1. A receiver sends a request to join group (G) in an Internet Group Management Protocol (IGMP) host membership report. A PIM sparse-mode router, the receiver's DR, receives

- the report on a directly attached subnet and creates an RPT branch for the multicast group of interest.
2. The receiver's DR sends a PIM join message to its RPF neighbor, the next-hop address in the RPF table, or the unicast routing table.
3. The PIM join message travels up the tree and is multicast to the ALL-PIM-ROUTERS group (224.0.0.13). Each router in the tree finds its RPF neighbor by using either the RPF table or the unicast routing table. This is done until the message reaches the RP and forms the RPT. Routers along the path set up the multicast forwarding state to forward requested multicast traffic back down the RPT to the receiver.

**Figure 147: Building an RPT Between the RP and the Receiver**

## PIM Sparse Mode Source Registration

The RPT is a unidirectional tree, permitting traffic to flow down from the RP to the receiver in one direction. For multicast traffic to reach the receiver from the source, another branch of the distribution tree, called the shortest-path tree, needs to be built from the source's DR to the RP.

The shortest-path tree is created in the following way:

1. The source becomes active, sending out multicast packets on the LAN to which it is attached. The source's DR receives the packets and encapsulates them in a PIM register message, which it sends to the RP router (see [Figure 14-8 on page 4751](#)).
2. When the RP router receives the PIM register message from the source, it sends a PIM join message back to the source.

Figure 148: PIM Register Message and PIM Join Message Exchanged

3. The source's DR receives the PIM join message and begins sending traffic down the SPT toward the RP router (see [Figure 149 on page 4752](#)).
4. Once traffic is received by the RP router, it sends a register stop message to the source's DR to stop the register process.

Figure 149: Traffic Sent from the Source to the RP Router

- The RP router sends the multicast traffic down the RPT toward the receiver (see [Figure 150 on page 4752](#)).

Figure 150: Traffic Sent from the RP Router Toward the Receiver

## Multicast Shortest-Path Tree

The distribution tree used for multicast is rooted at the source and is the shortest-path tree (SPT) as well. Consider a set of multicast routers without any active multicast traffic for a certain group (that is, they have no multicast forwarding state for that group). When a router learns that an interested receiver for that group is on one of its directly connected subnets, the router attempts to join the tree for that group.

To join the distribution tree, the router determines the unicast IP address of the source for that group. This address can be a simple static configuration on the router, or as complex as a set of protocols.

To build the SPT for that group, the router executes an a reverse path forwarding (RPF) check on the source address in its routing table. The RPF check produces the interface closest to the source, which is where multicast packets from this source for this group need to flow into the router.

The router next sends a join message out on this interface using the proper multicast protocol to inform the upstream router that it wants to join the distribution tree for that group. This message is an (S,G) join message because both S and G are known. The router receiving the (S,G) join message adds the interface on which the message was received to its output interface list (OIL) for the group and also performs an RPF check on the source address. The upstream router then sends an (S,G) join message out on the RPF interface toward the source, informing the upstream router that it also wants to join the group.

Each upstream router repeats this process, propagating joins out on the RPF interface, building the SPT as it goes. The process stops when the join message does one of two things:

- Reaches the router directly connected to the host that is the source.
- Reaches a router that already has multicast forwarding state for this source-group pair.

In either case, the branch is created, each of the routers has multicast forwarding state for the source-group pair, and packets can flow down the distribution tree from source to receiver. The RPF check at each router makes sure that the tree is an SPT.

SPTs are always the shortest path, but they are not necessarily short. That is, sources and receivers tend to be on the periphery of a router network, not on the backbone, and multicast distribution trees have a tendency to sprawl across almost every router in the network. Because multicast traffic can overwhelm a slow interface, and one packet can easily become a hundred or a thousand on the opposite side of the backbone, it makes sense to provide a shared tree as a distribution tree so that the multicast source can be located more centrally in the network, on the backbone. This sharing of distribution trees with roots in the core network is accomplished by a multicast rendezvous point.

## SPT Cutover

Instead of continuing to use the SPT to the RP and the RPT toward the receiver, a direct SPT is created between the source and the receiver in the following way:

1. Once the receiver's DR receives the first multicast packet from the source, the DR sends a PIM join message to its RPF neighbor (see [Figure 151 on page 4754](#)).
2. The source's DR receives the PIM join message, and an additional (S,G) state is created to form the SPT.
3. Multicast packets from that particular source begin coming from the source's DR and flowing down the new SPT to the receiver's DR. The receiver's DR is now receiving two copies of each multicast packet sent by the source—one from the RPT and one from the new SPT.

**Figure 151: Receiver DR Sends a PIM Join Message to the Source**

4. To stop duplicate multicast packets, the receiver's DR sends a PIM prune message toward the RP router, letting it know that the multicast packets from this particular source coming in from the RPT are no longer needed (see [Figure 152 on page 4755](#)).

Figure 152: PIM Prune Message Is Sent from the Receiver's DR Toward the RP Router

5. The PIM prune message is received by the RP router, and it stops sending multicast packets down to the receiver's DR. The receiver's DR is getting multicast packets only for this particular source over the new SPT. However, multicast packets from the source are still arriving from the source's DR toward the RP router (see [Figure 153 on page 4755](#)).

Figure 153: RP Router Receives PIM Prune Message

6. To stop the unneeded multicast packets from this particular source, the RP router sends a PIM prune message to the source's DR (see [Figure 154 on page 4756](#)).

**Figure 154: RP Router Sends a PIM Prune Message to the Source DR**

7. The receiver's DR now receives multicast packets only for the particular source from the SPT (see [Figure 155 on page 4756](#)).

**Figure 155: Source's DR Stops Sending Duplicate Multicast Packets Toward the RP Router**

## SPT Cutover Control

In some cases, the last-hop router needs to stay on the shared tree to the RP and not transition to a direct SPT to the source. You might not want the last-hop router to transition when, for example, a low-bandwidth multicast stream is forwarded from the RP to a last-hop router. All routers between last hop and source must maintain and refresh the SPT state. This can become a resource-intensive activity that does not add much to the network efficiency for a particular pair of source and multicast group addresses.

In these cases, you configure an SPT threshold policy on the last-hop router to control the transition to a direct SPT. An SPT cutover threshold of infinity applied to a source-group address pair means the last-hop router will never transition to a direct SPT. For all other source-group address pairs, the last-hop router transitions immediately to a direct SPT rooted at the source DR.

## Introduction to IGMP

- [Understanding Group Membership Protocols on page 4757](#)
- [Understanding IGMP on page 4759](#)

## Understanding Group Membership Protocols

There is a big difference between the multicast protocols used between host and router and between the multicast routers themselves. Hosts on a given subnetwork need to inform their router only whether or not they are interested in receiving packets from a certain multicast group. The source host needs to inform its routers only that it is the source of traffic for a particular multicast group. In other words, no detailed knowledge of the distribution tree is needed by any hosts; only a group membership protocol is needed to inform routers of their participation in a multicast group. Between adjacent routers, on the other hand, the multicast routing protocols must avoid loops as they build a detailed sense of the network topology and distribution tree from source to leaf. So, different multicast protocols are used for the host-router portion and the router-router portion of the multicast network.

Multicast group membership protocols enable a router to detect when a host on a directly attached subnet, typically a LAN, wants to receive traffic from a certain multicast group. Even if more than one host on the LAN wants to receive traffic for that multicast group, the router sends only one copy of each packet for that multicast group out on that interface, because of the inherent broadcast nature of LANs. When the multicast group membership protocol informs the router that there are no interested hosts on the subnet, the packets are withheld and that leaf is pruned from the distribution tree.

The Internet Group Management Protocol (IGMP) and the Multicast Listener Discovery (MLD) Protocol are the standard IP multicast group membership protocols: IGMP and MLD have several versions that are supported by hosts and routers:

- IGMPv1—The original protocol defined in RFC 1112. An explicit join message is sent to the router, but a timeout is used to determine when hosts leave a group. This process wastes processing cycles on the router, especially on older or smaller routers.
- IGMPv2—Defined in RFC 2236. Among other features, IGMPv2 adds an explicit leave message to the join message so that routers can more easily determine when a group has no interested listeners on a LAN.
- IGMPv3—Defined in RFC 3376. Among other features, IGMPv3 optimizes support for a single source of content for a multicast group, or *source-specific multicast (SSM)*.
- MLDv1—Defined in RFC 2710. MLDv1 is similar to IGMPv2.
- MLDv2—Defined in RFC 3810. MLDv2 similar to IGMPv3.

The various versions of IGMP and MLD are backward compatible. It is common for a router to run multiple versions of IGMP and MLD on LAN interfaces. Backward compatibility is achieved by dropping back to the most basic of all versions run on a LAN. For example, if one host is running IGMPv1, any router attached to the LAN running IGMPv2 can drop back to IGMPv1 operation, effectively eliminating the IGMPv2 advantages. Running multiple IGMP versions ensures that both IGMPv1 and IGMPv2 hosts find peers for their versions on the router.

**CAUTION:** On MX Series platforms, IGMPv2 and IGMPv3 cannot be configured together on the same interface. Configuring both together causes unexpected behavior in multicast traffic forwarding.

## Understanding IGMP

The IPv4 address scheme assigns class D addresses for IP multicast. IGMP is the protocol that uses these addresses, which can be in the range 224.0.0.0 to 239.255.255.255. The following addresses have specific functions or are unavailable:

- 224.0.0.0 is reserved—you cannot assign it to a group.
- 224.0.0.1 is the all-hosts address—a packet sent to this address reaches all hosts on a subnet.
- 224.0.0.2 is the all-routers address—a packet sent to this address reaches all routers on a subnet.

This implementation of IGMP complies with IGMP versions 1, 2, and 3. IGMPv3 supports source-specific join and leave messages and is backward compatible with IGMPv1 and IGMPv2.

IGMPv2 mode interfaces exchange the following types of messages between routers and hosts:

- Group membership queries
- Group membership reports
- Leave group membership messages

IGMPv3 mode interfaces exchange the following types of messages with IGMPv3 hosts:

- Group membership queries
- IGMPv3 group membership reports

IGMP manages the membership of hosts and routers in multicast groups. IP hosts use IGMP to report their multicast group memberships to any immediately neighboring multicast routers. Multicast routers use IGMP to learn, for each of their attached physical networks, which groups have members.

A router receives explicit join and prune messages from those neighboring routers that have downstream group members. When PIM is the multicast protocol in use, IGMP begins the process as follows:

1. To join a multicast group, G, a host conveys its membership information through IGMP.
2. The router then forwards data packets addressed to a multicast group G to only those interfaces on which explicit join messages have been received.
3. A designated router (DR) sends periodic join and prune messages toward a group-specific rendezvous point (RP) for each group for which it has active members. One or more routers are automatically or statically designated as the RP, and all routers must explicitly join through the RP.
4. Each router along the path toward the RP builds a wild card (any-source) state for the group and sends join and prune messages toward the RP.

The term *route entry* is used to refer to the state maintained in a router to represent the distribution tree.

A route entry can include such fields as:

- source address
- group address
- incoming interface from which packets are accepted
- list of outgoing interfaces to which packets are sent
- timers
- flag bits

The wild card route entry's incoming interface points toward the RP.

The outgoing interfaces point to the neighboring downstream routers that have sent join and prune messages toward the RP as well as the directly connected hosts that have requested membership to group G.

5. This state creates a shared, RP-centered, distribution tree that reaches all group members.

IGMP is also used as the transport for several related multicast protocols (for example, Distance Vector Multicast Routing Protocol [DVMRP] and Protocol Independent Multicast version 1 [PIMv1]).

IGMP is an integral part of IP and must be enabled on all routers and hosts that need to receive IP multicast traffic.

For each attached network, a multicast router can be either a querier or a nonquerier. The querier router periodically sends general query messages to solicit group membership information. Hosts on the network that are members of a multicast group send report messages. When a host leaves a group, it sends a leave group message.

IGMP version 3 (IGMPv3) supports inclusion and exclusion lists. Inclusion lists enable you to specify which sources can send to a multicast group. This type of multicast group is called a source-specific multicast (SSM) group, and its multicast address is 232/8.

IGMPv3 provides support for source filtering. For example, a router can specify particular routers from which it accepts or rejects traffic. With IGMPv3, a multicast router can learn which sources are of interest to neighboring routers.

Exclusion mode works the opposite of an inclusion list. It allows any source but the ones listed to send to the SSM group.

IGMPv3 interoperates with versions 1 and 2 of the protocol. However, to remain compatible with older IGMP hosts and routers, IGMPv3 routers must also implement versions 1 and 2 of the protocol. IGMPv3 supports the following membership-report record types: mode is allowed, allow new sources, and block old sources.

## Introduction to IGMP Snooping

---

- [IGMP Snooping Overview on page 4761](#)

### IGMP Snooping Overview

With IGMP snooping enabled, a switch monitors the IGMP (Internet Group Management Protocol) traffic between hosts and multicast routers and uses what it learns to forward multicast traffic to only the downstream interfaces that are connected to interested receivers. This conserves bandwidth by allowing the switch to send multicast traffic to only those interfaces that are connected to devices that want to receive the traffic (instead of flooding the traffic to all the downstream VLAN interfaces).

This IGMP snooping topic includes:

- [How IGMP Snooping Works on page 4761](#)
- [How IGMP Snooping Works with Routed VLAN Interfaces on page 4762](#)
- [How Hosts Join and Leave Multicast Groups on page 4762](#)
- [IGMP Snooping and Forwarding Interfaces on page 4762](#)
- [General Forwarding Rules on page 4763](#)
- [Using a Switch as an IGMP Querier on page 4763](#)

---

### How IGMP Snooping Works

---

A switch usually learns unicast MAC addresses by checking the source address field of the frames it receives and then sends any traffic for that unicast address only to the appropriate interface. However, a multicast MAC address can never be the source address for a packet. As a result, when a switch receives traffic for a multicast destination address, it floods the traffic on the relevant VLAN, which can cause a significant amount of traffic to be sent unnecessarily.

IGMP snooping prevents this flooding. When you enable IGMP snooping, the switch monitors IGMP packets between receivers and multicast routers and uses the content of the packets to build a multicast cache table—a database of multicast groups and the interfaces that are connected to members of the groups. When the switch receives multicast packets, it uses the cache table to selectively forward the traffic to only the interfaces that are connected to members of the appropriate multicast groups.

**NOTE:** IGMP snooping is enabled by default on the default VLAN only. With versions of Junos OS for the QFX Series previous to 13.2, IGMP snooping is enabled by default on all VLANs.

**NOTE:** You cannot configure IGMP snooping on a secondary (private) VLAN.

### How IGMP Snooping Works with Routed VLAN Interfaces

---

A switch can use a routed VLAN interface (RVI) to forward traffic between VLANs that connect to it. IGMP snooping works with Layer 2 interfaces and RVIs to forward multicast traffic in a switched network.

When a switch receives a multicast packet, its Packet Forwarding Engines perform a multicast lookup on the packet to determine how to forward the packet to its local interfaces. From the results of the lookup, each Packet Forwarding Engine extracts a list of Layer 3 interfaces that have ports local to the Packet Forwarding Engine. If the list includes an RVI, the switch provides a bridge multicast group ID for the RVI to the Packet Forwarding Engine.

For VLANs that include multicast receivers, the bridge multicast ID includes a sub-next-hop ID, which identifies the Layer 2 interfaces in the VLAN that are interested in receiving the multicast stream. The Packet Forwarding Engine then forwards multicast traffic to bridge multicast IDs that have multicast receivers for a given multicast group.

### How Hosts Join and Leave Multicast Groups

---

Hosts can join multicast groups in two ways:

- By sending an unsolicited IGMP join message to a multicast router that specifies the IP multicast group that the host is attempting to join.
- By sending an IGMP join message in response to a general query from a multicast router.

A multicast router continues to forward multicast traffic to a VLAN provided that at least one host on that VLAN responds to the periodic general IGMP queries. For a host to remain a member of a multicast group, therefore, it must continue to respond to the periodic general IGMP queries.

To leave a multicast group, either a host cannot respond to the periodic general IGMP queries, which results in a “silent leave” (the only leave option for IGMPv1), or a host can send a group-specific IGMPv2 leave message.

### IGMP Snooping and Forwarding Interfaces

---

To determine how to forward multicast traffic, a switch with IGMP snooping enabled maintains information about the following interfaces in its multicast forwarding table:

- Multicast-router interfaces—These interfaces lead toward multicast routers or IGMP queriers.
- Group-member interfaces—These interfaces lead toward hosts that are members of multicast groups.

The switch learns about these interfaces by monitoring IGMP traffic. If an interface receives IGMP queries or Protocol Independent Multicast (PIM) updates, the switch adds the interface to its multicast forwarding table as a multicast-router interface. If an interface receives membership reports for a multicast group, the switch adds the interface to its multicast forwarding table as a group-member interface.

Table entries for interfaces that the switch learns about are subject to aging. For example, if a learned multicast-router interface does not receive IGMP queries or PIM hellos within a certain interval, the switch removes the entry for that interface from its multicast forwarding table.

**NOTE:** For a switch to learn multicast-router interfaces and group-member interfaces, an IGMP querier must exist in the network. This is often a multicast router, but if there is no multicast router on the local network, you can configure the switch itself to be an IGMP querier.

You can statically configure an interface to be a multicast-router interface or a group-member interface. The switch adds a static interface to its multicast forwarding table without having to learn about the interface, and the entry in the table is not subject to aging. You can have a mix of statically configured and dynamically learned interfaces on a switch.

### General Forwarding Rules

Multicast traffic received on a switch interface in a VLAN on which IGMP snooping is enabled is forwarded according to the following rules.

IGMP traffic is forwarded as follows:

- IGMP general queries received on a multicast-router interface are forwarded to all other interfaces in the VLAN.
- IGMP group-specific queries received on a multicast-router interface are forwarded to only those interfaces in the VLAN that are members of the group.
- IGMP reports received on a host interface are forwarded to multicast-router interfaces in the same VLAN, but not to the other host interfaces in the VLAN.

Multicast traffic that is not IGMP traffic is forwarded as follows:

- A multicast packet with a destination address of 224.0.0.0/24 is flooded to all other interfaces on the VLAN.
- An unregistered multicast packet—that is, a packet for a group that has no current members—is forwarded to all multicast-router interfaces in the VLAN.
- A registered multicast packet is forwarded only to those host interfaces in the VLAN that are members of the multicast group and to all multicast-router interfaces in the VLAN.

### Using a Switch as an IGMP Querier

If IGMP snooping is enabled on a pure Layer 2 local network (that is, Layer 3 is not enabled on the network), and there is not multicast router in the network, multicast traffic might not be properly forwarded through the network. This problem occurs if the local network is configured such that multicast traffic must be forwarded between switches in order to reach a multicast receiver. In this case, an upstream switch does not forward multicast traffic to a downstream switch (and therefore to the multicast receivers

attached to the downstream switch) because the downstream switch does not forward IGMP reports to the upstream switch. You can solve this problem by configuring one of the switches to be an IGMP querier. This switch sends periodic general query packets to all the switches in the network, which ensures that the snooping membership tables are updated and prevents any multicast traffic loss.

If you configure multiple switches to be IGMP queriers, the switch with the highest (greatest) IGMP querier source address takes precedence and acts as the querier. Switches with lower IGMP querier source addresses stop sending IGMP queries unless they do not receive IGMP queries for 255 seconds. If a switch with a lower IGMP querier source address does not receive any IGMP queries during that period, it starts sending queries again.

To configure a standalone switch to act as an IGMP querier, enter the following:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name l2-querier source-address source address
```

To configure a QFabric Node device switch to act as an IGMP querier, enter the following:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name igmp-querier source-address source address
```

## Introduction to MLD

---

- [Understanding MLD on page 4764](#)

### Understanding MLD

The Multicast Listener Discovery (MLD) Protocol manages the membership of hosts and routers in multicast groups. IP version 6 (IPv6) multicast routers use MLD to learn, for each of their attached physical networks, which groups have interested listeners. Each routing device maintains a list of host multicast addresses that have listeners for each subnetwork, as well as a timer for each address. However, the routing device does not need to know the address of each listener—just the address of each host. The routing device provides addresses to the multicast routing protocol it uses, which ensures that multicast packets are delivered to all subnetworks where there are interested listeners.

In this way, MLD is used as the transport for the Protocol Independent Multicast (PIM) Protocol.

MLD is an integral part of IPv6 and must be enabled on all IPv6 routing devices and hosts that need to receive IP multicast traffic. The Junos OS supports MLD versions 1 and 2. Version 2 is supported for source-specific multicast (SSM) include and exclude modes.

In include mode, the receiver specifies the source or sources it is interested in receiving the multicast group traffic from. Exclude mode works the opposite of include mode. It allows the receiver to specify the source or sources it is not interested in receiving the multicast group traffic from.

For each attached network, a multicast routing device can be either a querier or a nonquerier. A querier routing device, usually one per subnet, solicits group membership information by transmitting MLD queries. When a host reports to the querier routing device that it has interested listeners, the querier routing device forwards the membership information to the rendezvous point (RP) routing device by means of the receiver's (host's) designated router (DR). This builds the rendezvous-point tree (RPT) connecting the host with interested listeners to the RP routing device. The RPT is the initial path used by the sender to transmit information to the interested listeners. Nonquerier routing devices do not transmit MLD queries on a subnet but can do so if the querier routing device fails.

All MLD-configured routing devices start as querier routing devices on each attached subnet (see [Figure 156 on page 4765](#)). The querier routing device on the right is the receiver's DR.

**Figure 156: Routing Devices Start Up on a Subnet**

To elect the querier routing device, the routing devices exchange query messages containing their IPv6 source addresses. If a routing device hears a query message whose IPv6 source address is numerically lower than its own selected address, it becomes a nonquerier. In [Figure 157 on page 4766](#), the routing device on the left has a source address numerically lower than the one on the right and therefore becomes the querier routing device.

**NOTE:** In the practical application of MLD, several routing devices on a subnet are nonqueriers. If the elected querier routing device fails, query messages are exchanged among the remaining routing devices. The routing device with the lowest IPv6 source address becomes the new querier routing device. The IPv6 Neighbor Discovery Protocol (NDP) implementation drops incoming Neighbor Announcement (NA) messages that have a broadcast or multicast address in the target link-layer address option. This behavior is recommended by RFC 2461.

Figure 157: Querier Routing Device Is Determined

The querier routing device sends general MLD queries on the **link-scope all-nodes** multicast address `FF02::1` at short intervals to all attached subnets to solicit group membership information (see Figure 158 on page 4766). Within the query message is the *maximum response delay* value, specifying the maximum allowed delay for the host to respond with a report message.

Figure 158: General Query Message Is Issued

If interested listeners are attached to the host receiving the query, the host sends a report containing the host's IPv6 address to the routing device (see Figure 159 on page 4766). If the reported address is not yet in the routing device's list of multicast addresses with interested listeners, the address is added to the list and a timer is set for the address. If the address is already on the list, the timer is reset. The host's address is transmitted to the RP in the PIM domain.

Figure 159: Reports Are Received by the Querier Routing Device

If the host has no interested multicast listeners, it sends a done message to the querier routing device. On receipt, the querier routing device issues a multicast address-specific query containing the last **listener query interval** value to the multicast address of the host. If the routing device does not receive a report from the multicast address, it removes the multicast address from the list and notifies the RP in the PIM domain of its removal (see [Figure 160 on page 4767](#)).

**Figure 160: Host Has No Interested Receivers and Sends a Done Message to Routing Device**

If a done message is not received by the querier routing device, the querier routing device continues to send multicast address-specific queries. If the timer set for the address on receipt of the last report expires, the querier routing device assumes there are no longer interested listeners on that subnet, removes the multicast address from the list, and notifies the RP in the PIM domain of its removal (see [Figure 161 on page 4767](#)).

**Figure 161: Host Address Timer Expires and Address Is Removed from Multicast Address List**

## Introduction to MSDP

- [Understanding MSDP on page 4767](#)
- [Filtering MSDP SA Messages on page 4769](#)

## Understanding MSDP

The Multicast Source Discovery Protocol (MSDP) is used to connect multicast routing domains. It typically runs on the same router as the Protocol Independent Multicast (PIM) sparse-mode rendezvous point (RP). Each MSDP router establishes adjacencies with internal and external MSDP peers similar to the way BGP establishes peers. These peer routers inform each other about active sources within the domain. When they detect

active sources, the routers can send PIM sparse-mode explicit join messages to the active source.

The peer with the higher IP address passively listens to a well-known port number and waits for the side with the lower IP address to establish a Transmission Control Protocol (TCP) connection. When a PIM sparse-mode RP that is running MSDP becomes aware of a new local source, it sends source-active type, length, and values (TLVs) to its MSDP peers. When a source-active TLV is received, a peer-reverse-path-forwarding (peer-RPF) check (not the same as a multicast RPF check) is done to make sure that this peer is in the path that leads back to the originating RP. If not, the source-active TLV is dropped. This TLV is counted as a “rejected” source-active message.

The MSDP peer-RPF check is different from the normal RPF checks done by non-MSDP multicast routers. The goal of the peer-RPF check is to stop source-active messages from looping. Router R accepts source-active messages originated by Router S only from neighbor Router N or an MSDP mesh group member. For more information about configuring MSDP mesh groups, see [“Example: Configuring MSDP with Active Source Limits and Mesh Groups” on page 4880](#).

Router R locates its MSDP peer-RPF neighbor (Router N) deterministically. A series of rules is applied in a particular order to received source-active messages, and the first rule that applies determines the peer-RPF neighbor. All source-active messages from other routers are rejected.

The six rules applied to source-active messages originating at Router S received at Router R from Router X are as follows:

1. If Router X originated the source-active message (Router X is Router S), then Router X is also the peer-RPF neighbor, and its source-active messages are accepted.
2. If Router X is a member of the Router R mesh group, or is the configured peer, then Router X is the peer-RPF neighbor, and its source-active messages are accepted.
3. If Router X is the BGP next hop of the active multicast RPF route toward Router S (Router X installed the route on Router R), then Router X is the peer-RPF neighbor, and its source-active messages are accepted.
4. If Router X is an external BGP (EBGP) or internal BGP (IBGP) peer of Router R, and the last autonomous system (AS) number in the BGP AS-path to Router S is the same as Router X's AS number, then Router X is the peer-RPF neighbor, and its source-active messages are accepted.
5. If Router X uses the same next hop as the next hop to Router S, then Router X is the peer-RPF neighbor, and its source-active messages are accepted.
6. If Router X fits none of these criteria, then Router X is not an MSDP peer-RPF neighbor, and its source-active messages are rejected.

The MSDP peers that receive source-active TLVs can be constrained by BGP reachability information. If the AS path of the network layer reachability information (NLRI) contains the receiving peer's AS number prepended second to last, the sending peer is using the receiving peer as a next hop for this source. If the split horizon information is not being received, the peer can be pruned from the source-active TLV distribution list.

- Related Documentation**
- [Configuring MSDP on page 4876](#)

## Filtering MSDP SA Messages

Along with applying MSDP source active (SA) filters on all external MSDP sessions (in and out) to prevent SAs for groups and sources from leaking in and out of the network, you need to apply bootstrap router (BSR) filters. Applying a BSR filter to the boundary of a network prevents foreign BSR messages (which announce RP addresses) from leaking into your network. Since the routers in a PIM sparse-mode domain need to know the address of only one RP router, having more than one in the network can create issues.

If you did not use multicast scoping to create boundary filters for all customer-facing interfaces, you might want to use PIM join filters. Multicast scopes prevent the actual multicast data packets from flowing in or out of an interface. PIM join filters prevent PIM sparse-mode state from being created in the first place. Since PIM join filters apply only to the PIM sparse-mode state, it might be more beneficial to use multicast scoping to filter the actual data.

**NOTE:** When you apply firewall filters, firewall action modifiers, such as **log**, **sample**, and **count**, work only when you apply the filter on an inbound interface. The modifiers do not work on an outbound interface.

## Introduction to Source-Specific Multicast

- [Source-Specific Multicast Groups Overview on page 4769](#)
- [Understanding PIM Source-Specific Mode on page 4770](#)
- [PIM SSM on page 4771](#)

## Source-Specific Multicast Groups Overview

Source-specific multicast (SSM) is a service model that identifies session traffic by both source and group address. SSM implemented in Junos OS has the efficient explicit join procedures of Protocol Independent Multicast (PIM) sparse mode but eliminates the immediate shared tree and rendezvous point (RP) procedures using (\*,G) pairs. The (\*) is a wildcard referring to any source sending to group G, and "G" refers to the IP multicast group. SSM builds shortest-path trees (SPTs) directly represented by (S,G) pairs. The "S" refers to the source's unicast IP address, and the "G" refers to the specific multicast group address. The SSM (S,G) pairs are called channels to differentiate them from any-source multicast (ASM) groups. Although ASM supports both one-to-many and many-to-many communications, ASM's complexity is in its method of source discovery. For example, if you click a link in a browser, the receiver is notified about the group

information, but not the source information. With SSM, the client receives both source and group information.

SSM is ideal for one-to-many multicast services such as network entertainment channels. However, many-to-many multicast services might require ASM.

To deploy SSM successfully, you need an end-to-end multicast-enabled network and applications that use an Internet Group Management Protocol version 3 (IGMPv3) or Multicast Listener Discovery version 2 (MLDv2) stack, or you need to configure SSM mapping from IGMPv1 or IGMPv2 to IGMPv3. An IGMPv3 stack provides the capability of a host operating system to use the IGMPv3 protocol. IGMPv3 is available for Windows XP, Windows Vista, and most UNIX operating systems.

SSM mapping allows operators to support an SSM network without requiring all hosts to support IGMPv3. This support exists in static (S,G) configurations, but SSM mapping also supports dynamic per-source group state information, which changes as hosts join and leave the group using IGMP.

SSM is typically supported with a subset of IGMPv3 and PIM sparse mode known as *PIM SSM*. Using SSM, a client can receive multicast traffic directly from the source. PIM SSM uses the PIM sparse-mode functionality to create an SPT between the client and the source, but builds the SPT without the help of an RP.

An SSM-configured network has distinct advantages over a traditionally configured PIM sparse-mode network. There is no need for shared trees or RP mapping (no RP is required), or for RP-to-RP source discovery through the Multicast Source Discovery Protocol (MSDP).

## Understanding PIM Source-Specific Mode

RFC 1112, the original multicast RFC, supported both many-to-many and one-to-many models. These came to be known collectively as any-source multicast (ASM) because ASM allowed one or many sources for a multicast group's traffic. However, an ASM network must be able to determine the locations of all sources for a particular multicast group whenever there are interested listeners, no matter where the sources might be located in the network. In ASM, the key function of *source discovery* is a required function of the network itself.

Multicast source discovery appears to be an easy process, but in sparse mode it is not. In dense mode, it is simple enough to flood traffic to every router in the whole network so that every router learns the source address of the content for that multicast group. However, the flooding presents scalability and network resource use issues and is not a viable option in sparse mode.

PIM sparse mode (like any sparse mode protocol) achieves the required source discovery functionality without flooding at the cost of a considerable amount of complexity. The RP routers must be added and must know all multicast sources, and complicated shared distribution trees must be built to the RPs.

In an environment where many sources come and go, such as for a videoconferencing service, ASM is appropriate. However, by ignoring the many-to-many model and focusing attention on the one-to-many source-specific multicast (SSM) model, several commercially promising multicast applications, such as television channel distribution

over the Internet, might be brought to the Internet much more quickly and efficiently than if full ASM functionality were required of the network.

PIM SSM is simpler than PIM sparse mode because only the one-to-many model is supported. Initial commercial multicast Internet applications are likely to be available to *subscribers* (that is, receivers that issue join messages) from only a single source (a special case of SSM covers the need for a backup source). PIM SSM therefore forms a subset of PIM sparse mode. PIM SSM builds shortest-path trees (SPTs) rooted at the source immediately because in SSM, the router closest to the interested receiver host is informed of the unicast IP address of the source for the multicast traffic. That is, PIM SSM bypasses the RP connection stage through shared distribution trees, as in PIM sparse mode, and goes directly to the source-based distribution tree.

PIM SSM introduces new terms for many of the concepts in PIM sparse mode. PIM SSM can technically be used in the entire 224/4 multicast address range, although PIM SSM operation is guaranteed only in the 232/8 range (232.0.0/24 is reserved). The new SSM terms are appropriate for Internet video applications and are summarized in

[Table 386 on page 4771](#).

**Table 386: ASM and SSM Terminology**

Term	Any-Source Multicast	Source-Specific Multicast
Address identifier	G	S,G
Address designation	group	channel
Receiver operations	join, leave	subscribe, unsubscribe
Group address range	224/4 excluding 232/8	224/4 (guaranteed only for 232/8)

Although PIM SSM describes receiver operations as *subscribe* and *unsubscribe*, the same PIM sparse mode join and leave messages are used by both forms of the protocol. The terminology change distinguishes ASM from SSM even though the receiver messages are identical.

## PIM SSM

PIM source-specific multicast (SSM) uses a subset of PIM sparse mode and IGMP version 3 (IGMPv3) to allow a client to receive multicast traffic directly from the source. PIM SSM uses the PIM sparse-mode functionality to create an SPT between the receiver and the source, but builds the SPT without the help of an RP.

By default, the SSM group multicast address is limited to the IP address range from 232.0.0.0 through 232.255.255.255. However, you can extend SSM operations into another Class D range by including the **ssm-groups** statement at the **[edit routing-options multicast]** hierarchy level. The default SSM address range from 232.0.0.0 through 232.255.255.255 cannot be used in the **ssm-groups** statement. This statement is for adding other multicast addresses to the default SSM group addresses. This statement does not override the default SSM group address range.

You can also configure the Junos OS to accept any-source multicast (ASM) join messages (\*G) for group addresses that are within the default or configured range of source-specific multicast (SSM) groups. This allows you to support a mix of any-source and source-specific multicast groups simultaneously.

An SSM-configured network has distinct advantages over a traditionally configured PIM sparse-mode network. There is no need for shared trees or RP mapping (no RP is required), or for RP-to-RP source discovery through MSDP.

Deploying SSM is easy. You need to configure PIM sparse mode on all router interfaces and issue the necessary SSM commands, including specifying IGMPv3 on the receiver's LAN. If PIM sparse mode is not explicitly configured on both the source and group member interfaces, multicast packets are not forwarded. Source lists, supported in IGMPv3, are used in PIM SSM. As sources become active and start sending multicast packets, interested receivers in the SSM group receive the multicast packets.

In a PIM SSM-configured network, a host subscribes to an SSM channel (by means of IGMPv3), announcing a desire to join group G and source S (see [Figure 162 on page 4772](#)). The directly connected PIM sparse-mode router, the receiver's DR, sends an (S,G) join message to its RPF neighbor for the source. Notice in [Figure 162 on page 4772](#) that the RP is not contacted in this process by the receiver, as would be the case in normal PIM sparse-mode operations.

**Figure 162: Receiver Announces Desire to Join Group G and Source S**

The (S,G) join message initiates the source tree and then builds it out hop by hop until it reaches the source. In [Figure 163 on page 4772](#), the source tree is built across the network to Router 3, the last-hop router connected to the source.

**Figure 163: Router 3 (Last-Hop Router) Joins the Source Tree**

Using the source tree, multicast traffic is delivered to the subscribing host (see [Figure 164 on page 4773](#)).

Figure 164: (S,G) State Is Built Between the Source and the Receiver

To configure additional SSM groups, include the **ssm-groups** statement at the **[edit routing-options multicast]** hierarchy level.

## Introduction to Multicast VLAN Registration

- [Understanding Multicast VLAN Registration on page 4773](#)

### Understanding Multicast VLAN Registration

Multicast VLAN registration (MVR) enables you to efficiently distribute IPTV multicast streams across an Ethernet ring-based Layer 2 network and reduce the amount of bandwidth consumed by this multicast traffic.

In a standard Layer 2 network, a multicast stream received on one VLAN is never distributed to interfaces outside that VLAN. If hosts in multiple VLANs request the same multicast stream, a separate copy of that multicast stream is distributed to the requesting VLANs.

MVR introduces the concept of a *multicast source VLAN* (MVLAN), which is created by MVR and becomes the only VLAN over which IPTV multicast traffic flows throughout the Layer 2 network. A Juniper Networks EX Series switch or QFX Series switch that is enabled for MVR selectively forwards IPTV multicast traffic from interfaces on the MVLAN (source interfaces) to hosts that are connected to interfaces that are not part of the MVLAN. These interfaces are known as *MVR receiver ports*. The MVR receiver ports can receive traffic from a port on the MVLAN but cannot send traffic onto the MVLAN, and they remain in their own VLANs for bandwidth and security reasons.

This topic includes:

- [How MVR Works on page 4773](#)

#### How MVR Works

In many ways, MVR is similar to IGMP snooping. Both MVR and IGMP snooping monitor IGMP join and leave messages and build forwarding tables based on the media access control (MAC) addresses of the hosts sending those IGMP messages. Whereas IGMP snooping operates within a given VLAN to regulate multicast traffic, MVR can operate

with hosts on different VLANs in a Layer 2 network to selectively deliver IPTV multicast traffic to requesting hosts, thereby reducing the amount of bandwidth needed to forward multicast traffic.

When you configure an MVLAN, you assign a range of multicast group addresses to it. You then configure other VLANs to be MVR receiver VLANs, which receive multicast streams from the MVLAN. The MVR receiver ports comprise all the interfaces that exist on any of the MVR receiver VLANs. Interfaces that are on the MVLAN itself cannot be MVR receiver ports for that MVLAN.

**NOTE:** MVR is supported on VLANs running IGMP version 2 (IGMPv2) only.

### ***MVR Modes***

MVR operates in two modes: MVR transparent mode and MVR proxy mode. Both modes enable MVR to forward only one copy of a multicast stream to the Layer 2 network.

- [MVR Transparent Mode on page 4774](#)
- [MVR Proxy Mode on page 4774](#)

### ***MVR Transparent Mode***

In MVR transparent mode, the switch receives one copy of each IPTV multicast stream and then replicates the stream only to those hosts that want to receive it, while forwarding all other types of multicast traffic without modification. Transparent mode is the default mode.

The switch handles IGMP packets destined for both the multicast source VLAN and multicast receiver VLANs in the same way that it handles them when MVR is not being used. That is, when a host on a VLAN sends IGMP join and leave messages, the switch floods the messages to all router interfaces in the VLAN. Similarly, when a VLAN receives IGMP queries from its router interfaces, it floods the queries to all interfaces in the VLAN.

If a host on a multicast receiver port joins an MVR group on the multicast receiver VLAN, the appropriate bridging entry is added and the MVLAN forwards that group's IPTV multicast traffic on that port (even though that port is not in the MVLAN). Likewise, if a host on a multicast receiver port leaves an MVR group on the multicast receiver VLAN, the appropriate bridging entry is deleted, and the MVLAN stops forwarding that group's IPTV multicast traffic on that port. In addition, you can configure the switch to statically install the bridging entries on the multicast receiver VLAN.

### ***MVR Proxy Mode***

When you use MVR in proxy mode, the switch acts as a proxy for any MVR group in both the upstream and downstream directions. In the downstream direction, the switch acts as the querier for the groups in the MVR receiver VLANs. In the upstream direction, the switch originates the IGMP reports and leaves and answers IGMP queries from multicast routers. When the MVR receiver VLANs receive IGMP joins and leaves, the switch creates bridging entries on the MVLAN as needed, as it does in MVR transparent mode. In addition, the switch sends out IGMP joins and leaves on the MVLAN based on these bridging entries.

Configuring MVR proxy mode on the MVLAN automatically enables IGMP snooping proxy mode on all MVR receiver VLANs as well as on the MVLAN.

- [Disabling PIM on page 4782](#)

## Changing the PIM Version

All systems on a subnet must run the same version of PIM.

The default PIM version can be version 1 or version 2, depending on the mode you are configuring. PIMv1 is the default for rendezvous point (RP) mode (at the **[edit protocols pim rp static address address]** hierarchy level). However, PIMv2 is the default for interface mode (at the **[edit protocols pim interface interface-name]** hierarchy level). Explicitly configured versions override the defaults.

To configure the PIM version, include the **version** statement:

```
version (1 | 2);
```

## Modifying the PIM Hello Interval

Routing devices send hello messages at a fixed interval on all PIM-enabled interfaces. By using hello messages, routing devices advertise their existence as PIM routing devices on the subnet. With all PIM-enabled routing devices advertised, a single designated router for the subnet is established.

When a routing device is configured for PIM, it sends a hello message at a 30-second default interval. The interval range is from 0 through 255. When the interval counts down to 0, the routing device sends another hello message, and the timer is reset. A routing device that receives no response from a neighbor in 3.5 times the interval value drops the neighbor. In the case of a 30-second interval, the amount of time a routing device waits for a response is 105 seconds.

If a PIM hello message contains the hold-time option, the neighbor timeout is set to the hold-time sent in the message. If a PIM hello message does not contain the hold-time option, the neighbor timeout is set to the default hello hold time.

To modify how often the routing device sends hello messages out of an interface:

1. This example shows the configuration for the routing instance. Configure the interface globally or in the routing instance.

```
[edit routing-instances PIM.master protocols pim interface fe-3/0/2.0]  
user@host# set hello-interval 255
```

2. Verify the configuration by checking the **Hello Option Holdtime** field in the output of the **show pim neighbors detail** command.

```
user@host> show pim neighbors detail  
Instance: PIM.master  
Interface: fe-3/0/2.0  
Address: 192.168.195.37, IPv4, PIM v2, Mode: Sparse  
Hello Option Holdtime: 255 seconds  
Hello Option DR Priority: 1  
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms  
Join Suppression supported  
Rx Join: Group Source Timeout  
225.1.1.1 192.168.195.78 0  
225.1.1.1 0
```

```
Interface: lo0.0
Address: 10.255.245.91, IPv4, PIM v2, Mode: Sparse
Hello Option Holdtime: 255 seconds
Hello Option DR Priority: 1
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported
```

```
Interface: pd-6/0/0.32768
Address: 0.0.0.0, IPv4, PIM v2, Mode: Sparse
Hello Option Holdtime: 255 seconds
Hello Option DR Priority: 0
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported
```

**Related Documentation** • [show pim neighbors on page 5175](#) in the [CLI Explorer](#)

## Preserving Multicast Performance by Disabling Response to the ping Utility

The ping utility uses ICMP Echo messages to verify connectivity to any device with an IP address. However, in the case of multicast applications, a single ping sent to a multicast address can degrade the performance of routers because the stream of packets is replicated multiple times.

You can disable the router's response to ping (ICMP Echo) packets sent to multicast addresses. The system responds normally to unicast ping packets.

To disable the router's response to ping packets sent to multicast addresses:

1. Include the **no-multicast-echo** statement:

```
[edit system]
user@host# set no-multicast-echo
```

2. Verify the configuration by checking the **echo drops with broadcast or multicast destination address** field in the output of the **show system statistics icmp** command.

```
user@host> show system statistics icmp

icmp:
0 drops due to rate limit
0 calls to icmp_error
0 errors not generated because old message was icmp
Output histogram:
echo reply: 21
0 messages with bad code fields
0 messages less than the minimum length
0 messages with bad checksum
0 messages with bad source address
0 messages with bad length
100 echo drops with broadcast or multicast destination address
0 timestamp drops with broadcast or multicast destination address
Input histogram:
echo: 21
21 message responses generated
```

**Related Documentation** • [Configuring Junos OS to Disable the Routing Engine Response to Multicast Ping Packets](#) in the [Junos OS Administration Library for Routing Devices](#)

- *show system statistics icmp* in the [CLI Explorer](#)

## Configuring PIM Trace Options

Tracing operations record detailed messages about the operation of routing protocols, such as the various types of routing protocol packets sent and received, and routing policy actions. You can specify which trace operations are logged by including specific tracing flags. The following table describes the flags that you can include.

Flag	Description
<b>all</b>	Trace all operations.
<b>assert</b>	Trace assert messages, which are used to resolve which of the parallel routers connected to a multiaccess LAN is responsible for forwarding packets to the LAN.
<b>autorp</b>	Trace bootstrap, RP, and auto-RP messages.
<b>bidirectional-df-election</b>	Trace bidirectional PIM designated-forwarder (DF) election events.
<b>bootstrap</b>	Trace bootstrap messages, which are sent periodically by the PIM domain's bootstrap router and are forwarded, hop by hop, to all routers in that domain.
<b>general</b>	Trace general events.
<b>graft</b>	Trace graft and graft acknowledgment messages.
<b>hello</b>	Trace hello packets, which are sent so that neighboring routers can discover one another.
<b>join</b>	Trace join messages, which are sent to join a branch onto the multicast distribution tree.
<b>mdt</b>	Trace messages related to multicast data tunnels.
<b>normal</b>	Trace normal events.
<b>nsr-synchronization</b>	Trace nonstop routing synchronization events
<b>packets</b>	Trace all PIM packets.
<b>policy</b>	Trace poison-route-reverse packets.
<b>prune</b>	Trace prune messages, which are sent to prune a branch off the multicast distribution tree.

Flag	Description
<b>register</b>	Trace register and register-stop messages. Register messages are sent to the RP when a multicast source first starts sending to a group.
<b>route</b>	Trace routing information.
<b>rp</b>	Trace candidate RP advertisements.
<b>state</b>	Trace state transitions.
<b>task</b>	Trace task processing.
<b>timer</b>	Trace timer processing.

In the following example, tracing is enabled for all routing protocol packets. Then tracing is narrowed to focus only on PIM packets of a particular type.

To configure tracing operations for PIM:

1. (Optional) Configure tracing at the [**routing-options** hierarchy level to trace all protocol packets.

```
[edit routing-options traceoptions]
user@host# set file all-packets-trace
user@host# set flag all
```

2. Configure the filename for the PIM trace file.

```
[edit protocols pim traceoptions]
user@host# set file pim-trace
```

3. (Optional) Configure the maximum number of trace files.

```
[edit protocols pim traceoptions]
user@host# set file files 5
```

4. (Optional) Configure the maximum size of each trace file.

```
[edit protocols pim traceoptions]
user@host# set file size 1m
```

5. (Optional) Enable unrestricted file access.

```
[edit protocols pim traceoptions]
user@host# set file world-readable
```

6. Configure tracing flags.

Suppose you are troubleshooting issues with PIM version 1 control packets that are received on an interface configured for PIM version 2. The following example shows how to trace messages associated with this problem.

```
[edit protocols pim traceoptions]
user@host# set flag packets | match "Rx V1 Require V2"
```

7. View the trace file.

```
user@host> file list /var/log
user@host> file show /var/log/pim-trace
```

## Disabling PIM

By default, when configured, the PIM protocol is enabled on all interfaces for all families. If desired, you can disable PIM at the protocol, interface, or family hierarchy levels.

The hierarchy in which you configure PIM is critical. In general, the most specific configuration takes precedence. However, if PIM is disabled at the protocol level, then any disable statements with respect to an interface or family are ignored.

For example, the order of precedence for disabling PIM on a particular interface family is:

1. If PIM is disabled at the **[edit protocols pim interface *interface-name* family]** hierarchy level, then PIM is disabled for that interface family.
2. If PIM is not configured at the **[edit protocols pim interface *interface-name* family]** hierarchy level, but is disabled at the **[edit protocols pim interface *interface-name*]** hierarchy level, then PIM is disabled for all families on the specified interface.
3. If PIM is not configured at either the **[edit protocols pim interface *interface-name* family]** hierarchy level or the **[edit protocols pim interface *interface-name*]** hierarchy level, but is disabled at the **[edit protocols pim]** hierarchy level, then the PIM protocol is disabled globally for all interfaces and all families.

The following sections describe how to disable PIM at the various hierarchy levels.

- [Disabling the PIM Protocol on page 4782](#)
- [Disabling PIM On an Interface on page 4783](#)
- [Disabling PIM for a Family on page 4783](#)
- [Disabling PIM for a Rendezvous Point on page 4784](#)

### Disabling the PIM Protocol

---

You can explicitly disable the PIM protocol. Disabling the PIM protocol disables the protocol for all interfaces and all families. This is accomplished at the **[edit protocols pim]** hierarchy level:

```
[edit protocols]
pim {
  disable;
}
```

To disable the PIM protocol:

1. Include the **disable** statement.

```
user@host# set protocols pim disable
```

2. (Optional) Verify your configuration settings before committing them by using the **show protocols pim** command.

```
user@host# run show protocols pim
```

### Disabling PIM On an Interface

You can disable the PIM protocol on a per-interface basis. This is accomplished at the **[edit protocols pim interface *interface-name*]** hierarchy level:

```
[edit protocols]
pim {
  interface interface-name {
    disable;
  }
}
```

To disable PIM on an interface:

1. Include the **disable** statement.

```
user@host# set protocols pim interface fe-0/1/0 disable
```

2. (Optional) Verify your configuration settings before committing them by using the **show protocols pim** command.

```
user@host# run show protocols pim
```

### Disabling PIM for a Family

You can disable the PIM protocol on a per-family basis. This is accomplished at the **[edit protocols pim family]** hierarchy level:

```
[edit protocols]
pim {
  family inet {
    disable;
  }
  family inet6 {
    disable;
  }
}
```

To disable PIM for a family:

1. Include the **disable** statement.

```
user@host# set protocols pim family inet disable
```

```
user@host# set protocols pim family inet6 disable
```

2. (Optional) Verify your configuration settings before committing them by using the **show protocols pim** command.

```
user@host# run show protocols pim
```

### Disabling PIM for a Rendezvous Point

---

You can disable the PIM protocol for a rendezvous point (RP) on a per-family basis. This is accomplished at the **[edit protocols pim rp local family]** hierarchy level:

```
[edit protocols]
pim {
  rp {
    local {
      family inet {
        disable;
      }
      family inet6 {
        disable;
      }
    }
  }
}
```

To disable PIM for an RP family:

1. Use the **disable** statement.

```
user@host# set protocols pim rp local family inet disable
user@host# set protocols pim rp local family inet6 disable
```

2. (Optional) Verify your configuration settings before committing them by using the **show protocols pim** command.

```
user@host# run show protocols pim
```

## PIM Designated Router

---

- [Configuring Interface Priority for PIM Designated Router Selection on page 4784](#)
- [Configuring PIM Designated Router Election on Point-to-Point Links on page 4785](#)

### Configuring Interface Priority for PIM Designated Router Selection

A designated router (DR) sends periodic join messages and prune messages toward a group-specific rendezvous point (RP) for each group for which it has active members. When a Protocol Independent Multicast (PIM) router learns about a source, it originates a Multicast Source Discovery Protocol (MSDP) source-address message if it is the DR on the upstream interface.

By default, every PIM interface has an equal probability (priority 1) of being selected as the DR. Configuring the interface DR priority helps ensure that changing an IP address does not alter your forwarding model.

To configure the interface designated router priority:

1. This example shows the configuration for the routing instance. Configure the interface globally or in the routing instance.

```
[edit routing-instances PIM.master protocols pim interface ge-0/0/0.0 family inet]
user@host# set priority 5
```

2. Verify the configuration by checking the **Hello Option DR Priority** field in the output of the **show pim neighbors detail** command.

```
user@host> show pim neighbors detail
```

```
Instance: PIM.master
Interface: ge-0/0/0.0
Address: 192.168.195.37, IPv4, PIM v2, Mode: Sparse
Hello Option Holdtime: 65535 seconds

## Configuring PIM Designated Router Election on Point-to-Point Links

To comply with the latest PIM drafts, enable designated router (DR) election on all PIM interfaces, including point-to-point (P2P) interfaces. (DR election is enabled by default on all other interfaces.) One of the two routers might join a multicast group on its P2P link interface. The DR on that link is responsible for initiating the relevant join messages.

To enable DR election on point-to-point interfaces:

1. On both point-to-point link routers, configure the router globally or in the routing instance. This example shows the configuration for the routing instance.

```
[edit routing-instances PIM.master protocols pim]
user@host# set dr-election-on-p2p
```

2. Verify the configuration by checking the **State** field in the output of the **show pim interfaces** command. The possible values for the **State** field are DR, NotDR, and P2P. When a point-to-point link interface is elected to be the DR, the interface state becomes DR instead of P2P.

3. If the **show pim interfaces** command continues to report the P2P state, consider running the **restart routing** command on both routers on the point-to-point link. Then recheck the state.

**CAUTION:** Do not restart a software process unless specifically asked to do so by your Juniper Networks customer support representative. Restarting a software process during normal operation of a routing platform could cause interruption of packet forwarding and loss of data.

[edit]  
user@host# run restart routing

## PIM Sparse Mode

---

- [Enabling PIM Sparse Mode on page 4786](#)
- [Configuring PIM Join Load Balancing on page 4787](#)
- [Modifying the Join State Timeout on page 4790](#)
- [Example: Enabling Join Suppression on page 4791](#)

### Enabling PIM Sparse Mode

In PIM sparse mode (PIM-SM), the assumption is that very few of the possible receivers want packets from a source, so the network establishes and sends packets only on branches that have at least one leaf indicating (by message) a desire for the traffic. WANs are appropriate networks for sparse-mode operation.

By default, PIM is disabled. When you enable PIM, it operates in sparse mode by default. You do not need to configure Internet Group Management Protocol (IGMP) version 2 for a sparse mode configuration. After you enable PIM, by default, IGMP version 2 is also enabled.

All systems on a subnet must run the same version of PIM.

The default PIM version can be version 1 or version 2, depending on the mode you are configuring. PIMv1 is the default for rendezvous point (RP) mode (at the **[edit protocols pim rp static address address]** hierarchy level). However, PIMv2 is the default for interface mode (at the **[edit protocols pim interface interface-name]** hierarchy level). Explicitly configured versions override the defaults. The following example explicitly configures PIMv2 on the interfaces.

You can configure PIM sparse mode globally or for a routing instance. This example shows how to configure PIM sparse mode globally on all interfaces. It also shows how to configure a static RP router and how to configure the non-RP routers.

To configure the router properties for PIM sparse mode:

1. Configure the static RP router.

```
[edit protocols pim]
user@host# set rp local family inet address 192.168.3.253
```

2. Configure the RP router interfaces. When configuring all interfaces, exclude the **fxp0.0** management interface by including the **disable** statement for that interface.

```
[edit protocols pim]
user@host# set interface all mode sparse
user@host# set interface all version 2
user@host# set interface fxp0.0 disable
```

3. Configure the non-RP routers. Include the following configuration on all of the non-RP routers.

```
[edit protocols pim]
user@host# set rp static address 192.168.3.253 version 2
user@host# set interface all mode sparse
user@host# set interface all version 2
user@host# set interface fxp0.0 disable
```

4. Monitor the operation of PIM sparse mode.

## Configuring PIM Join Load Balancing

By default, PIM join messages are sent toward a source based on the RPF routing table check. If there is more than one equal-cost path toward the source, then one upstream interface is chosen to send the join message. This interface is also used for all downstream traffic, so even though there are alternative interfaces available, the multicast load is concentrated on one upstream interface and routing device.

For PIM sparse mode, you can configure PIM join load balancing to spread join messages and traffic across equal-cost upstream paths (interfaces and routing devices) provided by unicast routing toward a source. PIM join load balancing is only supported for PIM sparse mode configurations.

PIM join load balancing is supported on draft-rosen multicast VPNs (also referred to as dual PIM multicast VPNs). PIM join load balancing is not supported on multiprotocol BGP-based multicast VPNs (also referred to as next-generation Layer 3 VPN multicast). When PIM join load balancing is enabled in a draft-rosen Layer 3 VPN scenario, the load balancing is achieved based on the join counts for the far-end PE routing devices, not for any intermediate P routing devices.

If an internal BGP (IBGP) multipath forwarding VPN route is available, the Junos OS uses the multipath forwarding VPN route to send join messages to the remote PE routers to achieve load balancing over the VPN.

By default, when multiple PIM joins are received for different groups, all joins are sent to the same upstream gateway chosen by the unicast routing protocol. Even if there are multiple equal-cost paths available, these alternative paths are not utilized to distribute multicast traffic from the source to the various groups.

When PIM join load balancing is configured, the PIM joins are distributed equally among all equal-cost upstream interfaces and neighbors. Every new join triggers the selection of the least-loaded upstream interface and neighbor. If there are multiple neighbors on the same interface (for example, on a LAN), join load balancing maintains a value for each of the neighbors and distributes multicast joins (and downstream traffic) among these as well.

Join counts for interfaces and neighbors are maintained globally, not on a per-source basis. Therefore, there is no guarantee that joins for a particular source are load-balanced. However, the joins for all sources and all groups known to the routing device are load-balanced. There is also no way to administratively give preference to one neighbor over another: all equal-cost paths are treated the same way.

You can configure message filtering globally or for a routing instance. This example shows the global configuration.

You configure PIM join load balancing on the non-RP routers in the PIM domain.

1. Determine if there are multiple paths available for a source (for example, an RP) with the output of the **show pim join extensive** or **show pim source** commands.

```
user@host> show pim join extensive
Instance: PIM.master Family: INET

Group: 224.1.1.1
Source: *
RP: 10.255.245.6
Flags: sparse,rptree,wildcard
Upstream interface: t1-0/2/3.0
Upstream neighbor: 192.168.38.57
Upstream state: Join to RP
Downstream neighbors:
    Interface: t1-0/2/1.0
```

```

192.168.38.16 State: JOIN Flags; SRW Timeout: 164
Group: 224.2.127.254
Source: *
RP: 10.255.245.6
Flags: sparse,rptree,wildcard
Upstream interface: so-0/3/0.0
Upstream neighbor: 192.168.38.47
Upstream state: Join to RP
Downstream neighbors:
Interface: t1-0/2/3.0
192.168.38.16 State: JOIN Flags; SRW Timeout: 164

```

Note that for this router, the RP at IP address 10.255.245.6 is the source for two multicast groups: 224.1.1.1 and 224.2.127.254. This router has two equal-cost paths through two different upstream interfaces (**t1-0/2/3.0** and **so-0/3/0.0**) with two different neighbors (192.168.38.57 and 192.168.38.47). This router is a good candidate for PIM join load balancing.

2. On the non-RP router, configure PIM join load balancing.

```

[edit protocols pim rp]
user@host# set static address 10.10.10.1
user@host# set interface all mode sparse version 2
user@host# set join-load-balance

```

The static address is the address of the RP.

3. Monitor the operation.

If load balancing is enabled for this router, the number of PIM joins sent on each interface is shown in the output for the **show pim interfaces** command.

```

user@host> show pim interfaces
Instance: PIM.master

```

Name	Stat	Mode	IP V	State	NbrCnt	JoinCnt	DR address
lo0.0	Up	Sparse	4 2	DR	0	0	10.255.168.58
pe-1/2/0.32769	Up	Sparse	4 2	P2P	0	0	
so-0/3/0.0	Up	Sparse	4 2	P2P	1	1	
t1-0/2/1.0	Up	Sparse	4 2	P2P	1	0	
t1-0/2/3.0	Up	Sparse	4 2	P2P	1	1	
lo0.0	Up	Sparse	6 2	DR	0	0	fe80::2a0:a5ff:4b7

Note that the two equal-cost paths shown by the **show pim interfaces** command now have nonzero join counts. If the counts differ by more than one and were zero (0) when load balancing commenced, an error occurs (joins before load balancing are not redistributed). The join count also appears in the **show pim neighbors detail** output:

```

user@host> show pim neighbors detail
Interface: so-0/3/0.0

```

```

Address: 192.168.38.46, IPv4, PIM v2, Mode: Sparse, Join Count: 0
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 1
Hello Option Generation ID: 1689116164
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms

```

```

Address: 192.168.38.47, IPv4, PIM v2, Join Count: 1
BFD: Disabled
Hello Option Holdtime: 105 seconds 102 remaining
Hello Option DR Priority: 1

```

```
Hello Option Generation ID: 792890329
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
```

```
Interface: t1-0/2/3.0
```

```
Address: 192.168.38.56, IPv4, PIM v2, Mode: Sparse, Join Count: 0
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 1
Hello Option Generation ID: 678582286
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
```

```
Address: 192.168.38.57, IPv4, PIM v2, Join Count: 1
BFD: Disabled
Hello Option Holdtime: 105 seconds 97 remaining
Hello Option DR Priority: 1
Hello Option Generation ID: 1854475503
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
```

Note that the join count is nonzero on the two load-balanced interfaces toward the upstream neighbors.

PIM join load balancing only takes effect when the feature is configured. Prior joins are not redistributed to achieve perfect load balancing. In addition, if an interface or neighbor fails, the new joins are redistributed among remaining active interfaces and neighbors. However, when the interface or neighbor is restored, prior joins are not redistributed. The **clear pim join-distribution** command redistributes the existing flows to new or restored upstream neighbors. Redistributing the existing flows causes traffic to be disrupted, so we recommend that you perform PIM join redistribution during a maintenance window.

## Modifying the Join State Timeout

This section describes how to configure the join state timeout.

A downstream router periodically sends join messages to refresh the join state on the upstream router. If the join state is not refreshed before the timeout expires, the join state is removed.

By default, the join state timeout is 210 seconds. You can change this timeout to allow additional time to receive the join messages. Because the messages are called join-prune messages, the name used is the **join-prune-timeout** statement.

To modify the timeout, include the **join-prune-timeout** statement:

```
user@host# set protocols pim join-prune-timeout 230
```

The join timeout value can be from 210 through 240 seconds.

Related Documentation • [join-prune-timeout on page 4933](#)

## Example: Enabling Join Suppression

This example describes how to enable PIM join suppression.

- [Requirements on page 4791](#)
- [Overview on page 4791](#)
- [Configuration on page 4793](#)
- [Verification on page 4795](#)

### Requirements

---

Before you begin:

- Configure the router interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure an interior gateway protocol or static routing. See the *Junos OS Routing Protocols Library for Routing Devices*.
- Configure PIM Sparse Mode on the interfaces. See [“Enabling PIM Sparse Mode” on page 4786](#).

### Overview

---

PIM join suppression enables a router on a multiaccess network to defer sending join messages to an upstream router when it sees identical join messages on the same network. Eventually, only one router sends these join messages, and the other routers suppress identical messages. Limiting the number of join messages improves scalability and efficiency by reducing the number of messages sent to the same router.

This example includes the following statements:

- **override-interval**—Sets the maximum time in milliseconds to delay sending override join messages. When a router sees a prune message for a join it is currently suppressing, it waits before it sends an override join message. Waiting helps avoid multiple downstream routers sending override join messages at the same time. The override interval is a random timer with a value of 0 through the maximum override value.
- **propagation-delay**—Sets a value in milliseconds for a prune pending timer, which specifies how long to wait before executing a prune on an upstream router. During this period, the router waits for any prune override join messages that might be currently suppressed. The period for the prune pending timer is the sum of the **override-interval** value and the value specified for **propagation-delay**.
- **reset-tracking-bit**—Enables PIM join suppression on each multiaccess downstream interface. This statement resets a tracking bit field (T-bit) on the LAN prune delay hello option from the default of 1 (join suppression disabled) to 0 (join suppression enabled).

When multiple identical join messages are received, a random join suppression timer is activated, with a range of 66 through 84 milliseconds. The timer is reset each time join suppression is triggered.

Figure 165 on page 4792 shows the topology used in this example.

**Figure 165: Join Suppression**

The items in the figure represent the following functions:

- Host 0 is the multicast source.
- Host 1, Host 2, Host 3, and Host 4 are receivers.
- Router R0 is the first-hop router and the RP.
- Router R1 is an upstream router.
- Routers R2, R3, R4, and R5 are downstream routers in the multicast LAN.

This example shows the configuration of the downstream devices: Routers R2, R3, R4, and R5.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
[edit]
set protocols pim traceoptions file pim.log
set protocols pim traceoptions file size 5m
set protocols pim traceoptions file world-readable
set protocols pim traceoptions flag join detail
set protocols pim traceoptions flag prune detail
set protocols pim traceoptions flag normal detail
set protocols pim traceoptions flag register detail
set protocols pim rp static address 10.255.112.160
set protocols pim interface all mode sparse
set protocols pim interface all version 2
set protocols pim interface fxp0.0 disable
set protocols pim reset-tracking-bit
set protocols pim propagation-delay 500
set protocols pim override-interval 4000
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure PIM join suppression on a non-RP downstream router in the multicast LAN:

1. Configure PIM sparse mode on the interfaces.

```
[edit]
user@host# edit protocols pim
[edit protocols pim]
user@host# set rp static address 10.255.112.160
[edit protocols pim]
user@host# set interface all mode sparse version 2
[edit protocols pim]
user@host# set interface all version 2
[edit protocols pim]
user@host# set interface fxp0.0 disable
```

2. Enable the join suppression timer.

```
[edit protocols pim]
user@host# set reset-tracking-bit
```

3. Configure the prune override interval value.

```
[edit protocols pim]
user@host# set override-interval 4000
```

4. Configure the propagation delay of the link.

```
[edit protocols pim]
user@host# set propagation-delay 500
```

5. (Optional) Configure PIM tracing operations.

```
[edit protocols pim]
user@host# set traceoptions file pim.log size 5m world-readable
[edit protocols pim]
user@host# set traceoptions flag join detail
[edit protocols pim]
user@host# set traceoptions flag normal detail
[edit protocols pim]
user@host# set traceoptions flag register detail
```

6. If you are done configuring the device, commit the configuration.

```
[edit protocols pim]
user@host# commit
```

### Results

From configuration mode, confirm your configuration by entering the **show protocols** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols
pim {
  traceoptions {
    file pim.log size 5m world-readable;
    flag join detail;
    flag prune detail;
    flag normal detail;
    flag register detail;
  }
  rp {
    static {
      address 10.255.112.160;
    }
  }
  interface all {
    mode sparse;
    version 2;
  }
  interface fxp0.0 {
    disable;
  }
  reset-tracking-bit;
  propagation-delay 500;
  override-interval 4000;
}
```

## Verification

To verify the configuration, run the following commands on the upstream and downstream routers:

- `show pim join extensive`
- `show multicast route extensive`

## Static RP

- [Configuring Local PIM RPs on page 4795](#)
- [Configuring the Static PIM RP Address on the Non-RP Routing Device on page 4797](#)

## Configuring Local PIM RPs

Local RP configuration makes the routing device a statically defined RP. Consider statically defining an RP if the network does not have many different RPs defined or if the RP assignment does not change very often. The Junos IPv6 PIM implementation supports only static RP configuration. Automatic RP announcement and bootstrap routers are not available with IPv6.

You can configure a local RP globally or for a routing instance. This example shows how to configure a local RP in a routing instance for IPv4 or IPv6.

To configure the routing device's RP properties:

1. Configure the routing instance as the local RP.

```
[routing-instances VPN-A protocols pim]
user@host# set rp local
```

2. Configure the IP protocol family and IP address.

IPv6 PIM hello messages are sent to every interface on which you configure **family inet6**, whether at the PIM level of the hierarchy or not. As a result, if you configure an interface with both **family inet** at the **[edit interface *interface-name*]** hierarchy level and **family inet6** at the **[edit protocols pim interface *interface-name*]** hierarchy level, PIM sends both IPv4 and IPv6 hellos to that interface.

By default, PIM operates in sparse mode on an interface. If you explicitly configure sparse mode, PIM uses this setting for all IPv6 multicast groups. However, if you configure sparse-dense mode, PIM does not accept IPv6 multicast groups as dense groups and operates in sparse mode over them.

```
[edit routing-instances VPN-A protocols pim rp local]
user@host# set family inet6 address 2001:db8:85a3::8a2e:370:7334
user@host# set family inet address 10.1.2.254
```

3. (IPv4 only) Configure the routing device's RP priority.

**NOTE:** The priority statement is not supported for IPv6, but is included here for informational purposes. The routing device's priority value for becoming the RP is included in the bootstrap messages that the routing device sends. Use a smaller number to increase the likelihood that the routing device becomes the RP for local multicast groups. Each PIM routing device uses the priority value and other factors to determine the candidate RPs for a particular group range. After the set of candidate RPs is distributed, each routing device determines algorithmically the RP from the candidate RP set using a hash function. By default, the priority value is set to 1. If this value is set to 0, the bootstrap router can override the group range being advertised by the candidate RP.

```
[edit routing-instances VPN-A protocols pim rp local]
user@host# set priority 5
```

4. Configure the groups for which the routing device is the RP.

By default, a routing device running PIM is eligible to be the RP for all IPv4 or IPv6 groups (224.0.0.0/4 or FF70::/12 to FFF0::/12). The following example limits the groups for which this routing device can be the RP.

```
[edit routing-instances VPN-A protocols pim rp local]
user@host# set group-ranges fec0::/10
user@host# set group-ranges 10.1.2.0/24
```

5. (IPv4 only) Modify the local RP hold time.

If the local routing device is configured as an RP, it is considered a candidate RP for its local multicast groups. For candidate RPs, the hold time is used by the bootstrap router to time out RPs, and applies to the bootstrap RP-set mechanism. The RP hold time is part of the candidate RP advertisement message sent by the local routing device to the bootstrap router. If the bootstrap router does not receive a candidate RP advertisement from an RP within the hold time, it removes that routing device from its list of candidate RPs. The default hold time is 150 seconds.

```
[edit routing-instances VPN-A protocols pim rp local]
user@host# set hold-time 200
```

6. (Optional) Override dynamic RP for the specified group address range.

If you configure both static RP mapping and dynamic RP mapping (such as auto-RP) in a single routing instance, allow the static mapping to take precedence for the given static RP group range, and allow dynamic RP mapping for all other groups.

If you exclude this statement from the configuration and you use both static and dynamic RP mechanisms for different group ranges within the same routing instance, the dynamic RP mapping takes precedence over the static RP mapping, even if static RP is defined for a specific group range.

```
[edit routing-instances VPN-A protocols pim rp local]
user@host# set override
```

7. Monitor the operation of PIM by running the **show pim** commands. Run **show pim ?** to display the supported commands.

**Related  
Documentation**

- [Understanding MLD on page 4764](#)

## Configuring the Static PIM RP Address on the Non-RP Routing Device

Consider statically defining an RP if the network does not have many different RPs defined or if the RP assignment does not change very often. The Junos IPv6 PIM implementation supports only static RP configuration. Automatic RP announcement and bootstrap routers are not available with IPv6.

You configure a static RP address on the non-RP routing device. This enables the non-RP routing device to recognize the local statically defined RP. For example, if R0 is a non-RP router and R1 is the local RP router, you configure R0 with the static RP address of R1. The static IP address is the routable address assigned to the loopback interface on R1. In the following example, the loopback address of the RP is 2001:db8:85a3::8a2e:370:7334.

You can configure a static RP address globally or for a routing instance. This example shows how to configure a static RP address in a routing instance for IPv6.

To configure the static RP address:

1. On a non-RP routing device, configure the routing instance to point to the routable address assigned to the loopback interface of the RP.

```
[routing-instances VPN-A protocols pim rp]
user@host# set static address 2001:db8:85a3::8a2e:370:7334
```

**NOTE:** Logical systems are also supported. You can configure a static RP address in a logical system only if the logical system is not directly connected to a source.

2. (Optional) Set the PIM sparse mode version.

For each static RP address, you can optionally specify the PIM version. The default PIM version is version 1.

```
[edit routing-instances VPN-A protocols pim rp]
user@host# set static address 2001:db8:85a3::8a2e:370:7334 version 2
```

**NOTE:** The default PIM version can be version 1 or version 2, depending on the mode you are configuring. PIM version 1 is the default for RP mode ([edit pim rp static address *address*]). PIM version 2 is the default for interface mode ([edit pim interface *interface-name*]). Explicitly configured versions override the defaults.

---

3. (Optional) Set the group address range.

By default, a routing device running PIM is eligible to be the RP for all IPv4 or IPv6 groups (224.0.0.0/4 or FF70::/12 to FFF0::/12). The following example limits the groups for which the 2001:db8:85a3::8a2e:370:7334 address can be the RP.

```
[edit routing-instances VPN-A protocols pim rp]
user@host# set static address 2001:db8:85a3::8a2e:370:7334 group-ranges fec0::/10
```

The RP that you select for a particular group must be consistent across all routers in a multicast domain.

4. (Optional) Override dynamic RP for the specified group address range.

If you configure both static RP mapping and dynamic RP mapping (such as auto-RP) in a single routing instance, allow the static mapping to take precedence for the given static RP group range, and allow dynamic RP mapping for all other groups.

If you exclude this statement from the configuration and you use both static and dynamic RP mechanisms for different group ranges within the same routing instance, the dynamic RP mapping takes precedence over the static RP mapping, even if static RP is defined for a specific group range.

```
[edit routing-instances VPN-A protocols pim rp static address
  2001:db8:85a3::8a2e:370:7334]
user@host# set override
```

5. Monitor the operation of PIM by running the **show pim** commands. Run **show pim ?** to display the supported commands.

## Anycast RP

- [Example: Configuring PIM Anycast With or Without MSDP on page 4799](#)
- [Configuring a PIM Anycast RP Router with MSDP on page 4802](#)
- [Configuring a PIM Anycast RP Router Using Only PIM on page 4803](#)
- [Configuring All PIM Anycast Non-RP Routers on page 4804](#)
- [Example: Configuring Multiple RPs in a Domain with Anycast RP on page 4805](#)

## Example: Configuring PIM Anycast With or Without MSDP

When you configure anycast RP, you bypass the restriction of having one active rendezvous point (RP) per multicast group, and instead deploy multiple RPs for the same group range. The RP routers share one unicast IP address. Sources from one RP are known to other RPs that use the Multicast Source Discovery Protocol (MSDP). Sources and receivers use the closest RP, as determined by the interior gateway protocol (IGP).

You can use anycast RP within a domain to provide redundancy and RP load sharing. When an RP stops operating, sources and receivers are taken to a new RP by means of unicast routing.

You can configure anycast RP to use PIM and MSDP for IPv4, or PIM alone for both IPv4 and IPv6 scenarios. Both are discussed in this section.

We recommend a static RP mapping with anycast RP over a bootstrap router and auto-RP configuration because it provides all the benefits of a bootstrap router and auto-RP without the complexity of the BSR and auto-RP mechanisms.

All systems on a subnet must run the same version of PIM.

The default PIM version can be version 1 or version 2, depending on the mode you are configuring. PIMv1 is the default RP mode (at the **[edit protocols pim rp static address address]** hierarchy level). However, PIMv2 is the default for interface mode (at the **[edit protocols pim interface interface-name]** hierarchy level). Explicitly configured versions override the defaults. This example explicitly configures PIMv2 on the interfaces.

The following example shows an anycast RP configuration for the RP routers, first with MSDP and then using PIM alone, and for non-RP routers.

1. For a network using an RP with MSDP, configure the RP using the **lo0** loopback interface, which is always up. Include the **address** statement and specify the unique and routable router ID and the RP address at the **[edit interfaces lo0 unit 0 family inet]** hierarchy level. In this example, the router ID is **198.58.3.254** and the shared RP address is **198.58.3.253**. Include the **primary** statement for the first address. Including the **primary** statement selects the router's primary address from all the preferred addresses on all interfaces.

```
interfaces {
  lo0 {
    description "PIM RP";
    unit 0 {
      family inet {
        address 198.58.3.254/32;
        primary;
        address 198.58.3.253/32;
      }
    }
  }
}
```

2. Specify the RP address. Include the **address** statement at the **[edit protocols pim rp local]** hierarchy level (the same address as the secondary **lo0** interface).

For all interfaces, include the **mode** statement to set the mode to **sparse** and the **version** statement to specify PIM version 2 at the **[edit protocols pim rp local interface all]** hierarchy level. When configuring all interfaces, exclude the **fxp0.0** management interface by including the **disable** statement for that interface.

```
protocols {
  pim {
    rp {
      local {
        family inet;
        address 198.58.3.253;
      }
      interface all {
        mode sparse;
        version 2;
      }
      interface fxp0.0 {
        disable;
      }
    }
  }
}
```

3. Configure MSDP peering. Include the **peer** statement to configure the address of the MSDP peer at the **[edit protocols msdp]** hierarchy level. For MSDP peering, use the unique, primary addresses instead of the anycast address. To specify the local address for MSDP peering, include the **local-address** statement at the **[edit protocols msdp peer]** hierarchy level.

```
protocols {
  msdp {
    peer 198.58.3.250 {
      local-address 198.58.3.254;
    }
  }
}
```

**NOTE:** If you need to configure a PIM RP for both IPv4 and IPv6 scenarios, perform Step 4 and Step 5. Otherwise, go to Step 6.

---

4. Configure an RP using the **lo0** loopback interface, which is always up. Include the **address** statement to specify the unique and routable router address and the RP address at the **[edit interfaces lo0 unit 0 family inet]** hierarchy level. In this example, the router ID is **198.58.3.254** and the shared RP address is **198.58.3.253**. Include the **primary** statement on the first address. Including the **primary** statement selects the router's primary address from all the preferred addresses on all interfaces.

```
interfaces {
  lo0 {
    description "PIM RP";
    unit 0 {
      family inet {
        address 198.58.3.254/32 {
```

```

        primary;
    }
    address 198.58.3.253/32;
}
}
}
}

```

5. Include the **address** statement at the **[edit protocols pim rp local]** hierarchy level to specify the RP address (the same address as the secondary **lo0** interface).

For all interfaces, include the **mode** statement to set the mode to **sparse**, and the **version** statement to specify PIM version 2 at the **[edit protocols pim rp local interface all]** hierarchy level. When configuring all interfaces, exclude the **fxp0.0** management interface by including the **disable** statement for that interface.

Include the **anycast-pim** statement to configure anycast RP without MSDP (for example, if IPv6 is used for multicasting). The other RP routers that share the same IP address are configured using the **rp-set** statement. There is one entry for each RP, and the maximum that can be configured is 15. For each RP, specify the routable IP address of the router and whether MSDP source active (SA) messages are forwarded to the RP.

MSDP configuration is not necessary for this type of IPv4 anycast RP configuration.

```

protocols {
  pim {
    rp {
      local {
        family inet {
          address 198.58.3.253;
          anycast-pim {
            rp-set {
              address 198.58.3.240;
              address 198.58.3.241 forward-msdp-sa;
            }
            local-address 198.58.3.254; #If not configured, use lo0 primary
          }
        }
      }
    }
  }
  interface all {
    mode sparse;
    version 2;
  }
  interface fxp0.0 {
    disable;
  }
}
}

```

6. Configure the non-RP routers. The anycast RP configuration for a non-RP router is the same whether MSDP is used or not. Specify a static RP by adding the address at the **[edit protocols pim rp static]** hierarchy level. Include the **version** statement at the **[edit protocols pim rp static address]** hierarchy level to specify PIM version 2.

```
protocols {
  pim {
    rp {
      static {
        address 198.58.3.253 {
          version 2;
        }
      }
    }
  }
}
```

7. Include the **mode** statement at the **[edit protocols pim interface all]** hierarchy level to specify sparse mode on all interfaces. Then include the **version** statement at the **[edit protocols pim rp interface all mode]** to configure all interfaces for PIM version 2. When configuring all interfaces, exclude the **fxp0.0** management interface by including the **disable** statement for that interface.

```
protocols {
  pim {
    interface all {
      mode sparse;
      version 2;
    }
    interface fxp0.0 {
      disable;
    }
  }
}
```

## Configuring a PIM Anycast RP Router with MSDP

Add the **address** statement at the **[edit protocols pim rp local]** hierarchy level to specify the RP address (the same address as the secondary **lo0** interface).

For all interfaces, use the **mode** statement to set the mode to **sparse** and the **version** statement to specify PIM version 2 at the **[edit protocols pim rp local interface all]** hierarchy level. When configuring all interfaces, exclude the **fxp0.0** management interface by adding the **disable** statement for that interface.

```
protocols {
  pim {
    rp {
      local {
        family inet;
        address 198.58.3.253;
      }
      interface all {
        mode sparse;
        version 2;
      }
      interface fxp0.0 {
        disable;
      }
    }
  }
}
```

```

    }
  }

```

To configure MSDP peering, add the **peer** statement to configure the address of the MSDP peer at the **[edit protocols msdp]** hierarchy level. For MSDP peering, use the unique, primary addresses instead of the anycast address. To specify the local address for MSDP peering, add the **local-address** statement at the **[edit protocols msdp peer]** hierarchy level.

```

protocols {
  msdp {
    peer 198.58.3.250 {
      local-address 198.58.3.254;
    }
  }
}

```

## Configuring a PIM Anycast RP Router Using Only PIM

In this example, configure an RP using the **lo0** loopback interface, which is always up. Use the **address** statement to specify the unique and routable router address and the RP address at the **[edit interfaces lo0 unit 0 family inet]** hierarchy level. In this case, the router ID is 198.58.3.254/32 and the shared RP address is 198.58.3.253/32. Add the flag statement **primary** to the first address. Using this flag selects the router's primary address from all the preferred addresses on all interfaces.

```

interfaces {
  lo0 {
    description "PIM RP";
    unit 0 {
      family inet {
        address 198.58.3.254/32 {
          primary;
        }
        address 198.58.3.253/32;
      }
    }
  }
}

```

Add the **address** statement at the **[edit protocols pim rp local]** hierarchy level to specify the RP address (the same address as the secondary **lo0** interface).

For all interfaces, use the **mode** statement to set the mode to **sparse**, and include the **version** statement to specify PIM version 2 at the **[edit protocols pim rp local interface all]** hierarchy level. When configuring all interfaces, exclude the **fxp0.0** management interface by adding the **disable** statement for that interface.

Use the **anycast-pim** statement to configure anycast RP without MSDP (for example, if IPv6 is used for multicasting). The other RP routers that share the same IP address are configured using the **rp-set** statement. There is one entry for each RP, and the maximum that can be configured is 15. For each RP, specify the routable IP address of the router and whether MSDP source active (SA) messages are forwarded to the RP.

```
protocols {
  pim {
    rp {
      local {
        family inet {
          address 198.58.3.253;
          anycast-pim {
            rp-set {
              address 198.58.3.240;
              address 198.58.3.241 forward-msdp-sa;
            }
            local-address 198.58.3.254; #If not configured, use lo0 primary
          }
        }
      }
    }
  }
  interface all {
    mode sparse;
    version 2;
  }
  interface fxp0.0 {
    disable;
  }
}
```

MSDP configuration is not necessary for this type of IPv4 anycast RP configuration.

## Configuring All PIM Anycast Non-RP Routers

Use the **mode** statement at the **[edit protocols pim rp interface all]** hierarchy level to specify sparse mode on all interfaces. Then add the **version** statement at the **[edit protocols pim rp interface all mode]** to configure all interfaces for PIM version 2. When configuring all interfaces, exclude the **fxp0.0** management interface by adding the **disable** statement for that interface.

```
protocols {
  pim {
    interface all {
      mode sparse;
      version 2;
    }
    interface fxp0.0 {
      disable;
    }
  }
}
```

## Example: Configuring Multiple RPs in a Domain with Anycast RP

This example shows how to configure anycast RP on each RP router in the PIM-SM domain. With this configuration you can deploy more than one RP for a single group range. This enables load balancing and redundancy.

- [Requirements on page 4805](#)
- [Overview on page 4805](#)
- [Configuration on page 4805](#)
- [Verification on page 4807](#)

### Requirements

Before you begin:

- Configure the router interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure an interior gateway protocol or static routing. See the *Junos OS Routing Protocols Library for Routing Devices*.
- Configure PIM Sparse Mode on the interfaces. See “[Enabling PIM Sparse Mode](#)” on [page 4786](#).

### Overview

When you configure anycast RP, the RP routers in the PIM-SM domain use a shared address. In this example, the shared address is 10.1.1.2/32. Anycast RP uses Multicast Source Discovery Protocol (MSDP) to discover and maintain a consistent view of the active sources. Anycast RP also requires an RP selection method, such as static, auto-RP, or bootstrap RP. This example uses static RP and shows only one RP router configuration.

### Configuration

<b>CLI Quick Configuration</b>	To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the <b>[edit]</b> hierarchy level.
<b>RP Routers</b>	<pre> set interfaces lo0 unit 0 family inet address 192.168.132.1/32 primary set interfaces lo0 unit 0 family inet address 10.1.1.2/32 set protocols msdp local-address 192.168.132.1 set protocols msdp peer 192.168.12.1 set protocols pim rp local address 10.1.1.2 set routing-options router-id 192.168.132.1 </pre>
<b>Non-RP Routers</b>	<pre> set protocols pim rp static address 10.1.1.2 </pre>

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure anycast RP:

1. On each RP router in the domain, configure the shared anycast address on the router's loopback address.

```
[edit interfaces]
user@host# set lo0 unit 0 family inet address 10.1.1.2/32
```

2. On each RP router in the domain, make sure that the router's regular loopback address is the primary address for the interface, and set the router ID.

```
[edit interfaces]
user@host# set lo0 unit 0 family inet address 192.168.132.1/32 primary
```

```
[edit routing-options]
user@host# set router-id 192.168.132.1
```

3. On each RP router in the domain, configure the local RP address, using the shared address.

```
[edit protocols pim]
user@host# set rp local address 10.1.1.2
```

4. On each RP router in the domain, create MSDP sessions to the other RPs in the domain.

```
[edit protocols msdp]
user@host# set local-address 192.168.132.1
user@host# set peer 192.168.12.1
```

5. On each non-RP router in the domain, configure a static RP address using the shared address.

```
[edit protocols pim]
user@host# set rp static address 10.1.1.2
```

6. If you are done configuring the devices, commit the configuration.

```
user@host# commit
```

### Results

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
lo0 {
  unit 0 {
    family inet {
      address 192.168.132.1/32 {
        primary;
      }
      address 10.1.1.2/32;
    }
  }
}
```

```

    }
  }
}

```

*On the RP routers:*

```

user@host# show protocols
msdp {
  local-address 192.168.132.1;
  peer 192.168.12.1;
}
pim {
  rp {
    local {
      address 10.1.1.2;
    }
  }
}
}

```

*On the non-RP routers:*

```

user@host# show protocols
pim {
  rp {
    static {
      address 10.1.1.2;
    }
  }
}

user@host# show routing-options
router-id 192.168.132.1;

```

### Verification

To verify the configuration, run the `show pim rps extensive inet` command.

## PIM Bootstrap Router

- [Configuring PIM Bootstrap Properties for IPv4 or IPv6 on page 4807](#)
- [Example: Rejecting PIM Bootstrap Messages at the Boundary of a PIM Domain on page 4809](#)
- [Example: Configuring PIM BSR Filters on page 4809](#)

### Configuring PIM Bootstrap Properties for IPv4 or IPv6

For correct operation, every multicast router within a PIM domain must be able to map a particular multicast group address to the same rendezvous point (RP). The bootstrap

router mechanism is one way that a multicast router can learn the set of group-to-RP mappings. Bootstrap routers are supported in IPv4 and IPv6.

To determine which routing device is the RP, all routing devices within a PIM domain collect bootstrap messages. A PIM domain is a contiguous set of routing devices that implement PIM. All devices are configured to operate within a common boundary. The domain's bootstrap router initiates bootstrap messages, which are sent hop by hop within the domain. The routing devices use bootstrap messages to distribute RP information dynamically and to elect a bootstrap router when necessary.

You can configure bootstrap properties globally or for a routing instance. This example shows the global configuration.

To configure the bootstrap router properties:

1. Configure the bootstrap priority.

By default, each routing device has a bootstrap priority of 0, which means the routing device can never be the bootstrap router. The routing device with the highest priority value is elected to be the bootstrap router. In the case of a tie, the routing device with the highest IP address is elected to be the bootstrap router. A simple bootstrap configuration assigns a bootstrap priority value to a routing device.

**NOTE:** In the IPv4-only configuration, specifying a bootstrap priority of 0 disables the bootstrap function and does not cause the routing device to send BSR packets with a 0 in the priority field. In the combined IPv4 and IPv6 configuration, specifying a bootstrap priority of 0 does not disable the function, but causes the routing device to send BSR packets with a 0 in the priority field. To disable the bootstrap function in the IPv4 and IPv6 configuration, delete the `bootstrap` statement.

```
user@host# edit protocols pim rp
user@host# set bootstrap family inet priority 3
```

2. (Optional) Create import and export policies to control the flow of bootstrap messages to and from the RP, and apply the policies to PIM. Import and export policies are useful when some of the routers in your PIM domain have interfaces that connect to other PIM domains. Configuring a policy prevents bootstrap messages from crossing domain boundaries. The **import** statement prevents messages from being imported into the RP. The **export** statement prevents messages from being exported from the RP.

```
[edit protocols pim rp]
user@host# set bootstrap family inet import pim-bootstrap-import
user@host# set bootstrap family inet export pim-bootstrap-export
user@host# exit
```

3. Configure the policies.

```
user@host# edit policy-options policy-statement pim-bootstrap-import
[edit policy-options policy-statement pim-bootstrap-import]
user@host# set from interface se-0/0/0
user@host# set then reject
user@host# exit
```

```

user@host# edit policy-options policy-statement pim-bootstrap-export
user@host# set from interface se-0/0/0
user@host# set then reject
user@host# exit

```

4. Monitor the operation of PIM bootstrap routers by running the `show pim bootstrap` command.

#### Related Documentation

- [Understanding PIM Sparse Mode on page 4741](#)
- [Example: Rejecting PIM Bootstrap Messages at the Boundary of a PIM Domain on page 4809](#)
- [show pim bootstrap on page 5148](#) in the CLI Explorer

### Example: Rejecting PIM Bootstrap Messages at the Boundary of a PIM Domain

In this example, the `from interface so-0-1/0 then reject` policy statement rejects bootstrap messages from the specified interface (the example is configured for both IPv4 and IPv6 operation):

```

protocols {
  pim {
    rp {
      bootstrap {
        family inet {
          priority 1;
          import pim-import;
          export pim-export;
        }
        family inet6 {
          priority 1;
          import pim-import;
          export pim-export;
        }
      }
    }
  }
}
policy-options {
  policy-statement pim-import {
    from interface so-0/1/0;
    then reject;
  }
  policy-statement pim-export {
    to interface so-0/1/0;
    then reject;
  }
}

```

### Example: Configuring PIM BSR Filters

Configure a filter to prevent BSR messages from entering or leaving your network. Add this configuration to all routers:

```
protocols {
  pim {
    rp {
      bootstrap-import no-bsr;
      bootstrap-export no-bsr;
    }
  }
}
policy-options {
  policy-statement no-bsr {
    then reject;
  }
}
```

---

## PIM Filtering

- [Configuring Interface-Level PIM Neighbor Policies on page 4810](#)
- [Filtering Outgoing PIM Join Messages on page 4811](#)
- [Filtering Incoming PIM Join Messages on page 4812](#)
- [Configuring Register Message Filters on a PIM RP and DR on page 4813](#)

### Configuring Interface-Level PIM Neighbor Policies

You can configure a policy to filter unwanted PIM neighbors. In the following example, the PIM interface compares neighbor IP addresses with the IP address in the policy statement before any hello processing takes place. If any of the neighbor IP addresses (primary or secondary) match the IP address specified in the prefix list, PIM drops the hello packet and rejects the neighbor.

If you configure a PIM neighbor policy after PIM has already established a neighbor adjacency to an unwanted PIM neighbor, the adjacency remains intact until the neighbor hold time expires. When the unwanted neighbor sends another hello message to update its adjacency, the router recognizes the unwanted address and rejects the neighbor.

To configure a policy to filter unwanted PIM neighbors:

1. Configure the policy. The neighbor policy must be a properly structured policy statement that uses a prefix list (or a route filter) containing the neighbor primary address (or any secondary IP addresses) in a prefix list, and the **reject** option to reject the unwanted address.

```
[edit policy-options]
user@host# set prefix-list nbrGroup 1 20.20.20.1/32
user@host# set policy-statement nbr-policy from prefix-list nbrGroup1
user@host# set policy-statement nbr-policy then reject
```

2. Configure the interface globally or in the routing instance. This example shows the configuration for the routing instance.

```
[edit routing-instances PIM.master protocols pim]
user@host# set neighbor-policy nbr-policy
```

3. Verify the configuration by checking the **Hello dropped on neighbor policy** field in the output of the **show pim statistics** command.

## Filtering Outgoing PIM Join Messages

When the core of your network is using MPLS, PIM join and prune messages stop at the customer edge (CE) routers and are not forwarded toward the core, because these routers do not have PIM neighbors on the core-facing interfaces. When the core of your network is using IP, PIM join and prune messages are forwarded to the upstream PIM neighbors in the core of the network.

When the core of your network is using a mix of IP and MPLS, you might want to filter certain PIM join and prune messages at the upstream egress interface of the CE routers.

You can filter PIM sparse mode (PIM-SM) join and prune messages at the egress interfaces for IPv4 and IPv6 in the upstream direction. The messages can be filtered based on the group address, source address, outgoing interface, PIM neighbor, or a combination of these values. If the filter is removed, the join is sent after the PIM periodic join timer expires.

To filter PIM sparse mode join and prune messages at the egress interfaces, create a policy rejecting the group address, source address, outgoing interface, or PIM neighbor, and then apply the policy.

The following example filters PIM join and prune messages for group addresses 224.0.1.2 and 225.1.1.1.

1. In configuration mode, create the policy.

```
user@host# set policy-options policy-statement block-groups term t1 from route-filter
224.0.1.2/32 exact
user@host# set policy-options policy-statement block-groups term t1 from route-filter
225.1.1.1/32 exact
user@host# set policy-options policy-statement block-groups term t1 then reject
user@host# set policy-options policy-statement block-groups term last then accept
```

2. Verify the policy configuration by running the **show policy-options** command.

```
user@host# show policy-options
policy-statement block-groups {
  term t1 {
    from {
      route-filter 224.0.1.2/32 exact;
      route-filter 225.1.1.1/32 exact;
      then reject;
    }
    term last {
      then accept;
    }
  }
}
```

3. Apply the PIM join and prune message filter.

```
user@host> set protocols pim export block-groups
```

4. After the configuration is committed, use the **show pim statistics** command to verify that outgoing PIM join and prune messages are being filtered.

```
user@host> show pim statistics | grep filtered
RP Filtered Source                0
Rx Joins/Prunes filtered          0
Tx Joins/Prunes filtered          254
```

The egress filter count is shown on the **Tx Joins/Prunes filtered** line.

**Related Documentation**

## Filtering Incoming PIM Join Messages

Multicast scoping controls the propagation of multicast messages. Whereas multicast scoping prevents the actual multicast data packets from flowing in or out of an interface, PIM join filters prevent a state from being created in a router. A state—the (\*,G) or (S,G) entries—is the information used for forwarding unicast or multicast packets. Using PIM join filters prevents the transport of multicast traffic across a network and the dropping of packets at a scope at the edge of the network. Also, PIM join filters reduce the potential for denial-of-service (DoS) attacks and PIM state explosion—large numbers of PIM join messages forwarded to each router on the rendezvous-point tree (RPT), resulting in memory consumption.

To use PIM join filters to efficiently restrict multicast traffic from certain source addresses, create and apply the routing policy across all routers in the network.

See [Table 387 on page 4812](#) for a list of match conditions.

**Table 387: PIM Join Filter Match Conditions**

Match Condition	Matches On
<b>interface</b>	Router interface or interfaces specified by name or IP address
<b>neighbor</b>	Neighbor address (the source address in the IP header of the join and prune message)
<b>route-filter</b>	Multicast group address embedded in the join and prune message
<b>source-address-filter</b>	Multicast source address embedded in the join and prune message

The following example shows how to create a PIM join filter. The filter is composed of a route filter and a source address filter—**bad-groups** and **bad-sources**, respectively. the **bad-groups** filter prevents (\*,G) or (S,G) join messages from being received for all groups listed. The **bad-sources** filter prevents (S,G) join messages from being received for all sources listed. The **bad-groups** filter and **bad-sources** filter are in two different terms. If route filters and source address filters are in the same term, they are logically ANDed.

To filter incoming PIM join messages:

1. Configure the policy.

```
[edit policy-statement pim-join-filter term bad-groups]
user@host# set from route-filter 224.0.1.2/32 exact
user@host# set from route-filter 239.0.0.0/8 orlonger
user@host# set then reject

[edit policy-statement pim-join-filter term bad-sources]
user@host# set from source-address-filter 10.0.0.0/8 orlonger
user@host# set from source-address-filter 127.0.0.0/8 orlonger
user@host# set then reject

[edit policy-statement pim-join-filter term last]
user@host# set then accept
```

2. Apply one or more policies to routes being imported into the routing table from PIM.

```
[edit protocols pim]
user@host# set import pim-join-filter
```

3. Verify the configuration by checking the output of the **show pim join** and **show policy** commands.

## Configuring Register Message Filters on a PIM RP and DR

PIM register messages are sent to the rendezvous point (RP) by a designated router (DR). When a source for a group starts transmitting, the DR sends unicast PIM register packets to the RP.

Register messages have the following purposes:

- Notify the RP that a source is sending to a group.
- Deliver the initial multicast packets sent by the source to the RP for delivery down the shortest-path tree (SPT).

The PIM RP keeps track of all active sources in a single PIM sparse mode domain. In some cases, you want more control over which sources an RP discovers, or which sources a DR notifies other RPs about. A high degree of control over PIM register messages is provided by RP or DR register message filtering. Message filtering prevents unauthorized groups and sources from registering with an RP router.

You configure RP or DR register message filtering to control the number and location of multicast sources that an RP discovers. You can apply register message filters on a DR to control outgoing register messages, or apply them on an RP to control incoming register messages.

When anycast RP is configured, all RPs in the anycast RP set need to be configured with the same register message filtering policy.

You can configure message filtering globally or for a routing instance. These examples show the global configuration.

To configure an RP filter to drop the register packets for multicast group range 224.1.1.0/24 from source address 10.10.94.2:

1. On the RP, configure the policy.

```
[edit policy-options policy-statement incoming-policy-for-rp from]
user@host# set route-filter 224.1.1.0/24 orlonger
user@host# set source-address-filter 10.10.94.2/32 exact
user@host# set then reject
user@host# exit
```

2. Apply the policy to the RP.

```
[edit protocols pim rp]
user@host# set rp-register-policy incoming-policy-for-rp
user@host# set local address 10.10.10.5
user@host# exit
```

To configure a DR filter to prevent sending register packets for group range 224.1.1.0/24 and source address 10.10.10.1/32:

1. On the DR, configure the policy.

```
[edit policy-options policy-statement outgoing-policy-for-rp]
user@host# set from route-filter 224.1.1.0/24 orlonger
user@host# set from source-address-filter 10.10.10.1/32 exact
user@host# set then reject
user@host# exit
```

2. Apply the policy to the DR.

The static address is the address of the RP to which you do not want the DR to send the filtered register messages.

```
[edit protocols pim rp]
user@host# set dr-register-policy outgoing-policy-for-dr
user@host# set static 10.10.10.3
user@host# exit
```

To configure a policy expression to accept register messages for multicast group 224.1.1.5 but reject those for 224.1.1.1:

1. On the RP, configure the policies.

```
[edit policy-options policy-statement reject_224_1_1_1]
user@host# set from route-filter 224.1.1.0/24 orlonger
user@host# set from source-address-filter 10.10.94.2/32 exact
user@host# set then reject
user@host# exit
```

```
[edit policy-options policy-statement accept_224_1_1_5]
user@host# set term one from route-filter 224.1.1.5/32 exact
```

```

user@host# set term one from source-address-filter 10.10.94.2/32 exact
user@host# set term one then accept
user@host# set term two then reject
user@host# exit

```

2. Apply the policies to the RP.

```

[edit protocols pim rp]
user@host# set rp-register-policy [ reject_224_1_1_1 | accept_224_1_1_5 ]
user@host# set local address 10.10.10.5

```

To monitor the operation of the filters, run the **show pim statistics** command. The command output contains the following fields related to filtering:

- RP Filtered Source
- Rx Joins/Prunes filtered
- Tx Joins/Prunes filtered
- Rx Register msgs filtering drop
- Tx Register msgs filtering drop

### Example: Configuring the PIM Assert Timeout

This example shows how to configure the timeout period for a PIM assert forwarder.

- [Requirements on page 4815](#)
- [Overview on page 4816](#)
- [Configuration on page 4817](#)

#### Requirements

Before you begin:

- Configure the router interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure an interior gateway protocol or static routing. See the *Junos OS Routing Protocols Library for Routing Devices*.
- Configure PIM Sparse Mode on the interfaces. See [“Enabling PIM Sparse Mode” on page 4786](#).

## Overview

---

The role of PIM assert messages is to determine the forwarder on a network with multiple routers. The forwarder is the router that forwards multicast packets to a network with multicast group members. The forwarder is generally the same as the PIM DR.

A router sends an assert message when it receives a multicast packet on an interface that is listed in the outgoing interface list of the matching routing entry. Receiving a message on an outgoing interface is an indication that more than one router forwards the same multicast packets to a network.

In [Figure 166 on page 4817](#), both routing devices R1 and R2 forward multicast packets for the same (S,G) entry on a network. Both devices detect this situation and both devices send assert messages on the Ethernet network. An assert message contains, in addition to a source address and group address, a unicast cost metric for sending packets to the source, and a preference metric for the unicast cost. The preference metric expresses a preference between unicast routing protocols. The routing device with the smallest preference metric becomes the forwarder (also called the assert winner). If the preference metrics are equal, the device that sent the lowest unicast cost metric becomes the forwarder. If the unicast metrics are also equal, the routing device with the highest IP address becomes the forwarder. After the transmission of assert messages, only the forwarder continues to forward messages on the network.

When an assert message is received and the RPF neighbor is changed to the assert winner, the assert timer is set to an assert timeout period. The assert timeout period is restarted every time a subsequent assert message for the route entry is received on the incoming interface. When the assert timer expires, the routing device resets its RPF neighbor according to its unicast routing table. Then, if multiple forwarders still exist, the forwarders reenter the assert message cycle. In effect, the assert timeout period determines how often multicast routing devices enter a PIM assert message cycle.

The range is from 5 through 210 seconds. The default is 180 seconds.

Assert messages are useful for LANs that connect multiple routing devices and no hosts.

[Figure 166 on page 4817](#) shows the topology for this example.

Figure 166: PIM Assert Topology

### Configuration

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure an assert timeout:

1. Configure the timeout period, in seconds.  

```
[edit protocols pim]
user@host# set assert-timeout 60
```
2. (Optional) Trace assert messages.  

```
[edit protocols pim]
user@host# set traceoptions file PIM.log
user@host# set traceoptions flag assert detail
```
3. If you are done configuring the device, commit the configuration.  

```
user@host# commit
```
4. To verify the configuration, run the following commands:
  - `show pim join`
  - `show pim statistics`

## Example: Configuring the PIM SPT Threshold Policy

This example shows how to apply a policy that suppresses the transition from the rendezvous-point tree (RPT) rooted at the RP to the shortest-path tree (SPT) rooted at the source.

- [Requirements on page 4818](#)
- [Overview on page 4818](#)
- [Configuration on page 4819](#)
- [Verification on page 4821](#)

---

### Requirements

Before you begin:

- Configure the router interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure an interior gateway protocol or static routing. See the *Junos OS Routing Protocols Library for Routing Devices*.
- Configure PIM Sparse Mode on the interfaces. See [“Enabling PIM Sparse Mode” on page 4786](#).

---

### Overview

Multicast routing devices running PIM sparse mode can forward the same stream of multicast packets onto the same LAN through an RPT rooted at the RP or through an SPT rooted at the source. In some cases, the last-hop routing device needs to stay on the shared RPT to the RP and not transition to a direct SPT to the source. Receiving the multicast data traffic on SPT is optimal but introduces more state in the network, which might not be desirable in some multicast deployments. Ideally, low-bandwidth multicast streams can be forwarded on the SPT, and high-bandwidth streams can use the SPT. This example shows how to configure such a policy.

This example includes the following settings:

- **spt-threshold**—Enables you to configure an SPT threshold policy on the last-hop routing device to control the transition to a direct SPT. When you include this statement in the main PIM instance, the PE router stays on the RPT for control traffic.
- **infinity**—Applies an SPT cutover threshold of infinity to a source-group address pair, so that the last-hop routing device never transitions to a direct SPT. For all other source-group address pairs, the last-hop routing device transitions immediately to a direct SPT rooted at the source DR. This statement must reference a properly configured policy to set the SPT cutover threshold for a particular source-group pair to infinity. The use of values other than infinity for the SPT threshold is not supported. You can configure more than one policy.
- **policy-statement**—Configures the policy. The simplest type of SPT threshold policy uses a route filter and source address filter to specify the multicast group and source

addresses and to set the SPT threshold for that pair of addresses to infinity. The policy is applied to the main PIM instance.

This example sets the SPT transition value for the source-group pair 10.10.10.1 and 224.1.1.1 to infinity. When the policy is applied to the last-hop router, multicast traffic from this source-group pair never transitions to a direct SPT to the source. Traffic will continue to arrive through the RP. However, traffic for any other source-group address combination at this router transitions to a direct SPT to the source.

Note these points when configuring the SPT threshold policy:

- Configuration changes to the SPT threshold policy affect how the routing device handles the SPT transition.

Note these points when configuring the SPT threshold policy:

- Configuration changes to the SPT threshold policy affect how the routing device handles the SPT transition.

Note these points when configuring the SPT threshold policy:

- Configuration changes to the SPT threshold policy affect how the routing device handles the SPT transition.
- When the policy is configured for the first time, the routing device continues to transition to the direct SPT for the source-group address pair until the PIM-join state is cleared with the **clear pim join** command.
- If you do not clear the PIM-join state when you apply the infinity policy configuration for the first time, you must apply it before the PE router is brought up.
- When the policy is deleted for a source-group address pair for the first time, the routing device does not transition to the direct SPT for that source-group address pair until the PIM-join state is cleared with the **clear pim join** command.
- When the policy is changed for a source-group address pair for the first time, the routing device does not use the new policy until the PIM-join state is cleared with the **clear pim join** command.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
[edit]
set policy-options policy-statement spt-infinity-policy term one from route-filter
  224.1.1.1/32 exact
set policy-options policy-statement spt-infinity-policy term one from source-address-filter
  10.10.10.1/32 exact
set policy-options policy-statement spt-infinity-policy term one then accept
set policy-options policy-statement spt-infinity-policy term two then reject
set protocols pim spt-threshold infinity spt-infinity-policy
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see the *CLI User Guide*.

To configure an SPT threshold policy:

1. Apply the policy.

```
[edit]
user@host# edit protocols pim
[edit protocols pim]
user@host# set spt-threshold infinity spt-infinity-policy
[edit protocols pim]
user@host# exit
```

2. Configure the policy.

```
[edit]
user@host# edit policy-options policy-statement spt-infinity-policy
[edit policy-options policy-statement spt-infinity-policy]
user@host# set term one from route-filter 224.1.1.1/32 exact
[edit policy-options policy-statement spt-infinity-policy]
user@host# set term one from source-address-filter 10.10.10.1/32 exact
[edit policy-options policy-statement spt-infinity-policy]
user@host# set term one then accept
[edit policy-options policy-statement spt-infinity-policy]
user@host# set term two then reject
[edit policy-options policy-statement spt-infinity-policy]
user@host# exit
policy-statement {
```

3. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

4. Clear the PIM join cache to force the configuration to take effect.

```
[edit]
user@host# run clear pim join
```

### Results

Confirm your configuration by entering the **show policy-options** command and the **show protocols** command from configuration mode. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show policy-options
policy-statement spt-infinity-policy {
  term one {
    from {
      route-filter 224.1.1.1/32 exact;
      source-address-filter 10.10.10.1/32 exact;
    }
    then accept;
  }
  term two {
    then reject;
  }
}
```

```

    }
  }

user@host# show protocols
pim {
  spt-threshold {
    infinity spt-infinity-policy;
  }
}

```

### Verification

To verify the configuration, run the `show pim join` command.

## PIM and the BFD Protocol

- [Configuring BFD for PIM on page 4821](#)
- [Configuring BFD Authentication for PIM on page 4823](#)

### Configuring BFD for PIM

The Bidirectional Forwarding Detection (BFD) Protocol is a simple hello mechanism that detects failures in a network. BFD works with a wide variety of network environments and topologies. A pair of routing devices exchanges BFD packets. Hello packets are sent at a specified, regular interval. A neighbor failure is detected when the routing device stops receiving a reply after a specified interval. The BFD failure detection timers have shorter time limits than the Protocol Independent Multicast (PIM) hello hold time, so they provide faster detection.

The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the `clear bfd adaptation` command to return BFD interval timers to their configured values. The `clear bfd adaptation` command is hitless, meaning that the command does not affect traffic flow on the routing device.

You must specify the minimum transmit and minimum receive intervals to enable BFD on PIM.

To enable failure detection:

1. Configure the interface globally or in a routing instance.

This example shows the global configuration.

```
[edit protocols pim]
user@host# edit interface fe-1/0/0.0 family inet bfd-liveness-detection
```

2. Configure the minimum transmit interval.

This is the minimum interval after which the routing device transmits hello packets to a neighbor with which it has established a BFD session. Specifying an interval smaller than 300 ms can cause undesired BFD flapping.

```
[edit protocols pim interface fe-1/0/0.0 family inet bfd-liveness-detection]
user@host# set transmit-interval 350
```

3. Configure the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session.

Specifying an interval smaller than 300 ms can cause undesired BFD flapping.

```
[edit protocols pim interface fe-1/0/0.0 family inet bfd-liveness-detection]
user@host# set minimum-receive-interval 350
```

4. (Optional) Configure other BFD settings.

As an alternative to setting the receive and transmit intervals separately, configure one interval for both.

```
[edit protocols pim interface fe-1/0/0.0 family inet bfd-liveness-detection]
user@host# set minimum-interval 350
```

5. Configure the threshold for the adaptation of the BFD session detection time.

When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

```
[edit protocols pim interface fe-1/0/0.0 family inet bfd-liveness-detection]
user@host# set detection-time threshold 800
```

6. Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

```
[edit protocols pim interface fe-1/0/0.0 family inet bfd-liveness-detection]
user@host# set multiplier 50
```

7. Configure the BFD version.

```
[edit protocols pim interface fe-1/0/0.0 family inet bfd-liveness-detection]
user@host# set version 1
```

8. Specify that BFD sessions should not adapt to changing network conditions.

We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

```
[edit protocols pim interface fe-1/0/0.0 family inet bfd-liveness-detection]
user@host# set no-adaptation
```

9. Verify the configuration by checking the output of the **show bfd session** command.

**Related Documentation**

- *show bfd session* in the [CLI Explorer](#)

## Configuring BFD Authentication for PIM

Beginning with Junos OS Release 9.6, you can configure authentication for Bidirectional Forwarding Detection (BFD) sessions running over Protocol Independent Multicast (PIM). Routing instances are also supported. The following steps are needed to configure authentication on a BFD session:

1. Specify the BFD authentication algorithm for the PIM protocol.
2. Associate the authentication keychain with the PIM protocol.
3. Configure the related security authentication keychain.

The following sections provide instructions for configuring and viewing BFD authentication on PIM:

- [Configuring BFD Authentication Parameters on page 4823](#)
- [Viewing Authentication Information for BFD Sessions on page 4824](#)

### Configuring BFD Authentication Parameters

BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

To configure BFD authentication:

1. Specify the algorithm (**keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**, or **simple-password**) to use for BFD authentication on a PIM route or routing instance.

```
[edit protocols pim]
user@host# set interface ge-0/1/5 family inet bfd-liveness-detection authentication
algorithm keyed-sha-1
```

**NOTE:** Nonstop active routing (NSR) is not supported with the **meticulous-keyed-md5** and **meticulous-keyed-sha-1** authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

2. Specify the keychain to be used to associate BFD sessions on the specified PIM route or routing instance with the unique security authentication keychain attributes.

The keychain you specify must match the keychain name configured at the **[edit security authentication key-chains]** hierarchy level.

```
[edit protocols pim]
user@host# set interface ge-0/1/5 family inet bfd-liveness-detection authentication
keychain bfd-pim
```

**NOTE:** The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

3. Specify the unique security authentication information for BFD sessions:

- The matching keychain name as specified in Step 2.
- At least one key, a unique integer between 0 and 63. Creating multiple keys allows multiple clients to use the BFD session.
- The secret data used to allow access to the session.
- The time at which the authentication key becomes active, in the format *yyyy-mm-dd.hh:mm:ss*.

```
[edit security]
```

```
user@host# set authentication-key-chains key-chain bfd-pim key 53 secret  
$9$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHM start-time 2009-06-14.10:00:00
```

4. (Optional) Specify loose authentication checking if you are transitioning from nonauthenticated sessions to authenticated sessions.

```
[edit protocols pim]
```

```
user@host# set interface ge-0/1/5 family inet bfd-liveness-detection authentication  
loose-check
```

5. (Optional) View your configuration by using the **show bfd session detail** or **show bfd session extensive** command.

6. Repeat these steps to configure the other end of the BFD session.

---

### Viewing Authentication Information for BFD Sessions

You can view the existing BFD authentication configuration by using the **show bfd session detail** and **show bfd session extensive** commands.

The following example shows BFD authentication configured for the **ge-0/1/5** interface. It specifies the keyed SHA-1 authentication algorithm and a keychain name of **bfd-pim**. The authentication keychain is configured with two keys. Key 1 contains the secret data “\$9\$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHM” and a start time of June 1, 2009, at 9:46:02 AM PST. Key 2 contains the secret data “\$9\$a5jiKW9L.reP38ny.TszF2/9” and a start time of June 1, 2009, at 3:29:20 PM PST.

```
[edit protocols pim]
```

```
interface ge-0/1/5 {  
  family inet {  
    bfd-liveness-detection {  
      authentication {  
        key-chain bfd-pim;  
        algorithm keyed-sha-1;  
      }  
    }  
  }  
}
```

```

}
[edit security]
authentication key-chains {
  key-chain bfd-pim {
    key 1 {
      secret "$9$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHm";
      start-time "2009-6-1.09:46:02 -0700";
    }
    key 2 {
      secret "$9$a5jiKW9l.reP38ny.TszF2/9";
      start-time "2009-6-1.15:29:20 -0700";
    }
  }
}
}

```

If you commit these updates to your configuration, you see output similar to the following example. In the output for the **show bfd session detail** command, **Authenticate** is displayed to indicate that BFD authentication is configured. For more information about the configuration, use the **show bfd session extensive** command. The output for this command provides the keychain name, the authentication algorithm and mode for each client in the session, and the overall BFD authentication configuration status, keychain name, and authentication algorithm and mode.

## Configuring IGMP

Before you begin:

1. Determine whether the router is directly attached to any multicast sources. Receivers must be able to locate these sources.
2. Determine whether the router is directly attached to any multicast group receivers. If receivers are present, IGMP is needed.
3. Determine whether to configure multicast to use sparse, dense, or sparse-dense mode. Each mode has different configuration considerations.
4. Determine the address of the RP if sparse or sparse-dense mode is used.
5. Determine whether to locate the RP with the static configuration, BSR, or auto-RP method.

6. Determine whether to configure multicast to use its own RPF routing table when configuring PIM in sparse, dense, or sparse-dense mode.
7. Configure the SAP and SDP protocols to listen for multicast session announcements. See *Configuring the Session Announcement Protocol*.

To configure the Internet Group Management Protocol (IGMP), include the **igmp** statement:

```
igmp {
  accounting;
  interface interface-name {
    disable;
    (accounting | no-accounting);
    group-policy [ policy-names ];
    immediate-leave;
    oif-map map-name;
    promiscuous-mode;
    ssm-map ssm-map-name;
    static {
      group multicast-group-address {
        exclude;
        group-count number;
        group-increment increment;
        source ip-address {
          source-count number;
          source-increment increment;
        }
      }
    }
  }
  version version;
}
query-interval seconds;
query-last-member-interval seconds;
query-response-interval seconds;
robust-count number;
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable>;
  flag flag <flag-modifier> <disable>;
}
```

You can include this statement at the following hierarchy levels:

- [edit protocols]
- [edit logical-systems *logical-system-name* protocols]

By default, IGMP is enabled on all interfaces on which you configure Protocol Independent Multicast (PIM), and on all broadcast interfaces on which you configure the Distance Vector Multicast Routing Protocol (DVMRP).

**NOTE:** You can configure IGMP on an interface without configuring PIM. PIM is generally not needed on IGMP downstream interfaces. Therefore, only one “pseudo PIM interface” is created to represent all IGMP downstream (IGMP-only) interfaces on the router. This reduces the amount of router resources, such as memory, that are consumed. You must configure PIM on upstream IGMP interfaces to enable multicast routing, perform reverse-path forwarding for multicast data packets, populate the multicast forwarding table for upstream interfaces, and in the case of bidirectional PIM and PIM sparse mode, to distribute IGMP group memberships into the multicast routing domain.

## Enabling IGMP

The Internet Group Management Protocol (IGMP) manages multicast groups by establishing, maintaining, and removing groups on a subnet. Multicast routing devices use IGMP to learn which groups have members on each of their attached physical networks. IGMP must be enabled for the router to receive IPv4 multicast packets. IGMP is only needed for IPv4 networks, because multicast is handled differently in IPv6 networks. IGMP is automatically enabled on all IPv4 interfaces on which you configure PIM and on all IPv4 broadcast interfaces when you configure DVMRP.

If IGMP is not running on an interface—either because PIM and DVMRP are not configured on the interface or because IGMP is explicitly disabled on the interface—you can explicitly enable IGMP.

To explicitly enable IGMP:

1. If PIM and DVMRP are not running on the interface, explicitly enable IGMP by including the interface name.

```
[edit protocols igmp]
user@host# set interface fe-0/0/0.0
```

2. See if IGMP is disabled on any interfaces. In the following example, IGMP is disabled on a Gigabit Ethernet interface.

```
[edit protocols igmp]
user@host# show
interface fe-0/0/0.0;
interface ge-1/0/0.0 {
  disable;
}
```

3. Enable IGMP on the interface by deleting the **disable** statement.

```
[edit protocols igmp]
delete interface ge-1/0/0.0 disable
```

4. Verify the configuration.

```
[edit protocols igmp]
user@host# show
interface fe-0/0/0.0;
```

```
interface ge-1/0/0.0;
```

5. Verify the operation of IGMP on the interfaces by checking the output of the **show igmp interface** command.

## Changing the IGMP Version

By default, the routing device runs IGMPv2. Routing devices running different versions of IGMP determine the lowest common version of IGMP that is supported by hosts on their subnet and operate in that version.

To enable source-specific multicast (SSM) functionality, you must configure version 3 on the host and the host's directly connected routing device. If a source address is specified in a multicast group that is statically configured, the version must be set to IGMPv3.

If a static multicast group is configured with the source address defined, and the IGMP version is configured to be version 2, the source is ignored and only the group is added. In this case, the join is treated as an IGMPv2 group join.

If you configure the IGMP version setting at the individual interface hierarchy level, it overrides the **interface all** statement.

If you have already configured the routing device to use IGMP version 1 (IGMPv1) and then configure it to use IGMPv2, the routing device continues to use IGMPv1 for up to 6 minutes and then uses IGMPv2.

To change to IGMPv3 for SSM functionality:

1. Configure the IGMP interface.

```
[edit protocols igmp]
user@host# set interface ge-0/0/0 version 3
```

2. Verify the configuration by checking the version field in the output of the **show igmp interfaces** command. The **show igmp statistics** command has version-specific output fields, such as V1 Membership Report, V2 Membership Report, and V3 Membership Report.

**CAUTION:** On MX Series platforms, IGMPv2 and IGMPv3 cannot be configured together on the same interface. Configuring both together causes unexpected behavior in multicast traffic forwarding.

## Modifying the IGMP Host-Query Message Interval

The objective of IGMP is to keep routers up to date with group membership of the entire subnet. Routers need not know who all the members are, only that members exist. Each host keeps track of which multicast groups are subscribed to. On each link, one router is elected the querier. The IGMP querier router periodically sends general host-query messages on each attached network to solicit membership information. The messages are sent to the all-systems multicast group address, 224.0.0.1.

The query interval, the response interval, and the robustness variable are related in that they are all variables that are used to calculate the group membership timeout. The group membership timeout is the number of seconds that must pass before a multicast router determines that no more members of a host group exist on a subnet. The group membership timeout is calculated as the (robustness variable x query-interval) + (query-response-interval). If no reports are received for a particular group before the group membership timeout has expired, the routing device stops forwarding remotely-originated multicast packets for that group onto the attached network.

By default, host-query messages are sent every 125 seconds. You can change this interval to change the number of IGMP messages sent on the subnet.

To modify the query interval:

1. Configure the interval.

```
[edit protocols igmp]  
user@host# set query-interval 200
```

The value can be from 1 through 1024 seconds.

2. Verify the configuration by checking the IGMP Query Interval field in the output of the **show igmp interface** command.
3. Verify the operation of the query interval by checking the Membership Query field in the output of the **show igmp statistics** command.

## Modifying the IGMP Last-Member Query Interval

The last-member query interval is the maximum amount of time between group-specific query messages, including those sent in response to leave-group messages. You can configure this interval to change the amount of time it takes a routing device to detect the loss of the last member of a group.

When the routing device that is serving as the querier receives a leave-group message from a host, the routing device sends multiple group-specific queries to the group being left. The querier sends a specific number of these queries at a specific interval. The number of queries sent is called the last-member query count. The interval at which the queries are sent is called the last-member query interval. Because both settings are configurable, you can adjust the leave latency. The IGMP leave latency is the time between a request to leave a multicast group and the receipt of the last byte of data for the multicast group.

The last-member query count x (times) the last-member query interval = (equals) the amount of time it takes a routing device to determine that the last member of a group has left the group and to stop forwarding group traffic.

The default last-member query interval is 1 second. You can configure a subsecond interval up to one digit to the right of the decimal point. The configurable range is 0.1 through 0.9, then in 1-second intervals 1 through 999,999.

To modify this interval:

1. Configure the time (in seconds) that the routing device waits for a report in response to a group-specific query.

```
[edit protocols igmp]
user@host# set query-last-member-interval 0.1
```

2. Verify the configuration by checking the IGMP Last Member Query Interval field in the output of the **show igmp interfaces** command.

**NOTE:** You can configure the last-member query count by configuring the robustness variable. The two are always equal.

## Specifying Immediate-Leave Host Removal for IGMP

The immediate leave setting is useful for minimizing the leave latency of IGMP memberships. When this setting is enabled, the routing device leaves the multicast group immediately after the last host leaves the multicast group.

The immediate-leave setting enables host tracking, meaning that the device keeps track of the hosts that send join messages. This allows IGMP to determine when the last host sends a leave message for the multicast group.

When the immediate leave setting is enabled, the device removes an interface from the forwarding-table entry without first sending IGMP group-specific queries to the interface. The interface is pruned from the multicast tree for the multicast group specified in the IGMP leave message. The immediate leave setting ensures optimal bandwidth management for hosts on a switched network, even when multiple multicast groups are being used simultaneously.

When immediate leave is disabled and one host sends a leave group message, the routing device first sends a group query to determine if another receiver responds. If no receiver responds, the routing device removes all hosts on the interface from the multicast group. Immediate leave is disabled by default for both IGMP version 2 and IGMP version 3.

**NOTE:** Although host tracking is enabled for IGMPv2 and MLDv1 when you enable immediate leave, use immediate leave with these versions only when there is one host on the interface. The reason is that IGMPv2 and MLDv1 use a report suppression mechanism whereby only one host on an interface sends a group join report in response to a membership query. The other interested hosts suppress their reports. The purpose of this mechanism is to avoid a flood of reports for the same group. But it also interferes with host tracking, because the router only knows about the one interested host and does not know about the others.

To enable immediate leave on an interface:

1. Configure immediate leave on the IGMP interface.

```
[edit protocols IGMP]
user@host# set interface ge-0/0/0.1 immediate-leave
```

2. Verify the configuration by checking the Immediate Leave field in the output of the `show igmp interface` command.

## Filtering Unwanted IGMP Reports at the IGMP Interface Level

Suppose you need to limit the subnets that can join a certain multicast group. The **group-policy** statement enables you to filter unwanted IGMP reports at the interface level. When this statement is enabled on a router running IGMP version 2 (IGMPv2) or version 3 (IGMPv3), after the router receives an IGMP report, the router compares the group against the specified group policy and performs the action configured in that policy (for example, rejects the report if the policy matches the defined address or network).

You define the policy to match only IGMP group addresses (for IGMPv2) by using the policy's **route-filter** statement to match the group address. You define the policy to match IGMP (source, group) addresses (for IGMPv3) by using the policy's **route-filter** statement to match the group address and the policy's **source-address-filter** statement to match the source address.

**CAUTION:** On MX Series platforms, IGMPv2 and IGMPv3 cannot be configured together on the same interface. Configuring both together causes unexpected behavior in multicast traffic forwarding.

To filter unwanted IGMP reports:

1. Configure an IGMPv2 policy.

```
[edit policy-statement reject_policy_v2]
user@host# set from route-filter 224.1.1.1/32 exact
user@host# set from route-filter 239.0.0.0/8 orlonger
user@host# set then reject
```

2. Configure an IGMPv3 policy.

```
[edit policy-statement reject_policy_v3]
user@host# set from route-filter 224.1.1.1/32 exact
user@host# set from route-filter 239.0.0.0/8 orlonger
user@host# set from source-address-filter 10.0.0.0/8 orlonger
user@host# set from source-address-filter 127.0.0.0/8 orlonger
user@host# set then reject
```

3. Apply the policies to the IGMP interfaces on which you prefer not to receive specific group or (source, group) reports. In this example, **ge-0/0/0.1** is running IGMPv2, and **ge-0/1/1.0** is running IGMPv3.

```
[edit protocols igmp]
user@host# set interface ge-0/0/0.1 group-policy reject_policy_v2
user@host# set interface ge-0/1/1.0 group-policy reject_policy_v3
```

4. Verify the operation of the filter by checking the Rejected Report field in the output of the **show igmp statistics** command.

## Accepting IGMP Messages from Remote Subnetworks

By default, IGMP interfaces accept IGMP messages only from the same subnet. Including the **promiscuous-mode** statement enables the routing device to accept IGMP messages from indirectly connected subnets.

**NOTE:** When you enable IGMP on an unnumbered Ethernet interface that uses a /32 loopback address as a donor address, you must configure IGMP promiscuous mode to accept the IGMP packets received on this interface.

**NOTE:** When enabling promiscuous-mode, all routers on the ethernet segment must be configured with the promiscuous mode statement. Otherwise, only the interface configured with lowest IPv4 address acts as the querier for IGMP for this Ethernet segment.

To enable IGMP promiscuous mode on an interface:

1. Configure the IGMP interface.

```
[edit protocols igmp]
```

```
user@host# set interface ge-0/1/1.0 promiscuous-mode
```

2. Verify the configuration by checking the Promiscuous Mode field in the output of the **show igmp interface** command.
3. Verify the operation of the filter by checking the Rx non-local field in the output of the **show igmp statistics** command.

## Modifying the IGMP Query Response Interval

The query response interval is the maximum amount of time that can elapse between when the querier router sends a host-query message and when it receives a response from a host. Configuring this interval allows you to adjust the burst peaks of IGMP messages on the subnet. Set a larger interval to make the traffic less bursty. Bursty traffic refers to an uneven pattern of data transmission: sometimes a very high data transmission rate, whereas at other times a very low data transmission rate.

The query response interval, the host-query interval, and the robustness variable are related in that they are all variables that are used to calculate the group membership timeout. The group membership timeout is the number of seconds that must pass before a multicast router determines that no more members of a host group exist on a subnet. The group membership timeout is calculated as the (robustness variable x query-interval) + (query-response-interval). If no reports are received for a particular group before the group membership timeout has expired, the routing device stops forwarding remotely originated multicast packets for that group onto the attached network.

The default query response interval is 10 seconds. You can configure a subsecond interval up to one digit to the right of the decimal point. The configurable range is 0.1 through 0.9, then in 1-second intervals 1 through 999,999.

To modify the query response interval:

1. Configure the interval.

```
[edit protocols igmp]
user@host# set query-response-interval 0.4
```

2. Verify the configuration by checking the IGMP Query Response Interval field in the output of the **show igmp interface** command.
3. Verify the operation of the query interval by checking the Membership Query field in the output of the **show igmp statistics** command.

## Modifying the IGMP Robustness Variable

Fine-tune the IGMP robustness variable to allow for expected packet loss on a subnet. The robust count automatically changes certain IGMP message intervals for IGMPv2 and IGMPv3. Increasing the robust count allows for more packet loss but increases the leave latency of the subnetwork.

When the query router receives an IGMP leave message on a shared network running IGMPv2, the query router must send an IGMP group query message a specified number of times. The number of IGMP group query messages sent is determined by the robust count.

The value of the robustness variable is also used in calculating the following IGMP message intervals:

- Group member interval—Amount of time that must pass before a multicast router determines that there are no more members of a group on a network. This interval is calculated as follows: (robustness variable x query-interval) + (1 x query-response-interval).
- Other querier present interval—The robust count is used to calculate the amount of time that must pass before a multicast router determines that there is no longer another multicast router that is the querier. This interval is calculated as follows: (robustness variable x query-interval) + (0.5 x query-response-interval).
- Last-member query count—Number of group-specific queries sent before the router assumes there are no local members of a group. The number of queries is equal to the value of the robustness variable.

In IGMPv3, a change of interface state causes the system to immediately transmit a state-change report from that interface. In case the state-change report is missed by one or more multicast routers, it is retransmitted. The number of times it is retransmitted

is the robust count minus one. In IGMPv3, the robust count is also a factor in determining the group membership interval, the older version querier interval, and the other querier present interval.

By default, the robustness variable is set to 2. You might want to increase this value if you expect a subnet to lose packets.

The number can be from 2 through 10.

To change the value of the robustness variable:

1. Configure the robust count.

When you set the robust count, you are in effect configuring the number of times the querier retries queries on the connected subnets.

```
[edit protocols igmp]
user@host# set robust-count 5
```

2. Verify the configuration by checking the IGMP Robustness Count field in the output of the **show igmp interfaces** command.

## Limiting the Maximum IGMP Message Rate

This section describes how to change the limit for the maximum number of IGMP packets transmitted in 1 second by the router.

Increasing the maximum number of IGMP packets transmitted per second might be useful on a router with a large number of interfaces participating in IGMP.

To change the limit for the maximum number of IGMP packets the router can transmit in 1 second, include the **maximum-transmit-rate** statement and specify the maximum number of packets per second to be transmitted.

#### Related Documentation

- [maximum-transmit-rate \(Protocols IGMP\) on page 4984](#)

## Enabling IGMP Static Group Membership

You can create IGMP static group membership to test multicast forwarding without a receiver host. When you enable IGMP static group membership, data is forwarded to an interface without that interface receiving membership reports from downstream hosts.

The router on which you enable static IGMP group membership must be the designated router (DR) for the subnet. Otherwise, traffic does not flow downstream.

When enabling IGMP static group membership, you cannot configure multiple groups using the **group-count**, **group-increment**, **source-count**, and **source-increment** statements if the **all** option is specified as the IGMP interface.

Class-of-service (CoS) adjustment is not supported with IGMP static group membership.

In this example, you create static group 225.1.1.1.

1. On the DR, configure the static groups to be created by including the **static** statement and **group** statement and specifying which IP multicast address of the group to be created. When creating groups individually, you must specify a unique address for each group.

```
[edit protocols igmp]
user@host# set interface fe-0/1/2 static group 225.1.1.1
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp

interface fe-0/1/2.0 {
  static {
    group 225.1.1.1;
  }
}
```

3. After you have committed the configuration and the source is sending traffic, use the **show igmp group** command to verify that static group 225.1.1.1 has been created.

```
user@host> show igmp group
Interface: fe-0/1/2
Group: 225.1.1.1
Source: 10.0.0.2
Last reported by: Local
Timeout: 0 Type: Static
```

**NOTE:** When you configure static IGMP group entries on point-to-point links that connect routing devices to a rendezvous point (RP), the static IGMP group entries do not generate join messages toward the RP.

When you create IGMP static group membership to test multicast forwarding on an interface on which you want to receive multicast traffic, you can specify that a number of static groups be automatically created. This is useful when you want to test forwarding to multiple receivers without having to configure each receiver separately.

In this example, you create three groups.

1. On the DR, configure the number of static groups to be created by including the **group-count** statement and specifying the number of groups to be created.

```
[edit protocols igmp]
```

```
user@host# set interface fe-0/1/2 static group 225.1.1.1 group-count 3
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp

interface fe-0/1/2.0 {
  static {
    group 225.1.1.1 {
      group-count 3;
    }
  }
}
```

3. After you have committed the configuration and after the source is sending traffic, use the **show igmp group** command to verify that static groups 225.1.1.1, 225.1.1.2, and 225.1.1.3 have been created.

```
user@host> show igmp group
Interface: fe-0/1/2
  Group: 225.1.1.1
    Source: 10.0.0.2
    Last reported by: Local
    Timeout: 0 Type: Static
  Group: 225.1.1.2
    Source: 10.0.0.2
    Last reported by: Local
    Timeout: 0 Type: Static
  Group: 225.1.1.3
    Source: 10.0.0.2
    Last reported by: Local
    Timeout: 0 Type: Static
```

When you create IGMP static group membership to test multicast forwarding on an interface on which you want to receive multicast traffic, you can also configure the group address to be automatically incremented for each group created. This is useful when you want to test forwarding to multiple receivers without having to configure each receiver separately and when you do not want the group addresses to be sequential.

In this example, you create three groups and increase the group address by an increment of two for each group.

1. On the DR, configure the group address increment by including the **group-increment** statement and specifying the number by which the address should be incremented for each group. The increment is specified in dotted decimal notation similar to an IPv4 address.

```
[edit protocols igmp]
user@host# set interface fe-0/1/2 static group 225.1.1.1 group-count 3 group-increment
0.0.0.2
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp

interface fe-0/1/2.0 {
  version 3;
```

```
static {
  group 225.1.1.1 {
    group-increment 0.0.0.2;
    group-count 3;
  }
}
```

3. After you have committed the configuration and after the source is sending traffic, use the **show igmp group** command to verify that static groups 225.1.1.1, 225.1.1.3, and 225.1.1.5 have been created.

```
user@host> show igmp group
Interface: fe-0/1/2
  Group: 225.1.1.1
    Source: 10.0.0.2
    Last reported by: Local
    Timeout: 0 Type: Static
  Group: 225.1.1.3
    Source: 10.0.0.2
    Last reported by: Local
    Timeout: 0 Type: Static
  Group: 225.1.1.5
    Source: 10.0.0.2
    Last reported by: Local
    Timeout: 0 Type: Static
```

When you create IGMP static group membership to test multicast forwarding on an interface on which you want to receive multicast traffic, and your network is operating in source-specific multicast (SSM) mode, you can also specify that the multicast source address be accepted. This is useful when you want to test forwarding to multicast receivers from a specific multicast source.

If you specify a group address in the SSM range, you must also specify a source.

If a source address is specified in a multicast group that is statically configured, the IGMP version on the interface must be set to IGMPv3. IGMPv2 is the default value.

In this example, you create group 225.1.1.1 and accept IP address 10.0.0.2 as the only source.

1. On the DR, configure the source address by including the **source** statement and specifying the IPv4 address of the source host.

```
[edit protocols igmp]
user@host# set interface fe-0/1/2 static group 225.1.1.1 source 10.0.0.2
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp
interface fe-0/1/2.0 {
  version 3;
  static {
    group 225.1.1.1 {
      source 10.0.0.2;
    }
  }
}
```

```
    }  
  }
```

3. After you have committed the configuration and the source is sending traffic, use the **show igmp group** command to verify that static group 225.1.1.1 has been created and that source 10.0.0.2 has been accepted.

```
user@host> show igmp group  
Interface: fe-0/1/2  
  Group: 225.1.1.1  
    Source: 10.0.0.2  
    Last reported by: Local  
    Timeout: 0 Type: Static
```

When you create IGMP static group membership to test multicast forwarding on an interface on which you want to receive multicast traffic, you can specify that a number of multicast sources be automatically accepted. This is useful when you want to test forwarding to multicast receivers from more than one specified multicast source.

In this example, you create group 255.1.1.1 and accept addresses 10.0.0.2, 10.0.0.3, and 10.0.0.4 as the sources.

1. On the DR, configure the number of multicast source addresses to be accepted by including the **source-count** statement and specifying the number of sources to be accepted.

```
[edit protocols igmp]  
user@host# set interface fe-0/1/2 static group 225.1.1.1 source 10.0.0.2 source-count  
3
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp  
  
interface fe-0/1/2.0 {  
  version 3;  
  static {  
    group 225.1.1.1 {  
      source 10.0.0.2 {  
        source-count 3;  
      }  
    }  
  }  
}
```

3. After you have committed the configuration and the source is sending traffic, use the **show igmp group** command to verify that static group 225.1.1.1 has been created and that sources 10.0.0.2, 10.0.0.3, and 10.0.0.4 have been accepted.

```
user@host> show igmp group  
Interface: fe-0/1/2  
  Group: 225.1.1.1  
    Source: 10.0.0.2  
    Last reported by: Local  
    Timeout: 0 Type: Static  
  Group: 225.1.1.1  
    Source: 10.0.0.3  
    Last reported by: Local
```

```

        Timeout: 0 Type: Static
Group: 225.1.1.1
Source: 10.0.0.4
Last reported by: Local
Timeout: 0 Type: Static

```

When you configure static groups on an interface on which you want to receive multicast traffic, and specify that a number of multicast sources be automatically accepted, you can also specify the number by which the address should be incremented for each source accepted. This is useful when you want to test forwarding to multiple receivers without having to configure each receiver separately and you do not want the source addresses to be sequential.

In this example, you create group 225.1.1.1 and accept addresses 10.0.0.2, 10.0.0.4, and 10.0.0.6 as the sources.

1. Configure the multicast source address increment by including the **source-increment** statement and specifying the number by which the address should be incremented for each source. The increment is specified in dotted decimal notation similar to an IPv4 address.

```
[edit protocols igmp]
```

```
user@host# set interface fe-0/1/2 static group 225.1.1.1 source 10.0.0.2 source-count
3 source-increment 0.0.0.2
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp
```

```

interface fe-0/1/2.0 {
  version 3;
  static {
    group 225.1.1.1 {
      source 10.0.0.2 {
        source-count 3;
        source-increment 0.0.0.2;
      }
    }
  }
}

```

3. After you have committed the configuration and after the source is sending traffic, use the **show igmp group** command to verify that static group 225.1.1.1 has been created and that sources 10.0.0.2, 10.0.0.4, and 10.0.0.6 have been accepted.

```

user@host> show igmp group
Interface: fe-0/1/2
  Group: 225.1.1.1
    Source: 10.0.0.2
    Last reported by: Local
    Timeout: 0 Type: Static
  Group: 225.1.1.1
    Source: 10.0.0.4
    Last reported by: Local
    Timeout: 0 Type: Static
  Group: 225.1.1.1
    Source: 10.0.0.6

```

Last reported by: Local  
Timeout: 0 Type: Static

When you configure static groups on an interface on which you want to receive multicast traffic and your network is operating in source-specific multicast (SSM) mode, you can specify that certain multicast source addresses be excluded.

By default the multicast source address configured in a static group operates in include mode. In include mode the multicast traffic for the group is accepted from the source address configured. You can also configure the static group to operate in exclude mode. In exclude mode the multicast traffic for the group is accepted from any address other than the source address configured.

If a source address is specified in a multicast group that is statically configured, the IGMP version on the interface must be set to IGMPv3. IGMPv2 is the default value.

In this example, you exclude address 10.0.0.2 as a source for group 225.1.1.1.

1. On the DR, configure a multicast static group to operate in exclude mode by including the **exclude** statement and specifying which IPv4 source address to exclude.

```
[edit protocols igmp]
```

```
user@host# set interface fe-0/1/2 static group 225.1.1.1 exclude source 10.0.0.2
```

2. After you commit the configuration, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@host> show configuration protocol igmp
```

```
interface fe-0/1/2.0 {  
  version 3;  
  static {  
    group 225.1.1.1 {  
      exclude;  
      source 10.0.0.2;  
    }  
  }  
}
```

3. After you have committed the configuration and the source is sending traffic, use the **show igmp group detail** command to verify that static group 225.1.1.1 has been created and that the static group is operating in exclude mode.

```
user@host> show igmp group detail
```

```
Interface: fe-0/1/2  
Group: 225.1.1.1  
Group mode: Exclude  
Source: 10.0.0.2  
Last reported by: Local  
Timeout: 0 Type: Static
```

## Recording IGMP Join and Leave Events

To determine whether IGMP tuning is needed in a network, you can configure the routing device to record IGMP join and leave events. You can record events globally for the routing device or for individual interfaces.

[Table 388 on page 4843](#) describes the recordable IGMP events.

**Table 388: IGMP Event Messages**

ERRMSG Tag	Definition
RPD_IGMP_JOIN	Records IGMP join events.
RPD_IGMP_LEAVE	Records IGMP leave events.
RPD_IGMP_ACCOUNTING_ON	Records when IGMP accounting is enabled on an IGMP interface.
RPD_IGMP_ACCOUNTING_OFF	Records when IGMP accounting is disabled on an IGMP interface.
RPD_IGMP_MEMBERSHIP_TIMEOUT	Records IGMP membership timeout events.

To enable IGMP accounting:

1. Enable accounting globally or on an IGMP interface. This example shows both options.

```
[edit protocols igmp]
user@host# set accounting
user@host# set interface fe-0/1/0.2 accounting
```

2. Configure the events to be recorded and filter the events to a system log file with a descriptive filename, such as **igmp-events**.

```
[edit system syslog file igmp-events]
user@host# set any info
user@host# set match ".*RPD_IGMP_JOIN.* | .*RPD_IGMP_LEAVE.* |
.*RPD_IGMP_ACCOUNTING.* | .*RPD_IGMP_MEMBERSHIP_TIMEOUT.*"
```

3. Periodically archive the log file.

This example rotates the file size when it reaches 100 KB and keeps three files.

```
[edit system syslog file igmp-events]
user@host# set archive size 100000
user@host# set archive files 3
user@host# set archive archive-sites "ftp://user@host1//var/tmp" password
"anonymous"
user@host# set archive archive-sites "ftp://user@host2//var/tmp" password "test"
```

```
user@host# set archive transfer-interval 24
user@host# set archive start-time 2011-01-07:12:30
```

4. You can monitor the system log file as entries are added to the file by running the **monitor start** and **monitor stop** commands.

```
user@host> monitor start igmp-events

*** igmp-events ***
Apr 16 13:08:23 host mgd[16416]: UI_CMDLINE_READ_LINE: User 'user', command
'run monitor start igmp-events '
monitor
```

## Limiting the Number of IGMP Multicast Group Joins on Logical Interfaces

The **group-limit** statement enables you to limit the number of IGMP multicast group joins for logical interfaces. When this statement is enabled on a router running IGMP version 2 (IGMPv2) or version 3 (IGMPv3), the limit is applied upon receipt of the group report. Once the group limit is reached, subsequent join requests are rejected.

When configuring limits for IGMP multicast groups, keep the following in mind:

- Each any-source group (\*G) counts as one group toward the limit.
- Each source-specific group (S,G) counts as one group toward the limit.
- Groups in IGMPv3 exclude mode are counted toward the limit.
- Multiple source-specific groups count individually toward the group limit, even if they are for the same group. For example, (S1, G1) and (S2, G1) would count as two groups toward the configured limit.
- Combinations of any-source groups and source-specific groups count individually toward the group limit, even if they are for the same group. For example, (\*, G1) and (S, G1) would count as two groups toward the configured limit.
- Configuring and committing a group limit on a network that is lower than what already exists on the network results in the removal of all groups from the configuration. The groups must then request to rejoin the network (up to the newly configured group limit).
- You can dynamically limit multicast groups on IGMP logical interfaces using dynamic profiles.

Beginning with Junos OS 12.2, you can optionally configure a system log warning threshold for IGMP multicast group joins received on the logical interface. It is helpful to review the system log messages for troubleshooting purposes and to detect if an excessive amount of IGMP multicast group joins have been received on the interface. These log messages convey when the configured group limit has been exceeded, when the configured threshold has been exceeded, and when the number of groups drop below the configured threshold.

The **group-threshold** statement enables you to configure the threshold at which a warning message is logged. The range is 1 through 100 percent. The warning threshold is a percentage of the group limit, so you must configure the **group-limit** statement to configure a warning threshold. For instance, when the number of groups exceed the configured warning threshold, but remain below the configured group limit, multicast groups continue to be accepted, and the device logs the warning message. In addition, the device logs a warning message after the number of groups drop below the configured warning threshold. You can further specify the amount of time (in seconds) between the log messages by configuring the **log-interval** statement. The range is 6 through 32,767 seconds.

You might consider throttling log messages because every entry added after the configured threshold and every entry rejected after the configured limit causes a warning message to be logged. By configuring a log interval, you can throttle the amount of system log warning messages generated for IGMP multicast group joins.

To limit multicast group joins on an IGMP logical interface:

1. Access the logical interface at the IGMP protocol hierarchy level.

```
[edit]
user@host# edit protocols igmp interface interface-name
```

2. Specify the group limit for the interface.

```
[edit protocols igmp interface interface-name]
user@host# set group-limit limit
```

3. (Optional) Configure the threshold at which a warning message is logged.

```
[edit protocols igmp interface interface-name]
user@host# set group-threshold value
```

4. (Optional) Configure the amount of time between log messages.

