still eligible to be exported from the routing table to other protocols. The **discard** statement silently drops packets without notice.

[Figure 110 on page 3898](#) shows the sample network.

**Figure 110: IS-IS Logical Systems with a Default Route to an ISP**

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set logical-systems LS3 interfaces lt-1/2/0 unit 3 description LS3->LS2
set logical-systems LS3 interfaces lt-1/2/0 unit 3 encapsulation ethernet
set logical-systems LS3 interfaces lt-1/2/0 unit 3 peer-unit 4
```

```

set logical-systems LS3 interfaces lt-1/2/0 unit 3 family inet address 10.0.2.1/30
set logical-systems LS3 interfaces lt-1/2/0 unit 3 family iso
set logical-systems LS3 interfaces lt-1/2/0 unit 5 description LS3->LS1
set logical-systems LS3 interfaces lt-1/2/0 unit 5 encapsulation ethernet
set logical-systems LS3 interfaces lt-1/2/0 unit 5 peer-unit 0
set logical-systems LS3 interfaces lt-1/2/0 unit 5 family inet address 10.0.1.1/30
set logical-systems LS3 interfaces lt-1/2/0 unit 5 family iso
set logical-systems LS3 interfaces lo0 unit 3 family iso address 49.0001.1234.1600.2231.00
set logical-systems LS3 protocols isis export isis-default
set logical-systems LS3 protocols isis interface lt-1/2/0.3
set logical-systems LS3 protocols isis interface lt-1/2/0.5
set logical-systems LS3 protocols isis interface lo0.3 passive
set logical-systems LS3 routing-options static route 0.0.0.0/0 discard
set logical-systems LS3 routing-options static route 0.0.0.0/0 no-install
set logical-systems LS3 policy-options policy-statement isis-default from protocol static
set logical-systems LS3 policy-options policy-statement isis-default from route-filter
    0.0.0.0/0 exact
set logical-systems LS3 policy-options policy-statement isis-default then accept

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure an IS-IS default route policy on logical systems:

1. Configure the logical tunnel interfaces.

```

[edit logical-systems LS3 interfaces lt-1/2/0]
user@R1# set unit 3 description LS3->LS2
user@R1# set unit 3 encapsulation ethernet
user@R1# set unit 3 peer-unit 4
user@R1# set unit 3 family inet address 10.0.2.1/30
user@R1# set unit 3 family iso
user@R1# set unit 5 description LS3->LS1
user@R1# set unit 5 encapsulation ethernet
user@R1# set unit 5 peer-unit 0
user@R1# set unit 5 family inet address 10.0.1.1/30
user@R1# set unit 5 family iso
[edit logical-systems LS3 interfaces lo0 unit 3]
user@R1# set family iso address 49.0001.1234.1600.2231.00

```

2. Enable IS-IS on the interfaces.

```

[edit logical-systems LS3 protocols isis]
user@R1# set interface lt-1/2/0.3
user@R1# set interface lt-1/2/0.5
user@R1# set interface lo0.3 passive

```

3. Configure the default route on Logical System LS3.

```

[edit logical-systems LS3 routing-options]
user@R1# set static route 0.0.0.0/0 discard
user@R1# set static route 0.0.0.0/0 no-install

```

4. Configure the default route policy on Logical System LS3.

```

[edit logical-systems LS3 policy-options]
user@R1# set policy-statement isis-default from protocol static

```

```
user@R1# set policy-statement isis-default from route-filter 0.0.0.0/0 exact
user@R1# set policy-statement isis-default then accept
```

5. Apply the export policy to IS-IS on Logical System LS3.

```
[edit logical-systems LS3 protocols isis]
user@R1# set export isis-default
```

6. If you are done configuring the device, commit the configuration.

```
[edit]
user@R1# commit
```

### Results

From configuration mode, confirm your configuration by issuing the **show logical-systems LS3** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show logical-systems LS3
interfaces {
  lt-1/2/0 {
    unit 3 {
      description LS3->LS2;
      encapsulation ethernet;
      peer-unit 4;
      family inet {
        address 10.0.2.1/30;
      }
      family iso;
    }
    unit 5 {
      description LS3->LS1;
      encapsulation ethernet;
      peer-unit 0;
      family inet {
        address 10.0.1.1/30;
      }
      family iso;
    }
  }
  lo0 {
    unit 3 {
      family iso {
        address 49.0001.1234.1600.2231.00;
      }
    }
  }
}
protocols {
  isis {
    export isis-default;
    interface lt-1/2/0.3;
    interface lt-1/2/0.5;
    interface lo0.3 {
      passive;
    }
  }
}
```

```
    }  
  }  
}  
policy-options {  
  policy-statement isis-default {  
    from {  
      protocol static;  
      route-filter 0.0.0.0/0 exact;  
    }  
    then accept;  
  }  
}  
routing-options {  
  static {  
    route 0.0.0.0/0 {  
      discard;  
      no-install;  
    }  
  }  
}
```

### Verification

Confirm that the configuration is working properly.

#### *Verifying That the Static Route Is Redistributed*

**Purpose** Make sure that the IS-IS policy is working by checking the routing tables.

```

Action user@R1> show route logical-system LS3
inet.0: 6 destinations, 6 routes (6 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

0.0.0.0/0          *[Static/5] 00:00:45
                   Discard
10.0.0.0/30        *[IS-IS/15] 1w0d 10:14:14, metric 20
                   to 10.0.2.2 via lt-1/2/0.3
                   > to 10.0.1.2 via lt-1/2/0.5
10.0.1.0/30        *[Direct/0] 1w0d 10:15:18
                   > via lt-1/2/0.5

                  > via lo0.1

```

**Meaning** The routing table on Logical System LS3 contains the default 0.0.0.0/0 route from protocol **Static**. The routing tables on Logical System LS1 and Logical System LS2 contain the default 0.0.0.0/0 route from protocol **IS-IS**. If Logical System LS1 and Logical System LS2 receive packets destined for networks not specified in their routing tables, those packets will be sent to Logical System LS3 for further processing. This configuration assumes that Logical System LS3 has a connection to an ISP or another external network.

## Example: Configuring IS-IS for CLNS

- [Understanding IS-IS for CLNS on page 3903](#)
- [Example: Configuring IS-IS for CLNS on page 3903](#)

### Understanding IS-IS for CLNS

IS-IS extensions provide the basic interior gateway protocol (IGP) support for collecting intradomain routing information for Connectionless Network Service (CLNS) destinations within a CLNS network. Routers that learn host addresses through End System-to-Intermediate System (ES-IS) can advertise the addresses to other routers (intermediate systems) by using IS-IS.

For more information about IS-IS, see the ISO 10589 standard.

### Example: Configuring IS-IS for CLNS

This example shows how to create a routing instance and enable the IS-IS protocol on all interfaces.

- [Requirements on page 3903](#)
- [Overview on page 3904](#)
- [Configuration on page 3904](#)
- [Verification on page 3905](#)

#### Requirements

Before you begin, configure the network interfaces. See the *Junos OS Interfaces Configuration Guide for Security Devices*.

### Overview

The configuration instructions in this topic describe how to create a routing instance called `aaaa`, enable IS-IS on all interfaces, define the BGP export policy name (`dist-bgp`), family (ISO), and protocol (BGP), and apply the export policy to IS-IS.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set routing-instances aaaa protocols isis clns-routing
set routing-instances aaaa protocols isis interface all
set routing-instances aaaa protocols isis no-ipv4-routing no-ipv6-routing
set policy-options policy-statement dist-bgp from family iso protocol bgp
set policy-options policy-statement dist-bgp then accept
set routing-instances aaaa protocols isis export dist-bgp
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IS-IS for CLNS:

1. Enable CLNS routing.  

```
[edit routing-instances aaaa]
user@host# set protocols isis clns-routing
```
2. Enable IS-IS on all interfaces.  

```
[edit routing-instances aaaa]
user@host# set protocols isis interface all
```
3. (Optional) Disable IPv4 and IPv6 routing to configure a pure CLNS network.  

```
[edit routing-instances aaaa]
user@host# set protocols isis no-ipv4-routing no-ipv6-routing
```
4. Define the BGP export policy name, family, and protocol.  

```
[edit policy-options]
user@host# set policy-statement dist-bgp from family iso protocol bgp
```
5. Define the action for the export policy.  

```
[edit policy-options]
user@host# set policy-statement dist-bgp then accept
```
6. Apply the export policy to IS-IS.  

```
[edit routing-instances aaaa]
user@host# set protocols isis export dist-bgp
```

**Results** From configuration mode, confirm your configuration by entering the **show routing-instances** and **show policy-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show routing-instances
aaaa {
  protocols {
    isis {
      export dist-bgp;
      no-ipv4-routing;
      no-ipv6-routing;
      clns-routing;
      interface all;
    }
  }
}

user@host# show policy-options
policy-statement dist-bgp {
  from {
    family iso;
    protocol bgp;
  }
  then accept;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying the ISO Routes on page 3905](#)
- [Checking the SPF Calculations on page 3905](#)

### **Verifying the ISO Routes**

**Purpose** Verify that the expected ISO routes are displayed in the IS-IS routing table.

**Action** From operational mode, enter the **show isis route** command.

### **Checking the SPF Calculations**

**Purpose** Display information about IS-IS shortest-path-first (SPF) calculations.

**Action** From operational mode, enter the **show isis spf** command.

## **Example: Configuring IS-IS Designated Routers**

- [Understanding IS-IS Designated Routers on page 3905](#)
- [Example: Configuring Designated Router Election Priority for IS-IS on page 3906](#)

### **Understanding IS-IS Designated Routers**

A router advertises its priority to become a designated router in its hello packets. On all multiaccess networks (physical networks that support the attachment of more than two

routers, such as Ethernet networks), IS-IS uses the advertised priorities to elect a designated router for the network. This router is responsible for sending network link-state advertisements, which describe all the routers attached to the network. These advertisements are flooded throughout a single area. The priority value is meaningful only on a multiaccess network. It has no meaning on a point-to-point interface.

A router's priority for becoming the designated router is indicated by an arbitrary number from 0 through 127, which you configure on the IS-IS interface. The router with the highest priority becomes the designated router for the area (Level 1, Level 2, or both), also configured on the IS-IS interface. If routers in the network have the same priority, then the router with the highest MAC address is elected as the designated router. By default, routers have a priority value of 64.

---

### Example: Configuring Designated Router Election Priority for IS-IS

---

This example shows how to configure the designated router election priority for IS-IS.

Before you begin:

- Configure network interfaces. See the *Junos OS Interfaces Configuration Guide for Security Devices*.
- Enable IS-IS on the interfaces. See [“Example: Configuring IS-IS” on page 3823](#).

In this example, you configure the priority for logical interface ge-0/0/1.0 to be 100 and the level number to be 1. If this interface has the highest priority value, the router becomes the designated router for the Level 1 area.

To configure a designated router election priority for IS-IS:

```
[edit]
user@host# set protocols isis interface ge-0/0/1.0 level 1 priority 100
```

#### Related Documentation

### Example: Enabling Packet Checksums on IS-IS Interfaces

This example shows how to enable packet checksums for IS-IS interfaces.

- [Requirements on page 3906](#)
- [Overview on page 3906](#)
- [Configuration on page 3907](#)
- [Verification on page 3908](#)

---

#### Requirements

---

Before you begin, configure IS-IS on both routers. See [“Example: Configuring IS-IS” on page 3823](#) for information about the sample IS-IS configuration.

---

#### Overview

---

Junos OS supports IS-IS checksums as documented in RFC 3358, *Optional Checksums in Intermediate System to Intermediate System (ISIS)*.

IS-IS protocol data units (PDUs) include link-state PDUs, complete sequence number PDUs (CSNPs), partial sequence number PDUs (PSNPs), and IS-IS hello (IIH) packets. These PDUs can be corrupt due to faulty implementations of Layer 2 hardware or lack of checksums on a specific network technology. Corruption of length or type, length, and value (TLV) fields can lead to the generation of extensive numbers of empty link-state PDUs in the receiving node. Because authentication is not a replacement for a checksum mechanism, you might want to enable the optional checksum TLV on your IS-IS interfaces.

The checksum cannot be enabled with MD5 hello authentication on the same interface.

Figure 111 on page 3907 shows the topology used in this example.

**Figure 111: IS-IS Checksum Topology**

This example describes the steps on Device R1.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set protocols isis traceoptions file isis
set protocols isis traceoptions flag all
set protocols isis interface fe-1/2/0.1 checksum
  
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IS-IS checksums:

1. Enable checksums.
 

```

[edit protocols isis interface fe-1/2/0.1]
user@R1# set checksum
      
```
2. (Optional) Enable tracing for tracking checksum operations.
 

```

[edit protocols isis traceoptions]
user@R1# set file isis
user@R1# set flag all
      
```

**Results** From configuration mode, confirm your configuration by entering the **show protocols** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show protocols
isis {
  traceoptions {
    file isis;
    flag all;
  }
  interface fe-1/2/0.1 {
    checksum;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

---

### Verification

Confirm that the configuration is working properly.

#### Verifying Checksums

**Purpose** Verify that checksums are performed.

**Action** From operational mode, enter the **show log isis | match checksum** command.

```
user@R1> show log isis | match checksum
```

```
May 31 16:47:39.513267      sequence 0x49 checksum 0x8e64
May 31 16:47:39.513394      sequence 0x4e checksum 0x34b3
May 31 16:47:39.513517      sequence 0x50 checksum 0x9dcb
May 31 16:47:46.563781      sequence 0x45 checksum 0x7e1a
May 31 16:47:46.563970      sequence 0x46 checksum 0x226d
May 31 16:47:46.564104      sequence 0x52 checksum 0x99cd
May 31 16:47:46.581087      sequence 0x49 checksum 0x8e64
May 31 16:47:46.581222      sequence 0x4e checksum 0x34b3
May 31 16:47:46.581353      sequence 0x50 checksum 0x9dcb
May 31 16:47:55.799090      sequence 0x45 checksum 0x7e1a
May 31 16:47:55.799223      sequence 0x46 checksum 0x226d
May 31 16:47:55.799347      sequence 0x52 checksum 0x99cd
May 31 16:47:55.818255      sequence 0x49 checksum 0x8e64
May 31 16:47:55.818473      sequence 0x4e checksum 0x34b3
May 31 16:47:55.818606      sequence 0x50 checksum 0x9dcb
May 31 16:48:03.455816      sequence 0x49 checksum 0x8e64
May 31 16:48:03.455973      sequence 0x4e checksum 0x34b3
```

**Meaning** The output shows that checksum information is captured in the IS-IS trace log file.

## Configuration Tasks

- [Configuring IS-IS Authentication on page 3909](#)
- [Configuring Authentication Without Network-Wide Deployment on page 3910](#)

## Configuring IS-IS Authentication

All IS-IS protocol exchanges can be authenticated to guarantee that only trusted routing devices participate in the autonomous system (AS) routing. By default, IS-IS authentication is disabled on the routing device.

To configure IS-IS authentication, you must define an authentication password and specify the authentication type.

You can configure one of the following authentication methods:

- Simple authentication—Uses a text password that is included in the transmitted packet. The receiving routing device uses an authentication key (password) to verify the packet. Simple authentication is included for compatibility with existing IS-IS implementations. However, we recommend that you do *not* use this authentication method because it is insecure (the text can be “sniffed”).

**CAUTION:** A simple password that exceeds 254 characters is truncated.

- HMAC-MD5 authentication—Uses an iterated cryptographic hash function. The receiving routing device uses an authentication key (password) to verify the packet.

You can also configure more fine-grained interface-level authentication for hello packets.

To enable authentication and specify an authentication method, include the **authentication-type** statement, specifying the **simple** or **md5** authentication type:

**authentication-type** *authentication*;

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

To configure a password, include the **authentication-key** statement. The authentication password for all routing devices in a domain must be the same.

**authentication-key** *key*;

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

To configure hitless authentication key rollover, include the **authentication-key-chain (Protocols IS-IS)** statement.

The password can contain up to 255 characters. If you include spaces, enclose all characters in quotation marks (" ").

If you are using the Junos OS IS-IS software with another implementation of IS-IS, the other implementation must be configured to use the same password for the domain, the area, and all interfaces that are shared with a Junos OS implementation.

Authentication of hello packets, partial sequence number PDU (PSNP), and complete sequence number PDU (CSNP) can be suppressed to enable interoperability with the

routing software of different vendors. Different vendors handle authentication in various ways, and suppressing authentication for different PDU types might be the simplest way to allow compatibility within the same network.

To configure IS-IS to generate authenticated packets, but not to check the authentication on received packets, include the **no-authentication-check** statement:

**no-authentication-check;**

To suppress authentication of IS-IS hello packets, include the **no-hello-authentication** statement:

**no-hello-authentication;**

To suppress authentication of PSNPs, include the **no-psnp-authentication** statement:

**no-psnp-authentication;**

To suppress authentication of CSNPs, include the **no-csnp-authentication** statement:

**no-csnp-authentication;**

For a list of hierarchy levels at which you can include these statements, see the statement summary sections for these statements.

**NOTE:** The **authentication** and the **no-authentication** statements must be configured at the same hierarchy level. Configuring authentication at the [edit protocols isis interface *interface-name*] hierarchy level and configuring **no-authentication** at the [edit protocols isis] hierarchy level has no effect.

## authentication-key (Protocols IS-IS)

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | authentication-key <i>key</i> ;  |
| <b>Hierarchy Level</b>     | [edit logical-systems <i>logical-system-name</i> protocols isis <b>level</b> <i>level-number</i> ],<br>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols<br>isis <b>level</b> <i>level-number</i> ],<br>[edit protocols isis <b>level</b> <i>level-number</i> ],<br>[edit routing-instances <i>routing-instance-name</i> protocols isis <b>level</b> <i>level-number</i> ]   |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.   |
| <b>Description</b>         | <p>Authentication key (password). Neighboring routing devices use the password to verify the authenticity of packets sent from this interface. For the key to work, you also must include the <b>authentication-type</b> statement.</p> <p>All routing devices must use the same password. If you are using the Junos OS IS-IS software with another implementation of IS-IS, the other implementation must be configured to use the same password for the domain, the area, and all interfaces adjacent to the Juniper Networks routing device.</p> |
| <b>Default</b>             | If you do not include this statement and the <b>authentication-type</b> statement, IS-IS authentication is disabled.   |
| <b>Options</b>             | <b>key</b> —Authentication password. The password can be up to 1024 characters long. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").   |

**CAUTION:** A simple password for authentication is truncated if it exceeds 254 characters.

|                                 |   |
|---------------------------------|---|
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.           |

## authentication-key-chain (Protocols IS-IS)

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | authentication-key-chain <i>key-chain-name</i> ;   |
| <b>Hierarchy Level</b>          | [edit logical-systems <i>name</i> protocols isis level <i>level-number</i> ],<br>[edit logical-systems <i>name</i> routing-instances <i>instance-name</i> protocols isis level <i>level-number</i> ],<br>[edit protocols isis level <i>level-number</i> ],<br>[edit routing-instances <i>instance-name</i> protocols isis level <i>level-number</i> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.2.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.  |
| <b>Description</b>              | Apply and enable an authentication keychain to the routing device.   |
| <b>Options</b>                  | <b>key-chain</b> —Authentication keychain name. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").  |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Hitless Authentication Key Rollover for IS-IS on page 3837</a></li><li>• <a href="#">Example: Configuring Route Authentication for BGP on page 3572</a></li><li>• <a href="#">Example: Configuring BFD Authentication for Static Routes on page 2931</a></li><li>• <a href="#">Configuring the Authentication Key Update Mechanism for BGP and LDP Routing Protocols</a></li><li>• <a href="#">Understanding Hitless Authentication Key Rollover for IS-IS on page 3818</a></li></ul> |

## authentication-type (Protocols IS-IS)

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>authentication-type <i>authentication</i>;</code>   |
| <b>Hierarchy Level</b>          | <p>[edit logical-systems <i>logical-system-name</i> protocols isis <a href="#">level level-number</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <a href="#">level level-number</a>],</p> <p>[edit protocols isis <a href="#">level level-number</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis <a href="#">level level-number</a>]</p>  |
| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>   |
| <b>Description</b>              | Enable authentication and specify the authentication scheme for IS-IS. If you enable authentication, you must specify a password by including the <b>authentication-key</b> statement.  |
| <b>Default</b>                  | If you do not include this statement and the <b>authentication-key</b> statement, IS-IS authentication is disabled.   |
| <b>Options</b>                  | <p><b><i>authentication</i></b>—Authentication scheme:</p> <ul style="list-style-type: none"> <li>• <b>md5</b>—Use HMAC authentication in combination with MD5. HMAC-MD5 authentication is defined in RFC 2104, <i>HMAC: Keyed-Hashing for Message Authentication</i>.</li> <li>• <b>simple</b>—Use a simple password for authentication. The password is included in the transmitted packet, making this method of authentication relatively insecure. We recommend that you <i>not</i> use this authentication method.</li> </ul> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <i>Example: Configuring Hitless Authentication Key Rollover for IS-IS</i></li> <li>• <a href="#">authentication-key on page 3913</a></li> <li>• <a href="#">no-authentication-check on page 3949</a></li> </ul>  |

## bfd-liveness-detection (Protocols IS-IS)

---

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | <pre>bfd-liveness-detection {   authentication {     algorithm <i>algorithm-name</i>;     key-chain <i>key-chain-name</i>;     loose-check;   }   detection-time {     threshold <i>milliseconds</i>;   }   minimum-interval <i>milliseconds</i>;   minimum-receive-interval <i>milliseconds</i>;   multiplier <i>number</i>;   no-adaptation;   transmit-interval {     minimum-interval <i>milliseconds</i>;     threshold <i>milliseconds</i>;   }   version (1   automatic); }</pre>   |
| <b>Hierarchy Level</b>     | <p>[edit logical-systems <i>logical-system-name</i> protocols isis <a href="#">interface interface-name</a>],<br/>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols<br/>isis <a href="#">interface interface-name</a>],<br/>[edit protocols isis <a href="#">interface interface-name</a>],<br/>[edit routing-instances <i>routing-instance-name</i> protocols isis <a href="#">interface interface-name</a>]</p>  |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.<br/>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br/><b>detection-time threshold</b> and <b>transmit-interval threshold</b> options added in Junos OS Release 8.2.<br/>Support for logical systems introduced in Junos OS Release 8.3.<br/><b>no-adaptation</b> statement introduced in Junos OS Release 9.0.<br/><b>authentication algorithm</b>, <b>authentication key-chain</b>, and <b>authentication loose-check</b> options introduced in Junos OS Release 9.6.<br/>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>   |
| <b>Description</b>         | Configure bidirectional failure detection timers and authentication.   |
| <b>Options</b>             | <p><b>authentication algorithm <i>algorithm-name</i></b>—Configure the algorithm used to authenticate the specified BFD session: <b>simple-password</b>, <b>keyed-md5</b>, <b>keyed-sha-1</b>, <b>meticulous-keyed-md5</b>, <b>meticulous-keyed-sha-1</b>.</p> <p><b>authentication key-chain <i>key-chain-name</i></b>—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the <b>authentication-key-chains key-chain</b> statement at the <b>[edit security]</b> hierarchy level.</p> <p><b>authentication loose-check</b>—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication might not be configured at both ends of the BFD session.</p> |

**detection-time threshold *milliseconds***—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**minimum-interval *milliseconds***—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the **transmit-interval**, **minimum-interval**, and **minimum-receive-interval** statements.

**Range:** 1 through 255,000

**minimum-receive-interval *milliseconds***—Configure the minimum interval after which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the **minimum-interval** statement.

**Range:** 1 through 255,000

**multiplier *number***—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255

**Default:** 3

**no-adaptation**—Specify that BFD sessions not adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

**transmit-interval threshold *milliseconds***—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**transmit-interval minimum-interval *milliseconds***—Configure a minimum interval after which the local routing device transmits hello packets to a neighbor. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement.

**Range:** 1 through 255,000

**version**—Configure the BFD version to detect: **1** (BFD version 1) or **automatic** (autodetect the BFD version)

**Default:** automatic

|                                 |   |

## csnp-interval

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>csnp-interval (seconds   disable);</code>  |
| <b>Hierarchy Level</b>          | <p>[edit logical-systems <i>logical-system-name</i> protocols isis <b>interface</b> <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <b>interface</b> <i>interface-name</i>],</p> <p>[edit protocols isis <b>interface</b> <i>interface-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis <b>interface</b> <i>interface-name</i>]</p>                             |
| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>  |
| <b>Description</b>              | <p>Configure the interval between complete sequence number PDUs (CSNPs) on a LAN interface.</p> <p>If the routing device is the designated router on a LAN, IS-IS sends CSN packets every 10 seconds. If the routing device is on a point-to-point interface, it sends CSN packets every 5 seconds multiplied by the number of IS-IS adjacencies over point-to-point links, which are in UP state.</p> <p>To configure the interface not to send any CSNPs, specify the <b>disable</b> option.</p> |
| <b>Default</b>                  | By default, IS-IS sends CSNPs periodically. If the routing device is the designated router on a LAN, IS-IS sends CSNPs every 10 seconds. If the routing device is on a point-to-point interface, it sends CSNPs every 5 seconds multiplied by the number of IS-IS adjacencies over point-to-point links, which are in UP state.  |
| <b>Options</b>                  | <p><b>disable</b>—Do not send CSNPs on this interface.</p> <p><b>seconds</b>—Number of seconds between the sending of CSNPs.</p> <p><b>Range:</b> 1 through 65,535 seconds</p> <p><b>Default:</b> 10 seconds on LAN broadcast links. 5 seconds on point-to-point links.</p>  |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li><i>Example: Configuring the Transmission Frequency for CSNP Packets on IS-IS Interfaces</i></li> </ul>  |

## disable (Protocols IS-IS)

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | disable;   |
| <b>Hierarchy Level</b>          | <p>[edit logical-systems <i>logical-system-name</i> protocols <b>isis</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols isis <b>interface</b> <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols isis <b>traffic-engineering</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>isis</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <b>interface</b> <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <b>traffic-engineering</b>],</p> <p>[edit protocols <b>isis</b>],</p> <p>[edit protocols isis <b>interface</b> <i>interface-name</i>],</p> <p>[edit protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit protocols isis <b>traffic-engineering</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <b>isis</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis <b>interface</b> <i>interface-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis <b>traffic-engineering</b>]</p> |
| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>  |
| <b>Description</b>              | <p>Disable IS-IS on the routing device, on an interface, or on a level.</p> <p>At the <b>[edit protocols isis traffic-engineering]</b> hierarchy level, disable IS-IS support for traffic engineering.</p> <p>Enabling IS-IS on an interface (by including the <b>interface</b> statement at the <b>[edit protocols isis]</b> or the <b>[edit routing-instances routing-instance-name protocols isis]</b> hierarchy level), disabling it (by including the <b>disable</b> statement), and not actually having IS-IS run on an interface (by including the <b>passive</b> statement) are mutually exclusive states.</p>   |
| <b>Default</b>                  | <p>IS-IS is enabled for Level 1 and Level 2 routers on all interfaces on which <b>family iso</b> is enabled.</p> <p>IS-IS support for traffic engineering is enabled.</p>  |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Multi-Level IS-IS on page 3829</a></li> <li>• <a href="#">IS-IS Overview on page 3812</a></li> </ul>   |

## export (Protocols IS-IS)

|   |   |
|---|---|
| <b>Syntax</b>   | <code>export [ <i>policy-names</i> ];</code>  |
| <b>Hierarchy Level</b>  | <p>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">isis</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a>],</p> <p>[edit protocols <a href="#">isis</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a>]</p>  |
| <b>Release Information</b>  | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>   |
| <b>Description</b>  | <p>Apply one or more policies to routes being exported from the routing table into IS-IS.</p> <p>All routing protocols store the routes that they learn in the routing table. The routing table uses this collected route information to determine the active routes to destinations. The routing table then installs the active routes into its forwarding table and exports them into the routing protocols. It is these exported routes that the protocols advertise.</p> <p>For each protocol, you control which routes the protocol stores in the routing table and which routes the routing table exports into the protocol from the routing table by defining a <i>routing policy</i> for that protocol.</p> |
| <div>  <p><b>NOTE:</b> For IS-IS, you cannot apply routing policies that affect how routes are imported into the routing table; doing so with a link-state protocol can easily lead to an inconsistent topology database.</p> </div> |   |
| <b>Options</b>  | <i>policy-names</i> —Name of one or more policies.  |
| <b>Required Privilege Level</b>   | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>  |

## graceful-restart (Protocols IS-IS)

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <pre>graceful-restart {<br/>    disable;<br/>    helper-disable;<br/>    restart-duration <i>seconds</i>;<br/>}</pre>   |
| <b>Hierarchy Level</b>          | [edit logical-systems <i>logical-system-name</i> protocols <a href="#">isis</a> ],<br>[edit protocols <a href="#">isis</a> ]  |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.   |
| <b>Description</b>              | <p>Configure graceful restart parameters for IS-IS.</p> <p>Graceful restart allows a routing device to restart with minimal effects to the network, and is enabled for all routing protocols at the <b>[edit routing-options]</b> hierarchy level. When graceful restart is enabled, the restarting routing device is not removed from the network topology during the restart period. The adjacencies are reestablished after restart is complete.</p> <p>On LAN interfaces where IS-IS is configured on a transit router that serves as the designated router (DR), a graceful restart causes:</p> <ul style="list-style-type: none"><li>• The ingress router of the label-switched path (LSP), which passes through the DR, to break the LSP.</li><li>• The ingress router to re-signal the LSP.</li></ul> |
| <b>Options</b>                  | <p><b>disable</b>—Disable graceful restart for IS-IS.</p> <p><b>helper-disable</b>—Disable graceful restart helper capability. Helper mode is enabled by default.</p> <p><b>restart-duration <i>seconds</i></b>—Time period for the restart to last, in seconds.<br/><b>Range:</b> 30 through 300 seconds<br/><b>Default:</b> 30 seconds</p>  |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Configuring Routing Protocols Graceful Restart on page 2261</a></li></ul>   |

## hello-authentication-key

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>hello-authentication-key password;</code>   |
| <b>Hierarchy Level</b>          | [edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i> level <i>number</i> ],<br>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>number</i> ],<br>[edit protocols isis interface <i>interface-name</i> level <i>number</i> ],<br>[edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>number</i> ] |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.  |
| <b>Description</b>              | Configure an authentication key (password) for hello packets. Neighboring routing devices use the password to verify the authenticity of packets sent from an interface. For the key to work, you also must include the <b>hello-authentication-type</b> statement.   |
| <b>Default</b>                  | By default, hello authentication is not configured on an interface. However, if IS-IS authentication is configured, the hello packets are authenticated using the IS-IS authentication type and password.   |
| <b>Options</b>                  | <b>password</b> —Authentication password. The password can be up to 255 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").   |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">authentication-key on page 3913</a></li> <li>• <a href="#">authentication-type on page 3915</a></li> <li>• <a href="#">hello-authentication-type on page 3927</a></li> </ul>   |

## hello-authentication-key-chain

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | hello-authentication-key-chain <i>key-chain-name</i> ;  |
| <b>Hierarchy Level</b>          | [edit logical-systems <i>name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i> ],<br>[edit logical-systems <i>name</i> routing-instances <i>instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i> ],<br>[edit protocols isis interface <i>interface-name</i> level <i>level-number</i> ],<br>[edit routing-instances <i>instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i> ] |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.2.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.   |
| <b>Description</b>              | Apply an authentication keychain to the IS-IS interface.  |
| <b>Options</b>                  | <i>key-chain-name</i> —Authentication keychain name. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").  |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <i>Example: Configuring Hitless Authentication Key Rollover for IS-IS</i></li></ul>   |

## hello-authentication-type

|   |  |
|---|--|
| <b>Syntax</b>   | hello-authentication-type (md5   simple);  |
| <b>Hierarchy Level</b>  | <p>[edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i> level <i>number</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>number</i>],</p> <p>[edit protocols isis interface <i>interface-name</i> level <i>number</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>number</i>]</p> |
| <b>Release Information</b>  | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>  |
| <b>Description</b>  | <p>Enable authentication on an interface for hello packets. If you enable authentication on hello packets, you must specify a password by including the <b>hello-authentication-key</b> statement.</p> <p>You can configure authentication for a given IS-IS level on an interface. On a point-to-point link, if you enable hello authentication for both IS-IS levels, the password configured for Level 1 is used for both levels.</p>   |
| <div style="display: flex; align-items: center;">  <div style="margin-left: 10px;"> <p><b>CAUTION:</b> If no authentication is configured for Level 1 on a point-to-point link with both levels enabled, the hello packets are sent without any password, regardless of the Level 2 authentication configurations.</p> </div> </div> |  |
| <b>Default</b>  | By default, hello authentication is not configured on an interface. However, if IS-IS authentication is configured, the hello packets are authenticated using the IS-IS authentication type and password.  |
| <b>Options</b>  | <p><b>md5</b>—Specifies Message Digest 5 as the packet verification type.</p> <p><b>simple</b>—Specifies simple authentication as the packet verification type.</p>  |
| <b>Required Privilege Level</b>   | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |

## hello-interval (Protocols IS-IS)

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>hello-interval <i>seconds</i>;</code>   |
| <b>Hierarchy Level</b>          | <code>[edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],</code><br><code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],</code><br><code>[edit protocols isis interface <i>interface-name</i> level <i>level-number</i>],</code><br><code>[edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>]</code> |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.  |
| <b>Description</b>              | <p>Modify the frequency with which the routing device sends hello packets out of an interface, in seconds.</p> <p>Routing devices send hello packets at a fixed interval on all interfaces to establish and maintain neighbor relationships. This interval is advertised in the hello interval field in the hello packet.</p> <p>You can send out hello packets in subsecond intervals. To send out hello packets every 333 milliseconds, set the <b>hello-interval</b> value to 1.</p>   |
| <b>Options</b>                  | <b><i>seconds</i></b> —Frequency of transmission for hello packets.<br><b>Range:</b> 1 through 20,000 seconds<br><b>Default:</b> 3 seconds (for designated intermediate system [DIS] routers), 9 seconds (for non-DIS routers)  |
| <b>Required Privilege Level</b> | <b>routing</b> —To view this statement in the configuration.<br><b>routing-control</b> —To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li><i>hold-time</i></li></ul>  |

## hello-padding

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | hello-padding (adaptive   disable   loose   strict);  |
| <b>Hierarchy Level</b>     | [edit logical-systems <i>logical-system-name</i> protocols isis <b>interface</b> <i>interface-name</i> ],<br>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols<br>isis <b>interface</b> <i>interface-name</i> ],<br>[edit protocols isis <b>interface</b> <i>interface-name</i> ],<br>[edit routing-instances <i>routing-instance-name</i> protocols isis <b>interface</b> <i>interface-name</i> ]  |
| <b>Release Information</b> | Statement introduced in Junos OS Release 8.0.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.  |
| <b>Description</b>         | <p>Configure padding on hello packets to accommodate asymmetrical maximum transfer units (MTUs) from different hosts.</p> <p>This helps to prevent a premature adjacency Up state when one routing device's MTU does not meet the requirements to establish the adjacency.</p> <p>As an OSI Layer 2 protocol, IS-IS does not support data fragmentation. Therefore, maximum packet sizes must be established and supported between two routers. During adjacency establishment, the IS-IS protocol makes sure that the link supports a packet size of 1492 bytes by padding outgoing hello packets up to the maximum packet size of 1492 bytes.</p> <p>This is the default behavior of the Junos OS IS-IS implementation. However, Junos OS provides an option to disable hello padding that can override this behavior.</p> <p>There are four types of hello padding:</p> <ul style="list-style-type: none"> <li>Adaptive padding—On point-to-point connections, the hello packets are padded from the initial detection of a new neighbor until the neighbor verifies the adjacency as Up in the adjacency state type, length, and value (TLV) tuple. If the neighbor does not support the adjacency state TLV, then padding continues. On LAN connections, padding starts from the initial detection of a new neighbor until there is at least one active adjacency on the interface. Adaptive padding has more overhead than loose padding and is able to detect MTU asymmetry from one side of the connection. This one-sided detection can result in generation of extra link-state PDUs that are flooded throughout the network. Specify the <b>adaptive</b> option to configure enough padding to establish an adjacency to neighbors.</li> <li>Disabled padding—Padding is disabled on all types of interfaces for all adjacency states. Specify the <b>disable</b> option to accommodate interfaces that support less than the default packet size of 1492 bytes.</li> <li>Loose padding (the default)—The hello packet is padded from the initial detection of a new neighbor until the adjacency transitions to the Up state. Loose padding might not be able to detect certain situations such as asymmetrical MTUs between the routing devices. Specify the <b>loose</b> option to configure enough padding to initialize an adjacency to neighbors.</li> </ul> |

- **Strict padding**—Padding is done on all interface types and for all adjacency states, and is continuous. Strict padding has the most overhead. The advantage is that strict padding detects MTU issues on both sides of a link. Specify the **strict** option to configure padding to allow all adjacency states with neighbors.

**Options**    **adaptive**—Configure padding until the neighbor adjacency is established and active.

**disable**—Disable padding on all types of interfaces for all adjacency states.

**loose**—Configure padding until the state of the adjacency is initialized.

**strict**—Configure padding for all adjacency states.

**Required Privilege Level**    routing—To view this statement in the configuration.  
   routing-control—To add this statement to the configuration.

**Related Documentation**    • *Example: Configuring IS-IS*

## hold-time (Protocols IS-IS)

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>hold-time seconds;</code>   |
| <b>Hierarchy Level</b>          | <p>[edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit protocols isis interface <i>interface-name</i> level <i>level-number</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i>]</p>  |
| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>   |
| <b>Description</b>              | <p>Set the length of time a neighbor considers this router to be operative (up) after receiving a hello packet. If the neighbor does not receive another hello packet within the specified time, it marks this routing device as inoperative (down). The hold time itself is advertised in the hello packets.</p> <p>The hold time specifies how long a neighbor should consider this routing device to be operative without receiving another hello packet. If the neighbor does not receive a hello packet from this routing device within the hold time, it marks the routing device as being unavailable.</p> <p>For systems configured with graceful routing switchover (GRES) with Graceful Restart, the hold time for Master and Backup Routing Engines should be set to a value higher than 40 seconds. This ensures that adjacencies between the Routing Engine and the neighboring peer 'helper' routers do not time out, stopping graceful restart, and all traffic.</p> |
| <b>Options</b>                  | <p><b>seconds</b>—Hold-time value, in seconds.</p> <p><b>Range:</b> 3 through 65,535 seconds, or 1 to send out hello packets every 333 milliseconds</p> <p><b>Default:</b> 9 seconds (for designated intermediate system [DIS] routers), 27 seconds (for non-DIS routers; three times the default hello interval)</p>   |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Configuring Graceful Routing Engine Switchover on page 2268</a></li> <li>• <a href="#">Example: Configuring IS-IS</a></li> <li>• <a href="#">Example: Configuring IS-IS for GRES with Graceful Restart</a></li> <li>• <a href="#">hello-interval on page 3928</a></li> </ul>   |

## ignore-attached-bit

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | ignore-attached-bit;   |
| <b>Hierarchy Level</b>          | [edit logical-systems <i>logical-system-name</i> protocols <a href="#">isis</a> ],<br>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ],<br>[edit protocols <a href="#">isis</a> ],<br>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ]  |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.   |
| <b>Description</b>              | <p>Ignore the attached bit on IS-IS Level 1 routers. Configuring this statement enables the routing device to ignore the attached bit on incoming Level 1 link-state PDUs. If the attached bit is ignored, no default route, which points to the routing device which has set the attached bit, is installed.</p> <p>There might be times, such as during a denial-of-service (DoS) attack, that you do not want a Level 1 router to be able to forward traffic based on a default route.</p> <p>To prevent a routing device from being able to reach interarea destinations, you can prevent the routing device from installing the default route without affecting the status of its IS-IS adjacencies. The <b>ignore-attached-bit</b> statement is used to tell the routing device to ignore the presence of the attached bit in Level 1 link-state PDUs, which blocks the installation of the IS-IS default route.</p> |
| <b>Default</b>                  | The <b>ignore-attached-bit</b> statement is disabled by default.   |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.  |

## ipv4-multicast

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | ipv4-multicast;  |
| <b>Hierarchy Level</b>     | [edit logical-systems <i>logical-system-name</i> protocols isis <a href="#">topologies</a> ],<br>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols<br>isis <a href="#">topologies</a> ],<br>[edit protocols isis <a href="#">topologies</a> ],<br>[edit routing-instances <i>routing-instance-name</i> protocols isis <a href="#">topologies</a> ] |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.   |
| <b>Description</b>         | Configure alternate IPv4 multicast topologies.   |

**NOTE:** The IS-IS interface metrics for the IPv4 topology can be configured independently of the IPv6 metrics. You can also selectively disable interfaces from participating in the IPv6 topology while continuing to participate in the IPv4 topology. This lets you exercise control over the paths that unicast data takes through a network.

|                                 |  |
|---------------------------------|--|
| <b>Default</b>                  | Multicast topologies are disabled.   |

## level (Global IS-IS)

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <pre> level <i>level-number</i> {     authentication-key <i>key</i>;     authentication-key-chain (Protocols IS-IS) <i>key-chain-name</i>;     authentication-type <i>type</i>;     disable;     external-preference <i>preference</i>;     no-csnp-authentication;     no-hello-authentication;     no-psnp-authentication;     preference <i>preference</i>;     wide-metrics-only; } </pre>  |
| <b>Hierarchy Level</b>          | <p>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">isis</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a>],</p> <p>[edit protocols <a href="#">isis</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a>]</p>  |
| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>   |
| <b>Description</b>              | <p>Configure the global-level properties.</p> <p>You can administratively divide a single AS into smaller groups called areas. You configure each routing device interface to be in an area. Any interface can be in any area. The area address applies to the entire routing device. You cannot specify one interface to be in one area and another interface in a different area. To route between areas, you must have two adjacent Level 2 routers that communicate with each other.</p> <p>Level 1 routers can only route within their IS-IS area. To send traffic outside their area, Level 1 routers must send packets to the nearest intra-area Level 2 router. A routing device can be a Level 1 router, a Level 2 router, or both. You specify the router level on a per-interface basis, and a routing device becomes adjacent to other routing devices on the same level on that link only.</p> <p>You can configure one Level 1 routing process and one Level 2 routing process on each interface, and you can configure the two levels differently.</p> |
| <b>Options</b>                  | <p><b><i>level-number</i></b>—IS-IS level number.</p> <p><b>Values:</b> 1 or 2</p> <p>The remaining statements are explained separately.</p>  |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>  |

## lsp-interval

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>lsp-interval <i>milliseconds</i>;</code>  |
| <b>Hierarchy Level</b>          | <p>[edit logical-systems <i>logical-system-name</i> protocols isis <b>interface</b> <i>interface-name</i>],<br/>         [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <b>interface</b> <i>interface-name</i>],<br/>         [edit protocols isis <b>interface</b> <i>interface-name</i>],<br/>         [edit routing-instances <i>routing-instance-name</i> protocols isis <b>interface</b> <i>interface-name</i>]</p>  |
| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.<br/>         Statement introduced in Junos OS Release 9.0 for EX Series switches.<br/>         Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>   |
| <b>Description</b>              | <p>Configure the link-state PDU interval time.</p> <p>By default, the routing device sends one link-state PDU packet out an interface every 100 milliseconds. To disable the transmission of all link-state PDUs, set the interval to 0.</p> <p>Link-state PDU throttling by use of the <b>lsp-interval</b> statement controls the flooding pace to neighboring routing devices in order to not overload them.</p> <p>Also, consider that control traffic (such as link-state PDUs and related packets) might delay user traffic (information packets) because control traffic always has precedence in terms of scheduling on the routing device interface cards. Unfortunately, the control traffic transmission rate is not decreased on low-bandwidth interfaces, such as DS-0 or fractional T1 and E1 interface. Line control traffic stays the same. On a low-bandwidth circuit that is transmitting 30 full-MTU-sized packets, there is not much bandwidth left over for other types of packets.</p> |
| <b>Default</b>                  | By default, the routing device sends one link-state PDU out an interface every 100 milliseconds.  |
| <b>Options</b>                  | <p><b>milliseconds</b>—Number of milliseconds between the sending of link-state PDUs. Specifying a value of 0 blocks all link-state PDU transmission.</p> <p><b>Range:</b> 0 through 1000 milliseconds</p> <p><b>Default:</b> 100 milliseconds</p>  |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li><i>Example: Configuring the Transmission Frequency for Link-State PDUs on IS-IS Interfaces</i></li> </ul>  |

## **lsp-lifetime**

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>lsp-lifetime seconds;</code>  |
| <b>Hierarchy Level</b>          | [edit logical-systems <i>logical-system-name</i> protocols <a href="#">isis</a> ],<br>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ],<br>[edit protocols <a href="#">isis</a> ],<br>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ]   |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.  |
| <b>Description</b>              | <p>Specify how long a link-state PDU originating from the routing device should persist in the network. The routing device sends link-state PDUs often enough so that the link-state PDU lifetime never expires.</p> <p>Because link-state PDUs have a maximum lifetime, they need to be refreshed. Refreshing means that a routing device needs to re-originate its link-state PDUs periodically. The re-origination interval must be less than the link-state PDU's lifetime. For example, if the link-state PDU is valid for 1200 seconds, the routing device needs to refresh the link-state PDU in less than 1200 seconds to avoid removal of the link-state PDU from the link-state database by other routing devices. The recommended maximum link-state PDU origination interval is the lifetime minus 300 seconds. So, in a default environment this would be 900 seconds. In Junos OS, the refresh interval is derived from the lifetime and is equal to the lifetime minus 317 seconds. You can change the lifetime to a higher value to reduce the number of refreshes in the network. (You would rarely want to increase the number of refreshes.) Often these periodic link-state PDU refreshes are referred to as refresh noise, and network administrators want to reduce this noise as much as possible.</p> <p>The <a href="#">show isis overview</a> command displays the link-state PDU lifetime.</p> |
| <b>Default</b>                  | By default, link-state PDUs are maintained in network databases for 1200 seconds (20 minutes) before being considered invalid. This length of time, called the <i>LSP lifetime</i> , normally is sufficient to guarantee that link-state PDUs never expire.   |
| <b>Options</b>                  | <b>seconds</b> —link-state PDU lifetime, in seconds.<br><b>Range:</b> 350 through 65,535 seconds<br><b>Default:</b> 1200 seconds  |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.   |

| <b>Description</b>              | <p>Configure an interface to be part of a mesh group, which is a set of fully connected nodes.</p> <p>A <i>mesh group</i> is a set of routing devices that are fully connected. That is, they have a fully meshed topology. When link-state PDUs are being flooded throughout an area, each router within a mesh group receives only a single copy of a link-state PDU instead of receiving one copy from each neighbor, thus minimizing the overhead associated with the flooding of link-state PDUs.</p> <p>To create a mesh group and designate that an interface be part of the group, assign a mesh-group number to all the routing device interfaces in the group. To prevent an interface in the mesh group from flooding link-state PDUs, configure blocking on that interface.</p> |
| <b>Options</b>                  | <p><b>blocked</b>—Configure the interface so that it does not flood link-state PDUs.</p> <p><b>value</b>—Number that identifies the mesh group.</p> <p><b>Range:</b> 1 through 4,294,967,295 (<math>2^{32} - 1</math>; 32 bits are allocated to identify a mesh group)</p>  |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.   |

## metric (Protocols IS-IS)

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | <code>metric <i>metric</i>;</code>  |
| <b>Hierarchy Level</b>     | [edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i> ],<br>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i> ],<br>[edit protocols isis interface <i>interface-name</i> level <i>level-number</i> ],<br>[edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i> ] |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.  |
| <b>Description</b>         | Specify the metric value for the level.   |

All IS-IS routes have a cost, which is a routing metric that is used in the IS-IS link-state calculation. The cost is an arbitrary, dimensionless integer that can be from 1 through 63, or from 1 through 16,777,215 ( $2^{24} - 1$ ) if you are using wide metrics.

Similar to other routing protocols, IS-IS provides a way of exporting routes from the routing table into the IS-IS network. When a route is exported into the IS-IS network without a specified metric, IS-IS uses default metric values for the route, depending on the protocol that was used to learn the route.

[Table 310 on page 3947](#) depicts IS-IS route export metric default values.

**Table 310: Default Metric Values for Routes Exported into IS-IS**

| Protocol Used for Learning the Route | Default Metric Value  |
|--------------------------------------|---|
| Direct                               | 10  |
| Static                               | Same as reported by the protocol used for exporting the route |
| Aggregate                            | 10  |
| Generate                             | 10  |
| RIP                                  | Same as reported by the protocol used for exporting the route |
| OSPF                                 | Same as reported by the protocol used for exporting the route |
| BGP                                  | 10  |

The default metric values behavior can be customized by using routing policies.

|                |  |
|----------------|--|
| <b>Options</b> | <b><i>metric</i></b> —Metric value.<br><b>Range:</b> 1 through 63, or 1 through 16,777,215 (if you have configured wide metrics) |
|----------------|--|

**Default:** 10 (for all interfaces except lo0), 0 (for the lo0 interface)

## node-link-protection (Protocols IS-IS)

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | node-link-protection;   |
| <b>Hierarchy Level</b>          | [edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i> ],<br>[edit logical-routers <i>logical-router-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> ],<br>[edit protocols isis interface <i>interface-name</i> ],<br>[edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> ] |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.5.<br>Statement introduced in Junos OS Release 9.5 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.  |
| <b>Description</b>              | Enable node-link protection on the specified IS-IS interface. Junos OS creates an alternate loop-free path to the primary next hop for all destination routes that traverse a protected interface. This alternate path avoids the primary next-hop routing device altogether and establishes a path through a different routing device.   |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Link and Node Protection for IS-IS Routes on page 3883</a></li><li>• <a href="#">link-protection on page 3942</a></li></ul>  |

## overload (Protocols IS-IS)

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | <pre> overload {     advertise-high-metrics;     allow-route-leaking;     timeout <i>seconds</i>; } </pre>  |
| <b>Hierarchy Level</b>     | <p>[edit logical-systems <i>logical-system-name</i> protocols <i>isis</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <i>isis</i>],</p> <p>[edit protocols <i>isis</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <i>isis</i>]</p>  |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>   |
| <b>Description</b>         | <p>Configure the local routing device so that it appears to be overloaded. This statement causes the routing device to continue participating in IS-IS routing, but prevents it from being used for transit traffic. Traffic destined to immediately attached subnets continues to transit the routing device.</p> <p>You can also advertise maximum link metrics in network layer reachability information (NLRI) instead of setting the overload bit.</p> <p>You configure or disable overload mode in IS-IS with or without a timeout. Without a timeout, overload mode is set until it is explicitly deleted from the configuration. With a timeout, overload mode is set if the time elapsed since the IS-IS instance started is less than the specified timeout.</p> <p>A timer is started for the difference between the timeout and the time elapsed since the instance started. If the time elapsed after the IS-IS instance is enabled is less than the specified timeout, overload mode is set. When the timer expires, overload mode is cleared. In overload mode, the routing device IS-IS advertisements are originated with the overload bit set. This causes the transit traffic to take paths around the routing device. However, the overloaded routing device's own links are still accessible.</p> <p>The value of the overload bit depends on these three scenarios:</p> <ol style="list-style-type: none"> <li>1. When the overload bit has already been set to a given value and the routing process is restarted: Link-state PDUs are regenerated with the overload bit cleared.</li> <li>2. When the overload bit is reset to a lesser value while the routing process is running: Link-state PDUs are regenerated with the overload bit cleared.</li> <li>3. When the overload bit is reset to a greater value while the routing process is running: Link-state PDUs are regenerated with the overload bit set to the difference between the old and new value.</li> </ol> <p>In overload mode, the routing device advertisement is originated with all the transit routing device links (except stub) set to a metric of 0xFFFF. The stub routing device links are</p> |

advertised with the actual cost of the interfaces corresponding to the stub. This causes the transit traffic to avoid the overloaded routing device and take paths around the routing device.

To understand the reason for setting the overload bit, consider that BGP converges slowly. It is not very good at detecting that a neighbor is down because it has slow-paced keepalive timers. Once the BGP neighbor is determined to be down, it can take up to 2 minutes for a BGP router to declare the neighbor down. IS-IS is much quicker. IS-IS only takes 10-30 seconds to detect absent peers. It is the slowness of BGP, more precisely the slowness of internal BGP (IBGP), that necessitates the use of the overload bit. IS-IS and BGP routing are mutually dependent on each other. If both do not converge at the same time, traffic is dropped without notification (black holed).

You might want to configure the routing device so that it appears to be overloaded when you are restarting routing on the device. Setting the overload bit for a fixed amount of time right after a restart of the routing protocol process (rpd) ensures that the router does not receive transit traffic while the routing protocols (especially IBGP) are still converging.

Setting the overload bit is useful when performing hardware or software maintenance work on a routing device. After the maintenance work, clear the overload bit to carry on forwarding transit traffic. Manual clearing of the overload bit is not always possible. What is needed is an automated way of clearing the overload bit after some amount of time. Most networks use a time value of 300 seconds. This 5-minute value provides a good balance, allowing time to bring up even large internal IBGP meshes, while still relatively quick.

Another appropriate application for setting for the overload bit is on dedicated devices such as BGP route reflectors, which are intentionally not meant to carry any transit traffic. In this case, you would not use the timer.

You can verify that the overload bit is set by running the **show isis database** command.

**Options** **advertise-high-metrics**—Advertise maximum link metrics in NLRI instead of setting the overload bit.

The **advertise-high-metric** setting is only valid while the routing device is in overload mode.

When **advertise-high-metric** is configured, IS-IS does not set the overload bit. Rather, it sets the metric to 63 or 16,777,214, depending whether wide metrics are enabled. This allows the overloaded routing device to be used for transit as a last resort.

An L1-L2 router in overload mode stops leaking route information between L1 and L2 levels and clears its attached bit. This is also true when **advertise-high-metrics** is configured.

**allow-route-leaking**—Enable leaking of route information into the network even if the overload bit is set.

**NOTE:** The **allow-route-leaking** option does not work if the routing device is in dynamic overload mode. Dynamic overload can occur if the device has exceeded its resource limits, such as the prefix limit.

**timeout seconds**—Number of seconds at which the overloading is reset.

**Range:** 60 through 1800 seconds

**Default:** 0 seconds

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## prefix-export-limit (Protocols IS-IS)

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>prefix-export-limit <i>number</i>;</code>  |
| <b>Hierarchy Level</b>          | <p>[edit logical-systems <i>logical-system-name</i> protocols isis <a href="#">level level-number</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis <a href="#">level level-number</a>],</p> <p>[edit protocols isis <a href="#">level level-number</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols isis <a href="#">level level-number</a>]</p>   |
| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>  |
| <b>Description</b>              | <p>Configure a limit to the number of prefixes exported into IS-IS.</p> <p>By default, there is no limit to the number of prefixes that can be exported into IS-IS. To configure a limit to the number of prefixes that can be exported into IS-IS, include the <b>prefix-export-limit</b> statement. The <b>prefix-export-limit</b> statement protects the rest of the network from a malicious policy by applying a threshold filter for exported routes.</p> <p>The number of prefixes depends on the size of your network. Good design advice is to set it to double the total number of IS-IS Level 1 and Level 2 routing devices in your network.</p> <p>If the number of prefixes exported into IS-IS exceeds the configured limit, the overload bit is set and the overload state is reached. When other routers detect that this bit is set, they do not use this routing device for transit traffic, but they do use it for packets destined to the overloaded routing device's directly connected networks and IP prefixes. The overload state can be cleared by using the <a href="#">clear isis overload</a> command.</p> <p>The <a href="#">show isis overview</a> command displays the prefix export limit when it is configured.</p> |
| <b>Options</b>                  | <p><b><i>number</i></b>—Prefix limit.</p> <p><b>Range:</b> 0 through 4,294,967,295 (<math>2^{32} - 1</math>)</p> <p><b>Default:</b> None</p>   |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <i>Example: Redistributing BGP Routes with a Specific Community Tag into IS-IS</i></li> <li>• <i>Example: Redistributing OSPF Routes into IS-IS</i></li> </ul>  |

## priority (Protocols IS-IS)

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>priority <i>number</i>;</code>  |
| <b>Hierarchy Level</b>          | [edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i> ],<br>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i> ],<br>[edit protocols isis interface <i>interface-name</i> level <i>level-number</i> ],<br>[edit routing-instances <i>routing-instance-name</i> protocols isis interface <i>interface-name</i> level <i>level-number</i> ]   |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.  |
| <b>Description</b>              | <p>Configure the interface's priority for becoming the designated router. The interface with the highest priority value becomes that level's designated router.</p> <p>The priority value is meaningful only on a multiaccess network. It has no meaning on a point-to-point interface.</p> <p>A routing device advertises its priority to become a designated router in its hello packets. On all multiaccess networks, IS-IS uses the advertised priorities to elect a designated router for the network. This routing device is responsible for sending network link-state advertisements, which describe all the routing devices attached to the network. These advertisements are flooded throughout a single area.</p> <p>A routing device's priority for becoming the designated router is indicated by an arbitrary number from 0 through 127. Routing devices with a higher value are more likely to become the designated router.</p> |
| <b>Options</b>                  | <i>number</i> —Priority value.<br><b>Range:</b> 0 through 127<br><b>Default:</b> 64   |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Example: Configuring IS-IS Designated Routers on page 3905</a></li></ul>  |

## reference-bandwidth (Protocols IS-IS)

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>reference-bandwidth <i>reference-bandwidth</i>;</code>  |
| <b>Hierarchy Level</b>          | <p>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">isis</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a>],</p> <p>[edit protocols <a href="#">isis</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a>]</p>  |
| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>   |
| <b>Description</b>              | <p>Optimize routing based on bandwidth by setting the reference bandwidth used in calculating the default interface cost.</p> <p>All IS-IS interfaces have a cost, which is a routing metric that is used in the IS-IS link-state calculation. Routes with lower total path metrics are preferred over those with higher path metrics. When there are several equal-cost routes to a destination, traffic is distributed equally among them.</p> <p>The cost of a route is described by a single dimensionless metric that is determined using the following formula:</p> $\text{cost} = \text{reference-bandwidth} / \text{bandwidth}$ <p>For example, if you set the reference bandwidth to 1 Gbps (that is, <i>reference-bandwidth</i> is set to 1,000,000,000), a 100-Mbps interface has a routing metric of 10.</p> <p>All IS-IS interfaces have a cost, which is a routing metric that is used in the IS-IS link-state calculation. Routes with lower total path metrics are preferred over those with higher path metrics.</p> |
| <b>Options</b>                  | <p><i>reference-bandwidth</i>—Reference bandwidth value in bits per second.</p> <p><b>Range:</b> 9600 through 1,000,000,000,000 bps</p> <p><b>Default:</b> None</p>   |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <i>Example: Configuring IS-IS</i></li> <li>• <a href="http://www.juniper.net/us/en/training/certification/JNCIP_studyguide.pdf">http://www.juniper.net/us/en/training/certification/JNCIP_studyguide.pdf</a></li> </ul>  |

## rib-group (Protocols IS-IS)

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <pre>rib-group {<br/>    inet <i>group-name</i>;<br/>    inet6 <i>group-name</i>;<br/>}</pre>   |
| <b>Hierarchy Level</b>          | [edit logical-systems <i>logical-system-name</i> protocols <a href="#">isis</a> ],<br>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ],<br>[edit protocols <a href="#">isis</a> ],<br>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ]             |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.  |
| <b>Description</b>              | <p>Install routes learned from IS-IS routing instances into routing tables in the IS-IS routing table group. You can install IPv4 routes or IPv6 routes.</p> <p>Support for IPv6 routing table groups in IS-IS enables IPv6 routes that are learned from IS-IS routing instances to be installed into other routing tables defined in an IS-IS routing table group.</p> |
| <b>Options</b>                  | <p><b><i>group-name</i></b>—Name of the routing table group.</p> <p><b>inet</b>—Install IPv4 IS-IS routes.</p> <p><b>inet6</b>—Install IPv6 IS-IS routes.</p>   |
| <b>Required Privilege Level</b> | <p><b>routing</b>—To view this statement in the configuration.</p> <p><b>routing-control</b>—To add this statement to the configuration.</p>  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <i>Example: Exporting Specific Routes from One Routing Table Into Another Routing Table</i></li><li>• <i>Example: Importing Direct and Static Routes Into a Routing Instance</i></li><li>• <i>Understanding Multiprotocol BGP</i></li></ul>   |

## spf-options (Protocols IS-IS)

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | <pre>spf-options {     delay <i>milliseconds</i>;     holddown <i>milliseconds</i>;     rapid-runs <i>number</i>; }</pre>  |
| <b>Hierarchy Level</b>     | [edit logical-systems <i>logical-system-name</i> protocols <i>isis</i> ],<br>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <i>isis</i> ],<br>[edit protocols <i>isis</i> ],<br>[edit routing-instances <i>routing-instance-name</i> protocols <i>isis</i> ]  |
| <b>Release Information</b> | Statement introduced in Junos OS Release 8.5.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.  |
| <b>Description</b>         | <p>Configure options for running the shortest-path-first (SPF) algorithm.</p> <p>Running the SPF algorithm is usually the beginning of a series of larger system-wide events. For example, the SPF algorithm can lead to interior gateway protocol (IGP) prefix changes, which then lead to BGP nexthop resolution changes. Consider what happens if there are rapid link changes in the network. The local routing device can become overwhelmed. This is why it sometimes makes sense to throttle the scheduling of the SPF algorithm.</p> <p>You can configure the following SPF options:</p> <ul style="list-style-type: none"> <li>• The delay in the time between the detection of a topology change and when the SPF algorithm actually runs.</li> <li>• The maximum number of times that the SPF algorithm can run in succession before the hold-down timer begins.</li> <li>• The time to hold down, or wait, before running another SPF calculation after the SPF algorithm has run in succession the configured maximum number of times.</li> </ul> <p>If the network stabilizes during the hold-down period and the SPF algorithm does not need to run again, the system reverts to the configured values for the <b>delay</b> and <b>rapid-runs</b> statements.</p> |
| <b>Options</b>             | <p><b>delay <i>milliseconds</i></b>—Time interval between the detection of a topology change and when the SPF algorithm runs.</p> <p><b>Range:</b> 50 through 1000 milliseconds</p> <p><b>Default:</b> 200 milliseconds</p> <p><b>holddown <i>milliseconds</i></b>—Time interval to hold down, or wait before a subsequent SPF algorithm runs after the SPF algorithm has run the configured maximum number of times in succession.</p> <p><b>Range:</b> 2000 through 10,000 milliseconds</p> <p><b>Default:</b> 5000 milliseconds</p>   |

**rapid-runs *number***—Maximum number of times the SPF algorithm can run in succession.  
After the maximum is reached, the holddown interval begins.

**Range:** 1 through 5

**Default:** 3

| <b>Hierarchy Level</b>     | [edit logical-systems <i>logical-system-name</i> protocols <a href="#">isis</a> ],<br>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ],<br>[edit protocols <a href="#">isis</a> ],<br>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">isis</a> ] |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.  |
| <b>Description</b>         | Configure IS-IS protocol-level tracing options. To specify more than one tracing operation, include multiple <b>flag</b> statements.  |

**NOTE:** The **traceoptions** statement is not supported on QFabric systems.

|                |   |
|----------------|---|
| <b>Default</b> | The default IS-IS protocol-level tracing options are those inherited from the routing protocols <b>traceoptions</b> statement included at the <b>[edit routing-options]</b> hierarchy level.  |
| <b>Options</b> | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>name</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks (" "). All files are placed in the directory <b>/var/log</b>. We recommend that you place IS-IS tracing output in the file <b>isis-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 10 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one flag, include multiple <b>flag</b> statements.</p> |

### IS-IS Protocol-Specific Tracing Flags

- **csn**—Complete sequence number PDU (CSNP) packets
- **error**—Errored IS-IS packets
- **graceful-restart**—Graceful restart operation
- **hello**—Hello packets
- **ldp-synchronization**—Synchronization between IS-IS and LDP
- **lsp**—Link-state PDUs
- **lsp-generation**—Link-state PDU generation packets
- **packets**—All IS-IS protocol packets
- **psn**—Partial sequence number PDU (PSNP) packets
- **spf**—Shortest-path-first calculations

#### Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations, including adjacency changes

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

***flag-modifier***—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **receive**—Trace the packets being received.
- **send**—Trace the packets being transmitted.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size** *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

## traffic-engineering (Protocols IS-IS)

---

**Syntax**

```
traffic-engineering {
  disable;
  credibility-protocol-preference;
  family inet {
    shortcuts {
      multicast-rpf-routes;
    }
  }
  family inet6 {
    shortcuts;
  }
  multipath {
    lsp-equal-cost;
  }
}
```

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols [isis](#)],  
[edit protocols [isis](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Support for the **family** statement introduced in Junos OS Release 9.3.  
Support for the **credibility-protocol-preference** statement introduced in Junos OS Release 9.4.  
Support for the **multipath** statement introduced in Junos OS Release 9.6.  
Support for the **lsp-equal-cost** statement introduced in Junos OS Release 9.6.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description** Configure traffic engineering properties for IS-IS.

IS-IS always performs shortest-path-first (SPF) calculations to determine next hops. For prefixes reachable through a particular next hop, IS-IS places that next hop for that prefix in the inet.0 routing table. In addition, for routers running MPLS, IS-IS installs the prefix for IPv4 routes in the inet.3 routing table as well. The inet.3 table, which is present on the ingress router, contains the host address of each MPLS label-switched path (LSP) egress router. BGP uses this routing table to resolve next-hop addresses.

If you enable IS-IS traffic engineering shortcuts and if there is a label-switched path to a point along the path to that prefix, IS-IS installs the prefix in the inet.3 routing table and uses the LSP as a next hop. The net result is that for BGP egress routers for which there is no LSP, BGP automatically uses an LSP along the path to reach the egress router.

In Junos OS Release 9.3 and later, IS-IS traffic engineering shortcuts support IPv6 routes. LSPs to be used for shortcuts continue to be signaled using IPv4. However, by default, shortcut routes calculated through IPv6 routes are added to the inet6.3 routing table. The default behavior is for only BGP to use LSPs in its calculations. If you configure MPLS so that both BGP and interior gateway protocols use LSPs for forwarding traffic, shortcut routes calculated through IPv6 are added to the inet6.0 routing table. IS-IS ensures that the IPv6 routes running over the IPv4 MPLS LSP are correctly de-encapsulated at the

tunnel egress by pushing an extra IPv6 explicit null label between the IPv6 payload and the IPv4 transport label.

RSVP LSPs with a higher preference than IS-IS routes are not considered during the computation of traffic engineering shortcuts.

To configure IS-IS so that it uses LSPs as shortcuts when installing information in the inet.3 or inet6.3 routing table, include the following statements:

```
family inet {
  shortcuts {
    multicast-rpf-routes;
  }
}
family inet6 {
  shortcuts;
}
```

For IPv4 traffic, include the **inet** statement. For IPv6 traffic, include the **inet6** statement.

To configure load balancing across multiple LSPs, include the **multipath** statement.

When traffic engineering shortcuts are used, RSVP first looks at the **metric2** value, which is derived from the IGP cost. After this, RSVP considers the LSP metric value. So, if a certain path changes for an LSP and the cost changes, not all LSPs are used to load-balance the network.

When a route with an improved metric is added to the IS-IS internal routing table, IS-IS flushes all next-hop information (including LSP next-hop information) for a route. This is undesirable, because certain equal-cost multipath (ECMP) combinations can be lost during route calculation. To override this default behavior for load balancing, include the **lsp-equal-cost** statement to retain the equal cost path information in the routing table.

```
multipath {
  lsp-equal-cost;
}
```

Because the inet.3 routing table is present only on ingress routers, you can configure LSP shortcuts only on these routers.

**Default** IS-IS traffic engineering support is enabled.

By default, IS-IS supports traffic engineering by exchanging basic information with the traffic engineering database. To disable this support, and to disable IS-IS shortcuts if they are configured, include the **disable** statement.

**Options**    **credibility-protocol-preference**—Specify that IS-IS should use the configured protocol preference for IGP routes to determine the traffic engineering database credibility value. By default, the traffic engineering database prefers IS-IS routes even when the routes of another IGP are configured with a lower, that is, more preferred value. Use this statement to override this default behavior.

The traffic engineering database assigns a credibility value to each IGP and prefers the routes of the IGP with the highest credibility value. In Junos OS Release 9.4 and later, you can configure IS-IS to take protocol preference into account to determine the traffic engineering database credibility value. When protocol preference is used to determine the credibility value, IS-IS routes are not automatically preferred by the traffic engineering database, depending on your configuration. For example, OSPF routes have a default preference value of 10, whereas IS-IS Level 1 routes have a default preference value of 15. When protocol preference is enabled, the credibility value is determined by deducting the protocol preference value from a base value of 512. Using default protocol preference values, OSPF has a credibility value of 502, whereas IS-IS has a credibility value of 497. Because the traffic engineering database prefers IGP routes with the highest credibility value, OSPF routes are now preferred.

**NOTE:** This feature is also supported for OSPFv2.

---

**lsp-equal-cost**—Configure LSPs to be retained as equal cost paths for load balancing when a better path metric is found during the IS-IS internal routing table calculation. When a route with an improved metric is added to the IS-IS internal routing table, IS-IS flushes all next-hop information (including LSP next-hop information) for a route. This is undesirable, because certain equal-cost multipath (ECMP) combinations can be lost during route calculation. To override this default IS-IS behavior, include the **lsp-equal-cost** statement for load balancing, so that the equal cost path information is retained in the routing table.

**multipath**—Enable load balancing for multiple LSPs.

The remaining statements are explained separately.

Table 311: show isis adjacency Output Fields

| Field Name                                | Field Description   | Level of Output         |
|---|---|-------------------------|
| <b>Interface</b>                          | Interface through which the neighbor is reachable.  | All levels              |
| <b>System</b>                             | System identifier ( <b>sysid</b> ), displayed as a name, if possible.   | <b>brief</b>            |
| <b>L or Level</b>                         | Level: <ul style="list-style-type: none"> <li>• 1—Level 1 only</li> <li>• 2—Level 2 only</li> <li>• 3—Level 1 and Level 2</li> </ul> An exclamation point (!) preceding the level number indicates that the adjacency is missing an IP address. | All levels              |
| <b>State</b>                              | State of the adjacency: <b>Up</b> , <b>Down</b> , <b>New</b> , <b>One-way</b> , <b>Initializing</b> , or <b>Rejected</b> .  | All levels              |
| <b>Hold (secs)</b>                        | Remaining hold time of the adjacency.   | <b>brief</b>            |
| <b>SNPA</b>                               | Subnetwork point of attachment (MAC address of the next hop).   | <b>brief</b>            |
| <b>Expires in</b>                         | How long until the adjacency expires, in seconds.   | <b>detail</b>           |
| <b>Priority</b>                           | Priority to become the designated intermediate system.  | <b>detail extensive</b> |
| <b>Up/Down transitions</b>                | Count of adjacency status changes from <b>Up</b> to <b>Down</b> or from <b>Down</b> to <b>Up</b> .  | <b>detail</b>           |
| <b>Last transition</b>                    | Time of the last <b>Up/Down</b> transition.   | <b>detail</b>           |
| <b>Circuit type</b>                       | Bit mask of levels on this interface: 1=Level 1 router; 2=Level 2 router; 3=both Level 1 and Level 2 router.  | <b>detail</b>           |
| <b>Speaks</b>                             | Protocols supported by this neighbor.   | <b>detail extensive</b> |
| <b>MAC address</b>                        | MAC address of the interface.   | <b>detail extensive</b> |
| <b>Topologies</b>                         | Supported topologies.   | <b>detail extensive</b> |
| <b>Restart capable</b>                    | Whether a neighbor is capable of graceful restart: <b>Yes</b> or <b>No</b> .  | <b>detail extensive</b> |
| <b>Adjacency advertisement: Advertise</b> | This routing device has signaled to advertise this interface to its neighbors in their link-state PDUs.   | <b>detail extensive</b> |
| <b>Adjacency advertisement: Suppress</b>  | This neighbor has signaled not to advertise the interface in the routing device's outbound link-state PDUs.   | <b>detail extensive</b> |
| <b>IP addresses</b>                       | IP address of this neighbor.  | <b>detail extensive</b> |

Table 311: show isis adjacency Output Fields (*continued*)

| Field Name     | Field Description  | Level of Output |
|----------------|--|-----------------|
| Transition log | <p>List of recent transitions, including:</p> <ul style="list-style-type: none"> <li>• <b>When</b>—Time at which an IS-IS adjacency transition occurred.</li> <li>• <b>State</b>—Current state of the IS-IS adjacency (<b>up</b>, <b>down</b>, or <b>rejected</b>). <ul style="list-style-type: none"> <li>• <b>Up</b>—Adjacency is up and operational.</li> <li>• <b>Down</b>—Adjacency is down and not available.</li> <li>• <b>Rejected</b>—Adjacency has been rejected.</li> </ul> </li> <li>• <b>Event</b>—Type of transition that occurred. <ul style="list-style-type: none"> <li>• <b>Seenself</b>—Possible routing loop has been detected.</li> <li>• <b>Interface down</b>—IS-IS interface has gone down and is no longer available.</li> <li>• <b>Error</b>—Adjacency error.</li> </ul> </li> <li>• <b>Down reason</b>—Reason that an IS-IS adjacency is down: <ul style="list-style-type: none"> <li>• <b>3-Way Handshake Failed</b>—Connection establishment failed.</li> <li>• <b>Address Mismatch</b>—Address mismatch caused link failure.</li> <li>• <b>Aged Out</b>—Link expired.</li> <li>• <b>ISO Area Mismatch</b>—IS-IS area mismatch caused link failure.</li> <li>• <b>Bad Hello</b>—Unacceptable hello message caused link failure.</li> <li>• <b>BFD Session Down</b>—Bidirectional failure detection caused link failure.</li> <li>• <b>Interface Disabled</b>—IS-IS interface is disabled.</li> <li>• <b>Interface Down</b>—IS-IS interface is unavailable.</li> <li>• <b>Interface Level Disabled</b>—IS-IS level is disabled.</li> <li>• <b>Level Changed</b>—IS-IS level has changed on the adjacency.</li> <li>• <b>Level Mismatch</b>—Levels on adjacency are not compatible.</li> <li>• <b>MPLS LSP Down</b>—Label-switched path (LSP) is unavailable.</li> <li>• <b>MT Topology Changed</b>—IS-IS topology has changed.</li> <li>• <b>MT Topology Mismatch</b>—IS-IS topology is mismatched.</li> <li>• <b>Remote System ID Changed</b>—Adjacency peer system ID changed.</li> <li>• <b>Protocol Shutdown</b>—IS-IS protocol is disabled.</li> <li>• <b>CLI Command</b>—Adjacency brought down by user.</li> <li>• <b>Unknown</b>—Unknown.</li> </ul> </li> </ul> | extensive       |

## Sample Output

### show isis adjacency

```

user@host> show isis adjacency
Interface          System      L State      Hold (secs) SNPA
at-2/3/0.0         ranier      3 Up          23

```

### show isis adjacency brief

The output for the **show isis adjacency brief** command is identical to that for the **show isis adjacency** command. For sample output, see [show isis adjacency on page 3988](#).

### show isis adjacency detail

```
user@host> show isis adjacency detail
ranier
Interface: at-2/3/0.0, Level: 3, State: Up, Expires in 21 secs
Priority: 0, Up/Down transitions: 1, Last transition: 00:01:09 ago
Circuit type: 3, Speaks: IP, IPv6
Topologies: Unicast
Restart capable: Yes
IP addresses: 11.1.1.2
```

### show isis adjacency extensive

```
user@host> show isis adjacency extensive
ranier
Interface: at-2/3/0.0, Level: 3, State: Up, Expires in 22 secs
Priority: 0, Up/Down transitions: 1, Last transition: 00:01:16 ago
Circuit type: 3, Speaks: IP, IPv6
Topologies: Unicast
Restart capable: Yes
IP addresses: 11.1.1.2
Transition log:
When           State      Event      Down reason
Wed Nov  8 21:24:25  Up        Seenself
```

**Table 314: show isis backup label-switched-path Output Fields**

| Field Name              | Field Description   |
|-------------------------|---|
| <b>Backup MPLS LSPs</b> | List of MPLS LSPs designated as backup paths for IS-IS routes.  |
| <b>Egress</b>           | IP address of the egress routing device for the LSP.  |
| <b>Status</b>           | State of the LSP: <ul style="list-style-type: none"> <li>• <b>Up</b>—The routing device can detect RSVP hello messages from the neighbor.</li> <li>• <b>Down</b>—The routing device has received one of the following indications:               <ul style="list-style-type: none"> <li>• Communication failure from the neighbor.</li> <li>• Communication from IGP that the neighbor is unavailable.</li> <li>• Change in the sequence numbers in the RSVP hello messages sent by the neighbor.</li> </ul> </li> <li>• <b>Deleted</b>—LSP is no longer available as a backup path.</li> </ul> |

Table 314: show isis backup label-switched-path Output Fields (*continued*)

| Field Name  | Field Description  |
|-------------|--|
| Last change | Time elapsed since the neighbor state changed either from up to down or from down to up. The format is <i>hh:mm:ss</i> . |
| TE-metric   | Configured traffic engineering metric.   |
| Metric      | Configured metric.   |

## Sample Output

### show isis backup label-switched-path

```
user@host> show isis backup label-switched-path
Backup MPLS LSPs:
f-to-g, Egress: 192.168.1.4, Status: up, Last change: 06:12:03
TE-metric: 9, Metric: 0
```

## show isis backup spf results

[show isis database extensive on page 4003](#)

**Output Fields** [Table 316 on page 4001](#) describes the output fields for the **show isis database** command. Output fields are listed in the approximate order in which they appear. Fields that contain internal IS-IS information useful only in troubleshooting obscure problems are not described in the table. For more details about these fields, contact your customer support representative.

**Table 316: show isis database Output Fields**

| Field Name            | Field Description  | Level of Output         |
|-----------------------|--|-------------------------|
| <b>Interface name</b> | Name of the interface on which the link-state PDU has been received; always <b>IS-IS</b> for this command.   | All levels              |
| level                 | Level of intermediate system: <ul style="list-style-type: none"> <li>• <b>1</b>—Intermediate system routes within an area; when the destination is outside an area, it routes toward a Level 2 system.</li> <li>• <b>2</b>—Intermediate system routes between areas and toward other ASs.</li> </ul>   | All levels              |
| LSP ID                | Link-state PDU identifier.   | All levels              |
| Sequence              | Sequence number of the link-state PDU.   | All levels              |
| Checksum              | Checksum value of the link-state PDU.  | All levels              |
| Lifetime (secs)       | Remaining lifetime of the link-state PDU, in seconds.  | All levels              |
| Attributes            | Attributes of the specified database: <b>L1</b> , <b>L2</b> , <b>Overload</b> , or <b>Attached</b> (L1 only).  | none <b>brief</b>       |
| # LSPs                | Total number of link-state PDUs in the specified link-state database.  | none <b>brief</b>       |
| IP prefix             | Prefix advertised by this link-state PDU.  | <b>detail extensive</b> |
| IS neighbor           | IS-IS neighbor of the advertising system.  | <b>detail extensive</b> |
| ES neighbor           | (J Series routers only) An ES-IS neighbor of the advertising system.   | <b>detail extensive</b> |
| IP prefix             | IPv4 prefix advertised by this link-state PDU.   | <b>detail extensive</b> |
| V6 prefix             | IPv6 prefix advertised by this link-state PDU.   | <b>detail extensive</b> |
| Metric                | Metric of the prefix or neighbor.  | <b>detail extensive</b> |
| Header                | <ul style="list-style-type: none"> <li>• <b>LSP ID</b>—Link state PDU identifier of the header.</li> <li>• <b>Length</b>—Header length.</li> <li>• <b>Allocated Length</b>—Amount of length available for the header.</li> <li>• <b>Router ID</b>—Address of the local routing device.</li> <li>• <b>Remaining Lifetime</b>—Remaining lifetime of the link-state PDU, in seconds.</li> </ul> | <b>extensive</b>        |

Table 316: show isis database Output Fields (*continued*)

| Field Name | Field Description  | Level of Output |
|------------|--|-----------------|
| Packet     | <ul style="list-style-type: none"> <li>• <b>LSP ID</b>—The identifier for the link-state PDU.</li> <li>• <b>Length</b>—Packet length.</li> <li>• <b>Lifetime</b>—Remaining lifetime, in seconds.</li> <li>• <b>Checksum</b>—The checksum of the link-state PDU.</li> <li>• <b>Sequence</b>—The sequence number of the link-state PDU. Every time the link-state PDU is updated, this number increments.</li> <li>• <b>Attributes</b>—Packet attributes.</li> <li>• <b>NLPID</b>—Network layer protocol identifier.</li> <li>• <b>Fixed length</b>—Specifies the set length for the packet.</li> </ul>  | extensive       |
| TLVs       | <ul style="list-style-type: none"> <li>• <b>Area Address</b>—Area addresses that the routing device can reach.</li> <li>• <b>Speaks</b>—Supported routing protocols.</li> <li>• <b>IP router id</b>—ID of the routing device (usually the IP address).</li> <li>• <b>IP address</b>—IPv4 address.</li> <li>• <b>Hostname</b>—Assigned name of the routing device.</li> <li>• <b>IP prefix</b>—IP prefix of the routing device.</li> <li>• <b>Metric</b>—IS-IS metric that measures the cost of the adjacency between the originating routing device and the advertised routing device.</li> <li>• <b>IP extended prefix</b>—Extended IP prefix of the routing device.</li> <li>• <b>IS neighbor</b>—Directly attached neighbor's name and metric.</li> <li>• <b>IS extended neighbor</b>—Directly attached neighbor's name, metric, IP address, local interface index, and remote interface index.</li> </ul> <p>The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205.</p> | extensive       |

## Sample Output

### show isis database

```

user@host> show isis database
IS-IS level 1 link-state database:

**Output Fields** Table 318 on page 4015 describes the output fields for the **show isis interface** command. Output fields are listed in the approximate order in which they appear.

**Table 318: show isis interface Output Fields**

| Field Name               | Field Description  | Level of Output  |
|--------------------------|--|------------------|
| <i>interface-name</i>    | Name of the interface.   | detail           |
| <b>Designated router</b> | Routing device selected by other routers that is responsible for sending link-state advertisements that describe the network. Used only on broadcast networks.   | detail           |
| <b>Index</b>             | Interface index assigned by the Junos OS kernel.   | detail           |
| <b>State</b>             | Internal implementation information.   | detail           |
| <b>Circuit id</b>        | Circuit identifier.  | detail           |
| <b>Circuit type</b>      | Circuit type: <ul style="list-style-type: none"> <li>• 1—Level 1 only</li> <li>• 2—Level 2 only</li> <li>• 3—Level 1 and Level 2</li> </ul>  | detail           |
| <b>LSP interval</b>      | Interval between link-state PDUs sent from the interface.  | detail           |
| <b>CSNP interval</b>     | Interval between complete sequence number PDUs sent from the interface.  | detail extensive |
| <b>Sysid</b>             | System identifier.   | detail           |
| <b>Interface</b>         | Interface through which the adjacency is made.   | none brief       |
| <b>L or Level</b>        | Level: <ul style="list-style-type: none"> <li>• 1—Level 1 only</li> <li>• 2—Level 2 only</li> <li>• 3—Level 1 and Level 2</li> </ul> <p><b>NOTE:</b> The default IS-IS level on loopback interfaces are always same as the IS-IS level configured on other IS-IS interfaces in a router. You can also configure IS-IS level on loopback interfaces per your requirement.</p> | All levels       |
| <b>CirID</b>             | Circuit identifier.  | none brief       |
| <b>Level 1 DR</b>        | Level 1 designated intermediate system.  | none brief       |
| <b>Level 2 DR</b>        | Level 2 designated intermediate system.  | none brief       |
| <b>L1/L2 Metric</b>      | Interface's metric for Level 1 and Level 2. If there is no information, the metric is 0.   | none brief       |

Table 318: show isis interface Output Fields (*continued*)

| Field Name                                | Field Description   | Level of Output         |
|---|---|-------------------------|
| <b>Adjacency advertisement: Advertise</b> | This routing device has signaled to advertise this interface to its neighbors in their label-switched paths (LSPs).   | <b>detail extensive</b> |
| <b>Adjacency advertisement: Suppress</b>  | This neighbor has signaled not to advertise this interface in the routing device's outbound LSPs.   | <b>detail extensive</b> |
| <b>Adjacencies</b>                        | Number of adjacencies established on this interface.  | <b>detail</b>           |
| <b>Priority</b>                           | Priority value for this interface.  | <b>detail</b>           |
| <b>Metric</b>                             | Metric value for this interface.  | <b>detail</b>           |
| <b>Hello(s) / Hello Interval</b>          | Interface's hello interval.   | <b>detail extensive</b> |
| <b>Hold(s) / Hold Time</b>                | Interface's hold time.  | <b>detail extensive</b> |
| <b>Designated Router</b>                  | Router responsible for sending network link-state advertisements, which describe all the routing devices attached to the network.   | <b>detail</b>           |
| <b>Hello padding</b>                      | Type of hello padding: <ul style="list-style-type: none"> <li>• <b>Adaptive</b>—On point-to-point connections, the hello packets are padded from the initial detection of a new neighbor until the neighbor verifies the adjacency as Up in the adjacency state TLV. If the neighbor does not support the adjacency state TLV, then padding continues. On LAN connections, padding starts from the initial detection of a new neighbor until there is at least one active adjacency on the interface.</li> <li>• <b>Loose</b>—(Default) The hello packet is padded from the initial detection of a new neighbor until the adjacency transitions to the Up state.</li> <li>• <b>Strict</b>—Padding is performed on all interface types and for all adjacency states, and is continuous.</li> </ul> | <b>extensive</b>        |
| <b>LDP sync state</b>                     | Current LDP synchronization state: <b>in sync</b> , <b>in holddown</b> , or <b>not supported</b> .  | <b>extensive</b>        |
| <b>reason</b>                             | Reason for being in the LDP sync state.   | <b>extensive</b>        |
| <b>config holdtime</b>                    | Configured value of the hold timer.   | <b>extensive</b>        |
| <b>remaining</b>                          | If the state is not in sync and the hold time is not infinity, then this field displays the remaining hold time in seconds.   | <b>extensive</b>        |

## Sample Output

### show isis interface

```
user@host> show isis interface
```

IS-IS interface database:

| Interface  | L | CirID | Level 1 DR     | Level 2 DR     | L1/L2 Metric |
|------------|---|-------|----------------|----------------|--------------|
| at-2/3/0.0 | 3 | 0x1   | Point to Point | Point to Point | 10/10        |
| lo0.0      | 3 | 0x1   | Passive        | Passive        | 0/0          |

### show isis interface brief

The output for the **show isis interface brief** command is identical to that for the **show isis interface** command. For sample output, see [show isis interface on page 4016](#).

### show isis interface detail

```
user@host> show isis interface detail
```

IS-IS interface database:

at-2/3/0.0

Index: 66, State: 0x6, Circuit id: 0x1, Circuit type: 3

LSP interval: 100 ms, CSNP interval: 5 s

| Level | Adjacencies | Priority | Metric | Hello (s) | Hold (s) | Designated Router |
|-------|-------------|----------|--------|-----------|----------|-------------------|
|-------|-------------|----------|--------|-----------|----------|-------------------|

**Table 319: show isis overview Output Fields**

| Field Name              | Field Description  |
|-------------------------|--|
| Instance                | IS-IS routing instance.  |
| Router ID               | Router ID of the routing device.   |
| Adjacency holddown      | Adjacency holddown capability: <b>enabled</b> or <b>disabled</b> .   |
| Maximum Areas           | Maximum number of IS-IS areas advertised by the routing device.  |
| LSP life time           | Lifetime of the link-state PDU, in seconds.  |
| Attached bit evaluation | Attached bit capability: <b>enabled</b> or <b>disabled</b> .   |
| SPF delay               | Delay before performing consecutive shortest-path-first (SPF) calculations.  |
| SPF holddown            | Delay before performing additional SPF calculations after the maximum number of consecutive SPF calculations is reached. |

Table 319: show isis overview Output Fields (*continued*)

| Field Name                     | Field Description   |
|--------------------------------|---|
| SPF rapid runs                 | Maximum number of SPF calculations that can be performed in succession before the holddown timer begins.                |
| Overload bit at startup is set | Overload bit capability is enabled.   |
| Overload high metrics          | Overload high metrics capability: <b>enabled</b> or <b>disabled</b> .   |
| Overload timeout               | Time period after which overload is reset and the time that remains before the timer is set to expire.                  |
| Traffic engineering            | Traffic engineering capability: <b>enabled</b> or <b>disabled</b> .   |
| Restart                        | Graceful restart capability: <b>enabled</b> or <b>disabled</b> .  |
| Restart duration               | Time period for complete reacquisition of IS-IS neighbors.  |
| Helper mode                    | Graceful restart helper capability: <b>enabled</b> or <b>disabled</b> .   |
| Level                          | IS-IS level: <ul style="list-style-type: none"> <li>• 1—Level 1 information</li> <li>• 2—Level 2 information</li> </ul> |
| IPv4 is enabled                | IP Protocol version 4 capability is enabled.  |
| IPv6 is enabled                | IP Protocol version 6 capability is enabled.  |
| CLNS is enabled                | (J Series routers only) OSI CLNP capability is enabled.   |
| Internal route preference      | Preference value of internal routes.  |
| External route preference      | Preference value of external routes.  |
| Prefix export limit            | Number of prefixes allowed to be exported, as configured by the <a href="#">prefix-export-limit</a> statement.          |
| Prefix export count            | Number of prefixes exported.  |
| Wide area metrics are enabled  | Wide area metrics capability is enabled.  |
| Narrow metrics are enabled     | Narrow metrics capability is enabled.   |

## Sample Output

### show isis overview

```
user@host> show isis overview
Instance: master
  Router ID: 10.255.107.183
  Adjacency holddown: disabled
  Maximum Areas: 3
  LSP life time: 1200
  Attached bit evaluation: enabled
  SPF delay: 200 msec, SPF holddown: 5000 msec, SPF rapid runs: 3
  IPv4 is enabled, IPv6 is enabled
  Traffic engineering: enabled
  Restart: Disabled
    Helper mode: Enabled
Level 1
  Internal route preference: 15
  External route preference: 160
  Wide metrics are enabled, Narrow metrics are enabled
Level 2
  Internal route preference: 18
  External route preference: 165
  Prefix export limit: 5, Prefix export count: 5
  Wide metrics are enabled
```

Table 320: show isis route Output Fields

| Field Name             | Field Description  |
|------------------------|--|
| <b>Current version</b> | Number of the current version of the IS-IS routing table.  |
| <b>L1</b>              | Version of Level 1 SPF that was run.   |
| <b>L2</b>              | Version of Level 2 SPF that was run.   |
| <b>Prefix</b>          | Destination of the route.  |
| <b>L</b>               | IS-IS level: <ul style="list-style-type: none"> <li>• 1—Level 1 only</li> <li>• 2—Level 2 only</li> <li>• 3—Level 1 and Level 2</li> </ul> |
| <b>Version</b>         | Version of SPF that generated the route.   |
| <b>Metric</b>          | Metric value associated with the route.  |
| <b>Type</b>            | Metric type: <b>int</b> (internal) or <b>ext</b> (external).   |
| <b>Interface</b>       | Interface to the next hop.   |
| <b>Via</b>             | System identifier of the next hop, displayed as a name if possible.  |
| <b>ISO Routes</b>      | ISO routing table entries.   |
| <b>snpa</b>            | MAC address.   |

## Sample Output

Table 322: show isis statistics Output Fields

| Field Name                  | Field Description   |
|-----------------------------|---|
| PDU type                    | <p>PDU type:</p> <ul style="list-style-type: none"> <li>• <b>CSNP</b>—Complete sequence number PDUs contain a complete list of all link-state PDUs in the IS-IS database. CSNPs are sent periodically on all links, and the receiving systems use the information in the CSNP to update and synchronize their link-state PDU databases. The designated router multicasts CSNPs on broadcast links in place of sending explicit acknowledgments for each link-state PDU.</li> <li>• <b>IIH</b>—IS-IS hello packets are broadcast to discover the identity of neighboring IS-IS systems and to determine whether the neighbors are Level 1 or Level 2 intermediate systems.</li> <li>• <b>LSP</b>—Link-state PDUs contain information about the state of adjacencies to neighboring IS-IS systems. Link-state PDUs are flooded periodically throughout an area.</li> <li>• <b>PSNP</b>—Partial sequence number PDUs are sent multicast by a receiver when it detects that it is missing a link-state PDU (when its link-state PDU database is out of date). The receiver sends a PSNP to the system that transmitted the CSNP, effectively requesting that the missing link-state PDU be transmitted. That routing device, in turn, forwards the missing link-state PDU to the requesting routing device.</li> <li>• <b>Unknown</b>—The PDU type is unknown.</li> </ul> |
| Received                    | Number of PDUs received since IS-IS started or since the statistics were set to zero.   |
| Processed                   | Number of PDUs received less the number dropped.  |
| Drops                       | Number of PDUs dropped.   |
| Sent                        | Number of PDUs transmitted since IS-IS started or since the statistics were set to zero.  |
| Rexmit                      | Number of PDUs retransmitted since IS-IS started or since the statistics were set to zero.  |
| Total packets received/sent | Total number of PDUs received and transmitted since IS-IS started or since the statistics were set to zero.   |
| SNP queue length            | Number of CSPN and PSNP packets currently waiting in the queue for processing. This value is almost always 0.   |
| LSP queue length            | Number of link-state PDUs waiting in the queue for processing. This value is almost always 0.   |
| SPF runs                    | Number of shortest-path-first (SPF) calculations that have been performed. If this number is incrementing rapidly, it indicates that the network is unstable.   |
| Fragments rebuilt           | Number of link-state PDU fragments that the local system has computed.  |
| LSP regenerations           | Number of link-state PDUs that have been regenerated. A link-state PDU is regenerated when it is nearing the end of its lifetime and it has not changed.  |
| Purges initiated            | Number of purges that the system initiated. A purge is initiated if the software decides that a link-state PDU must be removed from the network.  |

## OSPF Overview

OSPF is an interior gateway protocol (IGP) that routes packets within a single autonomous system (AS). OSPF uses link-state information to make routing decisions, making route calculations using the shortest-path-first (SPF) algorithm (also referred to as the Dijkstra algorithm). Each router running OSPF floods link-state advertisements throughout the AS or area that contain information about that router's attached interfaces and routing metrics. Each router uses the information in these link-state advertisements to calculate the least cost path to each network and create a routing table for the protocol.

Junos OS supports OSPF version 2 (OSPFv2) and OSPF version 3 (OSPFv3), including virtual links, stub areas, and for OSPFv2, authentication. Junos OS does not support type-of-service (ToS) routing.

OSPF was designed for the Transmission Control Protocol/Internet Protocol (TCP/IP) environment and as a result explicitly supports IP subnetting and the tagging of externally derived routing information. OSPF also provides for the authentication of routing updates.

OSPF routes IP packets based solely on the destination IP address contained in the IP packet header. OSPF quickly detects topological changes, such as when router interfaces become unavailable, and calculates new loop-free routes quickly and with a minimum of routing overhead traffic.

**NOTE:** On SRX Series devices, when only one link-protection is configured under the OSPF interface, the device does not install an alternative route in the forwarding table. When the per-packet load-balancing is enabled as a workaround, the device does not observe both the OSPF metric and sending the traffic through both the interfaces.

An OSPF AS can consist of a single area, or it can be subdivided into multiple areas. In a single-area OSPF network topology, each router maintains a database that describes the topology of the AS. Link-state information for each router is flooded throughout the AS. In a multiarea OSPF topology, each router maintains a database that describes the topology of its area, and link-state information for each router is flooded throughout that area. All routers maintain summarized topologies of other areas within an AS. Within each area, OSPF routers have identical topological databases. When the AS or area topology changes, OSPF ensures that the contents of all routers' topological databases converge quickly.

All OSPFv2 protocol exchanges can be authenticated. OSPFv3 relies on IPsec to provide this functionality. This means that only trusted routers can participate in the AS's routing. A variety of authentication schemes can be used. A single authentication scheme is configured for each area, which enables some areas to use stricter authentication than others.

Externally derived routing data (for example, routes learned from BGP) is passed transparently throughout the AS. This externally derived data is kept separate from the OSPF link-state data. Each external route can be tagged by the advertising router, enabling the passing of additional information between routers on the boundaries of the AS.

**NOTE:** By default, Junos OS is compatible with RFC 1583, *OSPF Version 2*. In Junos OS Release 8.5 and later, you can disable compatibility with RFC 1583 by including the `no-rfc-1583` statement. For more information, see [“Example: Disabling OSPFv2 Compatibility with RFC 1583” on page 4074](#).

This topic describes the following information:

- [OSPF Default Route Preference Values on page 4038](#)
- [OSPF Routing Algorithm on page 4038](#)
- [OSPF Three-Way Handshake on page 4039](#)
- [OSPF Version 3 on page 4040](#)

### OSPF Default Route Preference Values

The Junos OS routing protocol process assigns a default preference value to each route that the routing table receives. The default value depends on the source of the route. The preference value is from 0 through 4,294,967,295 ( $2^{32} - 1$ ), with a lower value indicating a more preferred route. [Table 323 on page 4038](#) lists the default preference values for OSPF.

**Table 323: Default Route Preference Values for OSPF**

| How Route Is Learned    | Default Preference | Statement to Modify Default Preference |
|-------------------------|--------------------|--|
| OSPF internal route     | 10                 | OSPF <code>preference</code>           |
| OSPF AS external routes | 150                | OSPF <code>external-preference</code>  |

### OSPF Routing Algorithm

OSPF uses the shortest-path-first (SPF) algorithm, also referred to as the Dijkstra algorithm, to determine the route to each destination. All routing devices in an area run this algorithm in parallel, storing the results in their individual topological databases. Routing devices with interfaces to multiple areas run multiple copies of the algorithm. This section provides a brief summary of how the SPF algorithm works.

When a routing device starts, it initializes OSPF and waits for indications from lower-level protocols that the router interfaces are functional. The routing device then uses the OSPF hello protocol to acquire neighbors, by sending hello packets to its neighbors and receiving their hello packets.

On broadcast or nonbroadcast multiaccess networks (physical networks that support the attachment of more than two routing devices), the OSPF hello protocol elects a designated router for the network. This routing device is responsible for sending *link-state advertisements* (LSAs) that describe the network, which reduces the amount of network traffic and the size of the routing devices' topological databases.

The routing device then attempts to form *adjacencies* with some of its newly acquired neighbors. (On multiaccess networks, only the designated router and backup designated

router form adjacencies with other routing devices.) Adjacencies determine the distribution of routing protocol packets. Routing protocol packets are sent and received only on adjacencies, and topological database updates are sent only along adjacencies. When adjacencies have been established, pairs of adjacent routers synchronize their topological databases.

A routing device sends LSA packets to advertise its state periodically and when its state changes. These packets include information about the routing device's adjacencies, which allows detection of nonoperational routing devices.

Using a reliable algorithm, the routing device floods LSAs throughout the area, which ensures that all routing devices in an area have exactly the same topological database. Each routing device uses the information in its topological database to calculate a shortest-path tree, with itself as the root. The routing device then uses this tree to route network traffic.

The description of the SPF algorithm up to this point has explained how the algorithm works within a single area (*intra-area routing*). For internal routers to be able to route to destinations outside the area (*interarea routing*), the area border routers must inject additional routing information into the area. Because the area border routers are connected to the backbone, they have access to complete topological data about the backbone. The area border routers use this information to calculate paths to all destinations outside its area and then advertise these paths to the area's internal routers.

Autonomous system (AS) boundary routers flood information about external autonomous systems throughout the AS, except to stub areas. Area border routers are responsible for advertising the paths to all AS boundary routers.

### OSPF Three-Way Handshake

OSPF creates a topology map by flooding LSAs across OSPF-enabled links. LSAs announce the presence of OSPF-enabled interfaces to adjacent OSPF interfaces. The exchange of LSAs establishes bidirectional connectivity between all adjacent OSPF interfaces (neighbors) using a three-way handshake, as shown in [Figure 112 on page 4039](#).

**Figure 112: OSPF Three-Way Handshake**

In [Figure 112 on page 4039](#), Router A sends hello packets out all its OSPF-enabled interfaces when it comes online. Router B receives the packet, which establishes that Router B can receive traffic from Router A. Router B generates a response to Router A to acknowledge receipt of the hello packet. When Router A receives the response, it establishes that Router B can receive traffic from Router A. Router A then generates a final response packet to inform Router B that Router A can receive traffic from Router B. This three-way handshake ensures bidirectional connectivity.

As new neighbors are added to the network or existing neighbors lose connectivity, the adjacencies in the topology map are modified accordingly through the exchange (or absence) of LSAs. These LSAs advertise only the incremental changes in the network, which helps minimize the amount of OSPF traffic on the network. The adjacencies are shared and used to create the network topology in the topological database.

### OSPF Version 3

---

OSPFv3 is a modified version of OSPF that supports IP version 6 (IPv6) addressing. OSPFv3 differs from OSPFv2 in the following ways:

- All neighbor ID information is based on a 32-bit router ID.
- The protocol runs per link rather than per subnet.
- Router and network link-state advertisements (LSAs) do not carry prefix information.
- Two new LSA types are included: link-LSA and intra-area-prefix-LSA.
- Flooding scopes are as follows:
  - Link-local
  - Area
  - AS
- Link-local addresses are used for all neighbor exchanges except virtual links.
- Authentication is removed. The IPv6 authentication header relies on the IP layer.
- The packet format has changed as follows:
  - Version number 2 is now version number 3.
  - The **db** option field has been expanded to 24 bits.
  - Authentication information has been removed.
  - Hello messages do not have address information.
  - Two new option bits are included: **R** and **V6**.
- Type 3 summary LSAs have been renamed *inter-area-prefix-LSAs*.
- Type 4 summary LSAs have been renamed *inter-area-router-LSAs*.

## OSPF Areas and Router Functionality Overview

In OSPF, a single autonomous system (AS) can be divided into smaller groups called *areas*. This reduces the number of link-state advertisements (LSAs) and other OSPF overhead traffic sent on the network, and it reduces the size of the topology database that each router must maintain. The routing devices that participate in OSPF routing perform one or more functions based on their location in the network.

This topic describes the following OSPF area types and routing device functions:

- [Areas on page 4041](#)
- [Area Border Routers on page 4041](#)
- [Backbone Areas on page 4041](#)
- [AS Boundary Routers on page 4042](#)
- [Backbone Router on page 4042](#)
- [Internal Router on page 4042](#)
- [Stub Areas on page 4042](#)
- [Not-So-Stubby Areas on page 4042](#)
- [Transit Areas on page 4043](#)

---

### Areas

An *area* is a set of networks and hosts within an AS that have been administratively grouped together. We recommend that you configure an area as a collection of contiguous IP subnetted networks. Routing devices that are wholly within an area are called *internal routers*. All interfaces on internal routers are directly connected to networks within the area.

The topology of an area is hidden from the rest of the AS, thus significantly reducing routing traffic in the AS. Also, routing within the area is determined only by the area's topology, providing the area with some protection from bad routing data.

All routing devices within an area have identical topology databases.

---

### Area Border Routers

Routing devices that belong to more than one area and connect one or more OSPF areas to the backbone area are called *area border routers* (ABRs). At least one interface is within the backbone while another interface is in another area. ABRs also maintain a separate topological database for each area to which they are connected.

---

### Backbone Areas

An OSPF *backbone area* consists of all networks in area ID 0.0.0.0, their attached routing devices, and all ABRs. The backbone itself does not have any ABRs. The backbone distributes routing information between areas. The backbone is simply another area, so the terminology and rules of areas apply: a routing device that is directly connected to the backbone is an internal router on the backbone, and the backbone's topology is hidden from the other areas in the AS.

The routing devices that make up the backbone must be physically contiguous. If they are not, you must configure *virtual links* to create the appearance of backbone connectivity. You can create virtual links between any two ABRs that have an interface to a common nonbackbone area. OSPF treats two routing devices joined by a virtual link as if they were connected to an unnumbered point-to-point network.

---

### AS Boundary Routers

Routing devices that exchange routing information with routing devices in non-OSPF networks are called *AS boundary routers*. They advertise externally learned routes throughout the OSPF AS. Depending on the location of the AS boundary router in the network, it can be an ABR, a backbone router, or an internal router (with the exception of stub areas). Internal routers within a stub area cannot be an AS boundary router because stub areas cannot contain any Type 5 LSAs.

Routing devices within the area where the AS boundary router resides know the path to that AS boundary router. Any routing device outside the area only knows the path to the nearest ABR that is in the same area where the AS boundary router resides.

---

### Backbone Router

*Backbone routers* are routing devices that have one or more interfaces connected to the OSPF backbone area (area ID 0.0.0.0).

---

### Internal Router

Routing devices that connect to only one OSPF area are called *internal routers*. All interfaces on internal routers are directly connected to networks within a single area.

---

### Stub Areas

*Stub areas* are areas through which or into which AS external advertisements are not flooded. You might want to create stub areas when much of the topological database consists of AS external advertisements. Doing so reduces the size of the topological databases and therefore the amount of memory required on the internal routers in the stub area.

Routing devices within a stub area rely on the default routes originated by the area's ABR to reach external AS destinations. You must configure the **default-metric** option on the ABR before it advertises a default route. Once configured, the ABR advertises a default route in place of the external routes that are not being advertised within the stub area, so that routing devices in the stub area can reach destinations outside the area.

The following restrictions apply to stub areas: you cannot create a virtual link through a stub area, a stub area cannot contain an AS boundary router, the backbone cannot be a stub area, and you cannot configure an area as both a stub area and a not-so-stubby area.

---

### Not-So-Stubby Areas

An OSPF stub area has no external routes in it, so you cannot redistribute from another protocol into a stub area. A *not-so-stubby area* (NSSA) allows external routes to be

flooded within the area. These routes are then leaked into other areas. However, external routes from other areas still do not enter the NSSA.

The following restriction applies to NSSAs: you cannot configure an area as both a stub area and an NSSA.

### Transit Areas

*Transit areas* are used to pass traffic from one adjacent area to the backbone (or to another area if the backbone is more than two hops away from an area). The traffic does not originate in, nor is it destined for, the transit area.

## Packets Overview

There are several types of link-state advertisement (LSA) packets.

This topic describes the following information:

- [OSPF Packet Header on page 4043](#)
- [Hello Packets on page 4044](#)
- [Database Description Packets on page 4044](#)
- [Link-State Request Packets on page 4044](#)
- [Link-State Update Packets on page 4044](#)
- [Link-State Acknowledgment Packets on page 4045](#)
- [Link-State Advertisement Packet Types on page 4045](#)

### OSPF Packet Header

All OSPFv2 packets have a common 24-byte header, and OSPFv3 packets have a common 16-byte header, that contains all information necessary to determine whether OSPF should accept the packet. The header consists of the following fields:

- Version number—The current OSPF version number. This can be either **2** or **3**.
- Type—Type of OSPF packet.
- Packet length—Length of the packet, in bytes, including the header.
- Router ID—IP address of the router from which the packet originated.
- Area ID—Identifier of the area in which the packet is traveling. Each OSPF packet is associated with a single area. Packets traveling over a virtual link are labeled with the backbone area ID, 0.0.0.0.

- Checksum—Fletcher checksum.
- Authentication—(OSPFv2 only) Authentication scheme and authentication information.
- Instance ID—(OSPFv3 only) Identifier used when there are multiple OSPFv3 realms configured on a link.

### Hello Packets

---

Routers periodically send hello packets on all interfaces, including virtual links, to establish and maintain neighbor relationships. Hello packets are multicast on physical networks that have a multicast or broadcast capability, which enables dynamic discovery of neighboring routers. (On nonbroadcast networks, dynamic neighbor discovery is not possible, so you must configure all neighbors statically as described in [“Example: Configuring an OSPFv2 Interface on a Nonbroadcast Multiaccess Network” on page 4079.](#))

Hello packets consist of the OSPF header plus the following fields:

- Network mask—(OSPFv2 only) Network mask associated with the interface.
- Hello interval—How often the router sends hello packets. All routers on a shared network must use the same hello interval.
- Options—Optional capabilities of the router.
- Router priority—The router’s priority to become the designated router.
- Router dead interval—How long the router waits without receiving any OSPF packets from a router before declaring that router to be down. All routers on a shared network must use the same router dead interval.
- Designated router—IP address of the designated router.
- Backup designated router—IP address of the backup designated router.
- Neighbor—IP addresses of the routers from which valid hello packets have been received within the time specified by the router dead interval.

### Database Description Packets

---

When initializing an adjacency, OSPF exchanges database description packets, which describe the contents of the topological database. These packets consist of the OSPF header, packet sequence number, and the link-state advertisement’s header.

### Link-State Request Packets

---

When a router detects that portions of its topological database are out of date, it sends a link-state request packet to a neighbor requesting a precise instance of the database. These packets consist of the OSPF header plus fields that uniquely identify the database information that the router is seeking.

### Link-State Update Packets

---

Link-state update packets carry one or more link-state advertisements one hop farther from their origin. The router multicasts (floods) these packets on physical networks that support multicast or broadcast mode. The router acknowledges all link-state update

packets and, if retransmission is necessary, sends the retransmitted advertisements unicast.

Link-state update packets consist of the OSPF header plus the following fields:

- Number of advertisements—Number of link-state advertisements included in this packet.
- Link-state advertisements—The link-state advertisements themselves.

### Link-State Acknowledgment Packets

The router sends link-state acknowledgment packets in response to link-state update packets to verify that the update packets have been received successfully. A single acknowledgment packet can include responses to multiple update packets.

Link-state acknowledgment packets consist of the OSPF header plus the link-state advertisement header.

### Link-State Advertisement Packet Types

Link-state request, link-state update, and link-state acknowledgment packets are used to reliably flood link-state advertisement packets. OSPF sends the following types of link-state advertisements:

- Router link advertisements—Are sent by all routers to describe the state and cost of the router's links to the area. These link-state advertisements are flooded throughout a single area only.
- Network link advertisements—Are sent by designated routers to describe all the routers attached to the network. These link-state advertisements are flooded throughout a single area only.
- Summary link advertisements—Are sent by area border routers to describe the routes that they know about in other areas. There are two types of summary link advertisements: those used when the destination is an IP network, and those used when the destination is an AS boundary router. Summary link advertisements describe interarea routes, that is, routes to destinations outside the area but within the AS. These link-state advertisements are flooded throughout the advertisement's associated areas.
- AS external link advertisement—Are sent by AS boundary routers to describe external routes that they know about. These link-state advertisements are flooded throughout the AS (except for stub areas).

Each link-state advertisement type describes a portion of the OSPF routing domain. All link-state advertisements are flooded throughout the AS.

Each link-state advertisement packet begins with a common 20-byte header.

## OSPF External Metrics Overview

When OSPF exports route information from external autonomous systems (ASs), it includes a cost, or *external metric*, in the route. OSPF supports two types of external metrics: Type 1 and Type 2. The difference between the two metrics is how OSPF calculates the cost of the route. Type 1 external metrics are equivalent to the link-state metric, where the cost is equal to the sum of the internal costs plus the external cost. This means that Type 1 external metrics include the external cost to the destination as well as the cost (metric) to reach the AS boundary router. Type 2 external metrics are greater than the cost of any path internal to the AS. Type 2 external metrics use only the external cost to the destination and ignore the cost (metric) to reach the AS boundary router. By default, OSPF uses the Type 2 external metric.

#### OSPF Designated Router Overview

---

Large LANs that have many routing devices and therefore many OSPF adjacencies can produce heavy control-packet traffic as link-state advertisements (LSAs) are flooded across the network. To alleviate the potential traffic problem, OSPF uses designated routers on all multiaccess networks (broadcast and nonbroadcast multiaccess [NBMA] networks types). Rather than broadcasting LSAs to all their OSPF neighbors, the routing devices send their LSAs to the designated router. Each multiaccess network has a designated router, which performs two main functions:

- Originate network link advertisements on behalf of the network.

- Establish adjacencies with all routing devices on the network, thus participating in the synchronizing of the link-state databases.

In LANs, the election of the designated router takes place when the OSPF network is initially established. When the first OSPF links are active, the routing device with the highest router identifier (defined by the **router-id** configuration value, which is typically the IP address of the routing device, or the loopback address) is elected the designated router. The routing device with the second highest router identifier is elected the backup designated router. If the designated router fails or loses connectivity, the backup designated router assumes its role and a new backup designated router election takes place between all the routers in the OSPF network.

OSPF uses the router identifier for two main purposes: to elect a designated router, unless you manually specify a priority value, and to identify the routing device from which a packet is originated. At designated router election, the router priorities are evaluated first, and the routing device with the highest priority is elected designated router. If router priorities tie, the routing device with the highest router identifier, which is typically the routing device's IP address, is chosen as the designated router. If you do not configure a router identifier, the IP address of the first interface to come online is used. This is usually the loopback interface. Otherwise, the first hardware interface with an IP address is used.

At least one routing device on each logical IP network or subnet must be eligible to be the designated router for OSPFv2. At least one routing device on each logical link must be eligible to be the designated router for OSPFv3.

By default, routing devices have a priority of 128. A priority of 0 marks the routing device as ineligible to become the designated router. A priority of 1 means the routing device has the least chance of becoming a designated router. A priority of 255 means the routing device is always the designated router.

---

### Example: Configuring an OSPF Router Identifier

---

This example shows how to configure an OSPF router identifier.

- [Requirements on page 4048](#)
- [Overview on page 4049](#)
- [Configuration on page 4049](#)
- [Verification on page 4050](#)

#### **Requirements**

Before you begin:

- Identify the interfaces on the routing device that will participate in OSPF. You must enable OSPF on all interfaces within the network on which OSPF traffic is to travel.
- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices* or the *Junos OS Interfaces Configuration Guide for Security Devices*.

### Overview

The router identifier is used by OSPF to identify the routing device from which a packet originated. Junos OS selects a router identifier according to the following set of rules:

1. By default, Junos OS selects the lowest configured physical IP address of an interface as the router identifier.
2. If a loopback interface is configured, the IP address of the loopback interface becomes the router identifier.
3. If multiple loopback interfaces are configured, the lowest loopback address becomes the router identifier.
4. If a router identifier is explicitly configured using the **router-id address** statement under the **[edit routing-options]** hierarchy level, the above three rules are ignored.

**NOTE:** If the router identifier is modified in a network, the link-state advertisements (LSAs) advertised by the previous router identifier are retained in the OSPF database until the LSA retransmit interval has timed out.

If the router identifier is not configured explicitly and an interface IP address is used as the router identifier, the established OSPF adjacency flaps when the interface goes down, or when it is brought back into the network. When the interface is brought back into the network, or a new interface is introduced into the network, the router identifier is selected again based on the rules stated above. Hence, it is strongly recommended that you explicitly configure the router identifier under the **[edit routing-options]** hierarchy level to avoid unpredictable behavior if the interface address on a loopback interface changes.

**NOTE:** The router identifier behavior described here holds good even when configured under **[edit routing-instances routing-instance-name routing-options]** and **[edit logical-systems logical-system-name routing-instances routing-instance-name routing-options]** hierarchy levels.

In this example, you configure the OSPF router identifier by setting its router ID value to the IP address of the device, which is 177.162.4.24.

### Configuration

#### CLI Quick Configuration

To quickly configure an OSPF router identifier, copy the following command and paste it into the CLI.

```
[edit]
set routing-options router-id 177.162.4.24
```

#### Step-by-Step Procedure

To configure an OSPF router identifier:

1. Configure the OSPF router identifier by entering the **[router-id]** configuration value.
- ```
[edit]
```

```
user@host# set routing-options router-id 177.162.4.24
```

2. If you are done configuring the device, commit the configuration.

```
[edit]  
user@host# commit
```

### Results

Confirm your configuration by entering the **show routing-options router-id** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show routing-options router-id  
router-id 177.162.4.24;
```

### Verification

After you configure the router ID and activate OSPF on the routing device, the router ID is referenced by multiple OSPF operational mode commands that you can use to monitor and troubleshoot the OSPF protocol. The router ID fields are clearly marked in the output.

### Example: Controlling OSPF Designated Router Election

---

This example shows how to control OSPF designated router election.

- [Requirements on page 4050](#)
- [Overview on page 4050](#)
- [Configuration on page 4050](#)
- [Verification on page 4051](#)

### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices* or the *Junos OS Interfaces Configuration Guide for Security Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4048.

### Overview

This example shows how to control OSPF designated router election. Within the example, you set the OSPF interface to **ge-/0/0/1** and the device priority to 200. The higher the priority value, the greater likelihood the routing device will become the designated router.

By default, routing devices have a priority of 128. A priority of 0 marks the routing device as ineligible to become the designated router. A priority of 1 means the routing device has the least chance of becoming a designated router.

### Configuration

#### CLI Quick Configuration

To quickly configure an OSPF designated router election, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf area 0.0.0.3 interface ge-0/0/1 priority 200
```

**Step-by-Step Procedure** To control OSPF designated router election:

1. Configure an OSPF interface and specify the device priority.

**NOTE:** To specify an OSPFv3 interface, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@host# set protocols ospf area 0.0.0.3 interface ge-0/0/1 priority 200
```

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

### Results

Confirm your configuration by entering the `show protocols ospf` command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.3 {
  interface ge-0/0/1.0 {
    priority 200;
  }
}
```

To confirm your OSPFv3 configuration, enter the `show protocols ospf3` command.

### Verification

Confirm that the configuration is working properly.

- [Verifying the Designated Router Election on page 4051](#)

### Verifying the Designated Router Election

**Purpose** Based on the priority you configured for a specific OSPF interface, you can confirm the address of the area's designated router. The DR ID, DR, or DR-ID field displays the address of the area's designated router. The BDR ID, BDR, or BDR-ID field displays the address of the backup designated router.

**Action** From operational mode, enter the `show ospf interface` and the `show ospf neighbor` commands for OSPFv2, and enter the `show ospf3 interface` and the `show ospf3 neighbor` commands for OSPFv3.

## Examples: Configuring OSPF Areas

- [Understanding OSPF Areas and Backbone Areas on page 4052](#)
- [Example: Configuring a Single-Area OSPF Network on page 4053](#)
- [Example: Configuring a Multiarea OSPF Network on page 4055](#)

### Understanding OSPF Areas and Backbone Areas

OSPF networks in an autonomous system (AS) are administratively grouped into *areas*. Each area within an AS operates like an independent network and has a unique 32-bit area ID, which functions similar to a network address. Within an area, the topology database contains only information about the area, link-state advertisements (LSAs) are flooded only to nodes within the area, and routes are computed only within the area. The topology of an area is hidden from the rest of the AS, thus significantly reducing routing traffic in the AS. Subnetworks are divided into other areas, which are connected to form the whole of the main network. Routing devices that are wholly within an area are called *internal routers*. All interfaces on internal routers are directly connected to networks within the area.

The central area of an AS, called the *backbone area*, has a special function and is always assigned the area ID 0.0.0.0. (Within a simple, single-area network, this is also the ID of the area.) Area IDs are unique numeric identifiers, in dotted decimal notation, but they are not IP addresses. Area IDs need only be unique within an AS. All other networks or areas in the AS must be directly connected to the backbone area by a routing device that has interfaces in more than one area. These connecting routing devices are called *area border routers* (ABRs). [Figure 113 on page 4052](#) shows an OSPF topology of three areas connected by two ABRs.

Figure 113: Multiarea OSPF Topology

Because all areas are adjacent to the backbone area, OSPF routers send all traffic not destined for their own area through the backbone area. The ABRs in the backbone area are then responsible for transmitting the traffic through the appropriate ABR to the destination area. The ABRs summarize the link-state records of each area and advertise destination address summaries to neighboring areas. The advertisements contain the ID of the area in which each destination lies, so that packets are routed to the appropriate ABR. For example, in the OSPF areas shown in [Figure 113 on page 4052](#), packets sent from Router A to Router C are automatically routed through ABR B.

Junos OS supports active backbone detection. Active backbone detection is implemented to verify that ABRs are connected to the backbone. If the connection to the backbone area is lost, then the routing device's default metric is not advertised, effectively rerouting traffic through another ABR with a valid connection to the backbone. Active backbone detection enables transit through an ABR with no active backbone connection. An ABR advertises to other routing devices that it is an ABR even if the connection to the backbone is down, so that the neighbors can consider it for interarea routes.

An OSPF restriction requires all areas to be directly connected to the backbone area so that packets can be properly routed. All packets are routed first to the backbone area by default. Packets that are destined for an area other than the backbone area are then routed to the appropriate ABR and on to the remote host within the destination area.

### Example: Configuring a Single-Area OSPF Network

This example shows how to configure a single-area OSPF network.

- [Requirements on page 4053](#)
- [Overview on page 4053](#)
- [Configuration on page 4054](#)
- [Verification on page 4055](#)

#### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices* or the *Junos OS Interfaces Configuration Guide for Security Devices*.
- Configure the router identifiers for the devices in your OSPF network. See "[Example: Configuring an OSPF Router Identifier](#)" on page 4048.

#### Overview

To activate OSPF on a network, you must enable the OSPF protocol on all interfaces within the network on which OSPF traffic is to travel. To enable OSPF, you must configure one or more interfaces on the device within an OSPF area. Once the interfaces are configured, OSPF LSAs are transmitted on all OSPF-enabled interfaces, and the network topology is shared throughout the network.

In an autonomous system (AS), the backbone area is always assigned area ID 0.0.0.0 (within a simple, single-area network, this is also the ID of the area). Area IDs are unique numeric identifiers, in dotted decimal notation. Area IDs need only be unique within an

AS. All other networks or areas in the AS must be directly connected to the backbone area by area border routers that have interfaces in more than one area. You must also create a backbone area if your network consists of multiple areas. In this example, you create the backbone area and add interfaces, such as **ge-0/0/0**, as needed to the OSPF area.

To use OSPF on the device, you must configure at least one OSPF area, such as the one shown in [Figure 114 on page 4054](#).

**Figure 114: Typical Single-Area OSPF Network Topology**

#### Configuration

##### CLI Quick Configuration

To quickly configure a single-area OSPF network, copy the following command and paste it into the CLI. You repeat this configuration for all interfaces that are part of the OSPF area.

```
[edit]
set protocols ospf area 0.0.0.0 interface ge-0/0/0
```

##### Step-by-Step Procedure

To configure a single-area OSPF network:

1. Configure the single-area OSPF network by specifying the area ID and associated interface.

**NOTE:** For a single-area OSPFv3 network, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# set protocols ospf area 0.0.0.0 interface ge-0/0/0
```

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

### Results

Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.0 {
  interface ge-0/0/0.0;
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### Verification

Confirm that the configuration is working properly.

#### Verifying the Interfaces in the Area

- |                |                                                                                                                                                                |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b> | Verify that the interface for OSPF or OSPFv3 has been configured for the appropriate area. Confirm that the Area field displays the value that you configured. |
| <b>Action</b>  | From operational mode, enter the <b>show ospf interface</b> command for OSPFv2, and enter the <b>show ospf3 interface</b> command for OSPFv3.                  |

### Example: Configuring a Multiarea OSPF Network

This example shows how to configure a multiarea OSPF network. To reduce traffic and topology maintenance for the devices in an OSPF autonomous system (AS), you can group the OSPF-enabled routing devices into multiple areas.

- [Requirements on page 4055](#)
- [Overview on page 4056](#)
- [Configuration on page 4056](#)
- [Verification on page 4058](#)

#### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices* or the *Junos OS Interfaces Configuration Guide for Security Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4048.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4050.
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4053.

### Overview

To activate OSPF on a network, you must enable the OSPF protocol on all interfaces within the network on which OSPF traffic is to travel. To enable OSPF, you must configure one or more interfaces on the device within an OSPF area. Once the interfaces are configured, OSPF LSAs are transmitted on all OSPF-enabled interfaces, and the network topology is shared throughout the network.

Each OSPF area consists of routing devices configured with the same area number. The backbone area is always assigned area ID 0.0.0.0. (All area identifiers (IDs) must be unique within an AS.) All other networks or areas in the AS must be directly connected to the backbone area by a router that has interfaces in more than one area. In

[Figure 115 on page 4056](#), Devices A and C are in the backbone area (area 0), and Devices D and E are in area 2. Device B has a special role. This is the area border router that connects area 0 and area 2. The area border router maintains a separate topological database for each area to which it is connected.

To reduce traffic and topology maintenance for the devices in an OSPF AS, you can group them into multiple areas as shown in [Figure 115 on page 4056](#). In this example, you create the backbone area, create an additional area (area 2) and assign it unique area ID 0.0.0.2, and you configure Device B as the area border router, where interface **ge-0/0/0** participates in OSPF area 0 and interface **ge-0/0/2** participates in OSPF area 2.

**Figure 115: Typical Multiarea OSPF Network Topology**

### Configuration

**CLI Quick Configuration** To quickly configure a multiarea OSPF network, copy the following commands and paste them into the CLI. You repeat this configuration for all interfaces that are part of the OSPF area.

**Device A** [edit]  
 set protocols ospf area 0.0.0.0 interface ge-0/0/0  
 set protocols ospf area 0.0.0.0 interface ge-0/0/1

**Device C** [edit]  
 set protocols ospf area 0.0.0.0 interface ge-0/0/0

**Device B** [edit]

```
set protocols ospf area 0.0.0.0 interface ge-0/0/0
set protocols ospf area 0.0.0.2 interface ge-0/0/2
```

**Device D**      [edit]  
 set protocols ospf area 0.0.0.2 interface ge-0/0/0  
 set protocols ospf area 0.0.0.2 interface ge-0/0/2

**Device E**      [edit]  
 set protocols ospf area 0.0.0.2 interface ge-0/0/2

**Step-by-Step Procedure**      To configure a multiarea OSPF network:

1.      Configure the backbone area.

**NOTE:** For an OSPFv3 network, include the `ospf3` statement at the [edit protocols] hierarchy level.

```
[edit]
user@A# set protocols ospf area 0.0.0.0 interface ge-0/0/0
user@A# set protocols ospf area 0.0.0.0 interface ge-0/0/1
```

```
[edit]
user@C# set protocols ospf area 0.0.0.0 interface ge-0/0/0
```

```
[edit]
user@B# set protocols ospf area 0.0.0.0 interface ge-0/0/0
```

2.      Configure an additional area for your OSPF network.

```
[edit]
user@B# set protocols ospf area 0.0.0.2 interface ge-0/0/2
```

```
[edit]
user@D# set protocols ospf area 0.0.0.2 interface ge-0/0/0
user@D# set protocols ospf area 0.0.0.2 interface ge-0/0/2
```

```
[edit]
user@E# set protocols ospf area 0.0.0.2 interface ge-0/0/2
```

3.      If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

### Results

Confirm your configuration by entering the `show protocols ospf` command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@A# show protocols ospf
area 0.0.0.0 {
  interface ge-0/0/0.0;
  interface ge-0/0/1.0;
}
```

```
user@C# show protocols ospf
area 0.0.0.0 {
  interface ge-0/0/0.0;
}

user@B# show protocols ospf
area 0.0.0.0 {
  interface ge-0/0/0.0;
}
area 0.0.0.2 {
  interface ge-0/0/2.0;
}

user@D# show protocols ospf
area 0.0.0.2 {
  interface ge-0/0/0.0;
  interface ge-0/0/2.0;
}

user@E# show protocols ospf
area 0.0.0.2 {
  interface ge-0/0/2.0;
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying the Interfaces in the Area on page 4058](#)

### **Verifying the Interfaces in the Area**

**Purpose** Verify that the interface for OSPF or OSPFv3 has been configured for the appropriate area. Confirm that the Area field displays the value that you configured.

**Action** From operational mode, enter the **show ospf interface** command for OSPFv2, and enter the **show ospf3 interface** command for OSPFv3.

### Understanding OSPF Stub Areas, Totally Stubby Areas, and Not-So-Stubby Areas

Figure 116 on page 4059 shows an autonomous system (AS) across which many external routes are advertised. If external routes make up a significant portion of a topology database, you can suppress the advertisements in areas that do not have links outside the network. By doing so, you can reduce the amount of memory the nodes use to maintain the topology database and free it for other uses.

Figure 116: OSPF AS Network with Stub Areas and NSSAs

To control the advertisement of external routes into an area, OSPF uses stub areas. By designating an area border router (ABR) interface to the area as a stub interface, you suppress external route advertisements through the ABR. Instead, the ABR advertises a default route (through itself) in place of the external routes and generates network summary (Type 3) link-state advertisements (LSAs). Packets destined for external routes are automatically sent to the ABR, which acts as a gateway for outbound traffic and routes the traffic appropriately.

**NOTE:** You must explicitly configure the ABR to generate a default route when attached to a stub or not-so-stubby-area (NSSA). To inject a default route with a specified metric value into the area, you must configure the `default-metric` option and specify a metric value.

For example, area 0.0.0.3 in [Figure 116 on page 4059](#) is not directly connected to the outside network. All outbound traffic is routed through the ABR to the backbone and then to the

destination addresses. By designating area 0.0.0.3 as a stub area, you reduce the size of the topology database for that area by limiting the route entries to only those routes internal to the area.

A stub area that only allows routes internal to the area and restricts Type 3 LSAs from entering the stub area is often called a *totally stubby area*. You can convert area 0.0.0.3 to a totally stubby area by configuring the ABR to only advertise and allow the default route to enter into the area. External routes and destinations to other areas are no longer summarized or allowed into a totally stubby area.

**NOTE:** If you incorrectly configure a totally stubby area, you might encounter network connectivity issues. You should have advanced knowledge of OSPF and understand your network environment before configuring totally stubby areas.

Similar to area 0.0.0.3 in [Figure 116 on page 4059](#), area 0.0.0.4 has no external connections. However, area 0.0.0.4 has static customer routes that are not internal OSPF routes. You can limit the external route advertisements to the area and advertise the static customer routes by designating the area an NSSA. In an NSSA, the AS boundary router generates NSSA external (Type 7) LSAs and floods them into the NSSA, where they are contained. Type 7 LSAs allow an NSSA to support the presence of AS boundary routers and their corresponding external routing information. The ABR converts Type 7 LSAs into AS external (Type 5) LSAs and leaks them to the other areas, but external routes from other areas are not advertised within the NSSA.

---

### Example: Configuring OSPF Stub and Totally Stubby Areas

---

This example shows how to configure an OSPF stub area and a totally stubby area to control the advertisement of external routes into an area.

- [Requirements on page 4060](#)
- [Overview on page 4061](#)
- [Configuration on page 4062](#)
- [Verification on page 4063](#)

#### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices* or the *Junos OS Interfaces Configuration Guide for Security Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4048.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4050
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4055.

### Overview

The backbone area, which is 0 in [Figure 117 on page 4062](#), has a special function and is always assigned the area ID 0.0.0.0. Area IDs are unique numeric identifiers, in dotted decimal notation. Area IDs need only be unique within an autonomous system (AS). All other networks or areas (such as 3, 7, and 9) in the AS must be directly connected to the backbone area by area border routers (ABRs) that have interfaces in more than one area.

Stub areas are areas through which or into which OSPF does not flood AS external link-state advertisements (Type 5 LSAs). You might create stub areas when much of the topology database consists of AS external advertisements and you want to minimize the size of the topology databases on the internal routers in the stub area.

The following restrictions apply to stub areas:

- You cannot create a virtual link through a stub area.
- A stub area cannot contain an AS boundary router.
- You cannot configure the backbone as a stub area.
- You cannot configure an area as both a stub area and a not-so-stubby area (NSSA).

In this example, you configure each routing device in area 7 (area ID 0.0.0.7) as a stub router and some additional settings on the ABR:

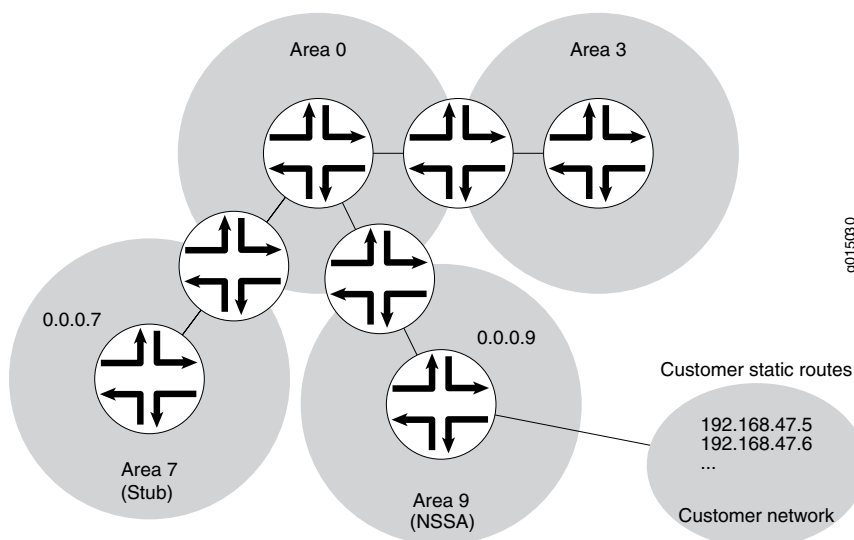

- **stub**—Specifies that this area become a stub area and not be flooded with Type 5 LSAs. You must include the **stub** statement on all routing devices that are in area 7 because this area has no external connections.
- **default-metric**—Configures the ABR to generate a default route with a specified metric into the stub area. This default route enables packet forwarding from the stub area to external destinations. You configure this option only on the ABR. The ABR does not automatically generate a default route when attached to a stub. You must explicitly configure this option to generate a default route.
- **no-summaries**—(Optional) Prevents the ABR from advertising summary routes into the stub area by converting the stub area into a totally stubby area. If configured in combination with the **default-metric** statement, a totally stubby area only allows routes internal to the area and advertises the default route into the area. External routes and destinations to other areas are no longer summarized or allowed into a totally stubby area. Only the ABR requires this additional configuration because it is the only routing device within the totally stubby area that creates Type 3 LSAs used to receive and send traffic from outside of the area.

**NOTE:**

In Junos OS Release 8.5 and later, the following applies:

- A router-identifier interface that is not configured to run OSPF is no longer advertised as a stub network in OSPF LSAs.
- OSPF advertises a local route with a prefix length of 32 as a stub link if the loopback interface is configured with a prefix length other than 32. OSPF also advertises the direct route with the configured mask length, as in earlier releases.

**Figure 117: OSPF Network Topology with Stub Areas and NSSAs**

### Configuration

#### CLI Quick Configuration

- To quickly configure an OSPF stub area, copy the following command and paste it into the CLI. You must configure all routing devices that are part of the stub area.

[edit]

```
set protocols ospf area 0.0.0.7 stub
```

- To quickly configure the ABR to inject a default route into the area, copy the following command and paste it into the CLI. You apply this configuration only on the ABR.

[edit]

```
set protocols ospf area 0.0.0.7 stub default-metric 10
```

- (Optional) To quickly configure the ABR to restrict all summary advertisements and allow only internal routes and default route advertisements into the area, copy the following command and paste it into the CLI. You apply this configuration only on the ABR.

[edit]

```
set protocols ospf area 0.0.0.7 stub no-summaries
```

**Step-by-Step  
Procedure**

To configure OSPF stub areas:

1. On all routing devices in the area, configure an OSPF stub area.

**NOTE:** To specify an OSPFv3 stub area, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@host# set protocols ospf area 0.0.0.7 stub
```

2. On the ABR, inject a default route into the area.

```
[edit]
user@host# set protocols ospf area 0.0.0.7 stub default-metric 10
```

3. (Optional) On the ABR, restrict summary LSAs from entering the area. This step converts the stub area into a totally stubby area.

```
[edit]
user@host# set protocols ospf area 0.0.0.7 stub no-summaries
```

4. If you are done configuring the devices, commit the configuration.

```
[edit]
user@host# commit
```

**Results**

Confirm your configuration by entering the `show protocols ospf` command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

Configuration on all routing devices:

```
user@host# show protocols ospf
area 0.0.0.7 {
  stub;
}
```

Configuration on the ABR (the output also includes the optional setting):

```
user@host# show protocols ospf
area 0.0.0.7 {
  stub default-metric 10 no-summaries;
}
```

To confirm your OSPFv3 configuration, enter the `show protocols ospf3` command.

**Verification**

Confirm that the configuration is working properly.

- [Verifying the Interfaces in the Area on page 4064](#)
- [Verifying the Type of OSPF Area on page 4064](#)

### ***Verifying the Interfaces in the Area***

**Purpose** Verify that the interface for OSPF has been configured for the appropriate area. Confirm that the output includes Stub as the type of OSPF area.

**Action** From operational mode, enter the **show ospf interface detail** command for OSPFv2, and enter the **show ospf3 interface detail** command for OSPFv3.

### ***Verifying the Type of OSPF Area***

**Purpose** Verify that the OSPF area is a stub area. Confirm that the output displays Normal Stub as the Stub type.

**Action** From operational mode, enter the **show ospf overview** command for OSPFv2, and enter the **show ospf3 overview** command for OSPFv3.

---

### **Example: Configuring OSPF Not-So-Stubby Areas**

This example shows how to configure an OSPF not-so-stubby area (NSSA) to control the advertisement of external routes into an area.

- [Requirements on page 4064](#)
- [Overview on page 4064](#)
- [Configuration on page 4066](#)
- [Verification on page 4068](#)

#### ***Requirements***

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices* or the *Junos OS Interfaces Configuration Guide for Security Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4048.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4050
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4055.

#### ***Overview***

The backbone area, which is 0 in [Figure 118 on page 4066](#), has a special function and is always assigned the area ID 0.0.0.0. Area IDs are unique numeric identifiers, in dotted decimal notation. Area IDs need only be unique within an AS. All other networks or areas (such as 3, 7, and 9) in the AS must be directly connected to the backbone area by ABRs that have interfaces in more than one area.

An OSPF stub area has no external routes, so you cannot redistribute routes from another protocol into a stub area. OSPF NSSAs allow external routes to be flooded within the area.

In addition, you might have a situation when exporting Type 7 LSAs into the NSSA is unnecessary. When an AS boundary router is also an ABR with an NSSA attached, Type 7 LSAs are exported into the NSSA by default. If the ABR is attached to multiple NSSAs, a separate Type 7 LSA is exported into each NSSA by default. During route redistribution, this routing device generates both Type 5 LSAs and Type 7 LSAs. You can disable exporting Type 7 LSAs into the NSSA.

**NOTE:** The following restriction applies to NSSAs: You cannot configure an area as both a stub area and an NSSA.

You configure each routing device in area 9 (area ID 0.0.0.9) with the following setting:

- **nssa**—Specifies an OSPF NSSA. You must include the **nssa** statement on all routing devices in area 9 because this area only has external connections to static routes.

You also configure the ABR in area 9 with the following additional settings:

- **no-summaries**—Prevents the ABR from advertising summary routes into the NSSA. If configured in combination with the **default-metric** statement, the NSSA only allows routes internal to the area and advertises the default route into the area. External routes and destinations to other areas are no longer summarized or allowed into the NSSA. Only the ABR requires this additional configuration because it is the only routing device within the NSSA that creates Type 3 LSAs used to receive and send traffic from outside the area.
- **default-lsa**—Configures the ABR to generate a default route into the NSSA. In this example, you configure the following:
  - **default-metric**—Specifies that the ABR generate a default route with a specified metric into the NSSA. This default route enables packet forwarding from the NSSA to external destinations. You configure this option only on the ABR. The ABR does not automatically generate a default route when attached to an NSSA. You must explicitly configure this option for the ABR to generate a default route.
  - **metric-type**—(Optional) Specifies the external metric type for the default LSA, which can be either Type 1 or Type 2. When OSPF exports route information from external ASs, it includes a cost, or external metric, in the route. The difference between the two metrics is how OSPF calculates the cost of the route. Type 1 external metrics are equivalent to the link-state metric, where the cost is equal to the sum of the internal costs plus the external cost. Type 2 external metrics use only the external cost assigned by the AS boundary router. By default, OSPF uses the Type 2 external metric.
  - **type-7**—(Optional) Floods Type 7 default LSAs into the NSSA if the **no-summaries** statement is configured. By default, when the **no-summaries** statement is configured, a Type 3 LSA is injected into NSSAs for Junos OS release 5.0 and later. To support backward compatibility with earlier Junos OS releases, include the **type-7** statement.

The second example also shows the optional configuration required to disable exporting Type 7 LSAs into the NSSA by including the **no-nssa-abr** statement on the routing device that performs the functions of both an ABR and an AS boundary router.

Figure 118: OSPF Network Topology with Stub Areas and NSSAs

#### Configuration

- [Configuring Routing Devices to Participate in a Not-So-Stubby-Area on page 4066](#)
- [Disabling the Export of Type 7 Link State Advertisements into Not-So-Stubby Areas on page 4068](#)

#### Configuring Routing Devices to Participate in a Not-So-Stubby-Area

**CLI Quick Configuration** To quickly configure an OSPF NSSA, copy the following command and paste it into the CLI. You must configure all routing devices that are part of the NSSA.

```
[edit]
set protocols ospf area 0.0.0.9 nssa
```

To quickly configure an ABR that participates in an OSPF NSSA, copy the following commands and paste them into the CLI.

```
[edit]
set protocols ospf area 0.0.0.9 nssa default-lsa default-metric 10
set protocols ospf area 0.0.0.9 nssa default-lsa metric-type 1
set protocols ospf area 0.0.0.9 nssa default-lsa type-7
set protocols ospf area 0.0.0.9 nssa no-summaries
```

**Step-by-Step Procedure** To configure OSPF NSSAs:

1. On all routing devices in the area, configure an OSPF NSSA.

**NOTE:** To specify an OSPFv3 NSSA area, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# set protocols ospf area 0.0.0.9 nssa
```

2. On the ABR, enter OSPF configuration mode and specify the NSSA area 0.0.0.9 that you already created.

```
[edit ]
user@host# edit protocols ospf area 0.0.0.9 nssa
```

3. On the ABR, inject a default route into the area.

```
[edit protocols ospf area 0.0.0.9 nssa]
user@host# set default-lsa default-metric 10
```

4. (Optional) On the ABR, specify the external metric type for the default route.

```
[edit protocols ospf area 0.0.0.9 nssa]
user@host# set default-lsa metric-type 1
```

5. (Optional) On the ABR, specify the flooding of Type 7 LSAs.

```
[edit protocols ospf area 0.0.0.9 nssa]
user@host# set default-lsa type-7
```

6. On the ABR, restrict summary LSAs from entering the area.

```
[edit protocols ospf area 0.0.0.9 nssa]
user@host# set no-summaries
```

7. If you are done configuring the devices, commit the configuration.

```
[edit protocols ospf area 0.0.0.9 nssa]
user@host# commit
```

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

Configuration on all routing devices in the area:

```
user@host# show protocols ospf
area 0.0.0.9 {
  nssa;
}
```

Configuration on the ABR. The output also includes the optional **metric-type** and **type-7** statements.

```
user@host# show protocols ospf
area 0.0.0.9 {
  nssa {
    default-lsa {
      default-metric 10;
      metric-type 1;
      type-7;
    }
    no-summaries;
  }
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

#### *Disabling the Export of Type 7 Link State Advertisements into Not-So-Stubby Areas*

**CLI Quick Configuration** To quickly disable exporting Type 7 LSAs into the NSSA, copy the following command and paste it into the CLI. You configure this setting on an AS boundary router that is also an ABR with an NSSA area attached.

```
[edit]
set protocols ospf no-nssa-abr
```

**Step-by-Step Procedure** You can configure this setting if you have an AS boundary router that is also an ABR with an NSSA area attached.

1. Disable exporting Type 7 LSAs into the NSSA.

**NOTE:** To specify OSPFv3, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# set protocols ospf no-nssa-abr
```

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
no-nssa-abr;
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

#### *Verification*

Confirm that the configuration is working properly.

- [Verifying the Interfaces in the Area on page 4068](#)
- [Verifying the Type of OSPF Area on page 4069](#)
- [Verifying the Type of LSAs on page 4069](#)

#### *Verifying the Interfaces in the Area*

**Purpose** Verify that the interface for OSPF has been configured for the appropriate area. Confirm that the output includes Stub NSSA as the type of OSPF area.

**Action** From operational mode, enter the **show ospf interface detail** command for OSPFv2, and enter the **show ospf3 interface detail** command for OSPFv3.

**Verifying the Type of OSPF Area**

**Purpose** Verify that the OSPF area is a stub area. Confirm that the output displays Not so Stubby Stub as the Stub type.

**Action** From operational mode, enter the **show ospf overview** command for OSPFv2, and enter the **show ospf3 overview** command for OSPFv3.

**Verifying the Type of LSAs**

**Purpose** Verify the type of LSAs that are in the area. If you disabled exporting Type 7 LSAs into an NSSA, confirm that the Type field does not include NSSA as a type of LSA.

**Action** From operational mode, enter the **show ospf database** command for OSPFv2, and enter the **show ospf3 database** command for OSPFv3.

**Example: Configuring OSPF Multiarea Adjacency**

- [Multiarea Adjacency for OSPF on page 4069](#)
- [Example: Configuring Multiarea Adjacency for OSPF on page 4070](#)

**Multiarea Adjacency for OSPF**

An area is a set of networks and hosts within an autonomous system (AS) that have been administratively grouped together. By default, a single interface can belong to only one OSPF area. However, in some situations, you might want to configure an interface to belong to more than one area. Doing so allows the corresponding link to be considered an intra-area link in multiple areas and to be preferred over other higher-cost intra-area paths. For example, you can configure an interface to belong to multiple areas with a high-speed backbone link between two area border routers (ABRs) so you can create multiarea adjacencies that belong to different areas.

In Junos OS Release 9.2 and later, you can configure a logical interface to belong to more than one OSPFv2 area. Support for OSPFv3 was introduced in Junos OS Release 9.4. As defined in RFC 5185, *OSPF Multi-Area Adjacency*, the ABRs establish multiple adjacencies belonging to different areas over the same logical interface. Each multiarea adjacency is announced as a point-to-point unnumbered link in the configured area by the routers connected to the link. For each area, one of the logical interfaces is treated as primary, and the remaining interfaces that are configured for the area are designated as secondary.

Any logical interface not configured as a secondary interface for an area is treated as the primary interface for that area. A logical interface can be configured as primary interface only for one area. For any other area for which you configure the interface, you must configure it as a secondary interface.

### Example: Configuring Multiarea Adjacency for OSPF

---

This example shows how to configure multiarea adjacency for OSPF.

- [Requirements on page 4070](#)
- [Overview on page 4070](#)
- [Configuration on page 4071](#)
- [Verification on page 4073](#)

#### Requirements

Before you begin, plan your multiarea OSPF network. See [“Example: Configuring a Multiarea OSPF Network” on page 4055](#).

#### Overview

By default, a single interface can belong to only one OSPF area. You can configure a single interface to belong in multiple OSPF areas. Doing so allows the corresponding link to be considered an intra-area link in multiple areas and to be preferred over other higher-cost intra-area paths. When configuring a secondary interface, consider the following:

- For OSPFv2, you cannot configure point-to-multipoint and nonbroadcast multiaccess (NBMA) network interfaces as a secondary interface because secondary interfaces are treated as a point-to-point unnumbered link.
- Secondary interfaces are supported for LAN interfaces (the primary interface can be a LAN interface, but any secondary interfaces are treated as point-to-point unnumbered links over the LAN). In this scenario, you must ensure that there are only two routing devices on the LAN or that there are only two routing devices on the LAN that have secondary interfaces configured for a specific OSPF area.
- Since the purpose of a secondary interface is to advertise a topological path through an OSPF area, you cannot configure a secondary interface or a primary interface with one or more secondary interfaces to be passive. Passive interfaces advertise their address, but do not run the OSPF protocol (adjacencies are not formed and hello packets are not generated).
- Any logical interface not configured as a secondary interface for an area is treated as a primary interface for that area. A logical interface can be configured as the primary interface only for one area. For any other area for which you configure the interface, you must configure it as a secondary interface.
- You cannot configure the **secondary** statement with the **interface all** statement.
- You cannot configure a secondary interface by its IP address.

In this example, you configure an interface to be in two areas, creating a multiarea adjacency with a link between two ABRs: ABR R1 and ABR R2. On each ABR, area 0.0.0.1 contains the primary interface and is the primary link between the ABRs, and area 0.0.0.2 contains the secondary logical interface, which you configure by including the **secondary** statement. You configure interface **so-0/0/0** on ABR R1 and interface **so-1/0/0** on ABR R2.

**Configuration**

**CLI Quick Configuration** To quickly configure a secondary logical interface for an OSPF area, copy the following commands and paste them into the CLI.

Configuration on ABR R1:

```
[edit]
set interfaces so-0/0/0 unit 0 family inet address 192.168.8.45/30
set routing-options router-id 10.255.0.1
set protocols ospf area 0.0.0.1 interface so-0/0/0
set protocols ospf area 0.0.0.2 interface so-0/0/0 secondary
```

Configuration on ABR R2:

```
[edit]
set interfaces so-1/0/0 unit 0 family inet address 192.168.8.37/30
set routing-options router-id 10.255.0.2
set protocols ospf area 0.0.0.1 interface so-1/0/0
set protocols ospf area 0.0.0.2 interface so-1/0/0 secondary
```

**Step-by-Step Procedure** To configure a secondary logical interface:

1. Configure the device interfaces.

**NOTE:** For OSPFv3, on each interface specify the inet6 address family and include the IPv6 address.

```
[edit]
user@R1# set interfaces so-0/0/0 unit 0 family inet address 192.168.8.45/30
```

```
[edit]
user@R2# set interfaces so-1/0/0 unit 0 family inet address 192.168.8.37/30
```

2. Configure the router identifier.

```
[edit]
user@R1# set routing-options router-id 10.255.0.1
```

```
[edit]
user@R2# set routing-options router-id 10.255.0.2
```

3. On each ABR, configure the primary interface for the OSPF area.

**NOTE:** For OSPFv3, include the ospf3 statement at the [edit protocols] hierarchy level.

```
[edit]
user@R1# set protocols ospf 0.0.0.1 interface so-0/0/0
```

```
[edit ]
user@R2# set protocols ospf 0.0.0.2 interface so-1/0/0
```

4. On each ABR, configure the secondary interface for the OSPF area.

```
[edit ]
user@R1# set protocols ospf area 0.0.0.1 so-0/0/0 secondary
```

```
[edit ]
user@R2# set protocols ospf area 0.0.0.2 so-1/0/0 secondary
```

5. If you are done configuring the devices, commit the configuration.

```
[edit protocols ospf area 0.0.0.1 ]
user@host# commit
```

### Results

Confirm your configuration by entering the **show interfaces**, **show routing-options**, and the **show protocols ospf** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

Configuration on ABR R1:

```
user@R1# show interfaces
so-0/0/0 {
  unit 0 {
    family inet {
      address 192.168.8.45/30;
    }
  }
}

user@R1# show routing-options
router-id 10.255.0.1;

user@R1# show protocols ospf
area 0.0.0.1 {
  interface so-0/0/0.0;
}
area 0.0.0.2 {
  interface so-0/0/0.0 {
    secondary;
  }
}
```

Configuration on ABR R2:

```
user@R2# show interfaces
so-0/0/0 {
  unit 0 {
    family inet {
      address 192.168.8.37/30;
    }
  }
}

user@R2# show routing-options
router-id 10.255.0.2;

user@R2# show protocols ospf
area 0.0.0.1 {
```

```

    interface so-1/0/0.0;
  }
  area 0.0.0.2 {
    interface so-1/0/0.0 {
      secondary;
    }
  }
}

```

### **Verification**

Confirm that the configuration is working properly.

- [Verifying the Secondary Interface on page 4073](#)
- [Verifying the Interfaces in the Area on page 4073](#)
- [Verifying Neighbor Adjacencies on page 4073](#)

### **Verifying the Secondary Interface**

**Purpose** Verify that the secondary interface appears for the configured area. The Secondary field displays if the interface is configured as a secondary interface. The output might also show the same interface listed in multiple areas.

**Action** From operational mode, enter the **show ospf interface detail** command for OSPFv2, and enter the **show ospf3 interface detail** command for OSPFv3.

### **Verifying the Interfaces in the Area**

**Purpose** Verify the interfaces configured for the specified area.

**Action** From operational mode, enter the **show ospf interface area *area-id*** command for OSPFv2, and enter the **show ospf3 interface area *area-id*** command for OSPFv3..

### **Verifying Neighbor Adjacencies**

**Purpose** Verify the primary and secondary neighbor adjacencies. The Secondary field displays if the neighbor is on a secondary interface.

**Action** From operational mode, enter the **show ospf neighbor detail** command for OSPFv2, and enter the **show ospf3 neighbor detail** command for OSPFv3.

## OSPFv2 Compatibility with RFC 1583 Overview

---

In the first implementation of OSPF (RFC1583, *OSPF Version 2*), the summary route assumes the cost of the granular route with the lowest cost. OSPF RFC 2328, *OSPF Version 2* changes the behavior so that the summary route assumes the cost of the granular route with the highest cost. OSPF readvertises the summary route whenever the cost of the summary changes. When using the default RFC 1583 behavior, this happens when the granular route with the lowest metric is changed or lost. When RFC 2328 is used, this happens when the granular route with the highest cost is changed or lost.

By default, the Junos OS implementation of OSPF is compatible with RFC 1583. This means that Junos OS maintains a single best route to an autonomous system (AS) boundary router in the OSPF routing table, rather than multiple intra-AS paths, if they are available. You can disable compatibility with RFC 1583. It is preferable to do so when the same external destination is advertised by AS boundary routers that belong to different OSPF areas. When you disable compatibility with RFC 1583, the OSPF routing table maintains the multiple intra-AS paths that are available, which the router uses to calculate AS external routes as defined in RFC 2328. Being able to use multiple available paths to calculate an AS external route can prevent routing loops.

## Example: Disabling OSPFv2 Compatibility with RFC 1583

---

This example shows how to disable OSPFv2 compatibility with RFC 1583 on the routing device.

- [Requirements on page 4074](#)
- [Overview on page 4074](#)
- [Configuration on page 4074](#)
- [Verification on page 4075](#)

### Requirements

No special configuration beyond device initialization is required before disabling OSPFv2 compatibility with RFC 1583.

### Overview

The introduction of RFC 2328 changed the method used to calculate the routes in an OSPF network. By default, the Junos OS implementation of OSPFv2 is compatible with RFC 1583, so OSPF uses the minimum cost to determine the route to any of the networks within the specified range. When you disable RFC 1583 compatibility, OSPF uses the maximum cost to determine the route to any of the networks within the specified range. To minimize the potential for routing loops, configure the same RFC compatibility on all OSPF devices in an OSPF domain.

### Configuration

#### CLI Quick Configuration

To quickly disable OSPFv2 compatibility with RFC 1583, copy the following command and paste it into the CLI. You configure this setting on all devices that are part of the OSPF domain.

[edit]

```
set protocols ospf no-rfc-1583
```

**Step-by-Step Procedure** To disable OSPFv2 compatibility with RFC 1583:

1. Disable RFC 1583.  

```
[edit]  
user@host# set protocols ospf no-rfc-1583
```
2. If you are done configuring the device, commit the configuration.  

```
[edit]  
user@host# commit
```

**NOTE:** Repeat this configuration on each routing device that participates in an OSPF routing domain.

### Results

Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf  
no-rfc-1583;
```

### Verification

Confirm that the configuration is working properly.

#### Verifying the OSPF Routes

**Purpose** Verify that the OSPF routing table maintains the intra-AS paths with the largest metric, which the router uses to calculate AS external routes.

**Action** From operational mode, enter the **show ospf route detail** command.

---

### About OSPF Interfaces

To activate OSPF on a network, you must enable the OSPF protocol on one or more interfaces on each device within the network on which traffic is to travel. How you configure the interface depends on whether the interface is connected to a broadcast or point-to-point network, a point-to-multipoint network, a nonbroadcast multiaccess (NBMA) network, or across a demand circuit.

- A broadcast interface behaves as if the routing device is connected to a LAN.
- A point-to-point interface provides a connection between a single source and a single destination (there is only one OSPF adjacency).
- A point-to-multipoint interface provides a connection between a single source and multiple destinations.
- An NBMA interface behaves in a similar fashion to a point-to-multipoint interface, but you might configure an NBMA interface to interoperate with other equipment.
- A demand circuit is a connection on which you can limit traffic based on user agreements. The demand circuit can limit bandwidth or access time based on agreements between the provider and user.

You can also configure an OSPF interface to be passive, to operate in passive traffic engineering mode, or to be a peer interface.

- A passive interface advertises its address, but does not run the OSPF protocol (adjacencies are not formed and hello packets are not generated).
- An interface operating in OSPF passive traffic engineering mode floods link address information within the autonomous system (AS) and makes it available for traffic engineering calculations.
- A peer interface can be configured for OSPFv2 routing devices. A peer interface is required for Generalized MPLS (GMPLS) to transport traffic engineering information through a link separate from the control channel. You establish this separate link by configuring a peer interface. The peer interface name must match the Link Management Protocol (LMP) peer name. A peer interface is optional for a hierarchy of RSVP label-switched paths (LSPs). After you configure the forwarding adjacency, you can configure OSPFv2 to advertise the traffic engineering properties of a forwarding adjacency to a specific peer.

Point-to-point interfaces differ from multipoint in that only one OSPF adjacency is possible. (A LAN, for instance, can have multiple addresses and can run OSPF on each subnet simultaneously.) As such, when you configure a numbered point-to-point interface

to OSPF by name, multiple OSPF interfaces are created. One, which is unnumbered, is the interface on which the protocol is run. An additional OSPF interface is created for each address configured on the interface, if any, which is automatically marked as passive.

For OSPFv3, one OSPF-specific interface must be created per interface name configured under OSPFv3. OSPFv3 does not allow interfaces to be configured by IP address.

Enabling OSPF on an interface (by including the **interface** statement), disabling it (by including the **disable** statement), and not actually having OSPF run on an interface (by including the **passive** statement) are mutually exclusive states.

**NOTE:** When you configure OSPFv2 on an interface, you must also include the **family inet** statement at the [edit interfaces *interface-name* unit *logical-unit-number*] hierarchy level. When you configure OSPFv3 on an interface, you must also include the **family inet6** statement at the [edit interfaces *interface-name* unit *logical-unit-number*] hierarchy level. In Junos OS Release 9.2 and later, you can configure OSPFv3 to support address families other than unicast IPv6.

### Example: Configuring an Interface on a Broadcast or Point-to-Point Network

This example shows how to configure an OSPF interface on a broadcast or point-to-point network.

- [Requirements on page 4077](#)
- [Overview on page 4077](#)
- [Configuration on page 4078](#)
- [Verification on page 4079](#)

#### Requirements

Before you begin:

- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4048.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4050
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4055.

#### Overview

If the interface on which you are configuring OSPF supports broadcast mode (such as a LAN), or if the interface supports point-to-point mode (such as a PPP interface or a point-to-point logical interface on Frame Relay), you specify the interface by including the IP address or the interface name for OSPFv2, or only the interface name for OSPFv3. In Junos OS Release 9.3 and later, an OSPF point-to-point interface can be an Ethernet

interface without a subnet. If you configure an interface on a broadcast network, designated router and backup designated router election is performed.

**NOTE:**

- Using both the interface name and the IP address of the same interface produces an invalid configuration.
- Including the IP address of loopback0 interface unit may implicitly enable OSPF on unnumbered interfaces with “unnumbered-address lo0.0” configured.

In this example, you configure interface **ge-0/2/0** as an OSPFv2 interface in OSPF area 0.0.0.1.

**Configuration**

**CLI Quick Configuration**

To quickly configure an OSPF interface on a broadcast or point-to-point network, copy the following commands and paste them into the CLI.

```
[edit]
set interfaces ge-0/2/0 unit 0 family inet address 10.0.0.1
set protocols ospf area 0.0.0.1 interface ge-0/2/0
```

**Step-by-Step Procedure**

To configure an OSPF interface on a broadcast or point-to-point network:

1. Configure the interface.

**NOTE:** For an OSPFv3 interface, specify an IPv6 address.

```
[edit]
user@host# set interfaces ge-0/2/0 unit 0 family inet address 10.0.0.1
```

2. Create an OSPF area.

**NOTE:** For an OSPFv3 interface, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# edit protocols ospf area 0.0.0.1
```

3. Assign the interface to the area.

```
[edit protocols ospf area 0.0.0.1 ]
user@host# set interface ge-0/2/0
```

4. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf area 0.0.0.1 ]
user@host# commit
```

### Results

Confirm your configuration by entering the **show interfaces** and the **show protocols ospf** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
ge-0/2/0 {
  unit 0 {
    family inet {
      address 10.0.0.1/32;
    }
  }
}

user@host# show protocols ospf
area 0.0.0.1 {
  interface ge-0/2/0.0;
}
```

To confirm your OSPFv3 configuration, enter the **show interfaces** and the **show protocols ospf3** commands.

### Verification

Confirm that the configuration is working properly.

#### Verifying the OSPF Interface

|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b> | Verify the interface configuration. Depending on your deployment, the Type field might display LAN or P2P.                                                  |
| <b>Action</b>  | From operational mode, enter the <b>show ospf interface detail</b> command for OSPFv2, and enter the <b>show ospf3 interface detail</b> command for OSPFv3. |

### Example: Configuring an OSPFv2 Interface on a Nonbroadcast Multiaccess Network

This example shows how to configure an OSPFv2 interface on a nonbroadcast multiaccess (NBMA) network.

- [Requirements on page 4079](#)
- [Overview on page 4080](#)
- [Configuration on page 4081](#)
- [Verification on page 4082](#)

#### Requirements

Before you begin:

- Configure the router identifiers for the devices in your OSPF network. See [“Example: Configuring an OSPF Router Identifier” on page 4048](#).

- Control OSPF designated router election. See [“Example: Controlling OSPF Designated Router Election” on page 4050](#).
- Configure a multiarea OSPF network. See [“Example: Configuring a Multiarea OSPF Network” on page 4055](#).

### Overview

When you configure OSPFv2 on an NBMA network, you can use nonbroadcast mode rather than point-to-multipoint mode. Using this mode offers no advantages over point-to-multipoint mode, but it has more disadvantages than point-to-multipoint mode. Nevertheless, you might occasionally find it necessary to configure nonbroadcast mode to interoperate with other equipment. Because there is no autodiscovery mechanism, you must configure each neighbor.

Nonbroadcast mode treats the NBMA network as a partially connected LAN, electing designated and backup designated routers. All routing devices must have a direct connection to both the designated and backup designated routers, or unpredictable results occur.

When you configure the interface, specify either the IP address or the interface name. Using both the IP address and the interface name produces an invalid configuration. For nonbroadcast interfaces, specify the IP address of the nonbroadcast interface as the interface name.

In this example, you configure the Asynchronous Transfer Mode (ATM) interface **at-0/1/0** as an OSPFv2 interface in OSPF area 0.0.0.1, and you specify the following settings:

- **interface-type nbma**—Sets the interface to run in NBMA mode. You must explicitly configure the interface to run in NBMA mode.
- **neighbor address <eligible>**—Specifies the IP address of the neighboring device. OSPF routing devices normally discover their neighbors dynamically by listening to the broadcast or multicast hello packets on the network. Because an NBMA network does not support broadcast (or multicast), the device cannot discover its neighbors dynamically, so you must configure all the neighbors statically. To configure multiple neighbors, include multiple **neighbor** statements. If you want the neighbor to be a designated router, include the **eligible** keyword.
- **poll-interval**—Specifies the length of time, in seconds, before the routing device sends hello packets out of the interface before it establishes adjacency with a neighbor. Routing devices send hello packets for a longer interval on nonbroadcast networks to minimize the bandwidth required on slow WAN links. The range is from 1 through 255 seconds. By default, the device sends hello packets out the interface every 120 seconds before it establishes adjacency with a neighbor.

Once the routing device detects an active neighbor, the hello packet interval changes from the time specified in the **poll-interval** statement to the time specified in the **hello-interval** statement.

### Configuration

**CLI Quick Configuration** To quickly configure an OSPFv2 interface on an NBMA network, copy the following commands and paste them into the CLI.

```
[edit]
set interfaces at-0/1/0 unit 0 family inet address 192.0.2.1
set protocols ospf area 0.0.0.1 interface at-0/1/0.0 interface-type nbma
set protocols ospf area 0.0.0.1 interface at-0/1/0.0 neighbor 192.0.2.2 eligible
set protocols ospf area 0.0.0.1 interface at-0/1/0.0 poll-interval 130
```

**Step-by-Step Procedure** To configure an OSPFv2 interface on an NBMA network:

1. Configure the interface.  

```
[edit]
user@host# set interfaces at-0/1/0 unit 0 family inet address 192.0.2.1
```
2. Create an OSPF area.  

```
[edit]
user@host# edit protocols ospf area 0.0.0.1
```
3. Assign the interface to the area.  
 In this example, include the **eligible** keyword to allow the neighbor to be a designated router.  

```
[edit protocols ospf area 0.0.0.1 ]
user@host# set interface at-0/1/0 interface-type nbma neighbor 192.0.2.2 eligible
```
4. Configure the poll interval.  

```
[edit protocols ospf area 0.0.0.1 ]
user@host# set interface at-0/1/0 poll-interval 130
```
5. If you are done configuring the device, commit the configuration.  

```
[edit protocols ospf area 0.0.0.1 ]
user@host# commit
```

### Results

Confirm your configuration by entering the **show interfaces** and the **show protocols ospf** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
at-0/1/0 {
  unit 0 {
    family inet {
      address 192.0.2.1/32;
    }
  }
}

user@host# show protocols ospf
area 0.0.0.1 {
  interface at-0/1/0.0 {
```

```
    interface-type nbma;  
    neighbor 192.0.2.2 eligible;  
    poll-interval 130;  
  }  
}
```

### **Verification**

Confirm that the configuration is working properly.

### **Verifying the OSPF Interface**

**Purpose** Verify the interface configuration. Confirm that the Type field displays NBMA.

**Action** From operational mode, enter the **show ospf interface detail** command.

---

### **Example: Configuring an OSPFv2 Interface on a Point-to-Multipoint Network**

This example shows how to configure an OSPFv2 interface on a point-to-multipoint network.

- [Requirements on page 4082](#)
- [Overview on page 4082](#)
- [Configuration on page 4083](#)
- [Verification on page 4083](#)

### **Requirements**

Before you begin:

- Configure the router identifiers for the devices in your OSPF network. See [“Example: Configuring an OSPF Router Identifier” on page 4048](#).
- Control OSPF designated router election. See [“Example: Controlling OSPF Designated Router Election” on page 4050](#)
- Configure a multiarea OSPF network. See [“Example: Configuring a Multiarea OSPF Network” on page 4055](#).

### **Overview**

When you configure OSPFv2 on a nonbroadcast multiaccess (NBMA) network, such as a multipoint Asynchronous Transfer Mode (ATM) or Frame Relay, OSPFv2 operates by default in point-to-multipoint mode. In this mode, OSPFv2 treats the network as a set of point-to-point links. Because there is no autodiscovery mechanism, you must configure each neighbor.

When you configure the interface, specify either the IP address or the interface name. Using both the IP address and the interface name produces an invalid configuration.

In this example, you configure ATM interface **at-0/1/0** as an OSPFv2 interface in OSPF area 0.0.0.1, and you specify 192.0.2.1 as the neighbor's IP address.

**Configuration**

**CLI Quick Configuration** To quickly configure an OSPFv2 interface on a point-to-multipoint network, copy the following commands and paste them into the CLI.

```
[edit]
set interfaces at-0/1/0 unit 0 family inet address 192.0.2.2
set protocols ospf area 0.0.0.1 interface at-0/1/0 neighbor 192.0.2.1
```

**Step-by-Step Procedure** To configure an OSPFv2 interface on a point-to-multipoint network:

1. Configure the interface.

```
[edit]
user@host# set interfaces at-0/1/0 unit 0 family inet address 192.0.2.2
```

2. Create an OSPF area.

```
[edit]
user@host# edit protocols ospf area 0.0.0.1
```

3. Assign the interface to the area and specify the neighbor.

```
[edit protocols ospf area 0.0.0.1]
user@host# set interface at-0/1/0 neighbor 192.0.2.1
```

To configure multiple neighbors, include a **neighbor** statement for each neighbor.

4. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf area 0.0.0.1]
user@host# commit
```

**Results**

Confirm your configuration by entering the **show interfaces** and the **show protocols ospf** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
at-0/1/0 {
  unit 0 {
    family inet {
      address 192.0.2.2/32;
    }
  }
}

user@host# show protocols ospf
area 0.0.0.1 {
  interface at-0/1/0.0 {
    neighbor 192.0.2.1;
  }
}
```

**Verification**

Confirm that the configuration is working properly.

### ***Verifying the OSPF Interface***

**Purpose** Verify the interface configuration. Confirm that the Type field displays P2MP.

**Action** From operational mode, enter the **show ospf interface detail** command.

---

### **Example: Configuring OSPF Demand Circuits**

This example shows how to configure an OSPF demand circuit interface.

- [Requirements on page 4084](#)
- [Overview on page 4084](#)
- [Configuration on page 4085](#)
- [Verification on page 4086](#)

#### ***Requirements***

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.

**NOTE:** If you are using OSPF demand circuits over an ISDN link, you must configure an ISDN interface and enable dial-on-demand routing. See the *Junos OS Network Interfaces Library for Routing Devices*.

- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4048.
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4053.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4055.

#### ***Overview***

OSPF sends periodic hello packets to establish and maintain neighbor adjacencies and uses link-state advertisements (LSAs) to make routing calculations and decisions. OSPF support for demand circuits is defined in RFC 1793, *Extending OSPF to Support Demand Circuits*, and suppresses the periodic hello packets and LSAs. A demand circuit is a connection on which you can limit traffic based on user agreements. The demand circuit can limit bandwidth or access time based on agreements between the provider and user.

You configure demand circuits on an OSPF interface. When the interface becomes a demand circuit, all hello packets and LSAs are suppressed as soon as OSPF synchronization is achieved. LSAs have a DoNotAge bit that stops the LSA from aging and prevents periodic updates from being sent. Hello packets and LSAs are sent and received on a demand-circuit interface only when there is a change in the network topology. This reduces the amount of traffic through the OSPF interface.

Consider the following when configuring OSPF demand circuits:

- Periodic hellos are only suppressed on point-to-point and point-to-multipoint interfaces. If you configure demand circuits on an OSPF broadcast network or on an OSPF nonbroadcast multiaccess (NBMA) network, periodic hello packets are still sent.
- Demand circuit support on an OSPF point-to-multipoint interface resembles that for point-to-point interfaces. If you configure a point-to-multipoint interface as a demand circuit, the device negotiates hello suppression separately on each interface that is part of the point-to-multipoint network.

This example assumes that you have a point-to-point connection between two devices using SONET/SDH interfaces. A demand-circuit interface automatically negotiates the demand-circuit connection with its OSPF neighbor. If the neighbor does not support demand circuits, then no demand circuit connection is established.

In this example, you configure OSPF interface **so-0/1/0** in OSPF area 0.0.0.1 as a demand circuit.

### Configuration

#### CLI Quick Configuration

To quickly configure an OSPF demand circuit interface, copy the following command and paste it into the CLI. You must configure both neighboring interfaces for OSPF demand circuits for the connection to be established.

[edit]

```
set protocols ospf area 0.0.0.1 interface so-0/1/0 demand-circuit
```

#### Step-by-Step Procedure

To configure an OSPF demand circuit interface on one neighboring interface:

1. Create an OSPF area.

**NOTE:** For OSPFv3, include the `ospf3` statement at the [edit protocols] hierarchy level.

[edit]

```
user@host# edit protocols ospf area 0.0.0.1
```

2. Configure the neighboring interface as a demand circuit.

[edit protocols ospf area 0.0.0.1]

```
user@host# set interface so-0/1/0 demand-circuit
```

3. If you are done configuring the device, commit the configuration.

[edit protocols ospf area 0.0.0.1]

```
user@host# commit
```

**NOTE:** Repeat this entire configuration on the other neighboring interface.

### Results

Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols
ospf {
  area 0.0.0.1 {
    interface so-0/1/0.0 {
      demand-circuit;
    }
  }
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### Verification

Confirm that the configuration is working properly.

#### Verifying the Status of Neighboring Interfaces

- |                |                                                                                                                                                           |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b> | Verify information about the neighboring interface. When the neighbor is configured for demand circuits, a DC flag displays.                              |
| <b>Action</b>  | From operational mode, enter the <b>show ospf neighbor detail</b> command for OSPFv2, and enter the <b>show ospf3 neighbor detail</b> command for OSPFv3. |

---

### Example: Configuring a Passive OSPF Interface

This example shows how to configure a passive OSPF interface. A passive OSPF interface advertises its address but does not run the OSPF protocol.

- [Requirements on page 4086](#)
- [Overview on page 4087](#)
- [Configuration on page 4087](#)
- [Verification on page 4088](#)

#### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4048.
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4053.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4055.

### Overview

By default, OSPF must be configured on an interface for direct interface addresses to be advertised as interior routes. To advertise the direct interface addresses without actually running OSPF on that interface (adjacencies are not formed and hello packets are not generated), you configure that interface as a passive interface.

Enabling OSPF on an interface (by including the **interface** statement), disabling it (by including the **disable** statement), and not actually having OSPF run on an interface (by including the **passive** statement) are mutually exclusive states.

**NOTE:** If you do not want to see notifications for state changes in a passive OSPF interface, you can disable the OSPF traps for the interface by including the **no-interface-state-traps** statement. The **no-interface-state-traps** statement is supported only for OSPFv2.

In this example, you configure interface **ge-0/2/0** as a passive OSPF interface in area 0.0.0.1 by including the **passive** statement.

### Configuration

#### CLI Quick Configuration

To quickly configure a passive OSPF interface, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf area 0.0.0.1 interface ge-0/2/0 passive
```

#### Step-by-Step Procedure

To configure a passive OSPF interface:

1. Create an OSPF area.

**NOTE:** For an OSPFv3 interface, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# edit protocols ospf area 0.0.0.1
```

2. Configure the passive interface.

```
[edit protocols ospf area 0.0.0.1 ]
user@host# set interface ge-0/2/0 passive
```

3. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf area 0.0.0.1]
user@host# commit
```

### Results

Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
  area 0.0.0.1 {
    interface ge-0/2/0.0 {
      passive;
    }
  }
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### Verification

Confirm that the configuration is working properly.

#### Verifying the Status of OSPF Interfaces

**Purpose** Verify the status of the OSPF interface. If the interface is passive, the Adj count field is 0 because no adjacencies have been formed. Next to this field, you might also see the word Passive.

**Action** From operational mode, enter the **show ospf interface detail** command for OSPFv2, and enter the **show ospf3 interface detail** command for OSPFv3.

---

### Example: Configuring OSPFv2 Peer interfaces

This example shows how to configure an OSPFv2 peer interface.

- [Requirements on page 4088](#)
- [Overview on page 4089](#)
- [Configuration on page 4089](#)
- [Verification on page 4089](#)

#### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure the router identifiers for the devices in your OSPF network. See [“Example: Configuring an OSPF Router Identifier” on page 4048](#).
- Configure a single-area OSPF network. See [“Example: Configuring a Single-Area OSPF Network” on page 4053](#).

- Configure a multiarea OSPF network. See [“Example: Configuring a Multiarea OSPF Network” on page 4055](#).
- Configure Generalized MPLS per your network requirements. See *LMP Configuration Overview* in the *Junos OS MPLS Applications Library for Routing Devices*.

### Overview

You can configure an OSPFv2 peer interface for many reasons, including when you configure Generalized MPLS (GMPLS). This example configures a peer interface for GMPLS. GMPLS requires traffic engineering information to be transported through a link separate from the control channel. You establish this separate link by configuring a peer interface. The OSPFv2 peer interface name must match the Link Management Protocol (LMP) peer name. You configure GMPLS and the LMP settings separately from OSPF.

This example assumes that GMPLS and the LMP peer named **oxc1** are already configured, and you need to configure the OSPFv2 peer interface in area 0.0.0.0.

### Configuration

**CLI Quick Configuration** To quickly configure an OSPFv2 peer interface, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf area 0.0.0.0 peer-interface oxc1
```

**Step-by-Step Procedure** To configure a peer OSPFv2 interface used by the LMP:

1. Create an OSPF area.  

```
[edit]
user@host# edit protocols ospf area 0.0.0.0
```
2. Configure the peer interface.  

```
[edit protocols ospf area 0.0.0.0]
user@host# set peer-interface oxc1
```
3. If you are done configuring the device, commit the configuration.  

```
[edit protocols ospf area 0.0.0.0]
user@host# commit
```

### Results

Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
  area 0.0.0.0 {
    peer-interface oxc1;
  }
```

### Verification

Confirm that the configuration is working properly.

### ***Verifying the Configured OSPFv2 Peer***

**Purpose** Verify the status of the OSPFv2 peer. When an OSPFv2 peer is configured for GMPLS, the Peer Name field displays the name of the LMP peer that you created for GMPLS, which is also the configured OSPFv2 peer.

**Action** From operational mode, enter the **show link-management** command.

## **Example: Configuring Multiple Address Families for OSPFv3**

- [Understanding Multiple Address Families for OSPFv3 on page 4090](#)
- [Example: Configuring Multiple Address Families for OSPFv3 on page 4091](#)

### **Understanding Multiple Address Families for OSPFv3**

---

By default, OSPFv3 supports only unicast IPv6 routes. In Junos OS Release 9.2 and later, you can configure OSPFv3 to support multiple address families, including IPv4 unicast, IPv4 multicast, and IPv6 multicast. This multiple address family support allows OSPFv3 to support both IPv6 and IPv4 nodes. Junos OS maps each address family to a separate realm as defined in Internet draft draft-ietf-ospf-af-alt-06.txt, *Support for Address Families in OSPFv3*. Each realm maintains a separate set of neighbors and link-state database.

When you configure multiple address families for OSPFv3, there is a new instance ID field that allows multiple OSPFv3 protocol instances per link. This allows a single link to belong to multiple areas.

You configure each realm independently. We recommend that you configure an area and at least one interface for each realm.

These are the default import and export routing tables for each of the four address families:

- IPv6 unicast: **inet6.0**
- IPv6 multicast: **inet6.2**
- IPv4 unicast: **inet.0**
- IPv4 multicast: **inet.2**

With the exception of virtual links, all configurations supported for the default IPv6 unicast family are supported for the address families that have to be configured as realms.

### Example: Configuring Multiple Address Families for OSPFv3

This example shows how to configure multiple address families for OSPFv3.

- [Requirements on page 4091](#)
- [Overview on page 4091](#)
- [Configuration on page 4092](#)
- [Verification on page 4093](#)

#### Requirements

Before you begin:

- Configure the router identifiers for the devices in your OSPF network. See [“Example: Configuring an OSPF Router Identifier” on page 4048](#).
- Configure a single-area OSPF network. See [“Example: Configuring a Single-Area OSPF Network” on page 4053](#).
- Configure a multiarea OSPF network. See [“Example: Configuring a Multiarea OSPF Network” on page 4055](#).

#### Overview

By default, OSPFv3 supports unicast IPv6 routes, but you can configure OSPFv3 to support multiple address families. To support an address family other than unicast IPv6, you configure a realm that allows OSPFv3 to advertise IPv4 unicast, IPv4 multicast, or IPv6 multicast routes. Junos OS then maps each address family that you configure to a separate realm with its own set of neighbors and link-state database.

**NOTE:** By default, LDP synchronization is only supported for OSPFv2. If you configure an IPv4 unicast or IPv4 multicast realm, you can also configure LDP synchronization. Since LDP synchronization is only supported for IPv4, this support is only available for OSPFv3 if you configure an IPv4 realm.

When configuring OSPFv3 to support multiple address families, consider the following:

- You configure each realm independently. We recommend that you configure an area and at least one interface for each realm.
- OSPFv3 uses IPv6 link-local addresses as the source of hello packets and next hop calculations. As such, you must enable IPv6 on the link regardless of the additional realm you configure.

[Figure 119 on page 4092](#) shows a connection between Routers R0 and R1. In this example, you configure interface **fe-0/1/0** on Router R0 in area 0 to advertise IPv4 unicast routes, in addition to the default unicast IPv6 routes in area 1, by including the **realm ipv4-unicast** statement. Depending on your network requirements, you can also advertise IPv4 multicast routes by including the **realm-ipv4-multicast** statement, and you can advertise IPv6 multicast routes by including the **realm-ipv6-multicast** statement.

Figure 119: IPv4 Unicast Realm

**Configuration****CLI Quick Configuration**

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Modifying the Junos OS Configuration* in *CLI User Guide*.

To quickly configure multiple address families for OSPFv3, copy the following commands and paste them into the CLI.

```
[edit]
set interfaces fe-0/1/0 unit 0 family inet address 11.1.2.1/24
set interfaces fe-0/1/0 unit 0 family inet6
set protocols ospf3 area 0.0.0.0 interface fe-0/1/0
set protocols ospf3 realm ipv4-unicast area 0.0.0.0 interface fe-0/1/0
```

**Step-by-Step Procedure**

To configure multiple address families for OSPFv3:

1. Configure the device interface participating in OSPFv3.
 

```
[edit]
user@host# set interfaces fe-0/1/0 unit 0 family inet address 11.1.2.1/24
user@host# set interfaces fe-0/1/0 unit 0 family inet6
```
2. Enter OSPFv3 configuration mode.
 

```
[edit ]
user@host# edit protocols ospf3
```
3. Add the interface you configured to the OSPFv3 area.
 

```
[edit protocols ospf3 ]
user@host# set area 0.0.0.0 interface fe-0/1/0
```
4. Configure an IPv4 unicast realm. This allows OSPFv3 to support both IPv4 unicast and IPv6 unicast routes.
 

```
[edit protocols ospf3 ]
user@host# set realm ipv4-unicast area 0.0.0.0 interface fe-0/1/0
```

- If you are done configuring the device, commit the configuration.

```
[edit protocols ospf3 ]
user@host# commit
```

**NOTE:** Repeat this entire configuration on the neighboring device that is part of the realm.

### Results

Confirm your configuration by entering the **show interfaces** and the **show protocols ospf** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
fe-0/1/0 {
  unit 0 {
    family inet {
      address 11.1.2.1/24;
    }
    family inet6;
  }
}

user@host# show protocols ospf3
realm ipv4-unicast {
  area 0.0.0.0 {
    interface fe-0/1/0.0;
  }
}
area 0.0.0.0 {
  interface fe-0/1/0.0;
}
```

### Verification

Confirm that the configuration is working properly.

- [Verifying the Link-State Database on page 4093](#)
- [Verifying the Status of OSPFv3 Interfaces with Multiple Address Families on page 4093](#)

#### Verifying the Link-State Database

**Purpose** Verify the status of the link-state database for the configured realm, or address family.

**Action** From operational mode, enter the **show ospf3 database realm ipv4-unicast** command.

#### Verifying the Status of OSPFv3 Interfaces with Multiple Address Families

**Purpose** Verify the status of the interface for the specified OSPFv3 realm, or address family.

**Action** From operational mode, enter the **show ospf3 interface realm ipv4-unicast** command.

## OSPF Route Control Configuration

---

- [Examples: Configuring OSPF Route Summarization on page 4094](#)
- [Examples: Configuring OSPF Traffic Control on page 4103](#)
- [Example: Configuring OSPF Overload Mode on page 4113](#)

### Examples: Configuring OSPF Route Summarization

- [Understanding OSPF Route Summarization on page 4094](#)
- [Example: Summarizing Ranges of Routes in OSPF Link-State Advertisements on page 4094](#)
- [Example: Limiting the Number of Prefixes Exported to OSPF on page 4100](#)
- [Configuring OSPF Refresh and Flooding Reduction in Stable Topologies on page 4102](#)

#### Understanding OSPF Route Summarization

---

Area border routers (ABRs) send summary link advertisements to describe the routes to other areas. Depending on the number of destinations, an area can get flooded with a large number of link-state records, which can utilize routing device resources. To minimize the number of advertisements that are flooded into an area, you can configure the ABR to coalesce, or summarize, a range of IP addresses and send reachability information about these addresses in a single link-state advertisement (LSA). You can summarize one or more ranges of IP addresses, where all routes that match the specified area range are filtered at the area boundary, and the summary is advertised in their place.

For an OSPF area, you can summarize and filter intra-area prefixes. All routes that match the specified area range are filtered at the area boundary, and the summary is advertised in their place. For an OSPF not-so-stubby area (NSSA), you can only coalesce or filter NSSA external (Type 7) LSAs before they are translated into AS external (Type 5) LSAs and enter the backbone area. All external routes learned within the area that do not fall into the range of one of the prefixes are advertised individually to other areas.

In addition, you can also limit the number of prefixes (routes) that are exported into OSPF. By setting a user-defined maximum number of prefixes, you prevent the routing device from flooding an excessive number of routes into an area.

#### Example: Summarizing Ranges of Routes in OSPF Link-State Advertisements

---

This example shows how to summarize routes sent into the backbone area.

- [Requirements on page 4095](#)
- [Overview on page 4095](#)
- [Configuration on page 4096](#)
- [Verification on page 4099](#)

## Requirements

Before you begin:

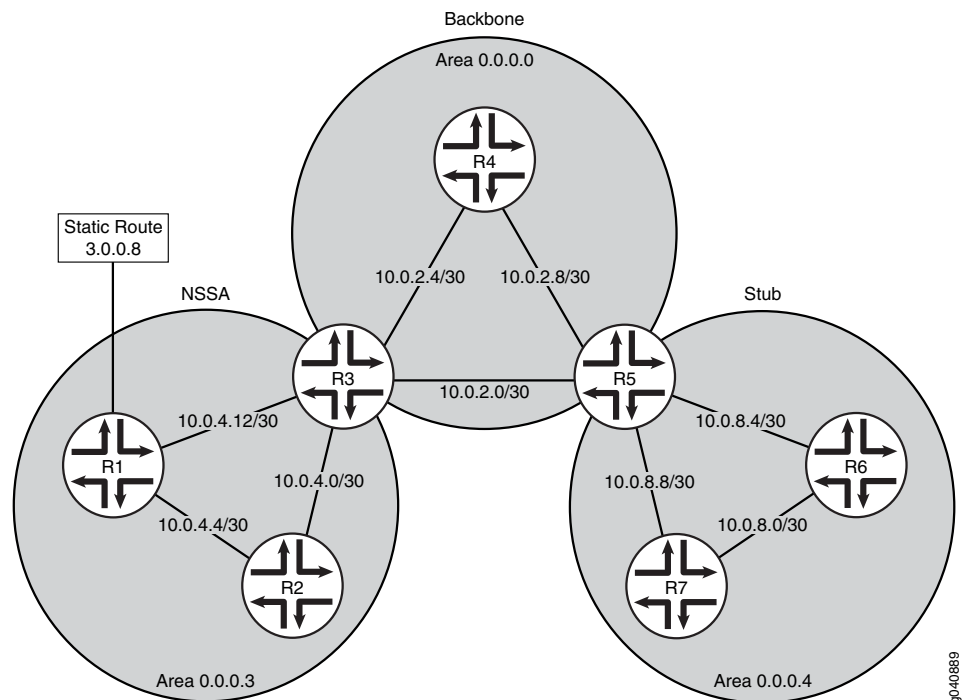

- Configure the router identifiers for the devices in your OSPF network. See [“Example: Configuring an OSPF Router Identifier” on page 4048](#).
- Control OSPF designated router election. See [“Example: Controlling OSPF Designated Router Election” on page 4050](#)
- Configure a static route. See *Examples: Configuring Static Routes* in the *Junos OS Routing Protocols Library for Routing Devices*.

## Overview

You can summarize a range of IP addresses to minimize the size of the backbone router's link-state database. All routes that match the specified area range are filtered at the area boundary, and the summary is advertised in their place.

[Figure 120 on page 4095](#) shows the topology used in this example. R5 is the ABR between area 0.0.0.4 and the backbone. The networks in area 0.0.0.4 are 10.0.8.4/30, 10.0.8.0/30, and 10.0.8.8/30, which can be summarized as 10.0.8.0/28. R3 is the ABR between NSSA area 0.0.0.3 and the backbone. The networks in area 0.0.0.3 are 10.0.4.4/30, 10.0.4.0/30, and 10.0.4.12/30, which can be summarized as 10.0.4.0/28. Area 0.0.0.3 also contains external static route 3.0.0.8 that you will prevent from flooding throughout the network.

**Figure 120: Summarizing Ranges of Routes in OSPF**

In this example, you configure the ABRs for route summarization by including the following settings:

- **area-range**—For an area, summarizes a range of IP addresses when sending summary intra-area link advertisements. For an NSSA, summarizes a range of IP addresses when sending NSSA link-state advertisements (Type 7 LSAs). The specified prefixes are used to aggregate external routes learned within the area when the routes are advertised to other areas.
- **network/mask-length**—Indicates the summarized IP address range and the number of significant bits in the network mask.
- **restrict**—On the NSSA ABR, prevents the configured summary from being advertised. In this example, we do not want to flood the external route outside of area 0.0.0.3.

### Configuration

#### CLI Quick Configuration

- To quickly configure route summarization for an OSPF area, copy the following commands and paste them into the CLI. The following is the configuration on ABR R5:

```
[edit]
set interfaces fe-0/0/1 unit 0 family inet address 10.0.8.3
set interfaces fe-0/0/2 unit 0 family inet address 10.0.8.4
set interfaces fe-0/0/0 unit 0 family inet address 10.0.2.3
set interfaces fe-0/0/4 unit 0 family inet address 10.0.2.5
set protocols ospf area 0.0.0.4 stub
set protocols ospf area 0.0.0.4 interface fe-0/0/1
set protocols ospf area 0.0.0.4 interface fe-0/0/2
set protocols ospf area 0.0.0.0 interface fe-0/0/0
set protocols ospf area 0.0.0.0 interface fe-0/0/4
set protocols ospf area 0.0.0.4 area-range 10.0.8.0/28
```

- To quickly configure route summarization for an OSPF NSSA, copy the following commands and paste them into the CLI. The following is the configuration on ABR R3:

```
[edit]
set interfaces fe-0/0/1 unit 0 family inet address 10.0.4.10
set interfaces fe-0/0/2 unit 0 family inet address 10.0.4.1
set interfaces fe-0/0/0 unit 0 family inet address 10.0.2.1
set interfaces fe-0/0/4 unit 0 family inet address 10.0.2.7
set protocols ospf area 0.0.0.3 interface fe-0/0/1
set protocols ospf area 0.0.0.3 interface fe-0/0/2
set protocols ospf area 0.0.0.0 interface fe-0/0/0
set protocols ospf area 0.0.0.0 interface fe-0/0/4
set protocols ospf area 0.0.0.3 area-range 10.0.4.0/28
set protocols ospf area 0.0.0.3 nssa
set protocols ospf area 0.0.0.3 nssa area-range 3.0.0.0/8 restrict
```

#### Step-by-Step Procedure

To summarize routes sent to the backbone area:

1. Configure the interfaces.

**NOTE:** For OSPFv3, include IPv6 addresses.

```
[edit]
user@R5# set interfaces fe-0/0/1 unit 0 family inet address 10.0.8.3
user@R5# set interfaces fe-0/0/2 unit 0 family inet address 10.0.8.4
user@R5# set interfaces fe-0/0/0 unit 0 family inet address 10.0.2.3
user@R5# set interfaces fe-0/0/4 unit 0 family inet address 10.0.2.5

[edit]
user@R3# set interfaces fe-0/0/1 unit 0 family inet address 10.0.4.10
user@R3# set interfaces fe-0/0/2 unit 0 family inet address 10.0.4.1
user@R3# set interfaces fe-0/0/0 unit 0 family inet address 10.0.2.1
user@R3# set interfaces fe-0/0/4 unit 0 family inet address 10.0.2.7
```

2. Configure the type of OSPF area.

**NOTE:** For OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@R5# set protocols ospf area 0.0.0.4 stub

[edit]
user@R3# set protocols ospf area 0.0.0.3 nssa
```

3. Assign the interfaces to the OSPF areas.

```
user@R5# set protocols ospf area 0.0.0.4 interface fe-0/0/1
user@R5# set protocols ospf area 0.0.0.4 interface fe-0/0/2
user@R5# set protocols ospf area 0.0.0.0 interface fe-0/0/0
user@R5# set protocols ospf area 0.0.0.0 interface fe-0/0/4

user@R3# set protocols ospf area 0.0.0.3 interface fe-0/0/1
user@R3# set protocols ospf area 0.0.0.3 interface fe-0/0/2
user@R3# set protocols ospf area 0.0.0.0 interface fe-0/0/0
user@R3# set protocols ospf area 0.0.0.0 interface fe-0/0/4
```

4. Summarize the routes that are flooded into the backbone.

```
[edit]
user@R5# set protocols ospf area 0.0.0.4 area-range 10.0.8.0/28

[edit]
user@R3# set protocols ospf area 0.0.0.3 area-range 10.0.4.0/28
```

5. On ABR R3, restrict the external static route from leaving area 0.0.0.3.

```
[edit]
user@R3# set protocols ospf area 0.0.0.3 nssa area-range 3.0.0.0/8 restrict
```

6. If you are done configuring the devices, commit the configuration.

```
[edit]
user@host# commit
```

### Results

Confirm your configuration by entering the `show interfaces` and the `show protocols ospf` commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

Configuration on ABR R5:

```
user@R5# show interfaces
fe-0/0/0 {
  unit 0 {
    family inet {
      address 10.0.2.3/32;
    }
  }
}
fe-0/0/1 {
  unit 0 {
    family inet {
      address 10.0.8.3/32;
    }
  }
}
fe-0/0/2 {
  unit 0 {
    family inet {
      address 10.0.8.4/32;
    }
  }
}
fe-0/0/4 {
  unit 0 {
    family inet {
      address 10.0.2.5/32;
    }
  }
}

user@R5# show protocols ospf
area 0.0.0.0 {
  interface fe-0/0/0.0;
  interface fe-0/0/4.0;
}
area 0.0.0.4 {
  stub;
  area-range 10.0.8.0/28;
  interface fe-0/0/1.0;
  interface fe-0/0/2.0;
}
```

Configuration on ABR R3:

```
user@R3# show interfaces
fe-0/0/0 {
  unit 0 {
    family inet {
      address 10.0.2.1/32;
    }
  }
}
fe-0/0/1 {
  unit 0 {
    family inet {
```

```

        address 10.0.4.10/32;

        }
    }
}

user@R3t# show protocols ospf
area 0.0.0.0 {
    interface fe-0/0/0.0;
    interface fe-0/0/4.0;
}
area 0.0.0.3 {
    nssa {
        area-range 3.0.0.0/8 restrict;
    }
    area-range 10.0.4.0/28;
    interface fe-0/0/1.0;
    interface fe-0/0/2.0;
}

```

To confirm your OSPFv3 configuration, enter the **show interfaces** and **show protocols ospf3** commands.

### **Verification**

Confirm that the configuration is working properly.

### **Verifying the Summarized Route**

**Purpose** Verify that the routes you configured for route summarization are being aggregated by the ABRs before the routes enter the backbone area. Confirm route summarization by checking the entries of the OSPF link-state database for the routing devices in the backbone.

**Action** From operational mode, enter the **show ospf database** command for OSPFv2, and enter the **show ospf3 database** command for OSPFv3.

### Example: Limiting the Number of Prefixes Exported to OSPF

---

This example shows how to limit the number of prefixes exported to OSPF.

- [Requirements on page 4100](#)
- [Overview on page 4100](#)
- [Configuration on page 4100](#)
- [Verification on page 4101](#)

#### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4048.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4050
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4053.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4055.

#### Overview

By default, there is no limit to the number of prefixes (routes) that can be exported into OSPF. By allowing any number of routes to be exported into OSPF, the routing device can become overwhelmed and potentially flood an excessive number of routes into an area.

You can limit the number of routes exported into OSPF to minimize the load on the routing device and prevent this potential problem. If the routing device exceeds the configured prefix export value, the routing device purges the external prefixes and enters into an overload state. This state ensures that the routing device is not overwhelmed as it attempts to process routing information. The prefix export limit number can be a value from 0 through 4,294,967,295.

In this example, you configure a prefix export limit of 100,000 by including the **prefix-export-limit** statement.

#### Configuration

##### CLI Quick Configuration

To quickly limit the number of prefixes exported to OSPF, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf prefix-export-limit 100000
```

**Step-by-Step Procedure** To limit the number of prefixes exported to OSPF:

1. Configure the prefix export limit value.

**NOTE:** For OSPFv3, include the `ospf3` statement at the [edit protocols] hierarchy level.

```
[edit]
user@host# set protocols ospf prefix-export-limit 100000
```

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

### Results

Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
prefix-export-limit 100000;
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### Verification

Confirm that the configuration is working properly.

#### Verifying the Prefix Export Limit

**Purpose** Verify the prefix export counter that displays the number of routes exported into OSPF.

**Action** From operational mode, enter the **show ospf overview** command for OSPFv2, and enter the **show ospf3 overview** command for OSPFv3.

### Configuring OSPF Refresh and Flooding Reduction in Stable Topologies

---

The OSPF standard requires that every link-state advertisement (LSA) be refreshed every 30 minutes. The Juniper Networks implementation refreshes LSAs every 50 minutes. By default, any LSA that is not refreshed expires after 60 minutes. This requirement can result in traffic overhead that makes it difficult to scale OSPF networks. You can override the default behavior by specifying that the DoNotAge bit be set in self-originated LSAs when they are initially sent by the router or switch. Any LSA with the DoNotAge bit set is reflooded only when a change occurs in the LSA. This feature thus reduces protocol traffic overhead while permitting any changed LSAs to be flooded immediately. Routers or switches enabled for flood reduction continue to send hello packets to their neighbors and to age self-originated LSAs in their databases.

The Juniper implementation of OSPF refresh and flooding reduction is based on RFC 4136, *OSPF Refresh and Flooding Reduction in Stable Topologies*. However, the Juniper implementation does not include the forced-flooding interval defined in the RFC. Not implementing the forced-flooding interval ensures that LSAs with the DoNotAge bit set are reflooded only when a change occurs.

This feature is supported for the following:

- OSPFv2 and OSPFv3 interfaces
- OSPFv3 realms
- OSPFv2 and OSPFv3 virtual links
- OSPFv2 sham links
- OSPFv2 peer interfaces
- All routing instances supported by OSPF
- Logical systems

To configure flooding reduction for an OSPF interface, include the **flood-reduction** statement at the `[edit protocols (ospf | ospf3) area area-id interface interface-id]` hierarchy level.

**NOTE:** If you configure flooding reduction for an interface configured as a demand circuit, the LSAs are not initially flooded, but sent only when their content has changed. Hello packets and LSAs are sent and received on a demand-circuit interface only when a change occurs in the network topology.

---

In the following example, the OSPF interface **so-0/0/1.0** is configured for flooding reduction. As a result, all the LSAs generated by the routes that traverse the specified interface have the DoNotAge bit set when they are initially flooded, and LSAs are refreshed only when a change occurs.

```
[edit]
protocols ospf {
  area 0.0.0.0 {
```

```

interface so-0/0/1.0 {
    flood-reduction;
}
interface lo0.0;
interface so-0/0/0.0;
}

```

**NOTE:** Beginning with Junos OS Release 12.2, you can configure a global default link-state advertisement (LSA) flooding interval in OSPF for self-generated LSAs by including the `lsa-refresh-interval minutes` statement at the `[edit protocols (ospf | ospf3)]` hierarchy level. The Juniper Networks implementation refreshes LSAs every 50 minutes. The range is 25 through 50 minutes. By default, any LSA that is not refreshed expires after 60 minutes.

If you have both the global LSA refresh interval configured for OSPF and OSPF flooding reduction configured for a specific interface in an OSPF area, the OSPF flood reduction configuration takes precedence for that specific interface.

## Examples: Configuring OSPF Traffic Control

- [Understanding OSPF Traffic Control on page 4103](#)
- [Example: Controlling the Cost of Individual OSPF Network Segments on page 4105](#)
- [Example: Dynamically Adjusting OSPF Interface Metrics Based on Bandwidth on page 4109](#)
- [Example: Controlling OSPF Route Preferences on page 4111](#)

### Understanding OSPF Traffic Control

Once a topology is shared across the network, OSPF uses the topology to route packets between network nodes. Each path between neighbors is assigned a cost based on the throughput, round-trip time, and reliability of the link. The sum of the costs across a particular path between hosts determines the overall cost of the path. Packets are then routed along the shortest path using the shortest-path-first (SPF) algorithm. Routes with lower total path metrics are preferred over those with higher path metrics.

You can use the following methods to control OSPF traffic:

- Control the cost of individual OSPF network segments
- Dynamically adjust OSPF interface metrics based on bandwidth
- Control OSPF route selection

### ***Controlling the Cost of Individual OSPF Network Segments***

OSPF uses the following formula to determine the cost of a route:

$\text{cost} = \text{reference-bandwidth} / \text{interface bandwidth}$

You can modify the reference-bandwidth value, which is used to calculate the default interface cost. The interface bandwidth value is not user-configurable and refers to the actual bandwidth of the physical interface.

By default, OSPF assigns a default cost metric of 1 to any link faster than 100 Mbps, and a default cost metric of 0 to the loopback interface (**lo0**). No bandwidth is associated with the loopback interface.

To control the flow of packets across the network, OSPF allows you to manually assign a cost (or metric) to a particular path segment. When you specify a metric for a specific OSPF interface, that value is used to determine the cost of routes advertised from that interface. For example, if all routers in the OSPF network use default metric values, and you increase the metric on one interface to 5, all paths through that interface have a calculated metric higher than the default and are not preferred.

**NOTE:** Any value you configure for the metric overrides the default behavior of using the reference-bandwidth value to calculate the route cost for that interface.

When there are multiple equal-cost routes to the same destination in a routing table, an equal-cost multipath (ECMP) set is formed. If there is an ECMP set for the active route, the Junos OS software uses a hash algorithm to choose one of the next-hop addresses in the ECMP set to install in the forwarding table.

You can configure Junos OS so that multiple next-hop entries in an ECMP set are installed in the forwarding table. Define a load-balancing routing policy by including one or more **policy-statement** configuration statements at the **[edit policy-options]** hierarchy level, with the action **load-balance per-packet**. Then apply the routing policy to routes exported from the routing table to the forwarding table.

#### ***Dynamically Adjusting OSPF Interface Metrics Based on Bandwidth***

You can specify a set of bandwidth threshold values and associated metric values for an OSPF interface or for a topology on an OSPF interface. When the bandwidth of an interface changes, the Junos OS automatically sets the interface metric to the value associated with the appropriate bandwidth threshold value. Junos OS uses the smallest configured bandwidth threshold value that is equal to or greater than the actual interface bandwidth to determine the metric value. If the interface bandwidth is greater than any of the configured bandwidth threshold values, the metric value configured for the interface is used instead of any of the bandwidth-based metric values configured. The ability to recalculate the metric for an interface when its bandwidth changes is especially useful for aggregate interfaces.

**NOTE:** You must also configure a metric for the interface when you enable bandwidth-based metrics.

### Controlling OSPF Route Preferences

You can control the flow of packets through the network using route preferences. Route preferences are used to select which route is installed in the forwarding table when several protocols calculate routes to the same destination. The route with the lowest preference value is selected.

By default, internal OSPF routes have a preference value of 10, and external OSPF routes have a preference value of 150. Although the default settings are appropriate for most environments, you might want to modify the default settings if all of the routing devices in your OSPF network use the default preference values, or if you are planning to migrate from OSPF to a different interior gateway protocol (IGP). If all of the devices use the default route preference values, you can change the route preferences to ensure that the path through a particular device is selected for the forwarding table any time multiple equal-cost paths to a destination exist. When migrating from OSPF to a different IGP, modifying the route preferences allows you to perform the migration in a controlled manner.

### Example: Controlling the Cost of Individual OSPF Network Segments

This example shows how to control the cost of individual OSPF network segments.

- [Requirements on page 4105](#)
- [Overview on page 4105](#)
- [Configuration on page 4106](#)
- [Verification on page 4108](#)

#### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices* or the *Junos OS Interfaces Configuration Guide for Security Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4048.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4050.
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4053.

#### Overview

All OSPF interfaces have a cost, which is a routing metric that is used in the link-state calculation. Routes with lower total path metrics are preferred to those with higher path metrics. In this example, we explore how to control the cost of OSPF network segments.

By default, OSPF assigns a default cost metric of 1 to any link faster than 100 Mbps, and a default cost metric of 0 to the loopback interface (**lo0**). No bandwidth is associated with the loopback interface. This means that all interfaces faster than 100 Mbps have the same default cost metric of 1. If multiple equal-cost paths exist between a source

and destination address, OSPF routes packets along each path alternately, in round-robin fashion.

Having the same default metric might not be a problem if all of the interfaces are running at the same speed. If the interfaces operate at different speeds, you might notice that traffic is not routed over the fastest interface because OSPF equally routes packets across the different interfaces. For example, if your routing device has Fast Ethernet and Gigabit Ethernet interfaces running OSPF, each of these interfaces have a default cost metric of 1.

In the first example, you set the reference bandwidth to 10g (10 Gbps, as denoted by 10,000,000,000 bits) by including the **reference-bandwidth** statement. With this configuration, OSPF assigns the Fast Ethernet interface a default metric of 100, and the Gigabit Ethernet interface a metric of 10. Since the Gigabit Ethernet interface has the lowest metric, OSPF selects it when routing packets. The range is 9600 through 1,000,000,000,000 bits.

Figure 121 on page 4106 shows three routing devices in area 0.0.0.0 and assumes that the link between Device R2 and Device R3 is congested with other traffic. You can also control the flow of packets across the network by manually assigning a metric to a particular path segment. Any value you configure for the metric overrides the default behavior of using the reference-bandwidth value to calculate the route cost for that interface. To prevent the traffic from Device R3 going directly to Device R2, you adjust the metric on the interface on Device R3 that connects with Device R1 so that all traffic goes through Device R1.

In the second example, you set the metric to 5 on interface **fe-1/0/1** on Device R3 that connects with Device R1 by including the **metric** statement. The range is 1 through 65,535.

**Figure 121: OSPF Metric Configuration**

#### Configuration

- [Configuring the Reference Bandwidth on page 4107](#)
- [Configuring a Metric for a Specific OSPF Interface on page 4107](#)

*Configuring the Reference Bandwidth*

**CLI Quick Configuration** To quickly configure the reference bandwidth, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf reference-bandwidth 10g
```

**Step-by-Step Procedure** To configure the reference bandwidth:

1. Configure the reference bandwidth to calculate the default interface cost.

**NOTE:** To specify OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@host# set protocols ospf reference-bandwidth 10g
```

**TIP:** As a shortcut in this example, you enter `10g` to specify 10 Gbps reference bandwidth. Whether you enter `10g` or `10000000000`, the output of `show protocols ospf` command displays 10 Gbps as `10g`, not `10000000000`.

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**NOTE:** Repeat this entire configuration on all routing devices in a shared network.

**Results** Confirm your configuration by entering the `show protocols ospf` command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
reference-bandwidth 10g;
```

To confirm your OSPFv3 configuration, enter the `show protocols ospf3` command.

*Configuring a Metric for a Specific OSPF Interface*

**CLI Quick Configuration** To quickly configure a metric for a specific OSPF interface, copy the following command and paste it into the CLI.

```
[edit]
```

```
set protocols ospf area 0.0.0.0 interface fe-1/0/1 metric 5
```

**Step-by-Step  
Procedure**

To configure the metric for a specific OSPF interface:

1. Create an OSPF area.

**NOTE:** To specify OSPFv3, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
```

```
user@host# edit protocols ospf area 0.0.0.0
```

2. Configure the metric of the OSPF network segment.

```
[edit protocols ospf area 0.0.0.0 ]
```

```
user@host# set interface fe-1/0/1 metric 5
```

3. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf area 0.0.0.0 ]
```

```
user@host# commit
```

**Results**

Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.0 {
  interface fe-1/0/1.0 {
    metric 5;
  }
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

**Verification**

Confirm that the configuration is working properly.

- [Verifying the Configured Metric on page 4108](#)
- [Verifying the Route on page 4109](#)

**Verifying the Configured Metric****Purpose**

Verify the metric setting on the interface. Confirm that the Cost field displays the interface's configured metric (cost). When choosing paths to a destination, OSPF uses the path with the lowest cost.

**Action**

From operational mode, enter the **show ospf interface detail** command for OSPFv2, and enter the **show ospf3 interface detail** command for OSPFv3.

**Verifying the Route**

**Purpose** When choosing paths to a destination, OSPF uses the path with the lowest total cost. Confirm that OSPF is using the appropriate path.

**Action** From operational mode, enter the **show route** command.

**Example: Dynamically Adjusting OSPF Interface Metrics Based on Bandwidth**

This example shows how to dynamically adjust OSPF interface metrics based on bandwidth.

- [Requirements on page 4109](#)
- [Overview on page 4109](#)
- [Configuration on page 4110](#)
- [Verification on page 4111](#)

**Requirements**

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4048.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4050
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4053.

**Overview**

You can specify a set of bandwidth threshold values and associated metric values for an OSPF interface. When the bandwidth of an interface changes, the Junos OS automatically sets the interface metric to the value associated with the appropriate bandwidth threshold value. When you configure bandwidth-based metric values, you typically configure multiple bandwidth and metric values.

In this example, you configure OSPF interface **ae0** for bandwidth-based metrics by including the **bandwidth-based-metrics** statement and the following settings:

- **bandwidth**—Specifies the bandwidth threshold in bits per second. The range is 9600 through 1,000,000,000,000,000.
- **metric**—Specifies the metric value to associate with a specific bandwidth value. The range is 1 through 65,535.

### Configuration

**CLI Quick Configuration** To quickly configure bandwidth threshold values and associated metric values for an OSPF interface, copy the following commands, remove any line breaks, and then paste the commands into the CLI.

```
[edit]
set protocols ospf area 0.0.0.0 interface ae0.0 metric 5
set protocols ospf area 0.0.0.0 interface ae0.0 bandwidth-based-metrics bandwidth 1g
metric 60
set protocols ospf area 0.0.0.0 interface ae0.0 bandwidth-based-metrics bandwidth 10g
metric 50
```

To configure the metric for a specific OSPF interface:

1. Create an OSPF area.

**NOTE:** To specify OSPFv3, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# edit protocols ospf area 0.0.0.0
```

2. Configure the metric of the OSPF network segment.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# set interface ae0 metric 5
```

3. Configure the bandwidth threshold values and associated metric values.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# set interface ae0.0 bandwidth-based-metrics bandwidth 1g metric 60
user@host# set interface ae0.0 bandwidth-based-metrics bandwidth 10g metric 50
```

4. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# commit
```

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.0 {
  interface ae0.0 {
    bandwidth-based-metrics {
      bandwidth 1g metric 60;
      bandwidth 10g metric 50;
    }
    metric 5;
  }
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

**Verification**

Confirm that the configuration is working properly.

**Verifying the Configured Metric**

- Purpose** Verify the metric setting on the interface. Confirm that the Cost field displays the interface's configured metric (cost). When choosing paths to a destination, OSPF uses the path with the lowest cost.
- Action** From operational mode, enter the **show ospf interface detail** command for OSPFv2, and enter the **show ospf3 interface detail** command for OSPFv3.

**Example: Controlling OSPF Route Preferences**

This example shows how to control OSPF route selection in the forwarding table. This example also shows how you might control route selection if you are migrating from OSPF to another IGP.

- [Requirements on page 4111](#)
- [Overview on page 4111](#)
- [Configuration on page 4112](#)
- [Verification on page 4113](#)

**Requirements**

This example assumes that OSPF is properly configured and running in your network, and you want to control route selection because you are planning to migrate from OSPF to a different IGP.

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices* or the *Junos OS Interfaces Configuration Guide for Security Devices*.
- Configure the IGP that you want to migrate to. See the *Junos OS Routing Protocols Library for Routing Devices*.

**Overview**

Route preferences are used to select which route is installed in the forwarding table when several protocols calculate routes to the same destination. The route with the lowest preference value is selected.

By default, internal OSPF routes have a preference value of 10, and external OSPF routes have a preference value of 150. You might want to modify this setting if you are planning to migrate from OSPF to a different IGP. Modifying the route preferences enables you to perform the migration in a controlled manner.

This example makes the following assumptions:

- OSPF is already running in your network.
- You want to migrate from OSPF to IS-IS.

- You configured IS-IS per your network requirements and confirmed it is working properly.

In this example, you increase the OSPF route preference values to make them less preferred than IS-IS routes by specifying 168 for internal OSPF routes and 169 for external OSPF routes. IS-IS internal routes have a preference of either 15 (for Level 1) or 18 (for Level 2), and external routes have a preference of 160 (for Level 1) or 165 (for Level 2). In general, it is preferred to leave the new protocol at its default settings to minimize complexities and simplify any future addition of routing devices to the network. To modify the OSPF route preference values, configure the following settings:

- **preference**—Specifies the route preference for internal OSPF routes. By default, internal OSPF routes have a value of 10. The range is from 0 through 4,294,967,295 ( $2^{32} - 1$ ).
- **external-preference**—Specifies the route preference for external OSPF routes. By default, external OSPF routes have a value of 150. The range is from 0 through 4,294,967,295 ( $2^{32} - 1$ ).

### Configuration

#### CLI Quick Configuration

To quickly configure the OSPF route preference values, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf preference 168 external-preference 169
```

To configure route selection:

1. Enter OSPF configuration mode and set the external and internal routing preferences.

**NOTE:** To specify OSPFv3, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# set protocols ospf preference 168 external-preference 169
```

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

#### Results

Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
preference 168;
external-preference 169;
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

**Verification**

Confirm that the configuration is working properly.

- [Verifying the Route on page 4113](#)

**Verifying the Route**

**Purpose** Verify that the IGP is using the appropriate route. After the new IGP becomes the preferred protocol (in this example, IS-IS), you should monitor the network for any issues. After you confirm that the new IGP is working properly, you can remove the OSPF configuration from the routing device by entering the **delete ospf** command at the **[edit protocols]** hierarchy level.

**Action** From operational mode, enter the **show route** command.

**Related Documentation**

- [OSPF Overview on page 4036](#)
- [OSPF Configuration Overview](#)

**Example: Configuring OSPF Overload Mode**

- [OSPF Overload Function Overview on page 4113](#)
- [Example: Configuring OSPF to Make Routing Devices Appear Overloaded on page 4114](#)

**OSPF Overload Function Overview**

If the time elapsed after the OSPF instance is enabled is less than the specified timeout, overload mode is set.

You can configure the local routing device so that it appears to be overloaded. An overloaded routing device determines it is unable to handle any more OSPF transit traffic, which results in sending OSPF transit traffic to other routing devices. OSPF traffic to directly attached interfaces continues to reach the routing device. You might configure overload mode for many reasons, including:

- If you want the routing device to participate in OSPF routing, but do not want it to be used for transit traffic. This could include a routing device that is connected to the network for analysis purposes, but is not considered part of the production network, such as network management routing devices.
- If you are performing maintenance on a routing device in a production network. You can move traffic off that routing device so network services are not interrupted during your maintenance window.

You configure or disable overload mode in OSPF with or without a timeout. Without a timeout, overload mode is set until it is explicitly deleted from the configuration. With a timeout, overload mode is set if the time elapsed since the OSPF instance started is less than the specified timeout.

A timer is started for the difference between the timeout and the time elapsed since the instance started. When the timer expires, overload mode is cleared. In overload mode,

the router link-state advertisement (LSA) is originated with all the transit router links (except stub) set to a metric of 0xFFFF. The stub router links are advertised with the actual cost of the interfaces corresponding to the stub. This causes the transit traffic to avoid the overloaded routing device and to take paths around the routing device. However, the overloaded routing device's own links are still accessible.

The routing device can also dynamically enter the overload state, regardless of configuring the device to appear overloaded. For example, if the routing device exceeds the configured OSPF prefix limit, the routing device purges the external prefixes and enters into an overload state.

In cases of incorrect configurations, the huge number of routes might enter OSPF, which can hamper the network performance. To prevent this, **prefix-export-limit** should be configured which will purge externals and prevent the network from the bad impact.

By allowing any number of routes to be exported into OSPF, the routing device can become overwhelmed and potentially flood an excessive number of routes into an area. You can limit the number of routes exported into OSPF to minimize the load on the routing device and prevent this potential problem.

By default, there is no limit to the number of prefixes (routes) that can be exported into OSPF. To prevent this, **prefix-export-limit** should be configured which will purge externals and prevent the network.

To limit the number of prefixes exported to OSPF:

```
[edit]
set protocols ospf prefix-export-limit number
```

The prefix export limit number can be a value from 0 through 4,294,967,295.

### Example: Configuring OSPF to Make Routing Devices Appear Overloaded

This example shows how to configure a routing device running OSPF to appear to be overloaded.

- [Requirements on page 4114](#)
- [Overview on page 4115](#)
- [Configuration on page 4115](#)
- [Verification on page 4116](#)

#### **Requirements**

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure the router identifiers for the devices in your OSPF network. See "[Example: Configuring an OSPF Router Identifier](#)" on page 4048.
- Control OSPF designated router election. See "[Example: Controlling OSPF Designated Router Election](#)" on page 4050

- Configure a single-area OSPF network. See [“Example: Configuring a Single-Area OSPF Network” on page 4053](#).
- Configure a multiarea OSPF network. See [“Example: Configuring a Multiarea OSPF Network” on page 4055](#).

### Overview

You can configure a local routing device running OSPF to appear to be overloaded, which allows the local routing device to participate in OSPF routing, but not for transit traffic. When configured, the transit interface metrics are set to the maximum value of 65535.

This example includes the following settings:

- **overload**—Configures the local routing device so it appears to be overloaded. You might configure this if you want the routing device to participate in OSPF routing, but do not want it to be used for transit traffic, or you are performing maintenance on a routing device in a production network.
- **timeout seconds**—(Optional) Specifies the number of seconds at which the overload is reset. If no timeout interval is specified, the routing device remains in the overload state until the overload statement is deleted or a timeout is set. In this example, you configure 60 seconds as the amount of time the routing device remains in the overload state. By default, the timeout interval is 0 seconds (this value is not configured). The range is from 60 through 1800 seconds.

### Configuration

**CLI Quick Configuration** To quickly configure a local routing device to appear as overloaded, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf overload timeout 60
```

**Step-by-Step Procedure** To configure a local routing device to appear overloaded:

1. Enter OSPF configuration mode.

**NOTE:** To specify OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@host# edit protocols ospf
```

2. Configure the local routing device to be overloaded.

```
[edit protocols ospf]
user@host# set overload
```

3. (Optional) Configure the number of seconds at which overload is reset.

```
[edit protocols ospf]
user@host# set overload timeout 60
```

4. (Optional) Configure the limit on the number prefixes exported to OSPF, to minimise the load on the routing device and prevent the device from entering the overload mode.

```
[edit protocols ospf]  
user@host# set prefix-export-limit 50
```

5. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf]  
user@host# commit
```

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration. The output includes the optional **timeout** and **prefix-export-limit** statements.

```
user@host# show protocols ospf
```

```
prefix-export-limit 50;  
overload timeout 60;
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### ***Verification***

Confirm that the configuration is working properly.

- [Verifying Traffic Has Moved Off Devices on page 4116](#)
- [Verifying Transit Interface Metrics on page 4116](#)
- [Verifying the Overload Configuration on page 4116](#)
- [Verifying the Viable Next Hop on page 4117](#)

### ***Verifying Traffic Has Moved Off Devices***

**Purpose** Verify that the traffic has moved off the upstream devices.

**Action** From operational mode, enter the **show interfaces detail** command.

### ***Verifying Transit Interface Metrics***

**Purpose** Verify that the transit interface metrics are set to the maximum value of 65535 on the downstream neighboring device.

**Action** From operational mode, enter the **show ospf database router detail advertising-router address** command for OSPFv2, and enter the **show ospf3 database router detail advertising-router address** command for OSPFv3.

### ***Verifying the Overload Configuration***

**Purpose** Verify that overload is configured by reviewing the Configured overload field. If the overload timer is also configured, this field also displays the time that remains before it is set to expire.

**Action** From operational mode, enter the **show ospf overview** command for OSPFv2, and the **show ospf3 overview** command for OSPFv3.

#### *Verifying the Viable Next Hop*

**Purpose** Verify the viable next hop configuration on the upstream neighboring device. If the neighboring device is overloaded, it is not used for transit traffic and is not displayed in the output.

**Action** From operational mode, enter the **show route address** command.

#### OSPF Timers Overview

OSPF routing devices constantly track the status of their neighbors, sending and receiving hello packets that indicate whether each neighbor still is functioning, and sending and receiving link-state advertisement (LSA) and acknowledgment packets. OSPF sends packets and expects to receive packets at specified intervals.

You configure OSPF timers on the interface of the routing device participating in OSPF. Depending on the timer, the configured interval must be the same on all routing devices on a shared network (area).

You can configure the following OSPF timers:

- Hello interval—Routing devices send hello packets at a fixed interval on all interfaces, including virtual links, to establish and maintain neighbor relationships. The hello interval specifies the length of time, in seconds, before the routing device sends a hello packet out of an interface. This interval must be the same on all routing devices on a shared network. By default, the routing device sends hello packets every 10 seconds (broadcast and point-to-point networks) and 30 seconds (nonbroadcast multiple access (NBMA) networks).
- Poll interval—(OSPFv2, Nonbroadcast networks only) Routing devices send hello packets for a longer interval on nonbroadcast networks to minimize the bandwidth required on slow WAN links. The poll interval specifies the length of time, in seconds,

before the routing device sends hello packets out of the interface before establishing adjacency with a neighbor. By default, the routing device sends hello packets every 120 seconds until active neighbors are detected.

Once the routing device detects an active neighbor, the hello packet interval changes from the time specified in the poll interval to the time specified in the hello interval.

- **LSA retransmission interval**—When a routing device sends LSAs to its neighbors, the routing device expects to receive an acknowledgment packet from each neighbor within a certain amount of time. The LSA retransmission interval specifies the length of time, in seconds, that the routing device waits to receive an LSA packet before retransmitting the LSA to an interface's neighbors. By default, the routing device waits 5 seconds for an acknowledgment before retransmitting the LSA.
- **Dead interval**—If a routing device does not receive a hello packet from a neighbor within a fixed amount of time, the routing device modifies its topology database to indicate that the neighbor is nonoperational. The dead interval specifies the length of time, in seconds, that the routing device waits before declaring that a neighboring routing device is unavailable. This is an interval during which the routing device receives no hello packets from the neighbor. This interval must be the same on all routing devices on a shared network. By default, this interval is four times the default hello interval, which is 40 seconds (broadcast and point-to-point networks) and 120 seconds (NBMA networks).
- **Transit delay**—Before a link-state update packet is propagated out of an interface, the routing device must increase the age of the packet. The transit delay sets the estimated time required to transmit a link-state update on the interface. By default, the transit delay is 1 second. You should never have to modify the transit delay time.

---

### Example: Configuring OSPF Timers

This example shows how to configure the OSPF timers.

- [Requirements on page 4118](#)
- [Overview on page 4119](#)
- [Configuration on page 4120](#)
- [Verification on page 4123](#)

#### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4048.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4050

- Configure a single-area OSPF network. See [“Example: Configuring a Single-Area OSPF Network” on page 4053](#).
- Configure a multiarea OSPF network. See [“Example: Configuring a Multiarea OSPF Network” on page 4055](#).

### Overview

The default OSPF timer settings are optimal for most networks. However, depending on your network requirements, you might need to modify the timer settings. This example explains why you might need to modify the following timers:

- Hello interval
- Dead interval
- LSA retransmission interval
- Transit delay

### Hello Interval and Dead Interval

The hello interval and the dead interval optimize convergence times by efficiently tracking neighbor status. By lowering the values of the hello interval and the dead interval, you can increase the convergence of OSPF routes if a path fails. These intervals must be the same on all routing devices on a shared network. Otherwise, OSPF cannot establish the appropriate adjacencies.

In the first example, you lower the hello interval to 2 seconds and the dead interval to 8 seconds on point-to-point OSPF interfaces **fe-0/0/1** and **fe-1/0/1** in area 0.0.0.0 by configuring the following settings:

- **hello-interval**—Specifies the length of time, in seconds, before the routing device sends a hello packet out of an interface. By default, the routing device sends hello packets every 10 seconds. The range is from 1 through 255 seconds.
- **dead-interval**—Specifies the length of time, in seconds, that the routing device waits before declaring that a neighboring routing device is unavailable. This is an interval during which the routing device receives no hello packets from the neighbor. By default, the routing device waits 40 seconds (four times the hello interval). The range is 1 through 65,535 seconds.

### LSA Retransmission Interval

The link-state advertisement (LSA) retransmission interval optimizes the sending and receiving of LSA and acknowledgement packets. You must configure the LSA retransmission interval to be equal to or greater than 3 seconds to avoid triggering a retransmit trap because the Junos OS delays LSA acknowledgments by up to 2 seconds. If you have a virtual link, you might find increased performance by increasing the value of the LSA retransmission interval.

In the second example, you increase the LSA retransmission timer to 8 seconds on OSPF interface **fe-0/0/1** in area 0.0.0.1 by configuring the following setting:

- **retransmit-interval**—Specifies the length of time, in seconds, that the routing device waits to receive an LSA packet before retransmitting LSA to an interface's neighbors. By default, the routing device retransmits LSAs to its neighbors every 5 seconds. The range is from 1 through 65,535 seconds.

### Transit Delay

The transit delay sets the time the routing device uses to age a link-state update packet. If you have a slow link (for example, one with an average propagation delay of multiple seconds), you should increase the age of the packet by a similar amount. Doing this ensures that you do not receive a packet back that is younger than the original copy.

In the final example, you increase the transit delay to 2 seconds on OSPF interface **fe-1/0/1** in area 0.0.0.1. By configuring the following setting, this causes the routing device to age the link-state update packet by 2 seconds:

- **transit-delay**—Sets the estimated time required to transmit a link-state update on the interface. You should never have to modify the transit delay time. By default, the routing device ages the packet by 1 second. The range is from 1 through 65,535 seconds.

### Configuration

- [Configuring the Hello Interval and the Dead Interval on page 4120](#)
- [Controlling the LSA Retransmission Interval on page 4121](#)
- [Specifying the Transit Delay on page 4122](#)

### Configuring the Hello Interval and the Dead Interval

#### CLI Quick Configuration

To quickly configure the hello and dead intervals, copy the following commands and paste them into the CLI.

```
[edit]
set protocols ospf area 0.0.0.0 interface fe-0/0/1 hello-interval 2
set protocols ospf area 0.0.0.0 interface fe-0/0/1 dead-interval 8
set protocols ospf area 0.0.0.0 interface fe-1/0/1 hello-interval 2
set protocols ospf area 0.0.0.0 interface fe-1/0/1 dead-interval 8
```

#### Step-by-Step Procedure

To configure the hello and dead intervals:

1. Create an OSPF area.

**NOTE:** To specify OSPFv3, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

---

```
[edit]
user@host# edit protocols ospf area 0.0.0.0
```

2. Specify the interfaces.

```
[edit protocols ospf area 0.0.0.0]
user@host# set interface fe-0/0/1
user@host# set interface fe-1/0/1
```

3. Configure the hello interval.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# set interface fe-0/0/1 hello-interval 2
user@host# set interface fe-1/0/1 hello-interval 2
```

4. Configure the dead interval.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# set interface fe-0/0/1 dead-interval 8
user@host# set interface fe-1/0/1 dead-interval 8
```

5. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# commit
```

**NOTE:** Repeat this entire configuration on all routing devices in a shared network.

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.0 {
  interface fe-0/0/1.0 {
    hello-interval 2;
    dead-interval 8;
  }
  interface fe-1/0/1.0 {
    hello-interval 2;
    dead-interval 8;
  }
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### *Controlling the LSA Retransmission Interval*

**CLI Quick Configuration** To quickly configure the LSA retransmission interval, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf area 0.0.0.1 interface fe-0/0/1 retransmit-interval 8
```

**Step-by-Step Procedure** To configure the LSA retransmission interval:

1. Create an OSPF area.

**NOTE:** To specify OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@host# edit protocols ospf area 0.0.0.1
```

2. Specify the interface.

```
[edit protocols ospf area 0.0.0.1]
user@host# set interface fe-0/0/1
```

3. Configure the LSA retransmission interval.

```
[edit protocols ospf area 0.0.0.1]
user@host# set interface fe-0/0/1 retransmit-interval 8
```

4. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf area 0.0.0.1]
user@host# commit
```

**Results** Confirm your configuration by entering the `show protocols ospf` command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.1 {
  interface fe-0/0/1.0 {
    retransmit-interval 8;
  }
}
```

To confirm your OSPFv3 configuration, enter the `show protocols ospf3` command.