```
[edit protocols igmp interface interface-name]
user@host# set log-interval seconds
```

To confirm your configuration, use the **show protocols igmp** command. To verify the operation of IGMP on the interface, including the configured group limit and the optional warning threshold and interval between log messages, use the **show igmp interface** command.

## Tracing IGMP Protocol Traffic

Tracing operations record detailed messages about the operation of routing protocols, such as the various types of routing protocol packets sent and received, and routing policy actions. You can specify which trace operations are logged by including specific tracing flags. The following table describes the flags that you can include.

Flag	Description
all	Trace all operations.

Flag	Description
<b>client-notification</b>	Trace notifications.
<b>general</b>	Trace general flow.
<b>group</b>	Trace group operations.
<b>host-notification</b>	Trace host notifications.
<b>leave</b>	Trace leave group messages (IGMPv2 only).
<b>mtrace</b>	Trace mtrace packets. Use the <b>mtrace</b> command to troubleshoot the software.
<b>normal</b>	Trace normal events.
<b>packets</b>	Trace all IGMP packets.
<b>policy</b>	Trace policy processing.
<b>query</b>	Trace IGMP membership query messages, including general and group-specific queries.
<b>report</b>	Trace membership report messages.
<b>route</b>	Trace routing information.
<b>state</b>	Trace state transitions.
<b>task</b>	Trace task processing.
<b>timer</b>	Trace timer processing.

In the following example, tracing is enabled for all routing protocol packets. Then tracing is narrowed to focus only on IGMP packets of a particular type. To configure tracing operations for IGMP:

1. (Optional) Configure tracing at the routing options level to trace all protocol packets.

```
[edit routing-options traceoptions]
user@host# set file all-packets-trace
user@host# set flag all
```

2. Configure the filename for the IGMP trace file.

```
[edit protocols igmp traceoptions]
user@host# set file igmp-trace
```

3. (Optional) Configure the maximum number of trace files.

```
[edit protocols igmp traceoptions]
user@host# set file files 5
```

4. (Optional) Configure the maximum size of each trace file.

```
[edit protocols igmp traceoptions]
user@host# set file size 1m
```

5. (Optional) Enable unrestricted file access.

```
[edit protocols igmp traceoptions]
user@host# set file world-readable
```

6. Configure tracing flags. Suppose you are troubleshooting issues with a particular multicast group. The following example shows how to flag all events for packets associated with the group IP address.

```
[edit protocols igmp traceoptions]
user@host# set flag group | match 232.1.1.2
```

7. View the trace file.

```
user@host> file list /var/log
user@host> file show /var/log/igmp-trace
```

## Disabling IGMP

To disable IGMP on an interface, include the **disable** statement:

```
disable;
```

You can include this statement at the following hierarchy levels:

- **[edit protocols igmp interface *interface-name*]**
- **[edit logical-systems *logical-system-name* protocols igmp interface *interface-name*]**

## IGMP Snooping

- [Configuring IGMP Snooping on page 4848](#)
- [Configuring VLAN-Specific IGMP Snooping Parameters on page 4849](#)
- [Example: Configuring IGMP Snooping on page 4849](#)
- [Using a Switch as an IGMP Querier on page 4851](#)

## Configuring IGMP Snooping

With IGMP snooping enabled, a switch monitors the IGMP (Internet Group Management Protocol) traffic between hosts and multicast routers and uses what it learns to forward multicast traffic to only the downstream interfaces that are connected to interested receivers. This conserves bandwidth by allowing the switch to send multicast traffic to only those interfaces that are connected to devices that want to receive the traffic (instead of flooding the traffic to all the downstream VLAN interfaces).

**NOTE:** You cannot configure IGMP snooping on a secondary VLAN.

To enable IGMP snooping and configure individual options as needed for your network by using the CLI:

1. Enable IGMP snooping on a VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan
```

2. Configure the switch to immediately remove group membership from interfaces on a VLAN when it receives a leave message through that VLAN, and have it not forward any membership queries for the multicast group to the VLAN (IGMPv2 only):

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name immediate-leave
```

3. Configure an interface to belong to a multicast group:

```
[edit protocols]
user@switch# set igmp-snooping vlan-name interface interface-name static group
group-address
```

4. Configure an interface to forward IGMP queries received from multicast routers.

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name interface interface-name
multicast-router-interface
```

5. Configure the switch to wait for four timeout intervals before timing out a multicast group on a VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name robust-count 4
```

6. If you want a standalone switch to act as an IGMP querier, enter the following:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name l2-querier source-address source address
```

The switch uses the address that you configure as the source address in the IGMP queries that it sends. If there are any multicast routers on the same local network, make sure the source address for the IGMP querier is greater (a higher number) than the IP addresses for those routers on the network. This ensures that switch is always the IGMP querier on the network.

7. If you want a QFabric Node device to act as an IGMP querier, enter the following:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name igmp-querier source-address source address
```

## Configuring VLAN-Specific IGMP Snooping Parameters

All of the IGMP snooping statements configured with the **igmp-snooping** statement, with the exception of the **traceoptions** statement, can be qualified with the same statement at the VLAN level. To configure IGMP snooping parameters at the VLAN level, include the **vlan** statement:

```
vlan vlan-id;
  immediate-leave;
  interface interface-name {
    group-limit limit;
    host-only-interface;
    multicast-router-interface;
    static {
      group ip-address {
        source ip-address;
      }
    }
  }
  proxy {
    source-address ip-address;
  }
  query-interval seconds;
  query-last-member-interval seconds;
  query-response-interval seconds;
  robust-count number;
}
```

You can include this statement at the following hierarchy levels:

- [edit bridge-domains *bridge-domain-name* protocols igmp-snooping]
- [edit routing-instances *routing-instance-name* bridge-domains *bridge-domain-name* protocols igmp-snooping]

- Related Documentation**

## Example: Configuring IGMP Snooping

With IGMP snooping enabled, a switch monitors the IGMP (Internet Group Management Protocol) traffic between hosts and multicast routers and uses what it learns to forward multicast traffic to only the downstream interfaces that are connected to interested receivers. This conserves bandwidth by allowing the switch to send multicast traffic to

only those interfaces that are connected to devices that want to receive the traffic (instead of flooding the traffic to all the downstream VLAN interfaces).

This example describes how to configure IGMP snooping:

- [Requirements on page 4850](#)
- [Overview and Topology on page 4850](#)
- [Configuration on page 4850](#)

## Requirements

This example requires Junos OS Release 11.1 or later on a QFX Series product.

Before you configure IGMP snooping, be sure you have:

- Configured the **employee-vlan** VLAN
- Assigned interfaces **ge-0/0/1**, **ge-0/0/2**, and **ge-0/0/3** to **employee-vlan**

## Overview and Topology

In this example you configure an interface to receive multicast traffic from a source and configure some multicast-related behavior for downstream interfaces. The example assumes that IGMP snooping was previously disabled for the VLAN.

[Table 389 on page 4850](#) shows the components of the topology for this example.

**Table 389: Components of the IGMP Snooping Topology**

Components	Settings
VLAN name	<b>employee-vlan</b> , tag 20
Interfaces in <b>employee-vlan</b>	<b>ge-0/0/1</b> , <b>ge-0/0/2</b> , <b>ge-0/0/3</b>
Multicast IP address for <b>employee-vlan</b>	225.100.100.100

## Configuration

To configure basic IGMP snooping on a switch:

### CLI Quick Configuration

To quickly configure IGMP snooping, copy the following commands and paste them into a terminal window:

```
[edit protocols]
set igmp-snooping vlan employee-vlan
set igmp-snooping vlan employee-vlan interface ge-0/0/3 static group 225.100.100.100
set igmp-snooping vlan employee-vlan interface ge-0/0/2 multicast-router-interface
set igmp-snooping vlan employee-vlan robust-count 4
```

### Step-by-Step Procedure

Configure IGMP snooping:

1. Enable and configure IGMP snooping on the VLAN **employee-vlan**:  

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan
```
2. Configure a interface to belong to a multicast group:  

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan interface ge-0/0/3 static group 225.100.100.100
```
3. Configure an interface to forward IGMP queries received from multicast routers.  

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan interface ge-0/0/2 multicast-router-interface
```
4. Configure the switch to wait for four timeout intervals before timing out a multicast group on a VLAN:  

```
[edit protocols]
user@switch# set igmp-snooping vlan employee-vlan robust-count 4
```

**Results** Check the results of the configuration:

```
user@switch# show protocols igmp-snooping
vlan employee-vlan {
  robust-count 4;
}
interface ge-0/0/2 {
  multicast-router-interface;
}
interface ge-0/0/3 {
  static {
    group 255.100.100.100;
  }
}
```

## Using a Switch as an IGMP Querier

If IGMP snooping is enabled on a pure Layer 2 a local network (that is, Layer 3 is not enabled on the network), and there is not multicast router in the network, multicast traffic might not be properly forwarded through the network. This problem occurs if the local network is configured such that multicast traffic must be forwarded between switches in order to reach a multicast receiver. In this case, an upstream switch does not forward multicast traffic to a downstream switch (and therefore to the multicast receivers attached to the downstream switch) because the downstream switch does not forward

IGMP reports to the upstream switch. You can solve this problem by configuring one of the switches to be an IGMP querier. This switch sends periodic general query packets to all the switches in the network, which ensures that the snooping membership tables are updated and prevents any multicast traffic loss.

If you configure multiple switches to be IGMP queriers, the switch with the highest (greatest) IGMP querier source address takes precedence and acts as the querier. Switches with lower IGMP querier source addresses stop sending IGMP queries unless they do not receive IGMP queries for 255 seconds. If a switch with a lower IGMP querier source address does not receive any IGMP queries during that period, it starts sending queries again.

To configure a standalone switch to act as an IGMP querier, enter the following:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name l2-querier source-address source address
```

To configure a QFabric Node device to act as an IGMP querier, enter the following:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name igmp-querier source-address source address
```

### Understanding MLD

The Multicast Listener Discovery (MLD) Protocol manages the membership of hosts and routers in multicast groups. IP version 6 (IPv6) multicast routers use MLD to learn, for each of their attached physical networks, which groups have interested listeners. Each routing device maintains a list of host multicast addresses that have listeners for each subnetwork, as well as a timer for each address. However, the routing device does not need to know the address of each listener—just the address of each host. The routing device provides addresses to the multicast routing protocol it uses, which ensures that multicast packets are delivered to all subnetworks where there are interested listeners. In this way, MLD is used as the transport for the Protocol Independent Multicast (PIM) Protocol.

MLD is an integral part of IPv6 and must be enabled on all IPv6 routing devices and hosts that need to receive IP multicast traffic. The Junos OS supports MLD versions 1 and 2. Version 2 is supported for source-specific multicast (SSM) include and exclude modes.

In include mode, the receiver specifies the source or sources it is interested in receiving the multicast group traffic from. Exclude mode works the opposite of include mode. It allows the receiver to specify the source or sources it is not interested in receiving the multicast group traffic from.

For each attached network, a multicast routing device can be either a querier or a nonquerier. A querier routing device, usually one per subnet, solicits group membership information by transmitting MLD queries. When a host reports to the querier routing device that it has interested listeners, the querier routing device forwards the membership information to the rendezvous point (RP) routing device by means of the receiver's (host's) designated router (DR). This builds the rendezvous-point tree (RPT) connecting the host with interested listeners to the RP routing device. The RPT is the initial path used by the sender to transmit information to the interested listeners. Nonquerier routing devices do not transmit MLD queries on a subnet but can do so if the querier routing device fails.

All MLD-configured routing devices start as querier routing devices on each attached subnet (see [Figure 156 on page 4765](#)). The querier routing device on the right is the receiver's DR.

**Figure 167: Routing Devices Start Up on a Subnet**

To elect the querier routing device, the routing devices exchange query messages containing their IPv6 source addresses. If a routing device hears a query message whose IPv6 source address is numerically lower than its own selected address, it becomes a nonquerier. In [Figure 157 on page 4766](#), the routing device on the left has a source address numerically lower than the one on the right and therefore becomes the querier routing device.

**NOTE:** In the practical application of MLD, several routing devices on a subnet are nonqueriers. If the elected querier routing device fails, query messages are exchanged among the remaining routing devices. The routing device with the lowest IPv6 source address becomes the new querier routing device. The IPv6 Neighbor Discovery Protocol (NDP) implementation drops incoming Neighbor Announcement (NA) messages that have a broadcast or multicast address in the target link-layer address option. This behavior is recommended by RFC 2461.

**Figure 168: Querier Routing Device Is Determined**

The querier routing device sends general MLD queries on the **link-scope all-nodes** multicast address `FF02::1` at short intervals to all attached subnets to solicit group membership information (see [Figure 158 on page 4766](#)). Within the query message is the *maximum response delay* value, specifying the maximum allowed delay for the host to respond with a report message.

**Figure 169: General Query Message Is Issued**

If interested listeners are attached to the host receiving the query, the host sends a report containing the host's IPv6 address to the routing device (see [Figure 159 on page 4766](#)). If the reported address is not yet in the routing device's list of multicast addresses with interested listeners, the address is added to the list and a timer is set for the address. If the address is already on the list, the timer is reset. The host's address is transmitted to the RP in the PIM domain.

Figure 170: Reports Are Received by the Querier Routing Device

If the host has no interested multicast listeners, it sends a done message to the querier routing device. On receipt, the querier routing device issues a multicast address-specific query containing the last **listener query interval** value to the multicast address of the host. If the routing device does not receive a report from the multicast address, it removes the multicast address from the list and notifies the RP in the PIM domain of its removal (see [Figure 160 on page 4767](#)).

Figure 171: Host Has No Interested Receivers and Sends a Done Message to Routing Device

If a done message is not received by the querier routing device, the querier routing device continues to send multicast address-specific queries. If the timer set for the address on receipt of the last report expires, the querier routing device assumes there are no longer interested listeners on that subnet, removes the multicast address from the list, and notifies the RP in the PIM domain of its removal (see [Figure 161 on page 4767](#)).

Figure 172: Host Address Timer Expires and Address Is Removed from Multicast Address List

### Configuring MLD

To configure the Multicast Listener Discovery (MLD) Protocol, include the **mld** statement:

```
mld {
  accounting;
  interface interface-name {
    disable;
    (accounting | no-accounting);
    group-policy [ policy-names ];
    immediate-leave;
  }
}
```

```
oif-map [ map-names ];
passive;
ssm-map ssm-map-name;
static {
    group multicast-group-address {
        exclude;
        group-count number;
        group-increment increment;
        source ip-address {
            source-count number;
            source-increment increment;
        }
    }
}
version version;
}
maximum-transmit-rate packets-per-second;
query-interval seconds;
query-last-member-interval seconds;
query-response-interval seconds;
robust-count number;
traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
}
}
```

You can include this statement at the following hierarchy levels:

- [edit protocols]
- [edit logical-systems *logical-system-name* protocols]

By default, MLD is enabled on all broadcast interfaces when you configure Protocol Independent Multicast (PIM) or the Distance Vector Multicast Routing Protocol (DVMRP).

---

### Enabling MLD

The Multicast Listener Discovery (MLD) Protocol manages multicast groups by establishing, maintaining, and removing groups on a subnet. Multicast routing devices use MLD to learn which groups have members on each of their attached physical networks. MLD must be enabled for the router to receive IPv6 multicast packets. MLD is only needed for IPv6 networks, because multicast is handled differently in IPv4 networks. MLD is enabled on all IPv6 interfaces on which you configure PIM and on all IPv6 broadcast interfaces when you configure DVMRP.

MLD specifies different behaviors for multicast listeners and for routers. When a router is also a listener, the router responds to its own messages. If a router has more than one interface to the same link, it needs to perform the router behavior over only one of those interfaces. Listeners, on the other hand, must perform the listener behavior on all interfaces connected to potential receivers of multicast traffic.

If MLD is not running on an interface—either because PIM and DVMRP are not configured on the interface or because MLD is explicitly disabled on the interface—you can explicitly enable MLD.

To explicitly enable MLD:

1. If PIM and DVMRP are not running on the interface, explicitly enable MLD by including the interface name.

```
[edit protocols mld]
user@host# set interface fe-0/0/0.0
```

2. Check to see if MLD is disabled on any interfaces. In the following example, MLD is disabled on a Gigabit Ethernet interface.

```
[edit protocols mld]
user@host# show

interface fe-0/0/0.0;
interface ge-0/0/0.0 {
    disable;
}
```

3. Enable MLD on the interface by deleting the **disable** statement.

```
[edit protocols mld]
delete interface ge-0/0/0.0 disable
```

4. Verify the configuration.

```
[edit protocols mld]
user@host# show

interface fe-0/0/0.0;
interface ge-0/0/0.0;
```

5. Verify the operation of MLD by checking the output of the **show mld interface** command.

### Modifying the MLD Version

By default, the router supports MLD version 1 (MLDv1). To enable the router to use MLD version 2 (MLDv2) for source-specific multicast (SSM) only, include the **version 2** statement.

If you configure the MLD version setting at the individual interface hierarchy level, it overrides configuring the IGMP version using the **interface all** statement.

If a source address is specified in a multicast group that is statically configured, the version must be set to MLDv2.

To change an MLD interface to version 2:

1. Configure the MLD interface.

```
[edit protocols mld]
user@host# set interface fe-0/0/0.0 version 2
```

2. Verify the configuration by checking the **version** field in the output of the **show mld interface** command. The **show mld statistics** command has version-specific output fields, such as the counters in the **MLD Message type** field.

### Modifying the MLD Host-Query Message Interval

---

The objective of MLD is to keep routers up to date with IPv6 group membership of the entire subnet. Routers need not know who all the members are, only that members exist. Each host keeps track of which multicast groups are subscribed to. On each link, one router is elected the querier. The MLD querier router periodically sends general host-query messages on each attached network to solicit membership information. These messages solicit group membership information and are sent to the **link-scope all-nodes** address **FF02::1**. A general host-query message has a maximum response time that you can set by configuring the query response interval.

The query response timeout, the query interval, and the robustness variable are related in that they are all variables that are used to calculate the multicast listener interval. The multicast listener interval is the number of seconds that must pass before a multicast router determines that no more members of a host group exist on a subnet. The multicast listener interval is calculated as the (robustness variable x query-interval) + (1 x query-response-interval). If no reports are received for a particular group before the multicast listener interval has expired, the routing device stops forwarding remotely-originated multicast packets for that group onto the attached network.

By default, host-query messages are sent every 125 seconds. You can change this interval to change the number of MLD messages sent on the subnet.

To modify the query interval:

1. Configure the interval.

```
[edit protocols mld]  
user@host# set query-interval 200
```

The value can be from 1 through 1024 seconds.

2. Verify the configuration by checking the **MLD Query Interval** field in the output of the **show mld interface** command.
3. Verify the operation of the query interval by checking the **Listener Query** field in the output of the **show mld statistics** command.

### Modifying the MLD Query Response Interval

---

The query response interval is the maximum amount of time that can elapse between when the querier router sends a host-query message and when it receives a response from a host. You can change this interval to adjust the burst peaks of MLD messages on the subnet. Set a larger interval to make the traffic less bursty.

The query response timeout, the query interval, and the robustness variable are related in that they are all variables that are used to calculate the multicast listener interval. The multicast listener interval is the number of seconds that must pass before a multicast router determines that no more members of a host group exist on a subnet. The multicast listener interval is calculated as the (robustness variable x query-interval) + (1 x query-response-interval). If no reports are received for a particular group before the

multicast listener interval has expired, the routing device stops forwarding remotely-originated multicast packets for that group onto the attached network.

The default query response interval is 10 seconds. You can configure a subsecond interval up to one digit to the right of the decimal point. The configurable range is 0.1 through 0.9, then in 1-second intervals 1 through 999,999.

To modify the query response interval:

1. Configure the interval.

```
[edit protocols mld]
user@host# set query-response-interval 0.5
```

2. Verify the configuration by checking the **MLD Query Response Interval** field in the output of the **show mld interface** command.
3. Verify the operation of the query interval by checking the **Listener Query** field in the output of the **show mld statistics** command.

### Modifying the MLD Last-Member Query Interval

The last-member query interval (also called the last-listener query interval) is the maximum amount of time between group-specific query messages, including those sent in response to done messages sent on the **link-scope-all-routers** address FF02::2. You can lower this interval to reduce the amount of time it takes a router to detect the loss of the last member of a group.

When the routing device that is serving as the querier receives a leave-group (done) message from a host, the routing device sends multiple group-specific queries to the group. The querier sends a specific number of these queries, and it sends them at a specific interval. The number of queries sent is called the last-listener query count. The interval at which the queries are sent is called the last-listener query interval. Both settings are configurable, thus allowing you to adjust the leave latency. The IGMP leave latency is the time between a request to leave a multicast group and the receipt of the last byte of data for the multicast group.

The last-listener query count x (times) the last-listener query interval = (equals) the amount of time it takes a routing device to determine that the last member of a group has left the group and to stop forwarding group traffic.

The default last-listener query interval is 1 second. You can configure a subsecond interval up to one digit to the right of the decimal point. The configurable range is 0.1 through 0.9, then in 1-second intervals 1 through 999,999.

To modify this interval:

1. Configure the time (in seconds) that the routing device waits for a report in response to a group-specific query.

```
[edit protocols mld]
user@host# set query-last-member-interval 0.1
```

2. Verify the configuration by checking the **MLD Last Member Query Interval** field in the output of the **show igmp interfaces** command.

**NOTE:** You can configure the last-member query count by configuring the robustness variable. The two are always equal.

---

### Specifying Immediate-Leave Host Removal for MLD

---

The immediate leave setting is useful for minimizing the leave latency of MLD memberships. When this setting is enabled, the routing device leaves the multicast group immediately after the last host leaves the multicast group.

The immediate-leave setting enables host tracking, meaning that the device keeps track of the hosts that send join messages. This allows MLD to determine when the last host sends a leave message for the multicast group.

When the immediate leave setting is enabled, the device removes an interface from the forwarding-table entry without first sending MLD group-specific queries to the interface. The interface is pruned from the multicast tree for the multicast group specified in the MLD leave message. The immediate leave setting ensures optimal bandwidth management for hosts on a switched network, even when multiple multicast groups are being used simultaneously.

When immediate leave is disabled and one host sends a leave group message, the routing device first sends a group query to determine if another receiver responds. If no receiver responds, the routing device removes all hosts on the interface from the multicast group. Immediate leave is disabled by default for both MLD version 1 and MLD version 2.

**NOTE:** Although host tracking is enabled for IGMPv2 and MLDv1 when you enable immediate leave, use immediate leave with these versions only when there is one host on the interface. The reason is that IGMPv2 and MLDv1 use a report suppression mechanism whereby only one host on an interface sends a group join report in response to a membership query. The other interested hosts suppress their reports. The purpose of this mechanism is to avoid a flood of reports for the same group. But it also interferes with host tracking, because the router only knows about the one interested host and does not know about the others.

To enable immediate leave:

1. Configure immediate leave on the MLD interface.

```
[edit protocols mld]  
user@host# set interface ge-0/0/0.1 immediate-leave
```

2. Verify the configuration by checking the **Immediate Leave** field in the output of the **show mld interface** command.

### Filtering Unwanted MLD Reports at the MLD Interface Level

Suppose you need to limit the subnets that can join a certain multicast group. The **group-policy** statement enables you to filter unwanted MLD reports at the interface level.

When the **group-policy** statement is enabled on a router, after the router receives an MLD report, the router compares the group against the specified group policy and performs the action configured in that policy (for example, rejects the report if the policy matches the defined address or network).

You define the policy to match only MLD group addresses (for MLDv1) by using the policy's **route-filter** statement to match the group address. You define the policy to match MLD (source, group) addresses (for MLDv2) by using the policy's **route-filter** statement to match the group address and the policy's **source-address-filter** statement to match the source address.

To filter unwanted MLD reports:

1. Configure an MLDv1 policy.

```
[edit policy-statement reject_policy_v1]
user@host# set from route-filter fec0:1:1:4::/64 exact
user@host# set then reject
```

2. Configure an MLDv2 policy.

```
[edit policy-statement reject_policy_v2]
user@host# set from route-filter fec0:1:1:4::/64 exact
user@host# set from source-address-filter fe80::2e0:81ff:fe05:1a8d/32 orlonger
user@host# set then reject
```

3. Apply the policies to the MLD interfaces where you prefer not to receive specific group or (source, group) reports. In this example, **ge-0/0/0.1** is running MLDv1 and **ge-0/1/1.0** is running MLDv2.

```
[edit protocols mld]
user@host# set interface ge-0/0/0.1 group-policy reject_policy_v1
user@host# set interface ge-0/1/1.0 group-policy reject_policy_v2
```

4. Verify the operation of the filter by checking the **Rejected Report** field in the output of the **show mld statistics** command.

### Example: Modifying the MLD Robustness Variable

This example shows how to configure and verify the MLD robustness variable in a multicast domain.

- [Requirements on page 4861](#)
- [Overview on page 4862](#)
- [Configuration on page 4862](#)
- [Verification on page 4863](#)

#### Requirements

Before you begin:

- Configure the router interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure an interior gateway protocol or static routing. See the *Junos OS Routing Protocols Library for Routing Devices*.
- Enable IPv6 unicast routing. See the *Junos OS Routing Protocols Library for Routing Devices*.
- Enable PIM. See [“PIM Overview” on page 4737](#).

### Overview

The MLD robustness variable can be fine-tuned to allow for expected packet loss on a subnet. Increasing the robust count allows for more packet loss but increases the leave latency of the subnetwork.

The value of the robustness variable is used in calculating the following MLD message intervals:

- Group member interval—Amount of time that must pass before a multicast router determines that there are no more members of a group on a network. This interval is calculated as follows: (robustness variable x query-interval) + (1 x query-response-interval).
- Other querier present interval—Amount of time that must pass before a multicast router determines that there is no longer another multicast router that is the querier. This interval is calculated as follows: (robustness variable x query-interval) + (0.5 x query-response-interval).
- Last-member query count—Number of group-specific queries sent before the router assumes there are no local members of a group. The default number is the value of the robustness variable.

By default, the robustness variable is set to 2. The number can be from 2 through 10. You might want to increase this value if you expect a subnet to lose packets.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set protocols mld robust-count 5
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To change the value of the robustness variable:

1. Configure the robust count.

```
[edit protocols mld]
```

```
user@host# set robust-count 5
```

- If you are done configuring the device, commit the configuration.

```
[edit protocols mld]
user@host# commit
```

### Verification

To verify the configuration is working properly, check the **MLD Robustness Count** field in the output of the **show mld interfaces** command.

### Limiting the Maximum MLD Message Rate

You can change the limit for the maximum number of MLD packets transmitted in 1 second by the router.

Increasing the maximum number of MLD packets transmitted per second might be useful on a router with a large number of interfaces participating in MLD.

To change the limit for the maximum number of MLD packets the router can transmit in 1 second, include the **maximum-transmit-rate** statement and specify the maximum number of packets per second to be transmitted.

### Enabling MLD Static Group Membership

You can create MLD static group membership to test multicast forwarding without a receiver host. When you enable MLD static group membership, data is forwarded to an interface without that interface receiving membership reports from downstream hosts.

Class-of-service (CoS) adjustment is not supported with MLD static group membership.

When you configure static groups on an interface on which you want to receive multicast traffic, you can specify the number of static groups to be automatically created.

In this example, you create static group ff0e::1:ff05:1a8d.

- Configure the static groups to be created by including the **static** statement and **group** statement and specifying which IPv6 multicast address of the group to be created.

```
[edit protocols mld]
user@host# set interface fe-0/1/2 static group ff0e::1:ff05:1a8d
```

- After you commit the configuration, use the **show configuration protocol mld** command to verify the MLD protocol configuration.

```
user@host> show configuration protocol mld

interface fe-0/1/2.0 {
  static {
    group ff0e::1:ff05:1a8d;
  }
}
```

- After you have committed the configuration and after the source is sending traffic, use the **show mld group** command to verify that static group ff0e::1:ff05:1a8d has been created.

```
user@host> show mld group
Interface: fe-0/1/2
Group: ff0e::1:ff05:1a8d
Group mode: Include
Source: fe80::2e0:81ff:fe05:1a8d
Last reported by: Local
Timeout: 0 Type: Static
```

**NOTE:** You must specify a unique address for each group.

### Automatically create static groups

When you create MLD static group membership to test multicast forwarding on an interface on which you want to receive multicast traffic, you can specify that a number of static groups be automatically created. This is useful when you want to test forwarding to multiple receivers without having to configure each receiver separately.

In this example, you create three groups.

1. Configure the number of static groups to be created by including the **group-count** statement and specifying the number of groups to be created.

```
[edit protocols mld]
```

```
user@host# set interface fe-0/1/2 static group ff0e::1:ff05:1a8d group-count 3
```

2. After you commit the configuration, use the **show configuration protocol mld** command to verify the MLD protocol configuration.

```
user@host> show configuration protocol mld
```

```
interface fe-0/1/2.0 {
  static {
    group ff0e::1:ff05:1a8d {
      group-count 3;
    }
  }
}
```

3. After you have committed the configuration and the source is sending traffic, use the **show mld group** command to verify that static groups ff0e::1:ff05:1a8d, ff0e::1:ff05:1a8e, and ff0e::1:ff05:1a8f have been created.

```
user@host> show mld group
```

```
Interface: fe-0/1/2
  Group: ff0e::1:ff05:1a8d
    Source: fe80::2e0:81ff:fe05:1a8d
    Last reported by: Local
    Timeout: 0 Type: Static
Interface: fe-0/1/2
  Group: ff0e::1:ff05:1a8e
    Source: fe80::2e0:81ff:fe05:1a8d
    Last reported by: Local
    Timeout: 0 Type: Static
Interface: fe-0/1/2
  Group: ff0e::1:ff05:1a8f
```

```
Source: fe80::2e0:81ff:fe05:1a8d
Last reported by: Local
Timeout: 0 Type: Static
```

### Automatically increment group addresses

When you configure static groups on an interface on which you want to receive multicast traffic and you specify the number of static groups to be automatically created, you can also configure the group address to be automatically incremented by some number of addresses.

In this example, you create three groups and increase the group address by an increment of two for each group.

1. Configure the group address increment by including the **group-increment** statement and specifying the number by which the address should be incremented for each group. The increment is specified in a format similar to an IPv6 address.

```
[edit protocols mld]
user@host# set interface fe-0/1/2 static group ff0e::1:ff05:1a8d group-count 3
group-increment ::2
```

2. After you commit the configuration, use the **show configuration protocol mld** command to verify the MLD protocol configuration.

```
user@host> show configuration protocol mld

interface fe-0/1/2.0 {
  static {
    group ff0e::1:ff05:1a8d {
      group-increment ::2;
      group-count 3;
    }
  }
}
```

3. After you have committed the configuration and the source is sending traffic, use the **show mld group** command to verify that static groups ff0e::1:ff05:1a8d, ff0e::1:ff05:1a8f, and ff0e::1:ff05:1a91 have been created.

```
user@host> show mld group

Interface: fe-0/1/2
  Group: ff0e::1:ff05:1a8d
    Source: fe80::2e0:81ff:fe05:1a8d
    Last reported by: Local
    Timeout: 0 Type: Static
Interface: fe-0/1/2
  Group: ff0e::1:ff05:1a8f
    Source: fe80::2e0:81ff:fe05:1a8d
    Last reported by: Local
    Timeout: 0 Type: Static
Interface: fe-0/1/2
  Group: ff0e::1:ff05:1a91
    Source: fe80::2e0:81ff:fe05:1a8d
    Last reported by: Local
    Timeout: 0 Type: Static
```

### Specify multicast source address (in SSM mode)

When you configure static groups on an interface on which you want to receive multicast traffic and your network is operating in source-specific multicast (SSM) mode, you can specify the multicast source address to be accepted.

If you specify a group address in the SSM range, you must also specify a source.

If a source address is specified in a multicast group that is statically configured, the MLD version must be set to MLDv2 on the interface. MLDv1 is the default value.

In this example, you create group ff0e::1:ff05:1a8d and accept IPv6 address fe80::2e0:81ff:fe05:1a8d as the only source.

1. Configure the source address by including the **source** statement and specifying the IPv6 address of the source host.

```
[edit protocols mld]
user@host# set interface fe-0/1/2 static group ff0e::1:ff05:1a8d source
fe80::2e0:81ff:fe05:1a8d
```

2. After you commit the configuration, use the **show configuration protocol mld** command to verify the MLD protocol configuration.

```
user@host> show configuration protocol mld

interface fe-0/1/2.0 {
  static {
    group ff0e::1:ff05:1a8d {
      source fe80::2e0:81ff:fe05:1a8d;
    }
  }
}
```

3. After you have committed the configuration and the source is sending traffic, use the **show mld group** command to verify that static group ff0e::1:ff05:1a8d has been created and that source fe80::2e0:81ff:fe05:1a8d has been accepted.

```
user@host> show mld group

Interface: fe-0/1/2
Group: ff0e::1:ff05:1a8d
Source: fe80::2e0:81ff:fe05:1a8d
Last reported by: Local
Timeout: 0 Type: Static
```

### Automatically specify multicast sources

When you configure static groups on an interface on which you want to receive multicast traffic, you can specify a number of multicast sources to be automatically accepted.

In this example, you create static group ff0e::1:ff05:1a8d and accept fe80::2e0:81ff:fe05:1a8d, fe80::2e0:81ff:fe05:1a8e, and fe80::2e0:81ff:fe05:1a8f as the source addresses.

1. Configure the number of multicast source addresses to be accepted by including the **source-count** statement and specifying the number of sources to be accepted.

```
[edit protocols mld]
user@host# set interface fe-0/1/2 static group ff0e::1:ff05:1a8d source
fe80::2e0:81ff:fe05:1a8d source-count 3
```

2. After you commit the configuration, use the **show configuration protocol mld** command to verify the MLD protocol configuration.

```
user@host> show configuration protocol mld

interface fe-0/1/2.0 {
  static {
    group ff0e::1:ff05:1a8d {
      source fe80::2e0:81ff:fe05:1a8d {
        source-count 3;
      }
    }
  }
}
```

3. After you have committed the configuration and the source is sending traffic, use the **show mld group** command to verify that static group ff0e::1:ff05:1a8d has been created and that sources fe80::2e0:81ff:fe05:1a8d, fe80::2e0:81ff:fe05:1a8e, and fe80::2e0:81ff:fe05:1a8f have been accepted.

```
user@host> show mld group

Interface: fe-0/1/2
  Group: ff0e::1:ff05:1a8d
    Source: fe80::2e0:81ff:fe05:1a8d
    Last reported by: Local

```

**Automatically  
increment source  
addresses**

When you configure static groups on an interface on which you want to receive multicast traffic, and specify a number of multicast sources to be automatically accepted, you can also specify the number by which the address should be incremented for each source accepted.

In this example, you create static group `ff0e::1:ff05:1a8d` and accept `fe80::2e0:81ff:fe05:1a8d`, `fe80::2e0:81ff:fe05:1a8f`, and `fe80::2e0:81ff:fe05:1a91` as the sources.

1. Configure the number of multicast source addresses to be accepted by including the **source-increment** statement and specifying the number of sources to be accepted.

```
[edit protocols mld]
user@host# set interface fe-0/1/2 static group ff0e::1:ff05:1a8d source
fe80::2e0:81ff:fe05:1a8d source-count 3 source-increment ::2
```

2. After you commit the configuration, use the **show configuration protocol mld** command to verify the MLD protocol configuration.

```
user@host> show configuration protocol mld

interface fe-0/1/2.0 {
  static {
    group ff0e::1:ff05:1a8d {
      source fe80::2e0:81ff:fe05:1a8d {
        source-count 3;
        source-increment ::2;
      }
    }
  }
}
```

3. After you have committed the configuration and the source is sending traffic, use the **show mld group** command to verify that static group `ff0e::1:ff05:1a8d` has been created and that sources `fe80::2e0:81ff:fe05:1a8d`, `fe80::2e0:81ff:fe05:1a8f`, and `fe80::2e0:81ff:fe05:1a91` have been accepted.

```
user@host> show mld group

Interface: fe-0/1/2
  Group: ff0e::1:ff05:1a8d
    Source: fe80::2e0:81ff:fe05:1a8d
    Last reported by: Local
    Timeout: 0 Type: Static

### Exclude multicast source addresses (in SSM mode)

When you configure static groups on an interface on which you want to receive multicast traffic and your network is operating in source-specific multicast (SSM) mode, you can specify that certain multicast source addresses be excluded.

By default the multicast source address configured in a static group operates in include mode. In include mode the multicast traffic for the group is accepted from the configured source address. You can also configure the static group to operate in exclude mode. In exclude mode the multicast traffic for the group is accepted from any address other than the configured source address.

If a source address is specified in a multicast group that is statically configured, the MLD version must be set to MLDv2 on the interface. MLDv1 is the default value.

In this example, you exclude address fe80::2e0:81ff:fe05:1a8d as a source for group ff0e::1:ff05:1a8d.

1. Configure a multicast static group to operate in exclude mode by including the **exclude** statement and specifying which IPv6 source address to be excluded.

```

[edit protocols mld]
user@host# set interface fe-0/1/2 static group ff0e::1:ff05:1a8d exclude source
fe80::2e0:81ff:fe05:1a8d

```

2. After you commit the configuration, use the **show configuration protocol mld** command to verify the MLD protocol configuration.

```

user@host> show configuration protocol mld

interface fe-0/1/2.0 {
  static {
    group ff0e::1:ff05:1a8d {
      exclude;
      source fe80::2e0:81ff:fe05:1a8d;
    }
  }
}

```

3. After you have committed the configuration and the source is sending traffic, use the **show mld group detail** command to verify that static group ff0e::1:ff05:1a8d has been created and that the static group is operating in exclude mode.

```

user@host> show mld group detail
Interface: fe-0/1/2
  Group: ff0e::1:ff05:1a8d
    Group mode: Exclude
    Source: fe80::2e0:81ff:fe05:1a8d
    Last reported by: Local
    Timeout: 0 Type: Static

```

Similar configuration is available for IPv4 multicast traffic using the IGMP protocol.

### Example: Recording MLD Join and Leave Events

This example shows how to determine whether MLD tuning is needed in a network by configuring the routing device to record MLD join and leave events.

- [Requirements on page 4870](#)
- [Overview on page 4870](#)
- [Configuration on page 4871](#)
- [Verification on page 4872](#)

#### Requirements

Before you begin:

- Configure the router interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure an interior gateway protocol or static routing. See the *Junos OS Routing Protocols Library for Routing Devices*.
- Enable IPv6 unicast routing. See the *Junos OS Routing Protocols Library for Routing Devices*.
- Enable PIM. See [“PIM Overview” on page 4737](#).

#### Overview

[Table 390 on page 4870](#) describes the recordable MLD join and leave events.

**Table 390: MLD Event Messages**

ERRMSG Tag	Definition
RPD_MLD_JOIN	Records MLD join events.
RPD_MLD_LEAVE	Records MLD leave events.
RPD_MLD_ACCOUNTING_ON	Records when MLD accounting is enabled on an MLD interface.
RPD_MLD_ACCOUNTING_OFF	Records when MLD accounting is disabled on an MLD interface.
RPD_MLD_MEMBERSHIP_TIMEOUT	Records MLD membership timeout events.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set protocols mld interface fe-0/1/0.2 accounting
set system syslog file mld-events any info
set system syslog file mld-events match ".*RPD_MLD_JOIN.* | .*RPD_MLD_LEAVE.* |
.*RPD_MLD_ACCOUNTING.* | .*RPD_MLD_MEMBERSHIP_TIMEOUT.*"
set system syslog file mld-events archive size 100000
set system syslog file mld-events archive files 3
set system syslog file mld-events archive transfer-interval 1440
set system syslog file mld-events archive archive-sites "ftp://user@host1//var/tmp"
password "anonymous"
set system syslog file mld-events archive archive-sites "ftp://user@host2//var/tmp"
password "test"
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure recording of MLD join and leave events:

1. Enable accounting globally or on an MLD interface. This example shows the interface configuration.

```
[edit protocols mld]
user@host# set interface fe-0/1/0.2 accounting
```

2. Configure the events to be recorded, and filter the events to a system log file with a descriptive filename, such as **mld-events**.

```
[edit system syslog file mld-events]
user@host# set any info
[edit system syslog file mld-events]
user@host# set match ".*RPD_MLD_JOIN.* | .*RPD_MLD_LEAVE.* |
.*RPD_MLD_ACCOUNTING.* | .*RPD_MLD_MEMBERSHIP_TIMEOUT.*"
```

3. Periodically archive the log file.

This example rotates the file every 24 hours (1440 minutes) when it reaches 100 KB and keeps three files.

```
[edit system syslog file mld-events]
user@host# set archive size 100000
[edit system syslog file mld-events]
user@host# set archive files 3
[edit system syslog file mld-events]
user@host# set archive archive-sites "ftp://user@host1//var/tmp" password
"anonymous"
[edit system syslog file mld-events]
user@host# set archive archive-sites "ftp://user@host2//var/tmp" password "test"
[edit system syslog file mld-events]
user@host# set archive transfer-interval 1440
```

```
[edit system syslog file mld-events]
user@host# set archive start-time 2011-01-07:12:30
```

4. If you are done configuring the device, commit the configuration.

```
[edit system syslog file mld-events]]
user@host# commit
```

### Verification

You can view the system log file by running the **file show** command.

```
user@host> file show mld-events
```

You can monitor the system log file as entries are added to the file by running the **monitor start** and **monitor stop** commands.

```
user@host> monitor start mld-events
```

```
*** mld-events ***
Apr 16 13:08:23 host mgd[16416]: UI_CMDLINE_READ_LINE: User 'user', command 'run
monitor start mld-events '
monitor
```

### Configuring the Number of MLD Multicast Group Joins on Logical Interfaces

---

The **group-limit** statement enables you to limit the number of MLD multicast group joins for logical interfaces. When this statement is enabled on a router running MLD version 2, the limit is applied upon receipt of the group report. Once the group limit is reached, subsequent join requests are rejected.

When configuring limits for MLD multicast groups, keep the following in mind:

- Each any-source group (\*G) counts as one group toward the limit.
- Each source-specific group (S,G) counts as one group toward the limit.
- Groups in MLDv2 exclude mode are counted toward the limit.
- Multiple source-specific groups count individually toward the group limit, even if they are for the same group. For example, (S1, G1) and (S2, G1) would count as two groups toward the configured limit.
- Combinations of any-source groups and source-specific groups count individually toward the group limit, even if they are for the same group. For example, (\*, G1) and (S, G1) would count as two groups toward the configured limit.
- Configuring and committing a group limit on a network that is lower than what already exists on the network results in the removal of all groups from the configuration. The groups must then request to rejoin the network (up to the newly configured group limit).
- You can dynamically limit multicast groups on MLD logical interfaces by using dynamic profiles. For detailed information about creating dynamic profiles, see the *Junos OS Subscriber Management and Services Library*.

Beginning with Junos OS 12.2, you can optionally configure a system log warning threshold for MLD multicast group joins received on the logical interface. It is helpful to review the system log messages for troubleshooting purposes and to detect if an excessive amount of MLD multicast group joins have been received on the interface. These log messages convey when the configured group limit has been exceeded, when the configured threshold has been exceeded, and when the number of groups drop below the configured threshold.

The **group-threshold** statement enables you to configure the threshold at which a warning message is logged. The range is 1 through 100 percent. The warning threshold is a percentage of the group limit, so you must configure the **group-limit** statement to configure a warning threshold. For instance, when the number of groups exceed the configured warning threshold, but remain below the configured group limit, multicast groups continue to be accepted, and the device logs a warning message. In addition, the device logs a warning message after the number of groups drop below the configured warning threshold. You can further specify the amount of time (in seconds) between the log messages by configuring the **log-interval** statement. The range is 6 through 32,767 seconds.

You might consider throttling log messages because every entry added after the configured threshold and every entry rejected after the configured limit causes a warning message to be logged. By configuring a log interval, you can throttle the amount of system log warning messages generated for MLD multicast group joins.

To limit multicast group joins on an MLD logical interface:

1. Access the logical interface at the MLD protocol hierarchy level.

```
[edit]
user@host# edit protocols mld interface interface-name
```

2. Specify the group limit for the interface.

```
[edit protocols mld interface interface-name]
user@host# set group-limit limit
```

3. (Optional) Configure the threshold at which a warning message is logged.

```
[edit protocols mld interface interface-name]
user@host# set group-threshold value
```

4. (Optional) Configure the amount of time between log messages.

```
[edit protocols mld interface interface-name]
user@host# set log-interval seconds
```

To confirm your configuration, use the **show protocols mld** command. To verify the operation of MLD on the interface, including the configured group limit and the optional warning threshold and interval between log messages, use the **show mld interface** command.

### Tracing MLD Protocol Traffic

Tracing operations record detailed messages about the operation of routing protocols, such as the various types of routing protocol packets sent and received, and routing policy

actions. You can specify which trace operations are logged by including specific tracing flags. The following table describes the flags that you can include.

Flag	Description
<b>all</b>	Trace all operations.
<b>client-notification</b>	Trace notifications.
<b>general</b>	Trace general flow.
<b>group</b>	Trace group operations.
<b>host-notification</b>	Trace host notifications.
<b>leave</b>	Trace leave group messages.
<b>mtrace</b>	Trace mtrace packets. Use the <b>mtrace</b> command to troubleshoot the software.
<b>normal</b>	Trace normal events.
<b>packets</b>	Trace all MLD packets.
<b>policy</b>	Trace policy processing.
<b>query</b>	Trace MLD membership query messages, including general and group-specific queries.
<b>report</b>	Trace membership report messages.
<b>route</b>	Trace routing information.
<b>state</b>	Trace state transitions.
<b>task</b>	Trace task processing.
<b>timer</b>	Trace timer processing.

In the following example, tracing is enabled for all routing protocol packets. Then tracing is narrowed to focus only on MLD packets of a particular type. To configure tracing operations for MLD:

- (Optional) Configure tracing at the routing options level to trace all protocol packets.
 

```
[edit routing-options traceoptions]
user@host# set file all-packets-trace
user@host# set flag all
```
- Configure the filename for the MLD trace file.
 

```
[edit protocols mld traceoptions]
```

```
user@host# set file mld-trace
```

3. (Optional) Configure the maximum number of trace files.

```
[edit protocols mld traceoptions]
```

```
user@host# set file files 5
```

4. (Optional) Configure the maximum size of each trace file.

```
[edit protocols mld traceoptions]
```

```
user@host# set file size 1m
```

5. (Optional) Enable unrestricted file access.

```
[edit protocols mld traceoptions]
```

```
user@host# set file world-readable
```

6. Configure tracing flags. Suppose you are troubleshooting issues with a particular interface. The following example shows how to flag all events for packets associated with the interface name.

```
[edit protocols mld traceoptions]
```

```
user@host# set flag all | match fe-1/0/1.0
```

7. View the trace file.

```
user@host> file list /var/log
```

```
user@host> file show /var/log/mld-trace
```

### Disabling MLD

To disable MLD on an interface, include the **disable** statement:

```
interface interface-name {
  disable;
}
```

You can include this statement at the following hierarchy levels:

- [edit protocols mld]
- [edit logical-systems *logical-system-name* protocols mld]

#### Related Documentation

### MSDP

- [Configuring MSDP on page 4876](#)
- [Tracing MSDP Protocol Traffic on page 4877](#)
- [Configuring the Interface to Accept Traffic from a Remote Source on page 4879](#)
- [Example: Configuring MSDP on page 4879](#)
- [Example: Configuring MSDP with Active Source Limits and Mesh Groups on page 4880](#)
- [Example: Configuring PIM Anycast With or Without MSDP on page 4886](#)
- [Configuring a PIM Anycast RP Router with MSDP on page 4890](#)

## Configuring MSDP

To configure the Multicast Source Discovery Protocol (MSDP), include the **msdp** statement:

```
msdp {
  disable;
  active-source-limit {
    maximum number;
    threshold number;
  }
  data-encapsulation (disable | enable);
  export [ policy-names ];
  group group-name {
    ... group-configuration ...
  }
  hold-time seconds;
  import [ policy-names ];
  local-address address;
  keep-alive seconds;
  peer address {
    ... peer-configuration ...
  }
  rib-group group-name;
  source ip-prefix </prefix-length> {
    active-source-limit {
      maximum number;
      threshold number;
    }
  }
  sa-hold-time seconds;
  traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>;
    flag flag <flag-modifier> <disable>;
  }
  group group-name {
    disable;
    export [ policy-names ];
    import [ policy-names ];
    local-address address;
    mode (mesh-group | standard);
    peer address {
      ... same statements as at the [edit protocols msdp peer address] hierarchy level shown
      just following ...
    }
    traceoptions {
      file filename <files number> <size size> <world-readable | no-world-readable>;
      flag flag <flag-modifier> <disable>;
    }
  }
  peer address {
    disable;
    active-source-limit {
      maximum number;
      threshold number;
    }
  }
}
```

```

    }
    authentication-key peer-key;
    default-peer;
    export [ policy-names ];
    import [ policy-names ];
    local-address address;
    traceoptions {
        file filename <files number> <size size> <world-readable | no-world-readable>;
        flag flag <flag-modifier> <disable>;
    }
}

```

You can include this statement at the following hierarchy levels:

- [edit protocols]
- [edit routing-instances *routing-instance-name* protocols]
- [edit logical-systems *logical-system-name* protocols]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols]

By default, MSDP is disabled.

## Tracing MSDP Protocol Traffic

Tracing operations record detailed messages about the operation of routing protocols, such as the various types of routing protocol packets sent and received, and routing policy actions. You can specify which trace operations are logged by including specific tracing flags. The following table describes the flags that you can include.

Flag	Description
<b>all</b>	Trace all operations.
<b>general</b>	Trace general events.
<b>keepalive</b>	Trace keepalive messages.
<b>normal</b>	Trace normal events.
<b>packets</b>	Trace all MSDP packets.
<b>policy</b>	Trace policy processing.
<b>route</b>	Trace MSDP changes to the routing table.
<b>source-active</b>	Trace source-active packets.

Flag	Description
<b>source-active-request</b>	Trace source-active request packets.
<b>source-active-response</b>	Trace source-active response packets.
<b>state</b>	Trace state transitions.
<b>task</b>	Trace task processing.
<b>timer</b>	Trace timer processing.

You can configure MSDP tracing for all peers, for all peers in a particular group, or for a particular peer.

In the following example, tracing is enabled for all routing protocol packets. Then tracing is narrowed to focus only on MSDP peers in a particular group. To configure tracing operations for MSDP:

1. (Optional) Configure tracing by including the **traceoptions** statement at the **[edit routing-options]** hierarchy level and set the **all-packets-trace** and **all** flags to trace all protocol packets.

```
[edit routing-options traceoptions]
user@host# set file all-packets-trace
user@host# set flag all
```

2. Configure the filename for the MSDP trace file.

```
[edit protocols msdp group groupa traceoptions]
user@host# set file msdp-trace
```

3. (Optional) Configure the maximum number of trace files.

```
[edit protocols msdp group groupa traceoptions]
user@host# set file files 5
```

4. (Optional) Configure the maximum size of each trace file.

```
[edit protocols msdp group groupa traceoptions]
user@host# set file size 1m
```

5. (Optional) Enable unrestricted file access.

```
[edit protocols msdp group groupa traceoptions]
user@host# set file world-readable
```

6. Configure tracing flags. Suppose you are troubleshooting issues with the source-active cache for **groupa**. The following example shows how to trace messages associated with the group address.

```
[edit protocols msdp group groupa traceoptions]
user@host# set flag source-active | match 230.0.0.3
```

7. View the trace file.

```
user@host> file list /var/log
user@host> file show /var/log/msdp-trace
```

## Configuring the Interface to Accept Traffic from a Remote Source

You can configure an incoming interface to accept traffic from a remote source. A remote source is a source that is not on the same subnet as the incoming interface. This enables the remote source to be learned and advertised by MSDP so that receivers in other MSDP areas can join the source. You do not need to disable RPF checking, but you do need to ensure that the best path to reach the remote source is through the incoming interface.

In this sample configuration, the incoming interface (**ge-1/3/0**) is on a provider edge (PE) router on the receiver side of a multicast VPN.

To accept traffic from a remote source:

1. Edit the incoming interface.

```
[edit protocols pim interface ge-1/3/0.0]
user@host# set accept-remote-source
```

2. If the incoming interface is not the only way to reach the remote source, ensure that the best path to reach the remote source is through the incoming interface. One way to do this is to use AS path prepending on the other possible routes.

```
[edit policy-options policy-statement as-path-prepend term prepend]
user@host# set from route-filter 192.168.0.0/16 orlonger
user@host# set from route-filter 172.16.0.0/16 orlonger
user@host# set then as-path-prepend "1 1 1 1"
```

Another way to do this might be to configure a static route on the receiver side PE router to the source.

3. After the configuration is committed, use the **show pim statistics** and **show msdp source** commands to verify that the interface is accepting traffic from the remote source.

- Related Documentation**
- *Example: Allowing MBGP MVPN Remote Sources*
  - *Understanding Prepending AS Numbers to BGP AS Paths* in the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*
  - [show msdp source on page 5107](#) in the [CLI Explorer](#)
  - [show pim statistics on page 5189](#) in the [CLI Explorer](#)

## Example: Configuring MSDP

Configure a router to act as a PIM sparse-mode rendezvous point and an MSDP peer:

```
[edit]
routing-options {
  interface-routes {
```

```
    rib-group ifrg;
  }
  rib-groups {
    ifrg {
      import-rib [inet.0 inet.2];
    }
    mcrg {
      export-rib inet.2;
      import-rib inet.2;
    }
  }
}
protocols {
  bgp {
    group lab {
      type internal;
      family any;
      neighbor 192.168.6.18 {
        local-address 192.168.6.17;
      }
    }
  }
  pim {
    dense-groups {
      224.0.1.39/32;
      224.0.1.40/32;
    }
    rib-group mcrg;
    rp {
      local {
        address 192.168.1.1;
      }
    }
    interface all {
      mode sparse-dense;
      version 1;
    }
  }
  msdp {
    rib-group mcrg;
    group lab {
      peer 192.168.6.18 {
        local-address 192.168.6.17;
      }
    }
  }
}
```

### Example: Configuring MSDP with Active Source Limits and Mesh Groups

This example shows how to configure MSDP to filter source-active messages and limit the flooding of source-active messages.

- [Requirements on page 4881](#)
- [Overview on page 4881](#)

- [Configuration on page 4885](#)
- [Verification on page 4886](#)

---

## Requirements

Before you begin:

- Configure the router interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.
- Configure an interior gateway protocol or static routing. See the *Junos OS Routing Protocols Library for Routing Devices*.
- Enable PIM sparse mode. See [“PIM Overview” on page 4737](#).
- Configure the router as a PIM sparse-mode RP. See [“Configuring Local PIM RPs” on page 4795](#).

---

## Overview

A router interested in MSDP messages, such as an RP, might have to process a large number of MSDP messages, especially source-active messages, arriving from other routers. Because of the potential need for a router to examine, process, and create state tables for many MSDP packets, there is a possibility of an MSDP-based denial-of-service (DoS) attack on a router running MSDP. To minimize this possibility, you can configure the router to limit the number of source active messages the router accepts. Also, you can configure a threshold for applying random early discard (RED) to drop some but not all MSDP active source messages. Beginning with Junos OS 12.2, you can optionally configure a warning threshold so the device can log warning messages in the system log when a certain number of source-active messages have been received. It is helpful to review the system log messages for troubleshooting purposes and to detect if an excessive amount of source-active messages have been received. These log messages convey when the configured message limit has been exceeded, when the configured warning threshold has been exceeded, and when the number of messages drop below the configured warning threshold.

By default, the router accepts 25,000 source active messages before ignoring the rest. The limit can be from 1 through 1,000,000. The limit is applied to both the number of messages and the number of MSDP peers.

By default, the router accepts 24,000 source-active messages before applying the RED profile to prevent a possible DoS attack. This number can also range from 1 through 1,000,000. The next 1000 messages are screened by the RED profile and the accepted messages processed. If you configure no drop profiles (as this example does not), RED is still in effect and functions as the primary mechanism for managing congestion. In the default RED drop profile, when the packet queue fill-level is 0 percent, the drop probability is 0 percent. When the fill-level is 100 percent, the drop probability is 100 percent.

**NOTE:** The router ignores source-active messages with encapsulated TCP packets. Multicast does not use TCP; segments inside source-active messages are most likely the result of worm activity.

---

The number configured for the threshold must be less than the number configured for the maximum number of active MSDP sources.

The warning threshold is a percentage of maximum number of MSDP source-active messages received, so you must configure the source-active message limit to configure a warning threshold. The range for the warning threshold is 1 through 100 percent. You can further specify the amount of time (in seconds) between the log messages. The range is 6 through 32,767 seconds.

You can configure an active source limit globally, for a group, or for a peer. If active source limits are configured at multiple levels of the hierarchy (as shown in this example), all are applied.

You can configure an active source limit for an address range as well as for a specific peer. A per-source active source limit uses an IP prefix and prefix length instead of a specific address. You can configure more than one per-source active source limit. The longest match determines the limit.

Per-source active source limits can be combined with active source limits at the peer, group, and global (instance) hierarchy level. Per-source limits are applied before any other type of active source limit. Limits are tested in the following order:

- Per-source
- Per-peer or group
- Per-instance

An active source message must “pass” all limits established before being accepted. For example, if a source is configured with an active source limit of 10,000 active multicast groups and the instance is configured with a limit of 5000 (and there are no other sources or limits configured), only 5000 active source messages are accepted from this source.

MSDP mesh groups are groups of peers configured in a full-mesh topology that limits the flooding of source-active messages to neighboring peers. Every mesh group member must have a peer connection with every other mesh group member. When a source-active message is received from a mesh group member, the source-active message is always accepted but is not flooded to other members of the same mesh group. However, the source-active message is flooded to non-mesh group peers or members of other mesh groups. By default, standard flooding rules apply if **mesh-group** is not specified.

**CAUTION:** When configuring MSDP mesh groups, you must configure all members the same way. If you do not configure a full mesh, excessive flooding of source-active messages can occur.

---

A common application for MSDP mesh groups is peer-reverse-path-forwarding (peer-RPF) check bypass. For example, if there are two MSDP peers inside an autonomous system (AS), and only one of them has an external MSDP session to another AS, the internal MSDP peer often rejects incoming source-active messages relayed by the peer with the external link. Rejection occurs because the external MSDP peer must be reachable by

the internal MSDP peer through the next hop toward the source in another AS, and this next-hop condition is not certain. To prevent rejections, configure an MSDP mesh group on the internal MSDP peer so it always accepts source-active messages.

**NOTE:** An alternative way to bypass the peer-RPF check is to configure a default peer. In networks with only one MSDP peer, especially stub networks, the source-active message always needs to be accepted. An MSDP default peer is an MSDP peer from which all source-active messages are accepted without performing the peer-RPF check. You can establish a default peer at the peer or group level by including the **default-peer** statement.

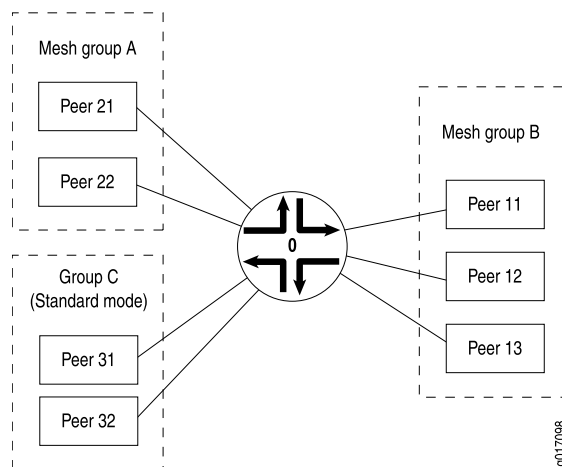

Table 391 on page 4883 explains how flooding is handled by peers in this example.

Figure 173 on page 4883 illustrates source-active message flooding between different mesh groups and peers within the same mesh group.

**Table 391: Source-Active Message Flooding Explanation**

Source-Active Message Received From	Source-Active Message Flooded To	Source-Active Message Not Flooded To
Peer 21	Peer 11, Peer 12, Peer 13, Peer 31, Peer 32	Peer 22
Peer 11	Peer 21, Peer 22, Peer 31, Peer 32	Peer 12, Peer 13
Peer 31	Peer 21, Peer 22, Peer 11, Peer 12, Peer 13, Peer 32	—

**Figure 173: Source-Active Message Flooding**

This example includes the following settings:

- **active-source-limit maximum 10000**—Applies a limit of 10,000 active sources to all other peers.
- **active-source-limit log-warning 80**—(Optional) Applies a warning threshold of 80 percent. In this example, the active source maximum is 10,000, so the device will start logging warning messages once it receives 8,000 active source messages.
- **active-source-limit log-interval 20**—(Optional) Applies a 20 second waiting period between system log messages.
- **data-encapsulation disable**—On an RP router using MSDP, disables the default encapsulation of multicast data received in MSDP register messages inside MSDP source-active messages.

MSDP data encapsulation mainly concerns bursty sources of multicast traffic. Sources that send only one packet every few minutes have trouble with the timeout of state relationships between sources and their multicast groups (S,G). Routers lose data while they attempt to reestablish (S,G) state tables. As a result, multicast register messages contain data, and this data encapsulation in MSDP source-active messages can be turned on or off through configuration.

By default, MSDP data encapsulation is enabled. An RP running MSDP takes the data packets arriving in the source's register message and encapsulates the data inside an MSDP source-active message.

However, data encapsulation creates both a multicast forwarding cache entry in the **inet.1** table (this is also the forwarding table) and a routing table entry in the **inet.4** table. Without data encapsulation, MSDP creates only a routing table entry in the **inet.4** table. In some circumstances, such as the presence of Internet worms or other forms of DoS attack, the router's forwarding table might fill up with these entries. To prevent the forwarding table from filling up with MSDP entries, you can configure the router not to use MSDP data encapsulation. However, if you disable data encapsulation, the router ignores and discards the encapsulated data. Without data encapsulation, multicast applications with bursty sources having transmit intervals greater than about 3 minutes might not work well.

- **group MSDP-group local-address 10.1.2.3**—Specifies the address of the local router (this router).
- **group MSDP-group mode mesh-group**—Specifies that all peers belonging to the **MSDP-group** are mesh group members.
- **group MSDP-group peer 10.10.10.10**—Prevents the sending of source-active messages to neighboring peer 10.10.10.10.
- **group MSDP-group peer 10.10.10.10 active-source-limit maximum 7500**—Applies a limit of 7500 active sources to MSDP peer 10.10.10.10 in group **MSDP-group**.
- **peer 10.0.0.1 active-source-limit maximum 5000 threshold 4000**—Applies a threshold of 4000 active sources and a limit of 5000 active sources to MSDP peer 10.0.0.1.
- **source 10.1.0.0/16 active-source-limit maximum 500**—Applies a limit of 500 active sources to any source on the 10.1.0.0/16 network.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set protocols msdp data-encapsulation disable
set protocols msdp active-source-limit maximum 10000
set protocols msdp active-source-limit log-warning 80
set protocols msdp active-source-limit log-interval 20
set protocols msdp peer 10.0.0.1 active-source-limit maximum 5000
set protocols msdp peer 10.0.0.1 active-source-limit threshold 4000
set protocols msdp source 10.1.0.0/16 active-source-limit maximum 500
set protocols msdp group MSDP-group mode mesh-group
set protocols msdp group MSDP-group local-address 10.1.2.3
set protocols msdp group MSDP-group peer 10.10.10.10 active-source-limit maximum
7500
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure MSDP source active routes and mesh groups:

1. (Optional) Disable data encapsulation.

```
[edit protocols msdp]
user@host# set data-encapsulation disable
```

2. Configure the active source limits.

```
[edit protocols msdp]
user@host# set peer 10.0.0.1 active-source-limit maximum 5000 threshold 4000
user@host# set group MSDP-group peer 10.10.10.10 active-source-limit maximum
7500
user@host# set active-source-limit maximum 10000
user@host# set source 10.1.0.0/16 active-source-limit maximum 500
```

3. (Optional) Configure the threshold at which warning messages are logged and the amount of time between log messages.

```
[edit protocols msdp]
user@host# set active-source-limit log-warning 80
user@host# set active-source-limit log-interval 20
```

4. Configure the mesh group.

```
[edit protocols msdp]
user@host# set group MSDP-group mode mesh-group
user@host# set group MSDP-group peer 10.10.10.10
user@host# set group MSDP-group local-address 10.1.2.3
```

5. If you are done configuring the device, commit the configuration.

```
[edit routing-instances]
user@host# commit
```

## Results

Confirm your configuration by entering the **show protocols** command.

```
user@host# show protocols
msdp {
  data-encapsulation disable;
  active-source-limit {
    maximum 10000;
    log-warning 80;
    log-interval 20;
  }
  peer 10.0.0.1 {
    active-source-limit {
      maximum 5000;
      threshold 4000;
    }
  }
  source 10.1.0.0/16 {
    active-source-limit {
      maximum 500;
    }
  }
  group MSDP-group {
    mode mesh-group;
    local-address 10.1.2.3;
    peer 10.10.10.10 {
      active-source-limit {
        maximum 7500;
      }
    }
  }
}
```

---

## Verification

To verify the configuration, run the following commands:

- [show msdp source-active](#)
- [show msdp statistics](#)

## Example: Configuring PIM Anycast With or Without MSDP

When you configure anycast RP, you bypass the restriction of having one active rendezvous point (RP) per multicast group, and instead deploy multiple RPs for the same group range. The RP routers share one unicast IP address. Sources from one RP are known to

other RPs that use the Multicast Source Discovery Protocol (MSDP). Sources and receivers use the closest RP, as determined by the interior gateway protocol (IGP).

You can use anycast RP within a domain to provide redundancy and RP load sharing. When an RP stops operating, sources and receivers are taken to a new RP by means of unicast routing.

You can configure anycast RP to use PIM and MSDP for IPv4, or PIM alone for both IPv4 and IPv6 scenarios. Both are discussed in this section.

We recommend a static RP mapping with anycast RP over a bootstrap router and auto-RP configuration because it provides all the benefits of a bootstrap router and auto-RP without the complexity of the BSR and auto-RP mechanisms.

All systems on a subnet must run the same version of PIM.

The default PIM version can be version 1 or version 2, depending on the mode you are configuring. PIMv1 is the default RP mode (at the **[edit protocols pim rp static address address]** hierarchy level). However, PIMv2 is the default for interface mode (at the **[edit protocols pim interface interface-name]** hierarchy level). Explicitly configured versions override the defaults. This example explicitly configures PIMv2 on the interfaces.

The following example shows an anycast RP configuration for the RP routers, first with MSDP and then using PIM alone, and for non-RP routers.

1. For a network using an RP with MSDP, configure the RP using the **lo0** loopback interface, which is always up. Include the **address** statement and specify the unique and routable router ID and the RP address at the **[edit interfaces lo0 unit 0 family inet]** hierarchy level. In this example, the router ID is **198.58.3.254** and the shared RP address is **198.58.3.253**. Include the **primary** statement for the first address. Including the **primary** statement selects the router's primary address from all the preferred addresses on all interfaces.

```
interfaces {
  lo0 {
    description "PIM RP";
    unit 0 {
      family inet {
        address 198.58.3.254/32;
        primary;
        address 198.58.3.253/32;
      }
    }
  }
}
```

2. Specify the RP address. Include the **address** statement at the **[edit protocols pim rp local]** hierarchy level (the same address as the secondary **lo0** interface).

For all interfaces, include the **mode** statement to set the mode to **sparse** and the **version** statement to specify PIM version 2 at the **[edit protocols pim rp local interface all]** hierarchy level. When configuring all interfaces, exclude the **fxp0.0** management interface by including the **disable** statement for that interface.

```

protocols {
  pim {
    rp {
      local {
        family inet;
        address 198.58.3.253;
      }
      interface all {
        mode sparse;
        version 2;
      }
      interface fxp0.0 {
        disable;
      }
    }
  }
}

```

3. Configure MSDP peering. Include the **peer** statement to configure the address of the MSDP peer at the **[edit protocols msdp]** hierarchy level. For MSDP peering, use the unique, primary addresses instead of the anycast address. To specify the local address for MSDP peering, include the **local-address** statement at the **[edit protocols msdp peer]** hierarchy level.

```

protocols {
  msdp {
    peer 198.58.3.250 {
      local-address 198.58.3.254;
    }
  }
}

```

**NOTE:** If you need to configure a PIM RP for both IPv4 and IPv6 scenarios, perform Step 4 and Step 5. Otherwise, go to Step 6.

4. Configure an RP using the **lo0** loopback interface, which is always up. Include the **address** statement to specify the unique and routable router address and the RP address at the **[edit interfaces lo0 unit 0 family inet]** hierarchy level. In this example, the router ID is **198.58.3.254** and the shared RP address is **198.58.3.253**. Include the **primary** statement on the first address. Including the **primary** statement selects the router's primary address from all the preferred addresses on all interfaces.

```

interfaces {
  lo0 {
    description "PIM RP";
    unit 0 {
      family inet {
        address 198.58.3.254/32 {
          primary;
        }
        address 198.58.3.253/32;
      }
    }
  }
}

```

```
}
```

5. Include the **address** statement at the **[edit protocols pim rp local]** hierarchy level to specify the RP address (the same address as the secondary **lo0** interface).

For all interfaces, include the **mode** statement to set the mode to **sparse**, and the **version** statement to specify PIM version 2 at the **[edit protocols pim rp local interface all]** hierarchy level. When configuring all interfaces, exclude the **fxp0.0** management interface by including the **disable** statement for that interface.

Include the **anycast-pim** statement to configure anycast RP without MSDP (for example, if IPv6 is used for multicasting). The other RP routers that share the same IP address are configured using the **rp-set** statement. There is one entry for each RP, and the maximum that can be configured is 15. For each RP, specify the routable IP address of the router and whether MSDP source active (SA) messages are forwarded to the RP.

MSDP configuration is not necessary for this type of IPv4 anycast RP configuration.

```
protocols {
  pim {
    rp {
      local {
        family inet {
          address 198.58.3.253;
          anycast-pim {
            rp-set {
              address 198.58.3.240;
              address 198.58.3.241 forward-msdp-sa;
            }
            local-address 198.58.3.254; #If not configured, use lo0 primary
          }
        }
      }
    }
  }
  interface all {
    mode sparse;
    version 2;
  }
  interface fxp0.0 {
    disable;
  }
}
```

6. Configure the non-RP routers. The anycast RP configuration for a non-RP router is the same whether MSDP is used or not. Specify a static RP by adding the address at the **[edit protocols pim rp static]** hierarchy level. Include the **version** statement at the **[edit protocols pim rp static address]** hierarchy level to specify PIM version 2.

```
protocols {
  pim {
    rp {
      static {
        address 198.58.3.253 {
          version 2;
        }
      }
    }
  }
}
```

```
    }  
  }  
}
```

7. Include the **mode** statement at the **[edit protocols pim interface all]** hierarchy level to specify sparse mode on all interfaces. Then include the **version** statement at the **[edit protocols pim rp interface all mode]** to configure all interfaces for PIM version 2. When configuring all interfaces, exclude the **fxp0.0** management interface by including the **disable** statement for that interface.

```
protocols {  
  pim {  
    interface all {  
      mode sparse;  
      version 2;  
    }  
    interface fxp0.0 {  
      disable;  
    }  
  }  
}
```

## Configuring a PIM Anycast RP Router with MSDP

Add the **address** statement at the **[edit protocols pim rp local]** hierarchy level to specify the RP address (the same address as the secondary **lo0** interface).

For all interfaces, use the **mode** statement to set the mode to **sparse** and the **version** statement to specify PIM version 2 at the **[edit protocols pim rp local interface all]** hierarchy level. When configuring all interfaces, exclude the **fxp0.0** management interface by adding the **disable** statement for that interface.

```
protocols {  
  pim {  
    rp {  
      local {  
        family inet;  
        address 198.58.3.253;  
      }  
      interface all {  
        mode sparse;  
        version 2;  
      }  
      interface fxp0.0 {  
        disable;  
      }  
    }  
  }  
}
```

To configure MSDP peering, add the **peer** statement to configure the address of the MSDP peer at the **[edit protocols mspf]** hierarchy level. For MSDP peering, use the unique, primary addresses instead of the anycast address. To specify the local address for MSDP

peering, add the **local-address** statement at the **[edit protocols msdp peer]** hierarchy level.

```
protocols {
  msdp {
    peer 198.58.3.250 {
      local-address 198.58.3.254;
    }
  }
}
```

## Source-Specific Multicast

- [Example: Configuring PIM SSM on a Network on page 4891](#)
- [Example: Configuring an SSM-Only Domain on page 4892](#)
- [Example: Configuring SSM Mapping on page 4893](#)
- [Example: Configuring Source-Specific Multicast Groups with Any-Source Override on page 4895](#)
- [Example: Configuring SSM Maps for Different Groups to Different Sources on page 4899](#)

### Example: Configuring PIM SSM on a Network

The following example shows how PIM SSM is configured between a receiver and a source in the network illustrated in [Figure 174 on page 4891](#).

Figure 174: Network on Which to Configure PIM SSM

This example shows how to configure the IGMP version to IGMPv3 on all receiving host interfaces.

1. Enable IGMPv3 on all host-facing interfaces, and disable IGMP on the **fxp0.0** interface on Router 1.

```
user@router1# set protocols igmp interface all version 3
user@router1# set protocols igmp interface fxp0.0 disable
```

**NOTE:** When you configure IGMPv3 on a router, hosts on interfaces configured with IGMPv2 cannot join the source tree.

2. After the configuration is committed, use the **show configuration protocol igmp** command to verify the IGMP protocol configuration.

```
user@router1> show configuration protocol igmp
```

```
[edit protocols igmp]
interface all {
  version 3;
}
interface fxp0.0 {
  disable;
}
```

3. Use the **show igmp interface** command to verify that IGMP interfaces are configured.

```
user@router1> show igmp interface
Interface      State    Querier      Timeout Version Groups
fe-0/0/0.0     Up      198.58.3.245  213      3      0
fe-0/0/1.0     Up      198.58.3.241  220      3      0
fe-0/0/2.0     Up      198.58.3.237  218      3      0
Configured Parameters:
IGMP Query Interval (1/10 secs): 1250
IGMP Query Response Interval (1/10 secs): 100
IGMP Last Member Query Interval (1/10 secs): 10
IGMP Robustness Count: 2
Derived Parameters:
IGMP Membership Timeout (1/10 secs): 2600
IGMP Other Querier Present Timeout (1/10 secs): 2550
```

4. Use the **show pim join extensive** command to verify the PIM join state on Router 2 and Router 3 (the upstream routers).

```
user@router2> show pim join extensive
232.1.1.1      10.4.1.2      sparse
  Upstream interface: fe-1/1/3.0
  Upstream State: Local Source
  Keepalive timeout: 209
  Downstream Neighbors:
    Interface: so-1/0/2.0
      10.10.71.1      State: Join  Flags: S    Timeout: 209
```

5. Use the **show pim join extensive** command to verify the PIM join state on Router 1 (the router connected to the receiver).

```
user@router1> show pim join extensive
232.1.1.1      10.4.1.2      sparse
  Upstream interface: so-1/0/2.0
  Upstream State: Join to Source
  Keepalive timeout: 209
  Downstream Neighbors:
    Interface: fe-0/2/3.0
      10.3.1.1      State: Join  Flags: S    Timeout: Infinity
```

## Example: Configuring an SSM-Only Domain

Deploying an SSM-only domain is much simpler than deploying an ASM domain because it only requires a few configuration steps. Enable PIM sparse mode on all interfaces by adding the **mode** statement at the **[edit protocols pim interface all]** hierarchy level. When configuring all interfaces, exclude the **fxp0.0** management interface by adding the **disable** statement for that interface. Then configure IGMPv3 on all host-facing interfaces by adding the **version** statement at the **[edit protocols igmp interface interface-name]** hierarchy level.

In the following example, the host-facing interface is **fe-0/1/2**:

```
[edit]
protocols {
  pim {
    interface all {
      mode sparse;
      version 2;
    }
    interface fxp0.0 {
      disable;
    }
  }
  igmp {
    interface fe-0/1/2 {
      version 3;
    }
  }
}
```

### Example: Configuring SSM Mapping

SSM mapping does not require that all hosts support IGMPv3. SSM mapping translates IGMPv1 or IGMPv2 membership reports to an IGMPv3 report. This enables hosts running IGMPv1 or IGMPv2 to participate in SSM until the hosts transition to IGMPv3.

SSM mapping applies to all group addresses that match the policy, not just those that conform to SSM addressing conventions (232/8 for IPv4, ff30::/32 through ff3F::/32 for IPv6).

We recommend separate SSM maps for IPv4 and IPv6 if both address families require SSM support. If you apply an SSM map containing both IPv4 and IPv6 addresses to an interface in an IPv4 context (using IGMP), only the IPv4 addresses in the list are used. If there are no such addresses, no action is taken. Similarly, if you apply an SSM map containing both IPv4 and IPv6 addresses to an interface in an IPv6 context (using MLD), only the IPv6 addresses in the list are used. If there are no such addresses, no action is taken.

In this example, you create a policy to match the group addresses that you want to translate to IGMPv3. Then you define the SSM map that associates the policy with the source addresses where these group addresses are found. Finally, you apply the SSM map to one or more IGMP (for IPv4) or MLD (for IPv6) interfaces.

1. Create an SSM policy named **ssm-policy-example**. The policy terms match the IPv4 SSM group address 232.1.1.1/32 and the IPv6 SSM group address ff35::1/128. All other addresses are rejected.

```
user@router1# set policy-options policy-statement ssm-policy-example term A from
route-filter 232.1.1.1/32 exact
user@router1# set policy-options policy-statement ssm-policy-example term A then
accept
user@router1# set policy-options policy-statement ssm-policy-example term B from
route-filter ff35::1/128 exact
user@router1# set policy-options policy-statement ssm-policy-example term B then
accept
```

2. After the configuration is committed, use the **show configuration policy-options** command to verify the policy configuration.

```
user@host> show configuration policy-options

[edit policy-options]
policy-statement ssm-policy-example {
  term A {
    from {
      route-filter 232.1.1.1/32 exact;
    }
    then accept;
  }
  term B {
    from {
      route-filter ff35::1/128 exact;
    }
    then accept;
  }
  then reject;
}
```

The group addresses must match the configured policy for SSM mapping to occur.

3. Define two SSM maps, one called **ssm-map-ipv6-example** and one called **ssm-map-ipv4-example**, by applying the policy and configuring the source addresses as a multicast routing option.

```
user@host# set routing-options multicast ssm-map ssm-map-ipv6-example policy
ssm-policy-example
user@host# set routing-options multicast ssm-map ssm-map-ipv6-example source
fec0::1 fec0::12
user@host# set routing-options multicast ssm-map ssm-map-ipv4-example policy
ssm-policy-example
user@host# set routing-options multicast ssm-map ssm-map-ipv4-example source
10.10.10.4
user@host# set routing-options multicast ssm-map ssm-map-ipv4-example source
192.168.43.66
```

4. After the configuration is committed, use the **show configuration routing-options** command to verify the policy configuration.

```
user@host> show configuration routing-options

[edit routing-options]
multicast {
  ssm-map ssm-map-ipv6-example {
    policy ssm-policy-example;
    source [ fec0::1 fec0::12 ];
  }
  ssm-map ssm-map-ipv4-example {
    policy ssm-policy-example;
    source [ 10.10.10.4 192.168.43.66 ];
  }
}
```

We recommend separate SSM maps for IPv4 and IPv6.

5. Apply SSM maps for IPv4-to-IGMP interfaces and SSM maps for IPv6-to-MLD interfaces:

```
user@host# set protocols igmp interface fe-0/1/0.0 ssm-map ssm-map-ipv4-example
user@host# set protocols mld interface fe-0/1/1.0 ssm-map ssm-map-ipv6-example
```

6. After the configuration is committed, use the **show configuration protocol** command to verify the IGMP and MLD protocol configuration.

```
user@router1> show configuration protocol
```

```
[edit protocols]
igmp {
  interface fe-0/1/0.0 {
    ssm-map ssm-map-ipv4-example;
  }
}
mld {
  interface fe-0/1/1.0 {
    ssm-map ssm-map-ipv6-example;
  }
}
```

7. Use the **show igmp interface** and the **show mld interface** commands to verify that the SSM maps are applied to the interfaces.

```
user@host> show igmp interface fe-0/1/0.0
Interface: fe-0/1/0.0
Querier: 192.168.224.28
State:      Up Timeout:    None Version:  2 Groups:  2
SSM Map: ssm-map-ipv4-example

user@host> show mld interface fe-0/1/1.0
Interface: fe-0/1/1.0
Querier: fec0:0:0:0:1::12
State:      Up Timeout:    None Version:  2 Groups:  2
SSM Map: ssm-map-ipv6-example
```

## Example: Configuring Source-Specific Multicast Groups with Any-Source Override

This example shows how to extend source-specific multicast (SSM) group operations beyond the default IP address range of 232.0.0.0 through 232.255.255.255. This example also shows how to accept any-source multicast (ASM) join messages (\*G) for group addresses that are within the default or configured range of SSM groups. This allows you to support a mix of any-source and source-specific multicast groups simultaneously.

- [Requirements on page 4895](#)
- [Overview on page 4896](#)
- [Configuration on page 4897](#)
- [Verification on page 4899](#)

### Requirements

Before you begin, configure the router interfaces. See the *Junos OS Network Interfaces Library for Routing Devices*.

## Overview

To deploy SSM, configure PIM sparse mode on all routing device interfaces and issue the necessary SSM commands, including specifying IGMPv3 or MLDv2 on the receiver's LAN. If PIM sparse mode is not explicitly configured on both the source and group members interfaces, multicast packets are not forwarded. Source lists, supported in IGMPv3 and MLDv2, are used in PIM SSM. Only sources that are specified send traffic to the SSM group.

In a PIM SSM-configured network, a host subscribes to an SSM channel (by means of IGMPv3 or MLDv2) to join group G and source S (see [Figure 175 on page 4896](#)). The directly connected PIM sparse-mode router, the receiver's designated router (DR), sends an (S,G) join message to its reverse-path forwarding (RPF) neighbor for the source. Notice in [Figure 175 on page 4896](#) that the RP is not contacted in this process by the receiver, as would be the case in normal PIM sparse-mode operations.

**Figure 175: Receiver Sends Messages to Join Group G and Source S**

The (S,G) join message initiates the source tree and then builds it out hop by hop until it reaches the source. In [Figure 176 on page 4896](#), the source tree is built across the network to Router 3, the last-hop router connected to the source.

**Figure 176: Router 3 (Last-Hop Router) Joins the Source Tree**

Using the source tree, multicast traffic is delivered to the subscribing host (see [Figure 177 on page 4897](#)).

Figure 177: (S,G) State Is Built Between the Source and the Receiver

SSM can operate in include mode or in exclude mode. In exclude mode the receiver specifies a list of sources that it does not want to receive the multicast group traffic from. The routing device forwards traffic to the receiver from any source except the sources specified in the exclusion list. The receiver accepts traffic from any sources except the sources specified in the exclusion list.

This example works with the simple RPF topology shown in [Figure 178 on page 4897](#).

Figure 178: Simple RPF Topology

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set protocols ospf area 0.0.0.0 interface fxp0.0 disable
set protocols ospf area 0.0.0.0 interface all
set protocols pim rp local address 10.255.72.46
set protocols pim rp local group-ranges 239.0.0.0/24
set protocols pim interface fe-1/0/0.0 mode sparse
set protocols pim interface lo0.0 mode sparse
set routing-options multicast ssm-groups 232.0.0.0/8
set routing-options multicast ssm-groups 239.0.0.0/8
set routing-options multicast asm-override-ssm
```

#### Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure an RPF policy:

1. Configure OSPF.

```
[edit protocols ospf]
user@host# set area 0.0.0.0 interface fxp0.0 disable
user@host# set area 0.0.0.0 interface all
```

2. Configure PIM sparse mode.

```
[edit protocols pim]
user@host# set rp local address 10.255.72.46
user@host# set rp local group-ranges 239.0.0.0/24
user@host# set interface fe-1/0/0.0 mode sparse
user@host# set interface lo0.0 mode sparse
```

3. Configure additional SSM groups.

```
[edit routing-options]
user@host# set ssm-groups [ 232.0.0.0/8 239.0.0.0/8 ]
```

4. Configure the RP to accept ASM join messages for groups within the SSM address range.

```
[edit routing-options]
user@host# set multicast asm-override-ssm
```

5. If you are done configuring the device, commit the configuration.

```
user@host# commit
```

### Results

Confirm your configuration by entering the **show protocols** and **show routing-options** commands.

```
user@host# show protocols
ospf {
  area 0.0.0.0 {
    interface fxp0.0 {
      disable;
    }
    interface all;
  }
}
pim {
  rp {
    local {
      address 10.255.72.46;
      group-ranges {
        239.0.0.0/24;
      }
    }
  }
}
interface fe-1/0/0.0 {
  mode sparse;
}
interface lo0.0 {
  mode sparse;
}
}

user@host# show routing-options
multicast {
  ssm-groups [ 232.0.0.0/8 239.0.0.0/8 ];
  asm-override-ssm;
```

```
}

```

Verification

To verify the configuration, run the following commands:

- `show igmp group`
- `show igmp statistics`
- `show pim join`

Related Documentation

Example: Configuring SSM Maps for Different Groups to Different Sources

- [Multiple SSM Maps and Groups for Interfaces on page 4899](#)
- [Example: Configuring Multiple SSM Maps Per Interface on page 4899](#)

Multiple SSM Maps and Groups for Interfaces

You can configure multiple source-specific multicast (SSM) maps so that different groups map to different sources, which enables a single multicast group to map to different sources for different interfaces.

Example: Configuring Multiple SSM Maps Per Interface

This example shows how to assign more than one SSM map to an IGMP interface.

- [Requirements on page 4899](#)
- [Overview on page 4899](#)
- [Configuration on page 4900](#)
- [Verification on page 4901](#)

Requirements

This example requires Junos OS Release 11.4 or later.

Overview

In this example, you configure a routing policy, `POLICY-ipv4-example1`, that maps multicast group join messages over an IGMP logical interface to IPv4 multicast source addresses based on destination IP address as follows:

Routing Policy Name	Multicast Group Join Messages for a Route Filter at This Destination Address	Multicast Source Addresses
POLICY-ipv4-example1 term 1	232.1.1.1	10.10.10.4, 192.168.43.66

Routing Policy Name	Multicast Group Join Messages for a Route Filter at This Destination Address	Multicast Source Addresses
POLICY-ipv4-example1 term 2	232.1.1.2	10.10.10.5, 192.168.43.67

You apply routing policy POLICY-ipv4-example1 to IGMP logical interface fe-0/1/0.0.

### Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see the *CLI User Guide*.

To configure this example, perform the following task:

#### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set policy-options policy-statement POLICY-ipv4-example1 term 1 from route-filter
  232.1.1.1/32 exact
set policy-options policy-statement POLICY-ipv4-example1 term 1 then ssm-source
  10.10.10.4
set policy-options policy-statement POLICY-ipv4-example1 term 1 then ssm-source
  192.168.43.66
set policy-options policy-statement POLICY-ipv4-example1 term 1 then accept
set policy-options policy-statement POLICY-ipv4-example1 term 2 from route-filter
  232.1.1.2/32 exact
set policy-options policy-statement POLICY-ipv4-example1 term 2 then ssm-source
  10.10.10.5
set policy-options policy-statement POLICY-ipv4-example1 term 2 then ssm-source
  192.168.43.67
set policy-options policy-statement POLICY-ipv4-example1 term 2 then accept
set protocols igmp interface fe-0/1/0.0 ssm-map-policy POLICY-ipv4-example1
```

#### Step-by-Step Procedure

To configure multiple SSM maps per interface:

1. Configure protocol-independent routing options for route filter 232.1.1.1, and specify the multicast source addresses to which matching multicast groups are to be mapped.

```
[edit policy-options policy-statement POLICY-ipv4-example1 term 1]
user@host# set from route-filter 232.1.1.1/32 exact
user@host# set then ssm-source 10.10.10.4
user@host# set then ssm-source 192.168.43.66
user@host# set then accept
```

2. Configure protocol-independent routing options for route filter 232.1.1.2, and specify the multicast source addresses to which matching multicast groups are to be mapped.

```
[edit policy-options policy-statement POLICY-ipv4-example1 term 2]
user@host# set from route-filter 232.1.1.2/32 exact
user@host# set then ssm-source 10.10.10.5
```

```
user@host# set then ssm-source 192.168.43.67
user@host# set then accept
```

3. Apply the policy map POLICY-ipv4-example1 to IGMP logical interface fe-0/1/1/0.

```
[edit protocols igmp interface fe-0/1/0.0]
user@host# set ssm-map-policy POLICY-ipv4-example1
```

**Results** After the configuration is committed, confirm the configuration by entering the **show policy-options** and **show protocols** configuration mode commands. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
user@host#> show policy-options
policy-statement POLICY-ipv4-example1 {
  term 1 {
    from {
      route-filter 232.1.1.1/32 exact;
    }
    then {
      ssm-source [ 10.10.10.4 192.168.43.66 ];
      accept;
    }
  }
  term 2 {
    from {
      route-filter 232.1.1.2/32 exact;
    }
    then {
      ssm-source [ 10.10.10.5 192.168.43.67 ];
      accept;
    }
  }
}

user@host# show protocols
igmp {
  interface fe-0/1/0.0 {
    ssm-map-policy POLICY-ipv4-example1;
  }
}
```

### Verification

Confirm that the configuration is working properly.

- [Displaying Information About IGMP-Enabled Interfaces on page 4901](#)
- [Displaying the PIM Groups on page 4902](#)
- [Displaying the Entries in the IP Multicast Forwarding Table on page 4902](#)

### Displaying Information About IGMP-Enabled Interfaces

**Purpose** Verify that the SSM map policy POLICY-ipv4-example1 is applied to logical interface fe-0/1/0.0.

**Action** Use the [show igmp interface](#) operational mode command for the IGMP logical interface to which you applied the SSM map policy.

```
user@host> show igmp interface
Interface: fe-0/1/0.0
  Querier: 10.111.30.1
  State:      Up Timeout:      None Version:  2 Groups:      2
  SSM Map Policy: POLICY-ipv4-example1;
```

```
Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2
```

```
Derived Parameters:
IGMP Membership Timeout: 260.0
IGMP Other Querier Present Timeout: 255.0
```

The command output displays the name of IGMP logical interface (fe-0/1/0.0), the address of the routing device that has been elected to send membership queries and group information.

#### *Displaying the PIM Groups*

**Purpose** Verify the Protocol Independent Multicast (PIM) source and group pair (S,G) entries.

**Action** Use the [show pim join extensive 232.1.1.1](#) operational mode command to display the PIM source and group pair (S,G) entries for the 232.1.1.1 group.

#### *Displaying the Entries in the IP Multicast Forwarding Table*

**Purpose** Verify that the IP multicast forwarding table displays the mroute state.

**Action** Use the [show multicast route extensive](#) operational mode command to display the entries in the IP multicast forwarding table to verify that the **Route state** is active and that the **Forwarding state** is forwarding.

<b>Description</b>	Configure properties for anycast RP using PIM.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring PIM Anycast With or Without MSDP on page 4799</a></li></ul>

## assert-timeout

---

<b>Syntax</b>	<code>assert-timeout <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim], [edit protocols pim], [edit routing-instances <i>routing-instance-name</i> protocols pim]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Multicast routing devices running PIM sparse mode often forward the same stream of multicast packets onto the same LAN through the rendezvous-point tree (RPT) and shortest-path tree (SPT). PIM assert messages help routing devices determine which routing device forwards the traffic and prunes the RPT for this group. By default, routing devices enter an assert cycle every 180 seconds. You can configure this assert timeout to be between 5 and 210 seconds.
<b>Options</b>	<b><i>seconds</i></b> —Time for routing device to wait before another assert message cycle. <b>Range:</b> 5 through 210 seconds <b>Default:</b> 180 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring the PIM Assert Timeout on page 4815</a></li> </ul>

## authentication (Protocols PIM)

---

<b>Syntax</b>	<pre>authentication {   algorithm <i>algorithm-name</i>;   key-chain <i>key-chain-name</i>;   loose-check; }</pre>
<b>Hierarchy Level</b>	[edit protocols pim interface <i>interface-name</i> family (inet   inet6) bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols pim interface family (inet   inet6) <i>interface-name</i> bfd-liveness-detection]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure the algorithm, security keychain, and level of authentication for BFD sessions running on PIM interfaces.  The remaining statements are explained separately.
<b>Options</b>	The statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring BFD Authentication for PIM on page 4823</a></li><li>• <a href="#">Configuring BFD for PIM on page 4821</a></li><li>• <a href="#">Understanding Bidirectional Forwarding Detection Authentication for PIM</a></li><li>• <a href="#">bfd-liveness-detection on page 4911</a></li><li>• <a href="#">key-chain (Protocols PIM) on page 4934</a></li><li>• <a href="#">loose-check on page 4937</a></li></ul>

## bfd-liveness-detection (Protocols PIM)

<b>Syntax</b>	<pre> bfd-liveness-detection {   authentication {     algorithm <i>algorithm-name</i>;     key-chain <i>key-chain-name</i>;     loose-check;   }   detection-time {     threshold <i>milliseconds</i>;   }   minimum-interval <i>milliseconds</i>;   minimum-receive-interval <i>milliseconds</i>;   multiplier <i>number</i>;   no-adaptation;   transmit-interval {     minimum-interval <i>milliseconds</i>;     threshold <i>milliseconds</i>;   }   version (0   1   automatic); } </pre>
<b>Hierarchy Level</b>	<p>[edit protocols pim interface <i>interface-name</i> <i>family</i> (inet   inet6)],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> <i>family</i> (inet   inet6)]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.1.</p> <p><b>authentication</b> option introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure bidirectional forwarding detection (BFD) timers and authentication for PIM.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring BFD for PIM on page 4821</a></li> <li>• <a href="#">Configuring BFD Authentication for PIM on page 4823</a></li> </ul>

## bootstrap

---

<b>Syntax</b>	<pre>bootstrap {     family (inet   inet6) {         export [ <i>policy-names</i> ];         import [ <i>policy-names</i> ];         priority <i>number</i>;     } }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim <b>rp</b> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim <b>rp</b> ], [edit protocols pim <b>rp</b> ], [edit routing-instances <i>routing-instance-name</i> protocols pim <b>rp</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.6. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Configure parameters to control bootstrap routers and messages.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring PIM Bootstrap Properties for IPv4</i></li><li>• <i>Configuring PIM Bootstrap Properties for IPv4 or IPv6</i></li></ul>

## bootstrap-export

---

<b>Syntax</b>	<code>bootstrap-export [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols pim <a href="#">rp</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim <a href="#">rp</a>],</p> <p>[edit protocols pim <a href="#">rp</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols pim <a href="#">rp</a>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Apply one or more export policies to control outgoing PIM bootstrap messages.
<b>Options</b>	<i>policy-names</i> —Name of one or more import policies.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring PIM Bootstrap Properties for IPv4</i></li> <li>• <i>Configuring PIM Bootstrap Properties for IPv4 or IPv6</i></li> <li>• <a href="#">bootstrap-import on page 4914</a></li> </ul>

## bootstrap-import

---

<b>Syntax</b>	<code>bootstrap-import [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols pim <a href="#">rp</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>pim <a href="#">rp</a>],</code> <code>[edit protocols pim <a href="#">rp</a>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols pim <a href="#">rp</a>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Apply one or more import policies to control incoming PIM bootstrap messages.
<b>Options</b>	<i>policy-names</i> —Name of one or more import policies.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring PIM Bootstrap Properties for IPv4</i></li><li>• <i>Configuring PIM Bootstrap Properties for IPv4 or IPv6</i></li><li>• <a href="#">bootstrap-export on page 4913</a></li></ul>

## bootstrap-priority

<b>Syntax</b>	<code>bootstrap-priority <i>number</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols pim <i>rp</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim <i>rp</i>],</p> <p>[edit protocols pim <i>rp</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols pim <i>rp</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Configure whether this routing device is eligible to be a bootstrap router. In the case of a tie, the routing device with the highest IP address is elected to be the bootstrap router.
<b>Options</b>	<p><i>number</i>—Priority for becoming the bootstrap router. A value of 0 means that the routing device is not eligible to be the bootstrap router.</p> <p><b>Range:</b> 0 through 255</p> <p><b>Default:</b> 0</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring PIM Bootstrap Properties for IPv4</i></li> </ul>

## detection-time (BFD for PIM)

---

Syntax	<pre>detection-time {     threshold milliseconds; }</pre>
Hierarchy Level	[edit protocols pim interface <i>interface-name</i> bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> bfd-liveness-detection]
Release Information	Statement introduced in Junos OS Release 8.2. Statement introduced in Junos OS Release 9.0 for EX Series switches. Support for BFD authentication introduced in Junos OS Release 9.6. Statement introduced in Junos OS Release 12.1 for the QFX Series.
Description	<p>Enable BFD failure detection. The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the <b>clear bfd adaptation</b> command to return BFD interval timers to their configured values. The <b>clear bfd adaptation</b> command is hitless, meaning that the command does not affect traffic flow on the routing device.</p> <p>The remaining statement is explained separately.</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring BFD for PIM on page 4821</a></li><li>• <a href="#">bfd-liveness-detection on page 4911</a></li><li>• <a href="#">threshold on page 4964</a></li></ul>

## disable (PIM)

<b>Syntax</b>	disable;
<b>Hierarchy Level</b>	<pre> [edit logical-systems <i>logical-system-name</i> protocols pim], [edit logical-systems <i>logical-system-name</i> protocols pim <b>family</b> (inet   inet6)], [edit logical-systems <i>logical-system-name</i> protocols pim interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> protocols pim <b>rp local family</b> (inet   inet6)], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   pim], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   pim interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   pim <b>rp local family</b> (inet   inet6)], [edit protocols pim], [edit protocols pim <b>family</b> (inet   inet6)], [edit protocols pim interface <i>interface-name</i>], [edit protocols pim <b>rp local family</b> (inet   inet6)], [edit routing-instances <i>routing-instance-name</i> protocols pim], [edit routing-instances <i>routing-instance-name</i> protocols pim <b>family</b> (inet   inet6)], [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols pim <b>rp local family</b> (inet   inet6)] </pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p><b>disable</b> statement extended to the <b>[family]</b> hierarchy level in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Explicitly disable PIM at the protocol, interface or family hierarchy levels.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Disabling PIM on page 4782</li> <li><i>disable (PIM Graceful Restart)</i></li> </ul>

## dr-election-on-p2p

---

<b>Syntax</b>	dr-election-on-p2p;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim], [edit protocols pim], [edit routing-instances <i>routing-instance-name</i> protocols pim]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.1. Statement introduced in Junos OS Release 9.1 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Enable PIM designated router (DR) election on point-to-point (P2P) links.
<b>Default</b>	No PIM DR election is performed on point-to-point links.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring PIM Designated Router Election on Point-to-Point Links on page 4785</a></li></ul>

## dr-register-policy

---

<b>Syntax</b>	dr-register-policy [ <i>policy-names</i> ];
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim <i>rp</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim <i>rp</i> ], [edit protocols pim <i>rp</i> ], [edit routing-instances <i>routing-instance-name</i> protocols pim <i>rp</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.6. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Apply one or more policies to control outgoing PIM register messages.
<b>Options</b>	<i>policy-names</i> —Name of one or more import policies.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Register Message Filters on a PIM RP and DR on page 4813</a></li><li>• <a href="#">rp-register-policy on page 4958</a></li></ul>

## embedded-rp

<b>Syntax</b>	<pre> embedded-rp {   group-ranges {     destination-ip-prefix&lt;/prefix-length&gt;;   }   maximum-rps limit; } </pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols pim <b>rp</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim <b>rp</b>],</p> <p>[edit protocols pim <b>rp</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols pim <b>rp</b>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Configure properties for embedded IP version 6 (IPv6) RPs.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring PIM Embedded RP for IPv6</i></li> </ul>

## export (Protocols PIM Bootstrap)

---

<b>Syntax</b>	<code>export [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim <a href="#">rp bootstrap family</a> (inet   inet6)], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim <a href="#">rp bootstrap family</a> (inet   inet6)], [edit protocols pim <a href="#">rp bootstrap family</a> (inet   inet6)], [edit routing-instances <i>routing-instance-name</i> protocols pim <a href="#">rp bootstrap family</a> (inet   inet6)]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.6. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Apply one or more export policies to control outgoing PIM bootstrap messages.
<b>Options</b>	<i>policy-names</i> —Name of one or more import policies.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring PIM Bootstrap Properties for IPv4</a></li><li>• <a href="#">Configuring PIM Bootstrap Properties for IPv4 or IPv6</a></li><li>• <a href="#">import (Protocols PIM Bootstrap) on page 4928</a></li></ul>

## export (Protocols PIM)

---

<b>Syntax</b>	<code>export [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim], [edit protocols pim], [edit routing-instances <i>routing-instance-name</i> protocols pim]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Apply one or more export policies to control outgoing PIM join and prune messages. PIM join and prune filters can be applied to PIM-SM and PIM-SSM messages. PIM join and prune filters cannot be applied to PIM-DM messages.
<b>Required Privilege Level</b>	view-level—To view this statement in the configuration. control-level—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Filtering Outgoing PIM Join Messages on page 4811</a></li></ul>

## family (Bootstrap)

<b>Syntax</b>	<pre>family (inet   inet6) {     export [ <i>policy-names</i> ];     import [ <i>policy-names</i> ];     priority <i>number</i>; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols pim <b>rp bootstrap</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim <b>rp bootstrap</b>],</p> <p>[edit protocols pim <b>rp bootstrap</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols pim <b>rp bootstrap</b>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 7.6.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Configure which IP protocol type bootstrap properties to apply.
<b>Options</b>	<p><b>inet</b>—Apply IP version 4 (IPv4) local RP properties.</p> <p><b>inet6</b>—Apply IPv6 local RP properties.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring PIM Bootstrap Properties for IPv4</i></li> <li>• <i>Configuring PIM Bootstrap Properties for IPv4 or IPv6</i></li> </ul>

## family (Protocols PIM)

---

<b>Syntax</b>	family (inet   inet6) { disable; }
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim], [edit protocols pim], [edit routing-instances <i>routing-instance-name</i> protocols pim], [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6. Statement introduced in Junos OS 11.3 for the QFX Series.
<b>Description</b>	Enable the PIM protocol for the specified family.
<b>Options</b>	<b>inet</b> —Enable the PIM protocol for the IP version 4 (IPv4) address family.  <b>inet6</b> —Enable the PIM protocol for the IP version 6 (IPv6) address family.  The remaining statement is explained separately.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Disabling PIM on page 4782</a></li><li>• <i>disable (PIM Graceful Restart)</i></li><li>• <a href="#">disable (PIM) on page 4917</a></li></ul>

## family (Local RP)

<b>Syntax</b>	<pre>family (inet   inet6) {     disable;     address address;     anycast-pim {         local-address address;         rp-set {             address address &lt;forward-msdp-sa&gt;;         }     }     group-ranges {         destination-ip-prefix &lt;/prefix-length&gt;;     }     hold-time seconds;     override;     priority number; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols pim <b>rp local</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim <b>rp local</b>],</p> <p>[edit protocols pim <b>rp local</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols pim <b>rp local</b>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Configure which IP protocol type local RP properties to apply.
<b>Options</b>	<p><b>inet</b>—Apply IP version 4 (IPv4) local RP properties.</p> <p><b>inet6</b>—Apply IPv6 local RP properties.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Configuring Local PIM RPs on page 4795</a></li> </ul>

## group (RPF Selection)

---

<b>Syntax</b>	<pre>group group-address{   source source-address {     next-hop next-hop-address;   }   wildcard-source {     next-hop next-hop-address;   } }</pre>
<b>Hierarchy Level</b>	[edit routing-instances <i>routing-instance-name</i> edit protocols pim rpf-selection]
<b>Release Information</b>	Statement introduced in JUNOS Release 10.4. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Configure the PIM group address for which you configure RPF selection <a href="#">group (RPF Selection)</a> .
<b>Default</b>	By default, PIM RPF selection is not configured.
<b>Options</b>	<b>group-address</b> —PIM group address for which you configure RPF selection.
<b>Required Privilege Level</b>	view-level—To view this statement in the configuration. control-level—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Configuring PIM RPF Selection</i></li></ul>

## group-ranges

<b>Syntax</b>	<pre>group-ranges {     destination-ip-prefix&lt;/prefix-length&gt;; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols pim rp bidirectional address <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols pim <b>rp embedded-rp</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>instance-name</i> protocols pim rp bidirectional address <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim <b>rp embedded-rp</b>],</p> <p>[edit protocols pim rp bidirectional address <i>address</i>],</p> <p>[edit protocols pim <b>rp embedded-rp</b>],</p> <p>[edit protocols pim <b>rp local family</b> (inet   inet6)],</p> <p>[edit protocols pim <b>rp static address</b> <i>address</i>],</p> <p>[edit routing-instances <i>instance-name</i> protocols pim rp bidirectional address <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols pim <b>rp embedded-rp</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols pim <b>rp local family</b> (inet   inet6)],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols pim <b>rp static address</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Support for bidirectional RP addresses introduced in Junos OS Release 12.1.</p> <p>Statement introduced in Junos OS Release 13.3 for the PTX5000 router.</p>
<b>Description</b>	Configure the address ranges of the multicast groups for which this routing device can be a rendezvous point (RP).
<b>Default</b>	The routing device is eligible to be the RP for all IPv4 or IPv6 groups (224.0.0.0/4 or FF70::/12 to FFF0::/12).
<b>Options</b>	<b><i>destination-ip-prefix&lt;/prefix-length&gt;</i></b> —Addresses or address ranges for which this routing device can be an RP.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Local PIM RPs on page 4795</a> in the <i>Multicast Protocols Feature Guide for Routing Devices</i></li> <li>• <i>Configuring PIM Embedded RP for IPv6</i> in the <i>Multicast Protocols Feature Guide for Routing Devices</i></li> <li>• <i>Example: Configuring Bidirectional PIM</i></li> </ul>

## hello-interval (Protocols PIM)

---

<b>Syntax</b>	hello-interval <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> ], [edit protocols pim interface <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Specify how often the routing device sends PIM hello packets out of an interface.
<b>Options</b>	<b><i>seconds</i></b> —Length of time between PIM hello packets. <b>Range:</b> 0 through 255 <b>Default:</b> 30 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">hold-time on page 4927</a></li><li>• <a href="#">Modifying the PIM Hello Interval on page 4778</a></li></ul>

## hold-time (Protocols PIM)

<b>Syntax</b>	<code>hold-time seconds;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols pim rp bidirectional address <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>instance-name</i> protocols pim rp bidirectional address <i>address</i>],</p> <p>[edit protocols pim rp bidirectional address <i>address</i>],</p> <p>[edit protocols pim <b>rp local family</b> (inet   inet6)],</p> <p>[edit routing-instances <i>instance-name</i> protocols pim rp bidirectional address <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols pim <b>rp local family</b> (inet   inet6)]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Support for bidirectional RP addresses introduced in Junos OS Release 12.1.</p> <p>Statement introduced in Junos OS Release 13.3 for the PTX5000 router.</p>
<b>Description</b>	Specify the time period for which a neighbor is to consider the sending routing device (this routing device) to be operative (up).
<b>Options</b>	<p><b>seconds</b>—Hold time.</p> <p><b>Range:</b> 0 through 255</p> <p><b>Default:</b> 150 seconds</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Local PIM RPs on page 4795</a> in the <i>Multicast Protocols Feature Guide for Routing Devices</i></li> <li>• <i>Example: Configuring Bidirectional PIM</i></li> </ul>

## import (Protocols PIM Bootstrap)

---

<b>Syntax</b>	<code>import [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim <b>rp bootstrap</b> (inet   inet6)], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim <b>rp bootstrap</b> (inet   inet6)], [edit protocols pim <b>rp bootstrap</b> (inet   inet6)], [edit routing-instances <i>routing-instance-name</i> protocols pim <b>rp bootstrap</b> (inet   inet6)]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.6. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Apply one or more import policies to control incoming PIM bootstrap messages.
<b>Options</b>	<i>policy-names</i> —Name of one or more import policies.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring PIM Bootstrap Properties for IPv4</i></li><li>• <i>Configuring PIM Bootstrap Properties for IPv4 or IPv6</i></li><li>• <a href="#">export (Protocols PIM Bootstrap) on page 4920</a></li></ul>

## import (Protocols PIM)

---

<b>Syntax</b>	<code>import [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols pim],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim],</p> <p>[edit protocols pim],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols pim]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Apply one or more policies to routes being imported into the routing table from PIM. Use the <b>import</b> statement to filter PIM join messages and prevent them from entering the network.
<b>Options</b>	<i>policy-names</i> —Name of one or more policies.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Filtering Incoming PIM Join Messages on page 4812</a></li> </ul>

## infinity

---

<b>Syntax</b>	<code>infinity [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols pim <a href="#">spt-threshold</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>pim <a href="#">spt-threshold</a>],</code> <code>[edit protocols pim <a href="#">spt-threshold</a>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols pim <a href="#">spt-threshold</a>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Apply one or more policies to set the SPT threshold to infinity for a source-group address pair. Use the <b>infinity</b> statement to prevent the last-hop routing device from transitioning from the RPT rooted at the RP to an SPT rooted at the source for that source-group address pair.
<b>Options</b>	<i>policy-names</i> —Name of one or more policies.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring the PIM SPT Threshold Policy on page 4818</a></li></ul>

## interface

<b>Syntax</b>	<pre> <b>interface</b> (all   <i>interface-name</i>) {     <b>disable</b>;     family (inet   inet6) {         <b>disable</b>;     }     <b>hello-interval</b> <i>seconds</i>;     mode (dense   sparse   sparse-dense);     <b>neighbor-policy</b> [ <i>policy-names</i> ];     <b>override-interval</b> <i>milliseconds</i>;     <b>priority</b> <i>number</i>;     <b>propagation-delay</b> <i>milliseconds</i>;     <b>reset-tracking-bit</b>;     <b>version</b> <i>version</i>; } </pre>
<b>Hierarchy Level</b>	[edit protocols pim], [edit routing-instances <i>routing-instance-name</i> protocols pim]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Enable PIM on an interface and configure interface-specific properties.
<b>Options</b>	<p><b><i>interface-name</i></b>—Name of the interface. Specify the full interface name, including the physical and logical address components. To configure all interfaces, you can specify <b>all</b>.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">PIM on Aggregated Interfaces on page 4740</a></li> </ul>

## join-load-balance

---

<b>Syntax</b>	<pre>join-load-balance {     automatic; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim], [edit protocols pim], [edit routing-instances <i>routing-instance-name</i> protocols pim]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Enable load balancing of PIM join messages across interfaces and routing devices.
<b>Options</b>	<b>automatic</b> —Enables automatic load balancing of PIM join messages. When a new interface or neighbor is introduced into the network, ECMP joins are redistributed with minimal disruption to traffic.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Configuring PIM Make-Before-Break Join Load Balancing</i></li><li>• <a href="#">Configuring PIM Join Load Balancing on page 4787</a></li><li>• <i>clear pim join-distribution</i> in the <a href="#">CLI Explorer</a></li></ul>

## join-prune-timeout

---

<b>Syntax</b>	join-prune-timeout <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim], [edit protocols pim], [edit routing-instances <i>routing-instance-name</i> protocols pim]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.4. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Configure the timeout for the join state. If the periodic join refresh message is not received before the timeout expires, the join state is removed.
<b>Options</b>	<b>seconds</b> —Number of seconds to wait for the periodic join message to arrive. <b>Range:</b> 210 through 240 seconds <b>Default:</b> 210 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Modifying the Join State Timeout on page 4790</a></li> </ul>

## key-chain (Protocols PIM)

---

<b>Syntax</b>	<code>key-chain <i>key-chain-name</i>;</code>
<b>Hierarchy Level</b>	[edit protocols pim interface <i>interface-name</i> family {inet   inet6} bfd-liveness-detection authentication], [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> family {inet   inet6} bfd-liveness-detection authentication]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6. Statement introduced in Junos OS Release 12.1 for the QFX Series. Statement modified in Junos OS Release 12.2 to include <b>family</b> in the hierarchy level.
<b>Description</b>	Specify the security keychain to use for BFD authentication.
<b>Options</b>	<b><i>key-chain-name</i></b> —Name of the security keychain to use for BFD authentication. The name is a unique integer between <b>0</b> and <b>63</b> . This must match one of the keychains in the <b>authentication-key-chains</b> statement at the [edit security] hierarchy level.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring BFD Authentication for PIM on page 4823</a></li><li>• <a href="#">Understanding Bidirectional Forwarding Detection Authentication for PIM authentication on page 4910</a></li></ul>

## local

<b>Syntax</b>	<pre> local {   disable;   address address;   family (inet   inet6) {     disable;     address address;     anycast-pim {       local-address address;       rp-set {         address address &lt;forward-msdp-sa&gt;;       }     }     group-ranges {       destination-ip-prefix &lt;/prefix-length&gt;;     }     hold-time seconds;     override;     priority number;   }   group-ranges {     destination-ip-prefix &lt;/prefix-length&gt;;   }   hold-time seconds;   override;   priority number; } </pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols pim <b>rp</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim <b>rp</b>],</p> <p>[edit protocols pim <b>rp</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols pim <b>rp</b>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>The remaining statements are explained separately.</p>
<b>Description</b>	Configure the routing device's RP properties.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Configuring Local PIM RPs on page 4795</a></li> </ul>

## local-address (Protocols PIM)

---

<b>Syntax</b>	<code>local-address <i>address</i>;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols pim <b>rp local family</b> (inet   inet6) <b>anycast-pim</b>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim <b>rp local family</b> (inet   inet6) <b>anycast-pim</b>],</code> <code>[edit protocols pim <b>rp local family</b> (inet   inet6) <b>anycast-pim</b>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols pim <b>rp local family</b> (inet   inet6) <b>anycast-pim</b>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Configure the routing device local address for the anycast rendezvous point (RP). If this statement is omitted, the router ID is used as this address.
<b>Options</b>	<b><i>address</i></b> —Anycast RP IPv4 or IPv6 address, depending on <b>family</b> configuration.
<b>Required Privilege Level</b>	<code>routing</code> —To view this statement in the configuration. <code>routing-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring PIM Anycast With or Without MSDP on page 4799</a></li></ul>

## loose-check

---

<b>Syntax</b>	loose-check;
<b>Hierarchy Level</b>	[edit protocols pim interface <i>interface-name</i> bfd-liveness-detection authentication], [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> bfd-liveness-detection authentication]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Specify loose authentication checking on the BFD session. Use loose authentication for transitional periods only when authentication might not be configured at both ends of the BFD session.</p> <p>By default, strict authentication is enabled and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure <i>loose checking</i>. When loose checking is configured, packets are accepted without authentication being checked at each end of the session.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring BFD Authentication for PIM on page 4823</a></li> <li>• <a href="#">Understanding Bidirectional Forwarding Detection Authentication for PIM authentication on page 4910</a></li> </ul>

## maximum-rps

---

<b>Syntax</b>	<code>maximum-rps <i>limit</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim <a href="#">rp embedded-rp</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim <a href="#">rp embedded-rp</a> ], [edit protocols pim <a href="#">rp embedded-rp</a> ], [edit routing-instances <i>routing-instance-name</i> protocols pim <a href="#">rp embedded-rp</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Limit the number of RPs that the routing device acknowledges.
<b>Options</b>	<i>limit</i> —Number of RPs. <b>Range:</b> 1 through 500 <b>Default:</b> 100
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring PIM Embedded RP for IPv6</i></li></ul>

## minimum-interval (PIM BFD Liveness Detection)

<b>Syntax</b>	<code>minimum-interval <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	[edit protocols pim interface <i>interface-name</i> <b>bfd-liveness-detection</b> ], [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> <b>bfd-liveness-detection</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.1. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure the minimum interval after which the local routing device transmits hello packets and then expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the <b>transmit-interval</b> <b>minimum-interval</b> and <b>minimum-receive-interval</b> statements.
<b>Options</b>	<b><i>milliseconds</i></b> —Minimum transmit and receive interval. <b>Range:</b> 1 through 255,000 milliseconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring BFD for PIM on page 4821</a></li> </ul>

## minimum-interval (PIM BFD Transmit Interval)

---

<b>Syntax</b>	<code>minimum-interval <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	[edit protocols pim interface <i>interface-name</i> bfd-liveness-detection transmit-interval], [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> bfd-liveness-detection transmit-interval]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.2. Statement introduced in Junos OS Release 9.0 for EX Series switches. Support for BFD authentication introduced in Junos OS Release 9.6. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure the minimum interval after which the local routing device transmits hello packets to a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit interval using the <b>minimum-interval</b> statement at the [edit protocols pim interface <i>interface-name</i> bfd-liveness-detection] hierarchy level.
<b>Options</b>	<i>milliseconds</i> —Minimum transmit interval value. <b>Range:</b> 1 through 255,000

**NOTE:** The threshold value specified in the **threshold** statement must be greater than the value specified in the **minimum-interval** statement for the **transmit-interval** statement.

---

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring BFD for PIM on page 4821</a></li><li>• <a href="#">bfd-liveness-detection on page 4911</a></li><li>• <a href="#">minimum-interval on page 4939</a></li><li>• <a href="#">threshold on page 4965</a></li></ul>

## minimum-receive-interval

<b>Syntax</b>	minimum-receive-interval <i>milliseconds</i> ;
<b>Hierarchy Level</b>	[edit protocols pim interface <i>interface-name</i> <b>bfd-liveness-detection</b> ], [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> <b>bfd-liveness-detection</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.1. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure the minimum interval after which the local routing device must receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the <b>minimum-interval</b> statement at the [edit protocols pim interface <i>interface-name</i> <b>bfd-liveness-detection</b> ] hierarchy level.
<b>Options</b>	<i>milliseconds</i> —Minimum receive interval. <b>Range:</b> 1 through 255,000 milliseconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring BFD for PIM on page 4821</a></li> </ul>

## mode (Protocols PIM)

---

<b>Syntax</b>	mode (dense   sparse   sparse-dense);
<b>Hierarchy Level</b>	[edit protocols pim interface <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Configure PIM to operate in sparse, dense, or sparse-dense mode.

**NOTE:** The QFX Series does not support dense or sparse-dense mode.

---

<b>Options</b>	<b>dense</b> —Operate in dense mode.  <b>sparse</b> —Operate in sparse mode.  <b>sparse-dense</b> —Operate in sparse-dense mode. <b>Default:</b> sparse
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## multiplier

---

<b>Syntax</b>	multiplier <i>number</i> ;
<b>Hierarchy Level</b>	[edit protocols pim interface <i>interface-name</i> <b>bfd-liveness-detection</b> ], [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> <b>bfd-liveness-detection</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.1. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.
<b>Options</b>	<b>number</b> —Number of hello packets. <b>Range:</b> 1 through 255 <b>Default:</b> 3
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring BFD for PIM on page 4821</a></li></ul>

## neighbor-policy

<b>Syntax</b>	<code>neighbor-policy [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> ], [edit protocols pim interface <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.2. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Apply a PIM interface-level policy to filter neighbor IP addresses.
<b>Options</b>	<i>policy-name</i> —Name of the policy that filters neighbor IP addresses.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Interface-Level PIM Neighbor Policies on page 4810</a></li> </ul>

## next-hop (PIM RPF Selection)

<b>Syntax</b>	<code>next-hop <i>next-hop-address</i>;</code>
<b>Hierarchy Level</b>	[edit routing-instances <i>routing-instance-name</i> protocols pim rpf-selection group <i>group-address</i> source <i>source-address</i> ], [edit routing-instances <i>routing-instance-name</i> protocols pim rpf-selection group <i>group-address</i> wildcard-source], [edit routing-instances <i>routing-instance-name</i> protocols pim rpf-selection prefix-list <i>prefix-list-addresses</i> source <i>source-address</i> ], [edit routing-instances <i>routing-instance-name</i> protocols pim rpf-selection prefix-list <i>prefix-list-addresses</i> wildcard-source]
<b>Release Information</b>	Statement introduced in JUNOS Release 10.4. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Configure the specific next-hop address for the PIM group source.
<b>Options</b>	<i>next-hop-address</i> —Specific next-hop address for the PIM group source.
<b>Required Privilege Level</b>	view-level—To view this statement in the configuration. control-level—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring PIM RPF Selection</a></li> </ul>

## no-adaptation (PIM BFD Liveness Detection)

---

<b>Syntax</b>	no-adaptation;
<b>Hierarchy Level</b>	[edit protocols pim interface <i>interface-name</i> bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> bfd-liveness-detection]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 Statement introduced in Junos OS Release 9.0 for EX Series switches. Support for BFD authentication introduced in Junos OS Release 9.6. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure BFD sessions not to adapt to changing network conditions. We recommend that you <i>do not</i> disable BFD adaptation unless it is preferable to have BFD adaptation disabled in your network.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring BFD for PIM on page 4821</a></li><li>• <a href="#">bfd-liveness-detection on page 4911</a></li></ul>

## override-interval

<b>Syntax</b>	<code>override-interval <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols pim],  [edit logical-systems <i>logical-system-name</i> protocols pim interface <i>interface-name</i>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i>],  [edit protocols pim],  [edit protocols pim interface <i>interface-name</i>],  [edit routing-instances <i>routing-instance-name</i> protocols pim]  [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.1.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Set the maximum time in milliseconds to delay sending override join messages for a multicast network that has join suppression enabled. When a router or switch sees a prune message for a join it is currently suppressing, it waits for the interval specified by the override timer before it sends an override join message.
<b>Options</b>	<p>This is a random timer with a value in milliseconds.</p> <p><b>Range:</b> 0 through maximum override value</p> <p><b>Default:</b> 2000 milliseconds</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Enabling Join Suppression on page 4791</a></li> <li>• <a href="#">propagation-delay on page 4953</a></li> <li>• <a href="#">reset-tracking-bit on page 4954</a></li> </ul>

## pim

---

```
Syntax  pim {
    disable;
    assert-timeout seconds;
    dense-groups {
        addresses;
    }
    dr-election-on-p2p;
    export;
    family (inet | inet6) {
        disable;
    }
    graceful-restart {
        disable;
        restart-duration seconds;
    }
    import [ policy-names ];
    interface interface-name {
        accept-remote-source;
        disable;
        family (inet | inet6) {
            disable;
        }
        hello-interval seconds;
        mode (dense | sparse | sparse-dense);
        neighbor-policy [ policy-names ];
        override-interval milliseconds;

## priority (Bootstrap)

---

<b>Syntax</b>	<code>priority <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim <b>rp bootstrap</b> (inet   inet6)], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim <b>rp bootstrap</b> (inet   inet6)], [edit protocols pim <b>rp bootstrap</b> (inet   inet6)], [edit routing-instances <i>routing-instance-name</i> protocols pim <b>rp bootstrap</b> (inet   inet6)]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.6. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Configure the routing device's likelihood to be elected as the bootstrap router.
<b>Options</b>	<b>number</b> —Routing device's priority for becoming the bootstrap router. A higher value corresponds to a higher priority. <b>Range:</b> 0 through a 32-bit number <b>Default:</b> 0 (The routing device has the least likelihood of becoming the bootstrap router and sends packets with a priority of 0.)
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring PIM Bootstrap Properties for IPv4</i></li><li>• <i>Configuring PIM Bootstrap Properties for IPv4 or IPv6</i></li><li>• <a href="#">bootstrap-priority on page 4915</a></li></ul>

## priority (PIM Interfaces)

<b>Syntax</b>	<code>priority <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> ], [edit protocols pim interface <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Configure the routing device's likelihood to be elected as the designated router.
<b>Options</b>	<b><i>number</i></b> —Routing device's priority for becoming the designated router. A higher value corresponds to a higher priority. <b>Range:</b> 0 through 4294967295 <b>Default:</b> 1 (Each routing device has an equal probability of becoming the DR.)
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Interface Priority for PIM Designated Router Selection on page 4784</a></li> </ul>

## priority (PIM RPs)

---

<b>Syntax</b>	<code>priority <i>number</i>;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols pim rp bidirectional address <i>address</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>instance-name</i> protocols pim</code> <code>rp bidirectional address <i>address</i>],</code> <code>[edit protocols pim rp bidirectional address <i>address</i>],</code> <code>[edit protocols pim <b>rp local family</b> (inet   inet6)],</code> <code>[edit routing-instances <i>instance-name</i> protocols pim rp bidirectional address <i>address</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols pim <b>rp local family</b> (inet   inet6)]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series. Support for bidirectional RP addresses introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 13.3 for the PTX5000 router.
<b>Description</b>	For PIM-SM, configure this routing device's priority for becoming an RP.  For bidirectional PIM, configure this RP address' priority for becoming an RP.  The bootstrap router uses this field when selecting the list of candidate rendezvous points to send in the bootstrap message. A smaller number increases the likelihood that the routing device or RP address becomes the RP. A priority value of 0 means that bootstrap router can override the group range being advertised by the candidate RP.
<b>Options</b>	<b><i>number</i></b> —Priority for becoming an RP. A lower value corresponds to a higher priority. <b>Range:</b> 0 through 255 <b>Default:</b> 1
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Local PIM RPs on page 4795</a> in the <i>Multicast Protocols Feature Guide for Routing Devices</i></li><li>• <i>Example: Configuring Bidirectional PIM</i></li></ul>

## propagation-delay

<b>Syntax</b>	<code>propagation-delay <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	<code>[edit protocols pim],</code> <code>[edit protocols pim interface <i>interface-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols pim],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols pim],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols pim interface <i>interface-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>pim interface <i>interface-name</i>]</code>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.1.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Set a delay for implementing a PIM prune message on the upstream routing device on a multicast network for which join suppression has been enabled. The routing device waits for the prune pending period to detect whether a join message is currently being suppressed by another routing device.
<b>Options</b>	<p><b><i>milliseconds</i></b>—Interval for the prune pending timer, which is the sum of the <b>propagation-delay</b> value and the <b>override-interval</b> value.</p> <p><b>Range:</b> 250 through 2000 milliseconds</p> <p><b>Default:</b> 500 milliseconds</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Enabling Join Suppression on page 4791</a></li> <li>• <a href="#">override-interval on page 4945</a></li> <li>• <a href="#">reset-tracking-bit on page 4954</a></li> </ul>

## reset-tracking-bit

---

<b>Syntax</b>	reset-tracking-bit;
<b>Hierarchy Level</b>	[edit protocols pim], [edit protocols pim interface <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols pim], [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> protocols pim], [edit logical-systems <i>logical-system-name</i> protocols pim interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.1. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Change the value of a tracking bit (T-bit) field in the LAN prune delay hello option from the default of 1 to 0, which enables join suppression for a multicast interface. When the network starts receiving multiple identical join messages, join suppression triggers a random timer with a value of 66 through 84 milliseconds ( $1.1 \times$ periodic through $1.4 \times$ periodic, where periodic is 60 seconds). This creates an interval during which no identical join messages are sent. Eventually, only one of the identical messages is sent. Join suppression is triggered each time identical messages are sent for the same join.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Enabling Join Suppression on page 4791</a></li><li>• <a href="#">override-interval on page 4945</a></li><li>• <a href="#">propagation-delay on page 4953</a></li></ul>

## rib-group (Protocols PIM)

---

<b>Syntax</b>	<pre> rib-group {     inet <i>group-name</i>;     inet6 <i>group-name</i>; } </pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim], [edit protocols pim], [edit routing-instances <i>routing-instance-name</i> protocols pim]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Associate a routing table group with PIM.
<b>Options</b>	<i>table-name</i> —Name of the routing table. The name must be one that you defined with the <b>rib-groups</b> statement at the <b>[edit routing-options]</b> hierarchy level.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring a Dedicated PIM RPF Routing Table</i></li> </ul>

## rp

---

```
Syntax  rp {

## rp-register-policy

---

<b>Syntax</b>	rp-register-policy [ <i>policy-names</i> ];
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim <b>rp</b> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim <b>rp</b> ], [edit protocols pim <b>rp</b> ], [edit routing-instances <i>routing-instance-name</i> protocols pim <b>rp</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.6. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Apply one or more policies to control incoming PIM register messages.
<b>Options</b>	<i>policy-names</i> —Name of one or more import policies.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Register Message Filters on a PIM RP and DR on page 4813</a></li><li>• <a href="#">dr-register-policy on page 4918</a></li></ul>

## rp-set

<b>Syntax</b>	<pre>rp-set {   address address &lt;forward-msdp-sa&gt;; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols pim <b>local family</b> (inet   inet6) <b>anycast-pim</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim <b>local family</b> (inet   inet6) <b>anycast-pim</b>],</p> <p>[edit protocols pim <b>local family</b> (inet   inet6) <b>anycast-pim</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols pim <b>local family</b> (inet   inet6) <b>anycast-pim</b>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Configure a set of rendezvous point (RP) addresses for anycast RP. You can configure up to 15 RPs.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring PIM Anycast With or Without MSDP on page 4799</a></li> </ul>

## rpf-selection

---

**Syntax**    `rpf-selection {  
              group group-address {  
                  source source-address {  
                      next-hop next-hop-address;  
                  }  
                  wildcard-source {  
                      next-hop next-hop-address;  
                  }  
              }  
              prefix-list prefix-list-addresses {  
                  source source-address {  
                      next-hop next-hop-address;  
                  }  
                  wildcard-source {  
                      next-hop next-hop-address;  
                  }  
              }  
          }`

**Hierarchy Level**    [edit routing-instances *routing-instance-name* protocols pim]

**Release Information**    Statement introduced in JUNOS Release 10.4.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**    Configure the PIM RPF next-hop neighbor for a specific group and source for a VRF routing instance.

The remaining statements are explained separately.

**Default**    If you omit the **rpf-selection** statement, PIM RPF checks typically choose the best path determined by the unicast protocol for all multicast flows.

**Options**    **source-address**—Specific source address for the PIM group.

**Required Privilege Level**    view-level—To view this statement in the configuration.  
control-level—To add this statement to the configuration.

**Related Documentation**    • *Example: Configuring PIM RPF Selection*

## source (PIM RPF Selection)

---

<b>Syntax</b>	<code>source source-address {     next-hop next-hop-address; }</code>
<b>Hierarchy Level</b>	[edit routing-instances <i>routing-instance-name</i> protocols pim rpf-selection group <i>group-address</i> ], [edit routing-instances <i>routing-instance-name</i> protocols pim rpf-selection prefix-list <i>prefix-list-addresses</i> ]
<b>Release Information</b>	Statement introduced in JUNOS Release 10.4. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Configure the source address for the PIM group.
<b>Options</b>	<b>source-address</b> —Specific source address for the PIM group.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	view-level—To view this statement in the configuration. control-level—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring PIM RPF Selection</i></li> </ul>

## spt-threshold

---

<b>Syntax</b>	spt-threshold { infinfinity [ <i>policy-names</i> ]; }
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim], [edit protocols pim], [edit routing-instances <i>routing-instance-name</i> protocols pim]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	<p>Set the SPT threshold to infinity for a source-group address pair. Last-hop multicast routing devices running PIM sparse mode can forward the same stream of multicast packets onto the same LAN through an RPT rooted at the RP or an SPT rooted at the source. By default, last-hop routing devices transition to a direct SPT to the source. You can configure this routing device to set the SPT transition value to infinity to prevent this transition for any source-group address pair.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring the PIM SPT Threshold Policy on page 4818</a></li></ul>

## static (Protocols PIM)

<b>Syntax</b>	<pre>static {   address address {     group-ranges {       destination-ip-prefix&lt;/prefix-length&gt;;     }     override;     version version;   } }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols pim <b>rp</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim <b>rp</b>],</p> <p>[edit protocols pim <b>rp</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols pim <b>rp</b>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Configure static RP addresses. The default static RP address is 224.0.0.0/4. To configure other addresses, include one or more <b>address</b> statements. You can configure a static RP in a logical system only if the logical system is not directly connected to a source.</p> <p>For each static RP address, you can optionally specify the PIM version and the groups for which this address can be the RP. The default PIM version is version 1.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Static PIM RP Address on the Non-RP Routing Device on page 4797</a></li> </ul>

## threshold (PIM BFD Detection Time)

---

<b>Syntax</b>	<code>threshold <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	[edit protocols pim interface <i>interface-name</i> bfd-liveness-detection detection-time], [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> bfd-liveness-detection detection-time]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.2. Statement introduced in Junos OS Release 9.0 for EX Series switches. Support for BFD authentication introduced in Junos OS Release 9.6. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify the threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**NOTE:** The threshold value must be equal to or greater than the transmit interval.

The threshold time must be equal to or greater than the value specified in the [minimum-interval](#) or the [minimum-receive-interval](#) statement.

---

<b>Options</b>	<i>milliseconds</i> —Value for the detection time adaptation threshold. <b>Range:</b> 1 through 255,000
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring BFD for PIM on page 4821</a></li><li>• <a href="#">bfd-liveness-detection on page 4911</a></li><li>• <a href="#">detection-time on page 4916</a></li><li>• <a href="#">minimum-interval on page 4939</a></li><li>• <a href="#">minimum-receive-interval on page 4941</a></li></ul>

## threshold (PIM BFD Transmit Interval)

<b>Syntax</b>	<code>threshold <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	[edit protocols pim interface <i>interface-name</i> bfd-liveness-detection transmit-interval], [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> bfd-liveness-detection transmit-interval]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.2. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent.
<b>Options</b>	<i>milliseconds</i> —Value for the transmit interval adaptation threshold. <b>Range:</b> 0 through 4,294,967,295 ( $2^{32} - 1$ )

**NOTE:** The threshold value specified in the `threshold` statement must be greater than the value specified in the `minimum-interval` statement for the `transmit-interval` statement.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring BFD for PIM on page 4821</a></li> <li>• <a href="#">bfd-liveness-detection on page 4911</a></li> </ul>

## transmit-interval (PIM BFD Liveness Detection)

---

Syntax	<pre>transmit-interval {     minimum-interval milliseconds;     threshold milliseconds; }</pre>
Hierarchy Level	[edit protocols pim interface <i>interface-name</i> bfd-liveness-detection], [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> bfd-liveness-detection]
Release Information	Statement introduced in Junos OS Release 8.2. Statement introduced in Junos OS Release 9.0 for EX Series switches. Support for BFD authentication introduced in Junos OS Release 9.6. Statement introduced in Junos OS Release 12.1 for the QFX Series.
Description	<p>Specify the transmit interval for the <b>bfd-liveness-detection</b> statement. The negotiated transmit interval for a peer is the interval between the sending of BFD packets to peers. The receive interval for a peer is the minimum interval between receiving packets sent from its peer; the receive interval is not negotiated between peers. To determine the transmit interval, each peer compares its configured minimum transmit interval with its peer's minimum receive interval. The larger of the two numbers is accepted as the transmit interval for that peer.</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring BFD for PIM on page 4821</a></li><li>• <a href="#">bfd-liveness-detection on page 4911</a></li><li>• <a href="#">threshold on page 4965</a></li><li>• <a href="#">minimum-interval on page 4940</a></li><li>• <a href="#">minimum-receive-interval on page 4941</a></li></ul>

## traceoptions (Protocols PIM)

<b>Syntax</b>	<pre>traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;flag-modifier&gt; &lt;disable&gt;; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols pim],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim],          [edit protocols pim],          [edit routing-instances <i>routing-instance-name</i> protocols pim]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.          Statement introduced in Junos OS Release 9.0 for EX Series switches.          Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	<p>Configure PIM tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>
<b>Default</b>	The default PIM trace options are those inherited from the routing protocol's <b>traceoptions</b> statement included at the <b>[edit routing-options]</b> hierarchy level.
<b>Options</b>	<p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place tracing output in the <b>pim-log</b> file.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>Range:</b> 2 through 1000 files  <b>Default:</b> 2 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p><b>PIM Tracing Flags</b></p> <ul style="list-style-type: none"> <li>• <b>assert</b>—Assert messages</li> <li>• <b>bidirectional-df-election</b>—Bidirectional PIM designated-forwarder (DF) election events</li> </ul>

- **bootstrap**—Bootstrap messages
- **cache**—Packets in the PIM sparse mode routing cache
- **graft**—Graft and graft acknowledgment messages
- **hello**—Hello packets
- **join**—Join messages
- **mt**—Multicast tunnel messages
- **nsr-synchronization**—Nonstop active routing (NSR) synchronization messages
- **packets**—All PIM packets
- **prune**—Prune messages
- **register**—Register and register stop messages
- **rp**—Candidate RP advertisements
- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Do not allow users to read the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 0 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

<b>Required Privilege Level</b>	routing and trace—To view this statement in the configuration.
	routing-control and trace-control—To add this statement to the configuration.

<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring PIM Trace Options on page 4780</a></li> <li>• <a href="#">Tracing DVMRP Protocol Traffic</a></li> <li>• <a href="#">Tracing MSDP Protocol Traffic on page 4877</a></li> <li>• <a href="#">Configuring PIM Trace Options on page 4780</a></li> </ul>
------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## version (BFD)

---

<b>Syntax</b>	version (0   1   automatic);
<b>Hierarchy Level</b>	[edit protocols piminterface <i>interface-name</i> <b>bfd-liveness-detection</b> ], [edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i> <b>bfd-liveness-detection</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.1. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify the bidirectional forwarding detection (BFD) protocol version that you want to detect.
<b>Options</b>	Configure the BFD version to detect: <b>1</b> (BFD version 1) or <b>automatic</b> (autodetect the BFD version) <b>Default:</b> automatic
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring BFD for PIM on page 4821</a></li></ul>

## version (PIM)

<b>Syntax</b>	<code>version <i>version</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols pim interface <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols pim <b>rp static address</b> <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols pim <b>rp static address</b> <i>address</i>],</p> <p>[edit protocols pim interface <i>interface-name</i>],</p> <p>[edit protocols pim <b>rp static address</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols pim interface <i>interface-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols pim <b>rp static address</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Specify the version of PIM.
<b>Options</b>	<p><b>version</b>—PIM version number.</p> <p><b>Range:</b> 1 or 2</p> <p><b>Default:</b> PIMv1 for rendezvous point (RP) mode (at the [edit protocols pim rp static address <i>address</i>] hierarchy level). PIMv2 for interface mode (at the [edit protocols pim interface <i>interface-name</i>] hierarchy level).</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Enabling PIM Sparse Mode on page 4786</a></li> <li>• <a href="#">Configuring PIM Dense Mode Properties</a></li> <li>• <a href="#">Configuring PIM Sparse-Dense Mode Properties</a></li> </ul>

## wildcard-source (PIM RPF Selection)

---

<b>Syntax</b>	wildcard-source { <a href="#">next-hop</a> <i>next-hop-address</i> ; }
<b>Hierarchy Level</b>	[edit routing-instances <i>routing-instance-name</i> protocols pim rpf-selection group <i>group-address</i> ], [edit routing-instances <i>routing-instance-name</i> protocols pim rpf-selection prefix-list <i>prefix-list-addresses</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.4. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Use a wildcard for the multicast source instead of (or in addition to) a specific multicast source.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	view-level—To view this statement in the configuration. control-level—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring PIM RPF Selection</a></li></ul>

## accounting (Protocols IGMP)

<b>Syntax</b>	accounting;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <a href="#">igmp</a> ], [edit protocols <a href="#">igmp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Enable the collection of IGMP join and leave event statistics on the system.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Recording IGMP Join and Leave Events on page 4843</a></li> </ul>

## accounting (Protocols IGMP Interface)

<b>Syntax</b>	(accounting   no-accounting);
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <a href="#">igmp interface</a> <i>interface-name</i> ], [edit protocols <a href="#">igmp interface</a> <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Enable or disable the collection of IGMP join and leave event statistics for an interface.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Recording IGMP Join and Leave Events on page 4843</a></li> </ul>

## asm-override-ssm

---

<b>Syntax</b>	asm-override-ssm;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast], [edit logical-systems <i>logical-system-name</i> routing-options multicast], [edit routing-instances <i>routing-instance-name</i> routing-options multicast], [edit routing-options multicast]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 9.5 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series. Statement introduced in Junos OS Release 12.3 for ACX Series routers.
<b>Description</b>	Enable the routing device to accept any-source multicast join messages (*G) for group addresses that are within the default or configured range of source-specific multicast groups.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Source-Specific Multicast Groups with Any-Source Override on page 4895</a></li></ul>

## disable (Protocols IGMP)

---

<b>Syntax</b>	disable;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <b>igmp interface</b> <i>interface-name</i> ], [edit protocols <b>igmp interface</b> <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Disable IGMP on the system.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Disabling IGMP on page 4847</a></li></ul>

---

## exclude (Protocols IGMP)

---

<b>Syntax</b>	exclude;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <b>igmp</b> interface <i>interface-name</i> <b>static group</b> <i>mcast-group-address</i> ], [edit protocols <b>igmp</b> interface <i>interface-name</i> <b>static group</b> <i>mcast-group-address</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Configure the static group to operate in exclude mode. In exclude mode all sources except the address configured are accepted for the group. If this statement is not included, the group operates in include mode.
<b>Required Privilege Level</b>	view-level—To view this statement in the configuration. control-level—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Enabling IGMP Static Group Membership on page 4836</a></li></ul>

## group (Protocols IGMP)

---

Syntax	<pre>group <i>multicast-group-address</i> {     exclude;     group-count <i>number</i>;     group-increment <i>increment</i>;     source <i>ip-address</i> {         source-count <i>number</i>;         source-increment <i>increment</i>;     } }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols <a href="#">igmp interface interface-name static</a> ], [edit protocols <a href="#">igmp interface interface-name static</a> ]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
Description	Specify the IGMP multicast group address and (optionally) the source address for the multicast group being statically configured on an interface.
<hr/>	
<div> <b>NOTE:</b> You must specify a unique address for each group.</div> <hr/>	
The remaining statements are explained separately.	
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Enabling IGMP Static Group Membership on page 4836</a></li></ul>

## group-count (Protocols IGMP)

<b>Syntax</b>	<code>group-count <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <b>igmp</b> interface <i>interface-name</i> <b>static group</b> <i>mcast-group-address</i> ], [edit protocols <b>igmp</b> interface <i>interface-name</i> <b>static group</b> <i>mcast-group-address</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify the number of static groups to be created.
<b>Options</b>	<i>number</i> —Number of static groups. <b>Range:</b> 1 through 512
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Enabling IGMP Static Group Membership on page 4836</a></li> </ul>

## group-increment (Protocols IGMP)

<b>Syntax</b>	<code>group-increment <i>increment</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <b>igmp</b> interface <i>interface-name</i> <b>static group</b> <i>mcast-group-address</i> ], [edit protocols <b>igmp</b> interface <i>interface-name</i> <b>static group</b> <i>mcast-group-address</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure the number of times the address should be incremented for each static group created. The increment is specified in dotted decimal notation similar to an IPv4 address.
<b>Options</b>	<i>increment</i> —Number of times the address should be incremented. <b>Default:</b> 0.0.0.1 <b>Range:</b> 0.0.0.1 through 255.255.255.255
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Enabling IGMP Static Group Membership on page 4836</a></li> </ul>

## group-limit (IGMP)

---

<b>Syntax</b>	<code>group-limit <i>limit</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <b>igmp interface</b> <i>interface-name</i> ], [edit protocols <b>igmp interface</b> <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.4. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>Configure a limit for the number of multicast groups (or [S,G] channels in IGMPv3) allowed on an interface. After this limit is reached, new reports are ignored and all related flows are not flooded on the interface.</p> <p>To confirm the configured group limit on the interface, use the <b>show igmp interface</b> command.</p>
<b>Default</b>	By default, there is no limit to the number of multicast groups that can join the interface.
<b>Options</b>	<b>limit</b> —group limit value for the interface. <b>Range:</b> 1 through 32767
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Limiting the Number of IGMP Multicast Group Joins on Logical Interfaces on page 4844</a></li><li>• <i>group-threshold</i></li><li>• <i>log-interval</i></li></ul>

---

## group-policy (Protocols IGMP)

---

<b>Syntax</b>	<code>group-policy [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <b>igmp</b> <b>interface</b> <i>interface-name</i> ], [edit protocols <b>igmp</b> <b>interface</b> <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.1. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	When this statement is enabled on a router running IGMP version 2 (IGMPv2) or version 3 (IGMPv3), after the router receives an IGMP report, the router compares the group against the specified group policy and performs the action configured in that policy (for example, rejects the report).
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Filtering Unwanted IGMP Reports at the IGMP Interface Level on page 4832</a></li></ul>

## immediate-leave (Protocols IGMP)

---

<b>Syntax</b>	<code>immediate-leave;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <b>igmp</b> interface <i>interface-name</i> ], [edit protocols <b>igmp</b> interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	<p>The immediate leave setting is useful for minimizing the leave latency of IGMP memberships. When this setting is enabled, the routing device leaves the multicast group immediately after the last host leaves the multicast group.</p> <p>Starting in Junos OS Release 9.3, both IGMP version 2 and IGMP version 3 do host tracking when the <b>immediate-leave</b> statement is configured. This means that the multicast group leaves only when the last host leaves. The routing device keeps track of the hosts that send join messages. This allows IGMP to determine when the last host sends a leave message for the multicast group.</p> <p>When the immediate leave setting is enabled, the device removes an interface from the forwarding-table entry without first sending IGMP group-specific queries to the interface. The interface is pruned from the multicast tree for the multicast group specified in the IGMP leave message. The immediate leave setting ensures optimal bandwidth management for hosts on a switched network, even when multiple multicast groups are being used simultaneously.</p> <p>When immediate leave is disabled and one host sends a leave group message, the routing device first sends a group query to determine if another receiver responds. If no receiver responds, the routing device removes all hosts on the interface from the multicast group. Immediate leave is disabled by default for both IGMP version 2 and IGMP version 3.</p>
	<div> <b>NOTE:</b> Although host tracking is enabled for IGMPv2 and MLDv1 when you enable immediate leave, use immediate leave with these versions only when there is one host on the interface. The reason is that IGMPv2 and MLDv1 use a report suppression mechanism whereby only one host on an interface sends a group join report in response to a membership query. The other interested hosts suppress their reports. The purpose of this mechanism is to avoid a flood of reports for the same group. But it also interferes with host tracking, because the routing device only knows about the one interested host and does not know about the others.</div>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## maximum-transmit-rate (Protocols IGMP)

---

<b>Syntax</b>	maximum-transmit-rate <i>packets-per-second</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols igmp], [edit protocols igmp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Limit the transmission rate of IGMP packets
<b>Options</b>	<b>packets-per-second</b> —Maximum number of IGMP packets transmitted in one second by the routing device. <b>Range:</b> 1 through 10000 <b>Default:</b> 500 packets
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Limiting the Maximum IGMP Message Rate on page 4836</a></li></ul>

## oif-map (IGMP Interface)

---

<b>Syntax</b>	oif-map <i>map-name</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <b>igmp interface</b> <i>interface-name</i> ], [edit protocols <b>igmp interface</b> <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Associates an outgoing interface (OIF) map to the IGMP interface. The OIF map is a routing policy statement that can contain multiple terms.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Multicast with Subscriber VLANs</a></li></ul>

## passive (IGMP)

<b>Syntax</b>	<code>passive &lt;allow-receive&gt; &lt;send-general-query&gt; &lt;send-group-query&gt;;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <b>igmp</b> interface <i>interface-name</i> ], [edit protocols <b>igmp</b> interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6. <b>allow-receive</b> , <b>send-general-query</b> , and <b>send-group-query</b> options were added in Junos OS Release 10.0. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify that IGMP run on the interface and either not send and receive control traffic or selectively send and receive control traffic such as IGMP reports, queries, and leaves.
<div>  <p><b>NOTE:</b> You can selectively activate up to two out of the three available options for the <b>passive</b> statement while keeping the other functions passive (inactive). Activating all three options would be equivalent to not using the <b>passive</b> statement.</p> </div>	
<b>Options</b>	<p><b>allow-receive</b>—Enables IGMP to receive control traffic on the interface.</p> <p><b>send-general-query</b>—Enables IGMP to send general queries on the interface.</p> <p><b>send-group-query</b>—Enables IGMP to send group-specific and group-source-specific queries on the interface.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring Multicast with Subscriber VLANs</i></li> <li>• <a href="#">Enabling IGMP on page 4828</a></li> </ul>

## promiscuous-mode (Protocols IGMP)

---

<b>Syntax</b>	<code>promiscuous-mode;</code>
<b>Hierarchy Level</b>	[edit dynamic-profiles <i>profile-name</i> protocols igmp interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> protocols <b>igmp</b> interface <i>interface-name</i> ], [edit protocols <b>igmp</b> interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 9.2 for dynamic profiles. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify that the interface accepts IGMP reports from hosts on any subnetwork. Note that when enabling promiscuous-mode, all routing devices on the ethernet segment must be configured with the promiscuous mode statement. Otherwise, only the interface configured with lowest IPv4 address acts as the querier for IGMP for this Ethernet segment.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Dynamic DHCP Client Access to a Multicast Network</a></li><li>• <a href="#">Accepting IGMP Messages from Remote Subnetworks on page 4833</a></li></ul>

## query-interval (Protocols IGMP)

---

<b>Syntax</b>	<code>query-interval <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <b>igmp</b> ], [edit protocols <b>igmp</b> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify how often the querier routing device sends general host-query messages.
<b>Options</b>	<i>seconds</i> —Time interval. <b>Range:</b> 1 through 1024 <b>Default:</b> 125 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Modifying the IGMP Host-Query Message Interval on page 4830</a></li><li>• <a href="#">query-last-member-interval (Protocols IGMP) on page 4987</a></li><li>• <a href="#">query-response-interval (Protocols IGMP) on page 4988</a></li></ul>

## query-last-member-interval (Protocols IGMP)

---

<b>Syntax</b>	query-last-member-interval <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <a href="#">igmp</a> ], [edit protocols <a href="#">igmp</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify how often the querier routing device sends group-specific query messages.
<b>Options</b>	<b>seconds</b> —Time interval, in fractions of a second or seconds. <b>Range:</b> 0.1 through 0.9, then in 1-second intervals 1 through 999999 <b>Default:</b> 1 second
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Modifying the IGMP Last-Member Query Interval on page 4831</a></li> <li>• <a href="#">query-interval (Protocols IGMP) on page 4986</a></li> <li>• <a href="#">query-response-interval (Protocols IGMP) on page 4988</a></li> </ul>

## query-response-interval (Protocols IGMP)

---

<b>Syntax</b>	<code>query-response-interval <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <a href="#">igmp</a> ], [edit protocols <a href="#">igmp</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify how long the querier routing device waits to receive a response to a host-query message from a host.
<b>Options</b>	<b><i>seconds</i></b> —The query response interval must be less than the query interval. <b>Range:</b> 1 through 1024 <b>Default:</b> 10 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Modifying the IGMP Query Response Interval on page 4834</a></li><li>• <a href="#">query-interval (Protocols IGMP) on page 4986</a></li><li>• <a href="#">query-last-member-interval (Protocols IGMP) on page 4987</a></li></ul>

## robust-count (Protocols IGMP)

---

<b>Syntax</b>	<code>robust-count <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <a href="#">igmp</a> ], [edit protocols <a href="#">igmp</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Tune the expected packet loss on a subnet. This factor is used to calculate the group member interval, other querier present interval, and last-member query count.
<b>Options</b>	<i>number</i> —Robustness variable. <b>Range:</b> 2 through 10 <b>Default:</b> 2
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Modifying the IGMP Robustness Variable on page 4835</a></li> </ul>

## source (Protocols IGMP)

---

<b>Syntax</b>	<code>source <i>ip-address</i> {     <i>source-count</i> <i>number</i>;     <i>source-increment</i> <i>increment</i>; }</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <b>igmp</b> <b>interface</b> <i>interface-name</i> <b>static group</b> <i>multicast-group-address</i> ], [edit protocols <b>igmp</b> <b>interface</b> <i>interface-name</i> <b>static group</b> <i>multicast-group-address</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify the IP version 4 (IPv4) unicast source address for the multicast group being statically configured on an interface.
<b>Options</b>	<i>ip-address</i> —IPv4 unicast address.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Enabling IGMP Static Group Membership on page 4836</a></li></ul>

## source-count (Protocols IGMP)

<b>Syntax</b>	<code>source-count <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <b>igmp</b> interface <i>interface-name</i> <b>static group multicast-group-address</b> <i>source</i> ], [edit protocols <b>igmp</b> interface <i>interface-name</i> <b>static group multicast-group-address</b> <i>source</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure the number of multicast source addresses that should be accepted for each static group created.
<b>Options</b>	<i>number</i> —Number of source addresses. <b>Default:</b> 1 <b>Range:</b> 1 through 1024
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Enabling IGMP Static Group Membership on page 4836</a></li> </ul>

## source-increment (Protocols IGMP)

<b>Syntax</b>	<code>source-increment <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <b>igmp</b> interface <i>interface-name</i> <b>static group multicast-group-address</b> <i>source</i> ], [edit protocols <b>igmp</b> interface <i>interface-name</i> <b>static group multicast-group-address</b> <i>source</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure the number of times the multicast source address should be incremented for each static group created. The increment is specified in dotted decimal notation similar to an IPv4 address.
<b>Options</b>	<i>increment</i> —Number of times the source address should be incremented. <b>Default:</b> 0.0.0.1 <b>Range:</b> 0.0.0.1 through 255.255.255.255
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Enabling IGMP Static Group Membership on page 4836</a></li> </ul>

## static (Protocols IGMP)

---

**Syntax**    static {  
              group *multicast-group-address* {  
                  exclude;  
                  group-count *number*;  
                  group-increment *increment*;  
                  source *ip-address* {  
                      source-count *number*;  
                      source-increment *increment*;  
                  }  
              }  
          }  
      }

**Hierarchy Level**    [edit logical-systems *logical-system-name* protocols **igmp** interface *interface-name*],  
                          [edit protocols **igmp** interface *interface-name*]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                              Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**    Test multicast forwarding on an interface without a receiver host.