### *Specifying the Transit Delay*

**CLI Quick Configuration** To quickly configure the transit delay, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf area 0.0.0.1 interface fe-1/0/1 transit-delay 2
```

**Step-by-Step Procedure** To configure the transit delay:

1. Create an OSPF area.

**NOTE:** To specify OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@host# edit protocols ospf area 0.0.0.1
```

2. Specify the interface.  

```
[edit protocols ospf area 0.0.0.1]
user@host# set interface fe-1/0/1
```
3. Configure the transit delay.  

```
[edit protocols ospf area 0.0.0.1 ]
user@host# set interface fe-1/0/1 transit-delay 2
```
4. If you are done configuring the device, commit the configuration.  

```
[edit protocols ospf area 0.0.0.1 ]
user@host# commit
```

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.1 {
  interface fe-1/0/1.0 {
    transit-delay 2;
  }
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### **Verification**

Confirm that the configuration is working properly.

### **Verifying the Timer Configuration**

**Purpose** Verify that the interface for OSPF or OSPFv3 has been configured with the applicable timer values. Confirm that the Hello field, the Dead field, and the ReXmit field display the values that you configured.

**Action** From operational mode, enter the **show ospf interface detail** for OSPFv2, and enter the **show ospf3 interface detail** command for OSPFv3.

## **Example: Configuring BFD for OSPF**

- [Understanding BFD for OSPF on page 4123](#)
- [Example: Configuring BFD for OSPF on page 4126](#)

### **Understanding BFD for OSPF**

The Bidirectional Forwarding Detection (BFD) protocol is a simple hello mechanism that detects failures in a network. BFD works with a wide variety of network environments and topologies. A pair of routing devices exchange BFD packets. Hello packets are sent

at a specified, regular interval. A neighbor failure is detected when the routing device stops receiving a reply after a specified interval. The BFD failure detection timers have shorter time limits than the OSPF failure detection mechanisms, so they provide faster detection.

The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the **clear bfd adaptation** command to return BFD interval timers to their configured values. The **clear bfd adaptation** command is hitless, meaning that the command does not affect traffic flow on the routing device.

**NOTE:** BFD is supported for OSPFv3 in Junos OS Release 9.3 and later.

---

You can configure the following BFD protocol settings:

- **detection-time threshold**—Threshold for the adaptation of the detection time. When the BFD session detection time adapts to a value equal to or greater than the configured threshold, a single trap and a single system log message are sent.
- **full-neighbors-only**—Ability to establish BFD sessions only for OSPF neighbors with full neighbor adjacency. The default behavior is to establish BFD sessions for all OSPF neighbors. This setting is available in Junos OS Release 9.5 and later.
- **minimum-interval**—Minimum transmit and receive interval for failure detection. This setting configures both the minimum interval after which the local routing device transmits hello packets and the minimum interval after which the routing device expects to receive a reply from the neighbor with which it has established a BFD session. Both intervals are in milliseconds. You can also specify the minimum transmit and receive intervals separately using the **transmit-interval** **minimum-interval** and **minimum-receive-interval** statements.

**NOTE:** BFD is an intensive protocol that consumes system resources. Specifying a minimum interval for BFD of less than 100 ms for Routing Engine-based sessions and 10 ms for distributed BFD sessions can cause undesired BFD flapping.

Depending on your network environment, these additional recommendations might apply:

- For large-scale network deployments with a large number of BFD sessions, specify a minimum interval of 300 ms for Routing Engine-based sessions and 100 ms for distributed BFD sessions.
- For very large-scale network deployments with a large number of BFD sessions, contact Juniper Networks customer support for more information.
- For BFD sessions to remain up during a Routing Engine switchover event when nonstop active routing (NSR) is configured, specify a minimum interval of 2500 ms for Routing Engine-based sessions. Without NSR, Routing Engine-based sessions can have a minimum interval of 100 ms. In OSPFv3, BFD is always based in the Routing Engine, meaning that BFD is not distributed. For distributed BFD sessions with NSR configured, the minimum interval recommendations are unchanged and depend only on your network deployment.

- **minimum-receive-interval**—Minimum receive interval for failure detection. This setting configures the minimum receive interval, in milliseconds, after which the routing device expects to receive a hello packet from a neighbor with which it has established a BFD session. You can also specify the minimum receive interval using the **minimum-interval** statement.
- **multiplier**—Multiplier for hello packets. This setting configures the number of hello packets that are not received by a neighbor, which causes the originating interface to be declared down. By default, three missed hello packets cause the originating interface to be declared down.
- **no-adaptation**—Disables BFD adaption. This setting disables BFD sessions from adapting to changing network conditions. This setting is available in Junos OS Release 9.0 and later.

**NOTE:** We recommend that you do not disable BFD adaptation unless it is preferable not to have BFD adaptation in your network.

- **transmit-interval minimum-interval**—Minimum transmit interval for failure detection. This setting configures the minimum transmit interval, in milliseconds, at which the local routing device transmits hello packets to the neighbor with which it has established a BFD session. You can also specify the minimum transmit interval using the **minimum-interval** statement.

- **transmit-interval threshold**—Threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system log message are sent. The threshold value must be greater than the minimum transmit interval. If you attempt to commit a configuration with a threshold value less than the minimum transmit interval, the routing device displays an error and does not accept the configuration.
- **version**—BFD version. This setting configures the BFD version used for detection. You can explicitly configure BFD version 1, or the routing device can automatically detect the BFD version. By default, the routing device automatically detects the BFD version automatically, which is either 0 or 1.

You can also trace BFD operations for troubleshooting purposes.

---

### Example: Configuring BFD for OSPF

This example shows how to configure the Bidirectional Forwarding Detection (BFD) protocol for OSPF.

- [Requirements on page 4126](#)
- [Overview on page 4126](#)
- [Configuration on page 4128](#)
- [Verification on page 4129](#)

#### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4048.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4050.
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4053.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4055.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4055.

#### Overview

An alternative to adjusting the OSPF hello interval and dead interval settings to increase route convergence is to configure BFD. The BFD protocol is a simple hello mechanism that detects failures in a network. The BFD failure detection timers have shorter timer limits than the OSPF failure detection mechanisms, thereby providing faster detection.

BFD is useful on interfaces that are unable to detect failure quickly, such as Ethernet interfaces. Other interfaces, such as SONET interfaces, already have built-in failure detection. Configuring BFD on those interfaces is unnecessary.

You configure BFD on a pair of neighboring OSPF interfaces. Unlike the OSPF hello interval and dead interval settings, you do not have to enable BFD on all interfaces in an OSPF area.

In this example, you enable failure detection by including the **bfd-liveness-detection** statement on the neighbor OSPF interface **fe-0/1/0** in area 0.0.0.0 and configure the BFD packet exchange interval to 300 milliseconds, configure 4 as the number of missed hello packets that causes the originating interface to be declared down, and configure BFD sessions only for OSPF neighbors with full neighbor adjacency by including the following settings:

- **full-neighbors-only**—In Junos OS Release 9.5 and later, configures the BFD protocol to establish BFD sessions only for OSPF neighbors with full neighbor adjacency. The default behavior is to establish BFD sessions for all OSPF neighbors.
- **minimum-interval**—Configures the minimum interval, in milliseconds, after which the local routing device transmits hello packets as well as the minimum interval after which the routing device expects to receive a reply from the neighbor with which it has established a BFD session. You can configure a number in the range from 1 through 255,000 milliseconds. You can also specify the minimum transmit and receive intervals separately using the **transmit-interval** **minimum-interval** and **minimum-receive-interval** statements.

**NOTE:** BFD is an intensive protocol that consumes system resources. Specifying a minimum interval for BFD of less than 100 ms for Routing Engine-based sessions and 10 ms for distributed BFD sessions can cause undesired BFD flapping.

Depending on your network environment, these additional recommendations might apply:

- For large-scale network deployments with a large number of BFD sessions, specify a minimum interval of 300 ms for Routing Engine-based sessions and 100 ms for distributed BFD sessions.
- For very large-scale network deployments with a large number of BFD sessions, contact Juniper Networks customer support for more information.
- For BFD sessions to remain up during a Routing Engine switchover event when nonstop active routing (NSR) is configured, specify a minimum interval of 2500 ms for Routing Engine-based sessions. For distributed BFD sessions with NSR configured, the minimum interval recommendations are unchanged and depend only on your network deployment.

- **multiplier**—Configures the number of hello packets not received by a neighbor that causes the originating interface to be declared down. By default, three missed hello packets cause the originating interface to be declared down. You can configure a value in the range from 1 through 255.

### Configuration

**CLI Quick Configuration** To quickly configure the BFD protocol for OSPF, copy the following commands, remove any line breaks, and then paste the commands into the CLI.

```
[edit]
set protocols ospf area 0.0.0.0 interface fe-0/0/1 bfd-liveness-detection minimum-interval 300
set protocols ospf area 0.0.0.0 interface fe-0/0/1 bfd-liveness-detection multiplier 4
set protocols ospf area 0.0.0.0 interface fe-0/0/1 bfd-liveness-detection full-neighbors-only
```

**Step-by-Step Procedure** To configure the BFD protocol for OSPF on one neighboring interface:

1. Create an OSPF area.

**NOTE:** To specify OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@host# edit protocols ospf area 0.0.0.0
```

2. Specify the interface.

```
[edit protocols ospf area 0.0.0.0]
user@host# set interface fe-0/0/1
```

3. Specify the minimum transmit and receive intervals.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# set interface fe-0/0/1 bfd-liveness-detection minimum-interval 300
```

4. Configure the number of missed hello packets that cause the originating interface to be declared down.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# set interface fe-0/0/1 bfd-liveness-detection multiplier 4
```

5. Configure BFD sessions only for OSPF neighbors with full neighbor adjacency.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# set interface fe-0/0/1 bfd-liveness-detection full-neighbors-only
```

6. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf area 0.0.0.0 ]
user@host# commit
```

**NOTE:** Repeat this entire configuration on the other neighboring interface.

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.0 {
  interface fe-0/0/1.0 {
    bfd-liveness-detection {
      minimum-interval 300;
      multiplier 4;
      full-neighbors-only;
    }
  }
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### **Verification**

Confirm that the configuration is working properly.

### **Verifying the BFD Sessions**

**Purpose** Verify that the OSPF interfaces have active BFD sessions, and that session components have been configured correctly.

**Action** From operational mode, enter the **show bfd session detail** command.

**Meaning** The output displays information about the BFD sessions.

- The Address field displays the IP address of the neighbor.
- The Interface field displays the interface you configured for BFD.
- The State field displays the state of the neighbor and should show Full to reflect the full neighbor adjacency that you configured.
- The Transmit Interval field displays the time interval you configured to send BFD packets.
- The Multiplier field displays the multiplier you configured.

## BFD Authentication for OSPF Overview

---

Bidirectional Forwarding Detection (BFD) enables rapid detection of communication failures between adjacent systems. By default, authentication for BFD sessions is disabled. However, when you run BFD over Network Layer protocols, the risk of service attacks can be significant. We strongly recommend using authentication if you are running BFD over multiple hops or through insecure tunnels. Beginning with Junos OS Release 9.6, Junos OS supports authentication for BFD sessions running over OSPFv2. BFD authentication is not supported on MPLS OAM sessions. BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

You authenticate BFD sessions by specifying an authentication algorithm and keychain, and then associating that configuration information with a security authentication keychain using the keychain name.

The following sections describe the supported authentication algorithms, security keychains, and level of authentication that can be configured:

- [BFD Authentication Algorithms on page 4130](#)
- [Security Authentication Keychains on page 4131](#)
- [Strict Versus Loose Authentication on page 4131](#)

### **BFD Authentication Algorithms**

Junos OS supports the following algorithms for BFD authentication:

- **simple-password**—Plain-text password. One to 16 bytes of plain text are used to authenticate the BFD session. One or more passwords can be configured. This method is the least secure and should be used only when BFD sessions are not subject to packet interception.
- **keyed-md5**—Keyed Message Digest 5 hash algorithm for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed MD5 uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than or equal to the last sequence number received. Although more secure than a simple password, this method is vulnerable to replay attacks. Increasing the rate at which the sequence number is updated can reduce this risk.
- **meticulous-keyed-md5**—Meticulous keyed Message Digest 5 hash algorithm. This method works in the same manner as keyed MD5, but the sequence number is updated with every packet. Although more secure than keyed MD5 and simple passwords, this method might take additional time to authenticate the session.
- **keyed-sha-1**—Keyed Secure Hash Algorithm I for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed SHA uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. The key is not carried within the packets. With this method,

packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than the last sequence number received.

- **meticulous-keyed-sha-1**—Meticulous keyed Secure Hash Algorithm I. This method works in the same manner as keyed SHA, but the sequence number is updated with every packet. Although more secure than keyed SHA and simple passwords, this method might take additional time to authenticate the session.

**NOTE:** Nonstop active routing (NSR) is not supported with the meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

### **Security Authentication Keychains**

The security authentication keychain defines the authentication attributes used for authentication key updates. When the security authentication keychain is configured and associated with a protocol through the keychain name, authentication key updates can occur without interrupting routing and signaling protocols.

The authentication keychain contains one or more keychains. Each keychain contains one or more keys. Each key holds the secret data and the time at which the key becomes valid. The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

BFD allows multiple clients per session, and each client can have its own keychain and algorithm defined. To avoid confusion, we recommend specifying only one security authentication keychain.

### **Strict Versus Loose Authentication**

By default, strict authentication is enabled and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure *loose checking*. When loose checking is configured, packets are accepted without authentication being checked at each end of the session. This feature is intended for transitional periods only.

### **Configuring BFD Authentication for OSPF**

Beginning with Junos OS Release 9.6, you can configure authentication for BFD sessions running over OSPFv2. Routing instances are also supported.

The following sections provide instructions for configuring and viewing BFD authentication on OSPF:

- [Configuring BFD Authentication Parameters on page 4131](#)
- [Viewing Authentication Information for BFD Sessions on page 4133](#)

### **Configuring BFD Authentication Parameters**

Only three steps are needed to configure authentication on a BFD session:

1. Specify the BFD authentication algorithm for the OSPFv2 protocol.
2. Associate the authentication keychain with the OSPFv2 protocol.
3. Configure the related security authentication keychain.

To configure BFD authentication:

1. Specify the algorithm (**keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**, or **simple-password**) to use for BFD authentication on an OSPF route or routing instance.

[edit]

```
user@host# set protocols ospf area 0.0.0.1 interface if2-ospf bfd-liveness-detection  
authentication algorithm keyed-sha-1
```

---

**NOTE:** Nonstop active routing (NSR) is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

---

2. Specify the keychain to be used to associate BFD sessions on the specified OSPF route or routing instance with the unique security authentication keychain attributes.

This keychain should match the keychain name configured at the **[edit security authentication key-chains]** hierarchy level.

[edit]

```
user@host# set protocols ospf area 0.0.0.1 interface if2-ospf bfd-liveness-detection  
authentication keychain bfd-ospf
```

---

**NOTE:** The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

---

3. Specify the unique security authentication information for BFD sessions:
  - The matching keychain name as specified in Step 2.
  - At least one key, a unique integer between 0 and 63. Creating multiple keys enables multiple clients to use the BFD session.
  - The secret data used to allow access to the session.
  - The time at which the authentication key becomes active, in the format *yyyy-mm-dd.hh:mm:ss*.

[edit security]

```
user@host# authentication-key-chains key-chain bfd-ospf key 53 secret  
$9$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHM start-time 2009-06-14.10:00:00
```

4. (Optional) Specify loose authentication checking if you are transitioning from nonauthenticated sessions to authenticated sessions.

```
[edit]
user@host> set protocols ospf interface if2-ospf bfd-liveness-detection authentication
loose-check
```

5. (Optional) View your configuration using the **show bfd session detail** or **show bfd session extensive** command.
6. Repeat the steps in this procedure to configure the other end of the BFD session.

**NOTE:** BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

### *Viewing Authentication Information for BFD Sessions*

You can view the existing BFD authentication configuration using the **show bfd session detail** and **show bfd session extensive** commands.

The following example shows BFD authentication configured for the **if2-ospf** BGP group. It specifies the keyed SHA-1 authentication algorithm and a keychain name of **bfd-ospf**. The authentication keychain is configured with two keys. Key 1 contains the secret data “\$9\$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHm” and a start time of June 1, 2009, at 9:46:02 AM PST. Key 2 contains the secret data “\$9\$a5jiKW9l.reP38ny.TszF2/9” and a start time of June 1, 2009, at 3:29:20 PM PST.

```
[edit protocols ospf]
area 0.0.0.1 {
  interface if2-ospf {
    bfd-liveness-detection {
      authentication {
        algorithm keyed-sha-1;
        key-chain bfd-ospf;
      }
    }
  }
}
[edit security]
authentication key-chains {
  key-chain bfd-ospf {
    key 1 {
      secret "$9$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHm";
      start-time "2009-6-1.09:46:02 -0700";
    }
    key 2 {
      secret "$9$a5jiKW9l.reP38ny.TszF2/9";
      start-time "2009-6-1.15:29:20 -0700";
    }
  }
}
```

If you commit these updates to your configuration, you see output similar to the following. In the output for the **show bfd session detail** command, **Authenticate** is displayed to indicate that BFD authentication is configured.

## show bfd session detail

```
user@host# show bfd session detail
```

Address	State	Interface	Detect Time	Transmit Interval	Multiplier
10.9.1.33	Up	so-7/1/0.0	0.600	0.200	3

Client OSPF, TX interval 0.200, RX interval 0.200, multiplier 3, **Authenticate**  
 Session up time 3d 00:34  
 Local diagnostic None, remote diagnostic None  
 Remote state Up, version 1  
 Replicated

1 sessions, 1 clients

Cumulative transmit rate 10.0 pps, cumulative receive rate 10.0 pps

For more information about the configuration, use the **show bfd session extensive** command. The output for this command provides the keychain name, the authentication algorithm and mode for each client in the session, and the overall BFD authentication configuration status, keychain name, and authentication algorithm and mode.

## show bfd session extensive

```
user@host# show bfd session extensive
```

Address	State	Interface	Detect Time	Transmit Interval	Multiplier

### Graceful Restart for OSPF Overview

Graceful restart allows a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition. During a graceful restart, the restarting device and its neighbors continue forwarding packets without disrupting network performance. Because neighboring devices assist in the restart (these neighbors are called *helper routers*), the restarting device can quickly resume full operation without recalculating algorithms.

**NOTE:** On a broadcast link with a single neighbor, when the neighbor initiates an OSPFv3 graceful restart operation, the restart might be terminated at the point when the local routing device assumes the role of a helper. A change in the LSA is considered a topology change, which terminates the neighbor's restart operation.

Graceful restart is disabled by default. You can globally enable graceful restart for all routing protocols by including the **graceful-restart** statement at the **[edit routing-options]** hierarchy level. To enable graceful restart specifically for OSPF, first you need to globally enable graceful restart for all routing protocols.

This topic describes the following information:

- [Helper Mode for Graceful Restart on page 4135](#)
- [Planned and Unplanned Graceful Restart on page 4136](#)

#### **Helper Mode for Graceful Restart**

When a device enabled for OSPF graceful restart restarts, it retains routes learned before the restart in its forwarding table. The device does not allow new OSPF link-state advertisements (LSAs) to update the routing table. This device continues to forward traffic to other OSPF neighbors (or helper routers), and sends only a limited number of LSAs during the restart period. To reestablish OSPF adjacencies with neighbors, the restarting device must send a grace LSA to all neighbors. In response, the helper routers enter helper mode (the ability to assist a neighboring device attempting a graceful restart) and send an acknowledgment back to the restarting device. If there are no topology changes, the helper routers continue to advertise LSAs as if the restarting device had remained in continuous OSPF operation.

**NOTE:** Helper mode is enabled by default when you start the routing platform, even if graceful restart is not enabled. You can disable helper mode specifically for OSPF.

When the restarting device receives replies from all the helper routers, the restarting device selects routes, updates the forwarding table, and discards the old routes. At this point, full OSPF adjacencies are reestablished and the restarting device receives and processes OSPF LSAs as usual. When the helper routers no longer receive grace LSAs from the restarting device or when the topology of the network changes, the helper routers also resume normal operation.

Beginning with Junos OS Release 11.4, you can configure restart signaling-based helper mode for OSPFv2 graceful restart configurations. The Junos OS implementation is based on RFC 4811, *OSPF Out-of-Band Link State Database (LSDB) Resynchronization*, RFC 4812, *OSPF Restart Signaling*, and RFC 4813, *OSPF Link-Local Signaling*. In restart signaling-based helper mode implementations, the restarting device informs its restart status to its neighbors only after the restart is complete. When the restart is complete, the restarting device sends hello messages to its helper routers with the restart signal (RS) bit set in the hello packet header. When a helper router receives a hello packet with the RS bit set in the header, the helper router returns a hello message to the restarting device. The reply hello message from the helper router contains the ResyncState flag and the ResyncTimeout timer that enable the restarting device to keep track of the helper routers that are syncing up with it. When all helpers complete the synchronization, the restarting device exits the restart mode.

**NOTE:** Restart signaling-based graceful restart helper mode is not supported for OSPFv3 configurations.

---

### ***Planned and Unplanned Graceful Restart***

OSPF supports two types of graceful restart: planned and unplanned. During a planned restart, the restarting routing device informs the neighbors before restarting. The neighbors act as if the routing device is still within the network topology, and continue forwarding traffic to the restarting routing device. A grace period is set to specify when the neighbors should consider the restarting routing device as part of the topology. During an unplanned restart, the routing device restarts without warning.

### **Example: Configuring Graceful Restart for OSPF**

---

This example shows how to configure graceful restart specifically for OSPF.

- [Requirements on page 4136](#)
- [Overview on page 4137](#)
- [Configuration on page 4137](#)
- [Verification on page 4140](#)

#### ***Requirements***

Before you begin:

- Configure the router identifiers for the devices in your OSPF network. See [“Example: Configuring an OSPF Router Identifier” on page 4048](#).
- Control OSPF designated router election. See [“Example: Controlling OSPF Designated Router Election” on page 4050](#).
- Configure a single-area OSPF network. See [“Example: Configuring a Single-Area OSPF Network” on page 4053](#).
- Configure a multiarea OSPF network. See [“Example: Configuring a Multiarea OSPF Network” on page 4055](#).

### Overview

Graceful restart enables a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition. During a graceful restart, the restarting routing device and its neighbors continue forwarding packets without disrupting network performance. By default, graceful restart is disabled. You can globally enable graceful restart for all routing protocols by including the **graceful-restart** statement at the **[edit routing-options]** hierarchy level, or you can enable graceful restart specifically for OSPF by including the **graceful-restart** statement at the **[edit protocols (ospf|ospf3)]** hierarchy level.

The first example shows how to enable graceful restart and configure the optional settings for the grace period interval. In this example, interfaces **fe-1/1/1** and **fe-1/1/2** are in OSPF area 0.0.0.0, and you configure those interfaces for graceful restart. The grace period interval for OSPF graceful restart is determined as equal to or less than the sum of the **notify-duration** time interval and the **restart-duration** time interval. The grace period is the number of seconds that the routing device's neighbors continue to advertise the routing device as fully adjacent, regardless of the connection state between the routing device and its neighbors.

The **notify-duration** statement configures how long (in seconds) the routing device notifies helper routers that it has completed graceful restart by sending purged grace link-state advertisements (LSAs) over all interfaces. By default, the routing device sends grace LSAs for 30 seconds. The range is from 1 through 3600 seconds.

The **restart-duration** statement configures the amount of time the routing device waits (in seconds) to complete reacquisition of OSPF neighbors from each area. By default, the routing device allows 180 seconds. The range is from 1 through 3600 seconds.

The second example shows how to disable graceful restart for OSPF by including the **disable** statement.

### Configuration

- [Enabling Graceful Restart for OSPF on page 4137](#)
- [Disabling Graceful Restart for OSPF on page 4139](#)

#### Enabling Graceful Restart for OSPF

**CLI Quick Configuration** To quickly enable graceful restart for OSPF, copy the following commands and paste them into the CLI.

[edit]

```
set interfaces fe-1/1/1 unit 0 family inet address 10.0.0.4
set interfaces fe-1/1/2 unit 0 family inet address 10.0.0.5
set protocols ospf area 0.0.0.0 interface fe-1/1/1
set protocols ospf area 0.0.0.0 interface fe-1/1/2
set routing-options graceful-restart
set protocols ospf graceful-restart restart-duration 190
set protocols ospf graceful-restart notify-duration 40
```

**Step-by-Step Procedure** To enable graceful restart for OSPF:

1. Configure the interfaces.

**NOTE:** For OSPFv3, use IPv6 addresses.

[edit]

```
user@host# set interfaces fe-1/1/1 unit 0 family inet address 10.0.0.4
```

```
user@host# set interfaces fe-1/1/2 unit 0 family inet address 10.0.0.5
```

2. Configure OSPF on the interfaces.

**NOTE:** To specify OSPFv3, include the `ospf3` statement at the [edit protocols] hierarchy level.

[edit]

```
user@host# set protocols ospf area 0.0.0.0 interface fe-1/1/1
```

```
user@host# set protocols ospf area 0.0.0.0 interface fe-1/1/2
```

3. Configure graceful restart globally

[edit]

```
user@host# edit routing-options graceful-restart
```

4. Configure OSPF graceful restart.

[edit]

```
user@host# edit protocols ospf graceful-restart
```

5. (Optional) Configure the restart duration time.

[edit protocols ospf graceful-restart]

```
user@host# set restart-duration 190
```

6. (Optional) Configure the notify duration time.

[edit protocols ospf graceful-restart]

```
user@host# set notify-duration 40
```

7. If you are done configuring the device, commit the configuration.

[edit protocols ospf graceful-restart]

```
user@host# commit
```

**Results** Confirm your configuration by entering the **show interfaces** and **show protocols ospf** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
fe-1/1/1 {
  unit 0 {
    family inet {
      address 10.0.0.4/32;
    }
  }
}
fe-1/1/2 {
  unit 0 {
    family inet {
      address 10.0.0.5/32;
    }
  }
}
user@host# show protocols ospf
graceful-restart {
  restart-duration 190;
  notify-duration 40;
}
area 0.0.0.0 {
  interface fe-1/1/1.0;
  interface fe-1/1/2.0;
}
```

To confirm an OSPFv3 configuration, enter the **show interfaces** and the **show protocols ospf3** commands.

### *Disabling Graceful Restart for OSPF*

**CLI Quick Configuration** To quickly disable graceful restart for OSPF, copy the following command and paste it into the CLI.

```
[edit]
user@host# set protocols ospf graceful-restart disable
```

**Step-by-Step Procedure** To disable graceful restart for OSPF:

1. Disable graceful restart for the OSPF protocol only.

This command does not affect the global graceful restart configuration setting.

**NOTE:** To specify OSPFv3, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# set protocols ospf graceful-restart disable
```

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
graceful-restart disable;
```

To confirm an OSPFv3 configuration, enter the **show protocols ospf3** command.

### ***Verification***

Confirm that the configuration is working properly.

- [Verifying the OSPF Graceful Restart Configuration on page 4140](#)
- [Verifying Graceful Restart Status on page 4140](#)

### ***Verifying the OSPF Graceful Restart Configuration***

**Purpose** Verify information about your OSPF graceful restart configuration.

**Action** From operational mode, enter the **show ospf overview** command for OSPFv2. Enter the **show ospf3 overview** command for OSPFv3.

**Meaning** The Restart field displays the status of graceful restart as either enabled or disabled. The Restart duration field displays how much time the restarted routing device requires to complete reacquisition of OSPF neighbors. The Restart grace period field displays how much time the neighbors should consider the restarted routing device as part of the topology.

### ***Verifying Graceful Restart Status***

**Purpose** Verify the status of graceful restart.

**Action** From operational mode, enter the **show route instance detail** command.

**Meaning** The Restart State field displays Pending if the restart has not been completed or Complete if the restart has finished. The Path selection timeout field indicates the amount of time remaining until graceful restart is declared complete. There is a more detailed Restart State field that displays a list of protocols that have or have not yet completed graceful restart for the specified routing table.

### **Example: Configuring the Helper Capability Mode for OSPFv2 Graceful Restart**

This example shows how to disable and reenabling the helper mode capability for OSPFv2 graceful restart.

- [Requirements on page 4141](#)
- [Overview on page 4141](#)

- [Configuration on page 4141](#)
- [Verification on page 4143](#)

### Requirements

Before you begin:

- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4048.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4050
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4053.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4055.

### Overview

The OSPF graceful restart helper capability assists a neighboring routing device attempting a graceful restart. By default, the helper capability is globally enabled when you start the routing platform. This means that the helper capability is enabled when you start OSPF, even if graceful restart is not globally enabled or specifically enabled for OSPF. You can further modify your graceful restart configuration to disable the helper capability.

Beginning with Junos OS Release 11.4, you can configure restart signaling-based helper mode for OSPFv2 graceful restart configurations. Both the standard and restart signaling-based helper modes are enabled by default.

In the first example, interfaces **fe-1/1/1** and **fe-1/1/2** are in OSPFv2 area 0.0.0.0, and you configure those interfaces for graceful restart. You then disable the standard OSPFv2 graceful restart helper capability by including the **helper-disable standard** statement. This configuration is useful if you have an environment that contains other vendor equipment that is configured for restart signaling-based graceful restart.

**NOTE:** The **helper-disable** statement and the **no-strict-lsa-checking** statement cannot be configured at the same time. If you attempt to configure both statements at the same time, the routing device displays a warning message when you enter the **show protocols ospf** command.

The second example shows how to reenabling the standard OSPFv2 restart helper capability that you disabled in the first example.

### Configuration

- [Disabling Helper Mode for OSPFv2 on page 4142](#)
- [Reenabling Helper Mode for OSPFv2 on page 4143](#)

### *Disabling Helper Mode for OSPFv2*

**CLI Quick Configuration** To quickly enable graceful restart for OSPFv2 with helper mode disabled, copy the following commands and paste them into the CLI.

```
[edit]
set interfaces fe-1/1/1 unit 0 family inet address 10.0.0.4
set interfaces fe-1/1/2 unit 0 family inet address 10.0.0.5
set protocols ospf area 0.0.0.0 interface fe-1/1/1
set protocols ospf area 0.0.0.0 interface fe-1/1/2
set protocols ospf graceful-restart helper-disable standard
```

**Step-by-Step Procedure** To enable graceful restart for OSPFv2 with helper mode disabled:

1. Configure the interfaces.  

```
[edit]
user@host# set interfaces fe-1/1/1 unit 0 family inet address 10.0.0.4
user@host# set interfaces fe-1/1/2 unit 0 family inet address 10.0.0.5
```
2. Configure OSPFv2 on the interfaces  

```
[edit]
user@host# set protocols ospf area 0.0.0.0 interface fe-1/1/1
user@host# set protocols ospf area 0.0.0.0 interface fe-1/1/2
```
3. Disable the OSPFv2 graceful restart helper capability.  
If you disable the OSPFv2 graceful restart helper capability, you cannot disable strict LSA checking.  

```
[edit]
user@host# set protocols ospf graceful-restart helper-disable standard
```
4. If you are done configuring the device, commit the configuration.  

```
[edit]
user@host# commit
```

**Results** Confirm your configuration by entering the **show interfaces** and the **show protocols ospf** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
fe-1/1/1 {
  unit 0 {
    family inet {
      address 10.0.0.4/32;
    }
  }
}
fe-1/1/2 {
  unit 0 {
    family inet {
      address 10.0.0.5/32;
    }
  }
}
```

```

user@host# show protocols ospf
graceful-restart {
  helper-disable {
    standard;
  }
}
area 0.0.0.0 {
  interface fe-1/1/1.0;
  interface fe-1/1/2.0;
}

```

### *Reenabling Helper Mode for OSPFv2*

#### **CLI Quick Configuration**

To quickly reenabling standard helper-mode for OSPFv2, copy the following command and paste it into the CLI.

```

[edit]
delete protocols ospf graceful-restart helper-disable standard

```

**NOTE:** To reenabling restart signaling-based helper mode, include the `restart-signaling` statement. To reenabling both standard and restart signaling-based helper mode, include the `both` statement.

#### **Step-by-Step Procedure**

To reenabling standard helper mode for OSPFv2:

1. Delete the standard helper-mode statement from the OSPFv2 configuration.

```

[edit]
user@host# delete protocols ospf graceful-restart helper-disable standard

```

2. If you are done configuring the device, commit the configuration.

```

[edit]
user@host# commit

```

#### **Results**

After you reenabling standard helper mode, the `show protocols ospf` command no longer displays the graceful restart configuration.

#### **Verification**

Confirm that the configuration is working properly.

- [Verifying the OSPFv2 Graceful Restart Configuration on page 4143](#)
- [Verifying Graceful Restart Status on page 4144](#)

#### **Verifying the OSPFv2 Graceful Restart Configuration**

#### **Purpose**

Verify information about your OSPFv2 graceful restart configuration. The Restart field displays the status of graceful restart as either enabled or disabled, the Graceful restart helper mode field displays the status of the standard helper mode capability as enabled or disabled, and the Restart-signaling helper mode field displays the status of the restart

signaling-based helper mode as enabled or disabled. By default, both standard and restart signaling-based helper modes are enabled.

**Action** From operational mode, enter the **show ospf overview** command.

#### ***Verifying Graceful Restart Status***

**Purpose** Verify the status of graceful restart. The Restart State field displays Pending if the restart has not completed, or Complete if the restart has finished. The Path selection timeout field indicates the amount of time remaining until graceful restart is declared complete. There is a more detailed Restart State field that displays a list of protocols that have completed graceful restart or have not yet completed graceful restart for the specified routing table.

**Action** From operational mode, enter the **show route instance detail** command.

#### **Example: Configuring the Helper Capability Mode for OSPFv3 Graceful Restart**

This example shows how to disable and reenabling the helper mode capability for OSPFv3 graceful restart.

- [Requirements on page 4144](#)
- [Overview on page 4144](#)
- [Configuration on page 4145](#)
- [Verification on page 4147](#)

#### ***Requirements***

Before you begin:

- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4048.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4050
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4053.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4055.

#### ***Overview***

The OSPF graceful restart helper capability assists a neighboring routing device attempting a graceful restart. By default, the helper capability is globally enabled when you start the routing platform. This means that the helper capability is enabled when you start OSPF, even if graceful restart is not globally enabled or specifically enabled for OSPF. You can further modify your graceful restart configuration to disable the helper capability.

In the first example, interfaces **fe-1/1/1** and **fe-1/1/2** are in OSPFv3 area 0.0.0.0, and you configure those interfaces for graceful restart. You then disable the OSPFv3 graceful restart helper capability by including the **helper-disable** statement.

**NOTE:** The **helper-disable** statement and the **no-strict-lsa-checking** statement cannot be configured at the same time. If you attempt to configure both statements at the same time, the routing device displays a warning message when you enter the **show protocols ospf** command.

The second example shows how to reenable the OSPFv3 restart helper capability that you disabled in the first example.

### Configuration

- [Disabling Helper Mode for OSPFv3 on page 4145](#)
- [Reenabling Helper Mode for OSPFv3 on page 4146](#)

### Disabling Helper Mode for OSPFv3

#### CLI Quick Configuration

To quickly enable graceful restart for OSPFv3 with helper mode disabled, copy the following commands and paste them into the CLI.

```
[edit]
set interfaces fe-1/1/1 unit 0 family inet6 address 2002:0a00:0004::
set interfaces fe-1/1/2 unit 0 family inet6 address 2002:0a00:0005::
set protocols ospf3 area 0.0.0.0 interface fe-1/1/1
set protocols ospf3 area 0.0.0.0 interface fe-1/1/2
set protocols ospf3 graceful-restart helper-disable
```

#### Step-by-Step Procedure

To enable graceful restart for OSPFv3 with helper mode disabled:

1. Configure the interfaces.
 

```
[edit]
user@host# set interfaces fe-1/1/1 unit 0 family inet6 address 2002:0a00:0004::
user@host# set interfaces fe-1/1/2 unit 0 family inet6 address 2002:0a00:0005::
```
2. Configure OSPFv3 on the interfaces
 

```
[edit]
user@host# set protocols ospf3 area 0.0.0.0 interface fe-1/1/1
user@host# set protocols ospf3 area 0.0.0.0 interface fe-1/1/2
```
3. Disable the OSPFv3 graceful restart helper capability.
 

If you disable the OSPFv3 graceful restart helper capability, you cannot disable strict LSA checking.

```
[edit]
user@host# set protocols ospf3 graceful-restart helper-disable
```
4. If you are done configuring the device, commit the configuration.
 

```
[edit]
user@host# commit
```

**Results** Confirm your configuration by entering the **show interfaces** and the **show protocols ospf3** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
fe-1/1/1 {
  unit 0 {
    family inet6 {
      address 2002:0a00:0004::/128;
    }
  }
}
fe-1/1/2 {
  unit 0 {
    family inet6 {
      address 2002:0a00:0005::/128;
    }
  }
}
user@host# show protocols ospf3
graceful-restart {
  helper-disable;
}
area 0.0.0.0 {
  interface fe-1/1/1.0;
  interface fe-1/1/2.0;
}
```

#### *Reenabling Helper Mode for OSPFv3*

**CLI Quick Configuration** To quickly reenable helper-mode for OSPFv3, copy the following command and paste it into the CLI.

```
[edit]
delete protocols ospf3 graceful-restart helper-disable
```

**Step-by-Step Procedure** To reenable helper mode for OSPFv3:

1. Delete the standard helper-mode statement from the OSPFv3 configuration.

```
[edit]
user@host# delete protocols ospf3 graceful-restart helper-disable
```

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**Results** After you reenable standard helper mode, the **show protocols ospfs** command no longer displays the graceful restart configuration.

**Verification**

Confirm that the configuration is working properly.

- [Verifying the OSPFv3 Graceful Restart Configuration on page 4147](#)
- [Verifying Graceful Restart Status on page 4147](#)

**Verifying the OSPFv3 Graceful Restart Configuration**

**Purpose** Verify information about your OSPFv3 graceful restart configuration. The Restart field displays the status of graceful restart as either enabled or disabled, and the Helper mode field displays the status of the helper mode capability as either enabled or disabled.

**Action** From operational mode, enter the **show ospf3 overview** command.

**Verifying Graceful Restart Status**

**Purpose** Verify the status of graceful restart. The Restart State field displays Pending if the restart has not completed, or Complete if the restart has finished. The Path selection timeout field indicates the amount of time remaining until graceful restart is declared complete. There is a more detailed Restart State field that displays a list of protocols that have completed graceful restart or have not yet completed graceful restart for the specified routing table.

**Action** From operational mode, enter the **show route instance detail** command.

**Example: Disabling Strict LSA Checking for OSPF Graceful Restart**

This example shows how to disable strict link-state advertisement (LSA) checking for OSPF graceful restart.

- [Requirements on page 4147](#)
- [Overview on page 4148](#)
- [Configuration on page 4148](#)
- [Verification on page 4149](#)

**Requirements**

Before you begin:

- Configure the router identifiers for the devices in your OSPF network. See [“Example: Configuring an OSPF Router Identifier” on page 4048](#).
- Control OSPF designated router election. See [“Example: Controlling OSPF Designated Router Election” on page 4050](#)
- Configure a single-area OSPF network. See [“Example: Configuring a Single-Area OSPF Network” on page 4053](#).
- Configure a multiarea OSPF network. See [“Example: Configuring a Multiarea OSPF Network” on page 4055](#).

### Overview

You can disable strict LSA checking to prevent the termination of graceful restart by a helping router. You might configure this option for interoperability with other vendor devices. The OSPF graceful restart helper capability must be enabled if you disable strict LSA checking. By default, LSA checking is enabled.

In this example, interfaces **fe-1/1/1** and **fe-1/1/2** are in OSPF area 0.0.0.0, and you configure those interfaces for graceful restart. You then disable strict LSA checking by including the **no-strict-lsa-checking** statement.

**NOTE:** The **helper-disable** statement and the **no-strict-lsa-checking** statement cannot be configured at the same time. If you attempt to configure both statements at the same time, the routing device displays a warning message when you enter the **show protocols ospf** command.

### Configuration

#### CLI Quick Configuration

To quickly enable graceful restart for OSPF with strict LSA checking disabled, copy the following commands and paste them into the CLI.

```
[edit]
set interfaces fe-1/1/1 unit 0 family inet address 10.0.0.4
set interfaces fe-1/1/2 unit 0 family inet address 10.0.0.5
set protocols ospf area 0.0.0.0 interface fe-1/1/1
set protocols ospf area 0.0.0.0 interface fe-1/1/2
set protocols ospf graceful-restart no-strict-lsa-checking
```

#### Step-by-Step Procedure

To enable graceful restart for OSPF with strict LSA checking disabled:

1. Configure the interfaces.

**NOTE:** For OSPFv3, use IPv6 addresses.

```
[edit]
user@host# set interfaces fe-1/1/1 unit 0 family inet address 10.0.0.4
user@host# set interfaces fe-1/1/2 unit 0 family inet address 10.0.0.5
```

2. Configure OSPF on the interfaces

**NOTE:** To specify OSPFv3, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# set protocols ospf area 0.0.0.0 interface fe-1/1/1
user@host# set protocols ospf area 0.0.0.0 interface fe-1/1/2
```

3. Disable strict LSA checking.

If you disable the strict LSA checking, OSPF graceful restart helper capability must be enabled (which is the default behavior).

```
[edit]
user@host# set protocols ospf graceful-restart no-strict-lsa-checking
```

4. If you are done configuring the device, commit the configuration.

```
[edit ]
user@host# commit
```

**Results** Confirm your configuration by entering the **show interfaces** and the **show protocols ospf** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
fe-1/1/1 {
  unit 0 {
    family inet {
      address 10.0.0.4/32;
    }
  }
}
fe-1/1/2 {
  unit 0 {
    family inet {
      address 10.0.0.5/32;
    }
  }
}
user@host# show protocols ospf
graceful-restart {
  no-strict-lsa-checking;
}
area 0.0.0.0 {
  interface fe-1/1/1.0;
  interface fe-1/1/2.0;
}
```

To confirm your OSPFv3 configuration, enter the **show interfaces** and the **show protocols ospf3** commands.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying the OSPF Graceful Restart Configuration on page 4149](#)
- [Verifying Graceful Restart Status on page 4150](#)

### **Verifying the OSPF Graceful Restart Configuration**

**Purpose** Verify information about your OSPF graceful restart configuration. The Restart field displays the status of graceful restart as either enabled or disabled.

**Action** From operational mode, enter the **show ospf overview** command for OSPFv2, and enter the **show ospf3 overview** command for OSPFv3.

#### ***Verifying Graceful Restart Status***

**Purpose** Verify the status of graceful restart. The Restart State field displays Pending if the restart has not completed, or Complete if the restart has finished. The Path selection timeout field indicates the amount of time remaining until graceful restart is declared complete. There is a more detailed Restart State field that displays a list of protocols that have completed graceful restart or have not yet completed graceful restart for the specified routing table.

**Action** From operational mode, enter the **show route instance detail** command.

#### OSPF Support for Traffic Engineering

Traffic engineering allows you to control the path that data packets follow, bypassing the standard routing model, which uses routing tables. Traffic engineering moves flows from congested links to alternate links that would not be selected by the automatically computed destination-based shortest path.

To help provide traffic engineering and MPLS with information about network topology and loading, extensions have been added to the Junos OS implementation of OSPF. When traffic engineering is enabled on the routing device, you can enable OSPF traffic engineering support. When you enable traffic engineering for OSPF, the shortest-path-first (SPF) algorithm takes into account the various label-switched paths (LSPs) configured under MPLS and configures OSPF to generate opaque link-state advertisements (LSAs) that carry traffic engineering parameters. The parameters are used to populate the traffic engineering database. The traffic engineering database is used exclusively for calculating explicit paths for the placement of LSPs across the physical topology. The Constrained

Shortest Path First (CSPF) algorithm uses the traffic engineering database to compute the paths that MPLS LSPs take. RSVP uses this path information to set up LSPs and to reserve bandwidth for them.

By default, traffic engineering support is disabled. To enable traffic engineering, include the **traffic-engineering** statement. You can also configure the following OSPF traffic engineering extensions:

- **advertise-unnnumbered-interfaces**—(OSPFv2 only) Advertises the link-local identifier in the link-local traffic engineering LSA packet. This statement must be included on both ends of an unnumbered link to allow an ingress LER to update the link in its traffic engineering database and use it for CSPF calculations. The link-local identifier is then used by RSVP to signal unnumbered interfaces as defined in RFC 3477, *Signalling Unnumbered Links in Resource Reservation Protocol - Traffic Engineering (RSVP-TE)*.
- **credibility-protocol-preference**—(OSPFv2 only) Assigns a credibility value to OSPF routes in the traffic engineering database. By default, Junos OS prefers IS-IS routes in the traffic engineering database over other interior gateway protocol (IGP) routes even if the routes of another IGP are configured with a lower, that is, more preferred, preference value. The traffic engineering database assigns a credibility value to each IGP and prefers the routes of the IGP with the highest credibility value. In Junos OS Release 9.4 and later, you can configure OSPF to take protocol preference into account to determine the traffic engineering database credibility value. When protocol preference is used to determine the credibility value, IS-IS routes are not automatically preferred by the traffic engineering database, depending on your configuration.
- **ignore-lsp-metrics**—Ignores RSVP LSP metrics in OSPF traffic engineering shortcut calculations or when you configure LDP over RSVP LSPs. This option avoids mutual dependency between OSPF and RSVP, eliminating the time period when the RSVP metric used for tunneling traffic is not up to date. In addition, If you are using RSVP for traffic engineering, you can run LDP simultaneously to eliminate the distribution of external routes in the core. The LSPs established by LDP are tunneled through the LSPs established by RSVP. LDP effectively treats the traffic-engineered LSPs as single hops.
- **multicast-rpf-routes**—(OSPFv2 only) Installs unicast IPv4 routes (not LSPs) in the multicast routing table (**inet.2**) for multicast reverse-path forwarding (RPF) checks. The **inet.2** routing table consists of unicast routes used for multicast RPF lookup. RPF is an antispoofing mechanism used to check if the packet is coming in on an interface that is also sending data back to the packet source.
- **no-topology**—(OSPFv2 only) To disable the dissemination of link-state topology information. If disabled, traffic engineering topology information is no longer distributed within the OSPF area.
- **shortcuts**—Configures OSPF to use MPLS LSPs as shortcut next hops. By default, shortcut routes calculated through OSPFv2 are installed in the **inet.3** routing table, and shortcut routes calculated through OSPFv3 are installed in the **inet6.3** routing table.

**NOTE:** Whenever possible, use OSPF IGP shortcuts configured at the `[edit protocols mpls traffic-engineering bgp-igp]` hierarchy level instead of traffic engineering shortcuts configured at the `[edit protocols (ospf | ospf3) traffic-engineering shortcuts]` hierarchy level.

If you configure OSPF IGP shortcuts, `inet.3` routes are moved into the `inet.0` routing table. In addition, you can verify the data path using `ping` or `traceroute` commands since the ping and traceroute packets get tunneled into the LSP. In case of a VPN enabled device, we recommend using `[edit protocols mpls traffic-engineering bgp-igp-both-ribs]` because BGP next-hop resolution for VPN prefixes relies on entries in the `inet.3` table.

If you configure traffic engineering shortcuts, OSPF treats the MPLS LSP as a candidate next hop and installs the routes in the `inet.3` (for OSPFv2) and `inet6.3` (for OSPFv3) routing tables. The only use for these tables is to allow BGP to perform next-hop resolution. In addition, you cannot verify the data path of these routes using `ping` or `traceroute` commands because the ping and traceroute packets get tunneled into the LSP.

- **`lsp-metric-info-summary`**—Advertises the LSP metric in summary LSAs to treat the LSP as a link. This configuration allows other routing devices in the network to use this LSP. To accomplish this, you need to configure MPLS and OSPF traffic engineering to advertise the LSP metric in summary LSAs.

When you enable traffic engineering on the routing device, you can also configure an OSPF metric that is used exclusively for traffic engineering. The traffic engineering metric is used for information injected into the traffic engineering database. Its value does not affect normal OSPF forwarding.

**CAUTION:** When the OSPF traffic engineering configuration is considerably modified, the routing table entries are deleted and the routing table is recreated. Changes to configuration that can cause this behavior include enabling or disabling:

- Traffic engineering shortcuts
- IGP shortcuts
- LDP tunneling
- Multiprotocol LSP
- Advertise summary metrics
- Multicast RPF routes

---

### Example: Enabling OSPF Traffic Engineering Support

---

This example shows how to enable OSPF traffic engineering support to advertise the label-switched path (LSP) metric in summary link-state advertisements (LSAs).

- [Requirements on page 4153](#)
- [Overview on page 4153](#)
- [Configuration on page 4154](#)
- [Verification on page 4157](#)

#### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure BGP per your network requirements. See the *Junos OS Routing Protocols Library for Routing Devices*
- Configure MPLS per your network requirements. See the *Junos OS MPLS Applications Library for Routing Devices*.

#### Overview

You can configure OSPF to treat an LSP as a link and have other routing devices in the network use this LSP. To accomplish this, you configure MPLS and OSPF traffic engineering to advertise the LSP metric in summary LSAs.

In this example, there are four routing devices in area 0.0.0.0, and you want OSPF to treat the LSP named R1-to-R4 that goes from the ingress Device R1 to the egress Device R4 as a link.

For OSPF, you enable traffic engineering on all four routing devices in the area by including the **traffic-engineering** statement. This configuration ensures that the shortest-path-first (SPF) algorithm takes into account the LSPs configured under MPLS and configures OSPF to generate LSAs that carry traffic engineering parameters. You further ensure that OSPF uses the MPLS LSP as the next hop and advertises the LSP metric in summary LSAs, by including the optional **shortcuts lsp-metric-into-summary** statement on the ingress Device R1.

For MPLS, you enable traffic engineering so that MPLS performs traffic engineering on both BGP and IGP destinations by including the **traffic-engineering bgp-igp** statement, and you include the LSP named R1-to-R4 by including the **label-switched-path lsp-path-name to address** statement on the ingress Device R1. The address specified in the **to** statement on the ingress Device R1 must match the router ID of the egress Device R4 for the LSP to function as a direct link to the egress routing device and to be used as input to the OSPF SPF calculations. In this example, the router ID of the egress Device R4 is 10.0.0.4.

### Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Modifying the Junos OS Configuration* in *CLI User Guide*.

**CLI Quick Configuration** To quickly enable OSPF traffic engineering support to advertise the LSP metric in summary LSAs, copy the following commands and paste them into the CLI.

Configuration on R1:

```
[edit]
set routing-options router-id 10.0.0.1
set protocols ospf area 0.0.0.0 interface all
set protocols ospf area 0.0.0.0 interface fxp0.0 disable
set protocols ospf traffic-engineering shortcuts lsp-metric-into-summary
set protocols mpls traffic-engineering bgp-igp
set protocols mpls label-switched-path R1-to-R4 to 10.0.0.4
```

Configuration on R2:

```
[edit]
set routing-options router-id 10.0.0.2
set protocols ospf area 0.0.0.0 interface all
set protocols ospf area 0.0.0.0 interface fxp0.0 disable
set protocols ospf traffic-engineering
```

Configuration on R3:

```
[edit]
set routing-options router-id 10.0.0.3
set protocols ospf area 0.0.0.0 interface all
set protocols ospf area 0.0.0.0 interface fxp0.0 disable
set protocols ospf traffic-engineering
```

Configuration on R4:

```
[edit]
set routing-options router-id 10.0.0.4
set protocols ospf area 0.0.0.0 interface all
set protocols ospf area 0.0.0.0 interface fxp0.0 disable
set protocols ospf traffic-engineering
```

**Step-by-Step Procedure** To enable OSPF traffic engineering support to advertise LSP metrics in summary LSAs:

1. Configure the router ID.

```
[edit]
user@R1# set routing-options router-id 10.0.0.1
```

```
[edit]
user@R2# set routing-options router-id 10.0.0.2
```

```
[edit]
user@R3# set routing-options router-id 10.0.0.3
```

```
[edit]
user@R4# set routing-options router-id 10.0.0.4
```

2. Configure the OSPF area and add the interfaces.

**NOTE:** To specify OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@R1# set protocols ospf area 0.0.0.0 interface all
user@R1# set protocols ospf area 0.0.0.0 interface fxp0.0 disable
```

```
[edit]
user@R2# set protocols ospf area 0.0.0.0 interface all
user@R2# set protocols ospf area 0.0.0.0 interface fxp0.0 disable
```

```
[edit]
user@R3# set protocols ospf area 0.0.0.0 interface all
user@R3# set protocols ospf area 0.0.0.0 interface fxp0.0 disable
```

```
[edit]
user@R4# set protocols ospf area 0.0.0.0 interface all
user@R4# set protocols ospf area 0.0.0.0 interface fxp0.0 disable
```

3. Enable OSPF traffic engineering.

```
[edit]
user@R1 set protocols ospf traffic-engineering shortcuts lsp-metric-into-summary
```

```
[edit]
user@R2 set protocols ospf traffic-engineering
```

```
[edit]
user@R3 set protocols ospf traffic-engineering
```

```
[edit]
user@R4 set protocols ospf traffic-engineering
```

4. On Device R1, configure MPLS traffic engineering.

```
[edit ]
user@R1 set protocol mpls traffic-engineering bgp-igp
user@R1 set protocols mpls label-switched-path R1-to-R4 to 10.0.0.4
```

5. If you are done configuring the devices, commit the configuration.

```
[edit]
user@host# commit
```

**Results** Confirm your configuration by entering the `show routing-options`, `show protocols ospf`, and `show protocols mpls` commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

Output for R1:

```
user@host# show routing-options
router-id 10.0.0.1;

user@host# show protocols ospf
traffic-engineering {
  shortcuts lsp-metric-into-summary;
```

```
}
area 0.0.0.0 {
  interface all;
  interface fxp0.0 {
    disable;
  }
}

user@host# show protocols mpls
traffic-engineering bgp-igp;
label-switched-path R1-to-R4 {
  to 10.0.0.4;
}
```

Output for R2:

```
user@host# show routing-options
router-id 10.0.0.2;

user@host# show protocols ospf
traffic-engineering;
area 0.0.0.0 {
  interface all;
  interface fxp0.0 {
    disable;
  }
}
```

Output for R3:

```
user@host# show routing-options
router-id 10.0.0.3;

user@host# show protocols ospf
traffic-engineering;
area 0.0.0.0 {
  interface all;
  interface fxp0.0 {
    disable;
  }
}
```

Output for R4:

```
user@host# show routing-options
router-id 10.0.0.4;

user@host# show protocols ospf
traffic-engineering;
area 0.0.0.0 {
  interface all;
  interface fxp0.0 {
    disable;
  }
}
```

To confirm your OSPFv3 configuration, enter the **show routing-options**, **show protocols ospf3**, and **show protocols mpls** commands.

**Verification**

Confirm that the configuration is working properly.

- [Verifying the Traffic Engineering Capability for OSPF on page 4157](#)
- [Verifying OSPF Entries in the Traffic Engineering Database on page 4157](#)
- [Verifying That the Traffic Engineering Database Is Learning Node Information from OSPF on page 4157](#)

**Verifying the Traffic Engineering Capability for OSPF**

**Purpose** Verify that traffic engineering has been enabled for OSPF. By default, traffic engineering is disabled.

**Action** From operational mode, enter the **show ospf overview** command for OSPFv2, and enter the **show ospf3 overview** for OSPFv3.

**Verifying OSPF Entries in the Traffic Engineering Database**

**Purpose** Verify the OSPF information in the traffic engineering database. The Protocol field displays OSPF and the area from which the information was learned.

**Action** From operational mode, enter the **show ted database** command.

**Verifying That the Traffic Engineering Database Is Learning Node Information from OSPF**

**Purpose** Verify that OSPF is reporting node information. The Protocol name field displays OSPF and the area from which the information was learned.

**Action** From operational mode, enter the **show ted protocol** command.

**Example: Configuring the Traffic Engineering Metric for a Specific OSPF Interface**

This example shows how to configure the OSPF metric value used for traffic engineering.

- [Configuration on page 4158](#)
- [Verification on page 4159](#)

**Requirements**

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure OSPF for traffic engineering. See “[Example: Enabling OSPF Traffic Engineering Support](#)” on page 4153

### Overview

You can configure an OSPF metric that is used exclusively for traffic engineering. To modify the default value of the traffic engineering metric, include the **te-metric** statement. The OSPF traffic engineering metric does not affect normal OSPF forwarding. By default, the traffic engineering metric is the same value as the OSPF metric. The range is 1 through 65,535.

In this example, you configure the OSPF traffic engineering metric on OSPF interface **fe-0/1/1** in area 0.0.0.0.

### Configuration

**CLI Quick Configuration** To quickly configure the OSPF traffic engineering metric for a specific interface, copy the following command and paste it into the CLI.

```
[edit]
set protocols ospf area 0.0.0.0 interface fe-0/1/1 te-metric 10
```

**Step-by-Step Procedure** To configure an OSPF traffic engineering metric for a specific interface used only for traffic engineering:

1. Create an OSPF area.

**NOTE:** To specify OSPFv3, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# edit protocols ospf area 0.0.0.0
```

2. Configure the traffic engineering metric of the OSPF network segments.

```
[edit protocols ospf area 0.0.0.0]
user@host# set interface fe-0/1/1 te-metric 10
```

3. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf area 0.0.0.0]
user@host# commit
```

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.0 {
  interface fe-0/1/1.0 {
    te-metric 10;
  }
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

**Verification**

Confirm that the configuration is working properly.

**Verifying the Configured Traffic Engineering Metric**

**Purpose** Verify the traffic engineering metric value. Confirm that Metric field displays the configured traffic engineering metric.

**Action** From operational mode, enter the **show ted database extensive** command.

**Example: Configuring OSPF Passive Traffic Engineering Mode**

- [OSPF Passive Traffic Engineering Mode on page 4159](#)
- [Example: Configuring OSPF Passive Traffic Engineering Mode on page 4159](#)

**OSPF Passive Traffic Engineering Mode**

Ordinarily, interior routing protocols such as OSPF are not run on links between autonomous systems. However, for inter-AS traffic engineering to function properly, information about the inter-AS link—in particular, the address on the remote interface—must be made available inside the autonomous system (AS). This information is not normally included either in the external BGP (EBGP) reachability messages or in the OSPF routing advertisements.

To flood this link address information within the AS and make it available for traffic engineering calculations, you must configure OSPF passive mode for traffic engineering on each inter-AS interface. You must also supply the remote address for OSPF to distribute and include it in the traffic engineering database. OSPF traffic engineering mode allows MPLS label-switched paths (LSPs) to dynamically discover OSPF AS boundary routers and to allow routers to establish a traffic engineering LSP across multiple autonomous systems.

**Example: Configuring OSPF Passive Traffic Engineering Mode**

This example shows how to configure OSPF passive mode for traffic engineering on an inter-AS interface. The AS boundary router link between the EBGP peers must be a directly connected link and must be configured as a passive traffic engineering link.

- [Requirements on page 4159](#)
- [Overview on page 4160](#)
- [Configuration on page 4160](#)
- [Verification on page 4161](#)

**Requirements**

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure BGP per your network requirements. See the *Junos OS Routing Protocols Library for Routing Devices*.
- Configure the LSP per your network requirements. See the *Junos OS MPLS Applications Library for Routing Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4048.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4050
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4053.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4055.

### Overview

You can configure OSPF passive mode for traffic engineering on an inter-AS interface. The address used for the remote node of the OSPF passive traffic engineering link must be the same as the address used for the EBGP link. In this example, you configure interface **so-1/1/0** in area 0.0.0.1 as the inter-AS link to distribute traffic engineering information with OSPF within the AS and include the following settings:

- **passive**—Advertises the direct interface addresses on an interface without actually running OSPF on that interface. A passive interface is one for which the address information is advertised as an internal route in OSPF, but on which the protocol does not run.
- **traffic-engineering**—Configures an interface in OSPF passive traffic-engineering mode to enable dynamic discovery of OSPF AS boundary routers. By default, OSPF passive traffic-engineering mode is disabled.
- **remote-node-id**—Specifies the IP address at the far end of the inter-AS link. In this example, the remote IP address is 192.168.207.2.

### Configuration

To quickly configure OSPF passive mode for traffic engineering, copy the following command, remove any line breaks, and paste it into the CLI.

```
[edit]
set protocols ospf area 0.0.0.1 interface so-1/1/0 passive traffic-engineering remote-node-id
192.168.207.2
```

### Step-by-Step Procedure

To configure OSPF passive traffic engineering mode:

1. Create an OSPF area.

**NOTE:** To specify OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@host# set protocols ospf area 0.0.0.1
```

2. Configure interface `so-1/1/0` as a passive interface configured for traffic engineering, and specify the IP address at the far end of the inter-AS link.

```
[edit protocols ospf area 0.0.0.1]
user@host# set interface so-1/1/0 passive traffic-engineering remote-node-id
192.168.207.2
```

3. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf]
user@host# commit
```

**Results** Confirm your configuration by entering the `show protocols ospf` command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
area 0.0.0.1 {
  interface so-1/1/0.0 {
    passive {
      traffic-engineering {
        remote-node-id 192.168.207.2;
      }
    }
  }
}
```

To confirm your OSPFv3 configuration, enter the `show protocols ospf3` command.

### Verification

Confirm that the configuration is working properly.

#### Verifying the Status of OSPF Interfaces

**Purpose** Verify the status of OSPF interfaces. If the interface is passive, the Adj count field is 0 because no adjacencies have been formed. Next to this field, you might also see the word Passive.

**Action** From operational mode, enter the `show ospf interface detail` command for OSPFv2, and enter the `show ospf3 interface detail` command for OSPFv3.

## OSPF Database Protection Configuration

---

- [Example: Configuring OSPF Database Protection on page 4162](#)

### Example: Configuring OSPF Database Protection

- [OSPF Database Protection Overview on page 4162](#)
- [Configuring OSPF Database Protection on page 4163](#)

#### OSPF Database Protection Overview

---

OSPF database protection allows you to limit the number of link-state advertisements (LSAs) not generated by the local router in a given OSPF routing instance, helping to protect the link-state database from being flooded with excessive LSAs. This feature is particularly useful if VPN routing and forwarding is configured on your provider edge and customer edge routers using OSPF as the routing protocol. An overrun link-state database on the customer edge router can exhaust resources on the provider edge router and impact the rest of the service provider network.

When you enable OSPF database protection, the maximum number of LSAs you specify includes all LSAs whose advertising router ID is not equal to the local router ID (nonsystem-generated LSAs). These might include external LSAs as well as LSAs with any scope such as the link, area, and autonomous system (AS).

Once the specified maximum LSA count is exceeded, the database typically enters into the ignore state. In this state, all neighbors are brought down, and nonsystem-generated LSAs are destroyed. In addition, the database sends out hellos but ignores all received packets. As a result, the database does not form any full neighbors, and therefore does not learn about new LSAs. However, if you have configured the **warning-only** option, only a warning is issued and the database does not enter the ignore state but continues to operate as before.

You can also configure one or more of the following options:

- A warning threshold for issuing a warning message before the LSA limit is reached.
- An ignore state time during which the database must remain in the ignore state and after which normal operations can be resumed.
- An ignore state count that limits the number of times the database can enter the ignore state, after which it must enter the isolate state. The isolate state is very similar to the ignore state, but has one important difference: once the database enters the isolate state, it must remain there until you issue a command to clear database protection before it can return to normal operations.
- A reset time during which the database must stay out of the ignore or isolate state before it is returned to a normal operating state.

## Configuring OSPF Database Protection

By configuring OSPF database protection, you can help prevent your OSPF link-state database from being overrun with excessive LSAs that are not generated by the local router. You specify the maximum number of LSAs whose advertising router ID is not the same as the local router ID in an OSPF instance. This feature is particularly useful if your provider edge and customer edge routers are configured with VPN routing and forwarding using OSPF.

OSPF database protection is supported on:

- Logical systems
- All routing instances supported by OSPFv2 and OSPFv3
- OSPFv2 and OSPFv3 topologies
- OSPFv3 realms

To configure OSPF database protection:

1. Include the **database-protection** statement at one of the following hierarchy levels:
  - [edit protocols ospf | ospf3]
  - [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ospf | ospf3)]
  - [edit routing-instances *routing-instance-name* protocols (ospf | ospf3)]
  - [edit routing-instances *routing-instance-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-unicast | ipv6-multicast)]
2. Include the **maximum-lsa *number*** statement.

**NOTE:** The **maximum-lsa** statement is mandatory, and there is no default value for it. If you omit this statement, you cannot configure OSPF database protection.

3. (Optional) Include the following statements:
  - **ignore-count *number***—Specify the number of times the database can enter the ignore state before it goes into the isolate state.
  - **ignore-time *seconds***—Specify the time limit the database must remain in the ignore state before it resumes regular operations.
  - **reset-time *seconds***—Specify the time during which the database must operate without being in either the ignore or isolate state before it is reset to a normal operating state.
  - **warning-threshold *percent***—Specify the percent of the maximum LSA number that must be exceeded before a warning message is issued.

4. (Optional) Include the **warning-only** statement to prevent the database from entering the ignore state or isolate state when the maximum LSA count is exceeded.

**NOTE:** If you include the **warning-only** statement, values for the other optional statements at the same hierarchy level are not used when the maximum LSA number is exceeded.

5. Verify your configuration by checking the database protection fields in the output of the **show ospf overview** command.

- [Example: Configuring a Route Filter Policy to Specify Priority for Prefixes Learned Through OSPF on page 4176](#)

---

#### Understanding OSPF Routing Policy

---

Each routing policy is identified by a policy name. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks. Each routing policy name must be unique within a configuration. Once a policy is created and named, it must be applied before it is active.

In the **import** statement, you list the name of the routing policy used to filter OSPF external routes from being installed into the routing tables of OSPF neighbors. You can filter the routes, but not link-state address (LSA) flooding. An external route is a route that is outside the OSPF Autonomous System (AS). The import policy does not impact the OSPF database. This means that the import policy has no impact on the link-state advertisements.

In the **export** statement, you list the name of the routing policy to be evaluated when routes are being exported from the routing table into OSPF.

By default, if a routing device has multiple OSPF areas, learned routes from other areas are automatically installed into area 0 of the routing table.

To specify more than one policy and create a policy chain, you list the policies using a space as a separator. If multiple policies are specified, the policies are evaluated in the order in which they are specified. As soon as an accept or reject action is executed, the policy chain evaluation ends.

This topic describes the following information:

- [Routing Policy Terms on page 4165](#)
- [Routing Policy Match Conditions on page 4165](#)
- [Routing Policy Actions on page 4166](#)

### ***Routing Policy Terms***

Routing policies are made up of one or more terms. A term is a named structure in which match conditions and actions are defined. You can define one or more terms. The name can contain letters, numbers, and hyphens ( - ) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks.

Each term contains a set of match conditions and a set of actions:

- Match conditions are criteria that a route must match before the actions can be applied. If a route matches all criteria, one or more actions are applied to the route.
- Actions specify whether to accept or reject the route, control how a series of policies are evaluated, and manipulate the characteristics associated with a route.

### ***Routing Policy Match Conditions***

A match condition defines the criteria that a route must match for an action to take place. You can define one or more match conditions for each term. If a route matches all of the match conditions for a particular term, the actions defined for that term are processed.

Each term can include two statements, **from** and **to**, that define the match conditions:

- In the **from** statement, you define the criteria that an incoming route must match. You can specify one or more match conditions. If you specify more than one, they all must match the route for a match to occur.

The **from** statement is optional. If you omit the **from** and the **to** statements, all routes are considered to match.

**NOTE:** In export policies, omitting the **from** statement from a routing policy term might lead to unexpected results. For more information, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

- In the **to** statement, you define the criteria that an outgoing route must match. You can specify one or more match conditions. If you specify more than one, they all must match the route for a match to occur.

The order of the match conditions in a term is not important because a route must match all match conditions in a term for an action to be taken.

For a complete list of match conditions, see *Routing Policy Match Conditions* in the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

### **Routing Policy Actions**

An action defines what the routing device does with the route when the route matches all the match conditions in the **from** and **to** statements for a particular term. If a term does not have **from** and **to** statements, all routes are considered to match and the actions apply to all routes.

Each term can have one or more of the following types of actions. The actions are configured under the **then** statement.

- Flow control actions, which affect whether to accept or reject the route and whether to evaluate the next term or routing policy.
- Actions that manipulate route characteristics.
- Trace action, which logs route matches.

The **then** statement is optional. If you omit it, one of the following occurs:

- The next term in the routing policy, if one exists, is evaluated.
- If the routing policy has no more terms, the next routing policy, if one exists, is evaluated.
- If there are no more terms or routing policies, the **accept** or **reject** action specified by the default policy is executed.

For a complete list of routing policy actions, see *Actions in Routing Policy Terms* in the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

### **Example: Injecting OSPF Routes into the BGP Routing Table**

---

This example shows how to create a policy that injects OSPF routes into the BGP routing table.

- [Requirements on page 4166](#)
- [Overview on page 4167](#)
- [Configuration on page 4167](#)
- [Verification on page 4169](#)
- [Troubleshooting on page 4169](#)

#### **Requirements**

Before you begin:

- Configure network interfaces.
- Configure external peer sessions. See [“Example: Configuring External BGP Point-to-Point Peer Sessions” on page 3262](#).

- Configure interior gateway protocol (IGP) sessions between peers.

### Overview

In this example, you create a routing policy called **injectpolicy1** and a routing term called **injectterm1**. The policy injects OSPF routes into the BGP routing table.

### Configuration

- [Configuring the Routing Policy on page 4167](#)
- [Configuring Tracing for the Routing Policy on page 4168](#)

### Configuring the Routing Policy

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set policy-options policy-statement injectpolicy1 term injectterm1 from protocol ospf
set policy-options policy-statement injectpolicy1 term injectterm1 from area 0.0.0.1
set policy-options policy-statement injectpolicy1 term injectterm1 then accept
set protocols bgp export injectpolicy1
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To inject OSPF routes into a BGP routing table:

1. Create the policy term.  

```
[edit policy-options policy-statement injectpolicy1]
user@host# set term injectterm1
```
2. Specify OSPF as a match condition.  

```
[edit policy-options policy-statement injectpolicy1 term injectterm1]
user@host# set from protocol ospf
```
3. Specify the routes from an OSPF area as a match condition.  

```
[edit policy-options policy-statement injectpolicy1 term injectterm1]
user@host# set from area 0.0.0.1
```
4. Specify that the route is to be accepted if the previous conditions are matched.  

```
[edit policy-options policy-statement injectpolicy1 term injectterm1]
user@host# set then accept
```
5. Apply the routing policy to BGP.  

```
[edit]
user@host# set protocols bgp export injectpolicy1
```

**Results** Confirm your configuration by entering the **show policy-options** and **show protocols bgp** commands from configuration mode. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show policy-options
policy-statement injectpolicy1 {
  term injectterm1 {
    from {
      protocol ospf;
      area 0.0.0.1;
    }
    then accept;
  }
}

user@host# show protocols bgp
export injectpolicy1;
```

If you are done configuring the device, enter **commit** from configuration mode.

#### *Configuring Tracing for the Routing Policy*

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set policy-options policy-statement injectpolicy1 term injectterm1 then trace
set routing-options traceoptions file ospf-bgp-policy-log
set routing-options traceoptions file size 5m
set routing-options traceoptions file files 5
set routing-options traceoptions flag policy
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Include a trace action in the policy.

```
[edit policy-options policy-statement injectpolicy1 term injectterm1]
user@host# then trace
```

2. Configure the tracing file for the output.

```
[edit routing-options traceoptions]
user@host# set file ospf-bgp-policy-log
user@host# set file size 5m
user@host# set file files 5
user@host# set flag policy
```

**Results** Confirm your configuration by entering the **show policy-options** and **show routing-options** commands from configuration mode. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show policy-options
```

```

policy-statement injectpolicy1 {
  term injectterm1 {
    then {
      trace;
    }
  }
}

user@host# show routing-options
traceoptions {
  file ospf-bgp-policy-log size 5m files 5;
  flag policy;
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

### Verifying That the Expected BGP Routes Are Present

**Purpose** Verify the effect of the export policy.

**Action** From operational mode, enter the **show route** command.

### Troubleshooting

- [Using the show log Command to Examine the Actions of the Routing Policy on page 4169](#)

### Using the show log Command to Examine the Actions of the Routing Policy

**Problem** The routing table contains unexpected routes, or routes are missing from the routing table.

**Solution** If you configure policy tracing as shown in this example, you can run the **show log ospf-bgp-policy-log** command to diagnose problems with the routing policy. The **show log ospf-bgp-policy-log** command displays information about the routes that the **injectpolicy1** policy term analyzes and acts upon.

### Example: Redistributing Static Routes into OSPF

This example shows how to create a policy that redistributes static routes into OSPF.

- [Requirements on page 4169](#)
- [Overview on page 4170](#)
- [Configuration on page 4170](#)
- [Verification on page 4171](#)

### Requirements

Before you begin:

- Configure the device interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure static routes. See *Examples: Configuring Static Routes* in the *Junos OS Routing Protocols Library for Routing Devices*.

### Overview

In this example, you create a routing policy called `exportstatic1` and a routing term called `exportstatic1`. The policy injects static routes into OSPF. This example includes the following settings:

- **policy-statement**—Defines the routing policy. You specify the name of the policy and further define the elements of the policy. The policy name must be unique and can contain letters, numbers, and hyphens ( - ) and be up to 255 characters long.
- **term**—Defines the match condition and applicable actions for the routing policy. The term name can contain letters, numbers, and hyphens ( - ) and be up to 255 characters long. You specify the name of the term and define the criteria that an incoming route must match by including the **from** statement and the action to take if the route matches the conditions by including the **then** statement. In this example you specify the static protocol match condition and the accept action.
- **export**—Applies the export policy you created to be evaluated when routes are being exported from the routing table into OSPF.

### Configuration

#### CLI Quick Configuration

To quickly create a policy that injects static routes into OSPF, copy the following commands and paste them into the CLI.

```
[edit]
set policy-options policy-statement exportstatic1 term exportstatic1 from protocol static
set policy-options policy-statement exportstatic1 term exportstatic1 then accept
set protocols ospf export exportstatic1
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Modifying the Junos OS Configuration* in *CLI User Guide*.

To inject static routes into OSPF:

1. Create the routing policy.  

```
[edit]
user@host# edit policy-options policy-statement exportstatic1
```
2. Create the policy term.  

```
[edit policy-options policy-statement exportstatic1]
user@host# set term exportstatic1
```
3. Specify static as a match condition.  

```
[edit policy-options policy-statement exportstatic1 term exportstatic1]
user@host# set from protocol static
```

4. Specify that the route is to be accepted if the previous condition is matched.

```
[edit policy-options policy-statement exportstatic1 term exportstatic1]
user@host# set then accept
```

5. Apply the routing policy to OSPF.

**NOTE:** For OSPFv3, include the `ospf3` statement at the [edit protocols] hierarchy level.

```
[edit]
user@host# set protocols ospf export exportstatic1
```

6. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**Results** Confirm your configuration by entering the `show policy-options` and `show protocols ospf` commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show policy-options
policy-statement exportstatic1 {
  term exportstatic1 {
    from protocol static;
    then accept;
  }
}
```

```
user@host# show protocols ospf
export exportstatic1;
```

To confirm your OSPFv3 configuration, enter the `show policy-options` and the `show protocols ospf3` commands.

### Verification

Confirm that the configuration is working properly.

- [Verifying That the Expected Static Routes Are Present on page 4171](#)
- [Verifying That AS External LSAs Are Added to the Routing Table on page 4172](#)

### Verifying That the Expected Static Routes Are Present

**Purpose** Verify the effect of the export policy.

**Action** From operational mode, enter the `show route` command.

### ***Verifying That AS External LSAs Are Added to the Routing Table***

- Purpose** On the routing device where you configured the export policy, verify that the routing device originates an AS external LSA for the static routes that are added to the routing table.
- Action** From operational mode, enter the **show ospf database** command for OSPFv2, and enter the **show ospf3 database** command for OSPFv3.

---

### **Example: Configuring an OSPF Import Policy**

This example shows how to create an OSPF import policy. OSPF import policies apply to external routes only. An external route is a route that is outside the OSPF autonomous system (AS).

- [Requirements on page 4172](#)
- [Overview on page 4172](#)
- [Configuration on page 4173](#)
- [Verification on page 4175](#)

#### ***Requirements***

Before you begin:

- Configure static routes. See *Examples: Configuring Static Routes* in the *Junos OS Routing Protocols Library for Routing Devices*.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4048.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4050.
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4053.

#### ***Overview***

External routes are learned by AS boundary routers. External routes can be advertised throughout the OSPF domain if you configure the AS boundary router to redistribute the route into OSPF. An external route might be learned by the AS boundary router from a routing protocol other than OSPF, or the external route might be a static route that you configure on the AS boundary router.

For OSPFv3, the link-state advertisement (LSA) is referred to as the interarea prefix LSA and performs the same function as a network-summary LSA performs for OSPFv2. An area border router (ABR) originates an interarea prefix LSA for each IPv6 prefix that must be advertised into an area.

OSPF import policy allows you to prevent external routes from being added to the routing tables of OSPF neighbors. The import policy does not impact the OSPF database. This means that the import policy has no impact on the link-state advertisements. The filtering

is done only on external routes in OSPF. The intra-area and interarea routes are not considered for filtering. The default action is to accept the route when the route does not match the policy.

This example includes the following OSPF policy settings:

- **policy-statement**—Defines the routing policy. You specify the name of the policy and further define the elements of the policy. The policy name must be unique and can contain letters, numbers, and hyphens ( - ) and be up to 255 characters long.
- **export**—Applies the export policy you created to be evaluated when network summary LSAs are flooded into an area. In this example, the export policy is named `export_static`.
- **import**—Applies the import policy you created to prevent external routes from being added to the routing table. In this example, the import policy is named `filter_routes`.

The devices you configure in this example represent the following functions:

- **R1**—Device R1 is in area 0.0.0.0 and has a direct connection to device R2. R1 has an OSPF export policy configured. The export policy redistributes static routes from R1's routing table into R1's OSPF database. Because the static route is in R1's OSPF database, the route is advertised in an LSA to R1's OSPF neighbor. R1's OSPF neighbor is device R2.
- **R2**—Device R2 is in area 0.0.0.0 and has a direct connection to device R1. R2 has an OSPF import policy configured that matches the static route to the 10.0.16.0/30 network and prevents the static route from being installed in R2's routing table. R2's OSPF neighbor is device R1.

### Configuration

#### CLI Quick Configuration

To quickly configure an OSPF import policy, copy the following commands, removing any line breaks, and then paste the commands into the CLI.

Configuration on Device R1:

```
[edit]
set interfaces so-0/2/0 unit 0 family inet address 10.0.2.1/30
set protocols ospf export export_static
set protocols ospf area 0.0.0.0 interface so-0/2/0
set policy-options policy-statement export_static from protocol static
set policy-options policy-statement export_static then accept
```

Configuration on Device R2:

```
[edit]
set interfaces so-0/2/0 unit 0 family inet address 10.0.2.2/30
set protocols ospf import filter_routes
set protocols ospf area 0.0.0.0 interface so-0/2/0
set policy-options policy-statement filter_routes from route-filter 10.0.16.0/30 exact
set policy-options policy-statement filter_routes then reject
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Modifying the Junos OS Configuration* in *CLI User Guide*.

To configure an OSPF import policy:

1. Configure the interfaces.

```
[edit]
user@R1# set interfaces so-0/2/0 unit 0 family inet address 10.0.2.1/30
```

```
[edit]
user@R2# set interfaces so-0/2/0 unit 0 family inet address 10.0.2.2/30
```

2. Enable OSPF on the interfaces.

**NOTE:** For OSPFv3, include the `ospf3` statement at the [edit protocols] hierarchy level.

```
[edit]
user@R1# set protocols ospf area 0.0.0.0 interface so-0/2/0
```

```
[edit]
user@R2# set protocols ospf area 0.0.0.0 interface so-0/2/0
```

3. On R1, redistribute the static route into OSPF.

```
[edit]
user@R1# set protocols ospf export export_static
user@R1# set policy-options policy-statement export_static from protocol static
user@R1# set policy-options policy-statement export_static then accept
```

4. On R2, configure the OSPF import policy.

```
[edit]
user@R2# set protocols ospf import filter_routes
user@R2# set policy-options policy-statement filter_routes from route-filter
10.0.16.0/30 exact
user@R2# set policy-options policy-statement filter_routes then reject
```

5. If you are done configuring the devices, commit the configuration.

```
[edit]
user@host# commit
```

**Results** Confirm your configuration by entering the `show interfaces`, `show policy-options`, and `show protocols ospf` commands on the appropriate device. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

Output for R1:

```
user@R1# show interfaces
so-0/2/0 {
  unit 0 {
    family inet {
```

```

        address 10.0.2.1/30;
    }
}

user@R1# show policy-options
policy-statement export_static {
    from protocol static;
    then accept;
}

user@R1# show protocols ospf
export export_static;
area 0.0.0.0 {
    interface so-0/2/0.0;
}

```

Output for R2:

```

user@R2# show interfaces
so-0/2/0 {
    unit 0 {
        family inet {
            address 10.0.2.2/30;
        }
    }
}

user@R2# show policy-options
policy-statement filter_routes {
    from {
        route-filter 10.0.16.0/30 exact;
    }
    then reject;
}

user@R2# show protocols ospf
import filter_routes;
area 0.0.0.0 {
    interface so-0/2/0.0;
}

```

To confirm your OSPFv3 configuration, enter the **show interfaces**, **show policy-options**, **show routing-options**, and **show protocols ospf3** commands on the appropriate device.

### Verification

Confirm that the configuration is working properly.

- [Verifying the OSPF Database on page 4175](#)
- [Verifying the Routing Table on page 4176](#)

### Verifying the OSPF Database

**Purpose** Verify that OSPF is advertising the static route in the OSPF database.

**Action** From operational mode, enter the **show ospf database** for OSPFv2, and enter the **show ospf3 database** command for OSPFv3.

#### *Verifying the Routing Table*

**Purpose** Verify the entries in the routing table.

**Action** From operational mode, enter the **show route** command.

### **Example: Configuring a Route Filter Policy to Specify Priority for Prefixes Learned Through OSPF**

---

This example shows how to create an OSPF import policy that prioritizes specific prefixes learned through OSPF.

- [Requirements on page 4176](#)
- [Overview on page 4176](#)
- [Configuration on page 4177](#)
- [Verification on page 4180](#)

#### **Requirements**

Before you begin:

- Configure the device interfaces.
- Configure the router identifiers for the devices in your OSPF network. See “[Example: Configuring an OSPF Router Identifier](#)” on page 4048.
- Control OSPF designated router election. See “[Example: Controlling OSPF Designated Router Election](#)” on page 4050.
- Configure a single-area OSPF network. See “[Example: Configuring a Single-Area OSPF Network](#)” on page 4053.
- Configure a multiarea OSPF network. See “[Example: Configuring a Multiarea OSPF Network](#)” on page 4055.

#### **Overview**

In a network with a large number of OSPF routes, it can be useful to control the order in which routes are updated in response to a network topology change. In Junos OS Release 9.3 and later, you can specify a priority of high, medium, or low for prefixes included in an OSPF import policy. In the event of an OSPF topology change, high priority prefixes are updated in the routing table first, followed by medium and then low priority prefixes.

OSPF import policy can only be used to set priority or to filter OSPF external routes. If an OSPF import policy is applied that results in a **reject** terminating action for a nonexternal route, then the **reject** action is ignored and the route is accepted anyway. By default, such a route is now installed in the routing table with a priority of low. This behavior prevents traffic black holes, that is, silently discarded traffic, by ensuring consistent routing within the OSPF domain.

In general, OSPF routes that are not explicitly assigned a priority are treated as priority medium, except for the following:

- Summary discard routes have a default priority of low.
- Local routes that are not added to the routing table are assigned a priority of low.
- External routes that are rejected by import policy and thus not added to the routing table are assigned a priority of low.

Any available match criteria applicable to OSPF routes can be used to determine the priority. Two of the most commonly used match criteria for OSPF are the **route-filter** and **tag** statements.

In this example, the routing device is in area 0.0.0.0, with interfaces fe-0/1/0 and fe-1/1/0 connecting to neighboring devices. You configure an import routing policy named **ospf-import** to specify a priority for prefixes learned through OSPF. Routes associated with these prefixes are installed in the routing table in the order of the prefixes' specified priority. Routes matching **200.3.0.0/16 orlonger** are installed first because they have a priority of **high**. Routes matching **200.2.0.0/16 orlonger** are installed next because they have a priority of **medium**. Routes matching **200.1.0.0/16 orlonger** are installed last because they have a priority of **low**. You then apply the import policy to OSPF.

**NOTE:** The priority value takes effect when a new route is installed, or when there is a change to an existing route.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set interfaces fe-0/1/0 unit 0 family inet address 192.168.8.4/30
set interfaces fe-0/2/0 unit 0 family inet address 192.168.8.5/30
set policy-options policy-statement ospf-import term t1 from route-filter 200.1.0.0/16
  orlonger
set policy-options policy-statement ospf-import term t1 then priority low
set policy-options policy-statement ospf-import term t1 then accept
set policy-options policy-statement ospf-import term t2 from route-filter 200.2.0.0/16
  orlonger
set policy-options policy-statement ospf-import term t2 then priority medium
set policy-options policy-statement ospf-import term t2 then accept
set policy-options policy-statement ospf-import term t3 from route-filter 200.3.0.0/16
  orlonger
set policy-options policy-statement ospf-import term t3 then priority high
set policy-options policy-statement ospf-import term t3 then accept
set protocols ospf import ospf-import
set protocols ospf area 0.0.0.0 interface fe-0/1/0.0
set protocols ospf area 0.0.0.0 interface fe-0/2/0.0
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure an OSPF import policy that prioritizes specific prefixes:

1. Configure the device interfaces.

```
[edit interfaces]
user@host# set fe-0/1/0 unit 0 family inet address 192.168.8.4/30

user@host# set fe-0/2/0 unit 0 family inet address 192.168.8.5/30
```

2. Enable OSPF on the interfaces.

**NOTE:** For OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit protocols ospf area 0.0.0.0]
user@host# set interface fe-0/1/0.0
user@host# set interface fe-0/2/0.0
```

3. Configure the policy to specify the priority for prefixes learned through OSPF.

```
[edit policy-options policy-statement ospf-import]
user@host# set term t1 from route-filter 200.1.0.0/16 orlonger
user@host# set term t1 then priority low
user@host# set term t1 then accept

user@host# set term t2 from route-filter 200.2.0.0/16 orlonger
user@host# set term t2 then priority medium
user@host# set term t2 then accept

user@host# set term t3 from route-filter 200.3.0.0/16 orlonger
user@host# set term t3 then priority high
user@host# set term t3 then accept
```

4. Apply the policy to OSPF.

```
[edit protocols ospf]
user@host# set import ospf-import
```

5. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols ospf**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
fe-0/1/0 {
```

```

    unit 0 {
        family inet {
            address 192.168.8.4/30;
        }
    }
}
fe-0/2/0 {
    unit 0 {
        family inet {
            address 192.168.8.5/30;
        }
    }
}

user@host# show protocols ospf
import ospf-import;
area 0.0.0.0 {
    interface fe-0/1/0.0;
    interface fe-0/2/0.0;
}

user@host# show policy-options
policy-statement ospf-import {
    term t1 {
        from {
            route-filter 200.1.0.0/16 orlonger;
        }
        then {
            priority low;
            accept;
        }
    }
    term t2 {
        from {
            route-filter 200.2.0.0/16 orlonger;
        }
        then {
            priority medium;
            accept;
        }
    }
    term t3 {
        from {
            route-filter 200.3.0.0/16 orlonger;
        }
        then {
            priority high;
            accept;
        }
    }
}

```

To confirm your OSPFv3 configuration, enter the **show interfaces**, **show protocols ospf3**, and **show policy-options** commands.

**Verification**

Confirm that the configuration is working properly.

**Verifying the Prefix Priority in the OSPF Routing Table**

**Purpose** Verify the priority assigned to the prefix in the OSPF routing table.

**Action** From operational mode, enter the **show ospf route detail** for OSPFv2, and enter the **show ospf3 route detail** command for OSPFv3.

- [Example: Configuring an OSPF Import Policy for Network Summaries on page 4190](#)

**Import and Export Policies for Network Summaries Overview**

By default, OSPF uses network-summary link-state advertisements (LSAs) to transmit route information across area boundaries. Each area border router (ABR) floods network-summary LSAs to other routing devices in the same area. The ABR also controls which routes from the area are used to generate network-summary LSAs into other areas. Each ABR maintains a separate topological database for each area to which they are connected. In Junos OS Release 9.1 and later, you can configure export and import policies for OSPFv2 and OSPFv3 that enable you to control how network-summary LSAs, which contain information about interarea OSPF prefixes, are distributed and generated. For OSPFv3, the LSA is referred to as the interarea prefix LSA and performs the same function as a network-summary LSA performs for OSPFv2. An ABR originates an interarea prefix LSA for each IPv6 prefix that must be advertised into an area.

The export policy enables you to specify which summary LSAs are flooded into an area. The import policy enables you to control which routes learned from an area are used to generate summary LSAs into other areas. You define a routing policy at the **[edit policy-options policy-statement *policy-name*]** hierarchy level. As with all OSPF export policies, the default for network-summary LSA export policies is to reject everything. Similarly, as with all OSPF import policies, the default for network-summary LSA import policies is to accept all OSPF routes.

### Example: Configuring an OSPF Export Policy for Network Summaries

This example shows how to create an OSPF export policy to control the network-summary (Type 3) LSAs that the ABR floods into an OSPF area.

- [Requirements on page 4181](#)
- [Overview on page 4181](#)
- [Configuration on page 4183](#)
- [Verification on page 4188](#)

#### Requirements

Before you begin:

- Configure the router identifiers for the devices in your OSPF network. See [“Example: Configuring an OSPF Router Identifier” on page 4048](#).
- Control OSPF designated router election. See [“Example: Controlling OSPF Designated Router Election” on page 4050](#)

#### Overview

OSPF uses network-summary LSAs to transmit route information across area boundaries. Depending on your network environment, you might want to further filter the network-summary LSAs between OSPF areas. For example, if you create OSPF areas to define administrative boundaries, you might not want to advertise internal route information between those areas. To further improve the control of route distribution between multiple OSPF areas, you can configure network summary policies on the ABR for the area that you want to filter the advertisement of network-summary LSAs.

**NOTE:** For OSPFv3, the LSA is referred to as the interarea prefix LSA and performs the same function as a network-summary LSA performs for OSPFv2. An ABR originates an interarea prefix LSA for each IPv6 prefix that must be advertised into an area. In this topic, the terms network summary policy and network-summary policy are used to describe both OSPFv2 and OSPFv3 functionality.

The following guidelines apply to export network summary policies:

- You should have a thorough understanding of your network before configuring these policies. Incorrect network summary policy configuration might result in an unintended result such as suboptimal routing or dropped traffic.
- We recommend that you use the **route-filter** policy match condition for these types of policies.
- We recommend that you use the **accept** and **reject** routing policy terms for these types of policies.

Figure 122 on page 4182 shows a sample topology with three OSPF areas. R4 generates network summaries for the routes in area 4 and sends them out of area 4 to area 0. R3 generates network summaries for the routes in area 3 and sends them out of area 3 to area 0.

Figure 122: Sample Topology Used for an OSPF Export Network Summary Policy

In this example, you configure R4 with an export network summary policy named `export-policy` that only allows routes that match the `10.0.4.4` prefix from area 3 into area 4. The export policy controls the network-summary LSAs that R4 floods into area 4. This results in only the allowed interarea route to enter area 4, and all other interarea routes to be purged from the OSPF database and the routing table of the devices in area 4. You first define the policy and then apply it to the ABR by including the **network-summary-export** statement for OSPFv2 or the **inter-area-prefix-export** statement for OSPFv3.

The devices operate as follows:

- R1—Device R1 is an internal router in area 3. Interface `ge-0/0/1` has an IP address of 10.0.4.13/30 and connects to R3. Interface `ge-0/0/0` has an IP address of 10.0.4.5/30 and connects to R2.
- R2—Device R2 is an internal router in area 3. Interface `ge-0/0/0` has an IP address of 10.0.4.6/30 and connects to R1. Interface `ge-0/0/2` has an IP address of 10.0.4.1 and connects to R3.
- R3—Device R3 participates in area 3 and area 0. R3 is the ABR between area 3 and area 0, and passes network-summary LSAs between the areas. Interface `ge-0/0/2` has an IP address of 10.0.4.2/30 and connects to R2. Interface `ge-0/0/1` has an IP address of 10.0.4.14/30 and connects to R1. Interface `ge-0/0/0` has an IP address of 10.0.2.1/30 and connects to R4.
- R4—Device R4 participates in area 0 and area 4. R4 is the ABR between area 0 and area 4, and passes network-summary LSAs between the areas. Interface `ge-0/0/0` has an IP address of 10.0.2.4/30 and connects to R3. Interface `ge-0/0/1` has an IP

address of 10.0.8.6/30 and connects to R5. Interface **ge-0/0/2** has an IP address of 10.0.8.9/30 and connects to R6.

- R5—Device R5 is an internal router in area 4. Interface **ge-0/0/1** has an IP address of 10.0.8.5/30 and connects to R4.
- R6—Device R6 is an internal router in area 4. Interface **ge-0/0/2** has an IP address of 10.0.8.10/30 and connects to R4.

### Configuration

**CLI Quick Configuration** To quickly configure an OSPF export policy for network summaries, copy the following commands, removing any line breaks, and then paste the commands into the CLI.

Configuration on Device R1:

```
[edit]
set interfaces ge-0/0/0 unit 0 family inet address 10.0.4.5/30
set interfaces ge-0/0/1 unit 0 family inet address 10.0.4.13/30
set protocols ospf area 0.0.0.3 interface ge-0/0/1
set protocols ospf area 0.0.0.3 interface ge-0/0/0
```

Configuration on Device R2:

```
[edit]
set interfaces ge-0/0/0 unit 0 family inet address 10.0.4.6/30
set interfaces ge-0/0/2 unit 0 family inet address 10.0.4.1/30
set protocols ospf area 0.0.0.3 interface ge-0/0/2
set protocols ospf area 0.0.0.3 interface ge-0/0/1
```

Configuration on Device R3:

```
[edit]
set interfaces ge-0/0/0 unit 0 family inet address 10.0.4.2/30
set interfaces ge-0/0/1 unit 0 family inet address 10.0.4.14/30
set interfaces ge-0/0/2 unit 0 family inet address 10.0.2.1/30
set protocols ospf area 0.0.0.0 interface ge-0/0/0
set protocols ospf area 0.0.0.3 interface ge-0/0/1
set protocols ospf area 0.0.0.3 interface ge-0/0/2
```

Configuration on Device R4:

```
[edit]
set interfaces ge-0/0/0 unit 0 family inet address 10.0.2.1/30
set interfaces ge-0/0/1 unit 0 family inet address 10.0.8.6/30
set interfaces ge-0/0/2 unit 0 family inet address 10.0.8.9/30
set protocols ospf area 0.0.0.0 interface ge-0/0/0
set protocols ospf area 0.0.0.4 network-summary-export export-policy
set protocols ospf area 0.0.0.4 interface ge-0/0/1
set protocols ospf area 0.0.0.4 interface ge-0/0/2
set policy-options policy-statement export-policy term term1 from route-filter 10.0.4.4/30
  prefix-length-range /30-/30
set policy-options policy-statement export-policy term term1 then accept
```

Configuration on Device R5:

```
[edit]
set interfaces ge-0/0/1 unit 0 family inet address 10.0.8.5/30
```

```
set protocols ospf area 0.0.0.4 interface ge-0/0/1
```

Configuration on Device R6:

```
[edit]
set interfaces ge-0/0/2 unit 0 family inet address 10.0.8.10/30
set protocols ospf area 0.0.0.4 interface ge-0/0/2
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Modifying the Junos OS Configuration* in *CLI User Guide*.

To configure an OSPF export policy for network summaries:

1. Configure the interfaces.

**NOTE:** For OSPFv3, use IPv6 addresses.

```
[edit]
user@R1# set interfaces ge-0/0/0 unit 0 family inet address 10.0.4.5/30
user@R1# set interfaces ge-0/0/1 unit 0 family inet address 10.0.4.13/30

[edit]
user@R2# set interfaces ge-0/0/0 unit 0 family inet address 10.0.4.6/30
user@R2# set interfaces ge-0/0/2 unit 0 family inet address 10.0.4.1/30

[edit]
user@R3# set interfaces fe-1/0/0 unit 0 family inet address 10.0.4.2/30
user@R3# set interfaces fe-1/1/0 unit 0 family inet address 10.0.4.14/30
user@R3# set interfaces fe-0/0/1 unit 0 family inet address 10.0.2.1/30

[edit]
user@R4# set interfaces ge-0/0/0 unit 0 family inet address 10.0.4.2/30
user@R4# set interfaces ge-0/0/1 unit 0 family inet address 10.0.4.14/30
user@R4# set interfaces ge-0/0/2 unit 0 family inet address 10.0.2.1/30

[edit]
user@R5# set interfaces ge-0/0/1 unit 0 family inet address 10.0.8.5/30

[edit]
user@R6# set interfaces ge-0/0/2 unit 0 family inet address 10.0.8.10/30
```

2. Enable OSPF on the interfaces.

**NOTE:** For OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@R1# set protocols ospf area 0.0.0.3 interface ge-0/0/1
user@R1# set protocols ospf area 0.0.0.3 interface ge-0/0/0

[edit]
user@R2# set protocols ospf area 0.0.0.3 interface ge-0/0/2
```

```

user@R2# set protocols ospf area 0.0.0.3 interface ge-0/0/1
[edit]
user@R3# set protocols ospf area 0.0.0.3 interface ge-0/0/1
user@R3# set protocols ospf area 0.0.0.3 interface ge-0/0/2
user@R3# set protocols ospf area 0.0.0.0 interface ge-0/0/0

[edit]
user@R4# set protocols ospf area 0.0.0.0 interface ge-0/0/0
user@R4# set protocols ospf area 0.0.0.4 interface ge-0/0/1
user@R4# set protocols ospf area 0.0.0.4 interface ge-0/0/2

[edit]
user@R5# set protocols ospf area 0.0.0.4 interface fe-0/0/1

[edit]
user@R6# set protocols ospf area 0.0.0.4 interface fe-0/0/2

```

3. On R4, configure the export network summary policy.

```

[edit ]
user@R4# set policy-options policy-statement export-policy term term1 from
route-filter 10.0.4.4/30 prefix-length-range /30-/30
user@R4# set policy-options policy-statement export-policy term term1 then accept

```

4. On R4, apply the export network summary policy to OSPF.

**NOTE:** For OSPFv3, include the `inter-area-prefix-export` statement at the `[edit protocols ospf3 area area-id]` hierarchy level.

```

[edit]
user@R4# set protocols ospf area 0.0.0.4 network-summary-export export-policy

```

5. If you are done configuring the devices, commit the configuration.

```

[edit]
user@host# commit

```

**Results** Confirm your configuration by entering the `show interfaces`, `show policy-options`, and `show protocols ospf` commands on the appropriate device. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

Output for R1:

```

user@R1# show interfaces
ge-0/0/0 {
  unit 0 {
    family inet {
      address 10.0.4.5/30;
    }
  }
}
ge-0/0/1 {
  unit 0 {
    family inet {

```

```
        address 10.0.4.13/30;
    }
}
```

```
user@R1# show protocols ospf
area 0.0.0.3 {
    interface ge-0/0/1.0;
    interface ge-0/0/0.0;
}
```

Output for R2:

```
user@R2# show interfaces
ge-0/0/0 {
    unit 0 {
        family inet {
            address 10.0.4.6/30;
        }
    }
}
ge-0/0/2 {
    unit 0 {
        family inet {
            address 10.0.4.1/30;
        }
    }
}
```

```
user@R2# show protocols ospf
area 0.0.0.3 {
    interface ge-0/0/2.0;
    interface ge-0/0/1.0;
}
```

Output for R3:

```
user@R3# show interfaces
ge-0/0/0 {
    unit 0 {
        family inet {
            address 10.0.2.1/30;
            address 10.0.4.2/30;
        }
    }
}
ge-0/0/1 {
    unit 0 {
        family inet {
            address 10.0.4.14/30;
        }
    }
}
ge-0/0/2 {
    unit 0 {
        family inet {
            address 10.0.4.2/30;
            address 10.0.2.1/30;
        }
    }
}
```

```

    }
  }
}

user@R3# show protocols ospf
area 0.0.0.0 {
  interface ge-0/0/0.0;
}
area 0.0.0.3 {
  interface ge-0/0/1.0;
  interface ge-0/0/2.0;
}

```

Output for R4:

```

user@R4# show interfaces
ge-0/0/0 {
  unit 0 {
    family inet {
      address 10.0.2.1/30;
    }
  }
}
ge-0/0/1 {
  unit 0 {
    family inet {
      address 10.0.8.6/30;
    }
  }
}
ge-0/0/2 {
  unit 0 {
    family inet {
      address 10.0.8.9/30;
    }
  }
}

user@R4# show protocols ospf
ospf {
  area 0.0.0.0 {
    interface ge-0/0/0.0;
  }
  area 0.0.0.4 {
    network-summary-export export-policy;
    interface ge-0/0/1.0;
    interface ge-0/0/2.0;
  }
}

user@R4# show policy-options
policy-statement export-policy {
  term term1 {
    from {
      route-filter 10.0.4.4/30 prefix-length-range /30-/30;
    }
    then accept;
  }
}

```

```
}  
}
```

Output for R5:

```
user@R5# show interfaces  
ge-0/0/1 {  
  unit 0 {  
    family inet {  
      address 10.0.8.5/30;  
    }  
  }  
}  
  
user@R5# show protocols ospf  
ospf {  
  area 0.0.0.4 {  
    interface ge-0/0/1.0;  
  }  
}
```

Output for R6:

```
user@R6# show interfaces  
ge-0/0/2 {  
  unit 0 {  
    family inet {  
      address 10.0.8.10/30;  
    }  
  }  
}  
  
user@R6# show protocols ospf  
area 0.0.0.4 {  
  interface ge-0/0/2.0;  
}
```

To confirm your OSPFv3 configuration, enter the **show interfaces**, **show policy-options**, and **show protocols ospf3** commands on the appropriate device.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying the OSPF Database on page 4188](#)
- [Verifying the Routing Table on page 4189](#)

### **Verifying the OSPF Database**

**Purpose** Verify that the OSPF database for the devices in area 4 includes the interarea route that we permitted on the ABR R4. The other interarea routes that are not specified should age out or no longer be present in the OSPF database.

**Action** From operational mode, enter the **show ospf database** command.

## Sample Output

```
user@R4>show ospf database
OSPF database, Area 0.0.0.0
  Type      ID            Adv Rtr      Seq      Age  Opt  Cksum  Len

### Verifying the Routing Table

- Purpose** Verify that the routes corresponding to the rejected network summaries are no longer present in R4's, R5's, or R6's routing table.
- Action** From operational mode, enter the **show route protocol ospf** command for both OSPFv2 and OSPFv3.

## Sample Output

```
user@R4> show route protocol ospf
inet.0: 10 destinations, 10 routes (10 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.4.0/30      * [OSPF/10] 00:37:05, metric 2
                  > to 10.0.2.1 via ge-3/0/2.4
10.0.4.4/30      * [OSPF/10] 00:36:59, metric 3
```

```
10.0.4.12/30      > to 10.0.2.1 via ge-3/0/2.4
                  *[OSPF/10] 00:37:05, metric 2
224.0.0.5/32     > to 10.0.2.1 via ge-3/0/2.4
                  *[OSPF/10] 00:38:05, metric 1
                  MultiRecv
```

user@R5> show route protocol ospf

inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)  
+ = Active Route, - = Last Active, \* = Both

```
10.0.4.4/30      *[OSPF/10] 00:37:09, metric 4
                  > to 10.0.8.6 via ge-3/0/2.5
10.0.8.8/30      *[OSPF/10] 00:37:30, metric 2
                  > to 10.0.8.6 via ge-3/0/2.5

                  MultiRecv
```

---

### Example: Configuring an OSPF Import Policy for Network Summaries

This example shows how to create an OSPF import policy to control the network-summary (Type 3) LSAs that the ABR advertises out of an OSPF area.

- [Requirements on page 4190](#)
- [Overview on page 4190](#)
- [Configuration on page 4192](#)
- [Verification on page 4198](#)

#### Requirements

Before you begin:

- Configure the router identifiers for the devices in your OSPF network. See [“Example: Configuring an OSPF Router Identifier” on page 4048](#).
- Control OSPF designated router election. See [“Example: Controlling OSPF Designated Router Election” on page 4050](#).

#### Overview

OSPF uses network-summary LSAs to transmit route information across area boundaries. Depending on your network environment, you might want to further filter the network-summary LSAs between OSPF areas. For example, if you create OSPF areas to define administrative boundaries, you might not want to advertise internal route information between those areas. To further improve the control of route distribution

between multiple OSPF areas, you can configure network summary policies on the ABR for the area that you want to filter the advertisement of network-summary LSAs.

**NOTE:** For OSPFv3, the LSA is referred to as the interarea prefix LSA and performs the same function as a network-summary LSA performs for OSPFv2. An ABR originates an interarea prefix LSA for each IPv6 prefix that must be advertised into an area. In this topic, the terms network summary policy and network-summary policy are used to describe both OSPFv2 and OSPFv3 functionality.

The following guidelines apply to import network summary policies:

- You should have a thorough understanding of your network before configuring these policies. Incorrect network summary policy configuration might result in an unintended result such as suboptimal routing or dropped traffic.
- We recommend that you use the **route-filter** policy match condition for these types of policies.
- We recommend that you use the **accept** and **reject** routing policy terms for these types of policies.

Figure 123 on page 4191 shows a sample topology with three OSPF areas. R4 generates network summaries for the routes in area 4 and sends them out of area 4 to area 0. R3 generates network summaries for the routes in area 3 and sends them out of area 3 to area 0.

**Figure 123: Sample Topology Used for an OSPF Import Network Summary Policy**

In this example, you configure R3 with an import network summary policy named **import-policy** so R3 only generates network summaries for the route 10.0.4.12/30. The import policy controls the routes and therefore the network summaries that R3 advertises out of area 3, so applying this policy means that R3 only advertises route 10.0.4.12/30 out of area 3. This results in existing network summaries from other interarea routes

getting purged from the OSPF database in area 0 and area 4, as well as the routing tables of the devices in areas 0 and area 4. You first define the policy and then apply it to the ABR by including the **network-summary-import** statement for OSPFv2 or the **inter-area-prefix-import** statement for OSPFv3.

The devices operate as follows:

- R1—Device R1 is an internal router in area 3. Interface **fe-0/1/0** has an IP address of 10.0.4.13/30 and connects to R3. Interface **fe-0/0/1** has an IP address of 10.0.4.5/30 and connects to R2.
- R2—Device R2 is an internal router in area 3. Interface **fe-0/0/1** has an IP address of 10.0.4.6/30 and connects to R1. Interface **fe-1/0/0** has an IP address of 10.0.4.1/30 and connects to R3.
- R3—Device R3 participates in area 3 and area 0. R3 is the ABR between area 3 and area 0, and passes network-summary LSAs between the areas. Interface **fe-1/0/0** has an IP address of 10.0.4.2/30 and connects to R2. Interface **fe-1/1/0** has an IP address of 10.0.4.14/30 and connects to R1. Interface **fe-0/0/1** has an IP address of 10.0.2.1/30 and connects to R4.
- R4—Device R4 participates in area 0 and area 4. R4 is the ABR between area 0 and area 4, and passes network-summary LSAs between the areas. Interface **fe-0/0/1** has an IP address of 10.0.2.1/30 and connects to R3. Interface **fe-1/1/0** has an IP address of 10.0.8.6/30 and connects to R5. Interface **fe-1/0/0** has an IP address of 10.0.8.9/30 and connects to R6.
- R5—Device R5 is an internal router in area 4. Interface **fe-1/1/0** has an IP address of 10.0.8.5/30 and connects to R4.
- R6—Device R6 is an internal router in area 4. Interface **fe-1/0/0** has an IP address of 10.0.8.10/30 and connects to R4.

### *Configuration*

#### **CLI Quick Configuration**

To quickly configure an OSPF import policy for network summaries, copy the following commands, removing any line breaks, and then paste the commands into CLI.

Configuration on Device R1:

```
[edit]
set interfaces fe-0/1/0 unit 0 family inet address 10.0.4.13/30
set interfaces fe-0/0/1 unit 0 family inet address 10.0.4.5/30
set protocols ospf area 0.0.0.3 interface fe-0/1/0
set protocols ospf area 0.0.0.3 interface fe-0/0/1
```

Configuration on Device R2:

```
[edit]
set interfaces fe-0/1/0 unit 0 family inet address 10.0.4.6/30
set interfaces fe-1/0/0 unit 0 family inet address 10.0.4.1/30
set protocols ospf area 0.0.0.3 interface fe-0/1/0
set protocols ospf area 0.0.0.3 interface fe-1/0/0
```

Configuration on Device R3:

```
[edit]
set interfaces fe-1/0/0 unit 0 family inet address 10.0.4.2/30
set interfaces fe-1/1/0 unit 0 family inet address 10.0.4.14/30
set interfaces fe-0/0/1 unit 0 family inet address 10.0.2.1/30
set policy-options policy-statement import-policy term term1 from route-filter 10.0.4.12/30
  prefix-length-range /30-/30
set policy-options policy-statement import-policy term term1 then accept
set protocols ospf area 0.0.0.3 interface fe-1/0/0
set protocols ospf area 0.0.0.3 interface fe-1/1/0
set protocols ospf area 0.0.0.0 interface fe-0/0/1
set protocols ospf area 0.0.0.3 network-summary-import import-policy
```

Configuration on Device R4:

```
[edit]
set interfaces fe-0/0/1 unit 0 family inet address 10.0.2.1/30
set interfaces fe-1/1/0 unit 0 family inet address 10.0.8.6/30
set interfaces fe-1/0/0 unit 0 family inet address 10.0.8.9/30
set protocols ospf area 0.0.0.0 interface fe-0/0/1
set protocols ospf area 0.0.0.4 interface fe-1/1/0
set protocols ospf area 0.0.0.4 interface fe-1/0/0
```

Configuration on Device R5:

```
[edit]
set interfaces fe-1/1/0 unit 0 family inet address 10.0.8.5/30
set protocols ospf area 0.0.0.4 interface fe-1/1/0
```

Configuration on Device R6:

```
[edit]
set interfaces fe-1/0/0 unit 0 family inet address 10.0.8.10/30
set protocols ospf area 0.0.0.4 interface fe-1/0/0
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Modifying the Junos OS Configuration* in *CLI User Guide*.

To configure an OSPF import policy for network summaries:

1. Configure the interfaces.

**NOTE:** For OSPFv3, use IPv6 addresses.

```
[edit]
user@R1# set interfaces fe-0/1/0 unit 0 family inet address 10.0.4.13/30
user@R1# set interfaces fe-0/0/1 unit 0 family inet address 10.0.4.5/30

[edit]
user@R2# set interfaces fe-0/1/0 unit 0 family inet address 10.0.4.6/30
user@R2# set interfaces fe-1/0/0 unit 0 family inet address 10.0.4.1/30

[edit]
user@R3# set interfaces fe-1/0/0 unit 0 family inet address 10.0.4.2/30
user@R3# set interfaces fe-1/1/0 unit 0 family inet address 10.0.4.14/30
```

```

user@R3#set interfaces fe-0/0/1 unit 0 family inet address 10.0.2.1/30
[edit]
user@R4# set interfaces fe-0/0/1 unit 0 family inet address 10.0.2.1/30
user@R4# set interfaces fe-1/1/0 unit 0 family inet address 10.0.8.6/30
user@R4# set interfaces fe-1/0/0 unit 0 family inet address 10.0.8.9/30
[edit]
user@R5# set interfaces fe-1/1/0 unit 0 family inet address 10.0.8.5/30
[edit]
user@R6# set interfaces fe-1/0/0 unit 0 family inet address 10.0.8.10/30

```

2. Enable OSPF on the interfaces.

**NOTE:** For OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```

[edit]
user@R1# set protocols ospf area 0.0.0.3 interface fe-0/1/0
user@R1# set protocols ospf area 0.0.0.3 interface fe-0/0/1
[edit]
user@R2# set protocols ospf area 0.0.0.3 interface fe-0/1/0
user@R2# set protocols ospf area 0.0.0.3 interface fe-1/0/0
[edit]
user@R3# set protocols ospf area 0.0.0.3 interface fe-1/0/0
user@R3# set protocols ospf area 0.0.0.3 interface fe-1/1/0
user@R3# set protocols ospf area 0.0.0.0 interface fe-0/0/1
[edit]
user@R4# set protocols ospf area 0.0.0.0 interface fe-0/0/1
user@R4# set protocols ospf area 0.0.0.4 interface fe-1/1/0
user@R4# set protocols ospf area 0.0.0.4 interface fe-1/0/0
[edit]
user@R5# set protocols ospf area 0.0.0.4 interface fe-1/1/0
[edit]
user@R6# set protocols ospf area 0.0.0.4 interface fe-1/0/0

```

3. On R3, configure the import network summary policy.

```

[edit ]
user@R3# set policy-options policy-statement import-policy term term1 from
route-filter 10.0.4.12/30 prefix-length-range /30-/30
user@R3# set policy-options policy-statement import-policy term term1 then accept

```

4. On R3, apply the import network summary policy to OSPF.

**NOTE:** For OSPFv3, include the `inter-area-prefix-export` statement at the `[edit protocols ospf3 area area-id]` hierarchy level.

```

[edit]

```

```
user@R3# set protocols ospf area 0.0.0.3 network-summary-import import-policy
```

5. If you are done configuring the devices, commit the configuration.

```
[edit]
user@host# commit
```

**Results** Confirm your configuration by entering the **show interfaces**, **show policy-options**, and **show protocols ospf** commands on the appropriate device. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

Output for R1:

```
user@R1# show interfaces
fe-0/0/1 {
  unit 0 {
    family inet {
      address 10.0.4.5/30;
    }
  }
}
fe-0/1/0 {
  unit 0 {
    family inet {
      address 10.0.4.13/30;
    }
  }
}

user@R1# show protocols ospf
area 0.0.0.3 {
  interface fe-0/1/0.0;
  interface fe-0/0/1.0;
}
```

Output for R2:

```
user@R2# show interfaces
fe-0/1/0 {
  unit 0 {
    family inet {
      address 10.0.4.6/30;
    }
  }
}
fe-1/0/0 {
  unit 0 {
    family inet {
      address 10.0.4.1/30;
    }
  }
}

user@R2# show protocols ospf
area 0.0.0.3 {
  interface fe-0/1/0.0;
```

```
    interface fe-1/0/0.0;  
  }
```

Output for R3:

```
user@R3# show interfaces  
fe-0/0/1 {  
  unit 0 {  
    family inet {  
      address 10.0.2.1/30;  
    }  
  }  
}  
fe-1/0/0 {

}
area 0.0.0.4 {
  interface fe-0/1/0.0;
  interface fe-1/0/0.0;
}

```

Output for R5:

```

user@R5# show interfaces
fe-1/1/0 {
  unit 0 {
    family inet {
      address 10.0.8.5/30;
    }
  }
}

user@R5# show protocols ospf
area 0.0.0.4 {
  interface fe-1/1/0.0;
}

```

Output for R6:

```

user@R6# show interfaces
fe-1/0/0 {
  unit 0 {
    family inet {
      address 10.0.8.10/30;
    }
  }
}

user@R6# show protocols ospf
area 0.0.0.4 {
  interface fe-1/0/0.0;
}

```

To confirm your OSPFv3 configuration, enter the **show interfaces**, **show policy-options**, and **show protocols ospf3** commands on the appropriate device.

**Verification**

Confirm that the configuration is working properly.

- [Verifying the OSPF Database on page 4198](#)
- [Verifying the Routing Table on page 4198](#)

**Verifying the OSPF Database**

**Purpose** Verify that the OSPF database for the devices in area 4 includes the interarea route that we are advertising from R3. Any other routes from area 3 should not be advertised into area 4, so those entries should age out or no longer be present in the OSPF database.

**Action** From operational mode, enter the **show ospf database netsummary area 0.0.0.4** command for OSPFv2, and enter the **show ospf3 database inter-area-prefix area 0.0.0.4** command for OSPFv3.

**Verifying the Routing Table**

**Purpose** Verify that the specified route is included in R4's, R5's, or R6's routing table. Any other routes from area 3 should not be advertised into area 4.

**Action** From operational mode, enter the **show route protocol ospf** command for both OSPFv2 and OSPFv3.

### Example: Configuring OSPF Trace Options

- [Tracing OSPF Protocol Traffic on page 4198](#)
- [Example: Tracing OSPF Protocol Traffic on page 4200](#)

---

#### Tracing OSPF Protocol Traffic

Tracing operations record detailed messages about the operation of OSPF. You can trace OSPF protocol traffic to help debug OSPF protocol issues. When you trace OSPF protocol traffic, you specify the name of the file and the type of information you want to trace.

You can specify the following OSPF protocol-specific trace options:

- **database-description**—All database description packets, which are used in synchronizing the OSPF topological database
- **error**—OSPF error packets
- **event**—OSPF state transitions
- **flooding**—Link-state flooding packets
- **graceful-restart**—Graceful-restart events
- **hello**—Hello packets, which are used to establish neighbor adjacencies and to determine whether neighbors are reachable
- **ldp-synchronization**—Synchronization events between OSPF and LDP
- **lsa-ack**—Link-state acknowledgment packets, which are used in synchronizing the OSPF topological database
- **lsa-analysis**—Link-state analysis. Specific to the Juniper Networks implementation of OSPF, Junos OS performs LSA analysis before running the shortest-path-first (SPF) algorithm. LSA analysis helps to speed the calculations performed by the SPF algorithm.
- **lsa-request**—Link-state request packets, which are used in synchronizing the OSPF topological database
- **lsa-update**—Link-state updates packets, which are used in synchronizing the OSPF topological database
- **nsr-synchronization**—Nonstop routing synchronization events
- **on-demand**—Trace demand circuit extensions
- **packet-dump**—Dump the contents of selected packet types
- **packets**—All OSPF packets
- **restart-signaling**—(OSPFv2 only) Restart-signaling graceful restart events
- **spf**—Shortest path first (SPF) calculations

You can optionally specify one or more of the following flag modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**NOTE:** Use the **detail** flag modifier with caution as it might cause the CPU to become very busy.

Global tracing options are inherited from the configuration set by the **traceoptions** statement at the **[edit routing-options]** hierarchy level. You can override the following global trace options for the OSPF protocol using the **traceoptions flag** statement included at the **[edit protocols ospf]** hierarchy level:

- **all**—All tracing operations
- **general**—All normal operations and routing table changes (a combination of the normal and route trace operations)
- **normal**—Normal events
- **policy**—Policy processing
- **route**—Routing information
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

**NOTE:** Use the trace flag **all** with caution as it might cause the CPU to become very busy.

---

### Example: Tracing OSPF Protocol Traffic

---

This example shows how to trace OSPF protocol traffic.

- [Requirements on page 4200](#)
- [Overview on page 4200](#)
- [Configuration on page 4201](#)
- [Verification on page 4205](#)

#### **Requirements**

This example assumes that OSPF is properly configured and running in your network, and you want to trace OSPF protocol traffic for debugging purposes.

#### **Overview**

You can trace OSPF protocol traffic to help debug OSPF protocol issues. When you trace OSPF protocol traffic, you specify the name of the file and the type of information you want to trace. All files are placed in a directory on the routing device's hard disk. On M Series and T Series routers, trace files are stored in the `/var/log` directory.

This example shows a few configurations that might be useful when debugging OSPF protocol issues. The verification output displayed is specific to each configuration.

---

**TIP:** To keep track of your log files, create a meaningful and descriptive name so it is easy to remember the content of the trace file. We recommend that

you place global routing protocol tracing output in the file `routing-log`, and OSPF tracing output in the file `ospf-log`.

In the first example, you globally enable tracing operations for all routing protocols that are actively running on your routing device to the file `routing-log`. With this configuration, you keep the default settings for the trace file size and the number of trace files. After enabling global tracing operations, you enable tracing operations to provide detailed information about OSPF packets, including link-state advertisements, requests, and updates, database description packets, and hello packets to the file `ospf-log`, and you configure the following options:

- **size**—Specifies the maximum size of each trace file, in KB, MB, or GB. In this example, you configure 10 KB as the maximum size. When the file reaches its maximum size, it is renamed with a .0 extension. When the file again reaches its maximum size, it is renamed with a .1 extension, and the newly created file is renamed with a .0 extension. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option. You specify **k** for KB, **m** for MB, and **g** for GB. By default, the trace file size is 128 KB. The file size range is 10 KB through the maximum file size supported on your system.
- **files**—Specifies the maximum number of trace files. In this example, you configure a maximum of 5 trace files. When a trace file reaches its maximum size, it is renamed with a .0 extension, then a .1 extension, and so on until the maximum number of trace files is reached. When the maximum number of files is reached, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the **size** option. By default, there are 10 files. The range is 2 through 1000 files.

In the second example, you trace all SPF calculations to the file `ospf-log` by including the **spf** flag. You keep the default settings for the trace file size and the number of trace files.

In the third example, you trace the creation, receipt, and retransmission of all LSAs to the file `ospf-log` by including the **lsa-request**, **lsa-update**, and **lsa-ack** flags. You keep the default settings for the trace file size and the number of trace files.

### **Configuration**

- [Configuring Global Tracing Operations and Tracing OSPF Packet Information on page 4201](#)
- [Tracing SPF Calculations on page 4203](#)
- [Tracing Link-State Advertisements on page 4204](#)

### **Configuring Global Tracing Operations and Tracing OSPF Packet Information**

#### **CLI Quick Configuration**

To quickly enable global tracing operations for all routing protocols actively running on your routing device and to trace detailed information about OSPF packets, copy the following commands and paste them into the CLI.

[edit]

```
set routing-options traceoptions file routing-log
set protocols ospf traceoptions file ospf-log
set protocols ospf traceoptions file files 5 size 10k
set protocols ospf traceoptions flag lsa-ack
set protocols ospf traceoptions flag database-description
set protocols ospf traceoptions flag hello
set protocols ospf traceoptions flag lsa-update
set protocols ospf traceoptions flag lsa-request
```

**Step-by-Step  
Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Modifying the Junos OS Configuration* in *CLI User Guide*.

To configure global routing tracing operations and tracing operations for OSPF packets:

1. Configure tracing at the routing options level to collect information about the active routing protocols on your routing device.

```
[edit]
user@host# edit routing-options traceoptions
```

2. Configure the filename for the global trace file.

```
[edit routing-options traceoptions]
user@host# set file routing-log
```

3. Configure the filename for the OSPF trace file.

**NOTE:** To specify OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@host# edit protocols ospf traceoptions
user@host# set file ospf-log
```

4. Configure the maximum number of trace files.

```
[edit protocols ospf traceoptions]
user@host# set file files 5
```

5. Configure the maximum size of each trace file.

```
[edit protocols ospf traceoptions]
user@host# set file size 10k
```

6. Configure tracing flags.

```
[edit protocols ospf traceoptions]
user@host# set flag lsa-ack
user@host# set flag database-description
user@host# set flag hello
user@host# set flag lsa-update
user@host# set flag lsa-request
```

7. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf traceoptions]
```

```
user@host# commit
```

**Results** Confirm your configuration by entering the **show routing-options** and the **show protocols ospf** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show routing-options
traceoptions {
  file routing-log;
}
```

```
user@host# show protocols ospf
traceoptions {
  file ospf-log size 10k files 5;
  flag lsa-ack;
  flag database-description;
  flag hello;
  flag lsa-update;
  flag lsa-request;
}
```

To confirm your OSPFv3 configuration, enter the **show routing-options** and the **show protocols ospf3** commands.

### *Tracing SPF Calculations*

**CLI Quick Configuration** To quickly trace SPF calculations, copy the following commands and paste them into the CLI.

```
[edit]
set protocols ospf traceoptions file ospf-log
set protocols ospf traceoptions flag spf
```

**Step-by-Step Procedure** To configure SPF tracing operations for OSPF:

1. Configure the filename for the OSPF trace file.

**NOTE:** To specify OSPFv3, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# edit protocols ospf traceoptions
user@host# set file ospf-log
```

2. Configure the SPF tracing flag.

```
[edit protocols ospf traceoptions]
user@host# set flag spf
```

3. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf traceoptions]
user@host# commit
```

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
traceoptions {
  file ospf-log ;
  flag spf;
}
```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### *Tracing Link-State Advertisements*

**CLI Quick Configuration** To quickly trace the creation, receipt, and retransmission of all LSAs, copy the following commands and paste them into the CLI.

```
[edit]
set protocols ospf traceoptions file ospf-log
set protocols ospf traceoptions flag lsa-request
set protocols ospf traceoptions flag lsa-update
set protocols ospf traceoptions flag lsa-ack
```

**Step-by-Step Procedure** To configure link-state advertisement tracing operations for OSPF:

1. Configure the filename for the OSPF trace file.

**NOTE:** To specify OSPFv3, include the **ospf3** statement at the **[edit protocols]** hierarchy level.

```
[edit]
user@host# edit protocols ospf traceoptions
user@host# set file ospf-log
```

2. Configure the link-state advertisement tracing flags.

```
[edit protocols ospf traceoptions]
user@host# set flag lsa-request
user@host# set flag lsa-update
user@host# set flag lsa-ack
```

3. If you are done configuring the device, commit the configuration.

```
[edit protocols ospf traceoptions]
user@host# commit
```

**Results** Confirm your configuration by entering the **show protocols ospf** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols ospf
traceoptions {
  file ospf-log;
```

```

    flag lsa-request;
    flag lsa-update;
    flag lsa-ack;
}

```

To confirm your OSPFv3 configuration, enter the **show protocols ospf3** command.

### Verification

Confirm that the configuration is working properly.

### Verifying Trace Operations

<b>Purpose</b>	Verify that the Trace options field displays the configured trace operations, and verify that the Trace file field displays the location on the routing device where the file is saved, the name of the file to receive the output of the tracing operation, and the size of the file.
<b>Action</b>	From operational mode, enter the <b>show ospf overview extensive</b> command for OSPFv2, and enter the <b>show ospf3 overview extensive</b> command for OSPFv3.

## area

<b>Syntax</b>	<pre> area <i>area-id</i> {     interface <i>interface-name</i> {         passive;         topology (ipv4-multicast   <i>name</i>) {             disable;         }     }     virtual-link neighbor-id <i>router-id</i> transit-area <i>area-id</i> {         topology (ipv4-multicast   <i>name</i>) {             disable;         }     } } </pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols (<b>ospf</b>   ospf3)],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (<b>ospf</b>   ospf3)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p> <p>[edit protocols (<b>ospf</b>   ospf3)],</p> <p>[edit protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols (<b>ospf</b>   ospf3)],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Specify the area identifier for this routing device to use when participating in OSPF routing. All routing devices in an area must use the same area identifier to establish adjacencies.</p> <p>Specify multiple <b>area</b> statements to configure the routing device as an area border router. An area border router does not automatically summarize routes between areas. Use the <b>area-range</b> statement to configure route summarization. By definition, an area border router must be connected to the backbone area either through a physical link or through a virtual link. To create a virtual link, include the <b>virtual-link</b> statement.</p> <p>To specify that the routing device is directly connected to the OSPF backbone, include the <b>area 0.0.0.0</b> statement.</p> <p>All routing devices on the backbone must be contiguous. If they are not, use the <b>virtual-link</b> statement to create the appearance of connectivity to the backbone.</p>

You can also configure any interface that belongs to one or more topologies to advertise the direct interface addresses without actually running OSPF on that interface. By default, OSPF must be configured on an interface in order for direct interface addresses to be advertised as interior routes.

**NOTE:** If you configure an interface with the **passive** statement, it applies to all the topologies to which the interface belongs. You cannot configure an interface as passive for only one specific topology and have it remain active for any other topologies to which it belongs.

<b>Options</b>	<b><i>area-id</i></b> —Area identifier. The identifier can be up to 32 bits. It is common to specify the area number as a simple integer or an IP address. Area number <b>0.0.0.0</b> is reserved for the OSPF backbone area.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">OSPF Areas and Router Functionality Overview on page 4041</a></li><li>• <a href="#">Understanding Multiple Address Families for OSPFv3 on page 4090</a></li><li>• <i>virtual-link</i></li></ul>

## area-range

<b>Syntax</b>	<b>area-range</b> <i>network/mask-length</i> <exact> <override-metric <i>metric</i> > <restrict>;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols (ospf   ospf3) <b>area</b> <i>area-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols (ospf   ospf3) area <i>area-id</i> nssa],</p> <p>[edit logical-systems <i>logical-system-name</i> realm (ipv4-unicast   ipv4-multicast   ipv6-multicast) area <i>area-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3) <b>area</b> <i>area-id</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3) area <i>area-id</i> nssa],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> realm (ipv4-unicast   ipv4-multicast   ipv6-multicast) <b>area</b> <i>area-id</i>],</p> <p>[edit protocols (ospf   ospf3) <b>area</b> <i>area-id</i>],</p> <p>[edit protocols (ospf   ospf3) area <i>area-id</i> nssa],</p> <p>[edit protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast) <b>area</b> <i>area-id</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3) <b>area</b> <i>area-id</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3) area <i>area-id</i> nssa],</p> <p>[edit routing-instances <i>routing-instance-name</i> realm (ipv4-unicast   ipv4-multicast   ipv6-multicast) <b>area</b> <i>area-id</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>(Area border routers only) For an area, summarize a range of IP addresses when sending summary link advertisements (within an area). To summarize multiple ranges, include multiple <b>area-range</b> statements.</p> <p>For a not-so-stubby area (NSSA), summarize a range of IP addresses when sending NSSA link-state advertisements. The specified prefixes are used to aggregate external routes learned within the area when the routes are advertised to other areas. To specify multiple prefixes, include multiple <b>area-range</b> statements. All external routes learned within the area that do not fall into one of the prefixes are advertised individually to other areas.</p>
<b>Default</b>	By default, area border routing devices do not summarize routes being sent from one area to other areas, but rather send all routes explicitly.
<b>Options</b>	<p><b>exact</b>—(Optional) Summarization of a route is advertised only when an exact match is made with the configured summary range.</p> <p><b>mask-length</b>—Number of significant bits in the network mask.</p> <p><b>network</b>—IP address. You can specify one or more IP addresses.</p>

**override-metric *metric***—(Optional) Override the metric for the IP address range and configure a specific metric value.

**restrict**—(Optional) Do not advertise the configured summary. This hides all routes that are contained within the summary, effectively creating a route filter.

**Range:** 1 through 16,777,215

<b>Required Privilege</b>	routing—To view this statement in the configuration.
<b>Level</b>	routing-control—To add this statement to the configuration.

## context-identifier (Protocols OSPF)

---

<b>Syntax</b>	context-identifier <i>identifier</i>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols (ospf   ospf3) <b>area</b> <i>area-id</i> ], [edit protocols (ospf   ospf3) <b>area</b> <i>area-id</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.4. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Configure OSPF context-identifier information.
<b>Options</b>	<i>identifier</i> —IPv4 address that defines a protection pair. The context identifier is manually configured on both the primary and protector provider edge (PE) devices.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show ospf context-identifier on page 4260</a></li></ul>

## bfd-liveness-detection (Protocols OSPF)

**Syntax**    `bfd-liveness-detection {`  
                   `authentication {`  
                     `algorithm algorithm-name;`  
                     `key-chain key-chain-name;`  
                     `loose-check;`  
                   `}`  
                   `detection-time {`  
                     `threshold milliseconds;`  
                   `}`  
                   `full-neighbors-only`  
                   `minimum-interval milliseconds;`  
                   `minimum-receive-interval milliseconds;`  
                   `multiplier number;`  
                   `no-adaptation;`  
                   `transmit-interval {`  
                     `minimum-interval milliseconds;`  
                     `threshold milliseconds;`  
                   `}`  
                   `version (1 | automatic);`  
                   `}`

**Hierarchy Level**    `[edit logical-systems logical-system-name protocols (ospf | ospf3) area area-id interface interface-name],`  
                           `[edit logical-systems logical-system-name protocols ospf3 realm (ipv4-unicast |`  
                             `ipv4-multicast | ipv6-multicast) area area-id interface interface-name],`  
                           `[edit logical-systems logical-system-name routing-instances routing-instance-name protocols`  
                             `(ospf | ospf3) area area-id interface interface-name],`  
                           `[edit logical-systems logical-system-name routing-instances routing-instance-name protocols`  
                             `ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast) area area-id interface`  
                             `interface-name],`  
                           `[edit protocols (ospf | ospf3) area area-id interface interface-name],`

                           `[edit routing-instances routing-instance-name protocols ospf3 realm (ipv4-unicast |`  
                             `ipv4-multicast | ipv6-multicast) area area-id interface interface-name]`

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                               Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                               **detection-time threshold** and **transmit-interval threshold** options added in Junos OS Release 8.2.  
                               Support for logical systems introduced in Junos OS Release 8.3.  
                               **no-adaptation** option introduced in Junos OS Release 9.0.  
                               **no-adaptation** option introduced in Junos OS Release 9.0 for EX Series switches.  
                               Support for OSPFv3 introduced in Junos OS Release 9.3.  
                               Support for OSPFv3 introduced in Junos OS Release 9.3 for EX Series switches.  
                               **full-neighbors-only** option introduced in Junos OS Release 9.5.  
                               **full-neighbors-only** option introduced in Junos OS Release 9.5 for EX Series switches.

**authentication algorithm**, **authentication key-chain**, and **authentication loose-check** options introduced in Junos OS Release 9.6.

Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description** Configure bidirectional failure detection timers and authentication for OSPF.

The remaining statements are explained separately.

**Options** **authentication algorithm *algorithm-name***—Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, or **meticulous-keyed-sha-1**.

**authentication key-chain *key-chain-name***—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

**authentication loose-check**—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

**detection-time threshold *milliseconds***—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**full-neighbors-only**—Establish BFD sessions only for OSPF neighbors in the full state. The default behavior is to establish BFD sessions for all OSPF neighbors.

**minimum-interval *milliseconds***—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the **transmit-interval minimum-interval** and **minimum-receive-interval** statements.

**Range:** 1 through 255,000 milliseconds

**minimum-receive-interval *milliseconds***—Configure the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the **minimum-interval** statement.

**Range:** 1 through 255,000 milliseconds

**multiplier *number***—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255

**Default:** 3

**no-adaptation**—Specify that BFD sessions should not adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

**transmit-interval threshold *milliseconds***—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**transmit-interval minimum-interval *milliseconds***—Configure the minimum interval at which the routing device transmits hello packets to a neighbor with which it has established

a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement.

**Range:** 1 through 255,000

**version**—Configure the BFD version to detect: **1** (BFD version 1) or **automatic** (autodetect the BFD version).

**Default:** **automatic**

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## database-protection

<b>Syntax</b>	<pre>database-protection {   ignore-count <i>number</i>;   ignore-time <i>seconds</i>;   maximum-lsa <i>number</i>;   reset-time <i>seconds</i>;   warning-only;   warning-threshold <i>percent</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit protocols (<b>ospf</b>   ospf3)], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (<b>ospf</b>   ospf3)], [edit routing-instances <i>routing-instance-name</i> protocols (<b>ospf</b>   ospf3)], [edit routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-unicast   ipv6-multicast)]</pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.2.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Configure the maximum number of link-state advertisements (LSAs) that are not generated by the router or switch in a given OSPF instance.
<b>Default</b>	By default, OSPF database protection is not enabled.
<b>Options</b>	<p><b>ignore-count <i>number</i></b>—Configure the number of times the database can enter the ignore state. When the ignore count is exceeded, the database enters the isolate state.</p> <p><b>Range:</b> 1 through 32</p> <p><b>Default:</b> 5</p> <p><b>ignore-time <i>seconds</i></b>—Configure the time the database must remain in the ignore state before it resumes regular operations (enters retry state).</p> <p><b>Range:</b> 30 through 3,600 seconds</p> <p><b>Default:</b> 300 seconds</p> <p><b>maximum-lsa <i>number</i></b>—Configure the maximum number of LSAs whose advertising router ID is different from the local router ID in a given OSPF instance. This includes external LSAs as well as LSAs with any scope, such as the link, area, and autonomous system (AS). This value is mandatory.</p> <p><b>Range:</b> 1 through 1,000,000</p> <p><b>Default:</b> None</p> <p><b>reset-time <i>seconds</i></b>—Configure the time period during which the database must operate without being in the ignore or isolate state before it is reset to a normal operating state.</p> <p><b>Range:</b> 60 through 86,400 seconds</p> <p><b>Default:</b> 600 seconds</p>

**warning-only**—Specify that only a warning should be issued when the maximum LSA number is exceeded. If configured, no other action is taken against the database.

**warning-threshold *percent***—Configure the percentage of the maximum number of LSAs to be exceeded before a warning message is logged.

**Range:** 30 through 100 percent

**Default:** 75 percent

<b>Required Privilege</b>	routing—To view this statement in the configuration.
<b>Level</b>	routing-control—To add this statement to the configuration.

------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## disable (OSPF)

<b>Syntax</b>	disable;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols (<b>ospf</b>   ospf3)],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols (ospf   ospf3) <b>area</b> <i>area-id</i> <b>interface</b> <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols ospf <b>area</b> <i>area-id</i> <b>peer-interface</b> <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols (ospf   ospf3) virtual-link],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast) <b>area</b> <i>area-id</i> <b>interface</b> <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (<b>ospf</b>   ospf3)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3) <b>area</b> <i>area-id</i> <b>interface</b> <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3) virtual-link],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instances</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast) <b>area</b> <i>area-id</i> <b>interface</b> <i>interface-name</i>],</p> <p>[edit protocols (<b>ospf</b>   ospf3)],</p> <p>[edit protocols (ospf   ospf3) <b>area</b> <i>area-id</i> <b>interface</b> <i>interface-name</i>],</p> <p>[edit protocols (ospf   ospf3) virtual-link],</p> <p>[edit protocols ospf <b>area</b> <i>area-id</i> <b>peer-interface</b> <i>interface-name</i>],</p> <p>[edit protocols ospf <b>area</b> <i>area-id</i> virtual-link neighbor-id <i>router-id</i> transit-area <i>area-id</i>],</p> <p>[edit protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p> <p>[edit protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast) <b>area</b> <i>area-id</i> <b>interface</b> <i>interface-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols (<b>ospf</b>   ospf3)],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3) <b>area</b> <i>area-id</i> <b>interface</b> <i>interface-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3) virtual-link],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast) <b>area</b> <i>area-id</i> <b>interface</b> <i>interface-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Disable OSPF, an OSPF interface, or an OSPF virtual link.</p> <p>By default, control packets sent to the remote end of a virtual link must be forwarded using the default topology. In addition, the transit area path consists only of links that</p>

are in the default topology. You can disable a virtual link for a configured topology, but not for a default topology. Include the **disable** statement at the **[edit protocols ospf area *area-id* virtual-link neighbor-id *router-id* transit-area *area-id* topology *name*]** hierarchy level.

**NOTE:** If you disable the virtual link by including the **disable** statement at the **[edit protocols ospf area *area-id* virtual-link neighbor-id *router-id* transit-area *area-id*]** hierarchy level, you disable the virtual link for all topologies, including the default topology. You cannot disable the virtual link only in the default topology.

<b>Default</b>	The configured object is enabled (operational) unless explicitly disabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>OSPF Configuration Overview</i></li><li>• <i>Configuring RSVP and OSPF for LMP Peer Interfaces</i></li></ul>

## export (Protocols OSPF)

<b>Syntax</b>	<code>export [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols (<a href="#">ospf</a>   ospf3)],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (<a href="#">ospf</a>   ospf3)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p> <p>[edit protocols (<a href="#">ospf</a>   ospf3)],</p> <p>[edit protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols (<a href="#">ospf</a>   ospf3)],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Apply one or more policies to routes being exported from the routing table into OSPF.
<b>Options</b>	<i>policy-names</i> —Name of one or more policies.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding OSPF Routing Policy on page 4164</a></li> <li>• <a href="#">Import and Export Policies for Network Summaries Overview on page 4180</a></li> <li>• <a href="#">import on page 4225</a></li> <li>• <i>Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices</i></li> </ul>

## external-preference (Protocols OSPF)

---

<b>Syntax</b>	<code>external-preference <i>preference</i>;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols (<b>ospf</b>   ospf3)],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (<b>ospf</b>   ospf3)],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</code> <code>[edit protocols (<b>ospf</b>   ospf3)],</code> <code>[edit protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols (<b>ospf</b>   ospf3)],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Support for the <b>realm</b> statement introduced in Junos OS Release 9.2. Support for the <b>realm</b> statement introduced in Junos OS Release 9.2 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Set the route preference for OSPF external routes.
<b>Options</b>	<b><i>preference</i></b> —Preference value. <b>Range:</b> 0 through 4,294,967,295 ( $2^{32} - 1$ ) <b>Default:</b> 150
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Controlling OSPF Route Preferences on page 4111</a></li><li>• <a href="#">preference on page 4232</a></li></ul>

## graceful-restart (Protocols OSPF)

<b>Syntax</b>	<pre> graceful-restart {   disable;   helper-disable (standard   restart-signaling   both);   no-strict-lsa-checking;   notify-duration <i>seconds</i>;   restart-duration <i>seconds</i>; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols (<a href="#">ospf</a>   ospf3)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (<a href="#">ospf</a>   ospf3)],</p> <p>[edit protocols (<a href="#">ospf</a>   ospf3)],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols ospf]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Support for the <b>no-strict-lsa-checking</b> statement introduced in Junos OS Release 8.5.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the helper mode <b>standard</b>, <b>restart-signaling</b>, and <b>both</b> options introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure graceful restart for OSPF.</p> <p>Graceful restart allows a routing device to restart with minimal effects to the network, and is enabled for all routing protocols at the [edit routing-options] hierarchy level.</p>
<b>Options</b>	<p><b>disable</b>—Disable graceful restart for OSPF.</p> <p><b>helper-disable (standard   restart-signaling   both)</b>—Disable helper mode for graceful restart. When helper mode is disabled, a device cannot help a neighboring device that is attempting to restart. Beginning with Junos OS Release 11.4, you can configure restart signaling-based helper mode for OSPFv2 graceful restart configurations. The <b>standard</b>, <b>restart-signaling</b>, and <b>both</b> options are only supported for OSPFv2. Specify <b>standard</b> to disable helper mode for standard graceful restart (based on RFC 3623). Specify <b>restart-signaling</b> to disable helper mode for restart signaling-based graceful restart (based on RFC 4811, RFC 4812, and RFC 4813). Specify <b>both</b> to disable helper mode for both standard and restart signaling-based graceful restart. The last committed statement takes precedence over the previously configured statement.</p> <p><b>Default:</b> Helper mode is enabled by default. For OSPFv2, both standard and restart-signaling based helper modes are enabled by default.</p> <p><b>no-strict-lsa-checking</b>—Disable strict OSPF link-state advertisement (LSA) checking to prevent the termination of graceful restart by a helping router. LSA checking is enabled by default.</p>

**NOTE:** The **helper-disable** statement and the **no-strict-lsa-checking** statement cannot be configured at the same time. If you attempt to configure both

statements at the same time, the routing device displays a warning message when you enter the `show protocols (ospf | ospf3)` command.

.....  
**notify-duration seconds**—Estimated time needed to send out purged grace LSAs over all the interfaces.

**Range:** 1 through 3600 seconds

**Default:** 30 seconds

**restart-duration seconds**—Estimated time needed to reacquire a full OSPF neighbor from each area.

**Range:** 1 through 3600 seconds

**Default:** 180 seconds

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
---------------------------------	---------------------------------------------------------------------------------------------------------------------

 ipv4-multicast | ipv6-multicast) *area area-id*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Support for the **topology** statement introduced in Junos OS Release 9.0.  
 Support for the **topology** statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Support for the **realm** statement introduced in Junos OS Release 9.2.  
 Support for the **realm** statement introduced in Junos OS Release 9.2 for EX Series switches.  
 Support for the **no-interface-state-traps** statement introduced in Junos OS Release 10.3.  
 This statement is supported only for OSPFv2.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Enable OSPF routing on a routing device interface.  
 You must include at least one **interface** statement in the configuration to enable OSPF on the routing device.

**Options** *interface-name*—Name of the interface. Specify the interface by IP address or interface name for OSPFv2, or only the interface name for OSPFv3. Using both the interface name and IP address of the same interface produces an invalid configuration. To configure all interfaces, you can specify **all**. Specifying a particular interface and **all** produces an invalid configuration.

**NOTE:** For nonbroadcast interfaces, specify the IP address of the nonbroadcast interface as *interface-name*.

The remaining statements are explained separately.

**NOTE:** You cannot run both OSPF and ethernet-tcc encapsulation between two Juniper Networks routing devices.

**Required Privilege Level** routing—To view this statement in the configuration.  
 routing-control—To add this statement to the configuration.

## no-nssa-abr

---

<b>Syntax</b>	no-nssa-abr;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ( <a href="#">ospf</a>   ospf3)], [edit logical-systems <i>logical-system-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ( <a href="#">ospf</a>   ospf3)], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)], [edit protocols ( <a href="#">ospf</a>   ospf3)], [edit protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)], [edit routing-instances <i>routing-instance-name</i> protocols ( <a href="#">ospf</a>   ospf3)], [edit routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.6. Statement introduced in Junos OS Release 9.0 for EX Series switches. Support for the <b>realm</b> statement introduced in Junos OS Release 9.2. Support for the <b>realm</b> statement introduced in Junos OS Release 9.2 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Disable exporting Type 7 link-state advertisements into not-so-stubby-areas (NSSAs) for an autonomous system boundary router (ASBR) or an area border router (ABR).
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring OSPF Not-So-Stubby Areas on page 4064</a></li></ul>

## no-rfc-1583

<b>Syntax</b>	no-rfc-1583;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols (<a href="#">ospf</a>   ospf3)],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (<a href="#">ospf</a>   ospf3)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p> <p>[edit protocols (<a href="#">ospf</a>   ospf3)],</p> <p>[edit protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols (<a href="#">ospf</a>   ospf3)],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.5.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Disable compatibility with RFC 1583, <i>OSPF Version 2</i> . If the same external destination is advertised by AS boundary routers that belong to different OSPF areas, disabling compatibility with RFC 1583 can prevent routing loops.
<b>Default</b>	Compatibility with RFC 1583 is enabled by default.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control-level—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Disabling OSPFv2 Compatibility with RFC 1583 on page 4074</a></li> </ul>

## ospf

---

<b>Syntax</b>	ospf { ... }
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols], [edit protocols], [edit routing-instances <i>routing-instance-name</i> protocols]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Enable OSPF routing on the routing device.  You must include the <b>ospf</b> statement to enable OSPF on the routing device.
<b>Default</b>	OSPF is disabled on the routing device.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>OSPF Configuration Overview</i></li><li>• <i>[edit protocols ospf] Hierarchy Level</i></li></ul>

## ospf3

---

<b>Syntax</b>	ospf3 { ... }
<b>Hierarchy Level</b>	[edit protocols], [edit routing-instances <i>routing-instance-name</i> protocols]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Enable OSPFv3 routing on the routing device.  You must include the <b>ospf3</b> statement to enable OSPFv3.
<b>Default</b>	OSPFv3 is disabled on the routing device.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>OSPF Configuration Overview</i></li><li>• <i>[edit protocols ospf3] Hierarchy Level</i></li></ul>

## overload (Protocols OSPF)

<b>Syntax</b>	<pre>overload {     timeout <i>seconds</i>; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols (<b>ospf</b>   ospf3)],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols ospf <b>topology</b> (default   ipv4-multicast   <i>name</i>)],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (<b>ospf</b>   ospf3)],</p> <p>[edit logical systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf <b>topology</b> (default   ipv4-multicast   <i>name</i>)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p> <p>[edit protocols (<b>ospf</b>   ospf3)],</p> <p>[edit protocols ospf <b>topology</b> (default   ipv4-multicast   <i>name</i>)],</p> <p>[edit protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols (<b>ospf</b>   ospf3)],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols ospf <b>topology</b> (default   ipv4-multicast   <i>name</i>)],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for Multitopology Routing introduced in Junos OS Release 9.0.</p> <p>Support for Multitopology Routing introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Configure the local routing device so that it appears to be overloaded. You might do this when you want the routing device to participate in OSPF routing, but do not want it to be used for transit traffic.</p>
<div>  <p><b>NOTE:</b> Traffic destined to directly attached interfaces continues to reach the routing device.</p> </div>	
<b>Options</b>	<p><b>timeout <i>seconds</i></b>—(Optional) Number of seconds at which the overloading is reset. If no timeout interval is specified, the routing device remains in overload state until the <b>overload</b> statement is deleted or a timeout is set.</p> <p><b>Range:</b> 60 through 1800 seconds</p> <p><b>Default:</b> 0 seconds</p>

**NOTE:** Multitopology Routing does not support the timeout option.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring OSPF to Make Routing Devices Appear Overloaded on page 4114</a></li> <li>• <a href="#">Example: Configuring Multitopology Routing Based on Applications</a></li> <li>• <a href="#">Example: Configuring Multitopology Routing Based on a Multicast Source</a></li> </ul>

## preference (Protocols OSPF)

<b>Syntax</b>	<code>preference preference;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols (<a href="#">ospf</a>   ospf3)],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (<a href="#">ospf</a>   ospf3)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p> <p>[edit protocols (<a href="#">ospf</a>   ospf3)],</p> <p>[edit protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols (<a href="#">ospf</a>   ospf3)],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Set the route preference for OSPF internal routes.
<b>Options</b>	<p><b>preference</b>—Preference value.</p> <p><b>Range:</b> 0 through 4,294,967,295 (<math>2^{32} - 1</math>)</p> <p><b>Default:</b> 10</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

<b>Description</b>	Install routes learned from OSPF routing instances into routing tables in the OSPF routing table group.
<b>Options</b>	<i>group-name</i> —Name of the routing table group.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Exporting Specific Routes from One Routing Table Into Another Routing Table</i></li> <li>• <i>Example: Importing Direct and Static Routes Into a Routing Instance</i></li> <li>• <i>Understanding Multiprotocol BGP</i></li> <li>• <a href="#">interface-routes on page 2989</a></li> <li>• <a href="#">rib-group on page 3031</a></li> </ul>

## topology (OSPF)

---

<b>Syntax</b>	<pre>topology (default   ipv4-multicast   <i>name</i>) {     spf-options {         delay <i>milliseconds</i>;         holddown <i>milliseconds</i>;         rapid-runs <i>number</i>;     }     topology-id <i>number</i>; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols <b>ospf</b>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>ospf</b>], [edit protocols <b>ospf</b>], [edit routing-instances <i>routing-instance-name</i> protocols <b>ospf</b>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0. Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Enable a topology for OSPF multitenancy routing. You must first configure one or more topologies under the <b>[edit routing-options]</b> hierarchy level.</p>
<b>Options</b>	<p><b>default</b>—Name of the default topology. This topology is automatically created, and all routes that correspond to it are automatically added to the <b>inet.0</b> routing table. You can modify certain default parameters, such as for the SPF algorithm.</p> <p><b>ipv4-multicast</b>—Name of the topology for IPv4 multicast traffic.</p> <p><b><i>name</i></b>—Name of a topology you configured at the <b>[edit routing-options]</b> hierarchy level to create a topology for a specific type of traffic, such as voice or video.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Configuring Multitenancy Routing Based on Applications</i></li><li>• <i>Example: Configuring Multitenancy Routing Based on a Multicast Source</i></li></ul>

## traceoptions (Protocols OSPF)

<b>Syntax</b>	<pre>traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;flag-modifier&gt; &lt;disable&gt;; }</pre>
<b>Hierarchy Level</b>	<pre>[edit logical-systems <i>logical-system-name</i> protocols (<b>ospf</b>   ospf3)], [edit logical-systems <i>logical-system-name</i> protocols ospf3 realm (ipv4-unicast     ipv4-multicast   ipv6-multicast)], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   (<b>ospf</b>   ospf3)], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)], [edit protocols (<b>ospf</b>   ospf3)], [edit protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)], [edit routing-instances <i>routing-instance-name</i> protocols (<b>ospf</b>   ospf3)], [edit routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast     ipv4-multicast   ipv6-multicast)]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Configure OSPF protocol-level tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>

**NOTE:** The **traceoptions** statement is not supported on QFabric systems.

<b>Default</b>	The default OSPF protocol-level tracing options are those inherited from the routing protocols <b>traceoptions</b> statement included at the <b>[edit routing-options]</b> hierarchy level.
<b>Options</b>	<p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place OSPF tracing output in the file <b>ospf-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p>

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 10 files

**flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

#### OSPF Tracing Flags

- **database-description**—Database description packets, which are used in synchronizing the OSPF and OSPFv3 topological database.
- **error**—OSPF and OSPFv3 error packets.
- **event**—OSPF and OSPFv3 state transitions.
- **flooding**—Link-state flooding packets.
- **graceful-restart**—Graceful-restart events.
- **hello**—Hello packets, which are used to establish neighbor adjacencies and to determine whether neighbors are reachable.
- **ldp-synchronization**—Synchronization events between OSPF and LDP.
- **lsa-ack**—Link-state acknowledgment packets, which are used in synchronizing the OSPF topological database.
- **lsa-analysis**—Link-state analysis. Specific to the Juniper Networks implementation of OSPF, Junos OS performs LSA analysis before running the shortest-path-first (SPF) algorithm. LSA analysis helps to speed the calculations performed by the SPF algorithm.
- **lsa-request**—Link-state request packets, which are used in synchronizing the OSPF topological database.
- **lsa-update**—Link-state updates packets, which are used in synchronizing the OSPF topological database.
- **nsr-synchronization**—Nonstop routing synchronization events.
- **on-demand**—Trace demand circuit extensions.
- **packet-dump**—Content of selected packet types.
- **packets**—All OSPF packets.
- **restart-signaling**—(OSPFv2 only) Restart-signaling graceful restart events.
- **spf**—Shortest-path-first (SPF) calculations.

#### Global Tracing Flags

- **all**—All tracing operations.
- **general**—A combination of the **normal** and **route** trace operations.
- **normal**—All normal operations. If you do not specify this option, only unusual or abnormal operations are traced.
- **policy**—Policy operations and actions.
- **route**—Routing table changes.
- **state**—State transitions.
- **task**—Routing protocol task processing.
- **timer**—Routing protocol timer processing.

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information.
- **receive**—Packets being received.
- **send**—Packets being transmitted.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

<b>Required Privilege Level</b>	routing and trace—To view this statement in the configuration. routing-control and trace-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Tracing OSPF Protocol Traffic on page 4200</a></li> </ul>

## traffic-engineering (OSPF)

---

<b>Syntax</b>	<pre>traffic-engineering {   &lt;advertise-unnumbered-interfaces&gt;;   &lt;credibility-protocol-preference&gt;;   ignore-lsp-metrics;   multicast-rpf-routes;   no-topology;   shortcuts {     lsp-metric-into-summary;   } }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ( <b>ospf</b>   ospf3)], [edit protocols ( <b>ospf</b>   ospf3)]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. <b>multicast-rpf-routes</b> option introduced in Junos OS Release 7.5. <b>advertise-unnumbered-interfaces</b> option introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 9.0 for EX Series switches. Support for OSPFv3 ( <b>ospf3</b> ) introduced in Junos OS Release 9.4. Support for OSPFv3 ( <b>ospf3</b> ) introduced in Junos OS Release 9.4 for EX Series switches. <b>credibility-protocol-preference</b> statement introduced in Junos OS Release 9.4. <b>credibility-protocol-preference</b> statement introduced in Junos OS Release 9.4 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Enable the OSPF traffic engineering features.
<b>Default</b>	Traffic engineering support is disabled.
<b>Options</b>	<p><b>advertise-unnumbered-interfaces</b>—(Optional) (OSPFv2 only) Include the link-local identifier in the link-local traffic-engineering link-state advertisement. This statement must be included on both ends of an unnumbered link to allow an ingress LER to update the link in its traffic engineering database and use it for CSPF calculations. The link-local identifier is then used by RSVP to signal unnumbered interfaces as defined in RFC 3477.</p> <p><b>credibility-protocol-preference</b>—(Optional) (OSPFv2 only) Use the configured preference value for OSPF routes to calculate the traffic engineering database credibility value used to select IGP routes. Use this statement to override the default behavior, in which the traffic engineering database prefers IS-IS routes even if OSPF routes are configured with a lower, that is, preferred, preference value. For example, OSPF routes have a default preference value of 10, whereas IS-IS Level 1 routes have a default preference value of 15. When protocol preference is enabled, the credibility value is determined by deducting the protocol preference value from a base value of 512. Using default protocol preference values, OSPF has a credibility value of 502, whereas IS-IS has a credibility value of 497. Because the traffic engineering database prefers IGP routes with the highest credibility value, OSPF routes are now preferred.</p>

**multicast-rpf-routes**—(Optional) (OSPFv2 only) Install routes for multicast RPF checks into the **inet.2** routing table. The **inet.2** routing table consists of unicast routes used for multicast RPF lookup. RPF is an antispoofing mechanism used to check whether the packet is coming in on an interface that is also sending data back to the packet source.

**NOTE:** You must enable OSPF traffic engineering shortcuts to use the **multicast-rpf-routes** statement. You must not allow LSP advertisements into OSPF when configuring the **multicast-rpf-routes** statement.

**no-topology**—(Optional) (OSPFv2 only) Disable the dissemination of the link-state topology information.

The remaining statements are explained separately.

**CAUTION:** When the OSPF traffic engineering configuration is considerably modified, the routing table entries are deleted and the routing table is recreated. Changes to configuration that can cause this behavior include enabling or disabling:

- Traffic engineering shortcuts
- IGP shortcuts
- LDP tunneling
- Multiprotocol LSP
- Advertise summary metrics
- Multicast RPF routes

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## CHAPTER 49

# Administration

- [Routine Monitoring on page 4243](#)
- [Operational Commands on page 4243](#)

## Routine Monitoring

---

- [Monitoring OSPF Routing Information on page 4243](#)

### Monitoring OSPF Routing Information

**Purpose** Use the monitoring functionality to monitor OSPF routing information on routing devices.

**Action** To view OSPF routing information in the CLI, enter the following CLI commands:

- `show ospf neighbor`
- `show ospf interface`
- `show ospf statistics`

**Related Documentation**

- [show \(ospf | ospf3\) interface on page 4270](#)
- [clear \(ospf | ospf3\) neighbor on page 4250](#)
- [show \(ospf | ospf3\) statistics on page 4298](#)

## Operational Commands

---

- `clear (ospf | ospf3) database`
- `clear (ospf | ospf3) database-protection`
- `clear (ospf | ospf3) io-statistics`
- `clear (ospf | ospf3) neighbor`
- `clear (ospf | ospf3) statistics`
- `clear (ospf | ospf3) overload`
- `show (ospf | ospf3) backup coverage`
- `show (ospf | ospf3) backup neighbor`

- `show ospf context-identifier`
- `show ospf database`
- `show (ospf | ospf3) interface`
- `show (ospf | ospf3) io-statistics`
- `show (ospf | ospf3) log`
- `show (ospf | ospf3) neighbor`
- `show (ospf | ospf3) overview`
- `show (ospf | ospf3) route`
- `show (ospf | ospf3) statistics`

## clear (ospf | ospf3) database

**List of Syntax**    [Syntax on page 4245](#)  
                           [Syntax \(EX Series Switch and QFX Series\) on page 4245](#)

**Syntax**    clear (ospf | ospf3) database  
                   <advertising-router (*router-id* | self) >  
                   <area *area-id* >  
                   <asbrsummary >  
                   <external >  
                   <instance *instance-name* >  
                   <inter-area-prefix >  
                   <inter-area-router >  
                   <intra-area-prefix >  
                   <link-local >  
                   <logical-system (all | *logical-system-name*) >  
                   <lsa-id *lsa-id* >  
                   <netsummary >  
                   <network >  
                   <nssa >  
                   <opaque-area >  
                   <purge >  
                   <realm (ipv4-multicast | ipv4-unicast | ipv6-multicast) >  
                   <router >

**Syntax (EX Series Switch and QFX Series)**    clear (ospf | ospf3) database  
                                                           <advertising-router (*router-id* | self) >  
                                                           <area *area-id* >  
                                                           <asbrsummary >  
                                                           <external >  
                                                           <instance *instance-name* >  
                                                           <inter-area-prefix >  
                                                           <inter-area-router >  
                                                           <intra-area-prefix >  
                                                           <link-local >  
                                                           <lsa-id *lsa-id* >  
                                                           <netsummary >  
                                                           <network >  
                                                           <nssa >  
                                                           <opaque-area >  
                                                           <purge >  
                                                           <router >

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                   **advertising-router** *router-id*, **netsummary**, **network**, **nssa**, **opaque-area**, and **router** options added in Junos OS Release 8.3. You must use the **purge** command with these options.  
                                   **area** *area-id* option added in Junos OS Release 8.3.  
                                   Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                   **realm** option added in Junos OS Release 9.2.  
                                   **advertising-router** (*router-id* | **self**) option added in Junos OS Release 9.5.  
                                   **advertising-router** (*router-id* | **self**) option introduced in Junos OS Release 9.5 for EX Series switches.  
                                   Command introduced in Junos OS Release 11.3 for the QFX Series.

**purge** option (and all options that are dependent on the **purge** option) hidden in Junos OS Release 13.3.

**Description** With the master Routing Engine, delete entries in the Open Shortest Path First (OSPF) link-state advertisement (LSA) database. With the backup Routing Engine, delete the OSPF LSA database and sync the new database with the master Routing Engine.

**CAUTION:** You can also use the **purge** command with any of the options to discard rather than delete the specified LSA entries. This command is useful only for testing. Use it with care, because it causes significant network disruption.

**Options** **none**—Delete all LSAs other than the system's own LSAs, which are regenerated. To resynchronize the database, the system destroys all adjacent neighbors that are in the state **EXSTART** or higher. The neighbors are then reacquired and the databases are synchronized.

**advertising-router (router-id | self)**—(Hidden) Discard entries for the LSA entries advertised by the specified routing device or by this routing device.

**area area-id**—(Optional) Discard entries for the LSAs in the specified area.

**asbrsummary**—(Optional) Discard summary AS boundary router LSA entries.

**external**—(Optional) Discard external LSAs.

**instance instance-name**—(Optional) Delete or discard entries for the specified routing instance only.

**inter-area-prefix**—(OSPFv3 only) (Optional) Discard interarea prefix LSAs.

**inter-area-router**—(OSPFv3 only) (Optional) Discard interarea router LSAs.

**intra-area-prefix**—(OSPFv3 only) (Optional) Discard intra-area prefix LSAs.

**logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**link-local**—(Optional) Delete link-local LSAs.

**lsa-id lsa-id**—(Optional) Discard the LSA entries with the specified LSA identifier.

**netsummary**—(Hidden) Discard summary network LSAs.

**network**—(Hidden) Discard network LSAs.

**nssa**—(Hidden) Discard not-so-stubby area (NSSA) LSAs.

**opaque-area**—(Hidden) Discard opaque area-scope LSAs.

**purge**—(Hidden) Discard all entries in the link-state advertisement database. All link-state advertisements are set to **MAXAGE** and are flooded. The database is repopulated when the originators of the link-state advertisements receive the **MAXAGE** link-state advertisements and reissue them.

**realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)**—(OSPFv3 only) (Optional) Delete the entries for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**router**—(Hidden) Discard router LSAs.

**Required Privilege Level**

clear

- [show ospf3 database](#)

**List of Sample Output** [clear ospf database on page 4247](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear ospf database

```
user@host> clear ospf database
```

## clear (ospf | ospf3) database-protection

---

<b>Syntax</b>	clear (ospf   ospf3) database-protection <instance <i>instance-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 10.2. Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Clear the Open Shortest Path First (OSPF) link-state database from its isolated state. Reset the ignore count, ignore timer, and reset timer, and resume normal operations.
<b>Options</b>	<b>instance <i>instance-name</i></b> —(Optional) Clear the OSPF link-state database for the specified routing instance only.
<b>Required Privilege Level</b>	clear
<b>Output Fields</b>	This command produces no output.

### Sample Output

#### clear ospf database-protection

```
user@host> clear ospf database-protection
```

## clear (ospf | ospf3) io-statistics

---

<b>List of Syntax</b>	<a href="#">Syntax on page 4249</a> <a href="#">Syntax (EX Series Switch and QFX Series) on page 4249</a>
<b>Syntax</b>	clear (ospf   ospf3) io-statistics <logical-system (all   <i>logical-system-name</i> )>
<b>Syntax (EX Series Switch and QFX Series)</b>	clear (ospf   ospf3) io-statistics
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Clear Open Shortest Path First (OSPF) input and output statistics.
<b>Options</b>	<b>none</b> —Clear OSPF input and output statistics.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Required Privilege Level</b>	clear
<b>List of Sample Output</b>	<a href="#">clear ospf io-statistics on page 4249</a>

Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>realm</b> option introduced in Junos OS Release 9.2. Command introduced in Junos OS Release 11.3 for the QFX Series.
Description	Clear Open Shortest Path First (OSPF) statistics.
Options	<b>none</b> —Clear OSPF statistics.  <b>instance <i>instance-name</i></b> —(Optional) Clear statistics for the specified routing instance only.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.  <b>realm (ipv4-multicast   ipv4-unicast   ipv6-multicast)</b> —(Optional) (OSPFv3 only) Clear statistics for the specified OSPFv3 realm, or address family. Use the <b>realm</b> option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">show (ospf   ospf3) statistics on page 4298</a></li></ul>
List of Sample Output	<a href="#">clear ospf statistics on page 4252</a>

**Table 324: show (ospf | ospf3) backup coverage Output Fields**

Field Name	Field Description
Node Coverage	Information about backup coverage for each OSPF node.
Area	Area number. Area 0.0.0.0 is the backbone.

Table 324: show (ospf | ospf3) backup coverage Output Fields (*continued*)

Field Name	Field Description
<b>Covered Nodes</b>	Number of nodes for which backup coverage is available.
<b>Total Nodes</b>	Total number of OSPF nodes.
<b>Route Coverage</b>	Information about backup coverage for each type of OSPF route.
<b>Path Type</b>	Type of OSPF path: <b>Intra</b> , <b>Inter</b> , <b>Ext1</b> , <b>Ext2</b> , and <b>All</b> .
<b>Covered Routes</b>	For each path type, the number of routes for which backup coverage is available.
<b>Total Routes</b>	For each path type, the total number of configured routes.
<b>Percent Covered</b>	For all nodes and for each path type, the percentage for which backup coverage is available.

## Sample Output

### show ospf backup coverage

```

user@host> show ospf backup coverage
Topology default coverage:

Node Coverage:

Area              Covered  Total  Percent
                  Nodes   Nodes  Covered
0.0.0.0           4        5    80.00%

Route Coverage:

Path Type  Covered  Total  Percent
          Routes Routes  Covered
Intra      8        14    57.14%
Inter      0         0   100.00%
Ext1       0         0   100.00%
Ext2       1         1   100.00%
All        9        15    60.00%

```

### show ospf3 backup coverage

```

user @host > show ospf3 backup coverage
show ospf3 backup coverage
Node Coverage:

Area              Covered  Total  Percent
                  Nodes   Nodes  Covered
0.0.0.0           4        5    80.00%

Route Coverage:

Path Type  Covered  Total  Percent
          Routes Routes  Covered

```

Intra	4	6	66.67%
Inter	0	0	100.00%
Ext1	0	0	100.00%
Ext2	1	1	100.00%
All	5	7	71.43%

**Table 327: show ospf database Output Fields**

Field Name	Field Description	Level of Output
<b>area</b>	Area number. Area 0.0.0.0 is the backbone area.	All levels
<b>Type</b>	Type of link advertisement: <b>ASBRSum</b> , <b>Extern</b> , <b>Network</b> , <b>NSSA</b> , <b>OpaqArea</b> , <b>Router</b> , or <b>Summary</b> .	All levels
<b>ID</b>	LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device.	All levels
<b>Adv Rtr</b>	Address of the routing device that sent the advertisement.	All levels

Table 327: show ospf database Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Seq</b>	Link sequence number of the advertisement.	All levels
<b>Age</b>	Time elapsed since the LSA was originated, in seconds.	All levels
<b>Opt</b>	Optional OSPF capabilities associated with the LSA.	All levels
<b>Cksum</b>	Checksum value of the LSA.	All levels
<b>Len</b>	Length of the advertisement, in bytes.	All levels
<b>Router</b>	Router link-state advertisement information: <ul style="list-style-type: none"> <li><b>bits</b>—Flags describing the routing device that generated the LSP.</li> <li><b>link count</b>—Number of links in the advertisement.</li> <li><b>id</b>—ID of a routing device or subnet on the link.</li> <li><b>data</b>—For stub networks, the subnet mask. Otherwise, the IP address of the routing device that generated the LSP.</li> <li><b>type</b>—Type of link. It can be <b>PointToPoint</b>, <b>Transit</b>, <b>Stub</b>, or <b>Virtual</b>.</li> <li><b>TOS count</b>—Number of type-of-service (ToS) entries in the advertisement.</li> <li><b>TOS 0 metric</b>—Metric for ToS 0.</li> <li><b>TOS</b>—Type-of-service (ToS) value.</li> <li><b>metric</b>—Metric for the ToS.</li> </ul>	<b>detail extensive</b>
<b>Network</b>	Network link-state advertisement information: <ul style="list-style-type: none"> <li><b>mask</b>—Network mask.</li> <li><b>attached router</b>—ID of the attached neighbor.</li> </ul>	<b>detail extensive</b>
<b>Summary</b>	Summary link-state advertisement information: <ul style="list-style-type: none"> <li><b>mask</b>—Network mask.</li> <li><b>TOS</b>—Type-of-service (ToS) value.</li> <li><b>metric</b>—Metric for the ToS.</li> </ul>	<b>detail extensive</b>
<b>Gen timer</b>	How long until the LSA is regenerated.	<b>extensive</b>
<b>Aging timer</b>	How long until the LSA expires.	<b>extensive</b>
<b>Installed <i>hh:mm:ss</i> ago</b>	How long ago the route was installed.	<b>extensive</b>
<b>expires in <i>hh:mm:ss</i></b>	How long until the route expires.	<b>extensive</b>
<b>sent <i>hh:mm:ss</i> ago</b>	How long ago the LSA was sent.	<b>extensive</b>
<b>Last changed <i>hh:mm:ss</i> ago</b>	How long ago the route was changed.	<b>extensive</b>

Table 327: show ospf database Output Fields (*continued*)

Field Name	Field Description	Level of Output
Change count	Number of times the route has changed.	extensive
Ours	Indicates that this is a local advertisement.	extensive
Router LSAs	Number of router link-state advertisements in the link-state database.	summary
Network LSAs	Number of network link-state advertisements in the link-state database.	summary
Summary LSAs	Number of summary link-state advertisements in the link-state database.	summary
NSSA LSAs	Number of not-so-stubby area link-state advertisements in the link-state database.	summary

**Output Fields** [Table 328 on page 4271](#) lists the output fields for the **show (ospf | ospf3) interface** command. Output fields are listed in the approximate order in which they appear.

**Table 328: show (ospf | ospf3) interface Output Fields**

Field Name	Field Description	Level of Output
<b>Interface</b>	Name of the interface running OSPF version 2 or OSPF version 3.	All levels
<b>State</b>	State of the interface: <b>BDR</b> , <b>Down</b> , <b>DR</b> , <b>DRother</b> , <b>Loop</b> , <b>PtToPt</b> , or <b>Waiting</b> .	All levels
<b>Area</b>	Number of the area that the interface is in.	All levels
<b>DR ID</b>	Address of the area's designated router.	All levels
<b>BDR ID</b>	Backup designated router for a particular subnet.	All levels
<b>Nbrs</b>	Number of neighbors on this interface.	All levels
<b>Type</b>	Type of interface: <b>LAN</b> , <b>NBMA</b> , <b>P2MP</b> , <b>P2P</b> , or <b>Virtual</b> .	<b>detail extensive</b>
<b>Address</b>	IP address of the neighbor.	<b>detail extensive</b>
<b>Mask</b>	Netmask of the neighbor.	<b>detail extensive</b>
<b>Prefix-length</b>	(OSPFv3) IPv6 prefix length, in bits.	<b>detail extensive</b>
<b>OSPF3-Intf-Index</b>	(OSPFv3) OSPF version 3 interface index.	<b>detail extensive</b>
<b>MTU</b>	Interface maximum transmission unit (MTU).	<b>detail extensive</b>
<b>Cost</b>	Interface cost (metric).	<b>detail extensive</b>
<b>DR addr</b>	Address of the designated router.	<b>detail extensive</b>
<b>BDR addr</b>	Address of the backup designated router.	<b>detail extensive</b>
<b>Adj count</b>	Number of adjacent neighbors.	<b>detail extensive</b>
<b>Secondary</b>	Indicates that this interface is configured as a secondary interface for this area. This interface can belong to more than one area, but can be designated as a primary interface for only one area.	<b>detail extensive</b>

Table 328: show (ospf | ospf3) interface Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Flood Reduction</b>	Indicates that this interface is configured with flooding reduction. All self-originated LSAs from this interface are initially sent with the <b>DoNotAge</b> bit set. As a result, LSAs are refreshed only when a change occurs.	<b>extensive</b>
<b>Priority</b>	Router priority used in designated router (DR) election on this interface.	<b>detail extensive</b>
<b>Flood list</b>	List of link-state advertisements (LSAs) that might be about to flood this interface.	<b>extensive</b>
<b>Ack list</b>	Acknowledgment list. List of pending acknowledgments on this interface.	<b>extensive</b>
<b>Descriptor list</b>	List of packet descriptors.	<b>extensive</b>
<b>Hello</b>	Configured value for the hello timer.	<b>detail extensive</b>
<b>Dead</b>	Configured value for the dead timer.	<b>detail extensive</b>
<b>Auth type</b>	(OSPFv2) Authentication mechanism for sending and receiving OSPF protocol packets: <ul style="list-style-type: none"> <li>• <b>MD5</b>—The MD5 mechanism is configured in accordance with RFC 2328.</li> <li>• <b>None</b>—No authentication method is configured.</li> <li>• <b>Password</b>—A simple password (RFC 2328) is configured.</li> </ul>	<b>detail extensive</b>
<b>Topology</b>	(Multiarea adjacency) Name of topology: <b>default</b> or <b>name</b> .	
<b>LDP sync state</b>	(OSPFv2 and LDP synchronization) Current state of LDP synchronization: <b>in sync</b> , <b>in holddown</b> , and <b>not supported</b> .	<b>extensive</b>
<b>reason</b>	(OSPFv2 and LDP synchronization) Reason for the current state of LDP synchronization. The LDP session might be up or down, or adjacency might be up or down.	<b>extensive</b>
<b>config holdtime</b>	(OSPFv2 and LDP synchronization) Configured value of the hold timer.  If the state is not synchronized, and the hold time is not infinity, the <b>remaining</b> field displays the number of seconds that remain until the configured hold timer expires.	<b>extensive</b>
<b>IPSec SA name</b>	(OSPFv2) Name of the IPSec security association name.	<b>detail extensive</b>
<b>Active key ID</b>	(OSPFv2 and MD5) Number from <b>0</b> to <b>255</b> that uniquely identifies an MD5 key.	<b>detail extensive</b>
<b>Start time</b>	(OSPFv2 and MD5) Time at which the routing device starts using an MD5 key to authenticate OSPF packets transmitted on the interface on which this key is configured. To authenticate received OSPF protocol packets, the key becomes effective immediately after the configuration is committed. If the start time option is not configured, the key is effective immediately for send and receive and is displayed as <b>Start time 1970 Jan 01 00:00:00 PST</b> .	<b>detail extensive</b>

Table 328: show (ospf | ospf3) interface Output Fields (*continued*)

Field Name	Field Description	Level of Output
ReXmit	Configured value for the Retransmit timer.	detail extensive
Stub, Not Stub, or Stub NSSA	Type of area.	detail extensive

<b>Syntax</b>	show (ospf   ospf3) io-statistics <logical-system (all   <i>logical-system-name</i> )>
<b>Syntax (EX Series Switch and QFX Series)</b>	show (ospf   ospf3) io-statistics
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Display Open Shortest Path First (OSPF) input and output statistics.
<b>Options</b>	none—Display OSPF input and output statistics.  logical-system (all   <i>logical-system-name</i> )—(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">clear (ospf   ospf3) statistics on page 4252</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ospf io-statistics on page 4277</a>
<b>Output Fields</b>	Table 329 on page 4276 lists the output fields for the <b>show ospf io-statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 329: show (ospf | ospf3) io-statistics Output Fields**

Field Name	Field Description
Packets read	Number of OSPF packets read since the last time the routing protocol was started.
average per run	Total number of packets divided by the total number of times the OSPF read operation is scheduled to run.
max run	Maximum number of packets for a given run among all scheduled runs.
Receive errors	Number of faulty packets received with errors.

## Sample Output

### show ospf io-statistics

```
user@host> show ospf io-statistics
```

```
Packets read: 7361, average per run: 1.00, max run: 1  
Receive errors:  
None
```

## show (ospf | ospf3) log

**List of Syntax** [Syntax on page 4278](#)  
[Syntax \(EX Series Switch and QFX Series\) on page 4278](#)

**Syntax** `show (ospf | ospf3) log`  
`<instance instance-name>`  
`<logical-system (all | logical-system-name)>`  
`<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>`  
`<topology topology-name>`

**Syntax (EX Series Switch and QFX Series)** `show (ospf | ospf3) log`  
`<instance instance-name>`  
`<topology topology-name>`

**Release Information** Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
**topology** option introduced in Junos OS Release 9.0.  
**topology** option introduced in Junos OS Release 9.0 for EX Series switches.  
**realm** option introduced in Junos OS Release 9.2.  
Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Display the entries in the Open Shortest Path First (OSPF) log of SPF calculations.

**Options** **none**—Display entries in the OSPF log of SPF calculations for all routing instances.

**instance *instance-name***—(Optional) Display entries for the specified routing instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**topology *topology-name***—(Optional) (OSPFv2 only) Display entries for the specified topology.

**realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)**—(OSPFv3 only) (Optional) Display entries for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**Required Privilege Level** view

**List of Sample Output** [show ospf log on page 4279](#)  
[show ospf log topology voice on page 4279](#)

**Output Fields** [Table 330 on page 4278](#) lists the output fields for the **show (ospf | ospf3) log** command. Output fields are listed in the approximate order in which they appear.

**Table 330: show (ospf | ospf3) log Output Fields**

Field Name	Field Description
<b>When</b>	Time, in weeks ( <b>w</b> ) and days ( <b>d</b> ), since the SPF calculation was made.

Table 330: show (ospf | ospf3) log Output Fields (*continued*)

Field Name	Field Description
Type	Type of calculation: Cleanup, External, Interarea, NSSA, Redist, SPF, Stub, Total, or Virtuallink.
Elapsed	Amount of time, in seconds, that elapsed during the operation, or the time required to complete the SPF calculation. The start time is the time displayed in the When field.

## Sample Output

### show ospf log

```

user@host> show ospf log

## show (ospf | ospf3) neighbor

**List of Syntax**    [Syntax on page 4281](#)  
                          [Syntax \(EX Series Switches and QFX Series\) on page 4281](#)

**Syntax**    `show (ospf | ospf3) neighbor`  
                  `<brief | detail | extensive>`  
                  `<area area-id>`  
                  `<instance (all | instance-name)>`  
                  `<interface interface-name>`  
                  `<logical-system (all | logical-system-name)>`  
                  `<neighbor>`  
                  `<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>`

**Syntax (EX Series Switches and QFX Series)**    `show (ospf | ospf3) neighbor`  
                  `<brief | detail | extensive>`  
                  `<area area-id>`  
                  `<instance (all | instance-name)>`  
                  `<interface interface-name>`  
                  `<neighbor>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                  **instance all** option introduced in Junos OS Release 9.1.  
                                  **instance all** option introduced in Junos OS Release 9.1 for EX Series switches.  
                                  **area**, **interface**, and **realm** options introduced in Junos OS Release 9.2.  
                                  **area** and **interface** options introduced in Junos OS Release 9.2 for EX Series switches.  
                                  Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**    Display information about OSPF neighbors.

CPU utilization might increase while the device learns its OSPF neighbors. We recommend that you use the **show (ospf | ospf3) neighbor** command after the device learns and establishes OSPF neighbor adjacencies. Depending on the size of your network, this might take several minutes. If you receive a “timeout communicating with routing daemon” error when using the **show (ospf | ospf3) neighbor** command, wait several minutes before attempting to use the command again. This is not a critical system error, but you might experience a delay in using the CLI.

**Options**    **none**—Display standard information about all OSPF neighbors for all routing instances.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**area *area-id***—(Optional) Display information about the OSPF neighbors for the specified area.

**instance (all | *instance-name*)**—(Optional) Display all OSPF interfaces for all routing instances or under the named routing instance.

**interface *interface-name***—(Optional) Display information about OSPF neighbors for the specified logical interface.

**logical-system** (**all** | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

**neighbor**—(Optional) Display information about the specified OSPF neighbor.

**realm** (**ipv4-multicast** | **ipv4-unicast** | **ipv6-multicast**)—(OSPFv3 only) (Optional) Display information about the OSPF neighbors for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**Required Privilege Level** view

**Related Documentation** • [clear \(ospf | ospf3\) neighbor on page 4250](#)

Field Name	Field Description	Level of Output
<b>Address</b>	Address of the neighbor.	All levels
<b>Interface</b>	Interface through which the neighbor is reachable.	All levels

Table 331: show (ospf | ospf3) neighbor Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>State</b>	<p>State of the neighbor:</p> <ul style="list-style-type: none"> <li>• <b>Attempt</b>—Valid only for neighbors attached to nonbroadcast networks. It indicates that no recent information has been received from the neighbor, but that a more concerted effort must be made to contact the neighbor.</li> <li>• <b>Down</b>—Initial state of a neighbor conversation. It indicates that no recent information has been received from the neighbor. Hello packets might continue to be sent to neighbors in the <b>Down</b> state, although at a reduced frequency.</li> <li>• <b>Exchange</b>—Routing device is describing its entire link-state database by sending database description packets to the neighbor. Each packet has a sequence number and is explicitly acknowledged.</li> <li>• <b>ExStart</b>—First step in creating an adjacency between the two neighboring routing devices. The goal of this step is to determine which routing device is the master, and to determine the initial sequence number.</li> <li>• <b>Full</b>—Neighboring routing devices are fully adjacent. These adjacencies appear in router link and network link advertisements.</li> <li>• <b>Init</b>—A hello packet has recently been sent by the neighbor. However, bidirectional communication has not yet been established with the neighbor. This state might occur, for example, because the routing device itself did not appear in the neighbor's hello packet.</li> <li>• <b>Loading</b>—Link-state request packets are sent to the neighbor to acquire more recent advertisements that have been discovered (but not yet received) in the <b>Exchange</b> state.</li> <li>• <b>2Way</b>—Communication between the two routing devices is bidirectional. This state has been ensured by the operation of the Hello Protocol. This is the most advanced state short of beginning adjacency establishment. The (backup) designated router is selected from the set of neighbors in state <b>2Way</b> or greater.</li> </ul>	All levels
<b>ID</b>	Router ID of the neighbor.	All levels
<b>Pri</b>	Priority of the neighbor to become the designated router.	All levels
<b>Dead</b>	Number of seconds until the neighbor becomes unreachable.	All levels
<b>Link state acknowledgment list</b>	Number of link-state acknowledgments received.	<b>extensive</b>
<b>Link state retransmission list</b>	<p>Total number of link-state advertisements retransmitted. For <b>extensive</b> output only, the following information is also displayed:</p> <ul style="list-style-type: none"> <li>• <b>Type</b>—Type of link advertisement: <b>ASBR</b>, <b>Sum</b>, <b>Extern</b>, <b>Network</b>, <b>NSSA</b>, <b>OpaqArea</b>, <b>Router</b>, or <b>Summary</b>.</li> <li>• <b>LSA ID</b>—LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device.</li> <li>• <b>Adv rtr</b>—Address of the routing device that sent the advertisement.</li> <li>• <b>Seq</b>—Link sequence number of the advertisement.</li> </ul>	<b>detail extensive</b>

Table 331: show (ospf | ospf3) neighbor Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Neighbor-address</b>	(OSPFv3 only) If the neighbor uses virtual links, the <b>Neighbor-address</b> is the site-local, local, or global address. If the neighbor uses a physical interface, the <b>Neighbor-address</b> is an IPv6 link-local address.	detail extensive
<b>area</b>	Area that the neighbor is in.	detail extensive
<b>OSPF3-Intf-Index</b>	(OSPFv3 only) Displays the OSPFv3 interface index.	detail extensive
<b>opt</b>	Option bits received in the hello packets from the neighbor.	detail extensive
<b>DR or DR-ID</b>	Address of the designated router.	detail extensive
<b>BDR or BDR-ID</b>	Address of the backup designated router.	detail extensive
<b>Up</b>	Length of time since the neighbor came up.	detail extensive
<b>adjacent</b>	Length of time since the adjacency with the neighbor was established.	detail extensive

## Sample Output

## show (ospf | ospf3) overview

<b>List of Syntax</b>	<a href="#">Syntax on page 4287</a> <a href="#">Syntax (EX Series Switch and QFX Series) on page 4287</a>
<b>Syntax</b>	show (ospf   ospf3) overview <brief   extensive> <instance <i>instance-name</i> > <logical-system (all   <i>logical-system-name</i> )> <realm (ipv4-multicast   ipv4-unicast   ipv6-multicast)>
<b>Syntax (EX Series Switch and QFX Series)</b>	show (ospf   ospf3) overview <brief   extensive> <instance <i>instance-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>realm</b> option introduced in Junos OS Release 9.2. Database protection introduced in Junos 10.2. Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Display Open Shortest Path First (OSPF) overview information.
<b>Options</b>	<b>none</b> —Display standard information about all OSPF neighbors for all routing instances.  <b>brief   extensive</b> —(Optional) Display the specified level of output.  <b>instance <i>instance-name</i></b> —(Optional) Display all OSPF interfaces under the named routing instance.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.  <b>realm (ipv4-multicast   ipv4-unicast   ipv6-multicast)</b> —(Optional) (OSPFv3 only) Display information about the specified OSPFv3 realm, or address family. Use the <b>realm</b> option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show ospf overview on page 4289</a> <a href="#">show ospf overview (With Database Protection) on page 4290</a> <a href="#">show ospf3 overview (With Database Protection) on page 4290</a> <a href="#">show ospf overview extensive on page 4290</a>
<b>Output Fields</b>	<a href="#">Table 211 on page 2362</a> lists the output fields for the <b>show ospf overview</b> command. Output fields are listed in the approximate order in which they appear.

Table 332: show ospf overview Output Fields

Field name	Field Description	Level of Output
Instance	OSPF routing instance.	All levels
Router ID	Router ID of the routing device.	All levels
Route table index	Route table index.	All levels
Configured overload	Overload capability is enabled. If the overload timer is also configured, display the time that remains before it is set to expire. This field is not displayed after the timer expires.	All levels
Topology	Topology identifier.	All levels
Prefix export count	Number of prefixes exported into OSPF.	All levels
Full SPF runs	Number of complete Shortest Path First calculations.	All levels
SPF delay	Delay before performing consecutive Shortest Path First calculations.	All levels
SPF holddown	Delay before performing additional Shortest Path First (SPF) calculations after the maximum number of consecutive SPF calculations is reached.	All levels
SPF rapid runs	Maximum number of Shortest Path First calculations that can be performed in succession before the hold-down timer begins.	All levels
LSA refresh time	Refresh period for link-state advertisement (in minutes).	All levels
Database protection state	Current state of database protection.	All levels
Warning threshold	Threshold at which a warning message is logged (percentage of maximum LSA count).	All levels
Non self-generated LSAs	Number of LSAs whose router ID is not equal to the local router ID: <b>Current</b> , <b>Warning</b> (threshold), and <b>Allowed</b> .	All levels
Ignore time	How long the database has been in the ignore state.	All levels
Reset time	How long the database must stay out of the ignore or isolated state before it returns to normal operations.	All levels
Ignore count	Number of times the database has been in the ignore state: <b>Current</b> and <b>Allowed</b> .	All levels
Restart	Graceful restart capability: <b>enabled</b> or <b>disabled</b> .	All levels
Restart duration	Time period for complete reacquisition of OSPF neighbors.	All levels
Restart grace period	Time period for which the neighbors should consider the restarting routing device as part of the topology.	All levels

Table 332: show ospf overview Output Fields (*continued*)

Field name	Field Description	Level of Output
Graceful restart helper mode	(OSPFv2) Standard graceful restart helper capability (based on RFC 3623): <b>enabled</b> or <b>disabled</b> .	All levels
Restart-signaling helper mode	(OSPFv2) Restart signaling-based graceful restart helper capability (based on RFC 4811, RFC 4812, and RFC 4813): <b>enabled</b> or <b>disabled</b> .	All levels
Helper mode	(OSPFv3) Graceful restart helper capability: <b>enabled</b> or <b>disabled</b> .	All levels
Trace options	OSPF-specific trace options.	<b>extensive</b>
Trace file	Name of the file to receive the output of the tracing operation.	<b>extensive</b>
Area	Area number. Area 0.0.0.0 is the backbone area.	All levels
Stub type	Stub type of area: <b>Normal Stub</b> , <b>Not Stub</b> , or <b>Not so Stubby Stub</b> .	All levels
Authentication Type	Type of authentication: <b>None</b> , <b>Password</b> , or <b>MD5</b> .  <b>NOTE:</b> The <b>Authentication Type</b> field refers to the authentication configured at the <b>[edit protocols ospf area area-id]</b> level. Any authentication configured for an interface in this area will not affect the value of this field.	All levels
Area border routers	Number of area border routers.	All levels
Neighbors	Number of autonomous system boundary routers.	All levels

## Sample Output

### show ospf overview

```

user@host> show ospf overview
Instance: master
  Router ID: 10.255.245.6
  Route table index: 0
  Configured overload, expires in 118 seconds
  LSA refresh time: 50 minutes
  Restart: Enabled
    Restart duration: 20 sec
    Restart grace period: 40 sec
    Helper mode: enabled
  Area: 0.0.0.0
    Stub type: Not Stub
    Authentication Type: None
    Area border routers: 0, AS boundary routers: 0
    Neighbors
      Up (in full state): 0
  Topology: default (ID 0)
  Prefix export count: 0
  Full SPF runs: 1
  SPF delay: 0.200000 sec, SPF holddown: 5 sec, SPF rapid runs: 3

```

### show ospf overview (With Database Protection)

```
user@host> show ospf overview
Instance: master
  Router ID: 10.255.112.218
  Route table index: 0
  LSA refresh time: 50 minutes
  Traffic engineering
  Restart: Enabled
    Restart duration: 180 sec
    Restart grace period: 210 sec
    Graceful restart helper mode: Enabled
    Restart-signaling helper mode: Enabled
  Database protection state: Normal
    Warning threshold: 70 percent
    Non self-generated LSAs: Current 582, Warning 700, Allowed 1000
    Ignore time: 30, Reset time: 60
    Ignore count: Current 0, Allowed 1
  Area: 0.0.0.0
    Stub type: Not Stub
    Authentication Type: None
    Area border routers: 0, AS boundary routers: 0
  Neighbors
    Up (in full state): 160
  Topology: default (ID 0)
    Prefix export count: 0
    Full SPF runs: 70
    SPF delay: 0.200000 sec, SPF holddown: 5 sec, SPF rapid runs: 3
    Backup SPF: Not Needed
```

### show ospf3 overview (With Database Protection)

```
user@host> show ospf3 overview
Instance: master
  Router ID: 10.255.112.128
  Route table index: 0
  LSA refresh time: 50 minutes
  Database protection state: Normal
    Warning threshold: 80 percent
    Non self-generated LSAs: Current 3, Warning 8, Allowed 10
    Ignore time: 30, Reset time: 60
    Ignore count: Current 0, Allowed 2
  Area: 0.0.0.0
    Stub type: Not Stub
    Area border routers: 0, AS boundary routers: 0
  Neighbors
    Up (in full state): 1
  Topology: default (ID 0)
    Prefix export count: 0
    Full SPF runs: 7
    SPF delay: 0.200000 sec, SPF holddown: 5 sec, SPF rapid runs: 3
    Backup SPF: Not Needed
```

### show ospf overview extensive

```
user@host> show ospf overview extensive
Instance: master
  Router ID: 1.1.1.103
  Route table index: 0
  Full SPF runs: 13, SPF delay: 0.200000 sec

| <b>Description</b>                              | Display the entries in the Open Shortest Path First (OSPF) routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                                  | <p><b>none</b>—Display standard information about all entries in the OSPF routing table for all routing instances and all topologies.</p> <p><b>destination</b>—Display routes to the specified IP address (with optional destination prefix length).</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>abr</b>—(Optional) Display routes to area border routers.</p> <p><b>asbr</b>—(Optional) Display routes to autonomous system border routers.</p> <p><b>extern</b>—(Optional) Display external routes.</p> <p><b>inter</b>—(Optional) Display interarea routes.</p> |

**intra**—(Optional) Display intra-area routes.

**instance** (**default** | **ipv4-multicast** | *instance-name*)—(Optional) Display entries for the default routing instance, the IPv4 multicast routing instance, or for the specified routing instance.

**logical-system** (**default** | **ipv4-multicast** | *logical-system-name*)—(Optional) Perform this operation on the default logical system, the IPv4 multicast logical system, or on a particular logical system.

**network**—(Optional) Display routes to networks.

**no-backup-coverage**—(Optional) Display routes with no backup coverage.

**realm** (**ipv4-multicast** | **ipv4-unicast** | **ipv6-multicast**)—(OSPFv3 only) (Optional) Display entries in the routing table for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**router**—(Optional) Display routes to all routers.

**topology** (**default** | **ipv4-multicast** | *topology-name*)—(OSPFv2 only) (Optional) Display routes for the default OSPF topology, IPv4 multicast topology, or for a particular topology.

**transit**—(Optional) (OSPFv3 only) Display OSPFv3 routes to pseudonodes.

**Required Privilege Level**

**Output Fields**

[Table 333 on page 4293](#) list the output fields for the **show (ospf | ospf3) route** command. Output fields are listed in the approximate order in which they appear.

**Table 333: show (ospf | ospf3) route Output Fields**

Field Name	Field Description	Output Level
<b>Topology</b>	Name of the topology.	All levels
<b>Prefix</b>	Destination of the route.	All levels

Table 333: show (ospf | ospf3) route Output Fields (*continued*)

Field Name	Field Description	Output Level
<b>Path type</b>	How the route was learned: <ul style="list-style-type: none"> <li>• <b>Inter</b>—Interarea route</li> <li>• <b>Ext1</b>—External type 1 route</li> <li>• <b>Ext2</b>—External type 2 route</li> <li>• <b>Intra</b>—Intra-area route</li> </ul>	All levels
<b>Route type</b>	The type of routing device from which the route was learned: <ul style="list-style-type: none"> <li>• <b>AS BR</b>—Route to AS border router.</li> <li>• <b>Area BR</b>—Route to area border router.</li> <li>• <b>Area/AS BR</b>—Route to router that is both an <b>Area BR</b> and <b>AS BR</b>.</li> <li>• <b>Network</b>—Network router.</li> <li>• <b>Router</b>—Route to a router that is neither an <b>Area BR</b> nor an <b>AS BR</b>.</li> <li>• <b>Transit</b>—(OSPFv3 only) Route to a pseudonode representing a transit network, LAN, or nonbroadcast multiaccess (NBMA) link.</li> <li>• <b>Discard</b>—Route to a summary discard.</li> </ul>	All levels
<b>NH Type</b>	Next-hop type: <b>LSP</b> or <b>IP</b> .	All levels
<b>Metric</b>	Route's metric value.	All levels
<b>NH-interface</b>	(OSPFv3 only) Interface through which the route's next hop is reachable.	All levels
<b>NH-addr</b>	(OSPFv3 only) IPv6 address of the next hop.	All levels
<b>NextHop Interface</b>	(OSPFv2 only) Interface through which the route's next hop is reachable.	All levels
<b>Nexthop addr/label</b>	(OSPFv2 only) If the <b>NH Type</b> is <b>IP</b> , then it is the address of the next hop. If the <b>NH Type</b> is <b>LSP</b> , then it is the name of the label-switched path.	All levels
<b>Area</b>	Area ID of the route.	detail
<b>Origin</b>	Router from which the route was learned.	detail
<b>Type 7</b>	Route was learned through a not-so-stubby area (NSSA) link-state advertisement (LSA).	detail
<b>P-bit</b>	Route was learned through NSSA LSA and the propagate bit was set.	detail
<b>Fwd NZ</b>	Forwarding address is nonzero. <b>Fwd NZ</b> is only displayed if the route is learned through an NSSA LSA.	detail

Table 333: show (ospf | ospf3) route Output Fields (*continued*)

Field Name	Field Description	Output Level
<b>optional-capability</b>	Optional capabilities propagated in the router LSA. This field is in the output for intra-area router routes only (when <b>Route Type</b> is <b>Area BR</b> , <b>AS BR</b> , <b>Area/AS BR</b> , or <b>Router</b> ), not for interarea router routes or network routes. Three bits in this field are defined as follows: <ul style="list-style-type: none"> <li>• <b>0x4 (V)</b>—Routing device is at the end of a virtual active link.</li> <li>• <b>0x2 (E)</b>—Routing device is an autonomous system boundary router.</li> <li>• <b>0x1 (B)</b>—Routing device is an area border router.</li> </ul>	<b>detail</b>
<b>priority</b>	The priority assigned to the prefix: <ul style="list-style-type: none"> <li>• <b>high</b></li> <li>• <b>medium</b></li> <li>• <b>low</b></li> </ul> <p><b>NOTE:</b> The <b>priority</b> field applies only to routes of type <b>Network</b>.</p>	<b>detail</b>

<b>Output Fields</b>	<p><a href="#">Table 334 on page 4298</a> lists the output fields for the <b>show (ospf   ospf3) statistics</b> command. Output fields are listed in the approximate order in which they appear.</p>

**Table 334: show (ospf | ospf3) statistics Output Fields**

Field Name	Field Description
Packet type	Type of OSPF packet.
Total Sent/Total Received	Total number of packets sent and received.

Table 334: show (ospf | ospf3) statistics Output Fields (*continued*)

Field Name	Field Description
Last 5 seconds Sent/Last 5 seconds Received	Total number of packets sent and received in the last 5 seconds.
DBDs retransmitted	Total number of database description packets retransmitted, and number retransmitted in the last 5 seconds.
LSAs flooded	Total number of link-state advertisements flooded, and number flooded in the last 5 seconds.
LSAs flooded high-prio	<p>Total number of high priority link-state advertisements flooded, and number flooded in the last 5 seconds.</p> <p>A link-state advertisement is deemed a high priority if it has changed since it was last sent.</p>
LSAs retransmitted	Total number of link-state advertisements retransmitted, and number retransmitted in the last 5 seconds.
LSAs transmitted to nbr	Total number of link-state advertisements transmitted to a neighbor, and number transmitted in the last 5 seconds.
LSAs requested	Total number of link-state advertisements requested by neighboring devices, and number requested in the last 5 seconds.
LSAs acknowledged	Total number of link-state advertisements acknowledged, and number acknowledged in the last 5 seconds.
Flood queue depth	Total number of entries in the extended queue.
Total rexmit entries	Total number of retransmission entries waiting to be sent from the OSPF routing instance.
db summaries	Total number of database description summaries waiting to be sent from the OSPF routing instance.
lsreq entries	Total number of link-state request entries waiting to be sent from the OSPF routing instance.
Receive errors	<p>Number and type of receive errors. Some sample receive errors include:</p> <ul style="list-style-type: none"> <li>• mtu mismatches</li> <li>• no interface found</li> <li>• no virtual link found</li> <li>• nssa mismatches</li> <li>• stub area mismatches</li> <li>• subnet mismatches</li> </ul> <p>If there are no receive errors, the output displays <b>none</b>.</p>

## Sample Output

### show ospf statistics

```

user@host> show ospf statistics

## RIP Overview

RIP is an interior gateway protocol (IGP) that uses a distance-vector algorithm to determine the best route to a destination, using the hop count as the metric.

In a RIP network, each router's forwarding table is distributed among the nodes through the flooding of routing table information. Because topology changes are flooded throughout the network, every node maintains the same list of destinations. Packets are then routed to these destinations based on path-cost calculations done at each node in the network.

NOTE: In general, the term *RIP* refers to RIP version 1 and RIP version 2.

This topic contains the following sections:

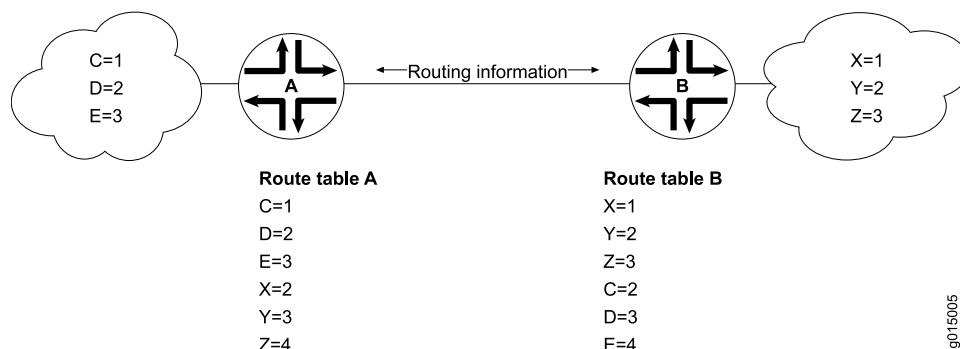

- [Distance-Vector Routing Protocols on page 4305](#)
- [RIP Protocol Overview on page 4306](#)
- [RIP Packets on page 4307](#)
- [Maximizing Hop Count on page 4308](#)

- [Limitations of Unidirectional Connectivity on page 4309](#)

## Distance-Vector Routing Protocols

---

Distance-vector routing protocols transmit routing information that includes a distance vector, typically expressed as the number of hops to the destination. This information is flooded out all protocol-enabled interfaces at regular intervals (every 30 seconds in the case of RIP) to create a network map that is stored in each node's local topology database. [Figure 124 on page 4306](#) shows how distance-vector routing works.

Figure 124: Distance-Vector Protocol

In Figure 124 on page 4306, Routers A and B have RIP enabled on adjacent interfaces. Router A has known RIP neighbors Routers C, D, and E, which are 1, 2, and 3 hops away, respectively. Router B has known RIP neighbors Routers X, Y, and Z, which are 1, 2, and 3 hops away, respectively. Every 30 seconds, each router floods its entire routing table information out all RIP-enabled interfaces. In this case, flooding exchanges routing table information across the RIP link.

When Router A receives routing information from Router B, it adds 1 to the hop count to determine the new hop count. For example, Router X has a hop count of 1, but when Router A imports the route to X, the new hop count is 2. The imported route also includes information about where the route was learned, so that the original route is imported as a route to Router X through Router B with a hop count of 2.

When multiple routes to the same host are received, RIP uses the distance-vector algorithm to determine which path to import into the forwarding table. The route with the smallest hop count is imported. If there are multiple routes with the same hop count, all are imported into the forwarding table, and traffic is sent along the paths in round-robin fashion.

### RIP Protocol Overview

The RIP IGP uses the Bellman-Ford, or *distance-vector*, algorithm to determine the best route to a destination. RIP uses the hop count as the metric. RIP enables hosts and routers to exchange information for computing routes through an IP-based network. RIP is intended to be used as an IGP in reasonably homogeneous networks of moderate size.

The Junos® operating system (Junos OS) supports RIP versions 1 and 2.

**NOTE:** RIP is not supported for multipoint interfaces.

RIP version 1 packets contain the minimal information necessary to route packets through a network. However, this version of RIP does not support authentication or subnetting.

RIP uses User Datagram Protocol (UDP) port 520.

RIP has the following architectural limitations:

- The longest network path cannot exceed 15 hops (assuming that each network, or hop, has a cost of 1).
- RIP depends on counting to infinity to resolve certain unusual situations—When the network consists of several hundred routers, and when a routing loop has formed, the amount of time and network bandwidth required to resolve a next hop might be great.
- RIP uses only a fixed metric to select a route. Other IGPs use additional parameters, such as measured delay, reliability, and load.

### RIP Packets

RIP packets contain the following fields:

- Command—Indicates whether the packet is a request or response message. Request messages seek information for the router's routing table. Response messages are sent periodically and also when a request message is received. Periodic response messages are called *update messages*. Update messages contain the command and version fields and 25 destinations (by default), each of which includes the destination IP address and the metric to reach that destination.

**NOTE:** Beginning with Junos OS Release 11.1, three additional command field types are available to support RIP demand circuits. When you configure an interface for RIP demand circuits, the command field indicates whether the packet is an update request, update response, or update acknowledge message. Neighbor interfaces send updates on demand, not periodically. These command field types are only valid on interfaces configured for RIP demand circuits. For more detailed information, see *RIP Demand Circuits Overview*.

- Version number—Version of RIP that the originating router is running.
- Address family identifier—Address family used by the originating router. The family is always IP.
- Address—IP address included in the packet.
- Metric—Value of the metric advertised for the address.
- Mask—Mask associated with the IP address (RIP version 2 only).
- Next hop—IP address of the next-hop router (RIP version 2 only).

Routing information is exchanged in a RIP network by RIP request and RIP response packets. A router that has just booted can broadcast a RIP request on all RIP-enabled interfaces. Any routers running RIP on those links receive the request and respond by sending a RIP response packet immediately to the router. The response packet contains the routing table information required to build the local copy of the network topology map.

In the absence of RIP request packets, all RIP routers broadcast a RIP response packet every 30 seconds on all RIP-enabled interfaces. The RIP broadcast is the primary way in which topology information is flooded throughout the network.

Once a router learns about a particular destination through RIP, it starts a timer. Every time it receives a new response packet with information about the destination, the router resets the timer to zero. However, if the router receives no updates about a particular destination for 180 seconds, it removes the destination from its RIP routing table.

In addition to the regular transmission of RIP packets every 30 seconds, if a router detects a new neighbor or detects that an interface is unavailable, it generates a triggered update. The new routing information is immediately broadcast out all RIP-enabled interfaces, and the change is reflected in all subsequent RIP response packets.

### Maximizing Hop Count

The successful routing of traffic across a RIP network requires that every node in the network maintain the same view of the topology. Topology information is broadcast between RIP neighbors every 30 seconds. If Router A is many hops away from a new host, Router B, the route to B might take significant time to propagate through the network and be imported into Router A's routing table. If the two routers are 5 hops away from each other, Router A cannot import the route to Router B until 2.5 minutes after Router B is online (30 seconds per hop). For large numbers of hops, the delay becomes prohibitive. To help prevent this delay from growing arbitrarily large, RIP enforces a maximum hop count of 15 hops. Any prefix that is more than 15 hops away is treated as unreachable and assigned a hop count equal to infinity. This maximum hop count is called the *network diameter*.

### Split Horizon and Poison Reverse Efficiency Techniques

Because RIP functions by periodically flooding the entire routing table out to the network, it generates a lot of traffic. The split horizon and poison reverse techniques can help reduce the amount of network traffic originated by RIP hosts and make the transmission of routing information more efficient.

If a router receives a set of route advertisements on a particular interface, RIP determines that those advertisements do not need to be retransmitted out the same interface. This technique, known as *split horizon*, helps limit the amount of RIP routing traffic by eliminating information that other neighbors on that interface have already learned.

[Figure 125 on page 4308](#) shows an example of the split horizon technique.

**Figure 125: Split Horizon Example**

In [Figure 125 on page 4308](#), Router A advertises routes to Routers C, D, and E to Router B. In this example, Router A can reach Router C in 2 hops. When Router A advertises the route to Router B, Router B imports it as a route to Router C through Router A in 3 hops. If Router B then readvertised this route to Router A, Router A would import it as a route to Router C through Router B in 4 hops. However, the advertisement from Router B to Router A is unnecessary, because Router A can already reach the route in 2 hops. The split horizon technique helps reduce extra traffic by eliminating this type of route advertisement.

Similarly, the poison reverse technique helps to optimize the transmission of routing information and improve the time to reach network convergence. If Router A learns about unreachable routes through one of its interfaces, it advertises those routes as unreachable (hop count of 16) out the same interface. [Figure 126 on page 4309](#) shows an example of the poison reverse technique.

**Figure 126: Poison Reverse Example**

In [Figure 126 on page 4309](#), Router A learns through one of its interfaces that routes to Routers C, D, and E are unreachable. Router A readvertises those routes out the same interface as unreachable. The advertisement informs Router B that Routers C, D, and E are definitely not reachable through Router A.

### Limitations of Unidirectional Connectivity

Because RIP processes routing information based solely on the receipt of routing table updates, it cannot ensure bidirectional connectivity. As [Figure 127 on page 4310](#) shows, RIP networks are limited by their unidirectional connectivity.

**Figure 127: Limitations of Unidirectional Connectivity**

In [Figure 127 on page 4310](#), Routers A and D flood their routing table information to Router B. Because the path to Router E has the fewest hops when routed through Router A, that route is imported into Router B's forwarding table. However, suppose that Router A can transmit traffic but is not receiving traffic from Router B because of an unavailable link or invalid routing policy. If the only route to Router E is through Router A, any traffic destined for Router A is lost, because bidirectional connectivity was never established.

OSPF establishes bidirectional connectivity with a three-way handshake.

### Example: Configuring RIP

- [Understanding Basic RIP Routing on page 4311](#)
- [Example: Configuring a Basic RIP Network on page 4312](#)

#### Understanding Basic RIP Routing

---

RIP is an interior gateway protocol (IGP) that routes packets within a single autonomous system (AS). By default, RIP does not advertise the subnets that are directly connected through the device's interfaces. For traffic to pass through a RIP network, you must create a routing policy to export these routes. Advertising only the direct routes propagates the routes to the immediately adjacent RIP-enabled router only. To propagate all routes through the entire RIP network, you must configure the routing policy to export the routes learned through RIP.

### Example: Configuring a Basic RIP Network

This example shows how to configure a basic RIP network.

- [Requirements on page 4312](#)
- [Overview on page 4312](#)
- [Configuration on page 4312](#)
- [Verification on page 4315](#)

#### Requirements

No special configuration beyond device initialization is required before configuring this example.

#### Overview

In this example, you configure a basic RIP network, create a RIP group called **rip-group**, and add the directly connected interfaces to the RIP group. Then you configure a routing policy to advertise direct routes using policy statement **advertise-routes-through-rip**.

By default, Junos OS does not advertise RIP routes, not even routes that are learned through RIP. To advertise RIP routes, you must configure and apply an export routing policy that advertises RIP-learned and direct routes.

In Junos OS, you do not need to configure the RIP version. RIP version 2 is used by default.

To use RIP on the device, you must configure RIP on all of the RIP interfaces within the network. [Figure 128 on page 4312](#) shows the topology used in this example.

**Figure 128: Sample RIP Network Topology**

“CLI Quick Configuration” on [page 4312](#) shows the configuration for all of the devices in [Figure 128 on page 4312](#). The section “Step-by-Step Procedure” on [page 4313](#) describes the steps on Device R1.

#### Configuration

##### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

##### Device R1

```
set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
```

```

set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Device R2**

```

set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor fe-1/2/1.5
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Device R3**

```

set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a basic RIP network:

1. Configure the network interfaces.

This example shows multiple loopback interface addresses to simulate attached networks.

```

[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30

```

```

user@R1# set lo0 unit 1 family inet address 172.16.0.1/32
user@R1# set lo0 unit 1 family inet address 192.168.1.1/32

```

2. Create the RIP group and add the interface.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

```

[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1

```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept
```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 172.16.0.1/32;
      address 192.168.1.1/32;
    }
  }
}

user@R1# show protocols
rip {
  group rip-group {
    export advertise-routes-through-rip;
    neighbor fe-1/2/0.1;
  }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
  term 1 {
    from protocol [ direct rip ];
    then accept;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

**Verification**

Confirm that the configuration is working properly.

- [Checking the Routing Table on page 4315](#)
- [Looking at the Routes That Device R1 Is Advertising to Device R2 on page 4315](#)
- [Looking at the Routes That Device R1 Is Receiving from Device R2 on page 4316](#)
- [Verifying the RIP-Enabled Interfaces on page 4316](#)
- [Verifying the Exchange of RIP Messages on page 4316](#)
- [Verifying Reachability of All Hosts in the RIP Network on page 4317](#)

**Checking the Routing Table**

**Purpose** Verify that the routing table is populated with the expected routes..

**Action** From operational mode, enter the **show route protocol rip** command.

```
user@R1> show route protocol rip
inet.0: 10 destinations, 10 routes (10 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.4/30      *[RIP/100] 00:59:15, metric 2, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
172.16.2.2/32    *[RIP/100] 02:52:48, metric 2, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
172.16.3.3/32    *[RIP/100] 00:45:05, metric 3, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
192.168.2.2/32   *[RIP/100] 02:52:48, metric 2, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
192.168.3.3/32   *[RIP/100] 00:45:05, metric 3, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
224.0.0.9/32     *[RIP/100] 00:45:09, metric 1
                 MultiRecv
```

**Meaning** The output shows that the routes have been learned from Device R2 and Device R3.

If you were to delete the **from protocol rip** condition in the routing policy on Device R2, the remote routes from Device R3 would not be learned on Device R1.

**Looking at the Routes That Device R1 Is Advertising to Device R2**

**Purpose** Verify that Device R1 is sending the expected routes.

**Action** From operational mode, enter the **show route advertising-protocol rip** command.

```
user@R1> show route advertising-protocol rip 10.0.0.1
inet.0: 10 destinations, 10 routes (10 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.0.1/32    *[Direct/0] 05:18:26
                 > via lo0.1
192.168.1.1/32   *[Direct/0] 05:18:25
                 > via lo0.1
```

**Meaning** Device R1 is sending routes to its directly connected networks.

**Looking at the Routes That Device R1 Is Receiving from Device R2**

**Purpose** Verify that Device R1 is receiving the expected routes.

**Action** From operational mode, enter the **show route receive-protocol rip** command.

```
user@R1> show route receive-protocol rip 10.0.0.2
inet.0: 10 destinations, 10 routes (10 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.4/30          * [RIP/100] 02:31:22, metric 2, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
172.16.2.2/32       * [RIP/100] 04:24:55, metric 2, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
172.16.3.3/32       * [RIP/100] 02:17:12, metric 3, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
192.168.2.2/32      * [RIP/100] 04:24:55, metric 2, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
192.168.3.3/32      * [RIP/100] 02:17:12, metric 3, tag 0
                    > to 10.0.0.2 via fe-1/2/0.1
```

**Meaning** Device R1 is receiving from Device R2 all of Device R2's directly connected networks. Device R1 is also receiving from Device R2 all of Device R3's directly connected networks, which Device R2 learned from Device R3 through RIP.

**Verifying the RIP-Enabled Interfaces**

**Purpose** Verify that all RIP-enabled Interfaces are available and active.

**Action** From operational mode, enter the **show rip neighbor** command.

```
user@R1> show rip neighbor
```

Neighbor	Local State	Source Address	Destination Address	Send Mode	Receive Mode	In Met
fe-1/2/0.1	Up	10.0.0.1	224.0.0.9	mcast	both	1

**Meaning** The output shows that the RIP-enabled interface on Device R1 is operational.

In general for this command, the output shows a list of the RIP neighbors that are configured on the device. Verify the following information:

- Each configured interface is present. Interfaces are listed in alphabetical order.
- Each configured interface is up. The state of the interface is listed in the **Local State** column. A state of **Up** indicates that the link is passing RIP traffic. A state of **Dn** indicates that the link is not passing RIP traffic. In a point-to-point link, this state generally means that either the end point is not configured for RIP or the link is unavailable.

**Verifying the Exchange of RIP Messages**

**Purpose** Verify that RIP messages are being sent and received on all RIP-enabled interfaces.

**Action** From operational mode, enter the **show rip statistics** command.

```

user@R1> show rip statistics
RIPv2 info: port 520; holddown 120s.
      rts learned  rts held down  rqsts dropped  resps dropped
              5              0              0              0

fe-1/2/0.1: 5 routes learned; 2 routes advertised; timeout 180s; update interval
30s
Counter                Total    Last 5 min  Last minute
-----
Updates Sent                2669         10         2
Triggered Updates Sent      2          0          0
Responses Sent              0          0          0
Bad Messages                0          0          0
RIPv1 Updates Received      0          0          0
RIPv1 Bad Route Entries     0          0          0
RIPv1 Updates Ignored       0          0          0
RIPv2 Updates Received     2675        11         2
RIPv2 Bad Route Entries     0          0          0
RIPv2 Updates Ignored       0          0          0
Authentication Failures     0          0          0
RIP Requests Received       0          0          0
RIP Requests Ignored        0          0          0
none                        0          0          0

```

**Meaning** The output shows the number of RIP routes learned. It also shows the number of RIP updates sent and received on the RIP-enabled interfaces. Verify the following information:

- The number of RIP routes learned matches the number of expected routes learned. Subnets learned by direct connectivity through an outgoing interface are not listed as RIP routes.
- RIP updates are being sent on each RIP-enabled interface. If no updates are being sent, the routing policy might not be configured to export routes.
- RIP updates are being received on each RIP-enabled interface. If no updates are being received, the routing policy might not be configured to export routes on the host connected to that subnet. The lack of updates might also indicate an authentication error.

#### *Verifying Reachability of All Hosts in the RIP Network*

**Purpose** Use the **traceroute** command on each loopback address in the network to verify that all hosts in the RIP network are reachable from each Juniper Networks device.

**Action** From operational mode, enter the **traceroute** command.

```

user@R1> traceroute 192.168.3.3
traceroute to 192.168.3.3 (192.168.3.3), 30 hops max, 40 byte packets
 1  10.0.0.2 (10.0.0.2)  1.094 ms  1.028 ms  0.957 ms
 2  192.168.3.3 (192.168.3.3)  1.344 ms  2.245 ms  2.125 ms

```

**Meaning** Each numbered row in the output indicates a routing hop in the path to the host. The three-time increments indicate the round-trip time (RTT) between the device and the hop for each traceroute packet.

To ensure that the RIP network is healthy, verify the following information:

- The final hop in the list is the host you want to reach.
- The number of expected hops to the host matches the number of hops in the traceroute output. The appearance of more hops than expected in the output indicates that a network segment is probably unreachable. It might also indicate that the incoming or outgoing metric on one or more hosts has been set unexpectedly.

## Example: Configuring Authentication for RIP Routes

- [Understanding RIP Authentication on page 4318](#)
- [Example: Configuring Route Authentication for RIP on page 4318](#)
- [Enabling Authentication with Plain-Text Passwords \(CLI Procedure\) on page 4323](#)
- [Enabling Authentication with MD5 Authentication \(CLI Procedure\) on page 4323](#)

### Understanding RIP Authentication

---

RIPv2 provides authentication support so that RIP links can require authentication keys (passwords) before they become active. Authentication provides an additional layer of security on the network beyond the other security features. By default, this authentication is disabled.

Authentication keys can be specified in either plain-text or MD5 form. Authentication requires all routers within the RIP network or subnetwork to have the same authentication type and key (password) configured.

This type of authentication is not supported on RIPv1 networks.

### Example: Configuring Route Authentication for RIP

---

This example shows how to configure authentication for a RIP network.

- [Requirements on page 4318](#)
- [Overview on page 4318](#)
- [Configuration on page 4319](#)
- [Verification on page 4322](#)

#### **Requirements**

No special configuration beyond device initialization is required before configuring this example.

#### **Overview**

You can configure the router to authenticate RIP route queries. By default, authentication is disabled. You can use one of the following authentication methods:

- Simple authentication—Uses a text password that is included in the transmitted packet. The receiving router uses an authentication key (password) to verify the packet.
- MD5 authentication—Creates an encoded checksum that is included in the transmitted packet. The receiving router uses an authentication key (password) to verify the packet's MD5 checksum.

This example shows MD5 authentication.

Figure 129 on page 4319 shows the topology used in this example.

**Figure 129: RIP Authentication Network Topology**

"CLI Quick Configuration" on page 4319 shows the configuration for all of the devices in Figure 129 on page 4319. The section "Step-by-Step Procedure" on page 4320 describes the steps on Device R1.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1
set protocols rip authentication-type md5
set protocols rip authentication-key "$9$ONLRBhreK87dsM8i.5FAtM8XxNb"
set protocols rip traceoptions file rip-authentication-messages
set protocols rip traceoptions flag auth
set protocols rip traceoptions flag packets
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Device R2**

```

set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2

```

```
set protocols rip group rip-group neighbor fe-1/2/1.5
set protocols rip authentication-type md5
set protocols rip authentication-key "$9$Lf1Xds2gJDHmoJCu1hKvoJGUjq"
set protocols rip traceoptions file rip-authentication-messages
set protocols rip traceoptions flag auth
set protocols rip traceoptions flag packets
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Device R3**

```
set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set protocols rip authentication-type md5
set protocols rip authentication-key "$9$G.UkP5T39tOz3K87V4oz36/Cu"
set protocols rip traceoptions file rip-authentication-messages
set protocols rip traceoptions flag auth
set protocols rip traceoptions flag packets
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure RIP authentication:

1. Configure the network interfaces.

This example shows multiple loopback interface addresses to simulate attached networks.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30
```

```
user@R1# set lo0 unit 1 family inet address 172.16.0.1/32
user@R1# set lo0 unit 1 family inet address 192.168.1.1/32
```

2. Create the RIP group and add the interface.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

```
[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1
```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
```

```
user@R1# set from protocol rip
user@R1# set then accept
```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip
```

5. Require MD5 authentication for RIP route queries received on an interface.

The passwords must match on neighboring RIP routers. If the password does not match, the packet is rejected. The password can be from 1 through 16 contiguous characters long and can include any ASCII strings.

Do not enter the password as shown here. The password shown here is the encrypted password that is displayed in the configuration after the actual password is already configured.

```
[edit protocols rip]
user@R1# set authentication-type md5
user@R1# set authentication-key "$9$ONLRBhreK87dsM8i.5FAtM8XxNb"
```

6. Configure tracing operations to track authentication.

```
[edit protocols rip traceoptions]
user@R1# set file rip-authentication-messages
user@R1# set flag auth
user@R1# set flag packets
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 172.16.0.1/32;
      address 192.168.1.1/32;
    }
  }
}

user@R1# show protocols
rip {
  traceoptions {
    file rip-authentication-messages;
    flag auth;
```

```

        flag packets;
    }
    authentication-type md5;
    authentication-key "$9$ONLRBhreK87dsM8i.5FAtM8XxNb"; ## SECRET-DATA
    group rip-group {
        export advertise-routes-through-rip;
        neighbor fe-1/2/0.1;
    }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
    term 1 {
        from protocol [ direct rip ];
        then accept;
    }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Checking for Authentication Failures on page 4322](#)
- [Verifying That MD5 Authentication Is Enabled in RIP Update Packets on page 4323](#)

### Checking for Authentication Failures

**Purpose** Verify that there are no authentication failures.

**Action** From operational mode, enter the **show rip statistics** command.

```

user@R1> show rip statistics
RIPv2 info: port 520; holddown 120s.
      rts learned  rts held down  rqsts dropped  resps dropped
              5              0              0              0

fe-1/2/0.1: 5 routes learned; 2 routes advertised; timeout 180s; update interval
30s
Counter              Total    Last 5 min  Last minute
-----
Updates Sent          2669         10          2
Triggered Updates Sent      2          0          0
Responses Sent          0          0          0
Bad Messages           0          0          0
RIPv1 Updates Received     0          0          0
RIPv1 Bad Route Entries    0          0          0
RIPv1 Updates Ignored       0          0          0
RIPv2 Updates Received    2675         11          2
RIPv2 Bad Route Entries     0          0          0
RIPv2 Updates Ignored       0          0          0
Authentication Failures      0          0          0
RIP Requests Received       0          0          0
RIP Requests Ignored        0          0          0
none                       0          0          0

```

**Meaning** The output shows that there are no authentication failures.

### Verifying That MD5 Authentication Is Enabled in RIP Update Packets

**Purpose** Use tracing operations to verify that MD5 authentication is enabled in RIP updates.

**Action** From operational mode, enter the **show log** command.