The **static** statement simulates IGMP joins on a routing device statically on an interface without any IGMP hosts. It is supported for both IGMPv2 and IGMPv3 joins. This statement is especially useful for testing multicast forwarding on an interface without a receiver host.

**NOTE:** To prevent joining too many groups accidentally, the **static** statement is not supported with the **interface all** statement.

---

The remaining statements are explained separately.

**Required Privilege Level**    routing and trace—To view this statement in the configuration.  
                                  routing-control and trace-control—To add this statement to the configuration.

**Related Documentation**    • [Enabling IGMP Static Group Membership on page 4836](#)

## traceoptions (Protocols IGMP)

<b>Syntax</b>	<pre>traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;flag-modifier&gt; &lt;disable&gt;; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <b>igmp</b> ], [edit protocols <b>igmp</b> ]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure IGMP tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p>To trace the paths of multicast packets, use the <b>mtrace</b> command.</p>
<b>Default</b>	The default IGMP trace options are those inherited from the routing protocols <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level.
<b>Options</b>	<p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place tracing output in the file <b>igmp-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p><b>IGMP Tracing Flags</b></p> <ul style="list-style-type: none"> <li><b>leave</b>—Leave group messages (for IGMP version 2 only).</li> <li><b>mtrace</b>—Mtrace packets. Use the <b>mtrace</b> command to troubleshoot the software.</li> <li><b>packets</b>—All IGMP packets.</li> </ul>

- **query**—IGMP membership query messages, including general and group-specific queries.
- **report**—Membership report messages.

#### Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Do not allow users to read the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

## data-forwarding

<b>Syntax</b>	<pre>data-forwarding {   receiver {     source-vlans <i>vlan-list</i>;     install;   }   source {     groups <i>group-prefix</i>;   } }</pre>
<b>Hierarchy Level</b>	[edit protocols igmp-snooping vlan (all   <i>vlan-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6 for EX Series switches. Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	<p>Configure the VLAN to be a multicast source VLAN (MVLAN) or a multicast VLAN registration (MVR) receiver VLAN. Each data-forwarding VLAN, which can be a multicast source VLAN (MVLAN) or a multicast receiver VLAN, must have exactly one source statement or exactly one receiver statement. A data-forwarding VLAN can operate only in IGMP version 2 (IGMPv2) mode.</p> <p>The remaining statements are explained separately.</p>
<b>Default</b>	Disabled
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Example: Configuring Multicast VLAN Registration</i></li> <li><i>Configuring Multicast VLAN Registration (CLI Procedure)</i></li> </ul>

## disable (IGMP Snooping)

<b>Syntax</b>	disable;
<b>Hierarchy Level</b>	[edit protocols igmp-snooping vlan <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Disable IGMP snooping on all interfaces in a VLAN.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Example: Configuring IGMP Snooping on page 4849</a></li> <li><a href="#">Configuring IGMP Snooping on page 4848</a></li> </ul>

## group (IGMP Snooping)

---

<b>Syntax</b>	<code>group <i>ip-address</i>;</code>
<b>Hierarchy Level</b>	[edit protocols igmp-snooping vlan <i>vlan-name</i> <b>interface</b> <i>interface-name</i> <b>static</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure a static multicast group using a valid IP multicast address.
<b>Default</b>	None.
<b>Options</b>	<i>ip-address</i> —IP address of the multicast group receiving data on an interface.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show igmp-snooping vlans on page 5103</a></li><li>• <a href="#">Example: Configuring IGMP Snooping on page 4849</a></li><li>• <a href="#">Configuring IGMP Snooping on page 4848</a></li></ul>

## group-limit (IGMP and MLD Snooping)

<b>Syntax</b>	<code>group-limit <i>limit</i>;</code>
<b>Hierarchy Level</b>	<p>[edit bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping <a href="#">interface</a> <i>interface-name</i>],</p> <p>[edit bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping vlan <i>vlan-id</i> <a href="#">interface</a> <i>interface-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping <a href="#">interface</a> <i>interface-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> protocols vlan <i>vlan-id</i> igmp-snooping <a href="#">interface</a> <i>interface-name</i>]</p> <p>[edit protocols igmp-snooping vlan <a href="#">interface</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.5.</p> <p>Statement introduced in Junos OS Release 13.2 for the QFX series.</p>
<b>Description</b>	Configure a limit for the number of multicast groups (or [S,G] channels in IGMPv3) allowed on an interface. After this limit is reached, new reports are ignored and all related flows are not flooded on the interface.
<b>Default</b>	By default, there is no limit to the number of multicast groups joining an interface.
<b>Options</b>	<i>limit</i> —a 32-bit number for the limit on the interface.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring IGMP Snooping</i></li> </ul>

## groups (Multicast VLAN Registration)

---

<b>Syntax</b>	<code>groups group-prefix;</code>
<b>Hierarchy Level</b>	[edit protocols igmp-snooping vlan (all   <i>vlan-name</i> ) data-forwarding source]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6 for EX Series switches. Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	Specify the IP address range of the multicast VLAN (MVLAN) source interfaces.
<b>Default</b>	Disabled
<b>Options</b>	<i>group-prefix</i> —IP address range of the source group. Each MVLAN must have exactly one <b>groups</b> statement. If there are multiple MVLANs on the switch, their group ranges must be unique.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Configuring Multicast VLAN Registration</i></li><li>• <i>Configuring Multicast VLAN Registration (CLI Procedure)</i></li></ul>

## host-only-interface

<b>Syntax</b>	host-only-interface;
<b>Hierarchy Level</b>	<p>[edit bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping <b>interface</b> <i>interface-name</i>],</p> <p>[edit bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping vlan <i>vlan-id</i> <b>interface</b> <i>interface-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping <b>interface</b> <i>interface-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> protocols vlan <i>vlan-id</i> igmp-snooping <b>interface</b> <i>interface-name</i>]</p> <p>[edit protocols igmp-snooping vlan <b>interface</b>]</p> <p>[edit protocols mld-snooping vlan <i>vlan-id</i> interface <i>interface-name</i>]</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols mld-snooping vlan <i>vlan-id</i> interface <i>interface-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.5.</p> <p>Statement introduced in Junos OS Release 13.2 for the QFX series.</p> <p>Support at the [edit protocols mld-snooping vlan <i>vlan-id</i> interface <i>interface-name</i>] and the [edit routing-instances <i>routing-instance-name</i> protocols mld-snooping vlan <i>vlan-id</i> interface <i>interface-name</i>] hierarchy levels introduced in Junos OS Release 13.3 for EX Series switches.</p>
<b>Description</b>	Configure an interface as a host-facing interface. IGMP and MLD queries received on these interfaces are dropped.
<b>Default</b>	The interface can either be a host-side or multicast-routing device interface.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring IGMP Snooping</i></li> <li>• <i>multicast-router-interface</i></li> </ul>

## igmp-querier

---

<b>Syntax</b>	igmp-querier <a href="#">source-address</a> <i>source address</i> ;
<b>Hierarchy Level</b>	[edit protocols igmp-snooping vlan <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	Configure a QFabric Node device to be an IGMP querier. If there are any multicast routers on the same local network, make sure the source address for the IGMP querier is greater (a higher number) than the IP addresses for those routers on the network. This ensures that Node is always the IGMP querier on the network.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring IGMP Snooping on page 4849</a></li><li>• <a href="#">Configuring IGMP Snooping on page 4848</a></li><li>• <a href="#">show igmp-snooping vlans on page 5103</a></li><li>• <a href="#">show configuration protocols igmp on page 5083</a></li></ul>

## igmp-snooping

<b>Syntax</b>	<pre> igmp-snooping {   vlan <i>vlan-id</i> {     immediate-leave;     interface <i>interface-name</i> {       group-limit <i>limit</i>;       host-only-interface;       immediate-leave;       multicast-router-interface;       static {         group <i>ip-address</i> {           source <i>ip-address</i>;         }       }     }   }   l2-querier {     source-address <i>ip-address</i>;   }   proxy {     source-address <i>ip-address</i>;   }   query-interval <i>seconds</i>;   query-last-member-interval <i>seconds</i>;   query-response-interval <i>seconds</i>;   robust-count <i>number</i>;   traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;no-stamp&gt; &lt;replace&gt; &lt;size <i>size</i>&gt; &lt;world-readable         no-world-readable&gt;;     flag <i>flag</i> &lt;flag-modifier&gt;;   } } </pre>
<b>Hierarchy Level</b>	[edit protocols]
<b>Release Information</b>	Statement introduced in Junos OS Release 13.2 for the QFX Series.
<b>Description</b>	Enable IGMP snooping on the router or switch.
<b>Default</b>	IGMP snooping is disabled on the router or switch.
<b>Options</b>	The statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Understanding IGMP Snooping</i></li> <li>• <i>IGMP Snooping in MC-LAG Active-Active on MX Series Routers Overview</i></li> </ul>

## immediate-leave (Bridge Domains)

<b>Syntax</b>	<code>immediate-leave;</code>
<b>Hierarchy Level</b>	<pre>[edit bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping], [edit bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping <i>interface</i> <i>interface-name</i>], [edit bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping vlan <i>vlan-id</i> <i>interface</i> <i>interface-name</i>], [edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping], [edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping <i>interface</i> <i>interface-name</i>], [edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> protocols vlan <i>vlan-id</i> igmp-snooping <i>interface</i> <i>interface-name</i>] [edit protocols igmp-snooping vlan <i>interface</i>]</pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.5.</p> <p>Statement introduced in Junos OS Release 13.2 for the QFX series.</p>
<b>Description</b>	<p>The immediate leave setting is useful for minimizing the leave latency of IGMP memberships. When this setting is enabled, the routing device leaves the multicast group immediately after the last host leaves the multicast group.</p> <p>The immediate-leave setting enables host tracking, meaning that the device keeps track of the hosts that send join messages. This allows IGMP to determine when the last host sends a leave message for the multicast group.</p> <p>When the immediate leave setting is enabled, the device removes an interface from the forwarding-table entry without first sending IGMP group-specific queries to the interface. The interface is pruned from the multicast tree for the multicast group specified in the IGMP leave message. The immediate leave setting ensures optimal bandwidth management for hosts on a switched network, even when multiple multicast groups are being used simultaneously.</p> <p>When immediate leave is disabled and one host sends a leave group message, the routing device first sends a group query to determine if another receiver responds. If no receiver responds, the routing device removes all hosts on the interface from the multicast group. Immediate leave is disabled by default for both IGMP version 2 and IGMP version 3.</p>

**NOTE:** Although host tracking is enabled for IGMPv2 and MLDv1 when you enable immediate leave, use immediate leave with these versions only when there is one host on the interface. The reason is that IGMPv2 and MLDv1 use a report suppression mechanism whereby only one host on an interface sends a group join report in response to a membership query. The other interested hosts suppress their reports. The purpose of this mechanism is to avoid a flood of reports for the same group. But it also interferes with host tracking, because the routing device only knows about the one interested host and does not know about the others.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

---

## install (Multicast VLAN Registration)

---

**Syntax** install;

**Hierarchy Level** [edit protocols igmp-snooping vlan (all | *vlan-name*) data-forwarding receiver]

**Release Information** Statement introduced in Junos OS Release 9.6 for EX Series switches.  
Statement introduced in Junos OS Release 12.3 for the QFX Series.

**Description** Install forwarding entries in the multicast receiver VLAN. By default, the multicast VLAN (MVLAN) installs forwarding entries for MVLAN groups only.

**Default** Disabled

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

## interface (Bridge Domains)

---

<b>Syntax</b>	<pre>interface <i>interface-name</i> {     <i>group-limit limit</i>;     <i>host-only-interface</i>;     multicast-router-interface;     static {         group <i>ip-address</i> {             source <i>ip-address</i>;         }     } }</pre>
<b>Hierarchy Level</b>	[edit bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping], [edit bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping vlan <i>vlan-id</i> ], [edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping], [edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> protocols vlan <i>vlan-id</i> igmp-snooping] [edit protocols igmp-snooping vlan],
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 13.2 for the QFX series.
<b>Description</b>	Enable IGMP snooping on an interface and configure interface-specific properties.
<b>Options</b>	<p><i>interface-name</i>—Name of the interface. Specify the full interface name, including the physical and logical address components. To configure all interfaces, you can specify <b>all</b>.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Configuring IGMP Snooping</i></li></ul>

## interface (IGMP Snooping)

<b>Syntax</b>	<pre>interface <i>interface-name</i> {     multicast-router-interface;     static {         group <i>ip-address</i>;     } }</pre>
<b>Hierarchy Level</b>	[edit protocols igmp-snooping vlan <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Enable IGMP snooping on an interface and configure interface-specific properties.</p> <p>The remaining statements are explained separately.</p>
<b>Options</b>	<i>interface-name</i> —Name of the interface.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring IGMP Snooping on page 4849</a></li> <li>• <a href="#">Configuring IGMP Snooping on page 4848</a></li> <li>• <a href="#">show igmp-snooping vlans on page 5103</a></li> </ul>

## l2-querier

<b>Syntax</b>	<pre>l2-querier {     source-address <i>ip-address</i>; }</pre>
<b>Hierarchy Level</b>	[edit protocols igmp-snooping vlan],
<b>Release Information</b>	Statement introduced in Junos OS Release 13.2 for the QFX Series.
<b>Description</b>	Configure the switch to be an IGMP querier. Use the <b>source-address</b> statement to configure the source address to use for IGMP snooping queries.
<b>Options</b>	<p><b>seconds</b>—Time interval.</p> <p><b>Range:</b> 1 through 1024</p> <p><b>Default:</b> 125 seconds</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	

## multicast-router-interface (IGMP Snooping)

---

<b>Syntax</b>	multicast-router-interface;
<b>Hierarchy Level</b>	[edit protocols igmp-snooping vlan <i>vlan-name</i> <b>interface</b> <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure an interface to forward IGMP messages to multicast routers.
<b>Default</b>	Disabled. If this statement is disabled, the interface drops IGMP messages it receives.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show igmp-snooping vlans on page 5103</a></li><li>• <a href="#">Example: Configuring IGMP Snooping on page 4849</a></li><li>• <a href="#">Configuring IGMP Snooping on page 4848</a></li></ul>

## proxy (Multicast VLAN Registration)

---

<b>Syntax</b>	proxy source-address <i>ip-address</i> ;
<b>Hierarchy Level</b>	[edit protocols igmp-snooping vlan (all   <i>vlan-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6 for EX Series switches. Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	Specify that the VLAN operate in proxy mode. The proxy option is supported only for a VLAN acting as a data-forwarding source.
<b>Default</b>	Disabled
<b>Options</b>	<b>source-address <i>ip-address</i></b> —IP address of the source VLAN to act as proxy.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Multicast VLAN Registration</a></li><li>• <a href="#">Configuring Multicast VLAN Registration (CLI Procedure)</a></li></ul>

## query-interval (Bridge Domains)

<b>Syntax</b>	<code>query-interval seconds;</code>
<b>Hierarchy Level</b>	<p>[edit bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping <a href="#">interface interface-name</a>],</p> <p>[edit bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping vlan <i>vlan-id</i> <a href="#">interface interface-name</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping <a href="#">interface interface-name</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping vlan <i>vlan-id</i> <a href="#">interface interface-name</a>]</p> <p>[edit protocols igmp-snooping <a href="#">vlan</a>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 8.5.</p> <p>Statement introduced in Junos OS Release 13.2 for the QFX series.</p>
<b>Description</b>	Configure the interval for host-query message timeouts.
<b>Options</b>	<p><b>seconds</b>—Time interval.</p> <p><b>Range:</b> 1 through 1024</p> <p><b>Default:</b> 125 seconds</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring IGMP Snooping</a></li> <li>• <a href="#">query-last-member-interval (Bridge Domains) on page 5010</a></li> <li>• <a href="#">query-response-interval (Bridge Domains) on page 5011</a></li> </ul>

## query-last-member-interval (Bridge Domains)

---

<b>Syntax</b>	<code>query-last-member-interval seconds;</code>
<b>Hierarchy Level</b>	<code>[edit bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping <a href="#">interface</a> <i>interface-name</i>],</code> <code>[edit bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping vlan <i>vlan-id</i> <a href="#">interface</a> <i>interface-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping <a href="#">interface</a> <i>interface-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping vlan <i>vlan-id</i> <a href="#">interface</a> <i>interface-name</i>]</code> <code>[edit protocols igmp-snooping <a href="#">vlan</a>],</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 13.2 for the QFX series.
<b>Description</b>	Configure the interval for group-specific query timeouts.
<b>Options</b>	<b>seconds</b> —Time interval, in fractions of a second or seconds. <b>Range:</b> 0.1 through 0.9, then in 1-second intervals 1 through 1024 <b>Default:</b> 1 second
<b>Required Privilege Level</b>	<b>routing</b> —To view this statement in the configuration. <b>routing-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring IGMP Snooping</a></li><li>• <a href="#">query-interval on page 5009</a></li><li>• <a href="#">query-response-interval on page 5011</a></li></ul>

## query-response-interval (Bridge Domains)

<b>Syntax</b>	query-response-interval <i>seconds</i> ;
<b>Hierarchy Level</b>	<p>[edit bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping <a href="#">interface interface-name</a>],</p> <p>[edit bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping vlan <i>vlan-id</i> <a href="#">interface interface-name</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping <a href="#">interface interface-name</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> protocols igmp-snooping vlan <i>vlan-id</i> <a href="#">interface interface-name</a>]</p> <p>[edit protocols igmp-snooping <a href="#">vlan</a>],</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.5.</p> <p>Statement introduced in Junos OS Release 13.2 for the QFX series.</p>
<b>Description</b>	Specify how long to wait to receive a response to a specific query message from a host.
<b>Options</b>	<p><b><i>seconds</i></b>—Time interval. This interval should be less than the host-query interval.</p> <p><b>Range:</b> 1 through 1024</p> <p><b>Default:</b> 10 seconds</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring IGMP Snooping</a></li> <li>• <a href="#">query-interval (Bridge Domains) on page 5009</a></li> <li>• <a href="#">query-last-member-interval (Bridge Domains) on page 5010</a></li> </ul>

## receiver

---

<b>Syntax</b>	<pre>receiver {     source-vlans <i>vlan-list</i>;     install; }</pre>
<b>Hierarchy Level</b>	[edit protocols igmp-snooping vlan (all   <i>vlan-name</i> ) data-forwarding]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6 for EX Series switches. Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	Configure a VLAN as a multicast receiver VLAN of the multicast VLAN (MVLAN).  The remaining statements are explained separately.
<b>Default</b>	Disabled
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Configuring Multicast VLAN Registration</i></li><li>• <i>Configuring Multicast VLAN Registration (CLI Procedure)</i></li></ul>

## robust-count (IGMP Snooping)

---

<b>Syntax</b>	<pre>robust-count <i>number</i>;</pre>
<b>Hierarchy Level</b>	[edit protocols igmp-snooping vlan <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the number of intervals the switch waits before removing a multicast group from the multicast forwarding table. Configure the length of each interval using the <b>query-interval</b> statement.
<b>Default</b>	2 intervals
<b>Options</b>	<b><i>number</i></b> —Number of intervals the switch waits before timing out a multicast group. <b>Range:</b> 2 through 10
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring IGMP Snooping on page 4849</a></li><li>• <a href="#">Configuring IGMP Snooping on page 4848</a></li><li>• <a href="#">show igmp-snooping vlans on page 5103</a></li></ul>

## source (Multicast VLAN Registration)

<b>Syntax</b>	source { groups group-prefix; }
<b>Hierarchy Level</b>	[edit protocols igmp-snooping vlan (all   vlan-name) data-forwarding]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6 for EX Series switches. Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	Configure a VLAN to be a multicast source VLAN (MVLAN).  The remaining statement is explained separately.
<b>Default</b>	Disabled
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring Multicast VLAN Registration</i></li> <li>• <i>Configuring Multicast VLAN Registration (CLI Procedure)</i></li> </ul>

## source-address

<b>Syntax</b>	source-address ip-address;
<b>Hierarchy Level</b>	[edit bridge-domains bridge-domain-name protocols igmp-snooping proxy], [edit bridge-domains bridge-domain-name protocols igmp-snooping vlan vlan-id proxy], [edit routing-instances routing-instance-name bridge-domains bridge-domain-name protocols igmp-snooping proxy], [edit routing-instances routing-instance-name bridge-domains bridge-domain-name protocols igmp-snooping vlan vlan-id proxy]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 13.2 for the QFX series.
<b>Description</b>	Specify the IP address to use as the source for IGMP snooping reports in proxy mode. Reports are sent with address 0.0.0.0 as the source address unless there is a source address configured. You can also use this statement to configure the source address to use for IGMP snooping queries.
<b>Options</b>	ip-address—IP address to use as the source for proxy-mode IGMP snooping reports.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring IGMP Snooping</i></li> </ul>

## source-address (IGMP Querier)

---

<b>Syntax</b>	<code>src-address source address;</code>
<b>Hierarchy Level</b>	[edit protocols igmp-snooping vlan <i>vlan-name</i> <b>igmp-querier</b> ] [edit protocols igmp-snooping vlan <i>vlan-name</i> <b>l2-querier</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	Configure the address that the switch uses as the source address in the IGMP queries that it sends. If there are any multicast routers on the same local network, make sure the source address for the IGMP querier is greater (a higher number) than the IP addresses for those routers on the network. This ensures that switch is always the IGMP querier on the network.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring IGMP Snooping on page 4849</a></li><li>• <a href="#">Configuring IGMP Snooping on page 4848</a></li><li>• <a href="#">show igmp-snooping vlans on page 5103</a></li><li>• <a href="#">show configuration protocols igmp on page 5083</a></li></ul>

## source-vlans

---

<b>Syntax</b>	<code>source-vlans vlan-list;</code>
<b>Hierarchy Level</b>	[edit protocols igmp-snooping vlan (all   <i>vlan-name</i> ) data-forwarding receiver]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6 for EX Series switches. Statement introduced in Junos OS Release 12.3 for the QFX Series.
<b>Description</b>	Specify a list of multicast VLANs (MVLANS) from which this multicast receiver VLAN receives multicast traffic. Either all of these MVLANS must be in proxy mode or none of them can be in proxy mode.
<b>Default</b>	Disabled
<b>Options</b>	<i>vlan-list</i> —Names of the MVLANS.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Multicast VLAN Registration</a></li><li>• <a href="#">Configuring Multicast VLAN Registration (CLI Procedure)</a></li></ul>

---

## static (IGMP Snooping)

---

<b>Syntax</b>	<pre>static {     group ip-address; }</pre>
<b>Hierarchy Level</b>	[edit protocols igmp-snooping vlan <i>vlan-name</i> interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Statically define multicast groups on an interface.</p> <p>The remaining statement is explained separately.</p>
<b>Default</b>	No multicast groups are statically defined.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring IGMP Snooping on page 4849</a></li><li>• <a href="#">Configuring IGMP Snooping on page 4848</a></li><li>• <a href="#">show igmp-snooping vlans on page 5103</a></li></ul>

## traceoptions (IGMP Snooping)

---

<b>Syntax</b>	<pre>traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;no-stamp&gt; &lt;size <i>size</i>&gt; &lt;replace&gt; &lt;world-readable       no-world-readable&gt;;     flag <i>flag</i> (detail   disable   receive   send); }</pre>
<b>Hierarchy Level</b>	For platforms without ELS:  [edit protocols igmp-snooping]  For platforms with ELS:  [edit protocols igmp-snooping vlan]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Define tracing operations for IGMP snooping.
<b>Default</b>	The <b>traceoptions</b> feature is disabled by default.
<b>Options</b>	<p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached (<b>xk</b> to specify KB, <b>xm</b> to specify MB, or <b>xg</b> to specify gigabytes), at which point the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b> —Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—All tracing operations.</li><li>• <b>general</b>—Trace general IGMP snooping protocol events.</li><li>• <b>krt</b>—Trace communication over routing sockets.</li><li>• <b>nexthop</b>— Trace next-hop related events.</li><li>• <b>normal</b>—Trace normal IGMP snooping protocol events.</li><li>• <b>packets</b>—Trace all IGMP packets.</li><li>• <b>policy</b>—Trace policy processing.</li><li>• <b>query</b>—Trace IGMP membership query messages.</li><li>• <b>report</b>—Trace membership report messages.</li></ul>

- **route**—Trace routing information.
- **state**—Trace IGMP state transitions.
- **task**—Trace routing protocol task processing.
- **timer**—Trace routing protocol timer processing.
- **vlan**—Trace VLAN related events.

**no-stamp**—(Optional) Do not time stamp trace file.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**size size** —(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option. Use **xk** to specify KB, **xm** to specify MB, or **xg** to specify gigabytes.

**Range:** 10 KB through 1 gigabytes

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring IGMP Snooping on page 4849</a></li> <li>• <a href="#">Configuring IGMP Snooping on page 4848</a></li> </ul>

## version (IGMP Snooping)

---

<b>Syntax</b>	<code>version number;</code>
<b>Hierarchy Level</b>	[edit protocols igmp-snooping vlan (all   <i>vlan-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Specify the IGMP version for the IGMP general query that the switch sends to hosts when an interface comes up. The configured IGMP version affects only the version of the general queries sent by a switch. It does not affect the version of IGMP messages that the switch can snoop. For example, If the switch is configured for IGMP version 1 (IGMPv1), it can snoop IGMPv2 and IGMPv3 messages.
<b>Default</b>	If you do not configure the <b>version</b> statement, the default is IGMPv2.
<b>Options</b>	<b>version</b> —IGMP version number. <b>Range:</b> 1 and 2.

**NOTE:** IGMP v3 snooping is not supported.

---

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring IGMP Snooping (CLI Procedure)</a></li><li>• <a href="#">Configuring IGMP Snooping on page 4848</a></li></ul>

## vlan (IGMP Snooping)

<b>Syntax</b>	<pre> vlan <i>vlan-id</i> {     immediate-leave;     interface <i>interface-name</i> {         group-limit <i>limit</i>;         host-only-interface;         multicast-router-interface;         static {             group <i>mcast-group-address</i> {                 source <i>ip-address</i>;             }         }     }     proxy {         source-address <i>ip-address</i>;     }     query-interval <i>seconds</i>;     query-last-member-interval <i>seconds</i>;     query-response-interval <i>seconds</i>;     robust-count <i>number</i>; } </pre>
<b>Hierarchy Level</b>	[edit protocols igmp-snooping ],
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 13.2 for the QFX series.
<b>Description</b>	Configure IGMP snooping parameters for a particular VLAN.
<b>Default</b>	By default, IGMP snooping options apply to all VLANs.
<b>Options</b>	<p><i>vlan-id</i>—Apply the parameters to this VLAN.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring VLAN-Specific IGMP Snooping Parameters on page 4849</a></li> <li>• <a href="#">igmp-snooping on page 5003</a></li> </ul>

## active-source-limit

<b>Syntax</b>	<pre>active-source-limit {     log-interval <i>seconds</i>;     log-warning <i>value</i>;     <b>maximum</b> <i>number</i>;     <b>threshold</b> <i>number</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit logical-systems <i>logical-system-name</i> protocols <b>msdp</b>], [edit logical-systems <i>logical-system-name</i> protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>], [edit logical-systems <i>logical-system-name</i> protocols <b>msdp peer</b> <i>address</i>], [edit logical-systems <i>logical-system-name</i> protocols <b>msdp source</b> <i>ip-address/prefix-length</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>instance-name</i> protocols <b>msdp</b>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp peer</b> <i>address</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp source</b> <i>ip-address/prefix-length</i>], [edit protocols <b>msdp</b>], [edit protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>], [edit protocols <b>msdp peer</b> <i>address</i>], [edit protocols <b>msdp source</b> <i>ip-address/prefix-length</i>], [edit routing-instances <i>routing-instance-name</i> protocols <b>msdp</b>], [edit routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>], [edit routing-instances <i>routing-instance-name</i> protocols <b>msdp peer</b> <i>address</i>], [edit routing-instances <i>routing-instance-name</i> protocols <b>msdp source</b> <i>ip-address/prefix-length</i>]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Limit the number of active source messages the routing device accepts.
<b>Default</b>	If you do not include this statement, the router accepts any number of MSDP active source messages.
<b>Options</b>	The options are explained separately.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring MSDP with Active Source Limits and Mesh Groups on page 4880</a></li> </ul>

## authentication-key

---

<b>Syntax</b>	<code>authentication-key peer-key;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems logical-system-name protocols msdp group group-name peer address],</code> <code>[edit logical-systems logical-system-name protocols msdp peer address],</code> <code>[edit logical-systems logical-system-name routing-instances routing-instance-name protocols</code> <code>msdp group group-name peer address],</code> <code>[edit logical-systems logical-system-name routing-instances routing-instance-name protocols</code> <code>msdp peer address],</code> <code>[edit protocols msdp group group-name peer address],</code> <code>[edit protocols msdp peer address],</code> <code>[edit routing-instances routing-instance-name protocols msdp group group-name peer</code> <code>address],</code> <code>[edit routing-instances routing-instance-name protocols msdp peer address]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Associate a Message Digest 5 (MD5) signature option authentication key with an MSDP peering session.
<b>Default</b>	If you do not include this statement, the routing device accepts any valid MSDP messages from the peer address.
<b>Options</b>	<b>peer-key</b> —MD5 authentication key. The peer key can be a text string up to 16 letters and digits long. Strings can include any ASCII characters with the exception of (, ), &, and [. If you include spaces in an MSDP authentication key, enclose all characters in quotation marks (" ").
<b>Required Privilege Level</b>	<code>routing</code> —To view this statement in the configuration. <code>routing-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Configuring MSDP in a Routing Instance</i></li></ul>

## data-encapsulation

---

<b>Syntax</b>	data-encapsulation (disable   enable);
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <a href="#">msdp</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">msdp</a> ], [edit protocols <a href="#">msdp</a> ], [edit routing-instances <i>routing-instance-name</i> protocols <a href="#">msdp</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure a rendezvous point (RP) using MSDP to encapsulate multicast data received in MSDP register messages inside forwarded MSDP source-active messages.
<b>Default</b>	If you do not include this statement, the RP encapsulates multicast data.
<b>Options</b>	<b>disable</b> —(Optional) Do not use MSDP data encapsulation. <b>enable</b> —Use MSDP data encapsulation. <b>Default:</b> <b>enable</b>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring MSDP with Active Source Limits and Mesh Groups on page 4880</a></li> </ul>

## default-peer

---

<b>Syntax</b>	default-peer;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols <b>msdp</b>], [edit logical-systems <i>logical-system-name</i> protocols <b>msdp group</b> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>], [edit logical-systems <i>logical-system-name</i> protocols <b>msdp peer</b> <i>address</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp</b>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp peer</b> <i>address</i>], [edit protocols <b>msdp</b>], [edit protocols <b>msdp group</b> <i>group-name</i>], [edit protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>], [edit protocols <b>msdp peer</b> <i>address</i>], [edit routing-instances <i>routing-instance-name</i> protocols <b>msdp</b>], [edit routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>], [edit routing-instances <i>routing-instance-name</i> protocols <b>msdp peer</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Establish this peer as the default MSDP peer and accept source-active messages from the peer without the usual peer-reverse-path-forwarding (peer-RPF) check.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring MSDP with Active Source Limits and Mesh Groups on page 4880</a></li></ul>

## disable (Protocols MSDP)

<b>Syntax</b>	disable;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols <b>msdp</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols <b>msdp group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols <b>msdp peer</b> <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp peer</b> <i>address</i>],</p> <p>[edit protocols <b>msdp</b>],</p> <p>[edit protocols <b>msdp group</b> <i>group-name</i>],</p> <p>[edit protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>],</p> <p>[edit protocols <b>msdp peer</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <b>msdp</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <b>msdp peer</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Explicitly disable MSDP.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Disabling MSDP</li> </ul>

## export (Protocols MSDP)

---

<b>Syntax</b>	<code>export [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">msdp</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">msdp group</a> <i>group-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">msdp group</a> <i>group-name</i> <a href="#">peer</a> <i>address</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">msdp peer</a> <i>address</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">msdp</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">msdp group</a> <i>group-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">msdp group</a> <i>group-name</i> <a href="#">peer</a> <i>address</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">msdp peer</a> <i>address</i>],</code> <code>[edit protocols <a href="#">msdp</a>],</code> <code>[edit protocols <a href="#">msdp group</a> <i>group-name</i>],</code> <code>[edit protocols <a href="#">msdp group</a> <i>group-name</i> <a href="#">peer</a> <i>address</i>],</code> <code>[edit protocols <a href="#">msdp peer</a> <i>address</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">msdp</a>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">msdp group</a> <i>group-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">msdp group</a> <i>group-name</i> <a href="#">peer</a> <i>address</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">msdp peer</a> <i>address</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Apply one or more policies to routes being exported from the routing table into MSDP.
<b>Options</b>	<i>policy-names</i> —Name of one or more policies.
<b>Required Privilege Level</b>	<code>routing</code> —To view this statement in the configuration. <code>routing-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Configuring MSDP in a Routing Instance</i></li><li>• <a href="#">import on page 5028</a></li></ul>

## group (Protocols MSDP)

```
Syntax  group group-name {
        disable;
        export [ policy-names ];
        import [ policy-names ];
        local-address address;
        mode (mesh-group | standard);
        traceoptions {
            file filename <files number> <size size> <world-readable | no-world-readable>;
            flag flag <flag-modifier> <disable>;
        }
        peer address; {
            disable;
            active-source-limit {
                maximum number;
                threshold number;
            }
            authentication-key peer-key;
            default-peer;
            export [ policy-names ];
            import [ policy-names ];
            local-address address;
            traceoptions {
                file filename <files number> <size size> <world-readable | no-world-readable>;
                flag flag <flag-modifier> <disable>;
            }
        }
    }
```

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols [msdp](#)],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols  
[msdp](#)],  
 [edit protocols [msdp](#)],  
 [edit routing-instances *routing-instance-name* protocols [msdp](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description** Define an MSDP peer group. MSDP peers within groups share common tracing options, if present and not overridden for an individual peer with the [peer](#) statement. To configure multiple MSDP groups, include multiple **group** statements.

By default, the group's options are identical to the global MSDP options. To override the global options, include group-specific options within the **group** statement.

The group must contain at least one peer.

**Options** *group-name*—Name of the MSDP group.

The remaining statements are explained separately.

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

**Related Documentation**

## local-address (Protocols MSDP)

<b>Syntax</b>	<code>local-address address;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols <b>msdp</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols <b>msdp group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols <b>msdp peer</b> <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp peer</b> <i>address</i>],</p> <p>[edit protocols <b>msdp</b>],</p> <p>[edit protocols <b>msdp group</b> <i>group-name</i>],</p> <p>[edit protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>],</p> <p>[edit protocols <b>msdp peer</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <b>msdp</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <b>msdp peer</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Configure the local end of an MSDP session. You must configure at least one peer for MSDP to function. When configuring a peer, you must include this statement. This address is used to accept incoming connections to the peer and to establish connections to the remote peer.
<b>Options</b>	<b>address</b> —IP address of the local end of the connection.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Example: Configuring MSDP in a Routing Instance</i></li> </ul>

## maximum (MSDP Active Source Messages)

---

<b>Syntax</b>	<code>maximum <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <a href="#">msdp active-source-limit</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">msdp active-source-limit</a> ], [edit protocols <a href="#">msdp active-source-limit</a> ], [edit routing-instances <i>routing-instance-name</i> protocols <a href="#">msdp active-source-limit</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure the maximum number of MSDP active source messages the router accepts.
<b>Options</b>	<i>number</i> —Maximum number of active source messages. <b>Range:</b> 1 through 1,000,000 <b>Default:</b> 25,000
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring MSDP with Active Source Limits and Mesh Groups on page 4880</a></li><li>• <a href="#">threshold (MSDP Active Source Messages) on page 5037</a></li></ul>

## mode (Protocols MSDP)

<b>Syntax</b>	mode (mesh-group   standard);
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <b>msdp group</b> <i>group-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i> ], [edit protocols <b>msdp group</b> <i>group-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Configure groups of peers in a full mesh topology to limit excessive flooding of source-active messages to neighboring peers. The default flooding mode is <b>standard</b> .
<b>Default</b>	If you do not include this statement, default flooding is applied.
<b>Options</b>	<b>mesh-group</b> —Group of peers that are mesh group members.  <b>standard</b> —Use standard MSDP source-active flooding rules. <b>Default:</b> standard
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring MSDP with Active Source Limits and Mesh Groups on page 4880</a></li> </ul>

## msdp

```

Syntax  msdp {
        disable;
        active-source-limit {
            log-interval seconds;
            log-warning value;
            maximum number;
            threshold number;
        }
        data-encapsulation (disable | enable);
        export [ policy-names ];
        group group-name {
            ... group-configuration ...
        }
        hold-time seconds;
        import [ policy-names ];
        local-address address;
        keep-alive seconds;
        peer address {
            ... peer-configuration ...
        }
        rib-group group-name;
        source ip-prefix </prefix-length> {
            active-source-limit {
                maximum number;
                threshold number;
            }
        }
        sa-hold-time seconds;
        traceoptions {
            file filename <files number> <size size> <world-readable | no-world-readable>;
            flag flag <flag-modifier> <disable>;
        }
        group group-name {
            disable;
            export [ policy-names ];
            import [ policy-names ];
            local-address address;
            mode (mesh-group | standard);
            peer address {
                ... same statements as at the [edit protocols msdp peer address] hierarchy level shown
                just following ...
            }
            traceoptions {
                file filename <files number> <size size> <world-readable | no-world-readable>;

            }
        }
        peer address {
            disable;
            active-source-limit {
                maximum number;
                threshold number;
            }
        }
    }

```

```

    }
    authentication-key peer-key;
    default-peer;
    export [ policy-names ];
    import [ policy-names ];
    local-address address;
    traceoptions {
        file filename <files number> <size size> <world-readable | no-world-readable>;
        flag flag <flag-modifier> <disable>;
    }
}
}

```

<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols], [edit protocols], [edit routing-instances <i>routing-instance-name</i> protocols]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.4 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Enable MSDP on the router or switch. You must also configure at least one peer for MSDP to function.
<b>Default</b>	MSDP is disabled on the router or switch.
<b>Options</b>	The statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring MSDP in a Routing Instance</i></li> </ul>

## peer (Protocols MSDP)

---

**Syntax**    `peer address {  
              disable;  
              active-source-limit {  
                  maximum number;  
                  threshold number;  
              }  
              authentication-key peer-key;  
              default-peer;  
              export [ policy-names ];  
              import [ policy-names ];  
              local-address address;  
              traceoptions {  
                  file filename <files number> <size size> <world-readable | no-world-readable>;  
                  flag flag <flag-modifier> <disable>;  
              }  
          }`

**Hierarchy Level**    [edit logical-systems *logical-system-name* protocols **msdp**],  
                          [edit logical-systems *logical-system-name* protocols **msdp group** *group-name*],  
                          [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols  
                              **msdp**],  
                          [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols  
                              **msdp group** *group-name*],  
                          [edit protocols **msdp**],  
                          [edit protocols **msdp group** *group-name*],  
                          [edit routing-instances *routing-instance-name* protocols **msdp**],  
                          [edit routing-instances *routing-instance-name* protocols **msdp group** *group-name*]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description**    Define an MSDP peering relationship. An MSDP routing device must know which routing devices are its peers. You define the peer relationships explicitly by configuring the neighboring routing devices that are the MSDP peers of the local routing device. After peer relationships are established, the MSDP peers exchange messages to advertise active multicast sources. To configure multiple MSDP peers, include multiple **peer** statements.

By default, the peer's options are identical to the global or group-level MSDP options. To override the global or group-level options, include peer-specific options within the **peer (Protocols MSDP)** statement.

At least one peer must be configured for MSDP to function. You must configure **address** and **local-address**.

**Options**    **address**—Name of the MSDP peer.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation** • *Example: Configuring MSDP in a Routing Instance*

## rib-group (Protocols MSDP)

<b>Syntax</b>	<code>rib-group group-name;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <a href="#">msdp</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">msdp</a> ], [edit protocols <a href="#">msdp</a> ], [edit routing-instances <i>routing-instance-name</i> protocols <a href="#">msdp</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Associate a routing table group with MSDP.
<b>Options</b>	<b>group-name</b> —Name of the routing table group. The name must be one that you defined with the <b>rib-groups</b> statement at the [edit routing-options] hierarchy level.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	• <i>Example: Configuring MSDP in a Routing Instance</i>

## source (Protocols MSDP)

---

<b>Syntax</b>	<pre>source ip-address &lt;/prefix-length&gt; {     active-source-limit {         maximum number;         threshold number;     } }</pre>
<b>Hierarchy Level</b>	<pre>[edit logical-systems logical-system-name protocols msdp], [edit logical-systems logical-system-name routing-instances routing-instance-name protocols msdp], [edit protocols msdp], [edit routing-instances routing-instance-name protocols msdp]</pre>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Limit the number of active source messages the routing device accepts from sources in this address range.
<b>Default</b>	If you do not include this statement, the routing device accepts any number of MSDP active source messages.
<b>Options</b>	The other statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring MSDP with Active Source Limits and Mesh Groups on page 4880</a></li></ul>

## threshold (MSDP Active Source Messages)

<b>Syntax</b>	<code>threshold <i>number</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols <a href="#">msdp active-source-limit</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <a href="#">msdp active-source-limit</a>],</p> <p>[edit protocols <a href="#">msdp active-source-limit</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <a href="#">msdp active-source-limit</a>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure the random early detection (RED) threshold for MSDP active source messages. This number must be less than the configured or default maximum.</p>
<b>Options</b>	<p><i>number</i>—RED threshold for active source messages.</p> <p><b>Range:</b> 1 through 1,000,000</p> <p><b>Default:</b> 24,000</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring MSDP with Active Source Limits and Mesh Groups on page 4880</a></li> <li>• <a href="#">maximum (MSDP Active Source Messages) on page 5030</a></li> </ul>

## traceoptions (Protocols MSDP)

<b>Syntax</b>	<pre> traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;flag-modifier&gt; &lt;disable&gt;; } </pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols <b>msdp</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols <b>msdp group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols <b>msdp peer</b> <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols <b>msdp peer</b> <i>address</i>],</p> <p>[edit protocols <b>msdp</b>],</p> <p>[edit protocols <b>msdp group</b> <i>group-name</i>],</p> <p>[edit protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>],</p> <p>[edit protocols <b>msdp peer</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <b>msdp</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <b>msdp group</b> <i>group-name</i> <b>peer</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols <b>msdp peer</b> <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	<p>Configure MSDP tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>
<b>Default</b>	<p>The default MSDP trace options are those inherited from the routing protocol's <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level.</p>
<b>Options</b>	<p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file</b> <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place tracing output in the <b>msdp-log</b> file.</p> <p><b>files</b> <i>number</i>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p>

If you specify a maximum number of files, you must also include the **size** statement to specify the maximum file size.

**Range:** 2 through 1000 files

**Default:** 2 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

#### MSDP Tracing Flags

- **keepalive**—Keepalive messages
- **packets**—All MSDP packets
- **route**—MSDP changes to the routing table
- **source-active**—Source-active packets
- **source-active-request**—Source-active request packets
- **source-active-response**—Source-active response packets

#### Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**flag-*modifier***—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Do not allow any user to read the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

<b>Required Privilege Level</b>	routing and trace—To view this statement in the configuration. routing-control and trace-control—To add this statement to the configuration.

## asm-override-ssm

---

<b>Syntax</b>	asm-override-ssm;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast], [edit logical-systems <i>logical-system-name</i> routing-options multicast], [edit routing-instances <i>routing-instance-name</i> routing-options multicast], [edit routing-options multicast]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 9.5 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series. Statement introduced in Junos OS Release 12.3 for ACX Series routers.
<b>Description</b>	Enable the routing device to accept any-source multicast join messages (*G) for group addresses that are within the default or configured range of source-specific multicast groups.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Source-Specific Multicast Groups with Any-Source Override on page 4895</a></li> </ul>

## policy (SSM Maps)

---

<b>Syntax</b>	<code>policy [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast <b>ssm-map</b> <i>ssm-map-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-options multicast <b>ssm-map</b> <i>ssm-map-name</i> ], [edit routing-instances <i>routing-instance-name</i> routing-options multicast <b>ssm-map</b> <i>ssm-map-name</i> ], [edit routing-options multicast <b>ssm-map</b> <i>ssm-map-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series. Statement introduced in Junos OS Release 12.3 for ACX Series routers.
<b>Description</b>	Apply one or more policies to an SSM map.
<b>Options</b>	<i>policy-names</i> —Name of one or more policies for SSM mapping.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To view this statement in the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring SSM Mapping on page 4893</a></li></ul>

## ssm-groups

<b>Syntax</b>	<code>ssm-groups [ <i>ip-addresses</i> ];</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options multicast],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options multicast],</p> <p>[edit routing-options multicast]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p>
<b>Description</b>	<p>Configure source-specific multicast (SSM) groups.</p> <p>By default, the SSM group multicast address is limited to the IP address range from 232.0.0.0 through 232.255.255.255. However, you can extend SSM operations into another Class D range by including the <b>ssm-groups</b> statement in the configuration. The default SSM address range from 232.0.0.0 through 232.255.255.255 cannot be used in the <b>ssm-groups</b> statement. This statement is for adding other multicast addresses to the default SSM group addresses. This statement does not override the default SSM group address range.</p> <p>IGMPv3 supports SSM groups. By utilizing inclusion lists, only sources that are specified send to the SSM group.</p>
<b>Options</b>	<i>ip-addresses</i> —List of one or more additional SSM group addresses separated by a space.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Source-Specific Multicast Groups with Any-Source Override on page 4895</a></li> </ul>

## ssm-map (Protocols IGMP)

---

<b>Syntax</b>	<code>ssm-map ssm-map-name;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <b>igmp</b> interface <i>interface-name</i> ], [edit protocols <b>igmp</b> interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Apply an SSM map to an IGMP interface.
<b>Options</b>	<i>ssm-map-name</i> —Name of SSM map.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring SSM Mapping on page 4893</a></li></ul>

## ssm-map (Routing Options Multicast)

---

<b>Syntax</b>	<code>ssm-map ssm-map-name {     <b>policy</b> [ <i>policy-names</i> ];     <b>source</b> [ <i>addresses</i> ]; }</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast], [edit logical-systems <i>logical-system-name</i> routing-options multicast], [edit routing-instances <i>routing-instance-name</i> routing-options multicast], [edit routing-options multicast]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.1 for the QFX Series. Statement introduced in Junos OS Release 12.3 for ACX Series routers.
<b>Description</b>	Configure SSM mapping.
<b>Options</b>	<i>ssm-map-name</i> —Name of the SSM map.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

# Administration

- [Routine Monitoring on page 5047](#)
- [Monitoring Commands for Multicast Protocols on page 5048](#)

## Routine Monitoring

- [Monitoring IGMP Snooping on page 5047](#)
- [Verifying the IGMP Snooping Group Timeout Value on page 5048](#)

### Monitoring IGMP Snooping

- Purpose** Use the monitoring feature to view status and information about the IGMP snooping configuration.
- Action** To display IGMP snooping details in the CLI, enter the following commands:
  - `show igmp-snooping vlans`
  - `show igmp-snooping statistics`
  - `show igmp-snooping route`
  - `show igmp-snooping membership`
- Meaning** [Table 392 on page 5047](#) summarizes the IGMP snooping details displayed.

Table 392: Summary of IGMP Snooping Output Fields

Field	Values
IGMP Snooping Monitor	
VLAN	VLAN for which IGMP snooping is enabled.
Interfaces	Interface connected to a multicast router.
Groups	Number of the multicast groups learned by the VLAN.
MRouters	Multicast router.
Receivers	Multicast receiver.

Table 392: Summary of IGMP Snooping Output Fields (*continued*)

Field	Values
IGMP Route Information	
VLAN	VLAN for which IGMP snooping is enabled.
Next-Hop	Next hop assigned by the switch after performing the route lookup.
Group	Multicast groups learned by the VLAN.

- Related Documentation**
- [IGMP Snooping Overview on page 4761](#)
  - [Example: Configuring IGMP Snooping on page 4849](#)
  - [Configuring IGMP Snooping on page 4848](#)
  - [Changing the IGMP Snooping Group Timeout Value](#)

## Verifying the IGMP Snooping Group Timeout Value

**Purpose** Verify that the IGMP snooping group timeout value has been changed correctly from its default value.

**Action** Display the IGMP snooping membership information, which contains the group timeout value that was derived from the IGMP configuration:

```
user@switch> show igmp-snooping membership detail
VLAN: v43 Tag: 43 (Index: 4)
Group: 225.0.0.1
Receiver count: 1, Flags: <v2-hosts>
ge-0/0/15.0 Uptime: 00:00:05 timeout: 510
```

**Meaning** The IGMP snooping group timeout value determines how long a switch waits to receive an IGMP query from a multicast router before removing a multicast group from its multicast cache table. When you enable IGMP snooping, the default IGMP snooping group timeout value of 260 seconds is applied to all VLANs, which means that the switch waits 260 seconds to receive an IGMP query before removing a multicast group from its multicast cache table. You can change the timeout value by using the **robust-count** option.

## clear pim join

**List of Syntax**    [Syntax on page 5065](#)  
                           [Syntax \(EX Series Switch and the QFX Series\) on page 5065](#)

**Syntax**    clear pim join  
                   <group-address>  
                   <bidirectional | dense | sparse>  
                   <exact>  
                   <inet | inet6>  
                   <instance *instance-name*>  
                   <logical-system (all | *logical-system-name*)>  
                   <rp *ip-address/prefix* | source *ip-address/prefix*>  
                   <sg | star-g>

**Syntax (EX Series Switch and the QFX Series)**    clear pim join  
                                                                   <group-address>  
                                                                   <dense | sparse>  
                                                                   <exact>  
                                                                   <inet | inet6>  
                                                                   <instance *instance-name*>  
                                                                   <rp *ip-address/prefix* | source *ip-address/prefix*>  
                                                                   <sg | star-g>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                   Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                   **inet6** and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.  
                                   Command introduced in Junos OS Release 11.3 for the QFX Series.  
                                   Multiple new filter options introduced in Junos OS Release 13.2.

**Description**    Clear the Protocol Independent Multicast (PIM) join and prune states.

**Options**    **none**—Clear the PIM join and prune states for all groups, family addresses, and instances.

**group-address**—(Optional) Clear the PIM join and prune states for a group address.

**bidirectional | dense | sparse**—(Optional) Clear PIM bidirectional mode, dense mode, or sparse and source-specific multicast (SSM) mode entries.

**exact**—(Optional) Clear only the group that exactly matches the specified group address.

**inet | inet6**—(Optional) Clear the PIM entries for IPv4 or IPv6 family addresses, respectively.

**instance *instance-name***—(Optional) Clear the entries for a specific PIM-enabled routing instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**rp *ip-address/prefix* | source *ip-address/prefix***—(Optional) Clear the PIM entries with a specified rendezvous point (RP) address and prefix or with a specified source address and prefix. You can omit the prefix.

**sg | star-g**—(Optional) Clear PIM (S,G) or (\*,G) entries.

**Additional Information** The **clear pim join** command cannot be used to clear the PIM join and prune state on a backup Routing Engine when nonstop active routing is enabled.

**Required Privilege Level** clear

## mtrace

<b>Syntax</b>	<code>mtrace source</code> <logical-system <i>logical-system-name</i> > <routing-instance <i>routing-instance-name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 9.5 for SRX1400, SRX3400, SRX3600, SRX5600, and SRX5800 devices. Command introduced in Junos OS Release 11.3 for the QFX Series. Command introduced in Junos OS Release 12.3 for the PTX Series.
<b>Description</b>	Display trace information about an IP multicast path.
<b>Options</b>	<b>source</b> —Source hostname or address.  <b>logical-system (<i>logical-system-name</i>)</b> —(Optional) Perform this operation on a logical system.  <b>routing-instance <i>routing-instance-name</i></b> —(Optional) Trace a particular routing instance.
<b>Additional Information</b>	The <b>mtrace</b> command for multicast traffic is similar to the <b>traceroute</b> command used for unicast traffic. Unlike <b>traceroute</b> , <b>mtrace</b> traces traffic backwards, from the receiver to the source.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">mtrace source on page 5074</a>
<b>Output Fields</b>	<a href="#">Table 393 on page 5072</a> describes the output fields for the <b>mtrace</b> command. Output fields are listed in the approximate order in which they appear.

**Table 393: mtrace Output Fields**

Field Name	Field Description
<b>Mtrace from</b>	IP address of the receiver.
<b>to</b>	IP address of the source.
<b>via group</b>	IP address of the multicast group (if any).
<b>Querying full reverse path</b>	Indicates the full reverse path query has begun.
<b><i>number-of-hops</i></b>	Number of hops from the source to the named router or switch.
<b><i>router-name</i></b>	Name of the router or switch for this hop.
<b><i>address</i></b>	Address of the router or switch for this hop.

Table 393: mtrace Output Fields (*continued*)

Field Name	Field Description
<i>protocol</i>	Protocol used (for example, PIM).
Round trip time	Average round-trip time, in milliseconds (ms).
total ttl of	Time-to-live (TTL) threshold.

## Sample Output

### mtrace source

```
user@host> mtrace 192.1.4.2
Mtrace from 192.1.4.2 to 192.1.1.2 via group 0.0.0.0
Querying full reverse path... * *
  0  routerA.lab.mycompany.net (192.1.1.2)
 -1  routerB.lab.mycompany.net (192.1.2.2) PIM thresh^ 1
 -2  routerC.lab.mycompany.net (192.1.3.2) PIM thresh^ 1
 -3  hostA.lab.mycompany.net (192.1.4.2)
Round trip time 2 ms; total ttl of 2 required.
```

## mtrace from-source

**Syntax** `mtrace from-source source source`  
`<brief | detail>`  
`<extra-hops extra-hops>`  
`<group group>`  
`<interval interval>`  
`<loop>`  
`<max-hops max-hops>`  
`<max-queries max-queries>`  
`<multicast-response | unicast-response>`  
`<no-resolve>`  
`<no-router-alert>`  
`<response response>`  
`<routing-instance routing-instance-name>`  
`<ttl tll>`  
`<wait-time wait-time>`

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Display trace information about an IP multicast path from a source to this router or switch. If you specify a group address with this command, Junos OS returns additional information, such as packet rates and losses.

**Options** **brief | detail**—(Optional) Display the specified level of output.

**extra-hops *extra-hops***—(Optional) Number of hops to take after reaching a nonresponsive router. You can specify a number between **0** and **255**.

**group *group***—(Optional) Group address for which to trace the path. The default group address is **0.0.0.0**.

**interval *interval***—(Optional) Number of seconds to wait before gathering statistics again. The default value is **10** seconds.

**loop**—(Optional) Loop indefinitely, displaying rate and loss statistics.

**max-hops *max-hops***—(Optional) Maximum hops to trace toward the source. The range of values is **0** through **255**. The default value is **32** hops.

**max-queries *max-queries***—(Optional) Maximum number of query attempts for any hop. The range of values is 1 through **32**. The default is **3**.

**multicast-response**—(Optional) Always request the response using multicast.

**no-resolve**—(Optional) Do not attempt to display addresses symbolically.

**no-router-alert**—(Optional) Do not use the router-alert IP option.

**response *response***—(Optional) Send trace response to a host or multicast address.

**routing-instance** *routing-instance-name*—(Optional) Trace a particular routing instance.

**source** *source*—Source hostname or address.

**ttl** *tll*—(Optional) IP time-to-live (TTL) value. You can specify a number between 0 and 255. Local queries to the multicast group use a value of 1. Otherwise, the default value is 127.

**unicast-response**—(Optional) Always request the response using unicast.

**wait-time** *wait-time*—(Optional) Number of seconds to wait for a response. The default value is 3.

**Required Privilege Level** view

**List of Sample Output** [mtrace from-source on page 5077](#)

**Output Fields** [Table 394 on page 5076](#) describes the output fields for the **mtrace from-source** command. Output fields are listed in the approximate order in which they appear.

**Table 394: mtrace from-source Output Fields**

Field Name	Field Description
<b>Mtrace from</b>	IP address of the receiver.
<b>to</b>	IP address of the source.
<b>via group</b>	IP address of the multicast group (if any).
<b>Querying full reverse path</b>	Indicates the full reverse path query has begun.
<b>number-of-hops</b>	Number of hops from the source to the named router or switch.
<b>router-name</b>	Name of the router or switch for this hop.
<b>address</b>	Address of the router or switch for this hop.
<b>protocol</b>	Protocol used (for example, PIM).
<b>Round trip time</b>	Average round-trip time, in milliseconds (ms).
<b>total ttl of</b>	Time-to-live (TTL) threshold.
<b>source</b>	Source address.
<b>Response Dest</b>	Response destination address.
<b>Overall</b>	Average packet rate for all traffic at each hop.

Table 394: mtrace from-source Output Fields (*continued*)

Field Name	Field Description
<b>Packet Statistics for Traffic From</b>	Number of packets lost, number of packets sent, percentage of packets lost, and average packet rate at each hop.
<b>Receiver</b>	IP address receiving the multicast.
<b>Query source</b>	IP address sending the mtrace query.

## Sample Output

### mtrace from-source

```

user@host> mtrace from-source source 192.1.4.2 group 225.1.1.1
Mtrace from 192.1.4.2 to 192.1.1.2 via group 225.1.1.1
Querying full reverse path... * *
 0 routerA.lab.mycompany.net (192.1.1.2)

**Release Information** Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Display trace information about a multicast path from this router or switch to a gateway router or switch.

**Options** `gateway gateway`—Send the trace query to a gateway multicast address.

`brief | detail`—(Optional) Display the specified level of output.

`extra-hops extra-hops`—(Optional) Number of hops to take after reaching a nonresponsive router or switch. You can specify a number between **0** and **255**.

`group group`—(Optional) Group address for which to trace the path. The default group address is **0.0.0.0**.

`interface interface-name`—(Optional) Source address for sending the trace query.

`interval interval`—(Optional) Number of seconds to wait before gathering statistics again. The default value is **10**.

`loop`—(Optional) Loop indefinitely, displaying rate and loss statistics.

`max-hops max-hops`—(Optional) Maximum hops to trace toward the source. You can specify a number between **0** and **255**. The default value is **32**.

`max-queries max-queries`—(Optional) Maximum number of query attempts for any hop. You can specify a number between **0** and **255**. The default value is **3**.

`multicast-response`—(Optional) Always request the response using multicast.

`no-resolve`—(Optional) Do not attempt to display addresses symbolically.

**no-router-alert**—(Optional) Do not use the router-alert IP option.

**response *response***—(Optional) Send trace response to a host or multicast address.

**routing-instance *routing-instance-name***—(Optional) Trace a particular routing instance.

**ttl *tll***—(Optional) IP time-to-live value. You can specify a number between 0 and 225.

Local queries to the multicast group use TTL 1. Otherwise, the default value is 127.

**unicast-response**—(Optional) Always request the response using unicast.

**wait-time *wait-time***—(Optional) Number of seconds to wait for a response. The default value is 3.

**Required Privilege Level** view

**List of Sample Output** [mtrace to-gateway on page 5081](#)

**Output Fields** [Table 396 on page 5081](#) describes the output fields for the **mtrace to-gateway** command. Output fields are listed in the approximate order in which they appear.

**Table 396: mtrace to-gateway Output Fields**

Field Name	Field Description
<b>Mtrace from</b>	IP address of the receiver.
<b>to</b>	IP address of the source.
<b>via group</b>	IP address of the multicast group (if any).
<b>Querying full reverse path</b>	Indicates the full reverse path query has begun.
<b><i>number-of-hops</i></b>	Number of hops from the source to the named router or switch.
<b><i>router-name</i></b>	Name of the router or switch for this hop.
<b><i>address</i></b>	Address of the router or switch for this hop.
<b><i>protocol</i></b>	Protocol used (for example, PIM).
<b>Round trip time</b>	Average round-trip time, in milliseconds (ms).
<b>total ttl of</b>	Time-to-live (TTL) threshold.

## Sample Output

### mtrace to-gateway

```
user@host> mtrace to-gateway gateway 192.1.3.2 group 225.1.1.1 interface 192.1.1.73 brief
```

```
Mtrace from 192.1.1.73 to 192.1.1.2 via group 225.1.1.1
```

```
Querying full reverse path... * *
 0 routerA.lab.mycompany.net (192.1.1.2)
-1 routerA.lab.mycompany.net (192.1.1.2) PIM thresh^ 1
-2 routerB.lab.mycompany.net (192.1.2.2) PIM thresh^ 1
-3 routerC.lab.mycompany.net (192.1.3.2) PIM thresh^ 1
Round trip time 2 ms; total ttl of 3 required.
```

## show configuration protocols igmp

<b>Syntax</b>	show configuration protocols igmp
<b>Release Information</b>	Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Display Internet Group Management Protocol (IGMP) information.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">IGMP Snooping Overview on page 4761</a></li> <li>• <a href="#">Configuring IGMP Snooping on page 4848</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show configuration protocols igmp on page 5083</a>
<b>Output Fields</b>	<a href="#">Table 397 on page 5083</a> describes the output fields for the <b>show configuration protocols igmp</b> command that relate to IGMP querying.

**Table 397: show igmp group Output Fields**

Field Name	Field Description	Level of Output
accounting	Enables notification for join and leave events.	All levels
igmp-querier	Configured source address for the IGMP querier.	All levels
interface	Name of the interface that receives IGMP membership reports.	All levels
query-interval	Interval at which the IGMP querier sends general host-query messages to solicit membership information.	All levels
query-response-interval	How long the IGMP querier waits to receive a response from a query message before sending another query.	All levels
src-address	Source address of IGMP queries.	
version	IGMP version.	All levels

## Sample Output

### show configuration protocols igmp

```

user@switch> show configuration protocols igmp
query-interval 150;
query-response-interval 50;
accounting;
interface vlan.43 {
  version 2;
}
igmp-querier {

```

```
src-address 10.0.0.2;  
}
```

## show igmp interface

<b>List of Syntax</b>	<a href="#">Syntax on page 5089</a> <a href="#">Syntax (EX Series Switches and the QFX Series) on page 5089</a>
<b>Syntax</b>	<pre>show igmp interface &lt;brief   detail&gt; &lt;interface-name&gt; &lt;logical-system (all   logical-system-name)&gt;</pre>
<b>Syntax (EX Series Switches and the QFX Series)</b>	<pre>show igmp interface &lt;brief   detail&gt; &lt;interface-name&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Display information about Internet Group Management Protocol (IGMP)-enabled interfaces.
<b>Options</b>	<p><b>none</b>—Display standard information about all IGMP-enabled interfaces.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>interface-name</b>—(Optional) Display information about the specified IGMP-enabled interface only.</p> <p><b>logical-system (all   logical-system-name)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear igmp membership on page 5051</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show igmp interface on page 5091</a> <a href="#">show igmp interface brief on page 5092</a> <a href="#">show igmp interface detail on page 5092</a> <a href="#">show igmp interface &lt;interface-name&gt; on page 5092</a>
<b>Output Fields</b>	<p><a href="#">Table 399 on page 5089</a> describes the output fields for the <b>show igmp interface</b> command. Output fields are listed in the approximate order in which they appear.</p>

**Table 399: show igmp interface Output Fields**

Field Name	Field Description	Level of Output
Interface	Name of the interface.	All levels
Querier	Address of the routing device that has been elected to send membership queries.	All levels

Table 399: show igmp interface Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>State</b>	State of the interface: <b>Up</b> or <b>Down</b> .	All levels
<b>SSM Map Policy</b>	Name of the source-specific multicast (SSM) map policy that has been applied to the IGMP interface.	All levels
<b>Timeout</b>	How long until the IGMP querier is declared to be unreachable, in seconds.	All levels
<b>Version</b>	IGMP version being used on the interface: <b>1</b> , <b>2</b> , or <b>3</b> .	All levels
<b>Groups</b>	Number of groups on the interface.	All levels
<b>Group limit</b>	Maximum number of groups allowed on the interface. Any joins requested after the limit is reached are rejected.	All levels
<b>Group threshold</b>	Configured threshold at which a warning message is generated.  This threshold is based on a percentage of groups received on the interface. If the number of groups received reaches the configured threshold, the device generates a warning message.	All levels
<b>Group log-interval</b>	Time (in seconds) between consecutive log messages.	All levels
<b>Immediate Leave</b>	State of the immediate leave option: <ul style="list-style-type: none"> <li><b>On</b>—Indicates that the router removes a host from the multicast group as soon as the router receives a leave group message from a host associated with the interface.</li> <li><b>Off</b>—Indicates that after receiving a leave group message, instead of removing a host from the multicast group immediately, the router sends a group query to determine if another receiver responds.</li> </ul>	All levels
<b>Promiscuous Mode</b>	State of the promiscuous mode option: <ul style="list-style-type: none"> <li><b>On</b>—Indicates that the router can accept IGMP reports from subnetworks that are not associated with its interfaces.</li> <li><b>Off</b>—Indicates that the router can accept IGMP reports only from subnetworks that are associated with its interfaces.</li> </ul>	All levels
<b>Passive</b>	State of the passive mode option: <ul style="list-style-type: none"> <li><b>On</b>—Indicates that the router can run IGMP on the interface but not send or receive control traffic such as IGMP reports, queries, and leaves.</li> <li><b>Off</b>—Indicates that the router can run IGMP on the interface and send or receive control traffic such as IGMP reports, queries, and leaves.</li> </ul> <p>The <b>passive</b> statement enables you to selectively activate up to two out of a possible three available query or control traffic options. When enabled, the following options appear after the <b>on</b> state declaration:</p> <ul style="list-style-type: none"> <li><b>send-general-query</b>—The interface sends general queries.</li> <li><b>send-group-query</b>—The interface sends group-specific and group-source-specific queries.</li> <li><b>allow-receive</b>—The interface receives control traffic.</li> </ul>	All levels

Table 399: show igmp interface Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>OIF map</b>	Name of the OIF map (if configured) associated with the interface.	All levels
<b>SSM map</b>	Name of the source-specific multicast (SSM) map (if configured) used on the interface.	All levels
<b>Configured Parameters</b>	Information configured by the user: <ul style="list-style-type: none"> <li>• <b>IGMP Query Interval</b>—Interval (in seconds) at which this router sends membership queries when it is the querier.</li> <li>• <b>IGMP Query Response Interval</b>—Time (in seconds) that the router waits for a report in response to a general query.</li> <li>• <b>IGMP Last Member Query Interval</b>—Time (in seconds) that the router waits for a report in response to a group-specific query.</li> <li>• <b>IGMP Robustness Count</b>—Number of times the router retries a query.</li> </ul>	All levels
<b>Derived Parameters</b>	Derived information: <ul style="list-style-type: none"> <li>• <b>IGMP Membership Timeout</b>—Timeout period (in seconds) for group membership. If no report is received for these groups before the timeout expires, the group membership is removed.</li> <li>• <b>IGMP Other Querier Present Timeout</b>—Time (in seconds) that the router waits for the IGMP querier to send a query.</li> </ul>	All levels

## Sample Output

### show igmp interface

```

user@host> show igmp interface
Interface: at-0/3/1.0
  Querier: 10.111.30.1
  State:      Up Timeout:  None Version:  2 Groups:    4
  SSM Map Policy: ssm-policy-A
Interface: so-1/0/0.0
  Querier: 10.111.10.1
  State:      Up Timeout:  None Version:  2 Groups:    2
  SSM Map Policy: ssm-policy-B
Interface: so-1/0/1.0
  Querier: 10.111.20.1
  State:      Up Timeout:  None Version:  2 Groups:    4
  SSM Map Policy: ssm-policy-C
Immediate Leave: On
Promiscuous Mode: Off

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

Derived Parameters:
IGMP Membership Timeout: 260.0
IGMP Other Querier Present Timeout: 255.0

```

### show igmp interface brief

The output for the **show igmp interface brief** command is identical to that for the **show igmp interface** command. For sample output, see [show igmp interface on page 5091](#).

### show igmp interface detail

The output for the **show igmp interface detail** command is identical to that for the **show igmp interface** command. For sample output, see [show igmp interface on page 5091](#).

### show igmp interface <interface-name>

```
user@host# show igmp interface ge-3/2/0.0
Interface: ge-3/2/0.0
Querier: 20.1.1.1
State: Up Timeout:      None Version: 3 Groups:      1
Group limit: 8
Group threshold: 60
Group log-interval: 10
Immediate leave: Off
Promiscuous mode: Off
```

## show igmp statistics

<b>Output Fields</b>	<p><a href="#">Table 401 on page 5096</a> lists the output fields for the <b>show igmp-snooping membership</b> command. Output fields are listed in the approximate order in which they appear.</p>

**Table 401: show igmp-snooping membership Output Fields**

Field Name	Field Description	Level of Output
VLAN	Name of the VLAN.	All
Interfaces	Interfaces assigned to the VLAN.	All
Tag	Numerical identifier of the VLAN.	<b>detail</b>

Table 401: show igmp-snooping membership Output Fields (*continued*)

Field Name	Field Description	Level of Output
Router interfaces	Names of multicast router interfaces.	<b>detail</b>
• static or dynamic	Whether the multicast router interface is <b>static</b> or <b>dynamic</b> .	<b>detail</b>
• Uptime	For static interfaces, length of time since the interface was configured as a multicast router interface; for dynamic interfaces, length of time since the first query was received on the interface.	<b>detail</b>
• timeout	Query timeout in seconds.	<b>detail</b>
Group	IP multicast address of the multicast group.	<b>detail</b>
Receiver count	Number of interfaces that have membership in a multicast group.	<b>detail</b>
Flags	IGMP version of the host sending a join message.	<b>detail</b>
Uptime	Length of time a multicast group has been active on the interface.	<b>detail</b>
timeout	Time (in seconds) left until the entry for the multicast group is removed.	All
Last reporter	Last host to report membership for the multicast group.	<b>detail</b>
Include source	Source addresses from which multicast streams are allowed based on IGMPv3 reports.	<b>detail</b>

## Sample Output

### show igmp-snooping membership

```

user@switch> show igmp-snooping membership
VLAN: v1
  224.1.1.1      *           258 secs
    Interfaces: ge-0/0/0.0
  224.1.1.3      *           258 secs
    Interfaces: ge-0/0/0.0
  224.1.1.5      *           258 secs
    Interfaces: ge-0/0/0.0
  224.1.1.7      *           258 secs

```

```
Interfaces: ge-0/0/0.0
224.1.1.9      *           258 secs
Interfaces: ge-0/0/0.0
224.1.1.11     *           258 secs
Interfaces: ge-0/0/0.0
```

### show igmp-snooping membership detail

```
user@switch> show igmp-snooping membership detail
VLAN: v43 Tag: 43 (Index: 4)
Group: 225.0.0.2

               Interfaces: ge-0/0/0.0
v1           224.1.1.11, *     1266
               Interfaces: ge-0/0/0.0
```

## show igmp-snooping statistics

<b>Syntax</b>	<b>show igmp-snooping statistics</b>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display IGMP snooping statistics.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Monitoring IGMP Snooping on page 5047</a></li> <li>• <a href="#">Configuring IGMP Snooping on page 4848</a></li> <li>• <a href="#">show igmp-snooping route on page 5099</a></li> <li>• <a href="#">show igmp-snooping vlans on page 5103</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show igmp-snooping statistics on page 5102</a>
<b>Output Fields</b>	Table 403 on page 5101 lists the output fields for the <b>show igmp-snooping statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 403: show igmp-snooping statistics Output Fields**

Field Name	Field Description
Bad length	IGMP packet has illegal or bad length.
Bad checksum	IGMP or IP checksum is incorrect.
Invalid interface	Packet was received through an invalid interface.
Not local	Number of packets received from senders that are not local.
Receive unknown	Unknown IGMP type.
Timed out	Number of timeouts for all multicast groups.
IGMP Type	Type of IGMP message ( <b>Queries</b> , <b>Reports</b> , <b>Leaves</b> , or <b>Other</b> ).
Received	Number of IGMP packets received.
Transmitted	Number of IGMP packets transmitted.
Recv Errors	Number of general receive errors.

## Sample Output

### show igmp-snooping statistics

```
user@switch> show igmp-snooping statistics
Bad length: 0 Bad checksum: 0 Invalid interface: 0
Not local: 0 Receive unknown: 0 Timed out: 58
```

IGMP Type	Received	Transmitted	Recv Errors
Queries:	74295	0	0
Reports:	18148423	0	16333523
Leaves:	0	0	0
Other:	0	0	0

## show igmp-snooping vlans

<b>Syntax</b>	<code>show igmp-snooping vlans</code> <code>&lt;brief   detail&gt;</code> <code>&lt;vlan <i>vlan-id</i>   <i>vlan-name</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display IGMP snooping VLAN information.
<b>Options</b>	<p><b>none</b>—Display general parameters.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>vlan <i>vlan-id</i>   vlan <i>vlan-number</i></b>—(Optional) Display VLAN information for the specified VLAN.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Monitoring IGMP Snooping on page 5047</a></li> <li>• <a href="#">Configuring IGMP Snooping on page 4848</a></li> <li>• <a href="#">show igmp-snooping route on page 5099</a></li> <li>• <a href="#">show igmp-snooping statistics on page 5101</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show igmp-snooping vlans on page 5104</a></p> <p><a href="#">show igmp-snooping vlans vlan on page 5104</a></p> <p><a href="#">show igmp-snooping vlans vlan detail on page 5104</a></p>
<b>Output Fields</b>	Table 404 on page 5103 lists the output fields for the <b>show igmp-snooping vlans</b> command. Output fields are listed in the approximate order in which they appear.

**Table 404: show igmp-snooping vlans Output Fields**

Field Name	Field Description	Level of Output
<b>VLAN</b>	Name of the VLAN.	All levels
<b>IGMP-L2-Querier</b>	Source address for IGMP snooping queries (if switch is an IGMP querier)	All levels
<b>Interfaces</b>	Number of interfaces in the VLAN.	All levels
<b>Groups</b>	Number of groups in the VLAN.	All levels
<b>MRouters</b>	Number of multicast routers associated with the VLAN.	All levels
<b>Receivers</b>	Number of host receivers in the VLAN.	All levels

Table 404: show igmp-snooping vlans Output Fields (*continued*)

Field Name	Field Description	Level of Output
Tag	Numerical identifier of the VLAN.	detail
tagged   untagged	Interface participates in a tagged (802.1Q) or untagged (native) VLAN.	detail
vlan-interface	Internal VLAN interface identifier.	detail
Membership timeout	Membership timeout value.	detail
Querier timeout	Timeout value for interfaces dynamically marked as router or switch interfaces (interfaces that receive queries). When the querier timeout is reached, the switch marks the interface as a host interface.	detail
Interface	Name of the interface.	detail
Reporters	Number of dynamic groups on an interface.	detail

## Sample Output

### show igmp-snooping vlans

```

user@switch> show igmp-snooping vlans
VLAN      Interfaces Groups MRouters Receivers
default   0           0      0         0
v1         11          50      0         0
v10        1           0      0         0
v11        1           0      0         0
v180       3           0      1         0
v181       3           0      0         0
v182       3           0      0         0

```

### show igmp-snooping vlans vlan

```

user@switch> show igmp-snooping vlans vlan v10
user@switch> show igmp-snooping vlans vlan v10
VLAN      Interfaces Groups MRouters Receivers
v10       1           0      0         0

```

### show igmp-snooping vlans vlan detail

```

user@switch> show igmp-snooping vlans vlan v10 detail
VLAN: v10, Tag: 10, vlan-interface: vlan.10
      Interface: ge-0/0/10.0, tagged, Groups: 0
IGMP-L2-Querier: Stopped, SourceAddress: 10.10.1.2

```

## show msdp

<b>Syntax</b>	show msdp <brief   detail> <instance <i>instance-name</i> > <logical-system (all   <i>logical-system-name</i> )> <peer <i>peer-address</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Display Multicast Source Discovery Protocol (MSDP) information.
<b>Options</b>	<p><b>none</b>—Display standard MSDP information for all routing instances.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display information for the specified instance only.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>peer <i>peer-address</i></b>—(Optional) Display information about the specified peer only.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show msdp source on page 5107</a></li> <li>• <a href="#">show msdp source-active on page 5109</a></li> <li>• <a href="#">show msdp statistics on page 5112</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show msdp on page 5106</a> <a href="#">show msdp brief on page 5106</a> <a href="#">show msdp detail on page 5106</a>
<b>Output Fields</b>	Table 405 on page 5105 describes the output fields for the <b>show msdp</b> command. Output fields are listed in the approximate order in which they appear.

**Table 405: show msdp Output Fields**

Field Name	Field Description	Level of Output
Peer address	IP address of the peer.	All levels
Local address	Local address of the peer.	All levels
State	Status of the MSDP connection: <b>Listen</b> , <b>Established</b> , or <b>Inactive</b> .	All levels
Last up/down	Time at which the most recent peer-state change occurred.	All levels

Table 405: show msdp Output Fields (*continued*)

Field Name	Field Description	Level of Output
Peer-Group	Peer group name.	All levels
SA Count	Number of source-active cache entries advertised by each peer that were accepted, compared to the number that were received, in the format <i>number-accepted/number-received</i> .	All levels
Peer Connect Retries	Number of peer connection retries.	detail
State timer expires	Number of seconds before another message is sent to a peer.	detail
Peer Times out	Number of seconds to wait for a response from the peer before the peer is declared unavailable.	detail
SA accepted	Number of entries in the source-active cache accepted from the peer.	detail
SA received	Number of entries in the source-active cache received by the peer.	detail

## Sample Output

### show msdp

```

user@host> show msdp
Peer address   Local address   State      Last up/down Peer-Group SA Count
198.32.8.193   198.32.8.195   Established 5d 19:25:44 North23 120/150
198.32.8.194   198.32.8.195   Established 3d 19:27:27 North23 300/345
198.32.8.196   198.32.8.195   Established 5d 19:39:36 North23 10/13
198.32.8.197   198.32.8.195   Established 5d 19:32:27 North23 5/6
198.32.8.198   198.32.8.195   Established 3d 19:33:04 North23 2305/3000

```

### show msdp brief

The output for the **show msdp brief** command is identical to that for the **show msdp** command. For sample output, see [show msdp on page 5106](#).

### show msdp detail

```

user@host> show msdp detail
Peer: 10.255.70.15
Local address: 10.255.70.19
State: Established
Peer Connect Retries: 0
State timer expires: 22
Peer Times out: 49
SA accepted: 0
SA received: 0

```

## show msdp source

---

<b>Syntax</b>	<pre>show msdp source &lt;instance <i>instance-name</i>&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;source-address&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Display multicast sources learned from Multicast Source Discovery Protocol (MSDP).
<b>Options</b>	<p><b>none</b>—Display standard MSDP source information for all routing instances.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display information for the specified instance only.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>source-address</b>—(Optional) IP address and optional prefix length. Display information for the specified source address only.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show msdp on page 5105</a></li> <li>• <a href="#">show msdp source-active on page 5109</a></li> <li>• <a href="#">show msdp statistics on page 5112</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show msdp source on page 5108</a>

**Output Fields** Table 406 on page 5108 describes the output fields for the **show msdp source** command. Output fields are listed in the approximate order in which they appear.

**Table 406: show msdp source Output Fields**

Field Name	Field Description
Source address	IP address of the source.
/Len	Length of the prefix for this IP address.
Type	Discovery method for this multicast source: <ul style="list-style-type: none"> <li>• <b>Configured</b>—Source-active limit explicitly configured for this source.</li> <li>• <b>Dynamic</b>—Source-active limit established when this source was discovered.</li> </ul>
Maximum	Source-active limit applied to this source.
Threshold	Source-active threshold applied to this source.
Exceeded	Number of source-active messages received from this source exceeding the established maximum.

## Sample Output

**show msdp source**

```

user@host> show msdp source
Source address /Len  Type      Maximum  Threshold  Exceeded
0.0.0.0        /0    Configured    5         none       0
10.1.0.0       /16   Configured    500       none       0
10.1.1.1       /32   Configured    10000     none       0
10.1.1.2       /32   Dynamic       6936     none       0
10.1.5.5       /32   Dynamic       500      none      123
10.2.1.1       /32   Dynamic        2         none       0

```

## show msdp source-active

<b>Syntax</b>	<pre>show msdp source-active &lt;brief   detail&gt; &lt;group <i>group</i>&gt; &lt;instance <i>instance-name</i>&gt; &lt;local&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;originator <i>originator</i>&gt; &lt;peer <i>peer-address</i>&gt; &lt;source <i>source-address</i>&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 12.1 for the QFX Series.</p>
<b>Description</b>	Display the Multicast Source Discovery Protocol (MSDP) source-active cache.
<b>Options</b>	<p><b>none</b>—Display standard MSDP source-active cache information for all routing instances.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>group <i>group</i></b>—(Optional) Display source-active cache information for the specified group.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display information for the specified instance.</p> <p><b>local</b>—(Optional) Display all source-active caches originated by this router.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>originator <i>originator</i></b>—(Optional) Display information about the peer that originated the source-active cache entries.</p> <p><b>peer <i>peer-address</i></b>—(Optional) Display the source-active cache of the specified peer.</p> <p><b>source <i>source-address</i></b>—(Optional) Display the source-active cache of the specified source.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show msdp on page 5105</a></li> <li>• <a href="#">show msdp source on page 5107</a></li> <li>• <a href="#">show msdp statistics on page 5112</a></li> </ul>

<b>Output Fields</b>	Table 407 on page 5110 describes the output fields for the <b>show msdp source-active</b> command. Output fields are listed in the approximate order in which they appear.

Table 407: show msdp source-active Output Fields

Field Name	Field Description
Global active source limit exceeded	Number of times all peers have exceeded configured active source limits.
Global active source limit maximum	Configured number of active source messages accepted by the device.
Global active source limit threshold	Configured threshold for applying random early discard (RED) to drop some but not all MSDP active source messages.
Global active source limit log-warning	Threshold at which a warning message is logged (percentage of the number of active source messages accepted by the device).
Global active source limit log interval	Time (in seconds) between consecutive log messages.
Group address	Multicast address of the group.
Source address	IP address of the source.
Peer address	IP address of the peer.
Originator	Router ID configured on the source of the rendezvous point (RP) that originated the message, or the loopback address when the router ID is not configured.
Flags	Flags: Accept, Reject, or Filtered.

## Sample Output

### show msdp source-active

```

user@host> show msdp source-active
Group address  Source address Peer address  Originator  Flags
230.0.0.0      192.168.195.46 local        10.255.14.30 Accept
230.0.0.1      192.168.195.46 local        10.255.14.30 Accept

## show msdp statistics

<b>Syntax</b>	show msdp statistics <instance <i>instance-name</i> > <logical-system (all   <i>logical-system-name</i> )> <peer <i>peer-address</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Display statistics about Multicast Source Discovery Protocol (MSDP) peers.
<b>Options</b>	<p><b>none</b>—Display statistics about all MSDP peers for all routing instances.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display statistics about a specific MSDP instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>peer <i>peer-address</i></b>—(Optional) Display statistics about a particular MSDP peer.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">clear msdp statistics on page 5059</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show msdp statistics on page 5114</a> <a href="#">show msdp statistics peer on page 5114</a>
<b>Output Fields</b>	Table 408 on page 5112 describes the output fields for the <b>show msdp statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 408: show msdp statistics Output Fields**

Field Name	Field Description
Global active source limit exceeded	Number of times all peers have exceeded configured active source limits.
Global active source limit maximum	Configured number of active source messages accepted by the device.
Global active source limit threshold	Configured threshold for applying random early discard (RED) to drop some but not all MSDP active source messages.
Global active source limit log-warning	Threshold at which a warning message is logged (percentage of the number of active source messages accepted by the device).
Global active source limit log interval	Time (in seconds) between consecutive log messages.
Peer	Address of peer.

Table 408: show msdp statistics Output Fields (*continued*)

Field Name	Field Description
Last State Change	How long ago the peer state changed.
Last message received from the peer	How long ago the last message was received from the peer.
RPF Failures	Number of reverse path forwarding (RPF) failures.
Remote Closes	Number of times the remote peer closed.
Peer Timeouts	Number of peer timeouts.
SA messages sent	Number of source-active messages sent.
SA messages received	Number of source-active messages received.
SA request messages sent	Number of source-active request messages sent.
SA request messages received	Number of source-active request messages received.
SA response messages sent	Number of source-active response messages sent.
SA response messages received	Number of source-active response messages received.
Active source exceeded	Number of times this peer has exceeded configured source-active limits.
Active source Maximum	Configured number of active source messages accepted by this peer.
Active source threshold	Configured threshold on this peer for applying random early discard (RED) to drop some but not all MSDP active source messages.
Active source log-warning	Configured threshold on this peer at which a warning message is logged (percentage of the number of active source messages accepted by the device).
Active source log-interval	Time (in seconds) between consecutive log messages on this peer.
Keepalive messages sent	Number of keepalive messages sent.
Keepalive messages received	Number of keepalive messages received.
Unknown messages received	Number of unknown messages received.

Table 408: show msdp statistics Output Fields (*continued*)

Field Name	Field Description
Error messages received	Number of error messages received.

## Sample Output

### show msdp statistics

```

user@host> show msdp statistics
Global active source limit exceeded: 0
Global active source limit maximum: 10
Global active source limit threshold: 8
Global active source limit log-warning: 60
Global active source limit log interval: 60

Peer: 10.255.245.39
Last State Change: 11:54:49 (00:24:59)
Last message received from peer: 11:53:32 (00:26:16)
RPF Failures: 0
Remote Closes: 0
Peer Timeouts: 0
SA messages sent: 376
SA messages received: 459
SA request messages sent: 0
SA request messages received: 0
SA response messages sent: 0
SA response messages received: 0
Active source exceeded: 0
Active source Maximum: 10
Active source threshold: 8
Active source log-warning: 60
Active source log-interval 120
Keepalive messages sent: 17
Keepalive messages received: 19
Unknown messages received: 0
Error messages received: 0

```

### show msdp statistics peer

```

user@host> show msdp statistics peer 10.255.182.140
Peer: 10.255.182.140
  Last State Change: 8:19:23 (00:01:08)
  Last message received from peer: 8:20:05 (00:00:26)
  RPF Failures: 0

<b>Output Fields</b>	<p><a href="#">Table 409 on page 5116</a> describes the output fields for the <b>show multicast flow-map</b> command. Output fields are listed in the approximate order in which they appear.</p>

**Table 409: show multicast flow-map Output Fields**

Field Name	Field Description	Levels of Output
<b>Name</b>	Name of the flow map.	All levels
<b>Policy</b>	Name of the policy associated with the flow map.	All levels
<b>Cache-timeout</b>	Cache timeout value assigned to the flow map.	All levels
<b>Bandwidth</b>	Bandwidth setting associated with the flow map.	All levels
<b>Adaptive</b>	Whether or not adaptive mode is enabled for the flow map.	none
<b>Flow-map</b>	Name of the flow map.	<b>detail</b>

Table 409: show multicast flow-map Output Fields (*continued*)

Field Name	Field Description	Levels of Output
<b>Adaptive Bandwidth</b>	Whether or not adaptive mode is enabled for the flow map.	<b>detail</b>
<b>Redundant Sources</b>	Redundant sources defined for the same destination group.	<b>detail</b>

## Sample Output

### show multicast flow-map

```

user@host> show multicast flow-map
Instance: master
Name          Policy          Cache timeout    Bandwidth Adaptive
map2          policy2         never            2000000 no
map1          policy1         60 seconds      2000000 no

```

## Sample Output

### show multicast flow-map detail

```

user@host> show multicast flow-map detail
Instance: master
Flow-map: map1
  Policy:          policy1
  Cache Timeout:   600 seconds
  Bandwidth:       2000000
  Adaptive Bandwidth: yes
  Redundant Sources: 11.11.11.11
  Redundant Sources: 11.11.11.12
  Redundant Sources: 11.11.11.13

```

## show multicast interface

<b>List of Syntax</b>	<a href="#">Syntax on page 5118</a> <a href="#">Syntax (EX Series Switch and the QFX Series) on page 5118</a>
<b>Syntax</b>	show multicast interface <logical-system (all   <i>logical-system-name</i> )>
<b>Syntax (EX Series Switch and the QFX Series)</b>	show multicast interface
<b>Release Information</b>	Command introduced in Junos OS Release 8.3. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Display bandwidth information about IP multicast interfaces.
<b>Options</b>	none—Display all interfaces that have multicast configured.  logical-system (all   <i>logical-system-name</i> )—(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show multicast interface on page 5119</a>
<b>Output Fields</b>	<a href="#">Table 410 on page 5118</a> describes the output fields for the <b>show multicast interface</b> command. Output fields are listed in the approximate order in which they appear.

**Table 410: show multicast interface Output Fields**

Field Name	Field Description
Interface	Name of the multicast interface.
Maximum bandwidth (bps)	Maximum bandwidth setting, in bits per second, for this interface.
Remaining bandwidth (bps)	Amount of bandwidth, in bits per second, remaining on the interface.
Mapped bandwidth deduction (bps)	Amount of bandwidth, in bits per second, used by any flows that are mapped to the interface.  <b>NOTE:</b> Adding the mapped bandwidth deduction value to the local bandwidth deduction value results in the total deduction value for the interface.  This field does not appear in the output when the no QoS adjustment feature is disabled.

Table 410: show multicast interface Output Fields (*continued*)

Field Name	Field Description
<b>Local bandwidth deduction (bps)</b>	<p>Amount of bandwidth, in bits per second, used by any mapped flows that are traversing the interface.</p> <p><b>NOTE:</b> Adding the mapped bandwidth deduction value to the local bandwidth deduction value results in the total deduction value for the interface.</p> <p>This field does not appear in the output when the no QoS adjustment feature is disabled.</p>
<b>Reverse OIF mapping</b>	<p>State of the reverse OIF mapping feature (<b>on</b> or <b>off</b>).</p> <p><b>NOTE:</b> This field does not appear in the output when the no QoS adjustment feature is disabled.</p>
<b>Reverse OIF mapping no QoS adjustment</b>	<p>State of the no QoS adjustment feature (<b>on</b> or <b>off</b>) for interfaces that are using reverse OIF mapping.</p> <p><b>NOTE:</b> This field does not appear in the output when the no QoS adjustment feature is disabled.</p>
<b>Leave timer</b>	<p>Amount of time a mapped interface remains active after the last mapping ends.</p> <p><b>NOTE:</b> This field does not appear in the output when the no QoS adjustment feature is disabled.</p>
<b>No QoS adjustment</b>	<p>State (<b>on</b>) of the no QoS adjustment feature when this feature is enabled.</p> <p><b>NOTE:</b> This field does not appear in the output when the no QoS adjustment feature is disabled.</p>

## Sample Output

### show multicast interface

```

user@host> show multicast interface
Interface           Maximum bandwidth (bps) Remaining bandwidth (bps)
fe-0/0/3            10000000                0
fe-0/0/3.210        10000000                -2000000
fe-0/0/3.220        100000000              100000000
fe-0/0/3.230        20000000               18000000
fe-0/0/2.200        100000000              100000000

```

## show multicast mrinfo

<b>Syntax</b>	<code>show multicast mrinfo</code> <code>&lt;host&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Display configuration information about IP multicast networks, including neighboring multicast router addresses.
<b>Options</b>	<b>none</b> —Display configuration information about all multicast networks.  <b>host</b> —(Optional) Display configuration information about a particular host. Replace <i>host</i> with a hostname or IP address.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show multicast mrinfo on page 5121</a>
<b>Output Fields</b>	<a href="#">Table 411 on page 5120</a> describes the output fields for the <b>show multicast mrinfo</b> command. Output fields are listed in the approximate order in which they appear.

Table 411: show multicast mrinfo Output Fields

Field Name	Field Description
<i>source-address</i>	Query address, hostname (DNS name or IP address of the source address), and multicast protocol version or the software version of another vendor.
<i>ip-address-1—&gt;ip-address-2</i>	Queried router interface address and directly attached neighbor interface address, respectively.
<i>(name or ip-address)</i>	Name or IP address of neighbor.
<i>[metric/threshold/type/flags]</i>	Neighbor's multicast profile: <ul style="list-style-type: none"> <li><b>metric</b>—Always has a value of 1, because <b>mrinfo</b> queries the directly connected interfaces of a device.</li> <li><b>threshold</b>—Multicast threshold time-to-live (TTL). The range of values is 0 through 255.</li> <li><b>type</b>—Multicast connection type: <b>pim</b> or <b>tunnel</b>.</li> <li><b>flags</b>—Flags for this route: <ul style="list-style-type: none"> <li><b>querier</b>—Queried router is the designated router for the neighboring session.</li> <li><b>leaf</b>—Link is a leaf in the multicast network.</li> <li><b>down</b>—Link status indicator.</li> </ul> </li> </ul>

## Sample Output

show multicast mrinfo

```
user@host> show multicast mrinfo 10.35.4.1
10.35.4.1 (10.35.4.1) [version 12.0]:
  192.168.195.166 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
  10.38.20.1 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
  10.47.1.1 -> 10.47.1.2 (10.47.1.2) [1/5/pim]
  0.0.0.0 -> 0.0.0.0 (local) [1/0/pim/down]
```

## show multicast next-hops

---

<b>List of Syntax</b>	<a href="#">Syntax on page 5122</a> <a href="#">Syntax (EX Series Switch and the QFX Series) on page 5122</a>
<b>Syntax</b>	<pre>show multicast next-hops &lt;brief   detail&gt; &lt;identifier-number&gt; &lt;inet   inet6&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt;</pre>
<b>Syntax (EX Series Switch and the QFX Series)</b>	<pre>show multicast next-hops &lt;brief   detail&gt; &lt;identifier-number&gt; &lt;inet   inet6&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>inet6</b> option introduced in Junos OS Release 10.0 for EX Series switches.</p> <p><b>detail</b> option display of next-hop ID number introduced in Junos OS Release 11.1 for M Series and T Series routers and EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Support for bidirectional PIM added in Junos OS Release 12.1.</p>
<b>Description</b>	Display the entries in the IP multicast next-hop table.
<b>Options</b>	<p><b>none</b>—Display standard information about all entries in the multicast next-hop table for all supported address families.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p>When you include the <b>detail</b> option on M Series and T Series routers and EX Series switches, the downstream interface name includes the next-hop ID number in parentheses, in the form <b>fe-0/1/2.0-(1048574)</b> where <b>1048574</b> is the next-hop ID number.</p> <p><b>identifier-number</b>—(Optional) Show a particular next hop by ID number. The range of values is 1 through <b>65,535</b>.</p> <p><b>inet   inet6</b>—(Optional) Display entries for IPv4 or IPv6 family addresses, respectively.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view

**Output Fields** Table 412 on page 5123 describes the output fields for the **show multicast next-hops** command. Output fields are listed in the approximate order in which they appear.

**Table 412: show multicast next-hops Output Fields**

Field Name	Field Description
<b>Family</b>	Protocol family (such as <b>INET</b> ).
<b>ID</b>	Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine.
<b>Refcount</b>	Number of cache entries that are using this next hop.
<b>KRefcount</b>	Kernel reference count for the next hop.
<b>Downstream interface</b>	Interface names associated with each multicast next-hop ID.
<b>Incoming interface list</b>	List of interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.

## Sample Output

### show multicast next-hops

```
user@host> show multicast next-hops
Family: INET
ID      Refcount  KRefcount Downstream interface
262142      4          2 so-1/0/0.0
262143      2          1 mt-1/1/0.49152
262148      2          1 mt-1/1/0.32769
```

### show multicast next-hops (Bidirectional PIM)

```
user@host> show multicast next-hops
Family: INET
ID      Refcount  KRefcount Downstream interface
2097151      8          4 ge-0/0/1.0

Family: INET6
ID      Refcount  KRefcount Downstream interface
2097157      2          1 ge-0/0/1.0

Family: Incoming interface list
ID      Refcount  KRefcount Downstream interface
513      5          2 lo0.0
           ge-0/0/1.0
514      5          2 lo0.0
           ge-0/0/1.0
           xe-4/1/0.0
515      3          1 lo0.0
           ge-0/0/1.0
           xe-4/1/0.0

<b>Syntax</b>	show multicast pim-to-mld-proxy <instance <i>instance-name</i> > <logical-system (all   <i>logical-system-name</i> )>
<b>Syntax (EX Series Switch and the QFX Series)</b>	show multicast pim-to-mld-proxy <instance <i>instance-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 9.6. Command introduced in Junos OS Release 9.6 for EX Series switches. <b>instance</b> option introduced in Junos OS Release 10.3. <b>instance</b> option introduced in Junos OS Release 10.3 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Display configuration information about PIM-to-MLD message translation, also known as PIM-to-MLD proxy.
<b>Options</b>	<b>none</b> —Display configuration information about PIM-to-MLD message translation for all routing instances.  <b>instance</b> <i>instance-name</i> —(Optional) Display configuration information about PIM-to-MLD message translation for a specific multicast instance.  <b>logical-system</b> (all   <i>logical-system-name</i> )—(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show multicast pim-to-mld-proxy on page 5128</a> <a href="#">show multicast pim-to-mld-proxy instance on page 5128</a>
<b>Output Fields</b>	Table 414 on page 5127 describes the output fields for the <b>show multicast pim-to-mld-proxy</b> command. Output fields are listed in the order in which they appear.

**Table 414: show multicast pim-to-mld-proxy Output Fields**

Field Name	Field Description
<b>Proxy state</b>	State of PIM-to-MLD message translation, also known as PIM-to-MLD proxy, on the configured upstream interfaces: <b>enabled</b> or <b>disabled</b> .
<i>interface-name</i>	Name of upstream interface (no more than two allowed) on which PIM-to-MLD message translation is configured.

## Sample Output

### show multicast pim-to-mld-proxy

```
user@host> show multicast pim-to-mld-proxy
Instance: master Proxy state: enabled
ge-0/5/0.1
ge-0/5/0.2
```

### show multicast pim-to-mld-proxy instance

```
user@host> show multicast pim-to-mld-proxy instance VPN-A
Instance: VPN-A Proxy state: enabled
ge-0/5/0.1
```

## show multicast route

**List of Syntax**    [Syntax on page 5129](#)  
                           [Syntax \(EX Series Switch and the QFX Series\) on page 5129](#)

**Syntax**    show multicast route  
                   <brief | detail | extensive | summary>  
                   <active | all | inactive>  
                   <group *group*>  
                   <inet | inet6>  
                   <instance *instance name*>  
                   <logical-system (all | *logical-system-name*)>  
                   <*regular-expression*>  
                   <source-prefix *source-prefix*>

**Syntax (EX Series Switch and the QFX Series)**    show multicast route  
                                                                           <brief | detail | extensive | summary>  
                                                                           <active | all | inactive>  
                                                                           <group *group*>  
                                                                           <inet | inet6>  
                                                                           <instance *instance name*>  
                                                                           <*regular-expression*>  
                                                                           <source-prefix *source-prefix*>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                   Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                   inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.  
                                   Command introduced in Junos OS Release 11.3 for the QFX Series.  
                                   Support for bidirectional PIM added in Junos OS Release 12.1.

**Description**    Display the entries in the IP multicast forwarding table. You can display similar information with the **show route table inet.1** command.

**Options**    **none**—Display standard information about all entries in the multicast forwarding table for all routing instances.

**brief | detail | extensive | summary**—(Optional) Display the specified level of output.

**active | all | inactive**—(Optional) Display all active entries, all entries, or all inactive entries, respectively, in the multicast forwarding table.

**group *group***—(Optional) Display the cache entries for a particular group.

**inet | inet6**—(Optional) Display multicast forwarding table entries for IPv4 or IPv6 family addresses, respectively.

**instance *instance-name***—(Optional) Display entries in the multicast forwarding table for a specific multicast instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**regular-expression**—(Optional) Display information about the multicast forwarding table entries that match a UNIX OS-style regular expression.

**source-prefix source-prefix**—(Optional) Display the cache entries for a particular source prefix.

**Required Privilege Level** view

**Output Fields** [Table 415 on page 5130](#) describes the output fields for the **show multicast route** command. Output fields are listed in the approximate order in which they appear.

**Table 415: show multicast route Output Fields**

Field Name	Field Description	Level of Output
family	IPv4 address family ( <b>INET</b> ) or IPv6 address family ( <b>INET6</b> ).	All levels
Group	Group address.  For any-source multicast routes, for example for bidirectional PIM, the group address includes the prefix length.	All levels
Source	Prefix and length of the source as it is in the multicast forwarding table.	All levels
Incoming interface list	List of interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.	All levels
Upstream interface	Name of the interface on which the packet with this source prefix is expected to arrive.	All levels
Upstream rpf interface list	When multicast-only fast reroute (MoFRR) is enabled, a PIM router propagates join messages on two upstream RPF interfaces to receive multicast traffic on both links for the same join request.	All levels
Downstream interface list	List of interface names to which the packet with this source prefix is forwarded.	All levels
Number of outgoing interfaces	Total number of outgoing interfaces for each (S,G) entry.	<b>extensive</b>

Table 415: show multicast route Output Fields (*continued*)

Field Name	Field Description	Level of Output
Session description	Name of the multicast session.	detail extensive
Statistics	Rate at which packets are being forwarded for this source and group entry (in Kbps and pps), and number of packets that have been forwarded to this prefix. If one or more of the kilobits per second packet forwarding statistic queries fails or times out, the statistics field displays <b>Forwarding statistics are not available</b> .  <b>NOTE:</b> On QFX Series switches, this field does not report valid statistics.	detail extensive
Next-hop ID	Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine and is also displayed in the output of the <b>show multicast nexthops</b> command.	detail extensive
Incoming interface list ID	For bidirectional PIM, incoming interface list identifier.  Identifiers for interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.	detail extensive
Upstream protocol	The protocol that maintains the active multicast forwarding route for this group or source.  When the <b>show multicast route extensive</b> command is used with the <b>display-origin-protocol</b> option, the field name is only <b>Protocol</b> and not <b>Upstream Protocol</b> . However, this field also displays the protocol that installed the active route.	detail extensive
Route type	Type of multicast route. Values can be (S,G) or (*,G).	summary
Route state	Whether the group is <b>Active</b> or <b>Inactive</b> .	summary extensive
Route count	Number of multicast routes.	summary
Forwarding state	Whether the prefix is pruned or forwarding.	extensive
Cache lifetime/timeout	Number of seconds until the prefix is removed from the multicast forwarding table. A value of <b>never</b> indicates a permanent forwarding entry. A value of <b>forever</b> indicates routes that do not have keepalive times.	extensive
Wrong incoming interface notifications	Number of times that the upstream interface was not available.	extensive
Uptime	Time since the creation of a multicast route.	extensive

## Sample Output

### show multicast route

## show multicast rpf

---

<b>List of Syntax</b>	<a href="#">Syntax on page 5136</a> <a href="#">Syntax (EX Series Switch and the QFX Series) on page 5136</a>
<b>Syntax</b>	<pre>show multicast rpf &lt;inet   inet6&gt; &lt;instance <i>instance-name</i>&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;prefix&gt; &lt;summary&gt;</pre>
<b>Syntax (EX Series Switch and the QFX Series)</b>	<pre>show multicast rpf &lt;inet   inet6&gt; &lt;instance <i>instance-name</i>&gt; &lt;prefix&gt; &lt;summary&gt;</pre>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>inet6</b> and <b>instance</b> options introduced in Junos OS Release 10.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Display information about multicast reverse-path-forwarding (RPF) calculations.
<b>Options</b>	<p><b>none</b>—Display RPF calculation information for all supported address families.</p> <p><b>inet   inet6</b>—(Optional) Display the RPF calculation information for IPv4 or IPv6 family addresses, respectively.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display information about multicast RPF calculations for a specific multicast instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>prefix</b>—(Optional) Display the RPF calculation information for the specified prefix.</p> <p><b>summary</b>—(Optional) Display a summary of all multicast RPF information.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show multicast rpf on page 5137</a> <a href="#">show multicast rpf inet6 on page 5138</a> <a href="#">show multicast rpf prefix on page 5139</a> <a href="#">show multicast rpf summary on page 5139</a>

**Output Fields** Table 416 on page 5137 describes the output fields for the **show multicast rpf** command. Output fields are listed in the approximate order in which they appear.

**Table 416: show multicast rpf Output Fields**

Field Name	Field Description
<b>Instance</b>	Name of the routing instance. (Displayed when multicast is configured within a routing instance.)
<b>Source prefix</b>	Prefix and length of the source as it exists in the multicast forwarding table.
<b>Protocol</b>	How the route was learned.
<b>Interface</b>	Upstream RPF interface.  <b>NOTE:</b> The displayed interface information does not apply to bidirectional PIM RP addresses. This is because the <b>show multicast rpf</b> command does not take into account equal-cost paths or the designated forwarder. For accurate upstream RPF interface information, always use the <b>show pim join extensive</b> command when bidirectional PIM is configured.
<b>Neighbor</b>	Upstream RPF neighbor.  <b>NOTE:</b> The displayed neighbor information does not apply to bidirectional PIM. This is because the <b>show multicast rpf</b> command does not take into account equal-cost paths or the designated forwarder. For accurate upstream RPF neighbor information, always use the <b>show pim join extensive</b> command when bidirectional PIM is configured.

## show multicast usage

<b>List of Syntax</b>	<a href="#">Syntax on page 5145</a> <a href="#">Syntax (EX Series Switch and the QFX Series) on page 5145</a>
<b>Syntax</b>	<pre>show multicast usage &lt;brief   detail&gt; &lt;inet   inet6&gt; &lt;instance <i>instance-name</i>&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt;</pre>
<b>Syntax (EX Series Switch and the QFX Series)</b>	<pre>show multicast usage &lt;brief   detail&gt; &lt;inet   inet6&gt; &lt;instance <i>instance-name</i>&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>inet6</b> and <b>instance</b> options introduced in Junos OS Release 10.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	Display usage information about the 10 most active Distance Vector Multicast Routing Protocol (DVMRP) or Protocol Independent Multicast (PIM) groups.
<b>Options</b>	<p><b>none</b>—Display multicast usage information for all supported address families for all routing instances.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>inet   inet6</b>—(Optional) Display usage information for IPv4 or IPv6 family addresses, respectively.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display information about the most active DVMRP or PIM groups for a specific multicast instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show multicast usage on page 5146</a> <a href="#">show multicast usage brief on page 5146</a> <a href="#">show multicast usage instance on page 5146</a> <a href="#">show multicast usage detail on page 5147</a>
<b>Output Fields</b>	<p><a href="#">Table 419 on page 5146</a> describes the output fields for the <b>show multicast usage</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 419: show multicast usage Output Fields

Field Name	Field Description
<b>Instance</b>	Name of the routing instance. (Displayed when multicast is configured within a routing instance.)
<b>Group</b>	Group address.
<b>Sources</b>	Number of sources.
<b>Packets</b>	Number of packets that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the packets field displays <b>unavailable</b> .
<b>Bytes</b>	Number of bytes that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the bytes field displays <b>unavailable</b> .
<b>Prefix</b>	IP address.
<b>/len</b>	Prefix length.
<b>Groups</b>	Number of multicast groups.

## Sample Output

### show multicast usage

```

user@host> show multicast usage
Group          Sources  Packets      Bytes
228.0.0.0      1        52847      4439148
239.1.1.1      2        13450      1125530

Prefix         /len  Groups  Packets      Bytes
10.255.14.144  /32   2        66254      5561304
10.255.70.15   /32   1         43        3374...
```

### show multicast usage brief

The output for the **show multicast usage brief** command is identical to that for the **show multicast usage** command. For sample output, see [show multicast usage on page 5146](#).

### show multicast usage instance

```

user@host> show multicast usage instance VPN-A
Group          Sources  Packets      Bytes
224.2.127.254  1        5538      509496
224.0.1.39     1         13         624
224.0.1.40     1         13         624

## show pim bootstrap

<b>List of Syntax</b>	<a href="#">Syntax on page 5148</a> <a href="#">Syntax (EX Series Switch and the QFX Series) on page 5148</a>
<b>Syntax</b>	<pre>show pim bootstrap &lt;instance <i>instance-name</i>&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt;</pre>
<b>Syntax (EX Series Switch and the QFX Series)</b>	<pre>show pim bootstrap &lt;instance <i>instance-name</i>&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>instance</b> option introduced in Junos OS Release 10.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	For sparse mode only, display information about Protocol Independent Multicast (PIM) bootstrap routers.
<b>Options</b>	<p><b>none</b>—Display PIM bootstrap router information for all routing instances.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display information about bootstrap routers for a specific PIM-enabled routing instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show pim bootstrap on page 5149</a> <a href="#">show pim bootstrap instance on page 5149</a>
<b>Output Fields</b>	<p><a href="#">Table 420 on page 5148</a> describes the output fields for the <b>show pim bootstrap</b> command. Output fields are listed in the approximate order in which they appear.</p>

**Table 420: show pim bootstrap Output Fields**

Field Name	Field Description
<b>Instance</b>	Name of the routing instance.
<b>BSR</b>	Bootstrap router.
<b>Pri</b>	Priority of the routing device as elected to be the bootstrap router.
<b>Local address</b>	Local routing device address.
<b>Pri</b>	Local routing device address priority to be elected as the bootstrap router.

Table 420: show pim bootstrap Output Fields (*continued*)

Field Name	Field Description
<b>State</b>	Local routing device election state: <b>Candidate</b> , <b>Elected</b> , or <b>Ineligible</b> .
<b>Timeout</b>	How long until the local routing device declares the bootstrap router to be unreachable, in seconds.

## Sample Output

### show pim bootstrap

```
user@host> show pim bootstrap
Instance: PIM.master
```

BSR	Pri	Local address	Pri	State	Timeout
None	0	10.255.71.46	0	InEligible	0
feco:1:1:1:1:0:aff:785c	34	feco:1:1:1:1:0:aff:7c12	0	InEligible	0

### show pim bootstrap instance

```
user@host> show pim bootstrap instance VPN-A
Instance: PIM.VPN-A
```

BSR	Pri	Local address	Pri	State	Timeout
None	0	192.168.196.105	0	InEligible	0

## show pim interfaces

<b>List of Syntax</b>	<a href="#">Syntax on page 5150</a> <a href="#">Syntax (EX Series Switch and the QFX Series) on page 5150</a>
<b>Syntax</b>	<pre>show pim interfaces &lt;inet   inet6&gt; &lt;instance (instance-name   all)&gt; &lt;logical-system (all   logical-system-name)&gt;</pre>
<b>Syntax (EX Series Switch and the QFX Series)</b>	<pre>show pim interfaces &lt;inet   inet6&gt; &lt;instance (instance-name   all)&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>inet6</b> and <b>instance</b> options introduced in Junos OS Release 10.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Support for bidirectional PIM added in Junos OS Release 12.1.</p> <p>Support for the <b>instance all</b> option added in Junos OS Release 12.1.</p>
<b>Description</b>	Display information about the interfaces on which Protocol Independent Multicast (PIM) is configured.
<b>Options</b>	<p><b>none</b>—Display interface information for all family addresses for the main instance.</p> <p><b>inet   inet6</b>—(Optional) Display interface information for IPv4 or IPv6 family addresses, respectively.</p> <p><b>instance (instance-name   all)</b>—(Optional) Display information about interfaces for a specific PIM-enabled routing instance or for all routing instances.</p> <p><b>logical-system (all   logical-system-name)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show pim interfaces on page 5151</a>
<b>Output Fields</b>	<p><a href="#">Table 421 on page 5150</a> describes the output fields for the <b>show pim interfaces</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 421: show pim interfaces Output Fields

Field Name	Field Description
<b>Instance</b>	Name of the routing instance.
<b>Name</b>	Interface name.
<b>State</b>	State of the interface. The state also is displayed in the <b>show interfaces</b> command.

Table 421: show pim interfaces Output Fields (*continued*)

Field Name	Field Description
<b>Mode</b>	<p>PIM mode running on the interface:</p> <ul style="list-style-type: none"> <li>• <b>B</b>—In bidirectional mode, multicast groups are carried across the network over bidirectional shared trees. This type of tree minimizes PIM routing state, which is especially important in networks with numerous and dispersed senders and receivers.</li> <li>• <b>S</b>—In sparse mode, routing devices must join and leave multicast groups explicitly. Upstream routing devices do not forward multicast traffic to this routing device unless this device has sent an explicit request (using a join message) to receive multicast traffic.</li> <li>• <b>Dense</b>—Unlike sparse mode, where data is forwarded only to routing devices sending an explicit request, dense mode implements a flood-and-prune mechanism, similar to DVMRP (the first multicast protocol used to support the multicast backbone). (Not supported on QFX Series.)</li> <li>• <b>Sparse-Dense</b>—Sparse-dense mode allows the interface to operate on a per-group basis in either sparse or dense mode. A group specified as <b>dense</b> is not mapped to a rendezvous point (RP). Instead, data packets destined for that group are forwarded using PIM-Dense Mode (PIM-DM) rules. A group specified as <b>sparse</b> is mapped to an RP, and data packets are forwarded using PIM-Sparse Mode (PIM-SM) rules. (Not supported on QFX Series.)</li> </ul> <p>When sparse-dense mode is configured, the output includes both <b>S</b> and <b>D</b>. When bidirectional-sparse mode is configured, the output includes <b>S</b> and <b>B</b>. When bidirectional-sparse-dense mode is configured, the output includes <b>B</b>, <b>S</b>, and <b>D</b>.</p>
<b>IP</b>	Version number of the address family on the interface: <b>4</b> (IPv4) or <b>6</b> (IPv6).
<b>V</b>	PIM version running on the interface: 1 or 2.
<b>State</b>	<p>State of PIM on the interface:</p> <ul style="list-style-type: none"> <li>• <b>Active</b>—Bidirectional mode is enabled on the interface and on all PIM neighbors.</li> <li>• <b>DR</b>—Designated router.</li> <li>• <b>NotCap</b>—Bidirectional mode is not enabled on the interface. This can happen when bidirectional PIM is not configured locally, when one of the neighbors is not configured for bidirectional PIM, or when one of the neighbors has not implemented the bidirectional PIM protocol.</li> <li>• <b>NotDR</b>—Not the designated router.</li> <li>• <b>P2P</b>—Point to point.</li> </ul>
<b>NbrCnt</b>	Number of neighbors that have been seen on the interface.
<b>JoinCnt(sg)</b>	Number of (s,g) join messages that have been seen on the interface.
<b>JointCnt(*g)</b>	Number of (*g) join messages that have been seen on the interface.
<b>DR address</b>	Address of the designated router.

## Sample Output

### show pim interfaces

```

user@host> show pim interfaces
Stat = Status, V = Version, NbrCnt = Neighbor Count,
S = Sparse, D = Dense, B = Bidirectional,
DR = Designated Router, P2P = Point-to-point link,

```

Active = Bidirectional is active, NotCap = Not Bidirectional Capable

Name	Stat	Mode	IP	V	State	NbrCnt	JoinCnt(sg/*g)	DR address
ge-0/3/0.0	Up	S	4	2	NotDR,NotCap	1	0/0	40.0.0.3
ge-0/3/3.50	Up	S	4	2	DR,NotCap	1	9901/100	50.0.0.2
ge-0/3/3.51	Up	S	4	2	DR,NotCap	1	0/0	51.0.0.2
pe-1/2/0.32769	Up	S	4	2	P2P,NotCap	0	0/0	

show pim join

<b>RP</b>	Rendezvous point for the PIM group.	<b>brief detail extensive none</b>

Table 422: show pim join Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Flags</b>	<p>PIM flags:</p> <ul style="list-style-type: none"> <li>• <b>bidirectional</b>—Bidirectional mode entry.</li> <li>• <b>dense</b>—Dense mode entry.</li> <li>• <b>rptree</b>—Entry is on the rendezvous point tree.</li> <li>• <b>sparse</b>—Sparse mode entry.</li> <li>• <b>spt</b>—Entry is on the shortest-path tree for the source.</li> <li>• <b>wildcard</b>—Entry is on the shared tree.</li> </ul>	<b>brief detail extensive none</b>
<b>Upstream interface</b>	<p>RPF interface toward the source address for the source-specific state (S,G) or toward the rendezvous point (RP) address for the non-source-specific state (*,G).</p> <p>For bidirectional PIM, <b>RP Link</b> means that the interface is directly connected to a subnet that contains a phantom RP address.</p> <p>A pseudo multipoint LDP (M-LDP) interface appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.</p>	<b>brief detail extensive none</b>
<b>Upstream neighbor</b>	<p>Information about the upstream neighbor: <b>Direct</b>, <b>Local</b>, <b>Unknown</b>, or a specific IP address.</p> <p>For bidirectional PIM, <b>Direct</b> means that the interface is directly connected to a subnet that contains a phantom RP address.</p> <p>The multipoint LDP (M-LDP) root appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.</p>	<b>extensive</b>
<b>Active upstream interface</b>	<p>When multicast-only fast reroute (MoFRR) is configured in a PIM domain, the upstream interface for the active path. A PIM router propagates join messages on two upstream RPF interfaces to receive multicast traffic on both links for the same join request. Preference is given to two paths that do not converge to the same immediate upstream router. PIM installs appropriate multicast routes with upstream neighbors as RPF next hops with two (primary and backup) interfaces.</p>	<b>extensive</b>
<b>Active upstream neighbor</b>	<p>On the MoFRR primary path, the IP address of the neighbor that is directly connected to the active upstream interface.</p>	<b>extensive</b>

Table 422: show pim join Output Fields (*continued*)

Field Name	Field Description	Level of Output
MoFRR Backup upstream interface	<p>The MoFRR upstream interface that is used when the primary path fails.</p> <p>When the primary path fails, the backup path is upgraded to primary, and traffic is forwarded accordingly. If there are alternate paths available, a new backup path is calculated and the appropriate multicast route is updated or installed.</p>	<b>extensive</b>
<b>Upstream state</b>	<p>Information about the upstream interface:</p> <ul style="list-style-type: none"> <li>• <b>Join to RP</b>—Sending a join to the rendezvous point.</li> <li>• <b>Join to Source</b>—Sending a join to the source.</li> <li>• <b>Local RP</b>—Sending neither join messages nor prune messages toward the RP, because this routing device is the rendezvous point.</li> <li>• <b>Local Source</b>—Sending neither join messages nor prune messages toward the source, because the source is locally attached to this routing device.</li> <li>• <b>Prune to RP</b>—Sending a prune to the rendezvous point.</li> <li>• <b>Prune to Source</b>—Sending a prune to the source.</li> </ul> <p><b>NOTE:</b> RP group range entries have <b>None</b> in the <b>Upstream state</b> field because RP group ranges do not trigger actual PIM join messages between routing devices.</p>	<b>extensive</b>
<b>Downstream neighbors</b>	<p>Information about downstream interfaces:</p> <ul style="list-style-type: none"> <li>• <b>Interface</b>—Interface name for the downstream neighbor.</li> </ul> <p>A pseudo PIM-SM interface appears for all IGMP-only interfaces.</p> <p>A pseudo multipoint LDP (M-LDP) interface appears on ingress root nodes in M-LDP point-to-multipoint LSPs with inband signaling.</p> <ul style="list-style-type: none"> <li>• <b>Interface address</b>—Address of the downstream neighbor.</li> <li>• <b>State</b>—Information about the downstream neighbor: <b>join</b> or <b>prune</b>.</li> <li>• <b>Flags</b>—PIM join flags: <b>R (RPtree)</b>, <b>S (Sparse)</b>, <b>W (Wildcard)</b>, or <b>zero</b>.</li> <li>• <b>Uptime</b>—Time since the downstream interface joined the group.</li> <li>• <b>Time since last Join</b>—Time since the last join message was received from the downstream interface.</li> <li>• <b>Time since last Prune</b>—Time since the last prune message was received from the downstream interface.</li> </ul>	<b>extensive</b>

Table 422: show pim join Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Number of downstream interfaces</b>	Total number of outgoing interfaces for each (S,G) entry.	<b>extensive</b>
<b>Assert Timeout</b>	Length of time between assert cycles on the downstream interface. Not displayed if the assert timer is null.	<b>extensive</b>
<b>Keepalive timeout</b>	Time remaining until the downstream join state is updated (in seconds). If the downstream join state is not updated before this keepalive timer reaches zero, the entry is deleted. If there is a directly connected host, <b>Keepalive timeout</b> is <b>Infinity</b> .	<b>extensive</b>
<b>Uptime</b>	Time since the creation of (S,G) or (*G) state. The uptime is not refreshed every time a PIM join message is received for an existing (S,G) or (*G) state.	<b>extensive</b>
<b>Bidirectional accepting interfaces</b>	<p>Interfaces on the routing device that forward bidirectional PIM traffic.</p> <p>The reasons for forwarding bidirectional PIM traffic are that the interface is the winner of the designated forwarder election (<b>DF Winner</b>), or the interface is the reverse path forwarding (RPF) interface toward the RP (<b>RPF</b>).</p>	<b>extensive</b>

## show pim neighbors

<b>List of Syntax</b>	<a href="#">Syntax on page 5175</a> <a href="#">Syntax (EX Series Switch and the QFX Series) on page 5175</a>
<b>Syntax</b>	<pre>show pim neighbors &lt;brief   detail&gt; &lt;inet   inet6&gt; &lt;instance (<i>instance-name</i>   all)&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt;</pre>
<b>Syntax (EX Series Switch and the QFX Series)</b>	<pre>show pim neighbors &lt;brief   detail&gt; &lt;inet   inet6&gt; &lt;instance (<i>instance-name</i>   all)&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>inet6</b> and <b>instance</b> options introduced in Junos OS Release 10.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Support for bidirectional PIM added in Junos OS Release 12.1.</p> <p>Support for the <b>instance all</b> option added in Junos OS Release 12.1.</p>
<b>Description</b>	Display information about Protocol Independent Multicast (PIM) neighbors.
<b>Options</b>	<p><b>none</b>—(Same as <b>brief</b>) Display standard information about PIM neighbors for all supported family addresses for the main instance.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>inet   inet6</b>—(Optional) Display information about PIM neighbors for IPv4 or IPv6 family addresses, respectively.</p> <p><b>instance (<i>instance-name</i>   all)</b>—(Optional) Display information about neighbors for the specified PIM-enabled routing instance or for all routing instances.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show pim neighbors on page 5177</a> <a href="#">show pim neighbors brief on page 5177</a> <a href="#">show pim neighbors instance on page 5177</a> <a href="#">show pim neighbors detail on page 5177</a> <a href="#">show pim neighbors detail (With BFD) on page 5178</a>
<b>Output Fields</b>	<p><a href="#">Table 423 on page 5176</a> describes the output fields for the <b>show pim neighbors</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 423: show pim neighbors Output Fields

Field Name	Field Description	Level of Output
<b>Instance</b>	Name of the routing instance.	All levels
<b>Interface</b>	Interface through which the neighbor is reachable.	All levels
<b>Neighbor addr</b>	Address of the neighboring PIM routing device.	All levels
<b>IP</b>	IP version: 4 or 6.	All levels
<b>V</b>	PIM version running on the neighbor: 1 or 2.	All levels
<b>Mode</b>	PIM mode of the neighbor: <b>Sparse</b> , <b>Dense</b> , <b>SparseDense</b> , or <b>Unknown</b> . When the neighbor is running PIM version 2, this mode is always <b>Unknown</b> .	All levels
<b>Option</b>	Can be one or more of the following: <ul style="list-style-type: none"> <li>• <b>B</b>—Bidirectional Capable.</li> <li>• <b>H</b>—Hello Option Holdtime.</li> <li>• <b>G</b>—Generation Identifier.</li> <li>• <b>P</b>—Hello Option DR Priority.</li> <li>• <b>L</b>—Hello Option LAN Prune Delay.</li> </ul>	<b>brief</b> none
<b>Uptime</b>	Time the neighbor has been operational since the PIM process was last initialized, in the format <b>dd:hh:mm:ss ago</b> for less than a week and <b>nwnd:hh:mm:ss ago</b> for more than a week.	All levels
<b>Address</b>	Address of the neighboring PIM routing device.	<b>detail</b>
<b>BFD</b>	Status and operational state of the Bidirectional Forwarding Detection (BFD) protocol on the interface: <b>Enabled</b> , <b>Operational state is up</b> , or <b>Disabled</b> .	<b>detail</b>
<b>Hello Option Holdtime</b>	Time for which the neighbor is available, in seconds. The range of values is 0 through 65,535.	<b>detail</b>
<b>Hello Default Holdtime</b>	Default holdtime and the time remaining if the <b>holdtime</b> option is not in the received hello message.	<b>detail</b>
<b>Hello Option DR Priority</b>	Designated router election priority. The range of values is 0 through 255.	<b>detail</b>
<b>Hello Option Generation ID</b>	9-digit or 10-digit number used to tag hello messages.	<b>detail</b>
<b>Hello Option Bi-Directional PIM supported</b>	Neighbor can process bidirectional PIM messages.	<b>detail</b>
<b>Hello Option LAN Prune Delay</b>	Time to wait before the neighbor receives prune messages, in the format <b>delay nnn ms override nnnn ms</b> .	<b>detail</b>

Table 423: show pim neighbors Output Fields (*continued*)

Field Name	Field Description	Level of Output
Join Suppression supported	Neighbor is capable of join suppression.	detail
Rx Join	Information about joins received from the neighbor. <ul style="list-style-type: none"> <li><b>Group</b>—Group addresses in the join message.</li> <li><b>Source</b>—Address of the source in the join message.</li> <li><b>Timeout</b>—Time for which the join is valid.</li> </ul>	detail

## Sample Output

### show pim neighbors

```

user@host> show pim neighbors
Instance: PIM.master
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority

Interface      IP V Mode      Option      Uptime Neighbor addr
so-1/0/0.0      4 2            HPLG        00:07:10 10.111.10.2

```

### show pim neighbors brief

The output for the **show pim neighbors brief** command is identical to that for the **show pim neighbors** command. For sample output, see [show pim neighbors on page 5177](#).

### show pim neighbors instance

```

user@host> show pim neighbors instance VPN-A
Instance: PIM.VPN-A
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority

**Output Fields** [Table 424 on page 5180](#) describes the output fields for the **show pim rps** command. Output fields are listed in the approximate order in which they appear.

**Table 424: show pim rps Output Fields**

Field Name	Field Description	Level of Output
<b>Instance</b>	Name of the routing instance.	All levels
<b>Family or Address family</b>	Name of the address family: <b>inet</b> (IPv4) or <b>inet6</b> (IPv6).	All levels
<b>RP address</b>	Address of the rendezvous point.	All levels
<b>Type</b>	Type of RP: <ul style="list-style-type: none"> <li><b>auto-rp</b>—Address of the RP known through the Auto-RP protocol.</li> <li><b>bootstrap</b>—Address of the RP known through the bootstrap router protocol (BSR).</li> <li><b>embedded</b>—Address of the RP known through an embedded RP (IPv6).</li> <li><b>static</b>—Address of RP known through static configuration.</li> </ul>	<b>brief none</b>
<b>Holdtime</b>	How long to keep the RP active, with time remaining, in seconds.	All levels
<b>Timeout</b>	How long until the local routing device determines the RP to be unreachable, in seconds.	All levels
<b>Groups</b>	Number of groups currently using this RP.	All levels
<b>Group prefixes</b>	Addresses of groups that this RP can span.	<b>brief none</b>
<b>Learned via</b>	Address and method by which the RP was learned.	<b>detail extensive</b>
<b>Mode</b>	The PIM mode of the RP: bidirectional or sparse.  If a sparse and bidirectional RPs are configured with the same RP address, they appear as separate entries in both formats.	All levels
<b>Time Active</b>	How long the RP has been active, in the format <b>hh:mm:ss</b> .	<b>detail extensive</b>

Table 424: show pim rps Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Device Index</b>	Index value of the order in which Junos OS finds and initializes the interface.  For bidirectional RPs, the <b>Device Index</b> output field is omitted because bidirectional RPs do not require encapsulation and de-encapsulation interfaces.	<b>detail extensive</b>
<b>Subunit</b>	Logical unit number of the interface.  For bidirectional RPs, the <b>Subunit</b> output field is omitted because bidirectional RPs do not require encapsulation and de-encapsulation interfaces.	<b>detail extensive</b>
<b>Interface</b>	Either the encapsulation or the de-encapsulation logical interface, depending on whether this routing device is a designated router (DR) facing an RP router, or is the local RP, respectively.  For bidirectional RPs, the <b>Interface</b> output field is omitted because bidirectional RPs do not require encapsulation and de-encapsulation interfaces.	<b>detail extensive</b>
<b>Group Ranges</b>	Addresses of groups that this RP spans.	<b>detail extensive</b>  <i>group-address</i>
<b>Active groups using RP</b>	Number of groups currently using this RP.	<b>detail extensive</b>
<b>total</b>	Total number of active groups for this RP.	<b>detail extensive</b>
<b>Register State for RP</b>	Current register state for each group: <ul style="list-style-type: none"> <li>• <b>Group</b>—Multicast group address.</li> <li>• <b>Source</b>—Multicast source address for which the PIM register is sent or received, depending on whether this router is a designated router facing an RP router, or is the local RP, respectively:</li> <li>• <b>First Hop</b>—PIM-designated routing device that sent the Register message (the source address in the IP header).</li> <li>• <b>RP Address</b>—RP to which the Register message was sent (the destination address in the IP header).</li> <li>• <b>State</b>: <ul style="list-style-type: none"> <li>On the designated router: <ul style="list-style-type: none"> <li>• <b>Send</b>—Sending Register messages.</li> <li>• <b>Probe</b>—Sent a null register. If a Register-Stop message does not arrive in 5 seconds, the designated router resumes sending Register messages.</li> <li>• <b>Suppress</b>—Received a Register-Stop message. The designated router is waiting for the timer to resume before changing to <b>Probe</b> state.</li> </ul> </li> <li>On the RP: <ul style="list-style-type: none"> <li>• <b>Receive</b>—Receiving Register messages.</li> </ul> </li> </ul> </li> </ul>	<b>extensive</b>
<b>Anycast-PIM rpset</b>	If anycast RP is configured, the addresses of the RPs in the set.	<b>extensive</b>
<b>Anycast-PIM local address used</b>	If anycast RP is configured, the local address used by the RP.	<b>extensive</b>

Table 424: show pim rps Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Anycast-PIM Register State</b>	<p>If anycast RP is configured, the current register state for each group:</p> <ul style="list-style-type: none"> <li>• <b>Group</b>—Multicast group address.</li> <li>• <b>Source</b>—Multicast source address for which the PIM register is sent or received, depending on whether this routing device is a designated router facing an RP router, or is the local RP, respectively.</li> <li>• <b>Origin</b>—How the information was obtained: <ul style="list-style-type: none"> <li>• <b>DIRECT</b>—From a local attachment</li> <li>• <b>MSDP</b>—From the Multicast Source Discovery Protocol (MSDP)</li> <li>• <b>DR</b>—From the designated router</li> </ul> </li> </ul>	<b>extensive</b>
<b>RP selected</b>	For sparse mode and bidirectional mode, the identity of the RP for the specified group address.	<i>group-address</i>

## Sample Output

### show pim rps

```

user@host> show pim rps
Instance: PIM.master
Address family INET
RP address      Type      Mode   Holdtime Timeout Groups  Group prefixes
10.10.1.3       static   bidir   150     None     2  224.1.3.0/24
                225.1.3.0/24
10.10.13.2      static   bidir   150     None     2  224.1.1.0/24

<b>List of Syntax</b>	<a href="#">Syntax on page 5186</a> <a href="#">Syntax (EX Series Switch and the QFX Series) on page 5186</a>
<b>Syntax</b>	<pre>show pim source &lt;brief   detail&gt; &lt;inet   inet6&gt; &lt;instance <i>instance-name</i>&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;source-prefix&gt;</pre>
<b>Syntax (EX Series Switch and the QFX Series)</b>	<pre>show pim source &lt;brief   detail&gt; &lt;inet   inet6&gt; &lt;instance <i>instance-name</i>&gt; &lt;source-prefix&gt;</pre>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>inet6</b> and <b>instance</b> options introduced in Junos OS Release 10.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Display information about the Protocol Independent Multicast (PIM) source reverse path forwarding (RPF) state.
<b>Options</b>	<p><b>none</b>—Display standard information about the PIM RPF state for all supported family addresses for all routing instances.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>inet   inet6</b>—(Optional) Display information for IPv4 or IPv6 family addresses, respectively.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display information about the RPF state for a specific PIM-enabled routing instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>source-prefix</b>—(Optional) Display the state for source RPF states in the given range.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show pim source on page 5187</a> <a href="#">show pim source brief on page 5187</a> <a href="#">show pim source detail on page 5187</a> <a href="#">show pim source (Egress Node with Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 5188</a>
<b>Output Fields</b>	<a href="#">Table 425 on page 5187</a> describes the output fields for the <b>show pim source</b> command. Output fields are listed in the approximate order in which they appear.

Table 425: show pim source Output Fields

Field Name	Field Description
<b>Instance</b>	Name of the routing instance.
<b>Source</b>	Address of the source or reverse path.
<b>Prefix/length</b>	Prefix and prefix length for the route used to reach the RPF address.
<b>Upstream Protocol</b>	Protocol toward the source address.
<b>Upstream interface</b>	RPF interface toward the source address.  A pseudo multipoint LDP (M-LDP) interface appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.
<b>Upstream Neighbor</b>	Address of the RPF neighbor used to reach the source address.  The multipoint LDP (M-LDP) root appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.

## Sample Output

### show pim source

```

user@host> show pim source
Instance: PIM.master Family: INET

Source 10.255.14.144
  Prefix 10.255.14.144/32
  Upstream interface Local
  Upstream neighbor Local

Source 10.255.70.15
  Prefix 10.255.70.15/32
  Upstream interface so-1/0/0.0
  Upstream neighbor 10.111.10.2

Instance: PIM.master Family: INET6

```

### show pim source brief

The output for the **show pim source brief** command is identical to that for the **show pim source** command. For sample output, see [show pim source on page 5187](#).

### show pim source detail

```

user@host> show pim source detail
Instance: PIM.master Family: INET

Source 10.255.14.144
  Prefix 10.255.14.144/32
  Upstream interface Local
  Upstream neighbor Local
  Active groups:228.0.0.0
    239.1.1.1

```

239.1.1.1

Source 10.255.70.15

<b>Output Fields</b>	<p><a href="#">Table 426 on page 5190</a> describes the output fields for the <b>show pim statistics</b> command.</p> <p>Output fields are listed in the approximate order in which they appear.</p>

Table 426: show pim statistics Output Fields

Field Name	Field Description
Instance	<p>Name of the routing instance.</p> <p>This field only appears if you specify an interface, for example:</p> <ul style="list-style-type: none"> <li>• <b>inet interface <i>interface-name</i></b></li> <li>• <b>inet6 interface <i>interface-name</i></b></li> <li>• <b>interface <i>interface-name</i></b></li> </ul>
Family	<p>Output is for IPv4 or IPv6 PIM statistics. <b>INET</b> indicates IPv4 statistics, and <b>INET6</b> indicates IPv6 statistics.</p> <p>This field only appears if you specify an interface, for example:</p> <ul style="list-style-type: none"> <li>• <b>inet interface <i>interface-name</i></b></li> <li>• <b>inet6 interface <i>interface-name</i></b></li> <li>• <b>interface <i>interface-name</i></b></li> </ul>
PIM statistics	PIM statistics for all interfaces or for the specified interface.
PIM message type	Message type for which statistics are displayed.
Received	Number of received statistics.
Sent	Number of messages sent of a certain type.
Rx errors	Number of received packets that contained errors.
V2 Hello	PIM version 2 hello packets.
V2 Register	PIM version 2 register packets.
V2 Register Stop	PIM version 2 register stop packets.
V2 Join Prune	PIM version 2 join and prune packets.
V2 Bootstrap	PIM version 2 bootstrap packets.
V2 Assert	PIM version 2 assert packets.
V2 Graft	PIM version 2 graft packets.
V2 Graft Ack	PIM version 2 graft acknowledgment packets.
V2 Candidate RP	PIM version 2 candidate RP packets.
V2 State Refresh	<p>PIM version 2 control messages related to PIM dense mode (PIM-DM) state refresh.</p> <p>State refresh is an extension to PIM-DM. It not supported in Junos OS.</p>

Table 426: show pim statistics Output Fields (*continued*)

Field Name	Field Description
V2 DF Election	PIM version 2 send and receive messages associated with bidirectional PIM designated forwarder election.
V1 Query	PIM version 1 query packets.
V1 Register	PIM version 1 register packets.
V1 Register Stop	PIM version 1 register stop packets.
V1 Join Prune	PIM version 1 join and prune packets.
V1 RP Reachability	PIM version 1 RP reachability packets.
V1 Assert	PIM version 1 assert packets.
V1 Graft	PIM version 1 graft packets.
V1 Graft Ack	PIM version 1 graft acknowledgment packets.
AutoRP Announce	Auto-RP announce packets.
AutoRP Mapping	Auto-RP mapping packets.
AutoRP Unknown type	Auto-RP packets with an unknown type.
Anycast Register	Auto-RP announce packets.
Anycast Register Stop	Auto-RP announce packets.
Global Statistics	Summary of PIM statistics for all interfaces.
Hello dropped on neighbor policy	Number of hello packets dropped because of a configured neighbor policy.
Unknown type	Number of PIM control packets received with an unknown type.
V1 Unknown type	Number of PIM version 1 control packets received with an unknown type.
Unknown Version	Number of PIM control packets received with an unknown version. The version is not version 1 or version 2.
Neighbor unknown	Number of PIM control packets received (excluding PIM hello) without first receiving the hello packet.
Bad Length	Number of PIM control packets received for which the packet size does not match the PIM length field in the packet.

Table 426: show pim statistics Output Fields (*continued*)

Field Name	Field Description
Bad Checksum	Number of PIM control packets received for which the calculated checksum does not match the checksum field in the packet.
Bad Receive If	Number of PIM control packets received on an interface that does not have PIM configured.
Rx Bad Data	Number of PIM control packets received that contain data for TCP Bad register packets.
Rx Intf disabled	Number of PIM control packets received on an interface that has PIM disabled.
Rx V1 Require V2	Number of PIM version 1 control packets received on an interface configured for PIM version 2.
Rx V2 Require V1	Number of PIM version 2 control packets received on an interface configured for PIM version 1.
Rx Register not RP	Number of PIM register packets received when the routing device is not the RP for the group.
Rx Register no route	Number of PIM register packets received when the RP does not have a unicast route back to the source.
Rx Register no decap if	Number of PIM register packets received when the RP does not have a de-encapsulation interface.
Null Register Timeout	Number of NULL register timeout packets.
RP Filtered Source	Number of PIM packets received when the routing device has a source address filter configured for the RP.
Rx Unknown Reg Stop	Number of register stop messages received with an unknown type.
Rx Join/Prune no state	Number of join and prune messages received for which the routing device has no state.
Rx Join/Prune on upstream if	Number of join and prune messages received on the interface used to reach the upstream routing device, toward the RP.
Rx Join/Prune for invalid group	Number of join or prune messages received for invalid multicast group addresses.
Rx Join/Prune messages dropped	Number of join and prune messages received and dropped.
Rx sparse join for dense group	Number of PIM sparse mode join messages received for a group that is configured for dense mode.

Table 426: show pim statistics Output Fields (*continued*)

Field Name	Field Description
Rx Graft/Graft Ack no state	Number of graft and graft acknowledgment messages received for which the router or switch has no state.
Rx Graft on upstream if	Number of graft messages received on the interface used to reach the upstream routing device, toward the RP.
Rx CRP not BSR	Number of BSR messages received in which the PIM message type is Candidate-RP-Advertisement, not Bootstrap.
Rx BSR when BSR	Number of BSR messages received in which the PIM message type is Bootstrap.
Rx BSR not RPF if	Number of BSR messages received on an interface that is not the RPF interface.
Rx unknown hello opt	Number of PIM hello packets received with options that Junos OS does not support.
Rx data no state	Number of PIM control packets received for which the routing device has no state for the data type.
Rx RP no state	Number of PIM control packets received for which the routing device has no state for the RP.
Rx aggregate	Number of PIM aggregate MDT packets received.
Rx malformed packet	Number of PIM control packets received with a malformed IP unicast or multicast address family.
No RP	Number of PIM control packets received with no RP address.
No register encaps if	Number of PIM register packets received when the first-hop routing device does not have an encapsulation interface.
No route upstream	Number of PIM control packets received when the routing device does not have a unicast route to the the interface used to reach the upstream routing device, toward the RP.
Nexthop Unusable	Number of PIM control packets with an unusable nexthop. A path can be unusable if the route is hidden or the link is down.
RP mismatch	Number of PIM control packets received for which the routing device has an RP mismatch.
RP mode mismatch	RP mode (sparse or bidirectional) mismatches encountered when processing join and prune messages.
RPF neighbor unknown	Number of PIM control packets received for which the routing device has an unknown RPF neighbor for the source.

Table 426: show pim statistics Output Fields (*continued*)

Field Name	Field Description
Rx Joins/Prunes filtered	The number of join and prune messages filtered because of configured route filters and source address filters.
Tx Joins/Prunes filtered	The number of join and prune messages filtered because of configured route filters and source address filters.
Embedded-RP invalid addr	Number of packets received with an invalid embedded RP address in PIM join messages and other types of messages sent between routing domains.
Embedded-RP limit exceed	Number of times the limit configured with the <b>maximum-rps</b> statement is exceeded. The <b>maximum-rps</b> statement limits the number of embedded RPs created in a specific routing instance. The range is from 1 through 500. The default is 100.
Embedded-RP added	<p>Number of packets in which the embedded RP for IPv6 is added.</p> <p>The following receive events trigger extraction of an IPv6 embedded RP address on the routing device:</p> <ul style="list-style-type: none"> <li>• Multicast Listener Discovery (MLD) report for an embedded RP multicast group address</li> <li>• PIM join message with an embedded RP multicast group address</li> <li>• Static embedded RP multicast group address associated with an interface</li> <li>• Packets sent to an embedded RP multicast group address received on the DR</li> </ul> <p>An embedded RP node discovered through these receive events is added if it does not already exist on the routing platform.</p>
Embedded-RP removed	Number of packets in which the embedded RP for IPv6 is removed. The embedded RP is removed whenever all PIM join states using this RP are removed or the configuration changes to remove the embedded RP feature.
Rx Register msgs filtering drop	Number of received register messages dropped because of a filter configured for PIM register messages.
Tx Register msgs filtering drop	Number of register messages dropped because of a filter configured for PIM register messages.
Rx Bidir Join/Prune on non-Bidir if	Error counter for join and prune messages received on non-bidirectional PIM interfaces.
Rx Bidir Join/Prune on non-DF if	Error counter for join and prune messages received on non-designated forwarder interfaces.
V4 (S,G) Maximum	Maximum number of (S,G) IPv4 multicast routes accepted for the VPN routing and forwarding (VRF) routing instance. If this number is met, additional (S,G) entries are not accepted.

Table 426: show pim statistics Output Fields (*continued*)

Field Name	Field Description
V4 (S,G) Accepted	Number of accepted (S,G) IPv4 multicast routes.
V4 (S,G) Threshold	Threshold at which a warning message is logged (percentage of the maximum number of (S,G) IPv4 multicast routes accepted by the device).
V4 (S,G) Log Interval	Time (in seconds) between consecutive log messages.
V6 (S,G) Maximum	Maximum number of (S,G) IPv6 multicast routes accepted for the VPN routing and forwarding (VRF) routing instance. If this number is met, additional (S,G) entries are not accepted.
V6 (S,G) Accepted	Number of accepted (S,G) IPv6 multicast routes.
V6 (S,G) Threshold	Threshold at which a warning message is logged (percentage of the maximum number of (S,G) IPv6 multicast routes accepted by the device).
V6 (S,G) Log Interval	Time (in seconds) between consecutive log messages.
V4 (grp-prefix, RP) Maximum	Maximum number of group-to-rendezvous point (RP) IPv4 multicast mappings accepted for the VRF routing instance. If this number is met, additional mappings are not accepted.
V4 (grp-prefix, RP) Accepted	Number of accepted group-to-RP IPv4 multicast mappings.
V4 (grp-prefix, RP) Threshold	Threshold at which a warning message is logged (percentage of the maximum number of group-to-RP IPv4 multicast mappings accepted by the device).
V4 (grp-prefix, RP) Log Interval	Time (in seconds) between consecutive log messages.
V6 (grp-prefix, RP) Maximum	Maximum number of group-to-RP IPv6 multicast mappings accepted for the VRF routing instance. If this number is met, additional mappings are not accepted.
V6 (grp-prefix, RP) Accepted	Number of accepted group-to-RP IPv6 multicast mappings.
V6 (grp-prefix, RP) Threshold	Threshold at which a warning message is logged (percentage of the maximum number of group-to-RP IPv6 multicast mappings accepted by the device).
V6 (grp-prefix, RP) Log Interval	Time (in seconds) between consecutive log messages.

Table 426: show pim statistics Output Fields (*continued*)

Field Name	Field Description
V4 Register Maximum	Maximum number of IPv4 PIM registers accepted for the VRF routing instance. If this number is met, additional PIM registers are not accepted.  You configure the register limits on the RP.
V4 Register Accepted	Number of accepted IPv4 PIM registers.
V4 Register Threshold	Threshold at which a warning message is logged (percentage of the maximum number of IPv4 PIM registers accepted by the device).
V4 Register Log Interval	Time (in seconds) between consecutive log messages.
V6 Register Maximum	Maximum number of IPv6 PIM registers accepted for the VRF routing instance. If this number is met, additional PIM registers are not accepted.  You configure the register limits on the RP.
V6 Register Accepted	Number of accepted IPv6 PIM registers.
V6 Register Threshold	Threshold at which a warning message is logged (percentage of the maximum number of IPv6 PIM registers accepted by the device).
V6 Register Log Interval	Time (in seconds) between consecutive log messages.
(*G) Join drop due to SSM range check	PIM join messages that are dropped because the multicast addresses are outside of the SSM address range of 232.0.0.0 through 232.255.255.255. You can extend the accepted SSM address range by configuring the <a href="#">ssm-groups</a> statement.

## Sample Output

### show pim statistics

```

user@host> show pim statistics
PIM Message type    Received    Sent    Rx errors
V2 Hello            15          32        0

## show system statistics igmp

---

<b>List of Syntax</b>	<a href="#">Syntax on page 5202</a> <a href="#">Syntax (EX Series Switches) on page 5202</a> <a href="#">Syntax (TX Matrix Router) on page 5202</a> <a href="#">Syntax (TX Matrix Plus Router) on page 5202</a>
<b>Syntax</b>	show system statistics igmp
<b>Syntax (EX Series Switches)</b>	show system statistics igmp <all-members> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system statistics igmp <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system statistics igmp <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 12.1 for the QFX Series.
<b>Description</b>	Display system-wide Internet Group Management Protocol (IGMP) statistics.
<b>Options</b>	<b>none</b> —Display system statistics for IGMP.  <b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only ) (Optional) Display system statistics for IGMP for all the routers in the chassis.  <b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for IGMP for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for IGMP for all connected T1600 or T4000 LCCs.  <b>all-members</b> —(EX4200 switches only) (Optional) Display IGMP statistics for all members of the Virtual Chassis configuration.  <b>lcc <i>number</i></b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for IGMP for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for IGMP for a specific router that is connected to the TX Matrix Plus router. Replace <i>number</i> with the following values depending on the LCC configuration: <ul style="list-style-type: none"><li>• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.</li><li>• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.</li></ul>

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches only) (Optional) Display IGMP statistics for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches only) (Optional) Display IGMP statistics for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

**scc**—(TX Matrix routers only) (Optional) Display system statistics for IGMP for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display system statistics for IGMP for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system statistics igmp** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

- [Applying Firewall Filters to Interfaces on page 5240](#)

## Overview of Firewall Filters

Firewall filters provide rules that define whether to accept or discard packets that are transiting an interface. If a packet is accepted, you can configure additional actions to perform on the packet, such as class-of-service (CoS) marking (grouping similar types of traffic together and treating each type of traffic as a class with its own level of service priority) and traffic policing (controlling the maximum rate of traffic sent or received). You configure firewall filters to determine whether to accept or discard a packet before it enters or exits any of these:

- Port
- VLAN

- Layer 3 (routed) interface
- Routed VLAN interface (RVI)

An *ingress* firewall filter is applied to packets that are entering an interface or VLAN, and an *egress* firewall filter is applied to packets that are exiting an interface or VLAN.