```
user@R1> show log rip-authentication-messages | match md5
Feb 15 15:45:13.969462      sending msg 0xb9a8c04, 3 rtes (needs MD5)
Feb 15 15:45:43.229867      sending msg 0xb9a8c04, 3 rtes (needs MD5)
Feb 15 15:46:13.174410      sending msg 0xb9a8c04, 3 rtes (needs MD5)
Feb 15 15:46:42.716566      sending msg 0xb9a8c04, 3 rtes (needs MD5)
Feb 15 15:47:11.425076      sending msg 0xb9a8c04, 3 rtes (needs MD5)
...
```

**Meaning** The **(needs MD5)** output shows that all route updates require MD5 authentication.

### Enabling Authentication with Plain-Text Passwords (CLI Procedure)

To configure authentication that requires a plain-text password to be included in the transmitted packet, enable simple authentication by performing these steps on all RIP devices in the network:

1. Navigate to the top of the configuration hierarchy.
2. Perform the configuration tasks described in [Table 335 on page 4323](#).
3. If you are finished configuring the router, commit the configuration.

**Table 335: Configuring Simple RIP Authentication**

Task	CLI Configuration Editor
Navigate to <b>Rip</b> level in the configuration hierarchy.	From the <b>[edit]</b> hierarchy level, enter  <b>edit protocols rip</b>
Set the authentication type to <b>simple</b> .	Set the authentication type to <b>simple</b> :  <b>set authentication-type simple</b>
Set the authentication key to a simple-text password.  The password can be from 1 through 16 contiguous characters long and can include any ASCII strings.	Set the authentication key to a simple-text password:  <b>set authentication-key <i>password</i></b>

### Enabling Authentication with MD5 Authentication (CLI Procedure)

To configure authentication that requires an MD5 password to be included in the transmitted packet, enable MD5 authentication by performing these steps on all RIP devices in the network:

1. Navigate to the top of the configuration hierarchy.
2. Perform the configuration tasks described in [Table 336 on page 4324](#).
3. If you are finished configuring the router, commit the configuration.

Table 336: Configuring MD5 RIP Authentication

Task	CLI Configuration Editor
Navigate to <b>Rip</b> level in the configuration hierarchy.	From the <b>[edit]</b> hierarchy level, enter  <b>edit protocols rip</b>
Set the authentication type to <b>MD5</b> .	Set the authentication type to <b>md5</b> :  <b>set authentication-type md5</b>
Set the MD5 authentication key (password).  The key can be from 1 through 16 contiguous characters long and can include any ASCII strings.	Set the MD5 authentication key:  <b>set authentication-key password</b>

#### Understanding BFD for RIP

The Bidirectional Forwarding Detection (BFD) Protocol is a simple hello mechanism that detects failures in a network. Hello packets are sent at a specified, regular interval. A neighbor failure is detected when the routing device stops receiving a reply after a specified interval. BFD works with a wide variety of network environments and topologies. BFD failure detection times are shorter than RIP detection times, providing faster reaction times to various kinds of failures in the network. Instead of waiting for the routing protocol neighbor timeout, BFD provides rapid detection of link failures. BFD timers are adaptive and can be adjusted to be more or less aggressive. For example, a timer can adapt to a higher value if the adjacency fails, or a neighbor can negotiate a higher value for a timer than the one configured.

BFD enables quick failover between a primary and a secondary routed path. The protocol tests the operational status of the interface multiple times per second. BFD provides for configuration timers and thresholds for failure detection. For example, if the minimum interval is set for 50 milliseconds and the threshold uses the default value of three missed messages, a failure is detected on an interface within 200 milliseconds of the failure.

Intervening devices (for example, an Ethernet LAN switch) hide link-layer failures from routing protocol peers, such as when two routers are connected by way of a LAN switch, where the local interface status remains up even when a physical fault happens on the remote link. Link-layer failure detection times vary, depending on the physical media and the Layer 2 encapsulation. BFD can provide fast failure detection times for all media types, encapsulations, topologies, and routing protocols.

To enable BFD for RIP, both sides of the connection must receive an update message from the peer. By default, RIP does not export any routes. Therefore, you must enable update messages to be sent by configuring an export policy for routes before a BFD session is triggered.

### Example: Configuring BFD for RIP

This example shows how to configure Bidirectional Forwarding Detection (BFD) for a RIP network.

- [Requirements on page 4325](#)
- [Overview on page 4325](#)
- [Configuration on page 4327](#)
- [Verification on page 4329](#)

#### Requirements

No special configuration beyond device initialization is required before configuring this example.

#### Overview

To enable failure detection, include the **bfd-liveness-detection** statement:

```

bfd-liveness-detection {
  detection-time {
    threshold milliseconds;
  }
  minimum-interval milliseconds;
  minimum-receive-interval milliseconds;
  multiplier number;
  no-adaptation;
  transmit-interval {
    threshold milliseconds;
    minimum-interval milliseconds;
  }
  version (1 | automatic);
}

```

Optionally, you can specify the threshold for the adaptation of the detection time by including the **threshold** statement. When the BFD session detection time adapts to a value equal to or greater than the threshold, a single trap and a system log message are sent.

To specify the minimum transmit and receive interval for failure detection, include the **minimum-interval** statement. This value represents the minimum interval at which the local routing device transmits hello packets as well as the minimum interval at which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a value in the range from 1 through 255,000 milliseconds. This examples sets a minimum interval of 600 milliseconds.

**NOTE:** BFD is an intensive protocol that consumes system resources. Specifying a minimum interval for BFD of less than 100 ms for Routing Engine-based sessions and 10 ms for distributed BFD sessions can cause undesired BFD flapping.

Depending on your network environment, these additional recommendations might apply:

- For large-scale network deployments with a large number of BFD sessions, specify a minimum interval of 300 ms for Routing Engine-based sessions and 100 ms for distributed BFD sessions.
- For very large-scale network deployments with a large number of BFD sessions, contact Juniper Networks customer support for more information.
- For BFD sessions to remain up during a Routing Engine switchover event when nonstop active routing (NSR) is configured, specify a minimum interval of 2500 ms for Routing Engine-based sessions. For distributed BFD sessions with nonstop active routing configured, the minimum interval recommendations are unchanged and depend only on your network deployment.

You can optionally specify the minimum transmit and receive intervals separately.

To specify only the minimum receive interval for failure detection, include the **minimum-receive-interval** statement. This value represents the minimum interval at which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a value in the range from 1 through 255,000 milliseconds.

To specify only the minimum transmit interval for failure detection, include the **transmit-interval minimum-interval** statement. This value represents the minimum interval at which the local routing device transmits hello packets to the neighbor with which it has established a BFD session. You can configure a value in the range from 1 through 255,000 milliseconds.

To specify the number of hello packets not received by a neighbor that causes the originating interface to be declared down, include the **multiplier** statement. The default is 3, and you can configure a value in the range from 1 through 255.

To specify the threshold for detecting the adaptation of the transmit interval, include the **transmit-interval threshold** statement. The threshold value must be greater than the transmit interval.

To specify the BFD version used for detection, include the **version** statement. The default is to have the version detected automatically.

You can trace BFD operations by including the **traceoptions** statement at the **[edit protocols bfd]** hierarchy level.

In Junos OS Release 9.0 and later, you can configure BFD sessions not to adapt to changing network conditions. To disable BFD adaptation, include the **no-adaptation** statement. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

Figure 130 on page 4327 shows the topology used in this example.

Figure 130: RIP BFD Network Topology

"CLI Quick Configuration" on page 4327 shows the configuration for all of the devices in Figure 130 on page 4327. The section "Step-by-Step Procedure" on page 4328 describes the steps on Device R1.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set protocols bfd traceoptions file bfd-trace
set protocols bfd traceoptions flag all
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1
set protocols rip group rip-group bfd-liveness-detection minimum-interval 600
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Device R2**

```

set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor fe-1/2/1.5
set protocols rip group rip-group bfd-liveness-detection minimum-interval 600
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Device R3**

```

set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set protocols rip group rip-group export advertise-routes-through-rip

```

```
set protocols rip group rip-group neighbor fe-1/2/0.6
set protocols rip group rip-group bfd-liveness-detection minimum-interval 600
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Step-by-Step  
Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a BFD for a RIP network:

1. Configure the network interfaces.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30
```

2. Create the RIP group and add the interface.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

```
[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1
```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept
```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip
```

5. Enable BFD.

```
[edit protocols rip group rip-group]
user@R1# set bfd-liveness-detection minimum-interval 600
```

6. Configure tracing operations to track BFD messages.

```
[edit protocols bfd traceoptions]
user@R1# set file bfd-trace
user@R1# set flag all
```

**Results**

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
```

```

unit 1 {
    family inet {
        address 10.0.0.1/30;
    }
}

user@R1# show protocols
bfd {
    traceoptions {
        file bfd-trace;
        flag all;
    }
}
rip {
    group rip-group {
        export advertise-routes-through-rip;
        bfd-liveness-detection {
            minimum-interval 600;
        }
        neighbor fe-1/2/0.1;
    }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
    term 1 {
        from protocol [ direct rip ];
        then accept;
    }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying That the BFD Sessions Are Up on page 4329](#)
- [Checking the BFD Trace File on page 4330](#)

### Verifying That the BFD Sessions Are Up

**Purpose** Make sure that the BFD sessions are operating.

**Action** From operational mode, enter the **show bfd session** command.

```
user@R1> show bfd session
```

Address	State	Interface	Detect Time	Transmit Interval	Multiplier
10.0.0.2	Up	fe-1/2/0.1	1.800	0.600	3

1 sessions, 1 clients

Cumulative transmit rate 1.7 pps, cumulative receive rate 1.7 pps

**Meaning** The output shows that there are no authentication failures.

### Checking the BFD Trace File

**Purpose** Use tracing operations to verify that BFD packets are being exchanged.

**Action** From operational mode, enter the **show log** command.

```
user@R1> show log bfd-trace
Feb 16 10:26:32 PPM Trace: BFD periodic xmit to 10.0.0.2 (IFL 124, rtbl 53,
single-hop port)
Feb 16 10:26:32 Received Downstream TraceMsg (24) len 86:
Feb 16 10:26:32   IfIndex (3) len 4: 0
Feb 16 10:26:32   Protocol (1) len 1: BFD
Feb 16 10:26:32   Data (9) len 61: (hex) 42 46 44 20 70 61 63 6b 65 74 20 66 72

---

#### Understanding BFD Authentication for RIP

BFD enables rapid detection of communication failures between adjacent systems. By default, authentication for BFD sessions is disabled. However, when running BFD over Network Layer protocols, the risk of service attacks can be significant. We strongly recommend using authentication if you are running BFD over multiple hops or through insecure tunnels. Beginning with Junos OS Release 9.6, Junos OS supports authentication for BFD sessions running over RIP. BFD authentication is only supported in the domestic image and is not available in the export image.

You authenticate BFD sessions by specifying an authentication algorithm and keychain, and then associating that configuration information with a security authentication keychain using the keychain name.

The following sections describe the supported authentication algorithms, security keychains, and the level of authentication that can be configured:

- [BFD Authentication Algorithms on page 4331](#)
- [Security Authentication Keychains on page 4331](#)
- [Strict Versus Loose Authentication on page 4332](#)

### ***BFD Authentication Algorithms***

Junos OS supports the following algorithms for BFD authentication:

- **simple-password**—Plain-text password. One to 16 bytes of plain text are used to authenticate the BFD session. One or more passwords can be configured. This method is the least secure and should be used only when BFD sessions are not subject to packet interception.
- **keyed-md5**—Keyed Message Digest 5 hash algorithm for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed MD5 uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than or equal to the last sequence number received. Although more secure than a simple password, this method is vulnerable to replay attacks. Increasing the rate at which the sequence number is updated can reduce this risk.
- **meticulous-keyed-md5**—Meticulous keyed Message Digest 5 hash algorithm. This method works in the same manner as keyed MD5, but the sequence number is updated with every packet. Although more secure than keyed MD5 and simple passwords, this method might take additional time to authenticate the session.
- **keyed-sha-1**—Keyed Secure Hash Algorithm I for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed SHA uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. The key is not carried within the packets. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than the last sequence number received.
- **meticulous-keyed-sha-1**—Meticulous keyed Secure Hash Algorithm I. This method works in the same manner as keyed SHA, but the sequence number is updated with every packet. Although more secure than keyed SHA and simple passwords, this method might take additional time to authenticate the session.

**NOTE:** Nonstop active routing is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

### ***Security Authentication Keychains***

The security authentication keychain defines the authentication attributes used for authentication key updates. When the security authentication keychain is configured and

associated with a protocol through the keychain name, authentication key updates can occur without interrupting routing and signaling protocols.

The authentication keychain contains one or more keychains. Each keychain contains one or more keys. Each key holds the secret data and the time at which the key becomes valid. The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

BFD allows multiple clients per session, and each client can have its own keychain and algorithm defined. To avoid confusion, we recommend specifying only one security authentication keychain.

### ***Strict Versus Loose Authentication***

By default, strict authentication is enabled and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure *loose checking*. When loose checking is configured, packets are accepted without authentication being checked at each end of the session. This feature is intended for transitional periods only.

### **Example: Configuring BFD Authentication for RIP**

---

This example shows how to configure Bidirectional Forwarding Detection (BFD) authentication for a RIP network.

- [Requirements on page 4332](#)
- [Overview on page 4332](#)
- [Configuration on page 4333](#)
- [Verification on page 4337](#)

### ***Requirements***

No special configuration beyond device initialization is required before configuring this example.

The devices must be running Junos OS Release 9.6 or later.

### ***Overview***

Only three steps are needed to configure authentication on a BFD session:

1. Specify the BFD authentication algorithm for the RIP protocol.
2. Associate the authentication keychain with the RIP protocol.
3. Configure the related security authentication keychain.

[Figure 131 on page 4333](#) shows the topology used in this example.

Figure 131: RIP BFD Authentication Network Topology

"CLI Quick Configuration" on page 4333 shows the configuration for all of the devices in Figure 131 on page 4333. The section "Step-by-Step Procedure" on page 4334 describes the steps on Device R1.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set protocols bfd traceoptions file bfd-trace
set protocols bfd traceoptions flag all

set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
set security authentication-key-chains key-chain bfd-rip key 53 secret
  "$9$d1V2aZGi.fzDiORSeXxDikqmT"
set security authentication-key-chains key-chain bfd-rip key 53 start-time
  "2012-2-16.12:00:00 -0800"
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a BFD authentication:

1. Configure the network interfaces.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30
```

2. Create the RIP group and add the interface.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

```
[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1
```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept
```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip
```

5. Enable BFD.

```
[edit protocols rip group rip-group]
user@R1# set bfd-liveness-detection minimum-interval 600
```

6. Specify the algorithm (**keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**, or **simple-password**) to use.

**NOTE:** Nonstop active routing is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

```
[edit protocols rip group rip-group]
user@R1# set bfd-liveness-detection authentication algorithm keyed-md5
```

7. Specify the keychain to be used to associate BFD sessions on RIP with the unique security authentication keychain attributes.

The keychain you specify must match a keychain name configured at the **[edit security authentication key-chains]** hierarchy level.

The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

```
[edit protocols rip group rip-group]
user@R1# set bfd-liveness-detection authentication key-chain bfd-rip
```

8. (Optional) Specify loose authentication checking if you are transitioning from nonauthenticated sessions to authenticated sessions.

```
[edit protocols rip group rip-group]
user@R1# set bfd-liveness-detection authentication loose-check
```

9. Specify the unique security authentication information for BFD sessions:

- The matching keychain name as specified in Step 7.
- At least one key, a unique integer between 0 and 63. Creating multiple keys allows multiple clients to use the BFD session.
- The secret data used to allow access to the session.
- The time at which the authentication key becomes active, in the format *yyyy-mm-dd.hh:mm:ss*.

```
[edit security authentication-key-chains key-chain bfd-rip]
user@R1# set key 53 secret "$9$d1V2aZGi.fzDiORSeXxDikqmT"
user@R1# set key 53 start-time "2012-2-16.12:00:00 -0800"
```

10. Configure tracing operations to track BFD authentication.

```
[edit protocols bfd traceoptions]
user@R1# set file bfd-trace
user@R1# set flag all
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show security** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}

user@R1# show protocols
bfd {
  traceoptions {
    file bfd-trace;
    flag all;
  }
}
rip {
  group rip-group {
    export advertise-routes-through-rip;
    bfd-liveness-detection {
      minimum-interval 600;
    }
    neighbor fe-1/2/0.1;
  }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
  term 1 {
    from protocol [ direct rip ];
    then accept;
  }
}

user@R1# show security
authentication-key-chains {
  key-chain bfd-rip {
    key 53 {
      secret "$9$d1V2aZGi.fzDiORSeXxDikqmT"; ## SECRET-DATA
      start-time "2012-2-16.12:00:00 -0800";
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

**Verification**

Confirm that the configuration is working properly.

- [Verifying That the BFD Sessions Are Authenticated on page 4337](#)
- [Viewing Extensive Information About the BFD Authentication on page 4337](#)
- [Checking the BFD Trace File on page 4338](#)

**Verifying That the BFD Sessions Are Authenticated**

**Purpose** Make sure that the BFD sessions are authenticated.

**Action** From operational mode, enter the **show bfd session detail** command.

```
user@R1> show bfd session detail
```

Address	State	Interface	Detect Time	Transmit Interval	Multiplier
10.0.0.2	Up	fe-1/2/0.1	1.800	0.600	3

1 sessions, 1 clients  
 Cumulative transmit rate 1.7 pps, cumulative receive rate 1.7 pps

**Meaning** **Authenticate** is displayed to indicate that BFD authentication is configured.

**Viewing Extensive Information About the BFD Authentication**

**Purpose** View the keychain name, the authentication algorithm and mode for each client in the session, and the BFD authentication configuration status.

**Action** From operational mode, enter the **show bfd session extensive** command.

```
user@R1> show bfd session extensive
```

Address	State	Interface	Detect Time	Transmit Interval	Multiplier
10.0.0.2	Up	fe-1/2/0.1	1.800	0.600	3

Client RIP, TX interval 0.600, RX interval 0.600, **Authenticate**  
**keychain bfd-rip, algo keyed-md5, mode loose**  
 Session up time 01:46:29  
 Local diagnostic None, remote diagnostic None  
 Remote state Up, version 1  
 Logical system 6, routing table index 53  
 Min async interval 0.600, min slow interval 1.000  
 Adaptive async TX interval 0.600, RX interval 0.600  
 Local min TX interval 0.600, minimum RX interval 0.600, multiplier 3  
 Remote min TX interval 0.600, min RX interval 0.600, multiplier 3  
 Local discriminator 225, remote discriminator 226  
 Echo mode disabled/inactive  
**Authentication enabled/active, keychain bfd-rip, algo keyed-md5, mode loose**  
 Session ID: 0x300501

1 sessions, 1 clients  
 Cumulative transmit rate 1.7 pps, cumulative receive rate 1.7 pps

**Meaning** The output shows the keychain name, the authentication algorithm and mode for the client in the session, and the BFD authentication configuration status.

#### *Checking the BFD Trace File*

**Purpose** Use tracing operations to verify that BFD packets are being exchanged.

**Action** From operational mode, enter the **show log** command.

```
user@R1> show log bfd-trace
Feb 16 10:26:32 PPM Trace: BFD periodic xmit to 10.0.0.2 (IFL 124, rtbl 53,
single-hop port)
Feb 16 10:26:32 Received Downstream TraceMsg (24) len 86:

## Example: Applying Policies to RIP Routes Imported from Neighbors

- [Understanding RIP Import Policy on page 4338](#)
- [Example: Applying Policies to RIP Routes Imported from Neighbors on page 4338](#)

### Understanding RIP Import Policy

The default RIP import policy is to accept all received RIP routes that pass a sanity check. To filter routes being imported by the local routing device from its neighbors, include the **import** statement, and list the names of one or more policies to be evaluated. If you specify more than one policy, they are evaluated in order (first to last) and the first matching policy is applied to the route. If no match is found, the local routing device does not import any routes.

### Example: Applying Policies to RIP Routes Imported from Neighbors

This example shows how to configure an import policy in a RIP network.

- [Requirements on page 4339](#)
- [Overview on page 4339](#)

- [Configuration on page 4339](#)
- [Verification on page 4342](#)

### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

In this example, Device R1 has an import policy that accepts the 10/8 and 192.168/16 RIP routes and rejects all other RIP routes. This means that the 172.16/16 RIP routes are excluded from Device R1's routing table.

An export policy is also shown because an export policy is required as part of the minimum configuration for RIP.

[Figure 132 on page 4339](#) shows the topology used in this example.

**Figure 132: RIP Import Policy Network Topology**

[“CLI Quick Configuration” on page 4339](#) shows the configuration for all of the devices in [Figure 132 on page 4339](#). The section [“Step-by-Step Procedure” on page 4340](#) describes the steps on Device R1.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
Device R1
set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip import rip-import
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
set policy-options policy-statement rip-import term 1 from protocol rip
set policy-options policy-statement rip-import term 1 from route-filter 10.0.0.0/8 orlonger
set policy-options policy-statement rip-import term 1 from route-filter 192.168.0.0/16
  orlonger
```

```
set policy-options policy-statement rip-import term 1 then accept
set policy-options policy-statement rip-import term 2 then reject
```

**Device R2**

```
set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor fe-1/2/1.5
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Device R3**

```
set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a RIP import policy:

1. Configure the network interfaces.

This example shows multiple loopback interface addresses to simulate attached networks.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30
```

```
user@R1# set lo0 unit 1 family inet address 172.16.0.1/32
user@R1# set lo0 unit 1 family inet address 192.168.1.1/32
```

2. Create the RIP group and add the interface.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled.

You do not need to enable RIP on the loopback interface.

```
[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1
```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
```

```

user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept

```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```

[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip

```

5. Configure the import policy.

```

[edit policy-options policy-statement rip-import]
user@R1# set term 1 from protocol rip
user@R1# set term 1 from route-filter 10.0.0.0/8 orlonger
user@R1# set term 1 from route-filter 192.168.0.0/16 orlonger
user@R1# set term 1 then accept
user@R1# set term 2 then reject

```

6. Apply the import policy.

```

[edit protocols rip]
user@R1# set import rip-import

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 172.16.0.1/32;
      address 192.168.1.1/32;
    }
  }
}

user@R1# show protocols
rip {
  import rip-import;
  group rip-group {
    export advertise-routes-through-rip;
    neighbor fe-1/2/0.1;
  }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {

```

```
term 1 {
    from protocol [ direct rip ];
    then accept;
}
}
policy-statement rip-import {
    term 1 {
        from {
            protocol rip;
            route-filter 10.0.0.0/8 orlonger;
            route-filter 192.168.0.0/16 orlonger;
        }
        then accept;
    }
    term 2 {
        then reject;
    }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Looking at the Routes That Device R2 Is Advertising to Device R1 on page 4342](#)
- [Looking at the Routes That Device R1 Is Receiving from Device R2 on page 4343](#)
- [Checking the Routing Table on page 4343](#)
- [Testing the Import Policy on page 4343](#)

### **Looking at the Routes That Device R2 Is Advertising to Device R1**

**Purpose** Verify that Device R2 is sending the expected routes.

**Action** From operational mode, enter the **show route advertising-protocol rip** command.

```
user@R2> show route advertising-protocol rip 10.0.0.2
```

```
inet.0: 11 destinations, 11 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
10.0.0.4/30      *[Direct/0] 2d 01:17:44
                  >   via fe-1/2/0.5
172.16.2.2/32    *[Direct/0] 2d 04:09:52
                  >   via lo0.2
172.16.3.3/32    *[RIP/100] 23:40:02, metric 2, tag 0
                  > to 10.0.0.6 via fe-1/2/0.5
192.168.2.2/32   *[Direct/0] 2d 04:09:52
                  >   via lo0.2
192.168.3.3/32   *[RIP/100] 23:40:02, metric 2, tag 0
                  > to 10.0.0.6 via fe-1/2/0.5
```

**Meaning** Device R2 is sending 172.16/16 routes to Device R1.

*Looking at the Routes That Device R1 Is Receiving from Device R2*

**Purpose** Verify that Device R1 is receiving the expected routes.

**Action** From operational mode, enter the **show route receive-protocol rip** command.

```
user@R1> show route receive-protocol rip 10.0.0.2
inet.0: 8 destinations, 8 routes (8 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.4/30      *[RIP/100] 01:06:03, metric 2, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
192.168.2.2/32  *[RIP/100] 01:06:03, metric 2, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
192.168.3.3/32  *[RIP/100] 01:06:03, metric 3, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
```

**Meaning** The output shows that the 172.16/16 routes are excluded.

*Checking the Routing Table*

**Purpose** Verify that the routing table is populated with the expected routes.

**Action** From operational mode, enter the **show route protocol rip** command.

```
user@R1> show route protocol rip

inet.0: 8 destinations, 8 routes (8 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.4/30      *[RIP/100] 00:54:34, metric 2, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
192.168.2.2/32  *[RIP/100] 00:54:34, metric 2, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
192.168.3.3/32  *[RIP/100] 00:54:34, metric 3, tag 0
                 > to 10.0.0.2 via fe-1/2/0.1
224.0.0.9/32    *[RIP/100] 00:49:00, metric 1
                 MultiRecv
```

**Meaning** The output shows that the routes have been learned from Device R2 and Device R3.

If you delete or deactivate the import policy, the routing table contains the 172.16/16 routes.

*Testing the Import Policy*

**Purpose** By using the **test policy** command, monitor the number of rejected prefixes.

**Action** From operational mode, enter the **test policy rip-import 172.16/16** command.

```
user@R1> test policy rip-import 172.16/16
Policy rip-import: 0 prefix accepted, 1 prefix rejected
```

**Meaning** The output shows that the policy rejected one prefix.

### Understanding Traffic Control with Metrics in a RIP Network

To tune a RIP network and to control traffic flowing through the network, you increase or decrease the cost of the paths through the network. RIP provides two ways to modify the path cost: an incoming metric and an outgoing metric, which are each set to 1 by default. In other words, by default, the metric of routes that RIP imports from a neighbor or exports to a neighbor is incremented by 1. These routes include those learned from RIP as well as those learned from other protocols. The metrics are attributes that specify the cost of any route advertised through a host. By increasing or decreasing the metrics—and thus the cost—of links throughout the network, you can control packet transmission across the network.

The incoming metric modifies the cost of an individual segment when a route across the segment is imported into the routing table. For example, if you set the incoming metric on the segment to **3**, the individual segment cost along the link is changed from 1 to **3**. The increased cost affects all route calculations through that link. Other routes that were previously excluded because of a high hop count might now be included in the router's forwarding table.

The outgoing metric modifies the path cost for all the routes advertised out of a particular interface. Unlike the incoming metric, the outgoing metric modifies the routes that other routers are learning and thereby controls the way they send traffic.

If an exported route was learned from a member of the same RIP group, the metric associated with that route is the normal RIP metric. For example, a RIP route with a metric of 5 learned from a neighbor configured with an incoming metric of 2 is advertised with a combined metric of 7 when advertised to neighbors in the same group. However, if this route was learned from a RIP neighbor in a different group or from a different protocol, the route is advertised with the metric value configured in the outgoing metric for that group.

You might want to increase the metric of routes to decrease the likelihood that a particular route is selected and installed in the routing table. This process is sometimes referred to as *route poisoning*. Some reasons that you might want to poison a route are that the route is relatively expensive to use, or it has relatively low bandwidth.

A route with a higher metric than another route becomes the active route only when the lower-metric route becomes unavailable. In this way, the higher-metric route serves as a backup path.

One way to increase the metric of imported routes is to configure an import policy. Another way is to include the **metric-in** statement in the RIP neighbor configuration. One way to increase the metric of export routes is to configure an export policy. Another way is to include the **metric-out** statement in the RIP neighbor configuration.

### Example: Controlling Traffic in a RIP Network with an Incoming Metric

This example shows how to control traffic with an incoming metric.

- [Requirements on page 4345](#)
- [Overview on page 4345](#)
- [Configuration on page 4346](#)
- [Verification on page 4346](#)

#### Requirements

Before you begin, define RIP groups, and add interfaces to the groups. Then configure a routing policy to export directly connected routes and routes learned through the RIP routing exchanges. See “[Example: Configuring a Basic RIP Network](#)” on page 4312.

#### Overview

In this example, routes to Router D are received by Router A across both of its RIP-enabled interfaces as shown in [Figure 133 on page 4345](#). Because the route through Router B and the route through Router C have the same number of hops, both routes are imported into the forwarding table. However, because the T3 link from Router B to Router D has a higher bandwidth than the T1 link from Router C to Router D, you want traffic to flow from Router A through Router B to Router D.

Figure 133: Controlling Traffic in a RIP Network with the Incoming Metric

To force this flow, you can modify the route metrics as they are imported into Router A's routing table. By setting the incoming metric on the interface from Router A to Router C, you modify the metric on all routes received through that interface. Setting the incoming route metric on Router A changes only the routes in Router A's routing table, and affects only how Router A sends traffic to Router D. Router D's route selection is based on its own routing table, which, by default, includes no adjusted metric values.

In the example, Router C receives a route advertisement from Router D and readvertises the route to Router A. When Router A receives the route, it applies the incoming metric on the interface. Instead of incrementing the metric by 1 (the default), Router A increments it by 3 (the configured incoming metric), giving the route from Router A to Router D

through Router C a total path metric of 4. Because the route through Router B has a metric of 2, it becomes the preferred route for all traffic from Router A to Router D.

This example uses a RIP group called **alpha 1** on interface **ge-0/0/0**.

### Configuration

#### Step-by-Step Procedure

To control traffic with an incoming metric:

1. Enable RIP on the interface.  

```
[edit protocols rip]  
user@host# set group alpha1 neighbor ge-0/0/0
```
2. Set the incoming metric.  

```
[edit protocols rip]  
user@host# set metric-in 3
```
3. If you are done configuring the device, commit the configuration.  

```
[edit]  
user@host# commit
```

### Verification

To verify that the configuration is working properly, enter the **show route protocols rip** command.

---

### Example: Controlling Traffic in a RIP Network with an Outgoing Metric

This example shows how to control traffic with an outgoing metric.

- [Requirements on page 4346](#)
- [Overview on page 4346](#)
- [Configuration on page 4347](#)
- [Verification on page 4347](#)

### Requirements

Before you begin:

- Define RIP groups, and add interfaces to the groups. Then configure a routing policy to export directly connected routes and routes learned through RIP routing exchanges. See [“Example: Configuring a Basic RIP Network” on page 4312](#).
- Control traffic with an incoming metric. See [“Example: Controlling Traffic in a RIP Network with an Incoming Metric” on page 4345](#).

### Overview

In this example, each route from Router A to Router D has two hops as shown in [Figure 134 on page 4347](#). However, because the link from Router A to Router B in the RIP group has a higher bandwidth than the link from Router A to Router C in RIP group Alpha 1, you want traffic from Router D to Router A to flow through Router B. To control the

way Router D sends traffic to Router A, you can alter the routes that Router D receives by configuring the outgoing metric on Router A's interfaces in the Alpha 1 RIP group.

**Figure 134: Controlling Traffic in a RIP Network with the Outgoing Metric**

If the outgoing metric for the Alpha 1 RIP group—the A-to-C link—is changed to 3, Router D calculates the total path metric from Router A through Router C as 4. In contrast, the unchanged default total path metric to Router A through Router B in the RIP group is 2. The fact that Router A's interfaces belong to two different RIP groups allows you to configure two different outgoing metrics on its interfaces, because you configure path metrics at the group level.

By configuring the outgoing metric, you control the way Router A sends traffic to Router D. By configuring the outgoing metric on the same router, you control the way Router D sends traffic to Router A.

This example uses an outgoing metric of 3.

### Configuration

#### Step-by-Step Procedure

To control traffic with an outgoing metric:

1. Set the outgoing metric.
 

```
[edit protocols rip group alpha1]
user@host# set metric-out 3
```
2. If you are done configuring the device, commit the configuration.
 

```
[edit]
user@host# commit
```

### Verification

To verify that the configuration is working properly, enter the **show protocols rip** command.

### Example: Configuring the Metric Value Added to Imported RIP Routes

This example shows how to change the default metric to be added to incoming routes to control the route selection process.

- [Requirements on page 4348](#)
- [Overview on page 4348](#)
- [Configuration on page 4348](#)
- [Verification on page 4351](#)

#### Requirements

No special configuration beyond device initialization is required before configuring this example.

#### Overview

Normally, when multiple routes are available, RIP selects the route with the lowest hop count. Changing the default metric enables you to control the route selection process such that a route with a higher hop count can be preferred over of a route with a lower hop count.

[Figure 135 on page 4348](#) shows the topology used in this example.

**Figure 135: RIP Incoming Metrics Network Topology**

Device R1 has two potential paths to reach 172.16.2.2/32. The default behavior is to send traffic out the 0.1/30 interface facing Device R2. Suppose, though, that the path through Device R3 is less expensive to use or has higher bandwidth links. This example shows how to use the **metric-in** statement to ensure that Device R1 uses the path through Device R3 to reach 172.16.2.2/32. “[CLI Quick Configuration on page 4348](#)” shows the configuration for all of the devices in [Figure 135 on page 4348](#). The section “[Step-by-Step Procedure on page 4349](#)” describes the steps on Device R1.

#### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 1 description to-R2
set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces ge-1/2/1 unit 10 description to-R3

```

```

set interfaces ge-1/2/1 unit 10 family inet address 10.0.0.10/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip group primary export advertise-routes-through-rip
set protocols rip group primary neighbor ge-1/2/1.10
set protocols rip group secondary export advertise-routes-through-rip
set protocols rip group secondary neighbor fe-1/2/0.1 metric-in 4
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Device R2**

```

set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces ge-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor ge-1/2/1.5
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Device R3**

```

set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces ge-1/2/1 unit 9 family inet address 10.0.0.9/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set protocols rip group rip-group neighbor ge-1/2/1.9
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a RIP metrics:

1. Configure the network interfaces.

```

[edit interfaces]
user@R1# set fe-1/2/0 unit 1 description to-R2
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30

user@R1# set ge-1/2/1 unit 10 description to-R3
user@R1# set ge-1/2/1 unit 10 family inet address 10.0.0.10/30

user@R1# set lo0 unit 1 family inet address 172.16.0.1/32

```

```
user@R1# set lo0 unit 1 family inet address 192.168.1.1/32
```

2. Create the RIP groups and add the interfaces.

To configure RIP in Junos OS, you must configure one or more groups that contain the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

For the interface that is facing Device R2, the **metric-in 4** setting causes this route to be less likely to be chosen as the active route.

```
[edit protocols rip]
user@R1# set group primary neighbor ge-1/2/1.10
user@R1# set group secondary neighbor fe-1/2/0.1 metric-in 4
```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept
```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip]
user@R1# set group primary export advertise-routes-through-rip
user@R1# set group secondary export advertise-routes-through-rip
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    description to-R2;
    family inet {
      address 10.0.0.1/30;
    }
  }
}
ge-1/2/1 {
  unit 10 {
    description to-R3;
    family inet {
      address 10.0.0.10/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 172.16.0.1/32;
      address 192.168.1.1/32;
    }
  }
}
```

```

    }
  }
user@R1# show protocols
rip {
  group primary {
    export advertise-routes-through-rip;
    neighbor ge-1/2/1.10;
  }
  group secondary {
    export advertise-routes-through-rip;
    neighbor fe-1/2/0.1 {
      metric-in 4;
    }
  }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
  term 1 {
    from protocol [ direct rip ];
    then accept;
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying That the Expected Route Is Active on page 4351](#)
- [Removing the metric-in Statement on page 4351](#)

### Verifying That the Expected Route Is Active

**Purpose** Make sure that to reach 172.16.2.2/32, Device R1 uses the path through Device R3.

**Action** From operational mode, enter the **show route 172.16.2.2** command.

```

user@R1> show route 172.16.2.2
inet.0: 12 destinations, 12 routes (12 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.2.2/32      *[RIP/100] 00:15:46, metric 3, tag 0
                   > to 10.0.0.9 via ge-1/2/1.10

```

**Meaning** The **to 10.0.0.9 via ge-1/2/1.10** output shows that Device R1 uses the path through Device R3 to reach 172.16.2.2/32. The metric for this route is 3.

### Removing the metric-in Statement

**Purpose** Delete or deactivate the **metric-in** statement to see what happens to the 172.16.2.2/32 route.

**Action** 1. From configuration mode, deactivate the **metric-in** statement.

```
[edit protocols rip group secondary neighbor fe-1/2/0.1]
user@R1# deactivate metric-in
user@R1# commit
```

2. From operational mode, enter the **show route 172.16.2.2** command.

```
user@R1> show route 172.16.2.2
inet.0: 12 destinations, 12 routes (12 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.2.2/32      * [RIP/100] 00:00:06, metric 2, tag 0
> to 10.0.0.2 via fe-1/2/0.1
```

**Meaning** The **to 10.0.0.2 via fe-1/2/0.1** output shows that Device R1 uses the path through Device R2 to reach 172.16.2.2/32. The metric for this route is 2.

### Understanding the Sending and Receiving of RIPv1 and RIPv2 Packets

---

RIP version 1 (RIPv1) and RIP version 2 (RIPv2) can run simultaneously. This might make sense when you are migrating a RIPv1 network to a RIPv2 network. This also allows interoperation with a device that supports RIPv1 but not RIPv2.

By default, when RIP is enabled on an interface, Junos OS receives both RIPv1 and RIPv2 packets and sends only RIPv2 packets. You can configure this behavior by including the [send](#) and [receive](#) statements in the RIP configuration.

### Example: Configuring the Sending and Receiving of RIPv1 and RIPv2 Packets

---

This example shows how to configure whether the RIP update messages conform to RIP version 1 (RIPv1) only, to RIP version 2 (RIPv2) only, or to both versions. You can also disable the sending or receiving of update messages.

#### Requirements

No special configuration beyond device initialization is required before configuring this example.

#### Overview

By default, when RIP is enabled on an interface, Junos OS receives both RIPv1 and RIPv2 packets and sends only RIPv2 packets.

Figure 136 on page 4353 shows the topology used in this example.

**Figure 136: Sending and Receiving RIPv1 and RIPv2 Packets Network Topology**

In this example, Device R1 is configured to receive only RIPv2 packets.

“CLI Quick Configuration” on page 4353 shows the configuration for all of the devices in Figure 136 on page 4353. The section “Step-by-Step Procedure” on page 4354 describes the steps on Device R1.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

- Device R1**
- ```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1 receive version-2
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```
- Device R2**
- ```

set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor fe-1/2/1.5
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```
- Device R3**
- ```

set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip

```

```
set protocols rip group rip-group neighbor fe-1/2/0.6
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a RIP packet versions that can be received:

1. Configure the network interfaces.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30
```

```
user@R1# set lo0 unit 1 family inet address 172.16.0.1/32
user@R1# set lo0 unit 1 family inet address 192.168.1.1/32
```

2. Create the RIP groups and add the interfaces.

To configure RIP in Junos OS, you must configure one or more groups that contain the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

For the interface that is facing Device R2, the **receive version-2** setting causes this interface to accept only RIPv2 packets.

```
[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1 receive version-2
```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept
```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
```

```

    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 172.16.0.1/32;
      address 192.168.1.1/32;
    }
  }
}

user@R1# show protocols
rip {
  group rip-group {
    export advertise-routes-through-rip;
    neighbor fe-1/2/0.1 {
      receive version-2;
    }
  }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
  term 1 {
    from protocol [ direct rip ];
    then accept;
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

#### Verifying That the Receive Mode Is Set to RIPv2 Only

**Purpose** Make sure that the interfacing Device R2 is configured to receive only RIPv2 packets, instead of both RIPv1 and RIPv2 packets.

**Action** From operational mode, enter the **show rip neighbor** command.

```
user@R1> show rip neighbor
```

| Neighbor   | Local<br>State | Source<br>Address | Destination<br>Address | Send<br>Mode | Receive<br>Mode | In<br>Met |
|------------|----------------|-------------------|------------------------|--------------|-----------------|-----------|
| fe-1/2/0.1 | Up             | 10.0.0.1          | 224.0.0.9              | mcast        | v2 only         | 1         |

**Meaning** In the output, the **Receive Mode** field displays **v2 only**. The default **Receive Mode** is **both**.

- [Example: Configuring RIP on page 4311](#)

## Example: Redistributing Routes Among RIP Instances

- [Understanding Route Redistribution Among RIP instances on page 4356](#)
- [Example: Redistributing Routes Between Two RIP Instances on page 4357](#)

### Understanding Route Redistribution Among RIP instances

---

You can redistribute routes among RIP processes. Another way to say this is to export RIP routes from one RIP instance to other RIP instances.

In Junos OS, route redistribution among routing instances is accomplished by using routing table groups, also called RIB groups. Routing table groups allow you to import and export routes from a protocol within one routing table into another routing table.

**NOTE:** In contrast, the policy-based import and export functions allow you import and export routes between different protocols within the same routing table.

---

Consider the following partial example:

```
protocols {
  rip {
    rib-group inet-to-voice;
  }
}
routing-instances {
  voice {
    protocols {
      rip {
        rib-group voice-to-inet;
      }
    }
  }
}
routing-options {
  rib-groups {
    inet-to-voice {
      import-rib [ inet.0 voice.inet.0 ];
    }
    voice-to-inet {
      import-rib [ voice.inet.0 inet.0 ];
    }
  }
}
```

The way to read the **import-rib** statement is as follows. Take the routes from the protocol (RIP, in this case), and import them into the primary (or local) routing table and also into any other routing tables listed after this. The primary routing table is the routing table where the routing table group is being used. That would be either **inet.0** if used in the main routing instance or **voice.inet.0** if used within the routing instance. In the **inet-to-voice** routing table group, **inet.0** is listed first because this routing table group is used in the

main routing instance. In the **voice-to-inet** routing table group, **voice.inet.0** is listed first because this routing table group is used in the voice routing instance.

### Example: Redistributing Routes Between Two RIP Instances

This example shows how to configure a RIP routing instance and control the redistribution of RIP routes between the routing instance and the master instance.

- [Requirements on page 4357](#)
- [Overview on page 4357](#)
- [Configuration on page 4357](#)
- [Verification on page 4361](#)

#### Requirements

No special configuration beyond device initialization is required before configuring this example.

#### Overview

When you create a routing instance called voice, Junos OS creates a routing table called **voice.inet.0**. The example shows how to install routes learned through the master RIP instance into the **voice.inet.0** routing table. The example also shows how to install routes learned through the voice routing instance into **inet.0**. This is done by configuring routing table groups. RIP routes are installed into each routing table that belongs to a routing table group.

[Figure 137 on page 4357](#) shows the topology used in this example.

**Figure 137: Redistributing Routes Between RIP Instances Network Topology**

[“CLI Quick Configuration” on page 4357](#) shows the configuration for all of the devices in [Figure 137 on page 4357](#). The section [“Step-by-Step Procedure” on page 4358](#) describes the steps on Device R2.

#### Configuration

##### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32

```

```
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip group to-R2 export advertise-routes-through-rip
set protocols rip group to-R2 neighbor fe-1/2/0.1
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Device R2**

```
set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip rib-group inet-to-voice
set protocols rip group to-R3 export advertise-routes-through-rip
set protocols rip group to-R3 neighbor fe-1/2/1.5
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
set routing-instances voice protocols rip group to-R1 export advertise-routes-through-rip
set routing-instances voice interface fe-1/2/0.2
set routing-instances voice protocols rip rib-group voice-to-inet
set routing-instances voice protocols rip group to-R1 neighbor fe-1/2/0.2
set routing-options rib-groups inet-to-voice import-rib inet.0
set routing-options rib-groups inet-to-voice import-rib voice.inet.0
set routing-options rib-groups voice-to-inet import-rib voice.inet.0
set routing-options rib-groups voice-to-inet import-rib inet.0
```

**Device R3**

```
set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group to-R2 export advertise-routes-through-rip
set protocols rip group to-R2 neighbor fe-1/2/0.6
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To redistribute RIP routes between routing instances:

1. Configure the network interfaces.

```
[edit interfaces]
user@R2# set fe-1/2/0 unit 2 family inet address 10.0.0.2/30

user@R2# set fe-1/2/1 unit 5 family inet address 10.0.0.5/30

user@R2# set lo0 unit 2 family inet address 192.168.2.2/32
```

```
user@R2# set lo0 unit 2 family inet address 172.16.2.2/32
```

2. Create the routing instance, and add one or more interfaces to the routing instance.

```
[edit routing-instances voice]
user@R2# set interface fe-1/2/0.2
```

3. Create the RIP groups and add the interfaces.

```
[edit protocols rip group to-R3]
user@R2# set neighbor fe-1/2/1.5

[edit routing-instances voice protocols rip group to-R1]
user@R2# set neighbor fe-1/2/0.2
```

4. Create the routing table groups.

```
[edit routing-options rib-groups]
user@R2# set inet-to-voice import-rib inet.0
user@R2# set inet-to-voice import-rib voice.inet.0

user@R2# set voice-to-inet import-rib voice.inet.0
user@R2# set voice-to-inet import-rib inet.0
```

5. Apply the routing table groups.

```
[edit protocols rip]
user@R2# set rib-group inet-to-voice

[edit routing-instances voice protocols rip]
user@R2# set rib-group voice-to-inet
```

6. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R2# set from protocol direct
user@R2# set from protocol rip
user@R2# set then accept
```

7. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group to-R3]
user@R2# set export advertise-routes-through-rip

[edit routing-instances voice protocols rip group to-R1]
user@R2# set export advertise-routes-through-rip
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, **show routing-instances**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 2 {
    family inet {
```

```
        address 10.0.0.2/30;
    }
}
fe-1/2/1 {
    unit 5 {
        family inet {
            address 10.0.0.5/30;
        }
    }
}
lo0 {
    unit 2 {
        family inet {
            address 192.168.2.2/32;
            address 172.16.2.2/32;
        }
    }
}

user@R2# show protocols
rip {
    rib-group inet-to-voice;
    group to-R3 {
        export advertise-routes-through-rip;
        neighbor fe-1/2/1.5;
    }
}

user@R2# show policy-options
policy-statement advertise-routes-through-rip {
    term 1 {
        from protocol [ direct rip ];
        then accept;
    }
}

user@R2# show routing-instances
voice {
    interface fe-1/2/0.2;
    protocols {
        rip {
            rib-group voice-to-inet;
            group to-R1 {
                export advertise-routes-through-rip;
                neighbor fe-1/2/0.2;
            }
        }
    }
}

user@R2# show routing-options
rib-groups {
    inet-to-voice {
        import-rib [ inet.0 voice.inet.0 ];
    }
    voice-to-inet {
```

```

import-rib [ voice.inet.0 inet.0 ];
}
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

### Checking the Routing Tables

**Purpose** Make sure that the routing tables contain the expected routes.

**Action** From operational mode, enter the **show route protocol rip** command.

```

user@R2> show route protocol rip
inet.0: 9 destinations, 9 routes (9 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.0.1/32    * [RIP/100] 01:58:14, metric 2, tag 0
                 > to 10.0.0.1 via fe-1/2/0.2
172.16.3.3/32    * [RIP/100] 02:06:03, metric 2, tag 0
                 > to 10.0.0.6 via fe-1/2/0.5
192.168.1.1/32   * [RIP/100] 01:58:14, metric 2, tag 0
                 > to 10.0.0.1 via fe-1/2/0.2
192.168.3.3/32   * [RIP/100] 02:06:03, metric 2, tag 0
                 > to 10.0.0.6 via fe-1/2/0.5
224.0.0.9/32     * [RIP/100] 01:44:13, metric 1
                 MultiRecv

voice.inet.0: 7 destinations, 7 routes (7 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.0.1/32    * [RIP/100] 02:06:03, metric 2, tag 0
                 > to 10.0.0.1 via fe-1/2/0.2
172.16.3.3/32    * [RIP/100] 01:58:14, metric 2, tag 0
                 > to 10.0.0.6 via fe-1/2/0.5
192.168.1.1/32   * [RIP/100] 02:06:03, metric 2, tag 0
                 > to 10.0.0.1 via fe-1/2/0.2
192.168.3.3/32   * [RIP/100] 01:58:14, metric 2, tag 0
                 > to 10.0.0.6 via fe-1/2/0.5
224.0.0.9/32     * [RIP/100] 01:44:13, metric 1
                 MultiRecv

```

**Meaning** The output shows that both routing tables contain all of the RIP routes.

## Understanding RIP Timers

---

RIP uses several timers to regulate its operation.

The update interval is the interval at which routes that are learned by RIP are advertised to neighbors. This timer controls the interval between routing updates. The update interval is set to 30 seconds, by default, with a small random amount of time added when the timer is reset. This added time prevents congestion that can occur if all routing devices update their neighbors simultaneously.

To configure the update time interval, include the **update-interval** statement:

**update-interval** *seconds*;

*seconds* can be a value from 10 through 60.

You can set a route timeout interval. If a route is not refreshed after being installed in the routing table by the specified time interval, the route is marked as invalid and is removed from the routing table after the hold-down period expires.

To configure the route timeout for RIP, include the **route-timeout** statement:

**route-timeout** *seconds*;

*seconds* can be a value from 30 through 360. The default value is 180 seconds.

RIP routes expire when either a route timeout limit is met or a route metric reaches infinity, and the route is no longer valid. However, the expired route is retained in the routing table for a specified period so that neighbors can be notified that the route has been dropped. This time period is set by configuring the hold-down timer. Upon expiration of the hold-down timer, the route is removed from the routing table.

To configure the hold-down timer for RIP, include the **holddown** statement:

**holddown** *seconds*;

*seconds* can be a value from 10 through 180. The default value is 120 seconds.

**NOTE:** In Junos OS Release 11.1 and later, a retransmission timer is available for RIP demand circuits.

---

Generally, we recommend against changing the RIP timers, unless the effects of a change are well understood. The route timeout should be at least three times the update interval. Normally, the default values are best left in effect for standard operations.

## Example: Configuring RIP Timers

---

This example shows how to configure the RIP update interval and how to monitor the impact of the change.

- [Requirements on page 4363](#)
- [Overview on page 4363](#)

- [Configuration on page 4363](#)
- [Verification on page 4366](#)

### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

In this example, Device R2 has an update interval of 60 seconds for its neighbor, Device R1, and an update interval of 10 seconds for its neighbor, Device R3.

This example is not necessarily practical, but it is shown for demonstration purposes. Generally, we recommend against changing the RIP timers, unless the effects of a change are well understood. Normally, the default values are best left in effect for standard operations.

An export policy is also shown because an export policy is required as part of the minimum configuration for RIP.

[Figure 138 on page 4363](#) shows the topology used in this example.

**Figure 138: RIP Timers Network Topology**

“CLI Quick Configuration” on [page 4363](#) shows the configuration for all of the devices in [Figure 138 on page 4363](#). The section “Step-by-Step Procedure” on [page 4364](#) describes the steps on Device R2.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Device R2**

```
set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2 update-interval 60
set protocols rip group rip-group neighbor fe-1/2/1.5 update-interval 10
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Device R3**

```
set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the RIP update interval:

1. Configure the network interfaces.

This example shows multiple loopback interface addresses to simulate attached networks.

```
[edit interfaces]
```

```
user@R2# set fe-1/2/0 unit 2 family inet address 10.0.0.2/30
```

```
user@R2# set fe-1/2/1 unit 5 family inet address 10.0.0.5/30
```

```
user@R2# set lo0 unit 2 family inet address 192.168.2.2/32
```

```
user@R2# set lo0 unit 2 family inet address 172.16.2.2/32
```

2. Configure different update intervals for the two RIP neighbors.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

```
[edit protocols rip group rip-group]
```

```
user@R2# set neighbor fe-1/2/0.2 update-interval 60
```

```
user@R2# set neighbor fe-1/2/1.5 update-interval 10
```

3. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
```

```
user@R2# set from protocol direct
```

```
user@R2# set from protocol rip
```

```
user@R2# set then accept
```

4. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R2# set export advertise-routes-through-rip
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 2 {
    family inet {
      address 10.0.0.2/30;
    }
  }
}
fe-1/2/1 {
  unit 5 {
    family inet {
      address 10.0.0.5/30;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 192.168.2.2/32;
      address 172.16.2.2/32;
    }
  }
}

user@R2# show protocols
rip {
  group rip-group {
    export advertise-routes-through-rip;
    neighbor fe-1/2/0.2 {
      update-interval 60;
    }
    neighbor fe-1/2/1.5 {
      update-interval 10;
    }
  }
}

user@R2# show policy-options
policy-statement advertise-routes-through-rip {
  term 1 {
    from protocol [ direct rip ];
    then accept;
  }
}
```

```
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Checking the RIP Updates Sent by Device R2 on page 4366](#)
- [Checking the RIP Updates Received by Device R2 on page 4367](#)
- [Checking the RIP Updates Received by Device R3 on page 4367](#)

### Checking the RIP Updates Sent by Device R2

**Purpose** Make sure that the RIP update packets are sent at the expected interval.

**Action** From operational mode, enter the **show rip statistics** command.

```
user@R2> show rip statistics
```

```
RIPv2 info: port 520; holddown 120s.
```

```
    rts learned   rts held down   rqsts dropped   resps dropped
          4             2             0             0
```

```
fe-1/2/0.2: 2 routes learned; 5 routes advertised; timeout 180s; update interval
60s
```

| Counter                 | Total | Last 5 min | Last minute |
|-------------------------|-------|------------|-------------|
| Updates Sent            | 123   | 5          | 1           |

| none                    | 0     | 0          | 0           |

```
fe-1/2/1.5: 2 routes learned; 5 routes advertised; timeout 180s; update interval
10s
```

| Counter                 | Total | Last 5 min | Last minute |
|-------------------------|-------|------------|-------------|
| Updates Sent            | 734   | 32         | 6           |
| Triggered Updates Sent  | 0     | 0          | 0           |
| Responses Sent          | 0     | 0          | 0           |
| Bad Messages            | 0     | 0          | 0           |
| RIPv1 Updates Received  | 0     | 0          | 0           |
| RIPv1 Bad Route Entries | 0     | 0          | 0           |
| RIPv1 Updates Ignored   | 0     | 0          | 0           |
| RIPv2 Updates Received  | 245   | 11         | 2           |
| RIPv2 Bad Route Entries | 0     | 0          | 0           |
| RIPv2 Updates Ignored   | 0     | 0          | 0           |
| Authentication Failures | 0     | 0          | 0           |
| RIP Requests Received   | 0     | 0          | 0           |

|                      |   |   |   |
|----------------------|---|---|---|
| RIP Requests Ignored | 0 | 0 | 0 |
| none                 | 0 | 0 | 0 |

**Meaning** The **update interval** field shows that the interval is 60 seconds for Neighbor R1 and 10 seconds for Neighbor R3. The **Updates Sent** field shows that Device R2 is sending updates to Device R1 at roughly 1/6 of the rate that it is sending updates to Device R3.

### *Checking the RIP Updates Received by Device R2*

**Purpose** Make sure that the RIP update packets are sent at the expected interval.

**Action** From operational mode, enter the **show rip statistics** command.

```
user@R1> show rip statistics
```

```
RIPv2 info: port 520; holddown 120s.
```

|             |               |               |               |
|-------------|---------------|---------------|---------------|
| rts learned | rts held down | rqsts dropped | resps dropped |
| 5           | 0             | 0             | 0             |

```
fe-1/2/0.1: 5 routes learned; 2 routes advertised; timeout 180s; update interval 30s
```

| Counter                 | Total | Last 5 min | Last minute |
|-------------------------|-------|------------|-------------|
| -----                   | ----- | -----      | -----       |
| Updates Sent            | 312   | 10         | 2           |

  - [Example: Configuring RIP Demand Circuits](#)

## Example: Tracing RIP Protocol Traffic

- [Understanding RIP Trace Operations on page 4368](#)
- [Example: Tracing RIP Protocol Traffic on page 4369](#)

### Understanding RIP Trace Operations

---

You can trace various types of RIP protocol traffic to help debug RIP protocol issues.

To trace RIP protocol traffic, include the **traceoptions** statement at the **[edit protocols rip]** hierarchy level:

```
traceoptions {  
  file filename <files number> <size size> <world-readable | no-world-readable>;  
  flag flag <flag-modifier> <disable>;  
}
```

You can specify the following RIP protocol-specific trace options using the **flag** statement:

- **auth**—RIP authentication
- **error**—RIP error packets
- **expiration**—RIP route expiration processing
- **holddown**—RIP hold-down processing
- **nsr-synchronization**—Nonstop active routing synchronization events
- **packets**—All RIP packets
- **request**—RIP information packets
- **trigger**—RIP triggered updates
- **update**—RIP update packets

You can optionally specify one or more of the following flag modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**NOTE:** Use the **detail** flag modifier with caution as this may cause the CPU to become very busy.

Global tracing options are inherited from the configuration set by the **traceoptions** statement at the **[edit routing-options]** hierarchy level. You can override the following global trace options for the RIP protocol using the **traceoptions flag** statement included at the **[edit protocols rip]** hierarchy level:

- **all**—All tracing operations
- **general**—All normal operations and routing table changes (a combination of the normal and route trace operations)
- **normal**—Normal events
- **policy**—Policy processing
- **route**—Routing information
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

**NOTE:** Use the trace flag **all** with caution because this may cause the CPU to become very busy.

### Example: Tracing RIP Protocol Traffic

This example shows how to trace RIP protocol operations.

- [Requirements on page 4369](#)
- [Overview on page 4370](#)
- [Configuration on page 4370](#)
- [Verification on page 4372](#)

#### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

In this example, Device R1 is set to trace routing information updates.

An export policy is also shown because an export policy is required as part of the minimum configuration for RIP.

Figure 139 on page 4370 shows the topology used in this example.

**Figure 139: RIP Trace Operations Network Topology**

“CLI Quick Configuration” on page 4370 shows the configuration for all of the devices in Figure 139 on page 4370. The section “Step-by-Step Procedure” on page 4371 describes the steps on Device R1.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces lo0 unit 1 family inet address 172.16.0.1/32
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols rip traceoptions file rip-trace-file
set protocols rip traceoptions flag route
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.1
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept

```

**Device R2**

```

set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 5 family inet address 10.0.0.5/30
set interfaces lo0 unit 2 family inet address 192.168.2.2/32
set interfaces lo0 unit 2 family inet address 172.16.2.2/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.2
set protocols rip group rip-group neighbor fe-1/2/1.5
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip

```

```
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Device R3**

```
set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 3 family inet address 192.168.3.3/32
set interfaces lo0 unit 3 family inet address 172.16.3.3/32
set protocols rip group rip-group export advertise-routes-through-rip
set protocols rip group rip-group neighbor fe-1/2/0.6
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  direct
set policy-options policy-statement advertise-routes-through-rip term 1 from protocol
  rip
set policy-options policy-statement advertise-routes-through-rip term 1 then accept
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the RIP update interval:

1. Configure the network interfaces.

This example shows multiple loopback interface addresses to simulate attached networks.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30

user@R1# set lo0 unit 1 family inet address 172.16.0.1/32
user@R1# set lo0 unit 1 family inet address 192.168.1.1/32
```

2. Configure the RIP group, and add the interface to the group.

To configure RIP in Junos OS, you must configure a group that contains the interfaces on which RIP is enabled. You do not need to enable RIP on the loopback interface.

```
[edit protocols rip group rip-group]
user@R1# set neighbor fe-1/2/0.1
```

3. Configure RIP tracing operations.

```
[edit protocols rip traceoptions]
user@R1# set file rip-trace-file
user@R1# set flag route
```

4. Create the routing policy to advertise both direct and RIP-learned routes.

```
[edit policy-options policy-statement advertise-routes-through-rip term 1]
user@R1# set from protocol direct
user@R1# set from protocol rip
user@R1# set then accept
```

5. Apply the routing policy.

In Junos OS, you can only apply RIP export policies at the group level.

```
[edit protocols rip group rip-group]
user@R1# set export advertise-routes-through-rip
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 172.16.0.1/32;
      address 192.168.1.1/32;
    }
  }
}

user@R1# show protocols
rip {
  traceoptions {
    file rip-trace-file;
    flag route;
  }
  group rip-group {
    export advertise-routes-through-rip;
    neighbor fe-1/2/0.1;
  }
}

user@R1# show policy-options
policy-statement advertise-routes-through-rip {
  term 1 {
    from protocol [ direct rip ];
    then accept;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

### **Checking the Log File**

**Purpose** Make sure that the RIP route updates are logged in the configured log file.

**Action** 1. Deactivate the extra loopback interface address on Device R3.

```
[edit interfaces lo0 unit 3 family inet]
user@R3# deactivate address 172.16.3.3/32
user@R3# commit
```

- From operational mode on Device R1, enter the **show log rip-trace-file** command with the **| match 172.16.3.3** option.

```

user@R1> show log rip-trace-file | match 172.16.3.3
Mar  1 11:39:53.975192 Setting RIPv2 rtbit on route 172.16.3.3/32, tsi =
0xbb69228
Mar  1 11:39:59.847118 172.16.3.3/32: metric-in: 16, change: 3 -> 16; # gw:
1, pkt_upd_src 10.0.0.2, inx: 0, rte_upd_src 10.0.0.2
Mar  1 11:39:59.847568 CHANGE 172.16.3.3/32      nhid 591 gw 10.0.0.2
RIP      pref 100/0 metric 3/0 fe-1/2/0.1 <Delete Int>
Mar  1 11:39:59.847629 Best route to 172.16.3.3/32 got deleted. Doing route calculation
on the stored rte-info

```

**Meaning** The output shows that the route to 172.16.3.3/32 was deleted.

## bfd-liveness-detection (Protocols RIP)

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | <pre> bfd-liveness-detection {     authentication {         algorithm <i>algorithm-name</i>;         key-chain <i>key-chain-name</i>;         loose-check;     }     detection-time {         threshold <i>milliseconds</i>;     }     minimum-interval <i>milliseconds</i>;     minimum-receive-interval <i>milliseconds</i>;     multiplier <i>number</i>;     no-adaptation;     transmit-interval {         minimum-interval <i>milliseconds</i>;         threshold <i>milliseconds</i>;     }     version (1   automatic); } </pre>   |
| <b>Hierarchy Level</b>     | <p>[edit logical-systems <i>logical-system-name</i> protocols rip <b>group</b> <i>group-name</i>],<br/> [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols<br/> rip group <i>group-name</i> <b>neighbor</b> <i>neighbor-name</i>],<br/> [edit protocols rip <b>group</b> <i>group-name</i>],<br/> [edit routing-instances <i>routing-instance-name</i> protocols rip group <i>group-name</i> <b>neighbor</b><br/> <i>neighbor-name</i>]</p>   |
| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 8.0.</p> <p>Options <b>detection-time threshold</b> and <b>transmit-interval threshold</b> introduced in Junos OS Release 8.2.</p> <p>Support for logical systems introduced in Junos OS Release 8.3.</p> <p>Option <b>no-adaptation</b> introduced in Junos OS Release 9.0.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Options <b>authentication algorithm</b>, <b>authentication key-chain</b>, and <b>authentication loose-check</b> introduced in Junos OS Release 9.6.</p> <p>Options <b>authentication algorithm</b>, <b>authentication key-chain</b>, and <b>authentication loose-check</b> introduced in Junos OS Release 9.6 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p> |
| <b>Description</b>         | Configure bidirectional failure detection timers and authentication.   |
| <b>Options</b>             | <p><b>authentication algorithm <i>algorithm-name</i></b> —Configure the algorithm used to authenticate the specified BFD session: <b>simple-password</b>, <b>keyed-md5</b>, <b>keyed-sha-1</b>, <b>meticulous-keyed-md5</b>, or <b>meticulous-keyed-sha-1</b>.</p> <p><b>authentication key-chain <i>key-chain-name</i></b>—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the <b>authentication-key-chains key-chain</b> statement at the <b>[edit security]</b> hierarchy level.</p>  |

**authentication loose-check**—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication is not configured at both ends of the BFD session.

**detection-time threshold *milliseconds***—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**minimum-interval *milliseconds***—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the **transmit-interval**, **minimum-interval**, and **minimum-receive-interval** statements.

**Range:** 1 through 255,000 milliseconds

**minimum-receive-interval *milliseconds***—Configure the minimum interval after which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the **minimum-interval** statement.

**Range:** 1 through 255,000 milliseconds

**multiplier *number***—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255

**Default:** 3

**no-adaptation**—Configure BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

**transmit-interval threshold *milliseconds***—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**transmit-interval minimum-interval *milliseconds***—Configure a minimum interval after which the local routing device transmits hello packets to a neighbor. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement.

**Range:** 1 through 255,000

**version**—Configure the BFD version to detect: **1** (BFD version 1) or **automatic** (autodetect the BFD version).

**Default:** automatic

| <b>Description</b>   | Specify the number of route entries to be included in every RIP update message.  |
| <div>  <p><b>TIP:</b> To ensure interoperability with other vendors' equipment, use the standard of 25 route entries per message. Do not change the default number of route entries in a RIP update message.</p> </div> |  |
| <b>Options</b>   | <p><i>number</i>—Number of route entries per update message.</p> <p><b>Range:</b> 25 through 255 entries</p> <p><b>Default:</b> 25 entries</p>   |
| <b>Required Privilege Level</b>  | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>   | <ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring RIP on page 4311</a></li> </ul>  |

## metric-in (Protocols RIP)

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>metric-in <i>metric</i>;</code>  |
| <b>Hierarchy Level</b>          | <p>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">rip</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols rip group <i>group-name</i> <a href="#">neighbor</a> <i>neighbor-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols rip group <i>group-name</i> <a href="#">neighbor</a> <i>neighbor-name</i>],</p> <p>[edit protocols <a href="#">rip</a>],</p> <p>[edit protocols rip group <i>group-name</i> <a href="#">neighbor</a> <i>neighbor-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols rip group <i>group-name</i> <a href="#">neighbor</a> <i>neighbor-name</i>]</p> |
| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>  |
| <b>Description</b>              | Specify the metric to add to incoming routes when the routing device advertises into RIP routes that were learned from other protocols. Use this statement to configure the routing device to prefer RIP routes learned through a specific neighbor.   |
| <b>Options</b>                  | <p><i>metric</i>—Metric value.</p> <p><b>Range:</b> 1 through 16</p> <p><b>Default:</b> 1</p>  |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring the Metric Value Added to Imported RIP Routes on page 4348</a></li> </ul>  |

## metric-out (Protocols RIP)

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>metric-out <i>metric</i>;</code>   |
| <b>Hierarchy Level</b>          | <code>[edit logical-systems <i>logical-system-name</i> protocols rip group <i>group-name</i> <b>neighbor</b> <i>neighbor-name</i>],</code><br><code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols rip group <i>group-name</i> <b>neighbor</b> <i>neighbor-name</i>],</code><br><code>[edit protocols rip group <i>group-name</i> <b>neighbor</b> <i>neighbor-name</i>],</code><br><code>[edit routing-instances <i>routing-instance-name</i> protocols rip group <i>group-name</i> <b>neighbor</b> <i>neighbor-name</i>]</code>  |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.  |
| <b>Description</b>              | <p>Specify the metric value to add to routes transmitted to the neighbor. Use this statement to control how other routing devices prefer RIP routes sent from this neighbor.</p> <p>If you have included the <b>export</b> statement, RIP exports routes it has learned to the neighbors configured by including the <b>neighbor</b> statement.</p> <p>The metric associated with a RIP route (unless modified by an export policy) is the normal RIP metric. For example, a RIP route with a metric of 5 learned from a neighbor configured with a <b>metric-in</b> value of 2 is advertised with a combined metric of 7 when advertised to RIP neighbors in the same group. However, if this route was learned from a RIP neighbor in a different group or from a different protocol, the route is advertised with the metric value configured for that group with the <b>metric-out</b> statement.</p> <p>The metric for a route can be modified with an export policy. That metric is seen when the route is exported to the next hop.</p> <p>To increase the metric for routes advertised outside a group, include the <b>metric-out</b> statement.</p> |
| <b>Options</b>                  | <b><i>metric</i></b> —Metric value.<br><b>Range:</b> 1 through 16<br><b>Default:</b> 1   |
| <b>Required Privilege Level</b> | <b>routing</b> —To view this statement in the configuration.<br><b>routing-control</b> —To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Examples: Controlling Traffic with Metrics in a RIP Network on page 434450</a></li></ul>   |

## neighbor (Protocols RIP)

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | <pre> neighbor <i>neighbor-name</i> {   authentication-key <i>password</i>;   authentication-type <i>type</i>;   bfd-liveness-detection {     authentication {       algorithm <i>algorithm-name</i>;       key-chain <i>key-chain-name</i>;       loose-check;     }     detection-time {       threshold <i>milliseconds</i>;     }     minimum-interval <i>milliseconds</i>;     minimum-receive-interval <i>milliseconds</i>;     transmit-interval {       threshold <i>milliseconds</i>;       minimum-interval <i>milliseconds</i>;     }     multiplier <i>number</i>;     version (0   1   automatic);   }   (check-zero   no-check-zero);   demand-circuit;   import <i>policy-name</i>;   max-retrans-time <i>seconds</i>;   message-size <i>number</i>;   metric-in <i>metric</i>;   metric-out <i>metric</i>;   receive <i>receive-options</i>;   route-timeout <i>seconds</i>;   send <i>send-options</i>;   update-interval <i>seconds</i>; } </pre> |
| <b>Hierarchy Level</b>     | <pre> [edit logical-systems <i>logical-system-name</i> protocols rip <b>group</b> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   rip <b>group</b> <i>group-name</i>], [edit protocols rip <b>group</b> <i>group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols rip <b>group</b> <i>group-name</i>] </pre>   |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>  |
| <b>Description</b>         | Configure neighbor-specific RIP parameters, thereby overriding the defaults set for the routing device.   |
| <b>Options</b>             | <p><b><i>neighbor-name</i></b>—Name of an interface over which a routing device communicates to its neighbors.</p> <p>The remaining statements are explained separately.</p>  |

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

---

## preference (Protocols RIP)

---

**Syntax** `preference preference;`

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols rip **group** *group-name*],  
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols  
rip **group** *group-name*],  
[edit protocols rip **group** *group-name*],  
[edit routing-instances *routing-instance-name* protocols rip **group** *group-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Specify the preference of external routes learned by RIP as compared to those learned from other routing protocols.

By default, Junos OS assigns a preference of 100 to routes that originate from RIP. When Junos OS determines a route's preference to become the active route, the software selects the route with the lowest preference and installs this route into the forwarding table.

**Options** *preference*—Preference value. A lower value indicates a more preferred route.  
**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )  
**Default:** 100

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## traceoptions (Protocols RIP)

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | <pre>traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;flag-modifier&gt; &lt;disable&gt;; }</pre>   |
| <b>Hierarchy Level</b>     | [edit logical-systems <i>logical-system-name</i> protocols <a href="#">rip</a> ],<br>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a> ],<br>[edit protocols <a href="#">rip</a> ],<br>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a> ] |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.  |
| <b>Description</b>         | Set RIP protocol-level tracing options.   |

**NOTE:** The `traceoptions` statement is not supported on QFabric systems.

**Default** The default RIP protocol-level trace options are inherited from the global `traceoptions` statement.

**Options** **disable**—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

**file *filename***—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place RIP tracing output in the file `/var/log/rip-log`.

**files *number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file.0***, then ***trace-file.1***, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 10 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

### RIP Tracing Options

- **auth**—RIP authentication
- **error**—RIP error packets

- **expiration**—RIP route expiration processing
- **holddown**—RIP hold-down processing
- **nsr-synchronization**—Nonstop routing synchronization events
- **packets**—All RIP packets
- **request**—RIP information packets such as request, poll, and poll entry packets
- **trigger**—RIP triggered updates
- **update**—RIP update packets

#### Global Tracing Options

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **receive**—Trace the packets being received.
- **receive-detail**—Provide detailed trace information for packets being received.
- **send**—Trace the packets being transmitted.
- **send-detail**—Provide detailed trace information for packets being transmitted.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

|                              |  |
|------------------------------|--|
| <b>Required Privilege</b>    | routing—To view this statement in the configuration.   |
| <b>Level</b>                 | routing-control—To add this statement to the configuration.  |

## update-interval (Protocols RIP)

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>update-interval seconds;</code>   |
| <b>Hierarchy Level</b>          | <code>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">rip</a>],</code><br><code>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">rip</a> group <i>group-name</i>],</code><br><code>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">rip</a> group <i>group-name</i> neighbor</code><br><code>    <i>neighbor-name</i>],</code><br><code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code><br><code>    <a href="#">rip</a>],</code><br><code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code><br><code>    <a href="#">rip</a> group <i>group-name</i>],</code><br><code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code><br><code>    <a href="#">rip</a> group <i>group-name</i> neighbor <i>neighbor-name</i>],</code><br><code>[edit protocols <a href="#">rip</a>],</code><br><code>[edit protocols <a href="#">rip</a> group <i>group-name</i>],</code><br><code>[edit protocols <a href="#">rip</a> group <i>group-name</i> neighbor <i>neighbor-name</i>],</code><br><code>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a>],</code><br><code>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a> group <i>group-name</i>],</code><br><code>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">rip</a> group <i>group-name</i> neighbor</code><br><code>    <i>neighbor-name</i>]</code> |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 7.6.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.  |
| <b>Description</b>              | Configure the interval at which routes learned by RIP are sent to neighbors. This timer controls the interval between routing updates. This timer is set to 30 seconds, by default, with a small random amount of time added when the timer is reset. This added time prevents congestion that can happen if all routing devices update their neighbors simultaneously.   |
| <b>Options</b>                  | <b>seconds</b> —Estimated time to wait before making updates to the routing table.<br><b>Range:</b> 10 through 60 seconds<br><b>Default:</b> 30 seconds   |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.   |

## CHAPTER 52

# Administration

- [Routine Monitoring on page 4399](#)
- [RIP Operational Commands on page 4399](#)

## Routine Monitoring

---

- [Monitoring RIP Routing Information on page 4399](#)

### Monitoring RIP Routing Information

**Purpose** Use the monitoring functionality to monitor RIP routing on routing devices.

**Action** To view RIP routing information in the CLI, enter the following CLI commands:

- **show rip statistics**
- **show rip neighbor**

**Related Documentation**

- [show rip neighbor on page 4404](#)
- [show rip statistics on page 4406](#)

## RIP Operational Commands

---

- [clear rip general-statistics](#)
- [clear rip statistics](#)
- [show rip general-statistics](#)
- [show rip neighbor](#)

## MPLS Overview

You can configure Multiprotocol Label Switching (MPLS) to increase transport efficiency in the network. MPLS services can be used to connect various sites to a backbone network and to ensure better performance for low-latency applications such as voice over IP (VoIP) and other business-critical functions.

MPLS has the following advantages over conventional packet forwarding:

- Packets arriving on different ports can be assigned different labels.
- A packet arriving at a particular provider edge (PE) switch can be assigned a label that is different from that of the same packet entering the network at a different PE switch. As a result, forwarding decisions that depend on the ingress PE switch can be easily made.
- Sometimes it is desirable to force a packet to follow a particular route that is explicitly chosen at or before the time the packet enters the network, rather than letting it follow the route chosen by the normal dynamic routing algorithm as the packet travels through the network. In MPLS, a label can be used to represent the route so that the packet need not carry the identity of the explicit route.

## Understanding MPLS Components

MPLS devices include a number of components. While some components are required for all MPLS applications, others might not be, depending on the specific application.

This topic includes:

- [Provider Edge Switches on page 4412](#)
- [Provider Switch on page 4413](#)
- [Components Required for All Switches in the MPLS Network on page 4413](#)

### Provider Edge Switches

---

To implement MPLS on a network, you must configure two provider edge (PE) switches—that is, an ingress PE switch and an egress PE switch. In addition, you must configure one or more provider switches as transit switches within the network to support the forwarding of MPLS packets.

The ingress PE switch (the entry point to the MPLS tunnel) receives a packet, analyzes it, and pushes an MPLS label onto it. This label places the packet in a forwarding equivalence class (FEC) and determines its handling and destination through the MPLS tunnel. The egress PE switch (the exit point from the MPLS tunnel) pops the MPLS label off the outgoing packet.

Within an MPLS tunnel, the network traffic is bidirectional. Therefore, each PE switch can be configured to be both an ingress switch and an egress switch, depending on the direction of the traffic.

The following MPLS components are configured on the PE switches but not on the provider switches:

- [MPLS Protocol and Label-Switched Paths on page 4412](#)
- [IP Over MPLS for Customer Edge Interfaces on page 4412](#)
- [BGP Layer 3 VPN Configuration on page 4413](#)
- [Routing Instances for Layer 3 VPN on page 4413](#)

#### ***MPLS Protocol and Label-Switched Paths***

Each PE switch must be configured to support the MPLS protocol. You must also configure label-switched paths (LSPs) at the **[edit protocols mpls]** hierarchy level.

#### ***IP Over MPLS for Customer Edge Interfaces***

You can configure the customer edge interfaces of the PE switches for IP over MPLS using a Layer 3 interface and a static route from the ingress PE switch to the egress PE switch. See [“Configuring MPLS on Provider Edge Switches” on page 4468](#).

### **BGP Layer 3 VPN Configuration**

If you are implementing a Layer 3 virtual private network (VPN), you must configure the BGP routing protocol on the PE switches.

### **Routing Instances for Layer 3 VPN**

If you are implementing a Layer 3 VPN, you must configure a routing instance. A routing instance is a collection of routing tables, interfaces, and routing protocol parameters. The set of interfaces belongs to the routing tables, and the routing protocol parameters control the information in the routing tables.

QFX Series and EX4600 devices support VPN routing and forwarding (VRF) routing instances for Layer 3 VPNs.

Each routing instance has a unique name and a corresponding IP unicast table. For example, if you configure a routing instance with the name **my-instance**, its corresponding IP unicast table will be **my-instance.inet.0**. All routes for **my-instance** are installed in **my-instance.inet.0**.

### **Provider Switch**

You must configure one or more provider switches as transit switches within the network to support the forwarding of MPLS packets. You can add provider switches without changing the configuration of the PE switches.

A provider switch does not analyze packets. It refers to an MPLS label forwarding table and swaps one label for another. The new label determines the next hop along the MPLS tunnel. A provider switch cannot perform push or pop operations.

### **Components Required for All Switches in the MPLS Network**

The following MPLS components are configured on both the PE switches and the provider switches:

- [Interior Gateway Protocol on page 4413](#)
- [MPLS Protocol on page 4414](#)
- [RSVP on page 4414](#)
- [Family mpls on page 4414](#)

### **Interior Gateway Protocol**

MPLS works in coordination with OSPF as the interior gateway protocol (IGP). Therefore, you must configure OSPF as the IGP on the loopback interface and CE-facing interfaces of both the PE switches and the provider switches.

The CE-facing interfaces can be either Gigabit Ethernet or 10-Gigabit Ethernet interfaces, and they can be configured as either individual interfaces or as aggregated Ethernet interfaces.

**NOTE:** The CE-facing interfaces cannot be configured with VLAN tagging or a VLAN ID. When you configure them to belong to family mpls, they are removed from the default VLAN if they were members of that VLAN. They operate as an exclusive tunnel for MPLS traffic.

### **MPLS Protocol**

You must enable the MPLS protocol on all switches that participate in the MPLS network and apply it to the core interfaces of both the PE and provider switches. You do not need to apply it to the loopback interface because the MPLS protocol uses the framework established by the RSVP signaling protocol to create LSPs. On the PE switches, the configuration of the MPLS protocol must also include the definition of an LSP.

### **RSVP**

RSVP is a signaling protocol that allocates and distributes labels throughout an MPLS network. RSVP sets up unidirectional paths between the ingress PE switch and the egress PE switch. RSVP makes the LSPs dynamic; it can detect topology changes and outages and establish new LSPs to allow traffic to move around a failure.

You must enable RSVP and apply it to the loopback interface and the core interface of both the PE and provider switches. The path message contains the configured information about the resources required for the LSP to be established.

When the egress PE switch receives the path message, it sends a reservation message back to the ingress PE switch. This reservation message is passed along from switch to switch along the same path as the original path message. Once the ingress PE switch receives this reservation message, an RSVP path is established.

The established LSP stays active as long as the RSVP session remains active. RSVP continues activity through the transmissions and responses to RSVP path and reservation messages. If the messages stop for three minutes, the RSVP session terminates and the LSP is lost.

RSVP runs as a separate software process in Junos OS and is not in the packet-forwarding path.

### **Family mpls**

You must configure the core interfaces used for MPLS traffic to belong to **family mpls**.

**NOTE:** You can enable **family mpls** on either individual interfaces or on aggregated Ethernet interfaces. You cannot enable it on tagged VLAN interfaces.

## Understanding MPLS Label Operations

In the traditional packet-forwarding paradigm, as a packet travels from one switch to the next, an independent forwarding decision is made at each hop. The IP network header is analyzed and the next hop is chosen based on this analysis and on the information in the routing table. In an MPLS environment, the analysis of the packet header is made only once, when a packet enters the MPLS tunnel (that is, the path used for MPLS traffic).

When an IP packet enters a label-switched path (LSP), the ingress provider edge (PE) switch examines the packet and assigns it a label based on its destination, placing the label in the packet's header. The label transforms the packet from one that is forwarded based on its IP routing information to one that is forwarded based on information associated with the label. The packet is then forwarded to the next provider switch in the LSP. This switch and all subsequent switches in the LSP do not examine any of the IP routing information in the labeled packet. Rather, they use the label to look up information in their label forwarding table. They then replace the old label with a new label and forward the packet to the next switch in the path. When the packet reaches the egress PE switch, the label is removed, and the packet again becomes a native IP packet and is forwarded based on its IP routing information.

This topic describes:

- [MPLS Label-Switched Paths and MPLS Labels on page 4415](#)
- [Reserved Labels on page 4416](#)
- [MPLS Label Operations on page 4416](#)
- [Penultimate-Hop Popping and Ultimate-Hop Popping on page 4418](#)

### MPLS Label-Switched Paths and MPLS Labels

When a packet enters the MPLS network, it is assigned to an LSP. Each LSP is identified by a label, which is a short (20-bit), fixed-length value at the front of the MPLS label (32 bits). Labels are used as lookup indexes for the label forwarding table. For each label, this table stores forwarding information. Because no additional parsing or lookup is done on the encapsulated packet, MPLS supports the transmission of any other protocols within the packet payload.

[Figure 140 on page 4416](#) shows the encoding of a single label. The encoding appears after data link layer headers, but before any network layer header.

Figure 140: Label Encoding

g040575

### Reserved Labels

Labels range from 0 through 1,048,575. Labels 0 through 999,999 are for internal use.

Some of the reserved labels (in the range 0 through 15) have well-defined meanings. The following reserved labels are used by QFX Series and EX4600 devices:

- 0, IPv4 Explicit Null label—This value is valid only when it is the sole label entry (no label stacking). It indicates that the label must be popped on receipt. Forwarding continues based on the IP version 4 (IPv4) packet.
- 1, Router Alert label—When a packet is received with a top label value of 1, it is delivered to the local software module for processing.
- 3, Implicit Null label—This label is used in the signaling protocol (RSVP) only to request label popping by the downstream switch. It never actually appears in the encapsulation. Labels with a value of 3 must not be used in the data packet as real labels. No payload type (IPv4 or IPv6) is implied with this label.

### MPLS Label Operations

QFX Series and EX4600 devices support the following MPLS label operations:

- Push
- Pop
- Swap

**NOTE:** There is a limit with regard to the number of labels that QFX and EX4600 devices can affix (push operations) to the label stack or remove (pop operations) from the label stack.

- For Push operations—As many as three labels are supported.
- For Pop operations—As many as two labels are supported.

The push operation affixes a new label to the top of the IP packet. For IPv4 packets, the new label is the first label. The time to live (TTL) field value in the packet header is derived from the IP packet header. The push operation cannot be applied to a packet that already has an MPLS label.

The pop operation removes a label from the beginning of the packet. Once the label is removed, the TTL is copied from the label into the IP packet header, and the underlying IP packet is forwarded as a native IP packet.

The swap operation removes an existing MPLS label from an IP packet and replaces it with a new MPLS label, based on the following:

- Incoming interface
- Label
- Label forwarding table

Figure 141 on page 4417 shows an IP packet without a label arriving on the customer edge interface (ge-0/0/1) of the ingress PE switch. The ingress PE switch examines the packet and identifies that packet's destination as the egress PE switch. The ingress PE switch applies label 100 to the packet and sends the MPLS packet to its outgoing MPLS core interface (ge-0/0/5). The MPLS packet is transmitted on the MPLS tunnel through the provider switch, where it arrives at interface ge-0/0/5 with label 100. The provider switch swaps label 100 with label 200 and forwards the MPLS packet through its core interface (ge-0/0/7) to the next hop on the tunnel, which is the egress PE switch. The egress PE switch receives the MPLS packet through its core interface (ge-0/0/7), removes the MPLS label, and sends the IP packet out of its customer edge interface (ge-0/0/1) to a destination that is beyond the tunnel.

**Figure 141: MPLS Label Swapping**

Figure 141 on page 4417 shows the path of a packet as it passes in one direction from the ingress PE switch to the egress PE switch. However, the MPLS configuration also allows traffic to travel in the reverse direction. Thus, each PE switch operates as both an ingress switch and an egress switch.

### Penultimate-Hop Popping and Ultimate-Hop Popping

The switches enable penultimate-hop popping (PHP) by default with IP over MPLS configurations. With PHP, the penultimate provider switch is responsible for popping the MPLS label and forwarding the traffic to the egress PE switch. The egress PE switch then performs an IP route lookup and forwards the traffic. This reduces the processing load on the egress PE switch, because it is not responsible for popping the MPLS label.

- The default advertised label is label 3 (Implicit Null label). If label 3 is advertised, the penultimate-hop switch removes the label and sends the packet to the egress PE switch.
- If ultimate-hop popping is enabled, label 0 (IPv4 Explicit Null label) is advertised and the egress PE switch of the LSP removes the label.

## Understanding CoS MPLS EXP Classifiers and Rewrite Rules

You can use class of service (CoS) within MPLS networks to prioritize certain types of traffic during periods of congestion by applying packet classifiers and rewrite rules to the MPLS traffic. (For information about DSCP and IEEE 802.1p classifiers and general information about classifiers, see [“Understanding CoS Classifiers” on page 5810](#). For information about DSCP and IEEE 802.1p rewrite rules, see [“Understanding CoS Rewrite Rules” on page 5914](#).)

When a packet enters a customer-edge interface on the ingress provider edge (PE) switch, the switch associates the packet with a particular CoS servicing level before placing the packet onto the label-switched path (LSP). The switches within the LSP utilize the CoS value set at the ingress PE switch. The CoS value that was embedded in the classifier is translated and encoded in the MPLS header by means of the experimental (EXP) bits.

EXP classifiers map incoming MPLS packets to a forwarding class and a loss priority, and assign MPLS packets to output queues based on the forwarding class mapping. EXP classifiers are behavior aggregate (BA) classifiers.

EXP rewrite rules change (rewrite) the CoS value of the EXP bits in outgoing packets on the egress queues of the switch so that the new (rewritten) value matches the policies of a targeted peer. Policy matching allows the downstream routing platform or switch in a neighboring network to classify each packet into the appropriate service group.

**NOTE:** There is no default EXP classifier. There is no default EXP rewrite rule. If you want to classify incoming MPLS packets using the EXP bits, you must configure a global EXP classifier. If you want to rewrite the EXP bit value at the egress interface, you must configure EXP rewrite rules and apply them to logical interfaces.

EXP classifiers and rewrite rules are applied only to interfaces that are configured as **family mpls** (for example, set interfaces xe-0/0/35 unit 0 family mpls.)

This topic includes:

- [EXP Classifiers on page 4419](#)
- [EXP Rewrite Rules on page 4420](#)
- [Schedulers on page 4421](#)

### EXP Classifiers

Unlike DSCP and IEEE 802.1p BA classifiers, EXP classifiers are global to the switch and apply to all switch interfaces that are configured as **family mpls**. When you configure and apply an EXP classifier, MPLS traffic on all **family mpls** interfaces uses the EXP classifier, even on interfaces that also have a fixed classifier. If an interface has both an EXP classifier and a fixed classifier, the EXP classifier is applied to MPLS traffic and the fixed classifier is applied to all other traffic.

Also unlike DSCP and IEEE 802.1p BA classifiers, there is no default EXP classifier. If you want to classify MPLS traffic based on the EXP bits, you must explicitly configure an EXP classifier and apply it to the switch interfaces. Each EXP classifier has eight entries that correspond to the eight EXP CoS values (0 through 7, which correspond to bits 000 through 111).

You can configure as many EXP classifiers as you want. However, the switch uses only one MPLS EXP classifier as a global classifier on all interfaces. After you configure an MPLS EXP classifier, you can configure it as the global EXP classifier by including the EXP classifier in the **[edit class-of-service system-defaults classifiers exp]** hierarchy. All switch interfaces use the global EXP classifier to classify MPLS traffic.

Only one EXP classifier can be configured as the global EXP classifier at any time. If you want to change the global EXP classifier, delete the global EXP classifier configuration (use the **user@switch# delete class-of-service system-defaults classifiers exp** configuration statement), then configure the new global EXP classifier.

If an EXP classifier is not configured, then if a fixed classifier is applied to the interface, the MPLS traffic uses the fixed classifier. If no EXP classifier and no fixed classifier is applied to the interface, MPLS traffic is treated as best-effort traffic. DSCP classifiers are not applied to MPLS traffic.

Because the EXP classifier is global, you cannot configure some ports to use a fixed IEEE 802.1p classifier for MPLS traffic on some interfaces and the global EXP classifier for MPLS traffic on other interfaces. When you configure a global EXP classifier, all MPLS traffic on all interfaces uses the EXP classifier.

**NOTE:** The switch uses only the outermost label of incoming EXP packets for classification.

---

**NOTE:** MPLS packets with 802.1Q tags are not supported.

---

### EXP Rewrite Rules

---

As MPLS packets enter or exit a network, edge switches might be required to alter the class-of-service (CoS) settings of the packets. EXP rewrite rules set the value of the EXP CoS bits within the header of the outgoing MPLS packet on **family mpls** interfaces. Each rewrite rule reads the current forwarding class and loss priority associated with the packet, locates the chosen CoS value from a table, and writes that CoS value into the packet header, replacing the old CoS value. EXP rewrite rules apply only to MPLS traffic.

EXP rewrite rules apply only to logical interfaces. You cannot apply EXP rewrite rules to physical interfaces.

There are no default EXP rewrite rules. If you want to rewrite the EXP value in MPLS packets, you must configure EXP rewrite rules and apply them to logical interfaces. If no rewrite rules are applied, all MPLS labels that are pushed have a value of zero (0). The EXP value remains unchanged on MPLS labels that are swapped.

You can configure as many EXP rewrite rules as you want, but you can only apply 16 EXP rewrite rules at any time on the switch. On a given logical interface, all pushed MPLS labels have the same EXP rewrite rule applied to them. You can apply different EXP rewrite rules to different logical interfaces on the same physical interface.

You can apply an EXP rewrite rule to an interface that has a DSCP, DSCP IPv6, or IEEE 802.1p rewrite rule. Only MPLS traffic uses the EXP rewrite rule. MPLS traffic does not use DSCP or DSCP IPv6 rewrite rules.

If the switch is performing penultimate hop popping (PHP), EXP rewrite rules do not take effect. If both an EXP classifier and an EXP rewrite rule are configured on the switch, then the EXP value from the last popped label is copied into the inner label. If either an EXP classifier or an EXP rewrite rule (but not both) is configured on the switch, then the inner label EXP value is sent unchanged.

**NOTE:** On each physical interface, either all forwarding classes that are being used on the interface must have rewrite rules configured or no forwarding classes that are being used on the interface can have rewrite rules configured. On any physical port, do not mix forwarding classes with rewrite rules and forwarding classes without rewrite rules.

## Schedulers

The schedulers for using CoS with MPLS are the same as for the other CoS configurations on the switch. Default schedulers are provided only for the best-effort, fcoe, no-loss, and network-control forwarding classes. If you configure a custom forwarding class for MPLS traffic, you need to configure a scheduler to support that forwarding class and provide bandwidth to that forwarding class. See “[Understanding CoS Output Queue Schedulers](#)” on page 5868 and “[Example: Configuring Queue Schedulers](#)” on page 6081 for more information.

## Understanding Using MPLS-Based Layer 3 VPNs

On the QFX Series and on EX4600, you can use MPLS-based Layer 3 virtual private networks (VPNs) to securely connect geographically diverse sites across an MPLS network. MPLS services can be used to connect various sites to a backbone network and to ensure better performance for low-latency applications such as voice over IP (VoIP) and other business-critical functions.

A VPN uses a public telecommunications infrastructure, such as the Internet, to provide remote offices or individual users with secure access to their organization's network. VPNs are designed to provide the same level of performance and security as privately owned or leased networks but without the attendant costs.

This topic describes:

- [MPLS-Based Layer 3 VPNs on page 4422](#)

---

### MPLS-Based Layer 3 VPNs

---

In Junos OS, Layer 3 VPNs are based on RFC 4364, [BGP/MPLS IP Virtual Private Networks](#). RFC 4364 defines a mechanism by which service providers can use their IP backbones to provide VPN services to their customers. A Layer 3 VPN is a set of sites that share common routing information and whose connectivity is controlled by a collection of policies. The sites that make up a Layer 3 VPN are connected over a provider's existing public Internet backbone.

Customer networks, because they are private, can use either public or private addresses, as defined in RFC 1918, [Address Allocation for Private Internets](#). When customer networks that use private addresses connect to the public Internet infrastructure, the private addresses might overlap with the same private addresses used by other network users. BGP/MPLS VPNs solve this problem by adding a VPN identifier prefix to each address from a particular VPN site, thereby creating an address that is unique both within the VPN and on the public Internet. In addition, each VPN has its own VPN-specific routing table that contains the routing information for that VPN only. Two different VPNs can use overlapping addresses. Each route within a VPN is assigned an MPLS label (for example, MPLS-ARCH, MPLS-BGP, or MPLS-ENCAPS). When BGP distributes a VPN route, it also distributes an MPLS label for that route. Before a customer data packet travels across the service provider's backbone, it is encapsulated along with the MPLS label that corresponds to the route within the customer's VPN that is the best match based on the packet's destination address. This MPLS packet is further encapsulated with another MPLS label or with an IP, so that it gets tunneled across the backbone to the egress provider edge (PE) switch. Thus, the backbone core switches do not need to know the VPN routes.

QFX5100 switches also support interprovider VPNs, and carrier-of-carriers VPNs. For more information, see *Interprovider and Carrier-of-Carriers VPNs*

- [Supported MPLS Scaling Values on page 4426](#)

### MPLS Feature Support on the QFX Series and EX4600 Switch Overview

This topic describes the major MPLS features that are supported and not supported on the QFX Series and on the EX4600 switch..

**NOTE:** The command-line interface (CLI) on QFX Series devices and on the EX4600 switch displays even the MPLS related configuration statements that are not supported. However, configuring the unsupported statements on a device will have no effect on the operation of the device. See the following topics for the list of supported MPLS related configuration statements on QFX Series devices and on the EX4600 switch:

- [“\[edit protocols mpls\] Hierarchy Level” on page 4509](#) for the list of supported configuration statements at the [edit protocols mpls] hierarchy level
- [“\[edit protocols rsvp\] Hierarchy Level” on page 4513](#) for the list of supported configuration statements at the [edit protocols rsvp] hierarchy level

- [Supported MPLS Features on page 4423](#)
- [Unsupported MPLS Features on page 4425](#)

### Supported MPLS Features

[Table 340 on page 4423](#) lists the major MPLS features that are supported on the QFX Series and on the EX4600 switch, and the Juniper Networks Junos operating system (Junos OS) release in which they were introduced.

**Table 340: MPLS Features on the QFX Series and on the EX4600 Switch**

| Feature  | QFX Series           | EX4600                        |
|--|----------------------|-------------------------------|
| QFX standalone switch or EX4600 switch as an MPLS provider edge (PE) switch or provider switch | Junos OS 12.2X50-D10 | Junos OS 13.2X51-D25          |
| QFX standalone switch or EX4600 switch as a route reflector for BGP labeled routes             | Junos OS 12.2X50-D10 | Junos OS 13.2X51-D25          |
| BGP labeled unicast  | Junos OS 12.2X50-D10 | Junos OS Junos OS 13.2X51-D25 |
| Carrier-over-carrier BGP inter- autonomous systems (AS) L3VPN implementations                  | Junos OS 14.1X53-D10 | Junos OS 14.1X53-D10          |

Table 340: MPLS Features on the QFX Series and on the EX4600 Switch (*continued*)

### Unsupported MPLS Features

The following major MPLS features are not supported on the QFX Series or on the EX4600 switch:

- Auto-policer
- Bidirectional Forwarding Detection (BFD) for MPLS LSPs
- ECMP for incoming MPLS packets
- L2 circuit-based local switching
- Link coloring using administrative groups
- MPLS-based circuit cross-connects (CCC)
- MPLS-based Layer 2 virtual private networks (VPNs)
- MPLS over routed VLAN interfaces (RVIs) and Layer 3 subinterfaces
- Point-to-multipoint LSP support
- Port mirroring on MPLS interfaces
- Virtual Private LAN Service (VPLS)

## LDP Introduction

The Label Distribution Protocol (LDP) is a protocol for distributing labels in non-traffic-engineered applications. LDP allows routers to establish label-switched paths (LSPs) through a network by mapping network-layer routing information directly to data link layer-switched paths.

These LSPs might have an endpoint at a directly attached neighbor (comparable to IP hop-by-hop forwarding), or at a network egress node, enabling switching through all intermediary nodes. LSPs established by LDP can also traverse traffic-engineered LSPs created by RSVP.

LDP associates a forwarding equivalence class (FEC) with each LSP it creates. The FEC associated with an LSP specifies which packets are mapped to that LSP. LSPs are extended through a network as each router chooses the label advertised by the next hop for the FEC and splices it to the label it advertises to all other routers. This process forms a tree of LSPs that converge on the egress router.

## Junos OS LDP Protocol Implementation

The Junos OS implementation of LDP supports LDP version 1. The Junos OS supports a simple mechanism for tunneling between routers in an interior gateway protocol (IGP), to eliminate the required distribution of external routes within the core. The Junos OS allows an MPLS tunnel next hop to all egress routers in the network, with only an IGP running in the core to distribute routes to egress routers. Edge routers run BGP but do not distribute external routes to the core. Instead, the recursive route lookup at the edge resolves to an LSP switched to the egress router. No external routes are necessary on the transit LDP routers.

## LDP Operation

You must configure LDP for each interface on which you want LDP to run. LDP creates LSP trees rooted at each egress router for the router ID address that is the subsequent BGP next hop. The ingress point is at every router running LDP. This process provides an inet.3 route to every egress router. If BGP is running, it will attempt to resolve next hops by using the inet.3 table first, which binds most, if not all, of the BGP routes to MPLS tunnel next hops.

Two adjacent routers running LDP become neighbors. If the two routers are connected by more than one interface, they become neighbors on each interface. When LDP routers become neighbors, they establish an LDP session to exchange label information. If per-router labels are in use on both routers, only one LDP session is established between them, even if they are neighbors on multiple interfaces. For this reason, an LDP session is not related to a particular interface.

LDP operates in conjunction with a unicast routing protocol. LDP installs LSPs only when both LDP and the routing protocol are enabled. For this reason, you must enable both LDP and the routing protocol on the same set of interfaces. If this is not done, LSPs might not be established between each egress router and all ingress routers, which might result in loss of BGP-routed traffic.

You can apply policy filters to labels received from and distributed to other routers through LDP. Policy filters provide you with a mechanism to control the establishment of LSPs.

For LDP to run on an interface, MPLS must be enabled on a logical interface on that interface. For more information, see the *Logical Interfaces*.

**Related Documentation**

- [Logical Interfaces](#)

## Tunneling LDP LSPs in RSVP LSPs

You can tunnel LDP LSPs over RSVP LSPs. The following sections describe how tunneling of LDP LSPs in RSVP LSPs works:

- [Tunneling LDP LSPs in RSVP LSPs Overview on page 4428](#)
- [Label Operations on page 4428](#)

## Tunneling LDP LSPs in RSVP LSPs Overview

If you are using RSVP for traffic engineering, you can run LDP simultaneously to eliminate the distribution of external routes in the core. The LSPs established by LDP are tunneled through the LSPs established by RSVP. LDP effectively treats the traffic-engineered LSPs as single hops.

When you configure the router to run LDP across RSVP-established LSPs, LDP automatically establishes sessions with the router at the other end of the LSP. LDP control packets are routed hop-by-hop, rather than carried through the LSP. This routing allows you to use simplex (one-way) traffic-engineered LSPs. Traffic in the opposite direction flows through LDP-established LSPs that follow unicast routing rather than through traffic-engineered tunnels.

If you configure LDP over RSVP LSPs, you can still configure multiple OSPF areas and IS-IS levels in the traffic engineered core and in the surrounding LDP cloud.

## Label Operations

[Figure 142 on page 4429](#) depicts an LDP LSP being tunneled through an RSVP LSP. (For definitions of label operations, see *Label Description*.) The shaded inner oval represents the RSVP domain, whereas the outer oval depicts the LDP domain. RSVP establishes an

LSP through routers B, C, D, and E, with the sequence of labels L3, L4. LDP establishes an LSP through Routers A, B, E, F, and G, with the sequence of labels L1, L2, L5. LDP views the RSVP LSP between Routers B and E as a single hop.

When the packet arrives at Router A, it enters the LSP established by LDP, and a label (L1) is pushed onto the packet. When the packet arrives at Router B, the label (L1) is swapped with another label (L2). Because the packet is entering the traffic-engineered LSP established by RSVP, a second label (L3) is pushed onto the packet.

This outer label (L3) is swapped with a new label (L4) at the intermediate router (C) within the RSVP LSP tunnel, and when the penultimate router (D) is reached, the top label is popped. Router E swaps the label (L2) with a new label (L5), and the penultimate router for the LDP-established LSP (F) pops the last label.

Figure 142: Swap and Push When LDP LSPs Are Tunneled Through RSVP LSPs

Figure 143 on page 4429 depicts a double push label operation (L1L2). A double push label operation is used when the ingress router (A) for both the LDP LSP and the RSVP LSP tunneled through it is the same device. Note that Router D is the penultimate hop for the LDP-established LSP, so L2 is popped from the packet by Router D.

Figure 143: Double Push When LDP LSPs Are Tunneled Through RSVP LSPs

## LDP Message Types

LDP uses the message types described in the following sections to establish and remove mappings and to report errors. All LDP messages have a common structure that uses a type, length, and value (TLV) encoding scheme.

- [Discovery Messages on page 4430](#)
- [Session Messages on page 4430](#)
- [Advertisement Messages on page 4430](#)
- [Notification Messages on page 4431](#)

## Discovery Messages

Discovery messages announce and maintain the presence of a router in a network. Routers indicate their presence in a network by sending hello messages periodically. Hello messages are transmitted as UDP packets to the LDP port at the group multicast address for all routers on the subnet.

LDP uses the following discovery procedures:

- Basic discovery—A router periodically sends LDP link hello messages through an interface. LDP link hello messages are sent as UDP packets addressed to the LDP discovery port. Receipt of an LDP link hello message on an interface identifies an adjacency with the LDP peer router.
- Extended discovery—LDP sessions between routers not directly connected are supported by LDP extended discovery. A router periodically sends LDP targeted hello messages to a specific address. Targeted hello messages are sent as UDP packets addressed to the LDP discovery port at the specific address. The targeted router decides whether to respond to or ignore the targeted hello message. A targeted router that chooses to respond does so by periodically sending targeted hello messages to the initiating router.

## Session Messages

Session messages establish, maintain, and terminate sessions between LDP peers. When a router establishes a session with another router learned through the hello message, it uses the LDP initialization procedure over TCP transport. When the initialization procedure is completed successfully, the two routers are LDP peers and can exchange advertisement messages.

## Advertisement Messages

Advertisement messages create, change, and delete label mappings for forwarding equivalence classes (FECs). Requesting a label or advertising a label mapping to a peer is a decision made by the local router. In general, the router requests a label mapping from a neighboring router when it needs one and advertises a label mapping to a neighboring router when it wants the neighbor to use a label.

## Notification Messages

Notification messages provide advisory information and signal error information. LDP sends notification messages to report errors and other events of interest. There are two kinds of LDP notification messages:

- Error notifications, which signal fatal errors. If a router receives an error notification from a peer for an LDP session, it terminates the LDP session by closing the TCP transport connection for the session and discarding all label mappings learned through the session.
- Advisory notifications, which pass information to a router about the LDP session or the status of some previous message received from the peer.

## LDP Session Protection

LDP session protection is based on the LDP targeted hello functionality defined in RFC 5036, *LDP Specification*, and is supported by the Junos OS as well as the LDP implementations of most other vendors. It involves sending unicast User Datagram Protocol (UDP) hello packets to a remote neighbor address and receiving similar packets from the neighbor router.

If you configure LDP session protection on a router, the LDP sessions are maintained as follows:

1. An LDP session is established between a router and a remote neighboring router.
2. If all of the direct links between the routers go down, the LDP session remains up so long as there is IP connectivity between the routers based on another connection over the network.
3. When the direct link between the routers is reestablished, the LDP session is not restarted. The routers simply exchange LDP hellos with each other over the direct link. They can then begin forwarding LDP-signaled MPLS packets using the original LDP session.

By default, LDP targeted hellos are set to the remote neighbor so long as the LDP session is up, even if there are no more link neighbors to that router. You can also specify the duration you would like to maintain the remote neighbor connection in the absence of link neighbors. When the last link neighbor for a session goes down, the Junos OS starts an LDP session protection timer. If this timer expires before any of the link neighbors come back up, the remote neighbor connection is taken down and the LDP session is terminated. If you configure a different value for the timer while it is currently running, the Junos OS updates the timer to the specified value without disrupting the current state of the LDP session.

## LDP Graceful Restart

LDP graceful restart enables a router whose LDP control plane is undergoing a restart to continue to forward traffic while recovering its state from neighboring routers. It also enables a router on which helper mode is enabled to assist a neighboring router that is attempting to restart LDP.

During session initialization, a router advertises its ability to perform LDP graceful restart or to take advantage of a neighbor performing LDP graceful restart by sending the graceful restart TLV. This TLV contains two fields relevant to LDP graceful restart: the reconnect time and the recovery time. The values of the reconnect and recovery times indicate the graceful restart capabilities supported by the router.

When a router discovers that a neighboring router is restarting, it waits until the end of the recovery time before attempting to reconnect. The recovery time is the length of time a router waits for LDP to restart gracefully. The recovery time period begins when an initialization message is sent or received. This time period is also typically the length of time that a neighboring router maintains its information about the restarting router, allowing it to continue to forward traffic.

You can configure LDP graceful restart in both the master instance for the LDP protocol and for a specific routing instance. You can disable graceful restart at the global level for all protocols, at the protocol level for LDP only, and on a specific routing instance. LDP graceful restart is disabled by default, because at the global level, graceful restart is disabled by default. However, helper mode (the ability to assist a neighboring router attempting a graceful restart) is enabled by default.

The following are some of the behaviors associated with LDP graceful restart:

- Outgoing labels are not maintained in restarts. New outgoing labels are allocated.
- When a router is restarting, no label-map messages are sent to neighbors that support graceful restart until the restarting router has stabilized (label-map messages are immediately sent to neighbors that do not support graceful restart). However, all other messages (keepalive, address-message, notification, and release) are sent as usual. Distributing these other messages prevents the router from distributing incomplete information.
- Helper mode and graceful restart are independent. You can disable graceful restart in the configuration, but still allow the router to cooperate with a neighbor attempting to restart gracefully.

# Configuration

## Configuration Guidelines

---

- [MPLS Configuration Guidelines on page 4433](#)

### MPLS Configuration Guidelines

When configuring MPLS on QFX Series devices or on EX4600, note that the number of IP prefixes supported depends on the specific platform being used. See the scale specifications in the data sheet of your device for additional information.

- We recommend the following:
  - If your ingress provider edge (PE) switch needs to support more than 8000 external IP prefixes, use a larger capacity device as an ingress PE switch.
  - If you use a switch as a route reflector for BGP labeled routes, use it as a dedicated route reflector (that is, the switch must not participate in managing data traffic).
  - If you use a switch as a PE switch or as a route reflector for BGP labeled routes, configure routing policies on the PE switch and the route reflector to filter external IP routes from the routing table.

The configuration example for a routing policy named `fib_policy` (at the **[edit policy-options]** and **[edit routing-options]** hierarchy levels) to filter BGP labeled routes from the `inet.0` routing table is given below:

```
user@switch# show policy-options
policy-statement fib_policy {
  from {
    protocol bgp;
    rib inet.0;
  }
}
```

```
        then reject;
    }

    user@switch# show routing-options
    forwarding-table {
        export fib_policy;
    }
```

- Packet fragmentation using the **allow-fragmentation** statement at the **[edit protocols mpls path-mtu]** hierarchy level is not supported on QFX Series devices or on the EX4600 switch. Therefore, you must ensure that the maximum transmission unit (MTU) values configured on every MPLS interface is sufficient to handle MPLS packets. The packets whose size exceeds the MTU value of an interface will be dropped.

## LDP Configuration Guidelines for QFX5100

- [Minimum LDP Configuration on page 4434](#)
- [Enabling and Disabling LDP on page 4435](#)
- [Enabling Strict Targeted Hello Messages for LDP on page 4435](#)
- [Filtering Inbound LDP Label Bindings on page 4435](#)
- [Filtering Outbound LDP Label Bindings on page 4437](#)
- [Specifying the Transport Address Used by LDP on page 4439](#)
- [Collecting LDP Statistics on page 4440](#)
- [Tracing LDP Protocol Traffic on page 4442](#)

### Minimum LDP Configuration

To enable LDP on a single interface, include the **ldp** statement and specify the interface using the **interface** statement. This is the minimum LDP configuration. All other LDP configuration statements are optional.

```
ldp {
    interface interface-name;
}
```

To enable LDP on all interfaces, specify **all** for *interface-name*.

For a list of hierarchy levels at which you can include these statements, see the statement summary sections.

## Enabling and Disabling LDP

LDP is routing-instance-aware. To enable LDP on a specific interface, include the following statements:

```
ldp {
  interface interface-name;
}
```

For a list of hierarchy levels at which you can include these statements, see the statement summary sections.

To enable LDP on all interfaces, specify **all** for *interface-name*.

If you have configured interface properties on a group of interfaces and want to disable LDP on one of the interfaces, include the **interface** statement with the **disable** option:

```
interface interface-name {
  disable;
}
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section.

## Enabling Strict Targeted Hello Messages for LDP

Use strict targeted hello messages to prevent LDP sessions from being established with remote neighbors that have not been specifically configured. If you configure the **strict-targeted-hellos** statement, an LDP peer does not respond to targeted hello messages coming from a source that is not one of its configured remote neighbors. Configured remote neighbors can include:

- Endpoints of RSVP tunnels for which LDP tunneling is configured
- Layer 2 circuit neighbors

If an unconfigured neighbor sends a hello message, the LDP peer ignores the message and logs an error (with the **error** trace flag) indicating the source. For example, if the LDP peer received a targeted hello from the Internet address 10.0.0.1 and no neighbor with this address is specifically configured, the following message is printed to the LDP log file:

```
LDP: Ignoring targeted hello from 10.0.0.1
```

To enable strict targeted hello messages, include the **strict-targeted-hellos** statement:

```
strict-targeted-hellos;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

## Filtering Inbound LDP Label Bindings

You can filter received LDP label bindings, applying policies to accept or deny bindings advertised by neighboring routers. To configure received-label filtering, include the **import** statement:

**import** [ *policy-names* ];

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

The named policy (configured at the **[edit policy-options]** hierarchy level) is applied to all label bindings received from all LDP neighbors. All filtering is done with **from** statements. [Table 342 on page 4436](#) lists the only **from** operators that apply to LDP received-label filtering.

**Table 342: from Operators That Apply to LDP Received-Label Filtering**

| from Operator       | Description  |
|---------------------|--|
| <b>interface</b>    | Matches on bindings received from a neighbor that is adjacent over the specified interface |
| <b>neighbor</b>     | Matches on bindings received from the specified LDP router ID                              |
| <b>next-hop</b>     | Matches on bindings received from a neighbor advertising the specified interface address   |
| <b>route-filter</b> | Matches on bindings with the specified prefix  |

If a binding is filtered, it still appears in the LDP database, but is not considered for installation as part of a label-switched path (LSP).

Generally, applying policies in LDP can be used only to block the establishment of LSPs, not to control their routing. This is because the path that an LSP follows is determined by unicast routing, and not by LDP. However, when there are multiple equal-cost paths to the destination through different neighbors, you can use LDP filtering to exclude some of the possible next hops from consideration. (Otherwise, LDP chooses one of the possible next hops at random.)

LDP sessions are not bound to interfaces or interface addresses. LDP advertises only per-router (not per-interface) labels; so if multiple parallel links exist between two routers, only one LDP session is established, and it is not bound to a single interface. When a router has multiple adjacencies to the same neighbor, take care to ensure that the filter does what is expected. (Generally, using **next-hop** and **interface** is not appropriate in this case.)

If a label has been filtered (meaning that it has been rejected by the policy and is not used to construct an LSP), it is marked as filtered in the database:

```
user@host> show ldp database
Input label database, 10.10.255.1:0-10.10.255.6:0
Label Prefix
3 10.10.255.6/32 (Filtered)
Output label database, 10.10.255.1:0-10.10.255.6:0
Label Prefix
3 10.10.255.1/32 (Filtered)
```

For more information about how to configure policies for LDP, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

### Examples: Filtering Inbound LDP Label Bindings

Accept only /32 prefixes from all neighbors:

```
[edit]
protocols {
  ldp {
    import only-32;
    ...
  }
}
policy-options {
  policy-statement only-32 {
    term first {
      from {
        route-filter 0.0.0.0/0 upto /31;
      }
      then reject;
    }
    then accept;
  }
}
```

Accept 131.108/16 or longer from router ID 10.10.255.2 and accept all prefixes from all other neighbors:

```
[edit]
protocols {
  ldp {
    import nosy-neighbor;
    ...
  }
}
policy-options {
  policy-statement nosy-neighbor {
    term first {
      from {
        neighbor 10.10.255.2;
        route-filter 131.108.0.0/16 orlonger accept;
        route-filter 0.0.0.0/0 orlonger reject;
      }
    }
    then accept;
  }
}
```

### Filtering Outbound LDP Label Bindings

You can configure export policies to filter LDP outbound labels. You can filter outbound label bindings by applying routing policies to block bindings from being advertised to neighboring routers. To configure outbound label filtering, include the **export** statement:

```
export [policy-name];
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

The named export policy (configured at the **[edit policy-options]** hierarchy level) is applied to all label bindings transmitted to all LDP neighbors. The only **from** operator that applies to LDP outbound label filtering is **route-filter**, which matches bindings with the specified prefix. The only **to** operators that apply to outbound label filtering are the operators in [Table 343 on page 4438](#).

**Table 343: to Operators for LDP Outbound-Label Filtering**

| to Operator      | Description  |
|------------------|--|
| <b>interface</b> | Matches on bindings sent to a neighbor that is adjacent over the specified interface |
| <b>neighbor</b>  | Matches on bindings sent to the specified LDP router ID                              |
| <b>next-hop</b>  | Matches on bindings sent to a neighbor advertising the specified interface address   |

If a binding is filtered, the binding is not advertised to the neighboring router, but it can be installed as part of an LSP on the local router. You can apply policies in LDP to block the establishment of LSPs, but not to control their routing. The path an LSP follows is determined by unicast routing, not by LDP.

LDP sessions are not bound to interfaces or interface addresses. LDP advertises only per-router (not per-interface) labels. If multiple parallel links exist between two routers, only one LDP session is established, and it is not bound to a single interface.

Do not use the **next-hop** and **interface** operators when a router has multiple adjacencies to the same neighbor.

Filtered labels are marked in the database:

```
user@host> show ldp database
Input label database, 10.10.255.1:0-10.10.255.3:0
Label Prefix
100007 10.10.255.2/32
3 10.10.255.3/32
Output label database, 10.10.255.1:0-10.10.255.3:0
Label Prefix
3 10.10.255.1/32
100001 10.10.255.6/32 (Filtered)
```

For more information about how to configure policies for LDP, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

### Examples: Filtering Outbound LDP Label Bindings

Block transmission of the route for **10.10.255.6/32** to any neighbors:

```
[edit protocols]
ldp {
  export block-one;
```

```

}
policy-options {
  policy-statement block-one {
    term first {
      from {
        route-filter 10.10.255.6/32 exact;
      }
      then reject;
    }
    then accept;
  }
}

```

Send only **131.108/16** or longer to router ID **10.10.255.2**, and send all prefixes to all other routers:

```

[edit protocols]
ldp {
  export limit-lsps;
}
policy-options {
  policy-statement limit-lsps {
    term allow-one {
      from {
        route-filter 131.108.0.0/16 orlonger;
      }
      to {
        neighbor 10.10.255.2;
      }
      then accept;
    }
    term block-the-rest {
      to {
        neighbor 10.10.255.2;
      }
      then reject;
    }
    then accept;
  }
}

```

## Specifying the Transport Address Used by LDP

Routers must first establish a TCP session between each other before they can establish an LDP session. The TCP session enables the routers to exchange the label advertisements needed for the LDP session. To establish the TCP session, each router must learn the other router's transport address. The transport address is an IP address used to identify the TCP session over which the LDP session will run.

To configure the LDP transport address, include the `transport-address` statement:

**transport-address** (router-id | interface);

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

If you specify the **router-id** option, the address of the router identifier is used as the transport address (unless otherwise configured, the router identifier is typically the same as the loopback address). If you specify the **interface** option, the interface address is used as the transport address for any LDP sessions to neighbors that can be reached over that interface. Note that the router identifier is used as the transport address by default.

You cannot specify the **interface** option when there are multiple parallel links to the same LDP neighbor, because the LDP specification requires that the same transport address be advertised on all interfaces to the same neighbor. If LDP detects multiple parallel links to the same neighbor, it disables interfaces to that neighbor one by one until the condition is cleared, either by disconnecting the neighbor on an interface or by specifying the **router-id** option.

## Collecting LDP Statistics

LDP traffic statistics show the volume of traffic that has passed through a particular FEC on a router.

When you configure the **traffic-statistics** statement at the **[edit protocols ldp]** hierarchy level, the LDP traffic statistics are gathered periodically and written to a file. You can configure how often statistics are collected (in seconds) by using the **interval** option. The default collection interval is 5 minutes. You must configure an LDP statistics file; otherwise, LDP traffic statistics are not gathered. If the LSP goes down, the LDP statistics are reset.

To collect LDP traffic statistics, include the **traffic-statistics** statement:

```
traffic-statistics {  
  file filename <files number> <size size> <world-readable | no-world-readable>;  
  interval interval;  
  no-penultimate-hop;  
}
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

This section includes the following topics:

- [LDP Statistics Output on page 4440](#)
- [Disabling LDP Statistics on the Penultimate-Hop Router on page 4441](#)
- [LDP Statistics Limitations on page 4442](#)

---

### LDP Statistics Output

The following sample output is from an LDP statistics file:

| FEC               | Type    | Packets | Bytes | Shared |
|-------------------|---------|---------|-------|--------|
| 10.255.350.448/32 | Transit | 0       | 0     | No     |
|                   | Ingress | 0       | 0     | No     |
| 10.255.350.450/32 | Transit | 0       | 0     | Yes    |
|                   | Ingress | 0       | 0     | No     |
| 10.255.350.451/32 | Transit | 0       | 0     | No     |

```

                Ingress      0      0      No
220.220.220.1/32 Transit      0      0      Yes
                Ingress      0      0      No
220.220.220.2/32 Transit      0      0      Yes
                Ingress      0      0      No
220.220.220.3/32 Transit      0      0      Yes
                Ingress      0      0      No
May 28 15:02:05, read 12 statistics in 00:00:00 seconds

```

The LDP statistics file includes the following columns of data:

- **read**—Number of bytes of data passed by the FEC since its LSP came up.
- **read**—FEC for which LDP traffic statistics are collected.
- **read**—Number of packets passed by the FEC since its LSP came up.
- **read**—This number (which appears next to the date and time) might differ from the actual number of the statistics displayed. Some of the statistics are summarized before being displayed.
- **Shared**—A **Yes** value indicates that several prefixes are bound to the same label (for example, when several prefixes are advertised with an egress policy). The LDP traffic statistics for this case apply to all the prefixes and should be treated as such.
- **Type**—Type of traffic originating from a router, either **Ingress** (originating from this router) or **Transit** (forwarded through this router).

### Disabling LDP Statistics on the Penultimate-Hop Router

Gathering LDP traffic statistics at the penultimate-hop router can consume excessive system resources, on next-hop routes in particular. This problem is exacerbated if you have configured the **deaggregate** statement in addition to the **traffic-statistics** statement. For routers reaching their limit of next-hop route usage, we recommend configuring the **no-penultimate-hop** option for the **traffic-statistics** statement:

```

traffic-statistics {
    no-penultimate-hop;
}

```

For a list of hierarchy levels at which you can configure the **traffic-statistics** statement, see the statement summary section for this statement.

**NOTE:** When you configure the **no-penultimate-hop** option, no statistics are available for the FECs that are the penultimate hop for this router.

Whenever you include or remove this option from the configuration, the LDP sessions are taken down and then restarted.

The following sample output is from an LDP statistics file showing routers on which the **no-penultimate-hop** option is configured:

```

FEC              Type      Packets      Bytes      Shared
10.255.245.218/32 Transit      0           0         No
                  Ingress      4          246         No

```

|                   |         |                     |
|-------------------|---------|---------------------|
| 10.255.245.221/32 | Transit | statistics disabled |
|                   | Ingress | statistics disabled |
| 13.1.1.0/24       | Transit | statistics disabled |
|                   | Ingress | statistics disabled |
| 13.1.3.0/24       | Transit | statistics disabled |
|                   | Ingress | statistics disabled |

---

### LDP Statistics Limitations

The following are issues related to collecting LDP statistics by configuring the **traffic-statistics** statement:

- You cannot clear the LDP statistics.
- If you shorten the specified interval, a new LDP statistics request is issued only if the statistics timer expires later than the new interval.
- A new LDP statistics collection operation cannot start until the previous one has finished. If the interval is short or if the number of LDP statistics is large, the time gap between the two statistics collections might be longer than the interval.

When an LSP goes down, the LDP statistics are reset.

## Tracing LDP Protocol Traffic

The following sections describe how to configure the trace options to examine LDP protocol traffic:

- [Tracing LDP Protocol Traffic at the Protocol and Routing Instance Levels on page 4442](#)
- [Tracing LDP Protocol Traffic Within FECs on page 4443](#)
- [Examples: Tracing LDP Protocol Traffic on page 4444](#)

---

### Tracing LDP Protocol Traffic at the Protocol and Routing Instance Levels

To trace LDP protocol traffic, you can specify options in the global **traceoptions** statement at the **[edit routing-options]** hierarchy level, and you can specify LDP-specific options by including the **traceoptions** statement:

```
traceoptions {  
    file filename <files number> <size size> <world-readable | no-world-readable>;  
    flag flag <flag-modifier> <disable>;  
}
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

Use the **file** statement to specify the name of the file that receives the output of the tracing operation. All files are placed in the directory `/var/log`. We recommend that you place LDP-tracing output in the file **ldp-log**.

The following trace flags display the operations associated with the sending and receiving of various LDP messages. Each can carry one or more of the following modifiers:

- **address**—Trace the operation of address and address withdrawal messages.
- **binding**—Trace label-binding operations.
- **error**—Trace error conditions.
- **event**—Trace protocol events.
- **initialization**—Trace the operation of initialization messages.
- **label**—Trace the operation of label request, label map, label withdrawal, and label release messages.
- **notification**—Trace the operation of notification messages.
- **packets**—Trace the operation of address, address withdrawal, initialization, label request, label map, label withdrawal, label release, notification, and periodic messages. This modifier is equivalent to setting the **address**, **initialization**, **label**, **notification**, and **periodic** modifiers.

You can also configure the **filter** flag modifier with the **match-on address** sub-option for the **packets** flag. This allows you to trace based on the source and destination addresses of the packets.

- **path**—Trace label-switched path operations.
- **path**—Trace label-switched path operations.
- **periodic**—Trace the operation of hello and keepalive messages.
- **route**—Trace the operation of route messages.
- **state**—Trace protocol state transitions.

### Tracing LDP Protocol Traffic Within FECs

LDP associates a forwarding equivalence class (FEC) with each LSP it creates. The FEC associated with an LSP specifies which packets are mapped to that LSP. LSPs are extended through a network as each router chooses the label advertised by the next hop for the FEC and splices it to the label it advertises to all other routers.

You can trace LDP protocol traffic within a specific FEC and filter LDP trace statements based on an FEC. This is useful when you want to trace or troubleshoot LDP protocol traffic associated with an FEC. The following trace flags are available for this purpose: **route**, **path**, and **binding**.

The following example illustrates how you might configure the LDP **traceoptions** statement to filter LDP trace statements based on an FEC:

```
[edit protocols ldp traceoptions]
set flag route filter match-on fec policy "filter-policy-for-ldp-fec";
```

This feature has the following limitations:

- The filtering capability is only available for FECs composed of IP version 4 (IPv4) prefixes.
- Layer 2 circuit FECs cannot be filtered.

- When you configure both route tracing and filtering, MPLS routes are not displayed (they are blocked by the filter).
- Filtering is determined by the policy and the configured value for the **match-on** option. When configuring the policy, be sure that the default behavior is always **reject**.
- The only **match-on** option is **fec**. Consequently, the only type of policy you should include is a route-filter policy.

---

### Examples: Tracing LDP Protocol Traffic

Trace LDP path messages in detail:

```
[edit]
protocols {
  ldp {
    traceoptions {
      file ldp size 10m files 5;
      flag path;
    }
  }
}
```

Trace all LDP outgoing messages:

```
[edit]
protocols {
  ldp {
    traceoptions {
      file ldp size 10m files 5;
      flag packets;
    }
  }
}
```

Trace all LDP error conditions:

```
[edit]
protocols {
  ldp {
    traceoptions {
      file ldp size 10m files 5;
      flag error;
    }
  }
}
```

Trace all LDP incoming messages and all label-binding operations:

```
[edit]
protocols {
  ldp {
    traceoptions {
      file ldp size 10m files 5 world-readable;
      flag packets receive;
      flag binding;
    }
  }
}
```

```

        interface all {
        }
    }
}

```

Trace LDP protocol traffic for an FEC associated with the LSP:

```

[edit]
protocols {
  ldp {
    traceoptions {
      flag route filter match-on fec policy filter-policy-for-ldp-fec;
    }
  }
}

```

## Configuration Examples

- [Example: Configuring MPLS-Based Layer 3 VPNs on page 4445](#)
- [Example: Tunneling IPv6 Traffic over MPLS IPv4 Networks on page 4454](#)
- [Example: Configuring LDP Downstream on Demand on page 4462](#)

### Example: Configuring MPLS-Based Layer 3 VPNs

You can implement an MPLS-based Layer 3 virtual private network (VPN) on QFX3500 switches to interconnect sites for customers who want the service provider to handle all the Layer 3 routing functions. To support an MPLS-based Layer 3 VPN, you need to add components of the Layer 3 VPN to the configuration of the two provider edge (PE) switches. You do not need to change the configuration of the provider switches.

This example shows how to configure an MPLS-based Layer 3 VPN spanning two corporate sites:

- [Requirements on page 4446](#)
- [Overview and Topology on page 4446](#)
- [Configuring the Local PE Switch on page 4449](#)
- [Configuring the Remote PE Switch on page 4451](#)

## Requirements

This example uses the following software and hardware components:

- Junos OS Release 12.3 or later for the QFX Series
- Three QFX3500 switches

Before you configure the Layer 3 VPN components, you must configure the basic components for an MPLS network:

- Configure two PE switches. See [“Configuring MPLS on Provider Edge Switches” on page 4468](#).
- Configure one or more provider switches. See [“Configuring MPLS on Provider Switches” on page 4471](#).

## Overview and Topology

Layer 3 VPNs allow customers to leverage the service provider’s technical expertise to ensure efficient site-to-site routing. The customer’s customer edge (CE) switch uses a routing protocol such as BGP or OSPF to communicate with the service provider’s provider edge (PE) switch to carry IP prefixes across the network. MPLS-based Layer 3 VPNs use only IP over MPLS; other protocol packets are not supported. This example includes two PE switches, PE1 and PE2.

In the basic MPLS configuration of the PE switches using IP over MPLS, the PE switches were configured to use OSPF as the routing protocol between the MPLS switches and RSVP as the signaling protocol. Traffic engineering was enabled. A label-switched path (LSP) was configured.

The following components must be added to the PE switches for an MPLS-based Layer 3 VPN:

- BGP group with **family inet-vpn unicast**
- Routing instance with instance type **vrf**

[Figure 144 on page 4446](#) illustrates the topology of this MPLS-based Layer 3 VPN.

**Figure 144: MPLS-Based Layer 3 VPN**

[Table 344 on page 4447](#) shows the settings of the customer edge interface on the local CE switch.

Table 344: Local CE Switch in the MPLS-Based Layer 3 VPN Topology

| Property                 | Settings  | Description                         |
|--------------------------|---|-------------------------------------|
| Local CE switch hardware | QFX3500 switch  | CE1                                 |
| Customer edge interface  | <b>ge-0/0/14 unit 0</b><br><b>family inet</b><br><b>address 51.51.0.14/16</b> | Interface that connects CE1 to PE1. |

Table 345 on page 4447 shows the settings of the customer edge interface on the remote CE switch.

Table 345: Remote CE Switch in the MPLS-Based Layer 3 VPN Topology

| Property                  | Settings  | Description                         |
|---------------------------|---|-------------------------------------|

### Configuring the Local PE Switch

- CLI Quick Configuration** To quickly configure the Layer 3 VPN components on the local PE switch, copy the following commands and paste them into the switch terminal window of PE1:
- ```
[edit]
set protocols bgp local-address 21.21.21.21 family inet-vpn unicast
set protocols bgp group PE1-PE2 type internal
set protocols bgp neighbor 22.22.22.22
set routing-instances L3VPN-1 instance-type vrf
set routing-instances L3VPN-1 description "BETWEEN PE1 AND PE2"
set routing-instances L3VPN-1 interface ge-0/0/14.0
set routing-instances L3VPN-1 route-distinguisher 21:21
set routing-instances L3VPN-1 vrf-target target:21:21
set routing-instances L3VPN-1 vrf-table-label
set routing-options router-id 21.21.21.21
set routing-options autonomous-system 10
```
- Step-by-Step Procedure** To configure the Layer 3 VPN components on the local PE switch:
1. Configure BGP, specifying the loopback address as the local address and specifying **family inet-vpn unicast**:
 

```
[edit protocols bgp]
user@switchPE1# set local-address 21.21.21.21 family inet-vpn unicast
```
  2. Configure the BGP group, specifying the group name and type:
 

```
[edit protocols bgp]
user@switchPE1# set group PE1-PE2 type internal
```
  3. Configure the BGP neighbor, specifying the loopback address of the remote PE switch as the neighbor's address:
 

```
[edit protocols bgp]
user@switchPE1# set neighbor 22.22.22.22
```
  4. Configure the routing instance, specifying the routing-instance name and using **vrf** as the instance type:
 

```
[edit routing-instances]
user@switchPE1# set L3VPN-1 instance-type vrf
```
  5. Configure a description for this routing instance:
 

```
[edit routing-instances]
user@switchPE1# set L3VPN-1 description "BETWEEN PE1 AND PE2"
```
  6. Configure the routing instance to use a route distinguisher:
 

```
[edit routing-instances]
user@switchPE1# set L3VPN-1 route-distinguisher 21:21
```

**NOTE:** Each routing instance that you configure on a PE switch must have a unique route distinguisher associated with it. VPN routing instances require a route distinguisher to allow BGP to distinguish between potentially identical network layer reachability information (NLRI) messages received from different VPNs. If you configure different VPN routing instances with the same route distinguisher, the commit fails.

7. Configure the VPN routing and forwarding (VRF) target of the routing instance:

```
[edit routing-instances]
user@switchPE1# set L3VPN-1 vrf-target target:21:21
```

**NOTE:** You can create more complex policies by explicitly configuring VRF import and export policies using the import and export options. See the *Junos OS VPNs Library for Routing Devices*.

8. Configure this routing instance with **vrf-table-label**, which maps the inner label of a packet to a specific VPN routing and forwarding (VRF) table and allows the examination of the encapsulated IP header:

```
[edit routing-instances]
user@switchPE1# set L3VPN-1 vrf-table-label
```

9. Configure the router ID and autonomous system (AS):

**NOTE:** We recommend that you explicitly configure the router identifier under the [edit routing-options] hierarchy level to avoid unpredictable behavior if the interface address on a loopback interface changes.

```
[edit routing-options]
user@switchPE1# set router-id 21.21.21.21 autonomous-system 10
```

**Results** Display the results of the configuration:

```
user@switchPE1> show configuration
```

```
interfaces {
  ge-0/0/14 {
    unit 0 {
      family inet {
        address 51.51.0.1/16;
      }
    }
  }
  lo0 {

### Configuring the Remote PE Switch

#### CLI Quick Configuration

To quickly configure the Layer 3 VPN components on the remote PE switch, copy the following commands and paste them into the switch terminal window of PE2:

```

[edit]
set protocols bgp local-address 22.22.22.22 family inet-vpn unicast
set protocols bgp group PE1-PE2 type internal
set protocols bgp neighbor 21.21.21.21
set routing-instances L3VPN-1 instance-type vrf
set routing-instances L3VPN-1 description "BETWEEN PE1 AND PE2"
set routing-instances L3VPN-1 interface ge-0/0/14.0
set routing-instances L3VPN-1 route-distinguisher 21:21
set routing-instances L3VPN-1 vrf-target target:21:21
set routing-instances L3VPN-1 vrf-table-label;
set routing-options router-id 22.22.22.22

```

**set routing-options autonomous-system 10****Step-by-Step  
Procedure**

To configure Layer 3 VPN components on the remote PE switch:

1. Configure BGP, specifying the loopback address as the local address and specifying **family inet-vpn unicast**:  

```
[edit protocols bgp]
user@switchPE2# set local-address 22.22.22.22 family inet-vpn unicast
```
2. Configure the BGP group, specifying the group name and type:  

```
[edit protocols bgp]
user@switchPE2# set group PE1-PE2 type internal
```
3. Configure the BGP neighbor, specifying the loopback address of the remote PE switch as the neighbor's address:  

```
[edit protocols bgp]
user@switchPE2# set neighbor 21.21.21.21
```
4. Configure the routing instance, specifying the routing-instance name and using **vrf** as the instance type:  

```
[edit routing-instances]
user@switchPE2# set L3VPN-1 instance-type vrf
```
5. Configure a description for this routing instance:  

```
[edit routing-instances]
user@switchPE1# set L3VPN-1 description "BETWEEN PE1 AND PE2"
```
6. Configure the routing instance to apply to the customer edge interface:  

```
[edit routing-instances]
user@switchPE2# set L3VPN-1 interface ge-0/0/14.0
```
7. Configure the routing instance to use a route distinguisher, using the format *ip-address:number*:  

```
[edit routing-instances]
user@switchPE2# set L3VPN-1 route-distinguisher 21:21
```
8. Configure the VPN routing and forwarding (VRF) target of the routing instance:  

```
[edit routing-instances]
user@switchPE2# set L3VPN-1 vrf-target target:21:21
```
9. Configure this routing instance with **vrf-table-label**, which maps the inner label of a packet to a specific VPN routing and forwarding (VRF) table and allows the examination of the encapsulated IP header.  

```
[edit routing-instances]
user@switchPE2# set L3VPN-1 vrf-table-label
```
10. Configure the router ID and autonomous system (AS):  

```
[edit routing-options]
user@switchPE2# set router-id 22.22.22.22 autonomous-system 10
```

**Results** Display the results of the configuration:

```
user@switchPE2> show configuration

interfaces {
  ge-0/0/14 {
    unit 0 {
      family inet {
        address 11.22.26.14/16;
      }
    }
  }
}
```

```

    }
  }
  lo0 {

## Example: Tunneling IPv6 Traffic over MPLS IPv4 Networks

This example shows how to configure Junos OS to tunnel IPv6 over an MPLS-based IPv4 network. External BGP (EBGP) is used between the customer edge (CE) and provider edge (PE) devices. The remote CE devices have different AS numbers for loop detection.

- [Requirements on page 4454](#)
- [Overview on page 4454](#)
- [Configuration on page 4457](#)
- [Verification on page 4462](#)

### Requirements

---

No special configuration beyond device initialization is required before you configure this example.

### Overview

---

Detailed information about the Juniper Networks implementation of IPv6 over MPLS is described in the following Internet drafts:

- Internet draft draft-ietf-l3vpn-bgp-ipv6-07.txt, *BGP-MPLS IP VPN extension for IPv6 VPN* (expires January 2006)
- Internet draft draft-ooms-v6ops-bgp-tunnel-06.txt, *Connecting IPv6 Islands over IPv4 MPLS using IPv6 Provider Edge Routers* (expires July 2006)

These Internet drafts are available on the IETF website at <http://www.ietf.org/>.

This example shows you how to interconnect a two IPv6 networks over an IPv4-based network core, giving you the ability to provide IPv6 service without having to upgrade the routers in your core network. Multiprotocol Border Gateway Protocol (MP-BGP) is configured to exchange routes between the IPv6 networks, and data is tunneled between these IPv6 networks by means of IPv4-based MPLS.

In [Figure 145 on page 4455](#), PE1 and PE2 are dual-stack BGP routers or switches, meaning they have both IPv4 and IPv6 stacks. The PE devices link the IPv6 networks through the customer edge (CE) routers or switches to the IPv4 core network. The CE devices and the PE devices connect through a link layer that can carry IPv6 traffic. The PE devices use IPv6 on the CE router-facing interfaces and use IPv4 and MPLS on the core-facing interfaces. Note that one of the connected IPv6 networks could be the global IPv6 Internet.

Figure 145: IPv6 Networks Linked by MPLS IPv4 Tunnels

The two PE devices are linked through an MP-BGP session using IPv4 addresses. They use the session to exchange IPv6 routes with an IPv6 (value 2) address family indicator (AFI) and a subsequent AFI (SAFI) (value 4). Each PE router sets the next hop for the IPv6 routes advertised on this session to its own IPv4 address. Because MP-BGP requires the BGP next hop to correspond to the same address family as the network layer reachability information (NLRI), this IPv4 address needs to be embedded within an IPv6 format.

The PE devices can learn the IPv6 routes from the CE devices connected to them using MP-BGP or through static configuration. Note that if BGP is used as the PE-router-to-CE-router protocol, the MP-BGP session between the PE device and CE device could occur over an IPv4 or IPv6 Transmission Control Protocol (TCP) session. Also, the BGP routes exchanged on that session would have SAFI unicast. You must configure an export policy to pass routes between IBGP and EBGp, and between BGP and any other protocol.

The PE routers have MPLS LSPs routed to each others' IPv4 addresses. IPv4 provides signaling for the LSPs by means of RSVP. These LSPs are used to resolve the next-hop addresses of the IPv6 routes learned from MP-BGP. The next hops use IPv4-mapped IPv6 addresses, while the LSPs use IPv4 addresses.

The PE devices always advertise IPv6 routes to each other using a label value of 2, the explicit null label for IPv6 as defined in RFC 3032, *MPLS Label Stack Encoding*. As a consequence, each of the forwarding next hops for the IPv6 routes learned from remote PE routers normally push two labels. The inner label is 2 (this label could be different if the advertising PE device is not a Juniper Networks routing or switching platform), and the outer label is the LSP label. If the LSP is a single-hop LSP, then only Label 2 is pushed.

It is also possible for the PE devices to exchange plain IPv6 routes using SAFI unicast. However, there is one major advantage in exchanging labeled IPv6 routes. The

penultimate-hop router for an MPLS LSP can pop the outer label and then send the packet with the inner label as an MPLS packet. Without the inner label, the penultimate-hop router would need to discover whether the packet is an IPv4 or IPv6 packet to set the protocol field in the Layer 2 header correctly.

When the PE1 device in [Figure 145 on page 4455](#) receives an IPv6 packet from the CE1 device, it performs a lookup in the IPv6 forwarding table. If the destination matches a prefix learned from the CE2 device, then no labels need to be pushed and the packet is simply sent to the CE2 device. If the destination matches a prefix that was learned from the PE2 device, then the PE1 router pushes two labels onto the packet and sends it to the Provider router. The inner label is 2 and the outer label is the LSP label for the PE2 router.

Each provider router in the service provider's network handles the packet as it would any MPLS packet, swapping labels as it passes from provider router to provider router. The penultimate-hop provider router for the LSP pops the outer label and sends the packet to the PE2 router. When the PE2 router receives the packet, it recognizes the IPv6 explicit null label on the packet (Label 2). It pops this label and treats it as an IPv6 packet, performing a lookup in the IPv6 forwarding table and forwarding the packet to the CE3 router.

This example includes the following settings:

- In addition to configuring the **family inet6** statement on all the CE router-facing interfaces, you must also configure the statement on all the core-facing interfaces running MPLS. Both configurations are necessary because the router must be able to process any IPv6 packets it receives on these interfaces. You should not see any regular IPv6 traffic arrive on these interfaces, but you will receive MPLS packets tagged with Label 2. Even though Label 2 MPLS packets are sent in IPv4, these packets are treated as native IPv6 packets.
- You enable IPv6 tunneling by including the **ipv6-tunneling** statement in the configuration for the PE routers. This statement allows IPv6 routes to be resolved over an MPLS network by converting all routes stored in the inet.3 routing table to IPv4-mapped IPv6 addresses and then copying them into the inet6.3 routing table. This routing table can be used to resolve next hops for both inet6 and inet6-vpn routes.

**NOTE:** BGP automatically runs its import policy even when copying routes from a primary routing table group to a secondary routing table group. If IPv4 labeled routes arrive from a BGP session (for example, when you have configured the **labeled-unicast** statement at the `[edit protocols bgp family inet]` hierarchy level on the PE router), the BGP neighbor's import policy also accepts IPv6 routes, since the neighbor's import policy is run while doing the copy operation to the inet6.3 routing table.

---

- When you configure MP-BGP to carry IPv6 traffic, the IPv4 MPLS label is removed at the destination PE router. The remaining IPv6 packet without a label can then be forwarded to the IPv6 network. To enable this, include the **explicit-null** statement in the BGP configuration.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

Device PE1
set interfaces xe-0/0/5 unit 2 family inet6 address ::10.1.1.2/126

```

### Configuring Device PE1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device PE1:

1. Configure the interfaces.

```

[edit interfaces]
user@PE1# set xe-0/0/5 unit 2 family inet6 address ::10.1.1.2/126
user@PE1# set xe-0/0/5 unit 2 family mpls

user@PE1# set xe-0/0/6 unit 5 family inet address 10.1.1.5/30
user@PE1# set xe-0/0/6 unit 5 family inet6
user@PE1# set xe-0/0/6 unit 5 family mpls

user@PE1# set lo0 unit 2 family inet address 1.1.1.2/32

```

2. Configure MPLS on the interfaces.

```

[edit protocols mpls]
user@PE1# set ipv6-tunneling
user@PE1# set interface xe-0/0/5.2
user@PE1# set interface xe-0/0/6.5

```

3. Configure BGP.

```

[edit protocols bgp]
user@PE1# set group toCE1 type external
user@PE1# set group toCE1 local-address ::10.1.1.2
user@PE1# set group toCE1 family inet6 unicast
user@PE1# set group toCE1 export send-bgp6
user@PE1# set group toCE1 peer-as 1
user@PE1# set group toCE1 neighbor ::10.1.1.1

user@PE1# set group toPE2 type internal
user@PE1# set group toPE2 local-address 1.1.1.2
user@PE1# set group toPE2 family inet6 labeled-unicast explicit-null
user@PE1# set group toPE2 export next-hop-self
user@PE1# set group toPE2 export send-v6

```

```
user@PE1# set group toPE2 neighbor 1.1.1.4
```

4. Configure OSPF

```
[edit protocols ospf area 0.0.0.0]
user@PE1# set interface xe-0/0/6.5
user@PE1# set interface lo0.2 passive
```

5. Configure a signaling protocol.

```
[edit protocols]
user@PE1# set rsvp interface xe-0/0/6.5
```

6. Configure the routing policies.

```
[edit policy-options]
user@PE1# set policy-statement next-hop-self then next-hop self
```

```
user@PE1# set policy-statement send-bgp6 from family inet6
user@PE1# set policy-statement send-bgp6 from protocol bgp
user@PE1# set policy-statement send-bgp6 then accept
```

```
user@PE1# set policy-statement send-v6 from family inet6
user@PE1# set policy-statement send-v6 from protocol bgp
user@PE1# set policy-statement send-v6 from protocol direct
user@PE1# set policy-statement send-v6 then accept
```

7. Configure the router ID and the autonomous system (AS) number.

```
[edit routing-options]
user@PE1# set router-id 1.1.1.2
user@PE1# set autonomous-system 2
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
xe-0/0/5 {
  unit 2 {
    family inet6 {
      address ::10.1.1.2/126;
    }
    family mpls;
  }
}
xe-0/0/6 {
  unit 5 {
    family inet {
      address 10.1.1.5/30;
    }
    family inet6;
    family mpls;
  }
}
lo0 {
```

```

    unit 2 {
        family inet {
            address 1.1.1.2/32;
        }
    }
}

user@R1# show policy-options
policy-statement next-hop-self {
    then {
        next-hop self;
    }
}
policy-statement send-bgp6 {
    from {
        family inet6;
        protocol bgp;
    }
    then accept;
}
policy-statement send-v6 {
    from {
        family inet6;
        protocol [ bgp direct ];
    }
    then accept;
}

user@R1# show protocols
mpls {
    ipv6-tunneling;
    interface xe-0/0/5.2;
    interface xe-0/0/6.5;
}
bgp {
    group toCE1 {
        type external;
        local-address ::10.1.1.2;
        family inet6 {
            unicast;
        }
        export send-bgp6;
        peer-as 1;
        neighbor ::10.1.1.1;
    }
    group toPE2 {
        type internal;
        local-address 1.1.1.2;
        family inet6 {
            labeled-unicast {
                explicit-null;
            }
        }
        export [ next-hop-self send-v6 ];
        neighbor 1.1.1.4;
    }
}

```

```
ospf {
  area 0.0.0.0 {
    interface xe-0/0/6.5;
    interface lo0.2 {
      passive;
    }
  }
}
rsvp {
  interface xe-0/0/6.5;
}

user@R1# show routing-options
router-id 1.1.1.2;
autonomous-system 2;
```

If you are done configuring the device, enter **commit** from configuration mode. Configure the other devices in the topology, as shown in “[CLI Quick Configuration](#)” on [page 4457](#).

---

### Verification

Confirm that the configuration is working properly.

#### *Verifying That the CE Devices Have Connectivity*

**Purpose** Make sure that the tunnel is operating.

**Action** From operational mode, enter the **ping** command.

```
user@CE1> ping ::10.1.1.14
PING6(56=40+8+8 bytes) ::10.1.1.1 --> ::10.1.1.14
16 bytes from ::10.1.1.14, icmp_seq=0 hlim=61 time=10.687 ms
16 bytes from ::10.1.1.14, icmp_seq=1 hlim=61 time=9.239 ms
16 bytes from ::10.1.1.14, icmp_seq=2 hlim=61 time=1.842 ms

user@CE3> ping ::10.1.1.1
PING6(56=40+8+8 bytes) ::10.1.1.14 --> ::10.1.1.1
16 bytes from ::10.1.1.1, icmp_seq=0 hlim=61 time=1.484 ms
16 bytes from ::10.1.1.1, icmp_seq=1 hlim=61 time=1.338 ms
16 bytes from ::10.1.1.1, icmp_seq=2 hlim=61 time=1.351 ms
```

**Meaning** The IPv6 CE devices can communicate over the core IPv4 network.

Documentation**

### Example: Configuring LDP Downstream on Demand

This example shows how to configure LDP downstream on demand. LDP is commonly configured using downstream unsolicited advertisement mode, meaning label advertisements for all routes are received from all LDP peers. As service providers integrate the access and aggregation networks into a single MPLS domain, LDP downstream on demand is needed to distribute the bindings between the access and aggregation networks and to reduce the processing requirements for the control plane.

Downstream nodes could potentially receive tens of thousands of label bindings from upstream aggregation nodes. Instead of learning and storing all label bindings for all possible loopback addresses within the entire MPLS network, the downstream aggregation node can be configured using LDP downstream on demand to only request the label bindings for the FECs corresponding to the loopback addresses of those egress nodes on which it has services configured.

- [Requirements on page 4463](#)
- [Overview on page 4463](#)
- [Configuration on page 4463](#)
- [Verification on page 4466](#)

### Requirements

This example uses the following hardware and software components:

- M Series router
- Junos OS 12.2

### Overview

You can enable LDP downstream on demand label advertisement for an LDP session by including the **downstream-on-demand** statement at the **[edit protocols ldp session]** hierarchy level. If you have configured downstream on demand, the Juniper Networks router advertises the downstream on demand request to its peer routers. For a downstream on demand session to be established between two routers, both have to advertise downstream on demand mode during LDP session establishment. If one router advertises downstream unsolicited mode and the other advertises downstream on demand, downstream unsolicited mode is used.

### Configuration

#### *Configuring LDP Downstream on Demand*

**Step-by-Step Procedure** To configure a LDP downstream on demand policy and then configure that policy and enable LDP downstream on demand on the LDP session:

1. Configure the downstream on demand policy (DOD-Request-Loopbacks in this example).

This policy causes the router to forward label request messages only to the FECs that are matched by the DOD-Request-Loopbacks policy.

[edit policy-options]

```
user@host# set prefix-list Request-Loopbacks 10.1.1/32
```

```
user@host# set prefix-list Request-Loopbacks 10.1.1.2/32
```

```
user@host# set prefix-list Request-Loopbacks 10.1.1.3/32
```

```
user@host# set prefix-list Request-Loopbacks 10.1.1.4/32
```

```
user@host# set policy-statement DOD-Request-Loopbacks term 1 from prefix-list
Request-Loopbacks
```

```
user@host# set policy-statement DOD-Request-Loopbacks term 1 then accept
```

2. Specify the DOD-Request-Loopbacks policy using the **dod-request-policy** statement at the **[edit protocols ldp]** hierarchy level.

The policy specified with the **dod-request-policy** statement is used to identify the prefixes to send label request messages. This policy is similar to an egress policy or an import policy. When processing routes from the inet.0 routing table, the Junos OS software checks for routes matching the **DOD-Request-Loopbacks** policy (in this example). If the route matches the policy and the LDP session is negotiated with DOD advertisement mode, label request messages are sent to the corresponding downstream LDP session.

```
[edit protocols ldp]
user@host# set dod-request-policy DOD-Request-Loopbacks
```

3. Include the **downstream-on-demand** statement in the configuration for the LDP session to enable downstream on demand distribution mode.

```
[edit protocols ldp]
user@host# set session 1.1.1.1 downstream-on-demand
```

#### *Distributing LDP Downstream on Demand Routes into Labeled BGP*

**Step-by-Step Procedure** To distribute LDP downstream on demand routes into labeled BGP, use a BGP export policy.

1. Configure the LDP route policy (**redistribute\_ldp** in this example).

```
[edit policy-options]
user@host# set policy-statement redistribute_ldp term 1 from protocol ldp
user@host# set policy-statement redistribute_ldp term 1 from tag 1000
user@host# set policy-statement redistribute_ldp term 1 then accept
```

2. Include the LDP route policy, **redistribute\_ldp** in the BGP configuration (as a part of the BGP group configuration **ebgp-to-abr** in this example).

BGP forwards the LDP routes based on the **redistribute\_ldp** policy to the remote PE router

```
[edit protocols bgp]
user@host# set group ebgp-to-abr type external
user@host# set group ebgp-to-abr local-address 192.168.0.1
user@host# set group ebgp-to-abr peer-as 65319
user@host# set group ebgp-to-abr local-as 65320
user@host# set group ebgp-to-abr neighbor 192.168.6.1 family inet unicast
user@host# set group ebgp-to-abr neighbor 192.168.6.1 family inet labeled-unicast
rib inet.3
user@host# set group ebgp-to-abr neighbor 192.168.6.1 export redistribute_ldp
```

**Step-by-Step Procedure** To restrict label propagation to other routers configured in downstream unsolicited mode (instead of downstream on demand), configure the following policies:

1. Configure the **dod-routes** policy to accept routes from LDP.

```
user@host# set policy-options policy-statement dod-routes term 1 from protocol
ldp
```

- ```

user@host# set policy-options policy-statement dod-routes term 1 from tag
1145307136
user@host# set policy-options policy-statement dod-routes term 1 then accept

```
2. Configure the **do-not-propagate-du-sessions** policy to not forward routes to neighbors 1.1.1.1, 2.2.2.2, and 3.3.3.3.
 

```

user@host# set policy-options policy-statement do-not-propagate-du-sessions
term 1 to neighbor 1.1.1.1
user@host# set policy-options policy-statement do-not-propagate-du-sessions
term 1 to neighbor 2.2.2.2
user@host# set policy-options policy-statement do-not-propagate-du-sessions
term 1 to neighbor 3.3.3.3
user@host# set policy-options policy-statement do-not-propagate-du-sessions
term 1 then reject

```
  3. Configure the **filter-dod-on-du-sessions** policy to prevent the routes examined by the **dod-routes** policy from being forwarded to the neighboring routers defined in the **do-not-propagate-du-sessions** policy.
 

```

user@host# set policy-options policy-statement filter-dod-routes-on-du-sessions
term 1 from policy dod-routes
user@host# set policy-options policy-statement filter-dod-routes-on-du-sessions
term 1 to policy do-not-propagate-du-sessions

```
  4. Specify the **filter-dod-routes-on-du-session** policy as the export policy for BGP group **ebgp-to-abr**.
 

```

[edit protocols bgp]
user@host# set group ebgp-to-abr neighbor 192.168.6.2 export
filter-dod-routes-on-du-sessions

```

**Results** From configuration mode, confirm your configuration by entering the **show policy-options** and **show protocols ldp** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@host#
show policy-options
prefix-list Request-Loopbacks {
  10.1.1.1/32;
  10.1.1.2/32;
  10.1.1.3/32;
  10.1.1.4/32;
}
policy-statement DOD-Request-Loopbacks {
  term 1 {
    from {
      prefix-list Request-Loopbacks;
    }
    then accept;
  }
}
policy-statement redistribute_ldp {
  term 1 {
    from {
      protocol ldp;
      tag 1000;
    }
  }
}

```

```
        then accept;
    }
}

user@host#
show protocols ldp
dod-request-policy DOD-Request-Loopbacks;
session 1.1.1.1 {
    downstream-on-demand;
}

user@host#
show protocols bgp
group ebgp-to-abr {
    type external;
    local-address 192.168.0.1;
    peer-as 65319;
    local-as 65320;
    neighbor 192.168.6.1 {
        family inet {
            unicast;
            labeled-unicast {
                rib {
                    inet.3;
                }
            }
        }
    }
    export redistribute_ldp;
}
}
```

---

## Verification

### *Verifying Label Advertisement Mode*

**Purpose** Confirm that the configuration is working properly.

Use the **show ldp session** command to verify the status of the label advertisement mode for the LDP session.

**Action** Issue the **show ldp session** and **show ldp session detail** commands:

- The following command output for the **show ldp session** command indicates that the **Adv. Mode** (label advertisement mode) is **DOD** (meaning the LDP downstream on demand session is operational):

```
user@host> show ldp session
  Address          State      Connection    Hold time  Adv. Mode
  1.1.1.2          Operational Open          22         DOD
```

- The following command output for the **show ldp session detail** command indicates that the **Local Label Advertisement mode** is **Downstream unsolicited**, the default value (meaning downstream on demand is not configured on the local session). Conversely, the **Remote Label Advertisement mode** and the **Negotiated Label Advertisement mode** both indicate that **Downstream on demand** is configured on the remote session

```
user@host> show ldp session detail
Address: 1.1.1.2, State: Operational, Connection: Open, Hold time: 24
Session ID: 1.1.1.1:0--1.1.1.2:0
Next keepalive in 4 seconds
Passive, Maximum PDU: 4096, Hold time: 30, Neighbor count: 1
Neighbor types: configured-tunneled
Keepalive interval: 10, Connect retry interval: 1
Local address: 1.1.1.1, Remote address: 1.1.1.2
Up for 17:54:52
Capabilities advertised: none
Capabilities received: none
Protection: disabled
Local - Restart: disabled, Helper mode: enabled,
Remote - Restart: disabled, Helper mode: enabled
Local maximum neighbor reconnect time: 120000 msec
Local maximum neighbor recovery time: 240000 msec
Local Label Advertisement mode: Downstream unsolicited

## Configuring MPLS on Provider Edge Switches

To implement MPLS, you must configure two provider edge (PE) switches—an ingress PE switch and an egress PE switch—and at least one provider switch. You can configure the customer edge (CE) interfaces on the PE switches of the MPLS network using IP over MPLS.

This topic describes how to configure an ingress PE switch and an egress PE switch using IP over MPLS:

1. [Configuring the Ingress PE Switch on page 4468](#)
2. [Configuring the Egress PE Switch on page 4470](#)

### Configuring the Ingress PE Switch

---

To configure the ingress PE switch:

1. Configure an IP address for the loopback interface and the core interfaces:

```
[edit interfaces]
user@switch# set lo0 unit 0 family inet address 192.168.10.1/32
user@switch# set xe-0/0/5 unit 0 family inet address 10.1.5.1/24
user@switch# set xe-0/0/6 unit 0 family inet address 10.1.6.1/24
```

**NOTE:** You cannot use routed VLAN interfaces (RVIs) or Layer 3 subinterfaces as core interfaces.

2. Configure OSPF on the loopback interface and the core interfaces:

**NOTE:** You can use the switch address as an alternative to the loopback interface.

```
[edit protocols ospf]
user@switch# set area 0.0.0.0 interface lo0.0
user@switch# set area 0.0.0.0 interface xe-0/0/5.0
user@switch# set area 0.0.0.0 interface xe-0/0/6.0
```

3. Configure OSPF traffic engineering:

```
[edit protocols ospf]
```

- ```

user@switch# set traffic-engineering

```
4. Configure RSVP on the loopback interface and the core interfaces:
 

```

[edit protocols rsvp]
user@switch# set interface lo0.0
user@switch# set interface xe-0/0/5.0
user@switch# set interface xe-0/0/6.0

```
  5. Configure MPLS traffic engineering.
 

```

[edit protocols mpls]
user@switch# set traffic-engineering

```
  6. Configure MPLS on the core interfaces:
 

```

[edit protocols mpls]
user@switch# set interface xe-0/0/5.0
user@switch# set interface xe-0/0/6.0

```
  7. Configure **family mpls** on the logical units of the core interfaces, thereby identifying the interfaces that will be used for forwarding MPLS packets:
 

```

[edit interfaces]
user@switch# set xe-0/0/5 unit 0 family mpls
user@switch# set xe-0/0/6 unit 0 family mpls

```
  8. Configure a customer edge interface as a Layer 3 routed interface, specifying an IP address:
 

```

[edit interfaces]
user@switch# set xe-0/0/3 unit 0 family inet address 121.100.10.1/16

```
  9. Configure this Layer 3 customer edge interface for the routing protocol:
 

```

[edit]
user@switch# set protocols ospf area 0.0.0 interface xe-0/0/3.0

```
  10. Configure an LSP on the ingress PE switch (192.168.10.1) to send IP packets over MPLS to the egress PE switch (192.168.12.1):
 

```

[edit protocols mpls]
user@switch# set label-switched-path lsp_1 to 192.168.12.1

```
  11. Disable constrained-path LSP computation for this LSP:
 

```

[edit protocols mpls]
user@switch# set label-switched-path lsp_1 no-cspf

```
  12. Configure a static route from the ingress PE switch to the egress PE switch, thereby indicating to the routing protocol that the packets will be forwarded over the MPLS LSP that has been set up to that destination:
 

```

[edit routing-options]
user@switch# set static route 2.2.2.0/24 next-hop 192.168.10.1
user@switch# set static route 2.2.2.0/24 resolve

```

## Configuring the Egress PE Switch

To configure the egress PE switch:

1. Configure an IP address for the loopback interface and the core interfaces:

```
[edit interfaces]
user@switch# set lo0 unit 0 family inet address 192.168.12.1/32
user@switch# set xe-0/0/5 unit 0 family inet address 10.1.20.1/24
user@switch# set xe-0/0/6 unit 0 family inet address 10.1.21.1/24
```

**NOTE:** You cannot use routed VLAN interfaces (RVIs) or Layer 3 subinterfaces as core interfaces.

2. Configure OSPF on the loopback interface and the core interfaces:

**NOTE:** You can use the switch address as an alternative to the loopback interface.

```
[edit protocols ospf]
user@switch# set area 0.0.0.0 interface lo0.0
user@switch# set area 0.0.0.0 interface xe-0/0/5.0
user@switch# set area 0.0.0.0 interface xe-0/0/6.0
```

3. Configure RSVP on the loopback interface and the core interfaces:

```
[edit protocols rsvp]
user@switch# set rsvp interface lo0.0
user@switch# set rsvp interface xe-0/0/5.0
user@switch# set rsvp interface xe-0/0/6.0
```

4. Configure MPLS on the core interfaces:

```
[edit protocols mpls]
user@switch# set interface xe-0/0/5.0
user@switch# set interface xe-0/0/6.0
```

5. Configure **family mpls** on the logical units of the core interfaces, thereby identifying the interfaces that will be used for forwarding MPLS packets:

```
[edit interfaces]
user@switch# set xe-0/0/5 unit 0 family mpls
user@switch# set xe-0/0/6 unit 0 family mpls
```

6. Configure a customer edge interface as a Layer 3 routed interface, specifying an IP address:

```
[edit interfaces]
user@switch# set xe-0/0/3 unit 0 family inet address 2.2.2.1/16
```

7. Configure this Layer 3 customer edge interface for the routing protocol:

```
[edit]
user@switch# set protocols ospf area 0.0.0 interface xe-0/0/3
```

8. Configure an LSP on the egress PE switch (192.168.12.1) to send IP packets over MPLS to the ingress PE switch (192.168.10.1):

```
[edit protocols mpls]
user@switch# set label-switched-path lsp_2 to 192.168.10.1
```

9. Disable constrained-path LSP computation for this LSP:

```
[edit protocols mpls]
```

```
user@switch# set label-switched-path lsp_2 no-cspf
```

10. Configure a static route from the ingress PE switch to the egress PE switch, thereby indicating to the routing protocol that the packets will be forwarded over the MPLS LSP that has been set up to that destination:

```
[edit routing-options]
```

```
user@switch# set static route 121.121.121.0/24 next-hop 192.168.12.1
```

```
user@switch# set static route 121.121.121.0/24 resolve
```

## Configuring MPLS on Provider Switches

To implement MPLS, you must configure at least one provider switch as a transit switch for the MPLS packets.

MPLS requires the configuration of an interior gateway protocol (OSPF) and a signaling protocol (RSVP) on the core interfaces and the loopback interface of all the switches. This procedure includes the configuration of OSPF on the provider switch.

To configure the provider switch, complete the following tasks:

1. Configure OSPF on the loopback and core interfaces:

**NOTE:** You can use the switch address as an alternative to the loopback interface.

```
[edit protocols ospf]
```

```
user@switch# set area 0.0.0.0 interface lo0.0
```

```
user@switch# set area 0.0.0.0 interface xe-0/0/5.0
```

```
user@switch# set area 0.0.0.0 interface xe-0/0/6.0
```

```
user@switch# set area 0.0.0.0 interface ae0
```

**NOTE:** You cannot use routed VLAN interfaces (RVIs) or Layer 3 subinterfaces as core interfaces.

2. Configure MPLS on the core interfaces:

```
[edit protocols mpls]
```

```
user@switch# set interface xe-0/0/5.0
```

```
user@switch# set interface xe-0/0/6.0
```

```
user@switch# set interface ae0
```

3. Configure RSVP on the loopback interface and the core interfaces:

```
[edit protocols rsvp]
```

```
user@switch# set interface lo0.0
user@switch# set interface xe-0/0/5.0
user@switch# set interface xe-0/0/6.0
user@switch# set interface ae0
```

4. Configure an IP address for the loopback interface and the core interfaces:

```
[edit interfaces]
user@switch# set lo0 unit 0 family inet address 127.1.1.1/32
user@switch# set xe-0/0/5 unit 0 family inet address 10.1.5.1/24
user@switch# set xe-0/0/6 unit 0 family inet address 10.1.6.1/24
user@switch# set ae0 unit 0 family inet address 10.1.9.2/24
```

5. Configure **family mpls** on the logical units of the core interfaces, thereby identifying the interfaces that will be used for forwarding MPLS packets:

```
[edit interfaces]
user@switch# set xe-0/0/5 unit 0 family mpls
user@switch# set xe-0/0/6 unit 0 family mpls
user@switch# set ae0 unit 0 family mpls
```

**NOTE:** You can configure **family mpls** on either individual interfaces or aggregated Ethernet interfaces. You cannot configure it on tagged VLAN interfaces.

## Configuring Static Label Switched Paths for MPLS

Configuring static label-switched paths (LSPs) for MPLS is similar to configuring static routes on individual switches. As with static routes, there is no error reporting, liveness detection, or statistics reporting.

To configure static LSPs, configure the ingress PE switch and each provider switch along the path up to and including the egress PE switch.

For the ingress PE switch, configure which packets to tag (based on the packet's destination IP address), configure the next switch in the LSP, and the tag to apply to the packet. Manually assigned labels can have values from 0 through 1,048,575.

For the transit switches in the path, configure the next switch in the path and the tag to apply to the packet. Manually assigned labels can have values from 1,000,000 through 1,048,575.

The egress PE switch removes the label and forwards the packet to the IP destination. However, if the previous switch removed the label, the egress switch examines the packet's IP header and forwards the packet toward its IP destination.

Before you configure a static LSP, you must configure the basic components for an MPLS network:

- Configure two PE switches. See “Configuring MPLS on Provider Edge Switches” on page 4468.

**NOTE:** Do not configure LSPs at the [edit protocols mpls label-switched-path] hierarchy level on the PE switches.

- Configure one or more provider switches. See “Configuring MPLS on Provider Switches” on page 4471.

This topic describes how to configure an ingress PE switch, one or more provider switches, and an egress PE switch for static LSP:

1. [Configuring the Ingress PE Switch on page 4473](#)
2. [Configuring the Provider and the Egress PE Switch on page 4474](#)

### Configuring the Ingress PE Switch

To configure the ingress PE switch:

1. Configure an IP address for every core interface:

```
[edit interfaces]
user@switch# set interface-name unit logical-unit-number family inet address address
```

**NOTE:** You cannot use routed VLAN interfaces (RVIs) or Layer 3 subinterfaces as core interfaces.

2. Configure the name associated with the static LSP:

```
[edit protocols mpls]
user@switch# set static-label-switched-path lsp-name
```

3. Configure the next hop switch for the LSP:

```
[edit protocols mpls]
user@switch# set static-label-switched-path lsp-name ingress next-hop address-of-next-hop
```

4. Specify the address of the egress switch for the LSP:

```
[edit protocols mpls]
user@switch# set static-label-switched-path lsp-name ingress to address-of-egress-switch
```

5. Configure the new label that you want to add to the top of the label stack:

```
[edit protocols mpls]
user@switch# set static-label-switched-path lsp-name ingress push out-label
```

## Configuring the Provider and the Egress PE Switch

To configure a static LSP for MPLS on the provider and egress PE switch:

1. Configure a transit static LSP:

```
[edit protocols mpls]
user@switch# set static-label-switched-path lsp-name transit incoming-label
```

2. Configure the next hop switch for the LSP:

```
[edit protocols mpls]
user@switch# set static-label-switched-path lsp-name transit incoming-label next-hop
address-of-next-hop
```

3. Only for provider switches, remove the label at the top of the label stack and replace it with the specified label:

```
[edit protocols mpls]
user@switch# set static-label-switched-path lsp-name transit incoming-label swap out-label
```

4. Only for the egress PE switch, remove the label at the top of the label stack:

**NOTE:** If there is another label in the stack, that label becomes the label at the top of the label stack. Otherwise, the packet is forwarded as a native protocol packet (typically, as an IP packet).

```
[edit protocols mpls]
user@switch# set static-label-switched-path lsp-name transit incoming-label pop
```

## Configuring MPLS Firewall Filters and Policers

You can configure firewall filters to filter MPLS traffic. To use an MPLS firewall filter, you must first configure the filter and then apply it to an interface you have configured for forwarding MPLS traffic. You can also configure a policer for the MPLS filter to police (that is, rate-limit) the traffic on the interface to which the filter is attached.

**NOTE:** You can configure ingress MPLS firewall filters only. Egress MPLS firewall filters are not supported. You cannot apply MPLS firewall filters to loopback interfaces.

When you configure an MPLS firewall filter, you define filtering criteria (terms, with match conditions) for the packets and an action (action, or action modifier) for the switch to take if the packets match the filtering criteria.

- [Table 348 on page 4475](#) describes the match conditions you can configure for MPLS firewall filters at the `[edit firewall family mpls filter filter-name term term-name from]` hierarchy level.

**NOTE:** If a packet has multiple MPLS labels, the filter applies the match conditions to only the bottom label in the label stack.

**Table 348: Supported Match Conditions for MPLS Firewall Filters**

Match Condition	Description
<b>exp <i>number</i></b>	<p>Experimental (EXP) bit number or range of bit numbers in the MPLS header of a packet.</p> <p>For <i>number</i>, you can specify one or more values from 0 through 7 in binary, decimal or hexadecimal format, as given below:</p> <ul style="list-style-type: none"> <li>• A single EXP bit—for example, <b>exp 3</b></li> <li>• Several EXP bits—for example, <b>exp 0,4</b></li> <li>• A range of EXP bits—for example, <b>exp [0-5]</b></li> </ul>
<b>label <i>number</i></b>	<p>MPLS label value or range of label values in the MPLS header of a packet.</p> <p>For <i>number</i>, you can specify one or more values from 0 through 1048575 in decimal or hexadecimal format, as given below:</p> <ul style="list-style-type: none"> <li>• A single label—for example, <b>label 3</b></li> <li>• Several labels—for example, <b>label 0,4</b></li> <li>• A range of labels—for example, <b>label [0-5]</b></li> </ul>

- [Table 349 on page 4475](#) describes the actions you can configure for MPLS firewall filters at the **[edit firewall family mpls filter *filter-name* term *term-name* then]** hierarchy level.

**Table 349: Supported Actions for MPLS Firewall Filters**

Action	Description
<b>accept</b>	Accept a packet
<b>count <i>counter-name</i></b>	<p>Count the number of packets that pass this filter or term.</p> <p><b>NOTE:</b> We recommend that you configure a counter for each term in a firewall filter, so that you can monitor the number of packets that match the conditions specified in each filter term.</p>
<b>discard</b>	Discard a packet silently without sending an Internet Control Message Protocol (ICMP) message
<b>policer</b>	Starting with Junos OS 13.2X51-D15, you can send traffic matched by an MPLS filter to a two-color policer.

Table 349: Supported Actions for MPLS Firewall Filters (*continued*)

Action	Description
<b>three-color-policer</b>	Starting with Junos OS 13.2X51-D15, you can send traffic matched by an MPLS filter to a three-color policer.

- [Configuring an MPLS Firewall Filter on page 4476](#)
- [Applying an MPLS Firewall Filter to an MPLS Interface on page 4476](#)
- [Configuring Policers for LSPs on page 4477](#)

### Configuring an MPLS Firewall Filter

To configure an MPLS firewall filter:

1. Configure the filter name, term name, and at least one match condition—for example, match on MPLS packets with EXP bits set to either 0 or 4:

```
[edit firewall family mpls]
user@switch# set filter ingress-exp-filter term term-one from exp 0,4
```

2. In each firewall filter term, specify the actions to take if the packet matches all the conditions in that term—for example, count MPLS packets with EXP bits set to either 0 or 4:

```
[edit firewall family mpls filter ingress-exp-filter term term-one then]
user@switch# set count counter0
user@switch# set accept
```

### Applying an MPLS Firewall Filter to an MPLS Interface

To apply the MPLS firewall filter to an interface you have configured for forwarding MPLS traffic (using the **family mpls** statement at the **[edit interfaces *interface-name* unit *unit-number*]** hierarchy level):

**NOTE:** You can apply firewall filters only to filter MPLS packets that enter an interface.

1. Apply the firewall filter to an MPLS interface—for example, apply the firewall filter to interface xe-0/0/5:

```
[edit interfaces]
user@switch# set xe-0/0/5 unit 0 family mpls filter input ingress-exp-filter
```

2. Review your configuration and issue the **commit** command:

```
[edit interfaces]
user@switch# commit
commit complete
```

---

## Configuring Policers for LSPs

---

Starting with Junos OS 13.2X51-D15, you can send traffic matched by an MPLS filter to a two-color policer or three-color policer. MPLS LSP policing allows you to control the amount of traffic forwarded through a particular LSP. Policing helps to ensure that the amount of traffic forwarded through an LSP never exceeds the requested bandwidth allocation. LSP policing is supported on regular LSPs, LSPs configured with DiffServ-aware traffic engineering, and multiclass LSPs. You can configure multiple policers for each multiclass LSP. For regular LSPs, each LSP policer is applied to all of the traffic traversing the LSP. The policer's bandwidth limitations become effective as soon as the total sum of traffic traversing the LSP exceeds the configured limit.

You configure the multiclass LSP and DiffServ-aware traffic engineering LSP policers in a filter. The filter can be configured to distinguish between the different class types and apply the relevant policer to each class type. The policers distinguish between class types based on the EXP bits.

You configure LSP policers under the **family any** filter. The **family any** filter is used because the policer is applied to traffic entering the LSP. This traffic might be from different families: IPv6, MPLS, and so on. You do not need to know what sort of traffic is entering the LSP, as long as the match conditions apply to all types of traffic.

When configuring MPLS LSP policers, be aware of the following limitations:

- LSP policers are supported for packet LSPs only.
- LSP policers are supported for unicast next hops only. Multicast next hops are not supported.
- The LSP policer runs before any output filters.
- Traffic sourced from the Routing Engine (for example, ping traffic) does not take the same forwarding path as transit traffic. This type of traffic cannot be policed.

## Configuring CoS Bits for an MPLS Network

When traffic enters a labeled-switch path (LSP) tunnel, the CoS bits in the MPLS header are set in one of two ways:

- The number of the output queue into which the packet was buffered and the packet loss priority (PLP) bit are written into the MPLS header and are used as the packet's CoS value. This behavior is the default, and no configuration is required. The *Class of Service Feature Guide for Routing Devices* explains the IP CoS values, and summarizes how the CoS bits are treated.
- You set a fixed CoS value on all packets entering the LSP tunnel. A fixed CoS value means that all packets entering the LSP receive the same class of service.

To set a fixed CoS value on all packets entering the LSP:

1. Specify a class of service value for the LSP:

**NOTE:** The CoS value set using the `class-of-service` statement at the `[edit protocols mpls]` hierarchy level supersedes the CoS value set at the `[edit class-of-service]` hierarchy level for an interface. Effectively, the CoS value configured for an LSP overrides the CoS value set for an interface.

```
[edit protocols mpls]
user@switch# set class-of-service cos-value
```

### Related Documentation

- [Defining CoS Rewrite Rules on page 6182](#)

## Configuring a Global MPLS EXP Classifier

EXP packet classification associates incoming packets with a particular MPLS CoS servicing level. EXP behavior aggregate (BA) classifiers examine the MPLS EXP value in the packet header to determine the CoS settings applied to the packet. EXP BA classifiers allow you to set the forwarding class and loss priority of an MPLS packet based on the incoming CoS value.

You can configure as many EXP classifiers as you want, however, the switch uses only one MPLS EXP classifier as a global classifier, which is applied only on interfaces configured as **family mpls**. All **family mpls** switch interfaces use the global EXP classifier to classify MPLS traffic.

If an EXP classifier is configured, MPLS traffic on **family mpls** interfaces uses the EXP classifier. If an EXP classifier is not configured, then if a fixed classifier is applied to the interface, the MPLS traffic uses the fixed classifier. If no EXP classifier and no fixed classifier is applied to the interface, MPLS traffic is treated as best-effort traffic. DSCP classifiers are not applied to MPLS traffic.

**NOTE:** There is no default MPLS EXP classifier. If you want to use an MPLS EXP classifier, you must configure it. The MPLS EXP classifier is global and applies only to all **family mpls** interfaces on the switch. You can configure as many MPLS EXP classifiers as you want, but you can only use one MPLS EXP classifier on switch interfaces at any time.

To configure a unicast MPLS EXP classifier using the CLI:

1. Create an EXP classifier and associate it with a forwarding class, a loss priority, and a code point:

```
[edit class-of-service classifiers]
user@switch# set (dscp | ieee-802.1 | exp) classifier-name forwarding-class
forwarding-class-name loss-priority level code-points [aliases] [bit-patterns]
```

2. Apply the EXP classifier to the switch interfaces:

```
[edit class-of-service]
user@switch# set system-defaults classifiers exp classifier-name
```

### Related Documentation

- [Configuring Rewrite Rules for MPLS EXP Classifiers on page 4480](#)

## Configuring Rewrite Rules for MPLS EXP Classifiers

You configure EXP rewrite rules to alter CoS values in outgoing MPLS packets on the outbound **family mpls** interfaces of a switch to match the policies of a targeted peer. Policy matching allows the downstream routing platform or switch in a neighboring network to classify each packet into the appropriate service group.

To configure an EXP CoS rewrite rule, create the rule by giving it a name and associating it with a forwarding class, loss priority, and code point. This creates a rewrite table. After the rewrite rule is created, enable it on a logical **family mpls** interface. EXP rewrite rules can only be enabled on logical **family mpls** interfaces, not on physical interfaces or on interfaces of other family types. You can also apply an existing EXP rewrite rule on a logical interface.

**NOTE:** There are no default rewrite rules.

You can configure as many EXP rewrite rules as you want, but you can only use 16 EXP rewrite rules at any time on the switch. On a given **family mpls** logical interface, all pushed MPLS labels have the same EXP rewrite rule applied to them. You can apply different EXP rewrite rules to different logical interfaces on the same physical interface.

**NOTE:** On each physical interface, either all forwarding classes that are being used on the interface must have rewrite rules configured, or no forwarding classes that are being used on the interface can have rewrite rules configured. On any physical port, do not mix forwarding classes with rewrite rules and forwarding classes without rewrite rules.

**NOTE:** To replace an existing rewrite rule on the interface with a new rewrite rule of the same type, first explicitly remove the existing rewrite rule and then apply the new rule.

To create an EXP rewrite rule for MPLS traffic and enable it on a logical interface:

1. Create an EXP rewrite rule:

```
user@switch# set class-of-service rewrite-rules exp rewrite-rule-name forwarding-class forwarding-class-name loss-priority level code-points [aliases] [bit-patterns]
```

For example, to configure an EXP rewrite rule named **exp-rr-1** for a forwarding class named **mpls-1** with a loss priority of **low** that rewrites the EXP code point value to **001**:

```
user@switch# set class-of-service rewrite-rules exp exp-rr-1 forwarding-class mpls-1 loss-priority low code-points 001
```

2. Apply the rewrite rule to a logical interface:

```
user@switch # set class-of-service interfaces interface-name unit logical-unit rewrite-rules exp rewrite-rule-name
```

For example, to apply a rewrite rule named **exp-rr-1** to logical interface **xe-0/0/10.0**:

```
user@switch# set class-of-service interfaces xe-0/0/10 unit 0 rewrite-rules exp exp-rr-1
```

**NOTE:** In this example, all forwarding classes assigned to port xe-0/0/10 must have rewrite rules. Do not mix forwarding classes that have rewrite rules with forwarding classes that do not have rewrite rules on the same interface.

## Configuring MPLS to Gather Statistics

You can configure MPLS so that it periodically gathers traffic statistics about all MPLS sessions, including transit sessions, by configuring the **statistics** statement. You must configure the **statistics** statement if you want to collect MPLS traffic statistics using SNMP polling of MPLS Management Information Bases (MIBs).

To enable or disable MPLS statistics collection, include the **statistics** statement:

```
statistics {
  auto-bandwidth;
  file filename <files number> <size size> <world-readable | no-world-readable>;
  interval seconds;
  no-transit-statistics;
}
```

You can configure these statements at the following hierarchy levels:

- **[edit protocols mpls]**
- **[edit logical-systems *logical-system-name* protocols mpls]**

The default interval is 300 seconds.

If you configure the **file** option, the statistics are placed in a file, with one entry per LSP. During the specified interval, the following information is recorded in this file:

- The number of packets, number of bytes, packets per second, and bytes per second transmitted by each LSP. Feature parity for the display of packet and byte statistics for sub-LSPs of a point-to-multipoint LSP on the Junos Trio chipset is supported in Junos OS Releases 11.1R2, 11.2R2, and 11.4.
- The percent of bandwidth transmitted over a given LSP in relation to the bandwidth percentage configured for that LSP. If no bandwidth is configured for an LSP, 0 percent is recorded in the percentage column.

At the end of each periodic report, a summary shows the current time, total number of sessions, number of sessions read, number of sessions ignored, and read errors, if any. Ignored sessions are typically those not in the up state or those with a reserved (0 through 15) incoming label (typically the egress point of an LSP). The reason for a read error appears on the same line as the entry for the LSP on which the error occurred. Gathering statistics is an unreliable process; occasional read errors might affect their accuracy. Sample output follows:

lsp6	0 pkt	0 Byte	0 pps	0 Bps	0
lsp5	0 pkt	0 Byte	0 pps	0 Bps	0
lsp6.1	34845 pkt	2926980 Byte	1049 pps	88179 Bps	132
lsp5.1	0 pkt	0 Byte	0 pps	0 Bps	0
lsp4	0 pkt	0 Byte	0 pps	0 Bps	0

Dec 7 17:28:38 Total 6 sessions: 5 success, 0 fail, 1 ignored

**Related  
Documentation**

- [Configuring Automatic Bandwidth Allocation for LSPs on page 4482](#)

## Configuring Automatic Bandwidth Allocation for LSPs

Automatic bandwidth allocation allows an MPLS tunnel to automatically adjust its bandwidth allocation based on the volume of traffic flowing through the tunnel. You can configure an LSP with minimal bandwidth, and this feature can dynamically adjust the LSP's bandwidth allocation based on current traffic patterns. The bandwidth adjustments do not interrupt traffic flow through the tunnel.

At the end of the automatic bandwidth allocation time interval, the current maximum average bandwidth usage is compared with the allocated bandwidth for the LSP. If the LSP needs more bandwidth, an attempt is made to set up a new path where bandwidth is equal to the current maximum average usage. If the attempt is successful, the LSP's traffic is routed through the new path and the old path is removed. If the attempt fails, the LSP continues to use its current path.

If you have configured link and node protection for the LSP and traffic has been switched to the bypass LSP, the automatic bandwidth allocation feature continues to operate and take bandwidth samples from the bypass LSP. For the first bandwidth adjustment cycle, the maximum average bandwidth usage taken from the original link and node-protected LSP is used to resignal the bypass LSP if more bandwidth is needed. (Link and node protection are not supported on QFX Series switches.)

If you have configured fast-reroute for the LSP, you might not be able to use this feature to adjust the bandwidth. Because the LSPs use a fixed filter (FF) reservation style, when a new path is signaled, the bandwidth might be double-counted. Double-counting can prevent a fast-reroute LSP from ever adjusting its bandwidth when automatic bandwidth allocation is enabled. (Fast reroute is not supported on QFX Series switches.)

To configure automatic bandwidth allocation, complete the steps in the following sections:

- [Configuring Automatic Bandwidth Allocation on LSPs on page 4483](#)
- [Requesting Automatic Bandwidth Allocation Adjustment on page 4488](#)

## Configuring Automatic Bandwidth Allocation on LSPs

To enable automatic bandwidth allocation on an LSP, include the **auto-bandwidth** statement:

```
auto-bandwidth {
  adjust-interval seconds;
  adjust-threshold percent;
  adjust-threshold-overflow-limit number;
  adjust-threshold-underflow-limit number;
  maximum-bandwidth bps;
  minimum-bandwidth bps;
  minimum-bandwidth-adjust-interval
  minimum-bandwidth-adjust-threshold-change
  minimum-bandwidth-adjust-threshold-value
  monitor-bandwidth;
}
```

You can include this statement at the following hierarchy levels:

- [edit protocols mpls label-switched-path *lsp-name*]
- [edit logical-systems *logical-system-name* protocols mpls label-switched-path *lsp-name*]

If an LSP has an automatic bandwidth configuration, you can disable automatic bandwidth adjustments on a particular path (either primary or secondary) by configuring a static bandwidth value and by disabling the CSPF computation (using the **no-cspf** statement).

For example:

```
user@host> show protocols mpls
label-switched-path primary-path {
  to 192.168.0.1;
  ldp-tunneling;
  optimize-timer 3571;
  least-fill;
  link-protection;
  adaptive;
  auto-bandwidth {
    adjust-interval 7177;
    adjust-threshold 5;
    minimum-bandwidth 1m;
    maximum-bandwidth 2500000000;
    adjust-threshold-overflow-limit 2;
    resignal-minimum-bandwidth;
  }
  primary primary-path;
  secondary secondary-path {
    bandwidth 0;
    no-cspf;
    priority 0 0;
  }
}
```

The statements configured at the **[edit protocols mpls label-switched-path *label-switched-path-name* auto-bandwidth]** hierarchy level are optional and explained in the following sections:

- [Configuring the Automatic Bandwidth Allocation Interval on page 4484](#)
- [Configuring the Maximum and Minimum Bounds of the LSP's Bandwidth on page 4484](#)
- [Configuring the Automatic Bandwidth Adjustment Threshold on page 4485](#)
- [Configuring a Limit on Bandwidth Overflow and Underflow Samples on page 4485](#)
- [Configuring Passive Bandwidth Utilization Monitoring on page 4487](#)

#### ***Configuring the Automatic Bandwidth Allocation Interval***

At the end of the automatic bandwidth allocation interval, the automatic bandwidth computation and new path setup process is triggered.

**NOTE:** To prevent unnecessary resignaling of LSPs, it is best to configure an LSP adjustment interval that is at least three times longer than the MPLS automatic bandwidth statistics interval. For example, if you configure a value of 30 seconds for the MPLS automatic bandwidth statistics interval (**interval** statement at the **[edit protocols mpls statistics]** hierarchy level), you should configure a value of at least 90 seconds for the LSP adjustment interval (**adjust-interval** statement at the **[edit protocols mpls label-switched-path *label-switched-path-name* auto-bandwidth]** hierarchy level). See also [“Configuring Reporting of Automatic Bandwidth Allocation Statistics” on page 4489](#).

To specify the bandwidth reallocation interval in seconds for a specific LSP, include the **adjust-interval** statement:

```
adjust-interval seconds;
```

You can include this statement at the following hierarchy levels:

- **[edit protocols mpls label-switched-path *lsp-name* auto-bandwidth]**
- **[edit logical-systems *logical-system-name* protocols mpls label-switched-path *lsp-name* auto-bandwidth]**

#### ***Configuring the Maximum and Minimum Bounds of the LSP's Bandwidth***

You can maintain the LSP's bandwidth between minimum and maximum bounds by specifying values for the **minimum-bandwidth** and **maximum-bandwidth** statements.

To specify the minimum amount of bandwidth allocated for a specific LSP, include the **minimum-bandwidth** statement:

```
minimum-bandwidth bps;
```

You can include this statement at the following hierarchy levels:

- **[edit protocols mpls label-switched-path *lsp-name* auto-bandwidth]**

- [edit logical-systems *logical-system-name* protocols mpls label-switched-path *lsp-name* [auto-bandwidth](#)]

To specify the maximum amount of bandwidth allocated for a specific LSP, include the **maximum-bandwidth** statement:

```
maximum-bandwidth bps;
```

You can include this statement at the following hierarchy levels:

- [edit protocols mpls label-switched-path *lsp-name* [auto-bandwidth](#)]
- [edit logical-systems *logical-system-name* protocols mpls label-switched-path *lsp-name* [auto-bandwidth](#)]

### ***Configuring the Automatic Bandwidth Adjustment Threshold***

Use the **adjust-threshold** statement to specify the sensitivity of the automatic bandwidth adjustment of an LSP to changes in bandwidth utilization. You can set the threshold for when to trigger automatic bandwidth adjustments. When configured, bandwidth demand for the current interval is determined and compared to the LSP's current bandwidth allocation. If the percentage difference in bandwidth is greater than or equal to the specified **adjust-threshold** percentage, the LSP's bandwidth is adjusted to the current bandwidth demand.

For example, assume that the current bandwidth allocation is 100 megabits per second (Mbps) and that the percentage configured for the **adjust-threshold** statement is 15 percent. If the bandwidth demand increases to 110 Mbps, the bandwidth allocation is not adjusted. However, if the bandwidth demand increases to 120 Mbps (20 percent over the current allocation) or decreases to 80 Mbps (20 percent under the current allocation), the bandwidth allocation is increased to 120 Mbps or decreased to 80 Mbps, respectively.

To configure the threshold for automatic bandwidth adjustment, include the **adjust-threshold** statement:

```
adjust-threshold percent;
```

You can include this statement at the following hierarchy levels:

- [edit protocols mpls label-switched-path *lsp-name* [auto-bandwidth](#)]
- [edit logical-systems *logical-system-name* protocols mpls label-switched-path *lsp-name* [auto-bandwidth](#)]

### ***Configuring a Limit on Bandwidth Overflow and Underflow Samples***

The automatic bandwidth adjustment timer is a periodic timer which is triggered every adjust interval to determine whether any bandwidth adjustments are required on the LSP's active path. This interval is typically configured as a long period of time, usually hours. If, at the end of adjust interval, the change in bandwidth is above a certain adjust threshold, the LSP is resigaled with the new bandwidth.

During the automatic bandwidth adjustment interval, the router might receive a steady increase in traffic (increasing bandwidth utilization) on an LSP, potentially causing

congestion or packet loss. To prevent this, you can define a second trigger to prematurely expire the automatic bandwidth adjustment timer before the end of the current adjustment interval.

Every statistics interval, the router samples the average bandwidth utilization of an LSP and if this has exceeded the current maximum average bandwidth utilization, the maximum average bandwidth utilization is updated.

During each sample period, the following conditions are also checked:

- Is the current average bandwidth utilization above the active bandwidth of the path?
- Has the difference between the average bandwidth utilization and the active bandwidth exceeded the adjust threshold (bandwidth utilization has changed significantly)?

If these conditions are true, it is considered to be one bandwidth overflow sample. Using the **adjust-threshold-overflow-limit** statement, you can define a limit on the number of bandwidth overflow samples such that when the limit is reached, the current automatic bandwidth adjustment timer is expired and a bandwidth adjustment is triggered. Once this adjustment is complete, the normal automatic bandwidth adjustment timer is reset to expire after the periodic adjustment interval.

To specify a limit on the number of bandwidth overflow samples before triggering an automatic bandwidth allocation adjustment, configure the **adjust-threshold-overflow-limit** statement:

**adjust-threshold-overflow-limit** *number*;

Similarly, if the current average bandwidth utilization is below the active bandwidth of the path by the configured adjusted threshold (meaning that bandwidth utilization has gone down significantly), the sample is considered to be an underflow sample. The adjusted (new signaling) bandwidth after an adjustment due to underflow is the maximum average bandwidth among the underflow samples. You can specify a limit on the number of bandwidth underflow samples before triggering an automatic bandwidth allocation adjustment by configuring the **adjust-threshold-underflow-limit** statement:

**adjust-threshold-underflow-limit** *number*;

These statements can be configured at the following hierarchy levels:

- [edit protocols mpls label-switched-path *lsp-name* **auto-bandwidth**]
- [edit logical-systems *logical-system-name* protocols mpls label-switched-path *lsp-name* **auto-bandwidth**]

You must configure the **adjust-threshold** and **minimum-bandwidth** statements whenever you configure the **adjust-threshold-underflow-limit** statement. You must configure the **adjust-threshold** and **maximum-bandwidth** statements whenever you configure the **adjust-threshold-overflow-limit** statement

- You must configure a nonzero value for the **adjust-threshold** statement if you configure the **adjust-threshold-overflow-limit** or **adjust-threshold-underflow-limit** statement.

- Any bandwidth increase or decrease below the value configured for the **adjust-threshold** statement does not constitute an overflow or underflow condition.
- To prevent unlimited increases in LSP bandwidth (to limit overflow beyond a certain bandwidth), you must also configure the **maximum-bandwidth** statement when you configure the **adjust-threshold-overflow-limit** statement.

The following describes the other aspects of the **adjust-threshold-overflow-limit** statement:

- It only applies to bandwidth overflows. If the bandwidth is decreasing, the normal automatic bandwidth adjustment interval is used.
- It does not affect manually triggered automatic bandwidth adjustment.
- It applies to single-class DiffServ-TE LSPs.
- Because the **adjust-threshold-overflow-limit** statement can trigger a bandwidth adjustment, it cannot be enabled at the same time as the **monitor-bandwidth** statement (for information about that statement, see [“Configuring Passive Bandwidth Utilization Monitoring” on page 4487](#)).
- You cannot configure automatic bandwidth adjustments to occur more often than every 300 seconds. The **adjust-threshold-overflow-limit** statement is subject to the same minimum value with regard to the minimum frequency of adjustment allowed. Overflow condition based adjustments can occur no sooner than 300 seconds from the start of the overflow condition. Therefore it is required that:

**sample interval x adjust-threshold-overflow-limit >= 300s**

These values are checked during the commit operation. An error is returned if the value is less than 300 seconds.

- If you change the value of the **adjust-threshold-overflow-limit** statement on a working router, you can expect the following behavior:
  - If you increase the current value of the **adjust-threshold-overflow-limit** statement, the old value is replaced with the new one.
  - If you decrease the current value of the **adjust-threshold-overflow-limit** statement and the current bandwidth overflow count is less than the new value, the old value is replaced with the new one.
  - If you decrease the current value of the **adjust-threshold-overflow-limit** statement and the current bandwidth overflow count is greater than the new value, the adjustment timer is immediately expired and a bandwidth adjustment is initiated.

### ***Configuring Passive Bandwidth Utilization Monitoring***

Use the **monitor-bandwidth** statement to switch to a passive bandwidth utilization monitoring mode. In this mode, no automatic bandwidth adjustments are made, but the maximum average bandwidth utilization is continuously monitored and recorded.

To configure passive bandwidth utilization monitoring, include the **monitor-bandwidth** statement:

**monitor-bandwidth;**

You can include this statement at the following hierarchy levels:

- [edit protocols mpls label-switched-path *lsp-name* **auto-bandwidth**]
- [edit logical-systems *logical-system-name* protocols mpls label-switched-path *lsp-name* **auto-bandwidth**]

If you have configured an LSP with primary and secondary paths, the automatic bandwidth allocation statistics are carried over to the secondary path if the primary path fails. For example, consider a primary path whose adjustment interval is half complete and whose maximum average bandwidth usage is currently calculated as 50 Mbps. If the primary path suddenly fails, the time remaining for the next adjustment and the maximum average bandwidth usage are carried over to the secondary path.

### Requesting Automatic Bandwidth Allocation Adjustment

---

For MPLS LSP automatic bandwidth allocation adjustment, the minimum value for the adjustment interval is 5 minutes (300 seconds). You might find it necessary to trigger a bandwidth allocation adjustment manually, for example in the following circumstances:

- When you are testing automatic bandwidth allocation in a network lab.
- When the LSP is configured for automatic bandwidth allocation in monitor mode (the **monitor-bandwidth** statement is included in the configuration as described in [“Configuring Passive Bandwidth Utilization Monitoring” on page 4487](#)), and want to initiate an immediate bandwidth adjustment.

To use the **request mpls lsp adjust-autobandwidth** command, the following must be true:

- Automatic bandwidth allocation must be enabled on the LSP.
- The criteria required to trigger a bandwidth adjustment have been met (the difference between the adjust bandwidth and the current LSP path bandwidth is greater than the threshold limit).

A manually triggered bandwidth adjustment operates only on the active LSP path. Also, if you have enabled periodic automatic bandwidth adjustment, the periodic automatic bandwidth adjustment parameters (the adjustment interval and the maximum average bandwidth) are not reset after a manual adjustment.

For example, suppose the periodic adjust interval is 10 hours and there are currently 5 hours remaining before an automatic bandwidth adjustment is triggered. If you initiate a manual adjustment with the **request mpls lsp adjust-autobandwidth** command, the adjust timer is not reset and still has 5 hours remaining.

To manually trigger a bandwidth allocation adjustment, you need to use the **request mpls lsp adjust-autobandwidth** command. You can trigger the command for all affected LSPs on the router, or you can specify a particular LSP:

```
user@host> request mpls lsp adjust-autobandwidth
```

Once you execute this command, the automatic bandwidth adjustment validation process is triggered. If all the criteria for adjustment are met, the LSP's active path bandwidth is adjusted to the adjusted bandwidth value determined during the validation process.

## Configuring Reporting of Automatic Bandwidth Allocation Statistics

Automatic bandwidth allocation allows an MPLS tunnel to automatically adjust its bandwidth allocation based on the volume of traffic flowing through the tunnel. You can configure the device to collect statistics related to automatic bandwidth allocation by completing the following steps:

1. To collect statistics related to automatic bandwidth allocation, configure the **auto-bandwidth** option for the **statistics** statement at the **[edit protocols mpls]** hierarchy level. These settings apply to all LSPs configured on the router on which you have also configured the **auto-bandwidth** statement at the **[edit protocols mpls label-switched-path label-switched-path-name]** hierarchy level.
 

```
statistics {
  auto-bandwidth;
  file filename <files number> <size size> <world-readable | no-world-readable>;
  interval seconds;
  no-transit-statistics;
}
```
2. Specify the **filename** for the files used to store the MPLS trace operation output using the **file** option. All files are placed in the directory **/var/log**. We recommend that you place MPLS tracing output in the file **mpls-log**.
3. Specify the maximum number of trace files using the **files number** option. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.
4. Specify the interval for calculating the average bandwidth usage by configuring a time in seconds using the **interval** option. You can also set the adjustment interval on a specific LSP by configuring the **interval** option at the **[edit protocols mpls label-switch-path label-switched-path-name statistics]** hierarchy level.

**NOTE:** To prevent unnecessary resignaling of LSPs, it is best to configure an LSP adjustment interval that is at least three times longer than the MPLS automatic bandwidth statistics interval. For example, if you configure a value of 30 seconds for the MPLS automatic bandwidth statistics interval (interval statement at the [edit protocols mpls statistics] hierarchy level), you should configure a value of at least 90 seconds for the LSP adjustment interval (adjust-interval statement at the [edit protocols mpls label-switched-path *label-switched-path-name* auto-bandwidth] hierarchy level).

- To trace automatic bandwidth allocation, include the **autobw-state** flag for the MPLS **traceoptions** statement at the [edit protocols mpls] hierarchy level.

The following configuration enables the MPLS traceoptions for automatic bandwidth allocation. The trace records are stored in a file called **auto-band-trace** (the filename is user configurable):

```
[edit protocols mpls]
traceoptions {
  file auto-band-trace size 10k files 10 world-readable;
  flag autobw-state;
}
```

- Using the **show log** command, you can display the automatic bandwidth allocation statistics file generated when you configure the **auto-bandwidth** statement. The following shows sample log file output taken from an MPLS statistics file named **auto-band-stats** on a router configured with an LSP named **E-D**. The log file shows that LSP **E-D** is operating over its reserved bandwidth limit initially. Before **Oct 30 17:14:57**, the router triggered an automatic bandwidth adjustment (you might see two sessions for an LSP undergoing an automatic bandwidth adjustment). By **Oct 30 17:16:57**, the LSP has been reestablished at a higher bandwidth and is now shown using less than 100 percent of its **Reserved Bw** (reserved bandwidth).

```

7. Issue the `show mpls lsp autobandwidth` command to display current information about automatic bandwidth allocation. The following shows sample output from the `show mpls lsp autobandwidth` command taken at about the same time as the log file shown previously:

```

user@host> show mpls lsp autobandwidth
Lspname      Last      Requested      Reserved      Highwater      AdjustTime LastAdjust
BW           BW           BW           mark           Left (sec)
E-D          300bps      812.005bps    812bps        1.56801kbps 294 sec      Wed Oct 30 17:15:26 2013

```

8. Issue the `file show` command to display the MPLS trace file. You need to specify the file location and file name (the file is located in `/var/log/`). The following shows sample trace file output is taken from an MPLS trace file named `auto-band-trace.0.gz` on a router configured with an LSP named `E-D`. The trace file shows that LSP `E-D` is operating over its reserved bandwidth limit initially. At `Oct 30 17:15:26`, the router triggers an automatic bandwidth adjustment (you might see two sessions for an LSP undergoing an automatic bandwidth adjustment). By `Oct 30 17:15:57`, the LSP has been reestablished at a higher bandwidth and is now shown using less than 100 percent of its **Reserved Bw** (reserved bandwidth).

```

## Configuring the LDP Timer for Hello Messages

LDP hello messages enable LDP nodes to discover one another and to detect the failure of a neighbor or the link to the neighbor. Hello messages are sent periodically on all interfaces where LDP is enabled.

There are two types of LDP hello messages:

- Link hello messages—Sent through the LDP interface as UDP packets addressed to the LDP discovery port. Receipt of an LDP link hello message on an interface identifies an adjacency with the LDP peer router.
- Targeted hello messages—Sent as UDP packets addressed to the LDP discovery port at a specific address. Targeted hello messages are used to support LDP sessions

between routers that are not directly connected. A targeted router determines whether to respond or ignore a targeted hello message. A targeted router that chooses to respond does so by periodically sending targeted hello messages back to the initiating router.

By default, LDP sends hello messages every 5 seconds for link hello messages and every 15 seconds for targeted hello messages. You can configure the LDP timer to alter how often both types of hello messages are sent. However, you cannot configure a time for the LDP timer that is greater than the LDP hold time. For more information, see [“Configuring the Delay Before LDP Neighbors Are Considered Down” on page 4493](#).

### Configuring the LDP Timer for Link Hello Messages

To modify how often LDP sends link hello messages, specify a new link hello message interval for the LDP timer using the **hello-interval** statement:

```
hello-interval seconds;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

### Configuring the LDP Timer for Targeted Hello Messages

To modify how often LDP sends targeted hello messages, specify a new targeted hello message interval for the LDP timer by configuring the **hello-interval** statement as an option for the **targeted-hello** statement:

```
targeted-hello {
  hello-interval seconds;
}
```

For a list of hierarchy levels at which you can include these statements, see the statement summary sections for these statements.

## Configuring the Delay Before LDP Neighbors Are Considered Down

The hold time determines how long an LDP node should wait for a hello message before declaring a neighbor to be down. This value is sent as part of a hello message so that each LDP node tells its neighbors how long to wait. The values sent by each neighbor do not have to match.

The hold time should normally be at least three times the hello interval. The default is 15 seconds for link hello messages and 45 seconds for targeted hello messages. However, it is possible to configure an LDP hold time that is close to the value for the hello interval.

**NOTE:** By configuring an LDP hold time close to the hello interval (less than three times the hello interval), LDP neighbor failures might be detected more quickly. However, this also increases the possibility that the router might declare an LDP neighbor down that is still functioning normally. For more information, see [“Configuring the LDP Timer for Hello Messages” on page 4492](#).

The LDP hold time is also negotiated automatically between LDP peers. When two LDP peers advertise different LDP hold times to one another, the smaller value is used. If an LDP peer router advertises a shorter hold time than the value you have configured, the peer router's advertised hold time is used. This negotiation can affect the LDP keepalive interval as well.

If the local LDP hold time is not shortened during LDP peer negotiation, the user-configured keepalive interval is left unchanged. However, if the local hold time is reduced during peer negotiation, the keepalive interval is recalculated. If the LDP hold time has been reduced during peer negotiation, the keepalive interval is reduced to one-third of the new hold time value. For example, if the new hold-time value is 45 seconds, the keepalive interval is set to 15 seconds.

This automated keepalive interval calculation can cause different keepalive intervals to be configured on each peer router. This enables the routers to be flexible in how often they send keepalive messages, because the LDP peer negotiation ensures they are sent more frequently than the LDP hold time.

When you reconfigure the hold-time interval, changes do not take effect until after the session is reset. The hold time is negotiated when the LDP peering session is initiated and cannot be renegotiated as long as the session is up (required by RFC 5036, *LDP Specification*). To manually force the LDP session to reset, issue the **clear ldp session** command.

---

### Configuring the LDP Hold Time for Link Hello Messages

To modify how long an LDP node should wait for a link hello message before declaring the neighbor down, specify a new time in seconds using the **hold-time** statement:

```
hold-time seconds;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

---

### Configuring the LDP Hold Time for Targeted Hello Messages

To modify how long an LDP node should wait for a targeted hello message before declaring the neighbor down, specify a new time in seconds using the **hold-time** statement as an option for the **targeted-hello** statement:

```
targeted-hello {  
  hold-time seconds;  
}
```

For a list of hierarchy levels at which you can include these statements, see the statement summary sections for these statements.

## Configuring the Interval for LDP Keepalive Messages

The keepalive interval determines how often a message is sent over the session to ensure that the keepalive timeout is not exceeded. If no other LDP traffic is sent over the session in this much time, a keepalive message is sent. The default is 10 seconds. The minimum value is 1 second.

The value configured for the keepalive interval can be altered during LDP session negotiation if the value configured for the LDP hold time on the peer router is lower than the value configured locally. For more information, see [“Configuring the Delay Before LDP Neighbors Are Considered Down” on page 4493](#).

To modify the keepalive interval, include the **keepalive-interval** statement:

```
keepalive-interval seconds;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

## Configuring the LDP Keepalive Timeout

After an LDP session is established, messages must be exchanged periodically to ensure that the session is still working. The keepalive timeout defines the amount of time that the neighbor LDP node waits before deciding that the session has failed. This value is usually set to at least three times the keepalive interval. The default is 30 seconds.

To modify the keepalive interval, include the **keepalive-timeout** statement:

```
keepalive-timeout seconds;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

The value configured for the **keepalive-timeout** statement is displayed as the hold time when you issue the **show ldp session detail** command.

## Configuring LDP Route Preferences

When several protocols calculate routes to the same destination, route preferences are used to select which route is installed in the forwarding table. The route with the lowest preference value is selected. The preference value can be a number in the range 0 through 255. By default, LDP routes have a preference value of 9.

To modify the route preferences, include the **preference** statement:

```
preference preference;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

## Configuring LDP Graceful Restart

When you alter the graceful restart configuration at either the **[edit routing-options graceful-restart]** or **[edit protocols ldp graceful-restart]** hierarchy levels, any running LDP session is automatically restarted to apply the graceful restart configuration. This behavior mirrors the behavior of BGP when you alter its graceful restart configuration.

By default, graceful restart helper mode is enabled, but graceful restart is disabled. Thus, the default behavior of a router is to assist neighboring routers attempting a graceful restart, but not to attempt a graceful restart itself.

To configure LDP graceful restart, see the following sections:

- [Enabling Graceful Restart on page 4496](#)
- [Disabling LDP Graceful Restart or Helper Mode on page 4496](#)
- [Configuring Reconnect Time on page 4497](#)
- [Configuring Recovery Time and Maximum Recovery Time on page 4497](#)

---

### Enabling Graceful Restart

To enable LDP graceful restart, you also need to enable graceful restart on the router. To enable graceful restart, include the **graceful-restart** statement:

```
graceful-restart;
```

You can include this statement at the following hierarchy levels:

- **[edit routing-options]**
- **[edit logical-systems *logical-system-name* routing-options]**

The **graceful-restart** statement enables graceful restart for all protocols supporting this feature on the router. For more information about graceful restart, see the *Junos OS Routing Protocols Library for Routing Devices*.

By default, LDP graceful restart is enabled when you enable graceful restart at both the LDP protocol level and on all the routing instances. However, you can disable both LDP graceful restart and LDP graceful restart helper mode.

---

### Disabling LDP Graceful Restart or Helper Mode

To disable LDP graceful restart and recovery, include the **disable** statement:

```
ldp {  
  graceful-restart {  
    disable;  
  }  
}
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

You can disable helper mode at the LDP protocols level only. You cannot disable helper mode for a specific routing instance. To disable LDP helper mode, include the **helper-disable** statement:

```
ldp {  
  graceful-restart {  
    helper-disable;  
  }  
}
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

The following LDP graceful restart configurations are possible:

- LDP graceful restart and helper mode are both enabled.
- LDP graceful restart is disabled but helper mode is enabled. A router configured in this way cannot restart gracefully but can help a restarting neighbor.
- LDP graceful restart and helper mode are both disabled. The router does not use LDP graceful restart or the graceful restart type, length, and value (TLV) sent in the initialization message. The router behaves as a router that cannot support LDP graceful restart.

A configuration error is issued if you attempt to enable graceful restart and disable helper mode.

### Configuring Reconnect Time

After the LDP connection between neighbors fails, neighbors wait a certain amount of time for the gracefully restarting router to resume sending LDP messages. After the wait period, the LDP session can be reestablished. You can configure the wait period in seconds. This value is included in the fault tolerant session TLV sent in LDP initialization messages when LDP graceful restart is enabled.

Suppose that Router A and Router B are LDP neighbors. Router A is the restarting Router. The reconnect time is the time that Router A tells Router B to wait after Router B detects that Router A restarted.

To configure the reconnect time, include the **reconnect-time** statement:

```
graceful-restart {
  reconnect-time seconds;
}
```

You can set the reconnect time to a value in the range from 30 through 300 seconds. By default, it is 60 seconds.

For a list of hierarchy levels at which you can configure these statements, see the statement summary sections for these statements.

### Configuring Recovery Time and Maximum Recovery Time

The recovery time is the amount of time a router waits for LDP to restart gracefully. The recovery time period begins when an initialization message is sent or received. This period is also typically the amount of time that a neighboring router maintains its information about the restarting router, allowing it to continue to forward traffic.

To prevent a neighboring router from being adversely affected if it receives a false value for the recovery time from the restarting router, you can configure the maximum recovery time on the neighboring router. A neighboring router maintains its state for the shorter of the two times. For example, Router A is performing an LDP graceful restart. It has sent a recovery time of 900 seconds to neighboring Router B. However, Router B has its maximum recovery time configured at 400 seconds. Router B will only wait for 400 seconds before it purges its LDP information from Router A.

To configure recovery time, include the **recovery-time** statement and the **maximum-neighbor-recovery-time** statement:

```
graceful-restart {  
  maximum-neighbor-recovery-time seconds;  
  recovery-time seconds;  
}
```

For a list of hierarchy levels at which you can configure these statements, see the statement summary sections for these statements.

## Configuring the Prefixes Advertised into LDP from the Routing Table

You can control the set of prefixes that are advertised into LDP and cause the router to be the egress router for those prefixes. By default, only the loopback address is advertised into LDP. To configure the set of prefixes from the routing table to be advertised into LDP, include the **egress-policy** statement:

```
egress-policy policy-name;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

**NOTE:** If you configure an egress policy for LDP that does not include the loopback address, it is no longer advertised in LDP. To continue to advertise the loopback address, you need to explicitly configure it as a part of the LDP egress policy.

The named policy (configured at the **[edit policy-options]** or **[edit logical-systems logical-system-name policy-options]** hierarchy level) is applied to all routes in the routing table. Those routes that match the policy are advertised into LDP. You can control the set of neighbors to which those prefixes are advertised by using the **export** statement. Only **from** operators are considered; you can use any valid **from** operator. For more information, see the *Junos OS Routing Protocols Library for Routing Devices*.

---

### Example: Configuring the Prefixes Advertised into LDP

---

Advertise all connected routes into LDP:

```
[edit protocols]  
ldp {  
  egress-policy connected-only;  
}  
policy-options {  
  policy-statement connected-only {  
    from {  
      protocol direct;  
    }  
    then accept;  
  }  
}
```

## Configuring LDP LSP Traceroute

You can trace the route followed by an LDP-signaled LSP. LDP LSP traceroute is based on RFC 4379, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures*. This

feature allows you to periodically trace all paths in a FEC. The FEC topology information is stored in a database accessible from the CLI.

A topology change does not automatically trigger a trace of an LDP LSP. However, you can manually initiate a traceroute. If the traceroute request is for an FEC that is currently in the database, the contents of the database are updated with the results.

The periodic traceroute feature applies to all FECs specified by the **oam** statement configured at the **[edit protocols ldp]** hierarchy level. To configure periodic LDP LSP traceroute, include the **periodic-traceroute** statement:

```
periodic-traceroute {
  disable;
  exp exp-value;
  fanout fanout-value;
  frequency minutes;
  paths number-of-paths;
  retries retry-attempts;
  source address;
  ttl ttl-value;
  wait seconds;
}
```

You can configure this statement at the following hierarchy levels:

- **[edit protocols ldp oam]**
- **[edit protocols ldp oam fec *address*]**

You can configure the **periodic-traceroute** statement by itself or with any of the following options:

- **exp**—Specify the class of service to use when sending probes.
- **fanout**—Specify the maximum number of next hops to search per node.
- **frequency**—Specify the interval between traceroute attempts.
- **paths**—Specify the maximum number of paths to search.
- **retries**—Specify the number of attempts to send a probe to a specific node before giving up.
- **source**—Specify the IPv4 source address to use when sending probes.
- **ttl**—Specify the maximum time-to-live value. Nodes that are beyond this value are not traced.
- **wait**—Specify the wait interval before resending a probe packet.

## Configuring Miscellaneous LDP Properties

The following sections describe how to configure a number of miscellaneous LDP properties:

- [Configuring LDP to Use the IGP Route Metric on page 4500](#)
- [Preventing Addition of Ingress Routes to the inet.0 Routing Table on page 4500](#)
- [Multiple-Instance LDP and Carrier-of-Carriers VPNs on page 4501](#)
- [Configuring MPLS and LDP to Pop the Label on the Ultimate-Hop Router on page 4501](#)
- [Enabling LDP over RSVP-Established LSPs on page 4501](#)
- [Enabling LDP over RSVP-Established LSPs in Heterogeneous Networks on page 4502](#)
- [Configuring the TCP MD5 Signature for LDP Sessions on page 4502](#)
- [Configuring LDP Session Protection on page 4503](#)
- [Disabling SNMP Traps for LDP on page 4504](#)
- [Configuring LDP Synchronization with the IGP on LDP Links on page 4504](#)
- [Configuring LDP Synchronization with the IGP on the Router on page 4505](#)
- [Configuring the Label Withdrawal Timer on page 4505](#)
- [Ignoring the LDP Subnet Check on page 4505](#)

---

### Configuring LDP to Use the IGP Route Metric

Use the **track-igp-metric** statement if you want the interior gateway protocol (IGP) route metric to be used for the LDP routes instead of the default LDP route metric (the default LDP route metric is 1).

To use the IGP route metric, include the **track-igp-metric** statement:

```
track-igp-metric;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

---

### Preventing Addition of Ingress Routes to the inet.0 Routing Table

By configuring the **no-forwarding** statement, you can prevent ingress routes from being added to the inet.0 routing table instead of the inet.3 routing table even if you enabled the **traffic-engineering bgp-igp** statement at the **[edit protocols mpls]** or the **[edit logical-systems *logical-system-name* protocols mpls]** hierarchy level. By default, the **no-forwarding** statement is disabled.

To omit ingress routes from the inet.0 routing table, include the **no-forwarding** statement:

```
no-forwarding;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

### Multiple-Instance LDP and Carrier-of-Carriers VPNs

By configuring multiple LDP routing instances, you can use LDP to advertise labels in a carrier-of-carriers VPN from a service provider provider edge (PE) router to a customer carrier customer edge (CE) router. This is especially useful when the carrier customer is a basic Internet service provider (ISP) and wants to restrict full Internet routes to its PE routers. By using LDP instead of BGP, the carrier customer shields its other internal routers from the Internet. Multiple-instance LDP is also useful when a carrier customer wants to provide Layer 2 or Layer 3 VPN services to its customers.

For an example of how to configure multiple LDP routing instances for carrier-of-carriers VPNs, see the *Multiple Instances for Label Distribution Protocol Feature Guide*.

### Configuring MPLS and LDP to Pop the Label on the Ultimate-Hop Router

The default advertised label is label 3 (Implicit Null label). If label 3 is advertised, the penultimate-hop router removes the label and sends the packet to the egress router. If ultimate-hop popping is enabled, label 0 (IPv4 Explicit Null label) is advertised. Ultimate-hop popping ensures that any packets traversing an MPLS network include a label.

To configure ultimate-hop popping, include the **explicit-null** statement:

```
explicit-null;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

**NOTE:** Juniper Networks routers queue packets based on the incoming label. Routers from other vendors might queue packets differently. Keep this in mind when working with networks containing routers from multiple vendors.

For more information about labels, see *Label Description* and *Label Allocation*.

### Enabling LDP over RSVP-Established LSPs

You can run LDP over LSPs established by RSVP, effectively tunneling the LDP-established LSP through the one established by RSVP. To do so, enable LDP on the lo0.0 interface (see “[Enabling and Disabling LDP](#)” on page 4435). You must also configure the LSPs over which you want LDP to operate by including the **ldp-tunneling** statement at the **[edit protocols mpls label-switched-path *lsp-name*]** hierarchy level:

```
[edit]
protocols {
  mpls {
    label-switched-path lsp-name {
      from source;
      to destination;
      ldp-tunneling;
    }
  }
}
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

**Related  
Documentation**

- [Tunneling LDP LSPs in RSVP LSPs Overview on page 4428](#)

---

### Enabling LDP over RSVP-Established LSPs in Heterogeneous Networks

Some other vendors use an OSPF metric of 1 for the loopback address. Juniper Networks routers use an OSPF metric of 0 for the loopback address. This might require that you manually configure the RSVP metric when deploying LDP tunneling over RSVP LSPs in heterogeneous networks.

When a Juniper Networks router is linked to another vendor's router through an RSVP tunnel, and LDP tunneling is also enabled, by default the Juniper Networks router might not use the RSVP tunnel to route traffic to the LDP destinations downstream of the other vendor's egress router if the RSVP path has a metric of 1 larger than the physical OSPF path.

To ensure that LDP tunneling functions properly in heterogeneous networks, you can configure OSPF to ignore the RSVP LSP metric by including the **ignore-lsp-metrics** statement:

```
ignore-lsp-metrics;
```

You can configure this statement at the following hierarchy levels:

- **[edit protocols ospf traffic-engineering shortcuts]**
- **[edit logical-systems *logical-system-name* protocols ospf traffic-engineering shortcuts]**

To enable LDP over RSVP LSPs, you also still need to complete the procedure in Section [“Enabling LDP over RSVP-Established LSPs” on page 4501](#).

---

### Configuring the TCP MD5 Signature for LDP Sessions

You can configure an MD5 signature for an LDP TCP connection to protect against the introduction of spoofed TCP segments into LDP session connection streams.

A router using the MD5 signature option is configured with a password for each peer for which authentication is required. The password is stored encrypted.

LDP hello adjacencies can still be created even when peering interfaces are configured with different security signatures. However, the TCP session cannot be authenticated and is never established.

To configure an MD5 signature for an LDP TCP connection, include the **session** and **authentication-key** statement:

```
session address {  
  authentication-key md5-authentication-key;  
}
```

For a list of hierarchy levels at which you can include these statements, see the statement summary section for the **session** statement.

Use the **session** statement to configure the address for the remote end of the LDP session.

The **md5-authentication-key** (password) can be up to 69 characters long. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks.

You can also configure an authentication key update mechanism for the LDP routing protocol. This mechanism allows you to update authentication keys without interrupting associated routing and signaling protocols such as Open Shortest Path First (OSPF) and Resource Reservation Setup Protocol (RSVP).

To configure the authentication key update mechanism, include the **key-chain** statement at the **[edit security authentication-key-chains]** hierarchy level, and specify the **key** option to create a keychain consisting of several authentication keys.

```
[edit security authentication-key-chains]
key-chain key-chain-name {
  key key {
    secret secret-data;
    start-time yyyy-mm-dd.hh:mm:ss;
  }
}
```

To configure the authentication key update mechanism for the LDP routing protocol, include the **authentication-key-chain** statement at the **[edit protocols ldp]** hierarchy level to associate the protocol with the **[edit security authentication-key-chains]** authentication keys.

```
[edit protocols ldp]
group group-name {
  neighbor address {
    authentication-key-chain key-chain-name;
  }
}
```

For more information about the authentication key update feature, see *Configuring the Authentication Key Update Mechanism for BGP and LDP Routing Protocols*.

### Configuring LDP Session Protection

An LDP session is normally created between a pair of routers that are connected by one or more links. The routers form one hello adjacency for every link that connects them and associate all the adjacencies with the corresponding LDP session. When the last hello adjacency for an LDP session goes away, the LDP session is terminated. You might want to modify this behavior to prevent an LDP session from being unnecessarily terminated and reestablished.

You can configure the Junos OS to leave the LDP session between two routers up even if there are no hello adjacencies on the links connecting the two routers by configuring the **session-protection** statement. You can optionally specify a time in seconds using the **timeout** option. The session remains up for the duration specified as long as the routers maintain IP network connectivity.

```
session-protection {
  timeout seconds;
}
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section.

### Disabling SNMP Traps for LDP

---

Whenever an LDP LSP makes a transition from up to down, or down to up, the router sends an SNMP trap. However, it is possible to disable the LDP SNMP traps on a router, logical system, or routing instance.

For information about the LDP SNMP traps and the proprietary LDP MIB, see the *SNMP MIBs and Traps Reference* and *Interpreting the Enterprise-Specific LDP MIB*.