**NOTE:** Firewall filters are sometimes called *access control lists (ACLs)*.

- [Firewall Filter Types on page 5210](#)
- [Firewall Filter Components on page 5211](#)
- [Firewall Filter Processing on page 5211](#)

---

### Firewall Filter Types

---

The following firewall filter types are supported:

- Port (Layer 2) firewall filter—Port firewall filters apply to Layer 2 traffic transiting system ports.
- VLAN firewall filter—VLAN firewall filters provide access control for packets that enter a VLAN, are bridged within a VLAN, or leave a VLAN.
- Router (Layer 3) firewall filter—You can apply a router firewall filter in both ingress and egress directions on IPv4 or IPv6 Layer 3 (routed) interfaces, routed VLAN interfaces (RVI) and a loopback interface, which filters traffic sent to the switch itself or generated by the switch. (You apply a filter to a loopback interface in the input direction to protect the switch from unwanted traffic. You also might want to apply a filter to a loopback interface in the output direction so that you can set the forwarding class and DSCP bit value for packets that originate on the switch itself. This feature gives you very fine control over the classification of CPU generated packets. For example, you might want to assign different DSCP values and forwarding classes to traffic generated by different routing protocols so the traffic for those protocols can be treated in a differentiated manner by other devices. You can apply a filter to a loopback interface in the output direction starting with Junos OS 13.2X51-D15.)

**NOTE:** You can apply a firewall filter to a management interface (for example, `me0`) on a QFX and EX4600 standalone switch. You cannot apply a firewall filter to a management interface on a QFX3000-G or QFX3000-M system.

- MPLS filter—You can apply a firewall filter to an MPLS interface

To apply a firewall filter:

1. Configure the firewall filter.
2. Apply the firewall filter to a port, VLAN, or router interface.

**NOTE:** You can apply only one firewall filter to a port, VLAN, or interface for a given direction. For example, for interface ge-0/0/6.0, you can apply one filter for the ingress direction and one for the egress direction.

---

## Firewall Filter Components

In a firewall filter, you first define the family address type (ethernet-switching, inet (for IPv4), inet6 (for IPv6), or mpls) and then define one or more terms that specify the filtering criteria and the action to take if a match occurs.

Each term consists of the following components:

- Match conditions—Specify values that a packet must contain to be considered a match. You can specify values for most fields in the IP, TCP, UDP, or ICMP headers. You can also match on interface names.
- Action—Specifies what to do if a packet matches the match conditions. A filter can accept, discard, or reject a matching packet and then perform additional actions, such as counting, classifying, and policing. If no action is specified for a term, the default is to accept the matching packet.

---

## Firewall Filter Processing

If there are multiple terms in a filter, the order of the terms is important. If a packet matches the first term, the switch executes the action defined by that term, and no other terms are evaluated. If the switch does not find a match between the packet and the first term, it compares the packet to the next term. If no match occurs between the packet and the second term, the system continues to compare the packet to each successive term in the filter until a match is found. If the packet does not match any terms in the filter, the switch discards the packet by default.

## Understanding Filter-Based Forwarding

You can use firewall filters in conjunction with virtual routing instances to specify different routes for packets to travel in their networks. To set up this feature—called filter-based forwarding—you specify a filter and match criteria and then specify the virtual routing instance to send packets to.

You might want to use filter-based forwarding to route specific types of traffic through a firewall or other security device before the traffic continues on its path. You can also use filter-based forwarding to give certain types of traffic preferential treatment. For example, you might want to ensure that the highest-priority traffic is forwarded over a 40-Gigabit Ethernet link. You might also use filter-based forwarding to obtain more control over load balancing than dynamic routing protocols provide.

**NOTE:** You can create as many as 128 filters or terms that direct packets to a given virtual routing instance.

Filters used for filter-based forwarding consume memory in two ternary content addressable memories (TCAMs), and this affects the number of supported filters. See [“Planning the Number of Firewall Filters to Create” on page 5236](#) and [“Understanding FIP Snooping, FBF, and MVR Filter Scalability” on page 5546](#) for more information. The section *FBF Filter VFP TCAM Consumption* in the latter topic specifically addresses the number of supported filters when using filter-based forwarding.

## Understanding How Firewall Filters Are Evaluated

A firewall filter consists of one or more terms, and the order of the terms within a filter is important. Before you configure firewall filters, you should understand how switches evaluate the terms within a filter and how packets are evaluated against the terms.

When a firewall filter consists of a single term, the filter is evaluated as follows:

- If the packet matches all the conditions, the action in the **then** statement is taken.
- If the packet matches all the conditions, and no action is specified in the **then** statement, the default action **accept** is taken.
- If the packet does not match all the conditions, the switch discards it.

When a firewall filter consists of more than one term, the filter is evaluated sequentially:

1. The packet is evaluated against the conditions in the **from** statement in the first term.
2. If the packet matches all the conditions in the term, the action in the **then** statement is taken and the evaluation ends. Subsequent terms in the filter are not evaluated.
3. If the packet does not match all the conditions in the term, the packet is evaluated against the conditions in the **from** statement in the second term.

This process continues until the packet matches all the conditions in the **from** statement in one of the subsequent terms or there are no more terms in the filter.

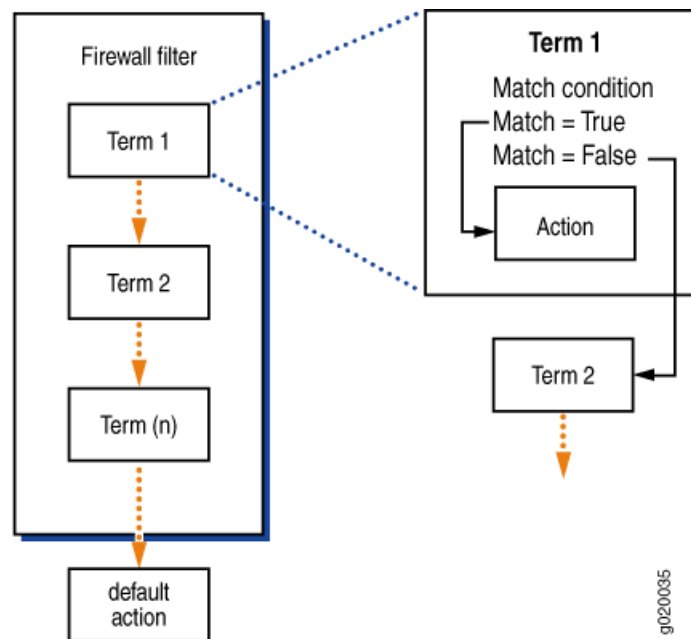

4. If a packet passes through all the terms in the filter without a match, the switch discards it.

**NOTE:** The order of conditions in a **from** statement is not important because a packet must match all the conditions to be considered a match.

Figure 179 on page 5213 shows how switches evaluate the terms within a firewall filter.

Figure 179: Evaluation of Terms Within a Firewall Filter

If you do not include a **from** statement in a term, all packets will match the term and be processed by the **then** statement. If a term does not contain a **then** statement or if an action has not been configured in the **then** statement, the term accepts any matching packets.

Every firewall filter contains an implicit **deny** statement at the end of the filter, which is equivalent to the following explicit filter term:

```
term implicit-rule {  
    then discard;  
}
```

Consequently, a packet that does not match any of the terms in a firewall filter is discarded. If you configure a filter that has no terms, all packets that pass through the filter are discarded.

**NOTE:** Firewall filtering is supported on packets that are at least 64 bytes long.

## Understanding How Firewall Filters Control Packet Flows

A switch supports firewall filters that allow you to control flows of data packets and local packets. *Data packets* transit a switch as they are forwarded from a source to a destination. *Local packets* are destined for or sent by a Routing Engine (they do not transit a switch). Local packets usually contain routing protocol data, data for IP services such as Telnet or SSH, or data for administrative protocols such as the Internet Control Message Protocol (ICMP).

Firewall filters affect packet flows entering into or exiting from a switch as follows:

- Ingress firewall filters affect the flow of data packets that are received on switch interfaces. When a switch receives a data packet, the Packet Forwarding Engine in the system that contains the ingress interface determines where to forward the packet by looking in its Layer 2 or Layer 3 forwarding table for the best route to the destination. Data packets are forwarded to an egress interface. Locally destined packets are forwarded to the Routing Engine.
- Egress firewall filters affect data packets that are transiting a switch but do not affect packets sent by the Routing Engine. These filters are applied by the Packet Forwarding Engine in the system that contains the egress interface.

[Figure 180 on page 5215](#) illustrates the application of ingress and egress firewall filters to control the flow of packets through a switch:

1. Ingress firewall filter applied to locally destined packets that are received on switch interfaces and are destined for the Routing Engine.
2. Ingress firewall filter applied to data packets that are received on switch interfaces and will transit the switch.
3. Egress firewall filter applied to data packets that are transiting the switch.

## Understanding Firewall Filter Match Conditions

Before you define terms for firewall filters, you must understand how the conditions in a term are handled and how to specify interface, numeric, address, and bit-field filter match conditions to achieve the desired filter results.

- [Filter Match Conditions on page 5215](#)
- [Numeric Filter Match Conditions on page 5216](#)
- [Interface Filter Match Conditions on page 5216](#)
- [IP Address Filter Match Conditions on page 5217](#)
- [MAC Address Filter Match Conditions on page 5217](#)
- [Bit-Field Filter Match Conditions on page 5218](#)

### Filter Match Conditions

In the **from** statement of a firewall filter term, you specify the conditions that the packet must match for the action in the **then** statement to be taken. All conditions must match for the action to be implemented. The order in which you specify match conditions is not important, because a packet must match all the conditions in a term for a match to occur.

If you specify multiple values for the same condition, a match on any one of those values matches that condition. For example, if you specify multiple IP source addresses using the **source-address** statement, a packet that contains any one of those IP source addresses

matches the condition. In some cases you can specify multiple values for the same condition by enclosing the possible values in square brackets, as in:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set protocol (icmp | udp)
```

In other cases you must enter multiple statements, as in:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-address 10.1.1.1
user@switch# set source-address 10.1.1.2
```

If you specify no match conditions in a term, that term matches all packets.

**NOTE:** Unlike traditional Junos OS firewall filters, you cannot use `except` in a condition statement to negate the condition.

---

### Numeric Filter Match Conditions

---

You can specify numeric filter match conditions that are identified by a numeric value, such as port and protocol numbers. For numeric filter match conditions, you specify the condition and a single value that a field in a packet must contain to be considered a match.

You can specify the numeric value in one of the following ways:

- Single number—A match occurs if the value of the field matches the number. For example, to match Telnet traffic:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-port 23
```

- Text synonym for a single number—A match occurs if the value of the field matches the number that corresponds to the synonym. For example, to match Telnet traffic:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-port telnet
```

- To specify multiple values for the same match condition in a filter term, enter each value in its own match statement. For example, a match occurs in the following term if the value of the source port in the packet is 22 or 23.

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-port 22
user@switch# set source-port 23
```

### Interface Filter Match Conditions

---

You can specify an interface filter match condition to match an interface on which a packet is received or transmitted. For example, if you apply a filter to a VLAN you might want the filter to match on some interfaces that participate in the VLAN and not match on other interfaces in the VLAN. When you specify the name of the interface, you must include a logical unit.

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set interface ge-0/0/6.0
```

In this example, the final character (0) specifies the logical unit. You can include the wildcard (\*) as part of the interface name. For example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set interface ge-0/*/6.0
user@switch# set interface ge-0/1/*0
user@switch# set interface ge-0/0/6.*
```

Note that you must specify a value or a wildcard for the logical unit.

### IP Address Filter Match Conditions

You can specify an address filter match condition to match an IP source or destination address or prefix in a packet. Specify the address or prefix type and the address or prefix itself. For example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-address 10.2.1.0/24;
```

If you omit the prefix length, it defaults to /32. For example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-address 10
[edit firewall family family-name filter filter-name term term-name from]
user@switch# show
destination-address {
  10.0.0.0/32;
}
```

To specify more than one IP address or prefix in a filter term, enter each address or prefix in its own match statement. For example, a match occurs in the following term if the source address of a packet matches either of the following prefixes:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-address 10.1.0.0/16
user@switch# set source-address 10.2.0.0/16
```

### MAC Address Filter Match Conditions

You can specify a MAC address filter match condition to match a source or destination MAC address. You specify the address type and value that a packet must contain to be considered a match.

You can specify the MAC address as six hexadecimal bytes in any of the following formats:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-mac-address 00:11:22:33:44:55
```

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-mac-address 0011.2233.4455
```

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-mac-address 001122334455
```

Regardless of the formats you use, the system resolves the address to the standard format, in this case 00:11:22:33:44:55.

To specify more than one MAC address in a filter term, enter each MAC address in its own match statement. For example, a match occurs in the following term if the value of the MAC source address matches either of the following addresses:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-mac-address 00:11:22:33:44:55
```

```
user@switch# set source-mac-address 00:11:22:33:20:15
```

### Bit-Field Filter Match Conditions

You can specify bit-field filter match conditions to match particular bits within certain fields in Ethernet frames and IP, TCP, UDP, and ICMP headers. You usually specify the field and the bit within the field that must be set in a packet to be considered a match.

In most cases you can use a keyword to specify the bit you want to match on. For example, to match on a TCP SYN packet you can enter **syn**, as in:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags syn
```

You can also enter **0x02** because the SYN bit is the third least-significant bit of the 8-bit tcp-flags field:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags 0x02
```

To match multiple bit-field values, use the logical operators, which are described in [Table 427 on page 5218](#). The operators are listed in order from highest precedence to lowest precedence. Operations are evaluated from left to right.

**Table 427: Actions for Firewall Filters**

Logical Operators	Description
!	Negation
&	Logical AND
	Logical OR

If you use a logical operator, enclose the values in quotation marks and do not include any spaces. For example, the following statement matches the second packet of a TCP handshake:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags "syn&ack"
```

To negate a match, precede the value with an exclamation point. For example, the following statement matches only the initial packet of a TCP handshake:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags "syn&!ack"
```

You can use text synonyms to specify some common bit-field matches. For example, the following statement also matches the initial packet of a TCP handshake:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-initial
```

## Firewall Filter Match Conditions and Actions

Each term in a firewall filter consists of *match conditions* and an *action*. Match conditions are the fields and values that a packet must contain to be considered a match. You can define single or multiple match conditions in *match statements*. You can also include no match statement, in which case the term matches all packets.

When a packet matches a filter, a switch takes the action specified in the term. In addition, you can specify action modifiers to count, mirror, rate-limit, and classify packets. If no match conditions are specified for the term, the switch accepts the packet by default.

This topic describes the various match conditions, actions, and action modifiers that you can define in a firewall filter.

- [Table 428 on page 5219](#) describes the match conditions you can specify when configuring a firewall filter. Some of the numeric range and bit-field match conditions allow you to specify a text synonym. To see a list of all the synonyms for a match condition, type `?` at the appropriate place in a statement.
- [Table 429 on page 5230](#) shows the actions that you can specify in a term.
- [Table 430 on page 5231](#) shows the action modifiers you can use to count, mirror, rate-limit, and classify packets.

**Table 428: Supported Match Conditions for Firewall Filters**

Match Condition	Description	Direction and Interface
<b>arp-type</b>	ARP request packet or ARP reply packet.	Egress and ingress ports.
<b>destination-address</b> <i>ip-address</i>	IP destination address field, which is the address of the final destination node.	Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.  Egress IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.
<b>destination-mac-address</b> <i>mac-address</i>	Destination media access control (MAC) address of the packet.	Ingress ports, VLANs and IPv4 (inet) interfaces.  Egress ports and VLANs.

Table 428: Supported Match Conditions for Firewall Filters (*continued*)

Match Condition	Description	Direction and Interface
<b>destination-port value</b>	<p>TCP or UDP destination port field. Typically, you specify this match in conjunction with the <b>protocol</b> match statement. For the following well-known ports you can specify text synonyms (the port numbers are also listed):</p> <p><b>afs</b> (1483), <b>bgp</b> (179), <b>biff</b> (512), <b>bootpc</b> (68), <b>bootps</b> (67),</p> <p><b>cmd</b> (514), <b>cvspserver</b> (2401),</p> <p><b>dhcp</b> (67), <b>domain</b> (53),</p> <p><b>eklogin</b> (2105), <b>ekshell</b> (2106), <b>exec</b> (512),</p> <p><b>finger</b> (79), <b>ftp</b> (21), <b>ftp-data</b> (20),</p> <p><b>http</b> (80), <b>https</b> (443),</p> <p><b>ident</b> (113), <b>imap</b> (143),</p> <p><b>kerberos-sec</b> (88), <b>klogin</b> (543), <b>kpasswd</b> (761), <b>krb-prop</b> (754), <b>krbupdate</b> (760), <b>kshell</b> (544),</p> <p><b>ldap</b> (389), <b>login</b> (513),</p> <p><b>mobileip-agent</b> (434), <b>mobileip-mn</b> (435), <b>msdp</b> (639),</p> <p><b>netbios-dgm</b> (138), <b>netbios-ns</b> (137), <b>netbios-ssn</b> (139), <b>nfsd</b> (2049), <b>nntp</b> (119), <b>ntalk</b> (518), <b>ntp</b> (123),</p> <p><b>pop3</b> (110), <b>pptp</b> (1723), <b>printer</b> (515),</p> <p><b>radacct</b> (1813), <b>radius</b> (1812), <b>rip</b> (520), <b>rkinit</b> (2108),</p> <p><b>smtp</b> (25), <b>snmp</b> (161), <b>snmptrap</b> (162), <b>snpp</b> (444), <b>socks</b> (1080), <b>ssh</b> (22), <b>sunrpc</b> (111), <b>syslog</b> (514),</p> <p><b>tacacs-ds</b> (65), <b>talk</b> (517), <b>telnet</b> (23), <b>tftp</b> (69), <b>timed</b> (525),</p> <p><b>who</b> (513),</p> <p><b>xmcp</b> (177),</p> <p><b>zephyr-clt</b> (2103), <b>zephyr-hm</b> (2104)</p>	<p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>

Table 428: Supported Match Conditions for Firewall Filters (*continued*)

Match Condition	Description	Direction and Interface
<b>destination-port range-optimize</b> <i>range</i>	Match a range of TCP or UDP port ranges while using the available memory more efficiently. Using this condition allows you to configure more firewall filters than if you configure individual destination ports. (Not supported with filter-based forwarding.)	Egress and ingress IPv4 (inet) interfaces.
<b>destination-prefix-list</b> <i>prefix-list</i>	IP destination prefix list field. You can define a list of IP address prefixes under a prefix-list alias for frequent use. Define this list at the <b>[edit policy-options]</b> hierarchy level.	Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.  Egress IPv4 (inet) interfaces and IPv6 (inet6) interfaces.
<b>dot1q-tag</b> <i>number</i>	802.1Q VLAN ID field in the Ethernet frame. The tag values can be 1–4094.	Ingress ports and VLANs.  Egress ports and VLANs ( <i>Number</i> must be the VLAN ID of the VLAN you want to match).
<b>dot1q-user-priority</b> <i>number</i>	<p>802.1Q priority field in the Ethernet frame (used for class-of-service priorities). Values can be 0–7.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <ul style="list-style-type: none"> <li>• <b>best-effort (0)</b>—Best effort</li> <li>• <b>background (1)</b>—Background</li> <li>• <b>standard (2)</b>—Standard or spare</li> <li>• <b>excellent-load (3)</b>—Excellent load</li> <li>• <b>controlled-load (4)</b>—Controlled load</li> <li>• <b>video (5)</b>—Video</li> <li>• <b>voice (6)</b>—Voice</li> <li>• <b>network-control (7)</b>—Network control reserved traffic</li> </ul>	Ingress ports and VLANs.  Egress ports and VLANs.

Table 428: Supported Match Conditions for Firewall Filters (*continued*)

Match Condition	Description	Direction and Interface
<b>dscp value</b>	<p>Differentiated Services code point (DSCP). The DiffServ protocol uses the type-of-service (ToS) byte in the IP header. The most-significant 6 bits of this byte form the DSCP.</p> <p>You can specify DSCP in hexadecimal, binary, or decimal form.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <ul style="list-style-type: none"> <li>• <b>be</b>—best effort (default)</li> <li>• <b>ef (46)</b>—as defined in <a href="#">RFC 3246</a>, <i>An Expedited Forwarding PHB</i>.</li> <li>• <b>af11 (10), af12 (12), af13 (14); af21 (18), af22 (20), af23 (22); af31 (26), af32 (28), af33 (30); af41 (34), af42 (36), af43 (38)</b> These four classes, with three drop precedences in each class, for a total of 12 code points, are defined in <a href="#">RFC 2597</a>, <i>Assured Forwarding PHB</i>.</li> <li>• <b>cs0, cs1, cs2, cs3, cs4, cs5, cs6, cs7, cs5</b></li> </ul>	<p>Ingress ports, VLANs, and IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>

Table 428: Supported Match Conditions for Firewall Filters (*continued*)

Match Condition	Description	Direction and Interface
<b>ether-type value</b>	<p>Ethernet type field of a packet. The EtherType value specifies what protocol is being transported in the Ethernet frame. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <ul style="list-style-type: none"> <li>• <b>aarp (0x80F3)</b>—EtherType value AARP</li> <li>• <b>appletalk (0x809B)</b>—EtherType value AppleTalk</li> <li>• <b>arp (0x0806)</b>—EtherType value ARP</li> <li>• <b>fcoe (0x8906)</b>—EtherType value FCoE</li> <li>• <b>fip (0x8914)</b>—EtherType value FIP</li> <li>• <b>ipv4 (0x0800)</b>—EtherType value IPv4</li> <li>• <b>ipv6 (0x08DD)</b>—EtherType value IPv6</li> <li>• <b>mpls-multicast (0x8848)</b>—EtherType value MPLS multicast</li> <li>• <b>mpls-unicast (0x8847)</b>—EtherType value MPLS unicast</li> <li>• <b>oam (0x88A8)</b>—EtherType value OAM</li> <li>• <b>ppp (0x880B)</b>—EtherType value PPP</li> <li>• <b>pppoe-discovery (0x8863)</b>—EtherType value PPPoE Discovery Stage</li> <li>• <b>pppoe-session (0x8864)</b>—EtherType value PPPoE Session Stage</li> <li>• <b>sna (0x80D5)</b>—EtherType value SNA</li> </ul>	<p>Ingress ports and VLANs.</p> <p>Egress ports and VLANs.</p>
<b>exp</b>	Match on MPLS EXP bits.	<p>Ingress MPLS interfaces.</p> <p>Egress MPLS interfaces.</p>
<b>fragment-flags value</b>	<p>IP fragmentation flags. In place of the numeric value, you can specify one of the following text synonyms (the hexadecimal values are also listed):</p> <ul style="list-style-type: none"> <li>• <b>is-fragment</b></li> <li>• <b>dont-fragment (0x4000)</b></li> <li>• <b>more-fragments (0x2000)</b></li> <li>• <b>reserved (0x8000)</b></li> </ul>	Ingress ports and VLANs.

Table 428: Supported Match Conditions for Firewall Filters (*continued*)

Match Condition	Description	Direction and Interface
<b>icmp-code value</b>	<p>ICMP code field. Because the meaning of the value depends upon the associated <b>icmp-type</b>, you must specify a value for <b>icmp-type</b> along with a value for <b>icmp-code</b>. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed). The keywords are grouped by the ICMP type with which they are associated:</p> <ul style="list-style-type: none"> <li><i>IPv4</i>: parameter-problem—ip-header-bad (0), required-option-missing (1)</li> <li><i>IPv6</i>: parameter-problem—ip6-header-bad (0), unrecognized-next-header (1), unrecognized-option (2)</li> <li>redirect—redirect-for-network (0), redirect-for-host (1), redirect-for-tos-and-net (2), redirect-for-tos-and-host (3)</li> <li>time-exceeded—ttl-eq-zero-during-reassembly (1), ttl-eq-zero-during-transit (0)</li> <li><i>IPv4</i>: unreachable—network-unreachable (0), host-unreachable (1), protocol-unreachable (2), port-unreachable (3), fragmentation-needed (4), source-route-failed (5), destination-network-unknown (6), destination-host-unknown (7), source-host-isolated (8), destination-network-prohibited (9), destination-host-prohibited (10), network-unreachable-for-TOS (11), host-unreachable-for-TOS (12), communication-prohibited-by-filtering (13), host-precedence-violation (14), precedence-cutoff-in-effect (15)</li> <li><i>IPv6</i>: unreachable—address-unreachable (3), administratively-prohibited (1), no-route-to-destination (0), port-unreachable (4)</li> </ul>	<p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>
<b>hop-limitvalue</b>	Match the the specified hop limit or set of hop limits. Specify a single value or a range of values from 0 through 255.	Ingress and egress IPv6 (inet6) interfaces.

Table 428: Supported Match Conditions for Firewall Filters (*continued*)

Match Condition	Description	Direction and Interface
<b>icmp-type</b> <i>value</i>	<p>ICMP message type field. Typically, you specify this match in conjunction with the <b>protocol</b> match statement to determine which protocol is being used on the port. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <p><i>IPv4:</i> echo-reply (0), destination unreachable (3), source-quench (4), redirect (5), echo-request (8), IPv4 (inet)-advertisement (9), IPv4 (inet)-solicit (10), time-exceeded (11), parameter-problem (12), timestamp (13), timestamp-reply (14), info-request (15), info-reply (16), mask-request (17), mask-reply (18)</p> <p><i>IPv6:</i> destination-unreachable (1), packet-too-big (2), time-exceeded (3), parameter-problem (4), echo-request (128), echo-reply (129), membership-query (130), membership-report (131), membership-termination (132), router-solicit (133), router-advertisement (134), neighbor-solicit (135), neighbor-advertisement (136), redirect (137), router-renumbering (138), node-information-request (139), node-information-reply (140)</p> <p>See also <b>icmp-code</b> <i>variable</i>.</p>	<p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>
<b>interface</b> <i>interface-name</i>	<p>Interface on which the packet is received, including the logical unit. You can include the wildcard character (*) as part of an interface name or logical unit.</p> <p><b>NOTE:</b> An interface from which a packet is sent cannot be used as a match condition.</p>	<p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces and IPv6 (inet6) interfaces.</p>
<b>ip-destination-address</b> <i>address</i>	IPv4 address that is the final destination node address for the packet.	Ingress ports and VLANs.
<b>ip6-destination-address</b> <i>address</i>	IPv6 address that is the final destination node address for the packet.	Ingress ports and VLANs. (You cannot simultaneously apply a filter with this match criterion to a Layer 2 port and VLAN that includes that port.)
<b>ip-options</b>	Specify <b>any</b> to create a match if anything is specified in the options field in the IP header.	<p>Ingress ports, VLANs, and IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>

Table 428: Supported Match Conditions for Firewall Filters (*continued*)

Match Condition	Description	Direction and Interface
<b>ip-precedence</b> <i>ip-precedence-field</i>	IP precedence field. In place of the numeric field value, you can specify one of the following text synonyms (the field values are also listed): <b>critical-ecp</b> (0xa0), <b>flash</b> (0x60), <b>flash-override</b> (0x80), <b>immediate</b> (0x40), <b>internet-control</b> (0xc0), <b>net-control</b> (0xe0), <b>priority</b> (0x20), or <b>routine</b> (0x00).	Ingress ports, VLANs, and IPv4 (inet) interfaces.  Egress IPv4 (inet) interfaces.
<b>ip-protocol</b> <i>number</i>	IP protocol field.	Ingress ports, VLANs, and IPv4 (inet) interfaces.  Egress IPv4 (inet) interfaces.
<b>ip-source-address</b> <i>address</i>	IPv4 address of the source node sending the packet.	Ingress ports and VLANs.
<b>ip6-source-address</b> <i>address</i>	IPv6 address of the source node sending the packet.	Ingress ports and VLANs. (You cannot simultaneously apply a filter with this match criterion to a Layer 2 port and VLAN that includes that port.)
<b>ip-version</b> <i>address</i>	IP version of the packet. Use this condition to match IPv4 or IPv6 header fields in traffic that arrives on a Layer 2 port or VLAN interface.	Ingress ports and VLANs.
<b>is-fragment</b>	Using this condition causes a match if the More Fragments flag is enabled in the IP header or if the fragment offset is not zero.	Ingress ports, VLANs, and IPv4 (inet) interfaces.  Egress IPv4 (inet) interfaces.
<b>l2-encap-type</b> <i>llc-non-snap</i>	Match on logical link control (LLC) layer packets for non-Subnet Access Protocol (SNAP) Ethernet Encapsulation type.	Ingress ports and VLANs.  Egress ports and VLANs.
<b>label</b>	Match on MPLS label bits.	Ingress MPLS interfaces.  Egress MPLS interfaces.
<b>learn-vlan-id</b> <i>number</i>	VLAN identifier used for MAC learning.	Ingress ports and VLANs.  Egress ports and VLANs.

Table 428: Supported Match Conditions for Firewall Filters (*continued*)

Match Condition	Description	Direction and Interface
<b>next-header</b>	<p>IPv4 or IPv6 protocol value. In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):</p> <p><b>hop-by-hop (0), icmp (1), icmp6 (58), igmp (2), ipip (4), tcp (6), egp (8), udp (17), ipv6 (41), routing (43), fragment (44), rsvp (46), gre (47), esp (50), ah (51), icmp6 (58), no-next-header (59), dstopts (60), ospf (89), pim (103), vrrp (112), sctp (132)</b></p>	<p>Ingress ports, VLANs, and IPv6 (inet6) interfaces.</p> <p>Egress IPv6 (inet6) interfaces.</p>
<b>packet-length</b>	<p>Packet length in bytes. You must enter a value between 0 and 65535.</p>	<p>Ingress ports, VLANs, IPv4 (inet), and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>
<b>payload-protocol</b>	<p>IPv4 or IPv6 protocol value. In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):</p> <p><b>hop-by-hop (0), icmp (1), icmp6 (58), igmp (2), ipip (4), tcp (6), egp (8), udp (17), ipv6 (41), routing (43), fragment (44), rsvp (46), gre (47), esp (50), ah (51), icmp6 (58), no-next-header (59), dstopts (60), ospf (89), pim (103), vrrp (112), sctp (132)</b></p>	<p>Ingress ports, VLANs, and IPv6 (inet6) interfaces.</p> <p>Egress IPv6 (inet6) interfaces.</p>
<b>precedence value</b>	<p>IP precedence bits in the type-of-service (ToS) byte in the IP header. (This byte can also be used for the DiffServ DSCP.) In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):</p> <ul style="list-style-type: none"> <li>• <b>routine (0)</b></li> <li>• <b>priority (1)</b></li> <li>• <b>immediate (2)</b></li> <li>• <b>flash (3)</b></li> <li>• <b>flash-override (4)</b></li> <li>• <b>critical-ecp (5)</b></li> <li>• <b>internet-control (6)</b></li> <li>• <b>net-control (7)</b></li> </ul>	<p>Ingress ports, VLANs, and IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>

Table 428: Supported Match Conditions for Firewall Filters (*continued*)

Match Condition	Description	Direction and Interface
<b>protocol type</b>	<p>IPv4 or IPv6 protocol value. In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):</p> <p><b>hop-by-hop (0), icmp (1), icmp6, igmp (2), ipip (4), tcp (6), egp (8), udp (17), ipv6 (41), routing (43), fragment (44), rsvp (46), gre (47), esp (50), ah (51), icmp6 (58), no-next-header (59), dstopts (60), ospf (89), pim (103), vrrp (112), sctp (132)</b></p>	<p>Ingress ports, VLANs and IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>
<b>rat-type</b> <b>tech-type-value</b>	<p>Match the radio-access technology (RAT) type specified in the 8-bit Tech-Type field of Proxy Mobile IPv4 (PMIPv4) access technology type extension. The technology type specifies the access technology through which the mobile device is connected to the access network. Specify a single value, a range of values, or a set of values. You can specify a technology type as a numeric value from 0 through 255 or as a system keyword.</p> <ul style="list-style-type: none"> <li>Numeric value 1 matches IEEE 802.3.</li> <li>Numeric value 2 matches IEEE 802.11a/b/g.</li> <li>Numeric value 3 matches IEEE 802.16e</li> <li>Numeric value 4 matches IEEE 802.16m.</li> <li>Text string <b>eutran</b> matches 4G.</li> <li>Text string <b>geran</b> matches 2G.</li> <li>Text string <b>utran</b> matches 3G.</li> <li></li> </ul>	Egress and ingress IPv4 (inet) interfaces.
<b>sample</b>	Sample the packet traffic. Apply this option only if you have enabled traffic sampling.	Egress and ingress IPv4 (inet) interfaces.
<b>source-address</b> <b>ip-address</b>	IP source address field, which is the address of the node that sent the packet.	<p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>
<b>source-mac-address</b> <i>mac-address</i>	Source media access control (MAC) address of the packet.	<p>Ingress ports and VLANs.</p> <p>Egress ports and VLANs.</p>

Table 428: Supported Match Conditions for Firewall Filters (*continued*)

Match Condition	Description	Direction and Interface
<b>source-port</b> <i>value</i>	TCP or UDP source port. Typically, you specify this match in conjunction with the <b>protocol</b> match statement. In place of the numeric field, you can specify one of the text synonyms listed under <b>destination-port</b> .	Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.  Egress IPv4 (inet) interfaces.
<b>source-port range-optimize</b> <i>range</i>	Match a range of TCP or UDP port ranges while using the available memory more efficiently. Using this condition allows you to configure more firewall filters than if you configure individual source ports. (Not supported with filter-based forwarding.)	Egress and ingress IPv4 (inet) interfaces.
<b>source-prefix-list</b> <i>prefix-list</i>	IP source prefix list. You can define a list of IP address prefixes under a prefix-list alias for frequent use. Define this list at the <b>[edit policy-options]</b> hierarchy level.	Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.  Egress IPv4 (inet) interfaces.
<b>tcp-established</b>	Match packets of an established TCP connection. This condition matches packets other than those used to set up a TCP connection—that is, three-way handshake packets are not matched.  When you specify <b>tcp-established</b> , a switch does not implicitly verify that the protocol is TCP. You must also specify the <b>protocol tcp</b> match condition.	Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.  Egress IPv4 (inet) interfaces.
<b>tcp-flags</b> <i>value</i>	One or more TCP flags: <ul style="list-style-type: none"> <li>• <b>ack</b> (0x10)</li> <li>• <b>fin</b> (0x01)</li> <li>• <b>push</b> (0x08)</li> <li>• <b>rst</b> (0x04)</li> <li>• <b>syn</b> (0x02)</li> <li>• <b>urgent</b> (0x20)</li> </ul>	Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.  Egress IPv4 (inet) interfaces.
<b>tcp-initial</b>	Match the first TCP packet of a connection. A match occurs when the TCP flag <b>SYN</b> is set and the TCP flag <b>ACK</b> is not set.  When you specify <b>tcp-initial</b> , a switch does not implicitly verify that the protocol is TCP. You must also specify the <b>protocol tcp</b> match condition.	Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.  Egress IPv4 (inet) interfaces.

Table 428: Supported Match Conditions for Firewall Filters (*continued*)

Match Condition	Description	Direction and Interface
<b>traffic-class</b>	<p>8-bit field that specifies the class-of-service (CoS) priority of the packet. The traffic-class field is used to specify a DiffServ code point (DSCP) value. This field was previously used as the type-of-service (ToS) field in IPv4, and, the semantics of this field (for example, DSCP) are identical to those of IPv4.</p> <p>You can specify one of the following text synonyms (the field values are also listed):</p> <p><b>af11 (10), af12 (12), af13 (14), af21 (18), af22 (20), af23 (22), af31 (26), af32 (28), af33 (30), af41 (34), af42 (36), af43 (38), cs0 (0), cs1 (8), cs2 (16), cs3 (24), cs4 (32), cs5 (40), cs6 (48), cs7 (56), ef (46)</b></p>	<p>Ingress ports, VLANs, and IPv6 (inet6) interfaces.</p> <p>Egress IPv6 (inet6) interfaces.</p>
<b>ttl value</b>	IP Time-to-live (TTL) field in decimal. The value can be 1-255.	<p>Ingress IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>
<b>user-vlan-1p-priority value</b>	Match on the IEEE 802.1p user priority bits in the customer VLAN tag (the inner tag in a dual-tag frame with 802.1Q VLAN tags). Specify a single value or multiple values from 0 through 7.	<p>Ingress ports, VLANs, and IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>
<b>user-vlan-id number</b>	Match the first VLAN identifier that is part of the payload.	<p>Ingress ports, VLANs, and IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>
<b>vlan (vlan-name   vlan-id )</b>	VLAN names or ID.	<p>Ingress ports and VLANs.</p> <p>Egress ports and VLANs.</p>

Use **then** statements to define actions that should occur if a packet matches all conditions in a **from** statement. [Table 429 on page 5230](#) shows the actions that you can specify in a term. (If you do not include a **then** statement, the system accepts packets that match the filter.)

Table 429: Actions for Firewall Filters

Action	Description
<b>accept</b>	Accept a packet. This is the default action for packets that match a term.
<b>discard</b>	Discard a packet silently without sending an Internet Control Message Protocol (ICMP) message.

Table 429: Actions for Firewall Filters (*continued*)

Action	Description
<b>reject</b> <i>message-type</i>	<p>Discard a packet and send a “destination unreachable” ICMPv4 message (type 3). To log rejected packets, configure the <b>syslog</b> action modifier.</p> <p>You can specify one of the following message types: <b>administratively-prohibited</b> (default), <b>bad-host-tos</b>, <b>bad-network-tos</b>, <b>host-prohibited</b>, <b>host-unknown</b>, <b>host-unreachable</b>, <b>network-prohibited</b>, <b>network-unknown</b>, <b>network-unreachable</b>, <b>port-unreachable</b>, <b>precedence-cutoff</b>, <b>precedence-violation</b>, <b>protocol-unreachable</b>, <b>source-host-isolated</b>, <b>source-route-failed</b>, or <b>tcp-reset</b>.</p> <p>If you specify <b>tcp-reset</b>, the system sends a TCP reset if the packet is a TCP packet; otherwise nothing is sent.</p> <p>If you do not specify a message type, the ICMP notification “destination unreachable” is sent with the default message “communication administratively filtered.”</p> <p><b>NOTE:</b> The <b>reject</b> action is supported on ingress interfaces only.</p>
<b>routing-instance</b> <i>instance-name</i>	Forward matched packets to a virtual routing instance.
<b>vlan</b> <i>VLAN-name</i>	Forward matched packets to a specific VLAN.
	<b>NOTE:</b> The <b>vlan</b> action is supported on ingress interfaces only.

You can also specify the action modifiers listed in [Table 430 on page 5231](#) to count, mirror, rate-limit, and classify packets.

Table 430: Action Modifiers for Firewall Filters

Action Modifier	Description
<b>analyzer</b> <i>analyzer-name</i>	<p>(Non-ELS platforms) Mirror traffic (copy packets) to an analyzer configured at the <b>[edit ethernet-switching-options analyzer]</b> hierarchy level.</p> <p>You can specify port mirroring for ingress port, VLAN, and IPv4 (inet) firewall filters only.</p>
<b>count</b> <i>counter-name</i>	Count the number of packets that match the term.
<b>decapsulate</b> [ <b>gre</b>   <i>routing-instance</i> ]	De-encapsulate GRE packets or forward de-encapsulated GRE packets to the specified routing instance

Table 430: Action Modifiers for Firewall Filters (*continued*)

Action Modifier	Description
<b>dscp value</b>	<p>Differentiated Services code point (DSCP). The DiffServ protocol uses the type-of-service (ToS) byte in the IP header. The most-significant 6 bits of this byte form the DSCP.</p> <p>You can specify DSCP in hexadecimal, binary, or decimal form.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <ul style="list-style-type: none"> <li><b>be</b>—best effort (default)</li> <li><b>ef (46)</b>—as defined in <a href="#">RFC 3246</a>, <i>An Expedited Forwarding PHB</i>.</li> <li><b>af11 (10), af12 (12), af13 (14); af21 (18), af22 (20), af23 (22); af31 (26), af32 (28), af33 (30); af41 (34), af42 (36), af43 (38)</b></li> </ul> <p>These four classes, with three drop precedences in each class, for a total of 12 code points, are defined in <a href="#">RFC 2597</a>, <i>Assured Forwarding PHB</i>.</p> <ul style="list-style-type: none"> <li><b>cs0, cs1, cs2, cs3, cs4, cs5, cs6, cs7, cs5</b></li> </ul>
<b>forwarding-class class</b>	<p>Classify the packet in one of the following forwarding classes:</p> <ul style="list-style-type: none"> <li><b>best-effort</b></li> <li><b>fcoe</b></li> <li><b>mcast</b></li> <li><b>network-control</b></li> <li><b>no-loss</b></li> </ul> <p><b>NOTE:</b> To configure a forwarding class, you must also configure loss priority.</p>
<b>log</b>	<p>Log the packet's header information in the Routing Engine. To view this information, enter the <b>show firewall log</b> operational mode command.</p> <p><b>NOTE:</b> The <b>log</b> action modifier is supported on ingress interfaces only.</p>
<b>loss-priority (low   medium-low   medium-high   high)</b>	<p>Set the packet loss priority (PLP).</p> <p><b>NOTE:</b> The <b>loss-priority</b> action modifier is supported on ingress interfaces only.</p> <p><b>NOTE:</b> The <b>loss-priority</b> action modifier is not supported in combination with the <b>policer</b> action.</p>
<b>policer policer-name</b>	<p>Send packets to a policer (for the purpose of applying rate limiting).</p> <p>You can specify a policer for ingress port, VLAN, IPv4 (inet), IPv6 (inet6), and MPLS filters.</p> <p><b>NOTE:</b> The <b>policer</b> action modifier is not supported in combination with the <b>loss-priority</b> action.</p>

Table 430: Action Modifiers for Firewall Filters (*continued*)

Action Modifier	Description
<b>port-mirror</b>	<p>(ELS platforms) Mirror traffic (copy packets) to an output interface configured in a port-mirroring instance at the <b>[edit forwarding-options port-mirroring]</b> hierarchy level.</p> <p>You can specify port mirroring for ingress port, VLAN, and IPv4 (inet) firewall filters only.</p>
<b>port-mirror-instance</b> <i>port-mirror-instance-name</i>	<p>(ELS platforms) Mirror traffic to a port-mirroring instance configured at the <b>[edit forwarding-options port-mirroring]</b> hierarchy level.</p> <p>You can specify port mirroring for ingress port, VLAN, and IPv4 (inet) firewall filters only.</p>
<b>syslog</b>	<p>Log an alert for this packet.</p> <p><b>NOTE:</b> The <b>syslog</b> action modifier is supported on ingress interfaces only.</p>
<b>three-color-policer</b> <i>three-color-policer-name</i>	<p>Send packets to a three-color policer (for the purpose of applying rate limiting).</p> <p>You can specify a three-color policer for ingress and egress port, VLAN, IPv4 (inet), IPv6 (inet6), and MPLS filters.</p> <p><b>NOTE:</b> The <b>policer</b> action modifier is not supported in combination with the <b>loss-priority</b> action.</p>

## Understanding How a Firewall Filter Tests a Protocol

When examining match conditions in a firewall filter, a switch tests only the fields that you specify. It does not implicitly test any fields that you do not explicitly configure. For example, if you specify a match condition of **source-port ssh**, there is no implied test to determine if the protocol is TCP. In this case, the switch considers any packet that has a value of **22** (decimal) in the 2-byte field that follows a *presumed* IP header to be a match. To ensure that the term matches on TCP packets, you also specify a **protocol tcp** match condition.

For the following match conditions, you should explicitly specify the protocol match condition in the same term:

- **destination-port**—Specify **protocol tcp** or **protocol udp**.
- **icmp-code**—Specify **protocol icmp** and **icmp-type**.
- **icmp-type**—Specify **protocol tcp** or **protocol udp**.
- **source-port**—Specify **protocol tcp** or **protocol udp**.
- **tcp-flags**—Specify **protocol tcp**.

## Understanding Firewall Filter Planning

Before you create a firewall filter and apply it, determine what you want the filter to accomplish and how to use its match conditions and actions to achieve your goals. It is important that you understand how packets are matched, the default and configured actions of the firewall filter, and where to apply the firewall filter.

You can apply no more than one firewall filter per port, VLAN, or router interface per direction (input and output). For example, for a given port you can apply at most one filter in the input direction and one filter in the output direction. You should try to be conservative in the number of terms (rules) that you include in each firewall filter, because a large number of terms requires longer processing time during a commit operation and can make testing and troubleshooting more difficult.

Before you configure and apply firewall filters, answer the following questions for each of them:

1. What is the purpose of the filter?

For example, the system can drop packets based on header information, rate-limit traffic, classify packets into forwarding classes, log and count packets, or prevent denial-of-service attacks.

2. What are the appropriate match conditions? Determine the packet header fields that the packet must contain for a match. Possible fields include:

- Layer 2 header fields—Source and destination MAC addresses, 802.1Q tag, Ethernet type, or VLAN.
- Layer 3 header fields—Source and destination IP addresses, protocols, and IP options (IP precedence, IP fragmentation flags, or TTL type).
- TCP header fields—Source and destination ports and flags.
- ICMP header fields—Packet type and code.

3. What are the appropriate actions to take if a match occurs?

The system can accept, discard, or reject packets.

4. What additional action modifiers might be required?

For example, you can configure the system to mirror (copy) packets to a specified port, count matching packets, apply traffic management, or police packets.

5. On what port, router interface, or VLAN should the firewall filter be applied?

Start with the following basic guidelines:

- If packets entering or leaving a Layer 2 interface (port) need to be filtered, apply the filter at the **[edit family ethernet switching filter]** hierarchy level. This is a port filter.
- If packets entering or leaving any port in a specific VLAN need to be filtered, use a VLAN filter.
- If packets entering or leaving a Layer 3 (routed) interface or routed VLAN interface (RVI) need to be filtered, use a router firewall filter. Apply the filter to the interface at the **[edit family inet]** hierarchy level. You can also apply a router firewall filter on a loopback interface.

Before you choose the interface or VLAN on which to apply a firewall filter, understand how that placement can affect traffic flow to other interfaces. In general, apply a filter close to the source device if the filter matches on source or destination IP addresses, IP protocols, or protocol information—such as ICMP message types, and TCP or UDP port numbers. However, you should apply a filter close to the destination device if the filter matches *only* on a source IP address. When you apply a filter too close to the source device, the filter could prevent that source device from accessing other services that are available on the network.

**NOTE:** Egress firewall filters do not affect the flow of locally generated control packets from the Routing Engine.

6. In which direction should the firewall filter be applied?

You typically configure different actions for traffic entering an interface than you configure for traffic exiting an interface.

7. How many filters should I create?

See “[Planning the Number of Firewall Filters to Create](#)” on [page 5236](#) for information about how many firewall filters you can apply.

### Understanding How Many Firewall Filters Are Supported

QFX3500, QFX3600, QFX5100, and EX4600 switches, QFabric Node devices, and VCF members support the maximum numbers of firewall filter terms per type of attachment point shown in [Table 431 on page 5236](#).

**Table 431: Supported Firewall Filter Numbers**

Filter Type	QFX3500, QFX3600	QFX5100, EX4600
Ingress	768	1536
Egress	1024	1024

These totals are applied in aggregate. For example, on the QFX3500 and QFX3600 you can apply a total of 768 terms in all your port filters, Layer 3 filters, and VLAN filters that are applied in the input direction and 1024 terms in port filters, Layer 3 filters, and VLAN filters that are applied in the output direction.

**NOTE:** If you want to create more than 512 egress VLAN filters, your first VLAN ID should be 6 and the subsequent VLAN IDs should increase by 1. For example, to create 1024 egress VLAN filters, the first VLAN ID would be 6, the second ID would be 7, and the sequence would continue through VLAN ID 1029. Similarly, if you want to create fewer than 512 egress VLAN filters but want the total number of terms in those filters to exceed 512, you should number your VLAN IDs in the same manner. If you do not use this approach to create your VLAN IDs, the total number of allowed terms or filters will be less than 1024 and might be 512.

The ternary content addressable memory (TCAM) for firewall filters is divided into slices that accommodate 256 terms, and all the terms in a memory slice must be in filters of the same type and applied in the same direction. A memory slice is reserved as soon as you commit a filter. For example, if you create a port filter and apply it in the input direction, a memory slice is reserved that will only store ingress port filters. If you create and apply only one ingress port filter and that filter has only one term, the rest of this slice is unused and is unavailable for other filter types.

Continuing with the above example, assume that you create and apply 256 ingress port filters with one term each so that one memory slice is filled. This leaves two more memory

slices available for ingress filters. (Remember that the maximum number of ingress terms is 768.) If you then create and apply an ingress Layer 3 filter with one term, another memory slice is reserved for ingress Layer 3 filters. As before, the rest of the slice is unused and is unavailable for different filter types. At this point there is one memory slice available for any ingress filter type.

Now assume that you create and apply a VLAN ingress filter. The final memory slice is reserved for VLAN ingress filters. Memory allocation for ingress filters (once again assuming one term per filter) is as follows:

- Slice 1: Filled with 256 ingress port filters. You cannot commit any more ingress port filters.
- Slice 2: Contains one ingress Layer 3 filter with one term. You can commit 255 more terms in ingress Layer 3 filters.
- Slice 3: Contains one ingress VLAN filter with one term. You can commit 255 more terms in ingress VLAN filters.

Here is another example. Assume that you create 257 ingress port filters with one term per filter—that is, you create one more term than a single memory slice can accommodate. When you apply the filters and commit the configuration, the filter memory allocation is:

- Slice 1: Filled with 256 ingress port filters. You cannot apply any more ingress port filters.
- Slice 2: Contains one ingress port filter. You can apply 255 more terms in ingress port filters.
- Slice 3: This slice is unassigned. You can create and apply 256 terms in ingress filters of any type (port, Layer 3, or VLAN), but all the filters must be of the same type.

### Egress Filters

---

All of the preceding principles also apply to egress filters, but four memory slices are used because IPv4 Layer 3 filters and IPv6 Layer 3 filters are stored in separate slices. The memory slices for egress filters are the same size as those for ingress filters, so the maximum number of egress filter terms is therefore 1024.

### Avoid Configuring too Many Filters

---

If you violate any of these restrictions and commit a configuration that is not in compliance, Junos OS rejects the excessive filters. For example, if you configure 300 ingress port filters and 300 ingress Layer 3 filters and try to commit the configuration, Junos OS does the following (again assuming one term per filter):

- Accepts the 300 ingress port filters (storing them in two memory slices).
- Accepts the first 256 ingress Layer 3 filters it processes (storing them in the third memory slice).
- Rejects the remaining 44 ingress Layer 3 filters.

**NOTE:** In this situation, be sure to delete excessive filters (for example, the remaining 44 ingress Layer 3 filters) from the configuration before you reboot the device. If you reboot a device that has a noncompliant configuration, you cannot predict which filters are installed after the reboot. Using the example above, the 44 ingress Layer 3 filters that were originally rejected might be installed, and 44 of the port filters that were originally accepted might be rejected.

---

### Policers can Limit Egress Filters

---

The number of egress policers that you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that consume two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

You can prevent this problem from occurring by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

### Planning for Filter-Specific Policers

You can configure policers to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps. However, the behavior of a filter-specific policer is affected by how the firewall filter terms that reference the policer are stored in ternary content addressable memory (TCAM). If you create a filter-specific policer and reference it in multiple firewall filter terms, the policer allows more traffic than expected if the terms are stored in different TCAM slices. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms that are stored in three separate memory slices, the total bandwidth allowed by the filter is 3 Gbps, not 1 Gbps.

To prevent this unexpected behavior from occurring, use the information about TCAM slices presented above to organize your configuration file so that all the firewall filter terms that reference a given filter-specific policer are stored in the same TCAM slice.

### Planning for Filter-Based Forwarding

You can use firewall filters in conjunction with virtual routing instances to specify different routes for packets to travel in their networks. To set up this feature—called filter-based forwarding—you specify a filter and match criteria and then specify the virtual routing instance to send packets to. Filters used in this way also consume memory in an additional TCAM. See [“Understanding FIP Snooping, FBF, and MVR Filter Scalability” on page 5546](#) for more information. The section *FBF Filter VFP TCAM Consumption* in this topic specifically addresses the number of supported filters when using filter-based forwarding.

## Understanding Firewall Filter Processing Points for Bridged and Routed Packets

You apply firewall filters at multiple processing points in the forwarding path. At each processing point, the action to be taken on a packet is determined by the configuration of the filter and the results of the lookup in the forwarding or routing table.

For both bridged (Layer 2) unicast packets and routed (Layer 3) unicast packets, firewall filters are applied in the prescribed order shown below (assuming that each filter is present and a packet is accepted by each one).

Bridged packets:

1. Ingress port filter
2. Ingress VLAN filter
3. Egress VLAN filter
4. Egress port filter

Routed packets:

1. Ingress port firewall filter
2. Ingress VLAN firewall filter (Layer 2 CoS)
3. Ingress router firewall filter (Layer 3 CoS)
4. Egress router firewall filter
5. Egress VLAN firewall filter
6. Egress port filter

**NOTE:** MAC learning occurs before filters are applied, so switches learn the MAC addresses of packets that are dropped by ingress filters.

## Applying Firewall Filters to Interfaces

For a firewall filter to work, you must apply it to at least one interface. To do this, include the **filter** statement when configuring a logical interface at the **[edit interfaces]** hierarchy level:

```
[edit interfaces]
user@switch# set interface-name unit logical-unit-number family family-name filter (input |
output) filter-name
```

In the **input** statement, specify a firewall filter to be evaluated when packets are received on the interface. Input filters applied to a loopback interface affect only traffic destined for the Routing Engine.

In the **output** statement, specify a filter to be evaluated when packets exit the interface.

**NOTE:** When you create a loopback interface, it is important to apply an ingress filter to it so the Routing Engine is protected. We recommend that when you apply a filter to the loopback interface lo0, you include the `apply-groups` statement. Doing so ensures that the filter is automatically inherited on every loopback interface, including lo0 and other loopback interfaces.

## Overview of Policers

A switch polices traffic by limiting the input or output transmission rate of a class of traffic according to user-defined criteria. Policing (or rate-limiting) traffic allows you to control the maximum rate of traffic sent or received on an interface and to provide multiple priority levels or classes of service.

- [Policer Overview on page 5241](#)
- [Policer Types on page 5242](#)

- [Policers can Limit Egress Firewall Filters on page 5245](#)

### Policer Overview

You use policers to apply limits to traffic flow and set consequences for packets that exceed these limits—usually applying a higher loss priority—so that if packets encounter downstream congestion, they can be discarded first. Policers apply only to unicast packets.

Policers provide two functions: metering and marking. A policer meters (measures) each packet against traffic rates and burst sizes that you configure. It then passes the packet and the metering result to the marker, which assigns a packet loss priority that corresponds to the metering result. [Figure 181 on page 5242](#) illustrates this process.

**Figure 181: Flow of Tricolor Marking Policer Operation**

9017049

After you name and configure a policer, you use it by specifying it as an action in one or more firewall filters.

### Policer Types

A switch supports three types of policers:

- **Single-rate two-color marker**—A two-color policer (or “policer” when used without qualification) meters the traffic stream and classifies packets into two categories of packet loss priority (PLP) according to a configured bandwidth and burst-size limit. You can mark packets that exceed the bandwidth and burst-size limit with a specified PLP or simply discard them.

You can specify this type of policer in an ingress or egress firewall.

**NOTE:** A two-color policer is most useful for metering traffic at the port (physical interface) level.

- **Single-rate three-color marker**—This type of policer is defined in RFC 2697, *A Single Rate Three Color Marker*, as part of an assured forwarding (AF) per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment. This type of policer meters traffic based on one rate—the configured committed information rate (CIR) as well as the committed burst size (CBS) and the excess burst size (EBS). The CIR specifies the average rate at which bits are admitted to the switch. The CBS specifies the usual burst size in bytes and the EBS specifies the maximum burst size in bytes. The EBS must be greater than or equal to the CBS, and neither can be 0.

You can specify this type of policer in an ingress or egress firewall.

**NOTE:** A single-rate three-color marker (TCM) is most useful when a service is structured according to packet length and not peak arrival rate.

- **Two-rate three-color marker**—This type of policer is defined in RFC 2698, *A Two Rate Three Color Marker*, as part of an assured forwarding per-hop-behavior classification system for a Differentiated Services environment. This type of policer meters traffic

based on two rates—the CIR and peak information rate (PIR) along with their associated burst sizes, the CBS and peak burst size (PBS). The PIR specifies the maximum rate at which bits are admitted to the network and must be greater than or equal to the CIR.

You can specify this type of policer in an ingress or egress firewall.

**NOTE:** A two-rate three-color policer is most useful when a service is structured according to arrival rates and not necessarily packet length.

See [Table 432 on page 5243](#) for information about how metering results are applied for each of these policer types.

### Policer Actions

Policer actions are implicit or explicit and vary by policer type. *Implicit* means that Junos OS assigns the loss priority automatically. [Table 432 on page 5243](#) describes the policer actions.

**Table 432: Policer Actions**

Policer	Marking	Implicit Action	Configurable Action
Single-rate two-color	Green (conforming)	Assign low loss priority	None
	Red (nonconforming)	None	Discard
Single-rate three-color	Green (conforming)	Assign low loss priority	None
	Yellow (above the CIR and CBS)	Assign medium-high loss priority	None
	Red (above the EBS)	Assign high loss priority	Discard
Two-rate three-color	Green (conforming)	Assign low loss priority	None
	Yellow (above the CIR and CBS)	Assign medium-high loss priority	None
	Red (above the PIR and PBS)	Assign high loss priority	Discard

**NOTE:** If you specify a policer in an egress firewall filter, the only supported action is discard.

## Policer Colors

---

Single-rate and two-rate three-color policers can operate in two modes:

- **Color-blind**—In color-blind mode, the three-color policer assumes that all packets examined have not been previously marked or metered. In other words, the three-color policer is “blind” to any previous coloring a packet might have had.
- **Color-aware**—In color-aware mode, the three-color policer assumes that all packets examined have been previously marked or metered. In other words, the three-color policer is “aware” of the previous coloring a packet might have had. In color-aware mode, the three-color policer can increase the PLP of a packet but cannot decrease it. For example, if a color-aware three-color policer meters a packet with a medium PLP marking, it can raise the PLP level to high but cannot reduce the PLP level to low.

## Filter-Specific Policers

---

You can configure policers to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps. However, the behavior of a filter-specific policer is affected by how the firewall filter terms that reference the policer are stored in TCAM. If you create a filter-specific policer and reference it in multiple firewall filter terms, the policer allows more traffic than expected if the terms are stored in different TCAM slices. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms that are stored in three separate memory slices, the total bandwidth allowed by the filter is 3 Gbps, not 1 Gbps.

To prevent this unexpected behavior from occurring, use the information about TCAM slices presented in [“Planning the Number of Firewall Filters to Create” on page 5236](#) to organize your configuration file so that all the firewall filter terms that reference a given filter-specific policer are stored in the same TCAM slice.

## Suggested Naming Convention for Policers

---

We recommend that you use the naming convention ***policertypeTCM#-color type*** when configuring three-color policers and ***policer#*** when configuring two-color policers. TCM stands for three-color marker. Because policers can be numerous and must be applied correctly to work, a simple naming convention makes it easier to apply the policers properly. For example, the first single-rate, color-aware three-color policer configured would be named ***srTCM1-ca***. The second two-rate, color-blind three-color configured would be named ***trTCM2-cb***. The elements of this naming convention are explained below:

- **sr** (single-rate)
- **tr** (two-rate)
- **TCM** (tricolor marking)
- **1 or 2** (number of marker)

- ca (color-aware)
- cb (color-blind)

### Policer Counters

---

Each policer that you configure includes an implicit counter that counts the number of packets that exceed the rate limits that are specified for the policer. If you use the same policer in multiple terms—either within the same filter or in different filters—the implicit counter counts all the packets that are policed in all of these terms. If you want to obtain separate packet counts for each term, use these options:

- Configure a unique policer for each term.
- Configure only one policer, but use a unique, explicit counter in each term.

### Policer Algorithms

---

Policing uses the *token-bucket algorithm*, which enforces a limit on average bandwidth while allowing bursts up to a specified maximum value. It offers more flexibility than the *leaky bucket algorithm* in allowing a certain amount of bursty traffic before it starts discarding packets.

### How Many Policers are Supported?

---

You can configure and commit the following numbers of policers on QFX3500 and QFX3600 standalone switches and QFabric Node devices:

- Two-color policers used in ingress firewall filters: 767
- Three-color policers used in ingress firewall filters: 767
- Two-color policers used in egress firewall filters: 1022
- Three-color policers used in egress firewall filters: 512

### Policers can Limit Egress Firewall Filters

---

The number of egress policers that you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that consume two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms,

1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.

- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

## Understanding Policers with Link Aggregation Groups

If you apply a policer to a link aggregation group (LAG) on a QFX3500 switch or node, the policer applies to all the interfaces in the LAG in aggregate. For example, if you configure a policer to rate-limit at 1 Gbps and apply the policer (by using a firewall filter) to a LAG that has two member interfaces on a single switch or node, the total allowed throughput for both members is 1 Gbps.

If you apply a policer to a LAG that has members on different nodes in a QFabric network Node group or redundant server Node group, the configured rate applies to the interface on each node. For example, if you configure a policer to rate-limit at 1 Gbps and apply the policer to a LAG that has one member on server node A and one member on server node B, the allowed throughput for each member is 1 Gbps, for a total allowed throughput of 2 Gbps.

## Understanding Color-Blind Mode for Single-Rate Tricolor Marking

With the color-blind mode of single-rate tricolor marking, all packets are evaluated against the CBS. If a packet exceeds the CBS, it is evaluated against the EBS. In color-blind mode, the policer supports three loss priorities only: low, medium-high, and high.

Packets that exceed the CBS but are below the EBS are marked yellow (medium-high). Packets that exceed the EBS are marked red (high), as shown in [Table 433 on page 5247](#).

**Table 433: Color-Blind Mode TCM Color-to-PLP Mapping**

Color	PLP	Meaning
Green	<b>low</b>	Conforming.
Yellow	<b>medium-high</b>	Packet exceeds the CIR and CBS but does not exceed the EBS.
Red	<b>high</b>	Packet exceeds the EBS.

- Related Documentation**
- [Overview of Policers on page 5241](#)
  - [Configuring Color-Blind Egress Policers for Medium-Low PLP on page 5296](#)

## Understanding Color-Aware Mode for Single-Rate Tricolor Marking

In color-aware mode, the treatment the packet receives depends on its classification. Marking can increase a preassigned PLP but cannot decrease it.

### Summary of PLP Changes

[Table 434 on page 5247](#) shows how a packet's incoming priority can be modified with single-rate marking.

**Table 434: Color-Aware Mode Single-Rate PLP Mapping**

Incoming PLP	Packet Metered Against	Possible Cases	Outgoing PLP
<b>low</b>	CIR, CBS, and EBS	Conforming	<b>low</b>
		Packet exceeds the CIR and CBS but does not exceed the EBS.	<b>medium-high</b>
		Packet exceeds the EBS.	<b>high</b>
<b>medium-low</b>	EBS only	Packet does not exceed the EBS.	<b>medium-low</b>
		Packet exceeds the EBS.	<b>high</b>

Table 434: Color-Aware Mode Single-Rate PLP Mapping (*continued*)

Incoming PLP	Packet Metered Against	Possible Cases	Outgoing PLP
medium-high	EBS only	Packet does not exceed the EBS.	medium-high
		Packet exceeds the EBS.	high
high	Not metered by the policer.	All cases.	high

The following sections describe single-rate color-aware PLP mapping in more detail.

#### ***Effect on Green Packets (Low PLP)***

Packets belonging to the green class have already been marked by a classifier with low PLP. The marking policer can leave the PLP unchanged or increase it to medium-high or high, so these packets are therefore metered against both the CBS and the EBS. For example, if a behavior aggregate or multifield classifier marks a packet with low PLP and the two-rate TCM policer is in color-aware mode, the output loss priority is as follows:

- If the rate of traffic flow is less than the CIR, packets remain marked as low PLP.
- If bursts exceed the CBS but not the EBS, some of the packets are marked as medium-high PLP, and some of the packets remain marked as low PLP.
- If bursts exceed the EBS, some of the packets are marked as high PLP, and some of the packets remain marked as low PLP.

#### ***Effect on Yellow Packets (Medium PLP)***

Packets belonging to the yellow class have already been marked by a classifier with medium-low or medium-high PLP. The marking policer can leave the PLP unchanged or increase it to high, so these packets are therefore metered against the EBS only. For example, if a behavior aggregate or multifield classifier marks a packet with medium-low PLP and the two-rate TCM policer is in color-aware mode, the output loss priority is as follows:

- If the rate of traffic flow is less than the CBS, the packets remain marked as medium-low PLP.
- If the rate of traffic flow is greater than the CBS but less than the EBS, the packets remain marked as medium-low PLP.
- If the rate of traffic flow is greater than the EBS, some of the packets are marked as high PLP and some remain marked as medium-low PLP.

If a BA or multifield classifier marks a packet with medium-high PLP and the two-rate TCM policer is in color-aware mode, the policer assigns output loss priority as follows:

- If the rate of traffic flow is less than the CBS, the packets remain marked as medium-high PLP.

- If the rate of traffic flow is greater than the CBS but less than the EBS, the packets remain marked as medium-high PLP.
- If the rate of traffic flow is greater than the EBS, some of the packets are marked as high PLP and some remain marked as medium-high PLP.

#### ***Effect on Red Packets (High PLP)***

Packets belonging to the red class have already been marked by a classifier with high PLP. Because the policer cannot decrease the PLP, it does not change it, and these packets are not metered against the CBS or the EBS.

#### **Related Documentation**

- [Overview of Policers on page 5241](#)
- [Configuring Color-Blind Egress Policers for Medium-Low PLP on page 5296](#)

## **Understanding Color-Blind Mode for Two-Rate Tricolor Marking**

With the color-blind mode of two-rate tricolor marking, all packets are evaluated against the committed information rate (CIR). If a packet exceeds the CIR, it is evaluated against the peak information rate (PIR). Packets that exceed the CIR but are below the PIR are marked yellow (medium-high). Packets that exceed the PIR are marked red (high).

**Table 435: Color-Blind Mode TCM Color-to-PLP Mapping**

Color	PLP	Meaning
Green	low	Packet does not exceed the CIR.
Yellow	medium-high	Packet exceeds the CIR but does not exceed the PIR.
Red	high	Packet exceeds the PIR.

#### **Related Documentation**

- [Overview of Policers on page 5241](#)
- [Configuring Color-Blind Egress Policers for Medium-Low PLP on page 5296](#)

## **Understanding Color-Aware Mode for Two-Rate Tricolor Marking**

In color-aware mode, the treatment the packet receives depends on its classification. Marking can increase the preassigned PLP but cannot decrease it

#### **Summary of PLP Changes**

[Table 436 on page 5250](#) shows how a packet's incoming priority can be modified with two-rate marking.

Table 436: Color-Aware Mode Two-Rate PLP Mapping

Incoming PLP	Packet Metered Against	Possible Cases	Outgoing PLP
<b>low</b>	CIR and PIR	Packet does not exceed the CIR.	<b>low</b>
		Packet exceeds the CIR but not the PIR.	<b>medium-high</b>
		Packet exceeds the PIR.	<b>high</b>
<b>medium-low</b>	PIR only	Packet does not exceed the PIR.	<b>medium-low</b>
		Packet exceeds the PIR.	<b>high</b>
<b>medium-high</b>	PIR only	Packet does not exceed the PIR.	<b>medium-high</b>
		Packet exceeds the PIR.	<b>high</b>
<b>high</b>	Not metered by the policer.	All cases.	<b>high</b>

The following sections describe color-aware two-rate PLP mapping in more detail.

#### Effect on Green Packets (Low PLP)

Packets belonging to the green class have already been marked by a classifier with low PLP. The marking policer can leave the packet's PLP unchanged or increase the PLP to medium-high or high. These packets are therefore metered against both the CIR and the PIR. For example, if a behavior aggregate or multifield classifier marks a packet with low PLP and the two-rate TCM policer is in color-aware mode, the output loss priority is as follows:

- If the rate of traffic flow is less than the CIR, the packets remain marked as low PLP.
- If the rate of traffic flow is greater than the CIR but less than the PIR, some of the packets are marked as medium-high PLP and some of the packets remain marked as low PLP.
- If the rate of traffic flow is greater than the PIR, some of the packets are marked as high PLP and some of the packets remain marked as low PLP.

#### Effect on Yellow Packets (Medium PLP)

Packets belonging to the yellow class have already been marked by a classifier with medium-low or medium-high PLP. The marking policer can leave the PLP unchanged or increase it to high. These packets are therefore metered against the PIR only. For example, if a behavior aggregate (BA) or multifield classifier marks a packet with medium-low PLP and the two-rate TCM policer is in color-aware mode, the policer assigns output loss priority as follows:

- If the rate of traffic flow is less than the CIR, the packets remain marked as medium-low PLP.
- If the rate of traffic flow is greater than the CIR but less than the PIR, the packets remain marked as medium-low PLP.
- If the rate of traffic flow is greater than the PIR, some of the packets are marked as high PLP and some of the packets remain marked as medium-low PLP.

If a BA or multifield classifier marks a packet with medium-high PLP and the two-rate TCM policer is in color-aware mode, the policer assigns output loss priority as follows:

- If the rate of traffic flow is less than the CIR, the packets remain marked as medium-high PLP.
- If the rate of traffic flow is greater than the CIR but less than the PIR, the packets remain marked as medium-high PLP.
- If the rate of traffic flow is greater than the PIR, some of the packets are marked as high PLP and some of the packets remain marked as medium-high PLP.

#### Effect on Red Packets (High PLP)

Packets belonging to the red class have already been marked by a classifier with high PLP. Because the policer cannot decrease the PLP, it does not change it, and these packets are not metered against the CIR or the PIR.

### Overview of Access Port Protection

Port security features can protect a switch against various types of attacks. Protection methods against some common attacks are:

- [Mitigation of Ethernet Switching Table Overflow Attacks on page 5252](#)
- [Mitigation of Rogue DHCP Server Attacks on page 5252](#)

- [Protection Against ARP Spoofing Attacks on page 5253](#)
- [Protection Against DHCP Snooping Database Alteration Attacks on page 5253](#)
- [Protection Against DHCP Starvation Attacks on page 5253](#)

### **Mitigation of Ethernet Switching Table Overflow Attacks**

---

In an overflow attack on an Ethernet switching table, an intruder sends so many requests from new MAC addresses that the table cannot learn all the addresses. The attack forces the switch to send broadcast messages when it needs to send traffic to addresses for which it lacks MAC addresses. In addition to generating unnecessary traffic, the attacker might be able to sniff the broadcast packets.

To mitigate such attacks, you can configure a limit for learned MAC addresses or allow only specific MAC addresses. Use the MAC limit feature to control the total number of MAC addresses that can be added to the Ethernet switching table for the specified interface or interfaces. By setting the MAC addresses that are explicitly allowed, you ensure that the addresses of network devices whose network access is critical are guaranteed to be included in the Ethernet switching table.

### **Mitigation of Rogue DHCP Server Attacks**

---

By default, all access ports are untrusted, and all trunk ports are trusted with regard to DHCP. Trusted ports allow DHCP servers to provide IP addresses and other information to requesting devices. If someone connects an unauthorized DHCP server to a trusted port, the unauthorized server can start issuing IP addresses and configuration information to the network's DHCP clients. The information provided to the clients by this server can disrupt their network access. The unauthorized server might also assign itself as the default gateway device for the network. An attacker can then sniff the network traffic and perpetrate a man-in-the-middle attack—that is, it misdirects traffic intended for a legitimate network device to a device of its choice.

To mitigate this problem, set the interface to which the unauthorized server is connected as untrusted. That action blocks all ingress DHCP server messages from that interface.

**NOTE:** The switch logs all DHCP server packets that are received on untrusted ports. For example:

```
5 untrusted DHCPOFFER received, interface xe-0/0/2.0[65], vlan v1[10] server  
ip/mac 12.12.12.1/00:00:00:00:01:12 offer ip/client mac  
12.12.12.253/00:AA:BB:CC:DD:01
```

You can use these messages to detect unauthorized DHCP servers on the network.

**NOTE:** If you attach a DHCP server to an access port, you must configure the port as trusted.

---

### Protection Against ARP Spoofing Attacks

---

In ARP spoofing, an attacker sends faked ARP messages on the network. The attacker associates its own MAC address with the IP address of a network device connected to the switch. Any traffic sent to that IP address is instead sent to the attacker. Now the attacker can create various types of problems, including sniffing the packets that were meant for another host and perpetrating man-in-the middle attacks. (In a man-in-the-middle attack, the attacker intercepts messages between two hosts, reads them, and perhaps alters them, all without the original hosts knowing that their communications have been compromised.)

To protect against ARP spoofing on your switch, enable both DHCP snooping and dynamic ARP inspection (DAI). DHCP snooping builds and maintains the DHCP snooping table. That table contains the MAC addresses, IP addresses, lease times, binding types, VLAN information, and interface information for the untrusted interfaces on the switch. DAI uses the information in the DHCP snooping table to validate ARP packets. Invalid ARP packets are blocked, and when they are blocked, a system log message is recorded that includes the type of ARP packet and the sender's IP address and MAC address.

*See Example: Configuring DHCP Snooping and DAI to Protect the Switch from ARP Spoofing Attacks.*

### Protection Against DHCP Snooping Database Alteration Attacks

---

In an attack designed to alter the DHCP snooping database, an intruder introduces a DHCP client on one of the switch's untrusted access interfaces that has a MAC address identical to that of a client on another untrusted port. The intruder acquires the DHCP lease, which results in changes to the entries in the DHCP snooping table. Subsequently, what would have been valid ARP requests from the legitimate client are blocked.

To protect against this type of alteration of the DHCP snooping database, configure MAC addresses that are explicitly allowed on the interface. *See Example: Configuring Allowed MAC Addresses to Protect the Switch from DHCP Snooping Database Alteration Attacks.*

### Protection Against DHCP Starvation Attacks

---

In a DHCP starvation attack, an attacker floods an Ethernet LAN with DHCP requests from spoofed (counterfeit) MAC addresses so that trusted DHCP servers cannot keep up with requests from legitimate DHCP clients. The address space of those servers is completely used up, so they can no longer assign IP addresses and lease times to clients. DHCP requests from those clients are either dropped—that is, the result is a denial of service (DoS)—or directed to a rogue DHCP server set up by the attacker to imitate a legitimate DHCP server.

To protect the switch from DHCP starvation attacks, use the MAC limiting feature. Specify the maximum number of MAC addresses that the switch can learn on the access interfaces to which DHCP clients connect. The DHCP server or servers can then supply only the specified number of IP addresses over each of those interfaces. If a DHCP starvation attack occurs after the maximum number of IP addresses has been assigned, the attack fails.

## Understanding Port Security

Ethernet LANs are vulnerable to attacks such as address spoofing (forging) and Layer 2 denial of service (DoS) on network devices. Port security features help protect the access ports on your device against the loss of information and productivity that such attacks can cause.

The Juniper Networks Junos operating system (Junos OS) provides features to help secure ports on a device. Ports can be categorized as either trusted or untrusted. You apply policies appropriate to each category to protect ports against various types of attacks.

Basic port security features are enabled in the device's default configuration. You can configure additional features with minimal configuration steps.

Depending on the particular feature, you can configure the feature either on VLANs or bridge domain interfaces.

Port security features supported on switching devices are:

- DHCP snooping—Filters and blocks ingress Dynamic Host Configuration Protocol (DHCP) server messages on untrusted ports; builds and maintains a database of valid bindings between IP addresses and MAC addresses (IP-MAC bindings), which is called the DHCP snooping database.

**NOTE:** DHCP snooping is not enabled in the default configuration of the switching device. DHCP snooping is enabled on a VLAN or bridge domain. The details of enabling DHCP snooping depend on the particular device.

- DHCPv6 snooping—DHCP for IPv6 (DHCPv6) equivalent for DHCP snooping.
- DHCP option 82—Also known as the DHCP Relay Agent information option. This DHCPv4 feature helps protect the switching device against attacks such as spoofing of IP addresses and MAC addresses and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.
- DHCPv6 option 37—Option 37 is the DHCPv6 equivalent of option 82 and is enabled by default when DHCPv6 is enabled on a VLAN.
- Dynamic ARP inspection (DAI)—Prevents Address Resolution Protocol (ARP) spoofing attacks. ARP requests and replies are compared against entries in the DHCP snooping

database, and filtering decisions are made on the basis of the results of those comparisons. You enable DAI on a VLAN.

- IPv6 neighbor discovery inspection—Prevents IPv6 address spoofing attacks. Neighbor discovery requests and replies are compared against entries in the DHCPv6 snooping database, and filtering decisions are made on the basis of the results of those comparisons. You enable neighbor discovery inspection on a VLAN.
- IP source guard—Mitigates the effects of IP address spoofing attacks on the Ethernet LAN. With IP source guard enabled, the source IP address in the packet sent from an untrusted access interface is validated against the source MAC address in the DHCP snooping database. The packet is forwarded if the source IP-MAC binding is valid; if the binding is not valid, the packet is discarded. You enable IP source guard on a VLAN or bridge domain.

**NOTE:** IP source guard is not supported on the QFX Series.

- IPv6 source guard—IP source guard for IPv6.

**NOTE:** IPv6 source guard is not supported on the QFX Series.

- MAC limiting—Protects against flooding of the Ethernet switching table (also known as the MAC forwarding table or Layer 2 forwarding table). You can enable MAC limiting on an interface.
- MAC move limiting—(Not supported on EX9200) Tracks MAC movement and detects MAC spoofing on access ports. You enable this feature on a VLAN or bridge domain.
- Persistent MAC learning—Also known as sticky MAC. Persistent MAC learning enables interfaces to retain dynamically learned MAC addresses across switch reboots. You enable this feature on an interface.
- RA guard—Examines incoming Router Advertisement (RA) messages and decides whether to forward or block them based on statically configured IPv6/MAC address bindings. If the content of the RA message does not match the bindings, the message is dropped.
- Trusted DHCP server—Configuring the DHCP server on a trusted port protects against rogue DHCP servers sending leases. You enable this feature on an interface (port). By default, access ports are untrusted, and trunk ports are trusted. (Access ports are the switch ports that connect to Ethernet endpoints such as user PCs and laptops, servers, and printers. Trunk ports are the switch ports that connect an Ethernet switch to other switches or to routers.)

## Understanding DHCP Snooping for Port Security

DHCP snooping enables the switching device, which can be either a switch or a router, to monitor and control DHCP messages received from untrusted devices connected to it. When DHCP snooping is enabled, the system snoops the DHCP messages to view DHCP lease information and builds and maintains a database of valid bindings between IP addresses and MAC address (IP-MAC bindings) called the DHCP snooping database. Only clients with valid bindings are allowed access to the network.

---

### DHCP Snooping Basics

The Dynamic Host Configuration Protocol (DHCP) allocates IP addresses dynamically, *leasing* addresses to devices so that the addresses can be reused when no longer needed. Hosts and end devices that require IP addresses obtained through DHCP must communicate with a DHCP server across the LAN.

DHCP snooping acts as a guardian of network security by keeping track of valid IP addresses assigned to downstream network devices by a trusted DHCP server (the server is connected to a trusted network port).

By default, all trunk ports on the switch are trusted and all access ports are untrusted for DHCP snooping.

When DHCP snooping is enabled, the lease information from the switching device is used to create the DHCP snooping table, also known as the binding table. The table shows current IP-MAC bindings, as well as lease time, type of binding, names of associated VLANs, and associated interfaces.

**NOTE:** DHCP snooping is disabled in the default configuration of the switching device. You must explicitly enable DHCP snooping by setting `examine-dhcp` at the `[edit ethernet-switching-options secure-access-port]` hierarchy level.

Entries in the DHCP snooping database are updated in these events:

- When a DHCP client releases an IP address (sends a DHCPRELEASE message). In this event, the associated mapping entry is deleted from the database.
- If you move a network device from one VLAN to another. In this event, typically the device needs to acquire a new IP address. Therefore, its entry in the database, including its VLAN ID, is updated.
- When the lease time (timeout value) assigned by the DHCP server expires. In this event, the associated entry is deleted from the database.

**TIP:** By default, the IP-MAC bindings are lost when the switching device is rebooted and DHCP clients (the network devices, or hosts) must reacquire bindings. However, you can configure the bindings to persist by setting the `dhcp-snooping-file` statement to store the database file either locally or remotely.

You can configure the switching device to snoop DHCP server responses from particular VLANs only. This prevents spoofing of DHCP server messages.

You configure DHCP snooping per VLAN, not per interface (port). DHCP snooping is disabled by default on switching devices.

### DHCP Snooping Process

The basic process of DHCP snooping consists of the following steps:

**NOTE:** When DHCP snooping is enabled for a VLAN, all DHCP packets sent from the network devices in that VLAN are subjected to DHCP snooping. The final IP-MAC binding occurs when the DHCP server sends DHCPACK to the DHCP client.

1. The network device sends a DHCPDISCOVER packet to request an IP address.
2. The switching device forwards the packet to the DHCP server.
3. The server sends a DHCPOFFER packet to offer an address. If the DHCPOFFER packet is from a trusted interface, the switching device forwards the packet to the DHCP client.
4. The network device sends a DHCPREQUEST packet to accept the IP address. The switching device adds an IP-MAC placeholder binding to the database. The entry is

considered a placeholder until a DHCPACK packet is received from the server. Until then, the IP address could still be assigned to some other host.

5. The server sends a DHCPACK packet to assign the IP address or a DHCPNAK packet to deny the address request.
6. The switching device updates the DHCP snooping database according to the type of packet received:
  - If the switching device receives a DHCPACK packet, it updates lease information for the IP-MAC bindings in its database.
  - If the switching device receives a DHCPNAK packet, it deletes the placeholder.

**NOTE:** The DHCP snooping database is updated only after the DHCPREQUEST packet has been sent.

For general information about the messages that the DHCP client and DHCP server exchange during the assignment of an IP address for the client, see the *Junos OS Administration Library for Routing Devices*.

### DHCPv6 Snooping

DHCPv6 snooping is the equivalent of DHCP snooping for IPv6. The process for DHCPv6 snooping is similar to that for DHCP snooping, but uses different names for the messages exchanged between the client and server to assign IPv6 addresses. [Table 437 on page 5258](#) shows DHCPv6 messages and their DHCP equivalents.

**Table 437: DHCPv6 Messages and Equivalent DHCPv4 Messages**

Sent by	DHCPv6 Messages	Equivalent DHCP Messages
Client	SOLICIT	DHCPDISCOVER
Server	ADVERTISE	DHCPOFFER
Client	REQUEST, RENEW, REBIND	DHCPREQUEST
Server	REPLY	DHCPACK/DHCPNAK
Client	RELEASE	DHCPRELEASE
Client	INFORMATION-REQUEST	DHCPINFORM
Client	DECLINE	DHCPDECLINE
Client	CONFIRM	none
Server	RECONFIGURE	DHCPFORCERENEW
Client	RELAY-FORW, RELAY-REPLY	none

---

## Rapid Commit for DHCPv6

---

DHCPv6 provides for a Rapid Commit option (DHCPv6 option 14), which, when supported by the server and set by the client, shortens the exchange from a four-way relay to a two-message handshake. For more information about enabling the Rapid Commit option, see *Enabling DHCPv6 Rapid Commit Support*.

In the rapid commit process:

1. The DHCPv6 client sends out a SOLICIT message that contains a request that rapid assignment of address, prefix, and other configuration parameters be preferred.
2. If the DHCPv6 server supports rapid assignment, it responds with a REPLY message, which contains the assigned IPv6 address and prefix and other configuration parameters.

---

## DHCP Server Access

---

You can configure a switching device's access to the DHCP server in three ways:

- [Switching Device, DHCP Clients, and DHCP Server Are All on the Same VLAN on page 5259](#)
- [Switching Device Acts as DHCP Server on page 5260](#)
- [Switching Device Acts as Relay Agent on page 5261](#)

### ***Switching Device, DHCP Clients, and DHCP Server Are All on the Same VLAN***

When the switching device, DHCP clients, and DHCP server are *all members of the same VLAN*, the DHCP server can be connected to the switching device in one of two ways:

- The server is directly connected to the same switching device as the one connected to the DHCP clients (the hosts, or network devices, that are requesting IP addresses from the server). The VLAN is enabled for DHCP snooping to protect the untrusted access ports. The trunk port is configured by default as a trusted port. See [Figure 182 on page 5260](#).
- The server is connected to an intermediary switching device (Switching Device 2). The DHCP clients are connected to Switching Device 1, which is connected through a trunk port to Switching Device 2. Switching Device 2 is being used as a transit device. The VLAN is enabled for DHCP snooping to protect the untrusted access ports. The trunk port is configured by default as a trusted port. As shown in [Figure 183 on page 5260](#), ge-0/0/11 is a trusted trunk port.

Figure 182: DHCP Server Connected Directly to a Switching Device

Figure 183: DHCP Server Connected Directly to Switching Device 2, with Switching Device 2 Connected to Switching Device 1 Through a Trusted Trunk Port

### Switching Device Acts as DHCP Server

**NOTE:** The switching device acting as a DHCP server is not supported on the QFX Series.

The switching device itself is configured as a DHCP server; this is known as a *local configuration*. See [Figure 184 on page 5261](#).

Figure 184: Switching Device Is the DHCP Server

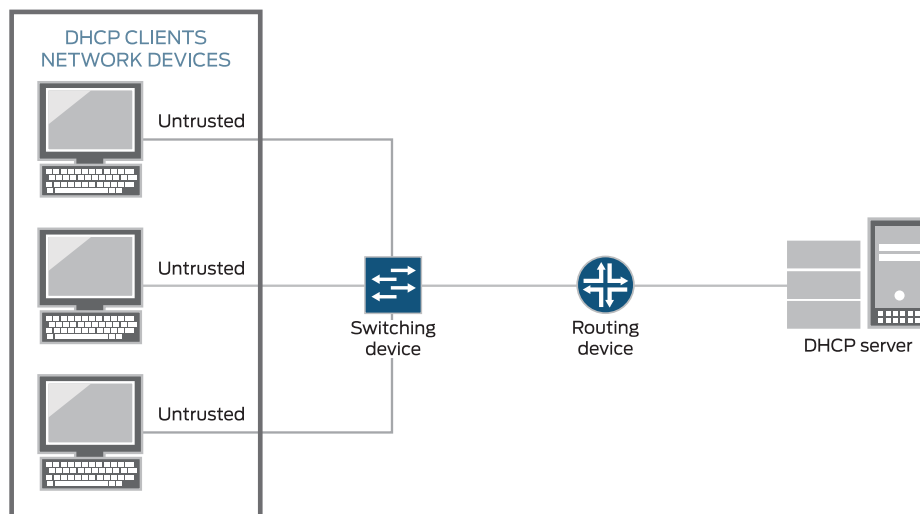

***Switching Device Acts as Relay Agent***

The switching device functions as a relay agent when the DHCP clients or the DHCP server is connected to the device through a Layer 3 interface. The Layer 3 interfaces on the switching device are configured as routed VLAN interfaces (RVIs), which are also known as integrated routing and bridging (IRB) interfaces. The trunk interfaces are trusted by default.

These two scenarios illustrate the switching device acting as a relay agent:

- The DHCP server and clients are in different VLANs.
- The switching device is connected to a router that is in turn connected to the DHCP server. See [Figure 185 on page 5262](#).

**Figure 185: Switching Device Acting as Relay Agent Through Router to DHCP Server**

8042487

### Static IP Address Additions to the DHCP Snooping Database

You can add specific static IP addresses to the database as well as have the addresses dynamically assigned through DHCP snooping. To add static IP addresses, you supply the IP address, the MAC address of the device, the interface on which the device is connected, and the VLAN with which the interface is associated. No lease time is assigned to the entry. The statically configured entry never expires.

### Snooping DHCP Packets That Have Invalid IP Addresses

If you enable DHCP snooping on a VLAN and then devices on that VLAN send DHCP packets that request invalid IP addresses, these invalid IP addresses are stored in the DHCP snooping database until they are deleted when their default timeout is reached. To eliminate this unnecessary consumption of space in the DHCP snooping database, the switching device drops the DHCP packets that request invalid IP addresses, preventing the snooping of these packets. The invalid IP addresses are:

- 0.0.0.0
- 128.0.x.x
- 191.255.x.x
- 192.0.0.x
- 223.255.255.x
- 224.x.x.x
- 240.x.x.x to 255.255.255.255

## Prioritizing Snooped Packets

**NOTE:** Prioritizing snooped packets is not supported on the QFX Series and the EX4600 switch.

You can use class-of-service (CoS) forwarding classes and queues to prioritize DHCP snooped packets for a specified VLAN. This type of configuration places the DHCP snooped packets for that VLAN in a specified egress queue, so that the security procedure does not interfere with the transmission of high-priority traffic. For additional information, see *Example: Using CoS Forwarding Classes to Prioritize Snooped Packets in Heavy Network Traffic*.

## Understanding DAI for Port Security

Dynamic ARP inspection (DAI) protects switching devices against ARP spoofing.

DAI inspects Address Resolution Protocol (ARP) packets on the LAN and uses the information in the DHCP snooping database on the switch to validate ARP packets and to protect against ARP spoofing (also known as ARP poisoning or ARP cache poisoning). ARP requests and replies are compared against entries in the DHCP snooping database, and filtering decisions are made based on the results of those comparisons. When an attacker tries to use a forged ARP packet to spoof an address, the switch compares the address with entries in the database. If the media access control (MAC) address or IP address in the ARP packet does not match a valid entry in the DHCP snooping database, the packet is dropped.

ARP packets are sent to the Routing Engine and are rate-limited to protect the switching device from CPU overload.

- [Address Resolution Protocol on page 5263](#)
- [ARP Spoofing on page 5264](#)
- [Dynamic ARP Inspection on page 5264](#)
- [Prioritizing Inspected Packets on page 5265](#)

### Address Resolution Protocol

Sending IP packets on a multi-access network requires mapping an IP address to an Ethernet MAC address.

Ethernet LANs use ARP to map MAC addresses to IP addresses.

The switching device maintains this mapping in a cache that it consults when forwarding packets to network devices. If the ARP cache does not contain an entry for the destination device, the host (the DHCP client) broadcasts an ARP request for that device's address and stores the response in the cache.

### ARP Spoofing

---

ARP spoofing is one way to initiate man-in-the-middle attacks. The attacker sends an ARP packet that spoofs the MAC address of another device on the LAN. Instead of the switching device sending traffic to the proper network device, it sends the traffic to the device with the spoofed address that is impersonating the proper device. If the impersonating device is the attacker's machine, the attacker receives all the traffic from the switch that must have gone to another device. The result is that traffic from the switching device is misdirected and cannot reach its proper destination.

One type of ARP spoofing is gratuitous ARP, which is when a network device sends an ARP request to resolve its own IP address. In normal LAN operation, gratuitous ARP messages indicate that two devices have the same MAC address. They are also broadcast when a network interface card (NIC) in a device is changed and the device is rebooted, so that other devices on the LAN update their ARP caches. In malicious situations, an attacker can poison the ARP cache of a network device by sending an ARP response to the device that directs all packets destined for a certain IP address to go to a different MAC address instead.

To prevent MAC spoofing through gratuitous ARP and through other types of spoofing, the switches examine ARP responses through DAI.

### Dynamic ARP Inspection

---

DAI examines ARP requests and responses on the LAN and validates ARP packets. The switch intercepts ARP packets from an access port and validates them against the DHCP snooping database. If no IP-MAC entry in the database corresponds to the information in the ARP packet, DAI drops the ARP packet and the local ARP cache is not updated with the information in that packet. DAI also drops ARP packets when the IP address in the packet is invalid. ARP probe packets are not subjected to dynamic ARP inspection. The switch always forwards such packets.

Junos OS for EX Series switches and the QFX Series uses DAI for ARP packets received on access ports because these ports are untrusted by default. Trunk ports are trusted by default, and therefore ARP packets bypass DAI on them.

You configure DAI for each VLAN, not for each interface (port). By default, DAI is disabled for all VLANs.

If you set an interface to be a DHCP trusted port, it is also trusted for ARP packets.

**NOTE:**

- If your switching device is an EX Series switch and uses Junos OS with support for the Enhanced Layer 2 Software (ELS) configuration style, see *Enabling a Trusted DHCP Server (CLI Procedure)* for information about configuring an access interface to be a DHCP trusted port.
- If your switching device is an EX Series switch and is *not* using Junos OS with support for the Enhanced Layer 2 Software (ELS) configuration style, see *Enabling a Trusted DHCP Server (CLI Procedure)* for information about configuring an access interface to be a DHCP trusted port.

For packets directed to the switching device to which a network device is connected, ARP queries are broadcast on the VLAN. The ARP responses to those queries are subjected to the DAI check.

For DAI, all ARP packets are trapped to the Packet Forwarding Engine. To prevent CPU overloading, ARP packets destined for the Routing Engine are rate-limited.

If the DHCP server goes down and the lease time for an IP-MAC entry for a previously valid ARP packet runs out, that packet is blocked.

### Prioritizing Inspected Packets

**NOTE:** Prioritizing inspected packets is not supported on the QFX Series and the EX4600 switch.

You can use class-of-service (CoS) forwarding classes and queues to prioritize DAI packets for a specified VLAN. This type of configuration places inspected packets for that VLAN in the egress queue, that you specify, ensuring that the security procedure does not interfere with the transmission of high-priority traffic.

## Understanding MAC Limiting and MAC Move Limiting for Port Security

MAC limiting protects against flooding of the Ethernet switching table (also known as the MAC forwarding table or Layer 2 forwarding table). You enable this feature on Layer 2 interfaces (ports). MAC move limiting detects MAC movement and MAC spoofing on access interfaces. You enable this feature on VLANs.

- [MAC Limiting on page 5266](#)
- [MAC Move Limiting on page 5266](#)
- [Actions for MAC Limiting on page 5267](#)
- [MAC Addresses That Exceed the MAC Limit or MAC Move Limit on page 5267](#)

### MAC Limiting

---

MAC limiting sets a limit on the number of MAC addresses that can be learned on a single Layer 2 access interface or on all the Layer 2 access interfaces on the switch. Junos OS provides two MAC limiting methods:

- Maximum number of MAC addresses—You configure the maximum number of dynamic MAC addresses allowed per interface. When the limit is exceeded, incoming packets with new MAC addresses can be ignored, dropped, or logged. You can also specify that the interface be shut down or temporarily disabled.
- Allowed MAC addresses—You configure specific “allowed” MAC addresses for the access interface. Any MAC address that is not in the list of configured addresses is not learned, and the switch logs an appropriate message. Allowed MAC binds MAC addresses to a VLAN so that the address does not get registered outside the VLAN. If an allowed MAC setting conflicts with a dynamic MAC setting, the allowed MAC setting takes precedence.

**NOTE:** If you do not want the system to log messages about invalid MAC addresses received by an interface that has been configured for allowed MAC addresses, disable the logging by configuring the [no-allowed-mac-log](#) statement.

You configure MAC limiting per interface, not per VLAN. You can specify the maximum number of dynamic MAC addresses that can be learned on a single Layer 2 access interface (including tagged-access interfaces) or on all Layer 2 access interfaces.

### MAC Move Limiting

---

MAC move limiting causes the switch to track the number of times a MAC address can move to a new interface (port). It can help to prevent MAC spoofing, and it can also detect and prevent loops.

If a MAC address moves more than the configured number of times within 1 second, the switch performs the configured action. You can configure MAC move limiting to apply to all VLANs or to a specific VLAN.

**CAUTION:** Mac move limiting does not work properly on a QFX5100 switch used as a Node device in a QFabric system. Do not use this feature on a QFX5100 switch in a QFabric system.

### Actions for MAC Limiting

You can choose to have one of the following actions performed when the limit of MAC addresses or the limit of MAC moves is exceeded:

- **drop**—Drop the packet and generate a system log entry. This is the default.
- **log**—Do not drop the packet but generate a system log entry.
- **none**—Take no action.
- **shutdown**—Disable the interface and generate an alarm. If you configure the switch with the **port-error-disable** statement, the disabled interface recovers automatically upon expiration of the specified timeout. If this is not configured, you can bring up the disabled interfaces by running the **clear ethernet-switching port-error** command.

See descriptions of results of these various action settings in “[Verifying That MAC Limiting Is Working Correctly](#)” on page 5385.

If you set a MAC limit to apply to all interfaces on the switch, you can override that setting for a particular interface by specifying action **none**. See *Configuring the none Action to Override a MAC Limit Applied to All Interfaces (CLI Procedure)*

### MAC Addresses That Exceed the MAC Limit or MAC Move Limit

If you have configured the **port-error-disable** statement, you can view which interfaces are temporarily disabled because the MAC limit or MAC move limit was exceeded. Use the **show ethernet-switching interfaces** command.

The log messages that indicate the MAC limit or MAC move limit has been exceeded include the offending MAC addresses.

## Understanding Trusted and Untrusted Ports

By default, all access ports are untrusted and all trunk ports are trusted in regard to DHCP. Trusted ports allow DHCP servers to provide IP addresses and other information to requesting devices. Untrusted ports drop traffic from DHCP servers to prevent unauthorized servers from providing any configuration information to clients.

If you attach a DHCP server to an access port, you must configure the port as trusted. Before you do so, ensure that the server is physically secure—that is, that access to the server is monitored and controlled.

## Understanding Trusted DHCP Servers for Port Security

Any interface on the switching device that connects to a DHCP server can be configured as a trusted port. Configuring a DHCP server on a trusted port protects against rogue DHCP servers sending leases.

Ensure that the DHCP server interface is physically secure—that is, that access to the server is monitored and controlled at the site—before you configure the port as trusted.

## Understanding DHCP Option 82 for Port Security

You can use DHCP option 82, also known as the DHCP relay agent information option, to help protect the switch against attacks such as spoofing (forging) of IP addresses and MAC addresses, and DHCP IP address starvation. Hosts on untrusted access interfaces on Ethernet LAN switches send requests for IP addresses in order to access the Internet. The switch forwards or relays these requests to DHCP servers, and the servers send offers for IP address leases in response. Attackers can use these messages to perpetrate address spoofing and starvation.

Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client. The Juniper Networks Junos operating system (Junos OS) implementation of DHCP option 82 supports RFC 3046, *DHCP Relay Agent Information Option*, at <http://tools.ietf.org/html/rfc3046>.

This topic covers:

- [DHCP Option 82 Processing on page 5269](#)
- [Suboption Components of Option 82 on page 5270](#)
- [Configurations That Support Option 82 on page 5270](#)

### DHCP Option 82 Processing

If DHCP option 82 is enabled on the switch, then when a DHCP client that is connected to the switch on an untrusted interface sends a DHCP request, the switch inserts information about the client's network location into the packet header of that request. The switch then sends the request to the DHCP server. The DHCP server reads the option 82 information in the packet header and uses it to implement the IP address or another parameter for the client. See “[Suboption Components of Option 82](#)” on page 5270 for details about option 82 information.

You can enable DHCP option 82 on a single VLAN or on all VLANs on the switch. You can also configure it on Layer 3 interfaces (in routed VLAN interfaces, or RVIs) when the switch is functioning as a relay agent.

When option 82 is enabled on the switch, then this sequence of events occurs when a DHCP client sends a DHCP request:

1. The switch receives the request and inserts the option 82 information in the packet header.
2. The switch forwards or relays the request to the DHCP server.
3. The server uses the DHCP option 82 information to formulate its reply and sends a response back to the switch. It does not alter the option 82 information.
4. The switch strips the option 82 information from the response packet.
5. The switch forwards the response packet to the client.

**NOTE:** To use the DHCP option 82 feature, you must ensure that the DHCP server is configured to accept option 82. If it is not configured to accept option 82, then when it receives requests containing option 82 information, it does not use the information in setting parameters and it does not echo the information in its response message.

---

### Suboption Components of Option 82

---

When configuring DHCP option 82, you can use the following suboptions:

- **circuit ID**—Identifies the circuit (interface and/or VLAN) on the switch on which the request was received. The circuit ID contains the interface name and/or VLAN name, with the two elements separated by a colon—for example, **xe-0/0/10:vlan1**. If the request packet is received on a Layer 3 interface, the circuit ID is just the interface name—for example, **xe-0/0/10**.

Use the **prefix** option to add an optional prefix to the circuit ID. If you enable the **prefix** option, the hostname for the switch is used as the prefix; for example, **switch1:xe-0/0/10:vlan1**.

You can also specify that the interface description be used rather than the interface name and that the VLAN ID be used rather than the VLAN name.

- **remote ID**—Identifies the host. By default, the remote ID is the MAC address of the switch. You can specify that the remote ID be the hostname of the switch, the interface description, or a character string of your choice. You can also add an optional prefix to the remote ID.
- **vendor ID**—Identifies the vendor of the host. If you specify the **vendor-id** option but do not enter a value, the default value **Juniper** is used. To specify a value, you type a character string.

---

### Configurations That Support Option 82

---

You can use option 82 with the following configurations:

- The DHCP client and the DHCP server are on the same VLAN. In this case the switch forwards the requests from the clients on untrusted access interfaces to the server on a trusted interface. For this configuration, you set DHCP option 82 at the **[edit ethernet-switching-options secure-access-port vlan]** hierarchy level.
- The DHCP client or the DHCP server is connected to the switch through a Layer 3 interface and the switch is configured to relay DHCP requests. [Figure 186 on page 5271](#) illustrates a scenario for the switch-as-relay-agent; in this instance, the switch relays requests through a router to the server.

Figure 186: Switch Relays DHCP Requests to Server

For the configuration shown in [Figure 186 on page 5271](#), you set DHCP option 82 at the `[edit forwarding-options helpers bootp]` hierarchy level.

## Understanding Static ARP Entries

You can create explicit mappings between IP addresses and MAC addresses, which are called static ARP table entries. Unlike dynamically learned ARP entries, static entries do not age out. You might want to create static ARP entries in a troubleshooting situation or if your device is unable to learn a MAC address dynamically for any reason.

- [Understanding Storm Control on page 5272](#)
- [Understanding Unicast RPF on page 5273](#)
- [Understanding Unknown Unicast Forwarding on page 5277](#)

### Understanding Storm Control

A traffic storm occurs when broadcast packets prompt receiving devices to broadcast packets in response. This prompts further responses, creating a snowball effect. The switch is flooded with packets, which creates unnecessary traffic that leads to poor performance or even a complete loss of service by some clients. Storm control causes a device to monitor traffic levels and take a specified action when a specified traffic level—called the *storm control level*—is exceeded, thus preventing packets from proliferating and degrading service. You can configure devices to drop broadcast and unknown unicast packets, shut down interfaces, or temporarily disable interfaces when the storm control level is exceeded.

Storm control is enabled by default on ELS platforms and disabled by default on non-ELS platforms. If storm control is enabled, the default level is 80 percent of the available bandwidth for ingress traffic. You can change the storm control level by configuring it as a specific bandwidth value. (The **level** configuration statement, which allows you to configure the storm control level as a percentage of the combined broadcast and unknown unicast streams, is deprecated and might be removed from future releases. We recommend that you phase out its use and replace it with the **bandwidth** statement.)

NOTE: Storm control is not enabled by default on MX platforms.

NOTE: When you configure storm control bandwidth, the value you configure is rounded off internally to the closest multiple of 64 Kbps, and the rounded-off value represents the bandwidth that is actually enforced. For example, if you configure a bandwidth limit of 150 Kbps, storm control enforces a bandwidth limit of 128 Kbps.

NOTE: On an FCoE-FC gateway, storm control must be disabled on all Ethernet interfaces that belong to an FCoE VLAN to prevent FCoE traffic from being dropped. Configuring storm control on an Ethernet interface that is included in an FCoE-FC gateway may have undesirable effects, including FCoE packet loss. After disabling storm control on all interfaces, enable storm control on any interfaces that are not part of an FCoE-FC gateway on which you want to use storm control. However, on an FCoE transit switch, you can enable storm control on interfaces that carry FCoE traffic.

**CAUTION:** The Junos OS allows you to configure a storm control value that exceeds the bandwidth of the interface. If you configure an interface this way, storm control does not drop broadcast or unknown unicast packets even if they consume all the available bandwidth.

To recognize a storm, you must be able to identify when traffic has reached an abnormal level. Suspect a storm when operations begin timing out and network response times slow down. Users might be unable to access expected services. Monitor the percentage of broadcast and unknown unicast traffic in the network when it is operating normally. This data can then be used as a benchmark to determine when traffic levels are too high. You can then configure storm control to set the level at which you want to drop broadcast and unknown unicast traffic.

## Understanding Unicast RPF

Unicast reverse-path forwarding (RPF) helps protect the switch against denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks by verifying the unicast source address of each packet that arrives on an ingress interface where unicast RPF is enabled. It also helps ensure that traffic arriving on ingress interfaces comes from a network source that the receiving interface can reach.

When you enable unicast RPF, the switch forwards a packet only if the receiving interface is the best return path to the packet's unicast source address. This is known as strict mode unicast RPF.

**NOTE:** On Juniper Networks EX3200, EX4200, and EX4300 Ethernet Switches, the switch applies unicast RPF *globally* to all interfaces when unicast RPF is configured on any interface. For additional information, see [“Limitations of the Unicast RPF Implementation on EX3200, EX4200, and EX4300 Switches” on page 5276](#).

This topic covers:

- [Unicast RPF for Switches Overview on page 5274](#)
- [Unicast RPF Implementation on page 5274](#)

- [When to Enable Unicast RPF on page 5275](#)
- [When Not to Enable Unicast RPF on page 5276](#)

### **Unicast RPF for Switches Overview**

---

Unicast RPF functions as an ingress filter that reduces the forwarding of IP packets that might be spoofing an address. By default, unicast RPF is disabled on the switch interfaces.

The type of unicast RPF provided on the switches—that is, strict mode unicast RPF is especially useful on untrusted interfaces. An untrusted interface is an interface where untrusted users or processes can place packets on the network segment.

The switch supports only the active paths method of determining the best return path back to a unicast source address. The active paths method looks up the best reverse path entry in the forwarding table. It does not consider alternate routes specified using routing-protocol-specific methods when determining the best return path.

If the forwarding table lists the receiving interface as the interface to use to forward the packet back to its unicast source, it is the best return path interface.

Use strict mode unicast RPF only on symmetrically routed interfaces. (For information about symmetrically routed interfaces, see [“When to Enable Unicast RPF” on page 5275](#).)

For more information about strict unicast RPF, see RFC 3704, *Ingress Filtering for Multihomed Networks* at <http://www.ietf.org/rfc/rfc3704.txt>.

### **Unicast RPF Implementation**

---

This section includes:

- [Unicast RPF Packet Filtering on page 5274](#)
- [Bootstrap Protocol \(BOOTP\) and DHCP Requests on page 5274](#)
- [Default Route Handling on page 5275](#)

#### **Unicast RPF Packet Filtering**

When you enable unicast RPF on the switch, the switch handles traffic in the following manner:

- If the switch receives a packet on the interface that is the best return path to the unicast source address of that packet, the switch forwards the packet.
- If the best return path from the switch to the packet's unicast source address is not the receiving interface, the switch discards the packet.
- If the switch receives a packet that has a source IP address that does not have a routing entry in the forwarding table, the switch discards the packet.

#### **Bootstrap Protocol (BOOTP) and DHCP Requests**

Bootstrap protocol (BOOTP) and DHCP request packets are sent with a broadcast MAC address and therefore the switch does not perform unicast RPF checks on them. The

switch forwards all BOOTP packets and DHCP request packets without performing unicast RPF checks.

### Default Route Handling

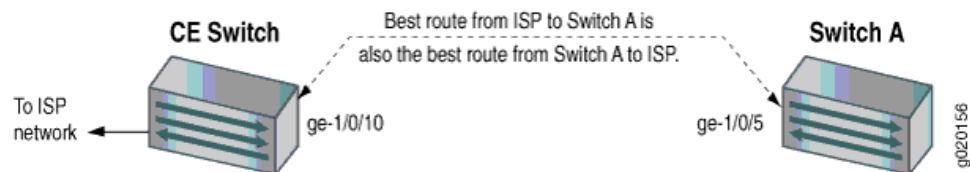

If the best return path to the source is the default route (0.0.0.0) and the default route points to **reject**, the switch discards the packets. If the default route points to a valid network interface, the switch performs a normal unicast RPF check on the packets.

### When to Enable Unicast RPF

Enable unicast RPF when you want to ensure that traffic arriving on a network interface comes from a source that resides on a network that that interface can reach. You can enable unicast RPF on untrusted interfaces to filter spoofed packets. For example, a common application for unicast RPF is to help defend an enterprise network from DoS/DDoS attacks coming from the Internet.

Enable unicast RPF only on symmetrically routed interfaces. A symmetrically routed interface uses the same route in both directions between the source and the destination, as shown in [Figure 187 on page 5275](#). Symmetrical routing means that if an interface receives a packet, the switch uses the same interface to send a reply to the packet source (the receiving interface matches the forwarding-table entry for the best return path to the source).

Figure 187: Symmetrically Routed Interfaces

Enabling unicast RPF on asymmetrically routed interfaces (where different interfaces receive a packet and reply to its source) results in packets from legitimate sources being filtered (discarded) because the best return path is not the same interface that received the packet.

The following switch interfaces are most likely to be symmetrically routed and thus are candidates for unicast RPF enabling:

- The service provider edge to a customer
- The customer edge to a service provider
- A single access point out of the network (usually on the network perimeter)
- A terminal network that has only one link

**NOTE:** Because unicast RPF is enabled globally on EX3200, EX4200, and EX4300 switches, ensure that *all* interfaces are symmetrically routed before you enable unicast RPF on these switches. Enabling unicast RPF on asymmetrically routed interfaces results in packets from legitimate sources being filtered.

**TIP:** Enabling unicast RPF as close as possible to the traffic source stops spoofed traffic before it can proliferate or reach interfaces that do not have unicast RPF enabled.

### When Not to Enable Unicast RPF

Typically, you will not enable unicast RPF if:

- Switch interfaces are multihomed.
- Switch interfaces are trusted interfaces.
- BGP is carrying prefixes and some of those prefixes are not advertised or are not accepted by the ISP under its policy. (The effect in this case is the same as filtering an interface by using an incomplete access list.)
- Switch interfaces face the network core. Core-facing interfaces are usually asymmetrically routed.

An asymmetrically routed interface uses different paths to send and receive packets between the source and the destination, as shown in [Figure 188 on page 5276](#). This means that if an interface receives a packet, that interface does not match the forwarding table entry as the best return path back to the source. If the receiving interface is not the best return path to the source of a packet, unicast RPF causes the switch to discard the packet even though it comes from a valid source.

**Figure 188: Asymmetrically Routed Interfaces**

**NOTE:** Do not enable unicast RPF on EX3200, EX4200, and EX4300 switches if any switch interfaces are asymmetrically routed, because unicast RPF is enabled globally on all interfaces of these switches. All switch interfaces must be symmetrically routed for you to enable unicast RPF without the risk of the switch discarding traffic that you want to forward.

### Limitations of the Unicast RPF Implementation on EX3200, EX4200, and EX4300 Switches

On EX3200, EX4200, and EX4300 switches, the switch implements unicast RPF on a global basis. You cannot enable unicast RPF on a per-interface basis. Unicast RPF is globally disabled by default.

- When you enable unicast RPF on any interface, it is automatically enabled on all switch interfaces, including link aggregation groups (LAGs), integrated routing and bridging (IRB) interfaces, and routed VLAN interfaces (RVIs).
- When you disable unicast RPF on the interface (or interfaces) on which you enabled unicast RPF, it is automatically disabled on all switch interfaces.

**NOTE:** You must explicitly disable unicast RPF on every interface on which it was explicitly enabled or unicast RPF remains enabled on all switch interfaces.

QFX switches and EX3200 and EX4200 switches do not perform unicast RPF filtering on equal-cost multipath (ECMP) traffic. The unicast RPF check examines only one best return path to the packet source, but ECMP traffic employs an address block consisting of multiple paths. Using unicast RPF to filter ECMP traffic on these switches can result in the switch discarding packets that you want to forward because the unicast RPF filter does not examine the entire ECMP address block.

## Understanding Unknown Unicast Forwarding

Unknown unicast traffic consists of unicast packets with unknown destination MAC addresses. By default, the switch floods these unicast packets that are traveling in a VLAN to all interfaces that are members of the VLAN. Forwarding this type of traffic can create unnecessary traffic that leads to poor network performance or even a complete loss of network service. This is known as a traffic storm.

To prevent a storm, you can disable the flooding of unknown unicast packets to all VLAN interfaces by configuring one VLAN or all VLANs to forward all unknown unicast traffic to a specific interface. This channels the unknown unicast traffic to a single interface.

- [Configuration Statements for Port Security on page 5332](#)
- [Configuration Statements for Port Security on page 5344](#)
- [Configuration Statements for Device Security on page 5364](#)

### Firewall and Policer Configuration Examples

---

- [Example: Using Filter-Based Forwarding to Route Application Traffic to a Security Device on page 5279](#)
- [Example: Using Two-Color Policers and Prefix Lists on page 5283](#)
- [Example: Using Policers to Manage Oversubscription on page 5286](#)

#### Example: Using Filter-Based Forwarding to Route Application Traffic to a Security Device

You can configure filter-based forwarding by using a firewall filter to forward matched traffic to a specific virtual routing instance.

This example describes how to set up filter-based forwarding:

- [Requirements on page 5279](#)
- [Overview and Topology on page 5280](#)
- [Configuration on page 5280](#)
- [Verification on page 5282](#)

#### Requirements

---

This example requires Junos OS Release 12.2X50-D20 or later.

## Overview and Topology

---

In this example, traffic from one application server that is destined for a different application server is matched by a firewall filter based on the IP address of the source application server. Any matching packets are routed to a virtual routing instance that sends the traffic to a security device. In this case, the security device must be able to forward the traffic to the destination application server. For this example, assume that the address of the destination application server is 192.168.0.1.

## Configuration

---

To configure filter-based forwarding:

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste them into the CLI at the **[edit]** hierarchy level.

```
[edit]
set interfaces xe-0/0/0 unit 0 family inet address 10.1.0.1/24
set interfaces xe-0/0/3 unit 0 family inet address 10.1.3.1/24
set firewall family inet filter f1 term t1 from source-address 10.1.0.50/32
set firewall family inet filter f1 term t1 from protocol tcp
set interfaces xe-0/0/0 unit 0 family inet filter input f1
set routing-instances vrf01 instance-type virtual-router
set routing-instances vrf01 interface xe-0/0/3.0
set routing-instances vrf01 routing-options static route 192.168.0.1/24 next-hop 10.1.3.254
set firewall family inet filter f1 term t1 then routing-instance vrf01
```

### Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*. To configure filter-based forwarding:

1. Configure an interface to connect to the application server:  

```
[edit interfaces]
user@switch# set xe-0/0/0 unit 0 family inet address 10.1.0.1/24
```
2. Configure an interface to connect to the security device:  

```
[edit interfaces]
user@switch# set xe-0/0/3 unit 0 family inet address 10.1.3.1/24
```
3. Create a firewall filter that matches packets based on the address of the application server that the traffic will be sent from. Also configure the filter so that it matches only TCP packets:  

```
[edit firewall]
user@switch# set family inet filter f1 term t1 from source-address 10.1.0.50/32
user@switch# set firewall family inet filter f1 term t1 from protocol tcp
```
4. Apply the filter to the interface that connects to the source application server and configure it to match incoming packets:  

```
[edit interfaces]
user@switch# set xe-0/0/0 unit 0 family inet filter input f1
```
5. Create a virtual router:  

```
[edit]
user@switch# set routing-instances vrf01 instance-type virtual-router
```
6. Associate the virtual router with the interface that connects to the security device:

- ```
[edit routing-instances]
user@switch# set vrf01 interface xe-0/0/3.0
```
7. Configure the routing information for the virtual routing instance:
- ```
[edit routing-instances]
user@switch# set vrf01 routing-options static route 192.168.0.1/24 next-hop 10.1.3.254
```
8. Set the filter to forward packets to the virtual router:
- ```
[edit firewall]
user@switch# set family inet filter f1 term t1 then routing-instance vrf01
```

### Results

Check the results of the configuration:

```
user@switch> show configuration
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        filter {
          input f1;
        }
        address 10.1.0.1/24;
      }
    }
  }
  xe-0/0/3 {
    unit 0 {
      family inet {
        address 10.1.3.1/24;
      }
    }
  }
}
firewall {
  family inet {
    filter f1 {
      term t1 {
        from {
          source-address {
            10.1.0.50/32;
          }
          protocol tcp;
        }
        then {
          routing-instance vrf01;
        }
      }
    }
  }
}
routing-instances {
  vrf01 {
    instance-type virtual-router;
    interface xe-0/0/1.0;
    routing-options {
```

```

static {
    route 12.34.56.0/24 next-hop 10.1.3.254;
}
}
}
}

```

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That Filter-Based Forwarding Was Configured on page 5282](#)

### Verifying That Filter-Based Forwarding Was Configured

**Purpose** Verify that filter-based forwarding was properly enabled on the switch.

**Action** 1. Use the `show interfaces filters` command:

```

user@switch> show interfaces filters xe-0/0/0.0
Interface      Admin Link Proto Input Filter      Output Filter
xe-0/0/0.0      up    down inet f1

```

2. Use the `show route forwarding-table` command:

```

user@switch> show route forwarding-table

Routing table: default.inet
Internet:
Destination      Type RtRef Next hop      Type Index NhRef Netif
default          user  1 0:12:f2:21:cf:0 ucst  331  4 me0.0
default          perm  0                rjct   36   3
0.0.0.0/32       perm  0                dscd   34   1
10.1.0.0/24      ifdn  0                rslv   613  1 xe-0/0/0.0

## Example: Using Two-Color Policers and Prefix Lists

If you provide specific amounts of bandwidth to internal or external customers, you can use policing to make sure that customers do not consume more bandwidth than they should receive. For example, you might connect many customers to one 10-Gbps interface and want to ensure that none of them congest the interface by using more bandwidth than they have been allotted.

You could accomplish this by creating a two-color policer similar to the following for each customer:

```

firewall {
  policer Limit-Customer-1 {
    if-exceeding {
      bandwidth-limit 100m;
      burst-size-limit 150m;
    }
    then discard;
  }
}

```

Creating a policer for each customer is clearly not a scalable solution, however. As an alternative, you can create prefix lists that group classes of customers and then create policers for each prefix list. For example, you could create prefix lists such as **Class-A-Customer-Prefixes**, **Class-B-Customer-Prefixes**, and **Class-C-Customer-Prefixes** (at the **[edit policy-options]** hierarchy level) and create the following corresponding policers:

```

firewall {
  policer Class-A {
    if-exceeding {
      bandwidth-limit 100m;
      burst-size-limit 150m;
    }
  }
}

```

```
    }
    then discard;
  }
  policer Class-B {
    if-exceeding {
      bandwidth-limit 75m;
      burst-size-limit 100m;
    }
    then discard;
  }
  policer Class-C {
    if-exceeding {
      bandwidth-limit 50m;
      burst-size-limit 75m;
    }
    then discard;
  }
}
```

You must create filter terms that specify the prefix lists in their **from** statements and the corresponding policers in their **then** statements similar to the following:

```
firewall
family inet {
  filter Class-A-Customers {
    term term-1 {
      from {
        destination-prefix-list {
          Class-A-Customer-Prefixes;
        }
      }
      then policer Class-A;
    }
  }
  filter Class-B-Customers {
    term term-1 {
      from {
        destination-prefix-list {
          Class-B-Customer-Prefixes;
        }
      }
      then policer Class-B;
    }
  }
  filter Class-C-Customers {
    term term-1 {
      from {
        destination-prefix-list {
          Class-C-Customer-Prefixes;
        }
      }
      then policer Class-C;
    }
  }
}
```

Here are the steps to create this firewall configuration:

1. Create the first policer:

```
[edit firewall]
user@switch# set policer Class-A if-exceeding bandwidth-limit 100m burst-size-limit 150m
user@switch# set policer Class-A then discard
```

2. Create the second policer:

```
[edit firewall]
user@switch# set policer Class-B if-exceeding bandwidth-limit 75m burst-size-limit 100m
user@switch# set policer Class-B then discard
```

3. Create the third policer:

```
[edit firewall]
user@switch# set policer Class-C if-exceeding bandwidth-limit 50m burst-size-limit 75m
user@switch# set policer Class-C then discard
```

4. Create a filter for class A customers:

```
[edit firewall]
user@switch# edit family inet filter Class-A-Customers
```

5. Configure the filter to send packets matching the Class-A-Customer-Prefixes prefix list to the Class-A policer:

```
[edit firewall family inet filter Class-A-Customers]
user@switch# set term term-1 from source-prefix-list Class-A-Customers
user@switch# set term term-1 then policer Class-A
```

6. Create a filter for class B customers:

```
[edit firewall]
user@switch# edit family inet filter Class-B-Customers
```

7. Configure the filter to send packets matching the Class-B-Customer-Prefixes prefix list to the Class-B policer:

```
[edit firewall family inet filter Class-B-Customers]
user@switch# set term term-1 from source-prefix-list Class-B-Customers
user@switch# set term term-1 then policer Class-B
```

8. Create a filter for class C customers:

```
[edit firewall]
user@switch# edit family inet filter Class-C-Customers
```

9. Configure the filter to send packets matching the Class-C-Customer-Prefixes prefix list to the Class-C policer:

```
[edit firewall family inet filter Class-C-Customers]
user@switch# set term term-1 from source-prefix-list Class-C-Customers
user@switch# set term term-1 then policer Class-C
```

10. Apply the filters you created to the appropriate interfaces in the output direction.

**NOTE:** Note that the implicit deny statement in this filter will block traffic from any source that does not match one of the prefix lists. If you want the filter to allow this traffic, you must include an explicit term for this purpose.

- *prefix-list*

## Example: Using Policers to Manage Oversubscription

You might want to use a policer when an interface is oversubscribed and you want to control what will happen if congestion occurs. For example, you might have servers connected to a switch as listed in [Table 438 on page 5286](#).

**Table 438: Servers Connected to Switch**

| Server Type                | Connection           | IP Address |
|----------------------------|----------------------|------------|
| Network application server | 1-gigabit interface  | 10.0.0.1   |
| Authentication server      | 1-gigabit interface  | 10.0.0.2   |
| Database server            | 10-gigabit interface | 10.0.0.3   |

In this example, users access services provided by the network application server, which requests information from the database server as appropriate. When it receives a request from a user, the network application server first contacts the authentication server to verify the user's credentials. When a user is authenticated and the network application server provides the requested service, all the packets sent from the database server to the application server must transit the 1-Gigabit Ethernet interface connected to the application server twice—once on ingress to the application server and again on egress to the user.

The sequence of events for a user session is as follows:

1. A user connects to the application server and requests a service.
2. The application server requests the user's credentials and relays them to the authentication server.
3. If the authentication server verifies the credentials, the application server initiates the requested service.
4. The application server requests the files necessary to meet the user's request from the database server.
5. The database server sends the requested files to the application server.
6. The application server includes the requested files in its response to the user.

Traffic from the database server to the application server might congest the 1-gigabit interface to which that the application server is connected. This congestion might prevent the server from responding to requests from users and creating new sessions for them. You can use policing to make sure that this does not occur.

To create this firewall configuration, perform the following steps on the database server:

1. Create a policer to drop traffic from the database server to the application server if it exceeds certain limits:

```
[edit firewall]
user@switch# set policer Database-Egress-Policer if-exceeding bandwidth-limit 400
burst-size-limit 500m
user@switch# set policer Database-Egress-Policer then discard
```

2. Create a filter to examine traffic from the database server to the application server:

```
[edit firewall]
user@switch# edit family inet filter Database-Egress-Filter
```

3. Configure the filter to apply the policer to traffic egressing the database server and destined for the application server:

```
[edit firewall family inet filter Database-Egress-Filter]
user@switch# set term term-1 from destination-address 10.0.0.1
user@switch# set term term-1 then policer Database-Egress-Policer
```

4. If required, configure a term to allow traffic from the database server to other destinations (otherwise the traffic will be dropped by the implicit deny statement):

```
[edit firewall family inet filter Database-Egress-Filter]
user@switch# set term term-2 then accept
```

Note that omitting a **from** statement causes the term to match all packets, which is the desired behavior.

5. Install the egress filter as an output filter on the database server interface that is connected the application server:

```
[edit interfaces]
user@switch# set xe-0/0/3 unit 0 family inet filter output Database-Egress-Filter
```

Here is how the final configuration would appear:

```
firewall {
  policer Database-Egress-Policer {
    if-exceeding {
      bandwidth-limit 400;
      burst-size-limit 500m;
    }
    then discard;
  }
  family inet {
    filter Database-Egress-Filter {
      term term-1 {
        from {
          destination-address {
            10.0.0.1/24;
          }
        }
        then policer Database-Egress-Policer;
      }
      term term-2 { # If required, include this term so that traffic from the database server
        to other destinations is allowed.
        then accept;
      }
    }
  }
}
```

```
}  
]
```

## Device Security Configuration Example

---

- [Example: Configuring Storm Control to Prevent Network Outages on page 5288](#)

### Example: Configuring Storm Control to Prevent Network Outages

Storm control enables you to prevent network outages caused by broadcast storms on the LAN. You can configure storm control on to rate-limit broadcast traffic, multicast traffic, and unknown unicast traffic at a specified level and to have packets dropped when the specified traffic level is exceeded, thereby preventing packets from proliferating and degrading the LAN.

**NOTE:** This example uses a Junos OS release that supports the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Example: Configuring Storm Control to Prevent Network Outages*.

- 
- [Requirements on page 5288](#)
  - [Overview and Topology on page 5288](#)
  - [Configuration on page 5289](#)

---

#### Requirements

---

This example uses the following hardware and software components:

- One QFX Series switch running Junos OS with ELS
- Junos OS Release 13.2 or later

---

#### Overview and Topology

---

A storm is generated when messages are broadcast on a network and each message prompts a receiving node to respond by broadcasting its own messages on the network. This, in turn, prompts further responses, creating a snowball effect and resulting in a broadcast storm that can cause network outages.

You can use storm control to prevent broadcast storms by specifying the amount, also known as the *storm control level*, of broadcast traffic, multicast traffic, and unknown unicast traffic to be allowed on an interface. You specify the storm control level as the traffic rate in kilobits per second (Kbps) of the combined applicable traffic streams or as the percentage of available bandwidth used by the combined applicable traffic streams. On ELS systems, storm control is enabled by default on all interfaces at a level of 80 percent of the available bandwidth.

Storm control monitors the level of applicable incoming traffic and compares it with the level that you specify. If the combined level of the applicable traffic exceeds the specified level, the switch drops packets for the controlled traffic types. As an alternative to having the switch drop packets, you can configure storm control to shut down interfaces or temporarily disable interfaces (see the **action-shutdown** statement or the [recovery-timeout](#) statement) when the storm control level is exceeded.

The topology used in this example consists of one switch connected to various network devices. This example shows how to configure the storm control level on interface xe-0/0/0 by setting the level to a traffic rate of 15,000 Kbps, based on the traffic rate of the combined applicable traffic streams. If the combined traffic exceeds this level, the switch drops packets for the controlled traffic types to prevent a network outage.

### Configuration

#### CLI Quick Configuration

To quickly configure storm control based on the traffic rate in kilobits per second of the combined traffic streams, copy the following command and paste it into the switch terminal window:

```
[edit]
set forwarding-options storm-control-profiles sc-profile all bandwidth-level 15000
set interfaces xe-0/0/0 unit 0 family ethernet-switching storm-control sc-profile
```

#### Step-by-Step Procedure

To configure storm control:

1. Configure a storm control profile, **sc-profile**, and specify the traffic rate in kilobits per second of the combined traffic streams:

```
[edit]
user@switch> set forwarding-options storm-control-profiles sc-profile all bandwidth-level 15000
```

2. Bind the storm control profile, **sc**, to a logical interface:

```
[edit]
user@switch> set interfaces xe-0/0/0 unit 0 family ethernet-switching storm-control sc-profile
```

**Results** Display the results of the configuration:

```
[edit forwarding-options]
user@switch> show storm-control-profiles sc-profile
all {
  bandwidth 15000;
}

[edit]
user@switch> show interfaces xe-0/0/0
unit 0 {
  family ethernet-switching {
    vlan {
      members default;
    }
    storm-control sc-profile;
  }
}
```

### Configuring Firewall Filters

You can configure firewall filters in a switch to control traffic that enters switch ports or enters and exits VLANs and Layer 3 (routed) interfaces. To use a firewall filter, you must configure the filter and then apply it to a port, VLAN, or Layer 3 interface.

- [Configuring a Firewall Filter on page 5290](#)
- [Applying a Firewall Filter to a Port on page 5292](#)
- [Applying a Firewall Filter to a VLAN on page 5292](#)
- [Applying a Firewall Filter to a Layer 3 \(Routed\) Interface on page 5293](#)

---

#### Configuring a Firewall Filter

---

To configure a firewall filter:

1. Configure the family address type, filter name, term name, and at least one match condition—for example, match on packets that contain a specific source address:

```
[edit]
user@switch# set firewall family ethernet-switching filter ingress-port-filter term term-one
from source-address 192.0.2.14
```

For a firewall filter that is applied to a port or VLAN, specify the family address type **ethernet-switching**. For a firewall filter that is applied to a Layer 3 (routed) interface, specify the family address type **inet**.

The filter and term names can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. Each filter name must be unique. A filter can contain one or more terms, and each term name must be unique within a filter.

2. Configure additional match conditions. For example, match on packets that contain a specific source port:

```
[edit firewall family ethernet-switching filter ingress-port-filter term
term-one from]
user@switch# set source-port 80
```

You can specify one or more match conditions in a single **from** statement. For a match to occur, the packet must match all the conditions in the term. The **from** statement is optional, but if included in a term, it cannot be empty. If you omit the **from** statement, all packets are considered to match.

3. If you want to apply a firewall filter to multiple interfaces and be able to see counters specific to each interface, configure the **interface-specific** option:

```
[edit firewall family ethernet-switching filter ingress-port-filter]
user@switch# set interface-specific
```

4. In each firewall filter term, specify the actions to take if the packet matches all the conditions in that term. You can specify an action and action modifiers:
  - To specify a filter action, for example, to discard packets that match the conditions of the filter term:

```
[edit firewall family ethernet-switching filter ingress-port-filter term
term-one then]
user@switch# set discard
```

You can specify no more than one action (**accept**, **discard**, **reject**, **routing-instance**, or **vlan**) per term.

- To specify action modifiers, for example, to count and classify packets to a forwarding class:

```
[edit firewall family ethernet-switching filter ingress-port-filter term
term-one then]
user@switch# set count counter-one
user@switch# set forwarding-class expedited-forwarding
user@switch# set loss-priority high
```

You can specify any of the following action modifiers in a **then** statement:

- **analyzer analyzer-name**—Mirror port traffic to a specified analyzer, which you must configure at the **[ethernet-switching-options]** level.
- **count counter-name**—Count the number of packets that pass this filter term.

**NOTE:** We recommend that you configure a counter for each term in a firewall filter, so that you can monitor the number of packets that match the conditions specified in each filter term.

**NOTE:** On QFX3500 and QFX3600 switches, filters automatically count packets that have been dropped on ingress because of cyclic redundancy check (CRC) errors.

- **forwarding-class class**—Assign packets to a forwarding class.
- **log**—Log the packet header information in the Routing Engine.
- **loss-priority priority**—Set the priority of dropping a packet.
- **policer policer-name**—Apply rate-limiting to the traffic.
- **syslog**—Log an alert for this packet.

If you omit the **then** statement or do not specify an action, packets that match all the conditions in the **from** statement are accepted. However, you should always explicitly configure an action in the **then** statement. You can include no more than one action statement, but you can use any combination of action modifiers. For an action or action modifier to take effect, all conditions in the **from** statement must match.

**NOTE:** Implicit discard is also applicable to a firewall filter applied to the loopback interface, lo0.

---

### Applying a Firewall Filter to a Port

To apply a firewall filter to an ingress port:

1. Provide a meaningful description of the firewall filter in the configuration of the port to which the filter will be applied:

```
[edit]
user@switch# set interfaces ge-0/0/6 description "filter to limit tcp traffic at trunk port for employee-vlan"
```

2. Apply the filter to the interface, specifying the unit number, family address type, the direction of the filter (for packets entering the port), and the filter name:

```
[edit]
user@switch# set ge-0/0/6 unit 0 family ethernet-switching filter input ingress-port-filter
```

For firewall filters that are applied to ports, the family address type must be **ethernet-switching**.

**NOTE:** You can apply only one filter to a port for a given direction (ingress or egress).

---

### Applying a Firewall Filter to a VLAN

To apply a firewall filter to a VLAN:

1. Provide a meaningful description of the firewall filter in the configuration of the VLAN to which the filter will be applied:

```
[edit]
user@switch# set vlans employee-vlan vlan-id 20 description "filter to block rogue devices on employee-vlan"
```

2. Apply firewall filters to filter packets that are entering or exiting the VLAN:

- To apply a filter to match packets that are entering the VLAN:

```
[edit]
user@switch# set vlans employee-vlan vlan-id 20 filter input ingress-vlan-rogue-block
```

- To apply a firewall filter to match packets that are exiting the VLAN:

```
[edit]
user@switch# set vlans employee-vlan vlan-id 20 filter output egress-vlan-filter
```

**NOTE:** You can apply only one filter to a VLAN for a given direction (ingress or egress).

### Applying a Firewall Filter to a Layer 3 (Routed) Interface

To apply a firewall filter to a Layer 3 routed interface:

1. Provide a meaningful description of the firewall filter in the configuration of the interface to which the filter will be applied:

```
[edit]
user@switch# set interfaces ge-0/1/6 description "filter to count and monitor traffic on layer
3 interface"
```

2. You can apply firewall filters to filter packets that enter or exit a Layer 3 routed interface:

- To apply a firewall filter to filter packets that enter a Layer 3 interface:

```
[edit]
user@switch# set interfaces ge-0/1/6 unit 0 family inet filter input ingress-router-filter
```

- To apply a firewall filter to filter packets that exit a Layer 3 interface:

```
[edit]
user@switch# set interfaces ge-0/1/6 unit 0 family inet filter output egress-router-filter
```

For firewall filters applied to Layer 3 routed interfaces, the family address type must be **inet**.

**NOTE:** You can apply only one filter to an interface for a given direction (ingress or egress).

#### Related Documentation

- [Configuring Port Mirroring](#)

### Applying Firewall Filters to Interfaces

For a firewall filter to work, you must apply it to at least one interface. To do this, include the **filter** statement when configuring a logical interface at the **[edit interfaces]** hierarchy level:

```
[edit interfaces]
user@switch# set interface-name unit logical-unit-number family family-name filter (input |
output) filter-name
```

In the **input** statement, specify a firewall filter to be evaluated when packets are received on the interface. Input filters applied to a loopback interface affect only traffic destined for the Routing Engine.