To disable SNMP traps for LDP, specify the **trap disable** option for the **log-updown** statement:

```
log-updown {  
    trap disable;  
}
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

### Configuring LDP Synchronization with the IGP on LDP Links

---

LDP is a protocol for distributing labels in non-traffic-engineered applications. Labels are distributed along the best path determined by the IGP. If synchronization between LDP and the IGP is not maintained, the LSP goes down. When LDP is not fully operational on a given link (a session is not established and labels are not exchanged), the IGP advertises the link with the maximum cost metric. The link is not preferred but remains in the network topology.

LDP synchronization is supported only on active point-to-point interfaces and LAN interfaces configured as point-to-point under the IGP. LDP synchronization is not supported during graceful restart.

To advertise the maximum cost metric until LDP is operational for synchronization, include the **ldp-synchronization** statement:

```
ldp-synchronization {  
    disable;  
    hold-time seconds;  
}
```

To disable synchronization, include the **disable** statement. To configure the time period to advertise the maximum cost metric for a link that is not fully operational, include the **hold-time** statement.

For a list of hierarchy levels at which you can configure this statement, see the statement summary section for this statement.

### Configuring LDP Synchronization with the IGP on the Router

You can configure the time the LDP waits before informing the IGP that the LDP neighbor and session for an interface are operational. For large networks with numerous FECs, you might need to configure a longer value to allow enough time for the LDP label databases to be exchanged.

To configure the time the LDP waits before informing the IGP that the LDP neighbor and session are operational, include the **igp-synchronization** statement and specify a time in seconds for the **holddown-interval** option:

```
igp-synchronization holddown-interval seconds;
```

For a list of hierarchy levels at which you can configure this statement, see the statement summary section for this statement.

### Configuring the Label Withdrawal Timer

The label withdrawal timer delays sending a label withdrawal message for a FEC to a neighbor. When an IGP link to a neighbor fails, the label associated with the FEC has to be withdrawn from all the upstream routers if the neighbor is the next hop for the FEC. After the IGP converges and a label is received from a new next hop, the label is readvertised to all the upstream routers. This is the typical network behavior. By delaying label withdrawal by a small amount of time (for example, until the IGP converges and the router receives a new label for the FEC from the downstream next hop), the label withdrawal and sending a label mapping soon could be avoided. The **label-withdrawal-delay** statement allows you to configure this delay time. By default, the delay is 60 seconds.

If the router receives the new label before the timer runs out, the label withdrawal timer is canceled. However, if the timer runs out, the label for the FEC is withdrawn from all of the upstream routers.

By default, LDP waits for 60 seconds before withdrawing labels to avoid resignaling LSPs multiple times while the IGP is reconverging. To configure the label withdrawal delay time in seconds, include the **label-withdrawal-delay** statement:

```
label-withdrawal-delay seconds;
```

For a list of hierarchy levels at which you can configure this statement, see the statement summary section for this statement.

### Ignoring the LDP Subnet Check

In Junos OS Release 8.4 and later releases, an LDP source address subnet check is performed during the neighbor establishment procedure. The source address in the LDP link hello packet is matched against the interface address. This causes an interoperability issue with some other vendors' equipment.

To disable the subnet check, include the **allow-subnet-mismatch** statement:

```
allow-subnet-mismatch;
```

This statement can be included at the following hierarchy levels:

- **[edit protocols ldp interface interface-name]**

- `[edit logical-systems logical-system-name protocols ldp interface interface-name]`

## Configuring Ethernet over MPLS (L2 Circuit)

To implement Ethernet over MPLS, you must configure a Layer 2 circuit on the provider edge (PE) switches. No special configuration is required on the customer edge (CE) switches. The provider switches require MPLS and LDP to be configured on the interfaces that will be receiving and transmitting MPLS packets.

**NOTE:** A Layer 2 circuit is similar to a circuit cross-connect (CCC), except that multiple Layer 2 circuits can be transported over a single label-switched path (LSP) tunnel between two PE routers. In contrast, each CCC requires a dedicated LSP

This topic describes how to configure the PE switches to support Ethernet over MPLS. You must configure interfaces and protocols on the local PE (PE1) and the remote PE (PE2). The configuration of the interfaces varies depending upon whether the Layer 2 circuit is port-based or VLAN-based.

**NOTE:** This topic refers to the local PE switch as PE1 and the remote PE switch as PE2. It also uses interface names rather than variables to help clarify the connections between the switches. The loopback addresses of the switches are configured as follows:

- PE1: 1.1.1.1
- PE2: 4.4.4.4

- [Configuring the Local PE Switch for Port-Based Layer 2 Circuit \(Pseudo-wire\) on page 4506](#)
- [Configuring the Remote PE Switch for Port-Based Layer 2 Circuit \(Pseudo-wire\) on page 4507](#)
- [Configuring the Local PE Switch for VLAN-Based Layer 2 Circuit on page 4507](#)
- [Configuring the Remote PE Switch for VLAN-Based Layer 2 Circuit on page 4508](#)

### Configuring the Local PE Switch for Port-Based Layer 2 Circuit (Pseudo-wire)

---

To configure the local PE switch (PE1) for a port-based layer 2 circuit (pseudo-wire):

1. Configure an access CE-facing interface for Ethernet encapsulation:

```
[edit interfaces]
user@switch# set xe-0/0/6 encapsulation ethernet-ccc
```

2. Configure the Layer 2 circuit from PE1 to PE2:

```
[edit protocols]
user@switch# set l2circuit neighbor 4.4.4.4 interface xe-0/0/6 virtual-circuit-id 1
```

3. Configure the label switched path from PE1 to PE2:

```
[edit protocols]
```

```
user@switch#set mpls label-switched-path PE1-to-PE2 to 4.4.4.4
```

4. Configure the protocols on the core and loopback interfaces:

```
[edit protocols]
user@switch#set mpls interface xe-0/0/7
user@switch#set rsvp interface xe-0/0/7
user@switch#set ldp interface lo0.0
```

### Configuring the Remote PE Switch for Port-Based Layer 2 Circuit (Pseudo-wire)

To configure the remote PE switch (PE2) for a port-based layer 2 circuit:

1. Configure an access CE-facing interface for Ethernet encapsulation:

```
[edit interfaces]
user@switch# set xe-0/0/6 encapsulation ethernet-ccc
```

2. Configure the Layer 2 circuit from PE2 to PE1:

```
[edit protocols]
user@switch#set l2circuit neighbor 1.1.1.1 interface xe-0/0/6 virtual-circuit-id 1
```

3. Configure the label switched path from PE2 to PE1:

```
[edit protocols]
user@switch#set mpls label-switched-path PE2-to-PE1 to 1.1.1.1
```

4. Configure the protocols on the core and loopback interfaces:

```
[edit protocols]
user@switch#set mpls interface xe-0/0/7
user@switch#set rsvp interface xe-0/0/7
user@switch#set ldp interface lo0.0
```

### Configuring the Local PE Switch for VLAN-Based Layer 2 Circuit

To configure the local PE switch (PE1) for a VLAN-based layer 2 circuit:

1. Configure an access CE-facing interface for VLAN encapsulation:

```
[edit interfaces]
user@switch# set xe-0/0/6 encapsulation vlan-ccc
```

2. Configure the logical unit of the CE-facing interface for VLAN encapsulation:

```
[edit interfaces]
user@switch# set xe-0/0/6 unit 0 encapsulation vlan-ccc
```

3. Configure the logical unit of the CE-facing interface to belong to family ccc:

```
[edit interfaces]
user@switch# set xe-0/0/6 unit 0 family ccc
```

4. Configure the same interface for VLAN tagging:

```
[edit interfaces]
user@switch# set xe-0/0/6 vlan-tagging
```

5. Configure the VLAN ID of the interface:

```
[edit interfaces]
user@switch# set xe-0/0/6 unit 0 vlan-id 600
```

6. Configure the Layer 2 circuit from PE1 to PE2:

```
[edit protocols]
user@switch#set l2circuit neighbor 4.4.4.4 interface xe-0/0/6 virtual-circuit-id 1
```

7. Configure the label switched path from PE1 to PE2:

```
[edit protocols]
```

```
user@switch#set mpls label-switched-path PE1-to-PE2 to 4.4.4.4
```

8. Configure the protocols on the core and loopback interfaces:

```
[edit protocols]
user@switch#set mpls interface xe-0/0/7
user@switch#set rsvp interface xe-0/0/7
user@switch#set ldp interface lo0.0
```

### Configuring the Remote PE Switch for VLAN-Based Layer 2 Circuit

---

To configure the remote PE switch (PE2) for a VLAN-based layer 2 circuit:

1. Configure an access CE-facing interface for VLAN encapsulation:

```
[edit interfaces]
user@switch# set xe-0/0/6 encapsulation vlan-ccc
```

2. Configure the logical unit of the CE-facing interface for VLAN encapsulation:

```
[edit interfaces]
user@switch# set xe-0/0/6 unit 0 encapsulation vlan-ccc
```

3. Configure the logical unit of the CE-facing interface to belong to family ccc:

```
[edit interfaces]
user@switch# set xe-0/0/6 unit 0 family ccc
```

4. Configure the same interface for VLAN tagging:

```
[edit interfaces]
user@switch# set xe-0/0/6 vlan-tagging
```

5. Configure the VLAN ID of the interface:

```
[edit interfaces]
user@switch# set xe-0/0/6 unit 0 vlan-id 600
```

6. Configure the Layer 2 circuit from PE2 to PE1:

```
[edit protocols]
user@switch#set l2circuit neighbor 1.1.1.1 interface xe-0/0/6 virtual-circuit-id 1
```

7. Configure the label switched path from PE2 to PE1:

```
[edit protocols]
user@switch#set mpls label-switched-path PE2-to-PE1 to 1.1.1.1
```

8. Configure the protocols on the core and loopback interfaces:

```
[edit protocols]
user@switch#set mpls interface xe-0/0/7
user@switch#set rsvp interface xe-0/0/7
user@switch#set ldp interface lo0.0
```

## [edit protocols mpls] Hierarchy Level

This topic lists the supported configuration statements at the [\[edit protocols mpls\]](#) hierarchy level on the QFX Series and on the EX4600 switch. For more information about these statements, see the *Junos OS MPLS Applications Library for Routing Devices*.

**NOTE:** The command-line interface (CLI) on QFX Series devices and on the EX4600 switch displays even the MPLS related configuration statements that are not supported. However, configuring the unsupported statements on a device will have no effect on the operation of the device.

## auto-bandwidth (MPLS Statistics)

---

<b>Syntax</b>	auto-bandwidth;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls statistics], [edit protocols mpls statistics]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	Collect statistics related to automatic bandwidth.
<b>Required Privilege Level</b>	routing and trace—To view this statement in the configuration. routing-control and trace-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Automatic Bandwidth Allocation for LSPs on page 4482</a></li><li>• <a href="#">Configuring MPLS to Gather Statistics on page 4481</a></li><li>• <i>statistics</i></li></ul>

## auto-bandwidth

---

<b>Syntax</b>	<pre>auto-bandwidth {   adjust-interval <i>seconds</i>;   adjust-threshold <i>percent</i>;   adjust-threshold-activate-bandwidth <i>bps</i>   adjust-threshold-overflow-limit <i>number</i>;   adjust-threshold-underflow-limit <i>number</i>;   maximum-bandwidth <i>bps</i>;   minimum-bandwidth <i>bps</i>;   minimum-bandwidth-adjust-interval   minimum-bandwidth-adjust-threshold-change   minimum-bandwidth-adjust-threshold-value   monitor-bandwidth; }</pre>
<b>Hierarchy Level</b>	[edit protocols mpls label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	Allow an MPLS tunnel to automatically adjust its bandwidth allocation based on the volume of traffic flowing through the tunnel.
<b>Options</b>	The statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Automatic Bandwidth Allocation for LSPs on page 4482</a></li><li>• <a href="#">request mpls lsp adjust-autobandwidth on page 4598</a></li></ul>

## adjust-interval

<b>Syntax</b>	<code>adjust-interval <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	Specify the bandwidth reallocation interval.
<b>Options</b>	<b><i>seconds</i></b> —Bandwidth reallocation interval, in seconds. <b>Range:</b> 300 through 315,360,000 seconds <b>Default:</b> 86,400 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Automatic Bandwidth Allocation Interval on page 4484</a></li> </ul>

## adjust-threshold

<b>Syntax</b>	<code>adjust-threshold <i>percent</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	Specify how sensitive the automatic bandwidth adjustment for a label-switched path (LSP) is to changes in bandwidth utilization.
<b>Options</b>	<b><i>percent</i></b> —Bandwidth demand for the current bandwidth adjustment interval is determined and compared to the LSP's current bandwidth allocation. If the percentage difference in bandwidth is greater than or equal to the percentage specified by this statement, the LSP's bandwidth is adjusted to the current bandwidth demand.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Automatic Bandwidth Adjustment Threshold on page 4485</a></li> </ul>

## adjust-threshold-overflow-limit

---

<b>Syntax</b>	adjust-threshold-overflow-limit <i>number</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.5. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	Specify the number of consecutive bandwidth overflow samples before triggering a bandwidth adjustment.
<b>Options</b>	<i>number</i> —Number of consecutive bandwidth overflow samples. <b>Range:</b> 1 through 65,535 <b>Default:</b> This feature is disabled by default.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring a Limit on Bandwidth Overflow and Underflow Samples on page 4485</a></li></ul>

## adjust-threshold-underflow-limit

---

<b>Syntax</b>	adjust-threshold-underflow-limit <i>number</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	Specify the number of consecutive bandwidth underflow samples before triggering a bandwidth adjustment.
<b>Options</b>	<i>number</i> —Number of consecutive bandwidth underflow samples. <b>Range:</b> 1 through 65,535 <b>Default:</b> This feature is disabled by default.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring a Limit on Bandwidth Overflow and Underflow Samples on page 4485</a></li></ul>

## exp

Syntax	<pre>exp classifier-name {     import (classifier-name   default);     forwarding-class class-name {         loss-priority level {             code-points [ aliases ] [ bit-patterns ];         }     } }</pre>
Rewrite Rule Configuration	<pre>exp rewrite-name {     import (rewrite-name   default);     forwarding-class class-name {         loss-priority level {             code-point [ aliases ] [ bit-patterns ];         }     } }</pre>
Global Classifier Association with Interfaces	exp classifier-name;
Hierarchy Level	<pre>[edit class-of-service classifiers], [edit class-of-service rewrite-rules] [edit class-of-service system-defaults classifiers]</pre>
Release Information	Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	<p>Define the EXP code point mapping that is applied to MPLS packets. EXP classifiers are not applied to any traffic except MPLS traffic. EXP classifiers are applied only to interfaces that are configured as <b>family mpls</b> (for example, <b>set interfaces xe-0/0/35 unit 0 family mpls</b>.)</p> <p>You can configure as many EXP classifiers as you want. However, the switch uses only one EXP classifier as a global MPLS classifier on all interfaces. You specify the global EXP classifier in the <b>[edit class-of-service system-defaults]</b> hierarchy.</p>
Options	<b>classifier-name</b> —Name of the EXP classifier.
Required Privilege Level	<p>interfaces—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <li>• <a href="#">Configuring a Global MPLS EXP Classifier on page 4479</a></li> <li>• <a href="#">Configuring Rewrite Rules for MPLS EXP Classifiers on page 4480</a></li> <li>• <a href="#">Understanding CoS MPLS EXP Classifiers and Rewrite Rules on page 4419</a></li> <li>• <a href="#">Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces on page 5820</a></li> </ul>

## maximum-bandwidth (Protocols MPLS)

---

<b>Syntax</b>	maximum-bandwidth <i>bps</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	Specify the maximum amount of bandwidth in bits per second (bps).
<b>Options</b>	<i>bps</i> —Maximum amount of bandwidth.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Maximum and Minimum Bounds of the LSP's Bandwidth on page 4484</a></li></ul>

## minimum-bandwidth

---

<b>Syntax</b>	minimum-bandwidth <i>bps</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	Set the minimum bandwidth in bps for an LSP with automatic bandwidth allocation enabled.
<b>Options</b>	<i>bps</i> —Minimum bandwidth for the LSP.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Maximum and Minimum Bounds of the LSP's Bandwidth on page 4484</a></li></ul>

## minimum-bandwidth-adjust-interval

<b>Syntax</b>	<code>minimum-bandwidth-adjust-interval <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	Specify the duration (in seconds) for which minimum bandwidth is frozen.
<b>Options</b>	<b><i>seconds</i></b> —Minimum bandwidth reallocation interval, in seconds. <b>Range:</b> 300 through 31,536,000 seconds.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Maximum and Minimum Bounds of the LSP's Bandwidth on page 4484</a></li> </ul>

## minimum-bandwidth-adjust-threshold-change

<b>Syntax</b>	<code>minimum-bandwidth-adjust-threshold-change <i>percentage</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	Specify the percentage change in maximum average bandwidth to freeze the minimum bandwidth.
<b>Options</b>	<b><i>percentage</i></b> —Percentage change in maximum average bandwidth. <b>Range:</b> Range: 0 through 100 percent.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Maximum and Minimum Bounds of the LSP's Bandwidth on page 4484</a></li> </ul>

## minimum-bandwidth-adjust-threshold-value

---

<b>Syntax</b>	minimum-bandwidth-adjust-threshold-value <i>bps</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	Specify the value in bits per second (bps) to freeze the minimum bandwidth if the maximum average bandwidth falls below this value.
<b>Options</b>	<i>bps</i> —Threshold value for minimum bandwidth if the maximum average bandwidth falls below the specified value.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Maximum and Minimum Bounds of the LSP's Bandwidth on page 4484</a></li></ul>

## monitor-bandwidth

---

<b>Syntax</b>	monitor-bandwidth;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	Do not automatically adjust bandwidth allocation. However, the maximum average bandwidth utilization is monitored on the LSP, and the information is recorded in the MPLS statistics file.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Passive Bandwidth Utilization Monitoring on page 4487</a></li></ul>

## system-defaults

---

<b>Syntax</b>	<pre>system-defaults {   classifiers exp classifier-name; }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">class-of-service</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	<p>Configure the global EXP classifier used on all interfaces to classify MPLS traffic.</p> <p>Although you can configure as many EXP classifiers as you want, the switch uses only one EXP classifier as a global MPLS classifier on all interfaces. All switch interfaces use the EXP classifier specified as the system default to classify MPLS traffic.</p>
<b>Options</b>	The statements are explained separately.
<b>Required Privilege Level</b>	<p>interfaces—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring a Global MPLS EXP Classifier on page 4479</a></li> <li>• <a href="#">Configuring Rewrite Rules for MPLS EXP Classifiers on page 4480</a></li> <li>• <a href="#">Understanding CoS MPLS EXP Classifiers and Rewrite Rules on page 4419</a></li> <li>• <a href="#">Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces on page 5820</a></li> </ul>

## allow-subnet-mismatch

---

<b>Syntax</b>	allow-subnet-mismatch;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp interface <i>interface-name</i> ], [edit protocols ldp interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Ignore the LDP subnet check. For Junos OS Release 8.4 and later releases, an LDP source address subnet check was added for the neighbor establishment procedure. The source address in the LDP link hello packet is matched against the interface address.
<b>Default</b>	The source address in the LDP link hello packet is matched against the interface address.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Ignoring the LDP Subnet Check on page 4505</a></li></ul>

## authentication-algorithm

**Syntax** authentication-algorithm *algorithm*;

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols bgp],  
 [edit logical-systems *logical-system-name* protocols bgp **group** *group-name*],  
 [edit logical-systems *logical-system-name* protocols bgp **group** *group-name* neighbor *address*],  
 [edit logical-systems *logical-system-name* protocols ldp session *session-address*],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp **group** *group-name*],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ldp session *session-address*],  
 [edit logical-systems *logical-system-name* routing-options **bmp**],  
 [edit logical-systems *logical-system-name* routing-options bmp **station** *station-name*],  
 [edit protocols bgp],  
 [edit protocols bgp **group** *group-name*],

 [edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],  
 [edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*],  
 [edit routing-instances *routing-instance-name* protocols ldp session *session-address*],  
 [edit routing-options **bmp**],  
 [edit routing-options bmp **station** *station-name*]

**Release Information** Statement introduced in Junos OS Release 7.6.  
 Statement introduced for BGP in Junos OS Release 8.0.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.  
 Statement introduced for BMP in Junos OS Release 13.2X51-D15 for the QFX Series.  
 Statement introduced for BMP in Junos OS Release 13.3.

**Description** Configure an authentication algorithm type.

**Options** *algorithm*—Specify one of the following types of authentication algorithms:

- **aes-128-cmac-96**—Cipher-based message authentication code (AES128, 96 bits).
- **hmac-sha-1-96**—Hash-based message authentication code (SHA1, 96 bits).
- **md5**—Message digest 5.

**Default:** hmac-sha-1-96

**NOTE:** The default is not displayed in the output of the `show bgp bmp` command unless a key or key-chain is also configured.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

- [Example: Configuring Route Authentication for BGP on page 3572](#)
- [Configuring BGP Monitoring Protocol Version 3 on page 3307](#)

## authentication-key (Protocols LDP)

**Syntax** authentication-key *md5-authentication-key*;

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols ldp session *address*],  
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ldp session *address*],  
[edit protocols ldp session *address*],  
[edit routing-instances *routing-instance-name* protocols ldp session *address*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description** Configure the MD5 authentication signature. The maximum length of the authentication signature is 69 characters.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

- [Configuring the TCP MD5 Signature for LDP Sessions on page 4502](#)

## authentication-key-chain (Protocols LDP)

---

<b>Syntax</b>	authentication-key-chain <i>key-chain</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>name</i> protocols ldp session <i>address</i> ], [edit logical-systems <i>name</i> routing-instances <i>instance-name</i> protocols ldp session <i>address</i> ], [edit protocols ldp session <i>address</i> ], [edit routing-instances <i>instance-name</i> protocols ldp session <i>address</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Apply and enable an authentication keychain to the routing device. Note that the referenced key chain must be defined. When configuring the authentication key update mechanism for LDP, you cannot commit the <b>0.0.0.0/allow</b> statement with authentication keys or key chains. The CLI issues a warning and fails to commit such configurations.
<b>Options</b>	<i>key-chain</i> —Authentication keychain name. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Authentication Key Update Mechanism for BGP and LDP Routing Protocols</i></li><li>• <a href="#">Configuring Miscellaneous LDP Properties on page 4500</a></li></ul>

## deaggregate

---

<b>Syntax</b>	deaggregate   no-deaggregate;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Control forwarding equivalence class (FEC) deaggregation on the router. The use of the <b>deaggregate</b> statement in LDP is a standard practice that we recommend for LDP deployments.
<b>Default</b>	Deaggregation is disabled on the router.
<b>Options</b>	<b>deaggregate</b> —Deaggregate FECs. <b>no-deaggregate</b> —Aggregate FECs.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring FEC Deaggregation</i></li> </ul>

## disable (Protocols LDP)

---

<b>Syntax</b>	disable;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp graceful-restart], [edit logical-systems <i>logical-system-name</i> protocols ldp interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options graceful-restart], [edit protocols ldp graceful-restart], [edit protocols ldp interface <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> routing-options graceful-restart]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Explicitly disable LDP on an interface, or explicitly disable LDP graceful restart.
<b>Default</b>	LDP is enabled on interfaces configured with the LDP <b>interface</b> statement. LDP graceful restart is automatically enabled when graceful restart is enabled under the <b>[edit routing-options]</b> hierarchy level.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Enabling and Disabling LDP on page 4435</a></li><li>• <a href="#">Configuring LDP Graceful Restart on page 4495</a></li></ul>

## dod-request-policy

---

<b>Syntax</b>	<code>dod-request-policy <i>dod-request-policy-name</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit protocols ldp]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify the name of the LDP downstream on demand request policy. LDP sends label request messages only for those FECs matching in the downstream on demand request policy.
<b>Options</b>	<i>dod-request-policy-name</i> —Specify the name of the downstream on demand request policy.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring LDP Downstream on Demand on page 4462</a></li> </ul>

## downstream-on-demand

---

<b>Syntax</b>	<code>downstream-on-demand;</code>
<b>Hierarchy Level</b>	[edit logical systems <i>logical-system-name</i> protocols ldp session <i>session-address</i> ], [edit protocols ldp session <i>session-address</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Enable LDP downstream on demand on the LDP session. LDP is widely deployed in downstream unsolicited advertisement mode. As service providers integrate the access and aggregation networks into a single MPLS domain, LDP downstream on demand is needed to distribute the bindings between access and aggregation networks to minimize the workload for the access node (AN) control plane and to avoid the storage of tens of thousands of label bindings from upstream aggregation nodes.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring LDP Downstream on Demand on page 4462</a></li> </ul>

## egress-policy

---

<b>Syntax</b>	<code>egress-policy [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Control the prefixes advertised into LDP.
<b>Default</b>	Only the loopback address is advertised.
<b>Options</b>	<i>policy-names</i> —Name of one or more routing policies.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Prefixes Advertised into LDP from the Routing Table on page 4498</a></li></ul>

## explicit-null (Protocols LDP)

---

<b>Syntax</b>	<code>explicit-null;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Advertise label 0 to the egress router of a label-switched path (LSP).
<b>Default</b>	If you do not include the <b>explicit-null</b> statement in the MPLS configuration, label 3 (implicit null) is advertised.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring MPLS and LDP to Pop the Label on the Ultimate-Hop Router on page 4501</a></li></ul>

---

## export (Protocols LDP)

---

<b>Syntax</b>	<code>export [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Apply policy filters to outbound LDP label bindings. Filters are applied to all label bindings from all neighbors.
<b>Options</b>	<i>policy-names</i> —Name of one or more routing policies.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Filtering Outbound LDP Label Bindings on page 4437</a></li></ul>

## fec

<b>Syntax</b>	<pre> fec <i>fec-address</i> {     bfd-liveness-detection {         detection-time threshold <i>milliseconds</i>;         ecmp;         failure-action {             remove-nexthop;             remove-route;         }         holddown-interval <i>milliseconds</i>;         ingress-policy <i>ingress-policy-name</i>;         minimum-interval <i>milliseconds</i>;         minimum-receive-interval <i>milliseconds</i>;         minimum-transmit-interval <i>milliseconds</i>;         multiplier <i>detection-time-multiplier</i>;         no-adaptation;         transmit-interval {             minimum-interval <i>milliseconds</i>;             threshold <i>milliseconds</i>;         }         version (0   1   automatic);     }     no-bfd-liveness-detection;     periodic-traceroute {         disable;         exp <i>exp-value</i>;         fanout <i>fanout-value</i>;         frequency <i>minutes</i>;         paths <i>number-of-paths</i>;         retries <i>retry-attempts</i>;         source <i>address</i>;         ttl <i>ttl-value</i>;         wait <i>seconds</i>;     } } </pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-systems-name</i> protocols ldp oam], [edit protocols ldp oam]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 12.2 for EX Series switches. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Allows you to configure BFD for a specific LDP forwarding equivalence class (FEC).
<b>Options</b>	<p><b><i>fec-address</i></b>—Specify the FEC address.</p> <p>The other statements are explained separately.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

Related Documentation • [Configuring BFD for LDP LSPs](#)

## graceful-restart (Protocols LDP)

Syntax	<pre>graceful-restart {   disable;   helper-disable;   maximum-neighbor-recovery-time value;   reconnect-time seconds;   recovery-time value; }</pre>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols ldp],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp],          [edit protocols ldp],          [edit routing-instances <i>routing-instance-name</i> protocols ldp]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.          Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
Description	<p>Configure LDP graceful restart on the LDP master protocol instance or for a specific routing instance.</p>

**NOTE:** When you alter the graceful restart configuration at either the [edit routing-options graceful-restart] or [edit protocols ldp graceful-restart] hierarchy levels, any running LDP session is automatically restarted to apply the graceful restart configuration. This behavior mirrors the behavior of BGP when you alter its graceful restart configuration.

Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
--------------------------	---------------------------------------------------------------------------------------------------------------------

Related Documentation • [Configuring LDP Graceful Restart on page 4495](#)

## hello-interval (Protocols LDP)

---

<b>Syntax</b>	<code>hello-interval <i>seconds</i>;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols ldp interface <i>interface-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols ldp targeted-hello],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>  ldp interface <i>interface-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>  ldp targeted-hello],</code> <code>[edit protocols ldp interface <i>interface-name</i>],</code> <code>[edit protocols ldp targeted-hello],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols ldp targeted-hello]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Support for LDP targeted hellos added in Junos OS Release 9.5. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Control the LDP timer that regulates how often hello messages are sent. You can control the rate both link hello messages and targeted hello messages are sent depending on the hierarchy level at which you configure the <b>hello-interval</b> statement.
<b>Options</b>	<b><i>seconds</i></b> —Length of time between transmission of hello packets. <b>Range:</b> 1 through 65,535 seconds <b>Default:</b> 5 seconds for link hello messages, 15 seconds for targeted hello messages
<b>Required Privilege Level</b>	<b>routing</b> —To view this statement in the configuration. <b>routing-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the LDP Timer for Hello Messages on page 4492</a></li></ul>

---

## helper-disable (LDP)

---

<b>Syntax</b>	helper-disable;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp graceful-restart], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp graceful-restart], [edit protocols ldp graceful-restart], [edit routing-instances <i>routing-instance-name</i> protocols ldp graceful-restart]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Disable helper mode for LDP graceful restart. When helper mode is disabled, a router cannot help a neighboring router that is attempting to restart LDP.
<b>Default</b>	Helper mode is enabled by default on all routing protocols (including LDP) that support graceful restart.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring LDP Graceful Restart on page 4495</a></li></ul>

## hold-time (Protocols LDP)

---

<b>Syntax</b>	<code>hold-time seconds;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols ldp interface <i>interface-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols ldp targeted-hello],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>  ldp interface <i>interface-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>  ldp targeted-hello],</code> <code>[edit protocols ldp interface <i>interface-name</i>],</code> <code>[edit protocols ldp targeted-hello],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols ldp targeted-hello]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Support for LDP targeted hellos added in Junos OS Release 9.5. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify how long an LDP node should wait for a hello message before declaring a neighbor to be down. This value is sent as part of a hello message so that each LDP node tells its neighbors how long to wait. You can specify times for both link hello messages and targeted hello messages depending on the hierarchy level at which you configure the <b>hold-time</b> statement.
<b>Options</b>	<b>seconds</b> —Hold-time value. <b>Range:</b> 1 through 65,535 seconds <b>Default:</b> 15 seconds for link hello messages, 45 seconds for targeted hello messages
<b>Required Privilege Level</b>	<b>routing</b> —To view this statement in the configuration. <b>routing-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Delay Before LDP Neighbors Are Considered Down on page 4493</a></li></ul>

## ignore-lsp-metrics

<b>Syntax</b>	ignore-lsp-metrics;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ospf traffic-engineering shortcuts], [edit protocols ospf traffic-engineering shortcuts]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.5. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Cause OSPF to ignore the RSVP LSP metric.  Some other vendors use an OSPF metric of 1 for the loopback address. Juniper Networks routers use an OSPF metric of 0 for the loopback address. This can cause interoperability problems when you configure LDP tunneling over RSVP LSPs in heterogeneous networks.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Enabling LDP over RSVP-Established LSPs in Heterogeneous Networks on page 4502</a></li> </ul>

## igp-synchronization

<b>Syntax</b>	igp-synchronization holddown-interval <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Configure the time the LDP waits before informing the IGP that the LDP neighbor and session for an interface are operational. For large networks with numerous FECs, you might need to configure a longer value to allow enough time for the LDP label databases to be exchanged.
<b>Options</b>	<b>holddown-interval <i>seconds</i></b> —Time the LDP waits before informing the IGP that the LDP neighbor and session for an interface are operational. <b>Default:</b> 10 seconds <b>Range:</b> 10 through 60 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring LDP Synchronization with the IGP on the Router on page 4505</a></li> </ul>

## import (Protocols LDP)

---

<b>Syntax</b>	<code>import [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Apply policy filters to received LDP label bindings. Filters are applied to all label bindings from all neighbors.
<b>Options</b>	<i>policy-names</i> —Name of one or more routing policies.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Filtering Inbound LDP Label Bindings on page 4435</a></li></ul>

## interface (Protocols LDP)

<b>Syntax</b>	<pre>interface <i>interface-name</i> {     disable;     hello-interval <i>seconds</i>;     hold-time <i>seconds</i>;     transport-address (interface   loopback); }</pre>
<b>Hierarchy Level</b>	<pre>[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	Enable LDP on one or more router interfaces.
<b>Default</b>	LDP is disabled on all interfaces.
<b>Options</b>	<p><i>interface-name</i>—Name of an interface. To configure all interfaces, specify <b>all</b>.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Enabling and Disabling LDP on page 4435</a></li> </ul>

## keepalive-interval

---

<b>Syntax</b>	<code>keepalive-interval <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Set the keepalive interval value.
<b>Options</b>	<b><i>seconds</i></b> —Keepalive value. <b>Range:</b> 1 through 65,535 <b>Default:</b> 10 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Interval for LDP Keepalive Messages on page 4494</a></li></ul>

## keepalive-timeout

<b>Syntax</b>	<code>keepalive-timeout seconds;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Set the keepalive timeout value. The keepalive timeout defines the amount of time that the neighbor LDP node waits before determining that the session has failed.
<b>Options</b>	<b>seconds</b> —Keepalive timeout value. <b>Range:</b> 1 through 65,535 <b>Default:</b> 30 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the LDP Keepalive Timeout on page 4495</a></li> </ul>

## l2-smart-policy

<b>Syntax</b>	<code>l2-smart-policy;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Prevent LDP from exporting IPv4 FECs over sessions with Layer 2 neighbors only. IPv4 FECs received over such sessions are filtered out.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring LDP IPv4 FEC Filtering</a></li> </ul>

## label-withdrawal-delay

---

<b>Syntax</b>	label-withdrawal-delay <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.1. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Delay the withdrawal of labels to reduce router workload during IGP convergence.
<b>Options</b>	<b>seconds</b> —Configure the number of seconds to wait before withdrawing labels for the LDP LSPs. <b>Default:</b> 60 seconds <b>Range:</b> 0 through 300 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Label Withdrawal Timer on page 4505</a></li></ul>

## ldp

```

<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols], [edit protocols], [edit routing-instances <i>routing-instance-name</i> protocols]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for EX Series switches. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Enable LDP routing on the router or switch.  You must include the <b>ldp</b> statement in the configuration to enable LDP on the router or switch.
<b>Default</b>	LDP is disabled on the router.
<b>Options</b>	The other statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Minimum LDP Configuration on page 4434</a></li> <li>• <a href="#">Enabling and Disabling LDP on page 4435</a></li> </ul>

## ldp-synchronization

---

<b>Syntax</b>	<pre>ldp-synchronization {     disable;     hold-time seconds; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ospf interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf interface <i>interface-name</i> ], [edit protocols ospf interface <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols ospf interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.5. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Enable synchronization by advertising the maximum cost metric until LDP is operational on the link.
<b>Options</b>	The other statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring LDP Synchronization with the IGP on LDP Links on page 4504</a></li></ul>

---

## log-updown (Protocols LDP)

---

<b>Syntax</b>	log-updown { trap disable; }
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Disable LDP traps on the router, logical system, or routing instance.
<b>Options</b>	<b>trap disable</b> —Disable LDP traps. <b>Default:</b> LDP traps are enabled on the router.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Disabling SNMP Traps for LDP on page 4504</a></li></ul>

## maximum-neighbor-recovery-time

---

<b>Syntax</b>	<code>maximum-neighbor-recovery-time seconds;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp graceful-restart], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp graceful-restart], [edit protocols ldp graceful-restart], [edit routing-instances <i>routing-instance-name</i> protocols ldp graceful-restart]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement changed from <b>maximum-recovery-time</b> to <b>maximum-neighbor-recovery-time</b> in Junos OS Release 9.1. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify the maximum amount of time to wait before giving up an attempt to gracefully restart.
<b>Options</b>	<b>seconds</b> —Configure the maximum recovery time, in seconds. <b>Range:</b> 120 through 1800 seconds <b>Default:</b> 140 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Recovery Time and Maximum Recovery Time on page 4497</a></li><li>• <a href="#">Configuring Graceful Restart Options for LDP</a></li><li>• <a href="#">no-strict-lsa-checking on page 2303</a></li><li>• <a href="#">recovery-time</a></li></ul>

## no-forwarding

---

<b>Syntax</b>	no-forwarding;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Do not add ingress routes to the inet.0 routing table even if <b>traffic-engineering bgp-igp</b> (configured at the [edit protocols mpls] hierarchy level) is enabled.
<b>Default</b>	The <b>no-forwarding</b> statement is disabled. Ingress routes are added to the inet.0 routing table instead of the inet.3 routing table when <b>traffic-engineering bgp-igp</b> is enabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Preventing Addition of Ingress Routes to the inet.0 Routing Table on page 4500</a></li> <li>• <a href="#">Configuring Virtual-Router Routing Instances in VPNs</a></li> </ul>

## policing (Protocols LDP)

---

<b>Syntax</b>	<pre>policing {     fec <i>fec-address</i> {         ingress-traffic <i>filter-name</i>;         transit-traffic <i>filter-name</i>;     } }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Enable policing of forwarding equivalence classes (FECs) for LDP.
<b>Options</b>	<p><b>fec <i>fec-address</i></b>—Specify the address for the FEC.</p> <p><b>ingress-traffic <i>filter-name</i></b>—Specify the name of the filter for policing ingress FEC traffic.</p> <p><b>transit-traffic <i>filter-name</i></b>—Specify the name of the filter for policing transit FEC traffic.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Policers for LDP FECs</i></li></ul>

## preference (Protocols LDP)

---

<b>Syntax</b>	<code>preference <i>preference</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit protocols ldp interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit protocols ldp interface <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Set the route preference level for LDP routes.
<b>Options</b>	<p><i>preference</i>—Preferred value.</p> <p><b>Range:</b> 0 through 255</p> <p><b>Default:</b> 9</p>
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring LDP Route Preferences on page 4495</a></li> </ul>

## reconnect-time

---

<b>Syntax</b>	<code>reconnect-time seconds;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp graceful-restart], [edit protocols ldp graceful-restart], [edit routing-instances <i>routing-instance-name</i> protocols ldp graceful-restart]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.1. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify the length of time required to reestablish a Label Distribution Protocol (LDP) session after graceful restart.
<b>Options</b>	<b>seconds</b> —Time required for reconnection. <b>Range:</b> 30 through 300 <b>Default:</b> 60 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring LDP Graceful Restart on page 4495</a> on <i>LDP Feature Guide for Routing Devices</i></li><li>• <i>Configuring Graceful Restart Options for LDP</i></li></ul>

## recovery-time

---

<b>Syntax</b>	<code>recovery-time seconds;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp graceful-restart], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp graceful-restart], [edit protocols ldp graceful-restart], [edit routing-instances <i>routing-instance-name</i> protocols ldp graceful-restart]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify the amount of time a router waits for LDP to restart gracefully.
<b>Options</b>	<b>seconds</b> —Configure the recovery time, in seconds. <b>Range:</b> 120 through 1800 seconds <b>Default:</b> 140 seconds
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Recovery Time and Maximum Recovery Time on page 4497</a></li></ul>

## session (ldp)

---

<b>Syntax</b>	<pre> session address {   authentication-algorithm <i>algorithm</i>;   authentication-key <i>authentication-key</i>;   authentication-key-chain <i>key-chain-name</i>; } </pre>
<b>Hierarchy Level</b>	<pre> [edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp] </pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p><b>authentication-algorithm</b> statement introduced in Junos OS Release 7.6.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	<p>Specify the address for the remote end of the LDP session.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the TCP MD5 Signature for LDP Sessions on page 4502</a></li> </ul>

## session-protection

---

<b>Syntax</b>	<code>session-protection {     timeout <i>seconds</i>; }</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Description</b>	Configure when an LDP session is torn down and resigaled after the router stops receiving hello messages from a neighboring router. You might want to modify this behavior to prevent an LDP session from being unnecessarily terminated and reestablished. The LDP session remains up for the duration specified as long as the routers maintain IP network connectivity.
<b>Options</b>	<b>timeout <i>seconds</i></b> —Time in seconds before the LDP session is torn down and resigaled. <b>Range:</b> 1 through 65,535 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring LDP Session Protection on page 4503</a></li></ul>

## strict-targeted-hellos

---

<b>Syntax</b>	<code>strict-targeted-hellos;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Prevent LDP sessions from being established with remote neighbors that have not been specifically configured. LDP peers will not respond to targeted hellos coming from a source that is not one of the configured remote neighbors.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Enabling Strict Targeted Hello Messages for LDP on page 4435</a></li></ul>

## targeted-hello

---

<b>Syntax</b>	targeted-hello { hello-interval <i>seconds</i> ; hold-time <i>seconds</i> ; }
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify the LDP timer and LDP hold time for targeted hellos.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the LDP Timer for Hello Messages on page 4492</a></li> <li>• <a href="#">Configuring the Delay Before LDP Neighbors Are Considered Down on page 4493</a></li> </ul>

## traceoptions (Protocols LDP)

---

<b>Syntax</b>	<pre>traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;flag-modifier&gt; &lt;disable&gt;; }</pre>
<b>Hierarchy Level</b>	<pre>[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p><b>match-on address</b> option for the <b>filter</b> flag modifier added in Junos OS Release 10.4.</p> <p><b>nsr-synchronization</b> and <b>p2mp-nsr-synchronization</b> operations for <b>flag</b> statement introduced in Junos OS Release 13.3.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	Specify LDP protocol-level trace options.
<b>Default</b>	The default LDP protocol-level trace options are inherited from the routing protocols <b>traceoptions</b> statement included at the <b>[edit routing-options]</b> hierarchy level.
<b>Options</b>	<p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>ldp-log</b>. We recommend that you place LDP tracing output in the file <b>ldp-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 2 files</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <ul style="list-style-type: none"><li>• <b>address</b>—Operation of address and address withdrawal messages</li><li>• <b>binding</b>—Label-binding operations</li><li>• <b>error</b>—Error conditions</li><li>• <b>event</b>—Protocol events</li></ul>

- **initialization**—Operation of initialization messages
- **label**—Operation of label request, label map, label withdrawal, and label release messages
- **notification**—Operation of notification messages
- **nsr-synchronization**—Nonstop active routing synchronization events
- **p2mp-nsr-synchronization**—Point-to-multipoint nonstop active routing synchronization events
- **packets**—Equivalent to setting **address**, **initialization**, **label**, **notification**, and **periodic** flags (see also the **filter** flag modifier)
- **path**—Label-switched path operations
- **periodic**—Operation of hello and keepalive messages
- **route**—Operation of route messages
- **state**—Protocol state transitions

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **disable**—Disable this trace flag.
- **filter**—Filter to apply to this flag. The **filter** flag modifier can be applied only to the **route**, **path**, and **binding** flags. This flag modifier has the following options:
  - **match-on**—Match on argument specified. The **match-on** option has the following suboptions:
    - **address**—Filter based on the source and destination addresses of packets. Available for the **packets** flag option only.
    - **fec**—Filter based on the FEC associated with the traced object.
    - **policy policy-name**—Specify the filter policy.
  - **receive**—Packets being received.
  - **send**—Packets being transmitted.

**no-world-readable**—(Optional) Prevent all users from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of files.

**world-readable**—(Optional) Enable any user to read the log file.

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

## track-igp-metric

---

**Syntax** track-igp-metric;

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols ldp],  
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ldp],  
[edit protocols ldp],  
[edit routing-instances *routing-instance-name* protocols ldp]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description** Cause the IGP route metric to be used for the LDP routes instead of the default LDP route metric (the default LDP route metric is 1).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

- [Configuring LDP to Use the IGP Route Metric on page 4500](#)

## traffic-statistics (Protocols LDP)

<b>Syntax</b>	<pre>traffic-statistics {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     interval <i>seconds</i>;     no-penultimate-hop; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols <i>ldp</i>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <i>ldp</i>],          [edit protocols <i>ldp</i>],          [edit routing-instances <i>routing-instance-name</i> protocols <i>ldp</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.          Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	LDP traffic statistics display the amount of traffic passed through a router for a particular FEC.
<b>Options</b>	<p><b>file <i>filename</i></b>—Name of the file to receive the output of the LDP statistics operation.          Enclose the name within quotation marks. All files are placed in the directory <i>/var/log</i>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of LDP statistics files. When a statistics file named <i>ldp-stat</i> reaches its maximum size, it is renamed <i>ldp-stat.0</i>, then <i>ldp-stat.1</i>, and so on, until the maximum number of LDP statistics files is reached. Then the oldest file is overwritten.</p> <p><b>Range:</b> 2 through 1000  <b>Default:</b> 2 files</p> <p>If you specify a maximum number of files, you also must include the <b>size</b> statement to specify the maximum file size.</p> <p><b>interval <i>seconds</i></b>—(Optional) Specify the interval at which the statistics are polled and written to the file.  <b>Default:</b> 300 seconds (5 minutes)</p> <p><b>no-penultimate-hop</b>—(Optional) Do not collect traffic statistics on the penultimate hop router.</p> <p><b>no-world-readable</b>—(Optional) Prevent all users from reading the log file.</p> <p><b>size <i>size</i></b>—(Optional) Maximum size of each statistics file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a statistics file named <i>ldp-stat</i> reaches this size, it is renamed <i>ldp-stat.0</i>. When <i>ldp-stat</i> again reaches this size, <i>ldp-stat.0</i> is renamed <i>ldp-stat.1</i> and <i>ldp-stat</i> is renamed <i>ldp-stat.0</i>. This renaming scheme continues until the maximum number of statistics files is reached. Then the oldest statistics file is overwritten.</p> <p><b>Syntax:</b> <i>xk</i> to specify KB, <i>xm</i> to specify MB, or <i>xg</i> to specify GB  <b>Range:</b> 10 KB through the maximum file size supported on your system</p>

**Default:** 1 MB

If you specify a maximum file size, you also must also include the **files** statement to specify the maximum number of files.

**world-readable**—(Optional) Enable log file access for all users.

<b>Required Privilege</b>	routing—To view this statement in the configuration.
<b>Level</b>	routing-control—To add this statement to the configuration.

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Collecting LDP Statistics on page 4440</a></li></ul>
------------------------------	----------------------------------------------------------------------------------------------------------

## transport-address

<b>Syntax</b>	<code>transport-address (interface   router-id);</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols ldp],          [edit logical-systems <i>logical-system-name</i> protocols ldp interface <i>interface-name</i>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp],          [edit protocols ldp],          [edit protocols ldp interface <i>interface-name</i>],          [edit routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	<p>Enables you to configure the IP address used to specify the TCP session for the LDP session. Routers must first establish a TCP session between one another before they can establish an LDP session. The TCP session enables the routers to exchange the label advertisements needed for the LDP session. To establish the TCP session, each router must learn the other router's transport address. The transport address is an IP address used to identify the TCP session over which the LDP session will run.</p>
<b>Default</b>	<b>router-id</b>
<b>Options</b>	<p><b>interface</b>—The first IP address on the interface is used as the transport address for any LDP sessions to neighbors that can be reached over that interface. You cannot specify the <b>interface</b> option when there are multiple parallel links to the same LDP neighbor, because the LDP specification requires that the same transport address be advertised on all interfaces to the same neighbor. If LDP detects multiple parallel links to the same neighbor, it disables interfaces to that neighbor one by one until the condition is cleared, either by disconnecting the neighbor on an interface or by specifying the <b>router-id</b> option.</p> <p><b>router-id</b>—The router identifier is used as the transport address. Unless otherwise configured, the router identifier is the loopback address.</p>
<b>Required Privilege Level</b>	<p><b>interface</b>—To view this statement in the configuration.</p> <p><b>interface-control</b>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Specifying the Transport Address Used by LDP on page 4439</a></li> </ul>

# Administration

- [Routine Monitoring on page 4565](#)
- [Operational Mode Commands on page 4567](#)

## Routine Monitoring

---

- [Verifying That MPLS Is Working Correctly on page 4565](#)

### Verifying That MPLS Is Working Correctly

To verify that MPLS is working correctly, perform the following tasks:

1. [Verifying the Physical Layer on the Switches on page 4565](#)
2. [Verifying the Routing Protocol on page 4566](#)
3. [Verifying the Core Interfaces Being Used for the MPLS Traffic on page 4566](#)
4. [Verifying RSVP on page 4566](#)

### Verifying the Physical Layer on the Switches

---

**Purpose** Verify that the interfaces are up. Perform this verification task on each of the switches.

**Action** user@switch> **show interfaces xe-\* terse**

Interface	Admin	Link	Proto	Local	Remote
xe-0/0/0	up	up			
xe-0/0/0.0	up	up			
xe-0/0/1.0	up	up			
xe-0/0/2.0	up	up			
xe-0/0/3.0	up	up	inet	2.2.2.1/16	
xe-0/0/4.0	up	up			
xe-0/0/5.0	up	up	inet mpls	10.1.5.1/24	
xe-0/0/6.0	up	up	inet mpls	10.1.6.1/24	

**Meaning** The **show interfaces terse** command displays status information about the 10-Gigabit Ethernet interfaces on the switch. This output verifies that the interfaces are **up**. The output for the protocol family (Proto column) of the core interfaces (xe-0/0/5.0 and

xe-0/0/6.0), shows that these interfaces are configured as both **inet** and **mpls**. The **Local** column for the core interfaces shows the IP address configured for these interfaces.

### Verifying the Routing Protocol

---

**Purpose** Verify the state of the configured routing protocol. You should perform this verification task on each of the switches. The state should be **Full**. If you have configured OSPF as the routing protocol, use the **show ospf neighbor** command to verify that the routing protocol is communicating with the switch neighbors.

**Action** user@switch> **show ospf neighbor**

Address	Interface	State	ID	Pri	Dead
127.1.1.1	xe-0/0/5	Full	10.10.10.10	128	39

**Meaning** The **show ospf neighbor** command displays the status of the routing protocol that has been configured on this switch. The output shows that the state is **Full**, meaning that the routing protocol is operating correctly—that is, hello packets are being exchanged between directly connected neighbors. For additional information on checking and monitoring routing protocols, see the [Junos OS Routing Protocols and Policies Command Reference](#).

### Verifying the Core Interfaces Being Used for the MPLS Traffic

---

**Purpose** Verify that the state of the MPLS interface is **Up**. You should perform this verification task on each of the switches.

**Action** user@switch> **show mpls interface**

Interface	State	Administrative groups
ge-0/0/5	Up	<none>
ge-0/0/6	Up	<none>

**Meaning** The **show mpls interface** command displays the status of the core interfaces that have been configured to belong to **family mpls**. This output shows that the interface configured to belong to **family mpls** is up.

### Verifying RSVP

---

**Purpose** Verify the state of the RSVP session. You should perform this verification task on each of the switches.

```
user@switch> show ldp session
```

```
Ingress RSVP: 1 sessions
To          From          State   Rt  Style Labelin Labelout LSPname
127.1.1.3   127.1.1.1   Up      0  1 FF      -    300064 lsp_to_pe2_ge1
Total 1 displayed, Up 1, Down 0

Egress RSVP: 1 sessions
To          From          State   Rt  Style Labelin Labelout LSPname
127.1.1.1   127.1.1.3   Up      0  1 FF  299968    -  lsp_to_pe1_ge1
Total 1 displayed, Up 1, Down 0

Transit RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

**Meaning** This output confirms that the RSVP sessions are up.

## clear mpls lsp

---

**List of Syntax**    [Syntax on page 4572](#)  
                          [Syntax \(EX and QFX Series Switches\) on page 4572](#)

**Syntax**    clear mpls lsp  
              <autobandwidth>  
              <logical-system (all | *logical-system-name*)>  
              <name *name*>  
              <optimize | optimize-aggressive>  
              <path *regular-expression*>  
              <statistics>

**Syntax (EX and QFX Series Switches)**    clear mpls lsp  
                                                  <autobandwidth>  
                                                  <name *name*>  
                                                  <optimize | optimize-aggressive>  
                                                  <path *regular-expression*>  
                                                  <statistics>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.5 for EX Series switches.  
                              Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.

**Description**    Release the routes and states associated with MPLS label-switched paths (LSPs), and start new LSPs.

**CAUTION:** This command disconnects existing Resource Reservation Protocol (RSVP) sessions on the ingress routing device. If there is a time lag between the old path being torn down and the new path being set up, this command might impact traffic traveling along the LSPs.

---

**Options**    **none**—Reset and restart all LSPs that originated from this routing device; that is, all LSPs for which this routing device is the ingress routing device. Depending on the number of LSPs involved, it might take a while to restart all the LSPs.

**autobandwidth**—(Optional) Clear LSP autobandwidth counters.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**name *name***—(Optional) Reset and restart the specified LSP or group of LSPs. You can include wildcard characters in the interface name, as described in the *Junos Network Interfaces Configuration Guide*.

**optimize | optimize-aggressive**—(Optional) Run nonpreemptive optimization or aggressive optimization computation now.

**path *regular-expression***—(Optional) Clear the specific LSP path matching the specified regular expression.

**statistics**—(Optional) Clear LSP statistics. You cannot clear the MPLS LSP statistics using a regular expression (**name** and **path** options) on transit routers.

**Required Privilege Level**

clear

**Related Documentation**

## monitor label-switched-path

**Syntax** `monitor label-switched-path lsp-name`  
`<logical-system (logical-system-name)>`

**Release Information** Command introduced before Junos OS Release 7.4.  
 Logical system support introduced in Junos OS Release 9.4.  
 Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.

**Description** Display the real-time status of the specified RSVP label-switched path (LSP). You can also use this command to monitor LSPs configured within logical systems.

**Options** `logical-system ( logical-system-name )`—(Optional) Perform this operation on all logical systems or on a particular logical system.

*lsp-name*—Name of the LSP.

**Additional Information** You can track the amount of traffic traversing an RSVP LSP and observe its essential parameters, such as uptime, ingress and egress addresses, labels, routes, and ports. Values are typically sampled every second. The display also allows you to scroll to other currently running LSPs. You cannot use this command to display information about static LSPs or LDP-signaled LSPs.

The output of this command shows how much each field has changed since you started the command or since you cleared the counters by using the `c` key. To control the output of the **monitor label-switched-path** command while it is running, use the keys listed in [Table 350 on page 4577](#). The keys are not case-sensitive.

**Table 350: Output Control Keys for the monitor label-switched-path Command**

Key	Action
c	Clears the screen and refreshes the display for this LSP.
f	Freezes the display, preventing new information from being displayed.
l	Monitors a different LSP. After you type l, you can type the new LSP name.
n	Displays information about the next LSP (whose name is alphabetically higher than the current LSP name) configured on the router.
p	Goes to the previous LSP (whose name is alphabetically lower than the current LSP name) configured on the router.
q or Esc	Quits the command and returns to the command prompt.
t	Thaws, or restarts, the data display for this LSP.

**Required Privilege Level** trace

**List of Sample Output** [monitor label-switched-path on page 4579](#)

**Output Fields** [Table 351 on page 4578](#) describes the output fields for the **monitor label-switched-path** command. Output fields are listed in the approximate order in which they appear.

**Table 351: monitor label-switched-path Output Fields**

Field Name	Field Description
(1)	Displays the following information: <ul style="list-style-type: none"> <li>• <b>hostname</b>—Name of the router.</li> <li>• <b>Seconds</b>—Time elapsed since this display was started.</li> <li>• <b>Time</b>—Current local time.</li> </ul>
(2)	<b>Delay</b> —Length of the time delay, in milliseconds, required to obtain the information in the monitor display. The first number shows the current sampling delay. The second number shows the shortest delay recorded to date. The third number shows the worst delay recorded to date. This delay can vary substantially depending on the system load.
(3)	Displays the following: <ul style="list-style-type: none"> <li>• <b>To</b>—Destination address of the LSP.</li> <li>• <b>From</b>—Originating address of the LSP.</li> <li>• <b>State</b>—Current state of the LSP: <b>Up</b> or <b>Down</b>.</li> </ul>
(4)	Displays the following: <ul style="list-style-type: none"> <li>• <b>LSPName</b>—Name of the LSP.</li> <li>• <b>Type</b>—Type of LSP: <b>Ingress</b>, <b>Egress</b>, or <b>Transit</b>.</li> </ul>
(5)	Displays the following: <ul style="list-style-type: none"> <li>• <b>Label in</b>—Incoming label of the LSP.</li> <li>• <b>Label out</b>—Outgoing label of the LSP.</li> </ul>
(6)	<b>Port number</b> —Port number for the sending router, the port number for the receiving router, and the protocol ID. For MPLS traffic engineering applications, the protocol ID is always 0.
(7/8)	<b>Record route</b> —All intermediate and egress router addresses for this LSP.
(9/10/11)	Displays traffic statistics: <ul style="list-style-type: none"> <li>• <b>Output packets</b>—Number of packets that have traversed this LSP, and the change (delta) in the number since the last sample, typically 1 second ago.</li> <li>• <b>Output bytes</b>—Number of bytes that have traversed this LSP, and the change (delta) in the number since the last sample, typically 1 second ago.</li> </ul>
(12)	Displays any errors the router encountered while attempting to retrieve information on the LSP.
(13)	Lists the keyboard commands you can use to navigate to other LSPs. For a description of the keyboard commands, see <a href="#">Table 350 on page 4577</a> .

## Sample Output

### monitor label-switched-path

```
user@host> monitor label-switched-path

## ping mpls bgp

---

**Syntax**    ping mpls bgp *fec*  
             <bottom-label-ttl>  
             <count *count*>  
             <destination *address*>  
             <detail>  
             <exp *forwarding-class*>  
             <instance *routing-instance-name*>  
             <logical-system (all | *logical-system-name*)>  
             <size *bytes*>  
             <source *source-address*>  
             <sweep>

**Release Information**    Command introduced in Junos OS Release 11.1.

**Description**    Check the operability of MPLS BGP-signaled label-switched path (LSP) connections. Press Ctrl+c to interrupt a **ping mpls bgp** command.

**Options**    **bottom-label-ttl**—(Optional) Time-to-live (TTL) value for the bottom label in the label stack. The range of values is 1 through 255. The default value is **255**.

**count** *count*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

**destination** *address*—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

**detail**—(Optional) Display detailed information about the echo requests sent and received.

**exp** *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

**fec**—Ping a BGP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.

**instance** *routing-instance-name*—(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.

**logical-system** (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

**size** *bytes*—(Optional) Size of the LSP ping request packet (88 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.

**source** *source-address*—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**Additional Information** If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only BGP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**Required Privilege Level** network

**List of Sample Output** [ping mpls bgp fec count on page 4581](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately. To display the error codes, use the **detail** option (for example, **ping mpls bgp 10.255.245.222 detail**).

## Sample Output

### ping mpls bgp fec count

```
user@host> ping mpls bgp 10.255.245.222 count 10
!!!xxx...x--- 1sping statistics ---10 packets transmitted, 3 packets received,
70% packet loss 4 packets received with error status, not counted as received.
```

## ping mpls l2circuit

---

**Syntax** ping mpls l2circuit (interface *interface-name* | virtual-circuit *virtual-circuit-id* neighbor *address*)  
<count *count*>  
<destination *address*>  
<detail>  
<exp *forwarding-class*>  
<logical-system (all | *logical-system-name*)>  
reply-mode (application-level-control-channel | ip-udp | no-reply)  
<size *bytes*>  
<source *source-address*>  
<sweep>  
<v1>

**Release Information** Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
The **size** and **sweep** options were introduced in Junos OS Release 9.6.  
The **reply-mode** option and its suboptions are introduced in Junos OS Release 10.4R1.

**Description** Check the operability of the MPLS Layer 2 circuit connections. Type Ctrl+c to interrupt a ping mpls l2circuit command. You can also issue this command within logical systems.

**Options** **count** *count*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

**destination** *address*—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

**detail**—(Optional) Display detailed information about the echo requests sent and received.

**exp** *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

**interface** *interface-name*—Ping an interface configured for the Layer 2 circuit on the egress provider edge (PE) router.

**logical-system** (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

**reply-mode**—(Optional) Reply mode for the ping request. This option has the following suboptions:

**application-level-control-channel**—Reply using an application level control channel.

**ip-udp**—Reply using an IPv4 or IPv6 UDP packet.

**no-reply**—Do not reply to the ping request.

**NOTE:** The **reply-mode** option and its suboptions **application-level-control-channel**, **ip-udp**, and **no-reply** are also available in Junos OS Release 10.2R4 and 10.3R2.

---

**size bytes**—(Optional) Size of the label-switched path (LSP) ping request packet (96 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

**source source-address**—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**vl**—(Optional) Use the type 9 Layer 2 circuit type, length, and value (TLV).

**virtual-circuit virtual-circuit-id neighbor address**—Ping the virtual circuit identifier on the egress PE router or switch and the specified neighbor, testing the integrity of the Layer 2 circuit between the ingress and egress PE routers or switches.

**Additional Information** You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**Required Privilege Level** network

**List of Sample Output** [ping mpls l2circuit interface on page 4583](#)  
[ping mpls l2circuit virtual-circuit detail on page 4583](#)  
[ping mpls l2circuit interface <interface-name> reply-mode on page 4584](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping mpls l2circuit interface

```
user@host> ping mpls l2circuit interface so-1/0/0.1
Request for seq 1, to interface 69, labels <100000, 100208>, packet size 100
Reply for seq 1, return code: Egress-ok, time: 0.439 ms
```

### ping mpls l2circuit virtual-circuit detail

```
user@host> ping mpls l2circuit virtual-circuit 200 neighbor 10.255.245.122/32 detail
```

Request for seq 1, to interface 68, labels <100048, 100128>, packet size 100

Reply for seq 1, return code: Egress-ok time: 0.539 ms

#### ping mpls l2circuit interface <interface-name> reply-mode

```
user@host> ping mpls l2circuit interface lt-1/2/0.21 reply-mode application-level-control-channel
!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

## ping mpls l3vpn

<b>Syntax</b>	<pre>ping mpls l3vpn prefix <i>prefix-name</i> &lt;l3vpn-name&gt; &lt;bottom-label-ttl&gt; &lt;count <i>count</i>&gt; &lt;destination <i>address</i>&gt; &lt;detail&gt; &lt;exp forwarding-class&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;size <i>bytes</i>&gt; &lt;source <i>source-address</i>&gt; &lt;sweep&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>The <b>size</b> and <b>sweep</b> options were introduced in Junos OS Release 9.6.</p>
<b>Description</b>	<p>Check the operability of an MPLS Layer 3 virtual private network (VPN) connection.</p> <p>Press Ctrl+c to interrupt a <b>ping mpls l3vpn</b> command.</p>
<b>Options</b>	<p><b>bottom-label-ttl</b>—(Optional) Display the time-to-live value for the bottom label in the label stack.</p> <p><b>count <i>count</i></b>—(Optional) Number of ping requests to send. If <b>count</b> is not specified, five ping requests are sent. The range of values is 1 through <b>1,000,000</b>. The default value is <b>5</b>.</p> <p><b>destination <i>address</i></b>—(Optional) Specify an address other than the default (<b>127.0.0.1/32</b>) for the ping echo requests. The address can be anything within the <b>127/8</b> subnet.</p> <p><b>detail</b>—(Optional) Display detailed information about the echo requests sent and received.</p> <p><b>exp forwarding-class</b>—(Optional) Value of the forwarding class for the MPLS ping packets.</p> <p><b>l3vpn-name</b>—(Optional) Layer 3 VPN name.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on the specified logical system.</p> <p><b>prefix <i>prefix-name</i></b>—Ping to test whether a prefix is present in a provider edge (PE) router's or switch's VPN routing and forwarding (VRF) table, by means of a Layer 3 VPN destination prefix. This option does not test the connection between a PE router or switch and a customer edge (CE) router or switch.</p> <p><b>size <i>bytes</i></b>—(Optional) Size of the label-switched path (LSP) ping request packet (<b>96</b> through <b>65468</b> bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.</p>

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**Additional Information** You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes. The echo response is dropped because the PAD TLV is included in the echo response, making it too large.

If the Layer 3 VPN traffic transits a route reflector within the network, the **ping mpls l3vpn** command does not work.

**Required Privilege Level** network

**List of Sample Output** [ping mpls l3vpn on page 4586](#)  
[ping mpls l3vpn detail on page 4586](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. When an echo reply is received with an error code, the packets are not counted in the received packets count, and are counted separately.

## Sample Output

### ping mpls l3vpn

```
user@host> ping mpls l3vpn vpn1 prefix 10.255.245.122/32
!!!!!!
--- 1sping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss

```

## ping mpls ldp

---

**Syntax**    ping mpls ldp *fec*  
             <count *count*>  
             <destination *address*>  
             <detail>  
             <exp *forwarding-class*>  
             <instance *routing-instance-name*>  
             <logical-system (all | *logical-system-name*)>  
             <p2mp root-addr *ip-address* lsp-id *identifier*>  
             <size *bytes*>  
             <source *source-address*>  
             <sweep>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                             Command introduced in Junos OS Release 9.0 for EX Series switches.  
                             **size** and **sweep** options introduced in Junos OS Release 9.6.  
                             **instance** option introduced in Junos OS Release 10.0.  
                             **p2mp**, **root-address**, and **lsp-id** options introduced in Junos OS Release 11.2.  
                             Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description**    Check the operability of MPLS LDP-signaled label-switched path (LSP) connections.  
                             Type Ctrl+c to interrupt a **ping mpls** command.

**Options**    **count** *count*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through **1,000,000**. The default value is **5**.

**destination** *address*—(Optional) Specify an address other than the default (**127.0.0.1/32**) for the ping echo requests. The address can be anything within the **127/8** subnet.

**detail**—(Optional) Display detailed information about the echo requests sent and received.

**exp** *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

**fec**—Ping an LDP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.

**instance** *routing-instance-name*—(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.

**logical-system** (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

**p2mp root-addr** *ip-address* **lsp-id** *identifier*—(Optional) Ping the end points of a point-to-multipoint LSP. Enter the IP address of the point-to-multipoint LSP root and the ID number of the point-to-multipoint LSP.

**size** *bytes*—(Optional) Size of the LSP ping request packet (**88** through **65468** bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller

than the minimum size, an error message is displayed reminding you of the 88-byte minimum.

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**Additional Information** If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

You can configure the ping interval for the **ping mpls ldp** command by specifying a new time in seconds using the **lsp-ping-interval** statement at the **[edit protocols ldp oam]** hierarchy level. For more information, see the *Junos OS MPLS Applications Library for Routing Devices*.

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**Required Privilege Level** network

**List of Sample Output** [ping mpls ldp fec count on page 4589](#)  
[ping mpls ldp p2mp root-addr lsp-id on page 4589](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping mpls ldp fec count

```
user@host> ping mpls ldp 10.255.245.222 count 10
!!!xxx...x--- lsping statistics ---10 packets transmitted, 3 packets received,
70% packet loss 4 packets received with error status, not counted as received.

 <size bytes>  
 <source source-address>  
 <standby standby-path-name>  
 <sweep>

**Release Information** Command introduced before Junos OS Release 7.4.  
 The **egress** and **multipoint** options were introduced in Junos OS Release 9.2.  
 The **size** and **sweep** options were introduced in Junos OS Release 9.6.  
 The **dynamic-bypass** and **manual-bypass** options were introduced in Junos OS Release 10.2.

**Description** Check the operability of MPLS RSVP-signaled label-switched path (LSP) connections. Type Ctrl+c to interrupt a **ping mpls** command.

**Options** **count count**—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

**destination address**—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

**detail**—(Optional) Display detailed information about the echo requests sent and received.

**NOTE:** When using the **detail** option, the reported time is based on the system time configured on the local and remote routers. Differences in these system times can result in inaccurate one way ping trip times being reported.

In practice, it is difficult to synchronize the system times of independent Juniper Networks routers with sufficient accuracy to provide a meaningful time value for the **detail** option (even when synchronized using NTP).

**dynamic-bypass**—(Optional) Ping dynamically generated bypass LSPs, used for protecting other LSPs.

**egress *egress-address***—(Optional) Only the specified egress router or switch responds to the ping request.

**exp *forwarding-class***—(Optional) Value of the forwarding class for the MPLS ping packets.

**interface**—(Optional) Specify the name of the interface protected by the manual bypass LSP. This option is only available when you have also used the **manual-bypass** option.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on the specified logical system.

***lsp-name***—Ping an RSVP-signaled LSP using an LSP name.

**manual-bypass**—(Optional) Ping manually configured bypass LSPs, used for protecting other LSPs. For this option, you must also specify the interface protected by the manual bypass LSP using the **interface** option.

**multipoint**—(Optional) Send ping requests to each of the egress routers or switches participating in a point-to-multipoint LSP. You can also include the **egress** option to ping a specific egress router or switch participating in a point-to-multipoint LSP.

**size *bytes***—(Optional) Size of the LSP ping request packet (100 through 65468 bytes). Packets are 4-byte aligned. For example, if you enter a size of 101, 102, 103, or 104, the router or switch uses a size value of 104 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 100-byte minimum.

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface.

**standby *standby-path-name***—(Optional) Name of the standby path.

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**Additional Information** If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**Required Privilege Level** network

**List of Sample Output** [ping mpls rsvp \(Echo Reply Received\) on page 4595](#)  
[ping mpls rsvp \(Echo Reply with Error Code\) on page 4595](#)

[ping mpls rsvp detail on page 4595](#)

[ping mpls rsvp multipoint egress detail count on page 4595](#)

[ping mpls rsvp multipoint detail count on page 4595](#)

[ping mpls rsvp destination detail count size on page 4596](#)

[ping mpls rsvp destination detail sweep size on page 4596](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping mpls rsvp (Echo Reply Received)

```
user@host> ping mpls rsvp test1
!!!!!--- lsping statistics ---5 packets transmitted, 5 packets received, 0% packet
loss
```

### ping mpls rsvp (Echo Reply with Error Code)

```
user@host> ping mpls rsvp test2
!!xxx--- lsping statistics ---5 packets transmitted, 2 packets received, 60%
packet loss3 packets received with error status, not counted as received.
```

### ping mpls rsvp detail

```
user@host> ping mpls rsvp to-green detail

## request mpls lsp adjust-autobandwidth

---

<b>List of Syntax</b>	<a href="#">Syntax on page 4598</a> <a href="#">Syntax (EX and QFX Series Switches) on page 4598</a>
<b>Syntax</b>	<pre>request mpls lsp adjust-autobandwidth &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;name <i>lsp-name</i>&gt;</pre>
<b>Syntax (EX and QFX Series Switches)</b>	<pre>request mpls lsp adjust-autobandwidth &lt;name <i>lsp-name</i>&gt;</pre>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches. Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	<p>Manually trigger a bandwidth allocation adjustment for active label-switched paths (LSPs).</p> <p>Without running this command, the bandwidth adjustment is recomputed at a configurable interval. The default interval is 5 minutes. If you do not want to wait for the periodic adjustment (for example, during a software demonstration), this command is useful.</p> <p>During bandwidth allocation adjustment, the LSP stays up to enable the bandwidth to be changed without dropping any traffic. This functionality is often referred to as <i>make-before-break</i>.</p>
<b>Options</b>	<p><b>none</b>—Manually trigger a bandwidth allocation adjustment for all active LSP paths.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>name <i>lsp-name</i></b>—(Optional) Manually trigger a bandwidth allocation adjustment on the specified LSP only.</p>
<b>Additional Information</b>	<p>For this command to work properly, the following conditions must exist:</p> <ul style="list-style-type: none"><li>• Automatic bandwidth allocation must be enabled on the LSP. The parameters for adjustment interval and maximum average bandwidth are not reset after you issue the <b>request mpls lsp adjust-autobandwidth</b> command.</li><li>• The difference between the adjusted bandwidth and the current LSP path bandwidth must be greater than the threshold limit.</li></ul>
<b>Required Privilege Level</b>	clear, maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">auto-bandwidth on page 4516</a></li><li>• <a href="#">Configuring Automatic Bandwidth Allocation for LSPs on page 4482</a></li></ul>

## show ldp database

---

<b>Syntax</b>	<pre>show ldp database &lt;brief   detail   extensive&gt; &lt;inet   l2circuit&gt; &lt;instance <i>instance-name</i>&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;session <i>session</i>&gt; p2mp</pre>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Display entries in the LDP database.
<b>Options</b>	<p><b>none</b>—Display standard information about all entries in the LDP database for all routing instances.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>inet   l2circuit</b>—(Optional) Display only IPv4 or Layer 2 circuit bindings.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display routing instance information for the specified instance only.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>session <i>session</i></b>—(Optional) Display database for the specified session only. <b><i>session</i></b> is the destination address of the LDP session.</p> <p><b>p2mp</b>—(Optional) Display point-to-multipoint binding information.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<p><a href="#">show ldp database (master) on page 4602</a></p> <p><a href="#">show ldp database (standby) on page 4603</a></p> <p><a href="#">show ldp database l2circuit detail on page 4604</a></p> <p><a href="#">show ldp database l2circuit extensive on page 4604</a></p> <p><a href="#">show ldp database p2mp (master) on page 4604</a></p> <p><a href="#">show ldp database p2mp (standby) on page 4605</a></p> <p><a href="#">show ldp database p2mp (master) on page 4605</a></p> <p><a href="#">show ldp database p2mp (standby) on page 4605</a></p> <p><a href="#">show ldp database session on page 4606</a></p> <p><a href="#">show ldp database (Ingress Node with Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 4606</a></p> <p><a href="#">show ldp database (Egress Node with Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 4607</a></p>
<b>Output Fields</b>	<p><a href="#">Table 352 on page 4601</a> describes the output fields for the <b>show ldp database</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 352: show ldp database Output Fields

Field Name	Field Description	Level of Output
Input label database	Label received from the other router.	All levels
Output label database	Label advertised to the other router.	All levels
<i>session-identifier</i>	Session identifier, which includes the local and remote label space identifiers.	All levels
Label	Label binding to a route prefix.	All levels
Prefix	<p>Route prefix.</p> <p>It can be one of the following values:</p> <ul style="list-style-type: none"> <li>IP prefix.</li> <li>Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.</li> <li>Layer 2 encapsulation type.</li> </ul> <p>Layer 2 encapsulation types are displayed in the format <b>L2CKT control word status encapsulation-type vc-number</b>, for example, <b>L2CKT CtlfWord FRAME RELAY VC 2</b></p> <ul style="list-style-type: none"> <li><b>control-word-status</b>—Displays whether the use of the control word has been negotiated for this virtual circuit: <ul style="list-style-type: none"> <li>NoCtrlWord</li> <li>CtrlWord</li> </ul> </li> <li><b>encapsulation-type</b>—Encapsulation type: <ul style="list-style-type: none"> <li>FRAME RELAY</li> <li>ATM AAL5</li> <li>ATM CELL</li> <li>VLAN</li> <li>ETHERNET</li> <li>CISCO_HDLC</li> <li>PPP</li> </ul> </li> <li><b>VC number</b>—Virtual circuit number. It can have any numeric value.</li> <li><b>(Stale)</b>—When you display the LDP database for the neighbor of a restarting router, the bindings learned from the restarting neighbor are displayed as (Stale). Stale bindings are deleted if they are not refreshed within the recovery time.</li> </ul>	All levels
MTU	MTU of the Layer 2 circuit. MTU is displayed for all encapsulation types except ATM cell encapsulations.	detail
VCCV Control Channel types	<p>Virtual Circuit Connection Verification (VCCV) control channel types.</p> <ul style="list-style-type: none"> <li>MPLS router alert label</li> <li>MPLS PW label with TTL=1</li> </ul>	extensive

Table 352: show ldp database Output Fields (*continued*)

Field Name	Field Description	Level of Output
VCCV Control Verification types	The only valid VCCV control verification type is <b>LSP ping</b> .	<b>extensive</b>
TDM payload size	Size of the Time Division Multiplex (TDM) payload.	All levels
TDM bitrate	Bit rate for the TDM traffic.	All levels
Requested VLAN ID	(VLANs) VLAN identifier of the Layer 2 circuit.	<b>detail</b>
Cell bundle size	(ATM cell encapsulations) Maximum number of cells that the Layer 2 circuit can receive in a packet.	<b>detail</b>
State	State of the label binding: <ul style="list-style-type: none"> <li>• <b>Active</b>—Label binding has been installed and distributed appropriately. A label binding is almost always in this state.</li> <li>• <b>New</b>—New label that has not yet been distributed.               <ul style="list-style-type: none"> <li>• <b>MapRcv</b>—Waiting to receive a label mapping message.</li> <li>• <b>MapSend</b>—Waiting to send a label mapping message.</li> <li>• <b>RelRcv</b>—Waiting to receive a label release message.</li> <li>• <b>RelRsnd</b>—Waiting to receive a label release message before resending label mapping message.</li> <li>• <b>RelSend</b>—Waiting to send a label release message.</li> <li>• <b>ReqSend</b>—Waiting to send a label request message.</li> <li>• <b>W/dSend</b>—Waiting to send a label withdrawal message.</li> </ul> </li> </ul>	<b>detail</b>
Age	Time elapsed since the binding was created.	<b>detail</b>

## show ldp fec-filters

<b>Syntax</b>	show ldp fec-filters <fec> <instance <i>instance-name</i> > <logical-system (all   <i>logical-system-name</i> )>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Display information about configured Label Distribution Protocol (LDP) forwarding equivalence class (FEC) filters.
<b>Options</b>	<b>fec</b> —(Optional) Display FEC filter information for the specified FEC.  <b>instance <i>instance-name</i></b> —(Optional) Display FEC filter information for the specified instance.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show ldp fec-filters on page 4608</a>
<b>Output Fields</b>	<a href="#">Table 353 on page 4608</a> lists the output fields for the <b>show ldp fec-filters</b> command. Output fields are listed in the approximate order in which they appear.

**Table 353: show ldp fec-filters Output Fields**

Field Name	Field Description
Ingress	Names of the FEC filters on the ingress routers.
Transit	Names of the FEC filters on the transit routers.

## Sample Output

### show ldp fec-filters

```
user@host> show ldp fec-filters 10/8
10.22.1.2/32
  Ingress: f1-10.22.1.2/32 (index: 3)
  Transit: (null) (index: 0)
```

## show ldp interface

<b>Syntax</b>	show ldp interface <brief   detail   extensive> <interface-name> <instance instance-name> <logical-system (all   logical-system-name)>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Display the status of Label Distribution Protocol (LDP)-enabled interfaces.
<b>Options</b>	<p><b>none</b>—Display standard status information about all LDP-enabled interface for all routing instances.</p> <p><b>interface-name</b>—(Optional) Display information for the specified interface.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>instance instance-name</b>—(Optional) Display information for the specified routing instance.</p> <p><b>logical-system (all   logical-system-name)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show ldp interface extensive on page 4610</a>
<b>Output Fields</b>	<a href="#">Table 354 on page 4609</a> describes the output fields for the <b>show ldp interface</b> command. Output fields are listed in the approximate order in which they appear.

Table 354: show ldp interface Output Fields

Field Name	Field Description	Level of Output
<b>Interface</b>	Interface name.	All levels
<b>Label space ID</b>	Label space identifier that the router is advertising on the interface.	All levels
<b>Nbr count</b>	Number of neighbors on the interface.	All levels
<b>Next hello</b>	How long until the next hello packet is sent on this interface, in seconds.	All levels
<b>Hello interval</b>	One-third of the negotiated hold time (in seconds). If the user-configured value for the hello interval is smaller than the computed value, the user-configured value is used.	<b>detail</b> <b>extensive</b>
<b>Hold time</b>	Configured hold time, in seconds.	<b>detail</b> <b>extensive</b>

Table 354: show ldp interface Output Fields (*continued*)

Field Name	Field Description	Level of Output
Transport address	Address to which the neighbor wants the local route to establish the LDP session.	extensive
Local hello interval	Locally configured hello interval.	extensive

## Sample Output

### show ldp interface extensive

```
user@host> show ldp interface extensive
Interface          Label space ID      Nbr count  Next hello
fe-0/0/3.0         10.255.245.6:0      2          0
Hello interval: 1, Hold time: 15, Transport address: 10.255.245.6
Local hello interval: 2, Index: 69
```

## show ldp neighbor

<b>Syntax</b>	show ldp neighbor <brief   detail   extensive> <instance <i>instance-name</i> > <logical-system (all   <i>logical-system-name</i> )> <neighbor-address>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. <b>neighbor-address</b> option added in Junos OS Release 8.5. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Display Label Distribution Protocol (LDP) neighbor information.
<b>Options</b>	<b>none</b> —Display standard information about LDP neighbors for all routing instances.  <b>brief   detail   extensive</b> —(Optional) Display the specified level of output.  <b>instance <i>instance-name</i></b> —(Optional) Display information for the specified routing instance.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.  <b>neighbor-address</b> —(Optional) Display information about the specified LDP neighbor.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear ldp neighbor on page 4569</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ldp neighbor extensive on page 4612</a>
<b>Output Fields</b>	<a href="#">Table 355 on page 4611</a> describes the output fields for the <b>show ldp neighbor</b> command. Output fields are listed in the approximate order in which they appear.

Table 355: show ldp neighbor Output Fields

Field Name	Field Description	Level of Output
Address	IP address of the neighbor.	All levels
Interface	Interface over which the neighbor was discovered.	All levels
Label space ID	Label space identifier advertised by the neighbor.	All levels
Hold time	Remaining hold time before the neighbor expires, in seconds.	All levels
Transport address	Address to which the neighbor wants the local route to establish the LDP session.	<b>detail</b>

Table 355: show ldp neighbor Output Fields (*continued*)

Field Name	Field Description	Level of Output
Configuration sequence	Counter that increments whenever the neighbor changes its configuration.	detail
Up for	Length of time the LDP neighbor has been in operation.	detail extensive
Reference count	Reference count for the LDP neighbor.	extensive
Hold time	Displays the neighbor's hold time. The hold time is the proposed hold times for the local and peer routers.	extensive
Proposed local/peer	Hold time value proposed by the local router and the peer router.	extensive

## Sample Output

### show ldp neighbor extensive

```

user@host> show ldp neighbor extensive
Address          Interface      Label space ID      Hold Time
192.168.37.23    so-1/0/0.0    10.255.245.5:0      44
  Transport address: 10.255.245.5, Configuration sequence: 6
  Up for 00:03:37
  Reference count: 1
  Hold time: 45, Proposed local/peer: 15/45

```

## show ldp path

<b>Syntax</b>	show ldp path <brief   detail   extensive> <destination> <instance <i>instance-name</i> > <logical-system (all   <i>logical-system-name</i> )>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Display Label Distribution Protocol (LDP) label-switched paths (LSPs).
<b>Options</b>	<p><b>none</b>—Display standard information about all LDP LSPs for all routing instances.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>destination</b>—(Optional) Restrict the output to entries that match the specified destination prefix.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display information for the specified routing instance only.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show ldp path extensive on page 4614</a>
<b>Output Fields</b>	<a href="#">Table 356 on page 4613</a> describes the output fields for the <b>show ldp path</b> command. Output fields are listed in the approximate order in which they appear.

**Table 356: show ldp path Output Fields**

Field Name	Field Description
<b>Output Session (label)</b>	Session ID and labels that this system has sent using LDP. These correspond to MPLS packets received.
<b>Input Session (label)</b>	Session ID and labels that this system has received using LDP. These correspond to MPLS packets transmitted.
<b>route</b>	MPLS route.
<b>Attached route</b>	Route corresponding to the LSP.
<b>Ingress route</b>	The router acts as the ingress for the LSP.
<b>Reference count</b>	Reference count for the LDP neighbor.

Table 356: show ldp path Output Fields (*continued*)

Field Name	Field Description
Transit route	Names of the forwarding equivalence class (FEC) filters on the transit routers.
Global label	MPLS label that is used globally.

## Sample Output

### show ldp path extensive

```
user@host> show ldp path extensive
Output Session (label)      Input Session (label)
10.255.14.220:0(3)         ( )
  Attached route: 10.255.14.221/32
  Reference count: 3, Global label: 3
10.255.14.220:0(100000)     10.255.14.220:0(3)
  Attached route: 10.255.14.220/32, Ingress route
  Reference count: 2, Transit route, Global label: 100000
10.255.14.220:0(100001)     10.255.14.220:0(100001)
  Attached route: 10.255.14.214/32, Ingress route
  Reference count: 2, Transit route, Global label: 100001
```

## show ldp route

<b>Syntax</b>	<pre>show ldp route &lt;brief   detail   extensive&gt; &lt;destination&gt; &lt;instance instance-name&gt; &lt;logical-system (all   logical-system-name)&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	Display the entries in the Label Distribution Protocol (LDP) internal topology table. The internal topology table contains routes from inet.0 and inet.3 and is used when binding a label to a forwarding equivalence class (FEC).
<b>Options</b>	<p><b>none</b>—Display standard information about all entries in the LDP internal topology table for all routing instances.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>destination</b>—(Optional) Restrict the output to entries that are longer than the specified destination prefix and prefix length.</p> <p><b>instance instance-name</b>—(Optional) Display entries for the specified routing instance only.</p> <p><b>logical-system (all   logical-system-name)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<p><a href="#">show ldp route detail on page 4617</a></p> <p><a href="#">show ldp route extensive on page 4617</a></p>
<b>Output Fields</b>	<a href="#">Table 357 on page 4615</a> describes the output fields for the <b>show ldp route</b> command. Output fields are listed in the approximate order in which they appear.

**Table 357: show ldp route Output Fields**

Field Name	Field Description
<b>Destination</b>	Destination prefix.
<b>Next-hop intf/lsp/table</b>	Interface that is the next hop to the destination prefix.
<b>Next-hop address</b>	IP address of the next hop.
<b>Session ID</b>	LDP session ID.

Table 357: show ldp route Output Fields (*continued*)

Field Name	Field Description
Route flags	Information about the route. For example, the <b>Ingress TTL propagate</b> flag indicates that the time-to-live (TTL) value is being propagated with the route.
Bound to outgoing label	The route has been bound to LSPs with the label being distributed for that LSP.
Topology entry	The topology that the route is bound to.
Ingress route status	Status of the ingress route. For example, it could be <b>Active</b> or <b>Inactive</b> .
Last modified	The length of time since the ingress route status last changed.

## Sample Output

### show ldap route detail

```

user@host> show ldap route 10.255.8.5 detail

## show ldp session

<b>Syntax</b>	show ldp session <brief   detail   extensive> <destination> <instance <i>instance-name</i> > <logical-system (all   <i>logical-system-name</i> )>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Display information about Label Distribution Protocol (LDP) sessions.
<b>Options</b>	<p><b>none</b>—Display standard information about all LDP sessions for all routing instances.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>destination</b>—(Optional) Restrict LDP session display to the specified address.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display routing instance information for the specified instance. If <b><i>instance-name</i></b> is omitted, information is displayed for the master instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear ldp session on page 4570</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ldp session brief on page 4623</a> <a href="#">show ldp session detail on page 4623</a> <a href="#">show ldp session extensive on page 4623</a>
<b>Output Fields</b>	Table 358 on page 4619 describes the output fields for the <b>show ldp session</b> command. Output fields are listed in the approximate order in which they appear.

Table 358: show ldp session Output Fields

Field Name	Field Description	Level of Output
Address	Transport address of the session.	any
State	State of the session: <b>Nonexistent</b> , <b>Connecting</b> , <b>Initialized</b> , <b>OpenRec</b> , <b>OpenSent</b> , <b>Operational</b> , or <b>Closing</b> . The states correspond to the state diagram specified in Internet Draft LDP Specification draft-ietf-mpls-rfc3036bis-01.txt.	any
Connection	TCP connection state: <b>Closed</b> , <b>Opening</b> , or <b>Open</b> .	any
Hold time	Time remaining until the session will be closed, in seconds.	any

Table 358: show ldp session Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Session ID</b>	LDP identifiers of the peers of this session.	detail extensive
<b>Next keepalive</b>	Time until next keepalive is sent, in seconds.	detail extensive
<b>Active</b>	Whether the local router is playing the active role in the session and during session establishment.	detail extensive
<b>Passive</b>	Whether the local router is playing the passive role in the session and during session establishment.	detail extensive
<b>Maximum PDU</b>	Maximum protocol data unit (PDU) size (packet size) for the session.	detail extensive
<b>Hold time</b>	Time remaining until the session will be closed, in seconds. This value corresponds to the one configured using the <b>keepalive-timeout</b> statement configured at the <b>[edit protocols ldp]</b> hierarchy level.	detail extensive
<b>Neighbor count</b>	Number of neighbors that are contributing to the session.	detail extensive
<b>Keepalive interval</b>	Keepalive interval, in seconds.	detail extensive
<b>Connect retry interval</b>	TCP connection retry interval, in seconds.	detail extensive
<b>Local address</b>	Local transport address.	detail extensive
<b>Remote address</b>	Remote transport address.	detail extensive
<b>Up for</b>	Time that this session has been up.	detail extensive
<b>Last down</b>	Time since the session last went down.	detail extensive

Table 358: show ldp session Output Fields (*continued*)

Field Name	Field Description	Level of Output
Reason	Reason the session went down: <ul style="list-style-type: none"> <li>Aborted graceful restart</li> <li>Authentication key was changed</li> <li>Bad type length value (TLV)</li> <li>Bad protocol data unit (PDU) packets</li> <li>Command-line interface (CLI) command</li> <li>Connect time expired</li> <li>Connection error</li> <li>Connection reset</li> <li>Error during initialization</li> <li>Hold time expired</li> <li>No adjacency or all adjacencies down</li> <li>Notification received</li> <li>Received notification from peer</li> <li>Unexpected End of File (EOF)</li> <li>Unknown reason</li> </ul>	detail extensive
Number of session flaps	Number of times the session changes from up to down.	detail extensive
Restarting	LDP is in the process of gracefully restarting.	detail extensive
Capabilities advertised	LDP capabilities advertised to a peer.	detail extensive
Capabilities received	LDP capabilities received from a peer.	detail extensive
Protection	Information about the status of MPLS LDP session protection.	detail extensive
restart complete in <i>nnn msec</i>	Amount of time (in milliseconds) remaining until graceful restart is declared complete.	detail extensive
Local	Information about graceful restart for the local end of an LDP session. Graceful restart and helper mode are independent. <ul style="list-style-type: none"> <li><b>Restart</b>—Status of the graceful restart feature at the local end of the LDP session: <b>enabled</b> or <b>disabled</b>.</li> <li><b>Helper mode</b>—Status of the helper mode feature at the local end of the LDP session: <b>enabled</b> or <b>disabled</b>. When this feature is enabled, the local end of the LDP session can help the restarting router with its LDP restart procedures.</li> <li><b>Reconnect time</b>—Amount of time to wait from when a restart is initiated until the router can exchange LDP messages with its neighbors. The default is <b>60000 msec</b> and is not configurable. (<b>Reconnect timeout</b> refers to "FT Reconnect timeout" in draft-ietf-mpls-ldp-restart-06, <i>Internet Draft Graceful Restart Mechanism for LDP</i>.)</li> </ul>	detail extensive

Table 358: show ldp session Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Remote</b>	<p>Information about graceful restart at the remote end of an LDP session. Graceful restart and helper mode are independent.</p> <ul style="list-style-type: none"> <li>• <b>Restart</b>—Status of the graceful restart feature at the remote end of the LDP session: <b>enabled</b> or <b>disabled</b>.</li> <li>• <b>Helper mode</b>—Status of the helper mode feature at the remote end of the LDP session: <b>enabled</b> or <b>disabled</b>. When this feature is enabled, the remote end of the LDP session can help the restarting router with its LDP restart procedures.</li> <li>• <b>Reconnect time</b>—Amount of time in milliseconds from when a restart is initiated until the remote router can exchange LDP messages with its neighbors.</li> </ul>	<b>detail extensive</b>
<b>Local maximum recovery time</b>	Amount of time during which the restarting node attempts to recover its lost states with help from its neighbors (in milliseconds).	<b>detail extensive</b>
<b>Next-hop addresses received</b>	Next-hop addresses received on the session.	<b>detail extensive</b>
<b>Queue depth</b>	Number of messages that are queued for sending to the peers in the group.	<b>extensive</b>
<b>Message type</b>	<p>Type of message being sent:</p> <ul style="list-style-type: none"> <li>• <b>Initialization</b>—Session initialization negotiation messages sent by an LSR to an LDP peer when the transport connection is established.</li> <li>• <b>Keepalive</b>—Keepalive timer messages sent by an LSR to an LDP peer to keep the session active when there is no information or PDU exchanged between them.</li> <li>• <b>Notification</b>—Notification messages (such as state of the LDP session) or error information (such as bad PDU length) sent by an LSR to an LDP peer.</li> <li>• <b>Address</b>—Message sent by an LSR to an LDP peer to advertise interface addresses.</li> <li>• <b>Address withdraw</b>—Message sent by an LSR to an LDP peer to withdraw a previously advertised interface address.</li> <li>• <b>Label mapping</b>—Message sent by an LSR to an LDP peer to advertise label mapping for a forwarding equivalence class (FEC).</li> <li>• <b>Label request</b>—Message sent by an LSR to an LDP peer to request a label mapping for an FEC.</li> <li>• <b>Label withdraw</b>—Message sent by an LSR to an LDP peer to withdraw a previously advertised FEC-label mapping.</li> <li>• <b>Label release</b>—Message sent by an LSR to an LDP peer to notify the peer that a specific FEC-label mapping has been released.</li> <li>• <b>Label abort</b>—Message sent by an LSR to an LDP peer to abort a label request message.</li> <li>• <b>Total</b>—Messages sent and received during the lifetime of the session.</li> <li>• <b>Last 5 seconds</b>—Messages sent and received during the current session.</li> </ul>	<b>extensive</b>

## Sample Output

### show ldp session brief

```
user@host> show ldp session brief
  Address      State      Connection  Hold time
10.255.72.160  Operational Open        21
10.255.72.164  Operational Open        20
10.255.72.172  Operational Open        21
```

### show ldp session detail

```
user@host> show ldp session detail
Address: 192.168.0.3, State: Operational, Connection: Open, Hold time: 27
Session ID: 192.168.0.2:0--192.168.0.3:0
Next keepalive in 7 seconds
Passive, Maximum PDU: 4096, Hold time: 30, Neighbor count: 1
Neighbor types: discovered
Keepalive interval: 10, Connect retry interval: 1
Local address: 192.168.0.2, Remote address: 192.168.0.3
Up for 00:00:02
Capabilities advertised: none
Capabilities received: none
Protection: disabled

Label abort	0	0	0	0

## show ldp statistics

<b>Syntax</b>	show ldp statistics <instance <i>instance-name</i> > <logical-system (all   <i>logical-system-name</i> )>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Display Label Distribution Protocol (LDP) statistics.
<b>Options</b>	<p><b>none</b>—Display LDP statistics for all routing instances.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display information for the specified routing instance only.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">clear ldp statistics on page 4571</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ldp statistics on page 4628</a>
<b>Output Fields</b>	<a href="#">Table 359 on page 4625</a> lists the output fields for the <b>show ldp statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 359: show ldp statistics Output Fields**

Field Name	Field Description
Total Sent, Received	Total number of each message type sent and received.
Last 5 seconds Sent, Received	Number of each message type sent and received in the last 5 seconds.

Table 359: show ldp statistics Output Fields (*continued*)

Field Name	Field Description
<b>Message type</b>	<p>LDP message types:</p> <ul style="list-style-type: none"> <li>• <b>Hello</b>—Messages that enable LDP nodes to discover one another and to detect the failure of a neighbor or of the link to the neighbor.</li> <li>• <b>Initialization</b>—Messages that indicate an LDP session has started.</li> <li>• <b>Keepalive</b>—Messages that ensure that the keepalive timeout is not exceeded.</li> <li>• <b>Notification</b>—Advisory information and signal error information.</li> <li>• <b>Address</b>—Messages with address information.</li> <li>• <b>Address withdrawal</b>—Messages regarding address withdrawal.</li> <li>• <b>Label mapping</b>—Messages with label mapping information.</li> <li>• <b>Label request</b>—Request for a label mapping from a neighboring router.</li> <li>• <b>Label withdrawal</b>—Withdrawal message sent by the downstream LSR to recall a label that it previously mapped. If an LSR that has received a label mapping subsequently determines that it no longer needs that label, it can send a label release message that frees the label for use.</li> <li>• <b>Label release</b>—Message sent by the downstream LSR to recall a label that it previously mapped. If an LSR that has received a label mapping subsequently determines that it no longer needs that label, it can send a label release message that frees the label for use.</li> <li>• <b>Label abort</b>—Messages about label interruptions.</li> <li>• <b>All UDP</b>—All hello messages sent by LSRs to the well-known UDP port, 646.</li> <li>• <b>All TCP</b>—All LDP session messages.</li> </ul>

Table 359: show ldp statistics Output Fields (*continued*)

Field Name	Field Description
<b>Event type</b>	<p>LDP events and errors:</p> <ul style="list-style-type: none"> <li>• <b>Sessions opened</b>—Number of LDP sessions that have been opened.</li> <li>• <b>Sessions closed</b>—Number of LDP sessions that have been closed.</li> <li>• <b>Topology changes</b>—Number of changes to the known LDP topology.</li> <li>• <b>No interface</b>—Number of missing interface address messages. When a new LDP session is initialized and before sending label lapping or label request messages, the LSR advertises its interface addresses with one or more address messages.</li> <li>• <b>No session</b>—Number of missing session messages. Session messages are used to establish, maintain, and terminate sessions between LDP peers.</li> <li>• <b>No adjacency</b>—The exchange of hello adjacency messages results in the creation of an adjacency. The LDP identifier, together with the sender's LDP identifier in the PDU header, enables the receiver to match the initialization message with one of its hello adjacencies. If there is no matching hello adjacency, the LSR sends a session the initialization message is rejected.</li> <li>• <b>Unknown version</b>—The LDP protocol version is not supported by the receiver, or it is supported but is not the version negotiated for the session during session establishment.</li> <li>• <b>Malformed PDU</b>—An LDP PDU received on a TCP connection for an LDP session is malformed if the LDP identifier in the PDU header is unknown to the receiver, or if it is known but is not the LDP identifier associated by the receiver with the LDP peer for this LDP session.  An LDP PDU is considered to be malformed if the LDP protocol version is not supported by the receiver, or it is supported but is not the version negotiated for the session during session establishment.  An LDP PDU is considered malformed if the PDU length field is too small (less than 14) or too large (greater than maximum PDU length).</li> <li>• <b>Malformed message</b>—Malformed LDP messages that are part of the LDP discovery mechanism are handled by silently discarding them.  An LDP message is malformed if the message type is unknown. If the message type is less than 0x8000 (high order bit = 0), it is an error signaled by the unknown message type status code.  An LDP message is considered to be malformed if the message length is too large, meaning that the message extends beyond the end of the containing LDP PDU.  The LDP message is considered to be malformed if the message length is too small, meaning that it is smaller than the smallest possible value component.  The LDP message is considered to be malformed if the message is missing one or more mandatory parameters.</li> <li>• <b>Unknown message type</b>—If the message type is less than 0x8000 (high order bit = 0) or greater than or equal to 0x8000 (high order bit = 1) it is considered to be an unknown message.</li> <li>• <b>Inappropriate message</b>—The message is not of the type that the receiver expects to receive.</li> <li>• <b>Malformed TLV</b>—The TLV Length is too large or the receiver cannot decode the TLV value. This can indicate an issue in either the sending or receiving LSR.</li> <li>• <b>Bad TLV value</b>—The TLV Length is too large.</li> <li>• <b>Missing TLV</b>—The TLV is missing one or more mandatory parameters.</li> <li>• <b>PDU too large</b>—The PDF is greater than the maximum PDU length. Section "Initialization Message" in RFC 5036 describes how the maximum PDU length for a session is determined.</li> </ul>
<b>Total</b>	Total number of each event or error.
<b>Last 5 seconds</b>	Number of each event or error in the last 5 seconds.

## Sample Output

### show ldp statistics

```
user@host> show ldp statistics
```

Message type	Total		Last 5 seconds

Bad TLV value	0		0
Missing TLV	0		0
PDU too large	0		0

## show ldp traffic-statistics

<b>Syntax</b>	<pre>show ldp traffic-statistics &lt;instance <i>instance-name</i>&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;p2mp&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p><b>p2mp</b> option added in Junos OS Release 11.2.</p> <p>Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.</p>
<b>Description</b>	Display Label Distribution Protocol (LDP) traffic statistics.
<div>  <b>NOTE:</b> If nonstop active routing features is configured, <b>show ldp traffic-statistics</b> command is not supported on backup Routing Engines. </div>	
<b>Options</b>	<p><b>none</b>—Display LDP traffic statistics for all routing instances.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display LDP traffic statistics for the specified routing instance only.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>p2mp</b>—(Optional) Display only the data traffic statistics for a point-to-multipoint LSP.</p>
<b>Additional Information</b>	To collect output from this command on a periodic basis, configure the <a href="#">traffic-statistics</a> statement for the LDP protocol. For more information, see the <i>Junos MPLS Applications Configuration Guide</i> .
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear ldp statistics on page 4571</a></li> <li>• <a href="#">Example: Configuring Multicast-Only Fast Reroute in a Multipoint LDP Domain</a></li> <li>• <a href="#">Example: Configuring Multipoint LDP In-Band Signaling for Point-to-Multipoint LSPs</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show ldp traffic-statistics on page 4630</a></p> <p><a href="#">show ldp traffic-statistics p2mp on page 4631</a></p> <p><a href="#">show ldp traffic-statistics p2mp (Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 4631</a></p> <p><a href="#">show ldp traffic-statistics p2mp (Multipoint LDP with Multicast-Only Fast Reroute) on page 4631</a></p>
<b>Output Fields</b>	<p><a href="#">Table 360 on page 4630</a> lists the output fields for the <b>show ldp traffic-statistics</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 360: show ldp traffic-statistics Output Fields

Field Name	Field Description
<b>Message type</b>	LDP message types.
<b>FEC</b>	Forwarding equivalence class (FEC) for which LDP traffic statistics are collected.  For P2MP LSPs, FEC appears as a combination of root address and the LSP ID ( <b>root_addr:lsp_id</b> ).  For M-LDP P2MP LSPs, FEC appears as a combination of root address multicast source address, and multicast group address ( <b>root_addr:lsp_id/grp,src</b> ).
<b>Type</b>	Type of traffic originating from a router, either <b>Ingress</b> (originating from this router) or <b>Transit</b> (forwarded through this router).
<b>Packets</b>	Number of packets passed by the FEC since its LSP came up.
<b>Bytes</b>	Number of bytes of data passed by the FEC since its LSP came up.
<b>Shared</b>	Whether a label is shared by prefixes: <b>Yes</b> or <b>No</b> . A <b>Yes</b> value indicates that several prefixes are bound to the same label (for example, when several prefixes are advertised with an egress policy). The LDP traffic statistics for this case apply to all the prefixes and should be treated as such.
<b>Nextthop</b>	The next hop address for P2MP LSPs. (This is the downstream LDP Session ID.)
<b>Label</b>	For multipoint LDP with multicast-only fast reroute (MoFRR), the multipoint LDP node selects two separate upstream peers and sends two separate labels, one to each upstream peer. The same algorithm described in RFC 6388 is used to select the primary upstream path. The backup upstream path selection again uses the same algorithm but excludes the primary upstream LSR as a candidate. Two streams of MPLS traffic are sent to the egress node from the two different upstream peers. The MPLS traffic from only one of the upstream neighbors is selected as the primary path to accept the traffic, and the other becomes the backup path. The traffic on the backup path is dropped. When the primary upstream path fails, the traffic from the backup path is then accepted. The multipoint LDP node selects the two upstream paths based on the interior gateway protocol (IGP) root node next hop.  Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.
<b>Backup route</b>	For multipoint LDP with MoFRR, the route that is used if the primary route becomes unavailable.

## Sample Output

## show security keychain

<b>Syntax</b>	show security keychain <brief   detail>
<b>Release Information</b>	Command introduced in Junos OS Release 11.2. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Display information about authentication keychains configured for the Border Gateway Protocol (BGP), the Label Distribution Protocol (LDP) routing protocols, the Bidirectional Forwarding Detection (BFD) protocol, and the Intermediate System-to-Intermediate System (IS-IS) protocol.
<b>Options</b>	<b>none</b> —Display information about authentication keychains. <b>brief   detail</b> —(Optional) Display the specified level of output.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show security keychain brief on page 4635</a> <a href="#">show security keychain detail on page 4635</a>
<b>Output Fields</b>	<a href="#">Table 312 on page 3990</a> describes the output fields for the <b>show security keychain</b> command. Output fields are listed in the approximate order in which they appear.

**Table 361: show security keychain Output Fields**

Field Name	Field Description	Level of Output
<b>keychain</b>	The name of the keychain in operation.	All levels
<b>Active-ID Send</b>	Number of routing protocols packets sent with the active key.	All levels
<b>Active-ID Receive</b>	Number of routing protocols packets received with the active key.	All levels
<b>Next-ID Send</b>	Number of routing protocols packets sent with the next key.	All levels
<b>Next-ID Receive</b>	Number of routing protocols packets received with the next key.	All levels
<b>Transition</b>	Amount of time until the current key will be replaced with the next key in the keychain.	All levels
<b>Tolerance</b>	Configured clock-skew tolerance, in seconds, for accepting keys for a key chain.	All levels

Table 361: show security keychain Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Id</b>	Identification number configured for the current key.	<b>detail</b>
<b>Algorithm</b>	Authentication algorithm configured for the current key.	<b>detail</b>
<b>State</b>	<p>State of the current key.</p> <p>The value can be:</p> <ul style="list-style-type: none"> <li>• <b>receive</b></li> <li>• <b>send</b></li> <li>• <b>send-receive</b></li> </ul> <p>For the active key, the <b>State</b> can be <b>send-receive</b>, <b>send</b>, or <b>receive</b>. For keys that have a future start time, the <b>State</b> is <b>inactive</b>. Compare the <b>State</b> field to the <b>Mode</b> field.</p>	<b>detail</b>
<b>Option</b>	<p>For IS-IS only, the option determines how Junos OS encodes the message authentication code in routing protocol packets.</p> <p>The values can be:</p> <ul style="list-style-type: none"> <li>• <b>basic</b>—Based on RFC 5304.</li> <li>• <b>isis-enhanced</b>—Based on RFC 5310.</li> </ul> <p>The default value is <b>basic</b>. When you configure the <b>isis-enhanced</b> option, Junos OS sends RFC 5310-encoded routing protocol packets and accepts both RFC 5304-encoded and RFC 5310-encoded routing protocol packets that are received from other devices.</p> <p>When you configure <b>basic</b> (or do not include the <b>options</b> statement in the key configuration) Junos OS sends and receives RFC 5304-encoded routing protocols packets, and drops 5310-encoded routing protocol packets that are received from other devices.</p> <p>Because this setting is for IS-IS only, the TCP and the BFD protocol ignore the encoding option configured in the key.</p>	<b>detail</b>
<b>Start-time</b>	Time that the current key became active.	<b>detail</b>

Table 361: show security keychain Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Mode</b>	<p>Mode of each key (Informational only.)</p> <p>The value can be</p> <ul style="list-style-type: none"> <li>• <b>receive</b></li> <li>• <b>send</b></li> <li>• <b>send-receive</b></li> </ul> <p>The mode of the key is based on the configuration. Suppose you configure two keys, one with a start-time of today and the other with a start-time of next week. For both keys, the <b>Mode</b> can be <b>send-receive</b>, <b>send</b>, or <b>receive</b>, regardless of the configured start-time. Compare the <b>Mode</b> field to the <b>State</b> field.</p>	<b>detail</b>

## show link-management

<b>Syntax</b>	show link-management
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display Multiprotocol Label Switching (MPLS) peer and traffic engineering link information.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show link-management peer on page 4640</a></li> <li>• <a href="#">show link-management routing on page 4642</a></li> <li>• <a href="#">show link-management statistics on page 4645</a></li> <li>• <a href="#">show link-management te-link on page 4647</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show link-management on page 4639</a>
<b>Output Fields</b>	<a href="#">Table 362 on page 4636</a> describes the output fields for the <b>show link-management</b> command. Output fields are listed in the approximate order in which they appear.

**Table 362: show link-management Output Fields**

Field Name	Field Description
Peer Name	Name of the peer.
System identifier	Internal identifier for the peer. The range of values is 0 through 64,000.
State	State of the peer: <b>Up</b> or <b>Down</b> .
Control address	Address to which a control channel is established.
CC local ID	Identifier assigned to the control channel by the local peer. The range of values is 1 through 4,294,967,296.
CC remote ID	Identifier assigned to the control channel by the remote peer. The range of values is 1 through 4,294,967,296.
State	State of the control channel: <b>Up</b> or <b>Down</b> .
TxSeqNum	Sequence number of the hello message being sent to the peer. The range of values is 1 through 4,294,967,295.
RcvSeqNum	Sequence number of the last hello message received from the peer. The range of values is 0 through 4,294,967,295.

Table 362: show link-management Output Fields (*continued*)

Field Name	Field Description
<b>Flags</b>	Code that provides information about the control channel. Currently supports only code value <b>R</b> , which indicates that the control channel is restarting after a failure in the control plane, as when the Link Management Protocol (LMP) process starts or restarts.
<b>TE links</b>	Traffic-engineered links that are managed by their peer.
<b>TE link name</b>	Name of the traffic-engineered link.
<b>State</b>	State of the traffic-engineered link: <b>Up</b> , <b>Down</b> , or <b>Init</b> .
<b>Local identifier</b>	Identifier of the local side of the link.
<b>Remote identifier</b>	Identifier of the remote side of the link.
<b>Local address</b>	Address of the local side of the link.
<b>Remote address</b>	Address of the remote side of the link.
<b>Encoding</b>	Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include <b>SDH/SONET</b> , <b>Ethernet</b> , <b>Packet</b> , and <b>PDH</b> .
<b>Switching</b>	Type of switching that can be performed on the traffic-engineered link. Supported values are <b>PSC-1</b> and <b>Packet</b> .
<b>Minimum bandwidth</b>	Smallest single allocation of bandwidth possible on the traffic-engineered link. This number is equal to the smallest bandwidth interface that is a member of the traffic-engineered link (in bps).
<b>Maximum bandwidth</b>	Largest single allocation of bandwidth possible on the traffic-engineered link. This number is equal to the largest bandwidth interface that is a member of the link (in bps).
<b>Total bandwidth</b>	Sum of the bandwidth, in bits per second (bps) and megabits per second (Mbps), of all interfaces that are members of the link.
<b>Available bandwidth</b>	Sum of the bandwidths of all interfaces that are members of the link and that are not yet allocated (in bps).
<b>Name</b>	Name of the interface.
<b>State</b>	State of the interface: <b>Up</b> or <b>Down</b> .
<b>Local ID</b>	Identifier of the local side of the interface.
<b>Remote ID</b>	Identifier of the remote side of the interface.
<b>Bandwidth</b>	Bandwidth, in bps or Mbps, of the member interface.
<b>Used</b>	Whether the resource is allocated to an LSP: <b>Yes</b> or <b>No</b> .

Table 362: show link-management Output Fields (*continued*)

Field Name	Field Description
LSP-name	LSP name.

## show link-management peer

<b>Syntax</b>	<code>show link-management peer</code> <code>&lt;name <i>peer-name</i>&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display Multiprotocol Label Switching (MPLS) peer link information.
<b>Options</b>	<b>none</b> —Display all peer link information.  <b>name <i>peer-name</i></b> —(Optional) Display information for the specified peer only.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show link-management on page 4636</a></li> <li>• <a href="#">show link-management routing on page 4642</a></li> <li>• <a href="#">show link-management statistics on page 4645</a></li> <li>• <a href="#">show link-management te-link on page 4647</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show link-management peer on page 4641</a>
<b>Output Fields</b>	Table 363 on page 4640 describes the output fields for the <b>show link-management peer</b> command. Output fields are listed in the approximate order in which they appear.

**Table 363: show link-management peer Output Fields**

Field Name	Field Description
Peer Name	Name of the peer.
System identifier	Internal identifier for the peer. The range of values is 0 through 64,000.
State	State of the peer: <b>Up</b> or <b>Down</b> .
Control address	Address to which a control channel is established.
Hello interval	How often the routing device sends Link Management Protocol (LMP) hello packets.
Hello dead interval	How long LMP waits before declaring the control channel to be dead. This is an interval during which the routing device receives no LMP hello packets from the neighbor on a control that is active or up.
CC local ID	Identifier assigned to the control channel by the local peer. The range of values is 1 through 4,294,967,296.
CC remote ID	Identifier assigned to the control channel by the remote peer. The range of values is 1 through 4,294,967,296.

Table 363: show link-management peer Output Fields (*continued*)

Field Name	Field Description
<b>State</b>	State of the control channel: <b>Up</b> or <b>Down</b> .
<b>TxSeqNum</b>	Sequence number of the hello message being sent to the peer. The range of values is <b>1</b> through <b>4,294,967,295</b> .
<b>RcvSeqNum</b>	Sequence number of the last hello message received from the peer. The range of values is <b>0</b> through <b>4,294,967,295</b> .
<b>Flags</b>	Code that provides information about the control channel. Currently supports only code value <b>R</b> , which indicates that the control channel is restarting after a failure in the control plane, as when the Link Management Protocol (LMP) process starts or restarts.
<b>TE links</b>	Traffic-engineered links that are managed by their peer.

## show link-management routing

<b>Syntax</b>	show link-management routing <peer <name <i>name</i> >   te-link <name <i>name</i> >> <resource <name <i>name</i> >>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display Multiprotocol Label Switching (MPLS) peer or traffic engineering link information from the routing process.
<b>Options</b>	<p><b>none</b>—Display all peer and traffic-engineered link information.</p> <p><b>peer &lt;name <i>name</i>&gt;</b>—(Optional) Display information for all peers or for the specified peer only.</p> <p><b>resource &lt;name <i>name</i>&gt;</b>—(Optional) Display information for all resources or for the specified resource only.</p> <p><b>te-link &lt;name <i>name</i>&gt;</b>—(Optional) Display information for all traffic-engineered forwarding paths or for the specified path only.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show link-management on page 4636</a></li> <li>• <a href="#">show link-management peer on page 4640</a></li> <li>• <a href="#">show link-management statistics on page 4645</a></li> <li>• <a href="#">show link-management te-link on page 4647</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show link-management routing on page 4644</a>
<b>Output Fields</b>	Table 364 on page 4642 describes the output fields for the <b>show link-management routing</b> command. Output fields are listed in the approximate order in which they appear.

**Table 364: show link-management routing Output Fields**

Field Name	Field Description
Peer Name	Name of the peer.
System identifier	Internal identifier for the peer. The range of values is 0 through 64,000.
State	State of the peer: Up or Down.
Control address	Address to which a control channel is established.
Control channel	Interface over which control packets are sent.

Table 364: show link-management routing Output Fields (*continued*)

Field Name	Field Description
<b>State</b>	State of the control channel.
<b>TE link name</b>	Traffic-engineered link name.
<b>State</b>	State of the traffic-engineered link: <b>Up</b> or <b>Down</b> .
<b>Local identifier</b>	Identifier of the local side of the link.
<b>Remote identifier</b>	Identifier of the remote side of the link.
<b>Local address</b>	Address of the local side of the link.
<b>Remote address</b>	Address of the remote side of the link.
<b>Encoding</b>	Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include <b>SDH/SONET</b> , <b>Ethernet</b> , and <b>Packet</b> .
<b>Minimum bandwidth</b>	Smallest single allocation of bandwidth, in bits per second (bps) or megabits per second (Mbps), possible on the traffic-engineered link. This number is equal to the smallest bandwidth interface that is a member of the traffic-engineered link.
<b>Maximum bandwidth</b>	Largest single allocation of bandwidth, in bps or Mbps, possible on the traffic-engineered link. This number is equal to the largest bandwidth interface that is a member of the link (in bps).
<b>Total bandwidth</b>	Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link.
<b>Available bandwidth</b>	Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link and that are not yet allocated.
<b>Resource</b>	Forwarding adjacency LSP information.
<b>Type</b>	Type of resource. The type is always a forwarding adjacency LSP.
<b>State</b>	State of the LSP: <b>Up</b> or <b>Down</b> .
<b>System Identifier</b>	Internal identifier for the peer. The range of values is <b>0</b> through <b>64,000</b> .
<b>Total bandwidth</b>	Bandwidth resource, in bps or Mbps, on the TE-link learned from the routing process.
<b>Traffic parameters</b>	<ul style="list-style-type: none"> <li>• <b>Encoding</b>—Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include <b>SDH/SONET</b>, <b>Ethernet</b>, and <b>Packet</b>.</li> <li>• <b>Switching</b>—Type of switching that can be performed on the traffic-engineered link: <b>PSC-1</b> and <b>Packet</b>.</li> <li>• <b>Granularity</b>—Layer 2 data for switching Layer 2 LSPs for this resource. Not supported. This value is always <b>unknown</b>.</li> </ul>

## show link-management statistics

<b>Syntax</b>	show link-management statistics <peer <name <i>name</i> >>
<b>Release Information</b>	Command introduced in Junos OS Release 8.0. Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display statistical information for Link Management Protocol (LMP) packets.
<b>Options</b>	<b>none</b> —Display information for all peers.  <b>peer &lt;name <i>name</i>&gt;</b> —(Optional) Display information for all peers or for the specified peer only.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show link-management on page 4636</a></li> <li>• <a href="#">show link-management peer on page 4640</a></li> <li>• <a href="#">show link-management routing on page 4642</a></li> <li>• <a href="#">show link-management te-link on page 4647</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show link-management statistics on page 4646</a>
<b>Output Fields</b>	Table 365 on page 4645 describes the output fields for the <b>show link-management statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 365: show link-management statistics Output Fields**

Field Name	Field Description
<b>Received packets</b>	Number of received packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.
<b>Received bad packets</b>	Number of received bad packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.
<b>Small packets</b>	Number of packets that are too small.
<b>Wrong protocol version</b>	Number of packets specifying the wrong LMP version.
<b>Messages for unknown peer</b>	Number of packets destined for an unknown peer.
<b>Messages for bad state</b>	Number of packets indicating a state that does not match the recipient.
<b>Stale acknowledgments</b>	Number of <b>configAck</b> and <b>LinkSummaryAck</b> packets received that have a stale message ID.

Table 365: show link-management statistics Output Fields (*continued*)

Field Name	Field Description
<b>Stale negative acknowledgments</b>	Number of <b>configNack</b> and <b>LinkSummaryNack</b> packets received that have a stale message ID.
<b>Sent packets</b>	Number of sent packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.
<b>Retransmitted packets</b>	Number of retransmitted packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.
<b>Dropped packets</b>	Number of packets sent, by message type, that have been dropped by the receiver after the LMP retransmission interval has been exceeded. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.

## Sample Output

### show link-management statistics

```

user@host> show link-management statistics peer pro4-a
Statistics for peer pro4-a
  Received packets
    Config: 1
    Hello: 2572
  Small packets: 0
  Wrong protocol version: 0
  Messages for unknown peer: 0
  Messages for bad state: 0
  Stale acknowledgments: 0
  Stale negative acknowledgments: 0
  Sent packets
    Config: 2
    ConfigAck: 1
    Hello: 2572
  Retransmitted packets
    Config: 1

```

## show link-management te-link

<b>Syntax</b>	show link-management te-link <brief   detail> <name <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display the resources used to set up Multiprotocol Label Switching (MPLS) traffic-engineered forwarding paths.
<b>Options</b>	<b>none</b> —Display information for all traffic-engineered links.  <b>brief   detail</b> —(Optional) Display the specified level of output.  <b>name <i>name</i></b> —(Optional) Display information for the specified traffic-engineered link only.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show link-management on page 4636</a></li> <li>• <a href="#">show link-management peer on page 4640</a></li> <li>• <a href="#">show link-management routing on page 4642</a></li> <li>• <a href="#">show link-management statistics on page 4645</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show link-management te-link on page 4648</a>
<b>Output Fields</b>	<a href="#">Table 366 on page 4647</a> describes the output fields for the <b>show link-management te-link</b> command. Output fields are listed in the approximate order in which they appear.

**Table 366: show link-management te-link Output Fields**

Field Name	Field Description
TE link name	Traffic-engineered link name.
State	State of the traffic-engineered link: <b>Up</b> or <b>Down</b> .
Local identifier	Identifier of the local side of the link.
Remote identifier	Identifier of the remote side of the link.
Local address	Address of the local side of the link.
Remote address	Address of the remote side of the link.
Encoding	Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include <b>SDH/SONET</b> , <b>Ethernet</b> , <b>Packet</b> , and <b>PDH</b> .

Table 366: show link-management te-link Output Fields (*continued*)

Field Name	Field Description
<b>Switching</b>	Type of switching that can be performed on the traffic-engineered link. Supported values are <b>PSC-1</b> and <b>Packet</b> .
<b>Minimum bandwidth</b>	Smallest single allocation of bandwidth, in bits per second (bps) or megabits per second (Mbps), possible on the traffic-engineered link. This number is equal to the smallest bandwidth interface that is a member of the traffic-engineered link.
<b>Maximum bandwidth</b>	Largest single allocation of bandwidth, in bps or Mbps, possible on the traffic-engineered link. This number is equal to the largest bandwidth interface that is a member of the link.
<b>Total bandwidth</b>	Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link (in bps).
<b>Available Bandwidth</b>	Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link and that are not yet allocated.
<b>Name</b>	Name of the interface.
<b>State</b>	State of the interface: <b>Up</b> or <b>Down</b> .
<b>Local ID</b>	Identifier of the local side of the interface.
<b>Remote ID</b>	Identifier of the remote side of the interface.
<b>Bandwidth</b>	Bandwidth, in bps or Mbps, of the member interface.
<b>Used</b>	Whether the resource is allocated to an LSP: <b>Yes</b> or <b>No</b> .
<b>LSP-name</b>	LSP name.

## Sample Output

### show link-management te-link

```

user@host> show link-management te-link

<b>Syntax (EX Series Switches)</b>	<pre>show mpls call-admission-control &lt;lsp-name&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.5 for EX Series switches.</p>
<b>Description</b>	Display Multiprotocol Label Switching (MPLS) label-switched path (LSP) call admission control (CAC) information.
<b>Options</b>	<p><b>none</b>—Display CAC information for all LSPs.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b><i>lsp-name</i></b>—(Optional) Display CAC information for the specified LSP only.</p>
<b>Additional Information</b>	The available bandwidth on an LSP path at a particular class type is the total path bandwidth at that class type minus the total bandwidth reserved by any Layer 2 connection at that class type.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show mpls call-admission-control on page 4650</a>
<b>Output Fields</b>	<a href="#">Table 367 on page 4649</a> describes the output fields for the <b>show mpls call-admission-control</b> command. Output fields are listed in the approximate order in which they appear.

**Table 367: show mpls call-admission-control Output Fields**

Field Name	Field Description
Available bandwidth	Current available bandwidth on each LSP path. Depending on whether the LSP is an E-LSP or a regular LSP, either per-class bandwidth or a single bandwidth value (corresponding to best-effort bandwidth at <b>ct0</b> ) is displayed. The available bandwidth on an LSP path at a particular class type is the total path bandwidth at that class type minus the total bandwidth reserved by some Layer 2 connections at that class type.
Layer2 connections	Different Layer 2 connections that had some bandwidth requirement and were admitted into an LSP path.
LSP name	LSP pathname.

Table 367: show mpls call-admission-control Output Fields (*continued*)

Field Name	Field Description
Neighbor address	Neighbor address from which CAC and bandwidth booking are configured for Layer 2 circuits.
Circuit	Interface name and circuit information.
Primary	LSP's primary standby path.
Standby	LSP's secondary standby path.
VC bandwidth	Bandwidth constraints associated with a Layer 2 circuit route.

## Sample Output

<b>Output Fields</b>	<a href="#">Table 368 on page 4651</a> describes the output fields for the <b>show mpls cspf</b> command. Output fields are listed in the approximate order in which they appear.

**Table 368: show mpls cspf Output Fields**

Field Name	Field Description
<b>Queue length</b>	Number of LSPs queued for automatic path computation.
<b>current</b>	Current queue length.
<b>maximum</b>	Maximum queue length (high-water mark).
<b>dequeued</b>	Number of aborted computation attempts.
<b>Paths</b>	Counters for label-switched path computations.
<b>total</b>	Sum of the next four fields.
<b>successful</b>	Number of path computations that were successfully completed.
<b>no route</b>	Number of path computations that failed because the destination is unreachable.

Table 368: show mpls cspf Output Fields (*continued*)

Field Name	Field Description
<b>Sys Error</b>	Number of path computations that failed because of lack of memory.
<b>CSPFs</b>	Total number of CSPF computations. A single path might require multiple CSPF computations.
<b>Time</b>	Time, in seconds, required to perform the label-switched path computation.
<b>Total</b>	Total amount of time consumed by the CSPF path computation algorithm.
<b>CSPFs</b>	Total number of CSPF computations.
<b>Avg per CSPF</b>	Average amount of time required for each CSPF computation.
<b>% of rpd</b>	Percentage of routing process CPU used in the CSPF computation.