In the **output** statement, specify a filter to be evaluated when packets exit the interface.

**NOTE:** When you create a loopback interface, it is important to apply an ingress filter to it so the Routing Engine is protected. We recommend that when you apply a filter to the loopback interface `lo0`, you include the `apply-groups` statement. Doing so ensures that the filter is automatically inherited on every loopback interface, including `lo0` and other loopback interfaces.

**Related Documentation**

- [Configuring Firewall Filters on page 5290](#)

## Assigning Forwarding Classes and Loss Priority

You can configure firewall filters to assign packet loss priority (PLP) and forwarding classes so that if congestion occurs, the marked packets can be dropped according to the priority you set. The valid match conditions are one or more of the six packet header fields: destination address, source address, IP protocol, source port, destination port, and DSCP. In other words, you can set the forwarding class and the PLP for each packet entering or an interface with a specific destination address, source address, IP protocol, source port, destination port, or DSCP.

**NOTE:** Junos OS assigns forwarding classes and PLP on ingress only. Do not use a filter that assigns forwarding classes or PLP as an egress filter.

When tricolor marking is enabled, a switch supports four PLP designations: **low**, **medium-low**, **medium-high**, and **high**. You can also specify any of the forwarding classes listed in [Table 439 on page 5294](#)

**Table 439: Unicast Forwarding Classes**

| Unicast Forwarding Class | For CoS Traffic Type   |
|--------------------------|--|
| <b>be</b>                | Best-effort traffic  |
| <b>no-loss</b>           | Guaranteed delivery for TCP traffic                                |
| <b>fcoe</b>              | Guaranteed delivery for Fibre Channel over Ethernet (FCoE) traffic |
| <b>nc</b>                | Network-control traffic  |

To assign forwarding classes in firewall filters:

1. Configure the family address type and filter name:

```
[edit]
```

```
user@switch# edit firewall family ethernet-switching filter ingress-filter
```

2. Configure the terms of the filter as appropriate, including the **forwarding-class** and **loss-priority** action modifiers. For example, each of the following terms in the filter examines various packet header fields and assigns the appropriate forwarding class and packet loss priority:

- The term **corp-traffic** matches all IPv4 packets with a 10.1.1.0/24 source address and assigns the packets to forwarding class **no-loss** with a loss priority of **low**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term corp-traffic from source-address 10.1.1.0/24;
user@switch# set term corp-traffic then forwarding-class no-loss
user@switch# set term corp-traffic then loss-priority low
```

- The term **data-traffic** matches all IPv4 packets with a 10.1.2.0/24 source address and assigns the packets to forwarding class **be** (best effort) with a loss priority of **medium-high**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term data-traffic from source-address 10.1.2.0/24;
user@switch# set term data-traffic then forwarding-class be
user@switch# set term data-traffic then loss-priority medium-high
```

- Because the loss of network-generated packets can jeopardize proper network operation, the delay of these packets is preferable to discarding these packets. The term **network-traffic** assigns the packets with an IP precedence of **net-control** to forwarding class **nc** (network control) with a loss priority of **low**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term network-traffic from precedence net-control
user@switch# set term network-traffic then forwarding-class nc
user@switch# set term network-traffic then loss-priority low
```

- The last term **accept-traffic** matches any packets that did not match on any of the preceding terms and assigns the packets to forwarding class **be** with a loss priority of **high**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term accept-traffic then forwarding-class be
user@switch# set term accept-traffic then loss-priority high
```

3. Apply the filter **ingress-filter** to a port, VLAN, or Layer 3 interface. For information about applying the filter, see [“Configuring Firewall Filters” on page 5290](#). (Assigning forwarding classes and PLP is supported only on ingress filters.)

## Configuring Color-Blind Egress Policers for Medium-Low PLP

If you use color-blind mode and want to configure an egress policer that marks packets to have medium-low PLP, you must configure a single-rate two-color policer at the **[edit firewall policer *policer-name*]** hierarchy level, because color-blind mode does not support medium-low priority. For example:

1. Specify the name of the policer, the bandwidth limit in bits per second (bps) to control the traffic rate on an interface, and the maximum allowed burst size to control the amount of traffic bursting:

```
[edit]
user@switch# set firewall policer policer-name if-exceeding bandwidth-limit bytes
burst-size-limit bytes
```

2. Specify medium-low loss priority for matching packets:

```
[edit]
user@switch# set firewall policer policer-name then loss-priority medium-low;
```

3. Apply the filter to a port, VLAN, or Layer 3 interface.

### Related Documentation

## Configuring Two-Color and Three-Color Policers to Control Traffic Rates

You can rate-limit traffic by configuring a policer and specifying it as an action modifier for a term in a firewall filter. By default, if you specify the same policer in multiple terms, Junos OS creates a separate policer instance for each term and applies rate limiting separately for each instance. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, each policer instance enforces a 1-Gbps limit. In this case, the total bandwidth allowed by the filter is 3 Gbps.

You can also configure a policer to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps.

**NOTE:** You can include two-color policer actions on ingress firewall filters only. You can include three-color policer actions on ingress and egress filters.

---

1. [Configuring Two-Color Policers on page 5297](#)
2. [Configuring Three-Color Policers on page 5297](#)

3. [Specifying Policers in a Firewall Filter Configuration on page 5298](#)
4. [Applying a Firewall Filter That Includes a Policer on page 5298](#)

### Configuring Two-Color Policers

To configure a two-color policer:

1. Specify the name of the policer, the bandwidth limit to control the traffic rate on an interface, and the maximum allowed burst size to control the amount of traffic bursting:

```
[edit firewall]
user@switch# set policer policer-name <filter-specific> if-exceeding bandwidth-limit bps
burst-size-limit bytes
```

The policer name can contain letters, numbers, and hyphens (-) and can have as many as 64 characters.

The range for the bandwidth limit is 32000 (32k) through 102,300,000,000 (102300m) bps.

To determine the value for the burst-size limit, multiply the bandwidth of the interface on which the filter is applied by the amount of time to allow a burst of traffic at that bandwidth to occur and divide the result by 8:

**maximum burst size = (interface bandwidth) X (allowable time for burst) / (8 bits/byte)**

The range for the burst-size limit is 1 through 2,147,450,880 bytes.

2. Specify the policer action to discard or assign a loss priority to packets that exceed the rate limits:

```
[edit firewall policer policer-name]
user@switch# set then (discard | loss-priority low | loss-priority high)
```

### Configuring Three-Color Policers

To configure a three-color policer:

1. Specify the name of the policer and (optionally) whether to automatically discard packets with high loss priority (PLP):

```
[edit firewall]
user@switch# set three-color-policer policer-name
user@switch# set three-color-policer policer-name action loss-priority high then discard
```

2. Specify whether the three-color policer should be single-rate or two-rate and whether it should be color-aware or color-blind:

```
[edit firewall three-color-policer policer-name]
user@switch# set (single-rate | two-rate) (color-aware | color-blind)
```

3. For single-rate three-color policers, configure the CIR, CBS, and EBS:

```
[edit firewall three-color-policer policer-name single-rate]
user@switch# set committed-information-rate bps
user@switch# set committed-burst-size bytes
user@switch# set excess-burst-size bytes
```

4. For two-rate three-color policers, configure the CIR, CBS, PIR, and PBS:

```
[edit firewall three-color-policer policer-name single-rate]
user@switch# set committed-information-rate bps
user@switch# set committed-burst-size bytes
```

```
user@switch# set peak-information-rate bps
user@switch# set peak-burst-size bytes
```

### Specifying Policers in a Firewall Filter Configuration

---

To use a two-color policer, configure a filter term that includes the action **policer**:

```
[edit firewall family family-name]
user@switch# set filter filter-name term name then name
```

For example, the following commands apply a two-color policer to all packets sent from 192.0.2.0/24.

```
[edit firewall family family-name]
user@switch# set filter limit—hosts term term1 from source-address 192.0.2.0/24
user@switch# set filter limit—hosts term term1 then policer policer1
```

To use a three-color policer, configure a filter term that includes the action **three-color-policer**:

```
[edit firewall family name]
user@switch# set filter name term name from match-condition
user@switch# set filter name term name then three-color-policer (single-rate | two-rate) name
```

For example, the following commands apply a single-rate three-color policer to all packets received or sent by interface **ge-0/0/6** (depending on whether the filter is an ingress or egress filter).

```
[edit firewall family name]
user@switch# set filter srTCM term term-one from interface ge-0/0/6
user@switch# set filter srTCM term term-one then three-color-policer single-rate srTCM1-ca
```

You must specify whether the three-color policer is single-rate or two-rate, and this must match the policer itself. Otherwise, the configuration listing includes an error message indicating that the three-color policer you referenced in the filter does not exist.

### Applying a Firewall Filter That Includes a Policer

---

A firewall filter that includes one or more policer action modifiers must be applied to a port, VLAN, or Layer 3 interface like any other filter. For information about applying firewall filters, see [“Configuring Firewall Filters” on page 5290](#).

**NOTE:** You can include two-color policer actions on ingress firewall filters only. You can include three-color policer actions on ingress and egress filters.

## Configuring MPLS Firewall Filters and Policers

You can configure an MPLS firewall filter to count packets based on the EXP bits for the top-level MPLS label in a packet. You can also configure policers for MPLS LSPs.

The following sections discuss MPLS firewall filters and policers:

- [Configuring MPLS Firewall Filters on page 5299](#)
- [Examples: Configuring MPLS Firewall Filters on page 5300](#)
- [Configuring Policers for LSPs on page 5300](#)

### Configuring MPLS Firewall Filters

You can configure an MPLS firewall filter to count packets based on the EXP bits for the top-level MPLS label in a packet. You can then apply this filter to a specific interface on input or output. You can also configure a policer for the MPLS filter to police (that is, rate-limit) the traffic on the interface to which the filter is attached. You cannot apply MPLS firewall filters to loopback interfaces.

You can configure the following match conditions for MPLS filters at the **[edit firewall family mpls filter *filter-name* term *term-name* from]** hierarchy level:

- **exp**
- **label**

These **exp** match condition can accept EXP bits in the range 0 through 7. You can configure the following choices:

- A single EXP bit—for example, **exp 3**;
- Several EXP bits—for example, **exp 0, 4**;
- A range of EXP bits—for example, **exp [0-5]**;

The **label** match condition can accept a range of values from 0 to 1048575.

If you do not specify a match criterion (that is, you do not configure the **from** statement and use only the **then** statement with the **count** action keyword), all the MPLS packets passing through the interface on which the filter is applied will be counted.

You also can configure any of the following action keywords at the **[edit firewall family mpls filter *filter-name* term *term-name* then]** hierarchy level:

- **accept**
- **count**
- **discard**
- **policer**
- **three-color-policer**

### Examples: Configuring MPLS Firewall Filters

---

The following examples illustrate how you might configure an MPLS firewall filter and then apply the filter to an interface. This filter is configured to count MPLS packets with EXP bits set to either 0 or 4.

The following shows a configuration for an MPLS firewall filter:

```
[edit firewall]
family mpls {
  filter expf {
    term expt0 {
      from {
        exp 0,4;
      }
      then {
        count counter0;
        accept;
      }
    }
  }
}
```

### Configuring Policers for LSPs

---

MPLS LSP policing allows you to control the amount of traffic forwarded through a particular LSP. Policing helps to ensure that the amount of traffic forwarded through an LSP never exceeds the requested bandwidth allocation. LSP policing is supported on regular LSPs, LSPs configured with DiffServ-aware traffic engineering, and multiclass LSPs. You can configure multiple policers for each multiclass LSP. For regular LSPs, each LSP policer is applied to all of the traffic traversing the LSP. The policer's bandwidth limitations become effective as soon as the total sum of traffic traversing the LSP exceeds the configured limit.

You configure the multiclass LSP and DiffServ-aware traffic engineering LSP policers in a filter. The filter can be configured to distinguish between the different class types and apply the relevant policer to each class type. The policers distinguish between class types based on the EXP bits.

You configure LSP policers under the **family any** filter. The **family any** filter is used because the policer is applied to traffic entering the LSP. This traffic might be from different families: IPv6, MPLS, and so on. You do not need to know what sort of traffic is entering the LSP, as long as the match conditions apply to all types of traffic.

#### ***LSP Policer Limitations***

When configuring MPLS LSP policers, be aware of the following limitations:

- LSP policers are supported for packet LSPs only.
- LSP policers are supported for unicast next hops only. Multicast next hops are not supported.
- LSP policers are not supported on aggregated interfaces.

- The LSP policer runs before any output filters.
- Traffic sourced from the Routing Engine (for example, ping traffic) does not take the same forwarding path as transit traffic. This type of traffic cannot be policed.

## Configuring a Firewall Filter to De-encapsulate GRE Traffic on a QFX5100 Switch

Generic routing encapsulation (GRE) provides a private, secure path for transporting packets through a network by encapsulating (or tunneling) the packets. GRE tunneling is performed by tunnel endpoints that encapsulate or de-encapsulate traffic.

You can use a firewall filter to de-encapsulate GRE traffic on a QFX5100 switch. This feature provides significant benefits in terms of scalability, performance, and flexibility because you don't need to create a tunnel interface to perform the de-encapsulation. For example, you can terminate many tunnels from multiple source IP addresses with one firewall term.

**NOTE:** QFX5100 switches support as many as 512 GRE tunnels, including tunnels created with a firewall filter. That is, you can create a total of 512 GRE tunnels, regardless of which method you use.

This topic describes:

1. [Configuring a Filter to De-encapsulate GRE Traffic on page 5301](#)
2. [Applying the Filter to an Interface on page 5302](#)

### Configuring a Filter to De-encapsulate GRE Traffic

To configure a firewall filter to de-encapsulate GRE traffic on a QFX5100 switch:

1. Create an IPv4 firewall filter and (optionally) specify a source address for the tunnel:

[edit]

```
user@switch# set firewall family inet filter filter-name term term-name from
source-address address
```

You must create an IPv4 filter by using **family inet** because the outer header of a GRE packet must be IPv4. If you specify a source address, it should be an address on a device that will encapsulate traffic into GRE packets.

**NOTE:** To terminate many tunnels from multiple source IP addresses with one firewall term, do not configure a source address. In this case, the filter will de-encapsulate any GRE packets received by the interface that you apply the filter to.

2. Specify a destination address for the tunnel:

[edit]

```
user@switch# set firewall family inet filter filter-name term term-name from
destination-address address
```

This should be an address on an interface of the QFX5100 switch on which you want the tunnel or tunnels to terminate and the GRE packets to be de-encapsulated. You should also configure this address as a tunnel endpoint on all the tunnel source routers that you want to form tunnels with the QFX5100 switch.

3. Specify that the filter should match and accept GRE traffic:

```
[edit ]
user@switch# set firewall family inet filter filter-name term term-name from protocol
gre
```

4. Specify that the filter should de-encapsulate GRE traffic:

```
[edit ]
user@switch# set firewall family inet filter filter-name term term-name then decapsulate
gre
```

Based on the configuration you have performed so far, the switch forwards the de-encapsulated packets by comparing the inner header to the default routing table (*inet0*). If you want the switch to use a virtual routing instance to forward the de-encapsulated packets, perform the following steps:

5. Specify the name of the virtual routing instance:

```
[edit ]
user@switch# set firewall family inet filter filter-name term term-name then decapsulate
routing-instance instance-name
```

6. Specify that the virtual routing instance is a virtual router:

```
[edit ]
user@switch# set routing-instances instance-name instance-type virtual-router
```

7. Specify the interfaces that belong to the virtual router:

```
[edit ]
user@switch# set routing-instances instance-name interface interface-name
```

---

### Applying the Filter to an Interface

After you create the firewall filter, you must also apply it to an interface that will receive GRE traffic. Be sure to apply it in the input direction. For example, enter

```
[edit ]
user@switch# set interfaces interface-name unit logical-unit-number family inet filter
input filter-name
```

Because the outer header of a GRE packet must be IPv4, you must apply the filter to an IPv4 interface and specify **family inet**.

## Device Security Configuration Tasks

- [Configuring Unicast RPF \(CLI Procedure\) on page 5303](#)
- [Disabling Unicast RPF \(CLI Procedure\) on page 5304](#)
- [Configuring Unknown Unicast Forwarding \(CLI Procedure\) on page 5305](#)

### Configuring Unicast RPF (CLI Procedure)

Unicast reverse-path forwarding (RPF) can help protect your LAN from denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks on untrusted interfaces. Enabling unicast RPF on the switch interfaces filters traffic with source addresses that do not use the incoming interface as the best return path back to the source. When a packet comes into an interface, if that interface is not the best return path to the source, the switch discards the packet. If the incoming interface is the best return path to the source, the switch forwards the packet.

**NOTE:** On EX3200, EX4200, and EX4300 switches, you can enable unicast RPF only globally—that is, on all switch interfaces. You cannot enable unicast RPF on a per-interface basis.

Before you begin:

- On an EX8200, EX6200, or QFX Series switch, ensure that the selected switch interface is symmetrically routed before you enable unicast RPF. A symmetrically routed interface is an interface that uses the same route in both directions between the source and the destination. Do not enable unicast RPF on asymmetrically routed interfaces. An asymmetrically routed interface uses different paths to send and receive packets between the source and the destination.
- On an EX3200, EX4200, or EX4300 switch, ensure that *all* switch interfaces are symmetrically routed before you enable unicast RPF on an interface. When you enable unicast RPF on any interface, it is enabled globally on all switch interfaces. Do not enable unicast RPF on asymmetrically routed interfaces. An asymmetrically routed interface uses different paths to send and receive packets between the source and the destination.

To enable unicast RPF, configure it explicitly on a selected customer-edge interface:

[edit interfaces]

```
user@switch# set ge-1/0/10 unit 0 family inet rpf-check
```

**BEST PRACTICE:** On EX3200, EX4200, and EX4300 switches, unicast RPF is enabled globally on *all* switch interfaces, regardless of whether you configure it explicitly on only one interface or only on some interfaces.

On EX3200, EX4200, and EX4300 switches, we recommend that you enable unicast RPF explicitly on either all interfaces or only one interface. To avoid possible confusion, do not enable it on only some interfaces:

- Enabling unicast RPF explicitly on only one interface makes it easier if you choose to disable it in the future because you must explicitly disable unicast RPF on every interface on which you explicitly enabled it. If you explicitly enable unicast RPF on two interfaces and you disable it on only one interface, unicast RPF is still implicitly enabled globally on the switch. The drawback of this approach is that the switch displays the flag that indicates that unicast RPF is enabled only on interfaces on which unicast RPF is explicitly enabled, so even though unicast RPF is enabled on all interfaces, this status is not displayed.
- Enabling unicast RPF explicitly on all interfaces makes it easier to know whether unicast RPF is enabled on the switch because every interface shows the correct status. (Only interfaces on which you explicitly enable unicast RPF display the flag that indicates that unicast RPF is enabled.) The drawback of this approach is that if you want to disable unicast RPF, you must explicitly disable it on every interface. If unicast RPF is enabled on any interface, it is implicitly enabled on all interfaces.

---

**Related  
Documentation**

- *Example: Configuring Unicast RPF on an EX Series Switch*
- [Verifying Unicast RPF Status on page 5389](#)
- [Disabling Unicast RPF \(CLI Procedure\) on page 5304](#)
- *Troubleshooting Unicast RPF*
- [Understanding Unicast RPF on page 5273](#)

## Disabling Unicast RPF (CLI Procedure)

Unicast reverse-path forwarding (RPF) can help protect your LAN from denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks on untrusted interfaces. Unicast RPF filters traffic with source addresses that do not use the incoming interface as the best return path back to the source. If the network configuration changes so that an interface that has unicast RPF enabled becomes a trusted interface or becomes asymmetrically routed (the interface that receives a packet is not the best return path to the packet's source), disable unicast RPF.

To disable unicast RPF on an EX3200, EX4200, or EX4300 switch, you must delete it from every interface on which you explicitly configured it. If you do not disable unicast RPF on every interface on which you explicitly enabled it, it remains implicitly enabled on all interfaces. If you attempt to delete unicast RPF from an interface on which it was not explicitly enabled, the **warning: statement not found** message appears. If you do not disable unicast RPF on every interface on which you explicitly enabled it, unicast RPF remains implicitly enabled on all interfaces of the EX3200, EX4200, or EX4300 switch.

On EX8200, EX6200, and QFX Series switches, the switch does not apply unicast RPF to an interface unless you explicitly enable that interface for unicast RPF.

To disable unicast RPF, delete its configuration from the interface:

[edit interfaces]

user@switch# **delete** ge-1/0/10 unit 0 family inet **rpf-check**

**NOTE:** On EX3200, EX4200, and EX4300 switches, if you do not disable unicast RPF on every interface on which you explicitly enabled it, unicast RPF remains implicitly enabled on all interfaces.

#### Related Documentation

- [Example: Configuring Unicast RPF on an EX Series Switch](#)
- [Verifying Unicast RPF Status on page 5389](#)
- [Configuring Unicast RPF \(CLI Procedure\) on page 5303](#)
- [Understanding Unicast RPF on page 5273](#)

## Configuring Unknown Unicast Forwarding (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches or QFX Series with support for the Enhanced Layer 2 Software (ELS) configuration style. If your EX Series switch runs software that does not support ELS, see [Configuring Unknown Unicast Forwarding \(CLI Procedure\)](#). For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 43](#)

Unknown unicast traffic consists of packets with unknown destination MAC addresses. By default, the switch floods these packets to all interfaces associated with a VLAN. Forwarding such traffic to interfaces on the switch can create a security issue.

To prevent flooding unknown unicast traffic across the switch, configure unknown unicast forwarding to direct all unknown unicast packets within a VLAN out to a specific interface. You can configure each VLAN to divert unknown unicast traffic to different interfaces or use one interface for multiple VLANs.

To configure unknown unicast forwarding options:

- Configure unknown unicast forwarding for a specific VLAN (here, the VLAN name is employee), and specify the interface to which all unknown unicast traffic will be forwarded:

[edit switch-options]

user@switch# **set** unknown-unicast-forwarding vlan *vlan-name* interface *ge-x/y/z.0*

## burst-size-limit

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>burst-size-limit bytes;</code>   |
| <b>Hierarchy Level</b>          | [edit <code>firewall policer policer-name if-exceeding</code> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.  |
| <b>Description</b>              | Specify the maximum allowed burst size to control the amount of traffic bursting.  |
| <b>Options</b>                  | <b>bytes</b> —Decimal value or a decimal number followed by k (thousand), m (million), or g (giga).<br><b>Range:</b> 1 through 2,147,450,880 bytes (2147 MB)   |
| <b>Required Privilege Level</b> | firewall—To view this statement in the configuration.<br>firewall-control—To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Configuring Two-Color and Three-Color Policers to Control Traffic Rates on page 5296</a></li><li>• <a href="#">Overview of Policers on page 5241</a></li></ul> |

## color-aware

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | color-aware;   |
| <b>Hierarchy Level</b>          | [edit <b>firewall three-color-policer</b> <i>policer-name</i> single-rate],<br>[edit <b>firewall three-color-policer</b> <i>policer-name</i> two-rate]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.  |
| <b>Description</b>              | Configure the way preclassified packets are metered. In color-aware mode, the switch can assign a higher packet-loss priority, but cannot assign a lower packet loss priority (PLP). For example, suppose an upstream device assigns medium-high PLP to a packet because the packet exceeded its committed information rate (CIR). The switch cannot change the PLP to low even if the packet conforms to the configured CIR of the appropriate interface. On the other hand, if an upstream device assigns low PLP to a packet but the packet exceeds the CIR and committed burst size (CBS) of the switch interface, the switch can increase the PLP to medium-high. |
| <b>Default</b>                  | If you omit the <b>color-aware</b> statement, the default behavior is color-aware mode.  |
| <b>Required Privilege Level</b> | firewall—To view this statement in the configuration.<br>firewall-control—To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Overview of Policers on page 5241</a></li> <li>• <a href="#">Understanding Color-Aware Mode for Single-Rate Tricolor Marking on page 5247</a></li> <li>• <a href="#">Understanding Color-Aware Mode for Two-Rate Tricolor Marking on page 5249</a></li> <li>• <a href="#">color-blind on page 5318</a></li> </ul>   |

## color-blind

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | color-blind;  |
| <b>Hierarchy Level</b>          | [edit <b>firewall three-color-policer</b> <i>policer-name</i> single-rate],<br>[edit <b>firewall three-color-policer</b> <i>policer-name</i> two-rate]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.   |
| <b>Description</b>              | Configure the way preclassified packets are metered. In color-blind mode, the switch ignores any preclassification of packets and can assign a higher or lower packet loss priority (PLP). For example, suppose an upstream device assigns medium-high PLP to a packet because the packet exceeded the CIR on the upstream device. The switch can change the PLP to low if the packet conforms to the CIR of the appropriate interface.                             |
| <b>Default</b>                  | If you omit the <b>color-blind</b> statement, the default behavior is color-aware mode.   |
| <b>Required Privilege Level</b> | firewall—To view this statement in the configuration.<br>firewall-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Overview of Policers on page 5241</a></li><li>• <a href="#">Understanding Color-Blind Mode for Single-Rate Tricolor Marking on page 5247</a></li><li>• <a href="#">Understanding Color-Blind Mode for Two-Rate Tricolor Marking on page 5249</a></li><li>• <a href="#">Configuring Color-Blind Egress Policers for Medium-Low PLP on page 5296</a></li><li>• <a href="#">color-aware on page 5317</a></li></ul> |

## committed-burst-size

|  |   |
|--|---|
| <b>Syntax</b>  | <code>committed-burst-size bytes;</code>  |
| <b>Hierarchy Level</b>   | [edit <a href="#">firewall three-color-policer</a> <i>policer-name</i> single-rate],<br>[edit <a href="#">firewall three-color-policer</a> <i>policer-name</i> two-rate]  |
| <b>Release Information</b>   | Statement introduced in Junos OS Release 11.1 for the QFX Series.   |
| <b>Description</b>   | Configure the maximum number of bytes allowed for incoming traffic to burst above the committed information rate and still be marked with low packet loss priority (green).   |
| <div>  <p><b>NOTE:</b> When you include the <code>committed-burst-size</code> statement in the configuration, you must also include the <code>committed-information-rate</code> statement at the same hierarchy level.</p> </div> |   |
| <b>Options</b>   | <p><b>bytes</b>—Number of bytes. You can specify a value in bytes either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).</p> <p><b>Range:</b> 512 bytes through 268435456 bytes (268 MB)</p> |
| <b>Required Privilege Level</b>  | <p><b>firewall</b>—To view this statement in the configuration.</p> <p><b>firewall-control</b>—To add this statement to the configuration.</p>  |

## committed-information-rate

---

|   |   |
|---|---|
| <b>Syntax</b>   | <code>committed-information-rate <i>bits-per-second</i>;</code>   |
| <b>Hierarchy Level</b>  | [edit <a href="#">firewall three-color-policer</a> <i>policer-name</i> single-rate],<br>[edit <a href="#">firewall three-color-policer</a> <i>policer-name</i> two-rate]  |
| <b>Release Information</b>  | Statement introduced in Junos OS Release 11.1 for the QFX Series.   |
| <b>Description</b>  | Configure the guaranteed bandwidth under normal line conditions and the average rate up to which packets are marked with low packet loss priority (green).  |
| <div> <b>NOTE:</b> When you include the <code>committed-information-rate</code> statement in the configuration, you must also include the <code>committed-burst-size</code> statement at the same hierarchy level.</div> |   |
| <b>Options</b>  | <b><i>bits-per-second</i></b> —Number of bits per second. You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).<br><b>Range:</b> 32,000 bps through 10,000,000,000 bps (10 gbps) |
| <b>Required Privilege Level</b>   | <b>firewall</b> —To view this statement in the configuration.<br><b>firewall-control</b> —To add this statement to the configuration.   |
| <b>Related Documentation</b>  | <ul style="list-style-type: none"><li>• <a href="#">Configuring Two-Color and Three-Color Policers to Control Traffic Rates on page 5296</a></li><li>• <a href="#">Overview of Policers on page 5241</a></li></ul>  |

## excess-burst-size

|  |   |
|--|---|
| <b>Syntax</b>  | <code>excess-burst-size bytes;</code>   |
| <b>Hierarchy Level</b>   | [edit <code>firewall three-color-policer policer-name</code> single-rate]   |
| <b>Release Information</b>   | Statement introduced in Junos OS Release 11.1 for the QFX Series.   |
| <b>Description</b>   | Configure the maximum number of bytes allowed for incoming traffic to burst above the committed information rate and still be marked with medium-high packet loss priority (yellow). Packets that exceed the excess burst size (EBS) are marked with high packet loss priority (red).             |
| <div>  <p><b>NOTE:</b> When you include the <code>excess-burst-size</code> statement in the configuration, you must also include the <code>committed-burst-size</code> and <code>committed-information-rate</code> statements at the same hierarchy level.</p> </div> |   |
| <b>Options</b>   | <p><b>bytes</b>—Number of bytes. You can specify a value in bytes either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).</p> <p><b>Range:</b> 512 bytes through 268435456 bytes (268 MB)</p> |
| <b>Required Privilege Level</b>  | <p><code>firewall</code>—To view this statement in the configuration.</p> <p><code>firewall-control</code>—To add this statement to the configuration.</p>  |
| <b>Related Documentation</b>   | <ul style="list-style-type: none"> <li>• <a href="#">Configuring Two-Color and Three-Color Policers to Control Traffic Rates on page 5296</a></li> <li>• <a href="#">Overview of Policers on page 5241</a></li> </ul>   |

## filter-specific

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | filter-specific;   |
| <b>Hierarchy Level</b>          | [edit <b>firewall</b> <b>policer</b> <i>policer-name</i> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.  |
| <b>Description</b>              | <p>Configure a policer to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. If you use a filter-specific policer in multiple terms, both of the following are true:</p> <ul style="list-style-type: none"><li>• Traffic is policed at the aggregate rate. For example, if you create a policer that has a bandwidth limit of 100 Mbps and use the policer in two terms, the total allowed bandwidth for both terms is 100 Mbps—not 100 Mbps for each term.</li><li>• The implicit counter counts all the packets are that matched by any of the terms. For example, if you reference the same filter-specific policer in term1 and term2, and term1 matches 1000 packets and term2 matches 500 packets, the implicit counter shows 1500 matches for the policer.</li></ul> |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Configuring Two-Color and Three-Color Policers to Control Traffic Rates on page 5296</a></li><li>• <a href="#">Overview of Policers on page 5241</a></li></ul>   |

## firewall

## policer

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <pre>policer <i>policer-name</i> {<br/>    filter-specific;<br/>    if-exceeding {<br/>        bandwidth-limit <i>bps</i>;<br/>        burst-size-limit <i>bytes</i>;<br/>    }<br/>    then {<br/>        <i>policer-action</i>;<br/>    }<br/>}</pre>   |
| <b>Hierarchy Level</b>          | [edit <a href="#">firewall</a> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.   |
| <b>Description</b>              | <p>Configure policer rate limits and actions. To activate a policer, you must include the <b>policer</b> action modifier in the <b>then</b> statement in a firewall filter term.</p> <p>Each policer that you configure includes an implicit counter that counts the number of packets that exceed the rate limits that are specified for the policer. If you use the same policer in multiple terms—either within the same filter or across filters—the policer's implicit counter is used to count packets that are policed in all of these terms. If you want to obtain separate packet counts for each term, use these approaches:</p> <ul style="list-style-type: none"><li>• Configure a unique policer for each term.</li><li>• Configure only one policer, but use a unique, explicit counter in each term.</li></ul> |
| <b>Options</b>                  | <p><b><i>policer-name</i></b>—Name that identifies the policer. The name can contain letters, numbers, hyphens (-), and can be up to 64 characters long.</p> <p>The remaining statements are explained separately.</p>  |
| <b>Required Privilege Level</b> | <p>firewall—To view this statement in the configuration.</p> <p>firewall-control—To add this statement to the configuration.</p>  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Configuring Two-Color and Three-Color Policers to Control Traffic Rates on page 5296</a></li><li>• <a href="#">Configuring Firewall Filters on page 5290</a></li><li>• <a href="#">Overview of Policers on page 5241</a></li></ul>  |

## single-rate

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <pre>single-rate {   (color-aware   color-blind);   committed-information-rate <i>bps</i>;   committed-burst-size <i>bytes</i>;   excess-burst-size <i>bytes</i>; }</pre>  |
| <b>Hierarchy Level</b>          | [edit <a href="#">firewall three-color-policer</a> <i>policer-name</i> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.  |
| <b>Description</b>              | <p>Configure a single-rate three-color policer in which marking is based on the committed information rate (CIR), committed burst size (CBS), and excess burst size (EBS).</p> <p>Packets that conform to the CIR or the CBS are assigned low loss priority (green). Packets that exceed the CIR and the CBS but are within the EBS are assigned medium-high loss priority (yellow). Packets that exceed the EBS are assigned high loss priority (red).</p> <p>Green and yellow packets are always forwarded; this action is not configurable. You can configure red packets to be discarded. By default, red packets are forwarded.</p> <p>The remaining statements are explained separately.</p> |
| <b>Options</b>                  | <b><i>policer-name</i></b> —Name of the three-color policer. Use this name when you apply the policer to an interface.   |
| <b>Required Privilege Level</b> | firewall—To view this statement in the configuration.<br>firewall-control—To add this statement to the configuration.  |

## fc-map

**Syntax** `fc-map fc-map-value;`

**Hierarchy Level** Original CLI

[edit ethernet-switching options secure-access-port vlan (all | *vlan-name*) examine-fip]

ELS CLI for Platforms that Support FCoE

[edit **v**lans *vlan-name* **f**orwarding-**o**ptions **f**ip-**s**ecurity]

**NOTE:** The `fc-map` configuration statement is in a different hierarchy on the original CLI than on the Enhanced Layer 2 Software (ELS) CLI.

QFX Series that Support FCoE-FC Gateway Configuration

[edit fc-fabrics *fc-fabric-name* protocols fip]

**Release Information** Statement introduced in Junos OS Release 10.4 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced for the ELS CLI in Junos OS Release 13.2 for the QFX Series.

**Description** Set the FCoE mapped address prefix (FC-MAP) value for the FCoE VLAN to match the FC switch (or FCoE forwarder) FC-MAP value for the FC fabric. The FC-MAP value is a unique MAC address prefix an FC switch uses to identify FCoE traffic for a given FC fabric (traffic on a particular FCoE VLAN).

You can configure the FC-MAP value or use the default value. The default FC-MAP value is different for VN\_Port to VF\_Port (VN2VF\_Port) FIP snooping (0x0EFC00) than for VN\_Port to VN\_Port (VN2VN\_Port) FIP snooping.

The FC switch provides the FC-MAP value to FCoE nodes (ENodes) in the FIP discovery advertisement message. If the EX Series switch or the QFX Series FCoE VLAN FC-MAP value does not match the FC switch FC-MAP value, neither device discovers the FC switch on that VLAN, and the ENodes on that VLAN cannot access the FC switch. The FC switch accepts only FCoE traffic that uses the correct FC-MAP value as part of the VN\_Port MAC address.

When the QFX Series acts as an FCoE-FC gateway, the FC-MAP value for the gateway and the FCoE devices must match the FC switch FC-MAP value in order to communicate with the FC switch.

**NOTE:** Changing the FC-MAP value causes all logins to drop and forces the ENodes to log in again.

**Options** `fc-map-value`—FC-MAP value, hexadecimal value preceded by “0x”.

**Range:** 0x0EFC00 through 0x0EFCFF

**Default:** 0x0EFC00 for VN2VF\_Port FIP snooping 0x0EFD00 for VN2VN\_Port FIP snooping

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

## fcoe-trusted

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | fcoe-trusted;  |
| <b>Hierarchy Level</b>          | Original CLI<br><br>[edit ethernet-switching-options secure-access-port interface <i>interface-name</i> ]<br><br>ELS CLI for Platforms that Support FCoE<br><br>[edit <b>vlangs</b> <i>vlan-name</i> <b>forwarding-options fip-security interface</b> <i>interface-name</i> ]  |
|                                 | <div>  <p><b>NOTE:</b> The <b>fcoe-trusted</b> configuration statement is in a different hierarchy on the original CLI than on the Enhanced Layer 2 Software (ELS) CLI.</p> </div>  |
|                                 | <p>QFX Series that Support FCoE-FC Gateway Configuration</p> <p>[edit fc-fabrics <i>fc-fabric-name</i> protocols fip]</p>  |
| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 10.4 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced for the FC fabric in Junos OS Release 11.3 for the QFX Series.</p> <p>Statement introduced for the ELS CLI in Junos OS Release 13.2 for the QFX Series.</p>  |
| <b>Description</b>              | <p>Configure the specified 10-Gigabit Ethernet interface to trust Fibre Channel over Ethernet (FCoE) traffic. If an interface is connected to another switch such as an FCoE forwarder (FCF) or a transit switch, you can configure the interface as trusted so that the interface forwards FCoE traffic from the switch to the FCoE devices without installing FIP snooping filters.</p> <p>(QFX Series FCoE-FC gateway) Configure the specified local Fibre Channel fabric to trust FCoE traffic on all ports in the fabric. Changing the fabric ports from untrusted to trusted removes any existing FIP snooping filters from the ports. Changing the fabric ports from trusted to untrusted by removing the <b>fcoe-trusted</b> configuration from the fabric forces all of the FCoE sessions on those ports to log out so that when the ENodes and VN_Ports log in again, the switch can build the appropriate FIP snooping filters.</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">show fip snooping on page 5746</a></li> <li>• <a href="#">Example: Configuring an FCoE Transit Switch</a></li> <li>• <a href="#">Configuring VN2VF_Port FIP Snooping and FCoE Trusted Interfaces on an FCoE Transit Switch on page 5662</a></li> <li>• <a href="#">Configuring VN2VF_Port FIP Snooping and FCoE Trusted Interfaces on an FCoE Transit Switch on page 5662</a></li> </ul>  |

## mac-move-limit

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>mac-move-limit <i>limit</i> &lt;fabric-limit <i>limit</i>&gt; action <i>action</i>;</code>  |
| <b>Hierarchy Level</b>          | <p>For platforms without ELS:</p> <pre>[edit ethernet-switching-options secure-access-port (all   <i>vlan-name</i>)]</pre> <p>For platforms with ELS:</p> <pre>[edit vlans <i>vlan-name</i> switch-options],</pre>  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.1 for the QFX Series.   |
| <b>Description</b>              | Specify the number of times a MAC address can move to a new interface (port) in 1 second and the action to be taken by the switch if the MAC address move limit is exceeded.  |
|                                 | <div>  <p><b>CAUTION:</b> Mac move limiting does not work properly on a QFX5100 switch used as a Node device in a QFabric system. Do not use this feature on a QFX5100 switch in a QFabric system.</p> </div>  |
| <b>Default</b>                  | The default move limit is unlimited. The default action is <b>drop</b> .  |
| <b>Options</b>                  | <p><b>fabric-limit</b>—Specify the maximum number of moves in a QFabric system. If you do not specify a fabric limit, the value for <b>mac-move-limit</b> applies to the QFabric system.</p> <p><b>limit</b>—Maximum number of moves to a new interface per second.</p> <p><b>action <i>action</i></b>—(Optional) Action to take when the MAC address move limit is reached:</p> <ul style="list-style-type: none"> <li>• <b>drop</b>—Drop the packet and generate an alarm, an SNMP trap, or a system log entry. This is the default.</li> <li>• <b>log</b>—Do not drop the packet but generate an alarm, an SNMP trap, or a system log entry.</li> <li>• <b>none</b>—No action.</li> <li>• <b>shutdown</b>—Disable the interface and generate an alarm. If you have configured the switch with the <b>port-error-disable</b> statement, the disabled interfaces recover automatically upon expiration of the specified disable timeout. If you have not configured the switch for autorecovery from port error disabled conditions, you can bring up the disabled interfaces by running the <b>clear-ethernet-switch-port</b> command.</li> </ul> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>  |

|                              |   |
|------------------------------|---|

|------------------------------|---|

## no-allowed-mac-log

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | no-allowed-mac-log;  |
| <b>Hierarchy Level</b>          | <ul style="list-style-type: none"> <li>• For platforms without ELS:<br/>[edit ethernet-switching-options secure-access-port interface (all   <i>interface-name</i>)]</li> <li>• For platforms with ELS:<br/>[edit switch-options interface <i>interface-name</i>]</li> </ul> |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.  |
| <b>Description</b>              | Specify that the switch should not log messages when it receives packets from invalid MAC addresses on an interface that has been configured for allowed MAC addresses.  |
| <b>Default</b>                  | The switch logs messages when it receives packets from invalid MAC addresses on an interface that has been configured for particular allowed (specific) MAC addresses.   |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing—control—To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Understanding MAC Limiting and MAC Move Limiting for Port Security on page 5266</a></li> <li>• <i>Configuring MAC Limiting</i></li> <li>• <i>allowed-mac</i></li> <li>• <i>mac-limit</i></li> </ul>                     |

## no-gratuitous-arp-request

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | no-gratuitous-arp-request;  |
| <b>Hierarchy Level</b>          | [edit <a href="#">interfaces</a> <i>interface-name</i> ],<br>[edit <a href="#">interfaces</a> <i>interface-range</i> <i>interface-name</i> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.   |
| <b>Description</b>              | Configure the switch not to respond to gratuitous ARP requests. You can disable responses to gratuitous ARP requests on both Layer 2 Ethernet switching interfaces and routed VLAN interfaces (RVIs). |
| <b>Default</b>                  | Gratuitous ARP responses are enabled on all Ethernet switching interfaces and RVIs.   |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Configuring IRB Interfaces on page 1675</a></li></ul>   |

## persistent-learning

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | persistent-learning;  |
| <b>Hierarchy Level</b>          | <ul style="list-style-type: none"><li>• For platforms without ELS:<br/>[edit ethernet-switching-options secure-access-port interface (all   <i>interface-name</i>)]</li><li>• For platforms with ELS:<br/>[edit switch-options interface <i>interface-name</i>]</li></ul> |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.<br>Hierarchy level [edit switch-options interface <i>interface-name</i> ] introduced in Junos OS Release 13.2X50-D10           |
| <b>Description</b>              | Specify that learned MAC addresses persist on the specified interfaces across restarts of the switch and link-down conditions. This feature is also known as sticky MAC.  |
| <b>Required Privilege Level</b> | system—To view this statement in the configuration.<br>system-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <i>Example: Configuring Basic Port Security Features</i></li><li>• <i>Configuring Persistent MAC Learning (CLI Procedure)</i></li><li>• <i>Configuring Persistent MAC Learning (CLI Procedure)</i></li></ul>                      |

## port-error-disable

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <pre>port-error-disable {   (disable-timeout <i>seconds</i>   <i>recovery-timeout seconds</i>); }</pre>   |
| <b>Hierarchy Level</b>          | <ul style="list-style-type: none"> <li>For platforms without ELS:<br/>[edit ethernet-switching-options]</li> <li>For platforms with ELS:<br/>[edit switch-options ]</li> </ul>  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 on the QFX Series.  |
| <b>Description</b>              | Disable rather than block an interface when enforcing MAC limiting, MAC move limiting, and storm control, and allow the interface to recover automatically from the error condition after a specified period of time:   |
|                                 | <div>  <p><b>NOTE:</b> The <b>port-error-disable</b> configuration does not apply to preexisting error conditions. It affects only error conditions that are detected after you enable and commit the <b>port-error-disable</b> statement. To clear a preexisting error condition and restore the interface to service, use the <a href="#">clear ethernet-switching port-error</a> command.</p> </div>  |
|                                 | <ul style="list-style-type: none"> <li>If you enable the <i>mac-limit</i> statement with the <b>shutdown</b> option and also enable the <b>port-error-disable</b> statement, the switch disables (rather than shuts down) the interface when the MAC address limit is reached.</li> <li>If you have enabled the <a href="#">mac-move-limit</a> statement with the <b>shutdown</b> option and you enable the <b>port-error-disable</b> statement, the switch disables (rather than shuts down) the interface when the maximum number of moves to a new interface is reached.</li> <li>If you enable the <i>storm-control</i> statement with the <b>action-shutdown</b> option and you also enable <b>port-error-disable</b>, the switch disables (rather than shuts down) the interface when broadcast traffic and unknown unicast traffic exceed the specified levels.</li> </ul> |
| <b>Default</b>                  | Not enabled.  |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing—control—To add this statement to the configuration.   |

## arp-inspection

---

**Syntax**    `arp-inspection {  
                  forwarding-class class-name;  
                  }`

- Hierarchy Level**
- For platforms with ELS:  
    `[edit vlans vlan-name forwarding-options dhcp-security],`  
    `[edit forwarding-options dhcp-relay ]`
  - For platforms without ELS:  
    `[edit ethernet-switching-options secure-access-port vlan (all | vlan-name)],`  
    `[edit forwarding-options dhcp-relay ]`

**Release Information**    Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Hierarchy level `[edit vlans vlan-name forwarding-options dhcp-security]` introduced in Junos OS Release 13.2X50-D10. (See [“Getting Started with Enhanced Layer 2 Software” on page 43](#) for information about ELS.)  
Statement introduced in Junos OS Release 13.2 for the QFX series.

**Description**    Perform dynamic ARP inspection (DAI) on all VLANs or on the specified VLAN.

When DAI is enabled, the switch logs invalid ARP packets that it receives on each interface, along with the sender’s IP and MAC addresses. ARP probe packets, which have the sender IP address 0.0.0.0, are validated by DAI.

**NOTE:** If you configure DAI at the `[edit vlans vlan-name forwarding-options dhcp-security]` hierarchy level:

- DAI can be configured only for a specific VLAN, not for a list or a range of VLAN IDs.
- DHCP snooping is automatically enabled on the specified VLAN.
- The `forwarding-class` statement is not available at the `[edit vlans vlan-name forwarding-options dhcp-security]` hierarchy level.

See *Enabling Dynamic ARP Inspection (CLI Procedure)* for more information about this configuration.

---

**NOTE:** On EX9200 switches, DAI is not supported in an MC-LAG scenario.

---

The remaining statement is explained separately.

**Default**    Disabled.

              }  
              vendor-id {  
                  use-string *string*;  
              }  
              }  
              }

**Hierarchy Level**    [edit vlans *vlan-name* forwarding-options]

**Release Information**    Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.  
Statement introduced in Junos OS Release 13.2 for the QFX series.  
Support for **static-ipv6**, **nd-inspection**, **ipv6-source-guard**, **no-dhcpv6-snooping**, and **no-option-37** introduced in Junos OS Release 13.2X51-D20 for EX Series switches.

**Description**    Configure port security features on the switch. DHCP snooping is enabled automatically if you configure any of the following port security features within this hierarchy:

- Dynamic ARP inspection (DAI)
- IP source guard

- DHCP option 82
- Static IP

For switches that support DHCPv6, both DHCP snooping and DHCPv6 snooping are enabled automatically if you configure any of the features listed above or any of the following IPv6 features:

- IPv6 Neighbor Discovery inspection
- IPv6 source guard
- Static IPv6

**NOTE:** On EX9200 switches, DHCP snooping, DAI, and IP source guard are not supported in an MC-LAG scenario.

The remaining statements are explained separately.

## group (DHCP Security)

```
Syntax  group group-name {
        interface interface-name {
            static-ip ip-address {
                mac mac-address;
            }
            static-ipv6 ip-address {
                mac mac-address;
            }
        }
        overrides {
            no-option37;
            no-option-82;
            trusted;
            untrusted;
        }
    }
```

**Hierarchy Level** [edit vlans *vlan-name* forwarding-options [dhcp-security](#)]

**Release Information** Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.  
Statement introduced in Junos OS Release 13.2 for the QFX series.  
Support for the **static-ipv6** and **no-option37** statements introduced in Junos OS Release 13.2X51-D20 for EX Series switches.

**Description** Specify the name of a group of access interfaces that you want to configure for DHCP security attributes that are different from the attributes set for other interfaces in the VLAN. A group must contain at least one interface.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## interface-mac-limit

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | <pre>interface-mac-limit <i>limit</i> {     <b>packet-action</b> drop; }</pre>   |
| <b>Hierarchy Level</b>     | <p>[edit bridge-domains <i>bridge-domain-name</i> bridge-options],<br/>         [edit bridge-domains <i>bridge-domain-name</i> bridge-options interface <i>interface-name</i>],<br/>         [edit logical-systems <i>logical-system-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options],<br/>         [edit logical-systems <i>logical-system-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options interface <i>interface-name</i>],<br/>         [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options],<br/>         [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options interface <i>interface-name</i>],<br/>         [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> switch-options],<br/>         [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> switch-options interface <i>interface-name</i>],<br/>         [edit logical-systems <i>logical-system-name</i> switch-options],<br/>         [edit logical-systems <i>logical-system-name</i> switch-options interface <i>interface-name</i>],<br/>         [edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options],<br/>         [edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options interface <i>interface-name</i>],<br/>         [edit routing-instances <i>routing-instance-name</i> switch-options],<br/>         [edit routing-instances <i>routing-instance-name</i> switch-options interface <i>interface-name</i>],<br/>         [edit switch-options],<br/>         [edit switch-options interface <i>interface-name</i>],<br/>         [edit switch-options interface <i>interface-name</i>],<br/>         [edit vlans <i>vlan-name</i> switch-options],<br/>         [edit vlans <i>vlan-name</i> switch-options interface <i>interface-name</i>]</p> |
| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 8.4.</p> <p>Support for the <b>switch-options</b> statement added in Junos OS Release 9.2.</p> <p>Support for top-level configuration for the <b>virtual-switch</b> type of routing instance added in Junos OS Release 9.2. In Junos OS Release 9.1 and earlier, the routing instances hierarchy supported this statement only for a VPLS instance or a bridge domain configured within a virtual switch.</p> <p>Support for logical systems added in Junos OS Release 9.6.</p> <p>[edit switch-options], [edit switch-options interface <i>interface-name</i>], [edit vlans <i>vlan-name</i> switch-options], and [edit vlans <i>vlan-name</i> switch-options interface <i>interface-name</i>] hierarchy levels introduced in Junos OS Release 12.3R2 for EX Series switches.</p>   |
| <b>Description</b>         | <p>(MX Series routers or EX Series switches only) Configure a limit to the number of MAC addresses that can be learned from a bridge domain, VLAN, virtual switch, or set of bridge domains or VLANs.</p>  |

**NOTE:** For multichassis link aggregation (MC-LAG) peers in active-active mode, configuring the `interface-mac-limit` statement or changing the `interface-mac-limit` configuration when traffic is flowing can cause the MAC entries to be out of synchronization between the two MC-LAG peers, which might result in flooding. To avoid flooding, you must either halt traffic forwarding and then configure the `interface-mac-limit` statement or use the `commit at configuration` statement to commit the changes at the same time in both the peer nodes.

Alternatively, if flooding does occur, you can clear the bridge MAC table on both the routers by using the `clear bridge mac-table` command. Running this command ensures that the MAC entries are re-learned and in synchronization between both the peers.

---

**Default** For an access port, the default MAC limit is 1024 MAC addresses. For a trunk port, the default MAC limit is 8192 MAC addresses.

**Options** *limit*—Maximum number of MAC addresses learned from an interface.

**Range:** 1 through 131,071 MAC addresses per interface

The remaining statement is explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## no-dhcp-snooping

|  |  |
|--|--|
| <b>Syntax</b>                                  | no-dhcp-snooping;  |
| <b>Hierarchy Level (EX Series, QFX Series)</b> | [edit vlans <i>vlan-name</i> forwarding-options <b>dhcp-security</b> ]   |
| <b>Hierarchy Level (MX Series)</b>             | [edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security]   |
| <b>Release Information</b>                     | Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.<br>Statement introduced in Junos OS Release 13.2 for the QFX series.<br>Hierarchy level [edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security] introduced in Junos OS Release 14.1 for the MX Series. |
| <b>Description</b>                             | Disable DHCP snooping for the specified VLAN or bridge domain.   |

**NOTE:** Explicitly disabling DHCP snooping also disables any other port security features that you have enabled under [edit vlans *vlan-name* forwarding-options **dhcp-security**], including dynamic ARP inspection (DAI) and IP source guard for the specified VLAN or bridge domain.

There is no configuration statement that explicitly enables DHCP snooping.

**Default** DHCP snooping is not enabled.

**NOTE:** Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style and MX Series routers do not have a configuration statement that explicitly enables DHCP snooping.

DHCP snooping is enabled automatically by Junos OS if any of the following is configured at the [edit vlans *vlan-name* forwarding-options dhcp-security] hierarchy level for EX Series switches or at the [edit bridge-domains *bridge-domain-name* forwarding-options dhcp-security] for MX Series routers:

- DAI
- IP source guard
- Static IP
- DHCP option 82

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## static-ip

---

- Syntax** `static-ip ip-addresses {  
    vlan vlan-name;  
    mac mac-address;  
}`
- Hierarchy Level**
- For platforms with ELS:  
`[edit vlans vlan-name forwarding-options dhcp-security group group-name interface interface-name]`
  - For platforms without ELS:  
`[edit ethernet-switching-options secure-access-port interface (all | interface-name)]`
- Release Information** Statement introduced in Junos OS Release 9.2 for EX Series switches.  
Hierarchy level `[edit vlans vlan-name forwarding-options dhcp-security]` introduced in Junos OS Release 13.2X50-D10. (See [“Getting Started with Enhanced Layer 2 Software” on page 43](#) for information about ELS.)
- Description** Configure a static IP address to MAC address (IP-MAC) binding to be added to the DHCP snooping database.

**NOTE:** The VLAN is specified at the higher hierarchy level when `static-ip` is configured at `[edit vlans vlan-name forwarding-options dhcp-security group group-name interface interface-name]`.

---

- Options**
- ip-address*—Static IP address assigned to a device connected on the specified interface.
- mac-address*—Static MAC address assigned to a device connected on the specified interface.
- The remaining statements are explained separately.
- Required Privilege Level**
- system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## action-shutdown

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | action-shutdown;   |
| <b>Hierarchy Level</b>          | For platforms without ELS:<br><br>[edit ethernet-switching-options storm-control]<br><br>For platforms with ELS:<br><br>[edit forwarding-options <a href="#">storm-control-profiles</a> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.  |
| <b>Description</b>              | Shut down or disable interfaces when the storm control level is exceeded, as follows: <ul style="list-style-type: none"> <li>• If you set both the <b>action-shutdown</b> and the <b>port-error-disable</b> statements, the affected interfaces are disabled temporarily and recover automatically when the disable timeout expires.</li> <li>• If you set the <b>action-shutdown</b> statement and do not set the <b>port-error-disable</b> statement, the affected interfaces are shut down when the storm control level is exceeded, and they do not recover automatically. You must issue the <b>clear ethernet-switching port-error</b> command to clear the port error and restore the interfaces to service.</li> </ul> |
| <b>Default</b>                  | The <b>action-shutdown</b> feature is disabled. If the storm control level is exceeded, the switch drops broadcast and unknown unicast messages on the specified interfaces.   |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Understanding Storm Control on page 5272</a></li> <li>• <i>Example: Configuring Storm Control to Prevent Network Outages</i></li> <li>• <a href="#">port-error-disable on page 5341</a></li> <li>• <i>disable-timeout</i></li> <li>• <a href="#">clear ethernet-switching port-error on page 5397</a></li> </ul>  |

## bandwidth-level

|   |  |
|---|--|
| <b>Syntax</b>   | <code>bandwidth-level <i>kbps</i>;</code>  |
| <b>Hierarchy Level</b>  | [edit forwarding-options <a href="#">storm-control-profiles</a> <i>profile-name</i> all]   |
| <b>Release Information</b>  | Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.<br>Statement introduced in Junos OS Release 13.2 for the QFX Series.<br>Statement introduced in Junos OS Release 14.1 for MX Series routers.  |
| <b>Description</b>  | Configure the storm control level as the bandwidth in kilobits per second of the available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams.   |
| <div>  <p><b>NOTE:</b> When you configure storm control level on an aggregated Ethernet interface, the storm control level for each member of the aggregated Ethernet interface is set to that bandwidth. For example, if you configure a storm control level of 15,000 Kbps on ae1, and ae1 has two members, ge-0/0/0 and ge-0/0/1, each member has a storm control level of 15,000 Kbps. Thus, the storm control level on ae1 allows a traffic rate of up to 30,000 Kbps of combined broadcast, multicast, and unknown unicast traffic.</p> </div> |  |
| <b>Default</b>  | <p>On EX4300 switches—If you do not specify the storm control level using either the <b>bandwidth-level</b> or the <b>bandwidth-percentage</b> statements, the storm control level defaults to 80 percent of the available bandwidth used by the combined broadcast, unknown unicast, and multicast traffic streams.</p> <p>On EX9200 switches—Storm control is not enabled by default.</p> <p>On MX Series routers—Storm control is not enabled by default.</p> |
| <b>Options</b>  | <p><b>bandwidth-level <i>kbps</i></b>—Traffic rate in kilobits per second of the combined broadcast, multicast, and unknown unicast traffic streams.</p> <p><b>Range:</b> 100 through 10,000,000</p> <p><b>Default:</b> None</p>   |
| <b>Required Privilege Level</b>   | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>  | <ul style="list-style-type: none"> <li>• <a href="#">bandwidth-percentage on page 5367</a></li> <li>• <i>Example: Configuring Storm Control to Prevent Network Outages on EX Series Switches</i></li> <li>• <i>Example: Configuring Storm Control to Prevent Network Outages on MX Series Routers</i></li> <li>• <i>Configuring or Disabling Storm Control (CLI Procedure)</i></li> </ul>  |

## bandwidth-percentage

|   |  |
|---|--|
| <b>Syntax</b>   | <code>bandwidth-percentage <i>percentage</i>;</code>   |
| <b>Hierarchy Level</b>  | [edit forwarding-options <a href="#">storm-control-profiles</a> <i>profile-name</i> all]   |
| <b>Release Information</b>  | Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.<br>Statement introduced in Junos OS Release 13.2 for the QFX series.<br>Statement introduced in Junos OS Release 14.1 for MX Series routers.  |
| <b>Description</b>  | Configure the storm control level as the percentage of available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams on an interface.<br>The storm control level is configured as part of the storm control profile.  |
| <div>  <p><b>NOTE:</b> When you configure storm control level on an aggregated Ethernet interface, the storm control level for each member of the aggregated Ethernet interface is set to that bandwidth. For example, if you configure a storm control level of 15,000 Kbps on ae1, and ae1 has two members, ge-0/0/0 and ge-0/0/1, each member has a storm control level of 15,000 Kbps. Thus, the storm control level on ae1 allows a traffic rate of up to 30,000 Kbps of combined broadcast, multicast, and unknown unicast traffic.</p> </div> |  |
| <b>Default</b>  | <p>On EX4300 switches—The storm control level is 80 percent of the available bandwidth used by the combined broadcast, unknown unicast, and multicast traffic streams.</p> <p>On EX9200 switches—Storm control is not enabled by default.</p> <p>On MX Series routers—Storm control is not enabled by default.</p>   |
| <b>Required Privilege Level</b>   | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>  | <ul style="list-style-type: none"> <li>• <a href="#">bandwidth-level on page 5366</a></li> <li>• <i>Example: Configuring Storm Control to Prevent Network Outages on EX Series Switches</i></li> <li>• <i>Example: Configuring Storm Control to Prevent Network Outages on MX Series Routers</i></li> <li>• <i>Configuring or Disabling Storm Control (CLI Procedure)</i></li> </ul> |

## interface (Unknown Unicast Forwarding)

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>interface <i>interface-name</i>;</code>   |
| <b>Hierarchy Level</b>          | <ul style="list-style-type: none"><li>For platforms with ELS:<br/>[edit switch-options <b>unknown-unicast-forwarding</b> vlan <i>vlan-name</i>]</li><li>For platforms without ELS:<br/>[edit ethernet-switching-options <b>unknown-unicast-forwarding</b> vlan <i>vlan-name</i>]</li></ul>  |
| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 9.3 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2 for the QFX Series.</p> <p>Hierarchy level <b>[edit switch-options]</b> introduced in Junos OS Release 13.2X50-D10. (See <a href="#">“Getting Started with Enhanced Layer 2 Software” on page 43</a> for information about ELS.)</p> |
| <b>Description</b>              | Specify the interface to which unknown unicast packets will be forwarded.   |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>  |

- [Verifying That Two-Color Policers Are Operational on page 5393](#)

### Monitoring Firewall Filter Traffic

You can use operational mode commands to monitor firewall filter traffic.

- [Monitoring Traffic for All Firewall Filters and Policers That Are Configured on page 5379](#)
- [Monitoring Traffic for a Specific Firewall Filter on page 5380](#)
- [Monitoring Traffic for a Specific Policer on page 5380](#)

#### Monitoring Traffic for All Firewall Filters and Policers That Are Configured

**Purpose** Monitor the number of packets and bytes that matched the firewall filters and monitor the number of packets that exceeded policer rate limits:

**Action** Use the **show firewall** operational mode command:

```
user@switch> show firewall
```

```
Filter: egress-vlan-watch-employee
Counters:
Name                               Bytes          Packets
counter-employee-web              3348           27
Filter: ingress-port-limit-tcp-icmp
Counters:
Name                               Bytes          Packets
icmp-counter                      560            10
Policers:
Name                               Packets
icmp-connection-policer          10
tcp-connection-policer           0
Filter: ingress-vlan-rogue-block
Filter: ingress-vlan-limit-guest
```

**Meaning** The **show firewall** command displays the names of all firewall filters, counters, and policers that are configured. For each counter that is specified in a filter configuration, the output field shows the byte count and packet count for the term in which the counter is specified. For each policer that is specified in a filter configuration, the output field shows the packet count for packets that exceed the specified rate limits.

---

#### Monitoring Traffic for a Specific Firewall Filter

**Purpose** Monitor the number of packets and bytes that matched a firewall filter and monitor the number of packets that exceeded policer rate limits.

**Action** Use the **show firewall filter *filter-name*** operational mode command:

```
user@switch> show firewall filter ingress-port-limit-tcp-icmp
Filter: ingress-port-limit-tcp-icmp
Counters:
Name                               Bytes          Packets
icmp-counter                      560            10
```

**Meaning** The **show firewall filter *filter-name*** command limits the display information to the counters and policers that are defined for the specified filter.

---

#### Monitoring Traffic for a Specific Policer

**Purpose** Monitor the number of packets that exceeded the rate limits of a policer:

**Action** Use the **show firewall policer *policer-name*** operational mode command:

```
user@switch> show firewall policer icmp-connection-policer
Filter: ingress-port-limit-tcp-icmp
Policers:
Name                               Packets
icmp-connection-policer           10
```

**Meaning** The **show firewall policer *policer-name*** command displays the number of packets that exceeded the rate limits for the specified policer.

- Related Documentation**

## Monitoring Port Security

### Purpose

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring functionality to view these port security details:

- DHCP snooping database for a VLAN or all VLANs
- ARP inspection details for all interfaces

### Action

To monitor port security in the J-Web interface, select **Monitor > Security > Port Security**.

To monitor and manipulate the DHCP snooping database and ARP inspection statistics in the CLI, enter the following commands:

- **show dhcp snooping binding**
- **clear dhcp snooping binding**—In addition to clearing the whole database, you can clear database entries for specified VLANs or MAC addresses.
- **show arp inspection statistics**
- **clear arp inspection statistics**

**NOTE:** On EX4300 switches, to monitor and manipulate the DHCP snooping database and ARP inspection statistics in the CLI, enter the following commands:

- **show dhcp-security binding**
- **clear dhcp-security binding**—In addition to clearing the whole database, you can clear database entries for specified VLANs or IP Address.
- **show dhcp-security arp inspection statistics**
- **clear arp inspection statistics**

### Meaning

The J-Web Port Security Monitoring page comprises two sections:

- **DHCP Snooping Details**—Displays the DHCP snooping database for all the VLANs for which DHCP snooping is enabled. To view the DHCP snooping database for a specific VLAN, select the specific VLAN from the list.

- **ARP Inspection Details**—Displays the ARP inspection details for all interfaces. The information includes details of the number of packets that passed ARP inspection and the number of packets that failed the inspection. The pie chart graphically represents these statistics when you select an interface. To view ARP inspection statistics for a specific interface, select the interface from the list.

You can use the following options on the page to clear DHCP snooping and ARP inspection details:

- **Clear All**—Clears the DHCP snooping database, either for all VLANs if the option **ALL** has been selected in the Select VLANs list or for the specific VLAN that has been selected in that list.
- **Clear**—Deletes a specific IP address from the DHCP snooping database.

To clear ARP inspection details on the page, click **Clear All** in the ARP inspection details section.

**NOTE:** Clear All button in the ARP inspection details section is not supported on EX4300 switches.

Use the CLI commands to show and clear DHCP snooping database and ARP inspection statistics details.

## Verifying That Firewall Filters Are Operational

**Purpose** Verify that firewall filters are working properly after you apply them to ports, VLANs, or Layer 3 interfaces.

**Action** Use the **show firewall** operational mode command to verify that the firewall filters are working properly:

```
user@switch> show firewall
Filter: egress-vlan-watch-employee
Counters:
Name                               Bytes      Packets
counter-employee-web              0           0
Filter: ingress-port-limit-tcp-icmp
Counters:
Name                               Bytes      Packets
icmp-counter                      560        10
Policers:
Name                               Packets
icmp-connection-policer          10
tcp-connection-policer           0
```

```
Filter: ingress-vlan-rogue-block
Filter: ingress-vlan-limit-guest
```

**Meaning** The **show firewall** command displays the names of all firewall filters, counters, and policers that are configured. For each counter that is specified in a filter configuration, the output field shows the byte count and packet count for the term in which the counter is specified. In the above example, the **icmp-counter** in the filter **ingress-port-limit-tcp-icmp** shows that the filter matched 10 packets. For each policer that is specified in a filter configuration, the output field shows the packet count for packets that exceed the specified rate limits. The policer **icmp-connection-policer** shows that 10 ICMP packets were policed.

  - [Configuring Two-Color and Three-Color Policers to Control Traffic Rates on page 5296](#)
  - [Monitoring Firewall Filter Traffic on page 5379](#)

## Verifying That DAI Is Working Correctly

**Purpose** Verify that dynamic ARP inspection (DAI) is working on the switch.

**Action** Send some ARP requests from network devices connected to the switch.

Display the DAI information:

```
user@switch> show arp inspection statistics
ARP inspection statistics:
Interface          Packets received  ARP inspection pass  ARP inspection failed
-----
ge-0/0/1.0          7                 5                   2
ge-0/0/2.0         10                10                  0
ge-0/0/3.0         12                12                  0
```

**Meaning** The sample output shows the number of ARP packets received and inspected per interface, with a listing of how many packets passed and how many failed the inspection on each interface. The switch compares the ARP requests and replies against the entries in the DHCP snooping database. If a MAC address or IP address in the ARP packet does not match a valid entry in the database, the packet is dropped.

  - [Monitoring Port Security on page 5381](#)

## Verifying That DHCP Snooping Is Working Correctly

**Purpose** Verify that DHCP snooping is working on the switch and that the DHCP snooping database is correctly populated with both dynamic and static bindings.

**Action** Send some DHCP requests from network devices (here they are DHCP clients) connected to the switch.

Display the DHCP snooping information when the interface on which the DHCP server connects to the switch is trusted. The following output results when requests are sent from the MAC addresses and the server has provided the IP addresses and leases:

```
user@switch> show dhcp snooping binding
DHCP Snooping Information:
MAC address      IP address  Lease (seconds) Type      VLAN    Interface
00:05:85:3A:82:77 192.0.2.17  600          dynamic employee ge-0/0/1.0
00:05:85:3A:82:79 192.0.2.18  653          dynamic employee ge-0/0/1.0
00:05:85:3A:82:80 192.0.2.19  720          dynamic employee ge-0/0/2.0
00:05:85:3A:82:81 192.0.2.20  932          dynamic employee ge-0/0/2.0
00:05:85:3A:82:83 192.0.2.21  1230         dynamic employee ge-0/0/2.0
00:05:85:27:32:88 192.0.2.22  -            static   data     ge-0/0/4.0
```

**Meaning** When the interface on which the DHCP server connects to the switch has been set to trusted, the output (see preceding sample) shows, for each MAC address, the assigned IP address and lease time—that is, the time, in seconds, remaining before the lease expires. Static IP addresses have no assigned lease time. The statically configured entry never expires.

If the DHCP server had been configured as untrusted, no entries would be added to the DHCP snooping database and nothing would be shown in the output of the **show dhcp snooping binding** command.

## Verifying That MAC Limiting Is Working Correctly

MAC limiting protects against flooding of the Ethernet switching table by setting a limit on the number of MAC addresses that can be learned on a single Layer 2 access interface (port).

Junos OS provides two MAC limiting methods:

- **Maximum number of MAC addresses**—You configure the maximum number of dynamic MAC addresses allowed per interface. When the limit is exceeded, incoming packets with new MAC addresses can be ignored, dropped, or logged. You can also specify that the interface be shut down or temporarily disabled.
- **Allowed MAC addresses**—You configure specific “allowed” MAC addresses for the access interface. Any MAC address that is not in the list of configured addresses is not learned, and the switch logs an appropriate message. The allowed MAC method binds MAC addresses to a VLAN so that the address is not registered outside the VLAN. If an allowed MAC setting conflicts with a dynamic MAC setting, the allowed MAC setting takes precedence.

This topic includes the following tasks:

1. [Verifying That MAC Limiting for Dynamic MAC Addresses Is Working Correctly on page 5385](#)
2. [Verifying That Allowed MAC Addresses Are Working Correctly on page 5386](#)
3. [Verifying That Interfaces Are Shut Down on page 5386](#)
4. [Customizing the Ethernet Switching Table Display to View Information for a Specific Interface on page 5387](#)

### Verifying That MAC Limiting for Dynamic MAC Addresses Is Working Correctly

**Purpose** Verify that MAC limiting for dynamic MAC addresses is working.

**Action** Display the MAC addresses that have been learned. The following sample output shows the results of sending two packets from hosts connected to **xe-1:0/0/1** and five packets from hosts connected to **xe-1:0/0/2**, with both interfaces configured with a MAC limit of **4** and the action **drop**:

```
user@switch> show ethernet-switching table
Ethernet-switching table: 7 entries, 6 learned
```

| VLAN          | MAC address       | Type  | Age | Interfaces   |
|---------------|-------------------|-------|-----|--------------|
| employee-vlan | *                 | Flood | -   | xe-1:0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:77 | Learn | 0   | xe-1:0/0/1.0 |
| employee-vlan | 00:05:85:3A:82:79 | Learn | 0   | xe-1:0/0/1.0 |
| employee-vlan | 00:05:85:3A:82:80 | Learn | 0   | xe-1:0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:81 | Learn | 0   | xe-1:0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:83 | Learn | 0   | xe-1:0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:85 | Learn | 0   | xe-1:0/0/2.0 |

**Meaning** The output shows that the fifth packet received on the **xe-1:0/0/2** interface was dropped because it exceeded the MAC limit for that interface. The address was not learned, and thus an asterisk (\*) rather than an address appears in the MAC address column in the first line of the sample output.

---

### Verifying That Allowed MAC Addresses Are Working Correctly

**Purpose** Verify that allowed MAC addresses are working.

**Action** Display the MAC cache information after allowed MAC addresses have been configured on an interface. The following sample shows the MAC cache after four allowed MAC addresses had been configured on interface **xe-1:0/0/2** and a fifth MAC address appeared on the interface.

```
user@switch> show ethernet-switching table
Ethernet-switching table: 5 entries, 4 learned
```

| VLAN          | MAC address       | Type  | Age | Interfaces   |
|---------------|-------------------|-------|-----|--------------|
| employee-vlan | 00:05:85:3A:82:80 | Learn | 0   | xe-1:0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:81 | Learn | 0   | xe-1:0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:83 | Learn | 0   | xe-1:0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:85 | Learn | 0   | xe-1:0/0/2.0 |
| employee-vlan | *                 | Flood | -   | xe-1:0/0/2.0 |

**Meaning** Because the fifth address was not allowed it was not learned, and an asterisk (\*) rather than an address appears in the MAC address column in the last line of the sample output.

---

### Verifying That Interfaces Are Shut Down

**Purpose** Verify that an interface is shut down when the MAC limit is exceeded.

**Action** For more information about interfaces that have been shut down because the MAC limit was exceeded, use the **show ethernet-switching interfaces** command.

```
user@switch> show ethernet-switching interfaces
Interface      State  VLAN members      Tag  Tagging  Blocking

bme0.32770     down  mgmt              untagged unblocked
xe-0/0/0.0     down  v1                untagged MAC limit exceeded
xe- 0/0/1.0    up    v1                untagged unblocked
xe-0/0/2.0     up    v1                untagged unblocked
me0.0          up    mgmt              untagged unblocked
```

**NOTE:** You can configure interfaces to recover automatically when the MAC limit has been exceeded by specifying the **port-error-disable** statement with a **disable timeout** value. The switch automatically restores the disabled interface to service when the disable timeout expires. The **port-error-disable** configuration does not apply to preexisting error conditions—it affects only error conditions that are detected after the **port-error-disable** statement has been enabled and the configuration has been committed. To clear a preexisting error condition and restore the interface to service, use the **clear ethernet-switching port-error** command.

### Customizing the Ethernet Switching Table Display to View Information for a Specific Interface

**Purpose** You can use the **show ethernet-switching table** command to view information for a specific interface.

**Action** For example, to display the MAC addresses that have been learned on the **xe-0/0/2** interface, enter:

```
user@switch> show ethernet-switching table interface xe-0/0/2.0
Ethernet-switching table: 1 unicast entries
```

| VLAN | MAC address       | Type  | Age | Interfaces  |
|------|-------------------|-------|-----|-------------|
| v1   | *                 | Flood | -   | All-members |
| v1   | 00:00:06:00:00:00 | Learn | 0   | xe-0/0/2.0  |

**Meaning** The MAC limit value for the **xe-0/0/2** interface had been set to **1**, and the output shows that only one MAC address was learned and added to the MAC cache.

- Related Documentation**
- [Configuring MAC Limiting](#)
  - [Monitoring Port Security on page 5381](#)
  - [Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces \(CLI Procedure\)](#)
  - [Example: Configuring Allowed MAC Addresses to Protect the Switch from DHCP Snooping Database Alteration Attacks](#)
  - [Example: Configuring MAC Limiting to Protect the Switch from DHCP Starvation Attacks](#)

## Verifying That MAC Move Limiting Is Working Correctly

**Purpose** Verify that MAC move limiting is working on the switch.

**Action** Display the MAC addresses in the Ethernet switching table when MAC move limiting has been configured for a VLAN. The following sample shows the results after two of the hosts on **ge-0/0/2** sent packets after the MAC addresses for those hosts had moved to other interfaces more than five times in 1 second. The VLAN, **employee-vlan**, was set to a MAC move limit of 5 with the action **drop**:

```
user@switch> show ethernet-switching table
```

```
Ethernet-switching table: 7 entries, 4 learned
```

| VLAN          | MAC address       | Type  | Age | Interfaces |
|---------------|-------------------|-------|-----|------------|
| employee-vlan | 00:05:85:3A:82:77 | Learn | 0   | ge-0/0/1.0 |
| employee-vlan | 00:05:85:3A:82:79 | Learn | 0   | ge-0/0/1.0 |
| employee-vlan | 00:05:85:3A:82:80 | Learn | 0   | ge-0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:81 | Learn | 0   | ge-0/0/2.0 |
| employee-vlan | *                 | Flood | -   | ge-0/0/2.0 |
| employee-vlan | *                 | Flood | -   | ge-0/0/2.0 |

**Meaning** The last two lines of the sample output show that MAC addresses for two hosts on **ge-0/0/2** were not learned, because the hosts had been moved back and forth from the original interfaces more than five times in 1 second.

- Related Documentation**
- [Configuring MAC Move Limiting \(CLI Procedure\)](#)
  - [Configuring MAC Move Limiting \(J-Web Procedure\)](#)
  - [Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces \(CLI Procedure\)](#)
  - [Example: Configuring Basic Port Security Features](#)
  - [Monitoring Port Security on page 5381](#)

## Verifying That the Port Error Disable Setting Is Working Correctly

**Purpose** Verify that the port error disable setting is working as expected for MAC limited and storm control interfaces.

**Action** Display information about interfaces:

```
user@switch> show ethernet-switching interfaces
```

| Interface    | State | VLAN members | Blocking                |
|--------------|-------|--------------|-------------------------|
| xe-2:0/0/0.0 | up    | T1122        | unblocked               |
| xe-2:0/0/1.0 | down  | default      | MAC limit exceeded      |
| xe-2:0/0/2.0 | down  | default      | Storm control in effect |
| xe-2:0/0/3.0 | down  | default      | unblocked               |
| xe-2:0/0/4.0 | down  | default      | unblocked               |
| xe-2:0/0/5.0 | down  | default      | unblocked               |
| xe-2:0/0/6.0 | down  | default      | unblocked               |

**Meaning** For interfaces disabled by port security features, the sample output from the **show ethernet-switching interfaces** command specifies the reasons that the interfaces are disabled:

- **MAC limit exceeded**—The interface is temporarily disabled because of a *mac-limit* error. The disabled interface is automatically restored to service when the *disable-timeout* (*Port Error Disable*) expires.
- **MAC move limit exceeded**—The interface is temporarily disabled because of a *mac-move-limit* error. The disabled interface is automatically restored to service when the *disable-timeout* expires.
- **Storm control in effect**—The interface is temporarily disabled because of a *storm-control* error. The disabled interface is automatically restored to service when the *disable-timeout* (*Port Error Disable*) expires.

## Verifying Unicast RPF Status

**Purpose** Verify that unicast reverse-path forwarding (RPF) is enabled and is working on the interface.

**Action** Use one of the **show interfaces *interface-name*** commands with either the **extensive** or **detail** options to verify that unicast RPF is enabled and working on the switch. The following example displays output from the **show interfaces ge- extensive** command.

```
user@switch> show interfaces ge-1/0/10 extensive
```

Physical interface: ge-1/0/10, Enabled, Physical link is Down  
 Interface index: 139, SNMP ifIndex: 58, Generation: 140

  Protocol inet, Generation: 144, Route table: 0
Flags: uRPF
Addresses, Flags: Is-Preferred Is-Primary

```

**Meaning** The `show interfaces ge-1/0/10 extensive` command (and the `show interfaces ge-1/0/10 detail` command) displays in-depth information about the interface. The **Flags:** output field near the bottom of the display reports the unicast RPF status. If unicast RPF has not been enabled, the **uRPF** flag is not displayed.

On EX3200, EX4200, and EX4300 switches, unicast RPF is implicitly enabled on *all* switch interfaces, including aggregated Ethernet interfaces (also referred to as link aggregation groups or LAGs), integrated routing and bridging (IRB) interfaces, and routed VLAN interfaces (RVIs) when you enable unicast RPF on a single interface. However, the unicast RPF status is shown as enabled only on interfaces for which you have explicitly configured unicast RPF. Thus, the **uRPF** flag is not displayed on interfaces for which you have not explicitly configured unicast RPF even though unicast RPF is implicitly enabled on all interfaces on EX3200 and EX4200 switches.

## Verifying That a Trusted DHCP Server Is Working Correctly

**Purpose** Verify that a DHCP trusted server is working on the switch. See what happens when the DHCP server is trusted and then untrusted.

**Action** Send some DHCP requests from network devices (here they are DHCP clients) connected to the switch.

Display the DHCP snooping information when the interface on which the DHCP server connects to the switch is trusted. The following output results when requests are sent from the MAC addresses and the server has provided the IP addresses and leases:

```
user@switch> show dhcp snooping binding
```

DHCP Snooping Information:

| MAC Address       | IP Address | Lease | Type    | VLAN          | Interface  |
|-------------------|------------|-------|---------|---------------|------------|
| 00:05:85:3A:82:77 | 192.0.2.17 | 600   | dynamic | employee-vlan | ge-0/0/1.0 |
| 00:05:85:3A:82:79 | 192.0.2.18 | 653   | dynamic | employee-vlan | ge-0/0/1.0 |
| 00:05:85:3A:82:80 | 192.0.2.19 | 720   | dynamic | employee-vlan | ge-0/0/2.0 |
| 00:05:85:3A:82:81 | 192.0.2.20 | 932   | dynamic | employee-vlan | ge-0/0/2.0 |
| 00:05:85:3A:82:83 | 192.0.2.21 | 1230  | dynamic | employee-vlan | ge-0/0/2.0 |
| 00:05:85:27:32:88 | 192.0.2.22 | 3200  | dynamic | employee-vlan | ge-0/0/2.0 |

**Meaning** When the interface on which the DHCP server connects to the switch has been set to trusted, the output (see preceding sample) shows, for each MAC address, the assigned IP address and lease time—that is, the time, in seconds, remaining before the lease expires.

If the DHCP server had been configured as untrusted, no entries would be added to the DHCP snooping database and nothing would be shown in the output of the **show dhcp snooping binding** command.

## Verifying That Three-Color Policers Are Operational

**Purpose** Verify that three-color policers in firewall filter configurations are working properly.

**Action** Use the following operational mode commands to verify that a three-color policer is working properly:

- `show class-of-service forwarding-table classifiers`
- `show interfaces interface-name extensive`
- `show interfaces queue interface-name`

**Related Documentation**

- [Overview of Policers on page 5241](#)
- [Configuring Two-Color and Three-Color Policers to Control Traffic Rates on page 5296](#)

## Verifying That Two-Color Policers Are Operational

**Purpose** Verify that two-color policers in firewall filter configurations are working properly.

**Action** Use the `show firewall policer` operational mode command to verify that the policers are working properly:

```
user@switch> show firewall policer
Filter: egress-vlan-watch-employee
Filter: ingress-port-filter
Filter: ingress-port-limit-tcp-icmp
Policers:
Name                               Packets
icmp-connection-policer            10
tcp-connection-policer             539
Filter: ingress-vlan-rogue-block
Filter: ingress-vlan-limit-guest
```

**Meaning** The `show firewall policer` command displays the names of all firewall filters and policers that are configured. For each policer that is specified in a filter configuration, the output field shows the current packet count for all packets that exceed the specified rate limits.

## Troubleshooting Firewall Filter Configuration

Use the following information to troubleshoot your firewall filter configuration.

- [Firewall Filter Configuration Returns a No Space Available in TCAM Message on page 5411](#)
- [Filter Counts Previously Dropped Packet on page 5413](#)
- [Matching Packets Not Counted on page 5414](#)
- [Counter Reset When Editing Filter on page 5414](#)
- [Cannot Include loss-priority and policer Actions in Same Term on page 5414](#)
- [Cannot Egress Filter Certain Traffic Originating on QFX Switch on page 5415](#)
- [Firewall Filter Match Condition Not Working with Q-in-Q Tunneling on page 5415](#)
- [Egress Firewall Filters with Private VLANs on page 5415](#)
- [Egress Filtering of L2PT Traffic Not Supported on page 5416](#)
- [Cannot Drop BGP Packets in Certain Circumstances on page 5416](#)
- [Invalid Statistics for Policer on page 5416](#)
- [Policers can Limit Egress Filters on page 5416](#)

### Firewall Filter Configuration Returns a No Space Available in TCAM Message

**Problem**    **Description:** When a firewall filter configuration exceeds the amount of available Ternary Content Addressable Memory (TCAM) space, the system returns the following **syslogd** message:

```
No space available in tcam.  
Rules for filter filter-name will not be installed.
```

A switch returns this message during the commit operation if the firewall filter that has been applied to a port, VLAN, or Layer 3 interface exceeds the amount of space available

in the TCAM table. The filter is not applied, but the commit operation for the firewall filter configuration is completed in the CLI module.

**Solution** When a firewall filter configuration exceeds the amount of available TCAM table space, you must configure a new firewall filter with fewer filter terms so that the space requirements for the filter do not exceed the available space in the TCAM table.

You can perform either of the following procedures to correct the problem:

To delete the filter and its binding and apply the new smaller firewall filter to the same binding:

1. Delete the filter and its binding to ports, VLANs, or Layer 3 interfaces. For example:

```
[edit]
user@switch# delete firewall family ethernet-switching filter ingress-vlan-rogue-block
user@switch# delete vlans employee-vlan description "filter to block rogue devices on
employee-vlan"
user@switch# delete vlans employee-vlan filter input ingress-vlan-rogue-block
```

2. Commit the changes:

```
[edit]
user@switch# commit
```

3. Configure a smaller filter with fewer terms that does not exceed the amount of available TCAM space. For example:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-ingress-vlan-rogue-block ...
```

4. Apply (bind) the new firewall filter to a port, VLAN, or Layer 3 interface. For example:

```
[edit]
user@switch# set vlans employee-vlan description "filter to block rogue devices on
employee-vlan"
user@switch# set vlans employee-vlan filter input new-ingress-vlan-rogue-block
```

5. Commit the changes:

```
[edit]
user@switch# commit
```

To apply a new firewall filter and overwrite the existing binding but not delete the original filter:

1. Configure a firewall filter with fewer terms than the original filter:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-ingress-vlan-rogue-block...
```

2. Apply the firewall filter to the port, VLAN, or Layer 3 interfaces to overwrite the binding of the original filter—for example:

```
[edit]
user@switch# set vlans employee-vlan description "smaller filter to block rogue devices on
employee-vlan"
user@switch# set vlans employee-vlan filter input new-ingress-vlan-rogue-block
```

Because you can apply no more than one firewall filter per VLAN per direction, the binding of the original firewall filter to the VLAN is overwritten with the new firewall filter **new-ingress-vlan-rogue-block**.

3. Commit the changes:

```
[edit]
user@switch# commit
```

**NOTE:** The original filter is not deleted and is still available in the configuration.

### Filter Counts Previously Dropped Packet

- Problem**    **Description:** If you configure two or more filters in the same direction for a physical interface and one of the filters includes a counter, the counter will be incorrect if the following circumstances apply:
- You configure the filter that is applied to packets first to discard certain packets. For example, imagine that you have a VLAN filter that accepts packets sent to 10.10.1.0/24 addresses and implicitly discards packets sent to any other addresses. You apply the filter to the **admin** VLAN in the output direction, and interface xe-0/0/1 is a member of that VLAN.
  - You configure a subsequent filter to accept and count packets that are dropped by the first filter. In this example, you have a port filter that accepts and counts packets sent to 192.168.1.0/24 addresses that is also applied to xe-0/0/1 in the output direction.

The egress VLAN filter is applied first and correctly discards packets sent to 192.168.1.0/24 addresses. The egress port filter is applied next and counts the discarded packets as matched packets. The packets are not forwarded, but the counter displayed by the egress port filter is incorrect.

Remember that the order in which filters are applied depends on the direction in which they are applied, as indicated here:

Ingress filters:

1. Port (Layer 2) filter
2. VLAN filter
3. Router (Layer 3) filter

Egress filters:

1. Router (Layer 3) filter
2. VLAN filter
3. Port (Layer 2) filter

**Solution**    This is expected behavior.

### Matching Packets Not Counted

---

**Problem** **Description:** If you configure two egress filters with counters for a physical interface and a packet matches both of the filters, only one of the counters includes that packet.  
For example:

- You configure an egress port filter with a counter for interface xe-0/0/1.
- You configure an egress VLAN filter with a counter for the **adminVLAN**, and interface xe-0/0/1 is a member of that VLAN.
- A packet matches both filters.

In this case, the packet is counted by only one of the counters even though it matched both filters.

**Solution** This is expected behavior.

### Counter Reset When Editing Filter

---

**Problem** **Description:** If you edit a firewall filter term, the value of any counter associated with any term in the same filter is set to 0, including the implicit counter for any policer referenced by the filter. Consider the following examples:

- Assume that your filter has **term1**, **term2**, and **term3**, and each term has a counter that has already counted matching packets. If you edit any of the terms in any way, the counters for all the terms are reset to 0.
- Assume that your filter has **term1** and **term2**. Also assume that **term2** has a **policer** action modifier and the implicit counter of the policer has already counted 1000 matching packets. If you edit **term1** or **term2** in any way, the counter for the policer referenced by **term2** is reset to 0.

**Solution** This is expected behavior.

### Cannot Include loss-priority and policer Actions in Same Term

---

**Problem** **Description:** You cannot include both of the following actions in the same firewall filter term in a QFX Series switch:

- **loss-priority**
- **policer**

If you do so, you see the following error message when you attempt to commit the configuration: "cannot support policer action if loss-priority is configured."

**Solution** This is expected behavior.

### Cannot Egress Filter Certain Traffic Originating on QFX Switch

**Problem** **Description:** On a QFX Series switch, you cannot filter certain traffic with a firewall filter applied in the output direction if the traffic originates on the QFX switch. This limitation applies to control traffic for protocols such as ICMP (ping), STP, LACP, and so on.

**Solution** This is expected behavior.

### Firewall Filter Match Condition Not Working with Q-in-Q Tunneling

**Problem** **Description:** If you create a firewall filter that includes a match condition of **dot1q-tag** or **dot1q-user-priority** and apply the filter on input to a trunk port that participates in a service VLAN, the match condition does not work if the Q-in-Q EtherType is not 0x8100. (When Q-in-Q tunneling is enabled, trunk interfaces are assumed to be part of the service provider or data center network and therefore participate in service VLANs.)

**Solution** This is expected behavior. To set the Q-in-Q EtherType to 0x8100, enter the **set dot1q-tunneling ethertype 0x8100** statement at the **[edit ethernet-switching-options]** hierarchy level. You must also configure the other end of the link to use the same Ethertype.

### Egress Firewall Filters with Private VLANs

**Problem** **Description:** If you apply a firewall filter in the output direction to a primary VLAN, the filter also applies to the secondary VLANs that are members of the primary VLAN when the traffic egresses with the primary VLAN tag or isolated VLAN tag, as listed below:

- Traffic forwarded from a secondary VLAN trunk port to a promiscuous port (trunk or access)
- Traffic forwarded from a secondary VLAN trunk port that carries an isolated VLAN to a PVLAN trunk port.
- Traffic forwarded from a promiscuous port (trunk or access) to a secondary VLAN trunk port
- Traffic forwarded from a PVLAN trunk port. to a secondary VLAN trunk port
- Traffic forwarded from a community port to a promiscuous port (trunk or access)

If you apply a firewall filter in the output direction to a primary VLAN, the filter does *not* apply to traffic that egresses with a community VLAN tag, as listed below:

- Traffic forwarded from a community trunk port to a PVLAN trunk port
- Traffic forwarded from a secondary VLAN trunk port that carries a community VLAN to a PVLAN trunk port
- Traffic forwarded from a promiscuous port (trunk or access) to a community trunk port
- Traffic forwarded from a PVLAN trunk port. to a community trunk port

If you apply a firewall filter in the output direction to a community VLAN, the following behaviors apply:

- The filter is applied to traffic forwarded from a promiscuous port (trunk or access) to a community trunk port (because the traffic egresses with the community VLAN tag).
- The filter is applied to traffic forwarded from a community port to a PVLAN trunk port (because the traffic egresses with the community VLAN tag).
- The filter is *not* applied to traffic forwarded from a community port to a promiscuous port (because the traffic egresses with the primary VLAN tag or untagged).

**Solution** These are expected behaviors. They occur only if you apply a firewall filter to a private VLAN in the output direction and do not occur if you apply a firewall filter to a private VLAN in the input direction.

---

#### Egress Filtering of L2PT Traffic Not Supported

**Problem** **Description:** Egress filtering of L2PT traffic is not supported on the QFX3500 switch. That is, if you configure L2PT to tunnel a protocol on an interface, you cannot also use a firewall filter to filter traffic for that protocol on that interface in the output direction. If you commit a configuration for this purpose, the firewall filter is not applied to the L2PT-tunneled traffic.

**Solution** This is expected behavior.

---

#### Cannot Drop BGP Packets in Certain Circumstances

**Problem** **Description:** BGP packets with a time-to-live (TTL) value greater than 1 cannot be discarded using a firewall filter applied to a loopback interface or applied on input to a Layer 3 interface. BGP packets with TTL value of 1 or 0 can be discarded using a firewall filter applied to a loopback interface or applied on input to a Layer 3 interface.

**Solution** This is expected behavior.

---

#### Invalid Statistics for Policer

**Problem** **Description:** If you apply a single-rate two-color policer in more than 128 terms in a firewall filter, the output of the **show firewall** command displays incorrect data for the policer.

**Solution** This is expected behavior.

---

#### Policers can Limit Egress Filters

**Problem** **Description:** The number of egress policers that you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that consume

two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

**Solution** You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

---

### Incomplete Count of Packet Drops

**Problem**    **Description:** Under certain circumstances, Junos OS might display a misleading number of packets dropped by an ingress policer.

If packets are dropped because of ingress admission control, policer statistics might not show the number of packet drops you would expect by calculating the difference between ingress and egress packet counts. This might happen if you apply an ingress policer to multiple interfaces, and the aggregate ingress rate of those interfaces exceeds the line rate of a common egress interface. In this case, packets might be dropped from the ingress buffer. These drops are not included in the count of packets dropped by the policer, which causes policer statistics to underreport the total number of drops.

**Solution**    This is expected behavior.

---

### Counter Reset When Editing Filter

**Problem**    **Description:** If you edit a firewall filter term, the value of any counter associated with any term in the same filter is set to 0, including the implicit counter for any policer referenced by the filter. Consider the following examples:

- Assume that your filter has **term1**, **term2**, and **term3**, and each term has a counter that has already counted matching packets. If you edit any of the terms in any way, the counters for all the terms are reset to 0.
- Assume that your filter has **term1** and **term2**. Also assume that **term2** has a **policer** action modifier and the implicit counter of the policer has already counted 1000 matching packets. If you edit **term1** or **term2** in any way, the counter for the policer referenced by **term2** is reset to 0.

**Solution**    This is expected behavior.

---

### Invalid Statistics for Policer

**Problem**    **Description:** If you apply a single-rate two-color policer in more than 128 terms in a firewall filter, the output of the **show firewall** command displays incorrect data for the policer.

**Solution** This is expected behavior.

### Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured

**Problem** **Description:** If you configure a policer to rate-limit throughput and apply it on egress to multiple interfaces on a QFX3500 switch or Node, the measured aggregate policed rate might be twice the configured rate, depending on which interfaces you apply the policer to. The doubling of the policed rate occurs if you apply a policer to multiple interfaces and *both* of the following are true:

- There is at least one policed interface in the range xe-0/0/0 to xe-0/0/23 or the range xe-0/1/1 to xe-0/1/7.
- There is at least one policed interface in the range xe-0/0/24 to xe-0/0/47 or the range xe-0/1/8 to xe-0/1/15.

For example, if you configure a policer to rate-limit traffic at 1 Gbps and apply the policer (by using a firewall filter) to xe-0/0/0 and xe-0/0/24 in the output direction, each interface is rate-limited at 1 Gbps, for a total allowed throughput of 2 Gbps. The same behavior occurs if you apply the policer to xe-0/1/1 and xe-0/0/24—each interface is rate-limited at 1 Gbps.

If you apply the same policer on egress to multiple interfaces in these groups, each *group* is rate-limited at 1 Gbps. For example, if you apply the policer to xe-0/0/0 through xe-0/0/4 (five interfaces) and xe-0/0/24 through xe-0/0/33 (ten interfaces), each group is rate-limited at 1 Gbps, for a total allowed throughput of 2 Gbps.

Here is another example: If you apply the policer to xe-0/0/0 through xe-0/0/4 and xe-0/1/1 through xe-0/1/5 (a total of ten interfaces), that group is rate-limited at 1 Gbps in aggregate. If you also apply the policer to xe-0/0/24, that one interface is rate-limited at 1 Gbps while the other ten are still rate-limited at 1 Gbps in aggregate.

Interfaces xe-0/1/1 through xe-0/1/15 are physically located on the QSFP+ uplink ports, according to the following scheme:

- xe-0/1/1 through xe-0/1/3 are on Q0.
- xe-0/1/4 through xe-0/1/7 are on Q1.
- xe-0/1/8 through xe-0/1/11 are on Q2.
- xe-0/1/12 through xe-0/1/15 are on Q3.

The doubling of the policed rate occurs only if the policer is applied in the output direction. If you configure a policer as described above but apply it in the input direction, the total allowed throughput for all interfaces is 1 Gbps.

**Solution** This is expected behavior.

### Filter-Specific Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured

---

**Problem** **Description:** You can configure policers to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps. However, the behavior of a filter-specific policer is affected by how the firewall filter terms that reference the policer are stored in ternary content addressable memory (TCAM). If you create a filter-specific policer and reference it in multiple firewall filter terms, the policer allows more traffic than expected if the terms are stored in different TCAM slices. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms that are stored in three separate memory slices, the total bandwidth allowed by the filter is 3 Gbps, not 1 Gbps.

**Solution** To prevent this unexpected behavior, use the information about TCAM slices presented in [“Planning the Number of Firewall Filters to Create” on page 5236](#) to organize your configuration file so that all the firewall filter terms that reference a given filter-specific policer are stored in the same TCAM slice.

### Policers Can Limit Egress Filters

---

**Problem** **Description:** The number of egress policers that you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that consume two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters. Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.

- Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

**Solution** You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

### Port Mirroring Overview

---

Port mirroring copies packets entering or exiting a port or entering a VLAN and sends the copies to a local interface for local monitoring or to a VLAN for remote monitoring. Use port mirroring to send traffic to applications that analyze traffic for purposes such as monitoring compliance, enforcing policies, detecting intrusions, monitoring and predicting traffic patterns, correlating events, and so on.

Port mirroring is needed for traffic analysis on a switch because a switch normally sends packets only to the port to which the destination device is connected. You configure port mirroring on the switch to send copies of unicast traffic to a local interface or a VLAN and run an analyzer application on a device connected to the interface or VLAN. You configure port mirroring by using the **analyzer** statement.

Keep performance in mind when configuring port mirroring. For example, If you mirror traffic from multiple ports, the mirrored traffic may exceed the capacity of the output interface. We recommend that you limit the amount of copied traffic by selecting specific interfaces instead of using the **all** keyword. You can also limit the amount of mirrored traffic by using a firewall filter to send specific traffic to a port mirroring instance. Mirroring only the necessary packets reduces the possibility of a performance impact.

You can use port mirroring to copy any of the following:

- All packets entering or exiting an interface (in any combination)—For example, you can send copies of the packets entering some interfaces and the packets exiting other interfaces to the same local interface or VLAN. If you configure port mirroring to copy packets exiting an interface, traffic that originates on that switch or Node device (in a QFabric system) is not copied when it egresses. Only switched traffic is copied on egress. (See the limitation on egress mirroring below.)
- All packets entering a VLAN—You cannot use port mirroring to copy packets exiting a VLAN.
- Firewall-filtered sample—Sample of packets entering a port or VLAN. Configure a firewall filter to select certain packets for mirroring.

**NOTE:** Firewall filters are not supported on egress ports; therefore, you cannot specify policy-based sampling of packets exiting an interface.

### Port Mirroring Instance Types

To configure port mirroring, you configure an instance of one of the following types:

- Analyzer instance: You must specify the input and output for the instance. This instance type is useful for ensuring that all traffic transiting an interface or VLAN is mirrored and sent to the analyzer device.
- Port-mirroring instance: You do not specify an input for this instance type. Instead, you create a firewall filter that specifies the required traffic and directs it to the mirror. This instance type is useful for controlling which types of traffic should be mirrored. When you use a port-mirroring instance, you can direct traffic to it in the following ways:
  - Specify the name of the port-mirroring instance in the firewall filter using the **port-mirror-instance *instance-name*** action. You should use this approach if there are multiple port-mirroring instances defined.
  - Configure the filter to send the mirrored packets to the output interface defined in the instance using the **port-mirror** action. You can use this approach if there is only one port-mirroring instance defined.

### Port-Mirroring Terminology

Table 445 on page 5426 lists the terms used in the documentation about port mirroring and provides definitions.

**Table 445: Port Mirroring Terms and Definitions**

| Term              | Description  |
|-------------------|--|
| Analyzer instance | Port-mirroring configuration that includes a name, source interfaces or source VLAN, and a destination for mirrored packets (either a local access interface or a VLAN). |

Table 445: Port Mirroring Terms and Definitions (*continued*)

|   |  |
|---|--|
| Port mirroring instance   | A port-mirroring configuration that does not specify an input.. A firewall filter must be used to send traffic to the port mirror. Use the action <b>port-mirror-instance <i>instance-name</i></b> in the firewall filter configuration to send packets to the port mirror.  |
| Output interface (also known as monitor interface)              | <p>Access interface to which packet copies are sent and to which a device running an analyzer application is connected.</p> <p>The following limitations apply to an output interface:</p> <ul style="list-style-type: none"> <li>• Cannot also be a source port.</li> <li>• Cannot be used for switching.</li> <li>• Cannot be an aggregated Ethernet interface (LAG).</li> <li>• Does not participate in Layer 2 protocols, such as Spanning Tree Protocol (STP).</li> <li>• Loses any existing VLAN associations when you configure it as an analyzer output interface.</li> </ul> <p>If the capacity of the output interface is insufficient to handle the traffic from the source ports, overflow packets are dropped.</p>  |
| Output IP address   | <p>IP address of the device running an analyzer application. The device can be on a remote network. When you use this feature, the mirrored packets are GRE-encapsulated. The analyzer device must be able to de-encapsulate GRE-encapsulated packets, or the GRE-encapsulated packets must be de-encapsulated before reaching the analyzer device. (You can use a network sniffer to de-encapsulate the packets.)</p> <ul style="list-style-type: none"> <li>• An output IP address cannot be in the same subnetwork as any of the switch's management interfaces.</li> <li>• If you create virtual routing instances and also create an analyzer configuration that includes an output IP address, the output address belongs to the default virtual routing instance (inet.0 routing table).</li> </ul> |
| Output VLAN (also known as monitor or analyzer VLAN)            | <p>VLAN to which copies are sent and to which a device running an analyzer application is connected. The analyzer VLAN can span multiple switches.</p> <p>The following limitations apply to an output VLAN:</p> <ul style="list-style-type: none"> <li>• Cannot be a private VLAN or VLAN range.</li> <li>• Cannot be shared by multiple <b>analyzer</b> statements.</li> <li>• An output VLAN interface cannot be a member of any other VLAN.</li> <li>• An output VLAN interface cannot be an aggregated Ethernet interface (LAG).</li> <li>• On the source (monitored) switch, only one interface can be a member of the analyzer VLAN.</li> </ul>   |
| Input interface (also known as mirrored or monitored interface) | Interface that provides traffic to be mirrored. This traffic can be entering or exiting the interface. (Ingress or egress traffic can be mirrored.) An input interface cannot also be an output interface for an analyzer.   |
| Monitoring station  | Computer running an analyzer application.  |
| Local port mirroring  | Port-mirroring configuration in which the mirrored packets are sent to an interface on the same switch.  |
| Remote port mirroring   | Flooding mirrored packets to an analyzer VLAN that you create to receive mirror traffic or sending the mirrored packets to a remote IP address. (You cannot send mirrored packets to a remote IP address on a QFabric system.)   |

Table 445: Port Mirroring Terms and Definitions (*continued*)

|                        |  |
|------------------------|--|
| Policy-based mirroring | Mirroring of packets that match the match a firewall filter term. The action <b>analyzer analyzer-name</b> is used in the firewall filter to send the packets to the analyzer. |
|------------------------|--|

### Port Mirroring and STP

The behavior of STP in a port-mirroring configuration depends on the version of Junos OS you are using:

- Junos OS 13.2X50, Junos OS 13.2X51-D25 or earlier, Junos OS 13.2X52: If you enable STP, port mirroring might not work because STP might block the mirrored packets.
- Junos OS 13.2X51-D30, Junos OS 14.1X53: STP is disabled for mirrored traffic. You must ensure that your topology prevents loops for this traffic.

### Port Mirroring Constraints and Limitations

- [Local and Remote Port Mirroring on page 5428](#)
- [Remote Port Mirroring Only on page 5430](#)

#### Local and Remote Port Mirroring

The following constraints and limitations apply to local and remote port mirroring:

- You can create a total of four port-mirroring configurations.
- You can create a total of four port-mirroring configurations on each Node group in a QFabric system, subject to the following constraints:
  - As many as four of the configurations can be for local port mirroring.
  - As many as three of the configurations can be for remote port mirroring.
- Regardless of whether you are configuring a standalone switch or a Node group, the following limits apply:
  - There can be no more than two configurations that mirror ingress traffic. (If you configure a firewall filter to send traffic to a port mirror—that is, you use the **analyzer** action modifier in a filter term—this counts as an ingress mirroring configuration for switch or Node group on which the filter is applied.)
  - There can be no more than two configurations that mirror egress traffic.

**NOTE:** On QFabric systems, there is no system-wide limit on the total number of mirror sessions.

- You can configure no more than one type of output in one port-mirroring configuration. That is, you can use no more than one of the following to complete a **set analyzer name output** statement:
  - **interface**
  - **ip-address**

- **vlan**
- If you configure Junos OS to mirror egress packets, do not configure more than 2000 VLANs on a standalone switch or QFabric system. If you do so, some VLAN packets might contain incorrect VLAN IDs. This applies to any VLAN packets—not only the mirrored copies.
- The **ratio** and **loss-priority** options are not supported.
- Packets with physical layer errors are filtered out and are not sent to the output port or VLAN.
- If you use sFlow monitoring to sample traffic, it does not sample the mirror copies when they exit from the output interface.
- You cannot mirror packets exiting or entering the following ports:
  - Dedicated Virtual Chassis interfaces
  - Management interfaces (me0 or vme0)
  - Fibre Channel interfaces
  - Routed VLAN interfaces
- An aggregated Ethernet interface cannot be an output interface if the input is a VLAN or if traffic is sent to the analyzer by a firewall filter.
- Do not include an 802.1Q subinterface that has a unit number other than 0 in a port mirroring configuration. Port mirroring does not work with subinterfaces if their unit number is not 0. (You configure 802.1Q subinterfaces using the **vlan-tagging** statement.)
- When packet copies are sent out the output interface, they are not modified for any changes that are normally applied on egress, such as CoS rewriting.
- An interface can be the input interface for only one mirroring configuration. Do not use the same interface as the input interface for multiple mirroring configurations.
- CPU-generated packets (such as ARP, ICMP, BPDU, and LACP packets) cannot be mirrored on egress.
- VLAN-based mirroring is not supported for STP traffic.
- (QFabric systems only) If you configure a QFabric analyzer to mirror egress traffic and the input and output interfaces are on different Node devices, the mirrored copies have incorrect VLAN IDs. This limitation does not apply if you configure a QFabric analyzer to mirror egress traffic and the input and output interfaces are on the *same* Node device. In this case the mirrored copies have the correct VLAN IDs (as long as you do not configure more than 2000 VLANs on the QFabric system).

### ***Remote Port Mirroring Only***

The following constraints and limitations apply to remote port mirroring:

- If you configure an output IP address, the address cannot be in the same subnetwork as any of the switch's management interfaces.
- If you create virtual routing instances and also create an analyzer configuration that includes an output IP address, the output address belongs to the default virtual routing instance (inet.0 routing table).
- An output VLAN cannot be a private VLAN or VLAN range.
- An output VLAN cannot be shared by multiple **analyzer** statements.
- An output VLAN interface cannot be a member of any other VLAN.
- An output VLAN interface cannot be an aggregated Ethernet interface.
- On the source (monitored) switch, only one interface can be a member of the analyzer VLAN.

## **Understanding Layer 3 Logical Interfaces**

A Layer 3 logical interface is a logical division of a physical interface that operates at the network level and therefore can receive and forward 802.1Q VLAN tags. You can use Layer 3 logical interfaces to route traffic among multiple VLANs along a single trunk line that connects a Juniper Networks switch to a Layer 2 switch. Only one physical connection is required between the switches.

To create Layer 3 logical interfaces on a switch, enable VLAN tagging, partition the physical interface into logical partitions, and bind the VLAN ID to the logical interface.

We recommend that you use the VLAN ID as the logical interface number when you configure the logical interface. QFX Series and EX4600 switches support a maximum of 4089 VLANs, which includes the default VLAN. You can, however, assign a VLAN ID in the range of 1 to 4094, but five of these VLAN IDs are reserved for internal use.

VLAN tagging places the VLAN ID in the frame header, allowing each physical interface to handle multiple VLANs. When you configure multiple VLANs on an interface, you must also enable tagging on that interface. Junos OS on switches supports a subset of the 802.1Q standard for receiving and forwarding routed or bridged Ethernet frames with single VLAN tags and running Virtual Router Redundancy Protocol (VRRP) over 802.1Q-tagged interfaces.

## DHCP Relay

---

- [DHCP and BOOTP Relay Overview on page 5431](#)

### DHCP and BOOTP Relay Overview

You can configure a Juniper Networks switch to act as a Dynamic Host Configuration Protocol (DHCP) or Bootstrap Protocol (BOOTP) relay agent. This means that if the switch receives a broadcast DHCP or BOOTP request from a locally attached host (client), it relays the message to a specified DHCP or BOOTP server. You should configure the switch to be a DHCP/BOOTP relay agent if you have locally attached hosts and a distant DHCP or BOOTP server.

**NOTE:** Because DHCP and BOOTP messages are broadcast and are not directed to a specific server, switch, or router, Juniper switches cannot function as both a DHCP server and a DHCP/BOOTP relay agent at the same time. The Junos operating system (Junos OS) generates a commit error if both options are configured at the same time, and the commit operation does not succeed until one of the options is removed.

### Examples: Configuring Port Mirroring for Local Analysis

Use port mirroring to send traffic to applications that analyze traffic for purposes such as monitoring compliance, enforcing policies, detecting intrusions, monitoring and predicting traffic patterns, correlating events, and so on. Port mirroring copies packets entering or exiting an interface or entering a VLAN and sends the copies to a local interface for local monitoring.

**NOTE:** This example uses the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Example: Configuring Port Mirroring for Local Analysis*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 43](#).

This example describes how to configure port mirroring to copy traffic sent by employee computers to a switch to an access interface on the same switch.

- [Requirements on page 5434](#)
- [Overview and Topology on page 5434](#)
- [Example: Mirroring All Employee Traffic for Local Analysis on page 5434](#)
- [Example: Mirroring Employee Web Traffic with a Firewall Filter on page 5435](#)

## Requirements

This example uses the following hardware and software components:

- Junos OS Release 13.2
- A switch

## Overview and Topology

This topic includes two related examples that describe how to mirror traffic entering interfaces on the switch to an access interface on the same switch. The first example shows how to mirror all traffic sent by employee computers to the switch. The second example includes a filter to mirror only the employee traffic going to the Web.

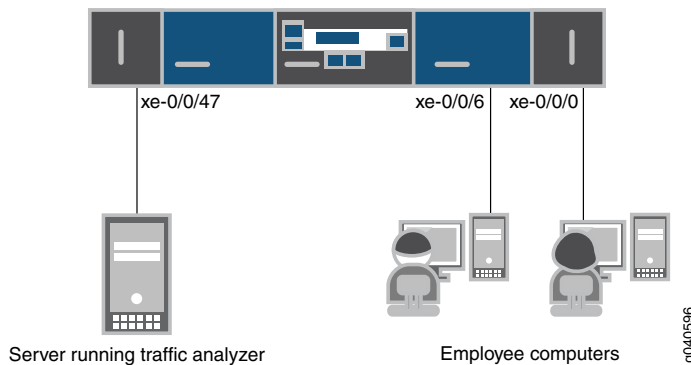

In this example, **xe-0/0/0** and **xe-0/0/6** serve as connections for employee computers. Interface **xe-0/0/47** is connected to a device running an analyzer application.

**NOTE:** Multiple ports mirrored to one interface can cause buffer overflow and dropped packets.

Figure 189 on page 5434 shows the network topology for this example.

Figure 189: Network Topology for Local Port Mirroring Example

### Example: Mirroring All Employee Traffic for Local Analysis

To configure port mirroring for all traffic sent by employee computers for local analysis, perform the tasks explained in this section.

#### CLI Quick Configuration

To quickly configure local port mirroring for ingress traffic to the two ports connected to employee computers, copy the following commands and paste them into a switch terminal window:

```
[edit]
set interfaces xe-0/0/0 unit 0 family ethernet-switching
set interfaces xe-0/0/6 unit 0 family ethernet-switching
set interfaces xe-0/0/47 unit 0 family ethernet-switching
set forwarding-options analyzer employee-monitor input ingress interface xe-0/0/0.0
```

```
set forwarding-options analyzer employee-monitor input ingress interface xe-0/0/6.0
set forwarding-options analyzer employee-monitor output interface xe-0/0/47.0
```

### Step-by-Step Procedure

To configure an analyzer called **employee-monitor** and specify the input (source) interfaces and the output interface:

1. Configure the interfaces connected to employee computers as input interfaces for the port-mirror analyzer **employee-monitor**:

```
[edit forwarding-options]
user@switch# set analyzer employee-monitor input ingress interface xe-0/0/0.0
user@switch# set analyzer employee-monitor input ingress interface xe-0/0/6.0
```

2. Configure the output analyzer interface for the **employee-monitor** analyzer. This will be the destination interface for the mirrored packets:

```
[edit forwarding-options]
user@switch# set analyzer employee-monitor output interface xe-0/0/47.0
```

**Results** Check the results of the configuration:

```
[edit]
user@switch# show forwarding-options analyzer
employee-monitor {
  input {
    ingress {
      interface xe-0/0/0.0;
      interface xe-0/0/6.0;
    }
  }
  output {
    interface {
      xe-0/0/47.0;
    }
  }
}
```

### Example: Mirroring Employee Web Traffic with a Firewall Filter

- [Requirements on page 5435](#)
- [Overview on page 5435](#)
- [Configuring on page 5436](#)
- [Verification on page 5438](#)

#### Requirements

This example uses the following hardware and software components:

- One switch
- Junos 13.2X51

#### Overview

Rather than mirror all traffic, it is usually desirable to mirror only certain traffic. This is a more-efficient use of your bandwidth and hardware and might be necessary because

constraints on these assets. To select specific traffic for mirroring, you use a firewall filter to match the desired traffic and direct it to a port-mirroring instance. The port-mirroring instance then copies the packets and sends them to the output VLAN, interface, or IP address.

### **Configuring**

To specify that the only traffic that will be mirrored is traffic sent by employees to the Web, perform the tasks explained in this section. To select this traffic for mirroring, you use a firewall filter to specify this traffic and direct it to a port-mirroring instance.

#### **CLI Quick Configuration**

To quickly configure local port mirroring of traffic from employee computers that is destined for the Web, copy the following commands and paste them into a switch terminal window:

```
[edit]
set forwarding-options port-mirroring instance employee-web-monitor output interface
xe-0/0/47.0
set firewall family ethernet-switching filter watch-employee term employee-to-corp from
destination-address 192.0.2.16/28
set firewall family ethernet-switching filter watch-employee term employee-to-corp from
source-address 192.0.2.16/28
set firewall family ethernet-switching filter watch-employee term employee-to-corp then accept
set firewall family ethernet-switching filter watch-employee term employee-to-web from
destination-port 80
set firewall family ethernet-switching filter watch-employee term employee-to-web then
port-mirror-instance employee-web-monitor
set interfaces xe-0/0/0 unit 0 family ethernet-switching filter input watch-employee
set interfaces xe-0/0/6 unit 0 family ethernet-switching filter input watch-employee
```

#### **Step-by-Step Procedure**

To configure local port mirroring of employee-to-web traffic from the two ports connected to employee computers:

1. Configure the output interface:

```
[edit interfaces]
user@switch# set xe-0/0/47 unit 0 family ethernet-switching
```

2. Configure the **employee-web-monitor** output interface. (Configure only the output—the input comes from the filter.)

```
[edit forwarding-options]
user@switch# set port-mirroring instance employee-web-monitor output interface
xe-0/0/47.0
```

3. Configure a firewall filter called **watch-employee** that includes a term to match traffic sent to the Web and send it to the port-mirroring instance **employee-web-monitor**. Traffic to and from the corporate subnet (destination or source address of **192.0.2.16/28**) does not need to be copied, so create another term to accept that traffic before it reaches the term that sends Web traffic to the instance:

```
[edit firewall family ethernet-switching]
user@switch# set filter watch-employee term employee-to-corp from destination-address
192.0.2.16/28
user@switch# set filter watch-employee term employee-to-corp from source-address
192.0.2.16/28
user@switch# set filter watch-employee term employee-to-corp then accept
user@switch# set filter watch-employee term employee-to-web from destination-port 80
```

- ```

user@switch# set filter watch-employee term employee-to-web then port-mirror-instance
employee-web-monitor

```
4. Apply the firewall filter to the appropriate interfaces as an ingress filter (egress filters do not allow analyzers):
- ```

[edit interfaces]
user@switch# set xe-0/0/0 unit 0 family ethernet-switching filter input watch-employee
user@switch# set xe-0/0/6 unit 0 family ethernet-switching filter input watch-employee

```

**Results** Check the results of the configuration:

```

[edit]
user@switch# show
forwarding-options {
  port-mirroring {
    instance {
      employee-web-monitor {
        output {
          interface xe-0/0/47.0;
        }
      }
    }
  }
}
...
firewall family ethernet-switching {
  filter watch-employee {
    term employee-to-web {
      from {
        destination-port 80;
      }
      then port-mirror-instance employee-web-monitor;
    }
  }
}
...
interfaces {
  xe-0/0/0 {
    unit 0 {
      family ethernet-switching {
        filter {
          input watch-employee;
        }
      }
    }
  }
  xe-0/0/6 {
    family ethernet-switching {
      filter {
        input watch-employee;
      }
    }
  }
}

```

### Verification

#### Verifying That the Analyzer Has Been Correctly Created

**Purpose** Verify that the analyzer named **employee-monitor** or **employee-web-monitor** has been created on the switch with the appropriate input interfaces and appropriate output interface.

**Action** You can verify that the port mirror analyzer has been configured as expected using the **show analyzer** command.

```
user@switch> show forwarding-options analyzer
  Port mirror name           : employee-monitor
  Mirror rate                 : 1
  Maximum packet length      : 0
  State                       : up
  Ingress monitored interfaces : xe-0/0/0.0
  Ingress monitored interfaces : xe-0/0/6.0
  Output interface           : xe-0/0/47.0
```

**Meaning** This output shows that the port-mirroring instance **employee-monitor** has a ratio of 1 (mirroring every packet, the default setting), the maximum size of the original packet that was mirrored (0 indicates the entire packet), the state of the configuration (is up indicates that the instance is mirroring the traffic entering the xe-0/0/0, and xe-0/0/6 interfaces, and sending the mirrored traffic to the xe-0/0/47 interface). If the state of the output interface is down or if the output interface is not configured, the value of state will be **down** and the instance will not be programmed for mirroring.

### Example: Configuring Port Mirroring for Remote Analysis

Use port mirroring to send traffic to applications that analyze traffic for purposes such as monitoring compliance, enforcing policies, detecting intrusions, monitoring and predicting traffic patterns, correlating events, and so on. Port mirroring copies packets entering or exiting an interface or entering a VLAN and sends the copies either to a local interface for local monitoring or to a VLAN for remote monitoring. This example describes how to configure port mirroring for remote analysis.

**NOTE:** This example uses the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Example: Configuring Port Mirroring for Remote Analysis*. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 43.

- Requirements on page 5439
- Overview and Topology on page 5439
- Mirroring All Employee Traffic for Remote Analysis on page 5439
- Mirroring Employee-to-Web Traffic for Remote Analysis on page 5440
- Verification on page 5442

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 13.2 for the QFX Series
- A switch

### Overview and Topology

This topic includes two related examples that describe how to mirror traffic entering ports on the switch to an analyzer VLAN so that you can perform analysis using a remote device. The first example shows how to mirror all traffic sent by employee computers to the switch. The second example includes a filter to mirror only the employee traffic going to the Web.

In this example:

- Interfaces **ge-0/0/0** and **ge-0/0/1** are Layer 2 interfaces that connect to employee computers.
- Interface **ge-0/0/10** is a Layer 2 interface that connects to another switch.
- VLAN **remote-analyzer** is configured on all switches in the topology to carry the mirrored traffic.

**NOTE:** In addition to performing the configuration steps described here, you must also configure the analyzer VLAN (**remote-analyzer** in this example) on the other switches that are used to connect the source switch (the one in this configuration) to the one that the monitoring station is connected to.

### Mirroring All Employee Traffic for Remote Analysis

#### CLI Quick Configuration

To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your

network configuration, and then copy and paste the commands into the CLI at the **edit** hierarchy level:

```
[edit]
set vlans remote-analyzer vlan-id 999
set interfaces ge-0/0/10 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/10 unit 0 family ethernet-switching vlan members 999
set forwarding-options analyzer employee-monitor input ingress interface ge-0/0/0.0
set forwarding-options analyzer employee-monitor input ingress interface ge-0/0/1.0
set forwarding-options analyzer employee-monitor output vlan remote-analyzer
```

#### Step-by-Step Procedure

To configure basic remote port mirroring:

1. Configure the analyzer VLAN (called **remote-analyzer** in this example):  

```
[edit vlans]
user@switch# set vlans remote-analyzer vlan-id 999
```
2. Configure the interface connected to another switch for trunk mode and associate it with the **remote-analyzer** VLAN:  

```
[edit interfaces]
user@switch# set ge-0/0/10 unit 0 family ethernet-switching port-mode trunk
user@switch# set ge-0/0/10 unit 0 family ethernet-switching vlan members 999
```
3. Configure the **employee-monitor** analyzer:  

```
[edit forwarding-options]
user@switch# set analyzer employee-monitor
user@switch# set analyzer employee-monitor input ingress interface ge-0/0/0.0
user@switch# set analyzer employee-monitor input ingress interface ge-0/0/1.0
user@switch# set analyzer employee-monitor output vlan remote-analyzer
```
4. Configure the **remote-analyzer** VLAN on the switches that connect this switch to the monitoring workstation.

**Results** Check the results of the configuration:

```
[edit]
user@switch# show
forwarding-options {
  analyzer employee-monitor {
    input {
      ingress {
        interface ge-0/0/0.0;
        interface ge-0/0/1.0;
      }
    }
    output {
      vlan {
        remote-analyzer;
      }
    }
  }
}
```

---

#### Mirroring Employee-to-Web Traffic for Remote Analysis

#### CLI Quick Configuration

To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your

network configuration, and then copy and paste the commands into the CLI at the **edit** hierarchy level:

```
[edit]
set vlans remote-analyzer vlan-id 999
set interfaces ge-0/0/10 unit 0 family ethernet-switching port mode trunk
set interfaces ge-0/0/10 unit 0 family ethernet-switching vlan members 999
set forwarding-options analyzer employee-web-monitor loss-priority high output vlan 999
set firewall family ethernet-switching filter watch-employee term employee-to-web from
destination-port 80
set firewall family ethernet-switching filter watch-employee term employee-to-web then analyzer
employee-web-monitor
set ge-0/0/0 unit 0 family ethernet-switching filter input watch-employee
set interfaces ge-0/0/1 unit 0 family ethernet-switching filter input watch-employee
```

### Step-by-Step Procedure

1. Configure the analyzer VLAN (called **remote-analyzer** in this example):  

```
[edit vlans]
user@switch# set remote-analyzer vlan-id 999
```
2. Configure an interface to associate it with the **remote-analyzer** VLAN:  

```
[edit interfaces]
user@switch# set interfaces ge-0/0/10 unit 0 family ethernet-switching port mode trunk
user@switch# set ge-0/0/10 unit 0 family ethernet-switching vlan members 999
```
3. Configure the **employee-web-monitor** analyzer. (Configure only the output—the input comes from the filter.)  

```
[edit forwarding-options]
user@switch# set forwarding-options analyzer employee-web-monitor output vlan 999
```
4. Configure a firewall filter called **watch-employee** to match traffic sent to the Web and send it to the analyzer **employee-web-monitor**:  

```
[edit firewall family ethernet-switching]
user@switch# set filter watch-employee term employee-to-web from destination-port 80
user@switch# set filter watch-employee term employee-to-web then analyzer
employee-web-monitor
```
5. Apply the firewall filter to the appropriate interfaces as an ingress filter:  

```
[edit interfaces]
user@switch# set ge-0/0/0 unit 0 family ethernet-switching filter input watch-employee
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input watch-employee
```
6. Configure the **remote-analyzer** VLAN on the switches that connect this switch to the monitoring workstation.

**Results** Check the results of the configuration:

```
[edit]
user@switch# show
interfaces {
  ...
  ge-0/0/10 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members remote-analyzer;
        }
      }
    }
  }
}
```

```
}
ge-0/0/0 {
  unit 0 {
    family ethernet-switching {
      filter {
        input watch-employee;
      }
    }
  }
}
ge-0/0/1 {
  unit 0 {
    family ethernet-switching {
      filter {
        input watch-employee;
      }
    }
  }
}
...
firewall {
  family ethernet-switching {
    ...
    filter watch-employee {
      term employee-to-web {
        from {
          destination-port 80;
        }
        then analyzer employee-web-monitor;
      }
    }
  }
}
forwarding-options analyzer {
  employee-web-monitor {
    output {
      vlan {
        999;
      }
    }
  }
}
vpls {
  remote-analyzer {
    vlan-id 999;
  }
}
```

---

## Verification

### *Verifying That the Analyzer Has Been Correctly Created*

**Purpose** Verify that the analyzer named **employee-monitor** or **employee-web-monitor** has been created on the switch with the appropriate input interfaces and appropriate output interface.

**Action** You can verify the port mirror analyzer is configured as expected using the **show analyzer** command.

```
user@switch> show analyzer
Analyzer name           : employee-monitor
Output VLAN             : remote-analyzer
Ingress monitored interfaces : ge-0/0/0.0
Ingress monitored interfaces : ge-0/0/1.0
```

**Meaning** This output shows that the **employee-monitor** analyzer is mirroring the traffic entering **ge-0/0/0** and **ge-0/0/1** and is sending the mirror traffic to the analyzer **remote-analyzer**.

- Related Documentation**
- [Understanding Port Mirroring on page 5425](#)

  - [Examples: Configuring Port Mirroring for Local Analysis on page 5433](#)
  - [Overview of Firewall Filters on page 5209](#)

## Example: Mirroring Employee Web Traffic with a Firewall Filter

- [Requirements on page 5443](#)
- [Overview on page 5443](#)
- [Configuring on page 5443](#)
- [Verification on page 5445](#)

### Requirements

This example uses the following hardware and software components:

- One switch
- Junos 13.2X51

### Overview

Rather than mirror all traffic, it is usually desirable to mirror only certain traffic. This is a more-efficient use of your bandwidth and hardware and might be necessary because constraints on these assets. To select specific traffic for mirroring, you use a firewall filter to match the desired traffic and direct it to a port-mirroring instance. The port-mirroring instance then copies the packets and sends them to the output VLAN, interface, or IP address.

### Configuring

To specify that the only traffic that will be mirrored is traffic sent by employees to the Web, perform the tasks explained in this section. To select this traffic for mirroring, you use a firewall filter to specify this traffic and direct it to a port-mirroring instance.

**CLI Quick Configuration** To quickly configure local port mirroring of traffic from employee computers that is destined for the Web, copy the following commands and paste them into a switch terminal window:

```
[edit]
set forwarding-options port-mirroring instance employee-web-monitor output interface
xe-0/0/47.0
set firewall family ethernet-switching filter watch-employee term employee-to-corp from
destination-address 192.0.2.16/28
set firewall family ethernet-switching filter watch-employee term employee-to-corp from
source-address 192.0.2.16/28
set firewall family ethernet-switching filter watch-employee term employee-to-corp then accept
set firewall family ethernet-switching filter watch-employee term employee-to-web from
destination-port 80
set firewall family ethernet-switching filter watch-employee term employee-to-web then
port-mirror-instance employee-web-monitor
set interfaces xe-0/0/0 unit 0 family ethernet-switching filter input watch-employee
set interfaces xe-0/0/6 unit 0 family ethernet-switching filter input watch-employee
```

**Step-by-Step Procedure** To configure local port mirroring of employee-to-web traffic from the two ports connected to employee computers:

1. Configure the output interface:

```
[edit interfaces]
user@switch# set xe-0/0/47 unit 0 family ethernet-switching
```

2. Configure the **employee-web-monitor** output interface. (Configure only the output—the input comes from the filter.)

```
[edit forwarding-options]
user@switch# set port-mirroring instance employee-web-monitor output interface
xe-0/0/47.0
```

3. Configure a firewall filter called **watch-employee** that includes a term to match traffic sent to the Web and send it to the port-mirroring instance **employee-web-monitor**. Traffic to and from the corporate subnet (destination or source address of **192.0.2.16/28**) does not need to be copied, so create another term to accept that traffic before it reaches the term that sends Web traffic to the instance:

```
[edit firewall family ethernet-switching]
user@switch# set filter watch-employee term employee-to-corp from destination-address
192.0.2.16/28
user@switch# set filter watch-employee term employee-to-corp from source-address
192.0.2.16/28
user@switch# set filter watch-employee term employee-to-corp then accept
user@switch# set filter watch-employee term employee-to-web from destination-port 80
user@switch# set filter watch-employee term employee-to-web then port-mirror-instance
employee-web-monitor
```

4. Apply the firewall filter to the appropriate interfaces as an ingress filter (egress filters do not allow analyzers):

```
[edit interfaces]
user@switch# set xe-0/0/0 unit 0 family ethernet-switching filter input watch-employee
user@switch# set xe-0/0/6 unit 0 family ethernet-switching filter input watch-employee
```

**Results** Check the results of the configuration:

```
[edit]
user@switch# show
```

```

forwarding-options {
  port-mirroring {
    instance {
      employee-web-monitor {
        output {
          interface xe-0/0/47.0;
        }
      }
    }
  }
}
...
firewall family ethernet-switching {
  filter watch-employee {
    term employee-to-web {
      from {
        destination-port 80;
      }
      then port-mirror-instance employee-web-monitor;
    }
  }
}
...
interfaces {
  xe-0/0/0 {
    unit 0 {
      family ethernet-switching {
        filter {
          input watch-employee;
        }
      }
    }
  }
  xe-0/0/6 {
    family ethernet-switching {
      filter {
        input watch-employee;
      }
    }
  }
}

```

## Verification

### *Verifying That the Analyzer Has Been Correctly Created*

**Purpose** Verify that the analyzer named **employee-monitor** or **employee-web-monitor** has been created on the switch with the appropriate input interfaces and appropriate output interface.

**Action** You can verify that the port mirror analyzer has been configured as expected using the **show analyzer** command.

```
user@switch> show forwarding-options analyzer
  Port mirror name           : employee-monitor
  Mirror rate                 : 1
  Maximum packet length      : 0
  State                       : up
  Ingress monitored interfaces : xe-0/0/0.0
  Ingress monitored interfaces : xe-0/0/6.0
  Output interface           : xe-0/0/47.0
```

**Meaning** This output shows that the port-mirroring instance **employee-monitor** has a ratio of 1 (mirroring every packet, the default setting), the maximum size of the original packet that was mirrored (**0** indicates the entire packet), the state of the configuration (is up indicates that the instance is mirroring the traffic entering the xe-0/0/0, and xe-0/0/6 interfaces, and sending the mirrored traffic to the xe-0/0/47 interface). If the state of the output interface is down or if the output interface is not configured, the value of state will be **down** and the instance will not be programmed for mirroring.

---

## Configuration Tasks

- [Configuring Port Mirroring on page 5446](#)
- [Configuring DHCP and BOOTP on page 5449](#)

### Configuring Port Mirroring

You use port mirroring to copy packets and send the copies to a device running an application such as a network analyzer or intrusion detection application so that you can analyze traffic without delaying it. You can mirror traffic entering or exiting a port or entering a VLAN, and you can send the copies to a local access interface or to a VLAN through a trunk interface.

We recommend that you disable port mirroring when you are not using it. To avoid creating a performance issue If you do enable port mirroring, we recommend that you select specific input interfaces instead of using the **all** keyword. You can also limit the amount of mirrored traffic by using a firewall filter.

**NOTE:** This task uses the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring Port Mirroring*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 43](#).

---

**NOTE:** If you want to create additional analyzers without deleting an existing analyzer, first disable the existing analyzer using the `disable analyzer analyzer-name` command.

**NOTE:** You must configure port mirroring output interfaces as family `ethernet-switching`.

- [Configuring Port Mirroring for Local Analysis on page 5447](#)
- [Configuring Port Mirroring for Remote Analysis on page 5448](#)
- [Filtering the Traffic Entering an Analyzer on page 5448](#)

### Configuring Port Mirroring for Local Analysis

To mirror interface traffic to a local interface on the switch:

1. If you want to mirror traffic that is ingressing or egressing specific interfaces, choose a name for the port-mirroring configuration and configure what traffic should be mirrored by specifying the interfaces and direction of traffic:

```
[edit forwarding-options]
user@switch# set analyzer analyzer-name input (ingress | egress) interface interface-name
```

**NOTE:** If you configure Junos OS to mirror egress packets, do not configure more than 2000 VLANs. If you do so, some VLAN packets might contain incorrect VLAN IDs.

**NOTE:** If you configure mirroring for packets that egress an access interface, the original packets lose any VLAN tags when they exit the access interface, but the mirrored (copied) packets retain the VLAN tags when they are sent to the analyzer system.

2. If you want to specify that all traffic entering a VLAN should be mirrored, choose a name for the port-mirroring configuration and specify the VLAN:

```
[edit forwarding-options]
user@switch# set analyzer analyzer-name input ingress vlan vlan-name
```

**NOTE:** You cannot configure port mirroring to copy traffic that egresses a VLAN.

3. Configure the destination interface for the mirrored packets:

```
[edit forwarding-options]
user@switch# set analyzer analyzer-name output interface interface-name
```

## Configuring Port Mirroring for Remote Analysis

---

To mirror traffic to a VLAN for analysis at a remote location:

1. Configure a VLAN to carry the mirrored traffic:

```
[edit]
user@switch# set vlans vlan-name vlan-id number
```

2. Configure the interface that connects to another switch (the uplink interface) to trunk mode and associate it with the appropriate VLAN:

```
[edit]
user@switch# set interfaces interface-name unit 0 family ethernet-switching port-mode
trunk vlan members (vlan-name | vlan-id)
```

3. Configure the analyzer:

- a. Choose a name for the analyzer:

```
[edit forwarding-options]
user@switch# set analyzer analyzer-name
```

- b. Specify the interface to be mirrored and whether the traffic should be mirrored on ingress or egress:

```
[edit forwarding-options]
user@switch# set analyzer analyzer-name input (ingress | egress) interface interface-name
```

- c. Specify the appropriate IP address or VLAN as the output (a VLAN is specified in this example:

```
[edit forwarding-options]
user@switch# set analyzer analyzer-name output vlan (vlan-name | vlan-id)
```

If you specify an IP address as the output, note the following constraints:

- The address cannot be in the same subnet as any of the switch's management interfaces.
- If you create virtual routing instances and also create an analyzer configuration that includes an output IP address, the output address belongs to the default virtual routing instance (**inet.0** routing table).
- The analyzer device must be able to de-encapsulate GRE-encapsulated packets, or the GRE-encapsulated packets must be de-encapsulated before reaching the analyzer device. (You can use a network sniffer to de-encapsulate the packets.)

## Filtering the Traffic Entering an Analyzer

---

In addition to specifying which traffic to mirror by configuring an analyzer, you can also use a firewall filter to exercise more control over which packets are copied. For example, you might use a filter to specify that only traffic from certain applications be mirrored. The filter can use any of the available match conditions and must have an action of modifier of **port-mirror-instance** *instance-name*. If you use the same analyzer in multiple filters or terms, the output packets are copied only once.

When you use a firewall filter as the input to a port-mirroring instance, you send the copied traffic to a local interface or a VLAN just as you do when a firewall is not involved.

To configure port mirroring with filters:

1. Configure a port-mirroring instance for local or remote analysis. Configure only the output. For example, for local analysis enter:

```
[edit forwarding-options]
user@switch# set port-mirroring-instance instance-name output interface interface-name
```

**NOTE:** You cannot configure input to this instance.

2. Create a firewall filter using any of the available match conditions. In a **then** term, specify include the action modifier **port-mirror-instance** *instance-name*.
3. Apply the firewall filter to the interfaces or VLAN that should provide the input to the analyzer:

```
[edit]
user@switch# set interfaces interface-name unit 0 family ethernet-switching filter input
filter-name
[edit]
user@switch# set vlan (vlan-name | vlan-id) filter input filter-name
```

## Configuring DHCP and BOOTP

You can configure a QFX Series switch to act as a Dynamic Host Configuration Protocol (DHCP) and Bootstrap Protocol (BOOTP) server or DHCP relay agent. When a switch is a relay agent, if a locally attached host issues a DHCP or BOOTP request as a broadcast message, the switch relays the message to a specified DHCP or BOOTP server. You should configure a switch to be a DHCP and BOOTP relay agent if you have locally attached hosts and a remote DHCP or BOOTP server.

**NOTE:** This task uses the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring DHCP and BOOTP Relay*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 43.

To configure a switch to be a server, use the **dhcp-local-server** statement. To configure a switch to be a relay agent, use the **dhcp-relay** statement.

If you want to enable BOOTP support when the switch is configured to be a DHCP server, enter the following statement:

```
[edit system services dhcp-local-server]
user@switch# set overrides bootp-support
```

If you want to enable BOOTP support when the switch is configured to be a DHCP relay agent, enter the following statement:

```
[edit forwarding-options dhcp-relay]  
user@switch# set overrides bootp-support
```

---

            ip-address ip-address;
            routing-instance
            vlan (vlan-id | vlan-name);
        }
    }
}
```

**Hierarchy Level** For platforms without ELS:

[edit ethernet-switching-options]

For platforms with ELS:

[edit forwarding-options]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.  
 Option **output vlan** added in Junos OS Release 12.1 for the QFX Series.  
 Option **output ip-address** added in Junos OS Release 12.3 for the QFX Series for non-ELS platforms and added in 14.1X53-D10 for ELS platforms.

**Description** Configure port mirroring. You can create a total of four port-mirroring configurations on the QFX Series, subject to the following limits:

- There can be no more than two configurations that mirror ingress traffic.
- There can be no more than two configurations that mirror egress traffic.

**Default** Port mirroring is disabled, and Junos OS creates no default analyzers.

**Options** **all**—Mirror all the access interfaces. Using this option does not cause the QSFP+ or management interfaces to be mirrored.

**CAUTION:** Configuring the **all** option in a QFabric system causes all the access interfaces on all the nodes to be mirrored. Be cautious about using this option on a QFabric system.

**name**—Name of the analyzer. The name can include as many as 125 characters; must begin with a letter; and can include uppercase letters, lowercase letters, numbers, dashes, and underscores. No other special characters are allowed.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

---

## egress

**Syntax** egress {  
    **interface** (all | *interface-name*);  
}

**Hierarchy Level** For platforms without ELS:  
  
[edit ethernet-switching-options **analyzer name input**]  
  
For platforms with ELS:  
  
[edit forwarding-options **analyzer name input**]

**Release Information** Statement introduced in Junos OS Release 11.2 for the QFX Series.

**Description** Specify interfaces for which egressing traffic is mirrored.

The statement is explained separately.

**NOTE:** If you configure Junos OS to mirror egress packets, do not configure more than 2000 VLANs. If you do so, some of the mirrored packets might contain incorrect VLAN IDs.

---

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2 for the QFX Series.  |
| <b>Description</b>              | Specify that the output interface for the port mirror will be configured as an <b>ethernet-switching</b> interface.  |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Understanding Port Mirroring on page 5425</a></li><li>• <a href="#">Configuring Port Mirroring on page 5446</a></li><li>• <a href="#">Examples: Configuring Port Mirroring for Local Analysis on page 5433</a></li></ul> |

## family (Port Mirroring)

---

**Syntax**    **family (Port Mirroring)**  
              **ethernet-switching** {  
                  **output** {  
                      **interface** *interface-name* {  
                          }  
                      no-filter-check;  
                      }  
                      **vlan** *vlan-name* {  
                          no-tag;  
                      }  
                  }  
              **inet**  
                  **output** {  
                      **ip-address** *address* {  
                          }  
                      **routing-instance** *instance-name* {  
                          **ip-address** *address* {  
                              }  
                      }  
                  }  
              }

**Hierarchy Level**    [edit forwarding-options port-mirroring [*instance name*] ]

**Release Information**    Statement introduced in Junos OS Release 13.2 for the QFX Series.

**Description**    Specify the type of interface that will be used to forward port mirrored packet to an analyzer device..

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

**Related Documentation**

## inet (Port Mirroring)

```
Syntax  inet {
        output {
            ip-address address {
            }
            routing-instance instance-name {
                ip-address address {
                }
            }
        }
    }
```

**Hierarchy Level** [edit forwarding-options port-mirroring [instance *name*] family]

**Release Information** Statement introduced in Junos OS Release 14.1X53 for the QFX Series.

**Description** Specify that the output interface will be of type **inet**. Use this statement so that you can send the mirrored packets to the IP address of the device running an analyzer application. The device can be on a remote network. When you use this feature, the mirrored packets are GRE-encapsulated. The analyzer device must be able to de-encapsulate GRE-encapsulated packets, or the GRE-encapsulated packets must be de-encapsulated before reaching the analyzer device. (You can use a network sniffer to de-encapsulate the packets.)

**NOTE:** An output IP address cannot be in the same subnetwork as any of the switch's management interfaces.

**NOTE:** If you create virtual routing instances and also create an analyzer configuration that includes an output IP address, the output address belongs to the default virtual routing instance (inet.0 routing table).

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## ingress (Port Mirroring)

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <pre>ingress {<br/>    interface (all   interface-name);<br/>    vlan (vlan-id   vlan-name);<br/>}</pre>   |
| <b>Hierarchy Level</b>          | <p>For platforms without ELS:</p> <pre>[edit ethernet-switching-options analyzer name input]</pre> <p>For platforms with ELS:</p> <pre>[edit forwarding-options analyzer name input]</pre>   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.  |
| <b>Description</b>              | <p>Specify the interfaces or VLANs for which incoming traffic is mirrored as part of a port mirroring configuration.</p> <p>The statements are explained separately.</p>   |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.routing-control—To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Understanding Port Mirroring on page 5425</a></li><li>• <a href="#">Configuring Port Mirroring on page 5446</a></li><li>• <a href="#">Examples: Configuring Port Mirroring for Local Analysis on page 5433</a></li></ul> |

## input

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <pre> input {   ingress {     interface (all   <i>interface-name</i>);     vlan (<i>vlan-id</i>   <i>vlan-name</i>);   }   egress {     interface (all   <i>interface-name</i>);   } } </pre>  |
| <b>Hierarchy Level</b>          | <p>For platforms without ELS:</p> <p>[edit ethernet-switching-options <a href="#">analyzer name</a>]</p> <p>For platforms with ELS:</p> <p>[edit forwarding-options <a href="#">analyzer name</a>]</p>   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.  |
| <b>Description</b>              | <p>Define the traffic to be mirrored. The definition can be a combination of traffic entering or exiting specific ports or VLANs.</p> <p>The statements are explained separately.</p>  |
| <b>Default</b>                  | No default.  |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Understanding Port Mirroring on page 5425</a></li> <li>• <a href="#">Configuring Port Mirroring on page 5446</a></li> <li>• <a href="#">Examples: Configuring Port Mirroring for Local Analysis on page 5433</a></li> </ul> |

## instance (Port Mirroring)

---

**Syntax**    `instance instance-name{  
              family (Port Mirroring)  
              ethernet-switching {  
                  output {  
                      interface interface-name {  
                          }  
                      no-filter-check;  
                      }  
                      vlan vlan-name {  
                          no-tag;  
                      }  
                  }  
              inet  
                  output {  
                      ip-address address {  
                          }  
                      routing-instance instance-name {  
                          ip-address address {  
                              }  
                          }  
                  }  
              }  
          }`

**Hierarchy Level**    [edit forwarding-options port-mirroring]

**Release Information**    Statement introduced in Junos OS Release 13.2 for the QFX Series.

**Description**    Specify a port-mirroring configuration (instance). You do not specify an input for this instance. Instead, you, create a firewall filter that specifies the required traffic and directs it to the mirror. This is useful for controlling which types of traffic should be mirrored.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

**Related Documentation**

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure security services. Most of the configuration statements do not have default values. If you do not specify an identifier for a statement that does not have a default value, you cannot commit the configuration.

## start-time (Authentication Key Transmission)

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>start-time (now   yyyy-mm-dd.hh:mm:ss);</code>   |
| <b>Hierarchy Level</b>          | [edit security authentication-key-chains key-chain <i>key-chain-name</i> key <i>key</i> ]  |
| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 7.6.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the BFD protocol introduced in Junos OS Release 9.6.</p> <p>Support for the BFD protocol introduced in Junos OS Release 9.6 for EX Series switches.</p> <p>Support for IS-IS introduced in JUNOS OS Release 11.2.</p> <p>Statement introduced in Junos OS Release 11.3 for QFX Series switches.</p>  |
| <b>Description</b>              | <p>Specify a start time for key transmission. You do not need to specify an end time for the key. If a new key is present with a new start time, the keychain rolls over to the new one. The start time must be unique within the keychain.</p>  |
| <b>Options</b>                  | <p><b>now</b>—Start time as the current year, month, day, hour, minute, and second.</p> <p><b>daydays</b>—Start time as the specified number of days after the current day. For example, if the current day is the 12th and you configure <b>start-time 2day</b>, the start time will be on the 14th, exactly two days after the configuration is entered.</p> <p><b>hourhours</b>—Start time as the specified number of hours after the current hour. For example, if the current hour is 9:00 and you configure <b>start-time 3hour</b>, the start time will be in 12:00, exactly three hours after the configuration is entered.</p> <p><b>minuteminutes</b>—Start time as the specified number of minutes after the current minute. For example, if the current minute is 27 minutes after the hour and you configure <b>start-time 5min</b>, the start time will be in 32 minutes after the hour, exactly five minutes after the configuration is entered.</p> <p><b>monthmonths</b>—Start time as the specified number of months after the current month. For example, if the current month is March and you configure <b>start-time 4month</b>, the start time will be in July, exactly four months after the configuration is entered.</p> <p><b>secondseconds</b>—Start time as the specified number of seconds after the current second. For example, if the current second is 10:20:40 and you configure <b>start-time 10seconds</b>, the start time will be 10:20:50, exactly 10 seconds after the configuration is entered.</p> <p><b>yearyears</b>—Start time as the specified number of years after the current year. For example, if the current year is 2011 and you configure <b>start-time 1year</b>, the start time will be in 2012, exactly one year after the configuration is entered.</p> <p><b>yyyy-mm-dd.hh:mm:ss</b>—Start time in UTC (Coordinated Universal Time). The start time must be unique within the keychain.</p> |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>   |

## traceoptions

|   |  |
|---|--|
| <b>Syntax</b>   | <pre> traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt;;     flag all;     flag certificates;     flag database;     flag general;     flag ike;     flag parse;     flag policy-manager;     flag routing-socket;     flag timer;     level     no-remote-trace } </pre>   |
| <b>Hierarchy Level</b>  | <p>[edit security],<br/>[edit services ipsec-vpn]</p> <p>Trace options can be configured at either the <b>[edit security]</b> or the <b>[edit services ipsec-vpn]</b> hierarchy level, but not at both levels.</p>   |
| <b>Release Information</b>  | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>  |
| <b>Description</b>  | <p>Configure security trace options.</p> <p>To specify more than one trace option, include multiple <b>flag</b> statements. Trace option output is recorded in the <b>/var/log/kmd</b> file.</p>   |
| <div style="display: flex; align-items: center;">  <p><b>NOTE:</b> The <b>traceoptions</b> statement is not supported on QFabric systems.</p> </div> |  |
| <b>Options</b>  | <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file (for example, <b>kmd</b>) reaches its maximum size, it is renamed <b>kmd.0</b>, then <b>kmd.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 0 files</p> <p><b>size <i>size</i></b>—(Optional) Maximum size of each trace file, in kilobytes (KB). When a trace file (for example, <b>kmd</b>) reaches this size, it is renamed, <b>kmd.0</b>, then <b>kmd.1</b> and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Default:</b> 1024 KB</p> |

**flag *flag***—Trace operation to perform. To specify more than one trace operation, include multiple **flag** statements.

- **all**—Trace all security events.
- **certificates**—Trace certificate events.
- **database**—Trace database events.
- **general**—Trace general events.
- **ike**—Trace IKE module processing.
- **parse**—Trace configuration processing.
- **policy-manager**—Trace policy manager processing.
- **routing-socket**—Trace routing socket messages.
- **timer**—Trace internal timer events.

**level *level***—(Optional) Set traceoptions level.

- **all**—match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match conditions that should be handled specially.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**no-remote-trace**—(Optional) Disable remote tracing

|                           |   |
|---------------------------|---|
| <b>Required Privilege</b> | admin—To view the configuration.                          |
| <b>Level</b>              | admin-control—To add this statement to the configuration. |

### Port Mirroring Constraints and Limitations

---

- [Local and Remote Port Mirroring on page 5501](#)
- [Remote Port Mirroring Only on page 5503](#)

#### ***Local and Remote Port Mirroring***

The following constraints and limitations apply to local and remote port mirroring:

- You can create a total of four port-mirroring configurations.
- You can create a total of four port-mirroring configurations on each Node group in a QFabric system, subject to the following constraints:
  - As many as four of the configurations can be for local port mirroring.
  - As many as three of the configurations can be for remote port mirroring.
- Regardless of whether you are configuring a standalone switch or a Node group, the following limits apply:
  - There can be no more than two configurations that mirror ingress traffic. (If you configure a firewall filter to send traffic to a port mirror—that is, you use the **analyzer** action modifier in a filter term—this counts as an ingress mirroring configuration for switch or Node group on which the filter is applied.)
  - There can be no more than two configurations that mirror egress traffic.

**NOTE:** On QFabric systems, there is no system-wide limit on the total number of mirror sessions.

- You can configure no more than one type of output in one port-mirroring configuration. That is, you can use no more than one of the following to complete a **set analyzer name output** statement:
  - **interface**
  - **ip-address**
  - **vlan**
- If you configure Junos OS to mirror egress packets, do not configure more than 2000 VLANs on a standalone switch or QFabric system. If you do so, some VLAN packets might contain incorrect VLAN IDs. This applies to any VLAN packets—not only the mirrored copies.
- The **ratio** and **loss-priority** options are not supported.
- Packets with physical layer errors are filtered out and are not sent to the output port or VLAN.
- If you use sFlow monitoring to sample traffic, it does not sample the mirror copies when they exit from the output interface.
- You cannot mirror packets exiting or entering the following ports:
  - Dedicated Virtual Chassis interfaces
  - Management interfaces (me0 or vme0)
  - Fibre Channel interfaces
  - Routed VLAN interfaces
- An aggregated Ethernet interface cannot be an output interface if the input is a VLAN or if traffic is sent to the analyzer by a firewall filter.
- Do not include an 802.1Q subinterface that has a unit number other than 0 in a port mirroring configuration. Port mirroring does not work with subinterfaces if their unit number is not 0. (You configure 802.1Q subinterfaces using the **vlan-tagging** statement.)
- When packet copies are sent out the output interface, they are not modified for any changes that are normally applied on egress, such as CoS rewriting.
- An interface can be the input interface for only one mirroring configuration. Do not use the same interface as the input interface for multiple mirroring configurations.
- CPU-generated packets (such as ARP, ICMP, BPDU, and LACP packets) cannot be mirrored on egress.
- VLAN-based mirroring is not supported for STP traffic.
- (QFabric systems only) If you configure a QFabric analyzer to mirror egress traffic and the input and output interfaces are on different Node devices, the mirrored copies have

incorrect VLAN IDs. This limitation does not apply if you configure a QFabric analyzer to mirror egress traffic and the input and output interfaces are on the *same* Node device. In this case the mirrored copies have the correct VLAN IDs (as long as you do not configure more than 2000 VLANs on the QFabric system).

### ***Remote Port Mirroring Only***

The following constraints and limitations apply to remote port mirroring:

- If you configure an output IP address, the address cannot be in the same subnetwork as any of the switch's management interfaces.
- If you create virtual routing instances and also create an analyzer configuration that includes an output IP address, the output address belongs to the default virtual routing instance (inet.0 routing table).
- An output VLAN cannot be a private VLAN or VLAN range.
- An output VLAN cannot be shared by multiple **analyzer** statements.
- An output VLAN interface cannot be a member of any other VLAN.
- An output VLAN interface cannot be an aggregated Ethernet interface.
- On the source (monitored) switch, only one interface can be a member of the analyzer VLAN.

### **Egress Port Mirroring with VLAN Translation**

**Problem** **Description:** If you create a port-mirroring configuration that mirrors customer VLAN (CVLAN) traffic on egress and the traffic undergoes VLAN translation before being mirrored, the VLAN translation does not apply to the mirrored packets. That is, the mirrored packets retain the service VLAN (SVLAN) tag that should be replaced by the CVLAN tag on egress. The original packets are unaffected—on these packets VLAN translation works properly, and the SVLAN tag is replaced with the CVLAN tag on egress.

**Solution** This is expected behavior.

### **Egress Port Mirroring with Private VLANs**

**Problem** **Description:** If you create a port-mirroring configuration that mirrors private VLAN (PVLAN) traffic on egress, the mirrored traffic (the traffic that is sent to the analyzer system) has the VLAN tag of the ingress VLAN instead of the egress VLAN. For example, assume the following PVLAN configuration:

- Promiscuous trunk port that carries primary VLANs pvlan100 and pvlan400.
- Isolated access port that carries secondary VLAN isolated200. This VLAN is a member of primary VLAN pvlan100.
- Community port that carries secondary VLAN comm300. This VLAN is also a member of primary VLAN pvlan100.
- Output interface (monitor interface) that connects to the analyzer system. This interface forwards the mirrored traffic to the analyzer.

If a packet for pvlan100 enters on the promiscuous trunk port and exits on the isolated access port, the original packet is untagged on egress because it is exiting on an access port. However, the mirror copy retains the tag for pvlan100 when it is sent to the analyzer.

Here is another example: If a packet for comm300 ingresses on the community port and egresses on the promiscuous trunk port, the original packet carries the tag for pvlan100 on egress, as expected. However, the mirrored copy retains the tag for comm300 when it is sent to the analyzer.

**Solution** This is expected behavior.

## Overview of Fibre Channel

Fibre Channel (FC) is a high-speed network technology that interconnects network elements and allows them to communicate with one another. The International Committee for Information Technology Standards (INCITS) T11 Technical Committee sets FC standards.

FC networks provide high-performance characteristics such as lossless transport combined with flexible network topology. FC is primarily used in storage area networks (SANs) because it provides reliable, lossless, in-order frame transport between initiators and targets. FC components include initiators, targets, and FC-capable switches that interconnect FC devices and may also interconnect FC devices with Fibre Channel over Ethernet (FCoE) devices. Initiators originate I/O commands. Targets receive I/O commands. For example, a server can initiate an I/O request to a storage device target.

The Juniper Networks QFX3500 Switch has native FC ports as well as Ethernet access ports, and can function as an FCoE-FC gateway or as an FCoE transit switch. All other QFX Series switches and EX4600 switches have Ethernet access ports and can function as an FCoE transit switch.

FCoE transports native FC frames over an Ethernet network by encapsulating the unmodified frames in Ethernet. It also provides protocol extensions to discover FCoE devices through the Ethernet network. FCoE requires that the Ethernet network support data center bridging (DCB) extensions that ensure lossless transport and allow the Layer 2 Ethernet domain to meet the requirements of FC transport.

The FCoE-FC gateway functionality is a licensed feature on the QFX Series that is available only on QFX3500 switches. As an FCoE-FC gateway, the switch connects FCoE devices on an Ethernet network to a SAN FC switch.

You do not need a license to use the switch as an FCoE transit switch. As an FCoE transit switch, the switch:

- Is a Layer 2 data center bridging (DCB) switch that can transport FCoE frames.
- Implements FCoE Initialization Protocol (FIP) snooping.
- Connects multiple FCoE endpoints to the FC network.

**NOTE:** Standalone switches support FCoE. Virtual Chassis (VC) and mixed-mode Virtual Chassis Fabric (VCF) configurations do not support FCoE. Pure QFX5100 switch VCFs (consisting of only QFX5100 switches) support FCoE.

---

This topic describes:

- [Fibre Channel Transport Protocol on page 5509](#)
- [How FC Works on the Switch on page 5509](#)

- [Lossless Transport Support on page 5512](#)

### Fibre Channel Transport Protocol

The Fibre Channel Protocol is a transport protocol that consists of five layers as shown in [Table 447 on page 5509](#):

**Table 447: Fibre Channel Protocol Layers**

| FC Protocol Layer | Description                                |
|-------------------|--|
| FC-0              | Physical (cabling, connectors, and so on)  |
| FC-1              | Data link layer                            |
| FC-2              | Network layer (defines the main protocols) |
| FC-3              | Common services                            |
| FC-4              | Protocol mapping                           |

The FC protocol layers are generally split into three groups:

- FC-0 and FC-1 are the physical layers.
- FC-2 is the protocol layer, similar to OSI Layer 3.
- FC-3 and FC-4 are the services layers.

The FCoE-FC gateway operates the physical layers and the protocol layer, and provides FIP and service redirection at the services layer.

### How FC Works on the Switch

The switch connects devices that support FC and Ethernet (such as FCoE servers on an Ethernet network) to an FC SAN, thus converging the Ethernet and FC networks on a single physical network infrastructure. The switch provides the class-of-service (CoS) features needed to handle the different types of traffic appropriately.

To converge FC and Ethernet networks, you can configure the switch as an:

- [FCoE-FC Gateway on page 5509](#)
- [FCoE Transit Switch on page 5510](#)
- [FCoE VLANs on page 5510](#)

#### **FCoE-FC Gateway**

When the switch functions as an FCoE-FC gateway, the switch aggregates FCoE traffic and performs the encapsulation and de-encapsulation of native FC frames in Ethernet as it transports the frames between FCoE devices in the Ethernet network and the FC switch. In effect, the switch translates Ethernet to FC and FC to Ethernet.

The gateway receives FC frames encapsulated in Ethernet from FCoE devices through an FCoE VLAN interface composed of one or more 10-Gigabit Ethernet interfaces. The gateway removes the Ethernet encapsulation from the FC frames, and then sends the native FC frames to the FC switch through a native FC interface.

The gateway receives native FC frames from the FC switch on the gateway's native FC interfaces. The gateway encapsulates the native FC frames in Ethernet, and then sends the encapsulated frames to the appropriate FCoE device through the FCoE VLAN interface.

To FCoE devices, the gateway behaves like an FC switch and can present multiple virtual F\_Ports (VF\_Ports) on a single interface. To an FC switch, the gateway behaves like an FC node that is doing N\_Port ID virtualization (NPIV).

### ***FCoE Transit Switch***

When the switch functions as an FCoE transit switch, it forwards traffic (including FCoE traffic) based on Layer 2 media access control (MAC) forwarding and is a normal DCB-enabled Layer 2 switch that also performs FIP snooping. The switch aggregates FCoE traffic and passes it through to an FCF. The switch does not remove the Ethernet encapsulation from the FC frames, but it does preserve the class of service (CoS) required to transport FC frames.

The switch inspects (snoops) FIP information in order to create filters that permit only valid FCoE traffic to flow through the switch between FCoE devices and the FCF. The switch does not use native FC ports because the FC frames are encapsulated in Ethernet when they flow between the FCoE devices and the FCF. Virtual point-to-point links between each FCoE device and the FCF pass transparently through the switch, so the switch is not seen as a terminating point or an intermediate point by FCoE devices or by the FCF.

### ***FCoE VLANs***

All FCoE traffic must travel in a VLAN dedicated to transporting only FCoE traffic. Only FCoE interfaces should be members of an FCoE VLAN. Ethernet traffic that is not FCoE or FIP traffic must travel in a different VLAN.

**NOTE:** The same VLAN cannot be used in both transit switch mode and FCoE-FC gateway mode.

---

**NOTE:** FCoE VLANs (any VLAN that carries FCoE traffic) support only Spanning Tree Protocol (STP) and link aggregation group (LAG) Layer 2 features.

FCoE traffic cannot use a standard LAG because traffic might be hashed to different physical LAG links on different transmissions. This breaks the (virtual) point-to-point link that Fibre Channel traffic requires. If you configure a standard LAG interface for FCoE traffic, FCoE traffic might be rejected by the FC SAN.

QFabric systems support a special LAG called an FCoE LAG, which enables you to transport FCoE traffic and regular Ethernet traffic (traffic that is not FCoE traffic) across the same link aggregation bundle. Standard LAGs use a hashing algorithm to determine which physical link in the LAG is used for a transmission, so communication between two devices might use different physical links in the LAG for different transmissions. An FCoE LAG ensures that FCoE traffic uses the same physical link in the LAG for requests and replies in order to preserve the virtual point-to-point link between the FCoE device converged network adapter (CNA) and the FC SAN switch across the QFabric system Node device. An FCoE LAG does not provide load balancing or link redundancy for FCoE traffic. However, regular Ethernet traffic uses the standard hashing algorithm and receives the usual LAG benefits of load balancing and link redundancy in an FCoE LAG.

**NOTE:** IGMP snooping is enabled by default on all VLANs in all software versions before Junos OS R13.2. Disable IGMP snooping on FCoE VLANs if you are using software that is older than 13.2.

You can configure more than one FCoE VLAN, but any given virtual link must be in only one FCoE VLAN.

**NOTE:** All 10-Gigabit Ethernet interfaces that connect to FCoE devices must have a native VLAN configured in order to transport FIP traffic, because FIP VLAN discovery and notification frames are exchanged as untagged packets.

**BEST PRACTICE:** Only FCoE traffic is permitted on the FCoE VLAN. A native VLAN might need to carry untagged traffic of different types and protocols. Therefore, it is a good practice to keep the native VLAN separate from FCoE VLANs.

## Supported FC Features and Functions

---

The following features and functionality are supported:

- As an FCoE-FC gateway:
  - DCB, including Data Center Bridging Capability Exchange protocol (DCBX), priority-based flow control (PFC), enhanced transmission service (ETS), and 10-Gigabit Ethernet interfaces
  - FCoE Initialization Protocol (FIP)
  - Proxy for FCoE devices when communicating with FC switches and acts as a proxy for FC switches when communicating with FCoE devices
  - Up to 12 native FC interfaces per QFX3500 switch (each interface can be configured as a 2-Gigabit, 4-Gigabit, or 8-Gigabit Ethernet interface)
- As an FCoE transit switch:
  - DCB functions
  - FIP snooping
  - Transparent Layer 2 MAC forwarding of FCoE frames

## Lossless Transport Support

---

Up to six lossless forwarding classes are supported. For lossless transport, you must enable PFC on the IEEE 802.1p code point of lossless forwarding classes. The following limitations apply to support lossless transport:

- The external cable length from a standalone switch or QFabric system Node device to other devices cannot exceed 300 meters.
- The internal cable length from a QFabric system Node device to the QFabric system Interconnect device cannot exceed 150 meters.
- For FCoE traffic, the interface maximum transmission unit (MTU) must be at least 2180 bytes to accommodate the packet payload, headers, and checks.

## Overview of FIP

Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) is a Layer 2 protocol that establishes and maintains Fibre Channel (FC) virtual links between pairs of FCoE devices such as server FCoE Nodes (ENodes) and FC switches. FIP can also establish and maintain virtual links between FCoE devices and an FCoE-FC gateway (such as the QFX3500 switch), where the gateway acts on behalf of the FC switch.

FIP enables FCoE devices to discover one another and to initialize and maintain virtual links over a physical Ethernet network. This allows FCoE devices in the Ethernet network to access storage devices in the FC storage area network (SAN).

FIP solves the problem presented by the FC requirement for point-to-point connections (FC does not permit point-to-multipoint connections) by creating a unique virtual link for each connection between an ENode VN\_Port and an FC switch VF\_Port. Multiple virtual links can use a single physical link and virtual links can traverse Ethernet transit (passthrough) switches while appearing to be direct point-to-point connections to the FC switch.

FIP has its own EtherType (0x8914) to distinguish its traffic from payload-carrying FCoE traffic and other Ethernet traffic. FIP operations occur on a per-VLAN basis.

For more details about FIP, see the Technical Committee T11 organization document *Fibre Channel Backbone - 5 (FC-BB-5) Rev 2.00* available at <http://www.t11.org/ftp/t11/pub/fc/bb-5/09-056v5.pdf>.

## Understanding DCB Features and Requirements

Data center bridging (DCB) is a set of enhancements to the IEEE 802.1 bridge specifications. DCB modifies and extends Ethernet behavior to support I/O convergence in the data center. I/O convergence includes but is not limited to the transport of Ethernet LAN traffic and Fibre Channel (FC) storage area network (SAN) traffic on the same physical Ethernet network infrastructure.

Video: [What is Data Center Bridging?](#)

A converged architecture saves cost by reducing the number of networks and switches required to support both types of traffic, reducing the number of interfaces required, reducing cable complexity, and reducing administration activities.

The Juniper Networks QFX Series and EX4600 switch support the DCB features required to transport converged Ethernet and FC traffic while providing the class-of-service (CoS) and other characteristics FC requires for transmitting storage traffic. To accommodate FC traffic, DCB specifications provide:

- A flow control mechanism called priority-based flow control (PFC, described in IEEE 802.1Qbb) to help provide lossless transport.
- A discovery and exchange protocol for conveying configuration and capabilities among neighbors to ensure consistent configuration across the network, called Data Center Bridging Capability Exchange protocol (DCBX), which is an extension of Link Layer Data Protocol (LLDP, described in IEEE 802.1AB).
- A bandwidth management mechanism called enhanced transmission selection (ETS, described in IEEE 802.1Qaz).
- A congestion management mechanism called quantized congestion notification (QCN, described in IEEE 802.1Qau).

The switch supports the PFC, DCBX, and ETS standards but does not support QCN. The switch also provides the high-bandwidth interfaces (10-Gbps minimum) required to support DCB and converged traffic.

This topic describes the DCB standards and requirements the switch supports:

- [Lossless Transport on page 5515](#)
- [ETS on page 5516](#)
- [DCBX on page 5517](#)

### Lossless Transport

FC traffic requires lossless transport (defined as no frames dropped because of congestion). Standard Ethernet does not support lossless transport, but the DCB extensions to Ethernet along with proper buffer management enable an Ethernet network to provide the level of class of service (CoS) necessary to transport FC frames encapsulated in Ethernet over an Ethernet network.

This section describes these factors in creating lossless transport over Ethernet:

- [PFC on page 5516](#)
- [Buffer Management on page 5516](#)
- [Physical Interfaces on page 5516](#)

### **PFC**

PFC is a link-level flow control mechanism similar to Ethernet PAUSE (described in IEEE 802.3x). Ethernet PAUSE stops all traffic on a link for a period of time. PFC enables you to divide traffic on a link into eight priorities and stop the traffic of a selected priority without stopping the traffic assigned to other priorities on the link.

Pausing the traffic of a selected priority enables you to provide lossless transport for traffic assigned that priority and at the same time use standard lossy Ethernet transport for the rest of the link traffic.

### **Buffer Management**

Buffer management is critical to the proper functioning of PFC, because if buffers are allowed to overflow, frames are dropped and transport is not lossless.

For each lossless flow priority, the switch requires sufficient buffer space to:

- Store frames sent during the time it takes to send the PFC pause frame across the cable between devices.
- Store the frames that are already on the wire when the sender receives the PFC pause frame.

The propagation delay due to cable length and speed, as well as processing speed, determines the amount of buffer space needed to prevent frame loss due to congestion.

The switch automatically sets the threshold for sending PFC pause frames to accommodate delay from cables as long as 150 meters (492 feet) and to accommodate large frames that might be on the wire when the switch sends the pause frame. This ensures that the switch sends pause frames early enough to allow the sender to stop transmitting before the receive buffers on the switch overflow.

### **Physical Interfaces**

The switch supports 10-Gbps, full-duplex interfaces. The switch enables DCB capability only on 10-Gbps (or faster) Ethernet interfaces.

### **ETS**

---

PFC divides traffic into up to eight separate streams (priorities, configured on the switch as forwarding classes) on a physical link. ETS enables you to manage the link bandwidth by:

- Grouping the priorities into priority groups (configured on the switch as forwarding class sets).
- Specifying the bandwidth available to each of the priority groups as a percentage of the total available link bandwidth.

- Allocating the bandwidth to the individual priorities in the priority group.

The available link bandwidth is the bandwidth remaining after servicing strict-high priority flows. We recommend that you always configure a shaping rate to limit the amount of bandwidth a strict-high priority flow can consume by including the [shaping-rate](#) statement in the [\[edit class-of-service schedulers\]](#) hierarchy on the strict-high priority scheduler. This prevents a strict-high priority from starving other queues on the port.

Managing link bandwidth with ETS provides several advantages:

- There is uniform management of all types of traffic on the link, both congestion-managed traffic and standard Ethernet traffic.
- When a priority group does not use all of its allocated bandwidth, other priority groups on the link can use that bandwidth as needed.

When a priority in a priority group does not use all of its allocated bandwidth, other priorities in the group can use that bandwidth.

The result is better bandwidth utilization, because priorities that consist of bursty traffic can share bandwidth during periods of low traffic transmission instead of consuming their entire bandwidth allocation when traffic loads are light.

- You can assign traffic types with different service needs to different priorities so that each traffic type receives appropriate treatment.
- Strict priority traffic retains its allocated bandwidth.

## DCBX

DCB devices use DCBX to exchange configuration information with directly connected peers (switches and endpoints such as servers). DCBX is an extension of LLDP. If you disable LLDP on an interface, that interface cannot run DCBX. If you attempt to enable DCBX on an interface on which LLDP is disabled, the configuration commit fails.

DCBX can:

- Discover the DCB capabilities of peers.
- Detect DCB feature misconfiguration or mismatches between peers.
- Configure DCB features on peers.

You can configure DCBX operation for PFC, ETS, and for Layer 2 and Layer 4 applications such as FCoE and iSCSI. DCBX is enabled or disabled on a per-interface basis.

## Understanding FCoE

Fibre Channel over Ethernet (FCoE) is a method of supporting converged Fibre Channel (FC) and Ethernet traffic on a data center bridging (DCB) network. FCoE encapsulates unmodified FC frames in Ethernet to transport the FC frames over a physical Ethernet network. The T11 Technical Committee, which is the International Committee for Information Technology Standards (INCITS) committee responsible for FC interfaces, developed the FCoE standard to provide a method for transporting FC frames over a DCB network. The T11 document *Fibre Channel Backbone - 5 (FC-BB-5) Rev 2.00* at <http://www.t11.org/ftp/t11/pub/fc/bb-5/09-056v5.pdf> provides details about the FCoE version 1 standard.

**NOTE:** The switch does not support T11 Annex F *FCoE Pre-FIP Virtual Link Instantiation Protocol*.

To the Ethernet network, an FCoE frame is the same as any other Ethernet frame because the Ethernet encapsulation provides the header information needed to forward the frames. However, to achieve the lossless behavior that FC transport requires, the Ethernet network must conform to DCB standards.

DCB standards create an environment over which FCoE can transport native FC traffic encapsulated in Ethernet while preserving the mandatory class of service (CoS) and other characteristics that FC traffic requires.

Supporting FCoE in a DCB network requires that the FCoE devices in the Ethernet network and the FC switches at the edge of the SAN network handle both Ethernet and native FC traffic. To handle Ethernet traffic, an FC switch does one of two things:

- Incorporates FCoE interfaces.
- Uses an FCoE-FC gateway such as a QFX3500 switch to de-encapsulate FCoE traffic from FCoE devices into native FC and to encapsulate native FC traffic from the FC switch into FCoE and forward it to FCoE devices through the Ethernet network.

**NOTE:** Standalone switches support FCoE. Virtual Chassis (VC) and mixed-mode Virtual Chassis Fabric (VCF) configurations do not support FCoE. Pure QFX5100 switch VCFs (consisting of only QFX5100 switches) support FCoE.

FCoE concepts include:

- [FCoE Devices on page 5519](#)
- [FCoE Frames on page 5520](#)

- [Virtual Links on page 5521](#)
- [FCoE VLANs on page 5521](#)

### FCoE Devices

Each FCoE device has a converged network adapter (CNA) that combines the functions of an FC host bus adapter (HBA) and a lossless Ethernet network interface card (NIC) with 10-Gbps Ethernet ports. The portion of the CNA that handles FCoE traffic is called an FCoE Node (ENode). An ENode combines FCoE termination functions and the client part of the FC stack on the CNA.

ENodes present virtual FC interfaces to FC switches in the form of virtual N\_Ports (VN\_Ports). A VN\_Port is an endpoint in a virtual point-to-point connection called a virtual link. The other endpoint of the virtual link is an FC switch (or FCF) port. A VN\_Port emulates a native FC N\_Port and performs similar functions: handling the creation, detection, and flow of messages to and from the FC switch. A single ENode can host multiple VN\_Ports. Each VN\_Port has a separate, unique virtual link with a FC switch.

ENodes contain at least one lossless Ethernet media access controller (MAC). Each Ethernet MAC is paired with an FCoE controller. The lossless Ethernet MAC is a full-duplex Ethernet MAC that implements Ethernet extensions to avoid frame loss due to congestion and supports frames of at least 2500 bytes. The FCoE controller instantiates and terminates VN\_Port instances dynamically as they are needed for FCoE sessions. Each VN\_Port instance has a unique virtual link to an FC switch.

**NOTE:** A *session* is a fabric login (FLOGI) or fabric discovery (FDISC) login to the FC SAN fabric. Session does not refer to end-to-end server-to-storage sessions.

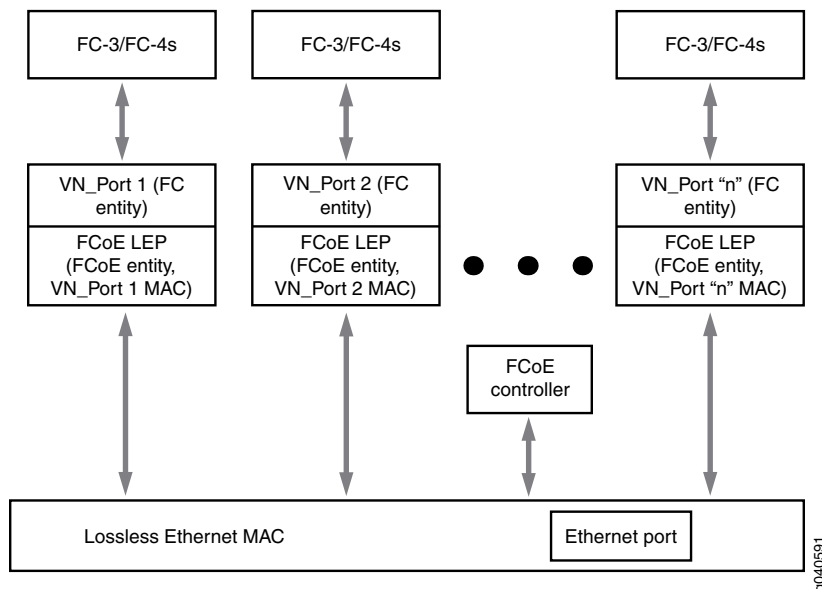

ENodes also contain one FCoE link end point (LEP) for each VN\_Port connection. An FCoE LEP is a virtual FC interface mapped onto the physical Ethernet interface.

An FCoE LEP:

- Transmits and receives FCoE frames on the virtual link.
- Handles FC frame encapsulation for traffic going from the server to the FC switch.
- Performs frame de-encapsulation of traffic received from the FC switch.

[Figure 190 on page 5520](#) shows a block diagram of the major ENode components.

Figure 190: ENode Components

### FCoE Frames

The FCoE protocol specification replaces the FC0 and FC1 layers of the FC stack with Ethernet, but retains the FC frame header. Retaining the FC frame header enables the FC frame to pass directly to a native FC SAN after de-encapsulation. The FCoE header carries the FC start of file (SOF) bits and end of file (EOF) bits in an encoded format. FCoE supports two frame types, control frames and data frames. FCoE Initialization Protocol (FIP) carries all of the discovery and fabric login frames.

FIP control frames handle FCoE device discovery, initializing communication, and maintaining communication. They do not carry a data payload. FIP has its own EtherType (0x8914) to distinguish FIP traffic from FCoE traffic and other Ethernet traffic. To establish communication, the ENode uses the globally unique MAC address assigned to it by the CNA manufacturer.

After FIP establishes a connection between FCoE devices, the FCoE data frames handle the transport of the FC frames encapsulated in Ethernet. FCoE also has its own EtherType (0x8906) to distinguish FCoE frames from other Ethernet traffic and ensure the in-order frame handling that FC requires. FCoE frames include:

- 2112 bytes FC payload
- 24 bytes FC header
- 14 bytes standard Ethernet header
- 14 bytes FCoE header
- 8 bytes cyclic redundancy check (CRC) plus EOF
- 4 bytes VLAN header
- 4 bytes frame check sequence (FCS)

The payload, headers, and checks add up to 2180 bytes. Therefore, interfaces that carry FCoE traffic should have a configured maximum transmission unit (MTU) of 2180 or larger. An MTU size of 2180 bytes is the minimum size; some network administrators prefer an MTU of 2240 or 2500 bytes.

### Virtual Links

Native FC uses point-to-point physical links between FC devices. In FCoE, virtual links replace the physical links. A virtual link emulates a point-to-point link between two FCoE device endpoints, such as a server VN\_Port and an FC switch (or FCF) VF\_Port.

Each FCoE interface can support multiple virtual links. The MAC addresses of the FCoE endpoints (the VN\_Port and the VF\_Port) uniquely identify each virtual link and allow traffic for multiple virtual links to share the same physical link while maintaining data separation and security.

A virtual link exists in one FCoE VLAN and cannot belong to more than one VLAN. Although the FC switch and the FCoE device detect a virtual link as a point-to-point connection, virtual links do not need to be direct connections between a VF\_Port and a VN\_Port. A virtual link can traverse one or more transit switches, also known as passthrough switches. A transit switch can transparently aggregate virtual links while still appearing and functioning as a point-to-point connection to the FCoE devices. However, a virtual link must remain within a single Layer 2 domain.

### FCoE VLANs

All FCoE traffic must travel in a VLAN dedicated to transporting only FCoE traffic. Only FCoE interfaces should be members of an FCoE VLAN. Ethernet traffic that is not FCoE or FIP traffic must travel in a different VLAN.

**NOTE:** On a standalone switch or QFabric system Node device, the same VLAN cannot be used in both transit switch mode and FCoE-FC gateway mode.

**NOTE:** FCoE VLANs (any VLAN that carries FCoE traffic) support only Spanning Tree Protocol (STP) and link aggregation group (LAG) Layer 2 features.

FCoE traffic cannot use a standard LAG because traffic might be hashed to different physical LAG links on different transmissions. This breaks the (virtual) point-to-point link that Fibre Channel traffic requires. If you configure a standard LAG interface for FCoE traffic, FCoE traffic might be rejected by the FC SAN.

QFabric systems support a special LAG called an FCoE LAG, which enables you to transport FCoE traffic and regular Ethernet traffic (traffic that is not FCoE traffic) across the same link aggregation bundle. Standard LAGs use a hashing algorithm to determine which physical link in the LAG is used for a transmission, so communication between two devices might use different physical links in the LAG for different transmissions. An FCoE LAG ensures that FCoE traffic uses the same physical link in the LAG for requests and replies in order to preserve the virtual point-to-point link between the FCoE device converged network adapter (CNA) and the FC SAN switch across the QFabric system Node device. An FCoE LAG does not provide load balancing or link redundancy for FCoE traffic. However, regular Ethernet traffic uses the standard hashing algorithm and receives the usual LAG benefits of load balancing and link redundancy in an FCoE LAG.

**NOTE:** IGMP snooping is enabled by default on all VLANs in all software versions before Junos OS R13.2. Disable IGMP snooping on FCoE VLANs if you are using software that is older than 13.2.

You can configure more than one FCoE VLAN, but any given virtual link must be in only one FCoE VLAN.

**NOTE:** All 10-Gigabit Ethernet interfaces that connect to FCoE devices must have a native VLAN configured in order to transport FIP traffic, because FIP VLAN discovery and notification frames are exchanged as untagged packets.

On switches that use the Enhanced Layer 2 Software (ELS) CLI, it is not sufficient only to configure the native VLAN on the interface, the interface must also be configured as a member of the native VLAN. (This is because the ELS CLI does not support tagged-access interface mode, so interfaces that are members of FCoE VLANs must use trunk mode, and trunk port interfaces must be explicitly included as members of a native VLAN.)

In addition, the VLAN ID must match the native VLAN ID that you configure on the physical interface. For example, to configure a native VLAN with an ID of 20 on interface xe-0/0/15 that is a member of an FCoE VLAN, you must include both of the following statements in the configuration:

1. Configure the native VLAN on the interface:

```
user@switch# set interfaces xe-0/0/15 native-vlan-id 20
```

(The equivalent configuration statement on a non-ELS device switch would be `set interfaces xe-0/0/15 unit 0 family ethernet-switching native-vlan-id 20`.)

2. Configure the port as a member of the native VLAN (this step is not required on switches that do not use the ELS software):

```
user@switch# set interfaces xe-0/0/15 unit 0 family ethernet-switching vlan members 20
```

**BEST PRACTICE:** Only FCoE traffic is permitted on the FCoE VLAN. A native VLAN might need to carry untagged traffic of different types and protocols. Therefore, it is a good practice to keep the native VLAN separate from FCoE VLANs.

## Understanding FCoE Transit Switch Functionality

You can use the switch as a Fibre Channel over Ethernet (FCoE) transit switch. An FCoE transit switch is a Layer 2 data center bridging (DCB) switch that can transport FCoE frames and implements FCoE Initialization Protocol (FIP) snooping. A DCB switch transports both FCoE and Ethernet LAN traffic over the same network infrastructure while preserving the class of service (CoS) that Fibre Channel (FC) traffic requires.

An FCoE transit switch does not encapsulate or de-encapsulate FC frames in Ethernet. It is an access switch that transports FC frames that have already been encapsulated in Ethernet between FCoE initiators such as servers and a storage area network (SAN) FC switch that supports both Ethernet and native FC traffic on its interfaces. The transit switch acts as a passthrough switch and is transparent to the FC switch, which detects each connection to an FCoE device as a direct point-to-point link.

When a switch acts as a transit switch, the VLANs you configure for FCoE traffic can use any of the switch ports because the traffic in both directions is standard Ethernet traffic, not native FC traffic.

.....

**NOTE:** The Ethernet interfaces that connect to FCoE devices must include a native VLAN to transport FIP traffic, because FIP VLAN discovery and notification frames are exchanged as untagged packets. It is a good practice to keep the native VLAN separate from the VLANs that carry FCoE traffic. FCoE VLANs should carry only FCoE traffic, but other types of untagged traffic might use the native VLAN.

Switches and QFabric system Node devices that use the original CLI (not the Enhanced Layer 2 (ELS) software) only require that you configure the native VLAN on the FCoE interfaces that belong to the FCoE VLAN by including the `[set interfaces interface-name unit unit family ethernet-switching native-vlan-id native-vlan-id]` statement in the configuration.

QFX5100 and EX4600 switches use ELS software and require that you include two statements in the configuration to configure a native VLAN on FCoE interfaces. Include the `[set interfaces interface-name native-vlan-id vlan-id]` statement in the configuration to configure the native VLAN on the interface, and also include the `[set interfaces interface-name unit unit family ethernet-switching native-vlan-id vlan-id]` statement in the configuration to configure the port as a member of the native VLAN.

.....

FCoE traffic should use a VLAN dedicated only to FCoE traffic. Do not mix FCoE traffic with standard Ethernet traffic on a VLAN on the switch.

**NOTE:** FCoE VLANs (any VLAN that carries FCoE traffic) support only Spanning Tree Protocol (STP) and link aggregation group (LAG) Layer 2 features.

FCoE traffic cannot use a standard LAG because traffic might be hashed to different physical LAG links on different transmissions. This breaks the (virtual) point-to-point link that Fibre Channel traffic requires. If you configure a standard LAG interface for FCoE traffic, FCoE traffic might be rejected by the FC SAN.

QFabric systems support a special LAG called an FCoE LAG, which enables you to transport FCoE traffic and regular Ethernet traffic (traffic that is not FCoE traffic) across the same link aggregation bundle. Standard LAGs use a hashing algorithm to determine which physical link in the LAG is used for a transmission, so communication between two devices might use different physical links in the LAG for different transmissions. An FCoE LAG ensures that FCoE traffic uses the same physical link in the LAG for requests and replies in order to preserve the virtual point-to-point link between the FCoE device converged network adapter (CNA) and the FC SAN switch across the QFabric system Node device. An FCoE LAG does not provide load balancing or link redundancy for FCoE traffic. However, regular Ethernet traffic uses the standard hashing algorithm and receives the usual LAG benefits of load balancing and link redundancy in an FCoE LAG.

**NOTE:** IGMP snooping is enabled by default on all VLANs in all software versions before Junos OS R13.2. Disable IGMP snooping on FCoE VLANs if you are using software that is older than 13.2.

**NOTE:** On a QFX3500 switch or on a QFabric system Node device, the same VLAN cannot be used in both transit switch mode and FCoE-FC gateway mode. (Only QFX3500 switches can be configured in FCoE-FC gateway mode.) If you configure both a transit switch and an FCoE-FC gateway on the same QFX3500 switch or QFabric system Node device, configure different FCoE VLANs for the transit switch and the FCoE-FC gateway.

Transit switch architecture differs from FCoE-FC gateway architecture. As an FCoE-FC gateway, the system transports traffic to the FC SAN as native FC frames, and the VLAN must use an FCoE VLAN interface and native FC interfaces to transport that traffic. As a transit switch, the system forwards Ethernet traffic, and requires DCB configuration for lossless transport of that traffic and FIP snooping at FCoE device access ports, but not the FCoE-FC gateway features necessary for transporting FC traffic.

With the exception of Virtual Chassis (VC) and mixed-mode Virtual Chassis Fabric (VCF) configurations, switches support the DCB standards for ensuring lossless transport and low latency, and provide 10-Gbps ports for FCoE traffic. VCF configurations that use only

QFX5100 switches support DCB standards. For lossless transport to function correctly, you must use priority-based flow control (PFC, described in IEEE 802.1Qbb) to create bandwidth reservations and ensure proper CoS for FCoE traffic.

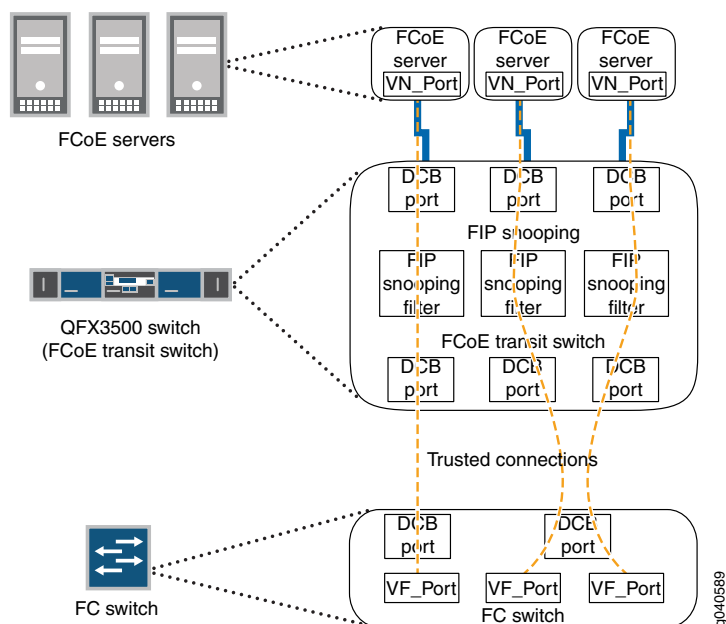

FIP snooping adds security by filtering access so that only traffic from servers that have successfully logged in to the FC network passes through the transit switch and reaches the FC network. The Technical Committee T11 organization specifications describe two types of FIP snooping:

- The FC-BB-5 specification describes VN\_Port to VF\_Port (VN2VF\_Port) FIP snooping, which provides security for communication between FCoE device VN\_Ports on the Ethernet network and FCF or FC switch VF\_Ports.
- The FC-BB-6 specification describes VN\_Port to VN\_Port (VN2VN\_Port) FIP snooping, which provides security for communication between FCoE device VN\_Ports on the Ethernet network.

To accommodate the larger size of Ethernet-encapsulated frames, FCoE interfaces should be configured with a maximum transmission unit (MTU) size of at least 2180 bytes.

The transit switch transparently connects FCoE-capable devices such as servers in an Ethernet LAN to an FC switch or to a gateway switch (hereafter referred to as the FC switch), as shown in [Figure 191 on page 5526](#). The transit switch acts as a transparent DCB access layer between FCoE servers and the FC switch.

**Figure 191: FCoE Transit Switch Connecting FCoE Devices to an FC Switch**

The transit switch performs FIP snooping at the ports connected to the FCoE devices. For VN2VF\_Port FIP snooping, at the SAN edge, the FC switch must be able to convert the FCoE traffic to native FC traffic. (VN2VN\_Port FIP snooping switches traffic between

VN\_Ports directly through the transit switch, without going through the FC switch, so no conversion of FCoE traffic to native FC traffic is needed.)

Encapsulated FCoE traffic flows through the transit switch to the FCoE ports on the FC switch. The FC switch removes the Ethernet encapsulation from the FCoE frames to restore the native FC frames. Native FC traffic travels out native FC ports to storage devices in the FC SAN.

Native FC traffic from storage devices flows to the FC switch FC ports, and the FC switch encapsulates that traffic in Ethernet as FCoE traffic. The FCoE traffic flows through the transit switch to the appropriate FCoE device.

**NOTE:** The FC switch and FC fabric apply appropriate zoning checks on traffic to and from each ENode and provide FC services (for example, name server, fabric login server, or event server).

**NOTE:** VN\_Port to VN\_Port FIP snooping is supported to allow FCoE initiators and targets to communicate directly through the switch without going through an FCoE forwarder (FCF) or an FC switch. An FCoE VLAN can support either VN2VF\_Port FIP snooping (FC-BB-5) or VN2VN\_Port FIP snooping (FC-BB-6), but not both. The same switch can have multiple FCoE VLANs configured, some FCoE VLANs for VN2VF FIP snooping traffic and others for VN2VN FIP snooping traffic.

## Understanding FCoE and FIP Session High Availability

High availability features maintain storage network sessions when a system process is terminated and during certain types of upgrades:

- [High Availability for Fibre Channel Process Termination \(FCoE-FC Gateway Mode\) on page 5528](#)
- [High Availability for FIP Snooping on page 5528](#)
- [Nonstop Software Upgrade \(QFabric Systems\) on page 5529](#)

### High Availability for Fibre Channel Process Termination (FCoE-FC Gateway Mode)

In FCoE-FC gateway mode, the QFX3500 switch provides high availability to restore the FCoE sessions running on the switch in case the Fibre Channel (FC) process is terminated. A session is a fabric login (FLOGI) or fabric discovery (FDISC) login to the FC SAN fabric, not an end-to-end server-to-storage session.

The switch stores FCoE session data in a persistent storage module. If the FC process terminates, the switch restores the existing FCoE sessions on the same interfaces that they were on before the FC process terminated. Data traffic for existing sessions is not affected during session restoration.

For a brief time, the system does not process control traffic because of the FC process restart and session restoration. During this brief time, no new FCoE sessions can be established, and no existing sessions can log out.

.....  
**NOTE:** During the restoration process, if the FC process does not receive an *interface up* notification from a particular interface within a certain time, the switch times out the restore operation and discards the data on that interface. The previously existing FCoE sessions on that interface are not restored, and the ENodes must log in again.  
.....

.....  
**NOTE:** An FC process restart and session restoration resets the Fibre Channel statistics.  
.....

If the FC process terminates repeatedly, the operating system disables the process until you manually restart it. To restart the FC process manually, issue the **restart fibre-channel** command.

### High Availability for FIP Snooping

You can configure the system to perform FIP snooping on Ethernet interfaces that are connected to FCoE devices that have ENodes. The high availability function restores running FIP snooping sessions in case the Ethernet switching process is terminated.

The Ethernet switching process stores the FIP snooping state in a persistent storage module. If the Ethernet switching process terminates, the switch restores the existing

FIP snooping sessions on the same interfaces that they were on before the Ethernet switching process terminated. The high availability features preserve:

- Logged in ENodes
- Discovered FCFs
- Existing sessions
- Existing FIP snooping filters

The complete restoration process, including reconciling all valid states, takes a maximum of 8 seconds. During the restoration process, the switch can learn a new FCF or a new FC switch, and new ENodes can log in to the FC network. However, FDISC messages from an ENode that is already logged in to the network might be dropped if the ENode has not yet been restored.

When the Ethernet switching process terminates ungracefully, the FIP keepalive timer is reset to the normal initial value, not the value at the time of the Ethernet switching process termination.

In the event of an Ethernet switching process termination, ENodes remain logged in, and existing sessions are not interrupted.

**NOTE:** An Ethernet switching process restart and session restoration resets the FIP snooping statistics.

### Nonstop Software Upgrade (QFabric Systems)

On QFabric system Node groups that have more than one Node device, nonstop software upgrade (NSSU) enables you to upgrade the Node devices with minimal packet loss and maximum uptime. NSSU automates software upgrades on the QFabric system components in an orderly and consistent manner to maximize system uptime.

The system upgrades components with redundant architectures, such as redundant server Node groups and network Node groups that have two or more members, in stages. While the system upgrades one component, the redundant component continues to function.

For example, while one member of a redundant server Node group is upgraded, the other member continues to forward traffic. When the first Node group member completes the upgrade, it comes online while the system upgrades the second member.

NSSU provides high availability for the lossless traffic forwarding required to support storage networks. If your system design includes redundancy (redundant Node devices in Node groups, LAGs, and so on) so that an alternate traffic path is available, when you upgrade a Node device, traffic is not impacted.

In fully redundant topologies, NSSU preserves FIP session, FIP snooping filter, VN2VF\_Port session, and VN2VN\_Port session information and prevents traffic loss in most cases.

An exception is that Node devices that are directly connected to ENodes experience momentary traffic loss when the Node device reboots.

## Understanding OxID Hash Control for FCoE Traffic Load Balancing on Standalone Switches

The originator exchange identifier (OxID) field is one of several fields that the switch can use in its hash function computation for FCoE traffic load balancing over multiple outgoing links in an Ethernet link aggregation group (LAG) on ports that face an FCoE forwarder (FCF). The originator of an exchange between a pair of Fibre Channel (FC) endpoints (such as an FCoE host and an FC storage device) uses the OxID field as an identifier for that exchange. The originator also uses the OxID field to track the progress of the series of sequences that comprise the exchange.

When FCoE traffic traverses a LAG that faces an FCF, it can take multiple different links between the source and destination endpoints. The idea is to distribute the FCoE traffic across the FCF-facing LAG links, thus balancing the link load. The switch creates a hash value from some of the packet header fields, and uses the hash value to assign each packet to one of the LAG links. The switch always uses five packet header fields to compute the hash value:

- Source ID (SID)
- Destination ID (DID)
- Fabric ID (FID)
- Source Port ID (SPID)
- Source Module ID (SMID)

In addition, the OxID field is included by default in the FCoE load-balancing hash computation. However, if you do not want to use the OxID field in the FCoE load-balancing hash computation, you can remove it from the computation by using the **set forwarding-options hash-key family fcoe oxid disable** command.

Including the OxID field in the load-balancing hash computation allows different exchanges between a pair of Fibre Channel (FC) endpoints (such as an FCoE host and an FC storage device) to take different paths across the network, thus improving the aggregate network throughput.

However, if the paths between different sets of FC endpoints have common links, congestion on one set of FC endpoints can affect the other set of endpoints. Such congestion can happen if the FCoE traffic on the two sets of endpoints uses the same priority (IEEE 802.1p code point). It is common for networks to use priority 3 (IEEE 802.1p code point 011) for FCoE traffic. However, you can assign different IEEE priorities to

different lossless FCoE flows as described in [“Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows” on page 5837](#) to further separate the traffic flows.

## Understanding VN\_Port to VF\_Port FIP Snooping on an FCoE Transit Switch

Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) snooping is a security mechanism that is designed to prevent unauthorized access and data transmission to a Fibre Channel (FC) network. It works by filtering traffic to permit only servers that have logged in to an FC network to access that network.

You explicitly enable VN\_Port to VF\_Port (VN2VF\_Port) FIP snooping (FC-BB-5) on FCoE VLANs when the switch is an FCoE transit switch at the access edge that connects FCoE devices on the Ethernet network to FC switches or gateways at the FC storage area network (SAN) edge. The transit switch applies FIP snooping filters at the ports associated with the FCoE VLANs on which you enable VN2VF\_Port FIP snooping. An FCoE transit switch is a data center bridging (DCB) switch with FIP snooping capability.

An FCoE device that has a converged network adapter (CNA) uses the FIP process to log in to the FC network as an FCoE Node (ENode). The login process establishes a dedicated virtual link between a virtual N\_Port (VN\_Port) on the ENode and a virtual F\_Port (VF\_Port) on the FC switch. This dedicated virtual link emulates a point-to-point connection. The emulated connection is called a virtual link.

Virtual links pass transparently through the transit switch. The ENode VN\_Port and the FC switch VF\_Port do not detect the transit switch, and virtual links appear to be direct point-to-point links.

The switch applies VN2VF\_Port FIP snooping firewall filters at the FCoE-network facing ports associated with the FCoE VLANs on which you enable VN2VF\_Port FIP snooping. FIP snooping provides security for virtual links by creating firewall filters based on information gathered (snooped) about FC devices during FIP transactions.

The switch also supports VN\_Port to VN\_Port (VN2VN\_Port) FIP snooping (FC-BB-6) to allow FCoE initiators and targets to communicate directly through the switch without going through an FCoE forwarder (FCF) or an FC switch, as described in [“Understanding VN\\_Port to VN\\_Port FIP Snooping on an FCoE Transit Switch” on page 5539](#).

**NOTE:** An FCoE VLAN can support either VN2VF\_Port FIP snooping (FC-BB-5) or VN2VN\_Port FIP snooping (FC-BB-6), but not both. The same switch can have multiple FCoE VLANs configured, some for VN2VF\_Port FIP snooping traffic and others for VN2VN\_Port FIP snooping traffic. On FCoE VLANs that are configured as VN2VN\_Port snooping VLANs, VN2VF\_Port FIP snooping traffic is dropped.

When you enable VN2VF\_Port FIP snooping on an FCoE VLAN, the system snoops VN\_Port to VF\_Port packets and enforces security only on VN2VF\_Port virtual links.

When you enable VN2VN\_Port FIP snooping on an FCoE VLAN, the system snoops VN\_Port to VN\_Port packets and enforces security only on VN2VN\_Port virtual links.

## **FC Network Security**

---

In traditional FC networks, the FC switch is usually a trusted entity, and server ENodes connect directly to its VF\_Ports. After an ENode gains access to the network through the fabric login (FLOGI) process, the FC switch enforces zoning configurations, ensures that the ENode uses valid addresses, monitors the connection, and performs other security functions to prevent unauthorized access.

However, FCoE exposes FC frames to Ethernet networks, which do not have the same level of security as native FC networks. VN2VF\_Port FIP snooping firewall filters emulate the native FC network security functions by preventing unauthorized access to the FC switch through the transit switch and by ensuring the security of the virtual link between each ENode and the FC switch, as shown in [Figure 192 on page 5533](#). VN2VF\_Port FIP snooping also prevents man-in-the-middle attacks.

Figure 192: FCoE Transit Switch Performs VN2VF\_Port FIP Snooping

The transit switch performs VN2VF\_Port FIP snooping at the ports connected to the FCoE devices. At the SAN edge, the FC switch must be able to convert the FCoE traffic to native FC traffic.

### VN2VF\_Port FIP Snooping Functions

When VN2VF\_Port FIP snooping is enabled, the transit switch sets and applies filters to block all FCoE traffic by default. The transit switch monitors FIP logs, solicitations, and advertisements that pass through it and gathers information about the ENode address and the address of the port on the FC switch. The transit switch uses the information to construct firewall filters that permit access only to logged-in ENodes. All other traffic on the VLAN is denied.

For example, when an ENode on an FCoE VLAN performs a successful login to an FC switch port, the transit switch snoops the FIP information and constructs a firewall filter that provides access for the ENode to that port on the FC switch.

The firewall filters enable FCoE frames to pass through the transit switch only on a virtual link established between an FCoE device ENode VN\_Port and the FC switch VF\_Port to which it has logged in. The firewall filters ensure that ENodes can only connect to the FC switches they have successfully logged in to and that only valid FCoE traffic along valid paths is transmitted. VN2VF\_Port FIP snooping maintains the filters by tracking FCoE sessions (ENode to FCF sessions).

### FIP Snooping Firewall Filters

---

The effect of the firewall filters is to protect the FCoE ports. VN2VF\_Port FIP snooping performs the following actions and checks to ensure that FCoE traffic is valid:

- Denies ENodes that use the FC switch media access control (MAC) address as the source address.
- Enables ENodes to transmit FIP and FCoE frames to the FC switch address.
- Ensures that the FCoE source address the FC switch assigns or accepts is only used for FCoE traffic.
- Ensures that FCoE frames are only addressed to the accepting FC switch.

### FIP Snooping Session Scalability

---

Enhanced FIP snooping session scaling, which supports up to 2,500 sessions, is enabled by default. On QFabric systems, if you want to disable enhanced FIP snooping scaling (which reduces the number of supported sessions to 376 sessions), you can do so as described in *Disabling Enhanced FIP Snooping Scaling*.

By default, up to 2500 total FIP snooping sessions are supported on an interface, an FCoE-FC gateway fabric (only supported on QFX3500 switches configured as standalone switches or as QFabric system Node devices), a switch, a QFabric Node device, or a QFabric Node group. For example, you can:

- Place all 2500 sessions on one FCoE interface.
- Split the 2500 sessions among multiple FCoE interfaces on one FCoE VLAN.
- Split the 2500 sessions among multiple FCoE interfaces on multiple FCoE VLANs.
- Split the 2500 sessions among the FCoE interfaces on multiple gateway FC fabrics on a switch.
- Split the 2500 sessions among the FCoE interfaces on multiple gateway FC fabrics on multiple Node devices in a QFabric Node group.

Regardless of how you allocate the sessions among interfaces and local FC fabrics on a switch or on a QFabric system Node device or Node group, the combined FIP session limit is a maximum of 2500 sessions.

**NOTE:** The total number of sessions the system can support is the combined number of VN2VF\_Port sessions and VN2VN\_Port sessions. If VN2VN\_Port sessions are active, the total number of available VN2VF\_Port sessions is reduced.

---

### VN2VF\_Port FIP Snooping Implementation

---

You enable VN2VF\_Port FIP snooping on a per-VLAN basis on VLANs that carry FCoE traffic. The switch snoops FIP frames at the ports associated with FCoE VLANs enabled

for VN2VF\_Port FIP snooping. The switch then installs the resulting firewall filters on the ports to ensure that all VN2VF\_Port FIP snooping occurs on the switch network edge.

VN2VF\_Port FIP snooping FCoE VLANs must meet the following criteria:

- An FCoE VLAN should be dedicated to FCoE traffic only.
- An FCoE VLAN cannot support both VN2VF\_Port FIP snooping and VN2VN\_Port FIP snooping simultaneously. You must configure separate FCoE VLANs for VN2VF\_Port FIP snooping traffic and for VN2VN\_Port FIP snooping traffic.

**NOTE:** Changing an FCoE VLAN from VN2VF\_Port FIP snooping mode to VN2VN\_Port snooping mode terminates the existing virtual links on the VLAN. The transit switch removes the existing FIP snooping filters, creates the new FIP snooping filters, and applies them to the FIP snooping ports. If you downgrade the software to Junos OS Release 12.1 or earlier, VLANs configured for VN2VN\_Port FIP snooping revert to VN2VF\_Port FIP snooping VLANs.

- For systems that use software that does not support Enhanced Layer 2 Software (ELS) CLI, configure all access ports that belong to an FCoE VLAN (ports connected to a converged network adapter [CNA] in an FCoE device) in **tagged-access** port mode. Access ports associated with an FCoE VLAN should not be configured as access ports or trunk ports on these platforms, although trunk port configuration is supported.

However, on switches that use the ELS CLI, configure access ports that belong to an FCoE VLAN in **trunk** interface mode.

- All ports connected to an FC switch (or FCoE forwarder) must be configured in **trunk** port mode. Ports connected to an FC switch must be configured as trusted ports.
- FIP traffic uses the native VLAN (FIP VLAN discovery and notification frames are exchanged as untagged packets).
- All FCoE VLAN traffic must be tagged and cannot belong to the native VLAN.
- FCoE VLAN traffic cannot be untagged or priority-tagged.

When you enable VN2VF\_Port FIP snooping, the switch inspects FIP frames.

The VN2VF\_Port FIP snooping implementation includes these considerations:

- [ENode-Facing Interfaces on page 5535](#)
- [Network-Facing Interfaces on page 5537](#)
- [FC-MAP on page 5537](#)

### ***ENode-Facing Interfaces***

When the interfaces that belong to an FCoE VLAN connect directly to FCoE devices (there is no other transit switch between the FCoE devices and the switch), we recommend that you enable VN2VF\_Port FIP snooping on all FCoE VLANs that connect VN\_Ports to VF\_Ports. Enabling FIP snooping ensures secure connections between server ENodes and FC switches. (Enabling VN2VN\_Port FIP snooping ensures secure connections on

FCoE VLANs that connect VN\_Ports to other VN\_Ports). FIP snooping should always be enabled at the access edge.

Systems that run Enhanced Layer 2 Software (ELS) support a slightly different configuration on ENode-facing interfaces than systems that do not run ELS. This section describes:

- [Non-ELS Port Mode for FCoE Interfaces on page 5536](#)
- [ELS Interface Mode for FCoE Interfaces on page 5536](#)
- [Trusted and Untrusted FCoE Interfaces on page 5536](#)

#### ***Non-ELS Port Mode for FCoE Interfaces***

The interfaces that belong to FCoE VLANs (interfaces that connect to CNAs in FCoE devices) on systems that do not support ELS should be configured in **tagged-access** port mode. After you enable VN2VF\_Port FIP snooping on an FCoE VLAN, the transit switch denies FCoE traffic from any ENode on that VLAN until the ENode performs a valid fabric login with an FC switch.

The **tagged-access** port mode was not available in Junos OS Release 11.3 and prior releases. In Release 11.3 and earlier, **trunk** port mode was used for Ethernet interfaces that connected to FCoE access devices. Because **tagged-access** mode is now available, using **trunk** mode for interfaces connected to FCoE CNAs is not recommended.

If an existing configuration uses **trunk** mode for ports connected to FCoE CNAs, you can change the port mode to **tagged-access** without disrupting traffic. Although we recommend changing the port mode of these ports from **trunk** to **tagged-access** as a best practice, it is not mandatory. New configurations should use **tagged-access** mode for interfaces that connect to FCoE devices.

#### ***ELS Interface Mode for FCoE Interfaces***

The interfaces that belong to FCoE VLANs (interfaces that connect to CNAs in FCoE devices) on systems that support ELS should be configured in **trunk** interface mode. After you enable VN2VF\_Port FIP snooping on an FCoE VLAN, the transit switch denies FCoE traffic from any ENode on that VLAN until the ENode performs a valid fabric login with an FC switch.

#### ***Trusted and Untrusted FCoE Interfaces***

Do not configure ENode-facing interfaces as FCoE trusted interfaces when VN2VF\_Port FIP snooping is enabled on those interfaces. If you enable VN2VF\_Port FIP snooping on an FCoE VLAN and you configure ENode-facing interfaces that are members of the FIP snooping VLAN as **fcoe-trusted**, then FCoE devices might not be able to log in to the FC network.

Changing ports from untrusted to trusted removes any existing VN2VF\_Port FIP snooping filters from the ports and terminates the existing sessions. Changing the fabric ports from trusted to untrusted forces all of the FCoE sessions on those ports to log out so that when the ENodes and VN\_Ports log in again, the switch can build the appropriate VN2VF\_Port FIP snooping filters.

### Network-Facing Interfaces

When the switch acts as an FCoE transit switch, you must configure any interface that is connected to a switch as an FCoE trusted interface in **trunk** port mode and as a 10-Gigabit Ethernet interface.

Switch-facing Ethernet interfaces have the following requirements and behaviors:

- You must explicitly configure switch-facing trunk ports on an FCoE transit switch as FCoE trusted interfaces.
- After you configure an FC switch-facing trunk port as a trusted interface, the FCoE transit switch always processes FC switch frames because they come from a source on a trusted interface.
- All ports in an FCoE VLAN must be configured as tagged access or trunk ports.

### FC-MAP

When the switch acts as an FCoE transit switch and you enable VN2VF\_Port FIP snooping on an FCoE VLAN, you can optionally specify a 24-bit FCoE mapped address prefix (FC-MAP) value. On a given VLAN, the transit switch learns only those FC switches that have a matching FC-MAP value. If the transit switch FCoE VLAN FC-MAP value does not match the FC switch FC-MAP value, the transit switch does not discover the FC switch on that VLAN, and the ENodes on that VLAN cannot access the FC switch. An FCoE VLAN can have one and only one FC-MAP value.

The FC-MAP value is a MAC address prefix unique to an FC switch in the FC SAN fabric that the FC switch uses to identify FCoE traffic for a given FC fabric (traffic on a particular FCoE VLAN). The FC switch combines the FC-MAP value with a unique 24-bit FCID value for the ENode VN\_Port during the login process. This creates a 48-bit identifier that is unique to the fabric. The FC switch assigns this 48-bit value to the ENode VN\_Port as its MAC address and unique identifier for the session. Each VN\_Port session the ENode establishes with the FC switch receives a unique FCID from the FC switch, so an FCoE device can host multiple virtual links (one for each VN\_Port) to an FC switch, each with a 48-bit MAC address that is unique to the fabric.

The VN2VF\_Port FIP snooping filter compares the configured FC-MAP value with the FC-MAP value in the header of frames coming from the ENode VN\_Port. If the values do not match, the transit switch denies access.

**NOTE:** Changing the FC-MAP value causes all logins to be dropped and forces ENodes to log in again.

NOTE: Do not configure static MAC addresses with the FC-MAP value as a prefix (the first 24 bits of the MAC address). If you configure a static MAC address that uses the FC-MAP value as a prefix, the system deletes the static MAC address automatically after you enable FIP snooping. The static MAC address configuration is not restored even if you disable FIP snooping later. (The system considers a static MAC address with the FC-MAP value as the prefix to be a misconfiguration.) Do not use a MAC address with the FC-MAP value as the prefix for any traffic other than the FIP snooping traffic when the switch is acting as a transit switch.

---

## Understanding VN\_Port to VN\_Port FIP Snooping on an FCoE Transit Switch

VN\_Port to VN\_Port (VN2VN\_Port) Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) snooping (FC-BB-6) on an FCoE transit switch is conceptually similar to VN\_Port to VF\_Port (VN2VF\_Port) FIP snooping (FC-BB-5) on an FCoE transit switch. An FCoE transit switch is a data center bridging (DCB) switch with FIP snooping capability. VN2VN\_Port FIP snooping provides security in the form of filters. The filters help prevent unauthorized access and data transmission on a bridge that connects ENodes on the Ethernet network.

The main difference between VN2VN\_Port FIP snooping and VN2VF\_Port FIP snooping is that you use VN2VN\_Port FIP snooping when the FCoE devices reside on the Ethernet network, so there is no need to forward traffic between FCoE devices to the Fibre Channel (FC) network, and you use VN2VF\_Port FIP snooping when FCoE devices on the Ethernet network need to access targets on the FC network, so FCoE traffic must be forwarded to the FC network. See “[Understanding VN\\_Port to VF\\_Port FIP Snooping on an FCoE Transit Switch](#)” on page 5531 for information about VN2VF\_Port FIP snooping.

You enable VN2VN\_Port FIP snooping on the FCoE VLAN that transports the VN2VN traffic. The transit switch applies VN2VN\_Port FIP snooping filters at the ports associated with the FCoE VLANs on which you enable VN2VN FIP snooping.

A key benefit of VN2VN\_Port FIP snooping is that it enables FCoE initiators and targets to communicate directly through the switch without going through an FCoE forwarder (FCF) or an FC switch. The transit switch does not differentiate between initiators and targets because the transit switch sees both VN\_Ports as FIP virtual link end points. Direct VN2VN\_Port communication requires secure access (FIP snooping filters) because ENodes are not trusted entities.

This topic describes:

### VN2VN\_Port FIP Snooping and FIP Snooping Virtual Links

FIP snooping under the T11 FC-BB-5 specification requires that an FC switch or an FCF be in the path between two VN\_Ports when they communicate. Introduced in the T11 FC-BB-6 specification (see <http://www.t11.org/ftp/t11/pub/fc/bb-6/10-019v3.pdf>), VN2VN\_Port FIP snooping allows the FCoE transit switch to connect two VN\_Ports to

each other directly, without going through an FC switch or an FCF, provided that the ENodes have logged in to the FC network.

In VN2VF\_Port FIP snooping, when an ENode logs in to the FC network, the FCoE transit switch snoops the FIP communication between the ENode and the FC switch. In VN2VN\_Port FIP snooping mode, the transit switch creates filters on the switch access ports to control VN\_Port access to other VN\_Ports on the Ethernet network. The VN2VN\_Port FIP snooping filters allow the switch to establish a dedicated virtual link that emulates a point-to-point connection between two VN\_Ports, through the switch.

Virtual links pass transparently through the transit switch. The VN\_Ports do not detect the transit switch, and virtual links appear to be direct point-to-point links.

You explicitly enable VN2VN\_Port FIP snooping on FCoE VLANs when the switch or QFabric system Node device is an FCoE transit switch connecting FCoE devices on the Ethernet network to each other and to FC switches or gateways at the FC storage area network (SAN) edge.

**NOTE:** An FCoE VLAN can support either VN2VF\_Port FIP snooping or VN2VN\_Port FIP snooping, but not both. Configure separate FCoE VLANs for VN2VF\_Port FIP snooping traffic and for VN2VN\_Port FIP snooping traffic. On FCoE VLANs that are configured as VN2VN\_Port FIP snooping VLANs, VN\_Port to VF\_Port traffic is dropped.

When you enable FIP snooping, the system snoops VN2VF\_Port packets and enforces security only on VN\_Port to VF\_Port virtual links. When you enable VN2VN\_Port FIP snooping, the system snoops VN\_Port to VN\_Port FIP packets and enforces security only on VN\_Port to VN\_Port virtual links.

The transit switch applies VN2VN\_Port FIP snooping filters at the ports associated with the FCoE VLANs on which you enable VN2VN\_Port FIP snooping. VN2VN\_Port FIP snooping provides security for virtual links by creating filters based on information gathered (snooped) about FCoE devices during FIP transactions.

---

### VN2VN\_Port Communication Modes

---

The transit switch supports two VN2VN\_Port communication modes:

- Point-to-point mode
- Multipoint mode

In point-to-point mode, two ENodes are connected to the network and form a single VN\_Port to VN\_Port virtual link. This is analogous to the point-to-point FC link between an FC initiator and an FC target.

In multipoint mode, multiple ENodes are connected to the network and form multiple virtual links. Each virtual link is created between one pair of VN\_Ports. This is analogous to loop mode in traditional FC networks.

The VN2VN\_Port communication mode is not configured; it is determined by the number of ENodes connected to the network.

### Network Security

In traditional FC networks, the FC switch is usually a trusted entity and the server ENodes are untrusted entities. The ENodes connect directly to the FC switch VF\_Ports. After an ENode gains access to the network through the fabric login (FLOGI) process, the FC switch enforces zoning configurations, ensures that the ENode uses valid addresses, monitors the connection, and performs other security functions to prevent unauthorized access.

However, FCoE exposes FC frames to Ethernet networks, which do not have the same level of security as native FC networks. VN2VN\_Port FIP snooping filters emulate the native FC network security functions by preventing unauthorized access and by ensuring the security of the virtual link between ENode VN\_Ports. The transit switch performs VN2VN\_Port FIP snooping at the ports connected to the FCoE VN\_Port devices.

### VN2VN\_Port FIP Snooping Functions

When you enable VN2VN\_Port FIP snooping, the transit switch sets and applies filters to block all FCoE traffic on the VLAN by default. The transit switch monitors FIP logins, solicitations, and advertisements that pass through it and gathers information about the ENode address. The transit switch uses the information to construct filters that permit access only to logged-in ENodes. All other traffic on the VLAN is denied.

The filters enable FCoE frames to pass through the transit switch only on a virtual link established between two VN\_Ports. The filters ensure that ENodes can only connect to other ENodes if they have successfully logged in to each other, and that only valid FCoE traffic along valid paths is transmitted. VN2VN\_Port FIP snooping maintains the filters by tracking VN\_Port to VN\_Port sessions.

### Scalability

Because ENodes are untrusted and the system needs to apply filters to untrusted FIP snooping interfaces, the total number of combined VN2VN\_Port FIP snooping sessions per switch is 376 sessions (ENode to ENode sessions) on untrusted interfaces. On interfaces that are configured as trusted interfaces, no FIP snooping filters are applied.

**NOTE:** The total number of sessions the system can support is the combined number of VN2VF\_Port sessions and VN2VN\_Port sessions. If VN2VF\_Port sessions are active, the total number of available VN2VN\_Port sessions is reduced.

### VN2VN\_Port FIP Snooping Implementation

You enable VN2VN\_Port FIP snooping on a per-VLAN basis on VLANs that carry FCoE traffic. The switch snoops FIP frames at the ports associated with FCoE VLANs enabled for VN2VN\_Port FIP snooping. The switch then installs the resulting filters on the ENode-facing ports to ensure that all FIP snooping occurs on the switch network edge.

VN2VN\_Port FIP snooping FCoE VLANs must meet the following criteria:

- An FCoE VLAN should be dedicated to FCoE traffic only.
- An FCoE VLAN cannot support both VN2VF\_Port FIP snooping (FC-BB-5) and VN2VN\_Port FIP snooping (FC-BB-6) simultaneously. You must configure separate FCoE VLANs for FIP snooping traffic and for VN2VN\_Port FIP snooping traffic.

**NOTE:** Changing an FCoE VLAN from VN2VF\_Port FIP snooping mode to VN2VN\_Port FIP snooping mode terminates the existing virtual links on the VLAN. The transit switch removes the existing FIP snooping filters, creates the new FIP snooping filters, and applies them to the FIP snooping ports. If you downgrade the software to Junos OS Release 12.1 or earlier, VLANs configured for VN2VN\_Port FIP snooping revert to VN2VF\_Port FIP snooping VLANs.

- For switches that do not run Enhanced Layer 2 Software (ELS), as a best practice, you should configure all access ports that belong to an FCoE VLAN (ports connected to a converged network adapter [CNA] in an FCoE device) in **tagged-access** port mode. However, access and trunk port modes are also supported. For switches that use ELS, configure access ports that belong to an FCoE VLAN in **trunk** interface mode.
- Access ports should be configured as untrusted ports.
- All ports connected to another transit switch must be configured in **trunk** port mode.
- FIP traffic uses the native VLAN.
- You can enable VN2VN\_Port FIP snooping on a native VLAN.

---

### ENode-Facing Interfaces

When the interfaces that belong to an FCoE VLAN connect directly to FCoE devices (there is no other transit switch between the FCoE devices and the switch), we recommend that you either enable VN2VN\_Port FIP snooping on all FCoE VLANs to ensure secure connections between VN\_Ports, or enable VN2VF\_Port FIP snooping on FCoE VLANs that connect ENodes to an FC switch. FIP snooping should always be enabled at the access edge.

Systems that run Enhanced Layer 2 Software (ELS) support a slightly different configuration on ENode-facing interfaces than systems that do not run ELS. This section describes:

- [Non-ELS Port Mode for FCoE Interfaces on page 5542](#)
- [ELS Interface Mode for FCoE Interfaces on page 5543](#)
- [Trusted and Untrusted FCoE Interfaces on page 5543](#)

#### **Non-ELS Port Mode for FCoE Interfaces**

The interfaces that belong to FCoE VLANs (interfaces that connect to CNAs in FCoE devices) should be configured in **tagged-access** port mode, unless your CNA does not support tagged VN2VN traffic. After you enable VN2VN\_Port FIP snooping on an FCoE

VLAN, the transit switch denies FCoE traffic from any ENode on that VLAN until the ENode performs a valid fabric login (FIP FLOGI) with another ENode.

The **tagged-access** port mode was not available in Junos OS Release 11.3 and prior releases. In Release 11.3 and earlier, **trunk** port mode was used for Ethernet interfaces that connected to FCoE access devices. Because **tagged-access** mode is now available, using **trunk** mode for interfaces connected to FCoE CNAs is not recommended.

If an existing configuration uses **trunk** mode for ports connected to FCoE CNAs, you can change the port mode to **tagged-access** without disrupting traffic. Although we recommend changing the port mode of these ports from **trunk** to **tagged-access** as a best practice, it is not mandatory. New configurations should use **tagged-access** mode for interfaces that connect to FCoE devices.

### ***ELS Interface Mode for FCoE Interfaces***

The interfaces that belong to FCoE VLANs (interfaces that connect to CNAs in FCoE devices) on systems that support ELS should be configured in **trunk** interface mode. After you enable VN2VF\_Port FIP snooping on an FCoE VLAN, the transit switch denies FCoE traffic from any ENode on that VLAN until the ENode performs a valid fabric login with an FC switch.

### ***Trusted and Untrusted FCoE Interfaces***

Do not configure ENode-facing interfaces as FCoE trusted interfaces when VN2VF\_Port FIP snooping is enabled on those interfaces. If you enable VN2VF\_Port FIP snooping on an FCoE VLAN and you configure ENode-facing interfaces that are members of the FIP snooping VLAN as **fcoe-trusted**, then FCoE devices might not be able to log in to the FC network.

Changing ports from untrusted to trusted removes any existing VN2VF\_Port FIP snooping filters from the ports and terminates the existing sessions. Changing the fabric ports from trusted to untrusted forces all of the FCoE sessions on those ports to log out so that when the ENodes and VN\_Ports log in again, the switch can build the appropriate VN2VF\_Port FIP snooping filters.

### ***Network-Facing Interfaces (Connecting to Another Transit Switch)***

Configure any interface that is connected to another transit switch (not to an ENode) as an FCoE trusted interface, in **trunk** port mode, and as a 10-Gigabit Ethernet interface.

Network-facing Ethernet interfaces have the following requirements and behaviors:

- You must explicitly configure network-facing trunk ports on an FCoE transit switch as FCoE trusted interfaces.
- After you configure a network-facing trunk port as a trusted interface, the FCoE transit switch always processes frames from the connected switch because they come from a source on a trusted interface.
- As a best practice, configure ports in an FCoE VLAN as tagged access ports, but access and trunk port modes are also supported to accommodate whatever types of VN2VN traffic your CNA supports.

### Beacon Period (VN2VN\_Port FIP Snooping Link Maintenance)

---

The transit switch needs to maintain the virtual links between VN\_Ports, and needs to know when sessions begin and end, and when to install and remove the FIP snooping filters. FIP snooping uses a FIP keepalive advertisement to accomplish this task. VN2VN\_Port FIP snooping does not exchange FIP keepalive timer information. Instead, you configure a *beacon period*, which performs the same function as a keepalive timer.

The beacon period is the time interval between messages which verify that the connection is still valid and that the device at the other end of the virtual link is still reachable. You set the beacon period value for each FCoE VLAN that you configure to do VN2VN\_Port FIP snooping.

**NOTE:** Explicitly set the beacon period when you configure VN2VN\_Port FIP snooping. VN\_Ports do not automatically send beacons.

---

ENodes transmit periodic multicast N\_Port\_ID beacons to the ALL-VN2VN-ENode-MACs address. The transmission period varies by a random delay of between 0 ms and 100 ms to avoid synchronized bursts of multicast traffic on the network.

If the transit switch does not receive a beacon message from an ENode within 2.5 times the configured beacon period, the transit switch considers the virtual link to be down and terminates the virtual link to that ENode.

### QFabric System Differences in VN2VN\_Port FIP Snooping Traffic Handling

---

Configuring VN2VN\_Port FIP snooping on a QFabric system is the same as configuring VN2VN\_Port FIP snooping on a standalone switch. However, there are internal differences in the way a QFabric system handles VN2VN\_Port FIP snooping traffic compared to the way a standalone switch handles VN2VN\_Port FIP snooping traffic. The internal differences are transparent. Whether you configure VN2VN\_Port FIP snooping on a QFabric system or on a standalone switch, the proper FIP snooping filters and forwarding information are installed on each device.

On standalone switches, the VN2VN\_Port FIP snooping traffic does not cross a fabric (Interconnect device). VN2VN\_Port traffic enters and exits ports on a single switch, so the ingress port and the egress port have access to the same *local* forwarding and FIP snooping databases.

However, on a QFabric system, VN2VN\_Port FIP snooping traffic might enter on the ingress port of one Node device, traverse the Interconnect device fabric, and exit on the egress port of a different Node device. In this case, the QFabric system must ensure that the FIP snooping database and forwarding information for the VN2VN\_Port traffic is installed correctly on both of the Node devices so that traffic is correctly filtered and forwarded.

For example, [Figure 193 on page 5545](#) shows that VN2VN\_Port traffic from FCoE host ENode E1 enters the QFabric system at Node device ND1, traverses the Interconnect device fabric, and then exits from Node device ND2 before arriving at FCoE host ENode E2. Similarly,

VN2VN\_Port traffic from FCoE host ENode E2 enters the QFabric system at Node device ND2, traverses the Interconnect device fabric, and then exits from Node device ND1 before arriving at FCoE host ENode E1.

**Figure 193: VN2VN\_Port Traffic Across a QFabric Interconnect Device**

When the QFabric system receives a FLOGI ACC from either ENode E1 or ENode E2, the QFabric system creates and installs the correct VN2VN\_Port FIP snooping filters on both Node devices, and updates the forwarding tables accordingly.

In addition, the QFabric system must also ensure that the VN2VN\_Port FIP snooping session statistics are correctly counted. Even though a session is running on each of the two Node devices, the QFabric system counts the complete VN2VN\_Port connection as one session because the two Node devices belong to the same session. This ensures that VN2VN\_Port sessions that traverse the Interconnect device fabric are counted as one unique session, not as two separate sessions.

## Understanding FIP Snooping, FBF, and MVR Filter Scalability

The VLAN filter processor (VFP) ternary content addressable memory (TCAM) stores the VLAN filter configuration for three filter types:

- Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) snooping—FIP snooping filters prevent an FCoE device from gaining unauthorized access to a Fibre Channel (FC) storage device or to another FCoE device. VN2VF\_Port FIP snooping filters prevent an FCoE device from gaining unauthorized access to devices on an FC network. VN2VN\_Port FIP snooping filters prevent an FCoE device from gaining unauthorized access to another FCoE device directly through the standalone switch or QFabric system, without traversing the FC network.

The VFP TCAM stores the VN2VF\_Port and VN2VN\_Port FIP snooping filters that the switch automatically creates when you enable FIP snooping on a VLAN that carries FCoE traffic. See [“Understanding VN\\_Port to VF\\_Port FIP Snooping on an FCoE Transit Switch” on page 5531](#) and [“Understanding VN\\_Port to VN\\_Port FIP Snooping on an FCoE Transit Switch” on page 5539](#) for more information.

- Filter-based forwarding (FBF)—FBF enables you to use firewall filters to direct packets to virtual routing instances. The switch then forwards the matching packets based on the configuration of the routing instances. The VFP TCAM stores the terms you configure for FBF filters. See [“Understanding Filter-Based Forwarding” on page 5212](#) for more information.
- Multicast VLAN registration (MVR)—MVR enables you to configure a multicast source VLAN (MVLAN) that is shared across a Layer 2 network. An MVLAN distributes IPTV multicast streams across different VLANs without having to create a separate multicast stream for each VLAN, and without compromising the security and separation of traffic in the different VLANs. The VFP TCAM stores the MVR rules you configure for MVLANS. See [“Understanding Multicast VLAN Registration” on page 4773](#) for more information.

FIP snooping filters, FBF filters, and MVR rules share the VFP TCAM memory space. In most use cases, the VFP TCAM memory is sufficient to store filter terms and information for all three applications.

### VFP TCAM Architecture and Allocation

When packets arrive at an ingress interface, the VFP TCAM is the first TCAM in the packet pipeline. The VFP TCAM stores a total of 1024 entries. The 1024 entries are partitioned into four equal *slices* of 256 entries.

The VFP TCAM allocates entries to three filter types (FIP snooping filters, FBF filter terms, and MVR rules) in 256-entry slices. The VFP TCAM dynamically allocates the minimum number of memory slices required to store the filters for a particular filter type, as needed.

The TCAM does not allocate partial slices to a filter type, and slices cannot be shared among filter types. At any given time, each slice contains entries for one and only one filter type.

For example, if you configure one MVR rule, the system allocates a whole slice to MVR rules, even if the MVR rule consumes only one TCAM entry. The remaining 256 entries in the slice allocated to MVR rules can store subsequently configured MVR rules, but not FIP snooping or FBF filters. Similarly, if FIP snooping filters consume 50 entries of a 256-entry slice, the remaining 206 entries in the FIP snooping slice are available only to store more FIP snooping filters, not to store FBF filter terms or MVR rules.

The VFP TCAM allocates slices to a filter type only if there is at least one configured filter or rule for that filter type. If no filters exist for a filter type, then the VFP TCAM does not allocate a slice to that filter type.

**NOTE:** The VFP TCAM rejects partial filters. For example, if an FBF filter contains six terms, but there is only space in the TCAM for four of those terms, the whole filter is not committed.

Each filter type can use from zero slices to all four slices of VFP TCAM space. However, if one filter type uses three slices, then only one slice remains, so only one other filter type can use the remaining slice. In that situation, if you configure filters for all three filter types, the last filter type that you configure receives no TCAM space for its filter entries. Filters that receive no TCAM entry space are not implemented.

### VFP TCAM Entry Consumption

FIP snooping filters, FBF filters, and MVR rules consume VFP TCAM entry space in different ways:

- [FIP Snooping Filter VFP TCAM Consumption on page 5547](#)
- [FBF Filter VFP TCAM Consumption on page 5548](#)
- [MVR Filter VFP TCAM Consumption on page 5549](#)
- [VFP TCAM Consumption Summary Table on page 5549](#)

#### *FIP Snooping Filter VFP TCAM Consumption*

VN2VF\_Port FIP snooping filters consume VFP TCAM entry space differently than VN2VN\_Port FIP snooping filters:

- [VN2VF\\_Port FIP Snooping Filter VFP TCAM Consumption on page 5548](#)
- [VN2VN\\_Port FIP Snooping Filter VFP TCAM Consumption on page 5548](#)

**NOTE:** One FCoE VLAN cannot support both VN2VF\_Port traffic and VN2VN\_Port traffic. Configure separate FCoE VLANs for VN2VF\_Port traffic and for VN2VN\_Port traffic.

### ***VN2VF\_Port FIP Snooping Filter VFP TCAM Consumption***

The switch uses an algorithm that allows one 256-entry slice of the VFP TCAM to store the maximum possible number of VN2VF\_Port FIP snooping filters (2500 filters). VN2VF\_Port FIP snooping filters never consume more than one slice of the VFP TCAM.

Regardless of whether there is one VN2VF\_Port FIP snooping session or there are 2500 VN2VF\_Port FIP snooping sessions, VN2VF\_Port FIP snooping filters consume one slice of the VFP TCAM. (If there are no VN2VF\_Port or VN2VN\_Port FIP snooping sessions, the TCAM does not allocate a slice for FIP snooping filters.)

### ***VN2VN\_Port FIP Snooping Filter VFP TCAM Consumption***

VN2VN\_Port FIP snooping filters consume one VFP TCAM entry for each VN2VN\_Port session. The maximum number of VN2VN\_Port FIP snooping sessions is 376 sessions per switch. (If you configure an interface that carries VN2VN\_Port FIP snooping traffic as a trusted interface, the switch does not apply filters on the trusted interface.)

Because the switch can have up to 376 VN2VN\_Port sessions running simultaneously, with each session consuming one entry, VN2VN\_Port FIP snooping filters consume VFP TCAM space as follows:

- 1–256 filters consume one slice
- 257–376 filters consume two slices

### ***FBF Filter VFP TCAM Consumption***

Each FBF filter term is double-wide, so each FBF filter term consumes two entries in the VFP TCAM. One 256-entry slice can contain up to 128 FBF filter terms. FBF filters consume VFP TCAM space as follows:

- 1–128 entries consume one slice
- 129–256 entries consume two slices
- 257–384 entries consume three slices
- 385–512 entries consume four slices

**NOTE:** In practice, FBF filters can consume only three slices of the VFP TCAM because FBF filters are also stored simultaneously in the ingress filter processor (IFP) TCAM, and the IFP TCAM can store only 384 FBF filter terms (768 entries, or 3 TCAM slices).

For example, if you configure FBF filters that contain 200 terms, then the FBF filters require 400 VFP TCAM entries and consume 2 slices.

FBF filter entries are simultaneously stored in the VFP TCAM and the IFP TCAM. The IFP TCAM can only contain up to 768 entries—256 fewer entries (1 slice) than the VFP TCAM. As with the VFP TCAM, FBF filters consume two IFP TCAM entries per filter term. In addition to FBF filter terms, the IFP TCAM stores filter entries for firewall filters.

**CAUTION:** There must be enough space in the VFP TCAM *and* the IFP TCAM for the FBF filter entries. If both TCAMs do not have enough space for the FBF filters, the switch rejects the portion of the configuration that it cannot store and sends a syslog message to notify you.

For example, if you configure FBF filters that have 400 terms, even though the VFP TCAM has enough space to store the resulting 800 entries, the switch rejects a portion of the configuration because the IFP TCAM can store a maximum of only 768 entries. If the IFP TCAM stores no other filter entries, the switch rejects 32 FBF filter entries.

In another example, if you configure firewall filters that have a total of 200 terms, which consume 200 entries in the IFP TCAM, and you then configure FBF filters that have a total of 300 terms, the switch rejects a portion of the configuration because the FBF filters require 600 entries. Combined with the 200 entries required for the firewall filters, the total number of 800 entries exceeds the maximum of 768 entries that the IFP TCAM can store. In this case, the switch accepts the first 768 entries and rejects the rest of the filter entries. The switch installs the filter entries in the order that they are committed; the rejected entries are the last entries the switch attempts to commit after the TCAM space is exhausted.

The IFP TCAM limit of 768 entries means that the true maximum number of FBF filter terms is 384 terms, even though the VFP TCAM can store up to 512 FBF terms.

#### ***MVR Filter VFP TCAM Consumption***

Each MVR rule consumes one entry in the VFP TCAM, so MVR rules consume VFP TCAM space as follows:

- 1–256 rules consume one slice
- 257–512 rules consume two slices
- 513–758 rules consume three slices
- 759–1024 rules consume four slices

#### ***VFP TCAM Consumption Summary Table***

Table 448 on page 5550 summarizes VFP TCAM consumption.

**NOTE:** FBF filters are simultaneously stored in the VFP TCAM and in the IFP TCAM. Due to the IFP TCAM limit of 768 entries (384 FBF filters), which is 256 entries fewer than the VFP TCAM, the effective VFP TCAM consumption limit for FBF filters is lower than the total amount of VFP TCAM entry space, even when no other filters consume VFP TCAM space.

Table 448: VFP TCAM Entry Consumption Summary

| Filter Type                     | VFP TCAM Entry Consumption         | Maximum VFP TCAM Slices Consumed             | Other Limitations                        |
|---------------------------------|------------------------------------|--|--|
| VN2VF_Port FIP snooping filters | Never consumes more than one slice | One slice (regardless of number of sessions) | 2500 session maximum                     |
| VN2VN_Port FIP snooping filters | One entry per session              | Two  | 376 session maximum                      |
| FBF filters                     | Two entries per filter             | Three (due to IFP TCAM limitation)           | 384 filters (due to IFP TCAM limitation) |
| MVR rules                       | One entry per rule                 | Four   | 1024 rule maximum                        |

#### Rejected Filter Configurations (No Available VFP TCAM Space)

If there is not enough space available in the VFP TCAM to store the FIP snooping filters, the configured FBF filters, and the MVR rules, the switch rejects only the portion of the configuration that it cannot store. Any portion of the filter configuration that the TCAM can store, is stored. In most cases, even if the switch rejects part of the configuration, part of the configuration is also stored.

If the switch rejects any portion of a configuration, the switch sends a syslog message to notify you of the failure. The switch does not generate a commit error, and the rejected portion of the configuration remains on the switch, even though the rejected configuration does not function. (The accepted portions of the configuration function as expected.) The syslog message shows you the filter configuration that the switch rejected.

We strongly recommend that you always delete rejected filter configurations from the switch. It is important to delete rejected filter configurations because:

- Even though the rejected configuration remains on the switch, it does not function.
- After a reboot, there is no guarantee that the same filters will be rejected. The previously rejected filters might be accepted, and other filters that had previously been accepted might be rejected. Therefore, the functioning filter configuration could be changed inadvertently and unexpectedly.
- Even if a VFP TCAM slice becomes available, the switch does not automatically allocate the available slice to the rejected configuration. To use the available slice, you must delete and reconfigure the rejected configuration.

For example, you configure FBF filters and MVR rules on a switch, and that switch also transports FCoE traffic with VN2VF\_Port FIP snooping (never consumes more than one slice) enabled on FCoE access interfaces. After you commit the configuration, you check the syslog. You find that the VN2VF\_Port FIP snooping and FBF filters consume all four slices of the VFP TCAM, and the MVR configuration was rejected. Instead of deleting the MVR configuration, you leave it on the switch. Subsequently, all VN2VF\_Port FIP snooping sessions end, the FIP snooping filters time out and are removed from the VFP TCAM, so the slice that was allocated to VN2VF\_Port FIP snooping filters becomes free. However, the MVR rules do *not* automatically receive the free slice.

To force the switch to allocate the free slice to the MVR rules, you should delete the MVR rules from the configuration and then reconfigure the MVR rules. When you commit the new configuration, check the syslog messages to ensure that the MVR rule configuration was accepted.

In this example, you could also choose to free a VFP TCAM slice for MVR rule storage by deleting some of the FBF filters. To do this, you delete both the unneeded FBF filters and the MVR rule configuration. Then you reconfigure the MVR rules, and check the syslog to ensure that the configuration was successful.

### VFP TCAM Allocation and Consumption (Scaling) Examples

The following examples illustrate how FIP snooping entries, FBF filter entries, and MVR rule entries consume VFP TCAM slices:

- [Example 1: Three Filter Types Consume Three Slices on page 5551](#)
- [Example 2: Three Filter Types Consume Four Slices on page 5551](#)
- [Example 3: Two Filter Types Consume Four Slices on page 5552](#)
- [Example 4: Three Filter Types Oversubscribe the VFP TCAM on page 5552](#)

#### **Example 1: Three Filter Types Consume Three Slices**

Filters and rules are configured in the following sequence:

- 100 VN2VN\_Port FIP snooping filters (1 slice)
- 2 MVR rules (1 slice, 2 entries)
- 60 FBF filter terms (1 slice, 120 entries)

One slice remains free. The slice allocated to VN2VN\_Port FIP snooping filters can store 156 more filters before another slice is required. The slice allocated to MVR rules can store 254 more rules before another slice is required. The slice allocated to FBF filters can store 68 more filter terms (136 entries) before another slice is required. Providing that the IFP TCAM has space for the FBF filter terms, the switch accepts this configuration and rejects no filters.

#### **Example 2: Three Filter Types Consume Four Slices**

Filters and rules are configured in the following sequence:

- 2000 VN2VF\_Port FIP snooping filters (always 1 slice)
- 18 MVR rules (1 slice, 18 entries)
- 150 FBF filter terms (2 slices, 300 entries)

All four slices are allocated to filter types. The slice allocated to MVR rules can store 238 more rules before it is full. The slice allocated to FBF filters can store 106 more filter terms (212 entries) before it is full. Providing that the IFP TCAM has space for the FBF filter terms, the switch accepts this configuration and rejects no filters.

**NOTE:** If you configure more MVR rules or FBF filters than entry space remaining in the slices, the switch rejects those rules and filters because no slice is available. The switch installs filters in the order that they were configured, so if filters are rejected, the filters configured last are rejected.

---

**Example 3: Two Filter Types Consume Four Slices**

Filters and rules are configured in the following sequence:

- 50 VN2VF\_Port FIP snooping filters (always 1 slice)
- 300 FBF filter terms (3 slices, 600 entries)

All four slices are allocated to filter types. No slices are available for MVR rules. The third slice allocated to FBF filters can store 84 more filter terms (168 entries) before it consumes all of its entry space. Providing that the IFP TCAM has space for the FBF filter terms, the switch accepts this configuration and rejects no filters.

**NOTE:** If you configure MVR rules or if you configure more than 84 more FBF filters, the switch rejects those rules and filters because no slice is available for the MVR rules, and the FBF filter slice has entry space for only 84 more filter terms.

---

**Example 4: Three Filter Types Oversubscribe the VFP TCAM**

Filters and rules are configured in the following sequence:

- 1750 VN2VF\_Port FIP snooping filters (always 1 slice)
- 10 MVR rules (1 slice, 10 entries)
- 275 FBF filter terms (2 slices, 512 accepted entries, 38 rejected entries)

All four slices are allocated to filter types. The slice allocated to MVR rules can store 246 more rules before it is full, but the number of FBF filter terms exceeds the amount of available VFP TCAM storage space. (The 275 FBF filter terms consume 550 VFP TCAM entries. However, there are only two available slices, for a total of 512 available entry spaces, so only 256 FBF filter terms can be stored, leaving 19 rejected FBF filter terms.)

The switch accepts the VN2VF\_Port FIP snooping filters, the MVR rules, and 256 FBF filter terms. The switch retains the excess FBF filters in the configuration, but does not install those filters in the VFP TCAM. In this case, you delete the rejected FBF filter terms from the configuration. Alternatively, you could delete the MVR rules from the configuration to free a slice of the TCAM, and then delete and reconfigure the rejected FBF filters so that the system allocates the freed slice to the FBF filters.

**NOTE:** The sequence of configuration makes a difference; if there is not enough VFP TCAM space for a given filter type, the switch installs the filters that fit in the order they are configured. For example, if you configure the FBF filters before you configure the MVR rules, the VFP TCAM allocates one slice to FIP snooping filters, three slices to FBF filters (assuming the IFP TCAM has available space), and no slices to MVR rules, because all four slices are allocated before the switch attempts to install the MVR rules in the VFP TCAM.

### Filter Configuration Recommendations

To utilize the VFP TCAM space most efficiently:

- [Configure and Maintain the Fewest Number of Filters Needed on page 5553](#)
- [Always Delete Rejected Filter Configurations on page 5554](#)

#### ***Configure and Maintain the Fewest Number of Filters Needed***

To conserve VFP TCAM entry space, and because FBF filter storage also depends on the availability of IFP TCAM space, we recommend that you configure as few FBF filters and MVR rules as is practical to serve your network needs. The more filters you configure, the greater the possibility of exceeding TCAM storage capacity.

Several factors determine VFP TCAM consumption:

- **Type of filters configured**—Different filter types consume different amounts of VFP TCAM space. VN2VF\_Port FIP snooping filters never consume more than one slice. MVR rules and VN2VN\_Port FIP snooping filters consume entries in a slice at a rate of one entry per MVR rule or VN2VN\_Port session. FBF filter terms consume entries in a slice at a rate of two entries per FBF filter term.
- **Number of filters configured**—Although the number of filters does not affect the number of slices allocated to the VN2VF\_Port FIP snooping filter type (it is always one slice for one or more VN2VF\_Port FIP snooping filters and no slice for no FIP snooping filters), the number of VN2VN\_Port FIP snooping filters, MVR rules, and FBF filter terms that you configure determine how many VFP TCAM slices are required for each filter type.

For example, if you configure 257 MVR rules, the MVR rule entries consume 2 slices. One slice stores 256 MVR rules (entries), and one slice stores 1 MVR rule (entry). In this case, if you can eliminate one MVR rule, you can free a slice to allocate to other filter types.

- **Sequence of filter configuration**—If you configure too many filters for the VFP TCAM to store, the last filters you configure are not stored in the TCAM.

Always check the syslog after you configure FBF filters or MVR rules to ensure that the configuration was not rejected. If you enable FIP snooping on access ports, check the syslog to ensure that the configuration was not rejected due to lack of VFP TCAM space.

If you check the syslog and a filter configuration has been rejected, delete the filters that were rejected from the configuration.

**TIP:** If you no longer need an FBF filter or an MVR rule, delete it from the configuration to conserve VFP TCAM space. Enable VN2VF\_Port or VN2VN\_Port FIP snooping on access ports only if the switch port is directly connected to FCoE devices. (FIP snooping should be performed at the access edge. FIP snooping should not be performed on traffic that has already been snooped and filtered at the access edge. If another switch that is physically between the transit switch (or QFabric system) and the FCoE devices already performs FIP snooping, you do not have to enable FIP snooping on the transit switch or QFabric system, but you can.)

---

### ***Always Delete Rejected Filter Configurations***

The switch does not return a commit error if it rejects any portion of a configuration. Instead, the switch sends a syslog message to report the rejected portion of the configuration. The rejected portion of the configuration remains on the switch, but does not function.

After you configure FBF filters or MVR rules, or enable FIP snooping, check the syslog messages to ensure that the switch accepted the configuration. If the switch rejected any portion of the configuration, delete that portion of the configuration. (You do not need to delete the portion of the configuration that was accepted, unless you want to reconfigure those filters or rules.)

**CAUTION:** If you do not delete rejected filter configurations, and if you reboot the system, you cannot predict which filters the system installs after the reboot. For example, a switch with the following configuration has more configured filters than the VFP TCAM can support:

- VN2VF\_Port FIP snooping sessions (always consumes one slice)
- 20 MVR rules (consume one slice)
- 300 FBF filters (attempt to consume three slices, but because only two slices are available, 256 filters consume two slices, and the remaining 44 filters are rejected)

If you do not delete the 44 rejected FBF filters, then if the switch reboots, the 44 FBF filters that were rejected might be accepted, and 44 different FBF filters might be rejected. This unpredictable behavior is the reason that you should check the syslog messages after you configure filters, and if any filters were rejected, you should always delete the rejected filters from the configuration.

## Understanding MC-LAGs on an FCoE Transit Switch

Multichassis link aggregation groups (MC-LAGs) provide redundancy and load balancing between two switches, multihoming support for client devices such as servers, and a loop-free Layer 2 network without running Spanning Tree Protocol (STP).

You can use an MC-LAG to provide a redundant aggregation layer for Fibre Channel over Ethernet (FCoE) traffic. To support lossless transport of FCoE traffic across an MC-LAG, you must configure the appropriate class of service (CoS) on both of the switches with MC-LAG port members. The CoS configuration must be the same on both of the MC-LAG switches because MC-LAGs do not carry forwarding class and IEEE 802.1p priority information.

Ports that are part of an FCoE-FC gateway configuration (a virtual FCoE-FC gateway fabric) do not support MC-LAGs. Ports that are members of an MC-LAG act as passthrough transit switch ports.

Standalone switches support MC-LAGs. QFabric system Node devices do not support MC-LAGs. Virtual Chassis (VC) and mixed-mode Virtual Chassis Fabric (VCF) configurations do not support FCoE. Only pure QFX5100 VCFs (consisting of only QFX5100 switches) support FCoE.

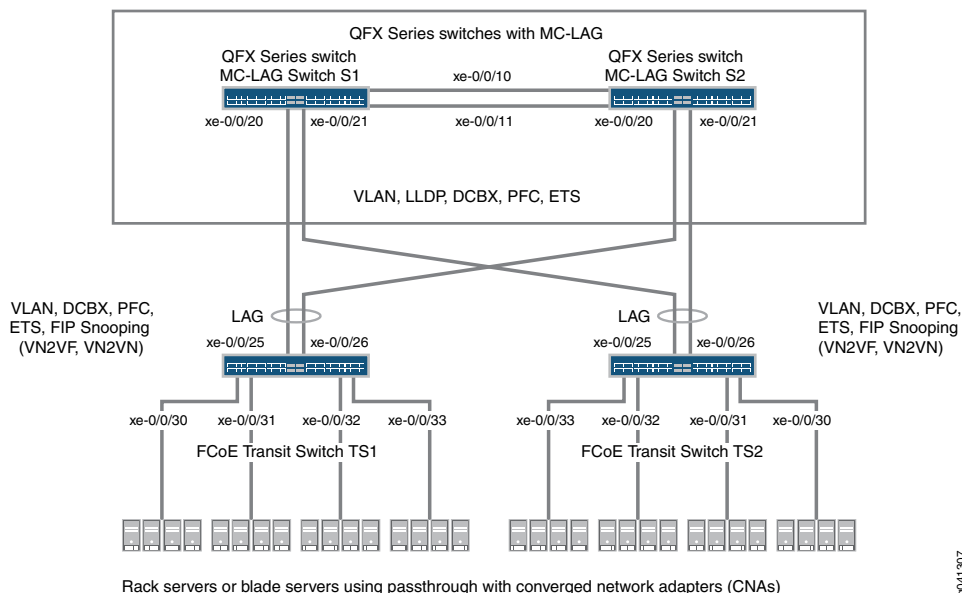

This topic describes:

- [Supported Topology on page 5555](#)
- [FIP Snooping and FCoE Trusted Ports on page 5557](#)
- [CoS and Data Center Bridging \(DCB\) on page 5558](#)

### Supported Topology

Switches that are not directly connected to FCoE hosts and that act as passthrough transit switches support MC-LAGs for FCoE traffic in an *inverted-U* network topology. [Figure 194 on page 5556](#) shows an inverted-U topology using QFX3500 switches.

Figure 194: Supported Topology for an MC-LAG on an FCoE Transit Switch

The following rules and guidelines apply to MC-LAGs when used for FCoE traffic. The rules and guidelines help ensure the proper handling and lossless transport characteristics required for FCoE traffic:

- The two switches that form the MC-LAG (Switches S1 and S2) cannot use ports that are part of an FCoE-FC gateway fabric. The MC-LAG switch ports must be passthrough transit switch ports (used as part of an intermediate transit switch that is not directly connected to FCoE hosts).
- MC-LAG Switches S1 and S2 cannot be directly connected to the FCoE hosts.
- The two switches that serve as access devices for FCoE hosts (FCoE Transit Switches TS1 and TS2) use standard LAGs to connect to MC-LAG Switches S1 and S2. FCoE Transit Switches TS1 and TS2 can be standalone switches or they can be Node devices in a QFabric system.
- Transit Switches TS1 and TS2 must use transit switch ports for the FCoE hosts and for the standard LAGs to MC-LAG Switches S1 and S2.
- Enable FIP snooping on the FCoE VLAN on Transit Switches TS1 and TS2. You can configure either VN\_Port to VF\_Port (VN2VF\_Port) FIP snooping or VN\_Port to VN\_Port (VN2VN\_Port) FIP snooping, depending on whether the FCoE hosts need to access targets in the FC SAN (VN2VF\_Port FIP snooping) or targets in the Ethernet network (VN2VN\_Port FIP snooping).

FIP snooping should be performed at the access edge and is not supported on MC-LAG switches. Do not enable FIP snooping on MC-LAG Switches S1 and S2. (Do not enable FIP snooping on the MC-LAG ports that connect Switches S1 and S2 to Switches TS1 and TS2 or on the LAG ports that connect Switch S1 to S2.)

- The CoS configuration must be consistent on the MC-LAG switches. Because MC-LAGs carry no forwarding class or priority information, each MC-LAG switch needs to have

the same CoS configuration to support lossless transport. (On each MC-LAG switch, the name, egress queue, and CoS provisioning of each forwarding class must be the same, and the priority-based flow control (PFC) configuration must be the same.)

### ***Transit Switches (Server Access)***

The role of FCoE Transit Switches TS1 and TS2 is to connect FCoE hosts in a multihomed fashion to the MC-LAG switches. In essence, Transit Switches TS1 and TS2 act as access switches for the FCoE hosts. (FCoE hosts are directly connected to Transit Switches TS1 and TS2.)

The transit switch configuration depends on whether you want to do VN2VF\_Port FIP snooping or VN2VN\_Port FIP snooping, and whether the transit switches also have ports configured as part of an FCoE-FC gateway virtual fabric. Ports that a QFX3500 switch uses in an FCoE-FC gateway virtual fabric cannot be included in the transit switch LAG connection to the MC-LAG switches. (Ports cannot belong to both a transit switch and an FCoE-FC gateway; you must use different ports for each mode of operation.)

### ***MC-LAG Switches (FCoE Aggregation)***

The role of MC-LAG Switches S1 and S2 is to provide redundant, load-balanced connections between FCoE transit switches. In essence, MC-LAG Switches S1 and S2 act as aggregation switches. FCoE hosts are not directly connected to the MC-LAG switches.

The MC-LAG switch configuration is the same regardless of which type of FIP snooping that FCoE Transit Switches TS1 and TS2 perform.

### **FIP Snooping and FCoE Trusted Ports**

To maintain secure access, enable VN2VF\_Port FIP snooping or VN2VN\_Port FIP snooping at the transit switch access ports connected directly to the FCoE hosts. FIP snooping should be performed at the access edge of the network to prevent unauthorized access. For example, in [Figure 194 on page 5556](#), you enable FIP snooping on the FCoE VLANs on Transit Switches TS1 and TS2 that include the access ports connected to the FCoE hosts.

Do not enable FIP snooping on the switches used to create the MC-LAG. For example, in [Figure 194 on page 5556](#), you would not enable FIP snooping on the FCoE VLANs on Switches S1 and S2.

Configure links between switches as FCoE trusted ports to reduce FIP snooping overhead and ensure that the system performs FIP snooping only at the access edge. In the sample topology, configure the Transit Switch TS1 and TS2 LAG ports connected to the MC-LAG switches as FCoE trusted ports, configure the Switch S1 and S2 MC-LAG ports connected to Switches TS1 and TS2 as FCoE trusted ports, and configure the ports in the LAG that connects Switches S1 to S2 as FCoE trusted ports.

## CoS and Data Center Bridging (DCB)

---

The MC-LAG links do not carry forwarding class or priority information. The following CoS properties must have the same configuration on each MC-LAG switch or on each MC-LAG interface to support lossless transport:

- FCoE forwarding class name—For example, the forwarding class for FCoE traffic could use the default **fcoe** forwarding class on both MC-LAG switches.
- FCoE output queue—For example, the **fcoe** forwarding class could be mapped to queue 3 on both MC-LAG switches (queue 3 is the default mapping for the **fcoe** forwarding class).
- Classifier—The forwarding class for FCoE traffic must be mapped to the same IEEE 802.1p code point on each member interface of the MC-LAG on both MC-LAG switches. For example, the FCoE forwarding class **fcoe** could be mapped to IEEE 802.1p code point **011** (code point **011** is the default mapping for the **fcoe** forwarding class).
- Priority-based flow control (PFC)—PFC must be enabled on the FCoE code point on each MC-LAG switch and applied to each MC-LAG interface using a congestion notification profile.

You must also configure enhanced transmission selection (ETS) on the MC-LAG interfaces to provide sufficient scheduling resources (bandwidth, priority) for lossless transport. The ETS configuration can be different on each MC-LAG switch, as long as enough resources are scheduled to support lossless transport for the expected FCoE traffic.

LLDP and DCBX must be enabled on each MC-LAG member interface (LLDP and DCBX are enabled by default on all interfaces).

**NOTE:** As with all other FCoE configurations, FCoE traffic requires a dedicated VLAN that carries only FCoE traffic, and IGMP snooping must be disabled on the FCoE VLAN.

## Understanding CoS Flow Control (Ethernet PAUSE and PFC)

Flow control supports lossless transmission by regulating traffic flows to avoid dropping frames during periods of congestion. Flow control stops and resumes the transmission of network traffic between two connected peer nodes on a full-duplex Ethernet physical link. Controlling the flow by pausing and restarting it prevents buffers on the nodes from overflowing and dropping frames. You configure flow control on a per-interface basis.

Two methods of peer-to-peer flow control are supported:

- IEEE 802.3X Ethernet PAUSE
- IEEE 802.1Qbb priority-based flow control (PFC)

Ethernet PAUSE and PFC are link-level flow control mechanisms.

**NOTE:** For end-to-end congestion control, see [“Understanding CoS Explicit Congestion Notification” on page 5926](#).

Ethernet PAUSE pauses transmission of all traffic on a physical Ethernet link.

PFC decouples the pause function from the physical Ethernet link and enables you to divide traffic on one link into eight priorities. You can think of the eight priorities as eight “lanes” of traffic that are mapped to forwarding classes and output queues. Each priority is mapped to a 3-bit IEEE 802.1p CoS code point flag in the VLAN header. You can enable PFC on one or more priorities (IEEE 802.1p code points) on a link. When PFC-enabled traffic is paused on a link, traffic that is not PFC-enabled continues to flow (or is dropped if congestion is severe enough).

**Video:** [Why Use PFC in a Data Center Network?](#)

Use Ethernet PAUSE when you want to prevent packet loss on all of the traffic on a link. Use PFC to prevent traffic loss only on specified types of traffic (for example, Fibre Channel over Ethernet traffic).

**NOTE:** Depending on the amount of traffic on a link or assigned to a priority, pausing traffic can cause ingress port congestion and spread congestion through the network.

Attempting to configure both Ethernet PAUSE and PFC on a link causes a commit error. Ethernet PAUSE and PFC are mutually exclusive configurations on an interface.

By default, all forms of flow control are disabled. You must explicitly enable flow control on interfaces to pause traffic.

- [Ethernet PAUSE on page 5560](#)

- [PFC on page 5564](#)
- [Lossless Transport Support Summary on page 5567](#)

## Ethernet PAUSE

---

Ethernet PAUSE is a congestion relief feature that works by providing link-level flow control for all traffic on a full-duplex Ethernet link. Ethernet PAUSE works in both directions on the link. In one direction, an interface generates and sends Ethernet PAUSE messages to stop the connected peer from sending more traffic. In the other direction, the interface responds to Ethernet PAUSE messages it receives from the connected peer to stop sending traffic. Ethernet PAUSE also works on aggregated Ethernet interfaces. For example, if the connected peer interfaces are called Node A and Node B:

- When the receive buffers on interface Node A reach a certain level of fullness, the interface generates and sends an Ethernet PAUSE message to the connected peer (interface Node B) to tell the peer to stop sending frames. The Node B buffers store frames until the time period specified in the Ethernet PAUSE frame elapses; then Node B resumes sending frames to Node A.
- When interface Node A receives an Ethernet PAUSE message from interface Node B, interface Node A stops transmitting frames until the time period specified in the Ethernet PAUSE frame elapses; then Node A resumes transmission. (The Node A transmit buffers store frames until Node A resumes sending frames to Node B.)

In this scenario, if Node B sends an Ethernet PAUSE frame with a time value of 0 to Node A, the 0 time value indicates to Node A that it can resume transmission. This happens when the Node B buffer empties to below a certain threshold and the buffer can once again accept traffic.

*Symmetric flow control* means an interface has the same Ethernet PAUSE configuration in both directions. The Ethernet PAUSE generation and Ethernet PAUSE response functions are both configured as enabled, or they are both disabled. You configure symmetric flow control by including the **flow-control** statement at the **[edit interfaces interface-name ether-options]** hierarchy level.

*Asymmetric flow control* allows you to configure the Ethernet PAUSE functionality in each direction independently on an interface. The configuration for generating Ethernet PAUSE messages and for responding to Ethernet PAUSE messages does not have to be the same. It can be enabled in both directions, disabled in both directions, or enabled in one direction and disabled in the other direction. You configure asymmetric flow control by including the **configured-flow-control** statement at the **[edit interfaces interface-name ether-options]** hierarchy level.

On any particular interface, symmetric and asymmetric flow control are mutually exclusive. Asymmetric flow control overrides and disables symmetric flow control. (If PFC is configured on an interface, the PFC configuration overrides Ethernet PAUSE flow control.) Both symmetric and asymmetric flow control are supported.

- [Symmetric Flow Control on page 5561](#)
- [Asymmetric Flow Control on page 5561](#)

### ***Symmetric Flow Control***

Symmetric flow control configures both the receive and transmit buffers in the same state. The interface can both send Ethernet PAUSE messages and respond to them (flow control is enabled), or the interface cannot send Ethernet PAUSE messages or respond to them (flow control is disabled).

When you enable symmetric flow control on an interface, the Ethernet PAUSE behavior depends on the configuration of the connected peer. With symmetric flow control enabled, the interface can perform any Ethernet PAUSE functions that the connected peer can perform. (When symmetric flow control is disabled, the interface does not send or respond to Ethernet PAUSE messages.)

### ***Asymmetric Flow Control***

Asymmetric flow control enables you to specify independently whether or not the interface receive buffer generates and sends Ethernet PAUSE messages to stop the connected peer from transmitting traffic, and whether or not the interface transmit buffer responds to Ethernet PAUSE messages it receives from the connected peer and stops transmitting traffic. The receive buffer configuration determines if the interface transmits Ethernet PAUSE messages, and the transmit buffer configuration determines if the interface receives and responds to Ethernet PAUSE messages:

- Receive buffers on—Enable Ethernet PAUSE transmission (generate and send Ethernet PAUSE frames)
- Transmit buffers on—Enable Ethernet PAUSE reception (respond to received Ethernet PAUSE frames)

You must explicitly set the flow control for both the receive buffer and the transmit buffer (**on** or **off**) to configure asymmetric Ethernet PAUSE. [Table 449 on page 5561](#) describes the configured flow control state when you set the receive (Rx) and transmit (Tx) buffers on an interface:

**Table 449: Asymmetric Ethernet PAUSE Flow Control Configuration**

| Receive (Rx) Buffer | Transmit (Tx) Buffer | Configured Flow Control State   |
|---------------------|----------------------|---|
| On                  | Off                  | Interface generates and sends Ethernet PAUSE messages. Interface does not respond to Ethernet PAUSE messages (interface continues to transmit even if peer requests that the interface stop sending traffic).         |
| Off                 | On                   | Interface responds to Ethernet PAUSE messages received from the connected peer, but does not generate or send Ethernet PAUSE messages. (The interface does not request that the connected peer stop sending traffic.) |
| On                  | On                   | Same functionality as symmetric Ethernet PAUSE. Interface generates and sends Ethernet PAUSE messages and responds to received Ethernet PAUSE messages.   |
| Off                 | Off                  | Ethernet PAUSE flow control is disabled.  |

The configured flow control is the Ethernet PAUSE state configured on the interface.

On 1-Gigabit Ethernet interfaces, autonegotiation of Ethernet PAUSE with the connected peer is supported. (Autonegotiation on 10-Gigabit Ethernet interfaces is not supported.) Autonegotiation enables the interface to exchange state advertisements with the connected peer so that the two devices can agree on the Ethernet PAUSE configuration. Each interface advertises its flow control state to the connected peer using a combination of the Ethernet PAUSE and ASM\_DIR bits, as described in [Table 450 on page 5562](#):

**Table 450: Flow Control State Advertised to the Connected Peer (Autonegotiation)**

| Rx Buffer State | Tx Buffer State | PAUSE Bit | ASM_DIR Bit | Description  |
|-----------------|-----------------|-----------|-------------|--|
| Off             | Off             | 0         | 0           | The interface advertises no Ethernet PAUSE capability. This is equivalent to disabling flow control on an interface.   |
| On              | On              | 1         | 0           | The interface advertises symmetric flow control (both the transmission of Ethernet PAUSE messages and the ability to receive and respond to Ethernet PAUSE messages).  |
| On              | Off             | 0         | 1           | The interface advertises asymmetric flow control (the transmission of Ethernet PAUSE messages, but not the ability to receive and respond to Ethernet PAUSE messages).   |
| Off             | On              | 1         | 1           | The interface advertises both symmetric and asymmetric flow control. Although the interface does not generate and send Ethernet PAUSE requests to the peer, the interface supports both symmetric and asymmetric Ethernet PAUSE configuration on the peer because the peer is not affected if the peer does not receive Ethernet PAUSE requests. (If the interface responds to the peer's Ethernet PAUSE requests, that is sufficient to support either symmetric or asymmetric flow control on the peer.) |

The flow control configuration on each switch interface interacts with the flow control configuration of the connected peer. Each peer advertises its state to the other peer. The interaction of the flow control configuration of the peers determines the flow control behavior (resolution) between them, as shown in [Table 451 on page 5563](#). The first four columns show the Ethernet PAUSE configuration on the local QFX Series or EX4600 switch and on the connected peer (also known as the link partner). The last two columns show the Ethernet PAUSE resolution that results from the local and peer configurations

on each interface. This illustrates how the Ethernet PAUSE configuration of each interface affects the Ethernet PAUSE behavior on the other interface.

**NOTE:** In the Resolution columns of the table, disabling Ethernet PAUSE transmit means that the interface receive buffers do not generate and send Ethernet PAUSE messages to the peer. Disabling Ethernet PAUSE receive means that the interface transmit buffers do not respond to Ethernet PAUSE messages received from the peer.

**Table 451: Asymmetric Ethernet PAUSE Behavior on Local and Peer Interfaces**

| Local Interface (QFX Series or EX4600 Switch) |             | Peer Interface |             | Local Resolution  | Peer Resolution   |
|---|-------------|----------------|-------------|---|---|
| PAUSE Bit                                     | ASM_DIR Bit | PAUSE Bit      | ASM_DIR Bit |   |   |
| 0   | 0           | Don't care     | Don't care  | Disable Ethernet PAUSE transmit and receive                       | Disable Ethernet PAUSE transmit and receive                       |
| 0   | 1           | 0              | Don't care  | Disable Ethernet PAUSE transmit and receive                       | Disable Ethernet PAUSE transmit and receive                       |
| 0   | 1           | 1              | 0           | Disable Ethernet PAUSE transmit and receive                       | Disable Ethernet PAUSE transmit and receive                       |
| 0   | 1           | 1              | 1           | Enable Ethernet PAUSE transmit and disable Ethernet PAUSE receive | Disable Ethernet PAUSE transmit and enable Ethernet PAUSE receive |
| 1   | 0           | 0              | Don't care  | Disable Ethernet PAUSE transmit and receive                       | Disable Ethernet PAUSE transmit and receive                       |
| 1   | 0           | 1              | Don't care  | Enable Ethernet PAUSE transmit and receive                        | Enable Ethernet PAUSE transmit and receive                        |
| 1   | 1           | 0              | 0           | Disable Ethernet PAUSE transmit and receive                       | Disable Ethernet PAUSE transmit and receive                       |
| 1   | 1           | 0              | 1           | Enable Ethernet PAUSE receive and disable Ethernet PAUSE transmit | Enable Ethernet PAUSE transmit and disable Ethernet PAUSE receive |
| 1   | 1           | Don't care     | Don't care  | Enable Ethernet PAUSE transmit and receive                        | Enable Ethernet PAUSE transmit and receive                        |

**NOTE:** For your convenience, [Table 451 on page 5563](#) replicates Table 28B-3 of Section 2 of the IEEE 802.X specification.

## PFC

---

PFC is a lossless transport and congestion relief feature that works by providing granular link-level flow control for each IEEE 802.1p code point (priority) on a full-duplex Ethernet link. When the receive buffer on a switch interface fills to a threshold, the switch transmits a pause frame to the sender (the connected peer) to temporarily stop the sender from transmitting more frames. The buffer threshold must be low enough so that the sender has time to stop transmitting frames and the receiver can accept the frames already on the wire before the buffer overflows. The switch automatically sets queue buffer thresholds to prevent frame loss.

When congestion forces one priority on a link to pause, all of the other priorities on the link continue to send frames. Only frames of the paused priority are not transmitted. When the receive buffer empties below another threshold, the switch sends a message that starts the flow again.

You configure PFC using a congestion notification profile (CNP). A CNP has two parts:

- Input—Specify the code point (or code points) on which to enable PFC, and optionally specify the maximum receive unit (MRU) and the cable length between the interface and the connected peer interface.
- Output—Specify the output queue or output queues that respond to pause messages from the connected peer.

You apply a PFC configuration by configuring a CNP on one or more interfaces. Each interface that uses a particular CNP is enabled to pause traffic with the priorities (code points) specified in that CNP. You can configure one CNP on an interface, and you can configure different CNPs on different interfaces. When you configure a CNP on an interface, ingress traffic that is mapped to a priority that the CNP enables for PFC is paused whenever the queue buffer fills to the pause threshold. (The pause threshold is not user-configurable.)

Configure PFC for a priority end to end along the entire data path to create a lossless lane of traffic on the network. You can selectively pause the traffic in any queue without pausing the traffic for other queues on the same link. You can create lossless lanes for traffic such as Fibre Channel over Ethernet (FCoE), LAN backup, or management, while using standard frame-drop congestion management for IP traffic on the same link.

Potential consequences of link-level flow control are:

- Ingress port congestion (configuring too many lossless flows can cause ingress port congestion)
- A paused priority that causes upstream devices to pause the same priority, thus spreading congestion back through the network

By definition, PFC supports symmetric pause only (as opposed to Ethernet PAUSE, which supports symmetric and asymmetric pause). With symmetric pause, a device can:

- Transmit pause frames to pause incoming traffic. (You configure this using the input stanza of a congestion notification profile.)

- Receive pause frames and stop sending traffic to a device whose buffer is too full to accept more frames. (You configure this using the output stanza of a congestion notification profile.)

Receiving a PFC frame from a connected peer pauses traffic on egress queues based on the IEEE 802.1p priorities that the PFC pause frame identifies. The priorities are 0 through 7. By default, the priorities map to queue numbers 0 through 7, respectively, and to specific forwarding classes, as shown in [Table 452 on page 5565](#):

**Table 452: Default PFC Priority to Queue and Forwarding Class Mapping**

| IEEE 802.1p Priority (Code Point) | Queue | Forwarding Class |
|-----------------------------------|-------|------------------|
| 0 (000)                           | 0     | best-effort      |
| 1 (001)                           | 1     | best-effort      |
| 2 (010)                           | 2     | best-effort      |
| 3 (011)                           | 3     | fcoe             |
| 4 (100)                           | 4     | no-loss          |
| 5 (101)                           | 5     | best-effort      |
| 6 (110)                           | 6     | network-control  |
| 7 (111)                           | 7     | network-control  |

For example, a received PFC pause frame that pauses priority 3 pauses output queue 3. If you do not want to use the default configuration, you can configure customized mapping of priorities to queues and forwarding classes.

**NOTE:** By convention, deployments with converged server access typically use IEEE 802.1p priority 3 for FCoE traffic. The default forwarding class configuration sets the fcoe forwarding class as a lossless forwarding class that is mapped to queue 3. The default classifier maps incoming priority 3 traffic to the fcoe forwarding class. *However, you must apply PFC to the entire FCoE data path to configure the end-to-end lossless behavior that FCoE traffic requires.*

If your network uses priority 3 for FCoE traffic, we recommend that you use the default configuration. If your network uses a priority other than 3 for FCoE traffic, you can configure lossless FCoE transport on any IEEE 802.1p priority as described in [“Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows” on page 5837](#) and [Understanding CoS IEEE 802.1p Priority Remapping on an FCoE-FC Gateway](#).

You enable PFC on a priority by:

1. Specifying the IEEE 802.1p code point to pause in the input stanza of a CNP
2. Applying the CNP to the ingress interfaces on which you want to pause the traffic

**CAUTION:** Any change to the PFC configuration on a port temporarily blocks the entire port (not just the priorities affected by the PFC change) so that the port can implement the change, then unblocks the port. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

A change to the PFC configuration means any change to a CNP, including changing the input portion of the CNP (enabling or disabling PFC on a priority, or changing the MRU or cable-length values) or changing the output portion the CNP that enables or disables output flow control on a queue. A PFC configuration change only affects ports that use the changed CNP.

The following actions change the PFC configuration:

- Deleting or disabling a PFC configuration (input or output) in a CNP that is in use on one or more interfaces. For example:
  1. An existing CNP with an input stanza that enables PFC on priorities 3, 5, and 6 is configured on interfaces xe-0/0/20 and xe-0/0/21.
  2. We disable the PFC configuration for priority 6 in the input CNP, and then commit the configuration.
  3. The PFC configuration change causes all traffic on interfaces xe-0/0/20 and xe-0/0/21 to stop until the PFC change has been implemented. When the PFC change has been implemented, traffic resumes.
- Configuring a CNP on an interface. (This changes the PFC state by enabling PFC on one or more priorities.)
- Deleting a CNP from an interface. (This changes the PFC state by disabling PFC on one or more priorities.)

When you associate the CNP with an interface, the interface uses PFC to send pause requests when the output queue buffer for the lossless traffic fills to the pause threshold.

Although unicast traffic and multdestination (multicast, broadcast, and destination lookup fail) traffic must use different classifiers, you can map a unicast queue (queue 0 through 7) and a multdestination queue (queue 8, 9, 10, or 11) to the same PFC priority so that both unicast and multicast traffic use that priority. Do not map multdestination traffic to lossless priorities. Starting with Junos OS Release 12.3, you can map one priority to multiple output queues.

**NOTE:** You can attach a maximum of one CNP to an interface, but you can create an unlimited number of CNPs that explicitly configure only the input stanza and use the default output stanza.

The output stanza of the CNP maps to a profile that interfaces use to respond to pause messages received from the connected peer. On standalone switches, you can create two CNPs with an explicitly configured output stanza.

When a switch is a Node device in a QFabric system, you can create one CNP with an explicitly configured output stanza. (One fewer profile is available on QFabric systems because the system needs a default profile for fabric interfaces, which are not used as fabric interfaces when the switches are not part of a QFabric system. “[Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows](#)” on page 5837 describes configuring output flow control.

### Lossless Transport Support Summary

The switch supports up to six lossless forwarding classes. For lossless transport, you must enable PFC on the IEEE 802.1p priorities (code points) mapped to lossless forwarding classes.

**CAUTION:** Any change to the PFC configuration on a port temporarily blocks the entire port (not just the priorities affected by the PFC change) so that the port can implement the change, then unblocks the port. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

The following limitation applies to support lossless transport on QFabric systems only:

- The internal fiber cable length from the QFabric system Node device to the QFabric system Interconnect device cannot exceed 150 meters.

The default CoS configuration provides two lossless forwarding classes, *fcoe* and *no-loss*. If you explicitly configure lossless forwarding classes, you must include the **no-loss** packet drop attribute to enable lossless behavior, or the traffic is not lossless. For both default and explicit lossless forwarding class configuration, you must configure CNP input stanzas to enable PFC on the priority of the lossless traffic and apply the CNPs to ingress interfaces.

**NOTE:** Junos OS Release 12.2 introduced changes to the way the switch handles lossless forwarding classes (including the default fcoe and no-loss forwarding classes).

In Junos OS Release 12.1, either explicitly configuring the fcoe and no-loss forwarding classes or using the default configuration for these forwarding classes resulted in the same lossless behavior for traffic mapped to those forwarding classes.

However, in Junos OS Release 12.2, if you explicitly configure the fcoe or the no-loss forwarding class, that forwarding class is no longer treated as a lossless forwarding class. Traffic mapped to these forwarding classes is treated as lossy (best-effort) traffic. This is true even if the explicit configuration is exactly the same as the default configuration.

If your CoS configuration from Junos OS Release 12.1 or earlier includes the explicit configuration of the fcoe or the no-loss forwarding class, then when you upgrade to Junos OS Release 12.2, those forwarding classes are not lossless. To preserve the lossless treatment of these forwarding classes, delete the the explicit fcoe and no-loss forwarding class configuration before you upgrade to Junos OS Release 12.2.

See *Overview of CoS Changes Introduced in Junos OS Release 12.2* for detailed information about this change and how to delete an existing lossless configuration.

In Junos OS Release 12.3, the default behavior of the fcoe and no-loss forwarding classes is the same as in Junos OS Release 12.2. However, in Junos OS Release 12.3, you can configure up to six lossless forwarding classes. All explicitly configured lossless forwarding classes must include the new no-loss packet drop attribute or the forwarding class is lossy.

[“Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows” on page 5837](#) provides detailed information about the explicit configuration of lossless priorities and about the default configuration of lossless priorities, including the input and output stanzas of the CNP.

**NOTE:** PFC and Ethernet PAUSE are used only on Ethernet interfaces. Fabric (fte) ports on QFabric systems (Node device fabric ports and Interconnect device fabric ports) use link-layer flow control (LLFC) to ensure the appropriate treatment of lossless traffic.

## Understanding Fibre Channel Terminology

To understand the Fibre Channel (FC) and Fibre Channel over Ethernet (FCoE) capabilities of the switches, you should become familiar with the terms defined in [Table 453 on page 5569](#).

**Table 453: Fibre Channel Terms**

| Term                    | Definition  |
|-------------------------|---|
| addressing mode         | <p>Format for the locally unique MAC address the FC switch assigns to FCoE devices for FCoE transactions after FIP establishes a connection between an FCoE device and the FC switch. The two addressing modes are <i>fabric-provided MAC address (FPMA)</i> and <i>server-provided MAC address (SPMA)</i>. Only FPMA is supported.</p> <p>During FLOGI or FDISC, the ENode advertises the addressing modes it supports. If the FC switch supports an addressing mode that the ENode uses, the virtual link can be established, and the devices can communicate.</p> <p>See also <i>fabric-provided MAC address (FPMA)</i> and <i>server-provided MAC address (SPMA)</i>.</p> |
| ALL-ENode-MACs          | <p>Well-known multicast MAC address to which all FCoE ENodes listen. FCFs send multicast <i>FIP discovery advertisement</i> messages and <i>FIP keepalive</i> messages to the ALL-ENode-MACs address so that ENodes can discover and maintain connections to FCFs. The hexadecimal format of the address is <b>01:10:18:01:00:01</b>.</p> <p>See also <i>well-known address (WKA)</i>.</p>  |
| ALL-FCF-MACs            | <p>Well-known multicast MAC address to which all FCFs listen. ENodes send multicast <i>FIP discovery solicitation</i> messages to the ALL-FCF-MACs address to find out which FCFs can accept a login. The hexadecimal format of the address is <b>01:10:18:01:00:02</b>.</p> <p>See also <i>well-known address (WKA)</i>.</p>   |
| congestion notification | See <i>quantized congestion notification (QCN)</i> .  |

Table 453: Fibre Channel Terms (*continued*)

| Term   | Definition  |
|--|---|
| converged network adapter (CNA)                          | <p>Physical adapter that combines the functions of a Fibre Channel <i>host bus adapter (HBA)</i> to process FCoE frames and a <i>lossless Ethernet network interface card (NIC)</i> to process non-FCoE Ethernet frames. CNAs have one or more Ethernet ports. CNAs encapsulate Fibre Channel frames in Ethernet for FCoE transport and de-encapsulate Fibre Channel frames from FCoE to native Fibre Channel.</p> <p>See also <i>host bus adapter (HBA)</i>.</p>   |
| data center bridging (DCB)                               | <p>Set of IEEE specifications that enhance Ethernet to allow it to support converged Ethernet (LAN) and Fibre Channel (SAN) traffic on one Ethernet network. DCB features include <i>priority-based flow control (PFC)</i>, <i>enhanced transmission selection (ETS)</i>, <i>Data Center Bridging Capability Exchange protocol (DCBX)</i>, <i>quantized congestion notification (QCN)</i>, and full-duplex 10-Gigabit Ethernet ports.</p> <p>See also <i>priority-based flow control (PFC)</i>, <i>Ethernet PAUSE</i>, <i>enhanced transmission selection (ETS)</i>, <i>Data Center Bridging Capability Exchange protocol (DCBX)</i>, and <i>quantized congestion notification (QCN)</i>.</p> |
| expansion port (E_Port)                                  | <p>An expansion port in an FC switch/FCF that connects the FC switch/FCF to the E_Port of another FC switch/FCF to form an <i>Interswitch Link (ISL)</i> in a common FC fabric.</p>   |
| Data Center Bridging Capability Exchange protocol (DCBX) | <p>Discovery and exchange protocol for conveying configuration and capabilities among neighbors to ensure consistent configuration across the network. It is an extension of the Link Layer Data Protocol (LLDP, described in IEEE 802.1AB)</p> <p>See also <i>data center bridging (DCB)</i>.</p>  |
| enhanced transmission selection (ETS)                    | <p>Mechanism that provides finer granularity of bandwidth management within a link.</p> <p>See also <i>data center bridging (DCB)</i>.</p>  |
| ENode  | <p>See <i>FCoE Node (ENode)</i></p>   |
| ENode MAC  | <p><i>Lossless Ethernet MAC</i> paired with an <i>FCoE controller</i> in an ENode.</p> <p>See also <i>FCoE node (ENode)</i>.</p>  |
| ENode MAC address  | <p>Globally unique address assigned to the CNA by the manufacturer and used to identify the node for FIP transactions.</p>  |

Table 453: Fibre Channel Terms (*continued*)

| Term                     | Definition   |
|--------------------------|--|
| Ethernet PAUSE           | <p>As defined in IEEE 802.3X, a flow control mechanism that temporarily stops the transmission of Ethernet frames on a link for a specified period. A receiving element sends an Ethernet PAUSE frame when a sender transmits data faster than the receiver can accept it. Ethernet PAUSE affects the entire link, not just an individual flow. An Ethernet PAUSE frame temporarily stops all traffic transmission on the link and allows the receiver's input buffer to empty sufficiently to restart traffic on the link. Ethernet PAUSE messages are sent to the previous hop and do not automatically propagate to the source of the congestion.</p> <p>See also <i>priority-based flow control (PFC)</i>.</p>   |
| fabric                   | Interconnection of network nodes using one or more network switches that function as a network single logical entity.  |
| fabric discovery (FDISC) | <p>Subsequent logins from the same ENode for different users, applications, or virtual machines after an ENode performs an initial FLOGI to log in to a switch.</p> <p>FC and FIP FDISC messages serve the same function in FC and FCoE networks, respectively. N_Ports send FC FDISC messages to the FC switch and VN_Ports send FIP FDISC messages to the FCF.</p> <p>After an N_Port acquires its initial N_Port ID through the FC FLOGI process, it can acquire additional N_Port IDs by sending an FC FDISC with a new worldwide port name and a source ID of 0x000000. The new port name and blank source ID tell the FC switch to assign a new N_Port ID to the N_Port. The different N_Port IDs allow multiple virtual machines or users on the N_Port to have separate, secure virtual links on the same physical N_Port. These additional ports are also referred to as VN_Ports.</p> <p>FIP FDISC works the same way, except the VN_Port logs in using a FIP FLOGI message.</p> <p>See also <i>fabric login (FLOGI)</i> and <i>N_Port ID</i>.</p> |
| fabric login (FLOGI)     | <p>Creation of a logical connection to the FC switch and establishment of a node's operating environment.</p> <p>For FC devices, an N_Port logs in to the FC network by sending an FC FLOGI message to the F_Port of an FC switch.</p> <p>For FCoE devices, a VN_Port logs in to the FC network by sending a FIP FLOGI message to the VF_Port of an FC switch.</p>   |
| fabric port (F_Port)     | <p>FC port on an FC switch or an FCF that connects point-to-point to an FC node port (N_Port) on an FC host (server or storage device). An F_Port provides access to fabric services for FC devices.</p> <p>F_Ports are intermediate ports in a connection between FC device end-point N_Ports. For example, a connection between an FC host server and an FC storage device through an FC switch looks like this: FC server N_Port to FC switch ingress F_Port to FC switch egress F_Port to FC storage device N_Port.</p> <p>See also <i>node port (N_Port)</i>.</p>   |

Table 453: Fibre Channel Terms (*continued*)

| Term                                | Definition   |
|-------------------------------------|--|
| fabric-provided MAC address (FPMA)  | <p>MAC address that an FCF assigns to a single ENode MAC through the FLOGI or FDISC process that is unique to the local fabric. The FPMA uniquely identifies a single VN_Port at that ENode MAC in FCoE transactions with the FCF.</p> <p>Because an ENode can have more than one ENode MAC, an FCF can assign multiple FPMAs to an ENode, one FPMA per ENode MAC.</p> <p>An FPMA is a 48-bit value that consists of two 24-bit values, the N_Port ID and the FC-MAP value. The N_Port ID uniquely identifies the VN_Port and the FC-MAP value identifies the FCF.</p> <p>See also <i>FCoE node (ENode)</i>, <i>N_Port ID</i>, and <i>FCoE mapped address prefix (FC-MAP)</i>.</p> |
| FCF-MAC                             | Lossless Ethernet MAC paired with an FCoE controller in an FCF. The FCF-MAC enables the FCF to handle FCoE traffic.  |
| FCoE controller                     | <p>Instantiates and terminates VN_Port and VF_Port instances on an ENode. An ENode can have more than one FCoE controller. Each FCoE controller is paired with a lossless Ethernet MAC on the ENode.</p> <p>See also <i>lossless Ethernet MAC</i>.</p>   |
| FC forwarder (FCF)                  | Alternative term and acronym to refer to an FC switch that has all physical Fibre Channel ports and the necessary set of services as defined in the T11 Organization <i>Fibre Channel Switched Fabric</i> (FC-SW) standards.   |
| FCoE forwarder (FCF)                | Defined by the <i>Fibre Channel Backbone - 5 (FC-BB-5) Rev 2.00</i> specification available at <a href="http://www.t11.org/ftp/t11/pub/fc/bb-5/09-056v5.pdf">http://www.t11.org/ftp/t11/pub/fc/bb-5/09-056v5.pdf</a> as a device that has the necessary set of services as defined in FC-SW and the FCoE capabilities to act as an FCoE-based FC switch.   |
| FCoE Initialization Protocol (FIP)  | <p>Layer 2 protocol for endpoint discovery, fabric login, and fabric association. FIP enables FCoE devices and FC switches to discover one another. Through FIP, FCoE nodes can log in to an FC switch, access the SAN FC fabric, and communicate with target FC devices. FIP messages also maintain the connection between the FCoE initiator and the FCF.</p> <p>FIP has its own EtherType (0x8914) to distinguish its traffic from payload-carrying FCoE traffic and other Ethernet traffic.</p>  |
| FCoE link endpoint (LEP)            | Virtual FC interface mapped onto a physical Ethernet interface to handle FC frame encapsulation and de-encapsulation and transmission and reception of FC frames encapsulated in Ethernet through a single virtual link.   |
| FCoE mapped address prefix (FC-MAP) | <p>24-bit value that identifies the FC switch and is half of the 48-bit FPMA MAC address. The FC-MAP value can be configured on the FC switch and has a default value of 0EFC00h. The FC-MAP value was originally called the Fibre Channel Organizationally Unique Identifier (FC-OUI).</p> <p>See also <i>fabric-provided MAC address (FPMA)</i>.</p>   |

Table 453: Fibre Channel Terms (*continued*)

| Term  | Definition  |
|---|---|
| FCoE node (ENode)   | <p>Fibre Channel node that has one or more lossless Ethernet MACs, each paired with an <i>FCoE Controller</i> in order to transmit FCoE frames. An ENode combines FCoE termination functions and the FC stack on a CNA. ENodes present virtual FC interfaces to FC switches or FCFs in the form of VN_Ports, which can establish FCoE virtual links with FC switch/FCF VF_Ports. ENodes perform FCoE related functions in a <i>converged network adapter (CNA)</i>.</p> <p>See also <i>converged network adapter (CNA)</i>.</p>   |
| FCoE-FC gateway   | A form of N_Port virtualizer in which the node-facing ports are FCoE ports and the FC switch-facing ports are FC ports.   |
| FCoE-FCoE gateway   | A form of N_Port virtualizer in which the node-facing ports are FCoE ports and the FC switch-facing ports are FCoE ports.   |
| FC-FC gateway   | A form of N_Port virtualizer in which the node-facing ports are FC ports and the FC switch-facing ports are FC ports.   |
| FCoE transit switch (also known as a FIP snooping bridge) | <p>Switch with a minimum set of features designed to support FCoE Layer 2 forwarding and FCoE security. The switch can also have optional additional features.</p> <p>Minimum feature support is:</p> <ul style="list-style-type: none"> <li>• Priority-based flow control (PFC)</li> <li>• Enhanced transmission selection (ETS)</li> <li>• Data Center Bridging Capability Exchange Protocol (DCBX), including the FCoE application TLV</li> <li>• FIP snooping (minimum support is FIP automated filter programming at the ENode edge)</li> </ul> <p>Additional FIP snooping capabilities can include learning the virtual FC connection paths (VN2VF, VN2VN, or VE2VE) and monitoring the FIP keepalive mechanisms. Other optional capabilities can also enhance FCoE within the standards. FIP snooping is typically configurable on a per-VLAN basis.</p> <p>A transit switch has an FC stack even though it is not an FC switch or an FCF.</p> |
| FCoE VLAN   | VLAN dedicated to carrying only FCoE traffic. FCoE traffic must travel in a VLAN. Only FCoE interfaces should be members of an FCoE VLAN. Ethernet traffic that is not FCoE traffic must travel in a different VLAN.  |
| Fibre Channel   | High-speed network technology used for storage area networks (SANs).  |
| Fibre Channel fabric                                      | <p>Network of Fibre Channel devices that allows communication among devices, device name lookup, security, and redundancy.</p> <p>Also a local fabric on a QFX3500 switch with FCoE interfaces connected to FCoE devices on the Ethernet network and native FC interfaces connected to an FC switch in a SAN.</p>   |

Table 453: Fibre Channel Terms (*continued*)

| Term                               | Definition   |
|------------------------------------|--|
| Fibre Channel ID (FCID)            | <p>24-bit value the FC switch assigns to the N_Port or VN_Port as a unique identifier within the local FC network. The FCID consists of an 8-bit domain value, an 8-bit area value, and an 8-bit port value. The FCID is sometimes called an N_Port ID.</p> <p>See also <i>N_Port ID</i>.</p>  |
| Fibre Channel over Ethernet (FCoE) | <p>Standard for transporting FC frames over Ethernet networks. FCoE encapsulates Fibre Channel frames in Ethernet so that the same high-speed Ethernet physical infrastructure can transport both data and storage traffic while preserving the lossless CoS that FC requires. FCoE has its own EtherType (0x8906) to differentiate it from other Ethernet traffic.</p> <p>FCoE runs on a DCB network. FCoE servers connect to a switch that supports both FCoE and native FC protocols. This allows FCoE servers on the Ethernet network to access FC storage devices in the SAN fabric on one converged network.</p> <p>See also <i>data center bridging (DCB)</i>.</p>  |
| Fibre Channel services             | Functions required for establishing FC network connectivity among devices and for managing devices on the FC network, such as login servers, domain managers, name servers, and zone servers.  |
| FC stack                           | <p>FC or FCoE protocol capability implemented on a device to support the FC or FCoE functionality. Having an FC stack does not imply consuming a domain ID.</p> <p>Each FC or FCoE enabled server or storage device has an FC stack. Similarly, an FC or FCoE switch, an FCF, an FCoE-FC gateway, and an FCoE transit switch have FC stacks.</p>   |
| Fibre Channel switch               | Network switch that implements the Fibre Channel protocol.   |
| FIP discovery advertisement        | <p>Multicast or unicast message that the FC switch (or FCF) transmits to ENodes to advertise the switch's presence on the network so that ENodes can discover the switch and request to log in to the FC fabric.</p> <p>The FC switch periodically sends multicast FIP discovery advertisements to the ALL-ENode-MACs address, a well-known address to which all ENodes listen. The multicast messages advertise the FC switch to all ENodes on the VLAN and serve as keepalive messages to maintain connectivity between the FC switch and ENodes.</p> <p>When an ENode sends a FIP discovery solicitation message to the FC switch, the FC switch responds with a unicast FIP discovery advertisement to that ENode.</p> |

Table 453: Fibre Channel Terms (*continued*)

| Term                       | Definition  |
|----------------------------|---|
| FIP discovery solicitation | <p>Multicast or unicast message that an ENode transmits to FC switches (or FCFs) to find compatible switches in the network.</p> <p>When an ENode initializes, it sends a multicast FIP discovery solicitation to the ALL-FCF-MACs address, a well-known address to which all FC switches and FCFs listen. Compatible switches reply with a unicast FIP discovery advertisement.</p> <p>The ENode compiles a list of compatible switches, selects a switch, and logs in to that switch.</p>   |
| FIP keepalive              | Periodic multicast FIP discovery advertisement sent from the FC switch or FCF to all ENodes to maintain connectivity.   |
| FIP snooping               | <p>For VN_Port to VF_Port (VN2VF) paths (Technical Committee T11 BB-FC-5 specification), FIP snooping is a security feature enabled for FCoE VLANs on an Ethernet switch that connects ENodes to FC switches or FCFs. FIP snooping inspects data in FIP frames and uses that data to create firewall filters. The filters permit only traffic from sources that perform a successful FLOGI to the FC switch. All other traffic on the VLAN is denied. FIP snooping filters are installed on the ports in the FCoE VLAN.</p> <p>For VN_Port to VN_Port (VN2VN) paths (Technical Committee T11 BB-FC-6 specification), the FIP snooping security feature filters access between VN_Ports in a similar manner to VN2VF_Port FIP snooping.</p> <p>FIP snooping can also apply similarly to VE_Port to VE_Port (VE2VE) paths.</p> <p>FIP snooping can also snoop to provide additional visibility of FCoE Layer 2 operation.</p> <p>See also <i>FCoE node (ENode)</i>.</p> |
| FIP snooping bridge        | See <i>FCoE transit switch</i> and <i>FIP snooping</i> .  |
| host bus adapter (HBA)     | Physical mechanism that connects a host system to other FC network and storage devices. HBAs have a unique worldwide node name (WWNN) for the HBA node, which all of the ports on the HBA share, and each port on an HBA has a unique worldwide port name (WWPN).   |
| initiator                  | System component that originates an I/O command over an I/O bus or network. An FCoE server sending a request to an FC storage device is an example of an initiator.   |

Table 453: Fibre Channel Terms (*continued*)

| Term                      | Definition  |
|---------------------------|---|
| iSCSI transit switch      | <p>Layer 2 Ethernet switch with a minimum set of best-practice Ethernet features to support iSCSI, along with optional enhancements. Minimum feature support is:</p> <ul style="list-style-type: none"> <li>• IEEE 802.3X asymmetric and symmetric flow control on ports not running in DCB mode</li> <li>• Priority-based flow control (PFC)</li> <li>• Enhanced transmission selection (ETS)</li> <li>• Data Center Bridging Capability Exchange Protocol (DCBX), including the iSCSI application TLV</li> </ul> <p>Other capabilities such as Internet storage name service (iSNS) are optional.</p> |
| interswitch link (ISL)    | <p>Link between the <i>E_Ports</i> of two FC switches in a common FC fabric. When two FCoE-based FC switches are connected together, there is a virtual ISL through Layer 2.</p>  |
| logout (LOGO)             | <p>For FC devices, an N_Port logs out from the FC network by sending an FC LOGO message to the F_Port of an FC switch. The switch can also send a LOGO message to an N_Port to terminate its connection.</p> <p>For FCoE devices, a VN_Port logs out from the FC network by sending a FIP LOGO message to the VF_Port of an FC switch. The switch can also send a LOGO message to a VN_Port to terminate its connection.</p>  |
| lossless Ethernet MAC     | <p>Full-duplex Ethernet MAC that implements Ethernet extensions to avoid Ethernet frame loss due to congestion and supports at least 2.5-KB jumbo frames. Each lossless Ethernet MAC combines with an FCoE Controller to perform FCoE termination functions on an ENode.</p> <p>See also <i>priority-based flow control (PFC)</i>, <i>quantized congestion notification (QCN)</i>, <i>FCoE controller</i>, and <i>FCoE node (ENode)</i>.</p>  |
| lossless Ethernet network | <p>Ethernet network composed of only full-duplex links and lossless Ethernet MACs and with CoS and flow control to prevent dropping of frames.</p>  |
| lossless transport        | <p>In DCB networks, the ability to switch FCoE frames over an Ethernet network without dropping any frames. Lossless transport uses mechanisms such as priority-based flow control and quantized congestion notification to control traffic flows and avoid congestion.</p>   |
| N_Port ID                 | <p>See <i>Fibre Channel ID (FCID)</i>.</p>  |

Table 453: Fibre Channel Terms (*continued*)

| Term                            | Definition   |
|---------------------------------|--|
| N_Port ID virtualizer           | <p>Presents itself as an FC or FCoE switch to external devices, but connects to an actual FC or FCoE switch in the other direction to provide the FC-SW services.</p> <p>An N_Port ID virtualizer logs in to the actual FC or FCoE switch in the same way as a normal node device and uses the NPIV mechanism to proxy incoming FLOGIs to FDISCs on the actual FC or FCoE switch.</p> <p>An N_Port ID virtualizer has an FC stack even though it is not an FC switch or an FCF.</p> <p>The acronym <i>NPV</i> is commonly used for N_Port ID virtualizer even though the acronym is not defined in the standards.</p>  |
| N_Port ID Virtualization (NPIV) | <p>NPIV enables a physical N_Port to acquire multiple N_Port IDs. Each N_Port ID maps to a different application (such as a virtual machine) or to a different user. This allows you to associate one F_Port with many N_Port IDs and create multiple discrete, secure virtual links over one physical point-to-point connection.</p> <p>NPIV increases resource and bandwidth utilization and allows the implementation of access control, zoning, and port security on a per-application or per-user basis.</p> <p>After an N_Port performs a FLOGI and receives its first N_Port ID, it can request more N_Port IDs by sending FDISC messages.</p> <p>See also <i>fabric login (FLOGI)</i>, <i>fabric discovery (FDISC)</i>, and <i>virtual link</i>.</p> |
| node port (N_Port)              | <p>N_Ports can be in two modes:</p> <ul style="list-style-type: none"> <li>• Fabric N_Port—Node port that is an FC host or storage device end port in a point-to-point link between the device and the F_Port of an FC switch. The point-to-point link can be virtual or physical.</li> <li>• Point-to-point N_Port—Node port that connects to another N_Port. The switch does not support this configuration.</li> </ul> <p>N_Ports handle creation, detection, and flow of messages to and from the connected devices.</p>   |
| node worldwide name (NWWN)      | <p>WWN that is unique worldwide and is assigned to an FC node. An NWWN is valid for multiple ports that are on that node (this identifies the ports as network interfaces of a particular node).</p>   |
| port mode                       | <p>Role that the port plays in the FC fabric (endpoint device, FC switch connection to endpoint devices, interswitch link).</p> <p>See also <i>node port (N_Port)</i>, <i>virtual node port (VN_Port)</i>, <i>proxy node port (NP_Port)</i>, <i>fabric port (F_Port)</i>, and <i>virtual fabric port (VF_Port)</i>.</p>  |
| port worldwide name (PWWN)      | <p>WWN that is unique worldwide and is assigned to an FC port.</p>   |

Table 453: Fibre Channel Terms (*continued*)

| Term                                    | Definition  |
|---|---|
| priority-based flow control (PFC)       | <p>Link-level flow control mechanism defined by IEEE 802.1Qbb that allows independent flow control for each class of service (as defined in the 3-bit CoS field of the Ethernet header by IEEE 802.1Q tags) to ensure that no frame loss from congestion occurs in DCB networks.</p> <p>PFC is an enhancement of the Ethernet PAUSE mechanism, but PFC controls classes of flows, whereas Ethernet PAUSE indiscriminately pauses all of the traffic on a link. With PFC, a receiving device can signal a transmitting device to pause transmission based on traffic class.</p> <p>PFC provides application-specific bandwidth reservations so you can ensure that time-critical protocols and applications such as FCoE receive the priority necessary to prevent frame loss. PFC allows the same physical link to carry FCoE traffic and provide lossless service while also carrying loss-tolerant Ethernet traffic.</p> <p>See also <i>Ethernet PAUSE</i>.</p> |
| proxy gateway mode                      | Connects FCoE initiators to FC switches in a converged Ethernet and Fibre Channel network and acts as an intermediary for these devices. The FCoE-FC gateway represents and acts for the FCoE initiators in transactions from the FCoE initiators destined for an FC switch, including converting FIP and FCoE frames to FC frames. The gateway represents and acts for an FC switch in transactions from the FC switch destined for an FCoE initiator, including converting FC frames to FIP frames and encapsulating FC frames in Ethernet.   |
| proxy node port (NP_Port)               | N_Port on the QFX3500 switch that performs proxy functions when it is configured as an FCoE-FC gateway. The NP_Port acts as a proxy for the FCoE device VN_Ports in transactions with the FC switch.  |
| quantized congestion notification (QCN) | Mechanism defined by IEEE 802.1Qau that manages network congestion within a Layer 2 domain. When a queue reaches a configured threshold, QCN throttles traffic at the source of the congestion by transmitting messages that propagate back to the source and temporarily stop the source from transmitting. When the queue crosses the threshold that indicates the congestion has dissipated, QCN sends a message to allow the source to resume transmitting frames.  |
| session                                 | Fabric login (FLOGI) or fabric discovery (FDISC) login to the FC SAN fabric. Session does not refer to end-to-end server-to-storage sessions.   |
| server-provided MAC address (SPMA)      | <p>MAC address that an ENode assigns to one of its ENode MACs and is not assigned to any other ENode MAC in the same FCoE VLAN. An SPMA can be associated with more than one VN_Port at that ENode MAC.</p> <p>The switch does not support SPMA.</p> <p>See also <i>ENode MAC</i> and <i>fabric-provided MAC address (FPMA)</i>.</p>  |
| storage area network (SAN)              | Network whose primary purpose is the transfer of data between computer systems and storage devices. This term is most commonly used in the context of any network that supports block storage, usually iSCSI, FC, and FCoE networks.  |

Table 453: Fibre Channel Terms (*continued*)

| Term                          | Definition   |
|-------------------------------|--|
| target                        | System component that receives an I/O command. An FC storage device that receives a request from a server is an example of a target.   |
| VE_Port                       | Virtual ports created to form a connection (an <i>interswitch link</i> ) between two FCoE-based FC switches as part of a common FC fabric.   |
| VE2VE (VE_Port to VE_Port)    | The <i>Fibre Channel Backbone - 5 (FC-BB-5) Rev 2.00</i> specification capability of FCFs to connect to each other as a single FCoE FC SAN.  |
| VN2VF (VN_Port to VF_Port)    | The <i>Fibre Channel Backbone - 5 (FC-BB-5) Rev 2.00</i> specification capability of an ENode to connect to an FCF or to an FCoE-enabled FC SAN.   |
| VN2VN (VN_Port to VN_Port)    | The <i>Fibre Channel Backbone - 6 (FC-BB-6)</i> specification capability of an ENode to connect directly over Layer 2 to another ENode without the need of any FC-related services. This capability is most often used in small-scale FCoE SANs.   |
| virtual fabric port (VF_Port) | <p>Data-forwarding component that emulates an F_Port. A VF_Port is dynamically instantiated on successful completion of a FIP FLOGI exchange and connects to one or more VN_Ports. The term <i>virtual</i> indicates the use of a non-FC link such as an FCoE link.</p> <p>See also <i>fabric port (F_Port)</i>.</p>   |
| virtual link                  | <p>Logical link connecting two FCoE Link End Points (LEPs) over a lossless Ethernet network, for example, the link between a VF_Port and a VN_Port. The MAC addresses of the two LEPs identifies a virtual link.</p> <p>See also <i>FCoE link end point (LEP)</i> and <i>lossless Ethernet network</i>.</p>  |
| virtual node port (VN_Port)   | <p>Data-forwarding component that emulates an N_Port. With FCoE, a VN_Port is dynamically instantiated on successful completion of a FIP FLOGI exchange and connects to one or more VF_Ports. The term <i>virtual</i> indicates the use of a non-FC link such as an FCoE link.</p> <p>VN_Port is also used for the virtual N_Ports created in both FC and FCoE when additional NPIV-based logins occur over a previously created N_Port-to-VN_Port or N_Port-to-VF_Port connection.</p> <p>See also <i>node port (N_Port)</i>.</p> |
| well-known address (WKA)      | Address identifier used to access a service provided by an FC fabric. The service can be distributed in many elements throughout a fabric, or it can be centralized in one element. A WKA is always accessible, regardless of zoning. An example of a WKA is the <i>ALL-FCF-MACs</i> address to which all FCFs listen.   |
| worldwide name (WWN)          | 64-bit identifier that is similar to a MAC address except that it is not used for forwarding. It uniquely identifies an FC device. The WWN is derived from the IEEE organizationally unique identifier (OUI) and vendor-supplied information. A WWN is unique worldwide.   |
| worldwide node name (WWNN)    | See <i>node worldwide name (NWWN)</i> .  |

Table 453: Fibre Channel Terms (*continued*)

## DCBX

- [Understanding DCBX on page 5580](#)
- [Understanding DCBX Application Protocol TLV Exchange on page 5589](#)

### Understanding DCBX

Data Center Bridging Capability Exchange protocol (DCBX) is an extension of Link Layer Data Protocol (LLDP). If you disable LLDP on an interface, that interface cannot run DCBX. If you attempt to enable DCBX on an interface on which LLDP is disabled, the configuration commit operation fails. Data center bridging (DCB) devices use DCBX to exchange configuration information with directly connected peers.

Video: [What is DCBX Protocol?](#)

This topic describes:

- [DCBX Basics on page 5580](#)
- [DCBX Modes and Support on page 5581](#)
- [DCBX Attribute Types on page 5584](#)
- [DCBX Application Protocol TLV Exchange on page 5585](#)
- [DCBX and PFC on page 5586](#)
- [DCBX and ETS on page 5587](#)

#### DCBX Basics

DCBX can:

- Discover the DCB capabilities of peers.
- Detect DCB feature misconfiguration or mismatches between peers.
- Configure DCB features on peers.

You can configure DCBX operation for priority-based flow control (PFC), Layer 2 and Layer 4 applications such as FCoE and iSCSI, and ETS. DCBX is enabled or disabled on a per-interface basis.

By default, for PFC and ETS, DCBX automatically negotiates administrative state and configuration with each interface's connected peer. To enable DCBX negotiation for applications, you must configure the applications, map them to IEEE 802.1p code points in an application map, and apply the application map to interfaces.

The FCoE application only needs to be included in an application map when you want an interface to exchange type, length, and values (TLVs) for other applications in addition to FCoE. If FCoE is the only application you want an interface to advertise, then you do not need to use an application map. For ETS, DCBX pushes the switch configuration to peers if they are set to learn the configuration from the switch (unless you disable sending the ETS recommendation TLV on interfaces in IEEE DCBX mode).

You can override the default behavior for PFC, for ETS, or for all applications mapped to an interface by turning off autonegotiation to force an interface to enable or disable that feature. You can also disable DCBX autonegotiation for applications on an interface by excluding those applications from the application map you apply to that interface or by deleting the application map from the interface.

The default autonegotiation behavior for applications that are mapped to an interface is:

- DCBX is enabled on the interface if the connected peer device also supports DCBX.
- DCBX is disabled on the interface if the connected peer device does not support DCBX.

During negotiation of capabilities, the switch can push the PFC configuration to an attached peer if the peer is configured as “willing” to learn the PFC configuration from other peers. The Juniper Networks switch does not support self autoprovisioning and does not change its configuration during autonegotiation to match the peer configuration. (The Juniper switch is not “willing” to learn the PFC configuration from peers.)

**NOTE:** When a port with DCBX enabled begins to exchange type, length, and value (TLV) entries, optional LLDP TLVs on that port are not advertised to neighbors, so that the switch can interoperate with a wider variety of converged network adapters (CNAs) and Layer 2 switches that support DCBX.

## DCBX Modes and Support

This section describes DCBX support:

- [DCBX Modes \(Versions\) on page 5581](#)
- [Autonegotiation on page 5583](#)
- [CNA Support for DCBX Modes on page 5584](#)
- [Interface Support for DCBX on page 5584](#)

### ***DCBX Modes (Versions)***

The two most common DCBX modes are supported:

- IEEE DCBX—The newest DCBX version. Different TLVs have different subtypes (for example, the subtype for the ETS configuration TLV is 9); the IEEE DCBX Organizationally Unique Identifier (OUI) is 0x0080c2.
- DCBX version 1.01—The Converged Enhanced Ethernet (CEE) version of DCBX. It has a subtype of 2 and an OUI of 0x001b21.

IEEE DCBX and DCBX version 1.01 differ mainly in frame format. DCBX version 1.01 uses one TLV that includes all DCBX attribute information, which is sent as sub-TLVs. IEEE DCBX uses a unique TLV for each DCB attribute.

**NOTE:** The switch does not support pre-CEE (pre-DCB) DCBX versions. Unsupported older versions of DCBX have a subtype of 1 and an OUI of 0x001b21. The switch drops LLDP frames that contain pre-CEE DCBX TLVs.

Table 454 on page 5582 summarizes the differences between IEEE DCBX and DCBX version 1.01, including show command output:

**Table 454: Summary of Differences Between IEEE DCBX and DCBX Version 1.01**

| Characteristic   | IEEE DCBX  | DCBX Version 1.01  |
|--|--|--|
| OUI  | 0x0080c2   | 0x001b21   |
| Frame Format   | Sends a separate, unique TLV for each DCBX attribute. For example, IEEE DCBX uses separate TLVs for ETS, PFC, and each application. Configuration and Recommendation information is sent in different TLVs   | Sends one TLV that includes all DCBX attribute information organized in sub-TLVs. The “willing” bit determines whether or not an interface can change its configuration to match the connected peer.   |
| Symmetric/asymmetric configuration with peer                                     | Asymmetric or symmetric  | Symmetric only   |
| Differences in the <b>show dcbx interface interface-name</b> operational command | <ul style="list-style-type: none"> <li>• Synchronization information is not shown because symmetric configuration is not required.</li> <li>• Operational state information is not shown because the operational states do not have to be symmetric.</li> <li>• TLV type is shown because unique TLVs are sent for each DCBX attribute.</li> <li>• ETS peer Configuration TLV and Recommendation TLV information is shown separately because they are different TLVs.</li> </ul> | <ul style="list-style-type: none"> <li>• Synchronization information is shown because symmetric configuration is required.</li> <li>• Operational state information is shown because the operational states do have to be symmetric.</li> <li>• TLV type is not shown because one TLV is used for all attribute information.</li> <li>• Recommendation TLV is not sent (DCBX Version 1.01 uses the “willing” bit to determine whether or not an interface uses the peer interface configuration).</li> </ul> |

For more information about how each DCBX mode exchanges TLVs, see the following specifications:

- For DCBX version 1.01—  
<http://www.ieee802.org/1/files/public/docs2008/az-wadkar-dcbx-capability-exchange-discovery-protocol-1108-v1.01.pdf>
- For IEEE DCBX—<http://www.ieee802.org/1/files/private/az-drafts/d2/802-1az-d2-4.pdf>

**NOTE:** As of Junos OS Release 12.2, this document is located in a private area of the IEEE website, and access requires a password from the IEEE organization. If you are not an IEEE member, you might not be able to access this document until it moves to the public area of the IEEE website.

You can configure interfaces to use the following DCBX modes:

- IEEE DCBX—The interface uses IEEE DCBX regardless of the configuration on the connected peer.
- DCBX version 1.01—The interface uses DCBX version 1.01 regardless of the configuration on the connected peer.
- Autonegotiation—The interface automatically negotiates with the connected peer to determine the DCBX version the peers use. Autonegotiation is the default DCBX mode.

If you configure a DCBX mode on an interface, the interface ignores DCBX protocol data units (PDUs) it receives from the connected peer if the PDUs do not match the DCBX version configured on the interface. For example, if you configure an interface to use IEEE DCBX and the connected peer sends DCBX version 1.01 LLDP PDUs, the interface ignores the version 1.01 PDUs. If you configure an interface to use DCBX version 1.01 and the peer sends IEEE DCBX LLDP PDUs, the interface ignores the IEEE DCBX PDUs.

**NOTE:** On interfaces that use the IEEE DCBX mode, the `show dcbx neighbors interface interface-name` operational command does not include application, PFC, or ETS operational state in the output.

### ***Autonegotiation***

Autonegotiation is the default DCBX mode. Each interface automatically negotiates with its connected peer to determine the DCBX version that both interfaces use to exchange DCBX information.

When an interface connects to its peer interface, the interface advertises IEEE DCBX TLVs to the peer. If the interface receives one IEEE DCBX PDU from the peer, the interface sets the DCBX mode as IEEE DCBX. If the interface receives three DCBX version 1.01 TLVs from the peer, the interface sets DCBX version 1.01 as the DCBX mode.

Autonegotiation works slightly differently on standalone switches compared to QFabric systems:

- Standalone switches—When an interface connects to its peer interface, the interface advertises IEEE DCBX TLVs to the peer. If the interface receives an IEEE DCBX TLV from the peer, the interface sets IEEE DCBX as the DCBX mode. If the interface receives three consecutive DCBX version 1.01 TLVs from the peer, the interface sets DCBX version 1.01 as the DCBX mode.
- QFabric system—When an interface connects to its peer interface, the interface advertises DCBX version 1.01 TLVs to the peer. If the interface receives an IEEE DCBX TLVs from the peer, the interface sets IEEE DCBX as the DCBX mode. If the interface receives three consecutive DCBX version 1.01 TLVs from the peer, the interface retains DCBX version 1.01 as the DCBX mode.

**NOTE:** If the link flaps or the LLDP process restarts, the interface starts the autonegotiation process again. The interface does not use the last received DCBX communication mode.

---

### ***CNA Support for DCBX Modes***

Different CNA vendors support different versions and capabilities of DCBX. The DCBX configuration you use on switch interfaces depends on the DCBX features that the CNAs in your network support.

### ***Interface Support for DCBX***

You can configure DCBX on 10-Gigabit Ethernet interfaces and on link aggregation group (LAG) interfaces whose member interfaces are all 10-Gigabit Ethernet interfaces.

---

### **DCBX Attribute Types**

DCBX has three attribute types:

- Informational—These attributes are exchanged using LLDP, but do not affect DCBX state or operation; they only communicate information to the peer. For example, application priority TLVs are informational TLVs.
- Asymmetric—The values for these types of attributes do not have to be the same on the connected peer interfaces. Peers exchange asymmetric attributes when the attribute values can differ on each peer interface. The peer interface configurations might match or they might differ. For example, ETS Configuration and Recommendation TLVs are asymmetric TLVs.
- Symmetric—The intention is that the values for these types of attributes should be the same on both of the connected peer interfaces. Peer interfaces exchange symmetric attributes to ensure symmetric DCBX configuration for those attributes. For example, PFC Configuration TLVs are symmetric TLVs.

The following sections describe asymmetric and symmetric DCBX attributes:

- [Asymmetric Attributes on page 5585](#)
- [Symmetric Attributes on page 5585](#)

### ***Asymmetric Attributes***

DCBX passes asymmetric attributes between connected peer interfaces to communicate parameter information about those attributes (features). The resulting configuration for an attribute might be different on each peer, so the parameters configured on one interface might not match the parameters on the connected peer interface.

There are two types of asymmetric attribute TLVs:

- **Configuration TLV**—Configuration TLVs communicate the current operational state and the state of the “willing” bit. The “willing” bit communicates whether or not the interface is willing to accept and use the configuration from the peer interface. If an interface is “willing,” the interface uses the configuration it receives from the peer interface. (The peer interface configuration can override the configuration on the “willing” interface.) If an interface is “not willing,” the configuration on the interface cannot be overridden by the peer interface configuration.
- **Recommendation TLV**—Recommendation TLVs communicate the parameters the interface recommends that the connected peer interface should use. When an interface sends a Recommendation TLV, if the connected peer is “willing,” the connected peer changes its configuration to match the parameters in the Recommendation TLV.

### ***Symmetric Attributes***

DCBX passes symmetric attributes between connected peer interfaces to communicate parameter information about those attributes (features), with the objective that both interfaces should use the same configuration. The intent is that the parameters configured on one interface should match the parameters on the connected peer interface.

There is one type of symmetric attribute TLV, the Configuration TLV. As with asymmetric attributes, symmetric attribute Configuration TLVs communicate the current operational state and the state of the “willing” bit. “Willing” interfaces use the peer interface parameter values for the attribute. (The attribute configuration of the peer overrides the configuration on the “willing” interface.)

### ***DCBX Application Protocol TLV Exchange***

DCBX advertises the switch’s capabilities for Layer 2 applications such as FCoE and Layer 4 applications such as iSCSI:

- [Application Protocol TLV Exchange on page 5585](#)
- [FCoE Application Protocol TLV Exchange on page 5586](#)
- [Disabling Application Protocol TLV Exchange on page 5586](#)

### ***Application Protocol TLV Exchange***

For all applications, DCBX advertises the application’s state and IEEE 802.1p code points on the interfaces to which the application is mapped. If an application is not mapped to an interface, that interface does not advertise the application’s TLVs. There is an exception for FCoE application protocol TLV exchange when FCoE is the only application you want DCBX to advertise on an interface.

### ***FCoE Application Protocol TLV Exchange***

Protocol TLV exchange for the FCoE application depends on whether FCoE is the only application you want the interface to advertise or whether you want the interface to exchange other application TLVs in addition to FCoE TLVs.

If FCoE is the only application you want DCBX to advertise on an interface, DCBX exchanges FCoE application protocol TLVs by default if the interface:

- Carries FCoE traffic (traffic mapped by CoS configuration to the FCoE forwarding class)
- Has a congestion notification profile with PFC enabled on the FCoE priority (IEEE 802.1p code point)
- Does *not* have an application map

**NOTE:** If no CoS configuration for FCoE is mapped to an interface, that interface does not exchange FCoE application protocol TLVs.

---

If you want DCBX to advertise FCoE and other applications on an interface, you must specify all of the applications, including FCoE, in an application map, and apply the application map to the desired interfaces.

---

**NOTE:** If an application map is applied to an interface, the FCoE application must be explicitly configured in the application map, or the interface does not exchange FCoE TLVs.

---

When DCBX advertises the FCoE application, it advertises the FCoE state and IEEE 802.1p code points. If a peer device connected to a switch interface does not support FCoE, DCBX uses autonegotiation to mark the interface as “FCoE down,” and FCoE is disabled on that interface.

### ***Disabling Application Protocol TLV Exchange***

To disable DCBX application protocol exchange for all applications on an interface, issue the **set protocols dcbx interface *interface-name* applications no-auto-negotiation** command.

You can also disable DCBX application protocol exchange for applications on an interface by deleting the application map from the interface, or by deleting a particular application from the application map. However, when you delete an application from an application map, the application protocol is no longer exchanged on any interface which uses that application map.

### ***DCBX and PFC***

---

After you enable PFC on a switch interface, DCBX uses autonegotiation to control the operational state of the PFC functionality.

If the peer device connected to the interface supports PFC and is provisioned compatibly with the switch, DCBX sets the PFC operational state to enabled. If the peer device

connected to the interface does not support PFC or is not provisioned compatibly with the switch, DCBX sets the operational state to disabled. (PFC must be symmetrical.)

If the peer advertises that it is “willing” to learn its PFC configuration from the switch, DCBX pushes the switch’s PFC configuration to the peer and does not check the peer’s administrative state.

You can manually override DCBX control of the PFC operational state on a per-interface basis by disabling autonegotiation. If you disable autonegotiation on an interface on which you have configured PFC, then PFC is enabled on that interface regardless of the peer configuration. To disable PFC on an interface, do not configure PFC on that interface.

### DCBX and ETS

---

This section describes:

- [Default DCBX ETS Advertisement on page 5587](#)
- [ETS Advertisement and Peer Configuration on page 5587](#)
- [ETS Recommendation TLV on page 5588](#)

#### ***Default DCBX ETS Advertisement***

If you do not configure ETS on an interface, the switch automatically creates a default priority group that contains all of the priorities (forwarding classes, which represent output queues) and assigns 100 percent of the port output bandwidth to that priority group. The default priority group is transparent. It does not appear in the configuration and is used for DCBX advertisement. DCBX advertises the default priority group, its priorities, and the assigned bandwidth.

If you configure ETS on an interface, DCBX advertises:

- Each priority group on the interface
- The priorities in each priority group
- The bandwidth properties of each priority group and priority

Any priority on that interface that is not part of an explicitly configured priority group (forwarding class set) is assigned to the automatically generated default priority group and receives no bandwidth. If you configure ETS on an interface, every forwarding class (priority) on that interface for which you want to forward traffic must belong to a forwarding class set (priority group).

#### ***ETS Advertisement and Peer Configuration***

DCBX does not control the switch’s ETS (hierarchical scheduling) operational state. If the connected peer is configured as “willing,” DCBX pushes the switch’s ETS configuration to the switch’s peers if the ETS Recommendation TLV is enabled (it is enabled by default). If the peer does not support ETS or is not consistently provisioned with the switch, DCBX does not change the ETS operational state on the switch. The ETS operational state remains enabled or disabled based only on the switch hierarchical scheduling configuration and is enabled by default.

When ETS is configured, DCBX advertises the priority groups, the priorities in the priority groups, and the bandwidth configuration for the priority groups and priorities. Any priority (essentially a forwarding class or queue) that is not part of a priority group has no scheduling properties and receives no bandwidth.

You can manually override whether DCBX advertises the ETS state to the peer on a per-interface basis by disabling autonegotiation. This does not affect the ETS state on the switch or on the peer, but it does prevent the switch from sending the Recommendation TLV or the Configuration TLV to the connected peer. To disable ETS on an interface, do not configure priority groups (forwarding class sets) on the interface.

### ***ETS Recommendation TLV***

The ETS Recommendation TLV communicates the ETS settings that the switch wants the connected peer interface to use. If the peer interface is “willing,” it changes its configuration to match the configuration in the ETS Recommendation TLV. By default, the switch interfaces send the ETS Recommendation TLV to the peer. The settings communicated are the egress ETS settings defined by configuring hierarchical scheduling on the interface.

We recommend that you use the same ETS settings on the connected peer that you use on the switch interface and that you leave the ETS Recommendation TLV enabled. However, on interfaces that use IEEE DCBX as the DCBX mode, if you want an asymmetric configuration between the switch interface and the connected peer, you can disable the ETS Recommendation TLV by including the **no-recommendation-tlv** statement at the **[edit protocols dcbx interface *interface-name* enhanced-transmission-selection]** hierarchy level.

**NOTE:** You can disable the ETS Recommendation TLV only when the DCBX mode on the interface is IEEE DCBX. Disabling the ETS Recommendation TLV has no effect if the DCBX mode on the interface is DCBX version 1.01. (IEEE DCBX uses separate application attribute TLVs, but DCBX version 1.01 sends all application attributes in the same TLV and uses sub-TLVs to separate the information.)

---

If you disable the ETS Recommendation TLV, the switch still sends the ETS Configuration TLV to the connected peer. The result is that the connected peer is informed about the switch DCBX ETS configuration, but even if the peer is “willing,” the peer does not change its configuration to match the switch configuration. This is asymmetric configuration—the two interfaces can have different parameter values for the ETS attribute.

For example, if you want a CNA connected to a switch interface to have different bandwidth allocations than the switch ETS configuration, you can disable the ETS Recommendation TLV and configure the CNA for the desired bandwidth. The switch interface and the CNA exchange configuration parameters, but the CNA does not change its configuration to match the switch interface configuration.

## Understanding DCBX Application Protocol TLV Exchange

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of connected peers. DCBX also advertises the capabilities of applications on interfaces by exchanging application protocol information through application type, length, and value (TLV) elements. DCBX is an extension of Link Layer Discovery Protocol (LLDP). LLDP must remain enabled on every interface on which you want to use DCBX.

**NOTE:** LLDP and DCBX are enabled by default on all interfaces.

Setting up application protocol exchange consists of:

- Defining applications
- Mapping the applications to IEEE 802.1p code points in an *application map*
- Configuring classifiers to prioritize incoming traffic and map the incoming traffic to the application by the traffic code points
- Applying the application maps and classifiers to interfaces

You need to explicitly define the applications that you want an interface to advertise. The FCoE application is a special case (see [“Applications” on page 5590](#)) and only needs to be defined on an interface if you want DCBX to exchange application protocol TLVs for other applications in addition to FCoE on that interface.

You also need to explicitly map all defined applications that you want an interface to advertise to IEEE 802.1p code points in an application map. The FCoE application is a special case (see [“Application Maps” on page 5590](#)) and only requires inclusion in an application map when you want an interface to use DCBX for other applications in addition to FCoE, as described later in this topic.

This topic describes:

- [Applications on page 5590](#)
- [Application Maps on page 5590](#)
- [Classifying and Prioritizing Application Traffic on page 5591](#)

- [Enabling Interfaces to Exchange Application Protocol Information on page 5592](#)
- [Disabling DCBX Application Protocol Exchange on page 5592](#)

## Applications

---

Before an interface can exchange application protocol information, you need to define the applications that you want to advertise, except FCoE if FCoE is the only application that you want the interface to advertise.

**NOTE:** If FCoE is the only application that you want DCBX to advertise on an interface, DCBX exchanges FCoE application protocol TLVs by default if the interface:

- Carries FCoE traffic (traffic mapped by CoS configuration to the FCoE forwarding class and applied to the interface)
- Has a congestion notification profile with PFC enabled on the FCoE priority (IEEE 802.1p code point)
- Does *not* have an application map

If you apply an application map to an interface, then all applications that you want DCBX to advertise must be defined and configured in the application map, including the FCoE application.

If no CoS configuration for FCoE is mapped to an interface, that interface does not exchange FCoE application protocol TLVs.

---

You can define:

- Layer 2 applications by EtherType
- Layer 4 applications by a combination of protocol (TCP or UDP) and destination port number

The EtherType is a two-octet field in the Ethernet frame that denotes the protocol encapsulated in the frame. For a list of common EtherTypes, see <http://standards.ieee.org/develop/regauth/ethertype/eth.txt> on the IEEE standards organization website. For a list of port numbers and protocols, see the *Service Name and Transport Protocol Port Number Registry* at <http://www.iana.org/assignments/service-names-port-numbers/service-names-port-numbers.xml> on the Internet Assigned Numbers Authority (IANA) website.

You must explicitly define each application that you want to advertise, except FCoE. The FCoE application is defined by default (EtherType 0x8906).

## Application Maps

---

An application map maps defined applications to one or more IEEE 802.1p code points. Each application map contains one or more applications. DCBX includes the configured application code points in the protocol TLVs exchanged with the connected peer.

To exchange protocol TLVs for an application, you must include the application in an application map. The FCoE application is a special case:

- If you want DCBX to exchange application protocol TLVs for more than one application on a particular interface, you must configure the applications, define an application map to map the applications to code points, and apply the application map to the interface. In this case, you must also define the FCoE application and add it to the application map.

This is the same process and treatment required for all other applications. In addition, for DCBX to exchange FCoE application TLVs, you must enable priority-based flow control (PFC) on the FCoE priority (the FCoE IEEE 802.1p code point) on the interface.

- If FCoE is the only application that you want DCBX to advertise on an interface, then you do not need to configure an application map and apply it to the interface. By default, when an interface has no application map, and the interface carries traffic mapped to the FCoE forwarding class, and PFC is enabled on the FCoE priority, the interface advertises FCoE TLVs (autonegotiation mode). DCBX exchanges FCoE application protocol TLVs by default until you apply an application map to the interface, remove the FCoE traffic from the interface (you can do this by removing the or editing the classifier for FCoE traffic), or disable PFC on the FCoE priority.

If you apply an application map to an interface that did not have an application map and was exchanging FCoE application TLVs, and you do not include the FCoE application in the application map, the interface stops exchanging FCoE TLVs. Every interface that has an application map must have FCoE included in the application map (and PFC enabled on the FCoE priority) in order for DCBX to exchange FCoE TLVs.

Mapping an application to code points does two things:

- Maps incoming traffic with the same code points to that application
- Allows you to configure classifiers that map incoming application traffic, by code point, to a forwarding class and a loss priority, in order to apply class of service (CoS) to application traffic and prioritize application traffic

You apply an application map to an interface to enable DCBX application protocol exchange on that interface for each application specified in the application map. All of the applications that you want an interface to advertise must be configured in the application map that you apply to the interface, with the previously noted exception for the FCoE application when FCoE is the only application for which you want DCBX to exchange protocol TLVs on an interface.

### Classifying and Prioritizing Application Traffic

When traffic arrives at an interface, the interface classifies the incoming traffic based on its code points. Classifiers map code points to loss priorities and forwarding classes. The loss priority prioritizes the traffic. The forwarding class determines the traffic output queue and CoS service level.

When you map an application to an IEEE 802.1p code point in an application map and apply the application map to an interface, incoming traffic on the interface that matches the application code points is mapped to the appropriate application. The application

receives the loss priority and the CoS associated with the forwarding class for those code points, and is placed in the output queue associated with the forwarding class.

You can use the default classifier or you can configure a classifier to map the application code points defined in the application map to forwarding classes and loss priorities.

### Enabling Interfaces to Exchange Application Protocol Information

---

Each interface with the **fcoe** forwarding class and PFC enabled on the FCoE code point is enabled for FCoE application protocol exchange by default until you apply an application map to the interface. If you apply an application map to an interface and you want that interface to exchange FCoE application protocol TLVs, you must include the FCoE application in the application map. (In all cases, to achieve lossless transport, you must also enable PFC on the FCoE code point or code points.)

Except when FCoE is the only protocol you want DCBX to advertise on an interface, interfaces on which you want to exchange application protocol TLVs must include the following two items:

- The application map that contains the application(s)
- A classifier

**NOTE:** You must also enable PFC on the code point of any traffic for which you want to achieve lossless transport.

---

### Disabling DCBX Application Protocol Exchange

---

To disable DCBX application protocol exchange for all applications on an interface, issue the **set protocols dcbx interface *interface-name* applications no-auto-negotiation** command.

You can also disable DCBX application protocol exchange for applications on an interface by deleting the application map from the interface, or by deleting a particular application from the application map. However, when you delete an application from an application map, the application protocol is no longer exchanged on any interface which uses that application map.

On interfaces that use IEEE DCBX mode to exchange DCBX parameters, you can disable sending the enhanced transmission selection (ETS) Recommendation TLV to the peer if you want an asymmetric ETS configuration between the peers.

### Example: Configuring DCBX Application Protocol TLV Exchange

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of connected peers by exchanging application configuration information. DCBX detects feature misconfiguration and mismatches and can configure DCB on peers. DCBX is an extension of the Link Layer Discovery Protocol (LLDP). LLDP must remain enabled on every interface on which you want to use DCBX.

**NOTE:** LLDP and DCBX are enabled by default on all interfaces.

The switch supports DCBX application protocol exchange for Layer 2 and Layer 4 applications such as the Internet Small Computer System Interface (iSCSI). You specify applications by EtherType (for Layer 2 applications) or by the destination port and protocol (for Layer 4 applications; the protocol can be either TCP or UDP).

The switch handles Fibre Channel over Ethernet (FCoE) application protocol exchange differently than other protocols in some cases:

- If FCoE is the only application for which you want to enable DCBX application protocol TLV exchange on an interface, you do not have to explicitly configure the FCoE application or an application map. By default, the switch exchanges FCoE application protocol TLVs on all interfaces that carry FCoE traffic (traffic mapped to the **fcoe** forwarding class) and have priority-based flow control (PFC) enabled on the FCoE

priority (the FCoE IEEE 802.1p code point). The default priority mapping for the FCoE application is IEEE 802.1p code point 011 (the default **fcoe** forwarding class code point).

- If you want an interface to use DCBX to exchange application protocol TLVs for any other applications in addition to FCoE, you must configure the applications (including FCoE), define an application map (including FCoE), and apply the application map to the interface. If you apply an application map to an interface, you must explicitly configure the FCoE application, or the interface does not exchange FCoE application protocol TLVs.

This example shows how to configure interfaces to exchange both Layer 2 and Layer 4 applications by configuring one interface to exchange iSCSI and FCoE application protocol information and configuring another interface to exchange iSCSI and Precision Time Protocol (PTP) application protocol information.

- [Requirements on page 5596](#)
- [Overview on page 5596](#)
- [Configuration on page 5600](#)
- [Verification on page 5601](#)

## Requirements

---

This example uses the following hardware and software components:

- Juniper Networks QFX Series device
- Junos OS Release 12.1 or later for the QFX Series

## Overview

---

The switch supports DCBX application protocol exchange for:

- Layer 2 applications, defined by EtherType
- Layer 4 applications, defined by destination port and protocol

**NOTE:** DCBX also advertises PFC and enhanced transmission selection (ETS) information. See [“Configuring DCBX Autonegotiation” on page 5669](#) for how DCBX negotiates and advertises configuration information for these features and for the applications.

DCBX is configured on a per-interface basis for each supported feature or application. For applications that you want to enable for DCBX application protocol exchange, you must:

- Define the application name and configure the EtherType or the destination port and protocol (TCP or UDP) of the application. Use the EtherType for Layer 2 applications, and use the destination port and protocol for Layer 4 protocols.
- Map the application to an IEEE 802.1p code point in an application map.

- Add the application map to DCBX interface.

In addition, for all applications (including FCoE, even when you do not use an application map), you either must create an IEEE 802.1p classifier and apply it to the appropriate ingress interfaces or use the default classifier. A classifier maps the code points of incoming traffic to a forwarding class and a loss priority so that ingress traffic is assigned to the correct class of service (CoS). The forwarding class determines the output queue on the egress interface.

If you do not create classifiers, trunk and tagged-access ports use the unicast IEEE 802.1 default trusted classifier. [Table 455 on page 5597](#) shows the default mapping of IEEE 802.1 code-point values to unicast forwarding classes and loss priorities for ports in trunk mode or tagged-access mode. [Table 456 on page 5597](#) shows the default untrusted classifier IEEE 802.1 code-point values to unicast forwarding class mapping for ports in access mode.

**Table 455: Default IEEE 802.1 Classifiers for Trunk Ports and Tagged-Access Ports (Default Trusted Classifier)**

| Code Point | Forwarding Class | Loss Priority |
|------------|------------------|---------------|
| be (000)   | best-effort      | low           |
| be1 (001)  | best-effort      | low           |
| ef (010)   | best-effort      | low           |
| ef1 (011)  | fcoe             | low           |
| af11 (100) | no-loss          | low           |
| af12 (101) | best-effort      | low           |
| nc1 (110)  | network-control  | low           |
| nc2 (111)  | network-control  | low           |

**Table 456: Default IEEE 802.1 Unicast Classifiers for Access Ports (Default Untrusted Classifier)**

| Code Point | Forwarding Class | Loss Priority |
|------------|------------------|---------------|
| 000        | best-effort      | low           |
| 001        | best-effort      | low           |
| 010        | best-effort      | low           |
| 011        | best-effort      | low           |
| 100        | best-effort      | low           |

**Table 456: Default IEEE 802.1 Unicast Classifiers for Access Ports (Default Untrusted Classifier) (continued)**

| Code Point | Forwarding Class | Loss Priority |
|------------|------------------|---------------|
| 101        | best-effort      | low           |
| 110        | best-effort      | low           |
| 111        | best-effort      | low           |

**Topology**

This example shows how to configure DCBX application protocol exchange for three protocols (iSCSI, PTP, and FCoE) on two interfaces. One interface exchanges iSCSI and FCoE application protocol information, and the other interface exchanges iSCSI and PTP application protocol information.

**NOTE:** You must map FCoE traffic to the interfaces on which you want to forward FCoE traffic. You must also enable PFC on the FCoE interfaces and create an ingress classifier for FCoE traffic, or else use the default classifier.

Table 457 on page 5598 shows the configuration components for this example.

**Table 457: Components of DCBX Application Protocol Exchange Configuration Topology**

| Component                   | Settings   |
|-----------------------------|--|
| Hardware                    | QFX Series device  |
| LLDP                        | Enabled by default on Ethernet interfaces  |

**NOTE:** This example does not include scheduling (bandwidth allocation) configuration or lossless configuration for the iSCSI forwarding class.

## Configuration

### CLI Quick Configuration

To quickly configure DCBX application protocol exchange, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set applications application iSCSI protocol tcp destination-port 3260
set applications application FCoE ether-type 0x8906
set applications application PTP ether-type 0x88F7
set policy-options application-maps dcbx-iscsi-fcoe-app-map application iSCSI code-points 111
set policy-options application-maps dcbx-iscsi-fcoe-app-map application FCoE code-points 011
set policy-options application-maps dcbx-iscsi-ptp-app-map application iSCSI code-points 111
set policy-options application-maps dcbx-iscsi-ptp-app-map application PTP code-points [001 101]
set protocols dcbx interface xe-0/0/10 application-map dcbx-iscsi-fcoe-app-map
set protocols dcbx interface xe-0/0/11 application-map dcbx-iscsi-ptp-app-map
set class-of-service congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
set class-of-service interfaces xe-0/0/10 congestion-notification-profile fcoe-cnp
set class-of-service classifiers ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class fcoe
loss-priority high code-points 011
set class-of-service classifiers ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class
network-control loss-priority high code-points 111
set class-of-service classifiers ieee-802.1 iscsi-ptp-cl2 import default forwarding-class
network-control loss-priority low code-points 111
set class-of-service classifiers ieee-802.1 iscsi-ptp-cl2 import default forwarding-class best-effort
loss-priority low code-points [001 101]
set class-of-service interfaces xe-0/0/10 unit 0 classifiers ieee-802.1 fcoe-iscsi-cl1
set class-of-service interfaces xe-0/0/11 unit 0 classifiers ieee-802.1 iscsi-ptp-cl2
```

### Configuring DCBX Application Protocol TLV Exchange

### Step-by-Step Procedure

To define the applications, map the applications to IEEE 802.1p code points, apply the applications to interfaces, and create classifiers for DCBX application protocol exchange:

1. Define the iSCSI application by specifying its protocol and destination port, and define the FCoE and PTP applications by specifying their EtherTypes.  
  

```
[edit applications]
user@switch# set application iSCSI protocol tcp destination-port 3260
user@switch# set application FCoE ether-type 0x8906
user@switch# set application PTP ether-type 0x88F7
```
2. Define an application map that maps the iSCSI and FCoE applications to IEEE 802.1p code points.  
  

```
[edit policy-options]
user@switch# set application-maps dcbx-iscsi-fcoe-app-map application iSCSI code-points 111
user@switch# set application-maps dcbx-iscsi-fcoe-app-map application FCoE code-points 011
```
3. Define the application map that maps the iSCSI and PTP applications to IEEE 802.1p code points.  
  

```
[edit policy-options]
user@switch# set application-maps dcbx-iscsi-ptp-app-map application iSCSI code-points 111
user@switch# set application-maps dcbx-iscsi-ptp-app-map application PTP code-points [001 101]
```

4. Apply the iSCSI and FCoE application map to interface **xe-0/0/10**, and apply the iSCSI and PTP application map to interface **xe-0/0/11**.

```
[edit protocols dcbx]
user@switch# set interface xe-0/0/10 application-map dcbx-iscsi-fcoe-app-map
user@switch# set interface xe-0/0/11 application-map dcbx-iscsi-ntp-app-map
```

5. Create the congestion notification profile to enable PFC on the FCoE code point (**011**), and apply the congestion notification profile to interface **xe-0/0/10**.

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
011 pfc
user@switch# set interfaces xe-0/0/10 congestion-notification-profile fcoe-cnp
```

6. Configure the classifier to apply to the interface that exchanges iSCSI and FCoE application information.

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class fcoe loss-priority
high code-points 011
user@switch# set ieee-802.1 fcoe-iscsi-cl1 import default forwarding-class network-control
loss-priority high code-points 111
```

7. Configure the classifier to apply to the interface that exchanges iSCSI and PTP application information.

```
[edit class-of-service classifiers]
user@switch# set ieee-802.1 iscsi-ntp-cl2 import default forwarding-class network-control
loss-priority low code-points 111
user@switch# set ieee-802.1 iscsi-ntp-cl2 import default forwarding-class best-effort
loss-priority low code-points [001 101]
```

8. Apply the classifiers to the appropriate interfaces.

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/10 unit 0 classifiers ieee-802.1 fcoe-iscsi-cl1
user@switch# set interfaces xe-0/0/11 unit 0 classifiers ieee-802.1 iscsi-ntp-cl2
```

## Verification

To verify that DCBX application protocol exchange configuration has been created and is operating properly, perform these tasks:

- [Verifying the Application Configuration on page 5601](#)
- [Verifying the Application Map Configuration on page 5602](#)
- [Verifying DCBX Application Protocol Exchange Interface Configuration on page 5602](#)
- [Verifying the PFC Configuration on page 5603](#)
- [Verifying the Classifier Configuration on page 5604](#)

### Verifying the Application Configuration

**Purpose** Verify that DCBX applications have been configured.

**Action** List the applications by using the configuration mode command **show applications**:

```
user@switch# show applications
```

```
application iSCSI {
  protocol tcp;
  destination-port 3260;
}

application fcoe {
  ether-type 0x8906;
}

application ptp {
  ether-type 0x88F7;
}
```

**Meaning** The **show applications** configuration mode command lists all of the configured applications and either their protocol and destination port (Layer 4 applications) or their EtherType (Layer 2 applications). The command output shows that the iSCSI application is configured with the **tcp** protocol and destination port **3260**, the FCoE application is configured with the EtherType **0x8906**, and that the PTP application is configured with the EtherType **0x88F7**.

#### *Verifying the Application Map Configuration*

**Purpose** Verify that the application maps have been configured.

**Action** List the application maps by using the configuration mode command **show policy-options application-maps**:

```
user@switch# show policy-options application-maps
dcbx-iscsi-fcoe-app-map {
  application iSCSI code-points 111;
  application FCoE code-points 011;
}

dcbx-iscsi-ptp-app-map {
  application iSCSI code-points 111;
  application PTP code-points [001 101];
}
```

**Meaning** The **show policy-options application-maps** configuration mode command lists all of the configured application maps and the applications that belong to each application map. The command output shows that there are two application maps, **dcbx-iscsi-fcoe-app-map** and **dcbx-iscsi-ptp-app-map**.

The application map **dcbx-iscsi-fcoe-app-map** consists of the iSCSI application, which is mapped to IEEE 802.1p code point **111**, and the FCoE application, which is mapped to IEEE 802.1p code point **011**.

The application map **dcbx-iscsi-ptp-app-map** consists of the iSCSI application, which is mapped to IEEE 802.1p code point **111**, and the PTP application, which is mapped to IEEE 802.1p code points **001** and **101**.

#### *Verifying DCBX Application Protocol Exchange Interface Configuration*

**Purpose** Verify that the application maps have been applied to the correct interfaces.

**Action** List the application maps by using the configuration mode command **show protocols dcbx**:

```
user@switch# show protocols dcbx
interface xe-0/0/10.0 {
    application-map dcbx-iscsi-fcoe-app-map;
}

interface xe-0/0/11.0 {
    application-map dcbx-iscsi-ptp-app-map;
}
```

**Meaning** The **show protocols dcbx** configuration mode command lists whether the interfaces are enabled for DCBX and lists the application map applied to each interface. The command output shows that interfaces **xe-0/0/10.0** and **xe-0/0/11.0** are enabled for DCBX, and that interface **xe-0/0/10.0** uses application map **dcbx-iscsi-fcoe-app-map**, and interface **xe-0/0/11.0** uses application map **dcbx-iscsi-ptp-app-map**.

### *Verifying the PFC Configuration*

**Purpose** Verify that PFC has been enabled on the FCoE code point and applied to the correct interface.

**Action** Display the PFC configuration to verify that PFC is enabled on the FCoE code point (011) in the congestion notification profile **fcoe-cnp** by using the configuration mode command **show class-of-service congestion-notification-profile**:

```
user@switch# show class-of-service congestion-notification-profile
fcoe-cnp {
    input {
        ieee-802.1 {
            code-point 011 {
                pfc;
            }
        }
    }
}
```

Display the class-of-service (CoS) interface information to verify that the correct interface has PFC enabled for the FCoE application by using the configuration mode command **show class-of-service interfaces**:

```
user@switch# show class-of-service interfaces
xe-0/0/10 {
    congestion-notification-profile fcoe-cnp;
}
```

**NOTE:** The sample output does not include all of the information this command can show. The output is abbreviated to focus on verifying the PFC configuration.

**Meaning** The **show class-of-service congestion-notification-profile** configuration mode command lists the configured congestion notification profiles. The command output shows that the congestion notification profile **fcoe-cnp** has been configured and has enabled PFC on the IEEE 802.1p code point **011** (the default FCoE code point).

The **show class-of-service interfaces** configuration mode command shows the interface CoS configuration. The command output shows that the congestion notification profile **fcoe-cnp**, which enables PFC on the FCoE code point, is applied to interface **xe-0/0/10**.

### *Verifying the Classifier Configuration*

**Purpose** Verify that the classifiers have been configured and applied to the correct interfaces.

**Action** Display the classifier configuration by using the configuration mode command **show class-of-service**:

```
user@switch# show class-of-service
classifiers {
  ieee-802.1 fcoe-iscsi-cl1 {
    import default;
    forwarding-class network-control {
      loss-priority high code-points 111;
    }
    forwarding-class fcoe {
      loss-priority high code-points 011;
    }
  }
  ieee-802.1 iscsi-ptp-cl2 {
    import default;
    forwarding-class network-control {
      loss-priority low code-points 111;
    }
    forwarding-class best-effort {
      loss-priority low code-points [ 001 101 ];
    }
  }
}
interfaces {
  xe-0/0/10 {
    congestion-notification-profile fcoe-cnp;
    unit 0 {
      classifiers {
        ieee-802.1 fcoe-iscsi-cl1;
      }
    }
  }
  xe-0/0/11 {
    unit 0 {
      classifiers {
        ieee-802.1 iscsi-ptp-cl2;
      }
    }
  }
}
```

**NOTE:** The sample output does not include all of the information this command can show. The output is abbreviated to focus on verifying the classifier configuration.

**Meaning** The **show class-of-service** configuration mode command lists the classifier and CoS interface configuration, as well as other information not shown in this example. The command output shows that there are two classifiers configured, **fcoe-iscsi-cl1** and **iscsi-ptp-cl2**.

Classifier **fcoe-iscsi-cl1** uses the **default** classifier as a template and edits the template as follows:

- The forwarding class **network-control** is set to a loss priority of **high** and is mapped to code point **111** (the code point mapped to the iSCSI application).
- The forwarding class **fcoe** is set to a loss priority of **high** and is mapped to code point **011** (the code point mapped by default to the FCoE application).

Classifier **iscsi-ptp-cl2** uses the **default** classifier as a template and edits the template as follows:

- The forwarding class **network-control** is set to a loss priority of **low** and is mapped to IEEE 802.1p code point **111** (the code point mapped to the iSCSI application).
- The forwarding class **best-effort** is set to a loss priority of **low** and is mapped to IEEE 802.1p code points **001** and **101** (the code points mapped by default to the PTP application).

The command output also shows that classifier **fcoe-iscsi-cl1** is mapped to interface **xe-0/0/10.0** and that classifier **iscsi-ptp-cl2** is mapped to interface **xe-0/0/11.0**.

## Example: Configuring CoS PFC for FCoE Traffic

Priority-based flow control (PFC, described in IEEE 802.1Qbb) is a link-level flow control mechanism that you apply at ingress interfaces. PFC enables you to divide traffic on one physical link into eight priorities. You can think of the eight priorities as eight “lanes” of traffic that correspond to queues (forwarding classes). Each priority is mapped to a 3-bit IEEE 802.1p CoS flag in the VLAN header.

You can selectively apply PFC to the traffic in any queue without pausing the traffic in other queues on the same link. You must apply PFC to FCoE traffic to ensure lossless transport.

To configure PFC on FCoE traffic, use the default FCoE forwarding-class-to-queue mapping and:

- Configure a classifier that associates the FCoE forwarding class with FCoE traffic.
- Configure a congestion notification profile to apply PFC to the FCoE traffic.
- Apply the classifier and the PFC configuration to ingress interfaces.
- Configure the bandwidth scheduling for the FCoE forwarding class output queue.
- Create a forwarding class set (priority group) that includes the FCoE forwarding class; this is required to configure enhanced transmission selection (ETS) and support data center bridging (DCB).
- Configure the bandwidth scheduling for the FCoE priority group.
- Apply the scheduling to the egress interfaces.

.....  
**NOTE:** If you are using Junos OS Release 12.2 or later, use the default forwarding classes for the lossless fcoe forwarding class. If you explicitly configure default lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best-effort) traffic and does *not* receive lossless treatment.

In Junos OS Release 12.3 and later, you can include the *no-loss* packet drop attribute in explicit forwarding class configurations to configure a lossless forwarding class.

.....  
This example describes how to configure PFC for FCoE traffic:

- [Requirements on page 5607](#)
- [Overview on page 5607](#)
- [Configuration on page 5608](#)
- [Verification on page 5612](#)

## Requirements

This example uses the following hardware and software components:

- A Juniper Networks QFX3500 Switch
- Junos OS Release 11.1 or later for the QFX Series

## Overview

FCoE traffic requires PFC to ensure lossless packet transport. This example shows you how to:

- Assign FCoE traffic to the FCoE priority at the ingress.
- Create and apply CoS for the FCoE traffic using ETS (hierarchical port scheduling).
- Apply PFC to the FCoE traffic.
- Apply the configuration to ingress and egress interfaces.

**NOTE:** Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

Each interface in this example is configured as both an ingress interface and an egress interface, so the classifier, congestion notification profile, and port scheduling are applied to all of the interfaces.

## Topology

Table 458 on page 5607 shows the configuration components for this example.

**Table 458: Components of the PFC for FCoE Traffic Configuration Topology**

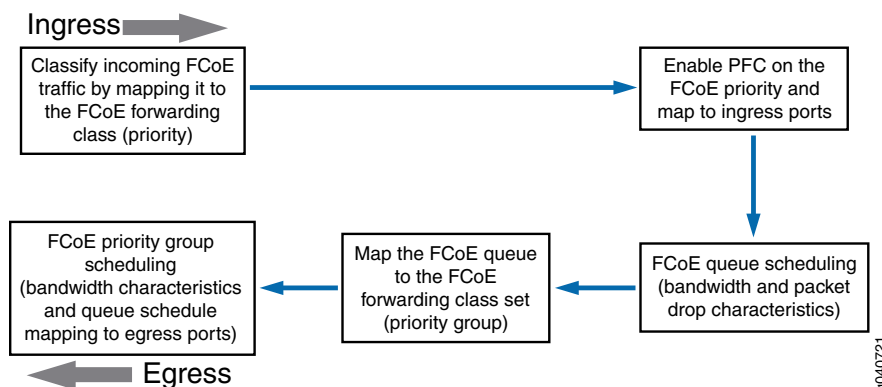

| Component   | Settings  |

Figure 195 on page 5608 shows a block diagram of the configuration components and the configuration flow of the CLI statements used in the example.

Figure 195: PFC for FCoE Traffic Configuration Components Block Diagram

### Configuration

#### CLI Quick Configuration

To quickly configure PFC for FCoE traffic, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level:

```

[edit class-of-service]
set classifiers ieee-802.1 fcoe-classifier forwarding-class fcoe loss-priority low code-points 011
set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
set interfaces xe-0/0/31 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/32 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/33 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/34 unit 0 classifiers ieee-802.1 fcoe-classifier
set interfaces xe-0/0/31 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/32 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/33 congestion-notification-profile fcoe-cnp
set interfaces xe-0/0/34 congestion-notification-profile fcoe-cnp
set schedulers fcoe-sched priority low transmit-rate 3g
set schedulers fcoe-sched shaping-rate percent 100

```

```

set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
set forwarding-class-sets fcoe-pg class fcoe
set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map guaranteed-rate 3g
set traffic-control-profiles fcoe-tcp shaping-rate percent 100
set interfaces xe-0/0/31 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/32 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/33 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
set interfaces xe-0/0/34 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp

```

### Step-by-Step Procedure

To configure the FCoE forwarding class (priority), ingress classifier, output queue scheduling, forwarding class set (priority group) and its output port scheduling, PFC application, and interfaces to set up PFC for FCoE traffic:

1. Configure a classifier to set the loss priority and IEEE 802.1 code point assigned to the FCoE forwarding class at the ingress:

```

[edit class-of-service]
user@switch# set classifiers ieee-802.1 fcoe-classifier forwarding-class fcoe loss-priority
low code-points 011

```

2. Configure PFC on the FCoE queue by applying FCoE to the IEEE 802.1 code point 011:

```

[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
011 pfc

```

3. Apply the PFC configuration to the ingress interfaces:

```

[edit class-of-service]
user@switch# set interfaces xe-0/0/31 congestion-notification-profile fcoe-cnp
user@switch# set interfaces xe-0/0/32 congestion-notification-profile fcoe-cnp
user@switch# set interfaces xe-0/0/33 congestion-notification-profile fcoe-cnp
user@switch# set interfaces xe-0/0/34 congestion-notification-profile fcoe-cnp

```

4. Assign the classifier to the ingress interfaces:

```

[edit class-of-service]
user@switch# set interfaces xe-0/0/31 unit 0 classifiers ieee-802.1 fcoe-classifier
user@switch# set interfaces xe-0/0/32 unit 0 classifiers ieee-802.1 fcoe-classifier
user@switch# set interfaces xe-0/0/33 unit 0 classifiers ieee-802.1 fcoe-classifier
user@switch# set interfaces xe-0/0/34 unit 0 classifiers ieee-802.1 fcoe-classifier

```

5. Configure output scheduling for the FCoE queue:

```

[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
user@switch# set schedulers fcoe-sched shaping-rate percent 100

```

6. Map the FCoE forwarding class to the FCoE scheduler:

```

[edit class-of-service]
user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched

```

7. Configure the forwarding class set for the FCoE traffic:

```

[edit class-of-service]
user@switch# set forwarding-class-sets fcoe-pg class fcoe

```

8. Define the traffic control profile for the FCoE forwarding class set:

```

[edit class-of-service]

```

```
user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
guaranteed-rate 3g
user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100
```

9. Apply the FCoE forwarding class set and traffic control profile to the egress ports:

```
[edit class-of-service]
user@switch# set interfaces xe-0/0/31 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/32 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/33 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set interfaces xe-0/0/34 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
```

### Results

Display the results of the configuration (the system shows only the explicitly configured parameters; it does not show default parameters such as the **fcoe** lossless forwarding class):

```
user@switch> show configuration class-of-service
```

```
classifiers {
  ieee-802.1 fcoe-classifier {
    forwarding-class fcoe {
      loss-priority low code-points 011;
    }
  }
}
traffic-control-profiles {
  fcoe-tcp {
    scheduler-map fcoe-map;
    shaping-rate percent 100;
    guaranteed-rate 3000000000;
  }
}
forwarding-class-sets {
  fcoe-pg {
    class fcoe;
  }
}
congestion-notification-profile {
  fcoe-cnp {
    input {
      ieee-802.1 {
        code-point 011 {
          pfc;
        }
      }
    }
  }
}
}
interfaces {
  xe-0/0/31 {
    congestion-notification-profile fcoe-cnp;
    forwarding-class-set {
      fcoe-pg {
```

```

        output-traffic-control-profile fcoe-tcp;
    }
}
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}
xe-0/0/32 {
    congestion-notification-profile fcoe-cnp;
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    unit 0 {
        classifiers {
            ieee-802.1 fcoe-classifier;
        }
    }
}
xe-0/0/33 {
    congestion-notification-profile fcoe-cnp;
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    unit 0 {
        classifiers {
            ieee-802.1 fcoe-classifier;
        }
    }
}
xe-0/0/34 {
    congestion-notification-profile fcoe-cnp;
    forwarding-class-set {
        fcoe-pg {
            output-traffic-control-profile fcoe-tcp;
        }
    }
    unit 0 {
        classifiers {
            ieee-802.1 fcoe-classifier;
        }
    }
}
}
scheduler-maps {
    fcoe-map {
        forwarding-class fcoe scheduler fcoe-sched;
    }
}
schedulers {
    fcoe-sched {

```

```

        transmit-rate 3000000000;
        shaping-rate percent 100;
        priority low;
    }
}

```

**TIP:** To quickly configure the interfaces, issue the `load merge terminal` command and then copy the hierarchy and paste it into the switch terminal window.

## Verification

To verify that the PFC configuration for FCoE traffic components has been created and is operating properly, perform these tasks:

- [Verifying That Priority-Based Flow Control Has Been Enabled on page 5612](#)
- [Verifying the Ingress Interface PFC Configuration on page 5613](#)

### *Verifying That Priority-Based Flow Control Has Been Enabled*

**Purpose** Verify that PFC is enabled on the FCoE queue to enable lossless transport.

**Action** List the congestion notification profiles using the operational mode command `show class-of-service congestion-notification`:

```
user@switch> show class-of-service congestion-notification
```

```
Type: Input, Name: fcoe-cnp, Index: 51697
```

```
Cable Length: 100 m
```

| Priority | PFC      | MRU  |
|----------|----------|------|
| 000      | Disabled |      |
| 001      | Disabled |      |
| 010      | Disabled |      |
| 011      | Enabled  | 2500 |
| 100      | Disabled |      |
| 101      | Disabled |      |
| 110      | Disabled |      |
| 111      | Disabled |      |

```
Type: Output
```

| Priority | Flow-Control-Queues |
|----------|---------------------|
| 000      | 0                   |
| 001      |                     |
| 010      | 1                   |
| 011      | 2                   |
| 100      | 3                   |
| 101      | 4                   |
| 110      | 5                   |
| 111      | 6                   |
|          | 7                   |

**Meaning** The **show class-of-service congestion-notification** operational command lists all of the congestion notification profiles and which IEEE 802.1p code points have PFC enabled. The command output shows that PFC is enabled on code point 011 for the **fcoe-cnp** congestion notification profile.

The command also shows the default cable length (100 meters), the default maximum receive unit (2500 bytes), and the default mapping of priorities to output queues because this example does not include configuring these options.

### *Verifying the Ingress Interface PFC Configuration*

**Purpose** Verify that the classifier **fcoe-classifier** and the congestion notification profile **fcoe-cnp** are configured on ingress interfaces **xe-0/0/31**, **xe-0/0/32**, **xe-0/0/33**, and **xe-0/0/34**.

**Action** List the ingress interfaces using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces xe-0/0/31
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/32
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/33
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}

user@switch> show configuration class-of-service interfaces xe-0/0/34
congestion-notification-profile fcoe-cnp;
unit 0 {
    classifiers {
        ieee-802.1 fcoe-classifier;
    }
}
```

**Meaning** The **show configuration class-of-service interfaces** commands list the congestion notification profile that is mapped to the interface (**fcoe-cnp**) and the IEEE 802.1p classifier associated with the interface (**fcoe-classifier**).

### Example: Configuring CoS for FCoE Transit Switch Traffic Across an MC-LAG

Multichassis link aggregation groups (MC-LAGs) provide redundancy and load balancing between two QFX Series switches, multihoming support for client devices such as servers, and a loop-free Layer 2 network without running Spanning Tree Protocol (STP).

**NOTE:** This example uses the Junos OS Enhanced Layer 2 Software (ELS) configuration style for QFX Series switches. If your switch runs software that does not support ELS, see [“Example: Configuring CoS for FCoE Transit Switch Traffic Across an MC-LAG” on page 5995](#). For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 43](#).

You can use an MC-LAG to provide a redundant aggregation layer for Fiber Channel over Ethernet (FCoE) traffic in an *inverted-U* topology. To support lossless transport of FCoE traffic across an MC-LAG, you must configure the appropriate class of service (CoS) on both of the QFX Series switches with MC-LAG port members. The CoS configuration must be the same on both of the MC-LAG switches because an MC-LAG does not carry forwarding class and IEEE 802.1p priority information.

Ports that are members of an MC-LAG act as FCoE passthrough transit switch ports.

**NOTE:** This example describes how to configure CoS to provide lossless transport for FCoE traffic across an MC-LAG that connects two QFX Series switches. It also describes how to configure CoS on the FCoE transit switches that connect FCoE hosts to the QFX Series switches that form the MC-LAG.

This example does *not* describe how to configure the MC-LAG itself. For a detailed example of MC-LAG configuration, see [“Example: Configuring Multichassis Link Aggregation” on page 2471](#). However, this example includes a subset of MC-LAG configuration that only shows how to configure interface membership in the MC-LAG.

QFX3500 and QFX3600 Virtual Chassis switches do not support FCoE.

This topic describes:

- [Requirements on page 5615](#)
- [Overview on page 5615](#)
- [Configuration on page 5619](#)
- [Verification on page 5628](#)

## Requirements

This example uses the following hardware and software components:

- Two Juniper Networks QFX5100 Switches running the ELS CLI that form an MC-LAG for FCoE traffic.
- Two Juniper Networks QFX5100 Switches running the ELS CLI that provide FCoE server access in transit switch mode and that connect to the MC-LAG switches.
- FCoE servers (or other FCoE hosts) connected to the transit switches.
- Junos OS Release 13.2 or later for the QFX Series.

## Overview

FCoE traffic requires lossless transport. This example shows you how to:

- Configure CoS for FCoE traffic on the two QFX5100 switches that form the MC-LAG, including priority-based flow control (PFC) and enhanced transmission selection (ETS; hierarchical scheduling of resources for the FCoE forwarding class priority and for the forwarding class set priority group).

**NOTE:** Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

- Configure CoS for FCoE on the two FCoE transit switches that connect FCoE hosts to the MC-LAG switches and enable FIP snooping on the FCoE VLAN at the FCoE transit switch access ports.
- Configure the appropriate port mode, MTU, and FCoE trusted or untrusted state for each interface to support lossless FCoE transport.

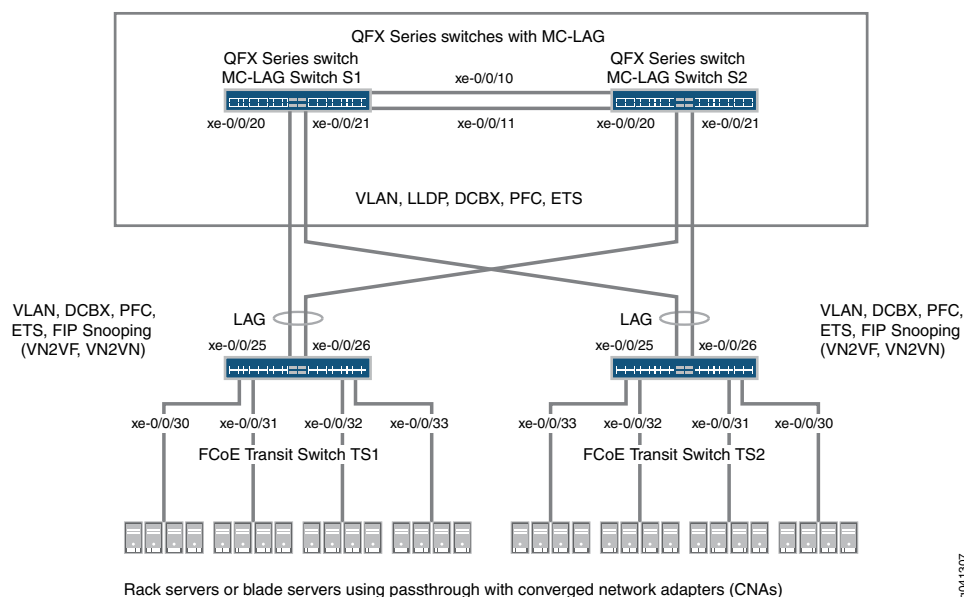

**NOTE:** Do not enable IGMP snooping on the FCoE VLAN. (IGMP snooping is enabled on the default VLAN by default, but is disabled by default on all other VLANs.)

### Topology

QFX5100 switches that act as transit switches support MC-LAGs for FCoE traffic in an inverted-U network topology, as shown in [Figure 196 on page 5616](#).

**Figure 196: Supported Topology for an MC-LAG on an FCoE Transit Switch**

[Table 459 on page 5616](#) shows the configuration components for this example.

**Table 459: Components of the CoS for FCoE Traffic Across an MC-LAG Configuration Topology**

| Component  | Settings   |
|--|--|
| Hardware   | Four QFX5100 switches running the ELS CLI (two to form the MC-LAG as passthrough transit switches and two transit switches for FCoE access). |
| Forwarding class (all switches)  | Default <b>fcoe</b> forwarding class.  |
| Classifier (forwarding class mapping of incoming traffic to IEEE priority) | Default IEEE 802.1p trusted classifier on all FCoE interfaces.   |

| FIP snooping                                       | Enable FIP snooping on Transit Switches TS1 and TS2 on the FCoE VLAN. Configure the LAG interfaces that connect to the MC-LAG switches as FCoE trusted interfaces so that they do not perform FIP snooping.<br><br>This example enables VN2VN_Port FIP snooping on the FCoE transit switch interfaces connected to the FCoE servers. The example is equally valid with VN2VF_Port FIP snooping enabled on the transit switch access ports. The method of FIP snooping you enable depends on your network configuration. |

**NOTE:** This example uses the default IEEE 802.1p trusted BA classifier, which is automatically applied to trunk mode interfaces if you do not apply an explicitly configured classifier.

To configure CoS for FCoE traffic across an MC-LAG:

- Use the default FCoE forwarding class and forwarding-class-to-queue mapping (do not explicitly configure the FCoE forwarding class or output queue). The default FCoE forwarding class is **fcoe**, and the default output queue is queue **3**.
- Use the default trusted BA classifier, which maps incoming packets to forwarding classes by the IEEE 802.1p code point (CoS priority) of the packet. The trusted classifier is the default classifier for interfaces in trunk interface mode. The default trusted classifier maps incoming packets with the IEEE 802.1p code point 3 (**011**) to the FCoE forwarding class. If you choose to configure the BA classifier instead of using the default classifier, you must ensure that FCoE traffic is classified into forwarding classes in exactly the same way on both MC-LAG switches. Using the default classifier ensures consistent classifier configuration on the MC-LAG ports.

- Configure a congestion notification profile that enables PFC on the FCoE code point (code point 011 in this example). The congestion notification profile configuration must be the same on both MC-LAG switches.
- Apply the congestion notification profile to the interfaces.
- Configure enhanced transmission selection (ETS, also known as hierarchical scheduling) on the interfaces to provide the bandwidth required for lossless FCoE transport. Configuring ETS includes configuring bandwidth scheduling for the FCoE forwarding class, a forwarding class set (priority group) that includes the FCoE forwarding class, and a traffic control profile to assign bandwidth to the forwarding class set that includes FCoE traffic.
- Apply the ETS scheduling to the interfaces.
- Configure the interface mode, MTU, and FCoE trusted or untrusted state for each interface to support lossless FCoE transport.

In addition, this example describes how to enable FIP snooping on the Transit Switch TS1 and TS2 ports that are connected to the FCoE servers. To provide secure access, FIP snooping must be enabled on the FCoE access ports.

This example focuses on the CoS configuration to support lossless FCoE transport across an MC-LAG. This example does not describe how to configure the properties of MC-LAGs and LAGs, although it does show you how to configure the port characteristics required to support lossless transport and how to assign interfaces to the MC-LAG and to the LAGs.

Before you configure CoS, configure:

- The MC-LAGs that connect Switches S1 and S2 to Switches TS1 and TS2. ([“Example: Configuring Multichassis Link Aggregation” on page 2471](#) describes how to configure MC-LAGs.)
- The LAGs that connect the Transit Switches TS1 and TS2 to MC-LAG Switches S1 and S2. ([“Configuring Link Aggregation” on page 2593](#) describes how to configure LAGs.)
- The LAG that connects Switch S1 to Switch S2.

## Configuration

To configure CoS for lossless FCoE transport across an MC-LAG, perform these tasks:

- [Configuring MC-LAG Switches S1 and S2 on page 5621](#)
- [Configuring FCoE Transit Switches TS1 and TS2 on page 5623](#)
- [Results on page 5625](#)

### CLI Quick Configuration

To quickly configure CoS for lossless FCoE transport across an MC-LAG, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI for MC-LAG Switch S1 and MC-LAG Switch S2 at the **[edit]** hierarchy level. The configurations on Switches S1 and S2 are identical because the CoS configuration must be identical, and because this example uses the same ports on both switches.

## Switch S1 and Switch S2

```
set class-of-service schedulers fcoe-sched priority low transmit-rate 3g
set class-of-service schedulers fcoe-sched shaping-rate percent 100
set class-of-service scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
set class-of-service forwarding-class-sets fcoe-pg class fcoe
set class-of-service traffic-control-profiles fcoe-tcp scheduler-map fcoe-map guaranteed-rate
3g
set class-of-service traffic-control-profiles fcoe-tcp shaping-rate percent 100
set class-of-service interfaces ae0 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
set class-of-service interfaces ae1 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
set class-of-service congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
set class-of-service interfaces ae0 congestion-notification-profile fcoe-cnp
set class-of-service interfaces ae1 congestion-notification-profile fcoe-cnp
set vlans fcoe_vlan vlan-id 100
set interfaces xe-0/0/10 ether-options 802.3ad ae0
set interfaces xe-0/0/11 ether-options 802.3ad ae0
set interfaces xe-0/0/20 ether-options 802.3ad ae1
set interfaces xe-0/0/21 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching interface-mode trunk vlan members fcoe_vlan
set interfaces ae1 unit 0 family ethernet-switching interface-mode trunk vlan members fcoe_vlan
set interfaces ae0 mtu 2180
set interfaces ae1 mtu 2180
set vlans fcoe_vlan forwarding-options fip-security interface ae0 fcoe-trusted
set vlans fcoe_vlan forwarding-options fip-security interface ae1 fcoe-trusted
```

To quickly configure CoS for lossless FCoE transport across an MC-LAG, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI for Transit Switch TS1 and Transit Switch TS2 at the **[edit]** hierarchy level. The configurations on Switches TS1 and TS2 are identical because the CoS configuration must be identical, and because this example uses the same ports on both switches.

## Switch TS1 and Switch TS2

```

```

### Configuring MC-LAG Switches S1 and S2

#### Step-by-Step Procedure

To configure CoS resource scheduling (ETS), PFC, the FCoE VLAN, and the LAG and MC-LAG interface membership and characteristics to support lossless FCoE transport across an MC-LAG (this example uses the default **fcoe** forwarding class and the default classifier to map incoming FCoE traffic to the FCoE IEEE 802.1p code point 011, so you do not configure them):

1. Configure output scheduling for the FCoE queue:

```

[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
user@switch# set schedulers fcoe-sched shaping-rate percent 100

```

2. Map the FCoE forwarding class to the FCoE scheduler (**fcoe-sched**):

```

[edit class-of-service]
user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched

```

3. Configure the forwarding class set (**fcoe-pg**) for the FCoE traffic:

```

[edit class-of-service]
user@switch# set forwarding-class-sets fcoe-pg class fcoe

```

4. Define the traffic control profile (**fcoe-tcp**) to use on the FCoE forwarding class set:

```

[edit class-of-service]
user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
guaranteed-rate 3g
user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100

```

5. Apply the FCoE forwarding class set and traffic control profile to the LAG and MC-LAG interfaces:

```

[edit class-of-service]
user@switch# set interfaces ae0 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp
user@switch# set interfaces ae1 forwarding-class-set fcoe-pg output-traffic-control-profile fcoe-tcp

```

6. Enable PFC on the FCoE priority by creating a congestion notification profile (**fcoe-cnp**) that applies FCoE to the IEEE 802.1 code point **011**:  

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point 011 pfc
```
7. Apply the PFC configuration to the LAG and MC-LAG interfaces:  

```
[edit class-of-service]
user@switch# set interfaces ae0 congestion-notification-profile fcoe-cnp
user@switch# set interfaces ae1 congestion-notification-profile fcoe-cnp
```
8. Configure the VLAN for FCoE traffic (**fcoe\_vlan**):  

```
[edit vlans]
user@switch# set fcoe_vlan vlan-id 100
```
9. Add the member interfaces to the LAG between the two MC-LAG switches:  

```
[edit interfaces]
user@switch# set xe-0/0/10 ether-options 802.3ad ae0
user@switch# set xe-0/0/11 ether-options 802.3ad ae0
```
10. Add the member interfaces to the MC-LAG:  

```
[edit interfaces]
user@switch# set xe-0/0/20 ether-options 802.3ad ae1
user@switch# set xe-0/0/21 ether-options 802.3ad ae1
```
11. Configure the interface mode as **trunk** and membership in the FCoE VLAN (**fcoe\_vlan**) for the LAG (**ae0**) and for the MC-LAG (**ae1**):  

```
[edit interfaces]
user@switch# set interfaces ae0 unit 0 family ethernet-switching interface-mode trunk
vlan members fcoe_vlan
user@switch# set interfaces ae1 unit 0 family ethernet-switching interface-mode trunk
vlan members fcoe_vlan
```
12. Set the MTU to **2180** for the LAG and MC-LAG interfaces. 2180 bytes is the minimum size required to handle FCoE packets because of the payload and header sizes; you can configure the MTU to a higher number of bytes if desired, but not less than 2180 bytes:  

```
[edit interfaces]
user@switch# set ae0 mtu 2180
user@switch# set ae1 mtu 2180
```
13. Set the LAG and MC-LAG interfaces as FCoE trusted ports. Ports that connect to other switches should be trusted and should not perform FIP snooping:  

```
[edit]
user@switch# set vlans fcoe_vlan forwarding-options fip-security interface ae0 fcoe-trusted
user@switch# set vlans fcoe_vlan forwarding-options fip-security interface ae1 fcoe-trusted
```

### Configuring FCoE Transit Switches TS1 and TS2

**Step-by-Step Procedure** The CoS configuration on FCoE Transit Switches TS1 and TS2 is similar to the CoS configuration on MC-LAG Switches S1 and S2. However, the port configurations differ, and you must enable FIP snooping on the Switch TS1 and Switch TS2 FCoE access ports.

To configure resource scheduling (ETS), PFC, the FCoE VLAN, and the LAG interface membership and characteristics to support lossless FCoE transport across the MC-LAG (this example uses the default **fcoe** forwarding class and the default classifier to map incoming FCoE traffic to the FCoE IEEE 802.1p code point **011**, so you do not configure them):

1. Configure output scheduling for the FCoE queue:  

```
[edit class-of-service]
user@switch# set schedulers fcoe-sched priority low transmit-rate 3g
user@switch# set schedulers fcoe-sched shaping-rate percent 100
```
2. Map the FCoE forwarding class to the FCoE scheduler (**fcoe-sched**):  

```
[edit class-of-service]
user@switch# set scheduler-maps fcoe-map forwarding-class fcoe scheduler fcoe-sched
```
3. Configure the forwarding class set (**fcoe-pg**) for the FCoE traffic:  

```
[edit class-of-service]
user@switch# set forwarding-class-sets fcoe-pg class fcoe
```
4. Define the traffic control profile (**fcoe-tcp**) to use on the FCoE forwarding class set:  

```
[edit class-of-service]
user@switch# set traffic-control-profiles fcoe-tcp scheduler-map fcoe-map
guaranteed-rate 3g
user@switch# set traffic-control-profiles fcoe-tcp shaping-rate percent 100
```
5. Apply the FCoE forwarding class set and traffic control profile to the LAG interface and to the FCoE access interfaces:  

```
[edit class-of-service]
user@switch# set interfaces ae1 forwarding-class-set fcoe-pg output-traffic-control-profile
fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/30 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/31 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/32 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
user@switch# set class-of-service interfaces xe-0/0/33 forwarding-class-set fcoe-pg
output-traffic-control-profile fcoe-tcp
```
6. Enable PFC on the FCoE priority by creating a congestion notification profile (**fcoe-cnp**) that applies FCoE to the IEEE 802.1 code point **011**:  

```
[edit class-of-service]
user@switch# set congestion-notification-profile fcoe-cnp input ieee-802.1 code-point
011 pfc
```
7. Apply the PFC configuration to the LAG interface and to the FCoE access interfaces:  

```
[edit class-of-service]
user@switch# set interfaces ae1 congestion-notification-profile fcoe-cnp
```

```
user@switch# set class-of-service interfaces xe-0/0/30 congestion-notification-profile fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/31 congestion-notification-profile fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/32 congestion-notification-profile fcoe-cnp
user@switch# set class-of-service interfaces xe-0/0/33 congestion-notification-profile fcoe-cnp
```

8. Configure the VLAN for FCoE traffic (**fcoe\_vlan**):

```
[edit vlans]
user@switch# set fcoe_vlan vlan-id 100
```

9. Add the member interfaces to the LAG:

```
[edit interfaces]
user@switch# set xe-0/0/25 ether-options 802.3ad ae1
user@switch# set xe-0/0/26 ether-options 802.3ad ae1
```

10. On the LAG (**ae1**), configure the interface mode as **trunk** and membership in the FCoE VLAN (**fcoe\_vlan**):

```
[edit interfaces]
user@switch# set interfaces ae1 unit 0 family ethernet-switching interface-mode trunk
vlan members fcoe_vlan
```

11. On the FCoE access interfaces (**xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, **xe-0/0/33**), configure the interface mode as **trunk** and membership in the FCoE VLAN (**fcoe\_vlan**):

```
[edit interfaces]
user@switch# set interfaces xe-0/0/30 unit 0 family ethernet-switching interface-mode trunk
vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/31 unit 0 family ethernet-switching interface-mode trunk
vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/32 unit 0 family ethernet-switching interface-mode trunk
vlan members fcoe_vlan
user@switch# set interfaces xe-0/0/33 unit 0 family ethernet-switching interface-mode trunk
vlan members fcoe_vlan
```

12. Set the MTU to **2180** for the LAG and FCoE access interfaces. 2180 bytes is the minimum size required to handle FCoE packets because of the payload and header sizes; you can configure the MTU to a higher number of bytes if desired, but not less than 2180 bytes:

```
[edit interfaces]
user@switch# set ae1 mtu 2180
user@switch# set xe-0/0/30 mtu 2180
user@switch# set xe-0/0/31 mtu 2180
user@switch# set xe-0/0/32 mtu 2180
user@switch# set xe-0/0/33 mtu 2180
```

13. Set the LAG interface as an FCoE trusted port. Ports that connect to other switches should be trusted and should not perform FIP snooping:

```
[edit]
user@switch# set vlans fcoe_vlan forwarding-options fip-security interface ae1 fcoe-trusted
```

**NOTE:** Access ports xe-0/0/30, xe-0/0/31, xe-0/0/32, and xe-0/0/33 are not configured as FCoE trusted ports. The access ports remain in the default state as untrusted ports because they connect directly to FCoE devices and must perform FIP snooping to ensure network security.

14. Enable FIP snooping on the FCoE VLAN to prevent unauthorized FCoE network access (this example uses VN2VN\_Port FIP snooping; the example is equally valid if you use VN2VF\_Port FIP snooping):

```
[edit]
user@switch# set vlans fcoe_vlan forwarding-options fip-security examine-vn2vn
beacon-period 90000
```

### Results

Display the results of the CoS configuration on MC-LAG Switch S1 and on MC-LAG Switch S2 (the results on both switches are the same):

```
user@switch> show configuration class-of-service
traffic-control-profiles {
  fcoe-tcp {
    scheduler-map fcoe-map;
    shaping-rate percent 100;
    guaranteed-rate 30000000000;
  }
}
forwarding-class-sets {
  fcoe-pg {
    class fcoe;
  }
}
congestion-notification-profile {
  fcoe-cnp {
    input {
      ieee-802.1 {
        code-point 011 {
          pfc;
        }
      }
    }
  }
}
}
interfaces {
  ae0 {
    forwarding-class-set {
      fcoe-pg {
        output-traffic-control-profile fcoe-tcp;
      }
    }
    congestion-notification-profile fcoe-cnp;
  }
  ae1 {
```

```
forwarding-class-set {
  fcoe-pg {
    output-traffic-control-profile fcoe-tcp;
  }
}
congestion-notification-profile fcoe-cnp;
}
}
scheduler-maps {
  fcoe-map {
    forwarding-class fcoe scheduler fcoe-sched;
  }
}
schedulers {
  fcoe-sched {
    transmit-rate 3000000000;
    shaping-rate percent 100;
    priority low;
  }
}
```

**NOTE:** The forwarding class and classifier configurations are not shown because the show command does not display default portions of the configuration.

For MC-LAG verification commands, see [“Example: Configuring Multichassis Link Aggregation” on page 2471](#).

Display the results of the CoS configuration on FCoE Transit Switch TS1 and on FCoE Transit Switch TS2 (the results on both transit switches are the same):

```
user@switch> show configuration class-of-service
traffic-control-profiles {
  fcoe-tcp {
    scheduler-map fcoe-map;
    shaping-rate percent 100;
    guaranteed-rate 3000000000;
  }
}
forwarding-class-sets {
  fcoe-pg {
    class fcoe;
  }
}
congestion-notification-profile {
  fcoe-cnp {
    input {
      ieee-802.1 {
        code-point 011 {
          pfc;
        }
      }
    }
  }
}
```

```

    }
  }
  interfaces {
    xe-0/0/30 {
      forwarding-class-set {
        fcoe-pg {
          output-traffic-control-profile fcoe-tcp;
        }
      }
      congestion-notification-profile fcoe-cnp;
    }
    xe-0/0/31 {
      forwarding-class-set {
        fcoe-pg {
          output-traffic-control-profile fcoe-tcp;
        }
      }
      congestion-notification-profile fcoe-cnp;
    }
    xe-0/0/32 {
      forwarding-class-set {
        fcoe-pg {
          output-traffic-control-profile fcoe-tcp;
        }
      }
      congestion-notification-profile fcoe-cnp;
    }
    xe-0/0/33 {
      forwarding-class-set {
        fcoe-pg {
          output-traffic-control-profile fcoe-tcp;
        }
      }
      congestion-notification-profile fcoe-cnp;
    }
    ae1 {
      forwarding-class-set {
        fcoe-pg {
          output-traffic-control-profile fcoe-tcp;
        }
      }
      congestion-notification-profile fcoe-cnp;
    }
  }
  scheduler-maps {
    fcoe-map {
      forwarding-class fcoe scheduler fcoe-sched;
    }
  }
  schedulers {
    fcoe-sched {
      transmit-rate 3000000000;
      shaping-rate percent 100;
      priority low;
    }
  }
}

```

**NOTE:** The forwarding class and classifier configurations are not shown because the `show` command does not display default portions of the configuration.

## Verification

To verify that the CoS components and FIP snooping have been configured and are operating properly, perform these tasks. Because this example uses the default **fcoe** forwarding class and the default IEEE 802.1p trusted classifier, the verification of those configurations is not shown:

- [Verifying That the Output Queue Schedulers Have Been Created on page 5628](#)
- [Verifying That the Priority Group Output Scheduler \(Traffic Control Profile\) Has Been Created on page 5629](#)
- [Verifying That the Forwarding Class Set \(Priority Group\) Has Been Created on page 5629](#)
- [Verifying That Priority-Based Flow Control Has Been Enabled on page 5630](#)
- [Verifying That the Interface Class of Service Configuration Has Been Created on page 5631](#)
- [Verifying That the Interfaces Are Correctly Configured on page 5632](#)
- [Verifying That FIP Snooping Is Enabled on the FCoE VLAN on FCoE Transit Switches TS1 and TS2 Access Interfaces on page 5635](#)
- [Verifying That the FIP Snooping Mode Is Correct on FCoE Transit Switches TS1 and TS2 on page 5635](#)

### *Verifying That the Output Queue Schedulers Have Been Created*

**Purpose** Verify that the output queue scheduler for FCoE traffic has the correct bandwidth parameters and priorities, and is mapped to the correct forwarding class (output queue). Queue scheduler verification is the same on each of the four switches.

**Action** List the scheduler map using the operational mode command `show class-of-service scheduler-map fcoe-map`:

```
user@switch> show class-of-service scheduler-map fcoe-map
Scheduler map: fcoe-map, Index: 9023
```

```
Scheduler: fcoe-sched, Forwarding class: fcoe, Index: 37289
  Transmit rate: 3000000000 bps, Rate Limit: none, Buffer size: remainder,
  Buffer Limit: none, Priority: low
  Excess Priority: unspecified
  Shaping rate: 100 percent,
  drop-profile-map-set-type: mark
  Drop profiles:
    Loss priority  Protocol  Index  Name
    Low           any       1      <default-drop-profile>
    Medium high   any       1      <default-drop-profile>
    High          any       1      <default-drop-profile>
```

**Meaning** The `show class-of-service scheduler-map fcoe-map` command lists the properties of the scheduler map `fcoe-map`. The command output includes:

- The name of the scheduler map (`fcoe-map`)
- The name of the scheduler (`fcoe-sched`)
- The forwarding classes mapped to the scheduler (`fcoe`)
- The minimum guaranteed queue bandwidth (transmit rate **3000000000 bps**)
- The scheduling priority (**low**)
- The maximum bandwidth in the priority group the queue can consume (shaping rate **100 percent**)
- The drop profile loss priority for each drop profile name. This example does not include drop profiles because you do not apply drop profiles to FCoE traffic.

***Verifying That the Priority Group Output Scheduler (Traffic Control Profile) Has Been Created***

**Purpose** Verify that the traffic control profile `fcoe-tcp` has been created with the correct bandwidth parameters and scheduler mapping. Priority group scheduler verification is the same on each of the four switches.

**Action** List the FCoE traffic control profile properties using the operational mode command `show class-of-service traffic-control-profile fcoe-tcp`:

```
user@switch> show class-of-service traffic-control-profile fcoe-tcp
Traffic control profile: fcoe-tcp, Index: 18303
  Shaping rate: 100 percent
  Scheduler map: fcoe-map
  Guaranteed rate: 3000000000
```

**Meaning** The `show class-of-service traffic-control-profile fcoe-tcp` command lists all of the configured traffic control profiles. For each traffic control profile, the command output includes:

- The name of the traffic control profile (`fcoe-tcp`)
- The maximum port bandwidth the priority group can consume (shaping rate **100 percent**)
- The scheduler map associated with the traffic control profile (`fcoe-map`)
- The minimum guaranteed priority group port bandwidth (guaranteed rate **3000000000** in bps)

***Verifying That the Forwarding Class Set (Priority Group) Has Been Created***

**Purpose** Verify that the FCoE priority group has been created and that the `fcoe` priority (forwarding class) belongs to the FCoE priority group. Forwarding class set verification is the same on each of the four switches.

**Action** List the forwarding class sets using the operational mode command **show class-of-service forwarding-class-set fcoe-pg**:

```
user@switch> show class-of-service forwarding-class-set fcoe-pg
Forwarding class set: fcoe-pg, Type: normal-type, Forwarding class set index:
31420
  Forwarding class          Index
  fcoe                      1
```

**Meaning** The **show class-of-service forwarding-class-set fcoe-pg** command lists all of the forwarding classes (priorities) that belong to the **fcoe-pg** priority group, and the internal index number of the priority group. The command output shows that the forwarding class set **fcoe-pg** includes the forwarding class **fcoe**.

#### *Verifying That Priority-Based Flow Control Has Been Enabled*

**Purpose** Verify that PFC is enabled on the FCoE code point. PFC verification is the same on each of the four switches.

**Action** List the FCoE congestion notification profile using the operational mode command **show class-of-service congestion-notification fcoe-cnp**:

```
user@switch> show class-of-service congestion-notification fcoe-cnp
Type: Input, Name: fcoe-cnp, Index: 6879
Cable Length: 100 m
  Priority    PFC      MRU
  000        Disabled
  001        Disabled
  010        Disabled
  011        Enabled   2500
  100        Disabled
  101        Disabled
  110        Disabled
  111        Disabled
Type: Output
  Priority    Flow-Control-Queues
  000
  001        0
  010        1
  011        2
  100        3
  101        4
  110        5
  111        6
  111        7
```

**Meaning** The **show class-of-service congestion-notification fcoe-cnp** command lists all of the IEEE 802.1p code points in the congestion notification profile that have PFC enabled. The command output shows that PFC is enabled on code point 011 (**fcoe** queue) for the **fcoe-cnp** congestion notification profile.

The command also shows the default cable length (100 meters), the default maximum receive unit (2500 bytes), and the default mapping of priorities to output queues because this example does not include configuring these options.

### ***Verifying That the Interface Class of Service Configuration Has Been Created***

**Purpose** Verify that the CoS properties of the interfaces are correct. The verification output on MC-LAG Switches S1 and S2 differs from the output on FCoE Transit Switches TS1 and TS2.

**Action** List the interface CoS configuration on MC-LAG Switches S1 and S2 using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces
ae0 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}

ae1 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}
```

List the interface CoS configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show configuration class-of-service interfaces**:

```
user@switch> show configuration class-of-service interfaces
xe-0/0/30 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}
xe-0/0/31 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
  congestion-notification-profile fcoe-cnp;
}
xe-0/0/32 {
  forwarding-class-set {
    fcoe-pg {
      output-traffic-control-profile fcoe-tcp;
    }
  }
}
```

```
        congestion-notification-profile fcoe-cnp;
    }
    xe-0/0/33 {
        forwarding-class-set {
            fcoe-pg {
                output-traffic-control-profile fcoe-tcp;
            }
        }
        congestion-notification-profile fcoe-cnp;
    }
    ae1 {
        forwarding-class-set {
            fcoe-pg {
                output-traffic-control-profile fcoe-tcp;
            }
        }
        congestion-notification-profile fcoe-cnp;
    }
}
```

**Meaning** The **show configuration class-of-service interfaces** command lists the class of service configuration for all interfaces. For each interface, the command output includes:

- The name of the interface (for example, **ae0** or **xe-0/0/30**)
- The name of the forwarding class set associated with the interface (**fcoe-pg**)
- The name of the traffic control profile associated with the interface (output traffic control profile, **fcoe-tcp**)
- The name of the congestion notification profile associated with the interface (**fcoe-cnp**)

**NOTE:** Interfaces that are members of a LAG are not shown individually. The LAG or MC-LAG CoS configuration is applied to all interfaces that are members of the LAG or MC-LAG. For example, the interface CoS configuration output on MC-LAG Switches S1 and S2 shows the LAG CoS configuration but does not show the CoS configuration of the member interfaces separately. The interface CoS configuration output on FCoE Transit Switches TS1 and TS2 shows the LAG CoS configuration but also shows the configuration for interfaces xe-0/0/30, xe-0/0/31, xe-0/0/32, and xe-0/0/33, which are not members of a LAG.

---

### ***Verifying That the Interfaces Are Correctly Configured***

**Purpose** Verify that the LAG membership, MTU, VLAN membership, and port mode of the interfaces are correct. The verification output on MC-LAG Switches S1 and S2 differs from the output on FCoE Transit Switches T1 and T2.

**Action** List the interface configuration on MC-LAG Switches S1 and S2 using the operational mode command **show configuration interfaces**:

```
user@switch> show configuration interfaces
```

```

xe-0/0/10 {
    ether-options {
        802.3ad ae0;
    }
}
xe-0/0/11 {
    ether-options {
        802.3ad ae0;
    }
}
xe-0/0/20 {
    ether-options {
        802.3ad ae1;
    }
}
xe-0/0/21 {
    ether-options {
        802.3ad ae1;
    }
}
ae0 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            interface-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
ae1 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            interface-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}

```

List the interface configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show configuration interfaces**:

```

user@switch> show configuration interfaces
xe-0/0/25 {
    ether-options {
        802.3ad ae1;
    }
}
xe-0/0/26 {
    ether-options {
        802.3ad ae1;
    }
}
xe-0/0/30 {
    mtu 2180;
    unit 0 {

```

```
        family ethernet-switching {
            interface-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
xe-0/0/31 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            interface-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
xe-0/0/32 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            interface-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
xe-0/0/33 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            interface-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
ae1 {
    mtu 2180;
    unit 0 {
        family ethernet-switching {
            interface-mode trunk;
            vlan {
                members fcoe_vlan;
            }
        }
    }
}
```

**Meaning** The **show configuration interfaces** command lists the configuration of each interface by interface name.

For each interface that is a member of a LAG, the command lists only the name of the LAG to which the interface belongs.

For each LAG interface and for each interface that is not a member of a LAG, the command output includes:

- The MTU (**2180**)
- The unit number of the interface (**0**)
- The interface mode (**trunk** mode both for interfaces that connect two switches and for interfaces that connect to FCoE hosts)
- The name of the VLAN in which the interface is a member (**fcoe\_vlan**)

***Verifying That FIP Snooping Is Enabled on the FCoE VLAN on FCoE Transit Switches TS1 and TS2 Access Interfaces***

**Purpose** Verify that FIP snooping is enabled on the FCoE VLAN access interfaces. FIP snooping is enabled only on the FCoE access interfaces, so it is enabled only on FCoE Transit Switches TS1 and TS2. FIP snooping is not enabled on MC-LAG Switches S1 and S2 because FIP snooping is done at the Transit Switch TS1 and TS2 FCoE access ports.

**Action** List the port security configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show configuration vlans fcoe\_vlan forwarding-options fip-security**:

```
user@switch> show configuration vlans fcoe_vlan forwarding-options fip-security
interface ae1.0 {
    fcoe-trusted;
}
examine-vn2vn {
    beacon-period 90000;
}
```

**Meaning** The **show configuration vlans fcoe\_vlan forwarding-options fip-security** command lists VLAN FIP security information, including whether a port member of the VLAN is trusted. The command output shows that:

- LAG port **ae1.0**, which connects the FCoE transit switch to the MC-LAG switches, is configured as an FCoE trusted interface. FIP snooping is not performed on the member interfaces of the LAG (**xe-0/0/25** and **xe-0/0/26**).
- VN2VN\_Port FIP snooping is enabled (**examine-vn2vn**) on the FCoE VLAN and the beacon period is set to 90000 milliseconds. On Transit Switches TS1 and TS2, all interface members of the FCoE VLAN perform FIP snooping unless the interface is configured as FCoE trusted. On Transit Switches TS1 and TS2, interfaces **xe-0/0/30**, **xe-0/0/31**, **xe-0/0/32**, and **xe-0/0/33** perform FIP snooping because they are not configured as FCoE trusted. The interface members of LAG **ae1** (**xe-0/0/25** and **xe-0/0/26**) do not perform FIP snooping because the LAG is configured as FCoE trusted.

***Verifying That the FIP Snooping Mode Is Correct on FCoE Transit Switches TS1 and TS2***

**Purpose** Verify that the FIP snooping mode is correct on the FCoE VLAN. FIP snooping is enabled only on the FCoE access interfaces, so it is enabled only on FCoE Transit Switches TS1 and TS2. FIP snooping is not enabled on MC-LAG Switches S1 and S2 because FIP snooping is done at the Transit Switch TS1 and TS2 FCoE access ports.

**Action** List the FIP snooping configuration on FCoE Transit Switches TS1 and TS2 using the operational mode command **show fip snooping brief**:

```
user@switch> show fip snooping brief
VLAN: fcoe_vlan,      Mode: VN2VN Snooping
FC-MAP: 0e:fc:00
...
```

**NOTE:** The output has been truncated to show only the relevant information.

---

**Meaning** The **show fip snooping brief** command lists FIP snooping information, including the FIP snooping VLAN and the FIP snooping mode. The command output shows that:

- The VLAN on which FIP snooping is enabled is **fcoe\_vlan**
- The FIP snooping mode is VN2VN\_Port FIP snooping (**VN2VN Snooping**)

### Example: Configuring VN2VN\_Port FIP Snooping (FCoE Hosts Directly Connected to the Same FCoE Transit Switch)

This example shows how to configure VN\_Port to VN\_Port (VN2VN\_Port) FIP snooping when the hosts are directly connected to the same FCoE transit switch.

**NOTE:** This example uses the Junos OS Enhanced Layer 2 Software (ELS) configuration style for QFX Series switches. If your switch runs software that does not support ELS, see *Example: Configuring VN2VN\_Port FIP Snooping (FCoE Hosts Directly Connected to the Same FCoE Transit Switch)*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 43.

---

VN2VN\_Port FIP snooping on an FCoE transit switch provides security to help prevent unauthorized access and data transmission on a bridge that connects ENodes in the Ethernet network. VN2VN\_Port FIP snooping provides security for virtual links by creating filters based on information gathered (snooped) about FCoE devices during FIP transactions.

VN2VN\_Port FIP snooping is conceptually similar to VN2VN\_Port FIP snooping between VN\_Ports and VF\_Ports, but VN2VN\_Port FIP snooping does not require traffic between VN\_Ports to traverse the Fibre Channel (FC) switch or FCoE forwarder (FCF). Instead, a VN\_Port communicates transparently through the transit switch on a virtual link that emulates a direct connection to the VN\_Port at the other end of the virtual link.

To configure VN2VN\_Port FIP snooping when the hosts are directly connected to the same FCoE transit switch, you must follow these configuration rules:

- VN2VN\_Port traffic must use a dedicated FCoE VLAN, and all ENodes that communicate using VN2VN\_Port FIP snooping must use that FCoE VLAN. You cannot mix VN2VN\_Port FIP snooping traffic with VN2VF\_Port FIP snooping traffic in the same FCoE VLAN.

**NOTE:** An FCoE VLAN can support either VN2VF\_Port FIP snooping or VN2VN\_Port FIP snooping, but not both. Configure separate FCoE VLANs for VN2VF\_Port FIP snooping traffic and for VN2VN\_Port FIP snooping traffic. On FCoE VLANs that are configured as VN2VN\_Port FIP snooping VLANs, VN\_Port to VF\_Port (FIP snooping) traffic is dropped.

- ENode-facing ports must be set in **trunk** interface mode.
- ENode-facing ports must be untrusted ports.
- Network-facing (switch-facing) ports must be set in **trunk** interface mode.
- Network-facing ports must be FCoE trusted ports.
- Explicitly configure the beacon period. The beacon period is essentially a keepalive timer for virtual link maintenance.

When you enable VN2VF\_Port FIP snooping, the system snoops VN\_Port to VF\_Port packets and enforces security only on VN\_Port to VF\_Port virtual links. When you enable VN2VN\_Port FIP snooping, the system snoops VN\_Port to VN\_Port packets and enforces security only on VN\_Port to VN\_Port virtual links.

The transit switch applies VN2VN\_Port FIP snooping filters at the ports associated with the FCoE VLANs on which you enable VN2VN FIP snooping.

This example describes how to configure VN2VN\_Port FIP snooping when the FCoE hosts are directly connected to the same transit switch:

- [Requirements on page 5637](#)
- [Overview on page 5638](#)
- [Configuration on page 5639](#)
- [Verification on page 5639](#)

### Requirements

This example uses the following hardware and software components:

- One Juniper Networks QFX5100 Switch running the ELS CLI and used as a transit switch

- Junos OS Release 13.2 or later for the QFX Series
- Two FCoE hosts that have ENodes

Overview

This example shows you how to:

- Set the correct interface mode on the transit switch.
- Configure the interfaces to use the dedicated FCoE VLAN for VN2VN\_Port FIP snooping.
- Configure the dedicated FCoE VLAN for VN2VN\_Port FIP snooping traffic.
- Enable VN2VN\_Port FIP snooping on the FCoE VLAN and configure the beacon period.

Topology

Table 460 on page 5638 shows the configuration components for this example.

Table 460: Components of the VN2VN\_Port FIP Snooping Configuration Topology (FCoE Hosts Directly Connected to the Same FCoE Transit Switch)

| Component                           | Settings  |
|-------------------------------------|---|
| Hardware                            | QFX5100 switch running the ELS CLI (FCoE transit switch TS1)<br><br>Two FCoE hosts that have ENodes (ENode1 and ENode2, respectively)   |

| Interface VLAN membership           | Both interfaces use VLAN <b>vlan200</b> .   |
| VN2VN_Port FIP snooping VLAN        | VLAN name— <b>vlan200</b><br>VLAN ID—200  |
| FIP snooping mode and beacon period | Set <b>examine-vn2vn</b> (VN2VN_Port FIP snooping)<br>Beacon period—90000 ms  |

Figure 197 on page 5638 shows the network topology for this example.

Figure 197: VN2VN\_Port FIP Snooping (FCoE Hosts Connected to Same Transit Switch) Topology

## Configuration

**CLI Quick Configuration** To quickly configure VN2VN\_Port FIP snooping for FCoE hosts connected directly to the same transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level:

```
set interfaces xe-0/0/20 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/21 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan200
set vlans vlan200 vlan-id 200
set vlans vlan200 forwarding-options fip-security examine-vn2vn beacon-period 90000
```

### *Configuring VN2VN\_Port FIP Snooping (FCoE Hosts Directly Connected to the Same FCoE Transit Switch)*

**Step-by-Step Procedure** To configure interface mode, configure interface VLAN membership in the FCoE VLAN dedicated to VN2VN\_Port traffic, configure the VLAN, set the beacon period, and enable VN2VN\_Port FIP snooping:

1. Configure the modes of the interfaces that connect directly to the FCoE host ENodes:

```
user@switch# set interfaces xe-0/0/20 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/21 unit 0 family ethernet-switching interface-mode trunk
```

2. Configure the interface VLAN membership so that the interfaces connected to the ENodes are members of the dedicated VN2VN\_Port VLAN (**vlan200**):

```
user@switch# set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan200
```

3. Configure the FCoE VLAN dedicated to VN2VN\_Port FIP snooping:

```
user@switch# set vlans vlan200 vlan-id 200
```

4. Enable VN2VN\_Port FIP snooping on the VLAN and configure the beacon period:

```
user@switch# set vlans vlan200 forwarding-options fip-security examine-vn2vn beacon-period 90000
```

## Verification

To verify that the VN2VN\_Port FIP snooping configuration has been created and is operating properly, perform these tasks:

- [Verifying That VN2VN\\_Port FIP Snooping is Enabled on the FCoE VLAN on page 5639](#)

### *Verifying That VN2VN\_Port FIP Snooping is Enabled on the FCoE VLAN*

**Purpose** Verify that VN2VN\_Port FIP snooping is enabled on the correct VLAN (**vlan200**), the beacon period is set to **90000** milliseconds, and the correct interfaces (**xe-0/0/20** and **xe-0/0/21**) are members of the VLAN.

**Action** List the FIP snooping information using the operational mode command **show fip snooping detail**.

```
user@switch> show fip snooping detail
VLAN: vlan200, Mode: VN2VN Snooping
FC-MAP: 0e:fd:00
Beacon_Period: 90000
VN2VN Mode: Point-to-Point
  Enode Information
    Enode-MAC: 10:10:94:01:00:02,      Interface: xe-0/0/20
    Active VN_Ports : 1
    VN_Port Information
      VN-Port MAC: 0e:fd:00:00:0a:01
      Active Sessions : 1
      Session Information
        Vlink far-end VN-Port-MAC: 0e:fd:00:00:0b:01
    Enode-MAC: 10:10:94:01:00:02,      Interface: xe-0/0/21
    Active VN_Ports : 1
    VN_Port Information
      VN-Port MAC: 0e:fd:00:00:0b:01
      Active Sessions : 1
      Session Information
        Vlink far-end VN-Port-MAC: 0e:fd:00:00:0a:01
```

**Meaning** The **show fip snooping detail** command lists all of the transit switch information about VN2VN\_Port FIP snooping and VN2VF\_Port FIP snooping. The command shows that:

- The VLAN is **vlan200**.
- The mode is FIP snooping mode **VN2VN**, for VN2VN\_Port FIP snooping. (If the Mode field shows **VN2VF**, then the FIP snooping mode is VN2VF\_Port FIP snooping.)
- The beacon period is **90000**.
- The interfaces for the ENodes are **xe-0/0/20** and **xe-0/0/21**.

In addition, this useful command shows information about the ENodes and the VN2VN\_Port sessions.

## Example: Configuring VN2VN\_Port FIP Snooping (FCoE Hosts Directly Connected to Different FCoE Transit Switches)

This example shows how to configure VN\_Port to VN\_Port (VN2VN\_Port) FIP snooping when the hosts are directly connected to different FCoE transit switches, and the transit switches are directly connected to each other.

**NOTE:** This example uses the Junos OS Enhanced Layer 2 Software (ELS) configuration style for QFX Series switches. If your switch runs software that does not support ELS, see *Example: Configuring VN2VN\_Port FIP Snooping (FCoE Hosts Directly Connected to Different FCoE Transit Switches)*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 43.

VN2VN\_Port FIP snooping on an FCoE transit switch provides security to help prevent unauthorized access and data transmission on a bridge that connects ENodes in the Ethernet network. VN2VN\_Port FIP snooping provides security for virtual links by creating filters based on information gathered (snooped) about FCoE devices during FIP transactions.

VN2VN\_Port FIP snooping is conceptually similar to VN2VF\_Port FIP snooping between VN\_Ports and VF\_Ports, but VN2VN\_Port FIP snooping does not require traffic between VN\_Ports to traverse the Fibre Channel (FC) switch or FCoE forwarder (FCF). Instead, a VN\_Port communicates transparently through one or more transit switches on a virtual link that emulates a direct connection to the VN\_Port at the other end of the virtual link.

To configure VN2VN\_Port FIP snooping when the hosts are directly connected to different FCoE transit switches, and the transit switches are directly connected to each other, you must follow these configuration rules:

- VN2VN\_Port traffic must use a dedicated FCoE VLAN, and all ENodes that communicate using VN2VN\_Port FIP snooping must use that FCoE VLAN. The FCoE VLAN must be configured on each transit switch. You cannot mix VN2VN\_Port FIP snooping traffic with VN2VF\_Port FIP snooping traffic in the same FCoE VLAN.

**NOTE:** An FCoE VLAN can support either VN2VF\_Port FIP snooping or VN2VN\_Port FIP snooping, but not both. Configure separate FCoE VLANs for VN2VF\_Port FIP snooping traffic and for VN2VN\_Port FIP snooping traffic. On FCoE VLANs that are configured as VN2VN\_Port FIP snooping VLANs, VN2VF\_Port traffic is dropped.

- ENode-facing ports must be set in **trunk** interface mode.
- ENode-facing ports must be untrusted ports.
- Network-facing (switch-facing) ports must be set in **trunk** interface mode.

- Network-facing ports must be FCoE trusted ports.
- Explicitly configure the beacon period. The beacon period is essentially a keepalive timer for virtual link maintenance.

When you enable VN2VF\_Port FIP snooping, the system snoops VN\_Port to VF\_Port packets and enforces security only on VN\_Port to VF\_Port virtual links. When you enable VN2VN\_Port FIP snooping, the system snoops VN\_Port to VN\_Port packets and enforces security only on VN\_Port to VN\_Port virtual links.

The transit switch applies VN2VN\_Port FIP snooping filters at the ports associated with the FCoE VLANs on which you enable VN2VN FIP snooping.

This example describes how to configure VN2VN\_Port FIP snooping when the FCoE hosts are directly connected to different transit switches, and the transit switches are directly connected to each other:

- [Requirements on page 5642](#)
- [Overview on page 5642](#)
- [Configuration on page 5643](#)
- [Verification on page 5645](#)

---

## Requirements

This example uses the following hardware and software components:

- Two Juniper Networks QFX5100 Switches running the ELS CLI and used as transit switches
- Junos OS Release 13.2 or later for the QFX Series
- Two FCoE hosts that have ENodes

---

## Overview

This example shows you how to:

- Set the correct interface mode on the transit switch.
- Configure the interfaces to use the dedicated FCoE VLAN for VN2VN\_Port FIP snooping.
- Configure the network-facing interfaces as FCoE trusted interfaces.
- Configure the dedicated FCoE VLAN for VN2VN\_Port FIP snooping traffic.
- Enable VN2VN\_Port FIP snooping on the FCoE VLAN and configure the beacon period.

## Topology

[Table 461 on page 5643](#) shows the configuration components for this example.

**Table 461: Components of the VN2VN\_Port FIP Snooping Configuration Topology (FCoE Hosts Directly Connected to Different FCoE Transit Switches)**

| Component                           | Settings   |
|-------------------------------------|--|
| Hardware                            | Two QFX5100 switches running the ELS CLI (FCoE transit switch TS1 and FCoE transit switch TS2)<br><br>Two FCoE hosts that have ENodes (ENode1 and ENode2, respectively)  |
| Interfaces and interface mode       | <ul style="list-style-type: none"> <li>Interface <b>xe-0/0/20</b>, interface mode <b>trunk</b>, connects directly from transit switch TS1 to the FCoE host with ENode1.</li> <li>Interface <b>xe-0/0/21</b>, interface mode <b>trunk</b>, connects directly from transit switch TS1 to transit switch TS2.</li> <li>Interface <b>xe-0/0/31</b>, interface mode <b>trunk</b>, connects directly from transit switch TS2 to transit switch TS1.</li> <li>Interface <b>xe-0/0/30</b>, interface mode <b>trunk</b>, connects directly from transit switch TS2 to the FCoE host with ENode2.</li> </ul> |
| Interface VLAN membership           | The interfaces on both transit switches use VLAN <b>vlan200</b> .  |
| VN2VN_Port FIP snooping VLAN        | VLAN name (both transit switches)— <b>vlan200</b><br>VLAN ID—200   |
| FIP snooping mode and beacon period | Set <b>examine-vn2vn</b> (VN2VN_Port FIP snooping)<br>Beacon period—90000 ms   |

Figure 198 on page 5643 shows the network topology for this example.

**Figure 198: VN2VN\_Port FIP Snooping (FCoE Hosts Connected to Different Transit Switches) Topology**

### Configuration

To configure VN2VN\_Port FIP snooping for VN\_Ports that are directly connected to different transit switches (and the transit switches are directly connected to each other), perform these tasks:

- [Configuring VN2VN\\_Port FIP Snooping on FCoE Transit Switch TS1 on page 5644](#)
- [Configuring VN2VN\\_Port FIP Snooping on FCoE Transit Switch TS2 on page 5645](#)

### CLI Quick Configuration

The configuration for each FCoE transit switch is shown separately.

To quickly configure VN2VN\_Port FIP snooping for FCoE hosts connected directly to different transit switches, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level. To configure FCoE transit switch TS1:

## FCoE Transit Switch TS1

```
set interfaces xe-0/0/20 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/21 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan200
set vlans vlan200 vlan-id 200
set vlans vlan200 forwarding-options fip-security interface xe-0/0/21 fcoe-trusted
set vlans vlan200 forwarding-options fip-security examine-vn2vn beacon-period 90000
```

To quickly configure VN2VN\_Port FIP snooping for FCoE hosts connected directly to different transit switches, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level. To configure FCoE transit switch TS2:

## FCoE Transit Switch TS2

```
set interfaces xe-0/0/30 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/31 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/30 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/31 unit 0 family ethernet-switching vlan members vlan200
set vlans vlan200 vlan-id 200
set vlans vlan200 forwarding-options fip-security interface xe-0/0/31 fcoe-trusted
set vlans vlan200 forwarding-options fip-security examine-vn2vn beacon-period 90000
```

### *Configuring VN2VN\_Port FIP Snooping on FCoE Transit Switch TS1*

#### Step-by-Step Procedure

To configure interface mode, configure interface VLAN membership in the FCoE VLAN dedicated to VN2VN\_Port traffic, set the network-facing port as FCoE trusted, configure the VLAN, set the beacon period, and enable VN2VN\_Port FIP snooping:

1. Configure the modes of the interfaces that connect directly to the FCoE host with ENode1 (**xe-0/0/20**) and to FCoE transit switch TS2 (**xe-0/0/21**):

```
user@switch# set interfaces xe-0/0/20 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/21 unit 0 family ethernet-switching interface-mode trunk
```

2. Configure the interface VLAN membership so that the interfaces are members of the dedicated VN2VN\_Port VLAN (**vlan200**):

```
user@switch# set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan200
```

3. Configure the FCoE VLAN dedicated to VN2VN\_Port FIP snooping:

```
user@switch# set vlans vlan200 vlan-id 200
```

4. Configure the network-facing port (**xe-0/0/21**) as an FCoE trusted port:

```
user@switch# set vlans vlan200 forwarding-options fip-security interface xe-0/0/21 fcoe-trusted
```

5. Enable VN2VN\_Port FIP snooping on the VLAN and configure the beacon period:

```
user@switch# set vlans vlan200 forwarding-options fip-security examine-vn2vn beacon-period 90000
```

### Configuring VN2VN\_Port FIP Snooping on FCoE Transit Switch TS2

- Step-by-Step Procedure** To configure interface mode, configure interface VLAN membership in the FCoE VLAN dedicated to VN2VN\_Port traffic, set the network-facing port as FCoE trusted, configure the VLAN, set the beacon period, and enable VN2VN\_Port FIP snooping:
1. Configure the modes of the interfaces that connect directly to the FCoE host with ENode2 (**xe-0/0/30**) and to FCoE transit switch TS1 (**xe-0/0/31**):  

```
user@switch# set interfaces xe-0/0/30 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/31 unit 0 family ethernet-switching interface-mode trunk
```
  2. Configure the interface VLAN membership so that the interfaces are members of the dedicated VN2VN\_Port VLAN (**vlan200**):  

```
user@switch# set interfaces xe-0/0/30 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/31 unit 0 family ethernet-switching vlan members vlan200
```
  3. Configure the FCoE VLAN dedicated to VN2VN\_Port FIP snooping:  

```
user@switch# set vlans vlan200 vlan-id 200
```
  4. Configure the network-facing port (**xe-0/0/31**) as an FCoE trusted port:  

```
user@switch# set vlans vlan200 forwarding-options fip-security interface xe-0/0/31 fcoe-trusted
```
  5. Enable VN2VN\_Port FIP snooping on the VLAN and configure the beacon period:  

```
user@switch# set vlans vlan200 forwarding-options fip-security examine-vn2vn beacon-period 90000
```

### Verification

To verify that the VN2VN\_Port FIP snooping configuration has been created and is operating properly on both switches, perform these tasks:

- [Verifying That VN2VN\\_Port FIP Snooping is Enabled on the FCoE VLAN \(Transit Switches TS1 and TS2\) on page 5645](#)

#### *Verifying That VN2VN\_Port FIP Snooping is Enabled on the FCoE VLAN (Transit Switches TS1 and TS2)*

- Purpose** Verify that VN2VN\_Port FIP snooping is enabled on the correct VLAN (**vlan200**), the beacon period is set to **90000** milliseconds, and that the correct interfaces (**xe-0/0/20** and **xe-0/0/21** on TS1, and **xe-0/0/30** and **xe-0/0/31** on TS2) are members of the VLAN.

**Action** List the FIP snooping information on transit switch TS1 using the operational mode command **show fip snooping detail**

```
user@switch> show fip snooping detail
VLAN: vlan200, Mode: VN2VN Snooping
FC-MAP: 0e:fc:00
Beacon_Period: 90000
VN2VN Mode: Point-to-Point
  Enode Information
    Enode-MAC: 10:10:94:01:00:02,      Interface: xe-0/0/20
    Active VN_Ports : 1
    VN_Port Information
      VN-Port MAC: 0e:fc:00:01:0a:01
      Active Sessions : 1
      Session Information
        Vlink far-end VN-Port-MAC: 0e:fc:00:01:0b:01
    Enode-MAC: 10:10:94:01:00:02,      Interface: xe-0/0/21
    Active VN_Ports : 1
    VN_Port Information
      VN-Port MAC: 0e:fc:00:01:0b:01
      Active Sessions : 1
      Session Information
        Vlink far-end VN-Port-MAC: 0e:fc:00:01:0a:01
```

List the FIP snooping information on transit switch TS2 using the operational mode command **show fip snooping detail**

```
user@switch> show fip snooping detail
VLAN: vlan200, Mode: VN2VN Snooping
FC-MAP: 0e:fd:00
Beacon_Period: 90000
VN2VN Mode: Point-to-Point
  Enode Information
    Enode-MAC: 10:10:94:01:00:02,      Interface: xe-0/0/30
    Active VN_Ports : 1
    VN_Port Information
      VN-Port MAC: 0e:fd:00:00:0b:01
      Active Sessions : 1
      Session Information
        Vlink far-end VN-Port-MAC: 0e:fd:00:00:0a:01
    Enode-MAC: 10:10:94:01:00:02,      Interface: xe-0/0/31
    Active VN_Ports : 1
    VN_Port Information
      VN-Port MAC: 0e:fd:00:00:0a:01
      Active Sessions : 1
      Session Information
        Vlink far-end VN-Port-MAC: 0e:fd:00:00:0b:01
```

**Meaning** The **show fip snooping detail** command lists all of the transit switch information about VN2VN\_Port FIP snooping and VN2VF\_Port FIP snooping on each transit switch. The command shows that:

- The VLAN is **vlan200**.
- The mode is FIP snooping mode **VN2VN**, for VN2VN\_Port FIP snooping. (If the Mode field shows **VN2VF**, then the FIP snooping mode is VN2VF\_Port FIP snooping.)

- The beacon period is **90000**.
- The interfaces connected to the ENodes are **xe-0/0/20** and **xe-0/0/21** on transit switch TS1, and **xe-0/0/30** and **xe-0/0/31** on transit switch TS2. Because the transit switches are transparent passthrough switches, the network-facing trunk ports “see” the FCoE host ENodes at the far end of the VN2VN\_Port virtual link.

In addition, this useful command shows information about the ENodes and the VN2VN\_Port sessions.

### Example: Configuring VN2VN\_Port FIP Snooping (FCoE Hosts Indirectly Connected Through an Aggregation Layer FCoE Transit Switch)

This example shows how to configure VN\_Port to VN\_Port (VN2VN\_Port) FIP snooping when the hosts are indirectly connected through an aggregation layer FCoE transit switch. Each FCoE host ENode is directly connected to an FCoE transit switch, but the FCoE transit switches are not directly connected to each other. The FCoE transit switches are both connected to a third FCoE transit switch that acts as an aggregation layer switch.

**NOTE:** This example uses the Junos OS Enhanced Layer 2 Software (ELS) configuration style for QFX Series switches. If your switch runs software that does not support ELS, see [Example: Configuring VN2VN\\_Port FIP Snooping \(FCoE Hosts Indirectly Connected Through an Aggregation Layer FCoE Transit Switch\)](#). For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 43](#).

VN2VN\_Port FIP snooping on an FCoE transit switch provides security to help prevent unauthorized access and data transmission on a bridge that connects ENodes in the Ethernet network. VN2VN\_Port FIP snooping provides security for virtual links by creating filters based on information gathered (snooped) about FCoE devices during FIP transactions.

VN2VN\_Port FIP snooping is conceptually similar to VN2VN\_Port FIP snooping between VN\_Ports and VF\_Ports, but VN2VN\_Port FIP snooping does not require traffic between VN\_Ports to traverse the Fibre Channel (FC) switch or FCoE forwarder (FCF). Instead, a VN\_Port communicates transparently through one or more transit switches on a virtual link that emulates a direct connection to the VN\_Port at the other end of the virtual link.

To configure VN2VN\_Port FIP snooping when the hosts are indirectly connected, you must follow these configuration rules:

- VN2VN\_Port traffic must use a dedicated FCoE VLAN, and all ENodes that communicate using VN2VN\_Port FIP snooping must use that FCoE VLAN. The FCoE VLAN must be configured on each transit switch. You cannot mix VN2VN\_Port FIP snooping traffic with VN2VF\_Port FIP snooping traffic in the same FCoE VLAN.

**NOTE:** An FCoE VLAN can support either VN2VF\_Port FIP snooping or VN2VN\_Port FIP snooping, but not both. Configure separate FCoE VLANs for VN2VF\_Port FIP snooping traffic and for VN2VN\_Port FIP snooping traffic. On FCoE VLANs that are configured as VN2VN\_Port FIP snooping VLANs, VN\_Port to VF\_Port traffic is dropped.

- ENode-facing ports must be set in **trunk** interface mode.
- ENode-facing ports must be untrusted ports.
- Network-facing (switch-facing) ports must be set in **trunk** interface mode.
- Network-facing ports must be FCoE trusted ports.
- Explicitly configure the beacon period. The beacon period is essentially a keepalive timer for virtual link maintenance.

When you enable FIP snooping, the system snoops VN\_Port to VF\_Port packets and enforces security only on VN\_Port to VF\_Port virtual links. When you enable VN2VN\_Port FIP snooping, the system snoops VN\_Port to VN\_Port packets and enforces security only on VN\_Port to VN\_Port virtual links.

The transit switch applies VN2VN\_Port FIP snooping filters at the ports associated with the FCoE VLANs on which you enable VN2VN FIP snooping.

This example describes how to configure VN2VN\_Port FIP snooping when the FCoE hosts are indirectly connected across an aggregation layer FCoE transit switch:

- [Requirements on page 5648](#)
- [Overview on page 5649](#)
- [Configuration on page 5650](#)
- [Verification on page 5653](#)

### Requirements

---

This example uses the following hardware and software components:

- Three Juniper Networks QFX5100 Switches running the ELS CLI and used as transit switches
- Junos OS Release 13.2 or later for the QFX Series
- Two FCoE hosts that have ENodes

## Overview

This example shows you how to:

- Set the correct interface mode on the transit switch.
- Configure the interfaces to use the dedicated FCoE VLAN for VN2VN\_Port FIP snooping.
- Configure the network-facing interfaces as FCoE trusted interfaces.
- Configure the dedicated FCoE VLAN for VN2VN\_Port FIP snooping traffic.
- Enable VN2VN\_Port FIP snooping on the FCoE VLAN and configure the beacon period.

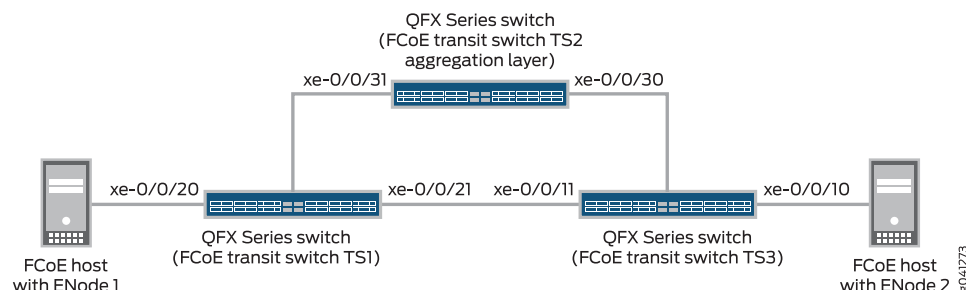

## Topology

Table 462 on page 5649 shows the configuration components for this example.

**Table 462: Components of the VN2VN\_Port FIP Snooping Configuration Topology (FCoE Hosts Indirectly Connected Across an Aggregation Layer FCoE Transit Switch)**

| Component                           | Settings   |
|-------------------------------------|--|
| Hardware                            | <p>Three QFX5100 switches running the ELS CLI, two of which are FCoE transit switches that are directly attached to the FCoE hosts (transit switches TS1 and TS2) and one of which is an aggregation layer FCoE transit switch (TS3)</p> <p>Two FCoE hosts that have ENodes (ENode1 and ENode2, respectively)</p>  |
| Interfaces and interface mode       | <ul style="list-style-type: none"> <li>• Interface <b>xe-0/0/20</b>, interface mode <b>trunk</b>, connects directly from transit switch TS1 to the FCoE host with ENode1.</li> <li>• Interface <b>xe-0/0/21</b>, interface mode <b>trunk</b>, connects directly from transit switch TS1 to aggregation layer transit switch TS2.</li> <li>• Interface <b>xe-0/0/31</b>, interface mode <b>trunk</b>, connects directly from aggregation layer transit switch TS2 to transit switch TS1.</li> <li>• Interface <b>xe-0/0/30</b>, interface mode <b>trunk</b>, connects directly from aggregation layer transit switch TS2 to transit switch TS3.</li> <li>• Interface <b>xe-0/0/11</b>, interface mode <b>trunk</b>, connects directly from transit switch TS3 to aggregation layer transit switch TS2.</li> <li>• Interface <b>xe-0/0/10</b>, interface mode <b>trunk</b>, connects directly from transit switch TS3 to the FCoE host with ENode2.</li> </ul> |
| Interface VLAN membership           | The interfaces on all three switches use VLAN <b>vlan200</b> .   |
| VN2VN_Port FIP snooping VLAN        | <p>VLAN name (all three switches)—<b>vlan200</b></p> <p>VLAN ID—200</p>  |

### Configuration

To configure VN2VN\_Port FIP snooping for VN\_Ports that are indirectly connected across an aggregation layer FCoE transit switch, perform these tasks:

- [Configuring VN2VN\\_Port FIP Snooping on FCoE Transit Switch TS1 on page 5651](#)
- [Configuring VN2VN\\_Port FIP Snooping on Aggregation Layer FCoE Transit Switch TS2 on page 5652](#)
- [Configuring VN2VN\\_Port FIP Snooping on FCoE Transit Switch TS3 on page 5652](#)

#### CLI Quick Configuration

The configuration for each FCoE transit switch is shown separately.

To quickly configure VN2VN\_Port FIP snooping for FCoE hosts that are indirectly connected across an aggregation layer FCoE transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level. To configure FCoE transit switch TS1:

#### FCoE Transit Switch TS1

```
set interfaces xe-0/0/20 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/21 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan200
set vlans vlan200 vlan-id 200
set vlans vlan200 forwarding-options fip-security interface xe-0/0/21 fcoe-trusted
set vlans vlan200 forwarding-options fip-security examine-vn2vn beacon-period 90000
```

To quickly configure VN2VN\_Port FIP snooping for FCoE hosts that are indirectly connected across an aggregation layer FCoE transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level. To configure FCoE transit switch TS2:

#### FCoE Transit Switch TS2

```
set interfaces xe-0/0/30 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/31 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/30 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/31 unit 0 family ethernet-switching vlan members vlan200
set vlans vlan200 vlan-id 200
```

```
set vlans vlan200 forwarding-options fip-security interface xe-0/0/30 fcoe-trusted
set vlans vlan200 forwarding-options fip-security interface xe-0/0/31 fcoe-trusted
set vlans vlan200 forwarding-options fip-security examine-vn2vn beacon-period 90000
```

To quickly configure VN2VN\_Port FIP snooping for FCoE hosts that are indirectly connected across an aggregation layer FCoE transit switch, copy the following commands, paste them in a text file, remove line breaks, change variables and details to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level. To configure FCoE transit switch TS3:

### FCoE Transit Switch TS3

```
set interfaces xe-0/0/10 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/11 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/10 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members vlan200
set vlans vlan200 vlan-id 200
set vlans vlan200 forwarding-options fip-security interface xe-0/0/11 fcoe-trusted
set vlans vlan200 forwarding-options fip-security examine-vn2vn beacon-period 90000
```

#### *Configuring VN2VN\_Port FIP Snooping on FCoE Transit Switch TS1*

#### Step-by-Step Procedure

To configure interface mode, configure interface VLAN membership in the FCoE VLAN dedicated to VN2VN\_Port traffic, set the network-facing port as FCoE trusted, configure the VLAN, set the beacon period, and enable VN2VN\_Port FIP snooping:

1. Configure the modes of the interfaces that connect directly to the FCoE host with ENode1 (**xe-0/0/20**) and to aggregation layer FCoE transit switch TS2 (**xe-0/0/21**):

```
user@switch# set interfaces xe-0/0/20 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/21 unit 0 family ethernet-switching interface-mode trunk
```

2. Configure the interface VLAN membership so that the interfaces are members of the dedicated VN2VN\_Port VLAN (**vlan200**):

```
user@switch# set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members vlan200
```

3. Configure the FCoE VLAN dedicated to VN2VN\_Port FIP snooping:

```
user@switch# set vlans vlan200 vlan-id 200
```

4. Configure the network-facing port (**xe-0/0/21**) as an FCoE trusted port:

```
user@switch# set vlans vlan200 forwarding-options fip-security interface xe-0/0/21 fcoe-trusted
```

5. Enable VN2VN\_Port FIP snooping on the VLAN and configure the beacon period:

```
user@switch# set vlans vlan200 forwarding-options fip-security examine-vn2vn beacon-period 90000
```

**Configuring VN2VN\_Port FIP Snooping on Aggregation Layer FCoE Transit Switch TS2**

**Step-by-Step Procedure** To configure interface mode, configure interface VLAN membership in the FCoE VLAN dedicated to VN2VN\_Port traffic, set the network-facing ports as FCoE trusted, configure the VLAN, set the beacon period, and enable VN2VN\_Port FIP snooping:

1. Configure the mode of the interfaces that connect directly to FCoE transit switches TS1 (**xe-0/0/31**) and TS3 (**xe-0/0/30**). Both interfaces are network-facing and must be configured as trunk interfaces:

```
user@switch# set interfaces xe-0/0/30 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/31 unit 0 family ethernet-switching interface-mode trunk
```

2. Configure the interface VLAN membership so that the interfaces are members of the dedicated VN2VN\_Port VLAN (**vlan200**):

```
user@switch# set interfaces xe-0/0/30 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/31 unit 0 family ethernet-switching vlan members vlan200
```

3. Configure the FCoE VLAN dedicated to VN2VN\_Port FIP snooping:

```
user@switch# set vlans vlan200 vlan-id 200
```

4. Configure the network-facing ports (**xe-0/0/30** and **xe-0/0/31**) as FCoE trusted ports:

```
user@switch# set vlans vlan200 forwarding-options fip-security interface xe-0/0/30 fcoe-trusted
user@switch# set vlans vlan200 forwarding-options fip-security interface xe-0/0/31 fcoe-trusted
```

5. Enable VN2VN\_Port FIP snooping on the VLAN and configure the beacon period:

```
user@switch# set vlans vlan200 forwarding-options fip-security examine-vn2vn beacon-period 90000
```

**Configuring VN2VN\_Port FIP Snooping on FCoE Transit Switch TS3**

**Step-by-Step Procedure** To configure interface mode, configure interface VLAN membership in the FCoE VLAN dedicated to VN2VN\_Port traffic, set the network-facing port as FCoE trusted, configure the VLAN, set the beacon period, and enable VN2VN\_Port FIP snooping:

1. Configure the mode of the interfaces that connect directly to the FCoE host with ENode2 (**xe-0/0/10**) and to aggregation layer FCoE transit switch TS2 (**xe-0/0/11**):

```
user@switch# set interfaces xe-0/0/10 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/0/11 unit 0 family ethernet-switching interface-mode trunk
```

2. Configure the interface VLAN membership so that the interfaces are members of the dedicated VN2VN\_Port VLAN (**vlan200**):

```
user@switch# set interfaces xe-0/0/10 unit 0 family ethernet-switching vlan members vlan200
set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members vlan200
```

3. Configure the FCoE VLAN dedicated to VN2VN\_Port FIP snooping:

```
user@switch# set vlans vlan200 vlan-id 200
```

4. Configure the network-facing port (**xe-0/0/11**) as an FCoE trusted port:  

```
user@switch# set vlans vlan200 forwarding-options fip-security interface xe-0/0/11
fcoe-trusted
```
5. Enable VN2VN\_Port FIP snooping on the VLAN and configure the beacon period:  

```
user@switch# set vlans vlan200 forwarding-options fip-security examine-vn2vn
beacon-period 90000
```

### Verification

To verify that the VN2VN\_Port FIP snooping configuration has been created and is operating properly on all three switches, perform these tasks:

- [Verifying That VN2VN\\_Port FIP Snooping Is Enabled on the FCoE VLAN \(All Three Transit Switches\) on page 5653](#)

#### *Verifying That VN2VN\_Port FIP Snooping Is Enabled on the FCoE VLAN (All Three Transit Switches)*

**Purpose** Verify that VN2VN\_Port FIP snooping is enabled on the correct VLAN (**vlan200**), the beacon period is set to **90000** milliseconds, and that the correct interfaces (**xe-0/0/20** and **xe-0/0/21** on TS1, **xe-0/0/30** and **xe-0/0/31** aggregation layer TS2, and **xe-0/0/10** and **xe-0/0/11** on TS3) are members of the VLAN.

**Action** List the FIP snooping information on transit switch TS1 using the operational mode command **show fip snooping detail**

```
user@switch> show fip snooping detail
VLAN: vlan200, Mode: VN2VN Snooping
FC-MAP: 0e:fc:00
Beacon_Period: 90000
VN2VN Mode: Point-to-Point
  Enode Information
    Enode-MAC: 10:10:94:01:00:02,      Interface: xe-0/0/20
    Active VN_Ports : 1
    VN_Port Information
      VN-Port MAC: 0e:fc:00:01:0a:01
      Active Sessions : 1
      Session Information
        Vlink far-end VN-Port-MAC: 0e:fc:00:01:0b:01
    Enode-MAC: 10:10:94:01:00:02,      Interface: xe-0/0/21
    Active VN_Ports : 1
    VN_Port Information
      VN-Port MAC: 0e:fc:00:01:0b:01
      Active Sessions : 1
      Session Information
        Vlink far-end VN-Port-MAC: 0e:fc:00:01:0a:01
```

List the FIP snooping information on aggregation layer transit switch TS2 using the operational mode command **show fip snooping detail**

```
user@switch> show fip snooping detail
VLAN: vlan200, Mode: VN2VN Snooping
FC-MAP: 0e:fc:00
Beacon_Period: 90000
VN2VN Mode: Point-to-Point
  Enode Information
    Enode-MAC: 10:10:94:01:00:02,      Interface: xe-0/0/30
    Active VN_Ports : 1
    VN_Port Information
      VN-Port MAC: 0e:fc:00:01:0b:01
      Active Sessions : 1
      Session Information
        Vlink far-end VN-Port-MAC: 0e:fc:00:01:0a:01
    Enode-MAC: 10:10:94:01:00:02,      Interface: xe-0/0/31
    Active VN_Ports : 1
    VN_Port Information
      VN-Port MAC: 0e:fc:00:01:0a:01
      Active Sessions : 1
      Session Information
        Vlink far-end VN-Port-MAC: 0e:fc:00:01:0b:01
```

List the FIP snooping information on transit switch TS3 using the operational mode command **show fip snooping detail**

```
user@switch> show fip snooping detail
VLAN: vlan200, Mode: VN2VN Snooping
FC-MAP: 0e:fd:00
Beacon_Period: 90000
VN2VN Mode: Point-to-Point
  Enode Information
```

```

Enode-MAC: 10:10:94:01:00:02,      Interface: xe-0/0/10
Active VN_Ports : 1
VN_Port Information
VN-Port MAC: 0e:fd:00:00:0b:01
Active Sessions : 1
Session Information
Vlink far-end VN-Port-MAC: 0e:fd:00:00:0a:01
Enode-MAC: 10:10:94:01:00:02,      Interface: xe-0/0/11
Active VN_Ports : 1
VN_Port Information
VN-Port MAC: 0e:fd:00:00:0a:01
Active Sessions : 1
Session Information
Vlink far-end VN-Port-MAC: 0e:fd:00:00:0b:01

```

**Meaning** The **show fip snooping detail** command lists all of the transit switch information about VN2VN\_Port FIP snooping and VN2VF\_Port FIP snooping on each transit switch. The command shows that:

- The VLAN is **vlan200**.
- The mode is FIP snooping mode **VN2VN**, for VN2VN\_Port FIP snooping. (If the Mode field shows **VN2VF**, then the FIP snooping mode is VN2VF\_Port FIP snooping.)
- The beacon period is **90000**.
- The interfaces connected to the ENodes are **xe-0/0/20** and **xe-0/0/21** on transit switch TS1, **xe-0/0/30** and **xe-0/0/31** on aggregation layer transit switch TS2, and **xe-0/0/10** and **xe-0/0/11** on transit switch TS3. Because the transit switches are transparent passthrough switches, the network-facing trunk ports “see” the FCoE host ENodes at the far end of the VN2VN\_Port virtual link.

In addition, this useful command shows information about the ENodes and the VN2VN\_Port sessions.

## Enabling and Disabling CoS OxID Hash Control on Standalone Switches

The originator exchange identifier (OxID) field is one of several fields that the switch can use in its hash function computation for FCoE traffic load balancing over multiple outgoing links in an Ethernet link aggregation group (LAG) on ports that face an FCoE forwarder (FCF). You can configure whether or not the switch uses the OxID in the hash computation.

Including the OxID field in the load-balancing hash computation allows different exchanges between a pair of Fibre Channel (FC) endpoints (such as an FCoE host and an FC storage device) to take different paths across the network, thus improving the aggregate network throughput.

However, if the paths between different sets of FC endpoints have common links, congestion on one set of FC endpoints can affect the other set of endpoints. Such congestion can happen if the FCoE traffic on the two sets of endpoints uses the same priority (IEEE 802.1p code point). It is common for networks to use priority 3 (IEEE 802.1p code point 011) for FCoE traffic. However, you can assign different IEEE priorities to different lossless FCoE flows as described in "[Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows](#)" on page 5837 to further separate the traffic flows.

OxID hash control is enabled by default.

- To enable OxID hash control field for FCoE traffic load balancing:

```
[edit forwarding-options hash-key]
user@switch# set family fcoe oxid enable
```

- To disable OxID hash control field for FCoE traffic load balancing:

```
[edit forwarding-options hash-key]
user@switch# set family fcoe oxid disable
```

## Configuring VLANs for FCoE Traffic on an FCoE Transit Switch

When you configure a switch as a Fibre Channel over Ethernet (FCoE) transit switch, you must configure a VLAN that transports only FCoE traffic. FCoE traffic requires a dedicated VLAN and cannot share a VLAN with any other type of traffic. Because FCoE traffic is tagged traffic, the port (or interface) mode cannot be access mode, it must be either tagged-access port-mode (for switches that run the original CLI) or trunk interface-mode (for switches that run the Enhanced Layer 2 Software (ELS) CLI).

However, each interface that belongs to an FCoE VLAN must not only transport the tagged FCoE traffic, it must also transport the untagged FCoE Initialization Protocol (FIP) traffic. FIP communicates with the storage area network (SAN) Fibre Channel (FC) switch to set up the FCoE session for the FCoE client.

To transport untagged traffic on a tagged-access or trunk mode interface, the interface must have a native VLAN configured on it. Therefore, each interface that belongs to an FCoE VLAN must also have a native VLAN on it.

There are slight differences in the way you configure a native VLAN on an interface, depending on whether the switch uses the ELS CLI or the original CLI. This topic describes both methods.

**NOTE:** FCoE VLANs (any VLAN that carries FCoE traffic) support only Spanning Tree Protocol (STP) and link aggregation group (LAG) Layer 2 features.

FCoE traffic cannot use a standard LAG because traffic might be hashed to different physical LAG links on different transmissions. This breaks the (virtual) point-to-point link that Fibre Channel traffic requires. If you configure a standard LAG interface for FCoE traffic, FCoE traffic might be rejected by the FC SAN.

QFabric systems support a special LAG called an FCoE LAG, which enables you to transport FCoE traffic and regular Ethernet traffic (traffic that is not FCoE traffic) across the same link aggregation bundle. Standard LAGs use a hashing algorithm to determine which physical link in the LAG is used for a transmission, so communication between two devices might use different physical links in the LAG for different transmissions. An FCoE LAG ensures that FCoE traffic uses the same physical link in the LAG for requests and replies in order to preserve the virtual point-to-point link between the FCoE device converged network adapter (CNA) and the FC SAN switch across the QFabric system Node device. An FCoE LAG does not provide load balancing or link redundancy for FCoE traffic. However, regular Ethernet traffic uses the standard hashing algorithm and receives the usual LAG benefits of load balancing and link redundancy in an FCoE LAG.

**NOTE:** To configure an FCoE VLAN on a QFX3500 switch that you are using as an FCoE-FC gateway, you must also configure an FCoE VLAN interface as described in *Configuring an FCoE VLAN Interface on an FCoE-FC Gateway*. (Only the QFX3500 switch supports FCoE-FC gateway configuration.)

---

FCoE VLAN configuration includes:

- Configuring a VLAN to use as a dedicated FCoE VLAN
- Configuring the interface members of the FCoE VLAN.
- Configuring a native VLAN for FIP traffic.

This topic includes two configuration procedures, one for switches that run the original CLI, and one for switches that run the ELS CLI.

## Original CLI Configuration

To configure an FCoE VLAN on a non-ELS switch:

1. Configure a dedicated FCoE VLAN:

```
[edit vlans]
user@switch# set vlan-name vlan-id vlan-id
```

For example, to configure a VLAN named **fcoe\_vlan** with a VLAN ID of **100** as the FCoE VLAN:

```
[edit vlans]
user@switch# set fcoe_vlan vlan-id 100
```

2. Configure the FCoE VLAN on the interface (use **ethernet-switching** as the family and **tagged-access** as the port mode):

```
[edit interfaces]
user@switch# set interface-name unit unit family family port-mode mode vlan members
vlan-name
```

For example, to configure the interface **xe-0/0/10** as a member of the FCoE VLAN **fcoe\_vlan**:

```
[edit interfaces]
user@switch# set xe-0/0/10 unit 0 family ethernet-switching port-mode tagged-access vlan
members fcoe_vlan
```

3. Configure the Ethernet interface membership in the FCoE VLAN:

```
[edit vlans]
user@switch# set vlan-name interface interface-name
```

For example, to assign the interface **xe-0/0/10.0** to the FCoE VLAN named **fcoe\_vlan**:

```
[edit vlans]
user@switch# set fcoe_vlan interface xe-0/0/10.0
```

4. Configure a native VLAN for the untagged FIP traffic:

```
[edit vlans]
user@switch# set native vlan-id vlan-id
```

For example, to configure the native VLAN with a VLAN ID of 1:

```
[edit vlans]
user@switch# set native vlan-id 1
```

5. Assign member interfaces to the native VLAN:

```
[edit interfaces]
user@switch# set interface-name unit unit family family native-vlan-id vlan-id
```

For example, to configure the interface **xe-0/0/10** as a member of the native VLAN with the native VLAN ID 1:

```
[edit interfaces]
user@switch# set xe-0/0/10 unit 0 family ethernet-switching native-vlan-id 1
```

## ELS CLI Configuration

To configure an FCoE VLAN on a switch running ELS:

1. Configure a dedicated FCoE VLAN:

```
[edit vlans]
user@switch# set vlan-name vlan-id vlan-id
```

For example, to configure a VLAN named **fcoe\_vlan** with a VLAN ID of **100** as the FCoE VLAN:

```
[edit vlans]
user@switch# set fcoe_vlan vlan-id 100
```

2. Configure the FCoE VLAN on the interface (use **ethernet-switching** as the family and **trunk** as the interface mode):

```
[edit interfaces]
user@switch# set interface-name unit unit family family interface-mode mode vlan members
vlan-name
```

For example, to configure the interface **xe-0/0/10** as a member of the FCoE VLAN **fcoe\_vlan**:

```
[edit interfaces]
user@switch# set xe-0/0/10 unit 0 family ethernet-switching interface-mode trunk vlan
members fcoe_vlan
```

3. Configure the Ethernet interface membership in the FCoE VLAN:

```
[edit vlans]
user@switch# set vlan-name interface interface-name
```

For example, to assign the interface **xe-0/0/10.0** to the FCoE VLAN named **fcoe\_vlan**:

```
[edit vlans]
user@switch# set fcoe_vlan interface xe-0/0/10.0
```

4. Configure a native VLAN on the physical Ethernet interface for the untagged FIP traffic:

```
[edit interfaces]
user@switch# set interface-name native-vlan-id vlan-id
```

For example, to configure the native VLAN on interface **xe-0/0/10** with a VLAN ID of **1**:

```
[edit interfaces]
user@switch# set xe-0/0/10 native-vlan-id 1
```

5. Configure the Ethernet interface as a member of the native VLAN:

```
[edit interfaces]
user@switch# set interface-name unit unit family family vlan members native-vlan-id
```

**NOTE:** The *native-vlan-id* number must be the same as the native VLAN ID number that you configured on the physical Ethernet interface (see step 4).

For example, to configure the interface **xe-0/0/10** as a member of the native VLAN with the native VLAN ID **1**:

```
[edit interfaces]
```

```
user@switch# set xe-0/0/10 unit 0 family ethernet-switching vlan members 1
```

## Configuring VN2VF\_Port FIP Snooping and FCoE Trusted Interfaces on an FCoE Transit Switch

VN\_Port to VF\_Port (VN2VF\_Port) Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) snooping uses information gathered during FIP discovery and login to create firewall filters that provide security against unauthorized access to the FC switch or FCoE forwarder (FCF) through the switch when the switch is acting as an FCoE transit switch. The firewall filters allow only FCoE devices that successfully log in to the FC fabric to access the FCF through the transit switch. VN2VF\_Port FIP snooping provides security for the point-to-point virtual links that connect host FCoE Nodes (ENodes) and FCFs in the FCoE VLAN by denying access to any device that does not successfully log in to the FCF.

VN2VF\_Port FIP snooping is disabled by default. You enable VN2VF\_Port FIP snooping on a per-VLAN basis for VLANs that carry FCoE traffic. Ensure that a VLAN that carries FCoE traffic carries only FCoE traffic, because enabling VN2VF\_Port FIP snooping denies access for all other Ethernet traffic.

**NOTE:** All of the transit switch ports are untrusted by default. If an ENode on an FCoE device logs in to an FCF before you enable VN2VF\_Port FIP snooping on the VLAN and you then enable VN2VF\_Port FIP snooping, the transit switch denies traffic from the ENode because the transit switch has not snooped (learned) the ENode state. The following process automatically logs the ENode back in to the FCF to reestablish the connection:

1. VN2VF\_Port FIP snooping is enabled on an FCoE VLAN on the switch.
2. The switch denies existing connections between servers and the FCF on the FCoE VLAN by filtering the FCoE traffic and FIP traffic, so no keepalive messages from the ENodes reach the FCF.
3. The FCF port timer for each ENode and for each VN\_Port on each ENode expires.
4. The FCF sends each ENode whose port timer has expired a Clear Virtual Links (CVL) message.
5. The CVL message causes the ENode to log in again.

Because the FCF is a trusted source, you configure interfaces that connect to the FCF as FCoE trusted interfaces. FCoE trusted interfaces do not filter traffic (FIP snooping filtering should occur only at the FCoE access edge), but VN2VF\_Port FIP snooping continues to run on trusted interfaces so that the switch learns the FCF state.

**NOTE:** Do not configure ENode-facing interfaces both with FIP snooping enabled and as trusted interfaces. FCoE VLANs with interfaces that are directly connected to FCoE hosts should be configured with FIP snooping enabled and the interfaces should *not* be trusted interfaces. Ethernet interfaces that are connected to an FCF should be configured as trusted interfaces and should not have FIP snooping enabled. Interfaces that are connected to a transit switch that is performing FIP snooping can be configured as trusted interfaces if the FCoE VLAN is not enabled for FIP snooping.

Optionally, you can specify an FC-MAP value for each FCoE VLAN. On a given FCoE VLAN, the switch learns only FCFs that have a matching FC-MAP value. The default FC-MAP value is 0EFC00h for all FC devices. (Enter hexadecimal values for FC-MAP preceded by the hexadecimal indicator "0x"—for example, 0x0EFC00.) If you change the FC-MAP value of an FCF, change the FC-MAP value for the FCoE VLAN it belongs to on the switch and on the servers you want to communicate with the FCF. An FCoE VLAN can have one and only one FC-MAP value.

**NOTE:** The default enhanced FIP snooping scaling supports 2,500 sessions. On QFabric systems, starting with Junos OS Release 13.2X52, you can disable enhanced FIP snooping scaling on a per-VLAN basis if you want to do so, but only 376 sessions are supported if you disable enhanced FIP snooping scaling.

There are differences in the way you configure FIP snooping and FCoE trusted interfaces on a switch that depend on whether the switch uses the original CLI or the Enhanced Layer 2 Software (ELS) CLI. This topic includes two configuration procedures, one for switches that run the original CLI, and one for switches that run the ELS CLI.

### Original CLI Configuration

To enable VN2VF\_Port FIP snooping:

- To enable VN2VF\_Port FIP snooping on a single VLAN and specify the optional FC-MAP value:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan vlan-name examine-fip fc-map fc-map-value
```

For example, to enable VN2VF\_Port FIP snooping on a VLAN named **san1\_vlan** and change the FC-MAP value to **0x0EFC03**:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan san1_vlan examine-fip fc-map 0x0EFC03
```

**NOTE:** Changing the FC-MAP value causes all logins to drop and forces ENodes to log in again.

- To enable VN2VF\_Port FIP snooping on all VLANs and use the default FC-MAP value:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan all examine-fip
```

- To configure an interface as an FCoE trusted interface:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface interface-name fc-e-trusted
```

For example, to configure interface **xe-0/0/30** as an FCoE trusted interface:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set interface xe-0/0/30 fc-e-trusted
```

### ELS CLI Configuration

To enable VN2VF\_Port FIP snooping:

- To enable VN2VF\_Port FIP snooping on a VLAN and specify the optional FC-MAP value:

```
[edit]
user@switch# set vlans vlan-name forwarding-options fip-security fc-map fc-map-value
examine-vn2vf
```

For example, to enable VN2VF\_Port FIP snooping on a VLAN named **san1\_vlan** and change the FC-MAP value to **0x0EFC03**:

```
[edit]
user@switch# set vlans san1_vlan forwarding-options fip-security fc-map 0x0EFC03
examine-vn2vf
```

**NOTE:** Changing the FC-MAP value causes all logins to drop and forces ENodes to log in again.

- To configure an interface as an FCoE trusted interface:

```
[edit]
user@switch# set vlans vlan-name forwarding-options fip-security interface interface-name
fcoe-trusted
```

For example, to configure interface **xe-0/0/30** on VLAN named **san1\_vlan** as an FCoE trusted interface:

```
[edit]
user@switch# set vlans san1_vlan forwarding-options fip-security interface xe-0/0/30
fcoe-trusted
```

## Enabling VN2VN\_Port FIP Snooping and Configuring the Beacon Period on an FCoE Transit Switch

VN\_Port to VN\_Port (VN2VN\_Port) FIP snooping on an FCoE transit switch provides security to help prevent unauthorized access and data transmission on a bridge that connects ENodes in the Ethernet network. VN2VN\_Port FIP snooping provides security for virtual links by creating filters based on information gathered (snooped) about FCoE devices during FIP transactions.

VN2VN\_Port FIP snooping is conceptually similar to VN2VF\_Port FIP snooping between VN\_Ports and VF\_Ports, but VN2VN\_Port FIP snooping does not require traffic between VN\_Ports to traverse the Fibre Channel (FC) switch or FCoE forwarder (FCF). Instead, a VN\_Port communicates transparently through the transit switch on a virtual link that emulates a direct connection to the VN\_Port at the other end of the virtual link.

VN2VN\_Port FIP snooping is disabled by default. You enable VN2VN\_Port FIP snooping on a per-VLAN basis on VLANs that carry VN2VN\_Port FCoE traffic. Ensure that the VLAN carries only FCoE traffic between VN\_Ports, because enabling VN2VN\_Port FIP snooping denies access for all other traffic, including VN2VF\_Port FIP snooping traffic.

All ENodes that you want to communicate using VN2VN\_Port FIP snooping must use an FCoE VLAN dedicated to VN2VN\_Port traffic. You cannot mix VN2VN\_Port FIP snooping traffic with VN2VF\_Port FIP snooping traffic in the same FCoE VLAN.

**NOTE:** An FCoE VLAN can support either VN2VF\_Port FIP snooping or VN2VN\_Port FIP snooping, but not both. Configure separate FCoE VLANs for VN2VF\_Port FIP snooping traffic and for VN2VN\_Port FIP snooping traffic. On FCoE VLANs that are configured as VN2VN\_Port FIP snooping VLANs, VN2VF\_Port traffic is dropped.

The *beacon period* is conceptually similar to the FIP keepalive period (timer) for VN2VF\_Port FIP snooping virtual link maintenance. The beacon period performs virtual link maintenance for VN2VN\_Port FIP snooping. It is the time interval between messages that verify the connection is still valid and the device at the other end of the virtual link is still reachable. You set the beacon period value for each FCoE VLAN that you configure to do VN2VN\_Port FIP snooping.

**NOTE:** In addition to enabling VN2VN\_Port FIP snooping and configuring the beacon period, you must also configure a dedicated FCoE VLAN for the VN2VN\_Port traffic, and set the FCoE transit switch ports in the proper port mode and trusted or untrusted state (interfaces are untrusted by default). See the VN2VN\_Port FIP snooping configuration example topics for complete configurations of several common network topologies.

There are differences in the way you configure a native VLAN on an interface that depend on whether the switch uses the original CLI or the Enhanced Layer 2 Software (ELS) CLI. This topic includes two configuration procedures, one for switches that run the original CLI, and one for switches that run the ELS CLI.

#### Original CLI Configuration

To enable VN2VN\_Port FIP snooping and set the beacon period on an FCoE VLAN that is dedicated to VN2VN\_Port traffic:

- [edit ethernet-switching-options secure-access-port]  
user@switch# **set vlan *vlan-name* examine-fip *examine-vn2vn* beacon-period *milliseconds***

For example, to enable VN2VN\_Port FIP snooping on a VLAN named **vlan200** and set the beacon period to **90000** milliseconds:

```
[edit ethernet-switching-options secure-access-port]
user@switch# set vlan vlan200 examine-fip examine-vn2vn beacon-period 90000
```

#### ELS CLI Configuration

To enable VN2VN\_Port FIP snooping and set the beacon period on an FCoE VLAN that is dedicated to VN2VN\_Port traffic:

- [edit]  
user@switch# **set vlans *vlan-name* forwarding-options fip-security examine-vn2vn beacon-period *milliseconds***

For example, to enable VN2VN\_Port FIP snooping on a VLAN named **vlan200** and set the beacon period to **90000** milliseconds:

```
[edit]
user@switch# set vlans vlan200 forwarding-options fip-security examine-vn2vn beacon-period
90000
```

- [Applying an Application Map to an Interface for DCBX Application Protocol TLV Exchange on page 5675](#)

## Configuring the DCBX Mode

You can configure the DCBX mode that an interface uses to communicate with the connected peer. Three DCBX modes are supported:

- Autonegotiation—The interface negotiates with the connected peer to determine the DCBX mode. This is the default DCBX mode.
- IEEE DCBX—The interface uses IEEE DCBX type, length, and value (TLV) to exchange DCBX information with the connected peer. QFX3500 Node devices come up with IEEE DCBX enabled by default and then autonegotiate with the connected peer to determine the final DCBX mode.
- DCBX Version 1.01—The interface uses Converged Enhanced Ethernet (CEE) DCBX version 1.01 TLVs to exchange DCBX information with the connected peer. QFabric system Node devices other than QFX3500 switches come up with DCBX version 1.01 enabled by default and then autonegotiate with the connected peer to determine the final DCBX mode.

**NOTE:** Pre-CEE (pre-DCB) versions of DCBX such as DCBX version 1.00 are not supported. If an interface receives an LLDP frame with pre-CEE DCBX TLVs, the system drops the frame.

---

Configure the DCBX mode by specifying the mode for one interface or for all interfaces.

- To configure the DCBX mode, specify the interface and the mode:

```
[edit protocols dcbx]  
user@switch# set interface interface-name mode (auto-negotiate | ieee-dcbx |  
dcbx-version-1.01)
```

For example, to configure DCBX version 1.01 on interface **xe-0/0/21**:

```
user@switch# set protocols dcbx interface xe-0/0/21 mode dcbx-version-1.01
```

To configure IEEE DCBX on all interfaces:

```
user@switch# set protocols dcbx interface all mode ieee-dcbx
```

## Configuring DCBX Autonegotiation

Data Center Bridging Capability Exchange protocol (DCBX) discovers the data center bridging (DCB) capabilities of peers by exchanging feature configuration information. DCBX also detects feature misconfiguration and mismatches, and can configure DCB on peers. DCBX is an extension of the Link Layer Discovery Protocol (LLDP), and LLDP must remain enabled on every interface for which you want to use DCBX. If you attempt to enable DCBX on an interface on which LLDP is disabled, the configuration commit operation fails.

**NOTE:** LLDP and DCBX are enabled by default on all interfaces.

The switch supports DCBX autonegotiation for:

- Priority-based flow control (PFC) configuration
- Layer 2 and Layer 4 applications such as Fibre Channel over Ethernet (FCoE) and Internet Small Computer System Interface (iSCSI)
- Enhanced transmission selection (ETS) advertisement

DCBX autonegotiation is configured on a per-interface basis for each supported feature or application. The PFC and application DCBX exchanges use autonegotiation by default. The default autonegotiation behavior is:

- DCBX is enabled on the interface if the connected peer device also supports DCBX.
- DCBX is disabled on the interface if the connected peer device does not support DCBX.

You can override the default behavior for each feature by turning off autonegotiation to force an interface to enable or disable the feature.

Autonegotiation of ETS means that when ETS is enabled on an interface (priority groups are configured), the interface advertises its ETS configuration to the peer device. In this case, priorities (forwarding classes) that are not part of a priority group (forwarding class set) receive no bandwidth and are advertised in an automatically generated default forwarding class. If ETS is not enabled on an interface (no priority groups are configured), all of the priorities are advertised in one automatically generated default priority group that receives 100 percent of the port bandwidth.

Disabling ETS autonegotiation prevents the interface from sending the Recommendation TLV or the Configuration TLV to the connected peer.

On interfaces that use IEEE DCBX mode to exchange DCBX parameters, you can disable autonegotiation of the enhanced transmission selection (ETS) Recommendation TLV to the peer if you want an asymmetric ETS configuration between the peers. DCBX still exchanges the ETS Configuration TLV if you disable the ETS Recommendation TLV.

Autonegotiation of PFC means that when PFC is enabled on an interface, if the peer device connected to the interface supports PFC and is provisioned compatibly with the switch, DCBX sets the PFC operational state to enabled. If the peer device connected to

the interface does not support PFC or is not provisioned compatibly with the switch, DCBX sets the operational state to disabled.

In addition, if the peer advertises that it is “willing” to learn its PFC configuration from the switch, DCBX pushes the switch’s PFC configuration to the peer and does not check the peer’s administrative state. The switch does not learn PFC configuration from peers (the switch does not advertise its state as “willing”).

Disabling PFC autonegotiation prevents the interface from exchanging PFC configuration information with the peer. It forces the interface to enable PFC if PFC is configured on the interface or to disable PFC if PFC is not configured on the interface. If you disable PFC autonegotiation, the assumption is that the peer is also configured manually.

Autonegotiation of applications depends on whether or not you apply an application map to an interface. If you apply an application map to an interface, the interface autonegotiates DCBX for each application in the application map. PFC must be enabled on the FCoE priority (the FCoE IEEE 802.1p code point) for the interface to advertise the FCoE application. The interface only advertises applications that are included in the application map.

For example, if you apply an application map to an interface and the application map does not include the FCoE application, then that interface does not perform DCBX advertisement of FCoE.

If you do not apply an application map to an interface, DCBX does not advertise applications on that interface, with the exception of FCoE, which is handled differently than other applications.

**NOTE:** If you do not apply an application map to an interface, the interface performs autonegotiation of FCoE if the interface carries traffic in the FCoE forwarding class and also has PFC enabled on the FCoE priority. On such interfaces, if DCBX detects that the peer device connected to the interface supports FCoE, the switch advertises its FCoE capability and IEEE 802.1p code point on that interface. If DCBX detects that the peer device connected to the interface does not support FCoE, DCBX marks that interface as “FCoE down” and disables FCoE on the interface.

---

When DCBX marks an interface as “FCoE down,” the behavior of the switch depends on how you use it in the network:

- When the switch acts as an FCoE-FC gateway, it does not send or receive FCoE Initialization Protocol (FIP) packets.
- When the switch acts as an FCoE transit switch, the interface drops all of the FIP packets it receives. In addition, FIP packets received from an FCoE forwarder (FCF) are not forwarded to interfaces marked as “FCoE down.”

Disabling autonegotiation prevents the interface from exchanging application information with the peer. In this case, the assumption is that the peer is also configured manually.

To disable DCBX autonegotiation of PFC, applications (including FCoE), and ETS using the CLI:

1. Turn off autonegotiation for PFC.

```
[edit]
user@switch# set protocols dcbx interface interface-name priority-flow-control
no-auto-negotiation
```

2. Turn off autonegotiation for applications.

```
[edit]
user@switch# set protocols dcbx interface interface-name applications no-auto-negotiation
```

3. Turn off autonegotiation for ETS.

```
[edit]
user@switch# set protocols dcbx interface interface-name enhanced-transmission-selection
no-auto-negotiation
```

To disable autonegotiation of the ETS Recommendation TLV so that DCBX exchanges only the ETS Configuration TLV:

- [edit protocols dcbx interface *interface-name*]  
user@switch# set enhanced-transmission-selection no-recommendation-tlv

#### Related Documentation

- [Example: Configuring CoS PFC for FCoE Traffic on page 5606](#)
- [Disabling the ETS Recommendation TLV on page 5672](#)
- [Understanding DCBX Application Protocol TLV Exchange on page 5589](#)

## Disabling the ETS Recommendation TLV

The enhanced transmission selection (ETS) Recommendation TLV communicates the ETS settings that the switch wants the connected peer interface to use. If the peer interface is “willing,” the peer interface changes its configuration to match the configuration in the ETS Recommendation TLV. By default, the switch interfaces send the ETS Recommendation TLV to the peer. The settings communicated are the egress ETS settings defined by configuring hierarchical scheduling on the interface.

We recommend that you use the same ETS settings on the connected peer that you use on the switch interface and that you leave the ETS Recommendation TLV enabled. However, on interfaces that use IEEE DCBX as the DCBX mode, if you want an asymmetric configuration between the switch interface and the connected peer, you can disable the ETS Recommendation TLV.

**NOTE:** Disabling the ETS Recommendation TLV on interfaces that use DCBX version 1.01 as the DCBX mode has no effect and does not change DCBX behavior.

If you disable the ETS Recommendation TLV, the switch still sends the ETS Configuration TLV to the connected peer. The result is that the connected peer is informed about the switch DCBX ETS configuration, but even if the peer is “willing,” the peer does not change its configuration to match the switch configuration. This is asymmetric configuration—the two interfaces can have different parameter values for the ETS attribute.

To disable the ETS Recommendation TLV:

- [edit protocols dcbx interface *interface-name*]  
user@switch# **set enhanced-transmission-selection no-recommendation-tlv**

## Defining an Application for DCBX Application Protocol TLV Exchange

Define each application for which you want DCBX to exchange application protocol information. You can define Layer 2 and Layer 4 applications. After you define applications, you map them to IEEE 802.1p code points, and then apply the application map to the interfaces on which you want DCBX to exchange application protocol information with connected peers. (See *Related Documentation* for how to configure application maps and apply them to interfaces, and for an example of the entire procedure that also includes classifier configuration.)

**NOTE:** In Junos OS Release 12.1, the FCoE application was configured by default, so you did not need to configure it in an application map. In Junos OS Release 12.2, if you want DCBX to advertise the FCoE application on an interface and you apply an application map to that interface, you must explicitly configure FCoE in the application map. You also must enable priority-based flow control (PFC) on the FCoE code point on all interfaces that you want to advertise FCoE. If you apply an application map to an interface, the interface sends DCBX TLVs only for the applications configured in the application map.

Define Layer 2 applications by mapping an application name to an EtherType. Define Layer 4 applications by mapping an application name to a protocol (TCP or UDP) and a destination port.

- To define a Layer 2 application, specify the name of the application and its EtherType:

```
[edit applications]
user@switch# set application application-name ether-type ether-type
```

For example, to configure an application named **PTP** (for Precision Time Protocol) that uses the EtherType **0x88F7**:

```
user@switch# set applications application ptp ether-type 0x88F7
```

- To define a Layer 4 application, specify the name of the application, its protocol (TCP or UDP), and its destination port:

```
[edit]
user@switch# set applications application application-name protocol (tcp | udp)
destination-port port-value
```

For example, to configure an application named **iscsi** (for Internet Small Computer System Interface) that uses the protocol **TCP** and the destination port **3260**:

```
user@switch# set applications application iscsi protocol tcp destination-port 3260
```

## Configuring an Application Map for DCBX Application Protocol TLV Exchange

After you define applications for which you want to exchange DCBX application protocol information, map the applications to IEEE 802.1p code points. The IEEE 802.1p code points identify incoming traffic and allow you to map that traffic to the desired application. You then apply the application map to the interfaces on which you want DCBX to exchange application protocol information with connected peers. (See *Related Documentation* for how to define applications and apply the application map to interfaces, and for an example of the entire procedure that also includes classifier configuration.)

**NOTE:** In Junos OS Release 12.1, the FCoE application was configured by default, so you did not need to configure it in an application map. In Junos OS Release 12.2, if you want DCBX to advertise the FCoE application on an interface and you apply an application map to that interface, you must explicitly configure FCoE in the application map. You also must enable priority-based flow control (PFC) on the FCoE code point on all interfaces that you want to advertise FCoE. If you apply an application map to an interface, the interface sends DCBX TLVs only for the applications configured in the application map.

Configure an application map by creating an application map name and mapping an application to one or more IEEE 802.1p code points.

- To define an application map, specify the name of the application map, the name of the application, and the IEEE 802.1p code points of the incoming traffic that you want to associate with the application in the application map:

```
[edit policy-options]
user@switch# set application-maps application-map-name application application-name
code-points [ aliases ] [ bit-patterns ]
```

For example, to configure an application map named **ptp-app-map** that includes an application named **PTP** (for Precision Time Protocol) and map the application to IEEE 802.1p code points **001** and **101**:

```
user@switch# set policy-options application-maps ptp-app-map application ptp code points
[ 001 101 ]
```

## Applying an Application Map to an Interface for DCBX Application Protocol TLV Exchange

After you define applications and map them to IEEE 802.1p code points in an application map, apply the application map to the interfaces on which you want DCBX to exchange the application protocol information with connected peers. (See *Related Documentation* for how to define applications and configure application maps to interfaces, and for an example of the entire procedure that also includes classifier configuration.)

**NOTE:** In Junos OS Release 12.1, the FCoE application was configured by default, so you did not need to configure it in an application map. In Junos OS Release 12.2, if you want DCBX to advertise the FCoE application on an interface and you apply an application map to that interface, you must explicitly configure FCoE in the application map. You also must enable priority-based flow control (PFC) on the FCoE code point on all interfaces that you want to advertise FCoE. If you apply an application map to an interface, the interface sends DCBX TLVs only for the applications configured in the application map.

- To apply an application map to a DCBX interface, specify the DCBX interface and the application map name:

```
[edit protocols]
```

```
user@switch# set dcbx interface interface-name application-map application-map-name
```

For example, to apply an application map named **ptp-app-map** on interface **xe-0/0/11**:

```
user@switch# set protocols dcbx interface xe-0/0/11 application-map ptp-app-map
```

## examine-vn2vf

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | examine-vn2vf   |
| <b>Hierarchy Level</b>          | [edit <a href="#">vlans</a> <i>vlan-name</i> <a href="#">forwarding-options</a> <a href="#">fip-security</a> ]  |
| <b>Release Information</b>      | Statement introduced for the ELS CLI in Junos OS Release 13.2 for the QFX Series.   |
| <b>Description</b>              | <p> <b>NOTE:</b> This statement supports the Enhanced Layer 2 Software (ELS) CLI. If your switch runs the original (non-ELS) software, see <i>examine-fip</i>. For ELS details, see “<a href="#">Getting Started with Enhanced Layer 2 Software</a>” on page 43.</p> <p>Enable VN_Port to VF_Port (VN2VF_Port) FIP snooping on the specified VLAN. Ensure that the VLAN is a dedicated FCoE VLAN that transports only FCoE traffic.</p> <p>If the switch also performs VN_Port to VN_Port (VN2VN_Port) FIP snooping, ensure that the VN2VN_Port traffic is on a different VLAN than the VN2VF_Port traffic. You cannot mix VN2VF_Port and VN2VN_Port traffic in the same VLAN, so you must use separate VLANs for VN2VF_Port and VN2VN_Port traffic.</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">examine-vn2vn on page 5692</a></li> <li>• <a href="#">Understanding VN_Port to VF_Port FIP Snooping on an FCoE Transit Switch on page 5531</a></li> <li>• <a href="#">Understanding FCoE Transit Switch Functionality on page 5524</a></li> <li>• <a href="#">Configuring VN2VF_Port FIP Snooping and FCoE Trusted Interfaces on an FCoE Transit Switch on page 5662</a></li> </ul>  |

## examine-vn2vn

**Syntax** `examine-vn2vn {  
    beacon-period milliseconds;  
}`

**Hierarchy Level** Original CLI

[edit ethernet-switching options secure-access-port vlan (all | *vlan-name*) examine-fip]

ELS CLI for Platforms that Support FCoE

[edit *vlangs* *vlan-name* forwarding-options fip-security]

**NOTE:** The `examine-vn2vn` configuration statement is in a different hierarchy on the original CLI than on the Enhanced Layer 2 Software (ELS) CLI.

**Release Information** Statement introduced in Junos OS Release 12.2 for the QFX Series.

Statement introduced for the ELS CLI in Junos OS Release 13.2 for the QFX Series.

**Description** Enable VN\_Port to VN\_Port (VN2VN) FIP snooping on a specified VLAN. The VLAN must be a dedicated FCoE VLAN that transports only FCoE traffic. A VLAN cannot support VN2VN FIP snooping and VN\_Port to VF\_Port FIP snooping (VN2VF) simultaneously. Configure separate VLANs for VN2VN FIP snooping and VN2VF FIP snooping.

When you enable VN2VN FIP snooping on a VLAN, the VN2VF session filters are removed and the all existing VN2VF sessions are terminated.

The remaining statement is explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## fc-map

---

**Syntax** `fc-map fc-map-value;`

**Hierarchy Level** Original CLI

[edit ethernet-switching options secure-access-port vlan (all | *vlan-name*) examine-fip]

ELS CLI for Platforms that Support FCoE

[edit **v**lans *vlan-name* **f**orwarding-**o**ptions **f**ip-**s**ecurity]

**NOTE:** The `fc-map` configuration statement is in a different hierarchy on the original CLI than on the Enhanced Layer 2 Software (ELS) CLI.

QFX Series that Support FCoE-FC Gateway Configuration

[edit fc-fabrics *fc-fabric-name* protocols fip]

**Release Information** Statement introduced in Junos OS Release 10.4 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced for the ELS CLI in Junos OS Release 13.2 for the QFX Series.

**Description** Set the FCoE mapped address prefix (FC-MAP) value for the FCoE VLAN to match the FC switch (or FCoE forwarder) FC-MAP value for the FC fabric. The FC-MAP value is a unique MAC address prefix an FC switch uses to identify FCoE traffic for a given FC fabric (traffic on a particular FCoE VLAN).

You can configure the FC-MAP value or use the default value. The default FC-MAP value is different for VN\_Port to VF\_Port (VN2VF\_Port) FIP snooping (0x0EFC00) than for VN\_Port to VN\_Port (VN2VN\_Port) FIP snooping.

The FC switch provides the FC-MAP value to FCoE nodes (ENodes) in the FIP discovery advertisement message. If the EX Series switch or the QFX Series FCoE VLAN FC-MAP value does not match the FC switch FC-MAP value, neither device discovers the FC switch on that VLAN, and the ENodes on that VLAN cannot access the FC switch. The FC switch accepts only FCoE traffic that uses the correct FC-MAP value as part of the VN\_Port MAC address.

When the QFX Series acts as an FCoE-FC gateway, the FC-MAP value for the gateway and the FCoE devices must match the FC switch FC-MAP value in order to communicate with the FC switch.

**NOTE:** Changing the FC-MAP value causes all logins to drop and forces the ENodes to log in again.

**Options** `fc-map-value`—FC-MAP value, hexadecimal value preceded by “0x”.

**Range:** 0x0EFC00 through 0x0EFCFF

**Default:** 0x0EFC00 for VN2VF\_Port FIP snooping 0x0EFD00 for VN2VN\_Port FIP snooping

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

| <b>Syntax</b>                   | oxid (enable   disable)  |
| <b>Hierarchy Level</b>          | <p>QFX Series Standalone Switches</p> <p>[edit forwarding-options hash-key family fcoe]</p> <p>QFabric Systems</p> <p>[edit forwarding-options hash-key family fcoe ethernet-interfaces node-group (node-group-name   all) {}]</p> <p>[edit forwarding-options hash-key family fcoe fabric-interfaces node-group (node-group-name   all) {}]</p>   |
| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 12.3 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2X52-D10 for the QFabric System.</p>   |
| <b>Description</b>              | Enable or disable whether the switch uses the originator exchange identifier (OxID) field for hash control for FCoE traffic load balancing.  |
| <b>Default</b>                  | OxID hash control is enabled by default.   |
| <b>Options</b>                  | <b>oxid (enable   disable)</b> —Enable or disable whether the switch uses the OxID hash control field for FCoE traffic load balancing.   |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Enabling and Disabling CoS OxID Hash Control on Standalone Switches on page 5656</a></li> <li>• <a href="#">Enabling and Disabling CoS OxID Hash Control on QFabric Systems</a></li> <li>• <a href="#">Understanding OxID Hash Control for FCoE Traffic Load Balancing on Standalone Switches on page 5530</a></li> <li>• <a href="#">Understanding OxID Hash Control for FCoE Traffic Load Balancing on QFabric Systems</a></li> </ul> |

## policy-options

---

**Syntax**    `policy-options`

```
  application-maps application-map-name {
    application application-name {
      code-points [ aliases ] [ bit-patterns ];
    }
  }
  policy-statement policy-name {
    term term-name {
      from {
        family family-name;
        match-conditions;
        policy subroutine-policy-name;
        prefix-list prefix-list-name;
        prefix-list-filter prefix-list-name match-type <actions>;
        route-filter destination-prefix match-type <actions>;
        source-address-filter source-prefix match-type <actions>;
      }
      to {
        match-conditions;
        policy subroutine-policy-name;
      }
      then actions;
    }
  }
```

**Hierarchy Level**    [edit]

**Release Information**    Statement introduced in Junos OS Release 12.1 for the QFX Series.  
Statement introduced in Junos OS Release 12.1 for the EX Series.

**Description**    Configure options such as application maps for DCBX application protocol exchange and policy statements.

**Required Privilege Level**    storage—To view this statement in the configuration.  
storage-control—To add this statement to the configuration.

## priority-flow-control

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>priority-flow-control {<br/>    no-auto-negotiation;<br/>}</code>  |
| <b>Hierarchy Level</b>          | [edit <a href="#">protocols dcbx interface</a> (all   <i>interface-name</i> )]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.<br>Statement introduced in Junos OS Release 11.3 for EX Series switches.   |
| <b>Description</b>              | Disable autonegotiation of priority-based flow control (PFC) on one or more Ethernet interfaces. Autonegotiation enables PFC on an interface only if the switch and the peer device connected to the switch both support PFC and have the same PFC configuration. Disabling autonegotiation on an interface forces the interface to use the PFC state (enabled or disabled) that is configured on the switch by the configuration and assignment of the congestion notification profile.   |
| <b>Options</b>                  | <b>no-auto-negotiation</b> —Disable automatic negotiation of PFC.  |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">show dcbx neighbors on page 5724</a></li> <li>• <a href="#">Configuring CoS PFC (Congestion Notification Profiles) on page 6174</a></li> <li>• <a href="#">Configuring Priority-Based Flow Control for an EX Series Switch (CLI Procedure)</a></li> <li>• <a href="#">Configuring DCBX Autonegotiation on page 5669</a></li> <li>• <a href="#">Example: Configuring CoS PFC for FCoE Traffic on page 5606</a></li> <li>• <a href="#">Understanding Data Center Bridging Capability Exchange Protocol for EX Series Switches</a></li> <li>• <a href="#">Understanding Priority-Based Flow Control</a></li> <li>• <a href="#">Understanding DCB Features and Requirements on page 5515</a></li> </ul> |

## protocol (Applications)

---

|  |   |
|--|---|
| <b>Syntax</b>  | <code>protocol (tcp   udp);</code>  |
| <b>Hierarchy Level</b>   | [edit applications <a href="#">application</a> <i>application-name</i> ]  |
| <b>Release Information</b>   | Statement introduced in Junos OS Release 12.1 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.  |
| <b>Description</b>   | Networking protocol type, which combines with <b>destination-port</b> to identify an application type.  |
| <div> <b>NOTE:</b> To create an application for iSCSI, use the protocol <code>tcp</code> with the destination port number 3260.</div> |   |
| <b>Options</b>   | <code>tcp</code> —Transmission Control Protocol<br><br><code>udp</code> —User Datagram Protocol   |
| <b>Required Privilege Level</b>  | <code>interface</code> —To view this statement in the configuration.<br><code>interface-control</code> —To add this statement to the configuration.   |

## recommendation-tlv

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <pre>recommendation-tlv {<br/>    no-auto-negotiation;<br/>}</pre>   |
| <b>Hierarchy Level</b>          | [edit <a href="#">protocols dcbx interface interface-name enhanced-transmission-selection</a> ]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2 for the QFX Series.  |
| <b>Description</b>              | Enable DCBX to send the ETS Recommendation TLV (also known as the Information TLV) on egress. This feature is valid only if the interface DCBX mode is IEEE DCBX. If the interface DCBX mode is DCBX version 1.01, this statement has no effect. (DCBX version 1.01 does not advertise separate TLVs for individual attributes.) |
| <b>Default</b>                  | DCBX-enabled interfaces send the ETS recommendation TLV unless it is disabled.   |
| <b>Options</b>                  | <b>no-auto-negotiation</b> —Disable sending of the ETS recommendation TLV.   |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">show dcbx neighbors on page 5724</a></li><li>• <a href="#">Configuring DCBX Autonegotiation on page 5669</a></li></ul>   |

## CHAPTER 70

# Administration

## clear fip snooping enode

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <b>clear fip snooping enode <i>enode-mac</i></b><br><b>&lt;vlan <i>vlan-name</i>&gt;</b>   |
| <b>Release Information</b>      | Command introduced in Junos OS Release 10.4 for EX Series switches.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.   |
| <b>Description</b>              | Clear FIP snooping information for the specified FCoE Node (ENode) or (optionally) only on a specified VLAN. This operation deletes the ENode state from the switch database and from the FIP snooping firewall filters, which causes the ENode to lose its connection to the FCoE forwarder (FCF) and to log in to the FCF again. |
| <b>Options</b>                  | <b><i>enode-mac</i></b> —MAC address of the ENode.<br><br><b>vlan <i>vlan-name</i></b> —(Optional) Name of the VLAN.   |
| <b>Required Privilege Level</b> | view   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">show fip snooping enode on page 5751</a></li></ul>   |
| <b>List of Sample Output</b>    | <a href="#">clear fip snooping enode enode-mac on page 5708</a>  |

### Sample Output

#### clear fip snooping enode enode-mac

```
user@switch> clear fip snooping enode 00:10:94:00:00:02
```

---

## clear fip snooping statistics

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>clear fip snooping statistics</code><br><code>&lt;vlan <i>vlan-name</i>&gt;</code>   |
| <b>Release Information</b>      | Command introduced in Junos OS Release 10.4 for EX Series switches.<br>Command introduced in Junos OS Release 11.1 for the QFX Series. |
| <b>Description</b>              | Clear FIP snooping statistics globally or on a specified VLAN.   |
| <b>Required Privilege Level</b> | view   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">show fip snooping statistics on page 5761</a></li></ul>                            |
| <b>List of Sample Output</b>    | <a href="#">clear fip snooping statistics on page 5709</a>   |

### Sample Output

#### clear fip snooping statistics

```
user@switch> clear fip snooping statistics
```

## clear fip snooping vlan

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>clear fip snooping vlan <i>vlan-name</i></code>  |
| <b>Release Information</b>      | Command introduced in Junos OS Release 10.4 for EX Series switches.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.   |
| <b>Description</b>              | Clear FIP snooping information for the specified VLAN. This operation deletes all ENode and FCF information for the VLAN from the switch database and causes the ENodes to lose their connections to the FCFs. After clearing a VLAN, the switch relearns all of the FCFs and ENodes on the VLAN, and the ENodes must log in to the FCF again. |
| <b>Options</b>                  | <i>vlan-name</i> —Name of the VLAN.  |
| <b>Required Privilege Level</b> | view   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">show fip snooping vlan on page 5764</a></li></ul>  |
| <b>List of Sample Output</b>    | <a href="#">clear fip snooping vlan vlan-name on page 5710</a>   |

### Sample Output

#### clear fip snooping vlan vlan-name

```
user@switch> clear fip snooping vlan fcoevlan1
```

## clear fip vlan-discovery statistics

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | clear fip vlan-discovery statistics  |
| <b>Release Information</b>      | Command introduced in Junos OS Release 12.1 for the QFX Series.  |
| <b>Description</b>              | Clear FIP VLAN discovery statistics.   |
| <b>Required Privilege Level</b> | view   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">show fip vlan-discovery on page 5768</a></li></ul> |
| <b>List of Sample Output</b>    | <a href="#">clear fip vlan-discovery statistics on page 5711</a>                                       |

### Sample Output

#### clear fip vlan-discovery statistics

```
user@switch> clear fip vlan-discovery statistics
```

## restart

#### Release Information

Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.  
 Command introduced in Junos OS Release 12.2 for ACX Series routers.  
 Options added:

- **dynamic-flow-capture** in Junos OS Release 7.4.
- **dlsr** in Junos OS Release 7.5.
- **event-processing** in Junos OS Release 7.5.
- **ppp** in Junos OS Release 7.5.
- **l2ald** in Junos OS Release 8.0.
- **link-management** in Release 8.0.
- **pgcp-service** in Junos OS Release 8.4.
- **sbc-configuration-process** in Junos OS Release 9.5.
- **services pgcp gateway** in Junos OS Release 9.6.
- **sfc** and **all-sfc** for the TX Matrix Router in Junos OS Release 9.6.

**Description** Restart a Junos OS process.

**CAUTION:** Never restart a software process unless instructed to do so by a customer support engineer. A restart might cause the router or switch to drop calls and interrupt transmission, resulting in possible loss of data.

**Options** **none**—Same as **gracefully**.

**adaptive-services**—(Optional) Restart the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) Restart the software process on all chassis.

**all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process on all T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process on all T1600 routers connected to the TX Matrix Plus router.

**all-members**—(MX Series routers only) (Optional) Restart the software process for all members of the Virtual Chassis configuration.

**all-sfc**—(TX Matrix Plus routers only) (Optional) For a TX Matrix Plus router, restart the software processes for the TX Matrix Plus router (or switch-fabric chassis).

**ancpd-service**—(Optional) Restart the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.

**application-identification**—(Optional) Restart the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.

**audit-process**—(Optional) Restart the RADIUS accounting process that gathers statistical data that can be used for general network monitoring, analyzing, and tracking usage patterns, for billing a user based on the amount of time or type of services accessed.

**auto-configuration**—(Optional) Restart the Interface Auto-Configuration process.

**autoinstallation**—(EX Series switches only) (Optional) Restart the autoinstallation process.

**captive-portal-content-delivery**—(Optional) Restart the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.

**ce-l2tp-service**—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.

**chassis-control**—(Optional) Restart the chassis management process.

**class-of-service**—(Optional) Restart the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.

**clksyncd-service**—(Optional) Restart the external clock synchronization process, which uses synchronous Ethernet (SyncE).

**database-replication**—(EX Series switches and MX Series routers only) (Optional) Restart the database replication process.

**dapath-trace-service**—(Optional) Restart the packet path tracing process.

**dhcp**—(J Series routers and EX Series switches only) (Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.

**dhcp-service**—(Optional) Restart the Dynamic Host Configuration Protocol process.

**dialer-services**—(J Series routers and EX Series switches only) (Optional) Restart the ISDN dial-out process.

**diameter-service**—(Optional) Restart the diameter process.

**disk-monitoring**—(Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.

**dlsw**—(J Series routers and QFX Series only) (Optional) Restart the data link switching (DLSw) service.

**dot1x-protocol**—(EX Series switches only) (Optional) Restart the port-based network access control process.

**dynamic-flow-capture**—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

**ecc-error-logging**—(Optional) Restart the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

**ethernet-connectivity-fault-management**—(Optional) Restart the process that provides IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

**ethernet-link-fault-management**—(EX Series switches and MX Series routers only) (Optional) Restart the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

**ethernet-switching**—(EX Series switches only) (Optional) Restart the Ethernet switching process.

**event-processing**—(Optional) Restart the event process (eventd).

**fibre-channel**—(QFX Series only) (Optional) Restart the Fibre Channel process.

**firewall**—(Optional) Restart the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

**general-authentication-service**—(EX Series switches and MX Series routers only) (Optional) Restart the general authentication process.

**gracefully**—(Optional) Restart the software process.

**iccp-service**—(Optional) Restart the Inter-Chassis Communication Protocol (ICCP) process.

**idp-policy**—(Optional) Restart the intrusion detection and prevention (IDP) protocol process.

**immediately**—(Optional) Immediately restart the software process.

**interface-control**—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

**ipsec-key-management**—(Optional) Restart the IPsec key management process.

**isdn-signaling**—(J Series routers and QFX Series only) (Optional) Restart the ISDN signaling process, which initiates ISDN connections.

**kernel-replication**—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

**l2-learning**—(Optional) Restart the Layer 2 address flooding and learning process.

**l2cpd-service**—(Optional) Restart the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

**l2tp-service**—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Layer 2 Tunneling Protocol (L2TP) process, which sets up client services for establishing Point-to-Point Protocol (PPP) tunnels across a network and negotiating Multilink PPP if it is implemented.

**l2tp-universal-edge**—(MX Series routers only) (Optional) Restart the L2TP process, which establishes L2TP tunnels and PPP sessions through L2TP tunnels.

**lACP**—(Optional) Restart the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG,

and to enable the transmission and reception processes for the link to function in an orderly manner.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process for a specific T640 router that is connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**license-service**—(EX Series switches only) (Optional) Restart the feature license management process.

**link-management**—(TX Matrix and TX Matrix Plus routers and EX Series switches only) (Optional) Restart the Link Management Protocol (LMP) process, which establishes and maintains LMP control channels.

**lldpd-service**—(EX Series switches only) (Optional) Restart the Link Layer Discovery Protocol (LLDP) process.

**local**—(MX Series routers only) (Optional) Restart the software process for the local Virtual Chassis member.

**local-policy-decision-function**—(Optional) Restart the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

**mac-validation**—(Optional) Restart the Media Access Control (MAC) validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

**member *member-id***—(MX Series routers only) (Optional) Restart the software process for a specific member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**mib-process**—(Optional) Restart the Management Information Base (MIB) version II process, which provides the router's MIB II agent.

**mobile-ip**—(Optional) Restart the Mobile IP process, which configures Junos OS Mobile IP features.

**mountd-service**—(EX Series switches and MX Series routers only) (Optional) Restart the service for NFS mount requests.

**mpls-traceroute**—(Optional) Restart the MPLS Periodic Traceroute process.

**mspd**—(Optional) Restart the Multiservice process.

**multicast-snooping**—(EX Series switches and MX Series routers only) (Optional) Restart the multicast snooping process, which makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

**named-service**—(Optional) Restart the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

**network-access-service**—(J Series routers and QFX Series only) (Optional) Restart the network access process, which provides the router's Challenge Handshake Authentication Protocol (CHAP) authentication service.

**nfsd-service**—(Optional) Restart the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

**packet-triggered-subscribers**—(Optional) Restart the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

**peer-selection-service**—(Optional) Restart the Peer Selection Service process.

**pgcp-service**—(Optional) Restart the pgcpd service process running on the Routing Engine. This option does not restart pgcpd processes running on mobile station PICs. To restart pgcpd processes running on mobile station PICs, use the **services pgcp gateway** option.

**pgm**—(Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.

**pic-services-logging**—(Optional) Restart the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

**pki-service**—(Optional) Restart the PKI Service process.

**ppp**—(Optional) Restart the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

**ppp-service**—(Optional) Restart the Universal Edge PPP process, which is the encapsulation protocol process for transporting IP traffic across Universal Edge routers.

**pppoe**—(Optional) Restart the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

**protected-system-domain-service**—(Optional) Restart the Protected System Domain (PSD) process.

**redundancy-interface-process**—(Optional) Restart the ASP redundancy process.

**remote-operations**—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.

**root-system-domain-service**—(Optional) Restart the Root System Domain (RSD) service.

**routing**—(ACX Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the routing protocol process.

**routing <logical-system *logical-system-name*>**—(Optional) Restart the routing protocol process, which controls the routing protocols that run on the router or switch and maintains the routing tables. Optionally, restart the routing protocol process for the specified logical system only.

**sampling**—(Optional) Restart the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

**sbc-configuration-process**—(Optional) Restart the session border controller (SBC) process of the border signaling gateway (BSG).

**scc**—(TX Matrix routers only) (Optional) Restart the software process on the TX Matrix router (or switch-card chassis).

**sdk-service**—(Optional) Restart the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

**secure-neighbor-discovery**—(QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

**sfc number**—(TX Matrix Plus routers only) (Optional) Restart the software process on the TX Matrix Plus router (or switch-fabric chassis). Replace **number** with **0**.

**service-deployment**—(Optional) Restart the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

**services**—(Optional) Restart a service.

**services pgcp gateway *gateway-name***—(Optional) Restart the pgcpd process for a specific border gateway function (BGF) running on an MS-PIC. This option does not restart the pgcpd process running on the Routing Engine. To restart the pgcpd process on the Routing Engine, use the **pgcp-service** option.

**sflow-service**—(EX Series switches only) (Optional) Restart the flow sampling (sFlow technology) process.

**snmp**—(Optional) Restart the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

**soft**—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.

**static-subscribers**—(Optional) Restart the static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

**statistics-service**—(Optional) Restart the process that manages the Packet Forwarding Engine statistics.

**subscriber-management**—(Optional) Restart the Subscriber Management process.

**subscriber-management-helper**—(Optional) Restart the Subscriber Management Helper process.

**tunnel-oamd**—(Optional) Restart the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 PDUs across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

**usb-control**—(J Series routers and MX Series routers only) (Optional) Restart the USB control process.

**vrrp**—(ACX Series routers, EX Series switches, and MX Series routers only) (Optional) Restart the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

**web-management**—(J Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the Web management process.

**Required Privilege Level** reset

**Related Documentation** [• Overview of Junos OS CLI Operational Mode Commands on page 58](#)

**List of Sample Output** [restart interfaces on page 5721](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### restart interfaces

```
user@host> restart interfaces
interfaces process terminated
interfaces process restarted
```

## show dcbx

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | show dcbx   |
| <b>Release Information</b>      | Command introduced in Junos OS Release 11.3 for the QFX Series.   |
| <b>Description</b>              | List DCBX status (enabled or disabled) and the interfaces on which DCBX is enabled.   |
| <b>Required Privilege Level</b> | view  |

**Table 464: show dcbx neighbors Output Fields**

| Field Name | Field Description      |
|------------|------------------------|
| Interface  | Name of the interface. |

Table 464: show dcbx neighbors Output Fields (*continued*)

| Field Name             | Field Description  |
|------------------------|--|
| Parent Interface       | Name of the link aggregation group (LAG) interface to which the DCBX interface belongs.  |
| Active-application-map | Name of the application map applied to the interface.  |
| Protocol-Mode          | <p>(QFX Series) DCBX protocol mode the interface uses:</p> <ul style="list-style-type: none"> <li>IEEE DCBX Version—The interface uses IEEE DCBX mode.</li> <li>DCBX Version 1.01—The interface uses DCBX version 1.01.</li> </ul> <p><b>NOTE:</b> On interfaces that use the IEEE DCBX mode, the <b>show dcbx neighbors interface <i>interface-name</i></b> operational command does not include application, PFC, or ETS operational state in the output.</p>  |
| Protocol-State         | <p>(DCBX Version 1.01 only) DCBX protocol state synchronization status:</p> <ul style="list-style-type: none"> <li><b>in-sync</b>—The local interface received an acknowledge message from the peer to indicate that the peer received a state change message sent by the local interface.</li> <li><b>ack-pending</b>—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received a state change message sent by the local interface.</li> </ul> |
| Local-Advertisement    | <p>(DCBX Version 1.01 only)</p> <p>Status of advertisements that the local interface sends to the peer.</p>  |
| Operational version    | Version of the DCBX standard used.   |
| sequence-number        | <p>Number of state change messages sent to the peer.</p> <p>If the interface <b>Protocol-State</b> value is <b>in-sync</b>, this number should match the <b>acknowledge-id</b> number in the <b>Peer-Advertisement</b> section.</p> <p>If the interface <b>Protocol-State</b> value is <b>ack-pending</b>, this number does not match the <b>acknowledge-id</b> number in the <b>Peer-Advertisement</b> section.</p>   |
| acknowledge-id         | <p>Number of acknowledge messages received from the peer.</p> <p>If the <b>Protocol-State</b> value is <b>in-sync</b>, this number should match the <b>sequence-number</b> value in the <b>Peer-Advertisement</b> section.</p> <p>If the <b>Protocol-State</b> value is <b>ack-pending</b>, this number does not match the <b>sequence-number</b> value in the <b>Peer-Advertisement</b> section.</p>  |

Table 464: show dcbx neighbors Output Fields (*continued*)

| Field Name                 | Field Description   |
|----------------------------|---|
| <b>Peer-Advertisement</b>  | (DCBX Version 1.01 only)<br><br>Status of advertisements that the peer sends to the local interface.  |
| <b>Operational version</b> | Version of the DCBX standard used.  |
| <b>sequence-number</b>     | <p>Number of state change messages the peer sent to the local interface.</p> <p>If this number matches the <b>acknowledge-id</b> number in the <b>Local-Advertisement</b> field, this indicates that the local interface has acknowledged all of the peer's state change messages and is synchronized.</p> <p>If this number does not match the <b>acknowledge-id</b> number in the <b>Local-Advertisement</b> field, this indicates that the peer has not yet received an acknowledgment for a state change message from the local interface.</p>            |
| <b>acknowledge-id</b>      | <p>Number of acknowledge messages the peer has received from the local interface.</p> <p>If this number matches the <b>sequence-number</b> value in the <b>Local-Advertisement</b> field, this indicates that the peer has acknowledged all of the local interface's state change messages and is in synchronization.</p> <p>If this number does not match the <b>sequence-number</b> value in the <b>Local-Advertisement</b> field, this indicates that the peer has not yet sent an acknowledgment for a state change message from the local interface.</p> |

Table 464: show dcbx neighbors Output Fields (*continued*)

| Field Name                        | Field Description  |
|-----------------------------------|--|
| <b>Feature: PFC</b>               | Priority-based flow control (PFC) feature DCBX state information.  |
| <b>Protocol-State</b>             | (DCBX Version 1.01 only)<br><br>DCBX protocol state synchronization status: <ul style="list-style-type: none"> <li>• <b>ack-pending</b>—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received a PFC state change message sent by the local interface.</li> <li>• <b>in-sync</b>—The local interface received an acknowledge message from the peer to indicate that the peer received a PFC state change message sent by the local interface.</li> <li>• <b>not-applicable</b>—PFC autonegotiation is disabled.</li> </ul> |
| <b>Operational State</b>          | (DCBX Version 1.01 only)<br><br>Operational state of the feature: <b>enabled</b> or <b>disabled</b> .  |
| <b>Local-Advertisement</b>        | Status of advertisements that the local interface sends to the peer.   |
| <b>Enable</b>                     | (DCBX Version 1.01 only)<br><br>State that the local interface advertises to the peer: <ul style="list-style-type: none"> <li>• <b>Yes</b>—The feature is enabled.</li> <li>• <b>No</b>—The feature is disabled.</li> </ul>  |
| <b>Willing</b>                    | Willingness of the local interface to learn the PFC configuration from the peer using DCBX: <ul style="list-style-type: none"> <li>• <b>Yes</b>—The local interface is willing to learn the PFC configuration from the peer.</li> <li>• <b>No</b>—The local interface is not willing to learn the PFC configuration from the peer.</li> </ul>  |
| <b>Mac auth Bypass Capability</b> | (IEEE DCBX only)<br><br>(QFX Series) Media access controller (MAC) authentication bypass provides access to devices based on MAC address authentication. This is not supported, so the only value seen in the local advertisement field is <b>no</b> .   |
| <b>Error</b>                      | (DCBX Version 1.01 only)<br><br>Configuration compatibility error status: <ul style="list-style-type: none"> <li>• <b>No</b>—No error detected. Local and peer configuration are compatible.</li> <li>• <b>Yes</b>—Error detected. Local and peer configuration are not compatible.</li> </ul>   |

Table 464: show dcbx neighbors Output Fields (*continued*)

| Field Name  | Field Description  |
|---|--|
| <b>Operational State</b>                              | <p>PFC operational state on the interface:</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—PFC is enabled on the interface</li> <li>• <b>Disabled</b>—PFC is disabled on the interface</li> </ul>  |
| <b>Maximum Traffic Classes capable to support PFC</b> | <p>Largest number of traffic classes the local interface supports for PFC:</p> <ul style="list-style-type: none"> <li>• <b>6</b> (EX Series switches)</li> <li>• <b>8</b> (QFX Series)</li> </ul>  |
| <b>Code Point</b>                                     | <p>PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.</p>  |
| <b>Admin Mode</b>                                     | <p>PFC administrative state for each code point on the local interface:</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—PFC is enabled for the code point.</li> <li>• <b>Disabled</b>—PFC is disabled for the code point.</li> </ul>   |
| <b>Operational Mode</b>                               | <p>(QFX Series) PFC operational mode for each code point:</p> <ul style="list-style-type: none"> <li>• <b>Enable</b>—PFC is enabled on the code point.</li> <li>• <b>Disable</b>—PFC is disabled on the code point.</li> </ul>   |
| <b>Peer-Advertisement</b>                             | <p>Status of advertisements that the peer sends to the local interface.</p>  |
| <b>Enable</b>   | <p>(DCBX Version 1.01 only)</p> <p>State that the peer advertises to the local interface:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—The feature is enabled.</li> <li>• <b>No</b>—The feature is disabled.</li> </ul>   |
| <b>Willing</b>  | <p>Willingness of the peer to learn the PFC configuration from the local interface using DCBX:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—The peer is willing to learn the PFC configuration from the local interface.</li> <li>• <b>No</b>—The peer is not willing to learn the PFC configuration from the local interface.</li> </ul> |
| <b>Error</b>  | <p>(DCBX Version 1.01 only)</p> <p>Configuration compatibility error status:</p> <ul style="list-style-type: none"> <li>• <b>No</b>—No error detected. Local and peer configuration are compatible.</li> <li>• <b>Yes</b>—Error detected. Local and peer configuration are not compatible.</li> </ul>  |

Table 464: show dcbx neighbors Output Fields (*continued*)

| Field Name  | Field Description  |
|---|--|
| <b>Operational State</b>                              | <p>PFC operational state on the interface:</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—PFC is enabled on the interface</li> <li>• <b>Disabled</b>—PFC is disabled on the interface</li> </ul>  |
| <b>Mac auth Bypass Capability</b>                     | <p>(IEEE DCBX only)</p> <p>(QFX Series) Media access controller (MAC) authentication bypass provides access to devices based on MAC address authentication. Although the QFX Series does not support this feature, the connected peer might support it. This field reports the peer state:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—The connected peer supports MAC authentication bypass.</li> <li>• <b>No</b>—The connected peer does not support MAC authentication bypass.</li> </ul> |
| <b>Maximum Traffic Classes capable to support PFC</b> | <p>Largest number of traffic classes the peer supports for PFC:</p> <ul style="list-style-type: none"> <li>• <b>6</b> (EX Series switches)</li> <li>• <b>8</b> (QFX Series)</li> </ul>   |
| <b>Code Point</b>                                     | <p>PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.</p>  |
| <b>Admin Mode</b>                                     | <p>PFC administrative state for each code point on the peer:</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—PFC is enabled for the code point.</li> <li>• <b>Disabled</b>—PFC is disabled for the code point.</li> </ul>  |

Table 464: show dcbx neighbors Output Fields (*continued*)

| Field Name                  | Field Description  |
|-----------------------------|--|
| <b>Feature: Application</b> | State information for the DCBX application.  |
| <b>Protocol-State</b>       | <p>(DCBX Version 1.01 only)</p> <p>DCBX protocol state synchronization status:</p> <ul style="list-style-type: none"> <li>• <b>in-sync</b>—The local interface received an acknowledge message from the peer to indicate that the peer received an FCoE state change message sent by the local interface.</li> <li>• <b>ack-pending</b>—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received an FCoE state change message sent by the local interface.</li> <li>• <b>not-applicable</b>—The local interface is set to <b>no-auto-negotiation</b> (autonegotiation is disabled). If the interface is associated with an FCoE forwarding class, the interface advertises FCoE capability even if the connected peer does not advertise FCoE capability.</li> </ul> |
| <b>Local-Advertisement</b>  | <p>Status of advertisements that the local interface sends to the peer.</p> <p>If the local interface is set to <b>no-auto-negotiation</b> (autonegotiation is disabled), the local advertisement portion of the output is not shown.</p>  |
| <b>Enable</b>               | <p>(DCBX Version 1.01 only)</p> <p>State that the local interface advertises to the peer:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—The feature is enabled.</li> <li>• <b>No</b>—The feature is disabled.</li> </ul>   |

Table 464: show dcbx neighbors Output Fields (*continued*)

| Field Name                            | Field Description  |
|---------------------------------------|--|
| <b>Error</b>                          | (DCBX Version 1.01 only)<br><br>Configuration compatibility error status: <ul style="list-style-type: none"> <li>• <b>No</b>—No error detected. Local and peer configuration are compatible.</li> <li>• <b>Yes</b>—Error detected. Local and peer configuration are not compatible.</li> </ul>   |
| <b>Appl-Name</b>                      | Name of the application: <ul style="list-style-type: none"> <li>• <b>FCoE</b>—Fibre Channel over Ethernet</li> </ul>   |
| <b>Ethernet-Type</b>                  | Ethernet type (EtherType) of the application. For example, <b>0x8906</b> indicates the EtherType for the FCoE application. Either the EtherType (for Layer 2 applications) or the Socket-Number (for Layer 4 applications) of the application is displayed in the output.  |
| <b>Socket-Number</b>                  | Destination port socket number of the application, if applicable. Either the EtherType (for Layer 2 applications) or the Socket Number (for Layer 4 applications) of the application is displayed in the output.   |
| <b>Priority-Field or Priority-Map</b> | Priority assigned to the application.  |
| <b>Status</b>                         | (DCBX Version 1.01 only)<br><br>Peer interface status: <ul style="list-style-type: none"> <li>• <b>Enabled</b>—The application feature is enabled on both the local interface and the peer interface. (The local configuration and the peer configuration match.)</li> <li>• <b>Disabled</b>—The local configuration and the peer configuration do not match.</li> </ul> |

Table 464: show dcbx neighbors Output Fields (*continued*)

| Field Name                 | Field Description  |
|----------------------------|--|
| <b>Feature: ETS</b>        | Enhanced Transmission Selection (ETS) DCBX state information.  |
| <b>Protocol-State</b>      | (DCBX Version 1.01 only)<br><br>ETS protocol state synchronization status: <ul style="list-style-type: none"> <li>• <b>in-sync</b>—The local interface received an acknowledge message from the peer to indicate that the peer received an ETS state change message sent by the local interface.</li> <li>• <b>ack-pending</b>—The local interface has not yet received an acknowledge message from the peer to indicate that the peer received an ETS state change message sent by the local interface.</li> </ul>  |
| <b>Operational State</b>   | (DCBX Version 1.01 only)<br><br>Operational state of the feature, <b>enabled</b> or <b>disabled</b> .  |
| <b>Local-Advertisement</b> | Status of advertisements that the local interface sends to the peer.   |
| <b>Enable</b>              | (DCBX Version 1.01 only)<br><br>State that the local interface advertises to the peer: <ul style="list-style-type: none"> <li>• <b>Yes</b>—The feature is enabled.</li> <li>• <b>No</b>—The feature is disabled.</li> </ul>  |
| <b>TLV Type</b>            | (IEEE DCBX only)<br><br>Type of ETS TLV: <ul style="list-style-type: none"> <li>• <b>Configuration</b>—Advertises the Configuration TLV, which communicates the local ETS configuration to the peer but does not ask the peer to use the configuration.</li> <li>• <b>Recommendation</b>—Advertises the Recommendation TLV, which communicates the local ETS configuration to the peer, and if the peer is “willing,” configures the peer interface to match the local ETS configuration.</li> <li>• <b>Recommendation-or-Configuration</b>—Advertises both TLVs.</li> </ul> |
| <b>Willing</b>             | Willingness of the local interface to learn the ETS state from the peer using DCBX (EX Series switches always advertise <b>No</b> for this field): <ul style="list-style-type: none"> <li>• <b>Yes</b>—Local interface is willing to learn the ETS state from the peer.</li> <li>• <b>No</b>—Local interface is not willing to learn the ETS state from the peer.</li> </ul>   |
| <b>Credit Based Shaper</b> |  |

Table 464: show dcbx neighbors Output Fields (*continued*)

| Field Name  | Field Description   |
|---|---|
|   | (IEEE DCBX only)  |
|   | Alternative method of flow control to buffer-to-buffer credit. The QFX Series does not support a credit-based shaper, so the value of this field is always <b>No</b> .  |
| <b>Error</b>  | (DCBX Version 1.01 only)<br><br>Configuration error status: <ul style="list-style-type: none"> <li>• <b>No</b>—No error. This should always be the switch ETS error state.</li> <li>• <b>Yes</b>—Error detected.</li> </ul>   |
| <b>Maximum Traffic Classes capable to support PFC</b> | (DCBX Version 1.01 only)<br><br>Largest number of traffic classes the local interface supports for PFC.   |
| <b>Maximum Traffic Classes supported</b>              | (IEEE DCBX only)<br><br>Largest number of traffic classes the local interface supports for ETS. (EX Series switches support only one traffic class for ETS. However, a different value might be shown for this field.)  |
| <b>Code Point</b>                                     | PFC code point, which is specified in the 3-bit class-of-service field in the VLAN header.  |
| <b>Priority-Group</b>                                 | Class-of-service (CoS) priority group (forwarding class set) identification number.   |
| <b>Percentage B/W</b>                                 | Configured minimum percentage of link bandwidth allocated to the priority group. Only explicitly configured values appear in this output column. If the link bandwidth is the default percentage, it is not shown. (EX Series switches allocate 100% of link bandwidth to the default priority group, group 7.) |
| <b>Transmission Selection Algorithm</b>               | (IEEE DCBX only)<br><br>The transmission selection algorithm used by the interface. The QFX Series supports ETS but does not support using the credit-based shaper algorithm, so the only value shown in this field is <b>ETS</b> .   |
| <b>Peer-Advertisement</b>                             | Status of advertisements that the peer sends to the local interface.  |
| <b>Enable</b>   |   |

Table 464: show dcbx neighbors Output Fields (*continued*)

| Field Name  | Field Description   |
|---|---|
|   | (DCBX Version 1.01 only)<br><br>State that the peer advertises to the local interface: <ul style="list-style-type: none"> <li>• <b>Yes</b>—The feature is enabled.</li> <li>• <b>No</b>—The feature is disabled.</li> </ul>   |
| <b>TLV Type</b>                                       | (IEEE DCBX only)<br><br>Type of ETS TLV: <ul style="list-style-type: none"> <li>• <b>Configuration</b>—Advertises the Configuration TLV, which communicates the local ETS configuration to the peer but does not ask the peer to use the configuration.</li> <li>• <b>Recommendation</b>—Advertises the Recommendation TLV, which communicates the local ETS configuration to the peer, and if the peer is “willing,” configures the peer interface to match the local ETS configuration.</li> <li>• <b>Configuration/Recommendation</b>—Advertises both TLVs.</li> </ul> |
| <b>Willing</b>  | Willingness of the peer to learn the ETS state from the local interface using DCBX: <ul style="list-style-type: none"> <li>• <b>Yes</b>—Peer is willing to learn the ETS state from the local interface.</li> <li>• <b>No</b>—Peer is not willing to learn the ETS state from the local interface.</li> </ul>   |

**Table 465: show fip snooping Output Fields**

| Field Name | Field Description | Level of Output |
|------------|-------------------|-----------------|
| VLAN       | Name of the VLAN. | All             |

Table 465: show fip snooping Output Fields (*continued*)

| Field Name                              | Field Description  | Level of Output |
|---|--|-----------------|
| <b>Mode</b>                             | <p>(QFX Series only)<br/>Snooping mode enabled on the FCoE VLAN:</p> <ul style="list-style-type: none"> <li>• VN2VF Snooping—The FCoE VLAN is configured for FIP snooping between an ENode VN_Port and a switch VF_Port.</li> <li>• VN2VN Snooping—The FCoE VLAN is configured for VN_Port to VN_Port FIP snooping between ENode VN_Ports.</li> </ul>  | All             |
| <b>FC-MAP</b>                           | FCoE mapped address prefix of the FCoE forwarder for the VLAN.   | All             |
| <b>FCF or FCF-MAC</b>                   | MAC address of the FCF.  | All             |
| <b>Session Count or Active Sessions</b> | Current number of virtual link sessions with VN_Ports.   | All             |
| <b>VN_Port Count</b>                    | <p>(QFX Series only)<br/>Number of VN_Ports active on an ENode.</p>  | <b>brief</b>    |
| <b>Configured FKA-ADV</b>               | <p>FIP keepalive interval in seconds configured on the FCF multiplied by three. For example, if the FKA_ADV period configured on the FCF is 86 seconds, the value of this field is 258.</p> <p>For the QFX Series only, the output of this field is always 0 (zero) if the VLAN is an FCoE-FC gateway VLAN. If the VLAN is a FIP snooping VLAN (a transit switch VLAN), then the output is accurate. This is because for an FCoE-FC gateway VLAN, FIP snooping is performed internally and the keepalive advertisements are not tracked by the switch's Ethernet module.</p> | <b>detail</b>   |
| <b>Running FKA-ADV</b>                  | <p>Runtime interval in seconds of the last FIP keepalive advertisement the FCF received. This value changes every time the FCF receives an FKA_ADV.</p> <p>For the QFX Series only, the output of this field is always 0 (zero) if the VLAN is an FCoE-FC gateway VLAN. If the VLAN is a FIP snooping VLAN (a transit switch VLAN), then the output is accurate. This is because for an FCoE-FC gateway VLAN, FIP snooping is performed internally and the keepalive advertisements are not tracked by the switch's Ethernet module.</p>                                     | <b>detail</b>   |
| <b>Beacon Period</b>                    | <p>(QFX Series only)<br/>Beacon period interval in milliseconds.</p>   | <b>detail</b>   |

Table 465: show fip snooping Output Fields (*continued*)

| Field Name                       | Field Description  | Level of Output |
|----------------------------------|--|-----------------|
| <b>VN2VN Mode</b>                | (QFX Series only)<br>Mode of VN2VN_Port snooping: <ul style="list-style-type: none"> <li>Multi-Point—Multiple ENodes are connected to the network and form multiple virtual links. Each virtual link is created between one pair of VN_Ports. This is analogous to the loop mode in traditional FC networks.</li> <li>Point-to-Point—Two ENodes are connected to the network and form a single VN_Port to VN_Port virtual link. This is analogous to the point-to-point FC link between an FC initiator and an FC target.</li> </ul> | <b>detail</b>   |
| <b>ENode-MAC</b>                 | MAC address of the connected FCoE node (ENode).  | All             |

| Number of LOGO_ACC             | Number of fabric logouts accepted on the VLAN.  |
| Number of LOGO_RJT             | Number of fabric logouts rejected on the VLAN.  |
| Number of CVL                  | Number of clear virtual links (CVL) actions on the VLAN.  |
| Number of VN_Port Probes Req   | (QFX Series only)<br>Number of multicast N_Port_ID probes sent to the ALL-VN2VN-ENode-MACs multicast address on the VLAN.                         |
| Number of VN_Port Claim Notif  | (QFX Series only)<br>Number of multicast N_Port_ID claim notifications sent on the VLAN.  |
| Number of VN_Port Beacons      | (QFX Series only)<br>Number of multicast beacons sent on the VLAN.  |
| Number of VN_Port Probes Reply | (QFX Series only)<br>Number of replies to N_Port_ID probes sent on the VLAN. Replies are unicast to the ENode MAC address of the probe requester. |

Table 469: show fip snooping statistics Output Fields (*continued*)

| Field Name                    | Field Description   |
|-------------------------------|---|
| Number of VN_Port Claim Reply | (QFX Series only)<br>Number of replies to N_Port_ID claim notifications sent on the VLAN. Replies are unicast to the ENode MAC address of the claim notifier. |

## Sample Output

### show fip snooping statistics (FIP Snooping)

```

user@switch> show fip snooping statistics
VLAN: fcoevlan1      Mode: VN2VF Snooping

Number of MDS:                2
Number of UDS:                2
Number of FLOGI:              2
Number of FDISC:              2
Number of LOGO:               0
Number of Enode-keep-alive: 200
Number of VNPort-keep-alive: 200

Number of MDA:                25
Number of UDA:                2
Number of FLOGI_ACC:          2
Number of FLOGI_RJT:          0
Number of FDISC_ACC:          2
Number of FDISC_RJT:          0
Number of LOGO_ACC:           0
Number of LOGO_RJT:           0
Number of CVL:                0

```

### show fip snooping statistics (VN2VN\_Port Snooping)

```

user@switch> show fip snooping statistics
VLAN: vlan101      Mode: VN2VN Snooping

Number of VN_Port Probes Req:    3
Number of VN_Port Claim Notif:  3
Number of VN_Port Beacons:      0

Number of VN_Port Probes Reply:  3
Number of VN_Port Claim Reply:   3
Number of FLOGI:                 0
Number of FLOGI_ACC:             0
Number of FLOGI_RJT:             0
Number of FDISC:                 0
Number of FDISC_ACC:             0
Number of FDISC_RJT:             0
Number of LOGO:                 0
Number of LOGO_ACC:             0
Number of LOGO_RJT:             0

```

## Troubleshooting Dropped FCoE Traffic

**Problem** **Description:** Fibre Channel over Ethernet (FCoE) traffic for which you want guaranteed delivery is dropped.

**Cause** There are several possible causes of dropped FCoE traffic (the list numbers of the possible causes correspond to the list numbers of the solutions in the *Solution* section.):

1. Priority-based flow control (PFC) is not enabled on the FCoE priority (IEEE 802.1p code point) in both the input and output stanzas of the congestion notification profile.
2. The FCoE traffic is not classified correctly at the ingress interface. FCoE traffic should either use the default **fcoe** forwarding class and classifier configuration (maps the **fcoe** forwarding class to IEEE 802.1p code point 011) or be mapped to a lossless forwarding class and to the code point enabled for PFC on the input and output interfaces.
3. The congestion notification profile that enables PFC on the FCoE priority is not attached to the interface.
4. The forwarding class set (priority group) used for guaranteed delivery traffic does not include the forwarding class used for FCoE traffic.
5. Insufficient bandwidth has been allocated for the FCoE queue or for the forwarding class set to which the FCoE queue belongs.
6. If you are using Junos OS Release 12.2, the **fcoe** forwarding class has been explicitly configured instead of using the default **fcoe** forwarding class configuration (forwarding-class-to-queue mapping).

.....

**NOTE:** If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless fcoe and no-loss forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

.....

7. If you are using Junos OS Release 12.3 or later and you are not using the default **fcoe** forwarding class configuration, the forwarding class used for FCoE is not configured with the **no-loss** packet drop attribute. In Junos OS 12.3 or later, explicit forwarding classes configurations must include the **no-loss** packet drop attribute to be treated as lossless forwarding classes.

**Solution** The list numbers of the possible solutions correspond to the list numbers of the causes in the *Cause* section.

1. Check the congestion notification profile (CNP) to see if PFC is enabled on the FCoE priority (the correct IEEE 802.1p code point) on both input and output interfaces. Use the **show class-of-service congestion-notification** operational command to show the code points that are enabled for PFC in each CNP.

If you are using the default configuration, FCoE traffic is mapped to code point 011 (priority 3). In this case, the input stanza of the CNP should show that PFC is enabled on code point 011, and the output stanza should show that priority 011 is mapped to flow control queue 3.

If you explicitly configured a forwarding class for FCoE traffic, ensure that:

- You specified the **no-loss** packet drop attribute in the forwarding class configuration
- The code point mapped to the FCoE forwarding class in the ingress classifier is the code point enabled for PFC in the CNP input stanza
- The code point and output queue used for FCoE traffic are mapped to each other in the CNP output stanza (if you are not using the default priority and queue, you must explicitly configure each output queue that you want to respond to PFC messages)

For example, if you explicitly configure a forwarding class for FCoE traffic that is mapped to output queue 5 and to code point 101 (priority 5), the output of the **show class-of-service congestion-notification** looks like:

```
Name: fcoe_p5_cnp, Index: 12183
Type: Input
Cable Length: 100 m
  Priority  PFC      MRU
  000      Disabled
  001      Disabled
  010      Disabled
  011      Disabled
  100      Disabled
  101      Enabled   2500
  110      Disabled
  111      Disabled
Type: Output
  Priority  Flow-Control-Queues
  101      5
```

2. Use the **show class-of-service classifier type ieee-802.1p** operational command to check if the classifier maps the forwarding class used for FCoE traffic to the correct IEEE 802.1p code point.
3. Ensure that the congestion notification profile and classifier are attached to the correct ingress interface. Use the operational command **show configuration class-of-service interfaces interface-name**.
4. Check that the forwarding class set includes the forwarding class used for FCoE traffic. Use the operational command **show configuration class-of-service forwarding-class-sets** to show the configured priority groups and their forwarding classes.

5. Verify the amount of bandwidth allocated to the queue mapped to the FCoE forwarding class and to the forwarding class set to which the FCoE traffic queue belongs. Use the **show configuration class-of-service schedulers *scheduler-name*** operational command (specify the scheduler for FCoE traffic as the *scheduler-name*) to see the minimum guaranteed bandwidth (**transmit-rate**) and maximum bandwidth (**shaping-rate**) for the queue.

Use the **show configuration class-of-service traffic-control-profiles *traffic-control-profile*** operational command (specify the traffic control profile used for FCoE traffic as the *traffic-control-profile*) to see the minimum guaranteed bandwidth (**guaranteed-rate**) and maximum bandwidth (**shaping-rate**) for the forwarding class set.

6. Delete the explicit FCoE forwarding-class-to-queue mapping so that the system uses the default FCoE forwarding-class-to-queue mapping. Include the **delete forwarding-classes class fcoe queue-num 3** statement at the **[edit class-of-service]** hierarchy level to remove the explicit configuration. The system then uses the default configuration for the FCoE forwarding class and preserves the lossless treatment of FCoE traffic.
7. Use the **show class-of-service forwarding-class** operational command to display the configured forwarding classes. The *No-Loss* column shows whether lossless transport is enabled or disabled for each forwarding class. If the forwarding class used for FCoE traffic is not enabled for lossless transport, include the **no-loss** packet drop attribute in the forwarding class configuration (**set class-of-service forwarding-classes class *fcoe-forwarding-class-name* queue-num *queue-number* no-loss**).

See “[Example: Configuring CoS PFC for FCoE Traffic](#)” on page 5606 for step-by-step instructions on how to configure PFC for FCoE traffic, including classifier, interface, congestion notification profile, PFC, and bandwidth scheduling configuration.

## Troubleshooting Dropped FIP Traffic

**Problem**    **Description:** Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) traffic such as FIP VLAN discovery and notification frames is dropped.

**Cause**        The interface on which the FIP traffic is dropped does not have a native VLAN configured. FIP VLAN discovery and notification messages are exchanged as untagged packets on the native VLAN. (After the FCoE session with the Fibre Channel switch is established, FCoE traffic uses the FCoE VLAN.)

**Solution** Check to ensure that every 10-Gigabit Ethernet interface that connects to an FCoE device includes a native VLAN. Configure a native VLAN on all 10-Gigabit Ethernet interfaces that connect to FCoE devices.

**NOTE:** Make sure that the native VLAN you are using is the same native VLAN that the FCoE devices use for Ethernet traffic.

The procedure for configuring a native VLAN on an interface is different on switches that use the original CLI than on switches that use the Enhanced Layer 2 Software (ELS) CLI. This topic provides the configuration procedure for each CLI.

### Configuring a Native VLAN on Switches Using the Original CLI

To configure a native VLAN on an interface:

1. Set the interface port mode to **tagged-access** if you have not already done so:

```
[edit]
user@switch# set interfaces interface unit unit family ethernet-switching port-mode
tagged-access
```

For example, to set the port mode to **tagged-access** for interface **xe-0/0/6.0**:

```
[edit]
user@switch# set interfaces xe-0/0/6 unit 0 family ethernet-switching port-mode
tagged-access
```

2. Configure the native VLAN if it does not already exist:

```
[edit]
user@switch# set vlans vlan-name vlan-id vlan-id
```

For example, to name the native VLAN **native** and use the VLAN ID 1:

```
[edit]
user@switch# set vlans native vlan-id 1
```

3. Configure the native VLAN on the interface:

```
[edit]
user@switch# set interfaces interface unit unit family ethernet-switching native-vlan-id
vlan-id
```

For example, to configure a native VLAN with the VLAN ID 1 on interface **xe-0/0/6.0**:

```
[edit]
user@switch# set interfaces xe-0/0/6 unit 0 family ethernet-switching native-vlan-id 1
```

### Configuring a Native VLAN on Switches Using the ELS CLI

To configure a native VLAN on an interface:

1. Set the interface mode to **trunk** if you have not already done so:

```
[edit]
user@switch# set interfaces interface unit unit family ethernet-switching interface-mode
trunk
```

For example, to set the interface mode to **trunk** for interface **xe-0/0/6.0**:

```
[edit]
user@switch# set interfaces xe-0/0/6 unit 0 family ethernet-switching interface-mode trunk
```

2. Configure the native VLAN if it does not already exist:

```
[edit]
user@switch# set vlans vlan-name vlan-id vlan-id
```

For example, to name the native VLAN **native** and use the VLAN ID 1:

```
[edit]
user@switch# set vlans native vlan-id 1
```

3. Configure the native VLAN on the physical Ethernet interface:

```
[edit]
user@switch# set interfaces interface native-vlan-id vlan-id
```

For example, to configure a native VLAN with the VLAN ID 1 on interface **xe-0/0/6.0**:

```
[edit]
user@switch# set interfaces xe-0/0/6 native-vlan-id 1
```

4. Configure the Ethernet interface as a member of the native VLAN:

```
[edit]
user@switch# set interfaces interface unit unit family ethernet-switching vlan members
vlan-name
```

For example, to configure an Ethernet interface as a member of a native VLAN with the VLAN ID 1 on interface **xe-0/0/6.0**:

```
[edit]
user@switch# set interfaces xe-0/0/6 unit 0 family ethernet-switching vlan members native
```

## Overview of Junos OS CoS for the QFX Series and EX4600 Switch

When a network experiences congestion and delay, some packets must be dropped. Junos OS class of service (CoS) enables you to divide traffic into classes and set various levels of throughput and packet loss when congestion occurs. You have greater control over packet loss because you can configure rules tailored to your needs.

You can configure CoS features to provide multiple classes of service for different applications. CoS also allows you to rewrite the Differentiated Services code point (DSCP) or IEEE 802.1p code-point bits of packets leaving an interface, thus allowing you to tailor packets for the network requirements of the remote peers.

CoS provides multiple classes of service for different applications. You can configure multiple forwarding classes for transmitting packets, define which packets are placed into each output queue, schedule the transmission service level for each queue, and manage congestion using a random early detection (RED) algorithm.

In designing CoS applications, you must carefully consider your service needs, and you must thoroughly plan and design your CoS configuration to ensure consistency and interoperability across all platforms in a CoS domain.

Because CoS is implemented in hardware rather than in software, you can experiment with and deploy CoS features without affecting packet forwarding and switching performance.

**NOTE:** CoS policies can be enabled or disabled on each switch interface. Also, each physical and logical interface on the switch can have associated custom CoS rules.

When you change or when you deactivate and then reactivate the class-of-service configuration, the system experiences packet drops because the system momentarily blocks traffic to change the mapping of incoming traffic to input queues.

This topic describes:

- [CoS Standards on page 5781](#)
- [How Junos CoS Works on page 5782](#)
- [Default CoS Behavior on page 5783](#)

### CoS Standards

The following RFCs define the standards for CoS capabilities:

- RFC 2474, *Definition of the Differentiated Services Field in the IPv4 and IPv6 Headers*
- RFC 2597, *Assured Forwarding PHB Group*
- RFC 2598, *An Expedited Forwarding PHB*

- RFC 2698, *A Two Rate Three Color Marker*
- RFC 3168, *The Addition of Explicit Congestion Notification (ECN) to IP*

The following data center bridging (DCB) standards are also supported to provide the CoS (and other characteristics) Fibre Channel requires for transmitting storage traffic over an Ethernet network:

- IEEE 802.1Qbb, priority-based flow control (PFC)
- IEEE 802.1Qaz, enhanced transmission selection (ETS)
- IEEE 802.1AB (LLDP) extension called Data Center Bridging Capability Exchange Protocol (DCBX)

### How Junos CoS Works

---

Junos CoS works by examining traffic entering at the edge of your network. The switch classifies traffic into defined service groups to provide the special treatment of traffic across the network. For example, you can send voice traffic across certain links and data traffic across other links. In addition, the data traffic streams can be serviced differently along the network path to ensure that higher-paying customers receive better service. As the traffic leaves the network at the far edge, you can reclassify the traffic to meet the policies of the targeted peer by rewriting the DSCP or IEEE 802.1 code-point bits.

To support CoS, you must configure each switch in the network. Generally, each switch examines the packets that enter it to determine their CoS settings. These settings dictate which packets are transmitted first to the next downstream switch. Switches at the edges of the network might be required to alter the CoS settings of the packets that enter the network to classify the packets into the appropriate service groups.

In [Figure 200 on page 5783](#), Switch A is receiving traffic. As each packet enters, Switch A examines the packet's current CoS settings and classifies the traffic into one of the groupings defined on the switch. This definition allows Switch A to prioritize its resources for servicing the traffic streams it receives. Switch A might alter the CoS settings (forwarding class and loss priority) of the packets to better match the defined traffic groups.

When Switch B receives the packets, it examines the CoS settings, determines the appropriate traffic groups, and processes the packet according to those settings. It then transmits the packets to Switch C, which performs the same actions. Switch D also examines the packets and determines the appropriate groups. Because Switch D sits at the far end of the network, it can reclassify (rewrite) the CoS code-point bits of the packets before transmitting them.

Figure 200: Packet Flow Across the Network

### Default CoS Behavior

If you do not configure CoS settings, the software performs some CoS functions to ensure that the system forwards traffic and protocol packets with minimum delay when the network is experiencing congestion. Some CoS settings, such as classifiers, are automatically applied to each logical interface that you configure. Other settings, such as rewrite rules, are applied only if you explicitly associate them with an interface.

### Overview of Policers

A switch polices traffic by limiting the input or output transmission rate of a class of traffic according to user-defined criteria. Policing (or rate-limiting) traffic allows you to control the maximum rate of traffic sent or received on an interface and to provide multiple priority levels or classes of service.

- [Policer Overview on page 5784](#)

- [How Many Policers are Supported? on page 5787](#)
- [Policers can Limit Egress Firewall Filters on page 5788](#)

## Policer Overview

You use policers to apply limits to traffic flow and set consequences for packets that exceed these limits—usually applying a higher loss priority—so that if packets encounter downstream congestion, they can be discarded first. Policers apply only to unicast packets.

Policers provide two functions: metering and marking. A policer meters (measures) each packet against traffic rates and burst sizes that you configure. It then passes the packet and the metering result to the marker, which assigns a packet loss priority that corresponds to the metering result. [Figure 181 on page 5242](#) illustrates this process.

**Figure 201: Flow of Tricolor Marking Policer Operation**

After you name and configure a policer, you use it by specifying it as an action in one or more firewall filters.

## Policer Types

A switch supports three types of policers:

- **Single-rate two-color marker**—A two-color policer (or “policer” when used without qualification) meters the traffic stream and classifies packets into two categories of packet loss priority (PLP) according to a configured bandwidth and burst-size limit. You can mark packets that exceed the bandwidth and burst-size limit with a specified PLP or simply discard them.

You can specify this type of policer in an ingress or egress firewall.

**NOTE:** A two-color policer is most useful for metering traffic at the port (physical interface) level.

- **Single-rate three-color marker**—This type of policer is defined in RFC 2697, *A Single Rate Three Color Marker*, as part of an assured forwarding (AF) per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment. This type of policer meters traffic based on one rate—the configured committed information rate (CIR) as well as the committed burst size (CBS) and the excess burst size (EBS). The CIR specifies the average rate at which bits are admitted to the switch. The CBS specifies the usual burst size in bytes and the EBS specifies the maximum burst size in bytes. The EBS must be greater than or equal to the CBS, and neither can be 0.

You can specify this type of policer in an ingress or egress firewall.

**NOTE:** A single-rate three-color marker (TCM) is most useful when a service is structured according to packet length and not peak arrival rate.

- Two-rate three-color marker—This type of policer is defined in RFC 2698, *A Two Rate Three Color Marker*, as part of an assured forwarding per-hop-behavior classification system for a Differentiated Services environment. This type of policer meters traffic based on two rates—the CIR and peak information rate (PIR) along with their associated burst sizes, the CBS and peak burst size (PBS). The PIR specifies the maximum rate at which bits are admitted to the network and must be greater than or equal to the CIR.

You can specify this type of policer in an ingress or egress firewall.

**NOTE:** A two-rate three-color policer is most useful when a service is structured according to arrival rates and not necessarily packet length.

See [Table 432 on page 5243](#) for information about how metering results are applied for each of these policer types.

### Policer Actions

Policer actions are implicit or explicit and vary by policer type. *Implicit* means that Junos OS assigns the loss priority automatically. [Table 432 on page 5243](#) describes the policer actions.

**Table 472: Policer Actions**

| Policer                 | Marking                        | Implicit Action                  | Configurable Action |
|-------------------------|--------------------------------|----------------------------------|---------------------|
| Single-rate two-color   | Green (conforming)             | Assign low loss priority         | None                |
|                         | Red (nonconforming)            | None                             | Discard             |
| Single-rate three-color | Green (conforming)             | Assign low loss priority         | None                |
|                         | Yellow (above the CIR and CBS) | Assign medium-high loss priority | None                |
|                         | Red (above the EBS)            | Assign high loss priority        | Discard             |

Table 472: Policer Actions (*continued*)

| Policer              | Marking                        | Implicit Action                  | Configurable Action |
|----------------------|--------------------------------|----------------------------------|---------------------|
| Two-rate three-color | Green (conforming)             | Assign low loss priority         | None                |
|                      | Yellow (above the CIR and CBS) | Assign medium-high loss priority | None                |
|                      | Red (above the PIR and PBS)    | Assign high loss priority        | Discard             |

**NOTE:** If you specify a policer in an egress firewall filter, the only supported action is **discard**.

### Policer Colors

Single-rate and two-rate three-color policers can operate in two modes:

- **Color-blind**—In color-blind mode, the three-color policer assumes that all packets examined have not been previously marked or metered. In other words, the three-color policer is “blind” to any previous coloring a packet might have had.
- **Color-aware**—In color-aware mode, the three-color policer assumes that all packets examined have been previously marked or metered. In other words, the three-color policer is “aware” of the previous coloring a packet might have had. In color-aware mode, the three-color policer can increase the PLP of a packet but cannot decrease it. For example, if a color-aware three-color policer meters a packet with a medium PLP marking, it can raise the PLP level to high but cannot reduce the PLP level to low.

### Filter-Specific Policers

You can configure policers to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps. However, the behavior of a filter-specific policer is affected by how the firewall filter terms that reference the policer are stored in TCAM. If you create a filter-specific policer and reference it in multiple firewall filter terms, the policer allows more traffic than expected if the terms are stored in different TCAM slices. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms that are stored in three separate memory slices, the total bandwidth allowed by the filter is 3 Gbps, not 1 Gbps.

To prevent this unexpected behavior from occurring, use the information about TCAM slices presented in [“Planning the Number of Firewall Filters to Create” on page 5236](#) to organize your configuration file so that all the firewall filter terms that reference a given filter-specific policer are stored in the same TCAM slice.

---

### Suggested Naming Convention for Policers

---

We recommend that you use the naming convention ***policertypeTCM#-color type*** when configuring three-color policers and ***policer#*** when configuring two-color policers. TCM stands for three-color marker. Because policers can be numerous and must be applied correctly to work, a simple naming convention makes it easier to apply the policers properly. For example, the first single-rate, color-aware three-color policer configured would be named ***srTCM1-ca***. The second two-rate, color-blind three-color configured would be named ***trTCM2-cb***. The elements of this naming convention are explained below:

- sr (single-rate)
- tr (two-rate)
- TCM (tricolor marking)
- 1 or 2 (number of marker)
- ca (color-aware)
- cb (color-blind)

---

### Policer Counters

---

Each policer that you configure includes an implicit counter that counts the number of packets that exceed the rate limits that are specified for the policer. If you use the same policer in multiple terms—either within the same filter or in different filters—the implicit counter counts all the packets that are policed in all of these terms. If you want to obtain separate packet counts for each term, use these options:

- Configure a unique policer for each term.
- Configure only one policer, but use a unique, explicit counter in each term.

---

### Policer Algorithms

---

Policing uses the *token-bucket algorithm*, which enforces a limit on average bandwidth while allowing bursts up to a specified maximum value. It offers more flexibility than the *leaky bucket algorithm* in allowing a certain amount of bursty traffic before it starts discarding packets.

---

### How Many Policers are Supported?

---

You can configure and commit the following numbers of policers on QFX3500 and QFX3600 standalone switches and QFabric Node devices:

- Two-color policers used in ingress firewall filters: 767
- Three-color policers used in ingress firewall filters: 767
- Two-color policers used in egress firewall filters: 1022
- Three-color policers used in egress firewall filters: 512

### Policers can Limit Egress Firewall Filters

The number of egress policers that you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that consume two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

## Understanding Junos CoS Components

This topic describes the Junos operating system (OS) class-of-service (CoS) components:

- [Code-Point Aliases on page 5789](#)
- [Policers on page 5789](#)
- [Classifiers on page 5789](#)
- [Forwarding Classes on page 5790](#)
- [Forwarding Class Sets on page 5790](#)
- [Flow Control \(Ethernet PAUSE, PFC, and ECN\) on page 5790](#)
- [WRED Profiles on page 5791](#)
- [Schedulers on page 5791](#)
- [Rewrite Rules on page 5792](#)

### Code-Point Aliases

A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers and rewrite rules.

### Policers

Policers limit traffic of a certain class to a specified bandwidth and burst size. Packets exceeding the policer limits can be discarded, or can be assigned to a different forwarding class, a different loss priority, or both. You define policers with filters that you can associate with input interfaces.

### Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. In Junos OS, *classifiers* associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class. Junos OS supports two general types of classifiers:

- Behavior aggregate (BA) or CoS value traffic classifiers—Examine the CoS value in the packet header. The value in this single field determines the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the Differentiated Services code point (DSCP) value or IEEE 802.1p value.
- Multifield traffic classifiers—Examine multiple fields in the packet, such as source and destination addresses and source and destination port numbers of the packet. With multifield classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

You can create unicast classifiers for unicast traffic and multideestination classifiers for multicast, broadcast, and destination lookup fail traffic. You cannot assign unicast traffic and multideestination traffic to the same classifier.

You can apply unicast classifiers to one or more interfaces. Multidestination classifiers apply to all of the switch interfaces and cannot be applied to individual interfaces.

### Forwarding Classes

---

Forwarding classes group packets for transmission and CoS. You assign each packet to an output queue based on the packet's forwarding class. Forwarding classes affect the forwarding, scheduling, and rewrite marking policies applied to packets as they transit the switch.

The switch provides five default forwarding classes:

- fcoe—Fibre Channel over Ethernet traffic
- no-loss—Lossless traffic
- be—Best-effort traffic
- nc—Network control traffic
- mcast—Multicast traffic

The switch supports a total of 12 forwarding classes (8 unicast forwarding classes and 4 multicast forwarding classes), which provide flexibility in classifying traffic.

### Forwarding Class Sets

---

You can group forwarding classes (output queues) into *forwarding class sets* in order to apply CoS to groups of traffic that require similar treatment. Forwarding class sets map traffic into priority groups to support enhanced transmission selection (ETS, described in IEEE 802.1Qaz).

You can configure up to three unicast forwarding class sets and one multicast forwarding class set. For example, you can configure different forwarding class sets to apply CoS to unicast groups of local area network (LAN) traffic, storage area network (SAN) traffic, and high-performance computing (HPC) traffic, and configure another group for multicast traffic.

Within each forwarding class set, you can configure special CoS treatment for the traffic mapped to each individual queue. This provides the ability to configure CoS in a two-tier hierarchical manner. At the forwarding class set tier, you configure CoS for groups of traffic using a *traffic control profile*. At the queue tier, you configure CoS for individual output queues within a forwarding class set using a *scheduler* that you map to a queue (forwarding class) using a *scheduler map*.

### Flow Control (Ethernet PAUSE, PFC, and ECN)

---

Ethernet PAUSE (described in IEEE 802.3X) is a link-level flow control mechanism. During periods of network congestion, Ethernet PAUSE stops all traffic on a full-duplex Ethernet link for a period of time specified in the PAUSE message.

Priority-based flow control (PFC, described in IEEE 802.1Qbb) is part of the IEEE data center bridging (DCB) specifications for creating a lossless Ethernet environment to transport loss-sensitive flows such as Fibre Channel over Ethernet (FCoE) traffic.

PFC is a link-level flow control mechanism similar to Ethernet PAUSE. However, Ethernet PAUSE stops all traffic on a link for a period of time. PFC decouples the pause function from the physical link and divides the traffic on the link into eight priorities (3-bit IEEE 802.1p code points). You can think of the eight priorities as eight “lanes” of traffic. You can apply pause selectively to the traffic on any priority without pausing the traffic on other priorities on the same link.

The granularity that PFC provides allows you to configure different levels of CoS for different types of traffic on the link. You can create lossless lanes for traffic such as FCoE, LAN backup, or management, while using standard frame-drop methods of congestion management for IP traffic on the same link.

**NOTE:** If you transport FCoE traffic, you must enable PFC on the priority assigned to FCoE traffic (usually IEEE 802.1p code point 011 on interfaces that carry FCoE traffic).

Explicit congestion notification (ECN) enables end-to-end congestion notification between two endpoints on TCP/IP based networks. ECN must be enabled on both endpoints and on all of the intermediate devices between the endpoints for ECN to work properly. Any device in the transmission path that does not support ECN breaks the end-to-end ECN functionality. ECN notifies networks about congestion with the goal of reducing packet loss and delay by making the sending device decrease the transmission rate until the congestion clears, without dropping packets. RFC 3168, *The Addition of Explicit Congestion Notification (ECN) to IP*, defines ECN.

### WRED Profiles

A WRED (weighted random early detection) profile (drop profile) defines parameters that enable the network to drop packets during periods of congestion. A drop profile defines the conditions under which packets of different loss priorities drop, by determining the probability of dropping a packet for each loss priority when output queues become congested. Drop profiles essentially set a value for a level of queue fullness—when the queue fills to the level of the queue fullness value, packets drop.

You can associate different drop profiles with different loss priorities to set the probability of dropping packets. You can apply a drop profile for each loss priority to a forwarding class (output queue) by applying a drop profile to a scheduler, and then mapping the scheduler to a forwarding class using a scheduler map. When the queue mapped to the forwarding class experiences congestion, the drop profile determines the level of packet drop for traffic of each loss priority in that queue.

Loss priority affects the scheduling of a packet without affecting the packet's relative ordering. Typically you mark packets exceeding a particular service level with a high loss priority.

### Schedulers

Each switch interface has multiple queues assigned to store packets. The switch determines which queue to service based on a particular method of scheduling. This

process often involves determining the sequence in which different types of packets should be transmitted.

You can define the priority (**priority**), minimum bandwidth (**transmit-rate**), maximum bandwidth (**shaping-rate**), and WRED profiles to be applied to a particular queue for packet transmission. Extra bandwidth is shared among queues in proportion to the minimum guaranteed bandwidth of each queue.

A scheduler map associates a specified forwarding class with a scheduler configuration. You can associate up to four user-defined scheduler maps with the interfaces.

### Rewrite Rules

---

A *rewrite rule* sets the appropriate CoS bits in the outgoing packet. This allows the next downstream device to classify the packet into the appropriate service group. Rewriting (marking) outbound packets is useful when the switch is at the border of a network and must change the CoS values to meet the policies of the targeted peer.

**NOTE:** Ingress firewall filters can also rewrite forwarding class and loss priority values.

## Understanding CoS Packet Flow

When a packet traverses a switch, the switch provides the appropriate level of service to the packet using either default class of service (CoS) settings or CoS settings that you configure. On ingress ports, the switch classifies packets into appropriate forwarding classes and assigns a loss priority to the packets. On egress ports, the switch applies packet scheduling and (if you have configured them) rewrite rules to re-mark packets.

You can configure CoS on Layer 2 logical interfaces, and you can configure CoS on Layer 3 physical interfaces if you have defined at least one logical interface on the Layer 3 physical interface. You cannot configure CoS on Layer 2 physical interfaces and Layer 3 logical interfaces.

For Layer 2 traffic, either use the default CoS settings or configure CoS on each logical interface. You can apply different CoS settings to different Layer 2 logical interfaces.

For Layer 3 traffic, either use the default CoS settings or configure CoS on the physical interface (not on the logical unit). The switch uses the CoS applied on the physical Layer 3 interface for all logical Layer 3 interfaces configured on the physical Layer 3 interface.

The switch applies to CoS to packets as they flow through the system:

- An interface has one or more classifiers of different types applied to it (configure this at the **[edit class-of-service interfaces]** hierarchy level). The classifier types are based on the portion of the incoming packet that the classifier examines (IEEE 802.1p code point bits or DSCP code point bits).
- When a packet enters an ingress port, the classifier assigns the packet to a forwarding class and a loss priority based on the code point bits of the packet (configure this at the **[edit class-of-service classifiers]** hierarchy level).
- The switch assigns each forwarding class to an output queue (configure this at the **[edit class-of-service forwarding-classes]** hierarchy level).
- Input (and output) policers meter traffic and can change the forwarding class and loss priority if a traffic flow exceeds its service level.
- A scheduler map is applied to each interface. When a packet exits an egress port, the scheduler map controls how it is treated (configure this at the **[edit class-of-service interfaces]** hierarchy level). A scheduler map assigns schedulers to forwarding classes (configure this at the **[edit class-of-service scheduler-maps]** hierarchy level).
- A scheduler defines how traffic is treated at the egress interface output queue (configure this at the **[edit class-of-service schedulers]** hierarchy level). You control the transmit rate, shaping rate, priority, and drop profile of each forwarding class by mapping schedulers to forwarding classes in scheduler maps, then applying scheduler maps to interfaces.
- A drop-profile defines how aggressively to drop packets that are mapped to a particular scheduler (configure this at the **[edit class-of-service drop-profiles]** hierarchy level).
- A rewrite rule takes effect as the packet leaves an interface that has a rewrite rule configured (configure this at the **[edit class-of-service rewrite-rules]** hierarchy level).

The rewrite rule writes information to the packet (for example, a rewrite rule can re-mark the code point bits of outgoing traffic) according to the forwarding class and loss priority of the packet.

Figure 202 on page 5794 is a high-level flow diagram of how packets from various sources enter switch interfaces, are classified at the ingress, and then scheduled (provided bandwidth) at the egress queues.

**Figure 202: CoS Classifier, Queues, and Scheduler**

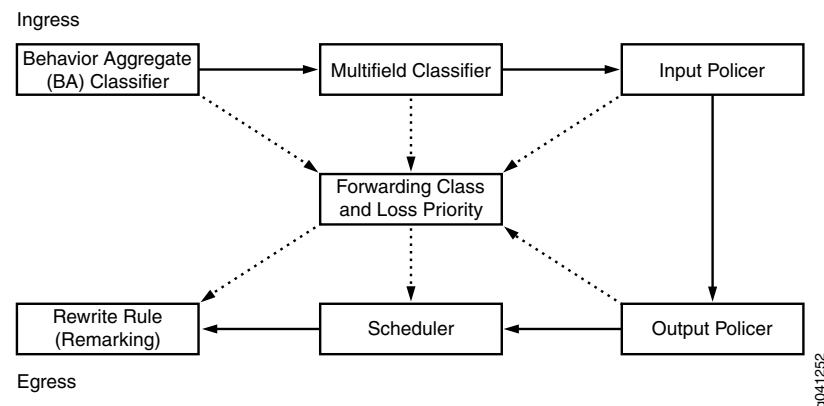

Figure 203 on page 5794 shows the packet flow through the CoS components that you can configure.

**Figure 203: Packet Flow Through Configurable CoS Components**

The middle box ("Forwarding Class and Loss Priority") represents two values that you can use on ingress and egress interfaces. The system uses these values for classifying traffic on ingress interfaces and for rewrite rule re-marking on egress interfaces. Each outer box represents a process component. The components in the top row apply to incoming packets. The components in the bottom row apply to outgoing packets.

The solid-line arrows show the direction of packet flow from ingress to egress. The dotted-line arrows show inputs and outputs or show settings and actions based on those settings.

For example, the BA classifier sets the forwarding class and loss priority of incoming packets, so the forwarding class and loss priority are outputs of the classifier and the arrow points away from the classifier. The scheduler receives the forwarding class and loss priority settings, and queues the outgoing packets based on those settings, so the arrow points toward the scheduler.

## CoS Inputs and Outputs Overview

Some CoS components map one set of values to another set of values. Each mapping contains one or more inputs and one or more outputs. When you configure a mapping, you set the outputs for a given set of inputs, as shown in [Table 473 on page 5795](#).

**Table 473: CoS Mappings—Inputs and Outputs**

| CoS Mappings   | Inputs  | Outputs   | Comments   |
|--|---|---|--|
| <a href="#">classifiers</a>                              | <a href="#">code-points</a>   | <a href="#">forwarding-class</a> ,<br><a href="#">loss-priority</a> | The map sets the forwarding class and packet loss priority (PLP) for a specific set of code points.  |

## Understanding Default CoS Settings

If you do not configure CoS settings, Junos OS performs some CoS functions to ensure that traffic and protocol packets are forwarded with minimum delay when the network experiences congestion. Some default mappings are automatically applied to each logical interface that you configure.

You can display default CoS settings by issuing the **show class-of-service** operational mode command.

This topic describes the default configurations for the following CoS components:

- [Default Forwarding Classes and Queue Mapping on page 5796](#)
- [Default Forwarding Class Sets \(Priority Groups\) on page 5797](#)

- [Default Shared Buffer Configuration on page 5804](#)

### Default Forwarding Classes and Queue Mapping

Table 474 on page 5796 shows the default mapping of the default forwarding classes to queues and packet drop attribute.

**Table 474: Default Forwarding Classes and Queue Mapping**

| Default Forwarding Class | Description  | Default Queue Mapping | Packet Drop Attribute |
|--------------------------|--|-----------------------|-----------------------|
| best-effort (be)         | Best-effort traffic class (priority 0, IEEE 802.1p code point 000)                   | 0                     | drop                  |
| fcoe                     | Guaranteed delivery for FCoE traffic (priority 3, IEEE 802.1p code point 011)        | 3                     | no-loss               |
| no-loss                  | Guaranteed delivery for TCP no-loss traffic (priority 4, IEEE 802.1p code point 100) | 4                     | no-loss               |
| network-control (nc)     | Network control traffic (priority 7, IEEE 802.1p code point 111)                     | 7                     | drop                  |

Table 474: Default Forwarding Classes and Queue Mapping (*continued*)

| Default Forwarding Class | Description              | Default Queue Mapping | Packet Drop Attribute |
|--------------------------|--------------------------|-----------------------|-----------------------|
| mcast                    | Multidestination traffic | 8                     | drop                  |

**NOTE:** You cannot configure multidestination forwarding classes as no-loss (lossless) traffic classes.

### Default Forwarding Class Sets (Priority Groups)

If you do not explicitly configure forwarding class sets, the system automatically creates a default forwarding class set that contains all of the forwarding classes on the switch. The system assigns 100 percent of the port output bandwidth to the default forwarding class set.

Ingress traffic is classified based on the default classifier settings. The forwarding classes (queues) in the default forwarding class set receive bandwidth based on the default scheduler settings. Forwarding classes that are not part of the default scheduler receive no bandwidth.

The default forwarding class set is transparent. It does not appear in the configuration and is used for Data Center Bridging Capability Exchange (DCBX) protocol advertisement.

### Default Code-Point Aliases

Table 475 on page 5797 shows the default mapping of code-point aliases to IEEE code points.

Table 475: Default IEEE 802.1 Code-Point Aliases

| CoS Value Types | Mapping |
|-----------------|---------|
| be              | 000     |
| be1             | 001     |
| ef              | 010     |
| ef1             | 011     |
| af11            | 100     |
| af12            | 101     |
| nc1             | 110     |
| nc2             | 111     |

Table 476 on page 5798 shows the default mapping of code-point aliases to DSCP and DSCP IPv6 code points.

**Table 476: Default DSCP and DCSP IPv6 Code-Point Aliases**

| CoS Value Types | Mapping |
|-----------------|---------|
| ef              | 101110  |
| af11            | 001010  |
| af12            | 001100  |
| af13            | 001110  |
| af21            | 010010  |
| af22            | 010100  |

| af31            | 011010  |
| af32            | 011100  |
| af33            | 011110  |
| af41            | 100010  |
| af42            | 100100  |
| af43            | 100110  |
| be              | 000000  |
| cs1             | 001000  |
| cs2             | 010000  |
| cs3             | 011000  |
| cs4             | 100000  |
| cs5             | 101000  |
| nc1             | 110000  |
| nc2             | 111000  |

### Default Classifiers

The switch applies default unicast IEEE 802.1, unicast DSCP, and multidestination classifiers to each interface that does not have explicitly configured classifiers. If you explicitly configure one type of classifier but not other types of classifiers, the system uses only the configured classifier and does not use default classifiers for other types of traffic. There are two different default unicast IEEE 802.1 classifiers, a trusted classifier for ports that are in trunk mode or tagged-access mode, and an untrusted classifier for ports that are in access mode.

[Table 477 on page 5799](#) shows the default mapping of IEEE 802.1 code-point values to unicast forwarding classes and loss priorities for ports in trunk mode or tagged-access mode.

**Table 477: Default IEEE 802.1 Unicast Classifiers for Ports in Trunk Mode or Tagged Access Mode (Trusted Classifier)**

| Code Point | Forwarding Class | Loss Priority |
|------------|------------------|---------------|
| be (000)   | best-effort      | low           |
| be1 (001)  | best-effort      | low           |
| ef (010)   | best-effort      | low           |
| ef1 (011)  | fcoe             | low           |
| af11 (100) | no-loss          | low           |
| af12 (101) | best-effort      | low           |
| nc1 (110)  | network-control  | low           |
| nc2 (111)  | network-control  | low           |

[Table 478 on page 5799](#) shows the default mapping of IEEE 802.1p code-point values to unicast forwarding classes and loss priorities for ports in access mode (all incoming traffic is mapped to best-effort forwarding classes).

**Table 478: Default IEEE 802.1 Unicast Classifiers for Ports in Access Mode (Untrusted Classifier)**

| Code Point | Forwarding Class | Loss Priority |
|------------|------------------|---------------|
| 000        | best-effort      | low           |
| 001        | best-effort      | low           |
| 010        | best-effort      | low           |
| 011        | best-effort      | low           |

**Table 478: Default IEEE 802.1 Unicast Classifiers for Ports in Access Mode (Untrusted Classifier) (continued)**

| Code Point | Forwarding Class | Loss Priority |
|------------|------------------|---------------|
| 100        | best-effort      | low           |
| 101        | best-effort      | low           |
| 110        | best-effort      | low           |
| 111        | best-effort      | low           |

[Table 479 on page 5800](#) shows the default mapping of IEEE 802.1 code-point values to multdestination (multicast, broadcast, and destination lookup fail traffic) forwarding classes and loss priorities.

**Table 479: Default IEEE 802.1 Multidestination Classifiers**

| Code Point | Forwarding Class | Loss Priority |
|------------|------------------|---------------|
| be (000)   | mcast            | low           |
| be1 (001)  | mcast            | low           |
| ef (010)   | mcast            | low           |
| ef1 (011)  | mcast            | low           |
| af11 (100) | mcast            | low           |
| af12 (101) | mcast            | low           |
| nc1 (110)  | mcast            | low           |
| nc2 (111)  | mcast            | low           |

[Table 480 on page 5800](#) shows the default mapping of DSCP code-point values to unicast forwarding classes and loss priorities for DSCP IP and DCSP IPv6.

**Table 480: Default DSCP IP and IPv6 Unicast Classifiers**

| Code Point    | Forwarding Class | Loss Priority |
|---------------|------------------|---------------|
| ef (101110)   | best-effort      | low           |
| af11 (001010) | best-effort      | low           |
| af12 (001100) | best-effort      | low           |
| af13 (001110) | best-effort      | low           |

Table 480: Default DSCP IP and IPv6 Unicast Classifiers (*continued*)

| Code Point    | Forwarding Class | Loss Priority |
|---------------|------------------|---------------|
| af21 (010010) | best-effort      | low           |
| af22 (010100) | best-effort      | low           |
| af23 (010110) | best-effort      | low           |
| af31 (011010) | best-effort      | low           |
| af32 (011100) | best-effort      | low           |
| af33 (011110) | best-effort      | low           |
| af41 (100010) | best-effort      | low           |
| af42 (100100) | best-effort      | low           |
| af43 (100110) | best-effort      | low           |
| be (000000)   | best-effort      | low           |
| cs1 (001000)  | best-effort      | low           |
| cs2 (010000)  | best-effort      | low           |
| cs3 (011000)  | best-effort      | low           |
| cs4 (100000)  | best-effort      | low           |
| cs5 (101000)  | best-effort      | low           |
| nc1 (110000)  | network-control  | low           |
| nc2 (111000)  | network-control  | low           |

**NOTE:** There are no default DSCP IP or IPv6 classifiers for multidestination traffic. DSCP IPv6 classifiers are not supported for multidestination traffic.

### Default Rewrite Rules

There are no default rewrite rules. If you do not explicitly configure rewrite rules, the switch does not reclassify egress traffic.

### Default Drop Profile

Table 481 on page 5802 shows the default drop profile configuration.

Table 481: Default Drop Profile

| Fill Level | Drop Probability |
|------------|------------------|
| 100        | 100              |

### Default Schedulers

Table 482 on page 5802 shows the default scheduler configuration.

Table 482: Default Schedulers

| Default Scheduler and Queue Number   | Transmit Rate (Guaranteed Minimum Bandwidth) | Shaping Rate (Maximum Bandwidth) | Excess Bandwidth Sharing | Priority | Buffer Size |
|--------------------------------------|--|----------------------------------|--------------------------|----------|-------------|
| Best-effort scheduler (queue 0)      | 5%   | None                             | 5%                       | low      | 5%          |
| FCoE scheduler (queue 3)             | 35%  | None                             | 35%                      | low      | 35%         |
| No-loss scheduler (queue 4)          | 35%  | None                             | 35%                      | low      | 35%         |
| Network-control scheduler (queue 7)  | 5%   | None                             | 5%                       | low      | 5%          |
| Multidestination scheduler (queue 8) | 20%  | None                             | 20%                      | low      | 20%         |

**NOTE:** The minimum guaranteed bandwidth (transmit rate) also determines the amount of excess (extra) bandwidth that the queue can share. Extra bandwidth is allocated to queues in proportion to the transmit rate of each queue.

By default, only the five default schedulers shown in [Table 482 on page 5802](#) have traffic mapped to them. Only the queues associated with the default schedulers receive default bandwidth, based on the default scheduler transmit rate. (You can configure schedulers and forwarding classes to allocate bandwidth to other queues or to change the default bandwidth of a default queue.) In addition, multidestination queue 11 receives enough bandwidth from the default multidestination scheduler to handle CPU-generated multidestination traffic.

Default hierarchical scheduling divides the total port bandwidth between two groups of traffic: unicast traffic and multidestination traffic. By default, unicast traffic consists of queue 0 (**best-effort** forwarding class), queue 3 (**fcoe** forwarding class), queue 4 (**no-loss** forwarding class), and queue 7 (**network-control** forwarding class). Unicast traffic receives and shares a total of 80 percent of the port bandwidth. By default, multidestination traffic (**mcast** queue 8) receives a total of 20 percent of the port bandwidth. So on a 10-Gigabit port, unicast traffic receives 8-Gbps of bandwidth and multidestination traffic receives 2-Gbps of bandwidth.

**NOTE:** Multidestination queue 11 also receives a small amount of default bandwidth from the multidestination scheduler. CPU-generated multidestination traffic uses queue 11, so you might see a small number of packets egress from queue 11. In addition, in the unlikely case that firewall filter match conditions map multidestination traffic to a unicast forwarding class, that traffic uses queue 11.

Default scheduling uses weighted round-robin (WRR) scheduling. Each queue receives a portion (weight) of the total available interface bandwidth. The scheduling weight is based on the transmit rate of the default scheduler for that queue. For example, queue 7 receives a default scheduling weight of 5 percent of the available bandwidth, and queue 4 receives a default scheduling weight of 35 percent of the available bandwidth. Queues are mapped to forwarding classes, so forwarding classes receive the default bandwidth for the queues to which they are mapped.

You should explicitly map traffic to non-default (unconfigured) queues and create schedulers to allocate bandwidth to those queues if you want to use them to forward traffic. By default, unicast queues 1, 2, 5, and 6 are unconfigured, and multidestination queues 9, 10, and 11 are unconfigured. Unconfigured queues have a default scheduling weight of 1 so that they can receive a small amount of bandwidth in case they need to forward traffic. (However, queue 11 can use more of the default multidestination scheduler bandwidth if necessary to handle CPU-generated multidestination traffic.)

**NOTE:** All four multidestination queues have a scheduling weight of 1. Because by default multidestination traffic goes to queue 8, queue 8 receives almost all of the multidestination bandwidth. (There is no traffic on queue 9 and queue 10, and very little traffic on queue 11, so there is almost no competition for multidestination bandwidth.)

However, if you explicitly configure queue 9, 10, or 11 (by mapping code points to the unconfigured multidestination forwarding classes using the multidestination classifier), the explicitly configured queues share the multidestination scheduler bandwidth equally with default queue 8, because all of the queues have the same scheduling weight (1). To ensure that multidestination bandwidth is allocated to each queue properly and that the bandwidth allocation to the default queue (8) is not reduced too much, we strongly recommend that you configure a scheduler if you explicitly classify traffic into queue 9, 10, or 11.

If you map traffic to an unconfigured queue, the queue receives only the amount of group bandwidth proportional to its default weight (1). The actual amount of bandwidth an unconfigured queue receives depends on how much bandwidth the other queues in the group are using.

If the other unicast queues use less than their allocated amount of bandwidth, the unconfigured queues can share the unused bandwidth. Sharing unused bandwidth is one of the key advantages of hierarchical port scheduling. Configured queues have higher

priority for bandwidth than unconfigured queues, so if a configured queue needs more bandwidth, then less bandwidth is available for unconfigured queues. Unconfigured queues always receive a minimum amount of bandwidth based on their scheduling weight (1). If you map traffic to an unconfigured queue, to allocate bandwidth to that queue, configure a scheduler for the forwarding class that is mapped to the queue.

### Default Scheduler Maps

Table 483 on page 5804 shows the default mapping of forwarding classes to schedulers.

**Table 483: Default Scheduler Maps**

| Forwarding Class | Scheduler                          |
|------------------|------------------------------------|
| best-effort      | Default BE scheduler               |
| fcoe             | Default FCoE scheduler             |
| no-loss          | No-loss scheduler                  |
| network-control  | Default network-control scheduler  |
| mcast-be         | Default multidestination scheduler |

### Default Shared Buffer Configuration

Table 484 on page 5804 and Table 485 on page 5804 show the default shared buffer allocations:

**Table 484: Default Ingress Shared Buffer Configuration**

| Total Shared Ingress Buffer | Lossless Buffer | Lossless-Headroom Buffer | Lossy Buffer |
|-----------------------------|-----------------|--------------------------|--------------|
| 100%                        | 9%              | 45%                      | 46%          |

**Table 485: Default Egress Shared Buffer Configuration**

| Total Shared Egress Buffer | Lossless Buffer | Lossy Buffer | Multicast Buffer |
|----------------------------|-----------------|--------------|------------------|
| 100%                       | 50%             | 31%          | 19%              |

## Understanding Host Inbound Traffic Classification

The destination address of traffic that enters the switch can be an external device such as another switch, a router, or a server, or the destination can be the host (the switch Routing Engine or CPU). When the destination is an external device, the DSCP and IEEE 802.1p code-point bits of incoming traffic are preserved as the traffic travels through the switch to the egress port. At the egress port, the code-point bits are either preserved when the packets are sent to the next hop or they are rewritten according to the rewrite rule attached to the egress interface.

When the destination of incoming traffic is the host, DSCP bits are preserved. However, IEEE 802.1p bits are not preserved. The IEEE 802.1p bits of traffic destined for the host are set to zero (0). This does not affect system behavior because the switch prioritizes traffic destined for the host based on the protocol type. For example, the switch gives a higher priority to BPDU traffic than to ping traffic.

## Understanding Host Routing Engine Outbound Traffic Queues and Defaults

The host Routing Engine and CPU generate outbound traffic that is transmitted using different protocols. You cannot configure a classifier to map different types of outbound traffic that the host generates to forwarding classes (queues). The traffic that the host generates is assigned to forwarding classes by default as shown in [Table 486 on page 5806](#).

If you want to separate host outbound traffic from other traffic or if you want to assign that traffic to a particular queue, you can configure a single forwarding class for all traffic that the host generates. If you configure a forwarding class for outbound host traffic, that forwarding class is used globally for all traffic generated by the host. (That is, the host outbound traffic is mapped to the selected queue on all egress interfaces.) Configuring a forwarding class for host outbound traffic does not affect transit or incoming traffic.

Whether you use the default host outbound traffic forwarding class configuration or configure a forwarding class for all host outbound traffic, the configuration applies to all Layer 2 and Layer 3 protocols and to all application-level traffic such as FTP and ping operations.

If you configure a queue for host outbound traffic, the queue must be properly configured on all interfaces.

**NOTE:** Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) packets generated by the CPU are always transmitted on the `fcoe` queue (queue 3), even if you configure a queue for host outbound traffic. This helps to ensure lossless behavior for FCoE traffic. QFabric systems classify FIP control packets into the same traffic class (`fcoe`) across the Interconnect device (`fabric`) and the egress Node device.

By default, traffic generated by the host is sent to the best effort queue (queue 0) or to the network control queue (queue 7). [Table 486 on page 5806](#) lists the default host traffic to output queue mapping.

**Table 486: Routing Engine Protocol Default Queue Mapping**

| Routing Engine Protocol  | Default Queue Mapping |
|--|-----------------------|
| Address Resolution Protocol (ARP) reply                          | Queue 0               |
| ARP request  | Queue 0               |
| Border Gateway Protocol (BGP)                                    | Queue 0               |
| BGP TCP Retransmission   | Queue 7               |
| Fibre Channel over Ethernet (FCoE) Initialization Protocol (FIP) | Queue 3               |
| File Transfer Protocol (FTP)                                     | Queue 0               |

Table 486: Routing Engine Protocol Default Queue Mapping (*continued*)

| Routing Engine Protocol                         | Default Queue Mapping |
|---|-----------------------|
| Internet Control Message Protocol (ICMP) reply  | Queue 0               |
| ICMP request                                    | Queue 0               |
| Internet Group Management Protocol (IGMP) query | Queue 7               |
| IGMP report                                     | Queue 0               |
| Link Aggregation Control Protocol (LACP)        | Queue 7               |
| Open Shortest Path First (OSPF) hello           | Queue 7               |
| OSPF protocol data unit (PDU)                   | Queue 7               |
| OSPF link state advertisements (LSAs)           | Queue 7               |
| Protocol Independent Multicast (PIM)            | Queue 7               |
| PIM hello                                       | Queue 7               |
| Simple Network Management Protocol (SNMP)       | Queue 0               |
| Secure Shell (SSH)                              | Queue 0               |
| Telnet  | Queue 0               |
| Virtual Router Redundancy Protocol (VRRP)       | Queue 7               |
| VLAN Spanning Tree Protocol (VSTP)              | Queue 7               |
| <code>xnm-clear-text</code>                     | Queue 0               |
| <code>xnm-ssl</code>                            | Queue 0               |

## Understanding CoS Code-Point Aliases

A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers, drop-profile maps, and rewrite rules.

Behavior aggregate classifiers use class-of-service (CoS) values such as Differentiated Services code points (DSCPs) and IEEE 802.1 bits to associate incoming packets with a particular CoS servicing level. You can assign a meaningful name or alias to the CoS values and use that alias instead of bits when configuring CoS components. These aliases are not part of the specifications but are well known through usage. For example, the alias for DSCP 101110 is widely accepted as ef (expedited forwarding).

When you configure classes and define classifiers, you can refer to the markers by alias names. You can configure alias names for user-defined classifiers. If the value of an alias changes, it alters the behavior of any classifier that references it.

You can configure code-point aliases for the following type of CoS markers:

- dscp or dscp-ipv6—Handles incoming IP and IPv6 packets.
- ieee-802.1—Handles Layer 2 CoS.

This topic covers:

- [Default Code-Point Aliases on page 5808](#)

### Default Code-Point Aliases

[Table 487 on page 5808](#) shows the default mapping of code-point aliases to IEEE code points.

**Table 487: Default IEEE 802.1 Code-Point Aliases**

| CoS Value Types | Mapping |
|-----------------|---------|
| be              | 000     |
| be1             | 001     |
| ef              | 010     |
| ef1             | 011     |
| af11            | 100     |
| af12            | 101     |
| nc1             | 110     |
| nc2             | 111     |

[Table 488 on page 5809](#) shows the default mapping of code-point aliases to DSCP and DSCP IPv6 code points.

**Table 488: Default DSCP and DSCP IPv6 Code-Point Aliases**

| CoS Value Types | Mapping |
|-----------------|---------|
| ef              | 101110  |
| af11            | 001010  |
| af12            | 001100  |

## Understanding CoS Classifiers

Packet classification associates incoming packets with a particular class-of-service (CoS) servicing level. Classifiers associate packets with a forwarding class and a loss priority, and assign packets to output queues based on the associated forwarding class. There are three general types of classifiers:

- Behavior aggregate (BA) classifiers—DSCP and DSCP IPv6 classify IP and IPv6 traffic, EXP classifies MPLS traffic, and IEEE 802.1p classifiers classify all other traffic. (Although this topic covers EXP classifiers, for more details about EXP classifiers, see [“Understanding CoS MPLS EXP Classifiers and Rewrite Rules” on page 4419](#). EXP classifiers are applied only on **family mpls** interfaces.)
  - Fixed classifiers—Fixed classifiers classify all ingress traffic on a physical interface into one forwarding class, regardless of the CoS bits in the packet header.
  - Multifield (MF) classifiers—MF classifiers classify traffic based on more than one field in the packet header and take precedence over BA and fixed classifiers.
- [Interfaces and Output Queues on page 5810](#)
  - [Behavior Aggregate Classifiers on page 5811](#)
  - [Fixed Classifiers on Ethernet Interfaces on page 5814](#)
  - [Fixed Classifiers on Native Fibre Channel Interfaces \(NP\\_Ports\) on page 5815](#)
  - [Multifield Classifiers on page 5815](#)
  - [Packet Classification for Routed VLAN Interfaces \(RVIs\) on page 5816](#)

### Interfaces and Output Queues

---

On Gigabit Ethernet interfaces, 10-Gigabit Ethernet interfaces, and link aggregation (LAG) interfaces, you can apply classifiers to Layer 2 logical interfaces and to Layer 3 physical interfaces if the Layer 3 physical interface has at least one defined logical interface. Classifiers applied to Layer 3 physical interfaces are used on all logical interfaces on that physical interface. [“Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces” on page 5820](#) describes the interaction between classifiers and interfaces in greater detail.

You can configure both a BA classifier and an MF classifier on an interface. If you do this, the BA classification is performed first and then the MF classification is performed. If the two classification results conflict, the MF classification result overrides the BA classification result.

You cannot configure a fixed classifier and a BA classifier on the same interface.

You can configure both a DSCP or a DSCP IPv6 classifier and an IEEE 802.1p classifier on the same interface. IP traffic uses the DSCP or DSCP IPv6 classifier. All other traffic uses the IEEE classifier (except when you configure a global EXP classifier; in that case, MPLS traffic uses the EXP classifier providing that the interface is configured as **family**

**mpls**). You can configure only one DSCP classifier on a physical interface (either one DSCP classifier or one DSCP IPv6 classifier, but not both).

Although you can configure as many EXP classifiers as you want, the switch uses only one MPLS EXP classifier as a global classifier on all interfaces. After you configure an MPLS EXP classifier, you can configure it as the global EXP classifier by including the EXP classifier in the **[edit class-of-service system-defaults classifiers exp]** hierarchy. All switch interfaces that are configured as **family mpls** use the EXP classifier specified using this configuration statement to classify MPLS traffic.

You can create unicast BA classifiers for unicast traffic and multicast BA classifiers for multdestination traffic, which includes multicast, broadcast, and destination lookup fail (DLF) traffic. You cannot assign unicast traffic and multdestination traffic to the same BA classifier.

On each interface, the switch has separate output queues for unicast traffic and for multdestination traffic:

- The switch supports 12 output queues, with 8 queues dedicated to unicast traffic and 4 queues dedicated to multdestination traffic.
- Queues 0 through 7 are unicast traffic queues. You can apply only unicast BA classifiers to unicast queues. A unicast BA classifier should contain only forwarding classes that are mapped to unicast queues.
- Queues 8 through 11 are multdestination traffic queues. You can apply only multdestination BA classifiers to multdestination queues. A multdestination BA classifier should contain only forwarding classes that are mapped to multdestination queues.

You can apply unicast classifiers to one or more interfaces. Multdestination classifiers and EXP classifiers apply to all of the switch interfaces and cannot be applied to individual interfaces. Use the DSCP multdestination classifier for both IP and IPv6 multdestination traffic. The DSCP IPv6 classifier is not supported for multdestination traffic.

### Behavior Aggregate Classifiers

The behavior aggregate classifier maps a class-of-service (CoS) value to a forwarding class and loss priority. The forwarding class determines the output queue. A scheduler uses the loss priority to control packet discard during periods of congestion by associating different drop profiles with different loss priorities.

The switch supports three types of BA classifiers:

- Differentiated Services Code Point (DSCP) for IP DiffServ (IP and IPv6)
- IEEE 802.1p CoS bits
- MPLS EXP (applies only to interfaces configured as **family mpls**)

BA classifiers are based on fixed-length fields, which makes them computationally more efficient than MF classifiers. Therefore, core devices, which handle high traffic volumes, are normally configured to perform BA classification.

Unicast and multicast traffic cannot share the same classifier. You can map unicast traffic and multicast traffic to the same classifier CoS value, but the unicast traffic must belong to a unicast classifier and the multicast traffic must belong to a multidestination classifier.

### Default Behavior Aggregate Classification

Juniper Networks Junos OS automatically assigns implicit default classifiers to all logical interfaces based on the type of interface. [Table 489 on page 5812](#) lists different types of interfaces and the corresponding implicit default BA classifiers.

**Table 489: Default BA Classification**

| Type of Interface  | Default BA Classification |
|--|---------------------------|
| Layer 2 interface in trunk mode or in tagged-access mode | ieee8021p-default         |
| Layer 3 interface  | dscp-default              |
| Layer 2 interface in access mode                         | ieee8021p-untrusted       |

**NOTE:** There are default BA classifiers for the best-effort, fcoe, no-loss, network-control, and mcast forwarding classes.

**NOTE:** There is no default MPLS EXP classifier. You must configure an EXP classifier and apply it globally to all interfaces that are configured as family mpls by including it in the [edit class-of-service system-defaults classifiers exp] hierarchy. On family mpls interfaces, if a fixed classifier is present on the interface, the EXP classifier overrides the fixed classifier.

If an EXP classifier is not configured, then if a fixed classifier is applied to the interface, the MPLS traffic uses the fixed classifier. If no EXP classifier and no fixed classifier is applied to the interface, MPLS traffic is treated as best-effort traffic. DSCP classifiers are not applied to MPLS traffic.

Because the EXP classifier is global, you cannot configure some ports to use a fixed IEEE 802.1p classifier for MPLS traffic on some interfaces and the global EXP classifier for MPLS traffic on other interfaces. When you configure a global EXP classifier, all MPLS traffic on all interfaces uses the EXP classifier, even interfaces that have a fixed classifier.

When you explicitly associate a unicast classifier with a logical interface, you override the default unicast classifier with the explicit unicast classifier.

**NOTE:** You can apply only one classifier of each type, DSCP and IEEE 802.1p, to a Layer 2 interface. If both types of classifiers are present, DSCP classifiers take precedence over IEEE 802.1p classifiers. (If you also configure a global EXP classifier, only MPLS traffic on interfaces configured as family `mpls` uses the EXP classifier, and other traffic uses the configured or default classifier for that traffic type.)

### **Importing a Classifier**

You can use any existing classifier, including the default classifiers, as the basis for defining a new classifier. You accomplish this using the **import** statement.

The imported classifier is used as a template and is not modified. The modifications you make become part of a new classifier (and a new template) identified by the name of the new classifier. Whenever you commit a configuration that assigns a new class-name and loss-priority value to a code-point alias or set of bits, it replaces that entry in the new classifier template. As a result, you must explicitly specify every CoS value in every designation that requires modification.

### **Multidestination Classifiers**

Multidestination classifiers are applied to all interfaces and cannot be applied to individual interfaces. You can configure both a DSCP multidestination classifier and an IEEE multidestination classifier. IP and IPv6 traffic use the DSCP classifier, and all other traffic uses the IEEE classifier.

DSCP IPv6 multidestination classifiers are not supported, so IPv6 traffic uses the DSCP multidestination classifier.

The default multidestination classifier is the IEEE 802.1p multidestination classifier.

### **PFC Priorities**

The eight IEEE 802.1p code points correspond to the eight priorities that priority-based flow control (PFC) uses to differentiate traffic classes for lossless transport. When you map a forwarding class (which maps to an output queue) to an IEEE 802.1p CoS value, the IEEE 802.1p CoS value identifies the priority.

Although you can map a priority to any output queue (by mapping the priority to a forwarding class), we recommend that the priority and the unicast forwarding class match in a one-to-one correspondence in which priority 0 is assigned to queue 0, priority 1 is assigned to queue 1, and so on, as shown in [Table 490 on page 5813](#). A one-to-one correspondence of queue and priority numbers makes it easier to configure and maintain the mapping of forwarding classes to priorities and queues.

**Table 490: Default IEEE 802.1p Code Point to PFC Priority, Output Queue, and Forwarding Class Mapping**

| IEEE 802.1p Code Point | PFC Priority | Unicast Output Queue | Forwarding Class and Packet Drop Attribute |
|------------------------|--------------|----------------------|--|
| 000                    | 0            | 0                    | best-effort (drop)                         |

**Table 490: Default IEEE 802.1p Code Point to PFC Priority, Output Queue, and Forwarding Class Mapping (*continued*)**

| IEEE 802.1p Code Point | PFC Priority | Unicast Output Queue | Forwarding Class and Packet Drop Attribute |
|------------------------|--------------|----------------------|--|
| 001                    | 1            | 1                    | best-effort (drop)                         |
| 010                    | 2            | 2                    | best-effort (drop)                         |
| 011                    | 3            | 3                    | fcoe (no-loss)                             |
| 100                    | 4            | 4                    | no-loss (no-loss)                          |
| 101                    | 5            | 5                    | best-effort (drop)                         |
| 110                    | 6            | 6                    | network-control (drop)                     |
| 111                    | 7            | 7                    | network-control (drop)                     |

**NOTE:** By convention, deployments with converged server access typically use IEEE 802.1p priority 3 (011) for FCoE traffic. The default mapping of the fcoe forwarding class is to queue 3. Apply priority-based flow control (PFC) to the entire FCoE data path to configure the end-to-end lossless behavior that FCoE requires. We recommend that you use priority 3 for FCoE traffic unless your network architecture requires that you use a different priority.

### Fixed Classifiers on Ethernet Interfaces

Fixed classifiers map all traffic on an interface to a forwarding class and a loss priority. (As opposed to BA classifiers, which map traffic into multiple different forwarding classes based on the CoS field value in the packet header.) The forwarding class determines the output queue. Incoming traffic of all IEEE 802.1p priorities is classified into the forwarding class specified in the fixed classifier. A scheduler uses the loss priority to control packet discard during periods of congestion by associating different drop profiles with different loss priorities.

You cannot configure a fixed classifier and a DSCP or IEEE 802.1p BA classifier on the same interface. If you configure a fixed classifier on an interface, you cannot configure a DSCP or an IEEE classifier on that interface. If you configure a DSCP classifier, an IEEE classifier, or both classifiers on an interface, you cannot configure a fixed classifier on that interface.

**NOTE:** Because EXP classifiers are global, you can configure both a global EXP classifier and also apply fixed classifiers on interfaces. When both the global EXP classifier and a fixed classifier are applied to an interface, MPLS traffic on interfaces configured as family mpls uses the EXP classifier and all other traffic uses the fixed classifier.

To switch from a fixed classifier to a BA classifier or to switch from a BA classifier to a fixed classifier, deactivate the existing classifier attachment on the interface, and then attach the new classifier to the interface.

**NOTE:** If you configure a fixed classifier that classifies all incoming traffic into the fcoe forwarding class (or any forwarding class designed to handle FCoE traffic), you must ensure that all traffic that enters the interface is FCoE traffic and is tagged with the FCoE IEEE 802.1p code point (priority).

### Fixed Classifiers on Native Fibre Channel Interfaces (NP\_Ports)

Applying a fixed classifier to a native Fibre Channel (FC) interface (NP\_Port) is a special case. By default, native FC interfaces classify incoming traffic from the FC SAN into the fcoe forwarding class and map the traffic to IEEE 802.1p priority 3 (code point 011). When you apply a fixed classifier to an FC interface, you also configure a priority rewrite value for the interface. The FC interface uses the priority rewrite value as the IEEE 802.1p tag value for all incoming packets instead of the default value of 3.

For example, if you specify a priority rewrite value of 5 (code point 101) for an FC interface, the interface tags all incoming traffic from the FC SAN with priority 5 and classifies the traffic into the forwarding class specified in the fixed classifier.

**NOTE:** The forwarding class specified in the fixed classifier on FC interfaces must be a lossless forwarding class.

### Multifield Classifiers

Multifield classifiers examine multiple fields in a packet such as source and destination addresses and source and destination port numbers of the packet. With MF classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

MF classification is normally performed at the network edge because of the general lack of DiffServ code point (DSCP) support in end-user applications. On a switch at the edge of a network, an MF classifier provides the filtering functionality that scans through a variety of packet fields to determine the forwarding class for a packet. Typically, a classifier performs matching operations on the selected fields against a configured value.

### Packet Classification for Routed VLAN Interfaces (RVIs)

You cannot apply classifiers directly to routed VLAN interfaces (RVIs) because the members of RVIs are VLANs, not ports. However, you can apply classifiers to the VLAN port members of an RVI. You can also apply MF classifiers to RVIs.

## Understanding CoS MPLS EXP Classifiers and Rewrite Rules

You can use class of service (CoS) within MPLS networks to prioritize certain types of traffic during periods of congestion by applying packet classifiers and rewrite rules to the MPLS traffic. (For information about DSCP and IEEE 802.1p classifiers and general information about classifiers, see [“Understanding CoS Classifiers” on page 5810](#). For information about DSCP and IEEE 802.1p rewrite rules, see [“Understanding CoS Rewrite Rules” on page 5914](#).)

When a packet enters a customer-edge interface on the ingress provider edge (PE) switch, the switch associates the packet with a particular CoS servicing level before placing the packet onto the label-switched path (LSP). The switches within the LSP utilize the CoS value set at the ingress PE switch. The CoS value that was embedded in the classifier is translated and encoded in the MPLS header by means of the experimental (EXP) bits.

EXP classifiers map incoming MPLS packets to a forwarding class and a loss priority, and assign MPLS packets to output queues based on the forwarding class mapping. EXP classifiers are behavior aggregate (BA) classifiers.

EXP rewrite rules change (rewrite) the CoS value of the EXP bits in outgoing packets on the egress queues of the switch so that the new (rewritten) value matches the policies of a targeted peer. Policy matching allows the downstream routing platform or switch in a neighboring network to classify each packet into the appropriate service group.

**NOTE:** There is no default EXP classifier. There is no default EXP rewrite rule. If you want to classify incoming MPLS packets using the EXP bits, you must configure a global EXP classifier. If you want to rewrite the EXP bit value at the egress interface, you must configure EXP rewrite rules and apply them to logical interfaces.

EXP classifiers and rewrite rules are applied only to interfaces that are configured as **family mpls** (for example, set interfaces xe-0/0/35 unit 0 family mpls.)

### EXP Classifiers

Unlike DSCP and IEEE 802.1p BA classifiers, EXP classifiers are global to the switch and apply to all switch interfaces that are configured as **family mpls**. When you configure and apply an EXP classifier, MPLS traffic on all **family mpls** interfaces uses the EXP classifier, even on interfaces that also have a fixed classifier. If an interface has both an EXP classifier and a fixed classifier, the EXP classifier is applied to MPLS traffic and the fixed classifier is applied to all other traffic.

Also unlike DSCP and IEEE 802.1p BA classifiers, there is no default EXP classifier. If you want to classify MPLS traffic based on the EXP bits, you must explicitly configure an EXP classifier and apply it to the switch interfaces. Each EXP classifier has eight entries that correspond to the eight EXP CoS values (0 through 7, which correspond to bits 000 through 111).

You can configure as many EXP classifiers as you want. However, the switch uses only one MPLS EXP classifier as a global classifier on all interfaces. After you configure an MPLS EXP classifier, you can configure it as the global EXP classifier by including the EXP classifier in the **[edit class-of-service system-defaults classifiers exp]** hierarchy. All switch interfaces use the global EXP classifier to classify MPLS traffic.

Only one EXP classifier can be configured as the global EXP classifier at any time. If you want to change the global EXP classifier, delete the global EXP classifier configuration (use the **user@switch# delete class-of-service system-defaults classifiers exp** configuration statement), then configure the new global EXP classifier.

If an EXP classifier is not configured, then if a fixed classifier is applied to the interface, the MPLS traffic uses the fixed classifier. If no EXP classifier and no fixed classifier is applied to the interface, MPLS traffic is treated as best-effort traffic. DSCP classifiers are not applied to MPLS traffic.

Because the EXP classifier is global, you cannot configure some ports to use a fixed IEEE 802.1p classifier for MPLS traffic on some interfaces and the global EXP classifier for MPLS traffic on other interfaces. When you configure a global EXP classifier, all MPLS traffic on all interfaces uses the EXP classifier.

**NOTE:** The switch uses only the outermost label of incoming EXP packets for classification.

---

**NOTE:** MPLS packets with 802.1Q tags are not supported.