## Sample Output

show mpls cspf

```

user@host> show mpls cspf
CSPF statistics
Queue length  current      maximum    dequeued
              0           0           0

## show mpls diffserv-te

<b>List of Syntax</b>	<a href="#">Syntax on page 4653</a> <a href="#">Syntax (EX Series Switches) on page 4653</a>
<b>Syntax</b>	show mpls diffserve-te <logical-system (all   <i>logical-system-name</i> )>
<b>Syntax (EX Series Switches)</b>	show mpls diffserve-te
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display Multiprotocol Label Switching (MPLS) label-switched path (LSP) Differentiated Services (DiffServ) class and preemption priority information.
<b>Options</b>	<b>none</b> —Display DiffServ classes and priorities used by MPLS LSPs.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show mpls diffserv-te on page 4654</a>
<b>Output Fields</b>	<a href="#">Table 369 on page 4653</a> describes the output fields for the <b>show mpls diffserv-te</b> command. Output fields are listed in the approximate order in which they appear.

**Table 369: show mpls diffserv-te Output Fields**

Field Name	Field Description
<b>Bandwidth model</b>	Bandwidth constraint model supported. The maximum allocation model (MAM) for EXP-inferred LSPs (E-LSPs) is currently supported.
<b>TE class</b>	DiffServ traffic engineering class.
<b>Traffic class</b>	MPLS class type that corresponds to the DiffServ traffic engineering class: <ul style="list-style-type: none"> <li>• <b>ct0</b>—Best effort</li> <li>• <b>ct1</b>—Assured forwarding</li> <li>• <b>ct2</b>—Expedited forwarding</li> <li>• <b>ct3</b>—Network control</li> </ul>
<b>Priority</b>	MPLS preemption priority for this class type, a value from 0 through 7. Interior gateway protocols (IGPs) distribute information about the available bandwidth for each traffic engineering class.

## Sample Output

`show mpls diffserv-te`

```
user@host> show mpls diffserv-te
Bandwidth model: Maximum Allocation Model with support for E-LSPs.
TE class    Traffic class    Priority
te0         ct0              3
te1         ct1              2
```

## show route forwarding-table

<b>Syntax</b>	<pre>show route forwarding-table &lt;detail   extensive   summary&gt; &lt;ccc ccc-interface-name&gt; &lt;destination&gt; &lt;family family-name&gt; &lt;label label&gt; &lt;matching ip_prefix&gt; &lt;multicast&gt; &lt;vpn vpn&gt;</pre>
<b>Release Information</b>	Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.
<b>Options</b>	<p><b>none</b>—Display the routes in the forwarding table.</p> <p><b>detail   extensive   summary</b>—(Optional) Display the specified level of output.</p> <p><b>ccc</b>—(Optional) Display the specified circuit cross-connect interface name for entries to match.</p> <p><b>destination</b>—(Optional) Display the destination prefix.</p> <p><b>family family-name</b>—(Optional) Display routing table entries for the specified family: <b>ethernet-switching, inet, inet6, iso, mpls, vlan classification</b>.</p> <p><b>label label</b>—(Optional) Display route entries for the specified label name.</p> <p><b>matching ip_prefix</b>—(Optional) Display route entries for the specified IP prefix.</p> <p><b>multicast</b>—(Optional) Display route entries for multicast routes.</p> <p><b>vpn vpn</b>—(Optional) Display route entries for the specified VPN.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Example: Configuring MPLS on EX Series Switches</i></li> <li><i>Configuring MPLS on Provider Switches (CLI Procedure)</i></li> </ul>

[show route forwarding-table label on page 4661](#)  
[show route forwarding-table matching on page 4661](#)  
[show route forwarding-table multicast on page 4661](#)

**Output Fields** Table 288 on page 3147 lists the output fields for the **show route forwarding-table** command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified or when the **detail** keyword is used instead of the **extensive** keyword.

Table 370: show route forwarding-table Output Fields

Field Name	Field Description	Level of Output
<b>Routing table</b>	Name of the routing table (for example, <b>inet</b> , <b>inet6</b> , <b>mpls</b> ).	All levels
<b>Address family</b>	Address family (for example, <b>IP</b> , <b>IPv6</b> , <b>ISO</b> , <b>MPLS</b> ).	All levels
<b>Destination</b>	Destination of the route.	<b>detail</b> , <b>extensive</b>
<b>Route Type (Type)</b>	How the route was placed into the forwarding table. When the <b>detail</b> keyword is used, the route type might be abbreviated (as shown in parentheses): <ul style="list-style-type: none"> <li><b>cloned (clon)</b>—(TCP or multicast only) Cloned route.</li> <li><b>destination (dest)</b>—Remote addresses directly reachable through an interface.</li> <li><b>destination down (iddn)</b>—Destination route for which the interface is unreachable.</li> <li><b>interface cloned (ifcl)</b>—Cloned route for which the interface is unreachable.</li> <li><b>route down (ifdn)</b>—Interface route for which the interface is unreachable.</li> <li><b>ignore (ignr)</b>—Ignore this route.</li> <li><b>interface (intf)</b>—Installed as a result of configuring an interface.</li> <li><b>permanent (perm)</b>—Routes installed by the kernel when the routing table is initialized.</li> <li><b>user</b>—Routes installed by the routing protocol process or as a result of the configuration.</li> </ul>	All levels
<b>Route reference (RtRef)</b>	Number of routes to reference.	<b>detail</b> , <b>extensive</b>
<b>Flags</b>	Route type flags: <ul style="list-style-type: none"> <li><b>none</b>—No flags are enabled.</li> <li><b>accounting</b>—Route has accounting enabled.</li> <li><b>cached</b>—Cache route.</li> <li><b>incoming-iface interface-number</b>—Check against incoming interface.</li> <li><b>prefix load balance</b>—Load balancing is enabled for this prefix.</li> <li><b>sent to PFE</b>—Route has been sent to the Packet Forwarding Engine.</li> <li><b>static</b>—Static route.</li> </ul>	<b>extensive</b>
<b>Nexthop</b>	IP address of the next hop to the destination.	<b>detail</b> , <b>extensive</b>

Table 370: show route forwarding-table Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Next hop type (Type)</b>	<p>Next-hop type. When the <b>detail</b> keyword is used, the next-hop type might be abbreviated (as indicated in parentheses):</p> <ul style="list-style-type: none"> <li>• <b>broadcast (bcst)</b>—Broadcast.</li> <li>• <b>deny</b>—Deny.</li> <li>• <b>hold</b>—Next hop is waiting to be resolved into a unicast or multicast type.</li> <li>• <b>indexed (idxd)</b>—Indexed next hop.</li> <li>• <b>indirect (indr)</b>—Indirect next hop.</li> <li>• <b>local (locl)</b>—Local address on an interface.</li> <li>• <b>routed multicast (mcr)</b>—Regular multicast next hop</li> <li>• <b>multicast (mcst)</b>—Wire multicast next hop (limited to the LAN).</li> <li>• <b>multicast discard (mdsc)</b>—Multicast discard.</li> <li>• <b>multicast group (mgrp)</b> —Multicast group member.</li> <li>• <b>receive (rcv)</b>—Receive.</li> <li>• <b>reject (rjct)</b>—Discard. An ICMP unreachable message was sent.</li> <li>• <b>resolve (rslv)</b>—Resolving the next hop.</li> <li>• <b>unicast (ucst)</b>—Unicast.</li> <li>• <b>unilist (ulst)</b>—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.</li> </ul>	<b>detail, extensive</b>
<b>Index</b>	Software index of the next hop that is used to route the traffic for a given prefix.	<b>detail, extensive none</b>
<b>Route interface-index</b>	Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned.	<b>extensive</b>
<b>Reference (NhRef)</b>	Number of routes that refer to this next hop.	<b>none detail, extensive</b>
<b>Next-hop interface (Netif)</b>	Interface used to reach the next hop.	<b>none detail, extensive</b>
<b>Alternate forward nh index</b>	Index number of the alternate next hop interface. Seen with <b>multicast</b> option only.	<b>extensive</b>
<b>Next-hop L3 Interface</b>	The next hop layer 3 interface. This option can be expressed as a VLAN name and is only seen with the <b>multicast</b> option.	<b>extensive</b>
<b>Next-hop L2 Interfaces</b>	The next hop layer 2 interfaces. Seen with <b>multicast</b> option only.	<b>extensive</b>

## Sample Output

### show route forwarding-table

## show mpls interface

<b>List of Syntax</b>	<a href="#">Syntax on page 4663</a> <a href="#">Syntax (EX Series Switches) on page 4663</a>
<b>Syntax</b>	show mpls interface <logical-system (all   <i>logical-system-name</i> )>
<b>Syntax (EX Series Switches)</b>	show mpls interface
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display information about Multiprotocol Label Switching (MPLS)-enabled interfaces.
<b>Options</b>	<b>none</b> —Display information about MPLS-enabled interfaces.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Additional Information</b>	MPLS is enabled on an interface when the interface is configured with both the <b>set protocol mpls interface <i>interface-name</i></b> and <b>set interface <i>interface-name</i> unit 0 family mpls</b> statements.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show mpls interface on page 4664</a>
<b>Output Fields</b>	<a href="#">Table 371 on page 4663</a> describes the output fields for the <b>show mpls interface</b> command. Output fields are listed in the approximate order in which they appear.

**Table 371: show mpls interface Output Fields**

Field Name	Field Description
<b>Interface</b>	Name of the interface.
<b>State</b>	State of the interface: <b>Up</b> or <b>Dn</b> (down).
<b>Administrative groups</b>	Administratively assigned colors of the link.
<b>Maximum labels</b>	Maximum number of MPLS labels upon which MPLS can operate on a logical interface. This is configured using the <b>maximum-labels</b> statement at the [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family mpls] or the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family mpls] hierarchy levels.

Table 371: show mpls interface Output Fields (*continued*)

Field Name	Field Description
Static protection revert time	Time (in seconds) that a static LSP must wait before traffic reverts from the bypass path to the original path. This is configured using the <b>protection-revert-time</b> statement at the [edit logical-systems <i>logical-system-name</i> protocols mpls interface <i>interface-name</i> static] or the [edit protocols mpls interface <i>interface-name</i> static] hierarchy levels.
Always mark connection protection tlv	Enabled or Disabled: Enabled indicates that the <b>always-mark-connection-protection-tlv</b> statement is configured at the [edit logical-systems <i>logical-system-name</i> protocols mpls interface <i>interface-name</i> static] or the [edit protocols mpls interface <i>interface-name</i> static] hierarchy levels. When this statement is configured, it marks all OAM traffic transiting this interface in preparation for switching the traffic to an alternate path based on the OAM functionality. To switch traffic to the bypass LSP, the <b>switch-away-lsps</b> statement must be configured.
Switch away lsps	Enabled or Disabled: Enabled indicates that the <b>switch-away-lsps</b> statement is configured at the [edit logical-systems <i>logical-system-name</i> protocols mpls interface <i>interface-name</i> static] or the [edit protocols mpls interface <i>interface-name</i> static] hierarchy levels. This enables you to switch an LSP away from a network node using a bypass LSP. This feature can be used in maintenance of active networks when a network device needs to be replaced without interrupting traffic passing through the network. The LSPs can be either static or dynamic.

## Sample Output

### show mpls interface

```

user@host> show mpls interface

Interface: ge-0/2/1.57
  State: Up
  Administrative group: <none>
  Maximum labels: 5
  Static protection revert time: 5 seconds
  Always mark connection protection tlv: Disabled
  Switch away lsps : Disabled

```

## show mpls lsp

**List of Syntax**    [Syntax on page 4665](#)

**Release Information**    Command introduced before Junos OS Release 7.4.  
                  **defaults** option added in Junos OS Release 8.5.  
                  Command introduced in Junos OS Release 9.5 for EX Series switches.  
                  **autobandwidth** option added in Junos OS Release 11.4.  
                  **externally-controlled** option added in Junos OS Release 12.3.  
                  **externally-provisioned** option added in Junos OS Release 13.3.  
                  Command introduced in Junos OS Release 13.2X51-D15 for QFX Series.

**Description**    Display information about configured and active dynamic Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).

**Options**    **none**—Display standard information about all configured and active dynamic MPLS LSPs.  
                  **brief | detail | extensive | terse**—(Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events.

**autobandwidth**—(Optional) Display automatic bandwidth information. This option is explained separately (see [show mpls lsp autobandwidth](#)).

**bidirectional | unidirectional**—(Optional) Display bidirectional or unidirectional LSP information, respectively.

**bypass**—(Optional) Display LSPs used for protecting other LSPs.

**count-active-routes**—(Optional) Display active routes for LSPs.

**defaults**—(Optional) Display the MPLS LSP default settings.

**descriptions**—(Optional) Display the MPLS label-switched path (LSP) descriptions. To view this information, you must configure the description statement at the **[edit protocol mpls lsp]** hierarchy level. Only LSPs with a description are displayed. This command is only valid for the ingress routing device, because the description is not propagated in RSVP messages.

**down | up**—(Optional) Display only LSPs that are inactive or active, respectively.

**externally-controlled**—(Optional) Display the LSPs that are under the control of an external Path Computation Element (PCE).

**externally-provisioned**—(Optional) Display the LSPs that are generated dynamically and provisioned by an external Path Computation Element (PCE).

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

***lsp-type***—(Optional) Display information about a particular LSP type:

- **bypass**—Sessions for bypass LSPs.
- **egress**—Sessions that terminate on this routing device.
- **ingress**—Sessions that originate from this routing device.
- **transit**—Sessions that pass through this routing device.

**name *name***—(Optional) Display information about the specified LSP or group of LSPs.

**p2mp**—(Optional) Display information about point-to-multipoint LSPs.

**statistics**—(Optional) (Ingress and transit routers only) Display accounting information about LSPs. Statistics are not available for LSPs on the egress routing device, because the penultimate routing device in the LSP sets the label to 0. Also, as the packet arrives at the egress routing device, the hardware removes its MPLS header and the packet reverts to being an IPv4 packet. Therefore, it is counted as an IPv4 packet, not an MPLS packet.

**NOTE:** If a bypass LSP is configured for the primary static LSP, display cumulative statistics of packets traversing through the protected LSP and bypass LSP when traffic is re-optimized when the protected LSP link is restored. (Bypass LSPs are not supported on QFX Series switches.)

When used with the `bypass` option (`show mpls lsp bypass statistics`), display statistics for the traffic that flows only through the bypass LSP.

**transit**—(Optional) Display LSPs transiting this routing device.

**Required Privilege Level** view

**Output Fields** [Table 372 on page 4667](#) describes the output fields for the `show mpls lsp` command. Output fields are listed in the approximate order in which they appear.

**Table 372: show mpls lsp Output Fields**

Field Name	Field Description	Level of Output
<b>Ingress LSP</b>	Information about LSPs on the ingress routing device. Each session has one line of output.	All levels
<b>Egress LSP</b>	Information about the LSPs on the egress routing device. MPLS learns this information by querying RSVP, which holds all the transit and egress session information. Each session has one line of output.	All levels
<b>Transit LSP</b>	Number of LSPs on the transit routing devices and the state of these paths. MPLS learns this information by querying RSVP, which holds all the transit and egress session information.	All levels
<b>P2MP name</b>	Name of the point-to-multipoint LSP. Dynamically generated P2MP LSPs used for VPLS flooding use dynamically generated P2MP LSP names. The name uses the format <code>identifier:vpls:router-id:routing-instance-name</code> . The <i>identifier</i> is automatically generated by Junos OS.	All levels

Table 372: show mpls lsp Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>P2MP branch count</b>	Number of destination LSPs the point-to-multipoint LSP is transmitting to.	All levels
<b>P</b>	An asterisk (*) under this heading indicates that the LSP is a primary path.	All levels
<b>address</b>	( <b>detail</b> and <b>extensive</b> ) Destination (egress routing device) of the LSP.	<b>detail extensive</b>
<b>To</b>	Destination (egress routing device) of the session.	<b>brief</b>
<b>From</b>	Source (ingress routing device) of the session.	<b>brief detail</b>
<b>State</b>	State of the LSP handled by this RSVP session: <b>Up</b> , <b>Dn</b> (down), or <b>Restart</b> .	<b>brief detail</b>
<b>Active Route</b>	Number of active routes (prefixes) installed in the forwarding table. For ingress LSPs, the forwarding table is the primary IPv4 table ( <b>inet.0</b> ). For transit and egress RSVP sessions, the forwarding table is the primary MPLS table ( <b>mpls.0</b> ).	<b>detail extensive</b>
<b>Rt</b>	Number of active routes (prefixes) installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table ( <b>inet.0</b> ). For transit and egress RSVP sessions, the routing table is the primary MPLS table ( <b>mpls.0</b> ).	<b>brief</b>
<b>P</b>	Path. An asterisk (*) underneath this column indicates that the LSP is a primary path.	<b>brief</b>
<b>ActivePath</b>	(Ingress LSP) Name of the active path: <b>Primary</b> or <b>Secondary</b> .	<b>detail extensive</b>
<b>LSPname</b>	Name of the LSP.	<b>brief detail</b>
<b>Statistics</b>	Displays the number of packets and the number of bytes transmitted over the LSP. These counters are reset to zero whenever the LSP path is optimized (for example, during an automatic bandwidth allocation).	<b>extensive</b>
<b>Aggregate statistics</b>	Displays the number of packets and the number of bytes transmitted over the LSP. These counters continue to iterate even if the LSP path is optimized. You can reset these counters to zero using the <b>clear mpls lsp statistics</b> command.	<b>extensive</b>
<b>Packets</b>	Displays the number of packets transmitted over the LSP.	<b>brief extensive</b>
<b>Bytes</b>	Displays the number of bytes transmitted over the LSP.	<b>brief extensive</b>
<b>DiffServInfo</b>	Type of LSP: multiclass LSP ( <b>multiclass diffServ-TE LSP</b> ) or Differentiated-Services-aware traffic engineering LSP ( <b>diffServ-TE LSP</b> ).	<b>detail</b>
<b>LSPtype</b>	Type of LSP: static <b>Static configured</b> or dynamic <b>Dynamic configured</b> . Also indicates if the LSP is a <b>Penultimate hop popping</b> LSP or an <b>Ultimate hop popping</b> LSP.	<b>detail extensive</b>
<b>Bypass</b>	(Bypass LSP) Destination address (egress routing device) for the bypass LSP.	All levels

Table 372: show mpls lsp Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>LSPpath</b>	Indicates whether the RSVP session is for the primary or secondary LSP path. <b>LSPpath</b> can be either <b>primary</b> or <b>secondary</b> and can be displayed on the ingress, egress, and transit routing devices.	<b>detail</b>
<b>Bidir</b>	(GMPLS) The LSP allows data to travel in both directions between GMPLS devices.	All levels
<b>Bidirectional</b>	(GMPLS) The LSP allows data to travel both ways between GMPLS devices.	All levels
<b>FastReroute desired</b>	Fast reroute has been requested by the ingress routing device.	<b>detail</b>
<b>Link protection desired</b>	Link protection has been requested by the ingress routing device.	<b>detail</b>
<b>Node/Link protection desired</b>	Link protection has been requested by the ingress routing device.	<b>detail extensive</b>
<b>LoadBalance</b>	(Ingress LSP) CSPF load-balancing rule that was configured to select the LSP's path among equal-cost paths: <b>Most-fill</b> , <b>Least-fill</b> , or <b>Random</b> .	<b>detail extensive</b>
<b>Signal type</b>	Signal type for GMPLS LSPs. The signal type determines the peak data rate for the LSP: <b>DS0</b> , <b>DS3</b> , <b>STS-1</b> , <b>STM-1</b> , or <b>STM-4</b> .	All levels
<b>Encoding type</b>	LSP encoding type: <b>Packet</b> , <b>Ethernet</b> , <b>PDH</b> , <b>SDH/SONET</b> , <b>Lambda</b> , or <b>Fiber</b> .	All levels
<b>Switching type</b>	Type of switching on the links needed for the LSP: <b>Fiber</b> , <b>Lambda</b> , <b>Packet</b> , <b>TDM</b> , or <b>PSC-1</b> .	All levels
<b>GPID</b>	Generalized Payload Identifier (identifier of the payload carried by an LSP): <b>HDLC</b> , <b>Ethernet</b> , <b>IPv4</b> , <b>PPP</b> , or <b>Unknown</b> .	All levels
<b>Protection</b>	Configured protection capability desired for the LSP: <b>Extra</b> , <b>Enhanced</b> , <b>none</b> , <b>One plus one</b> , <b>One to one</b> , or <b>Shared</b> .	All levels
<b>Upstream label in</b>	(Bidirectional LSPs) Incoming label for reverse direction traffic for this LSP.	All levels
<b>Upstream label out</b>	(Bidirectional LSPs) Outgoing label for reverse direction traffic for this LSP.	All levels
<b>Suggested label received</b>	(Bidirectional LSPs) Label the upstream node suggests to use in the Resv message that is sent.	All levels
<b>Suggested label sent</b>	(Bidirectional LSPs) Label the downstream node suggests to use in the Resv message that is returned.	All levels
<b>Autobandwidth</b>	(Ingress LSP) The LSP is performing autobandwidth allocation.	<b>detail extensive</b>
<b>MinBW</b>	(Ingress LSP) Configured minimum value of the LSP, in bps.	<b>detail extensive</b>

Table 372: show mpls lsp Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>MaxBW</b>	(Ingress LSP) Configured maximum value of the LSP, in bps.	<b>detail extensive</b>
<b>Dynamic MinBW</b>	(Ingress LSP) Displays the current dynamically specified minimum bandwidth allocation for the LSP, in bps.	<b>detail extensive</b>
<b>Adjustment Timer</b>	(Ingress LSP) Configured value for the <b>adjust-timer</b> statement, indicating the total amount of time allowed before bandwidth adjustment will take place, in seconds.	<b>detail extensive</b>
<b>Adjustment Threshold</b>	(Ingress LSP) Configured value for the <b>adjust-threshold</b> statement. Specifies how sensitive the automatic bandwidth adjustment for an LSP is to changes in bandwidth utilization.	<b>detail extensive</b>
<b>Time for Next Adjustment</b>	(Ingress LSP) Time in seconds until the next automatic bandwidth adjustment sample is taken.	<b>detail extensive</b>
<b>Time of Last Adjustment</b>	(Ingress LSP) Date and time since the last automatic bandwidth adjustment was completed.	<b>detail extensive</b>
<b>Max AvgBW util</b>	(Ingress LSP) Current value of the actual maximum average bandwidth utilization, in bps.	<b>detail extensive</b>
<b>Overflow limit</b>	(Ingress LSP) Configured value of the threshold overflow limit.	<b>detail extensive</b>
<b>Overflow sample count</b>	(Ingress LSP) Current value for the overflow sample count.	<b>detail extensive</b>
<b>Bandwidth Adjustment in <i>nnn</i> second(s)</b>	(Ingress LSP) Current value of the bandwidth adjustment timer, indicating the amount of time remaining until the bandwidth adjustment will take place, in seconds.	<b>detail extensive</b>
<b>Underflow limit</b>	(Ingress LSP) Configured value of the threshold underflow limit.	<b>detail extensive</b>
<b>Underflow sample count</b>	(Ingress LSP) Current value for the underflow sample count.	<b>detail extensive</b>
<b>Underflow Max AvgBW</b>	(Ingress LSP) The highest sample bandwidth among the underflow samples recorded currently. This is the signaling bandwidth if an adjustment occurs because of an underflow.	<b>detail extensive</b>
<b>Active path indicator</b>	(Ingress LSP) A value of * indicates that the path is active. The absence of * indicates that the path is not active. In the following example, "long" is the active path.  *Primary long Standby short	<b>detail extensive</b>
<b>Primary</b>	(Ingress LSP) Name of the primary path.	<b>detail extensive</b>
<b>Secondary</b>	(Ingress LSP) Name of the secondary path.	<b>detail extensive</b>

Table 372: show mpls lsp Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Standby</b>	(Ingress LSP) Name of the path in standby mode.	<b>detail extensive</b>
<b>State</b>	(Ingress LSP) State of the path: <b>Up</b> or <b>Dn</b> (down).	<b>detail extensive</b>
<b>COS</b>	(Ingress LSP) Class-of-service value.	<b>detail extensive</b>
<b>Bandwidth per class</b>	(Ingress LSP) Active bandwidth for the LSP path for each MPLS class type, in bps.	<b>detail extensive</b>
<b>Priorities</b>	(Ingress LSP) Configured value of the setup priority and the hold priority respectively (the setup priority is displayed first), where 0 is the highest priority and 7 is the lowest priority. If you have not explicitly configured these values, the default values are displayed (7 for the setup priority and 0 for the hold priority).	<b>detail extensive</b>
<b>OptimizeTimer</b>	(Ingress LSP) Configured value of the optimize timer, indicating the total amount of time allowed before path reoptimization, in seconds.	<b>detail extensive</b>
<b>SmartOptimizeTimer</b>	(Ingress LSP) Configured value of the smart optimize timer, indicating the total amount of time allowed before path reoptimization, in seconds.	<b>detail extensive</b>
<b>Reoptimization in xxx seconds</b>	(Ingress LSP) Current value of the optimize timer, indicating the amount of time remaining until the path will be reoptimized, in seconds.	<b>detail extensive</b>
<b>Computed ERO (S [L] denotes strict [loose] hops)</b>	(Ingress LSP) Computed explicit route. A series of hops, each with an address followed by a hop indicator. The value of the hop indicator can be strict ( <b>S</b> ) or loose ( <b>L</b> ).	<b>detail extensive</b>
<b>CSPF metric</b>	(Ingress LSP) Constrained Shortest Path First metric for this path.	<b>detail extensive</b>

Table 372: show mpls lsp Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Received RRO</b>	<p>(Ingress LSP) Received record route. A series of hops, each with an address followed by a flag. (In most cases, the received record route is the same as the computed explicit route. If <b>Received RRO</b> is different from <b>Computed ERO</b>, there is a topology change in the network, and the route is taking a detour.) The following flags identify the protection capability and status of the downstream node:</p> <ul style="list-style-type: none"> <li>• <b>0x01</b>—Local protection available. The link downstream from this node is protected by a local repair mechanism. This flag can be set only if the Local protection flag was set in the <b>SESSION_ATTRIBUTE</b> object of the corresponding Path message.</li> <li>• <b>0x02</b>—Local protection in use. A local repair mechanism is in use to maintain this tunnel (usually because of an outage of the link it was routed over previously).</li> <li>• <b>0x03</b>—Combination of <b>0x01</b> and <b>0x02</b>.</li> <li>• <b>0x04</b>—Bandwidth protection. The downstream routing device has a backup path providing the same bandwidth guarantee as the protected LSP for the protected section.</li> <li>• <b>0x08</b>—Node protection. The downstream routing device has a backup path providing protection against link and node failure on the corresponding path section. If the downstream routing device can set up only a link-protection backup path, the <b>Local protection available</b> bit is set but the <b>Node protection</b> bit is cleared.</li> <li>• <b>0x09</b>—Detour is established. Combination of <b>0x01</b> and <b>0x08</b>.</li> <li>• <b>0x10</b>—Preemption pending. The preempting node sets this flag if a pending preemption is in progress for the traffic engine LSP. This flag indicates to the ingress legacy edge router (LER) of this LSP that it should be rerouted.</li> <li>• <b>0x20</b>—Node ID. Indicates that the address specified in the RRO's IPv4 or IPv6 sub-object is a node ID address, which refers to the router address or router ID. Nodes must use the same address consistently.</li> <li>• <b>0xb</b>—Detour is in use. Combination of <b>0x01</b>, <b>0x02</b>, and <b>0x08</b>.</li> </ul>	<b>detail extensive</b>
<b>Index number</b>	(Ingress LSP) Log entry number of each LSP path event. The numbers are in chronological descending order, with a maximum of 50 index numbers displayed.	<b>extensive</b>
<b>Date</b>	(Ingress LSP) Date of the LSP event.	<b>extensive</b>
<b>Time</b>	(Ingress LSP) Time of the LSP event.	<b>extensive</b>
<b>Event</b>	(Ingress LSP) Description of the LSP event.	<b>extensive</b>
<b>Created</b>	(Ingress LSP) Date and time the LSP was created.	<b>extensive</b>
<b>Resv style</b>	(Bypass) RSVP reservation style. This field consists of two parts. The first is the number of active reservations. The second is the reservation style, which can be <b>FF</b> (fixed filter), <b>SE</b> (shared explicit), or <b>WF</b> (wildcard filter).	<b>brief detail extensive</b>
<b>Labelin</b>	Incoming label for this LSP.	<b>brief detail</b>
<b>Labelout</b>	Outgoing label for this LSP.	<b>brief detail</b>

Table 372: show mpls lsp Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>LSPname</b>	Name of the LSP.	<b>brief detail</b>
<b>Time left</b>	Number of seconds remaining in the lifetime of the reservation.	<b>detail</b>
<b>Since</b>	Date and time when the RSVP session was initiated.	<b>detail</b>
<b>Tspec</b>	Sender's traffic specification, which describes the sender's traffic parameters.	<b>detail</b>
<b>Port number</b>	Protocol ID and sender or receiver port used in this RSVP session.	<b>detail</b>
<b>PATH rcvfrom</b>	Address of the previous-hop (upstream) routing device or client, interface the neighbor used to reach this router, and number of packets received from the upstream neighbor.	<b>detail</b>
<b>PATH sentto</b>	Address of the next-hop (downstream) routing device or client, interface used to reach this neighbor, and number of packets sent to the downstream routing device.	<b>detail</b>
<b>RESV rcvfrom</b>	Address of the previous-hop (upstream) routing device or client, interface the neighbor used to reach this routing device, and number of packets received from the upstream neighbor. The output in this field, which is consistent with that in the <b>PATH rcvfrom</b> field, indicates that the RSVP negotiation is complete.	<b>detail</b>
<b>Record route</b>	Recorded route for the session, taken from the record route object.	<b>detail</b>
<b>Soft preempt</b>	Number of soft preemptions that occurred on a path and when the last soft preemption occurred. Only successful soft preemptions are counted (those that actually resulted in a new path being used).	<b>detail</b>
<b>Soft preemption pending</b>	Path is in the process of being soft preempted. This display is removed once the ingress router has calculated a new path.	<b>detail</b>
<b>MPLS-TE LSP Defaults</b>	Default settings for MPLS traffic engineered LSPs: <ul style="list-style-type: none"> <li>• <b>LSP Holding Priority</b>—Determines the degree to which an LSP holds on to its session reservation after the LSP has been set up successfully.</li> <li>• <b>LSP Setup Priority</b>—Determines whether a new LSP that preempts an existing LSP can be established.</li> <li>• <b>Hop Limit</b>—Specifies the maximum number of routers the LSP can traverse (including the ingress and egress).</li> <li>• <b>Bandwidth</b>—Specifies the bandwidth in bits per second for the LSP.</li> <li>• <b>LSP Retry Timer</b>—Length of time in seconds that the ingress router waits between attempts to establish the primary path.</li> </ul>	<b>defaults</b>

The XML tag name of the **bandwidth** tag under the **auto-bandwidth** tag has been updated to **maximum-average-bandwidth**. You can see the new tag when you issue the **show mpls lsp extensive** command with the **| display xml** pipe option. If you have any scripts that use the **bandwidth** tag, ensure that they are updated to **maximum-average-bandwidth**.

## Sample Output

## show mpls lsp autobandwidth

<b>Syntax</b>	<code>show mpls lsp autobandwidth</code> <brief   detail   extensive> <logical-system (all   <i>logical-system-name</i> )>
<b>Release Information</b>	Command introduced in Junos OS Release 11.4. Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	Display automatic bandwidth information for the LSP(s).
<b>Options</b>	<p><b>brief   detail   extensive</b> — (Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b> — (Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show mpls lsp on page 4665</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show mpls lsp autobandwidth on page 4682</a>
<b>Output Fields</b>	<a href="#">Table 373 on page 4681</a> describes the output fields for the <code>show mpls lsp autobandwidth</code> command. Output fields are listed in the approximate order in which they appear.

**Table 373: show mpls lsp autobandwidth Output Fields**

Field Name	Field Description	Level of Output
<b>To</b>	Destination (egress routing device) of the session.	All Levels
<b>From</b>	Source (ingress routing device) of the session.	All Levels
<b>LSPname</b>	Name of the LSP.	All Levels
<b>Min BW</b>	(Ingress LSP) Configured minimum value of the LSP, in bps.	<b>detail extensive</b>
<b>Max BW</b>	(Ingress LSP) Configured maximum value of the LSP, in bps.	<b>detail extensive</b>
<b>Max AvgBW util</b>	(Ingress LSP) Current value of the actual maximum average bandwidth utilization, in bps.	<b>detail extensive</b>
<b>Overflow limit</b>	(Ingress LSP) Configured value of the threshold overflow limit.	<b>detail extensive</b>
<b>Overflow sample count</b>	(Ingress LSP) Current value for the overflow sample count.	<b>detail extensive</b>
<b>Underflow limit</b>	(Ingress LSP) Configured value of the threshold underflow limit.	<b>detail extensive</b>

Table 373: show mpls lsp autobandwidth Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Underflow sample count</b>	(Ingress LSP) Current value for the underflow sample count.	<b>detail extensive</b>
<b>Adjustment Timer</b>	(Ingress LSP) Configured value for the adjust-timer statement, indicating the total amount of time allowed before bandwidth adjustment will take place, in seconds.	<b>detail extensive</b>
<b>Adjustment Threshold</b>	(Ingress LSP) Configured value for the adjust-threshold statement. Specifies how sensitive the automatic bandwidth adjustment for an LSP is to changes in bandwidth utilization.	<b>detail extensive</b>
<b>Time for Next Adjustment</b>	(Ingress LSP) Time in seconds until the next automatic bandwidth adjustment sample is taken.	<b>detail extensive</b>
<b>Time of Last Adjustment</b>	(Ingress LSP) Date and time since the last automatic bandwidth adjustment was completed.	<b>detail extensive</b>
<b>Last BW</b>	Previous active bandwidth of the LSP.	<b>detail extensive</b>
<b>Last Requested BW</b>	Bandwidth requested in the previous automatic bandwidth adjustment.	<b>detail extensive</b>
<b>Last Signaled BW</b>	Bandwidth signaled in the previous automatic bandwidth adjustment.	<b>detail extensive</b>
<b>Highest Watermark BW</b>	Maximum bandwidth used by the LSP.	<b>detail extensive</b>
<b>Total AutoBw Adjustments</b>	Total number of attempts to adjust automatic bandwidth including failed and successful adjustments.	<b>detail extensive</b>
<b>Successful Adjustments</b>	Number of successful automatic bandwidth adjustments.	<b>detail extensive</b>
<b>Failed Adjustments</b>	Number of failed automatic bandwidth adjustments.	<b>detail extensive</b>

## Sample Output

### show mpls lsp autobandwidth

## show mpls path

<b>List of Syntax</b>	<a href="#">Syntax on page 4684</a> <a href="#">Syntax (EX Series Switches) on page 4684</a>
<b>Syntax</b>	show mpls path <logical-system (all   <i>logical-system-name</i> )> <path-name>
<b>Syntax (EX Series Switches)</b>	show mpls path <path-name>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display dynamic Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).
<b>Options</b>	<b>none</b> —Display standard information about all MPLS LSPs.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.  <b>path-name</b> —(Optional) Display information about the specified LSP only.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show mpls path on page 4684</a>
<b>Output Fields</b>	<a href="#">Table 374 on page 4684</a> describes the output fields for the <b>show mpls path</b> command. Output fields are listed in the approximate order in which they appear.

**Table 374: show mpls path Output Fields**

Field Name	Field Description
<b>Path name</b>	Information about ingress LSPs. Each path has one line of output.
<b>Address</b>	Addresses of the routing devices that form the LSP.
<b>Strict/loose address</b>	Whether the address is configured as a strict or loose address.

## Sample Output

### show mpls path

```

user@host> show mpls path
Path name      Address          Strict/loose address
p1             123.456.55.6    Strict
               123.456.1.6     Loose
p2             191.456.1.4     Strict
  
```

## show mpls static-lsp

**Syntax** show mpls static-lsp  
 <brief | detail | extensive | terse>  
 <bypass>  
 <descriptions>  
 <down | up>  
 <ingress>  
 <logical-system (all | *logical-system-name*)>  
 <lsp-type>  
 <name *name*>  
 <statistics>  
 <transit>

**Release Information** Command introduced in Junos OS Release 10.1.

**Description** Display information about configured and active static Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).

**Options** **none**—Display standard information about all configured and active static MPLS LSPs.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output. The **extensive** option displays the same information as the **detail** option, but covers the most recent 50 events.

**bypass**—(Optional) Display LSPs used for protecting other static LSPs.

**descriptions**—(Optional) Display the MPLS static LSP descriptions. To view this information, you must configure the description statement at the **[edit protocols mpls static-label-switched-path *path-name* bypass]**, **[edit protocols mpls static-label-switched-path *path-name* ingress]**, or **[edit protocols mpls static-label-switched-path *path-name* transit *incoming-label*]** hierarchy levels. Only static LSPs with a description are displayed.

**down | up**—(Optional) Display only static LSPs that are inactive or active, respectively.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

***lsp-type***—(Optional) Display information about a particular LSP type:

- **bypass**—Sessions for bypass LSPs.
- **ingress**—Sessions that originate from this routing device.
- **transit**—Sessions that pass through this routing device.

**name *name***—(Optional) Display information about the specified static LSP or group of LSPs.

**statistics**—(Optional) Display accounting information about static LSPs.

**transit**—(Optional) Display static LSPs transiting this routing device.

**Required Privilege Level** view

**List of Sample Output** [show mpls static-lsp extensive on page 4687](#)  
[show mpls static-lsp statistics ingress on page 4687](#)

**Output Fields** [Table 375 on page 4686](#) describes the output fields for the **show mpls static-lsp** command. Output fields are listed in the approximate order in which they appear.

**Table 375: show mpls static-lsp Output Fields**

Field Name	Field Description	Level of Output
<b>Ingress LSPs</b>	Information about the static LSPs on the ingress routing device. Each session has one line of output.	All levels
<b>Transit LSPs</b>	Number of static LSPs on the transit routing devices and the state of these paths. MPLS learns this information by querying RSVP, which holds all the transit and egress session information.	All levels
<b>Bypass LSPs</b>	Information about the bypass LSPs configured on the routing device. Each session has one line of output.	All levels
<b>LSPname</b>	Name of the static LSP.	All levels
<b>To</b>	Destination (egress routing device) of the session.	All levels
<b>State</b>	State of the static LSP handled by this RSVP session: <b>Up</b> , <b>Dn</b> (down), or <b>Restart</b> .	All levels
<b>Packets</b>	Number of packet transiting the static LSP ( <b>statistics</b> option only).	All levels
<b>Bytes</b>	Number of bytes transiting the static LSP ( <b>statistics</b> option only).	All levels
<b>Nexthop</b>	IP address for the next-hop router for the static LSP.	<b>detail, extensive</b>
<b>Bypass</b>	(Bypass LSP) Destination address (egress routing device) for the bypass LSP.	All levels
<b>Link protection desired</b>	Link protection has been requested by the ingress routing device.	<b>detail, extensive</b>
<b>LabelOperation</b>	Label operation to perform: <b>Push</b> , <b>Pop</b> , <b>Swap</b> .	<b>detail, extensive</b>
<b>Outgoing-label</b>	Outgoing label to use for the MPLS packet in either push or swap label operations.	<b>detail, extensive</b>
<b>Created</b>	(Ingress LSP) Date and time the static LSP was created.	<b>extensive</b>
<b>Bandwidth</b>	Bandwidth configured for the static LSP.	<b>detail, extensive</b>
<b>Resv style</b>	(Bypass) RSVP reservation style. This field consists of two parts: the number of active reservations and the reservation style, which can be <b>FF</b> (fixed filter), <b>SE</b> (shared explicit), or <b>WF</b> (wildcard filter).	All levels

## Sample Output

### show mpls static-lsp extensive

```
user@host> show mpls static-lsp extensive
Ingress LSPs:
LSPname: alpha-to-beta, To: 192.168.14.1
State: Dn
Nexthop: 192.168.10.1
LabelOperation: Push, Outgoing-label: 1000001
Created: Thu Jan 14 16:44:43 2010
Bandwidth: 0 bps
Total 1, displayed 1, Up 0, Down 1

Transit LSPs:
Total 0, displayed 0, Up 0, Down 0

<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.5 for EX Series switches.</p>
<b>Description</b>	Display the status of Resource Reservation Protocol (RSVP)-enabled interfaces and packet statistics.
<b>Options</b>	<p><b>none</b>—Display standard information about the status of RSVP-enabled interfaces and packet statistics.</p> <p><b>brief   detail   extensive   link-management</b>—(Optional) Display the specified level of output.</p> <p><b>link-management</b>—(Optional) Use the link-management option to display the control peers and corresponding TE-link information created by the Link Management Protocol (LMP).</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show rsvp interface brief on page 4691</a> <a href="#">show rsvp interface detail on page 4691</a> <a href="#">show rsvp interface extensive on page 4691</a> <a href="#">show rsvp interface link-management on page 4692</a>
<b>Output Fields</b>	<a href="#">Table 376 on page 4688</a> lists the output fields for the <b>show rsvp interface</b> command. Output fields are listed in the approximate order in which they appear.

**Table 376: show rsvp interface Output Fields**

Field Name	Field Description	Level of Output
<b>RSVP interface</b>	Number of interfaces on which RSVP is active. Each interface has one line of output.	All levels
<b>Interface</b>	Name of the interface.	All levels

Table 376: show rsvp interface Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Index</b>	Index of the interface.	<b>detail</b>
<b>State</b>	State of the interface. <ul style="list-style-type: none"> <li>• <b>Disabled</b>—No traffic engineering information is displayed.</li> <li>• <b>Down</b>—Interface is not operational.</li> <li>• <b>Enabled</b>—Displays traffic engineering information.</li> <li>• <b>Up</b>—Interface is operational.</li> </ul>	All levels
<b>NoAuthentication</b>	Interface does not support RSVP authentication.	<b>detail</b>
<b>NoAggregate</b>	Interface does not support refresh reduction.	<b>detail</b>
<b>NoReliable</b>	Interface does not support refresh reduction message ID extension.	<b>detail</b>
<b>NoLinkProtection</b>	Interface does not support link protection.	<b>detail</b>
<b>HelloInterval</b>	Frequency at which RSVP hellos are sent on this interface (in seconds).	<b>detail</b>
<b>Address</b>	IP address of the local interface.	<b>detail</b>
<b>Active control channel</b>	Next-hop link address to transmit messages.	None specified
<b>TElink</b>	Traffic-engineered links that are managed by the peer they are associated with.	None specified
<b>Active resv</b>	Number of reservations that are actively reserving bandwidth on the interface.	All levels
<b>PreemptionCnt</b>	Number of times an RSVP session was preempted on this interface.	<b>detail</b>
<b>Update threshold</b>	Percentage change in reserved bandwidth to trigger an IGP update.	<b>detail</b>
<b>Subscription</b>	User-configured subscription factor.	All levels
<b>bc number</b>	Bandwidth allocated for the specified bandwidth constraint.	<b>extensive</b>
<b>ct number</b>	Bandwidth allocated for the specified class type.	<b>extensive</b>
<b>Static BW</b>	Total interface bandwidth, in bps.	All levels
<b>Available BW</b>	Amount of bandwidth that RSVP is allowed to reserve, in bps. It is equal to (static bandwidth * subscription factor).	all levels
<b>Reserved BW</b>	Currently reserved bandwidth, in bps.	All levels
<b>SoftPreemptionCnt</b>	Number of times a soft preemption occurred on this interface. This number is not included in the <b>PreemptionCnt</b> value.	<b>detail</b>

Table 376: show rsvp interface Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Overbooked BW</b>	Currently overbooked bandwidth, in bps, by class type (ct0 through ct3).	<b>detail</b>
<b>Highwater mark</b>	Highest bandwidth that has ever been reserved on this interface, in bps.	<b>brief</b>
<b>PacketType</b>	Type of RSVP packet.	<b>detail</b>
<b>Total Sent</b>	Total number of packets sent.	<b>detail</b>
<b>Total Received</b>	Total number of packets received since RSVP was enabled.	<b>detail</b>
<b>Last 5 seconds Sent</b>	Number of packets sent in the last 5 seconds.	<b>detail</b>
<b>Last 5 seconds Received</b>	Number of packets received in the last 5 seconds.	<b>detail</b>
<b>Path</b>	Statistics about Path messages, which are sent from the RSVP sender along the data paths and store path state information in each node along the path.	<b>detail</b>
<b>PathErr</b>	Statistics about PathErr messages, which are advisory messages that are sent upstream to the sender.	<b>detail</b>
<b>PathTear</b>	Statistics about PathTear messages, which remove path states and dependent reservation states in any routers along a path.	<b>detail</b>
<b>Resv</b>	Statistics about Resv messages, which are sent from the RSVP receiver along the data paths and store reservation state information in each node along the path.	<b>detail</b>
<b>ResvErr</b>	Statistics about ResvErr messages, which are advisory messages that are sent when an attempt to establish a reservation fails.	<b>detail</b>
<b>ResvTear</b>	Statistics about ResvTear messages, which remove reservation states along a path.	<b>detail</b>
<b>Hello</b>	Number of RSVP hello packets that have been sent to and received from the neighbor.	<b>detail</b>
<b>Ack</b>	Acknowledge message for refresh reductions.	<b>detail</b>
<b>Srefresh</b>	Summary refresh messages.	<b>detail</b>
<b>EndtoEnd RSVP</b>	Statistics for the number of end-to-end RSVP messages sent.	<b>detail</b>
<b>Queue</b>	CoS transmit queue number and its associated forwarding class designation.	<b>extensive</b>
<b>TxRate</b>	Configured bandwidth in Mbps and configured bandwidth as a percentage of the specified queue.	<b>extensive</b>
<b>Priority</b>	Weight of the queue relative to other configured queues, in percentage.	<b>extensive</b>

Table 376: show rsvp interface Output Fields (*continued*)

Field Name	Field Description	Level of Output
<i>queue-priority-value</i>	Low, High, None, or Exact. None indicates no rate limiting. Exact indicates the queue transmits at the configured rate only.	extensive

## show rsvp neighbor

<b>List of Syntax</b>	<a href="#">Syntax on page 4693</a> <a href="#">Syntax (EX Series Switches) on page 4693</a>
<b>Syntax</b>	show rsvp neighbor <brief   detail> <logical-system (all   <i>logical-system-name</i> )>
<b>Syntax (EX Series Switches)</b>	show rsvp neighbor <brief   detail>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display Resource Reservation Protocol (RSVP) neighbors that were discovered dynamically during the exchange of RSVP packets.
<b>Options</b>	<b>none</b> —Display standard information about RSVP neighbors.  <b>brief   detail</b> —(Optional) Display the specified level of output.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show rsvp neighbor on page 4697</a> <a href="#">show rsvp neighbor detail on page 4697</a>
<b>Output Fields</b>	<a href="#">Table 377 on page 4693</a> lists the output fields for the <b>show rsvp neighbor</b> command. Output fields are listed in the approximate order in which they appear.

**Table 377: show rsvp neighbor Output Fields**

Field Name	Field Description	Level of Output
<b>RSVP neighbor</b>	Number of neighbors that the routing device has learned of. Each neighbor has one line of output.	All levels
<b>via</b>	Name of the interface where the neighbor has been detected. In the case of generalized MPLS (GMPLS) LSPs, the name of the peer where the neighbor has been detected.	<b>detail</b>
<b>Address</b>	Address of a learned neighbor.	All levels
<b>Idle</b>	Length of time the neighbor has been idle, in seconds.	All levels

Table 377: show rsvp neighbor Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Up/Dn</b>	Number of neighbor up or down transitions detected by RSVP hello packets. If the up count is 1 greater than the down count, the neighbor is currently up. Otherwise, the neighbor is down. Neighbors that do not support RSVP hello packets, such as routers running Junos OS Release 3.2 or earlier, are not reported as up or down.	All levels
<b>Up cnt and Down cnt</b>	Number of neighbor up or down transitions detected by RSVP hello packets. If the up count is 1 greater than the down count, the neighbor is currently up. Otherwise, the neighbor is down. Neighbors that do not support RSVP hello packets, such as routers running Junos OS Release 3.2 or earlier, are not reported as up or down.	<b>detail</b>
<b>status</b>	<p>State of the RSVP neighbor:</p> <ul style="list-style-type: none"> <li>• <b>Up</b>—Routing device can detect RSVP Hello messages from the neighbor.</li> <li>• <b>Down</b>—Routing device has received one of the following indications: <ul style="list-style-type: none"> <li>• Communication failure from the neighbor.</li> <li>• Communication from IGP that the neighbor is unavailable.</li> <li>• Change in the sequence numbers in the RSVP Hello messages sent by the neighbor.</li> </ul> </li> <li>• <b>Restarting</b>—RSVP neighbor is unavailable and might be restarting. The neighbor remains in this state until it has restarted or is declared dead. This state is possible only when graceful restart is enabled.</li> <li>• <b>Restarted</b>—RSVP neighbor has restarted and is undergoing state recovery (graceful restart) procedures.</li> <li>• <b>Dead</b>—Routing device has lost all communication with the RSVP neighbor. Any RSVP sessions with that neighbor are torn down.</li> </ul>	<b>detail</b>
<b>LastChange</b>	Time elapsed since the neighbor state changed either from up to down or from down to up. The format is <b>hh:mm:ss</b> .	All levels
<b>Last changed time</b>	Time elapsed since the neighbor state changed either from up to down or from down to up.	<b>detail</b>
<b>HelloInt</b>	Frequency at which RSVP hellos are sent on this interface (in seconds).	All levels
<b>HelloTx/Rx</b>	Number of hello packets sent to and received from the neighbor.	All levels
<b>Hello</b>	Number of RSVP hello packets that have been sent to and received from the neighbor.	<b>detail</b>
<b>Message received</b>	Number of Path and Resv messages that this routing device has received from the neighbor.	<b>detail</b>
<b>Remote Instance</b>	Identification provided by the remote routing device during Hello message exchange.	<b>detail</b>
<b>Local Instance</b>	Identification sent to the remote routing device during Hello message exchange.	<b>detail</b>

Table 377: show rsvp neighbor Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Refresh reduction</b>	<p>Measure of processing overhead requests of refresh messages. Refresh reduction extensions improve routing device performance by reducing the process overhead, thus increasing the number of LSPs a routing device can support. <b>Refresh reduction</b> can have the following values:</p> <ul style="list-style-type: none"> <li>• <b>operational</b>—All four RSVP refresh reduction extensions—message ack, bundling, summary refresh, and staged refresh timer—are functional between the two neighboring routing devices. For a detailed explanation of these extensions, see RFC 2961.</li> <li>• <b>incomplete</b>—Some RSVP refresh reduction extensions are functional between the two neighboring routing devices.</li> <li>• <b>no operational</b>—Either the refresh reduction feature has been turned off, or the remote routing device cannot support the refresh reduction extensions.</li> </ul>	<b>detail</b>
<b>Remote end</b>	<p>Neighboring routing device's status with regard to refresh reduction:</p> <ul style="list-style-type: none"> <li>• <b>enabled</b>—Remote routing device has requested refresh reduction during RSVP message exchanges.</li> <li>• <b>disabled</b>—Remote routing device does not require refresh reduction.</li> </ul>	<b>detail</b>
<b>Ack-extension</b>	<p>An RSVP refresh reduction extension:</p> <ul style="list-style-type: none"> <li>• <b>enabled</b>—Both local and remote routing devices support the ack-extension (RFC 2961).</li> <li>• <b>disabled</b>—Remote routing device does not support the ack-extension.</li> </ul>	<b>detail</b>
<b>Link protection</b>	<p>Status of the MPLS fast reroute mechanism that protects traffic from link failure:</p> <ul style="list-style-type: none"> <li>• <b>enabled</b>—Link protection feature has been turned on, protecting the neighbor with a bypass LSP.</li> <li>• <b>disabled</b>—No link protection feature has been enabled for this neighbor.</li> </ul>	<b>detail</b>
<b>LSP name</b>	Name of the bypass LSP.	<b>detail</b>
<b>Bypass LSP</b>	<p>Status of the bypass LSP. It can have the following values:</p> <ul style="list-style-type: none"> <li>• <b>does not exist</b>—Bypass LSP is not available.</li> <li>• <b>connecting</b>—Routing device is in the process of establishing a bypass LSP, and the LSP is not available for link protection at the moment.</li> <li>• <b>operational</b>—Bypass LSP is up and running.</li> <li>• <b>down</b>—Bypass LSP has gone down, with the most probable cause a node or a link failure on the bypass path.</li> </ul>	<b>detail</b>
<b>Backup routes</b>	Number of user LSPs (or routes) that are being protected by a bypass LSP (before link failure).	<b>detail</b>
<b>Backup LSPs</b>	Number of LSPs that have been temporarily established to maintain traffic by refreshing the downstream LSPs during link failure (not a one-to-one correspondence).	<b>detail</b>
<b>Bypass explicit route</b>	Explicit route object's (ERO) path that is taken by the bypass LSP.	<b>detail</b>

Table 377: show rsvp neighbor Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Restart time</b>	Length of time a neighbor waits to receive a Hello from the restarting node before declaring the node dead and deleting the states (in milliseconds).	<b>detail</b>
<b>Recovery time</b>	Length of time during which the restarting node attempts to recover its lost states with help from its neighbors (in milliseconds). Recovery time is advertised by the restarting node to its neighbors, and applies to nodal faults. The restarting node considers its graceful restart complete after this time has elapsed.	<b>detail</b>

## Sample Output

**Output Fields**

[Table 378 on page 4700](#) describes the output fields for the **show rsvp session** command. Output fields are listed in the approximate order in which they appear.

Table 378: show rsvp session Output Fields

Field Name	Field Description	Level of Output
<b>Ingress RSVP</b>	Information about ingress RSVP sessions.	<b>detail</b>
<b>Ingress RSVP</b>	Information about ingress RSVP sessions. Each session has one line of output.	All levels
<b>Egress RSVP</b>	Information about egress RSVP sessions.	All levels
<b>Transit RSVP</b>	Information about the transit RSVP sessions.	All levels
<b>P2MP name</b>	(Appears only when the <b>p2mp</b> option is specified). Name of the point-to-multipoint LSP path.	All levels
<b>P2MP branch count</b>	(Appears only when the <b>p2mp</b> option is specified). Number of LSPs receiving packets from the point-to-multipoint LSP.	All levels
<b>To</b>	Destination (egress routing device) of the session.	All levels
<b>From</b>	Source (ingress routing device) of the session.	All levels
<b>State</b>	State of the path: <b>Up</b> , <b>Down</b> , or <b>AdminDn</b> . <b>AdminDn</b> indicates that the LSP is being taken down gracefully.	All levels
<b>Address</b>	Destination (egress routing device) of the LSP.	<b>detail</b>
<b>From</b>	Source (ingress routing device) of the session.	<b>detail</b>
<b>LSPstate</b>	State of the LSP that is being handled by this RSVP session. It can be either <b>Up</b> , <b>Dn</b> (down), or <b>AdminDn</b> . <b>AdminDn</b> indicates that the LSP is being taken down gracefully.	<b>brief detail</b>
<b>Rt</b>	Number of active routes (prefixes) that have been installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table ( <b>inet.0</b> ). For transit and egress RSVP sessions, the routing table is the primary MPLS table ( <b>mpls.0</b> ).	<b>brief</b>
<b>Active Route</b>	Number of active routes (prefixes) that have been installed in the forwarding table. For ingress RSVP sessions, the forwarding table is the primary IPv4 table ( <b>inet.0</b> ). For transit and egress RSVP sessions, the forwarding table is the primary MPLS table ( <b>mpls.0</b> ).	<b>detail</b>
<b>LSPname</b>	Name of the LSP.	<b>brief detail</b>
<b>LSPpath</b>	Indicates whether the RSVP session is for the primary or secondary LSP path. <b>LSPpath</b> can be either <b>primary</b> or <b>secondary</b> and can be displayed on the ingress, egress, and transit routing devices. <b>LSPpath</b> can also indicate when a graceful LSP deletion has been triggered.	<b>detail</b>
<b>Bypass</b>	(Egress routing device) Destination address for the bypass LSP.	<b>detail</b>

Table 378: show rsvp session Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Bidir</b>	(When LSP is bidirectional) LSP will allow data to travel in both directions between GMPLS devices.	<b>detail</b>
<b>Bidirectional</b>	(When LSP is bidirectional) LSP will allow data to travel both ways between GMPLS devices.	<b>detail</b>
<b>Upstream label in</b>	(When LSP is bidirectional) Incoming label for reverse direction traffic for this LSP.	<b>detail</b>
<b>Upstream label out</b>	(When LSP is bidirectional) Outgoing label for reverse direction traffic for this LSP.	<b>detail</b>
<b>Recovery label received</b>	(When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent.	<b>detail</b>
<b>Recovery label sent</b>	(When LSP is bidirectional) Label the downstream node suggests for use in its Resv messages that is returned.	<b>detail</b>
<b>Suggested label received</b>	(When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent.	<b>detail</b>
<b>Suggested label sent</b>	(When LSP is bidirectional) Label the downstream node suggests for use in its Resv message that is returned.	<b>detail</b>
<b>Resv style or Style</b>	RSVP reservation style. This field consists of two parts. The first is the number of active reservations. The second is the reservation style, which can be <b>FF</b> (fixed filter), <b>SE</b> (shared explicit), or <b>WF</b> (wildcard filter).	<b>brief detail</b>
<b>Label in</b>	Incoming label for this LSP.	<b>brief detail</b>
<b>Label out</b>	Outgoing label for this LSP.	<b>brief detail</b>
<b>Time left</b>	Number of seconds remaining in the lifetime of the reservation.	<b>brief detail</b>
<b>Since</b>	Date and time when the RSVP session was initiated.	<b>detail</b>
<b>Tspec</b>	Sender's traffic specification, which describes the sender's traffic parameters.	<b>detail</b>
<b>DiffServ info</b>	Indicates whether the LSP is a multiclass LSP ( <b>multiclass diffServ-TE LSP</b> ) or a Differentiated-Services-aware traffic engineering LSP ( <b>diffServ-TE LSP</b> ).	<b>detail</b>
<b>bandwidth</b>	Bandwidth for each class type ( <b>ct0</b> , <b>ct1</b> , <b>ct2</b> , or <b>ct3</b> ).	<b>detail</b>
<b>Port number</b>	Protocol ID and sender/receiver port used in this RSVP session.	<b>detail</b>
<b>Attrib flags</b>	<b>Non-PHP</b> indicates that ultimate hop popping has been requested by the LSP using this RSVP session	<b>extensive</b>

Table 378: show rsvp session Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>FastReroute desired</b>	Fast reroute has been requested by the ingress routing device.	<b>detail</b>
<b>Soft preemption desired</b>	Soft preemption has been requested by the ingress routing device.	<b>detail</b>
<b>FastReroute desired</b>	(Data [not a bypass or backup] LSP when the protection scheme has been requested) Fast reroute (one-to-one backup) has been requested by the ingress routing device.	<b>detail extensive</b>
<b>Link protection desired</b>	(Data [not a bypass or backup] LSP when the protection scheme has been requested) Link protection (many-to-one backup) has been requested by the ingress routing device.	<b>detail extensive</b>
<b>Node/Link protection desired</b>	(Data [not a bypass or backup] LSP when the protection scheme has been requested) Node and link protection (many-to-one backup) has been requested by the ingress routing device.	<b>detail extensive</b>
<b>Type</b>	<p>LSP type:</p> <ul style="list-style-type: none"> <li>• <b>Link protected LSP</b>—LSP has been protected by link protection at the outgoing interface. The name of the bypass used is also listed here (<b>extensive</b>).</li> <li>• <b>Node/Link protected LSP</b>—LSP has been protected by node and link protection at the outgoing interface. The name of the bypass used is also listed here (<b>extensive</b>).</li> <li>• <b>Protection down</b>—LSP is not currently protected.</li> <li>• <b>Bypass LSP</b>—LSP that is used to protect one or more user LSPs in case of link failure.</li> <li>• <b>Backup LSP at Point-of-Local-Repair (PLR)</b>—LSP that has been temporarily established to protect a user LSP at the ingress of a failed link.</li> <li>• <b>Backup LSP at Merge Point (MP)</b>—LSP that has been temporarily established to protect a user LSP at the egress of a failed link.</li> </ul>	<b>detail extensive</b>
<b>New bypass</b>	New bypass (the bypass name is also displayed) has been activated to protect the LSP.	<b>extensive</b>
<b>Link protection up, using <i>bypass-name</i></b>	Link protection (the bypass name is also displayed) has been activated for the LSP.	<b>extensive</b>
<b>Creating backup LSP, link down</b>	A <b>link down</b> event occurred, and traffic is being switched over to the bypass LSP.	<b>extensive</b>
<b>Deleting backup LSP, protected LSP restored</b>	Link has come back up and the LSP has been restored. Because the backup LSP is no longer needed, it is deleted.	<b>extensive</b>
<b>Path mtu</b>	Displays the value of the path MTU received from the network (through signaling) and the value used for forwarding. This value is only displayed on ingress routing devices with the <b>allow-fragmentation</b> statement configured at the <b>[edit protocols mpls path-mtu]</b> hierarchy level. If there is a detour LSP, the path MTU for the detour is also displayed.	<b>detail</b>

Table 378: show rsvp session Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>PATH rcvfrom</b>	Address of the previous-hop (upstream) routing device or client, interface the neighbor used to reach this routing device, and number of packets received from the upstream neighbor.	<b>detail</b>
<b>Adspec</b>	MTU signaled from the ingress routing device to the egress routing device by means of the adspec object.	<b>detail</b>
<b>PATH sentto</b>	Address of the next-hop (downstream) routing device or client, interface used to reach this neighbor (or peer-name in the GMPLS LSP case), and number of packets sent to the downstream routing device.	<b>detail</b>
<b>Explct route</b>	Explicit route for the session. Normally this value will be the same as that of record route. Differences indicate that path rerouting has occurred, typically during fast reroute.	<b>detail</b>
<b>Record route</b>	Recorded route for the session, taken from the record route object. Normally this value will be the same as that of explct route. Differences indicate that path rerouting has occurred, typically during fast reroute.	<b>detail</b>

## Sample Output

### show rsvp session

```

user@host> show rsvp session
Ingress RSVP: 1 sessions

## show rsvp statistics

<b>List of Syntax</b>	<a href="#">Syntax on page 4707</a> <a href="#">Syntax (EX Series Switches) on page 4707</a>
<b>Syntax</b>	show rsvp statistics <logical-system (all   <i>logical-system-name</i> )>
<b>Syntax (EX Series Switches)</b>	show rsvp statistics
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display Resource Reservation Protocol (RSVP) packet and error statistics.
<b>Options</b>	<b>none</b> —Display RSVP packet and error statistics.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">clear rsvp statistics on page 4576</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show rsvp statistics on page 4710</a>
<b>Output Fields</b>	<a href="#">Table 379 on page 4707</a> describes the output fields for the <b>show rsvp statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 379: show rsvp statistics Output Fields**

Field Name	Field Description
<b>Packet Type</b>	Statistics about different RSVP messages.
<b>Total Sent</b>	Total number of packets sent since RSVP was enabled.
<b>Total Received</b>	Total number of packets received since RSVP was enabled.
<b>Last 5 seconds Sent</b>	Total number of packets sent in the last 5 seconds.
<b>Last 5 seconds Received</b>	Number of packets received in the last 5 seconds.
<b>Path</b>	Statistics about Path messages, which are sent from the RSVP sender along the data paths and which store path state information in each node along the path.
<b>PathErr</b>	Statistics about PathErr messages, which are advisory messages that are sent upstream to the sender.

Table 379: show rsvp statistics Output Fields (*continued*)

Field Name	Field Description
<b>PathTear</b>	Statistics about PathTear messages, which remove path states and dependent reservation states in any routing devices along a path.
<b>Resv FF</b>	Statistics about fixed-filter reservation style messages, which consist of distinct reservations among explicit senders.
<b>Resv WF</b>	Statistics about wildcard-filter reservation style messages, which consist of shared reservations among wildcard senders.
<b>Res SE</b>	Statistics about shared-explicit reservation style messages, which consist of shared reservations among explicit senders.
<b>ResvErr</b>	Statistics about ResvErr messages, which are advisory messages that are sent when an attempt to establish a reservation fails.
<b>ResvTear</b>	Statistics about ResvTear messages, which remove reservation states along a path.
<b>ResvConf</b>	Statistics about ResvConfirm messages, which are responses to confirm a reservation request.
<b>Ack</b>	Acknowledge message for refresh reductions.
<b>SRefresh</b>	Summary refresh messages.
<b>Hello</b>	Number of RSVP hello packets that have been sent to and received from the neighbor.
<b>EndtoEnd RSVP</b>	Statistics for the number of End-to-end RSVP messages.
<b>Errors</b>	Statistics about errored RSVP packets.
<b>Rcv pkt bad length</b>	The packet was not processed because its length is inappropriate.
<b>Rcv pkt unknown type</b>	The packet is not one of the well-known RSVP types, as defined in RFC 2205, <i>Resource ReSerVation Protocol (RSVP)</i> .
<b>Rcv pkt bad version</b>	The packet is not an RSVP version 1 packet.
<b>Rcv pkt auth fail</b>	The packet failed authentication checks.
<b>Rcv pkt bad checksum</b>	The RSVP checksum check failed.
<b>Rcv pkt bad format</b>	General packet processing failed because the packet was badly formed.
<b>Memory allocation fail</b>	An internal resource failure occurred.
<b>No path information</b>	A reservation was received, but no sender is active.
<b>Resv style conflict</b>	The same session contains inconsistent reservation styles.

Table 379: show rsvp statistics Output Fields (*continued*)

Field Name	Field Description
<b>Port conflict</b>	There were inconsistent port numbers for the same session.
<b>Resv no interface</b>	An interface for the receive reservation packets cannot be located.
<b>PathErr to client</b>	Number of PathErr packets delivered to the local client.
<b>ResvErr to client</b>	Number of ResvErr packets delivered to the local client.
<b>Path timeout</b>	Number of times the sender timed out because the path was removed.
<b>Resv timeout</b>	Number of times the receiver timed out because the reservation was removed.
<b>Message out-of-order</b>	Records the number of RSVP incoming messages that are considered out of order. This is detected from the message ID object's sequence number.
<b>Unknown ack msg</b>	A neighboring routing device replies with an ACK object that contains an unknown message ID. This can indicate a message ID handshake problem. For example, a router receives an ACK for message IDs 1, 2, and 3. However, it only has state for message IDs 1 and 3. The router increments the unknown ack counter by 1.
<b>Recv nack</b>	If a neighboring router receives an unknown message ID in an RSVP refresh message, the router sends a Resv nack message back to the sender. This can happen if that neighbor has been rebooted. For this case, the router sends a regular RSVP refresh message to recover the state and start the message-ID handshake process again.
<b>Recv duplicated msg-id</b>	Number of times the same message ID is used by two different RSVP messages. This duplication is usually caused when a neighboring routing device restarts.
<b>No TE-link to rcv Hop</b>	Counter of packets discarded because a TE link was not found.
<b>Rcv pkt disabled interface</b>	Number of RSVP packets received on an interface that is not enabled for RSVP.
<b>Transmit buffer full</b>	Number of times the buffer for assembling an outgoing RSVP message was not large enough.
<b>Transmit failure</b>	Number of times the RSVP task failed to send out a packet.
<b>Receive failure</b>	Number of times the RSVP task failed to read an incoming packet.
<b>P2MP RESV discarded by appl</b>	Number of Resv messages discarded because the MPLS label is not valid for the P2MP LSP application.
<b>Rate limit</b>	Number of RSVP packets dropped due to rate limiting.
<b>Err msg loop detected</b>	Number of RSVP error messages that have looped back to their originator. This is detected by checking the error node address in the ERROR_SPEC object.

## Sample Output

### show rsvp statistics

```

user@host> show rsvp statistics

## show rsvp version

<b>List of Syntax</b>	<a href="#">Syntax on page 4711</a> <a href="#">Syntax (EX Series Switches) on page 4711</a>
<b>Syntax</b>	show rsvp version <logical-system (all   <i>logical-system-name</i> )>
<b>Syntax (EX Series Switches)</b>	show rsvp version
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display information about the Resource Reservation Protocol (RSVP) protocol settings, such as the version of the RSVP software, the refresh timer and keep multiplier, and local RSVP graceful restart capabilities on a routing device.
<b>Options</b>	<b>none</b> —Display RSVP protocol settings.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show rsvp version on page 4712</a>
<b>Output Fields</b>	<a href="#">Table 380 on page 4711</a> describes the output fields for the <b>show rsvp version</b> command. Output fields are listed in the approximate order in which they appear.

**Table 380: show rsvp version Output Fields**

Field Name	Field Description
Resource ReSerVation Protocol, version	RSVP software version.
RSVP protocol	Status of RSVP: <b>Enabled</b> or <b>Disabled</b> .
R(refresh timer)	Configured time interval used to generate periodic RSVP messages.
K(keep multiplier)	Number of RSVP messages that can be lost before an RSVP state is declared stale.
Preemption	Currently configured preemption capability: <b>Aggressive</b> , <b>Disabled</b> , or <b>Normal</b> . The default is <b>Normal</b> .
Soft-preemption cleanup	Time, in seconds, that an LSP is kept after it has been soft preempted. This is a global property of the RSVP protocol.
Graceful deleting timeout	Currently configured value for the <b>graceful-deletion-timeout</b> statement. The router that initiates the graceful deletion procedure for an RSVP session waits for the graceful deletion timeout interval to ensure that all routers along the path (especially the ingress and egress routers) have prepared for the LSP to be taken down.

Table 380: show rsvp version Output Fields (*continued*)

Field Name	Field Description
<b>NSR Mode</b>	Status of the nonstop active routing feature for RSVP on the restarting device: <b>Disabled</b> , <b>Enabled/Master</b> , or <b>Enabled/Standby</b> .
<b>NSR State</b>	<p>State of the nonstop active routing feature for RSVP on the restarting device.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>Idle</b></li> <li>• <b>TE-link sync complete</b></li> <li>• <b>Neighbor sync complete</b></li> <li>• <b>Path state sync complete</b></li> <li>• <b>Resv state sync complete</b></li> <li>• <b>Bypass sync complete</b></li> <li>• <b>Init sync complete</b></li> </ul>
<b>Setup protection</b>	Status of point-to-point and point-to-multipoint LSP setup protection configuration on the device: <b>Enabled</b> or <b>Disabled</b>
<b>Graceful restart</b>	Status of the graceful restart feature for RSVP on the restarting routing device: <b>Enabled</b> or <b>Disabled</b> .
<b>Restart helper mode</b>	Status of the helper mode feature: <b>Enabled</b> or <b>Disabled</b> . When this feature is enabled, the restarting routing device can help the neighbor with its RSVP restart procedures.
<b>Maximum helper restart time</b>	Number of milliseconds (ms) configured for the maximum helper restart time. The maximum helper restart time is the length of time the routing device waits before declaring that an RSVP neighbor attempting to restart gracefully is down.
<b>Maximum helper recovery time</b>	Number of milliseconds configured for the maximum helper recovery time. The maximum helper recovery time is the amount of time the routing device maintains the state of an RSVP neighbor attempting to restart gracefully.
<b>Restart time</b>	Number of milliseconds that a neighbor waits to receive a Hello message from the restarting node before declaring the node dead and deleting the states.
<b>Recovery time</b>	Number of milliseconds during which the restarting node attempts to recover its lost states with help from its neighbors. Recovery time is advertised by the restarting node to its neighbors, and applies to nodal faults. The restarting node considers its graceful restart complete after this time has elapsed.
<b>P2p transit LSP nexthop mode</b>	Point-to-point transit LSP nexthop mode on PTX Series devices. The possible values are <b>Chained</b> or <b>Unchained</b>
<b>P2mp transit LSP nexthop mode</b>	Point-to-multipoint transit LSP nexthop mode on PTX Series devices. The possible values are <b>Chained</b> or <b>Unchained</b>

## Sample Output

### show rsvp version

```
user@host> show rsvp version
```

```
Resource ReSerVation Protocol, version 1. rfc2205
  RSVP protocol:           Enabled
  R(refresh timer):        30 seconds
  K(keep multiplier):      3
  Preemption:              Normal
  Soft-preemption cleanup:  30 seconds
  Graceful deletion timeout: 30 seconds
  NSR mode:                Enabled/Master
  NSR state:                Init sync complete
  Setup protection:        Disabled
  Graceful restart:        Disabled
  Restart helper mode:      Enabled
  Maximum helper restart time: 20000 msec
  Maximum helper recovery time: 180000 msec
  Restart time:            0 msec
  P2p transit LSP nexthop mode: Unchained
  P2mp transit LSP nexthop mode: Unchained
```

## show ted database

<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.5 for EX Series switches.</p>
<b>Description</b>	Display the entries in the Multiprotocol Label Switching (MPLS) traffic engineering database.
<b>Options</b>	<p><b>none</b>—Display standard information about all entries in the traffic engineering database.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b><i>system-name</i></b>—(Optional) Display traffic engineering database information for a particular system.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show ted database brief on page 4716</a> <a href="#">show ted database detail on page 4717</a> <a href="#">show ted database extensive on page 4718</a>
<b>Output Fields</b>	<p><a href="#">Table 381 on page 4714</a> describes the output fields for the <b>show ted database</b> command. Output fields are listed in the approximate order in which they appear.</p>

**Table 381: show ted database Output Fields**

Field Name	Field Description	Level of Output
TED database	Number of nodes and pseudonodes participating in IS-IS and OSPF domain routing.	All levels
ID	Hostname and address of the node that the link is coming from. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode. If the node contains a router ID, it is displayed in parentheses.	<b>brief</b>

Table 381: show ted database Output Fields (*continued*)

Field Name	Field Description	Level of Output
NodeID	Hostname and address of the node that the link is coming from. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode.	extensive
Type	Type of node. It can be either <b>Rtr</b> (router) or <b>Net</b> (pseudonode).	All levels
Age(s)	How long since the node was last refreshed, in seconds.	All levels
LnkIn	Number of nodes pointing toward this node.	All levels
LnkOut	Number of nodes to which this node points.	All levels
Protocol	Protocol that reported the node information: <ul style="list-style-type: none"> <li>IS-IS(1)—IS-IS Level 1.</li> <li>IS-IS(2)—IS-IS Level 2.</li> <li>OSPF (area-number)—OSPF from the specified area.</li> </ul>	All levels
To	Address on the far end of a link.	detail extensive
Local	Address of the local interface being used to reach the remote node.	detail extensive
Remote	Address of the interface on the remote node.	detail extensive
Local interface index	The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205.	detail extensive
Remote interface index	The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205.	detail extensive
Metric	Configured traffic engineering metric.	extensive
Static BW	Total interface bandwidth in bps.	extensive
Reservable bandwidth	Subscription factor for the interface, which is the percentage of the link bandwidth that can be used for the RSVP reservation process. You configure this by including the <b>subscription</b> statement when configuring RSVP.	extensive
Available BW [priority]	(Must include <b>diffserv-te</b> statement when configuring LSPs) Amount of bandwidth actually reserved by RSVP for each priority level. The bandwidth shown is for the entire interface, not for each individual LSP.	extensive
Diffserv-TE BW Model	Bandwidth constraint model used by the LSPs.	extensive
Available BW [TE-class]	(Must include the <b>diffserv-te</b> statement when configuring LSPs) Amount of bandwidth actually reserved by RSVP for each traffic engineering class.	extensive

Table 381: show ted database Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Static BW [CT-class]</b>	Total interface bandwidth used by an MPLS traffic class, in bps.	<b>extensive</b>
Interface Switching Capability Descriptor ( <i>n</i> )	<p>Information about the interface switching capability descriptor, which is a subtype length value (TLV) of the link TLV. <i>n</i> is the index number.</p> <ul style="list-style-type: none"> <li>• <b>Switching type</b>—Type of switching to be performed on a particular link: <ul style="list-style-type: none"> <li>• <b>PSC-1</b>—Packet switch-capable 1</li> <li>• <b>PSC-2</b>—Packet switch-capable 2</li> <li>• <b>PSC-3</b>—Packet switch-capable 3</li> <li>• <b>PSC-4</b>—Packet switch-capable 4</li> <li>• <b>L2SC</b>—Layer-2-switch-capable</li> <li>• <b>TDM</b>—Time-division-multiplexing-capable</li> <li>• <b>LSC</b>—Lambda switch-capable</li> <li>• <b>FSC</b>—Fiber switch-capable</li> </ul> </li> <li>• <b>Encoding type</b>—Encoding of the LSP being requested: <ul style="list-style-type: none"> <li>• <b>Packet</b></li> <li>• <b>Ethernet</b></li> <li>• <b>ANSI/ETSI PDH</b></li> <li>• <b>Reserved</b></li> <li>• <b>SDH /SONET</b></li> <li>• <b>Digital Wrapper</b></li> <li>• <b>Lambda (photonic)</b></li> <li>• <b>Fiber</b></li> <li>• <b>FiberSDH/SONET</b></li> </ul> </li> <li>• <b>Maximum LSP BW [priority] bps</b>—Maximum LSP bandwidth information. Amount of bandwidth actually reserved for each priority level. The bandwidth shown is for the entire interface. <ul style="list-style-type: none"> <li>• <b>[<i>n</i>]</b>—Priority level. The range is from <b>0</b> (high) through <b>7</b> (low).</li> <li>• <b><i>n</i> Mbps</b>—Amount of the maximum bandwidth.</li> </ul> </li> <li>• <b>Minimum LSP BW</b>—Minimum LSP bandwidth in Mbps. Amount of bandwidth actually reserved for each priority level. The bandwidth shown is for the entire interface. <b>Minimum LSP BW</b> is displayed only when <b>switching type</b> is <b>PSC-1</b> or <b>TDM</b>.</li> <li>• <b>Interface MTU</b>—Displayed only when <b>switching type</b> is <b>TDM</b>.</li> <li>• <b>Interface supports standard SONET/SDH</b>—Displayed only when <b>switching type</b> is <b>TDM</b>.</li> </ul>	<b>extensive</b>

<b>Syntax</b>	show ted link <brief   detail> <logical-system (all   <i>logical-system-name</i> )>
<b>Syntax (EX Series Switches)</b>	show ted link <brief   detail>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display Multiprotocol Label Switching (MPLS) traffic engineering database link information.
<b>Options</b>	<b>none</b> —Display standard information about traffic engineering database link information.  <b>brief   detail</b> —(Optional) Display the specified level of output.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show ted link brief on page 4722</a> <a href="#">show ted link detail on page 4722</a>
<b>Output Fields</b>	<a href="#">Table 382 on page 4721</a> describes the output fields for the <b>show ted link</b> command. Output fields are listed in the approximate order in which they appear.

**Table 382: show ted link Output Fields**

Field Name	Field Description	Level of Output
ID	Hostname and address of the node that the link is coming from. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode.	<b>brief</b>
-->ID	Hostname and address of the node that the link is going to. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode.	<b>brief</b>
<i>hostname</i>	Hostname and address of the node that the link is coming from. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode.	<b>detail</b>
<i>hostname</i>	Hostname and address of the node that the link is going to. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode.	<b>detail</b>

Table 382: show ted link Output Fields (*continued*)

Field Name	Field Description	Level of Output
Local Path	Number of paths CSPF on the local routing device has placed on the link.	All levels
Local BW	Amount of bandwidth the local routing device has placed on the link.	All levels
Local	Address of the local interface being used to reach the remote node.	<b>detail extensive</b>
Remote	Address of the interface on the remote node.	<b>detail extensive</b>
Local interface index	The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205.	<b>detail</b>
Remote interface index	The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205.	<b>detail</b>

## show ted protocol

<b>List of Syntax</b>	<a href="#">Syntax on page 4724</a> <a href="#">Syntax (EX Series Switches) on page 4724</a>
<b>Syntax</b>	show ted protocol <brief   detail> <logical-system (all   <i>logical-system-name</i> )>
<b>Syntax (EX Series Switches)</b>	show ted protocol <brief   detail>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display information about the protocols from which the Multiprotocol Label Switching (MPLS) traffic engineering database learned about its nodes.
<b>Options</b>	<p><b>none</b>—Display standard information about the protocols from which the traffic engineering database learned about its nodes.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show ted protocol on page 4725</a>
<b>Output Fields</b>	<a href="#">Table 383 on page 4724</a> describes the output fields for the <b>show ted protocol</b> command. Output fields are listed in the approximate order in which they appear.

**Table 383: show ted protocol Output Fields**

Field Name	Field Description
<b>Protocol name</b>	Protocol that reported the node information: <ul style="list-style-type: none"> <li><b>IS-IS(1)</b>—IS-IS Level 1.</li> <li><b>IS-IS(2)</b>—IS-IS Level 2.</li> <li><b>OSPF (<i>area-number</i>)</b>—OSPF from the specified area.</li> </ul>
<b>Credibility</b>	If the protocols provide conflicting information about a node, the protocol with the highest credibility value is the one that the traffic engineering database uses.
<b>Self node</b>	Address the protocol uses as the local address.

## Sample Output

show ted protocol

```
user@host> show ted protocol
Protocol name      Credibility Self node
IS-IS(2)           2 (highest) corriedale.00(123.456.1.11)
IS-IS(1)           1          corriedale.00(123.456.1.11)
```

## traceroute mpls ldp

---

**Syntax** `traceroute mpls <ldp> fec`  
`<destination>`  
`<detail>`  
`<exp>`  
`<fanout>`  
`<logical-system>`  
`<no-resolve>`  
`<paths>`  
`<retries>`  
`<routing-instance>`  
`<source>`  
`<ttl>`  
`<update>`  
`<wait>`

**Release Information** Command introduced in Junos OS Release 8.4.  
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description** Trace route to a remote host for an MPLS label-switched path signaled by the LDP. Use **traceroute mpls ldp** as a debugging tool to locate MPLS label-switched path forwarding issues in a network. (Currently supported for IPv4 packets only.)

**Options** *fec*—Specify the IP address and optional prefix of the forwarding equivalence class (FEC).  
*destination*—(Optional) Specify the destination address to use when sending probes.  
*detail*—(Optional) Display detailed output.  
*exp*—(Optional) Specify the class-of-service to use when sending probes. The range of values is 0 through 7. The default value is 7.  
*fanout*—(Optional) Specify the maximum number of nexthops to search per node. The range of values is 1 through 16. The default value is 16.  
*logical-system*—(Optional) Specify the name of the logical system for the traceroute attempt.  
*no-resolve*—(Optional) Specify not to resolve the hostname that corresponds to the IP address.  
*paths*—(Optional) Specify the number of paths to search. The range of values is 1 through 255. The default value is 16.  
*retries*—(Optional) Specify the number of times to resend probe. values. The range of values is 1 through 9. The default value is 3.  
*routing-instance routing-instance-name*—(Optional) Specify the name of the routing instance for the traceroute attempt.  
*source source-address*—(Optional) Specify the source address of the outgoing traceroute packets.

**ttl value**—(Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds. The range of values is **1** through **125** and the default value is **64**.

**wait seconds**—(Optional) Specify the number of seconds to wait before resending a probe. The range of values is **5** through **15** and the default value is **10** seconds.

**Required Privilege Level** network

**List of Sample Output** [traceroute mpls ldp on page 4728](#)  
[traceroute mpls ldp detail on page 4728](#)

**Output Fields** [Table 384 on page 4727](#) describes the output fields for the **traceroute mpls ldp fec** command and the **traceroute mpls ldp fec detail** commands. Output fields are listed in the approximate order in which they appear.

**Table 384: traceroute mpls ldp Output Fields**

Field Name	Field Description	Level of Output
Probe options	Probe options specified in the <b>traceroute mpls ldp fec</b> command.	all levels
ttl	Time to live value of the labeled packet.	none specified
Label	Outgoing label used for forwarding the packet along the label-switched paths.	none specified
Protocol	Signaling protocol used. For this command, it is LDP.	none specified
Address	Address of the next hop.	none specified
Previous Hop	Address of the previous hop. Previous hop address of the first hop is <b>null</b> .	none specified
Probe status	Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths).	none specified
Hop	Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop.	<b>detail</b>
Parent	Address of the previous hop. Parent value for the first hop is <b>null</b> .	<b>detail</b>
Return Code	Return code for reporting the result of processing the echo request by the receiver.	<b>detail</b>
Response time	Time for the echo request to reach the receiver.	<b>detail</b>
Multipath type	Labels or addresses used by the specified multipath type. If multipaths are not used, the value is <b>none</b> .	<b>detail</b>

Table 384: traceroute mpls ldp Output Fields (*continued*)

Field Name	Field Description	Level of Output
Label Stack	Label stack used to forward the packet.	<b>detail</b>

## traceroute mpls rsvp

<b>Syntax</b>	<pre>traceroute mpls &lt;rsvp&gt; <i>lsp-name</i> &lt;detail&gt; &lt;egress&gt; &lt;exp&gt; &lt;logical-system&gt; &lt;multipoint&gt; &lt;no-resolve&gt; &lt;retries&gt; &lt;source <i>source-address</i>&gt; &lt;ttl&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.2.</p> <p><b>egress</b>, <b>multipoint</b>, and <b>ttl</b> options added in Junos OS Release 11.2.</p>
<b>Description</b>	<p>Trace route to a remote host for an MPLS LSP signaled by RSVP. Use <b>traceroute mpls rsvp</b> as a debugging tool to locate MPLS label-switched path (LSP) forwarding issues in a network. (Currently supported for IPv4 packets only.)</p>
<b>Options</b>	<p><b><i>lsp-name</i></b>—Specify the name of the LSP to be traced.</p> <p><b>detail</b>—(Optional) Display detailed output.</p> <p><b>egress</b>—(Optional) Request that a specific point-to-multipoint egress node reply to the trace route. The trace route would follow the associated sub-LSP to the egress node.</p> <p><b>exp</b>—(Optional) Specify the class of service to use when sending probes. The range of values is 0 through 7. The default value is 7.</p> <p><b>logical-system</b>—(Optional) Specify the name of the logical system for the traceroute attempt.</p> <p><b>multipoint</b>—(Optional) Perform a trace route on a point-to-multipoint LSP.</p> <p><b>no-resolve</b>—(Optional) Specify not to resolve the hostname that corresponds to the IP address.</p> <p><b>retries</b>—(Optional) Specify the number of times to resend probe. The range of values is 1 through 9. The default value is 3.</p> <p><b>source <i>source-address</i></b>—(Optional) Specify the source address of the outgoing traceroute packets.</p> <p><b>ttl</b>—(Optional) Specify the number of hops to follow before forcing the trace route to quit.</p>
<b>Required Privilege Level</b>	network
<b>List of Sample Output</b>	<p><a href="#">traceroute mpls rsvp on page 4731</a></p> <p><a href="#">traceroute mpls rsvp detail on page 4731</a></p>

[traceroute mpls rsvp multipoint \(branch node for sub-LSPs\) on page 4732](#)  
[traceroute mpls rsvp multipoint \(single-hop sub-LSPs\) on page 4732](#)

**Output Fields** Table 385 on page 4730 describes the output fields for the **traceroute mpls rsvp *lsp-name*** and **traceroute mpls rsvp *lsp-name* detail** commands. Output fields are listed in the approximate order in which they appear.

**Table 385: traceroute mpls rsvp Output Fields**

Field Name	Field Description	Level of Output
Probe options	Probe options specified in the <b>traceroute mpls rsvp <i>lsp-name</i></b> command.	all levels
ttl	Time-to-live value of the labeled packet.	none specified
Label	MPLS label used to forward the packets along the LSP.	none specified
Protocol	Signaling protocol used. For this command, it is RSVP-TE.	none specified
Address	Address of the next hop.	none specified
Previous Hop	Address of the previous hop. Previous hop address of the first hop is null.	none specified
Probe status	Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths). Displays <b>Success</b> if the trace to a hop is successful or <b>Egress</b> if the trace has reached the last router on the path.	none specified
Hop	Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop.	<b>detail</b>
Parent	Address of the previous hop. Parent value for the first hop is null.	<b>detail</b>
Return Code	Return code for reporting the result of processing the echo request by the receiver.	<b>detail</b>
Sender timestamp	Displays the timestamp when the MPLS echo request is sent to the next hop.	<b>detail</b>
Receiver timestamp	Timestamp when the echo request from the previous hop is received and acknowledged with an echo response by the next hop.	<b>detail</b>
Response time	Time for the echo request to reach the receiver.	<b>detail</b>
MTU	Size of the largest packet that includes the label stack forwarded to the next hop.	<b>detail</b>

Table 385: traceroute mpls rsvp Output Fields (*continued*)

Field Name	Field Description	Level of Output
Multipath type	Labels or addresses used by the specified multipath type. If multipaths are not used, the value is none.	<b>detail</b>
Label stack	Label stack used to forward the packet.	<b>detail</b>
Path	Displays the sub-lsp path number for this traceroute, the interface used, and the destination address.	all levels

- [Issues and Limitations in Operation of MPLS Features on the QFX Series and on the EX4600 Switch on page 4733](#)

### Issues and Limitations in Operation of MPLS Features on the QFX Series and on the EX4600 Switch

The following issues exist in the operation of MPLS features on QFX Series devices and on the EX4600 switch. In each case, the described behavior is the expected behavior.

- Configuring an MPLS firewall filter on a switch that is deployed as an egress provider edge (PE) switch has no effect.
- Configuring the **revert-timer** statement at the **[edit protocols mpls]** hierarchy level has no effect.
- If you configure the BGP labeled unicast address family (using the **labeled-unicast** statement at the **[edit protocols bgp family inet]** hierarchy level) on a QFX switch or on an EX4600 switch deployed as a route reflector for BGP labeled routes, path selection will occur at the route reflector, and a single best path will be advertised. This will result in loss of BGP multipath information.

## PIM Overview

The predominant multicast routing protocol in use on the Internet today is Protocol Independent Multicast, or PIM. The type of PIM used on the Internet is PIM sparse mode. PIM sparse mode is so accepted that when the simple term “PIM” is used in an Internet context, some form of sparse mode operation is assumed.

PIM emerged as an algorithm to overcome the limitations of dense-mode protocols such as the Distance Vector Multicast Routing Protocol (DVMRP), which was efficient for dense clusters of multicast receivers, but did not scale well for the larger, sparser, groups encountered on the Internet. The Core Based Trees (CBT) Protocol was intended to support sparse mode as well, but CBT, with its all-powerful core approach, made placement of the core critical, and large conference-type applications (many-to-many)

resulted in bottlenecks in the core. PIM was designed to avoid the dense-mode scaling issues of DVMRP and the potential performance issues of CBT at the same time.

PIM is one of the most rapidly evolving specifications on the Internet today. Since its introduction in 1995, PIM has already seen two major revisions to its packet structure (PIM version 1 [PIMv1] and PIM version 2 [PIMv2]), two major RFCs (RFC 2362 obsoleted RFC 2117), and numerous drafts describing major components of PIM, such as many-to-many trees and source-specific multicast (SSM). Long-lasting RFCs are not a feature of PIM, and virtually all of PIM must be researched, understood, and implemented directly from Internet drafts. In fact, no current RFC describes PIMv1 at all. The drafts have all expired, and PIMv1 was never issued as an official RFC.

PIM itself is not nonstandard or unstable, however. PIM has been a promising multicast routing protocol since its inception, especially PIM sparse mode, the first real sparse-mode multicast routing protocol. Work continues on PIM in a number of areas, from bidirectional trees to network management, and the rapid pace of development makes drafts essential for PIM.

PIMv1 and PIMv2 can coexist on the same routing device and even on the same interface. The main difference between PIMv1 and PIMv2 is the packet format. PIMv1 messages use Internet Group Management Protocol (IGMP) packets, whereas PIMv2 has its own IP protocol number (103) and packet structure. All routing devices connecting to an IP subnet such as a LAN must use the same PIM version. Some PIM implementations can recognize PIMv1 packets and automatically switch the routing device interface to PIMv1. Because the difference between PIMv1 and PIMv2 involves the message format, but not the meaning of the message or how the routing device processes the PIM message, a routing device can easily mix PIMv1 and PIMv2 interfaces.

PIM is used for efficient routing to multicast groups that might span wide-area and interdomain internetworks. It is called “protocol independent” because it does not depend on a particular unicast routing protocol. Junos OS supports bidirectional mode, sparse mode, dense mode, and sparse-dense mode.

PIM operates in several modes: bidirectional mode, sparse mode, dense mode, and sparse-dense mode. In sparse-dense mode, some multicast groups are configured as dense mode (flood-and-prune, [S,G] state) and others are configured as sparse mode (explicit join to rendezvous point [RP], [\*G] state).

PIM drafts also establish a mode known as PIM source-specific mode, or PIM SSM. In PIM SSM there is only one specific source for the content of a multicast group within a given domain.

Because the PIM mode you choose determines the PIM configuration properties, you first must decide whether PIM operates in bidirectional, sparse, dense, or sparse-dense mode in your network. Each mode has distinct operating advantages in different network environments.

- In sparse mode, routing devices must join and leave multicast groups explicitly. Upstream routing devices do not forward multicast traffic to a downstream routing device unless the downstream routing device has sent an explicit request (by means of a join message) to the rendezvous point (RP) routing device to receive this traffic. The RP serves as the root of the shared multicast delivery tree and is responsible for forwarding multicast data from different sources to the receivers.

Sparse mode is well suited to the Internet, where frequent interdomain join messages and prune messages are common.

**NOTE:** On all the EX series switches (except EX4300 and EX9200) and QFX5100 series switches, the rate limit is set to 1pps per SG to avoid overwhelming the rendezvous point (RP), First hop router (FHR) with PIM-sparse mode (PIM-SM) register messages and cause CPU hogs. This rate limit helps in improving scaling and convergence times by avoiding duplicate packets being trapped, and tunneled to RP in software.

- Bidirectional PIM is similar to sparse mode, and is especially suited to applications that must scale to support a large number of dispersed sources and receivers. In bidirectional PIM, routing devices build shared bidirectional trees and do not switch to a source-based tree. Bidirectional PIM scales well because it needs no source-specific (S,G) state. Instead, it builds only group-specific (\*,G) state.
- Unlike sparse mode and bidirectional mode, in which data is forwarded only to routing devices sending an explicit PIM join request, dense mode implements a *flood-and-prune* mechanism, similar to the Distance Vector Multicast Routing Protocol (DVMRP). In dense mode, a routing device receives the multicast data on the incoming interface, then forwards the traffic to the outgoing interface list. Flooding occurs periodically and is used to refresh state information, such as the source IP address and multicast group pair. If the routing device has no interested receivers for the data, and the outgoing interface list becomes empty, the routing device sends a PIM prune message upstream.

Dense mode works best in networks where few or no prunes occur. In such instances, dense mode is actually more efficient than sparse mode.

- Sparse-dense mode, as the name implies, allows the interface to operate on a per-group basis in either sparse or dense mode. A group specified as “dense” is not mapped to an RP. Instead, data packets destined for that group are forwarded by means of PIM dense mode rules. A group specified as “sparse” is mapped to an RP, and data packets are forwarded by means of PIM sparse-mode rules. Sparse-dense mode is useful in networks implementing auto-RP for PIM sparse mode.

## Basic PIM Network Components

---

PIM dense mode requires only a multicast source and series of multicast-enabled routing devices running PIM dense mode to allow receivers to obtain multicast content. Dense mode makes sure that all multicast traffic gets everywhere by periodically flooding the network with multicast traffic, and relies on prune messages to make sure that subnets where all receivers are uninterested in that particular multicast group stop receiving packets.

PIM sparse mode is more complicated and requires the establishment of special routing devices called *rendezvous points (RPs)* in the network core. These routing devices are where upstream join messages from interested receivers meet downstream traffic from the source of the multicast group content. A network can have many RPs, but PIM sparse mode allows only one RP to be active for any multicast group.

If there is only one RP in a routing domain, the RP and adjacent links might become congested and form a single point of failure for all multicast traffic. Thus, multiple RPs are the rule, but the issue then becomes how other multicast routing devices find the RP that is the source of the multicast group the receiver is trying to join. This RP-to-group mapping is controlled by a special *bootstrap router (BSR)* running the PIM BSR mechanism. There can be more than one bootstrap router as well, also for single-point-of-failure reasons.

The bootstrap router does not have to be an RP itself, although this is a common implementation. The bootstrap router's main function is to manage the collection of RPs and allow interested receivers to find the source of their group's multicast traffic. PIM bootstrap messages are sourced from the loopback address, which is always up. The loopback address must be routable. If it is not routable, then the bootstrap router is unable to send bootstrap messages to update the RP domain members. The **show pim bootstrap** command displays only those bootstrap routers that have routable loopback addresses.

PIM SSM can be seen as a subset of a special case of PIM sparse mode and requires no specialized equipment other than that used for PIM sparse mode (and IGMP version 3).

Bidirectional PIM RPs, unlike RPs for PIM sparse mode, do not need to perform PIM Register tunneling or other specific protocol action. Bidirectional PIM RPs implement no specific functionality. RP addresses are simply a location in the network to rendezvous toward. In fact, for bidirectional PIM, RP addresses need not be loopback interface addresses or even be addresses configured on any routing device, as long as they are covered by a subnet that is connected to a bidirectional PIM-capable routing device and advertised to the network.

## PIM on Aggregated Interfaces

If you configure PIM on an aggregated (**ae-** or **as-**) interface, each of the interfaces in the aggregate is included in the multicast output interface list and carries the single stream

of replicated packets in a load-sharing fashion. The multicast aggregate interface is “expanded” into its constituent interfaces in the next-hop database.

## Introduction to PIM Sparse Mode

- [Understanding PIM Sparse Mode on page 4741](#)
- [Designated Router on page 4744](#)

### Understanding PIM Sparse Mode

A Protocol Independent Multicast (PIM) sparse-mode domain uses reverse-path forwarding (RPF) to create a path from a data source to the receiver requesting the data. When a receiver issues an explicit join request, an RPF check is triggered. A (\*,G) PIM join message is sent toward the RP from the receiver's designated router (DR). (By definition, this message is actually called a join/prune message, but for clarity in this description, it is called either join or prune, depending on its context.) The join message is multicast hop by hop upstream to the ALL-PIM-ROUTERS group (224.0.0.13) by means of each router's RPF interface until it reaches the RP. The RP router receives the (\*,G) PIM join message and adds the interface on which it was received to the outgoing interface list (OIL) of the rendezvous-point tree (RPT) forwarding state entry. This builds the RPT connecting the receiver with the RP. The RPT remains in effect, even if no active sources generate traffic.

**NOTE:** State—the (\*,G) or (S,G) entries—is the information used for forwarding unicast or multicast packets. S is the source IP address, G is the multicast group address, and \* represents any source sending to group G. Routers keep track of the multicast forwarding state for the incoming and outgoing interfaces for each group.

When a source becomes active, the source DR encapsulates multicast data packets into a PIM register message and sends them by means of unicast to the RP router.

If the RP router has interested receivers in the PIM sparse-mode domain, it sends a PIM join message toward the source to build a shortest-path tree (SPT) back to the source. The source sends multicast packets out on the LAN, and the source DR encapsulates the packets in a PIM register message and forwards the message toward the RP router by means of unicast. The RP router receives PIM register messages back from the source, and thus adds a new source to the distribution tree, keeping track of sources in a PIM table. Once an RP router receives packets natively (with S,G), it sends a register stop message to stop receiving the register messages by means of unicast.

In actual application, many receivers with multiple SPTs are involved in a multicast traffic flow. To illustrate the process, we track the multicast traffic from the RP router to one receiver. In such a case, the RP router begins sending multicast packets down the RPT

toward the receiver's DR for delivery to the interested receivers. When the receiver's DR receives the first packet from the RPT, the DR sends a PIM join message toward the source DR to start building an SPT back to the source. When the source DR receives the PIM join message from the receiver's DR, it starts sending traffic down all SPTs. When the first multicast packet is received by the receiver's DR, the receiver's DR sends a PIM prune message to the RP router to stop duplicate packets from being sent through the RPT. In turn, the RP router stops sending multicast packets to the receiver's DR, and sends a PIM prune message for this source over the RPT toward the source DR to halt multicast packet delivery to the RP router from that particular source.

If the RP router receives a PIM register message from an active source but has no interested receivers in the PIM sparse-mode domain, it still adds the active source into the PIM table. However, after adding the active source into the PIM table, the RP router sends a register stop message. The RP router discovers the active source's existence and no longer needs to receive advertisement of the source (which utilizes resources).

**NOTE:** If the number of PIM join messages exceeds the configured MTU, the messages are fragmented in IPv6 PIM sparse mode. To avoid the fragmentation of PIM join messages, the multicast traffic receives the interface MTU instead of the path MTU.

---

The major characteristics of PIM sparse mode are as follows:

- Routers with downstream receivers join a PIM sparse-mode tree through an explicit join message.
- PIM sparse-mode RPs are the routers where receivers meet sources.
- Senders announce their existence to one or more RPs, and receivers query RPs to find multicast sessions.
- Once receivers get content from sources through the RP, the last-hop router (the router closest to the receiver) can optionally remove the RP from the shared distribution tree (\*;G) if the new source-based tree (S,G) is shorter. Receivers can then get content directly from the source.

The transitional aspect of PIM sparse mode from shared to source-based tree is one of the major features of PIM, because it prevents overloading the RP or surrounding core links.

There are related issues regarding source, RPs, and receivers when sparse mode multicast is used:

- Sources must be able to send to all RPs.
- RPs must all know one another.
- Receivers must send explicit join messages to a known RP.
- Receivers initially need to know only one RP (they later learn about others).

- Receivers can explicitly prune themselves from a tree.
- Receivers that never transition to a source-based tree are effectively running Core Based Trees (CBT).

PIM sparse mode has standard features for all of these issues.

### Rendezvous Point

The RP router serves as the information exchange point for the other routers. All routers in a PIM domain must provide mapping to an RP router. It is the only router that needs to know the active sources for a domain—the other routers just need to know how to reach the RP. In this way, the RP matches receivers with sources.

The RP router is downstream from the source and forms one end of the shortest-path tree. As shown in [Figure 14-6 on page 4743](#), the RP router is upstream from the receiver and thus forms one end of the rendezvous-point tree.

**Figure 14-6: Rendezvous Point as Part of the RPT and SPT**

The benefit of using the RP as the information exchange point is that it reduces the amount of state in non-RP routers. No network flooding is required to provide non-RP routers information about active sources.

### RP Mapping Options

RPs can be learned by one of the following mechanisms:

- Static configuration
- Anycast RP
- Auto-RP
- Bootstrap router

We recommend a static RP mapping with anycast RP and a bootstrap router (BSR) with auto-RP configuration, because static mapping provides all the benefits of a bootstrap router and auto-RP without the complexity of the full BSR and auto-RP mechanisms.

## Designated Router

In a PIM sparse mode (PIM-SM) domain, there are two types of designated routers to consider:

- The receiver DR sends PIM join and PIM prune messages from the receiver network toward the RP.
- The source DR sends PIM register messages from the source network to the RP.

Neighboring PIM routers multicast periodic PIM hello messages to each other every 30 seconds (the default). The PIM hello message usually includes a holdtime value for the neighbor to use, but this is not a requirement. If the PIM hello message does not include a holdtime value, a default timeout value (in Junos OS, 105 seconds) is used. On receipt of a PIM hello message, a router stores the IP address and priority for that neighbor. If the DR priorities match, the router with the highest IP address is selected as the DR.

If a DR fails, a new one is selected using the same process of comparing IP addresses.

**NOTE:** In PIM dense mode (PIM-DM), a DR is elected by the same process that PIM-SM uses. However, the only time that a DR has any effect in PIM-DM is when IGMPv1 is used on the interface. (IGMPv2 is the default.) In this case, the DR also functions as the IGMP Query Router because IGMPv1 does not have a Query Router election mechanism.

---

## Introduction to Static RP

- [Understanding Static RP on page 4744](#)

### Understanding Static RP

Protocol Independent Multicast (PIM) sparse mode is the most common multicast protocol used on the Internet. PIM sparse mode is the default mode whenever PIM is configured on any interface of the device. However, because PIM must not be configured on the network management interface, you must disable it on that interface.

Each any-source multicast (ASM) group has a shared tree through which receivers learn about new multicast sources and new receivers learn about all multicast sources. The rendezvous point (RP) router is the root of this shared tree and receives the multicast traffic from the source. To receive multicast traffic from the groups served by the RP, the device must determine the IP address of the RP for the source.

You can configure a static rendezvous point (RP) configuration that is similar to static routes. A static configuration has the benefit of operating in PIM version 1 or version 2. When you configure the static RP, the RP address that you select for a particular group must be consistent across all routers in a multicast domain.

One common way for the device to locate RPs is by static configuration of the IP address of the RP. A static configuration is simple and convenient. However, if the statically

defined RP router becomes unreachable, there is no automatic failover to another RP router. To remedy this problem, you can use anycast RP.

- Related Documentation**
- [Configuring Local PIM RPs on page 4795](#)
  - [Configuring the Static PIM RP Address on the Non-RP Routing Device on page 4797](#)

## Introduction to Anycast RP

- [Understanding RP Mapping with Anycast RP on page 4745](#)

### Understanding RP Mapping with Anycast RP

Having a single active rendezvous point (RP) per multicast group is much the same as having a single server providing any service. All traffic converges on this single point, although other servers are sitting idle, and convergence is slow when the resource fails. In multicast specifically, there might be closer RPs on the shared tree, so the use of a single RP is suboptimal.

For the purposes of load balancing and redundancy, you can configure anycast RP. You can use anycast RP within a domain to provide redundancy and RP load sharing. When an RP fails, sources and receivers are taken to a new RP by means of unicast routing. When you configure anycast RP, you bypass the restriction of having one active RP per multicast group, and instead deploy multiple RPs for the same group range. The RP routers share one unicast IP address. Sources from one RP are known to other RPs that use the Multicast Source Discovery Protocol (MSDP). Sources and receivers use the closest RP, as determined by the interior gateway protocol (IGP).

Anycast means that multiple RP routers share the same unicast IP address. Anycast addresses are advertised by the routing protocols. Packets sent to the anycast address are sent to the nearest RP with this address. Anycast addressing is a generic concept and is used in PIM sparse mode to add load balancing and service reliability to RPs.

Anycast RP is defined in Internet draft draft-ietf-mboned-anycast-rp-08.txt, *Anycast RP Mechanism Using PIM and MSDP*. To access Internet RFCs and drafts, go to the IETF website at <http://www.ietf.org>.

## Introduction to PIM Bootstrap Router

- [Understanding the PIM Bootstrap Router on page 4745](#)

### Understanding the PIM Bootstrap Router

To determine which router is the rendezvous point (RP), all routers within a PIM sparse-mode domain collect bootstrap messages. A PIM sparse-mode domain is a group

of routers that all share the same RP router. The domain bootstrap router initiates bootstrap messages, which are sent hop by hop within the domain. The routers use bootstrap messages to distribute RP information dynamically and to elect a bootstrap router when necessary.

**Related  
Documentation**

- [Configuring PIM Bootstrap Properties for IPv4 or IPv6](#)

---

## Introduction to PIM Filtering

- [Understanding Multicast Message Filters on page 4746](#)
- [Filtering MAC Addresses on page 4747](#)
- [Filtering RP and DR Register Messages on page 4747](#)

### Understanding Multicast Message Filters

Multicast sources and routers generate a considerable number of control messages, especially when using PIM sparse mode. These messages form distribution trees, locate rendezvous points (RPs) and designated routers (DRs), and transition from one type of tree to another. In most cases, this multicast messaging system operates transparently and efficiently. However, in some configurations, more control over the sending and receiving of multicast control messages is necessary.

You can configure multicast filtering to control the sending and receiving of multicast control messages.

To prevent unauthorized groups and sources from registering with an RP router, you can define a routing policy to reject PIM register messages from specific groups and sources and configure the policy on the designated router or the RP router.

- If you configure the reject policy on an RP router, it rejects incoming PIM register messages from the specified groups and sources. The RP router also sends a register stop message by means of unicast to the designated router. On receiving the register stop message, the designated router sends periodic null register messages for the specified groups and sources to the RP router.
- If you configure the reject policy on a designated router, it stops sending PIM register messages for the specified groups and sources to the RP router.

**NOTE:** If you have configured the reject policy on an RP router, we recommend that you configure the same policy on all the RP routers in your multicast network.

---

**NOTE:** If you delete a group and source address from the reject policy configured on an RP router and commit the configuration, the RP router will register the group and source only when the designated router sends a null register message.

---

- Related Documentation**
- [Filtering MAC Addresses on page 4747](#)
  - [Filtering RP and DR Register Messages on page 4747](#)
  - [Filtering MSDP SA Messages on page 4769](#)

## Filtering MAC Addresses

When a router is exclusively configured with multicast protocols on an interface, multicast sets the interface media access control (MAC) filter to multicast promiscuous mode, and the number of multicast groups is unlimited. However, when the router is not exclusively used for multicasting and other protocols such as OSPF, Routing Information Protocol version 2 (RIPv2), or Network Time Protocol (NTP) are configured on an interface, each of these protocols individually requests that the interface program the MAC filter to pick up its respective multicast group only. In this case, without multicast configured on the interface, the maximum number of multicast MAC filters is limited to 20. For example, the maximum number of interface MAC filters for protocols such as OSPF (multicast group 224.0.0.5) is 20, unless a multicast protocol is also configured on the interface.

No configuration is necessary for MAC filters.

## Filtering RP and DR Register Messages

You can filter Protocol Independent Multicast (PIM) register messages sent from the designated router (DR) or to the rendezvous point (RP). The PIM RP keeps track of all active sources in a single PIM sparse mode domain. In some cases, more control over which sources an RP discovers, or which sources a DR notifies other RPs about, is desired. A high degree of control over PIM register messages is provided by RP and DR register message filtering. Message filtering also prevents unauthorized groups and sources from registering with an RP router.

Register messages that are filtered at a DR are not sent to the RP, but the sources are available to local users. Register messages that are filtered at an RP arrive from source DRs, but are ignored by the router. Sources on multicast group traffic can be limited or directed by using RP or DR register message filtering alone or together.

If the action of the register filter policy is to discard the register message, the router needs to send a register-stop message to the DR. Register-stop messages are throttled to prevent malicious users from triggering them on purpose to disrupt the routing process.

Multicast group and source information is encapsulated inside unicast IP packets. This feature allows the router to inspect the multicast group and source information before sending or accepting the PIM register message.

Incoming register messages to an RP are passed through the configured register message filtering policy before any further processing. If the register message is rejected, the RP router sends a register-stop message to the DR. When the DR receives the register-stop message, the DR stops sending register messages for the filtered groups and sources to the RP. Two fields are used for register message filtering:

- Group multicast address

- Source address

The syntax of the existing policy statements is used to configure the filtering on these two fields. The **route-filter** statement is useful for multicast group address filtering, and the **source-address-filter** statement is useful for source address filtering. In most cases, the action is to **reject** the register messages, but more complex filtering policies are possible.

Filtering cannot be performed on other header fields, such as DR address, protocol, or port. In some configurations, an RP might not send register-stop messages when the policy action is to discard the register messages. This has no effect on the operation of the feature, but the router will continue to receive register messages.

When anycast RP is configured, register messages can be sent or received by the RP. All the RPs in the anycast RP set need to be configured with the same RP register message filtering policies. Otherwise, it might be possible to circumvent the filtering policy.

## Understanding Multicast Rendezvous Points, Shared Trees, and Rendezvous-Point Trees

In a shared tree, the root of the distribution tree is a router, not a host, and is located somewhere in the core of the network. In the primary sparse mode multicast routing protocol, Protocol Independent Multicast sparse mode (PIM SM), the core router at the root of the shared tree is the rendezvous point (RP). Packets from the upstream source and join messages from the downstream routers “rendezvous” at this core router.

In the RP model, other routers do not need to know the addresses of the sources for every multicast group. All they need to know is the IP address of the RP router. The RP router discovers the sources for all multicast groups.

The RP model shifts the burden of finding sources of multicast content from each router (the (S,G) notation) to the network (the (\*,G) notation knows only the RP). Exactly how the RP finds the unicast IP address of the source varies, but there must be some method to determine the proper source for multicast content for a particular group.

Consider a set of multicast routers without any active multicast traffic for a certain group. When a router learns that an interested receiver for that group is on one of its directly connected subnets, the router attempts to join the distribution tree for that group back to the RP, not to the actual source of the content.

To join the shared tree, or *rendezvous-point tree (RPT)* as it is called in PIM sparse mode, the router must do the following:

- Determine the IP address of the RP for that group. Determining the address can be as simple as static configuration in the router, or as complex as a set of nested protocols.
- Build the shared tree for that group. The router executes an RPF check on the RP address in its routing table, which produces the interface closest to the RP. The router now detects that multicast packets from this RP for this group need to flow into the router on this RPF interface.
- Send a join message out on this interface using the proper multicast protocol (probably PIM sparse mode) to inform the upstream router that it wants to join the shared tree for that group. This message is a (\*G) join message because S is not known. Only the RP is known, and the RP is not actually the source of the multicast packets. The router receiving the (\*G) join message adds the interface on which the message was received to its outgoing interface list (OIL) for the group and also performs an RPF check on the RP address. The upstream router then sends a (\*G) join message out from the RPF interface toward the source, informing the upstream router that it also wants to join the group.

Each upstream router repeats this process, propagating join messages from the RPF interface, building the shared tree as it goes. The process stops when the join message reaches one of the following:

- The RP for the group that is being joined
- A router along the RPT that already has a multicast forwarding state for the group that is being joined

In either case, the branch is created, and packets can flow from the source to the RP and from the RP to the receiver. Note that there is no guarantee that the shared tree (RPT) is the shortest path tree to the source. Most likely it is not. However, there are ways to “migrate” a shared tree to an SPT once the flow of packets begins. In other words, the forwarding state can transition from (\*G) to (S,G). The formation of both types of tree depends heavily on the operation of the RPF check and the RPF table.

### Building an RPT Between the RP and Receivers

The RPT is the path between the RP and receivers (hosts) in a multicast group (see [Figure 147 on page 4750](#)). The RPT is built by means of a PIM join message from a receiver's DR:
