| <b>Description</b>              | Display Interchassis Control Protocol (ICCP) information about the multichassis link aggregation group (MC-LAG) peers, including the state of the TCP connection, Bidirectional Forwarding Detection protocol, backup liveness peer status, and MCSNOOPD, LACPD, and ESWD applications.  |
| <b>Options</b>                  | <p><b>logical-system</b> [<i>system-name</i>   all]—(Optional) Display information for a specified logical system or all systems.</p> <p><b>none</b>—Display ICCP information about the MC-LAG peers, including the state of the TCP connection and Bidirectional Forwarding Detection protocol, and MCSNOOPD, LACPD, and ESWD applications.</p> <p><b>brief</b>—Display brief ICCP information about the MC-LAG peers, including the state of the TCP connection and Bidirectional Forwarding Detection protocol, and MCSNOOPD, LACPD, and ESWD applications.</p> <p><b>detail</b>—Display detailed ICCP information about the MC-LAG peers, including the state of the TCP connection and Bidirectional Forwarding Detection protocol, and MCSNOOPD, LACPD, and ESWD applications.</p> |

| <b>Output Fields</b>            | <a href="#">Table 251 on page 2766</a> lists the output fields for the <b>show iccp</b> command. Output fields are listed in the approximate order in which they appear.   |

Table 251: show iccp

| Field Name                            | Field Description   |
|---------------------------------------|---|
| Redundancy Group Information for peer | Aggregated Ethernet interface name.   |
| TCP Connection                        | Specifies if the TCP connection between the peers hosting the MC-LAG is up or down.                     |
| Liveness Detection                    | Specifies if liveness detection, also known as Bidirectional Forwarding Detection (BFD), is up or down. |

Table 251: show iccp (*continued*)

| Field Name                     | Field Description   |
|--------------------------------|---|
| Client Application             | Specifies information regarding the state of the MCSNOOPD and ESWD client applications.                             |
| Redundancy Group IDs<br>Joined | Denotes the redundancy group unique identifier that is associated for the particular client application or process. |

## Sample Output

### show iccp

```
user@switch> show iccp
Redundancy Group Information for peer 3.3.3.2
  TCP Connection      : Established
  Liveliness Detection : Up

Client Application: MCSNOOPD

Client Application: eswd
```

## show interfaces diagnostics optics

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>show interfaces diagnostics optics <i>interface-name</i></code>  |
| <b>Release Information</b>      | Command introduced in Junos OS Release 10.0 for EX Series switches.<br>Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series.  |
| <b>Description</b>              | <p>Display diagnostics data and alarms for Gigabit Ethernet optical transceivers (SFP, SFP+, XFP, QSFP+, or CFP) installed in EX Series or QFX Series switches. The information provided by this command is known as digital optical monitoring (DOM) information. For a list of transceivers supported on EX Series switches and their specifications, including DOM support, see <i>Pluggable Transceivers Supported on EX Series Switches</i>.</p> <p>Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transponder vendors. Generally, a high alarm or low alarm indicates that the optics module is not operating properly. This information can be used to diagnose why a transceiver is not working.</p> |
| <b>Options</b>                  | <i>interface-name</i> —Name of the interface associated with the port in which the transceiver is installed: <i>ge-fpc/pic/port</i> , <i>xe-fpc/pic/port</i> , or <i>et-fpc/pic/port</i> .   |

Table 252: show interfaces diagnostics optics Output Fields

| Field Name         | Field Description                            |
|--------------------|--|
| Physical interface | Displays the name of the physical interface. |

Table 252: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name   | Field Description  |
|--|--|
| <b>Laser bias current</b>  | Displays the magnitude of the laser bias power setting current, in milliamperes. The laser bias provides direct modulation of laser diodes and modulates currents. |
| <b>Laser output power</b><br>(Not available for QSFP+ transceivers)                                  | Displays the laser output power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).   |
| <b>Laser temperature</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)               | Displays the laser temperature, in Celsius and Fahrenheit.   |
| <b>Module temperature</b>  | Displays the temperature, in Celsius and Fahrenheit.   |
| <b>Module voltage</b><br>(Not available for XFP transceivers)  | Displays the voltage, in Volts.  |
| <b>Laser rx power</b><br>(Not available for SFP, SFP+, QSFP+, and CFP transceivers)                  | Displays the laser received optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).   |
| <b>Receiver signal average optical power</b><br>(Not available for XFP, QSFP+, and CFP transceivers) | Displays the receiver signal average optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).  |
| <b>Laser bias current high alarm</b>   | Displays whether the laser bias power setting high alarm is <b>On</b> or <b>Off</b> .  |
| <b>Laser bias current low alarm</b>  | Displays whether the laser bias power setting low alarm is <b>On</b> or <b>Off</b> .   |
| <b>Laser bias current high warning</b>   | Displays whether the laser bias power setting high warning is <b>On</b> or <b>Off</b> .  |
| <b>Laser bias current low warning</b>  | Displays whether the laser bias power setting low warning is <b>On</b> or <b>Off</b> .   |
| <b>Laser output power high alarm</b><br>(Not available for QSFP+ transceivers)                       | Displays whether the laser output power high alarm is <b>On</b> or <b>Off</b> .  |
| <b>Laser output power low alarm</b><br>(Not available for QSFP+ transceivers)                        | Displays whether the laser output power low alarm is <b>On</b> or <b>Off</b> .   |
| <b>Laser output power high warning</b><br>(Not available for QSFP+ transceivers)                     | Displays whether the laser output power high warning is <b>On</b> or <b>Off</b> .  |

Table 252: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name  | Field Description   |
|---|---|
| <b>Laser output power low warning</b><br>(Not available for QSFP+ transceivers)                     | Displays whether the laser output power low warning is <b>On</b> or <b>Off</b> .  |
| <b>Laser temperature high alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)   | Displays whether the laser temperature high alarm is <b>On</b> or <b>Off</b> .    |
| <b>Laser temperature low alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)    | Displays whether the laser temperature low alarm is <b>On</b> or <b>Off</b> .     |
| <b>Laser temperature high warning</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays whether the laser temperature high warning is <b>On</b> or <b>Off</b> .  |
| <b>Laser temperature low warning</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)  | Displays whether the laser temperature low warning is <b>On</b> or <b>Off</b> .   |
| <b>Module temperature high alarm</b><br>(Not available for QSFP+ transceivers)                      | Displays whether the module temperature high alarm is <b>On</b> or <b>Off</b> .   |
| <b>Module temperature low alarm</b><br>(Not available for QSFP+ transceivers)                       | Displays whether the module temperature low alarm is <b>On</b> or <b>Off</b> .    |
| <b>Module temperature high warning</b><br>(Not available for QSFP+ transceivers)                    | Displays whether the module temperature high warning is <b>On</b> or <b>Off</b> . |
| <b>Module temperature low warning</b><br>(Not available for QSFP+ transceivers)                     | Displays whether the module temperature low warning is <b>On</b> or <b>Off</b> .  |
| <b>Module voltage high alarm</b><br>(Not available for XFP and QSFP+ transceivers)                  | Displays whether the module voltage high alarm is <b>On</b> or <b>Off</b> .       |
| <b>Module voltage low alarm</b><br>(Not available for XFP and QSFP+ transceivers)                   | Displays whether the module voltage low alarm is <b>On</b> or <b>Off</b> .        |
| <b>Module voltage high warning</b><br>(Not available for XFP and QSFP+ transceivers)                | Displays whether the module voltage high warning is <b>On</b> or <b>Off</b> .     |
| <b>Module voltage low warning</b><br>(Not available for XFP and QSFP+ transceivers)                 | Displays whether the module voltage low warning is <b>On</b> or <b>Off</b> .      |

Table 252: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name  | Field Description  |
|---|--|
| <b>Laser rx power high alarm</b><br>(Not available for QSFP+ and CFP transceivers)                          | Displays whether the receive laser power high alarm is <b>On</b> or <b>Off</b> .   |
| <b>Laser rx power low alarm</b><br>(Not available for QSFP+ and CFP transceivers)                           | Displays whether the receive laser power low alarm is <b>On</b> or <b>Off</b> .  |
| <b>Laser rx power high warning</b><br>(Not available for QSFP+ and CFP transceivers)                        | Displays whether the receive laser power high warning is <b>On</b> or <b>Off</b> .   |
| <b>Laser rx power low warning</b><br>(Not available for QSFP+ and CFP transceivers)                         | Displays whether the receive laser power low warning is <b>On</b> or <b>Off</b> .  |
| <b>Laser bias current high alarm threshold</b><br>(Not available for QSFP+ transceivers)                    | Displays the vendor-specified threshold for the laser bias current high alarm.   |
| <b>Module not ready alarm</b><br>(Not available for SFP, SFP+, and QSFP+ transceivers)                      | Displays whether the module not ready alarm is <b>On</b> or <b>Off</b> . When the output is <b>On</b> , the module has an operational fault. |
| <b>Module low power alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)                 | Displays whether the module low power alarm is <b>On</b> or <b>Off</b> .   |
| <b>Module initialization incomplete alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays whether the module initialization incomplete alarm is <b>On</b> or <b>Off</b> .   |
| <b>Module fault alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)                     | Displays whether the module fault alarm is <b>On</b> or <b>Off</b> .   |
| <b>PLD Flash initialization fault alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)   | Displays whether the PLD Flash initialization fault alarm is <b>On</b> or <b>Off</b> .   |
| <b>Power supply fault alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)               | Displays whether the power supply fault alarm is <b>On</b> or <b>Off</b> .   |
| <b>Checksum fault alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)                   | Displays whether the checksum fault alarm is <b>On</b> or <b>Off</b> .   |
| <b>Tx laser disabled alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)                | Displays whether the Tx laser disabled alarm is <b>On</b> or <b>Off</b> .  |

Table 252: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name   | Field Description  |
|--|--|
| <b>Module power down alarm</b><br>(Not available for SFP, SFP+, QSFP+, and CFP transceivers) | Displays whether the module power down alarm is <b>On</b> or <b>Off</b> . When the output is <b>On</b> , module is in a limited power mode, low for normal operation.                            |
| <b>Tx data not ready alarm</b><br>(Not available for SFP, SFP+, QSFP+, and CFP transceivers) | Any condition leading to invalid data on the transmit path. Displays whether the Tx data not ready alarm is <b>On</b> or <b>Off</b> .  |
| <b>Tx not ready alarm</b><br>(Not available for SFP, SFP+, QSFP+, and CFP transceivers)      | Any condition leading to invalid data on the transmit path. Displays whether the Tx not ready alarm is <b>On</b> or <b>Off</b> .   |
| <b>Tx laser fault alarm</b><br>(Not available for SFP, SFP+, QSFP+, and CFP transceivers)    | Laser fault condition. Displays whether the Tx laser fault alarm is <b>On</b> or <b>Off</b> .  |
| <b>Tx CDR loss of lock alarm</b><br>(Not available for SFP, SFP+, and QSFP+ transceivers)    | Transmit clock and data recovery (CDR) loss of lock. Loss of lock on the transmit side of the CDR. Displays whether the Tx CDR loss of lock alarm is <b>On</b> or <b>Off</b> .                   |
| <b>Rx not ready alarm</b><br>(Not available for SFP, SFP+, QSFP+, and CFP transceivers)      | Any condition leading to invalid data on the receive path. Displays whether the Rx not ready alarm is <b>On</b> or <b>Off</b> .  |
| <b>Rx loss of signal alarm</b><br>(Not available for SFP and SFP+ transceivers)              | Receive loss of signal alarm. When the output is <b>On</b> , indicates insufficient optical input power to the module. Displays whether the Rx loss of signal alarm is <b>On</b> or <b>Off</b> . |
| <b>Rx CDR loss of lock alarm</b><br>(Not available for SFP, SFP+, and QSFP+ transceivers)    | Receive CDR loss of lock. Loss of lock on the receive side of the CDR. Displays whether the Rx CDR loss of lock alarm is <b>On</b> or <b>Off</b> .   |
| <b>Laser bias current low alarm threshold</b><br>(Not available for QSFP+ transceivers)      | Displays the vendor-specified threshold for the laser bias current low alarm.  |
| <b>Laser bias current high warning threshold</b><br>(Not available for QSFP+ transceivers)   | Displays the vendor-specified threshold for the laser bias current high warning.   |
| <b>Laser bias current low warning threshold</b><br>(Not available for QSFP+ transceivers)    | Displays the vendor-specified threshold for the laser bias current low warning.  |
| <b>Laser output power high alarm threshold</b><br>(Not available for QSFP+ transceivers)     | Displays the vendor-specified threshold for the laser output power high alarm.   |
| <b>Laser output power low alarm threshold</b><br>(Not available for QSFP+ transceivers)      | Displays the vendor-specified threshold for the laser output power low alarm.  |

Table 252: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name   | Field Description  |
|--|--|
| <b>Laser output power high warning threshold</b><br>(Not available for QSFP+ transceivers)     | Displays the vendor-specified threshold for the laser output power high warning. |
| <b>Laser output power low warning threshold</b><br>(Not available for QSFP+ transceivers)      | Displays the vendor-specified threshold for the laser output power low warning.  |
| <b>Module temperature high alarm threshold</b><br>(Not available for QSFP+ transceivers)       | Displays the vendor-specified threshold for the module temperature high alarm.   |
| <b>Module temperature low alarm threshold</b><br>(Not available for QSFP+ transceivers)        | Displays the vendor-specified threshold for the module temperature low alarm.    |
| <b>Module temperature high warning threshold</b><br>(Not available for QSFP+ transceivers)     | Displays the vendor-specified threshold for the module temperature high warning. |
| <b>Module temperature low warning threshold</b><br>(Not available for QSFP+ transceivers)      | Displays the vendor-specified threshold for the module temperature low warning.  |
| <b>Module voltage high alarm threshold</b><br>(Not available for XFP and QSFP+ transceivers)   | Displays the vendor-specified threshold for the module voltage high alarm.       |
| <b>Module voltage low alarm threshold</b><br>(Not available for XFP and QSFP+ transceivers)    | Displays the vendor-specified threshold for the module voltage low alarm.        |
| <b>Module voltage high warning threshold</b><br>(Not available for XFP and QSFP+ transceivers) | Displays the vendor-specified threshold for the module voltage high warning.     |
| <b>Module voltage low warning threshold</b><br>(Not available for XFP and QSFP+ transceivers)  | Displays the vendor-specified threshold for the module voltage low warning.      |
| <b>Laser rx power high alarm threshold</b><br>(Not available for QSFP+ transceivers)           | Displays the vendor-specified threshold for the laser rx power high alarm.       |
| <b>Laser rx power low alarm threshold</b><br>(Not available for QSFP+ transceivers)            | Displays the vendor-specified threshold for the laser rx power low alarm.        |
| <b>Laser rx power high warning threshold</b><br>(Not available for QSFP+ transceivers)         | Displays the vendor-specified threshold for the laser rx power high warning.     |

Table 252: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name  | Field Description  |
|---|--|
| <b>Laser rx power low warning threshold</b><br>(Not available for QSFP+ transceivers)                         | Displays the vendor-specified threshold for the laser rx power low warning.                                |
| <b>Laser temperature high alarm threshold</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)   | Displays the vendor-specified threshold for the laser temperature high alarm, in Celsius and Fahrenheit.   |
| <b>Laser temperature low alarm threshold</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)    | Displays the vendor-specified threshold for the laser temperature low alarm, in Celsius and Fahrenheit.    |
| <b>Laser temperature high warning threshold</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays the vendor-specified threshold for the laser temperature high warning, in Celsius and Fahrenheit. |
| <b>Laser temperature low warning threshold</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)  | Displays the vendor-specified threshold for the laser temperature low warning, in Celsius and Fahrenheit.  |
| <b>SOA bias current high alarm threshold</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)    | Displays the vendor-specified threshold for SOA bias current high alarm.                                   |
| <b>SOA bias current low alarm threshold</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)     | Displays the vendor-specified threshold for SOA bias current low alarm.                                    |
| <b>SOA bias current high warning threshold</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)  | Displays the vendor-specified threshold for SOA bias current high warning.                                 |
| <b>SOA bias current low warning threshold</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)   | Displays the vendor-specified threshold for SOA bias current low warning.                                  |
| <b>Laser receiver power high alarm</b><br>(Not available for SFP, SFP+, and XFP transceivers)                 | Displays whether the laser receiver power high alarm is <b>On</b> or <b>Off</b> .                          |
| <b>Laser receiver power low alarm</b><br>(Not available for SFP, SFP+, and XFP transceivers)                  | Displays whether the laser receiver power low alarm is <b>On</b> or <b>Off</b> .                           |
| <b>Laser receiver power high warning</b><br>(Not available for SFP, SFP+, and XFP transceivers)               | Displays whether the laser receiver power high warning is <b>On</b> or <b>Off</b> .                        |
| <b>Laser receiver power low warning</b><br>(Not available for SFP, SFP+, and XFP transceivers)                | Displays whether the laser receiver power low warning is <b>On</b> or <b>Off</b> .                         |

Table 252: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name  | Field Description  |
|---|--|
| <b>Laser receiver power</b><br>(Not available for SFP, SFP+, and XFP transceivers)                  | Displays the laser receiver power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm). |
| <b>Tx loss of signal functionality alarm</b><br>(Not available for SFP, SFP+, and XFP transceivers) | Displays whether the Tx loss of signal functionality alarm is <b>On</b> or <b>Off</b> .      |
| <b>APD supply fault alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)         | Displays whether the APD supply fault alarm is <b>On</b> or <b>Off</b> .                     |
| <b>TEC fault alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)                | Displays whether the TEC fault alarm is <b>On</b> or <b>Off</b> .                            |
| <b>Wavelength unlocked alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)      | Displays whether the Wavelength unlocked alarm is <b>On</b> or <b>Off</b> .                  |

## Sample Output

### show interfaces diagnostics optics ge-0/1/0 (SFP Transceiver)

## show interfaces ge

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>show interfaces <i>device-name:type-fpc/pic/port</i></code><br><code>&lt;brief   detail   extensive   terse&gt;</code><br><code>&lt;descriptions&gt;</code><br><code>&lt;media&gt;</code><br><code>&lt;routing-instance (all   <i>instance-name</i>)&gt;</code><br><code>&lt;snmp-index <i>snmp-index</i>&gt;</code><br><code>&lt;statistics&gt;</code>   |
| <b>Release Information</b>      | Command introduced in Junos OS Release 11.1 for the QFX Series.   |
| <b>Description</b>              | Display status information about the specified Gigabit Ethernet interface. This command does not display statistics for routed VLAN interfaces.   |
| <b>Options</b>                  | <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b><i>device-name:type-fpc/pic/port</i></b>—The device name is either the serial number or the alias of the QFabric system component, such as a Node device, Interconnect device, or QFabric infrastructure. The name can contain a maximum of 128 characters and cannot contain any colons.</p> <p><b>descriptions</b>—(Optional) Display interface description strings.</p> <p><b>media</b>—(Optional) Display media-specific information about network interfaces.</p> <p><b>routing instance (all   <i>instance-name</i>)</b>—(Optional) Display the name of an individual routing-instance or display all routing-instances.</p> <p><b>snmp-index <i>snmp-index</i></b>—(Optional) Display information for the specified SNMP index of the interface.</p> <p><b>statistics</b>—(Optional) Display static interface statistics.</p> |

**Output Fields** [Table 253 on page 2783](#) lists the output fields for the **show interfaces ge** command. Output fields are listed in the approximate order in which they appear.

**Table 253: show interfaces ge Output Fields**

| Field Name                     | Field Description  | Level of Output               |
|--------------------------------|--|-------------------------------|
| <b>Physical Interface</b>      |  |                               |
| <b>Physical interface</b>      | Name of the physical interface.  | All levels                    |
| <b>Enabled</b>                 | State of the interface: <b>Enabled</b> or <b>Disabled</b> .  | All levels                    |
| <b>Interface index</b>         | Index number of the physical interface, which reflects its initialization sequence.  | <b>detail extensive none</b>  |
| <b>SNMP ifIndex</b>            | SNMP index number for the physical interface.  | <b>detail extensive none</b>  |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.  | <b>detail extensive</b>       |
| <b>Description</b>             | Optional user-specified description.   | <b>brief detail extensive</b> |
| <b>Link-level type</b>         | Encapsulation being used on the physical interface.  | All levels                    |
| <b>MTU</b>                     | Maximum transmission unit size on the physical interface. The default is 1514.   | All levels                    |
| <b>Speed</b>                   | Speed at which the interface is running.   | All levels                    |
| <b>Loopback</b>                | Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .   | All levels                    |
| <b>Source filtering</b>        | Source filtering status: <b>Enabled</b> or <b>Disabled</b> .   | All levels                    |
| <b>Flow control</b>            | Flow control status: <b>Enabled</b> or <b>Disabled</b> .<br><br><i>NOTE:</i> This field is only displayed if asymmetric flow control is not configured.  | <b>detail extensive</b>       |
| <b>Configured-flow-control</b> | Configured flow control for the interface transmit buffers ( <b>tx-buffers</b> ) and receive buffers ( <b>rx-buffers</b> ):<br><br><ul style="list-style-type: none"> <li><b>tx-buffers</b>—<b>On</b> if the interface is configured to respond to Ethernet PAUSE messages received from the connected peer.<br/><b>Off</b> if the interface is not configured to respond to received PAUSE messages.</li> <li><b>rx-buffers</b>—<b>On</b> if the interface is configured to generate and send Ethernet PAUSE messages to the connected peer.<br/><b>Off</b> if the interface is not configured to generate and send PAUSE messages.</li> </ul><br><i>NOTE:</i> This field is only displayed if asymmetric flow control is configured. | <b>detail extensive</b>       |

Table 253: show interfaces ge Output Fields (*continued*)

| Field Name                     | Field Description  | Level of Output              |
|--------------------------------|--|------------------------------|
| <b>Auto-negotiation</b>        | Autonegotiation status: <b>Enabled</b> or <b>Disabled</b> .  | All levels                   |
| <b>Remote-fault</b>            | Remote fault status: <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul>  | All levels                   |
| <b>Device flags</b>            | Information about the physical device.   | All levels                   |
| <b>Interface flags</b>         | Information about the interface.   | All levels                   |
| <b>Link flags</b>              | Information about the link.  | All levels                   |
| <b>CoS queues</b>              | Number of CoS queues configured.   | <b>detail extensive none</b> |
| <b>Hold-times</b>              | Current interface hold-time up and hold-time down, in milliseconds.  | <b>detail extensive</b>      |
| <b>Current address</b>         | Configured MAC address.  | <b>detail extensive none</b> |
| <b>Hardware address</b>        | MAC address of the hardware.   | <b>detail extensive none</b> |
| <b>Last flapped</b>            | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2008-01-16 10:52:40 UTC (3d 22:58 ago)</b> .   | <b>detail extensive none</b> |
| <b>Statistics last cleared</b> | Time when the statistics for the interface were last set to zero.  | <b>detail extensive</b>      |
| <b>Traffic statistics</b>      | Number and rate of bytes and packets received and transmitted on the physical interface. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> <p><b>NOTE:</b> The bandwidth bps counter is not enabled on the switch.</p> | <b>detail extensive</b>      |

Table 253: show interfaces ge Output Fields (*continued*)

| Field Name          | Field Description   | Level of Output  |
|---------------------|---|------------------|
| <b>Input errors</b> | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 sanity checks of the headers. For example, a frame with less than 20 bytes of available IP header is discarded.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b> |

Table 253: show interfaces ge Output Fields (*continued*)

| Field Name                              | Field Description  | Level of Output              |
|---|--|------------------------------|
| <b>Output errors</b>                    | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the switch interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>             |
| <b>Egress queues</b>                    | Total number of egress queues supported on the specified interface.  | <b>detail extensive</b>      |
| <b>Queue counters (Egress )</b>         | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>  | <b>detail extensive</b>      |
| <b>Queue Number</b>                     | The CoS queue number and the forwarding classes mapped to the queue number. The <b>Mapped forwarding class</b> column lists the forwarding classes mapped to each CoS queue.   | <b>detail extensive</b>      |
| <b>Active alarms and Active defects</b> | <p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the switch configuration, an alarm can ring the red or yellow alarm bell on the switch or turn on the red or yellow alarm LED on the front of the switch. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul>   | <b>detail extensive none</b> |

Table 253: show interfaces ge Output Fields (*continued*)

| Field Name               | Field Description  | Level of Output  |
|--------------------------|--|------------------|
| <b>MAC statistics</b>    | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem.</p> <ul style="list-style-type: none"> <li>• <b>Total octets</b> and <b>total packets</b>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type.</li> <li>• <b>Unicast packets, Broadcast packets, and Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—Number of packets that exceeds the configured MTU.</li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. This counter is not supported on EX Series switches and is always displayed as 0.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul> | <b>extensive</b> |
| <b>Filter Statistics</b> | Receive and Transmit statistics reported by the PIC's MAC address filter subsystem.  | <b>extensive</b> |

Table 253: show interfaces ge Output Fields (*continued*)

| Field Name                             | Field Description   | Level of Output       |
|--|---|-----------------------|
| Autonegotiation information            | <p>Information about link autonegotiation:</p> <ul style="list-style-type: none"> <li>• <b>Negotiation status:</b> <ul style="list-style-type: none"> <li>• <b>Incomplete</b>—Ethernet interface has the speed or link mode configured.</li> <li>• <b>No autonegotiation</b>—Remote Ethernet interface has the speed or link mode configured or does not perform autonegotiation.</li> <li>• <b>Complete</b>—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> </ul> </li> <li>• <b>Link partner status</b>—OK when the Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> <li>• <b>Link partner:</b> <ul style="list-style-type: none"> <li>• <b>Link mode</b>—Depending on the capability of the attached Ethernet device, either <b>Full-duplex</b> or <b>Half-duplex</b>.</li> <li>• <b>Flow control</b>—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are <b>Symmetric</b> (link partner supports PAUSE on receive and transmit), <b>Asymmetric</b> (link partner supports PAUSE on transmit), and <b>Symmetric/Asymmetric</b> (link partner supports PAUSE on both receive and transmit or PAUSE only on receive).</li> <li>• <b>Remote fault</b>—Remote fault information from the link partner—<b>Failure</b> indicates a receive link error. <b>OK</b> indicates that the link partner is receiving. <b>Negotiation error</b> indicates a negotiation error. <b>Offline</b> indicates that the link partner is going offline.</li> <li>• <b>Link partner speed</b>—Speed of the link partner.</li> </ul> </li> <li>• <b>Local resolution:</b> <ul style="list-style-type: none"> <li>• <b>Flow control</b>—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are <b>Symmetric</b> (link partner supports PAUSE on receive and transmit), <b>Asymmetric</b> (link partner supports PAUSE on transmit), and <b>Symmetric/Asymmetric</b> (link partner supports PAUSE on both receive and transmit or PAUSE only on receive). For asymmetric PAUSE, shows if the PAUSE transmit and PAUSE receive states on the interface are <b>enable</b> or <b>disable</b>.</li> <li>• <b>Remote fault</b>—Remote fault information. <b>Link OK</b> (no error detected on receive), <b>Offline</b> (local interface is offline), and <b>Link Failure</b> (link error detected on receive).</li> </ul> </li> </ul> | extensive             |

| <b>Encapsulation</b>           | Encapsulation on the logical interface.   | All levels                   |
| <b>Protocol</b>                | Protocol family.  | <b>detail extensive none</b> |
| <b>Traffic statistics</b>      | Number and rate of bytes and packets received (input) and transmitted (output) on the specified interface.  | <b>detail extensive</b>      |
| <b>IPv6 transit statistics</b> | If IPv6 statistics tracking is enabled, number of IPv6 bytes and packets received and transmitted on the logical interface.   | <b>extensive</b>             |
| <b>Local statistics</b>        | Number and rate of bytes and packets destined to and from the switch.   | <b>extensive</b>             |
| <b>Transit statistics</b>      | Number and rate of bytes and packets transiting the switch.   | <b>extensive</b>             |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.   | <b>detail extensive</b>      |
| <b>Route Table</b>             | Route table in which the logical interface address is located. For example, 0 refers to the routing table <b>inet.0</b> .   | <b>detail extensive none</b> |
| <b>Input Filters</b>           | Names of any input filters applied to this interface.   | <b>detail extensive</b>      |
| <b>Output Filters</b>          | Names of any output filters applied to this interface.  | <b>detail extensive</b>      |
| <b>Flags</b>                   | Information about protocol family flags.<br><br>If unicast reverse-path forwarding (RPF) is explicitly configured on the specified interface, the uRPF flag is displayed. If unicast RPF was configured on a different interface (and therefore is enabled on all switch interfaces) but was not explicitly configured on the specified interface, the uRPF flag is not displayed even though unicast RPF is enabled. | <b>detail extensive</b>      |
| <b><i>protocol-family</i></b>  | Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address of the interface is also displayed.  | <b>brief</b>                 |
| <b>Flags</b>                   | Information about the address flags.  | <b>detail extensive none</b> |
| <b>Destination</b>             | IP address of the remote side of the connection.  | <b>detail extensive none</b> |
| <b>Local</b>                   | IP address of the logical interface.  | <b>detail extensive none</b> |
| <b>Broadcast</b>               | Broadcast address of the logical interlace.   | <b>detail extensive none</b> |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.   | <b>detail extensive</b>      |

## Sample Output

### show interfaces

```
user@switch> show interfaces ge-0/0/9
Physical interface: ge-0/0/9, Enabled, Physical link is Down
  Interface index: 129, SNMP ifIndex: 21
  Link-level type: Ethernet, MTU: 1514, Speed: Unspecified, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled
  Remote fault: Online
  Device flags   : Present Running Down
  Interface flags: Hardware-Down SNMP-Traps Internal: 0x0
  CoS queues     : 8 supported, 8 maximum usable queues
  Hold-times     : Up 0 ms, Down 0 ms
  Current address: 00:19:e2:50:3f:41, Hardware address: 00:19:e2:50:3f:41
  Last flapped   : 2008-01-16 11:40:53 UTC (4d 02:30 ago)
  Input rate      : 0 bps (0 pps)
  Output rate     : 0 bps (0 pps)
  Ingress rate at Packet Forwarding Engine : 0 bps (0 pps)
  Ingress drop rate at Packet Forwarding Engine : 0 bps (0 pps)
  Active alarms   : None
  Active defects  : None

Logical interface ge-0/0/9.0 (Index 65) (SNMP ifIndex 22)
  Flags: SNMP-Traps
  Encapsulation: ENET2
  Input packets : 0
  Output packets: 0
  Protocol eth-switch
  Flags: None
```

### show interfaces brief

```
user@switch> show interfaces ge-0/0/9 brief
Physical interface: ge-0/0/9, Enabled, Physical link is Down
  Description: voice priority and tcp and icmp traffic rate-limiting filter at i
  ngress port
  Link-level type: Ethernet, MTU: 1514, Speed: Unspecified, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
  Remote fault: Online
  Device flags   : Present Running Down
  Interface flags: Hardware-Down SNMP-Traps Internal: 0x0
  Link flags     : None

Logical interface ge-0/0/9.0
  Flags: Device-Down SNMP-Traps Encapsulation: ENET2
  eth-switch
```

### show interfaces detail (Symmetric Flow Control and Autonegotiation Enabled)

```
user@switch> show interfaces ge-0/0/9 detail
Physical interface: ge-0/0/9, Enabled, Physical link is Up
  Interface index: 193, SNMP ifIndex: 206, Generation: 196
  Link-level type: Ethernet, MTU: 1514, Speed: Auto, Duplex: Auto,
  BPDU Error: None, MAC-REWRITE Error: None, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
  Remote fault: Online
  Device flags   : Present Running
  Interface flags: SNMP-Traps Internal: 0x0
  Link flags     : None
  CoS queues     : 8 supported, 8 maximum usable queues
```

```

Hold-times      : Up 0 ms, Down 0 ms
Current address: 00:1f:12:30:ff:40, Hardware address: 00:1f:12:30:ff:40

| <b>List of Sample Output</b>   | <p><a href="#">show interfaces (GRE) on page 2801</a></p> <p><a href="#">show interfaces brief (GRE) on page 2801</a></p> <p><a href="#">show interfaces detail (GRE) on page 2801</a></p> <p><a href="#">show interfaces detail (GRE) on an EX4200 Virtual Chassis Member Switch on page 2802</a></p> <p><a href="#">show interfaces extensive (GRE) on page 2803</a></p>   |
| <b>Output Fields</b>   | <p><a href="#">Table 254 on page 2798</a> lists the output fields for the <b>show interfaces (GRE)</b> command. Output fields are listed in the approximate order in which they appear.</p>  |

Table 254: GRE show interfaces Output Fields

| Field Name                     | Field Description  | Level of Output              |
|--------------------------------|--|------------------------------|
| <b>Physical Interface</b>      |  |                              |
| <b>Physical interface</b>      | Name of the physical interface.  | All levels                   |
| <b>Enabled</b>                 | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .   | All levels                   |
| <b>Interface index</b>         | Physical interface's index number, which reflects its initialization sequence.   | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>            | SNMP index number for the physical interface.  | <b>detail extensive none</b> |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.  | <b>detail extensive</b>      |
| <b>Type</b>                    | Type of interface.   | All levels                   |
| <b>Link-level type</b>         | Encapsulation used on the physical interface.  | All levels                   |
| <b>MTU</b>                     | MTU size on the physical interface.  | All levels                   |
| <b>Speed</b>                   | Speed at which the interface is running.   | All levels                   |
| <b>Hold-times</b>              | Current interface hold-time up and hold-time down, in milliseconds.  | <b>detail extensive</b>      |
| <b>Device Flags</b>            | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .   | All levels                   |
| <b>Interface Flags</b>         | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .  | All levels                   |
| <b>Input rate</b>              | Input rate in bits per second (bps) and packets per second (pps).  | None specified               |
| <b>Output rate</b>             | Output rate in bps and pps.  | None specified               |
| <b>Statistics last cleared</b> | Time when the statistics for the interface were last set to zero.  | <b>detail extensive</b>      |
| <b>Traffic statistics</b>      | <p>The number of and the rate at which input and output bytes and packets are received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> | <b>detail extensive</b>      |
| <b>Logical Interface</b>       |  |                              |
| <b>Logical interface</b>       | Name of the logical interface.   | All levels                   |
| <b>Index</b>                   | Logical interface index number, which reflects its initialization sequence.  | <b>detail extensive none</b> |

Table 254: GRE show interfaces Output Fields (*continued*)

| Field Name                     | Field Description  | Level of Output       |
|--------------------------------|--|-----------------------|
| SNMP ifIndex                   | Logical interface SNMP interface index number.   | detail extensive none |
| Generation                     | Unique number for use by Juniper Networks technical support.   | detail extensive      |
| Flags                          | <p>Information about the logical interface. Possible values listed in the “Logical Interface Flags” section under <i>Common Output Fields Description</i>. describe general information about the logical interface.</p> <p>GRE-specific information about the logical interface is indicated by the presence or absence of the following value in this field:</p> <ul style="list-style-type: none"> <li>• <b>Reassemble-Pkts</b>—If the <b>Flags</b> field includes this string, the GRE tunnel is configured to reassemble tunnel packets that were fragmented after tunnel encapsulation.</li> </ul>                               | All levels            |
| IP-Header                      | <p>IP header of the logical interface. If the <b>tunnel key</b> statement is configured, this information is included in the <b>IP Header</b> entry.</p> <p>GRE-specific information about the logical interface is indicated by the presence or absence of the following value in this field:</p> <ul style="list-style-type: none"> <li>• <b>df</b>—If the <b>IP-Header</b> field includes this string immediately following the 16 bits of identification information (that is, if <b>:df:</b> displays after the twelfth byte), the GRE tunnel is configured to allow fragmentation of GRE packets after encapsulation.</li> </ul> | All levels            |
| Encapsulation                  | Encapsulation on the logical interface.  | All levels            |
| Copy-tos-to-outer-ip-header    | <p>Status of type of service (ToS) bits in the GRE packet header:</p> <ul style="list-style-type: none"> <li>• <b>On</b>—ToS bits were copied from the payload packet header into the header of the IP packet sent through the GRE tunnel.</li> <li>• <b>Off</b>—ToS bits were not copied from the payload packet header and are set to 0 in the GRE packet header.</li> </ul> <p><b>NOTE:</b> EX Series switches do not support copying ToS bits to the encapsulated packet, so the value of this field is always <b>Off</b> in switch output.</p>  | detail extensive      |
| Gre keepalives configured      | <p>Indicates whether a GRE keepalive time and hold time are configured for the GRE tunnel.</p> <p><b>NOTE:</b> EX Series switches do not support configuration of GRE tunnel keepalive times and hold times, so the value of this field is always <b>Off</b> in switch output.</p>   | detail extensive      |
| Gre keepalives adjacency state | Status of the other end of the GRE tunnel: <b>Up</b> or <b>Down</b> . If keepalive messages are not received by either end of the GRE tunnel within the hold-time period, the GRE keepalive adjacency state is down even when the GRE tunnel is up.  | detail extensive      |
| Input packets                  | Number of packets received on the logical interface.   | None specified        |
| Output packets                 | Number of packets transmitted on the logical interface.  | None specified        |

Table 254: GRE show interfaces Output Fields (*continued*)

| Field Name                    | Field Description   | Level of Output              |
|-------------------------------|---|------------------------------|
| <b>Traffic statistics</b>     | <p>Rate of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.</p> <ul style="list-style-type: none"> <li>• <b>Input rate</b>—Rate of bits and packets received on the interface.</li> <li>• <b>Output rate</b>—Rate of bits and packets transmitted on the interface.</li> </ul> | <b>detail extensive</b>      |
| <b>Local statistics</b>       | Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.  | <b>detail extensive</b>      |
| <b>Transit statistics</b>     | Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.  | <b>detail extensive none</b> |
| <b>Protocol</b>               | Protocol family configured on the logical interface, such as <b>iso</b> , <b>inet6</b> , or <b>mpls</b> .   | <b>detail extensive none</b> |
| <b><i>protocol-family</i></b> | Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address of the interface is also displayed.  | <b>brief</b>                 |
| <b>MTU</b>                    | MTU size on the logical interface.  | <b>detail extensive none</b> |
| <b>Generation</b>             | Unique number for use by Juniper Networks technical support only.   | <b>detail extensive</b>      |
| <b>Route table</b>            | Routing table in which the logical interface address is located. For example, <b>0</b> refers to the routing table <b>inet.0</b> .  | <b>detail extensive</b>      |
| <b>Flags</b>                  | Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .  | <b>detail extensive none</b> |
| <b>Addresses, Flags</b>       | Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .   | <b>detail extensive none</b> |
| <b>Destination</b>            | IP address of the remote side of the connection.  | <b>detail extensive none</b> |
| <b>Local</b>                  | IP address of the logical interface.  | <b>detail extensive none</b> |
| <b>Broadcast</b>              | Broadcast address of the logical interface.   | <b>detail extensive none</b> |

## Sample Output

### show interfaces (GRE)

```

user@host> show interfaces gr-1/2/0
Physical interface: gr-0/0/0, Enabled, Physical link is Up
  Interface index: 132, SNMP ifIndex: 26
  Type: GRE, Link-level type: GRE, MTU: Unlimited, Speed: 800mbps
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps
  Input rate     : 0 bps (0 pps)
  Output rate    : 0 bps (0 pps)

Logical interface gr-0/0/0.0 (Index 68) (SNMP ifIndex 47)
  Flags: Point-To-Point SNMP-Traps 16384
  IP-Header 1.1.1.2:1.1.1.1:47:df:64:0000000000000000 Encapsulation: GRE-NULL
  Input packets : 0
  Output packets: 0
  Protocol inet, MTU: 1476
  Flags: None
  Addresses, Flags: Is-Primary
    Local: 1.10.1.1

```

### show interfaces brief (GRE)

```

user@host> show interfaces gr-1/2/0 brief
Physical interface: gr-1/2/0, Enabled, Physical link is Up
  Type: GRE, Link-level type: GRE, MTU: Unlimited, Speed: 800mbps
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps

Logical interface gr-1/2/0.0
  Flags: Hardware-Down Point-To-Point SNMP-Traps 0x4000
  IP-Header 10.10.0.2:10.10.0.1:47:df:64:0000000000000000
  Encapsulation: GRE-NULL
  inet 10.100.0.1/30
  mpls

```

### show interfaces detail (GRE)

```

user@host> show interfaces gr-1/2/0 detail
Physical interface: gr-0/0/0, Enabled, Physical link is Up
  Interface index: 132, SNMP ifIndex: 26, Generation: 13
  Type: GRE, Link-level type: GRE, MTU: Unlimited, Speed: 800mbps
  Hold-times      : Up 0 ms, Down 0 ms
  Device flags    : Present Running
  Interface flags: Point-To-Point SNMP-Traps
  Statistics last cleared: Never
  Traffic statistics:
    Input bytes : 0 0 bps
    Output bytes : 0 0 bps
    Input packets: 0 0 pps
    Output packets: 0 0 pps

Logical interface gr-0/0/0.0 (Index 68) (SNMP ifIndex 47) (Generation 8)
  Flags: Point-To-Point SNMP-Traps 16384
  IP-Header 1.1.1.2:1.1.1.1:47:df:64:0000000000000000 Encapsulation: GRE-NULL
  Traffic statistics:
    Input bytes : 0
    Output bytes : 0
    Input packets: 0

```

```

Output packets:                0
Local statistics:
Input bytes :                  0
Output bytes :                  0
Input packets:                 0
Output packets:                0
Transit statistics:
Input bytes :                  0          0 bps
Output bytes :                  0          0 bps
Input packets:                 0          0 pps
Output packets:                0          0 pps
Protocol inet, MTU: 1476, Generation: 12, Route table: 0
Flags: None
Addresses, Flags: Is-Primary
Destination: Unspecified, Local: 1.10.1.1, Broadcast: Unspecified,
Generation: 15

```

### show interfaces detail (GRE) on an EX4200 Virtual Chassis Member Switch

```

user@switch> show interfaces gr-2/0/15 detail
Physical interface: gr-2/0/15, Enabled, Physical link is Up
Interface index: 195, SNMP ifIndex: 846, Generation: 198
Type: GRE, Link-level type: GRE, MTU: Unlimited, Speed: 1000mbps
Hold-times      : Up 0 ms, Down 0 ms

### show interfaces extensive (GRE)

The output for the **show interfaces extensive** command is identical to that for the **show interfaces detail** command. For sample output, see [show interfaces detail \(GRE\) on page 2801](#) and [show interfaces detail \(GRE\) on an EX4200 Virtual Chassis Member Switch on page 2802](#).

## show interfaces irb

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <pre>show interfaces irb &lt;brief   detail   extensive   terse&gt; &lt;descriptions&gt; &lt;media&gt; &lt;routing-instance <i>instance-name</i>&gt; &lt;snmp-index <i>snmp-index</i>&gt; &lt;statistics&gt;</pre>  |
| <b>Release Information</b>      | <p>Command introduced in Junos OS Release 12.3R2.</p> <p>Command introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Command introduced in Junos OS Release 13.2 for the QFX Series</p>  |
| <b>Description</b>              | Display integrated routing and bridging interfaces information.   |
| <b>Options</b>                  | <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b>descriptions</b>—(Optional) Display interface description strings.</p> <p><b>media</b>—(Optional) Display media-specific information about network interfaces.</p> <p><b>routing-instance <i>instance-name</i></b>—(Optional) Display information for the interface with the specified SNMP index.</p> <p><b>snmp-index <i>snmp-index</i></b>—(Optional) Display information for the interface with the specified SNMP index.</p> <p><b>statistics</b>—(Optional) Display static interface statistics.</p> |
| <b>Additional Information</b>   | Integrated routing and bridging (IRB) provides simultaneous support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route local packets to another routed interface or to another VLAN that has a Layer 3 protocol configured.  |
| <b>Required Privilege Level</b> | view  |
| <b>List of Sample Output</b>    | <p><a href="#">show interfaces irb extensive on page 2808</a></p> <p><a href="#">show interfaces irb snmp-index on page 2809</a></p>  |
| <b>Output Fields</b>            | <a href="#">Table 255 on page 2804</a> lists the output fields for the <b>show interfaces irb</b> command. Output fields are listed in the approximate order in which they appear.  |

**Table 255: show interfaces irb Output Fields**

| Field Name                | Field Description   | Level of Output |
|---------------------------|---|-----------------|
| <b>Physical Interface</b> |   |                 |
| <b>Physical interface</b> | Name of the physical interface.   | All levels      |
| <b>Enabled</b>            | State of the physical interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels      |

Table 255: show interfaces irb Output Fields (*continued*)

| Field Name                     | Field Description  | Level of Output                    |
|--------------------------------|--|------------------------------------|
| <b>Proto</b>                   | Protocol configured on the interface.  | <b>terse</b>                       |
| <b>Interface index</b>         | Physical interface index number, which reflects its initialization sequence.   | <b>detail extensive none</b>       |
| <b>SNMP ifIndex</b>            | SNMP index number for the physical interface.  | <b>detail extensive none</b>       |
| <b>Type</b>                    | Physical interface type.   | <b>detail extensive none</b>       |
| <b>Link-level type</b>         | Encapsulation being used on the physical interface.  | <b>detail extensive brief none</b> |
| <b>MTU</b>                     | MTU size on the physical interface.  | <b>detail extensive brief none</b> |
| <b>Clocking</b>                | Reference clock source: <b>Internal</b> or <b>External</b> . Always unspecified on IRB interfaces.   | <b>detail extensive brief</b>      |
| <b>Speed</b>                   | Speed at which the interface is running. Always unspecified on IRB interfaces.   | <b>detail extensive brief</b>      |
| <b>Device flags</b>            | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .   | <b>detail extensive brief none</b> |
| <b>Interface flags</b>         | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .  | <b>detail extensive brief none</b> |
| <b>Link type</b>               | Physical interface link type: <b>full duplex</b> or <b>half duplex</b> .   | <b>detail extensive none</b>       |
| <b>Link flags</b>              | Information about the link. Possible values are described in the “Links Flags” section under <i>Common Output Fields Description</i> .   | <b>detail extensive none</b>       |
| <b>Physical Info</b>           | Physical interface information.  | All levels                         |
| <b>Hold-times</b>              | Current interface hold-time up and hold-time down, in milliseconds.  | <b>detail extensive</b>            |
| <b>Current address</b>         | Configured MAC address.  | <b>detail extensive none</b>       |
| <b>Hardware address</b>        | MAC address of the hardware.   | <b>detail extensive none</b>       |
| <b>Alternate link address</b>  | Backup address of the link.  | <b>detail extensive</b>            |
| <b>Last flapped</b>            | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hours:minutes:seconds timezone (hours:minutes:seconds ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> . | <b>detail extensive none</b>       |
| <b>Statistics last cleared</b> | Time when the statistics for the interface were last set to zero.  | <b>detail extensive</b>            |

Table 255: show interfaces irb Output Fields (*continued*)

| Field Name                     | Field Description   | Level of Output         |
|--------------------------------|---|-------------------------|
| <b>Traffic statistics</b>      | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>   | <b>detail extensive</b> |
| <b>IPv6 transit statistics</b> | <p>Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>   | <b>detail extensive</b> |
| <b>Input errors</b>            | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>           | <b>detail extensive</b> |
| <b>Output errors</b>           | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the DPC is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>detail extensive</b> |

#### Logical Interface

---

Table 255: show interfaces irb Output Fields (*continued*)

| Field Name                     | Field Description   | Level of Output                 |
|--------------------------------|---|---------------------------------|
| <b>Logical interface</b>       | Name of the logical interface.  | All levels                      |
| <b>Index</b>                   | Index number of the logical interface (which reflects its initialization sequence).   | <b>detail extensive</b><br>none |
| <b>SNMP ifIndex</b>            | SNMP interface index number of the logical interface.   | <b>detail extensive</b><br>none |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.   | <b>detail extensive</b>         |
| <b>Flags</b>                   | Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under <i>Common Output Fields Description</i> .   | <b>detail extensive</b>         |
| <b>Encapsulation</b>           | Encapsulation on the logical interface.   | <b>detail extensive</b>         |
| <b>Bandwidth</b>               | Speed at which the interface is running.  | <b>detail extensive</b>         |
| <b>Routing Instance</b>        | Routing instance IRB is configured under.   | <b>detail extensive</b>         |
| <b>Bridging Domain</b>         | Bridging domain IRB is participating in.  | <b>detail extensive</b>         |
| <b>Traffic statistics</b>      | Number and rate of bytes and packets received and transmitted on the logical interface. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>   | <b>detail extensive</b>         |
| <b>IPv6 transit statistics</b> | Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> | <b>detail extensive</b>         |
| <b>Local statistics</b>        | Statistics for traffic received from and transmitted to the Routing Engine.   | <b>detail extensive</b>         |
| <b>Transit statistics</b>      | Statistics for traffic transiting the router.   | <b>detail extensive</b>         |
| <b>Protocol</b>                | Protocol family configured on the local interface. Possible values are described in the "Protocol Field" section under <i>Common Output Fields Description</i> .  | <b>detail extensive</b>         |
| <b>MTU</b>                     | Maximum transmission unit size on the logical interface.  | <b>detail extensive</b>         |
| <b>Maximum labels</b>          | Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.   | <b>detail extensive</b><br>none |

Table 255: show interfaces irb Output Fields (*continued*)

| Field Name              | Field Description   | Level of Output         |
|-------------------------|---|-------------------------|
| <b>Generation</b>       | Unique number for use by Juniper Networks technical support only.   | <b>detail extensive</b> |
| <b>Route table</b>      | Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.   | <b>detail extensive</b> |
| <b>Addresses, Flags</b> | Information about address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .                 | <b>detail extensive</b> |
| <b>Policer</b>          | The policer that is to be evaluated when packets are received or transmitted on the interface.  | <b>detail extensive</b> |
| <b>Flags</b>            | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> . | <b>detail extensive</b> |

## Sample Output

### show interfaces irb extensive

```

user@host> show interfaces irb extensive
Physical interface: irb, Enabled, Physical link is Up

| <b>Output Fields</b>            | <a href="#">Table 256 on page 2810</a> lists the output fields for the <b>show interfaces mc-ae</b> command. Output fields are listed in the approximate order in which they appear.   |

**Table 256: show interfaces mc-ae Output Fields**

| Output Field Name                    | Field Description   |
|--------------------------------------|---|
| <b>Current State Machine's State</b> | Specifies the state of the MC-LAG initialization state machine. |

Table 256: show interfaces mc-ae Output Fields (*continued*)

| Output Field Name        | Field Description  |
|--------------------------|--|
| <b>Member Link</b>       | Specifies the identifiers of the configured multichassis link aggregated interface members.  |
| <b>Local Status</b>      | Specifies the status of the local link: <b>active</b> or <b>standby</b> .  |
| <b>Peer Status</b>       | Specifies the status of the peer link: <b>active</b> or <b>standby</b> .   |
| <b>Peer State</b>        | Specifies the status of the local and peer links in an <b>active/active</b> MC-LAG configuration   |
| <b>Logical Interface</b> | Specifies the identifier and unit of the AE interface.   |
| <b>Topology Type</b>     | Specifies the bridge configured on the AE.   |
| <b>Local State</b>       | Specifies if the local device is up or down.   |
| <b>Peer State</b>        | Specifies if the peer device is up or down.  |
| <b>Peer Ip/MCP/State</b> | Specifies the multichassis protection (MCP) link or the interchassis link-protection link (ICL-PL) for all of the multichassis aggregated Ethernet (MC-AE) interfaces that are part of the peer. |

## Sample Output

### show interfaces mc-ae

```

user@host> show interfaces mc-ae ae1 512
Member Link           : ae0
Current State Machine's State: mcae active state
Local Status          : active
Local State           : up
Peer Status           : active
Peer State            : up
    Logical Interface  : ae0.0
    Topology Type      : bridge
    Local State        : up
    Peer State         : up
    Peer Ip/MCP/State  : 3.3.3.2 ae1.0 up

```

## show interfaces queue

---

**Syntax**    show interfaces queue  
              <aggregate | remaining-traffic>  
              <both-ingress-egress>  
              <egress>  
              <forwarding-class *forwarding-class*>  
              <ingress>  
              <interface-name *interface-name*>  
              <l2-statistics>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              **both-ingress-egress**, **egress**, and **ingress** options introduced in Junos OS Release 7.6.  
                              Command introduced in Junos OS Release 11.1 for the QFX Series.  
                              **l2-statistics** option introduced in Junos OS Release 12.1.

**Description**    Display class-of-service (CoS) queue information for physical interfaces.

**Options**    **none**—Show detailed CoS queue statistics for all physical interfaces.

**aggregate**—(Optional) Display the aggregated queuing statistics of all logical interfaces that have traffic-control profiles configured. (Not on the QFX Series.)

**both-ingress-egress**—(Optional) On Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs, display both ingress and egress queue statistics. (Not on the QFX Series.)

**egress**—(Optional) Display egress queue statistics.

**forwarding-class *forwarding-class***—(Optional) Forwarding class name for this queue. Shows detailed CoS statistics for the queue associated with the specified forwarding class.

**ingress**—(Optional) On Gigabit Ethernet IQ2 PICs, display ingress queue statistics. (Not on the QFX Series.)

**interface-name *interface-name***—(Optional) Show detailed CoS queue statistics for the specified interface.

**l2-statistics**—(Optional) Display Layer 2 statistics for MLPPP, FRF.15, and FRF.16 bundles

**remaining-traffic**—(Optional) Display the remaining-traffic queue statistics of all logical interfaces that have traffic-control profiles configured.

### Overhead for Layer 2 Statistics

Transmitted packets and transmitted byte counts are displayed for the Layer 2 level with the addition of encapsulation overheads applied for fragmentation, as shown in [Table 257 on page 2813](#). Others counters, such as packets and bytes queued (input) and drop counters, are displayed at the Layer 3 level. In the case of link fragmentation and interleaving (LFI) for which fragmentation is not applied, corresponding Layer 2 overheads are added, as shown in [Table 257 on page 2813](#).

Table 257: Layer 2 Overhead, Transmitted Packets/Bytes

| Protocol       | Fragmentation       |                                   | LFI |
|----------------|---------------------|-----------------------------------|-----|
|                | First fragmentation | Second to <i>n</i> fragmentations |     |
|                | Bytes               | Bytes                             |     |
| MLPPP (Long)   | 13                  | 12                                | 8   |
| MLPPP (short)  | 11                  | 10                                | 8   |
| MLFR (FRF15)   | 12                  | 10                                | 8   |
| MFR (FRF16)    | 10                  | 8                                 | -   |
| MCMLPPP(Long)  | 13                  | 12                                | -   |
| MCMLPPP(Short) | 11                  | 10                                | -   |

## Layer 2 Statistics—Fragmentation Overhead Calculation

## MLPPP/MC-MLPPP Overhead details:

=====

## Fragment 1:

```

Outer PPP header           : 4 bytes
Long or short sequence MLPPP header : 4 bytes or 2 bytes
Inner PPP header           : 1 byte
HDLC flag and FCS bytes    : 4 bytes

```

## Fragments 2 .. n :

```

Outer PPP header           : 4 bytes
Long or short sequence MLPPP header : 4 bytes or 2 bytes
HDLC flag and FCS bytes    : 4 bytes

```

## MLFR (FRF15) Overhead details:

=====

## Fragment 1:

```

Framereley header         : 2 bytes
Control,NLPID             : 2 bytes
Fragmentaion header       : 2 bytes
Inner proto               : 2 bytes
HDLC flag and FCS         : 4 bytes

```

## Fragments 2 ...n :

```

Framereley header         : 2 bytes
Control,NLPID             : 2 bytes
Fragmentaion header       : 2 bytes
HDLC flag and FCS         : 4 bytes

```

## MFR (FRF16) Overhead details:

=====

```
Fragment 1:
  Fragmentation header : 2 bytes
  Framereelay header   : 2 bytes
  Inner proto          : 2 bytes
  HDLC flag and FCS    : 4 bytes

Fragments 2 ...n :
  Fragmentation header : 2 bytes
  Framereelay header   : 2 bytes
  HDLC flag and FCS    : 4 bytes
```

## Overhead with LFI

```
MLPPP(Long & short sequence):
=====
  Outer PPP header      : 4 bytes
  HDLC flag and FCS     : 4 bytes
```

```
MLFR (FRF15):
=====
  Framereelay header    : 2 bytes
  Control,NLPID         : 2 bytes
  HDLC flag and FCS     : 4 bytes
```

The following examples show overhead for different cases:

- A 1000-byte packet is sent to a mlppp bundle without any fragmentation. At the Layer 2 level, bytes transmitted is 1013 in 1 packet. This overhead is for MLPPP long sequence encap.
- A 1000-byte packet is sent to a mlppp bundle with a fragment threshold of 250byte. At the Layer 2 level, bytes transmitted is 1061 bytes in 5 packets.
- A 1000-byte LFI packet is sent to an mlppp bundle. At the Layer 2 level, bytes transmitted is 1008 in 1 packet.

**remaining-traffic**—(Optional) Display the queuing statistics of all logical interfaces that do not have traffic-control profiles configured. (Not on the QFX Series.)

## Additional Information

For rate-limited interfaces hosted on Modular Interface Cards (MICs), Modular Port Concentrators (MPCs), or Enhanced Queuing DPCs, rate-limit packet-drop operations occur *before* packets are queued for transmission scheduling. For such interfaces, the statistics for queued traffic do not include the packets that have already been dropped due to rate limiting, and consequently the displayed statistics for queued traffic are the same as the displayed statistics for transmitted traffic.

**NOTE:** For rate-limited interfaces hosted on other types of hardware, rate-limit packet-drop operations occur *after* packets are queued for transmission scheduling. For these other interface types, the statistics for queued traffic include the packets that are later dropped due to rate limiting, and consequently the displayed statistics for queued traffic equals the sum of the statistics for transmitted and rate-limited traffic.

On M Series routers (except for the M320 and M120 routers), this command is valid only for a PIC installed on an enhanced Flexible PIC Concentrator (FPC).

Queue statistics for aggregated interfaces are supported on the M Series and T Series routers only. Statistics for an aggregated interface are the summation of the queue statistics of the child links of that aggregated interface. You can view the statistics for a child interface by using the **show interfaces statistics** command for that child interface.

When you configure tricolor marking on a 10-port 1-Gigabit Ethernet PIC, for queues 6 and 7 only, the output does not display the number of queued bytes and packets, or the number of bytes and packets dropped because of RED. If you do not configure tricolor marking on the interface, these statistics are available for all queues.

For the 4-port Channelized OC12 IQE PIC and 1-port Channelized OC48 IQE PIC, the **Packet Forwarding Engine Chassis Queues** field represents traffic bound for a particular physical interface on the PIC. For all other PICs, the **Packet Forwarding Engine Chassis Queues** field represents the total traffic bound for the PIC.

For Gigabit Ethernet IQ2 PICs, the **show interfaces queue** command output does not display the number of tail-dropped packets. This limitation does not apply to Packet Forwarding Engine chassis queues.

When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (under the **Packet Forwarding Engine Chassis Queues** field) shows the prefragmentation values.

The behavior of the **egress** queues for the **Routing Engine-Generated Traffic** is not same as the configured queue for MLPPP and MFR configurations.

For information about how to configure CoS, see the *Junos OS Network Interfaces Library for Routing Devices*. For related CoS operational mode commands, see the [CLI Explorer](#).

**Output Fields** Table 258 on page 2816 lists the output fields for the **show interfaces queue** command. Output fields are listed in the approximate order in which they appear.

**Table 258: show interfaces queue Output Fields**

| Field Name  | Field Description   |
|---|---|
| Physical interface  | Name of the physical interface.   |
| Enabled   | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .  |
| Interface index   | Physical interface's index number, which reflects its initialization sequence.  |
| SNMP ifindex  | SNMP index number for the interface.  |
| Forwarding classes supported  | Total number of forwarding classes supported on the specified interface.  |
| Forwarding classes in use   | Total number of forwarding classes in use on the specified interface.   |
| Ingress queues supported  | On Gigabit Ethernet IQ2 PICs only, total number of ingress queues supported on the specified interface.   |
| Ingress queues in use   | On Gigabit Ethernet IQ2 PICs only, total number of ingress queues in use on the specified interface.  |
| Output queues supported   | Total number of output queues supported on the specified interface.   |
| Output queues in use  | Total number of output queues in use on the specified interface.  |
| Egress queues supported   | Total number of egress queues supported on the specified interface.   |
| Egress queues in use  | Total number of egress queues in use on the specified interface.  |
| Queue counters (Ingress)  | CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces. <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul> |
| Burst size  | (Logical interfaces on IQ PICs only) Maximum number of bytes up to which the logical interface can burst. The burst size is based on the shaping rate applied to the interface.   |
| The following output fields are applicable to both interface component and Packet Forwarding component in the <b>show interfaces queue</b> command: |   |
| Queue   | Queue number.   |
| Forwarding classes  | Forwarding class name.  |

Table 258: show interfaces queue Output Fields (*continued*)

| Field Name                  | Field Description   |
|-----------------------------|---|
| <b>Queued Packets</b>       | <p>Number of packets queued to this queue.</p> <p><b>NOTE:</b> For Gigabit Ethernet IQ2 interfaces, the Queued Packets count is calculated by the Junos OS interpreting one frame buffer as one packet. If the queued packets are very large or very small, the calculation might not be completely accurate for transit traffic. The count is completely accurate for traffic terminated on the router.</p> <p>For rate-limited interfaces hosted on MICs or MPCs only, this statistic does not include traffic dropped due to rate limiting. For more information, see <a href="#">“Additional Information” on page 2814</a>.</p> |
| <b>Queued Bytes</b>         | <p>Number of bytes queued to this queue. The byte counts vary by interface hardware. For more information, see <a href="#">Table 259 on page 2819</a>.</p> <p>For rate-limited interfaces hosted on MICs or MPCs only, this statistic does not include traffic dropped due to rate limiting. For more information, see <a href="#">“Additional Information” on page 2814</a>.</p>   |
| <b>Transmitted Packets</b>  | <p>Number of packets transmitted by this queue. When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (displayed under the <b>Packet Forwarding Engine Chassis Queues</b> field) shows the prefragmentation values.</p> <p><b>NOTE:</b> For Layer 2 statistics, see <a href="#">“Overhead for Layer 2 Statistics” on page 2812</a></p>  |
| <b>Transmitted Bytes</b>    | <p>Number of bytes transmitted by this queue. The byte counts vary by interface hardware. For more information, see <a href="#">Table 259 on page 2819</a>.</p> <p><b>NOTE:</b> On MX Series routers, this number can be inaccurate when you issue the command for a physical interface repeatedly and in quick succession, because the statistics for the child nodes are collected infrequently. Wait ten seconds between successive iterations to avoid this situation.</p> <p><b>NOTE:</b> For Layer 2 statistics, see <a href="#">“Overhead for Layer 2 Statistics” on page 2812</a></p>                                       |
| <b>Tail-dropped packets</b> | Number of packets dropped because of tail drop.   |
| <b>RL-dropped packets</b>   | <p>Number of packets dropped due to rate limiting.</p> <p>For rate-limited interfaces hosted on MICs, MPCs, and Enhanced Queuing DPCs only, this statistic is not included in the queued traffic statistics. For more information, see <a href="#">“Additional Information” on page 2814</a>.</p>   |
| <b>RL-dropped bytes</b>     | <p>Number of bytes dropped due to rate limiting.</p> <p>For rate-limited interfaces hosted on MICs, MPCs, and Enhanced Queuing DPCs only, this statistic is not included in the queued traffic statistics. For more information, see <a href="#">“Additional Information” on page 2814</a>.</p>   |

Table 258: show interfaces queue Output Fields (*continued*)

| Field Name          | Field Description   |
|---------------------|---|
| RED-dropped packets | <p>Number of packets dropped because of random early detection (RED).</p> <ul style="list-style-type: none"> <li>(M Series and T Series routers only) On M320 and M120 routers and the T Series routers, the total number of dropped packets is displayed. On all other M Series routers, the output classifies dropped packets into the following categories: <ul style="list-style-type: none"> <li><b>Low, non-TCP</b>—Number of low-loss priority non-TCP packets dropped because of RED.</li> <li><b>Low, TCP</b>—Number of low-loss priority TCP packets dropped because of RED.</li> <li><b>High, non-TCP</b>—Number of high-loss priority non-TCP packets dropped because of RED.</li> <li><b>High, TCP</b>—Number of high-loss priority TCP packets dropped because of RED.</li> </ul> </li> <li>(J Series routers and MX Series routers with enhanced DPCs, and T Series routers with enhanced FPCs only) The output classifies dropped packets into the following categories: <ul style="list-style-type: none"> <li><b>Low</b>—Number of low-loss priority packets dropped because of RED.</li> <li><b>Medium-low</b>—Number of medium-low loss priority packets dropped because of RED.</li> <li><b>Medium-high</b>—Number of medium-high loss priority packets dropped because of RED.</li> <li><b>High</b>—Number of high-loss priority packets dropped because of RED.</li> </ul> </li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> |
| RED-dropped bytes   | <p>Number of bytes dropped because of RED. The byte counts vary by interface hardware. For more information, see <a href="#">Table 259 on page 2819</a>.</p> <ul style="list-style-type: none"> <li>(M Series and T Series routers only) On M320 and M120 routers and the T Series routers, only the total number of dropped bytes is displayed. On all other M Series routers, the output classifies dropped bytes into the following categories: <ul style="list-style-type: none"> <li><b>Low, non-TCP</b>—Number of low-loss priority non-TCP bytes dropped because of RED.</li> <li><b>Low, TCP</b>—Number of low-loss priority TCP bytes dropped because of RED.</li> <li><b>High, non-TCP</b>—Number of high-loss priority non-TCP bytes dropped because of RED.</li> <li><b>High, TCP</b>—Number of high-loss priority TCP bytes dropped because of RED.</li> </ul> </li> <li>(J Series routers only) The output classifies dropped bytes into the following categories: <ul style="list-style-type: none"> <li><b>Low</b>—Number of low-loss priority bytes dropped because of RED.</li> <li><b>Medium-low</b>—Number of medium-low loss priority bytes dropped because of RED.</li> <li><b>Medium-high</b>—Number of medium-high loss priority bytes dropped because of RED.</li> <li><b>High</b>—Number of high-loss priority bytes dropped because of RED.</li> </ul> </li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p>                 |

Byte counts vary by interface hardware. [Table 259 on page 2819](#) shows how the byte counts on the outbound interfaces vary depending on the interface hardware.

[Table 259 on page 2819](#) is based on the assumption that outbound interfaces are sending IP traffic with 478 bytes per packet.

Table 259: Byte Count by Interface Hardware

| Interface Hardware               | Output Level                | Byte Count Includes  | Comments   |
|----------------------------------|-----------------------------|--|--|
| Gigabit Ethernet IQ and IQE PICs | Interface                   | <p>Queued: 490 bytes per packet, representing 478 bytes of Layer 3 packet + 12 bytes</p> <p>Transmitted: 490 bytes per packet, representing 478 bytes of Layer 3 packet + 12 bytes</p> <p>RED dropped: 496 bytes per packet representing 478 bytes of Layer 3 packet + 18 bytes</p>  | <p>The 12 additional bytes include 6 bytes for the destination MAC address + 4 bytes for the VLAN + 2 bytes for the Ethernet type.</p> <p>For RED dropped, 6 bytes are added for the source MAC address.</p> |
|                                  | Packet forwarding component | <p>Queued: 478 bytes per packet, representing 478 bytes of Layer 3 packet</p> <p>Transmitted: 478 bytes per packet, representing 478 bytes of Layer 3 packet</p>   | —  |

Table 259: Byte Count by Interface Hardware (*continued*)

| Interface Hardware                                   | Output Level                | Byte Count Includes   | Comments   |
|--|-----------------------------|---|--|
| IQ and IQE PICs with a SONET/SDH interface           | Interface                   | <p>Queued: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes</p> <p>Transmitted: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes</p> <p>RED dropped: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes</p>   | The additional 4 bytes are for the Layer 2 Point-to-Point Protocol (PPP) header.   |
|  | Packet forwarding component | <p>Queued: 478 bytes per packet, representing 478 bytes of Layer 3 packet</p> <p>Transmitted: 486 bytes per packet, representing 478 bytes of Layer 3 packet + 8 bytes</p>  | For transmitted packets, the additional 8 bytes includes 4 bytes for the PPP header and 4 bytes for a cookie.                      |
| Non-IQ PIC with a SONET/SDH interface                | Interface                   | <p>T Series, TX Series, T1600, and MX Series routers:</p> <ul style="list-style-type: none"> <li>Queued: 478 bytes of Layer 3 packet.</li> <li>Transmitted: 478 bytes of Layer 3 packet.</li> </ul> <p>M Series routers:</p> <ul style="list-style-type: none"> <li>Queued: 478 bytes of Layer 3 packet.</li> <li>Transmitted: 483 bytes per packet, representing 478 bytes of Layer 3 packet + 5 bytes</li> <li>RED dropped: 478 bytes per packet, representing 478 bytes of Layer 3 packet</li> </ul> | For transmitted packets, the additional 5 bytes includes 4 bytes for the PPP header and 1 byte for the packet loss priority (PLP). |
| Interfaces configured with Frame Relay Encapsulation | Interface                   | The default Frame Relay overhead is 7 bytes. If you configure the Frame Check Sequence (FCS) to 4 bytes, then the overhead increases to 10 bytes.   |  |
| 1-port 10-Gigabit Ethernet IQ2 and IQ2-E PICs        | Interface                   | <p>Queued: 478 bytes of Layer 3 packet + the full Layer 2 overhead including CRC.</p> <p>Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead including CRC.</p>  | The Layer 2 overhead is 18 bytes for non-VLAN traffic and 22 bytes for VLAN traffic.   |
| 4-port 1G IQ2 and IQ2-E PICs                         | Packet forwarding component | Queued: 478 bytes of Layer 3 packet.  | —  |
| 8-port 1G IQ2 and IQ2-E PICs                         |                             | Transmitted: 478 bytes of Layer 3 packet.   |  |

## Sample Output

### show interfaces queue (Rate-Limited Interface on a Gigabit Ethernet MIC in an MPC)

The following example shows queue information for the rate-limited interface ge-4/2/0 on a Gigabit Ethernet MIC in an MPC. For rate-limited queues for interfaces hosted on MICs or MPCs, rate-limit packet drops occur prior to packet output queuing. In the

command output, the nonzero statistics displayed in the **RL-dropped packets** and **RL-dropped bytes** fields quantify the traffic dropped to rate-limit queue 0 output to 10 percent of 1 gigabyte (100 megabits) per second. Because the RL-dropped traffic is not included in the **Queued** statistics, the statistics displayed for queued traffic are the same as the statistics for transmitted traffic.

```
user@host> show interfaces queue ge-4/2/0
Physical interface: ge-4/2/0, Enabled, Physical link is Up
  Interface index: 203, SNMP ifIndex: 1054
Forwarding classes: 16 supported, 4 in use
Egress queues: 8 supported, 4 in use
Queue: 0, Forwarding classes: best-effort
  Queued:

## show interfaces xe

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>show interfaces <i>device-name:type-fpc/pic/port</i></code><br><code>&lt;brief   detail   extensive   terse&gt;</code><br><code>&lt;descriptions&gt;</code><br><code>&lt;media&gt;</code><br><code>&lt;routing-instance (all   <i>instance-name</i>)&gt;</code><br><code>&lt;snmp-index <i>snmp-index</i>&gt;</code><br><code>&lt;statistics&gt;</code>  |
| <b>Release Information</b>      | Command introduced in Junos OS Release 11.1 for the QFX Series.  |
| <b>Description</b>              | Display status information about the specified 10-Gigabit Ethernet interface. This command does not display statistics for routed VLAN interfaces.   |
| <b>Options</b>                  | <p><b><i>device-name:type-fpc/pic/port</i></b>—(QFabric systems only) The device name is either the serial number or the alias of the QFabric system component, such as a Node device, Interconnect device, or QFabric infrastructure. The name must contain a maximum of 128 characters and not contain any colons.</p> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b>descriptions</b>—(Optional) Display interface description strings.</p> <p><b>media</b>—(Optional) Display media-specific information about network interfaces.</p> <p><b>routing-instance (all   <i>instance-name</i>)</b>—(Optional) Display the name of an individual routing instance or display all routing instances.</p> <p><b>snmp-index <i>snmp-index</i></b>—(Optional) Display information for the specified SNMP index of the interface.</p> <p><b>statistics</b>—(Optional) Display static interface statistics.</p> |

**Output Fields** Table 260 on page 2853 lists the output fields for the **show interfaces xe** command. Output fields are listed in the approximate order in which they appear.

**Table 260: show interfaces xe Output Fields**

| Field Name  | Field Description   | Level of Output              |
|---|---|------------------------------|
| <b>Physical Interface</b>   |   |                              |
| <b>Physical interface</b>   | Name of the physical interface.   | All levels                   |
| <b>Enabled</b>  | State of the interface.   | All levels                   |
| <b>Interface index</b>  | Index number of the physical interface, which reflects its initialization sequence.   | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>   | SNMP index number for the physical interface.   | <b>detail extensive none</b> |
| <b>Generation</b>   | Unique number for use by Juniper Networks technical support only.   | <b>detail extensive</b>      |
| <b>Link-level type</b>  | Encapsulation being used on the physical interface.   | All levels                   |
| <b>MTU</b>  | Maximum transmission unit size on the physical interface.   | All levels                   |
| <b>Speed</b>  | Speed at which the interface is running.  | All levels                   |
| <b>Duplex</b>   | Duplex mode of the interface, either <b>Full-Duplex</b> or <b>Half-Duplex</b> .   | All levels                   |
| <b>Loopback</b>   | Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .  | All levels                   |
| <b>Source filtering</b>   | Source filtering status: <b>Enabled</b> or <b>Disabled</b> .  | All levels                   |
| <b>LAN-PHY mode</b>   | 10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications. | All levels                   |
| <b>Unidirectional</b>   | Unidirectional link mode status for 10-Gigabit Ethernet interface: <b>Enabled</b> or <b>Disabled</b> for parent interface; <b>Rx-only</b> or <b>Tx-only</b> for child interfaces.             | All levels                   |
| <b>Flow control</b>   | Flow control status: <b>Enabled</b> or <b>Disabled</b> .  | All levels                   |
| <b>NOTE:</b> This field is only displayed if asymmetric flow control is not configured. |   |                              |

Table 260: show interfaces xe Output Fields (*continued*)

| Field Name                     | Field Description   | Level of Output              |
|--------------------------------|---|------------------------------|
| <b>Configured-flow-control</b> | Configured flow control for the interface transmit buffers ( <b>tx-buffers</b> ) and receive buffers ( <b>rx-buffers</b> ): <ul style="list-style-type: none"> <li><b>tx-buffers</b>—<b>On</b> if the interface is configured to respond to Ethernet PAUSE messages received from the connected peer.<br/><b>Off</b> if the interface is not configured to respond to received PAUSE messages.</li> <li><b>rx-buffers</b>—<b>On</b> if the interface is configured to generate and send Ethernet PAUSE messages to the connected peer.<br/><b>Off</b> if the interface is not configured to generate and send PAUSE messages.</li> </ul> <p><b>NOTE:</b> This field is only displayed if asymmetric flow control is configured.</p> | All levels                   |
| <b>Auto-negotiation</b>        | Autonegotiation status: <b>Enabled</b> or <b>Disabled</b> .   | All levels                   |
| <b>Remote-fault</b>            | Remote fault status: <ul style="list-style-type: none"> <li><b>Online</b>—Autonegotiation is manually configured as online.</li> <li><b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul>   | All levels                   |
| <b>Device flags</b>            | Information about the physical device.  | All levels                   |
| <b>Interface flags</b>         | Information about the interface.  | All levels                   |
| <b>Link flags</b>              | Information about the link.   | All levels                   |
| <b>Wavelength</b>              | Configured wavelength, in nanometers (nm).  | All levels                   |
| <b>Frequency</b>               | Frequency associated with the configured wavelength, in terahertz (THz).  | All levels                   |
| <b>CoS queues</b>              | Number of CoS queues configured.  | <b>detail extensive none</b> |
| <b>Schedulers</b>              | Number of CoS schedulers configured.  | <b>extensive</b>             |
| <b>Hold-times</b>              | Current interface hold-time up and hold-time down, in milliseconds.   | <b>detail extensive</b>      |
| <b>Current address</b>         | Configured MAC address.   | <b>detail extensive none</b> |
| <b>Hardware address</b>        | Hardware MAC address.   | <b>detail extensive none</b> |
| <b>Last flapped</b>            | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2008-01-16 10:52:40 UTC (3d 22:58 ago)</b> .  | <b>detail extensive none</b> |
| <b>Input Rate</b>              | Input rate in bits per second (bps) and packets per second (pps).   | None specified               |
| <b>Output Rate</b>             | Output rate in bps and pps.   | None specified               |
| <b>Statistics last cleared</b> | Time when the statistics for the interface were last set to zero.   | <b>detail extensive</b>      |

Table 260: show interfaces xe Output Fields (*continued*)

| Field Name                | Field Description   | Level of Output         |
|---------------------------|---|-------------------------|
| <b>Traffic statistics</b> | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> <p><b>NOTE:</b> The bandwidth bps counter is not enabled.</p>  | <b>detail extensive</b> |
| <b>Input errors</b>       | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored if you configure the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>        |

Table 260: show interfaces xe Output Fields (*continued*)

| Field Name                      | Field Description  | Level of Output         |
|---------------------------------|--|-------------------------|
| <b>Output errors</b>            | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>        |
| <b>Egress queues</b>            | Total number of egress queues supported on the specified interface.  | <b>detail extensive</b> |
| <b>Queue counters (Egress)</b>  | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>  | <b>detail extensive</b> |
| <b>Queue Number</b>             | The CoS queue number and the forwarding classes mapped to the queue number. The <b>Mapped forwarding class</b> column lists the forwarding classes mapped to each CoS queue.   | <b>detail extensive</b> |
| <b>Ingress queues</b>           | Total number of ingress queues supported on the specified interface.   | <b>extensive</b>        |
| <b>Queue counters (Ingress)</b> | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>  | <b>extensive</b>        |

Table 260: show interfaces xe Output Fields (*continued*)

| Field Name                              | Field Description  | Level of Output              |
|---|--|------------------------------|
| <b>Active alarms and Active defects</b> | <p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the switch configuration, an alarm can ring the red or yellow alarm bell on the switch, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul>  | <b>detail extensive none</b> |
| <b>PCS statistics</b>                   | Physical Coding Sublayer (PCS) fault conditions from the LAN PHY device.   | <b>detail extensive</b>      |
| <b>MAC statistics</b>                   | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem.</p> <ul style="list-style-type: none"> <li>• <b>Total octets and total packets</b>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type.</li> <li>• <b>Unicast packets, Broadcast packets, and Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—Number of packets that exceeds the configured MTU.</li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runs (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. This counter is not supported on EX Series switches and is always displayed as 0.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul> | <b>extensive</b>             |
| <b>Filter statistics</b>                | Receive and Transmit statistics reported by the PIC's MAC address filter subsystem.  | <b>extensive</b>             |

Table 260: show interfaces xe Output Fields (*continued*)

| Field Name                  | Field Description  | Level of Output |
|-----------------------------|--|-----------------|
| Autonegotiation information | <p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> <li>• <b>Negotiation status:</b> <ul style="list-style-type: none"> <li>• <b>Incomplete</b>—Ethernet interface has the speed or link mode configured.</li> <li>• <b>No autonegotiation</b>—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.</li> <li>• <b>Complete</b>—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> </ul> </li> <li>• <b>Link partner status</b>—OK when the Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> <li>• <b>Link partner:</b> <ul style="list-style-type: none"> <li>• <b>Link mode</b>—Depending on the capability of the attached Ethernet device, either <b>Full-duplex</b> or <b>Half-duplex</b>.</li> <li>• <b>Flow control</b>—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is <b>None</b>. For Gigabit Ethernet interfaces, types are <b>Symmetric</b> (link partner supports <b>PAUSE</b> on receive and transmit), <b>Asymmetric</b> (link partner supports <b>PAUSE</b> on transmit), and <b>Symmetric/Asymmetric</b> (link partner supports both <b>PAUSE</b> on receive and transmit or only <b>PAUSE</b> receive).</li> <li>• <b>Remote fault</b>—Remote fault information from the link partner—<b>Failure</b> indicates a receive link error. <b>OK</b> indicates that the link partner is receiving. <b>Negotiation error</b> indicates a negotiation error. <b>Offline</b> indicates that the link partner is going offline.</li> </ul> </li> <li>• <b>Local resolution:</b> <ul style="list-style-type: none"> <li>• <b>Flow control</b>—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are <b>Symmetric</b> (link partner supports <b>PAUSE</b> on receive and transmit), <b>Asymmetric</b> (link partner supports <b>PAUSE</b> on transmit), and <b>Symmetric/Asymmetric</b> (link partner supports both <b>PAUSE</b> on receive and transmit or only <b>PAUSE</b> receive). For asymmetric <b>PAUSE</b>, shows if the <b>PAUSE</b> transmit and <b>PAUSE</b> receive states on the interface are <b>enable</b> or <b>disable</b>.</li> <li>• <b>Remote fault</b>—Remote fault information. <b>Link OK</b> (no error detected on receive), <b>Offline</b> (local interface is offline), and <b>Link Failure</b> (link error detected on receive).</li> </ul> </li> </ul> | extensive       |

Table 260: show interfaces xe Output Fields (*continued*)

| Field Name                                    | Field Description  | Level of Output              |
|---|--|------------------------------|
| <b>Packet Forwarding Engine configuration</b> | Information about the configuration of the Packet Forwarding Engine: <ul style="list-style-type: none"> <li>• <b>Destination slot</b>—FPC slot number.</li> <li>• <b>CoS transmit queue</b>—Queue number and its associated user-configured forwarding class name.</li> <li>• <b>Bandwidth %</b>—Percentage of bandwidth allocated to the queue.</li> <li>• <b>Bandwidth bps</b>—Bandwidth allocated to the queue (in bps).</li> <li>• <b>Buffer %</b>—Percentage of buffer space allocated to the queue.</li> <li>• <b>Buffer usec</b>—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time.</li> <li>• <b>Priority</b>—Queue priority: <b>low</b> or <b>high</b>.</li> <li>• <b>Limit</b>—Displayed if rate limiting is configured for the queue. Possible values are <b>none</b> and <b>exact</b>. If <b>exact</b> is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If <b>none</b> is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.</li> </ul> | <b>extensive</b>             |
| <b>Logical Interface</b>                      |  |                              |
| <b>Logical interface</b>                      | Name of the logical interface.   | All levels                   |
| <b>Index</b>                                  | Index number of the logical interface, which reflects its initialization sequence.   | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>                           | SNMP interface index number for the logical interface.   | <b>detail extensive none</b> |
| <b>Generation</b>                             | Unique number for use by Juniper Networks technical support only.  | <b>detail extensive</b>      |
| <b>Flags</b>                                  | Information about the logical interface.   | All levels                   |
| <b>Encapsulation</b>                          | Encapsulation on the logical interface.  | All levels                   |
| <b>Protocol</b>                               | Protocol family.   | <b>detail extensive none</b> |
| <b>Traffic statistics</b>                     | Number and rate of bytes and packets received (input) and transmitted (output) on the specified interface.   | <b>detail extensive</b>      |
| <b>IPv6 transit statistics</b>                | If IPv6 statics tracking is enabled, number of IPv6 bytes and packets received and transmitted on the logical interface.   | <b>extensive</b>             |
| <b>Local statistics</b>                       | Number and rate of bytes and packets destined to and from the switch.  | <b>extensive</b>             |
| <b>Transit statistics</b>                     | Number and rate of bytes and packets transiting the switch.  | <b>extensive</b>             |
| <b>Generation</b>                             | Unique number for use by Juniper Networks technical support only.  | <b>detail extensive</b>      |
| <b>Route Table</b>                            | Route table in which the logical interface address is located. For example, <b>0</b> refers to the routing table inet.0.   | <b>detail extensive none</b> |

Table 260: show interfaces xe Output Fields (*continued*)

| Field Name              | Field Description  | Level of Output              |
|-------------------------|--|------------------------------|
| <b>Input Filters</b>    | Names of any input filters applied to this interface.  | <b>detail extensive</b>      |
| <b>Output Filters</b>   | Names of any output filters applied to this interface.   | <b>detail extensive</b>      |
| <b>Flags</b>            | Information about protocol family flags.<br><br>If unicast Reverse Path Forwarding (uRPF) is explicitly configured on the specified interface, the uRPF flag appears. If uRPF was configured on a different interface (and therefore is enabled on all switch interfaces) but was not explicitly configured on the specified interface, the uRPF flag does not appear even though uRPF is enabled. | <b>detail extensive</b>      |
| <b>Addresses, Flags</b> | Information about the address flags.   | <b>detail extensive none</b> |
| <i>protocol-family</i>  | Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address of the interface is also displayed.   | <b>brief</b>                 |
| <b>Flags</b>            | Information about the address flag.  | <b>detail extensive none</b> |
| <b>Destination</b>      | IP address of the remote side of the connection.   | <b>detail extensive none</b> |
| <b>Local</b>            | IP address of the logical interface.   | <b>detail extensive none</b> |
| <b>Broadcast</b>        | Broadcast address of the logical interlace.  | <b>detail extensive none</b> |
| <b>Generation</b>       | Unique number for use by Juniper Networks technical support only.  | <b>detail extensive</b>      |

## Sample Output

### show interfaces

```

user@switch> show interfaces xe-0/0/1
Physical interface: xe-0/0/1, Enabled, Physical link is Up
  Interface index: 49195, SNMP ifIndex: 591
  Link-level type: Ethernet, MTU: 1514, Speed: 10Gbps, Duplex: Full-Duplex, BPDU
  Error: None, MAC-REWRITE Error: None, Loopback: Disabled, Source filtering:
  Disabled,
  Flow control: Disabled
  Device flags   : Present Running
  Interface flags: SNMP-Traps Internal: 0x0
  Link flags     : None
  CoS queues    : 12 supported, 12 maximum usable queues
  Current address: 00:1d:b5:f7:4e:e1, Hardware address: 00:1d:b5:f7:4e:e1
  Last flapped  : 2011-06-01 00:42:03 PDT (00:02:42 ago)
  Input rate    : 0 bps (0 pps)
  Output rate   : 0 bps (0 pps)
  Active alarms : None
  Active defects : None

Logical interface xe-0/0/1.0 (Index 73) (SNMP ifIndex 523)
  Flags: SNMP-Traps 0x0 Encapsulation: ENET2
  Input packets : 0

```

```

Output packets: 0
Protocol eth-switch, MTU: 0
Flags: Trunk-Mode

```

### show interfaces (Asymmetric Flow Control)

```

user@switch> show interfaces xe-0/0/1
Physical interface: xe-0/0/1, Enabled, Physical link is Up
  Interface index: 49195, SNMP ifIndex: 591
  Link-level type: Ethernet, MTU: 1514, Speed: 10Gbps, Duplex: Full-Duplex, BPDU
  Error: None, MAC-REWRITE Error: None, Loopback: Disabled, Source filtering:
  Disabled,
  Configured-flow-control tx-buffers: off rx-buffers: on
  Device flags   : Present Running
  Interface flags: SNMP-Traps Internal: 0x0
  Link flags     : None
  CoS queues    : 12 supported, 12 maximum usable queues
  Current address: 00:1d:b5:f7:4e:e1, Hardware address: 00:1d:b5:f7:4e:e1
  Last flapped  : 2011-06-01 00:42:03 PDT (00:02:42 ago)
  Input rate    : 0 bps (0 pps)
  Output rate   : 0 bps (0 pps)
  Active alarms : None
  Active defects : None

Logical interface xe-0/0/1.0 (Index 73) (SNMP ifIndex 523)
  Flags: SNMP-Traps 0x0 Encapsulation: ENET2
  Input packets : 0
  Output packets: 0
  Protocol eth-switch, MTU: 0
  Flags: Trunk-Mode

```

### show interfaces brief

```

user@switch> show interfaces xe-0/0/1 brief
Physical interface: xe-0/0/1, Enabled, Physical link is Up
  Link-level type: Ethernet, MTU: 1514, Speed: 1000mbps, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled
  Device flags   : Present Running
  Interface flags: SNMP-Traps Internal: 0x0
  Link flags     : None

Logical interface xe-0/0/1.0
  Flags: SNMP-Traps Encapsulation: ENET2
  eth-switch

```

### show interfaces detail

```

user@switch> show interfaces xe-0/0/1 detail
Physical interface: xe-0/0/1, Enabled, Physical link is Up
  Interface index: 49195, SNMP ifIndex: 591, Generation: 169
  Link-level type: Ethernet, MTU: 1514, Speed: 10Gbps, Duplex: Full-Duplex, BPDU
  Error: None, MAC-REWRITE Error: None, Loopback: Disabled, Source filtering:
  Disabled,
  Flow control: Disabled
  Device flags   : Present Running
  Interface flags: SNMP-Traps Internal: 0x0
  Link flags     : None
  CoS queues    : 12 supported, 12 maximum usable queues
  Hold-times    : Up 0 ms, Down 0 ms
  Current address: 00:1d:b5:f7:4e:e1, Hardware address: 00:1d:b5:f7:4e:e1

```

| <b>List of Sample Output</b>    | <a href="#">show lacp interfaces (EX Series Switches) on page 2872</a><br><a href="#">show lacp interfaces (QFX Series) on page 2873</a>  |
| <b>Output Fields</b>            | <a href="#">Table 251 on page 2766</a> lists the output fields for the <code>show lacp interfaces</code> command. Output fields are listed in the approximate order in which they appear.   |

Table 261: show lacp interfaces Output Fields

| Field Name           | Field Description  |
|----------------------|--|
| Aggregated interface | Aggregated Ethernet interface name.  |
| LACP State           | <p>LACP state information for each aggregated Ethernet interface:</p> <ul style="list-style-type: none"> <li>For a child interface configured with the <b>force-up</b> statement, LACP state displays <b>FUP</b> along with the interface name.</li> <li><b>Role</b>—Role played by the interface. It can be one of the following: <ul style="list-style-type: none"> <li><b>Actor</b>—Local device participating in the LACP negotiation.</li> <li><b>Partner</b>—Remote device participating in the LACP negotiation.</li> </ul> </li> <li><b>Exp</b>—Expired state. <b>Yes</b> indicates that the actor or partner is in an expired state. <b>No</b> indicates that the actor or partner is not in an expired state.</li> <li><b>Def</b>—Default. <b>Yes</b> indicates that the actor's receive machine is using the default operational partner information, which is administratively configured for the partner. <b>No</b> indicates that the operational partner information in use has been received in an LACP PDU.</li> <li><b>Dist</b>—Distribution of outgoing frames. <b>No</b> indicates that the distribution of outgoing frames on the link is currently disabled and is not expected to be enabled. Otherwise, the value is <b>Yes</b>.</li> <li><b>Col</b>—Collection of incoming frames. <b>Yes</b> indicates that the collection of incoming frames on the link is currently enabled and is not expected to be disabled. Otherwise, the value is <b>No</b>.</li> <li><b>Syn</b>—Synchronization. If the value is <b>Yes</b>, the link is considered to be synchronized. The link has been allocated to the correct link aggregation group, the group has been associated with a compatible aggregator, and the identity of the link aggregation group is consistent with the system ID and operational key information transmitted. If the value is <b>No</b>, the link is not synchronized. The link is currently not in the right aggregation.</li> <li><b>Aggr</b>—Ability of the aggregation port to aggregate (<b>Yes</b>) or to operate only as an individual link (<b>No</b>).</li> <li><b>Timeout</b>—LACP timeout preference. Periodic transmissions of LACP PDUs occur at either a slow or a fast transmission rate, depending upon the expressed LACP timeout preference (<b>Long Timeout</b> or <b>Short Timeout</b>).</li> <li><b>Activity</b>—Actor's or partner's port activity. <b>Passive</b> indicates the port's preference for not transmitting LAC PDUs unless its partner's control value is <b>Active</b>. <b>Active</b> indicates the port's preference to participate in the protocol regardless of the partner's control value.</li> </ul> |

Table 261: show lacp interfaces Output Fields (*continued*)

| Field Name    | Field Description  |
|---------------|--|
| LACP Protocol | <p>LACP protocol information for each aggregated interface:</p> <ul style="list-style-type: none"> <li>Link state (active or standby) indicated in parentheses next to the interface when link protection is configured.</li> <li><b>Receive State</b>—One of the following values: <ul style="list-style-type: none"> <li><b>Current</b>—The state machine receives an LACP PDU and enters the <b>Current</b> state.</li> <li><b>Defaulted</b>—If no LACP PDU is received before the timer for the <b>Current</b> state expires a second time, the state machine enters the <b>Defaulted</b> state.</li> <li><b>Expired</b>—If no LACP PDU is received before the timer for the <b>Current</b> state expires once, the state machine enters the <b>Expired</b> state.</li> <li><b>Initialize</b>—When the physical connectivity of a link changes or a Begin event occurs, the state machine enters the <b>Initialize</b> state.</li> <li><b>LACP Disabled</b>—If the port is operating in half duplex, the operation of LACP is disabled on the port, forcing the state to <b>LACP Disabled</b>. This state is similar to the <b>Defaulted</b> state, except that the port is forced to operate as an individual port.</li> <li><b>Port Disabled</b>—If the port becomes inoperable and a Begin event has not occurred, the state machine enters the <b>Port Disabled</b> state.</li> </ul> </li> <li><b>Transmit State</b>—Transmit state of the state machine. The transmit state is one of the following values: <ul style="list-style-type: none"> <li><b>Fast periodic</b>—Periodic transmissions are enabled at a fast transmission rate.</li> <li><b>No periodic</b>—Periodic transmissions are disabled.</li> <li><b>Periodic timer</b>—Transitory state entered when the periodic timer expires.</li> <li><b>Slow periodic</b>—Periodic transmissions are enabled at a slow transmission rate.</li> </ul> </li> <li><b>Mux State</b>—State of the multiplexer state machine for the aggregation port. The state is one of the following values: <ul style="list-style-type: none"> <li><b>Attached</b>—The multiplexer state machine initiates the process of attaching the port to the selected aggregator.</li> <li><b>Collecting—Yes</b> indicates that the receive function of this link is enabled with respect to its participation in an aggregation. Received frames are passed to the aggregator for collection. <b>No</b> indicates the receive function of this link is not enabled.</li> <li><b>Collecting distributing</b>—Collecting and distributing states are merged together to form a combined state (coupled control). Because independent control is not possible, the coupled control state machine does not wait for the partner to signal that collection has started before enabling both collection and distribution.</li> <li><b>Detached</b>—Process of detaching the port from the aggregator is in progress.</li> <li><b>Distributing—Yes</b> indicates that the transmit function of this link is enabled with respect to its participation in an aggregation. Frames can be passed down from the aggregator's distribution function for transmission. <b>No</b> indicates the transmit function of this link is not enabled.</li> <li><b>Waiting</b>—The multiplexer state machine is in a holding process, awaiting an outcome.</li> </ul> </li> </ul> |

## show oam ethernet link-fault-management

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | show oam ethernet link-fault-management<br><brief   detail><br><interface-name>   |
| <b>Release Information</b>      | Command introduced in Junos OS Release 9.4 for EX Series switches.  |
| <b>Description</b>              | Displays Operation, Administration, and Maintenance (OAM) link fault management (LFM) information for Ethernet interfaces.  |
| <b>Options</b>                  | <b>brief   detail</b> —(Optional) Display the specified level of output.<br><br><b>interface-name</b> —(Optional) Display link fault management information for the specified Ethernet interface only.  |
| <b>Required Privilege Level</b> | view  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Ethernet OAM Link Fault Management on EX Series Switches on page 2583</a></li> <li>• <a href="#">Configuring Ethernet OAM Link Fault Management (CLI Procedure) on page 2604</a></li> </ul> |
| <b>List of Sample Output</b>    | <a href="#">show oam ethernet link-fault-management brief on page 2881</a><br><a href="#">show oam ethernet link-fault-management detail on page 2881</a>   |
| <b>Output Fields</b>            | Table 263 on page 2877 lists the output fields for the <b>show oam ethernet link-fault-management</b> command. Output fields are listed in the approximate order in which they appear.  |

Table 263: show oam ethernet link-fault-management Output Fields

| Field Name             | Field Description   | Level of Output |
|------------------------|---|-----------------|
| <b>Status</b>          | Indicates the status of the established link. <ul style="list-style-type: none"> <li>• <b>Fail</b>—A link fault condition exists.</li> <li>• <b>Running</b>—A link fault condition does not exist.</li> </ul>   | All levels      |
| <b>Discovery state</b> | State of the discovery mechanism: <ul style="list-style-type: none"> <li>• <b>Passive Wait</b></li> <li>• <b>Send Any</b></li> <li>• <b>Send Local Remote</b></li> <li>• <b>Send Local Remote Ok</b></li> </ul> | All levels      |
| <b>Peer address</b>    | Address of the OAM peer.  | All levels      |

Table 263: show oam ethernet link-fault-management Output Fields (*continued*)

| Field Name                       | Field Description  | Level of Output |
|----------------------------------|--|-----------------|
| <b>Flags</b>                     | Information about the interface. <ul style="list-style-type: none"> <li><b>Remote-Stable</b>—Indicates remote OAM client acknowledgment of, and satisfaction with local OAM state information. <b>False</b> indicates that remote DTE has either not seen or is unsatisfied with local state information. <b>True</b> indicates that remote DTE has seen and is satisfied with local state information.</li> <li><b>Local-Stable</b>—Indicates local OAM client acknowledgment of, and satisfaction with remote OAM state information. <b>False</b> indicates that local DTE either has not seen or is unsatisfied with remote state information. <b>True</b> indicates that local DTE has seen and is satisfied with remote state information.</li> <li><b>Remote-State-Valid</b>—Indicates the OAM client has received remote state information found within Local Information TLVs of received Information OAM PDUs. <b>False</b> indicates that OAM client has not seen remote state information. <b>True</b> indicates that the OAM client has seen remote state information.</li> </ul>  | All levels      |
| <b>Remote loopback status</b>    | Indicates the remote loopback status. An OAM entity can put its remote peer into loopback mode using the Loopback control OAM PDU. In loopback mode, every frame received is transmitted back on the same port (except for OAM PDUs, which are needed to maintain the OAM session).  | All levels      |
| <b>Remote entity information</b> | Remote entity information. <ul style="list-style-type: none"> <li><b>Remote MUX action</b>—Indicates the state of the multiplexer functions of the OAM sublayer. Device is forwarding non-OAM PDUs to the lower sublayer or discarding non-OAM PDUs.</li> <li><b>Remote parser action</b>—Indicates the state of the parser function of the OAM sublayer. Device is forwarding non-OAM PDUs to higher sublayer, looping back non-OAM PDUs to the lower sublayer, or discarding non-OAM PDUs.</li> <li><b>Discovery mode</b>—Indicates whether discovery mode is active or inactive.</li> <li><b>Unidirectional mode</b>—Indicates the ability to operate a link in a unidirectional mode for diagnostic purposes.</li> <li><b>Remote loopback mode</b>—Indicates whether remote loopback is supported or not supported.</li> <li><b>Link events</b>—Indicates whether interpreting link events is supported or not supported on the remote peer.</li> <li><b>Variable requests</b>—Indicates whether variable requests are supported or not supported. The Variable Request OAM PDU, is used to request one or more MIB variables from the remote peer.</li> </ul> | All levels      |
| <b>OAM Receive Statistics</b>    |  |                 |
| <b>Information</b>               | The number of information PDUs received.   | <b>detail</b>   |
| <b>Event</b>                     | The number of loopback control PDUs received.  | <b>detail</b>   |
| <b>Variable request</b>          | The number of variable request PDUs received.  | <b>detail</b>   |
| <b>Variable response</b>         | The number of variable response PDUs received.   | <b>detail</b>   |
| <b>Loopback control</b>          | The number of loopback control PDUs received.  | <b>detail</b>   |

Table 263: show oam ethernet link-fault-management Output Fields (*continued*)

| Field Name   | Field Description  | Level of Output |
|--|--|-----------------|
| <b>Organization specific</b>                       | The number of vendor organization specific PDUs received.  | <b>detail</b>   |

- [Troubleshooting Multichassis Link Aggregation on page 2887](#)
- [Troubleshooting Network Interfaces on page 2893](#)

## Troubleshooting an Aggregated Ethernet Interface

**Problem**    **Description:** The `show interfaces terse` command shows that the LAG is down.

**Solution**    Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet-switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.
- Verify that the LAG members belong to the same switch.

**Related Documentation**

- [No Commit Checks Are Done for ICL-PL Interfaces on page 2892](#)
- [Double Failover Scenario on page 2892](#)
- [Multicast Traffic Floods the VLAN When the ICL-PL Interface Goes Down and Up on page 2892](#)
- [Layer 3 Traffic Sent to the Standby MC-LAG Peer Is Not Redirected to Active MC-LAG Peer on page 2892](#)
- [AE Interfaces Go Down on page 2892](#)
- [Flooding of Upstream Traffic on page 2893](#)

### MAC Addresses Learned on MC-AE Interfaces Are Not Removed from the MAC Address Table

**Problem Description:** When both of the multichassis aggregated Ethernet (MC-AE) interfaces on both connected multichassis link aggregation group (MC-LAG) peers are down, the MAC addresses learned on the MC-AE interfaces are not removed from the MAC address table. For example, if you disable the MC-AE interface (ae0) on both MC-LAG peers by issuing the **set interfaces ae0 disable** command and commit the configuration, the MAC table still shows the MAC addresses as being learned on the MC-AE interfaces of both MC-LAG peers:

```
user@switchA> show ethernet-switching table
Ethernet-switching table: 6 entries, 2 learned, 0 persistent entries
VLAN      MAC address      Type      Age Interfaces
v10        *                Flood     - All-members
v10        00:10:94:00:00:01 Learn(L)    3:55 ae0.0 (MCAE)
v10        00:10:94:00:00:02 Learn(R)    0 xe-0/0/9.0
v20        *                Flood     - All-members
v30        *                Flood     - All-members
v30        84:18:88:de:b1:2e Static      - Router
```

```
user@switchB> show ethernet-switching table
Ethernet-switching table: 6 entries, 2 learned, 0 persistent entries
VLAN      MAC address      Type      Age Interfaces
v10        *                Flood     - All-members
```

|     |                   |          |                |
|-----|-------------------|----------|----------------|
| v10 | 00:10:94:00:00:01 | Learn(R) | 0 ae0.0 (MCAE) |

| v30 | 84:18:88:df:83:0a | Static   | - Router       |

**Solution** This is expected behavior.

### MC-LAG Peer Does Not Go into Standby Mode

**Problem** **Description:** A multichassis link aggregation group (MC-LAG) peer does not go into standby mode if the MC-LAG peer IP address specified in the Interchassis Control Protocol (ICCP) configuration and the IP address specified in the multichassis protection configuration are different.

**Solution** To prevent failure to enter standby mode, make sure the peer IP address in the ICCP configurations and the IP address in multichassis protection configurations are the same.

### Secondary MC-LAG Peer with Status Control Set to Standby Becomes Inactive

**Problem** **Description:** When the interchassis control link-protection link (ICL-PL) and multichassis aggregated Ethernet (MC-AE) interfaces go down on the primary multichassis link aggregation group (MC-LAG) peer, the secondary MC-LAG peer's MC-AE interfaces with status control set to standby become inactive instead of active.

**Solution** This is expected behavior.

### Redirect Filters Take Priority over User-Defined Filters

**Problem** **Description:** Multichassis link aggregation group (MC-LAG) implicit failover redirection filters take precedence over user-configured explicit filters. This is expected behavior.

**Solution** This is expected behavior.

### Operational Command Output Is Wrong

**Problem** **Description:** After you deactivate the Interchassis Control Protocol (ICCP), the **show iccp** operational command output still shows registered client daemons, such as mcsnoopd, lacpd, and eswd.

For example:

```
user@switch> show iccp
Client Application: MCSNOOPD
Redundancy Group IDs Joined: None
```

```
Client Application: lacpd
Redundancy Group IDs Joined: 1
```

```
Client Application: eswd
Redundancy Group IDs Joined: 1
```

The **show iccp** command output always shows registered modules regardless of whether or not ICCP peers are configured.

**Solution** This is expected behavior.

---

### ICCP Connection Might Take Up to 60 Seconds to Become Active

---

**Problem** **Description:** When the Interchassis Control Protocol (ICCP) configuration and the routed VLAN interface (RVI) configuration are committed together, the ICCP connection might take up to 60 seconds to become active.

**Solution** This is expected behavior.

---

### MAC Address Age Learned on an MC-AE Interface Is Reset to Zero

---

**Problem** **Description:** When you activate and then deactivate an interchassis control link-protection link (ICL-PL), the MAC address age learned on the multichassis aggregated Ethernet (MC-AE) interface is reset to zero. The next-hop interface changes trigger MAC address updates in the hardware, which then triggers aging updates in the Packet Forwarding Engine (PFE). The result is that the MAC address age is updated to zero.

For example, the ICL-PL has been deactivated, and the **show ethernet-switching table** command output shows that the MAC addresses have an age of 0.

```
user@switch> show ethernet-switching table
Ethernet-switching table: 3 entries, 2 learned, 0 persistent entries
  VLAN      MAC address      Type      Age Interfaces
  ---      -
v100        *                Flood     - All-members
v100        00:10:00:00:00:01 Learn(L)   0 ae0.0 (MCAE)
v100        00:10:00:00:00:02 Learn(L)   0 ae0.0 (MCAE)
```

**Solution** This is expected behavior.

---

### MAC Address Is Not Learned Remotely in a Default VLAN

---

**Problem** **Description:** If a multichassis link aggregation group (MC-LAG) peer learns a MAC address in the default VLAN, the Interchassis Control Protocol (ICCP) does not synchronize the MAC address with the MAC address of the other MC-LAG peer.

**Solution** This is expected behavior.

---

### Snooping Entries Learned on MC-AE Interfaces Are Not Removed

---

**Problem** **Description:** When multichassis aggregated Ethernet (MC-AE) interfaces are configured on a VLAN that is enabled for multicast snooping, the membership entries learned on the MC-AE interfaces on the VLAN are not cleared when the MC-AE interfaces go down.

This is done to speed up convergence time when the interfaces come up, or come up and go down.

**Solution** This is expected behavior.

---

#### ICCP Does Not Come Up After You Add or Delete an Authentication Key

---

**Problem** **Description:** The Interchassis Control Protocol (ICCP) connection is not established when you add an authentication key and then delete it only at the global ICCP level. However, authentication works correctly at the ICCP peer level.

**Solution** Delete the ICCP configuration , and then add the ICCP configuration.

---

#### Local Status Is Standby When It Should Be Active

---

**Problem** **Description:** If the multichassis aggregated Ethernet (MC-AE) interface is down when the state machine is in a synchronized state, the multichassis link aggregation group (MC-LAG) peer local status is standby. If the MC-AE interface goes down after the state machine is in an active state, then the local status remains active, and the local state indicates that the interface is down.

**Solution** This is expected behavior.

---

#### Packets Loop on the Server When ICCP Fails

---

**Problem** **Description:** When you enable backup liveness detection for a multichassis link aggregation group (MC-LAG), and the backup liveness detection packets are lost because of a temporary failure on the MC-LAG, then both of the peers in the MC-LAG remain active. If this happens, both of the MC-LAG peers send packets to the connected server.

**Solution** This is expected behavior.

---

#### Both MC-LAG Peers Use the Default System ID After a Reboot or an ICCP Configuration Change

---

**Problem** **Description:** After a reboot or after a new Interchassis Control Protocol (ICCP) configuration has been committed, and the ICCP connection does not become active, the Link Aggregation Control Protocol (LACP) messages transmitted over the multichassis aggregated Ethernet (MC-AE) interfaces use the default system ID. The configured system ID is used instead of the default system ID only after the MC-LAG peers synchronize with each other.

**Solution** This is expected behavior.

### No Commit Checks Are Done for ICL-PL Interfaces

---

**Problem** **Description:** There are no commit checks on the interface being configured as an interchassis control link-protection link (ICL-PL), so you must provide a valid interface name for the ICL-PL.

**Solution** This is expected behavior.

### Double Failover Scenario

---

**Problem** **Description:** If the following events happen in this exact order—the Interchassis Control Protocol (ICCP) goes down, and the multichassis aggregated Ethernet (MC-AE) interface on the multichassis link aggregation group (MC-LAG) peer in active mode goes down—a double failover occurs. In this scenario, the MC-LAG peer in standby mode does not detect what happens on the active MC-LAG peer. The MC-LAG peer in standby mode operates as if the MC-AE interface on the MC-LAG in active mode were up and blocks the interchassis control protocol-protection link (ICL-PL) traffic. The ICL-PL traffic is not forwarded.

**Solution** This is expected behavior.

### Multicast Traffic Floods the VLAN When the ICL-PL Interface Goes Down and Up

---

**Problem** **Description:** When the interchassis control link-protection link (ICL-PL) goes down and up, multicast traffic is flooded to all of the interfaces in the VLAN. The Packet Forwarding Engine (PFE) flag Ip4McastFloodMode for the VLAN is changed to MCAST\_FLOOD\_ALL. This problem only occurs when a multichassis link aggregation group (MC-LAG) is configured for Layer 2.

**Solution** This is expected behavior.

### Layer 3 Traffic Sent to the Standby MC-LAG Peer Is Not Redirected to Active MC-LAG Peer

---

**Problem** **Description:** When the Interchassis Control Protocol (ICCP) is down, the status of a remote MC-LAG peer is unknown. Even if the MC-LAG peer is configured as standby, the traffic is not redirected to this peer because it is assumed that this peer is down.

**Solution** This is expected behavior.

### AE Interfaces Go Down

---

**Problem** **Description:** When a multichassis aggregated Ethernet (MC-AE) interface is converted to an aggregated Ethernet (AE) interface, it retains some MC-AE properties. For example, the AE interface might retain the administrative key of the MC-AE. When this happens, the AE interface goes down.

**Solution** Restart the Link Aggregation Control Protocol (LACP) on the multichassis link aggregation group (MC-LAG) peer hosting the AE interface to bring up the AE interface. Restarting LACP removes the MC-AE properties of the AE interface.

### Flooding of Upstream Traffic

**Problem** **Description:** When MAC synchronization is enabled, the multichassis link aggregation group (MC-LAG) peer can resolve Address Resolution Protocol (ARP) entries for the MC-LAG routed VLAN interface (RVI) with either of the MC-LAG peer MAC addresses. If the downstream traffic is sent with one MAC address (MAC1) but the peer has resolved the MAC address with a different MAC address (MAC2), the MAC2 address might not be learned by any of the access layer switches. Flooding of the upstream traffic for the MAC2 address might then occur.

**Solution** Make sure that downstream traffic is sent from the MC-LAG peers periodically to prevent the MAC addresses from aging out.

## Troubleshooting Network Interfaces

### The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down

**Problem** **Description:** The QFX Series has an SFP or SFP+ module installed. The interface on the port in which an SFP or SFP+ transceiver is installed is down.

**Symptoms:** When you check the status with the CLI command **show interfaces *interface-name***, the disabled port is not listed.

**Cause** By default, the SFP or SFP+ module operates in the 10-Gigabit Ethernet mode and supports only SFP or SFP+ transceivers. The operating mode for the module is incorrectly set.

**Solution** Only SFP or SFP+ transceivers can be installed in SFP or SFP+ modules. You must configure the operating mode of the SFP or SFP+ module to match the type of transceiver you want to use. For SFP+ transceivers, configure 10-Gigabit Ethernet operating mode.

## Overview of Routing Options

In addition to dynamic routing protocols, you can configure static routing on QFX Series switches. You can also configure a variety of protocol-independent routing properties, such as

- Per-packet load balancing (equal cost multipath routing)
- Autonomous system numbers
- Autonomous system confederation members
- Router identifiers
- Routing table groups
- Multicast scoping

### Related Documentation

## Understanding Virtual Router Routing Instances

Virtual router routing instances allow administrators to divide a QFX Series switch into multiple independent virtual routers, each with its own routing table. Virtual router routing instances enable you to isolate traffic without using multiple devices to segment your network. You can create routing instances for unicast routing protocols and PIM sparse mode.

Each virtual router routing instance consists of sets of the following:

- Routing tables
- Interfaces that belong to these routing tables
- Routing protocol configurations
- Routing option configurations

You can use virtual router routing instances to isolate customer traffic on a network and to bind customer-specific routing instances to customer-owned interfaces. Each interface can belong to only one routing instance. QFX 3500 and QFX3600 switches and QFabric systems support as many as 256 virtual router routing instances. QFX 5100 switches support as many as 512 virtual router routing instances.

## Understanding Distributed Periodic Packet Management

Periodic packet management (PPM) is responsible for processing a variety of time-sensitive periodic tasks for particular processes so that other processes can more optimally direct their resources. PPM is responsible for the periodic transmission of packets on behalf of its various client processes, which include the processes that control the Link Aggregation Control Protocol (LACP) and Bidirectional Forwarding Detection (BFD) protocol, and also for receiving packets on behalf of these client processes. PPM also gathers some statistics and sends process-specific packets. PPM cannot be disabled and is always running on any operational switch.

The responsibility for PPM processing on the switch is distributed between the Routing Engine and the access interfaces for all protocols that use PPM by default. This distributed model provides a faster response time for protocols that use PPM than the response time provided by the nondistributed model.

If distributed PPM is disabled, the PPM process runs on the Routing Engine only.

You can disable distributed PPM for all protocols that use PPM. You can also disable distributed PPM for LACP packets only.

**BEST PRACTICE:** We generally recommend that you disable distributed PPM only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.

## Understanding Bidirectional Forwarding Detection (BFD)

The Bidirectional Forwarding Detection (BFD) protocol is a simple mechanism that detects failures in a network and works in a wide variety of network environments and topologies. In BFD operation, switches exchange BFD hello packets at a specified interval and detect a neighbor failure if they do not receive a reply after a specified interval. The BFD failure detection timers support shorter time limits than the static route failure detection mechanisms, so they can provide faster detection of failures.

To configure faster failure detection, use lower BFD timer values. The timers can automatically adapt to a higher value if an adjacency fails, and they also adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. In this case, a back-off algorithm increases the receive interval by two if the local BFD instance is the reason for the session flap and increases the transmission interval by two if the remote BFD instance is the reason for the session flap.

You can use the **clear bfd adaptation** command to return BFD interval timers to their configured values. This command is hitless, meaning that it does not affect traffic flow.

**NOTE:** QFX and EX4600 switches do not support BFD timer values of less than 1 second.

## Understanding the Unified Forwarding Table

- [Using the Unified Forwarding Table to Optimize Address Storage on page 2899](#)
- [MAC Address and Host Address Memory Allocation on page 2900](#)
- [LPM Table Memory Allocation on page 2901](#)

### Using the Unified Forwarding Table to Optimize Address Storage

On QFX5100 and EX4600 switches, you can control the allocation of forwarding table memory available to store the following:

- MAC addresses.
- Layer 3 host entries.
- Longest prefix match (LPM) table entries.

**NOTE:** Starting with Junos OS 13.2X51-D15, you can allocate more memory to store prefixes in the range /65 to /127 range.

This feature gives you the flexibility to configure your switch to match the needs of your particular network environment.

### MAC Address and Host Address Memory Allocation

There are several profiles that allocate memory differently for MAC addresses and host addresses. You configure the mix that best meets your needs by choosing the appropriate profile. [Table 96 on page 1546](#) lists the profiles you can choose and the associated maximum values for the MAC address and host table entries.

**Table 266: Unified Forwarding Table Profiles**

| Profile Name                      | MAC Table     | Host Table (unicast and multicast addresses) |              |             |             |             |             |
|-----------------------------------|---------------|--|--------------|-------------|-------------|-------------|-------------|
|                                   | MAC Addresses | IPv4 unicast                                 | IPv6 unicast | IPv4 (*, G) | IPv4 (S, G) | IPv6 (*, G) | IPv6 (S, G) |
| <b>l2-profile-one</b>             | 288K          | 16K  | 8K           | 8K          | 8K          | 4K          | 4K          |
| <b>l2-profile-two</b>             | 224K          | 80K  | 40K          | 40K         | 40K         | 20K         | 20K         |
| <b>l2-profile-three (default)</b> | 160K          | 144K   | 72K          | 72K         | 72K         | 36K         | 36K         |
| <b>l3-profile</b>                 | 96K           | 208K   | 104K         | 104K        | 104K        | 52K         | 52K         |
| <b>lpm-profile</b>                | 32K           | 16K  | 8K           | 8K          | 8K          | 4K          | 4K          |

Note that all entries in the host table share the same memory space. If the host table stores the maximum number of entries for any given type, the entire shared table is full and is unable to accommodate *any* entries of any other type. As you can see, different entry types occupy different amounts of memory. For example, an IPv6 unicast address occupies twice as much memory as an IPv4 unicast address, and an IPv6 multicast address occupies four times as much memory as an IPv4 unicast address.

[Table 97 on page 1546](#) lists various valid combinations that the host table can store if you use the **l2-profile-one** profile. Each row in the table represents a case in which the host table is full and cannot accommodate any more entries. .

**Table 267: Example Host Table Combinations Using l2-profile-one**

| IPv4 unicast | IPv6 unicast | IPv4 multicast (*, G) | IPv4 multicast (S, G) | IPv6 multicast (*, G) | IPv6 multicast (S, G) |
|--------------|--------------|-----------------------|-----------------------|-----------------------|-----------------------|
| 16K          | 0            | 0                     | 0                     | 0                     | 0                     |
| 12K          | 2K           | 0                     | 0                     | 0                     | 0                     |
| 12K          | 0            | 2K                    | 2K                    | 0                     | 0                     |
| 8K           | 4K           | 0                     | 0                     | 0                     | 0                     |
| 4K           | 2K           | 2K                    | 2K                    | 0                     | 0                     |

Table 267: Example Host Table Combinations Using l2-profile-one (continued)

- [Configuring Static Routing on page 2904](#)
- [Configuring Per-Packet Load Balancing on page 2904](#)
- [Configuring Distributed Periodic Packet Management on page 2906](#)
- [Configuring Virtual Router Routing Instances on page 2908](#)
- [Configuring the Unified Forwarding Table on page 2909](#)

## Configuring Static Routing

Static routes are routes that are manually configured and entered into the routing table.

The switch uses static routes:

- When the switch does not have a route to a destination that has a better (lower) *preference* value. The preference is an arbitrary value in the range from 0 through 255 that the software uses to rank routes received from different protocols, interfaces, or remote systems. The routing protocol process generally determines the active route by selecting the route with the lowest preference value. In the given range, **0** is the lowest and **255** is the highest.
- When the switch cannot determine the route to a destination.
- When the switch is forwarding unroutable packets.

To configure basic static route options using the CLI:

- To configure the switch's default gateway:  

```
[edit]
user@switch# set routing-options static route 0.0.0.0/0 next-hop 10.0.1.1
```
- To configure a static route and specify the next address to be used when routing traffic to the static route:  

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 next-hop 10.0.0.2.1
```
- To always keep the static route in the forwarding table:  

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 retain
```
- To prevent the static route from being readvertised:  

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 no-readvertise
```
- To remove inactive routes from the forwarding table:  

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 active
```

### Related Documentation

- [Monitoring Routing Information on page 3055](#)

## Configuring Per-Packet Load Balancing

By default, when there are multiple equal-cost paths to the same destination for the active route, Junos OS chooses one of the next-hop addresses to install into the forwarding table in a random fashion. Whenever the set of next hops for a destination changes in any way, the next-hop address is chosen again, also in a random fashion.

You can configure Junos OS so that, for the active route, all next-hop addresses for a destination are installed in the forwarding table. This is called per-packet load balancing. You can use this feature to spread traffic across multiple paths.

On a QFX3500 standalone switch, with static routing configured, whenever a route pointing to an ECMP next-hop changes to a new ECMP next-hop with a different member list but contains the exact member count as before, the location of the retained members in the new member list is the same as in the old member list.

For example, if you have the following configuration on the switch:

```
set routing-options static route 0.0.0.0/0 next-hop 11.8.12.2
set routing-options static route 0.0.0.0/0 next-hop 11.9.12.2
set routing-options static route 0.0.0.0/0 next-hop 11.10.12.2
set routing-options static route 0.0.0.0/0 next-hop 11.11.12.2
set routing-options static route 0.0.0.0/0 next-hop 11.12.12.2
set routing-options static route 0.0.0.0/0 next-hop 11.13.12.2
set routing-options static route 0.0.0.0/0 next-hop 11.14.12.2
set routing-options static route 0.0.0.0/0 next-hop 11.15.12.2
```

and want to change the first and eighth route to point to another location, you can issue the following commands:

```
delete routing-options static route 0.0.0.0/0 next-hop 11.8.12.2
delete routing-options static route 0.0.0.0/0 next-hop 11.15.12.2
set routing-options static route 0.0.0.0/0 next-hop 11.16.12.2
set routing-options static route 0.0.0.0/0 next-hop 11.17.12.2
```

This configuration does not affect the second next-hop through the seventh next-hop.

When per-packet load balancing is configured, traffic is divided into individual flows (up to a maximum of 16). Packets for an individual flow are sent out a single interface. To determine flows, the switch examines each of the following packet fields:

- Source IP address
- Destination IP address
- Protocol
- Source port number
- Destination port number
- Source interface index
- Type of service (ToS)

The switch recognizes packets in which all of these parameters are identical and ensures that these packets are sent out through the same interface. This prevents problems that might otherwise occur with packets arriving at their destination out of their original sequence.

**NOTE:** Load balancing is not supported on management interfaces.

The following steps show how to configure per-packet load balancing:

1. Define a load-balancing routing policy by including one or more **policy-statement** statements at the **[edit policy-options]** hierarchy level, defining an action of **load-balance per-packet**:

```
policy-statement policy-name {
```

```
from {  
    match-conditions;  
    route-filter destination-prefix match-type <actions>;  
    prefix-list name;  
}  
then {  
    load-balance per-packet;  
}  
}
```

2. Apply the policy to routes exported from the routing table to the forwarding table. To do this, include the **forwarding-table** and **export** statements:

```
forwarding-table {  
    export policy-name;  
}
```

When you enable per-packet load balancing on a QFabric system, packets might be switched across the fabric even though there is a local port with a same-cost route to the destination. For example, if per-packet load balancing is enabled and a packet arrives at network Node device A, it might be switched to network Node device B and forwarded from there even if there is a same-cost route through a port on Node device A to the destination. In this case, traffic transits the fabric needlessly. You can configure a QFabric system to choose a locally switched route if one is available. To enable this feature, include the **ecmp-do-local-lookup** statement at the **[edit forwarding-options]** hierarchy level.

## Configuring Distributed Periodic Packet Management

Periodic packet management (PPM) is responsible for processing a variety of time-sensitive periodic tasks so that other processes can more optimally direct their resources.

The responsibility for PPM processing on the switch is distributed between the Routing Engine and the access interfaces for all protocols that use PPM by default. This distributed model provides a faster response time for protocols that use PPM than the response time provided by the nondistributed model.

If distributed PPM is disabled, the PPM process runs on the Routing Engine only.

You can disable distributed PPM for all protocols that use PPM. You can also disable distributed PPM for Link Aggregation Control Protocol (LACP) packets only.

**BEST PRACTICE:** We generally recommend that you disable distributed PPM only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.

This topic describes:

- [Disabling or Enabling Distributed Periodic Packet Management Globally on page 2907](#)
- [Disabling or Enabling Distributed Periodic Packet Management for LACP Packets on page 2907](#)

### Disabling or Enabling Distributed Periodic Packet Management Globally

Distributed PPM is enabled by default. Disable distributed PPM if you need to move all PPM processing to the Routing Engine. Enable distributed PPM if it was previously disabled and you need to run distributed PPM.

To disable distributed PPM:

```
[edit routing-options]
user@switch# set ppm no-delegate-processing
```

To enable distributed PPM if it was previously disabled:

```
[edit routing-options]
user@switch# delete ppm no-delegate-processing
```

### Disabling or Enabling Distributed Periodic Packet Management for LACP Packets

Distributed PPM is enabled by default. Disable distributed PPM for only LACP packets if you need to move all PPM processing for LACP packets to the Routing Engine.

To disable distributed PPM for LACP packets:

```
[edit protocols]
user@switch# set lacp ppm centralized
```

To enable distributed PPM for LACP packets if it was previously disabled:

```
[edit protocols]
user@switch# delete lacp ppm centralized
```

## Configuring Virtual Router Routing Instances

Use virtual router routing instances to divide a QFX Series switch into multiple independent virtual routers, each with its own routing table. Virtual router routing instances enable you to isolate traffic without using multiple devices to segment your network. You can create routing instances for unicast routing protocols and PIM sparse mode.

To configure virtual router routing instances:

1. Create a routing instance:

```
[edit routing-instances]user@switch# set routing-instance-name instance-type virtual-router
```

**NOTE:** The default routing instance, master, refers to the main inet.0 routing table. The master routing instance is reserved and cannot be specified as a routing instance.

2. Bind each routing instance to the corresponding interfaces:

```
[edit routing-instances]user@switch# set routing-instance-name interface
device-name:type-fpc/pic/port.logical-unit-number
```

**NOTE:**

- You must bind routing instances to interfaces from the Node devices assigned to the network Node group only. If you try to bind routing instances to interfaces from the Node devices assigned to server Node groups, the configuration does not commit.
- You can bind an interface to one routing instance only.

3. Create each of the logical interfaces bound to each routing instance:

```
[edit interfaces]user@switch# set device-name:type-fpc/pic/port unit logical-unit-number
family inet address ip-address
```

**NOTE:** Do not create a logical interface using the family ethernet-switching option in this step. Binding an interface using the family ethernet-switching option to a routing instance can cause the interface to shut down.

4. (Optional) Configure routing protocols for the routing instance at the `[edit routing-instances routing-instance-name protocols]` hierarchy level.
5. (Optional) Configure routing options for the routing instance at the `[edit routing-instances routing-instance-name routing-options]` hierarchy level.

## Configuring the Unified Forwarding Table

To optimize the way your switch allocates memory for different types of addresses, you can choose a unified forwarding table profile. In addition to choosing this profile, you can also decide how you want memory allocated for longest prefix match (LPM) entries.

- [Configuring an Address-Storage Profile on page 2909](#)
- [Configuring the LPM Allocation on page 2910](#)

### Configuring an Address-Storage Profile

On QFX5100 and EX4600 switches, you can control the allocation of memory available to store the following:

- MAC addresses
- Layer 3 host entries
- Longest prefix match (LPM) table entries

You configure the mix that best meets your needs by choosing the appropriate profile. [Table 109 on page 1698](#) lists the profiles you can choose and the maximum values for the MAC address and host table entries.

**Table 268: Unified Forwarding Table Profiles**

| Profile Name                      | MAC Table | Host Table (unicast and multicast addresses) |              |             |             |             |             |
|-----------------------------------|-----------|--|--------------|-------------|-------------|-------------|-------------|
|                                   |           | IPv4 unicast                                 | IPv6 unicast | IPv4 (*, G) | IPv4 (S, G) | IPv6 (*, G) | IPv6 (S, G) |
| <b>l2-profile-one</b>             | 288K      | 16K  | 8K           | 8K          | 8K          | 4K          | 4K          |
| <b>l2-profile-two</b>             | 224K      | 80K  | 40K          | 40K         | 40K         | 20K         | 20K         |
| <b>l2-profile-three (default)</b> | 160K      | 144K   | 72K          | 72K         | 72K         | 36K         | 36K         |
| <b>l3-profile</b>                 | 96K       | 208K   | 104K         | 104K        | 104K        | 52K         | 52K         |
| <b>lpm-profile*</b>               | 32K       | 16K  | 8K           | 8K          | 8K          | 4K          | 4K          |

Note that if the host table stores the maximum number of entries for any given type, the entire table is full and is unable to accommodate *any* entries of any other type. For example, an IPv6 unicast address occupies twice as much memory as an IPv4 unicast address, and an IPv6 multicast address occupies four times as much memory as an IPv4 unicast address. For more information about valid combinations of table entries see *Understanding the Unified Forwarding Table*.

To configure the profile that you want, enter and commit the following statement:

```
[edit]
user@switch# set chassis forwarding-options profile-name
```

**NOTE:** When you configure and commit a profile, the PFE process restarts and all the data interfaces on the switch go down and come back up.

The settings for **l2-profile-three** are configured by default. That is, if you do not enter a **set forwarding-options chassis profile-name** statement, these settings are configured.

### Configuring the LPM Allocation

---

In addition to choosing a profile, you can further optimize memory allocation for LPM table entries by configuring how many IPv6 prefixes in the range /65 through /127 you want the switch to store. The switch uses LPM entries during address lookup to match addresses to the most-specific (longest) applicable prefix. The procedures for configuring the LPM table are different depending on which version of Junos OS you are using.

- [Configuring the LPM Table With Junos OS 13.2X51-D10 and 13.2X52-D10 on page 2910](#)
- [Configuring the LPM Table With Junos OS 13.2x51-D15 on page 2911](#)

#### **Configuring the LPM Table With Junos OS 13.2X51-D10 and 13.2X52-D10**

With Junos OS 13.2x51-D10 and 13.2X52-D10, the switch allocates memory for 16 IPv6 prefixes in the range /65 through /127 by default. If you want to use more than 16 IPv6 prefixes in this range, you must enter and commit the following statement:

```
user@switch# set chassis forwarding-options profile-name num-65-127-prefix [1-128]
```

Each increment adds support for 16 IPv6 prefixes between /65 and /127, for a maximum of 2048 such prefixes (16 x 128 = 2048). The system supports 16 of these prefixes by default, so to increase the number of supported prefixes, you must enter a value of 2 or greater. For example, if you enter **2**, the system will support 32 IPv6 prefixes in the range /65 through /127.

**NOTE:** When you configure and commit the **num-65-127-prefix** value, all the data interfaces on the switch restart. The management interfaces are unaffected.

The LPM table is shared, and each increment that you add for IPv6 prefixes in the range /65 through /127 reduces the number of table entries that are available for IPv4 prefixes and IPv6 prefixes shorter than /65. Note that IPv6 prefixes /65 and longer consume twice as much memory as shorter IPv6 prefixes and four times as much memory as IPv4 prefixes. So, for example, entering the following statement

```
user@switch# set chassis forwarding-options l2-profile-one num-65-127-prefix 2
```

provides for 16 additional IPv6 prefixes /65 or longer (for a total of 32 such prefixes) and reduces the numbers of other prefixes that can be stored, as indicated:

- 32 fewer IPv6 prefixes shorter than /65 (16 IPv6 prefixes /65 or longer consume the same amount of memory as 32 IPv6 prefixes shorter than /65), or
- 64 fewer IPv4 prefixes (16 IPv6 prefixes /65 or longer consume the same amount of memory as 64 IPv4 prefixes)

Table 110 on page 1700 provides examples of valid combinations that the LPM table can store using the **l2** and **l3** profiles. Once again, each row in the table represents a case in which the table is full and cannot accommodate any more entries.

**Table 269: Example LPM Table Combinations Using l2-and l3 Profiles With Junos OS 13.2X51-D10 and 13.2X52-D10**

| num-65-127-prefix Value | IPv4 Entries | IPv6 Entries (Prefix <= 64) | IPv6 Entries (Prefix >= 65) |
|-------------------------|--------------|-----------------------------|-----------------------------|
| 1 (default)             | 16K-16       | 0K                          | 16                          |
| 1 (default)             | 0K           | 8K-16                       | 16                          |
| 1 (default)             | 8K-16        | 4K                          | 16                          |
| 64                      | 4K           | 4K                          | 1K                          |
| 64                      | 2K           | 5K                          | 1K                          |
| 64                      | 0K           | 6K                          | 1K                          |
| 128                     | 4K           | 2K                          | 2K                          |
| 128                     | 2K           | 3K                          | 2K                          |
| 128                     | 0K           | 4K                          | 2K                          |

**NOTE:** With Junos OS 13.2X51-D10 and 13.2X52-D10, the **lpm-profile** does not support IPv6 prefixes. If you use this version of Junos OS and also use the **lpm-profile**, do not configure the **num-65-127-prefix** statement. That is, leave it at its default value of 1, which allows for as many as 128K IPv4 prefixes (the maximum possible).

#### *Configuring the LPM Table With Junos OS 13.2x51-D15*

With Junos OS 13.2X51-D15, you can configure the memory allocation for the LPM table for the **lpm-profile** profile independently of the other profiles. In addition, Junos OS 13.2x51-D15 offers twice as much storage for IPv6 prefixes /65 through /127 (4K instead of 2K) for the **l2** and **l3** profiles.

- [Configuring the l2 and l3 profiles With Junos OS 13.2x51-D15 on page 2912](#)
- [Configuring The lpm-profile With Junos OS 13.2x51-D15 on page 2912](#)

### Configuring the l2 and l3 profiles With Junos OS 13.2x51-D15

With Junos OS 13.2x51-D15, you can configure the switch to support as many as 4K IPv6 prefixes /65 through /127 if you are using any profile other than the **lpm-profile** profile. To do so, enter and commit the following statement:

```
user@switch# set chassis forwarding-options profile-name num-65-127-prefix [0-4]
```

Each increment adds support for 1K IPv6 prefixes between /65 and /127, for a maximum of 4K such prefixes. The default value is 1, which allocates memory for 1K of IPv6 prefixes in this range. Each increment that you add for IPv6 prefixes in the range /65 through /127 reduces the number of table entries that are available for IPv6 prefixes shorter than /65 and IPv4 prefixes. [Table 111 on page 1701](#) shows the numbers of entries that you can allocate by using the **num-65-127-prefix** statement with Junos OS 13.2X51-D15. Once again, each row represents a case in which the table is full and cannot accommodate any more entries.

**Table 270: LPM Table Combinations for l2 and l3 profiles With Junos OS 13.2X51-D15**

| num-65-127-prefix Value | IPv4 Entries | IPv6 Entries (Prefix <= 64) | IPv6 Entries (Prefix >= 65) |
|-------------------------|--------------|-----------------------------|-----------------------------|
| 0                       | 16K          | 8K                          | 0K                          |
| 1 (default)             | 12K          | 6K                          | 1K                          |
| 2                       | 8K           | 4K                          | 2K                          |
| 3                       | 4K           | 2K                          | 3K                          |
| 4                       | 0K           | 0K                          | 4K                          |

**NOTE:** When you configure the **num-65-127-prefix** value, the PFE process restarts and all the data interfaces on the switch go down and come back up. The management interfaces are unaffected.

### Configuring The lpm-profile With Junos OS 13.2x51-D15

If you use the **lpm-profile** profile with Junos OS 13.2x51-D15, you can control whether the switch allocates any memory for IPv6 prefixes /65 through /127. By default, the switch supports the following with this profile:

- 128K IPv4 prefixes
- 16K IPv6 prefixes (all lengths)

You can disable support for IPv6 prefixes /65 through /127 with the **lpm-profile** profile so that there is more memory for IPv6 prefixes shorter than /65. To do so, enter and commit the following statement:

```
user@switch# set chassis forwarding-options profile-name prefix-65-127-disable
```

If you enter this statement, the switch allocates memory for the following:

- 128K IPv4 and IPv6 prefixes shorter than /65
- 0K IPv6 prefixes /65 through /127

For example, if you use the **prefix-65-127-disable** statement, each of the following combinations are valid:

- 100K IPv4 and 28K IPv6 /64 prefixes
- 64K IPv4 and 64K IPv6 /64 prefixes
- 128K IPv4 and 0K IPv6 /64 prefixes
- 0K IPv4 and 128K IPv6 /64 prefixes

## Configuration Examples

- [Examples: Configuring Per-Packet Load Balancing on page 2913](#)
- [Examples: Configuring BFD for Static Routes on page 2914](#)
- [Example: Configuring BFD Authentication for Static Routes on page 2929](#)

### Examples: Configuring Per-Packet Load Balancing

Perform per-packet load balancing for all routes:

```
[edit]
policy-options {
  policy-statement load-balancing-policy {
    then {
      load-balance per-packet;
    }
  }
}
routing-options {
  forwarding-table {
    export load-balancing-policy;
  }
}
```

Perform per-packet load balancing for a limited set of routes:

```
[edit]
policy-options {
  policy-statement load-balancing-policy {
    from {
      route-filter 192.168.10/24 orlonger;
      route-filter 9.114/16 orlonger;
    }
    then {
      load-balance per-packet;
    }
  }
}
```

```
}
routing-options {
  forwarding-table {
    export load-balancing-policy;
  }
}
```

- [Understanding BFD for Static Routes on page 2914](#)
- [Example: Configuring BFD for Static Routes on page 2918](#)
- [Example: Enabling BFD on Qualified Next Hops in Static Routes on page 2923](#)

### Understanding BFD for Static Routes

---

The Bidirectional Forwarding Detection (BFD) protocol is a simple hello mechanism that detects failures in a network. BFD works with a wide variety of network environments and topologies. A pair of routing devices exchanges BFD packets. Hello packets are sent at a specified, regular interval. A neighbor failure is detected when the routing device stops receiving a reply after a specified interval. The BFD failure detection timers have shorter time limits than the static route failure detection mechanisms, so they provide faster detection.

The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the **clear bfd adaptation** command to return BFD interval timers to their configured values. The **clear bfd adaptation** command is hitless, meaning that the command does not affect traffic flow on the routing device.

By default, BFD is supported on single-hop static routes. In Junos OS Release 8.2 and later, BFD also supports multihop static routes.

To enable failure detection, include the **bfd-liveness-detection** statement in the static route configuration.

In Junos OS Release 9.1 and later, the BFD protocol is supported for IPv6 static routes. Global unicast and link-local IPv6 addresses are supported for static routes. The BFD protocol is not supported on multicast or anycast IPv6 addresses. For IPv6, the BFD protocol supports only static routes and only in Junos OS Release 9.3 and later. IPv6 for BFD is not supported for any other protocol.

To configure the BFD protocol for IPv6 static routes, include the **bfd-liveness-detection** statement at the **[edit routing-options rib inet6.0 static route destination-prefix]** hierarchy level.

In Junos OS Release 8.5 and later, you can configure a hold-down interval to specify how long the BFD session must remain up before a state change notification is sent.

To specify the hold-down interval, include the **holddown-interval** statement in the BFD configuration.

You can configure a number in the range from 0 through 255,000 milliseconds. The default is 0. If the BFD session goes down and then comes back up during the hold-down interval, the timer is restarted.

**NOTE:** If a single BFD session includes multiple static routes, the hold-down interval with the highest value is used.

To specify the minimum transmit and receive intervals for failure detection, include the **minimum-interval** statement in the BFD configuration.

This value represents both the minimum interval after which the local routing device transmits hello packets and the minimum interval after which the routing device expects to receive a reply from the neighbor with which it has established a BFD session. You can configure a number in the range from 1 through 255,000 milliseconds. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the **transmit-interval**, **minimum-interval**, and **minimum-receive-interval** statements.

**NOTE:** BFD is an intensive protocol that consumes system resources. Specifying a minimum interval for BFD of less than 100 ms for Routing Engine-based sessions and 10 ms for distributed BFD sessions can cause undesired BFD flapping.

Depending on your network environment, these additional recommendations might apply:

- For large-scale network deployments with a large number of BFD sessions, specify a minimum interval of 300 ms for Routing Engine-based sessions and 100 ms for distributed BFD sessions.
- For very large-scale network deployments with a large number of BFD sessions, contact Juniper Networks customer support for more information.
- For BFD sessions to remain up during a Routing Engine switchover event when nonstop active routing (NSR) is configured, specify a minimum interval of 2500 ms for Routing Engine-based sessions. For distributed BFD sessions with NSR configured, the minimum interval recommendations are unchanged and depend only on your network deployment.

**NOTE:** SRX Series devices do not support distributed BFD.

To specify the minimum receive interval for failure detection, include the **minimum-receive-interval** statement in the BFD configuration. This value represents the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a number in the range from 1 through 255,000 milliseconds. Optionally, instead of using this statement, you can configure the minimum receive interval using the **minimum-interval** statement at the **[edit routing-options static route destination-prefix bfd-liveness-detection]** hierarchy level.

To specify the number of hello packets not received by the neighbor that causes the originating interface to be declared down, include the **multiplier** statement in the BFD configuration.

The default value is 3. You can configure a number in the range from 1 through 255.

To specify a threshold for detecting the adaptation of the detection time, include the **threshold** statement in the BFD configuration.

When the BFD session detection time adapts to a value equal to or higher than the threshold, a single trap and a system log message are sent. The detection time is based on the multiplier of the **minimum-interval** or the **minimum-receive-interval** value. The threshold must be a higher value than the multiplier for either of these configured values. For example if the **minimum-receive-interval** is 300 ms and the **multiplier** is 3, the total detection time is 900 ms. Therefore, the detection time threshold must have a value higher than 900.

To specify the minimum transmit interval for failure detection, include the **transmit-interval** **minimum-interval** statement in the BFD configuration.

This value represents the minimum interval after which the local routing device transmits hello packets to the neighbor with which it has established a BFD session. You can configure a value in the range from 1 through 255,000 milliseconds. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement at the **[edit routing-options static route destination-prefix bfd-liveness-detection]** hierarchy level.

To specify the threshold for the adaptation of the transmit interval, include the **transmit-interval threshold** statement in the BFD configuration.

The threshold value must be greater than the transmit interval. When the BFD session transmit time adapts to a value greater than the threshold, a single trap and a system log message are sent. The detection time is based on the multiplier of the value for the **minimum-interval** or the **minimum-receive-interval** statement at the **[edit routing-options static route destination-prefix bfd-liveness-detection]** hierarchy level. The threshold must be a higher value than the multiplier for either of these configured values.

To specify the BFD version, include the **version** statement in the BFD configuration. The default is to have the version detected automatically.

To include an IP address for the next hop of the BFD session, include the **neighbor** statement in the BFD configuration.

**NOTE:** You must configure the **neighbor** statement if the next hop specified is an interface name. If you specify an IP address as the next hop, that address is used as the neighbor address for the BFD session.

In Junos OS Release 9.0 and later, you can configure BFD sessions not to adapt to changing network conditions.

To disable BFD adaptation, include the **no-adaptation** statement in the BFD configuration.

**NOTE:** We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation in your network.

**NOTE:** If BFD is configured only on one end of a static route, the route is removed from the routing table. BFD establishes a session when BFD is configured on both ends of the static route.

BFD is not supported on ISO address families in static routes. BFD does support IS-IS.

If you configure graceful Routing Engine switchover (GRES) at the same time as BFD, GRES does not preserve the BFD state information during a failover.

Junos OS also supports BFD over multihop static routes. For example, you can configure BFD over a Layer 3 path to provide path integrity over that path. You can limit the number of hops by specifying the time to live (TTL).

To configure BFD over multihop static routes, include the following statements:

```
static route destination-prefix {
  bfd-liveness-detection {
    local-address ip-address;
    minimum-receive-ttl number;
  }
}
```

To specify the source address for the multihop static route and to enable multihop BFD support, include the **local-address** statement.

To specify the number of hops, include the **minimum-receive-ttl** statement. You must configure this statement for a multihop BFD session. You can configure a value in the range from 1 through 255. It is optional for a single-hop BFD session. If you configure the **minimum-receive-ttl** statement for a single-hop session, the value must be 255.

On M Series and T Series platforms only, starting in Junos OS Release 12.3, multihop BFD runs on the CPU in the FPC, DPC, or MPC. This is referred to as *distributed BFD*. Previously, multihop BFD ran from the Routing Engine.

### Example: Configuring BFD for Static Routes

---

This example shows how to configure Bidirectional Forwarding Detection (BFD) for static routes.

- [Requirements on page 2918](#)
- [Overview on page 2918](#)
- [Configuration on page 2919](#)
- [Verification on page 2922](#)

#### **Requirements**

In this example, no special configuration beyond device initialization is required.

#### **Overview**

There are many practical applications for static routes. Static routing is often used at the network edge to support attachment to stub networks, which, given their single point of entry and egress, are well suited to the simplicity of a static route. In Junos OS, static routes have a global preference of 5. Static routes are activated if the specified next hop is reachable.

In this example, you configure the static route 192.168.47.0/24 from the provider network to the customer network, using the next-hop address of 172.16.1.2. You also configure a static default route of 0.0.0.0/0 from the customer network to the provider network, using a next-hop address of 172.16.1.1.

For demonstration purposes, some loopback interfaces are configured on Device B and Device D. These loopback interfaces provide addresses to ping and thus verify that the static routes are working.

[Figure 56 on page 2919](#) shows the sample network.

Figure 56: Customer Routes Connected to a Service Provider

**Configuration**

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device B**

```

set interfaces ge-1/2/0 unit 0 description B->D
set interfaces ge-1/2/0 unit 0 family inet address 172.16.1.1/24
set interfaces lo0 unit 57 family inet address 10.0.0.1/32
set interfaces lo0 unit 57 family inet address 10.0.0.2/32
set routing-options static route 192.168.47.0/24 next-hop 172.16.1.2
set routing-options static route 192.168.47.0/24 bfd-liveness-detection minimum-interval 1000
set protocols bfd traceoptions file bfd-trace
set protocols bfd traceoptions flag all

```

**Device D**

```

set interfaces ge-1/2/0 unit 1 description D->B
set interfaces ge-1/2/0 unit 1 family inet address 172.16.1.2/24
set interfaces lo0 unit 2 family inet address 192.168.47.5/32
set interfaces lo0 unit 2 family inet address 192.168.47.6/32
set routing-options static route 0.0.0.0/0 next-hop 172.16.1.1
set routing-options static route 0.0.0.0/0 bfd-liveness-detection minimum-interval 1000
set protocols bfd traceoptions file bfd-trace
set protocols bfd traceoptions flag all

```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure BFD for static routes:

1. On Device B, configure the interfaces.

```
[edit interfaces]
```

```
user@B# set ge-1/2/0 unit 0 description B->D
```

```
user@B# set ge-1/2/0 unit 0 family inet address 172.16.1.1/24
```

```
user@B# set lo0 unit 57 family inet address 10.0.0.1/32
```

```
user@B# set lo0 unit 57 family inet address 10.0.0.2/32
```

2. On Device B, create a static route and set the next-hop address.

```
[edit routing-options]
```

```
user@B# set static route 192.168.47.0/24 next-hop 172.16.1.2
```

3. On Device B, configure BFD for the static route.

```
[edit routing-options]
```

```
user@B# set static route 192.168.47.0/24 bfd-liveness-detection minimum-interval  
1000
```

4. On Device B, configure tracing operations for BFD.

```
[edit protocols]
```

```
user@B# set bfd traceoptions file bfd-trace
```

```
user@B# set bfd traceoptions flag all
```

5. If you are done configuring Device B, commit the configuration.

```
[edit]
```

```
user@B# commit
```

6. On Device D, configure the interfaces.

```
[edit interfaces]
```

```
user@D# set ge-1/2/0 unit 1 description D->B
```

```
user@D# set ge-1/2/0 unit 1 family inet address 172.16.1.2/24
```

```
user@D# set lo0 unit 2 family inet address 192.168.47.5/32
```

```
user@D# set lo0 unit 2 family inet address 192.168.47.6/32
```

7. On Device D, create a static route and set the next-hop address.

```
[edit routing-options]
```

```
user@D# set static route 0.0.0.0/0 next-hop 172.16.1.1
```

8. On Device D, configure BFD for the static route.

```
[edit routing-options]
```

```
user@D# set static route 0.0.0.0/0 bfd-liveness-detection minimum-interval 1000
```

9. On Device D, configure tracing operations for BFD.

```
[edit protocols]
```

```
user@D# set bfd traceoptions file bfd-trace
```

```
user@D# set bfd traceoptions flag all
```

10. If you are done configuring Device D, commit the configuration.

```
[edit]
```

```
user@D# commit
```

## Results

Confirm your configuration by issuing the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

Device B  user@B# show interfaces
          ge-1/2/0 {
            unit 0 {
              description B->D;
              family inet {
                address 172.16.1.1/24;
              }
            }
          }
          lo0 {
            unit 57 {
              family inet {
                address 10.0.0.1/32;
                address 10.0.0.2/32;
              }
            }
          }

          user@D# show protocols
          bfd {
            traceoptions {
              file bfd-trace;
              flag all;
            }
          }

          user@B# show routing-options
          static {
            route 192.168.47.0/24 {
              next-hop 172.16.1.2;
              bfd-liveness-detection {
                minimum-interval 1000;
              }
            }
          }

Device D  user@D# show interfaces
          ge-1/2/0 {
            unit 1 {
              description D->B;
              family inet {
                address 172.16.1.2/24;
              }
            }
          }
          lo0 {
            unit 2 {
              family inet {
                address 192.168.47.5/32;
                address 192.168.47.6/32;
              }
            }
          }

          user@D# show routing-options
          static {

```

```

route 0.0.0.0/0 {
  next-hop 172.16.1.1;
  bfd-liveness-detection {
    minimum-interval 1000;
  }
}

```

### Verification

Confirm that the configuration is working properly.

- [Verifying That BFD Sessions Are Up on page 2922](#)
- [Viewing Detailed BFD Events on page 2923](#)

### Verifying That BFD Sessions Are Up

**Purpose** Verify that the BFD sessions are up, and view details about the BFD sessions.

**Action** From operational mode, enter the **show bfd session extensive** command.

```
user@B> show bfd session extensive
```

| Address    | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2 | Up    | lt-1/2/0.0 | 3.000       | 1.000             | 3          |

Client Static, TX interval 1.000, RX interval 1.000  
 Session up time 00:14:30  
 Local diagnostic None, remote diagnostic None  
 Remote state Up, version 1  
 Replicated, routing table index 172  
 Min async interval 1.000, min slow interval 1.000  
 Adaptive async TX interval 1.000, RX interval 1.000  
 Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3  
 Remote min TX interval 1.000, min RX interval 1.000, multiplier 3  
 Local discriminator 2, remote discriminator 1  
 Echo mode disabled/inactive

1 sessions, 1 clients

Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps

```
user@D> show bfd session extensive
```

| Address    | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.1 | Up    | lt-1/2/0.1 | 3.000       | 1.000             | 3          |

Client Static, TX interval 1.000, RX interval 1.000  
 Session up time 00:14:35  
 Local diagnostic None, remote diagnostic None  
 Remote state Up, version 1  
 Replicated, routing table index 170  
 Min async interval 1.000, min slow interval 1.000  
 Adaptive async TX interval 1.000, RX interval 1.000  
 Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3  
 Remote min TX interval 1.000, min RX interval 1.000, multiplier 3  
 Local discriminator 1, remote discriminator 2  
 Echo mode disabled/inactive

1 sessions, 1 clients

Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps

**Meaning** The TX interval 1.000, RX interval 1.000 output represents the setting configured with the **minimum-interval** statement. All of the other output represents the default settings for BFD. To modify the default settings, include the optional statements under the **bfd-liveness-detection** statement.

#### *Viewing Detailed BFD Events*

**Purpose** View the contents of the BFD trace file to assist in troubleshooting, if needed.

**Action** From operational mode, enter the **file show /var/log/bfd-trace** command.

```
user@B> file show /var/log/bfd-trace
Nov 23 14:26:55 Data (9) len 35: (hex) 42 46 44 20 70 65 72 69 6f 64 69 63 20

78 6d 69 74 20 74
```

**Meaning** BFD messages are being written to the trace file.

#### Example: Enabling BFD on Qualified Next Hops in Static Routes

This example shows how to configure a static route with multiple possible next hops. Each next hop has Bidirectional Forwarding Detection (BFD) enabled.

- [Requirements on page 2923](#)
- [Overview on page 2923](#)
- [Configuration on page 2924](#)
- [Verification on page 2927](#)

#### **Requirements**

In this example, no special configuration beyond device initialization is required.

#### **Overview**

In this example, Device B has the static route **192.168.47.0/24** with two possible next hops. The two next hops are defined using two **qualified-next-hop** statements. Each next hop has BFD enabled.

BFD is also enabled on Device D because BFD must be enabled on both ends of the connection.

A next hop is included in the routing table if the BFD session is up. The next hop is removed from the routing table if the BFD session is down.

See [Figure 57 on page 2924](#).

**Figure 57: BFD Enabled on Qualified Next Hops**

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

Device B
set interfaces fe-0/1/0 unit 2 description secondary-B->D
set interfaces fe-0/1/0 unit 2 family inet address 192.168.2.1/24
set interfaces ge-1/2/0 unit 0 description B->D
set interfaces ge-1/2/0 unit 0 family inet address 172.16.1.1/24
set routing-options static route 192.168.47.0/24 qualified-next-hop 192.168.2.2
  bfd-liveness-detection minimum-interval 60
set routing-options static route 192.168.47.0/24 qualified-next-hop 172.16.1.2
  bfd-liveness-detection minimum-interval 60

Device D
set interfaces fe-0/1/0 unit 3 description secondary-D->B
set interfaces fe-0/1/0 unit 3 family inet address 192.168.2.2/24
set interfaces ge-1/2/0 unit 1 description D->B
set interfaces ge-1/2/0 unit 1 family inet address 172.16.1.2/24
set routing-options static route 0.0.0.0/0 qualified-next-hop 192.168.2.1
set routing-options static route 0.0.0.0/0 qualified-next-hop 172.16.1.1
set routing-options static route 0.0.0.0/0 bfd-liveness-detection minimum-interval 60
  
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a static route with two possible next hops, both with BFD enabled:

1. On Device B, configure the interfaces.

```
[edit interfaces fe-0/1/0]
user@B# set unit 2 description secondary-B->D
user@B# set unit 2 family inet address 192.168.2.1/24
```

```
[edit interfaces ge-1/2/0]
user@B# set unit 0 description B->D
user@B# set unit 0 family inet address 172.16.1.1/24
```

2. On Device B, configure the static route with two next hops, both with BFD enabled.

```
[edit routing-options static route 192.168.47.0/24]
user@B# set qualified-next-hop 192.168.2.2 bfd-liveness-detection minimum-interval
60
user@B# set qualified-next-hop 172.16.1.2 bfd-liveness-detection minimum-interval
60
```

3. On Device D, configure the interfaces.

```
[edit interfaces fe-0/1/0]
user@D# set unit 3 description secondary-D->B
user@D# set unit 3 family inet address 192.168.2.2/24
```

```
[edit interfaces ge-1/2/0]
user@D# set unit 1 description D->B
user@D# set unit 1 family inet address 172.16.1.2/24
```

4. On Device D, configure a BFD-enabled default static route with two next hops to the provider network.

In this case, BFD is enabled on the route, not on the next hops.

```
[edit routing-options static route 0.0.0.0/0]
user@D# set qualified-next-hop 192.168.2.1
user@D# set qualified-next-hop 172.16.1.1
user@D# set bfd-liveness-detection minimum-interval 60
```

**Results** Confirm your configuration by issuing the **show interfaces** and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@B# show interfaces
fe-0/1/0 {
  unit 2 {
    description secondary-B->D;
    family inet {
      address 192.168.2.1/24;
    }
  }
}
```

```
ge-1/2/0 {
  unit 0 {
    description B->D;
    family inet {
      address 172.16.1.1/24;
    }
  }
}

user@B# show routing-options
static {
  route 192.168.47.0/24 {
    qualified-next-hop 192.168.2.2 {
      bfd-liveness-detection {
        minimum-interval 60;
      }
    }
    qualified-next-hop 172.16.1.2 {
      bfd-liveness-detection {
        minimum-interval 60;
      }
    }
  }
}

user@D# show interfaces
fe-0/1/0 {
  unit 3 {
    description secondary-D->B;
    family inet {
      address 192.168.2.2/24;
    }
  }
}
ge-1/2/0 {
  unit 1 {
    description D->B;
    family inet {
      address 172.16.1.2/24;
    }
  }
}

user@D# show routing-options
static {
  route 0.0.0.0/0 {
    qualified-next-hop 192.168.2.1;
    qualified-next-hop 172.16.1.1;
    bfd-liveness-detection {
      minimum-interval 60;
    }
  }
}
```

If you are done configuring the devices, enter **commit** from configuration mode.

**Verification**

Confirm that the configuration is working properly.

- [Checking the Routing Tables on page 2927](#)
- [Verifying the BFD Sessions on page 2927](#)
- [Removing BFD from Device D on page 2927](#)
- [Removing BFD from One Next Hop on page 2928](#)

**Checking the Routing Tables**

**Purpose** Make sure that the static route appears in the routing table on Device B with two possible next hops.

**Action** user@B> show route 192.168.47.0 extensive  
 inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)  
 192.168.47.0/24 (1 entry, 1 announced)  
 TSI:  
 KRT in-kernel 192.168.47.0/24 -> {192.168.2.2}  
     \*Static Preference: 5  
         Next hop type: Router  
         Address: 0x9334010  
         Next-hop reference count: 1  
         Next hop: 172.16.1.2 via ge-1/2/0.0  
         Next hop: 192.168.2.2 via fe-0/1/0.2, selected  
         State: <Active Int Ext>  
         Age: 9  
         Task: RT  
         Announcement bits (1): 3-KRT  
         AS path: I

**Meaning** Both next hops are listed. The next hop 192.168.2.2 is the selected route.

**Verifying the BFD Sessions**

**Purpose** Make sure that the BFD sessions are up.

**Action** user@B> show bfd session

| Address     | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|-------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2  | Up    | ge-1/2/0.0 | 0.720       | 0.240             | 3          |
| 192.168.2.2 | Up    | fe-0/1/0.2 | 0.720       | 0.240             | 3          |

2 sessions, 2 clients  
 Cumulative transmit rate 8.3 pps, cumulative receive rate 8.3 pps

**Meaning** The output shows that the BFD sessions are up.

**Removing BFD from Device D**

**Purpose** Demonstrate what happens when the BFD session is down for both next hops.

- Action** 1. Deactivate BFD on Device D.

```
[edit routing-options static route 0.0.0.0/0]
user@D# deactivate bfd-liveness-detection
user@D# commit
```

2. Rerun the **show bfd session** command on Device B.

```
user@B> show bfd session
```

| Address     | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|-------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2  | Down  | ge-1/2/0.0 | 3.000       | 1.000             | 3          |
| 192.168.2.2 | Down  | fe-0/1/0.2 | 3.000       | 1.000             | 3          |

```
2 sessions, 2 clients
```

```
Cumulative transmit rate 2.0 pps, cumulative receive rate 2.0 pps
```

3. Rerun the **show route 192.168.47.0** command on Device B.

```
user@B> show route 192.168.47.0
```

**Meaning** As expected, when the BFD sessions are down, the static route is removed from the routing table.

### *Removing BFD from One Next Hop*

**Purpose** Demonstrate what happens when only one next hop has BFD enabled.

- Action** 1. If it is not already deactivated, deactivate BFD on Device D.

```
[edit routing-options static route 0.0.0.0/0]
user@D# deactivate bfd-liveness-detection
user@D# commit
```

2. Deactivate BFD on one of the next hops on Device B.

```
[edit routing-options static route 192.168.47.0/24 qualified-next-hop 172.16.1.2]
user@B# deactivate bfd-liveness-detection
user@B# commit
```

3. Rerun the **show bfd session** command on Device B.

```
user@B> show bfd session
```

| Address     | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|-------------|-------|------------|-------------|-------------------|------------|
| 192.168.2.2 | Down  | fe-0/1/0.2 | 3.000       | 1.000             | 3          |

4. Rerun the **show route 192.168.47.0 extensive** command on Device B.

```
user@B> show route 192.168.47.0 extensive
```

```
inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
```

```
192.168.47.0/24 (1 entry, 1 announced)
```

```
TSI:
```

```
KRT in-kernel 192.168.47.0/24 -> {172.16.1.2}
```

```
*Static Preference: 5
```

```
Next hop type: Router, Next hop index: 624
```

```
Address: 0x92f0178
```

```
Next-hop reference count: 3
```

```

Next hop: 172.16.1.2 via ge-1/2/0.0, selected
State: <Active Int Ext>
Age: 2:36
Task: RT
Announcement bits (1): 3-KRT
AS path: I

```

**Meaning** As expected, the BFD session is down for the 192.168.2.2 next hop. The 172.16.1.2 next hop remains in the routing table, and the route remains active, because BFD is not a condition for this next hop to remain valid.

## Example: Configuring BFD Authentication for Static Routes

- [Understanding BFD Authentication for Static Routes on page 2929](#)
- [Example: Configuring BFD Authentication for Static Routes on page 2931](#)

### Understanding BFD Authentication for Static Routes

Bidirectional Forwarding Detection (BFD) enables rapid detection of communication failures between adjacent systems. By default, authentication for BFD sessions is disabled. However, when you run BFD over Network Layer protocols, the risk of service attacks can be significant.

**NOTE:** We strongly recommend using authentication if you are running BFD over multiple hops or through insecure tunnels.

Beginning with Junos OS Release 9.6, Junos OS supports authentication for BFD sessions running over IPv4 and IPv6 static routes. BFD authentication is not supported on MPLS OAM sessions. BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

You authenticate BFD sessions by specifying an authentication algorithm and keychain, and then associating that configuration information with a security authentication keychain using the keychain name.

The following sections describe the supported authentication algorithms, security keychains, and level of authentication that can be configured:

- [BFD Authentication Algorithms on page 2930](#)
- [Security Authentication Keychains on page 2930](#)
- [Strict Versus Loose Authentication on page 2931](#)

### ***BFD Authentication Algorithms***

Junos OS supports the following algorithms for BFD authentication:

- **simple-password**—Plain-text password. One to 16 bytes of plain text are used to authenticate the BFD session. One or more passwords can be configured. This method is the least secure and should be used only when BFD sessions are not subject to packet interception.
- **keyed-md5**—Keyed Message Digest 5 hash algorithm for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed MD5 uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than or equal to the last sequence number received. Although more secure than a simple password, this method is vulnerable to replay attacks. Increasing the rate at which the sequence number is updated can reduce this risk.
- **meticulous-keyed-md5**—Meticulous keyed Message Digest 5 hash algorithm. This method works in the same manner as keyed MD5, but the sequence number is updated with every packet. Although more secure than keyed MD5 and simple passwords, this method might take additional time to authenticate the session.
- **keyed-sha-1**—Keyed Secure Hash Algorithm I for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed SHA uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. The key is not carried within the packets. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than the last sequence number received.
- **meticulous-keyed-sha-1**—Meticulous keyed Secure Hash Algorithm I. This method works in the same manner as keyed SHA, but the sequence number is updated with every packet. Although more secure than keyed SHA and simple passwords, this method might take additional time to authenticate the session.

**NOTE:** Nonstop active routing (NSR) is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

---

### ***Security Authentication Keychains***

The security authentication keychain defines the authentication attributes used for authentication key updates. When the security authentication keychain is configured and

associated with a protocol through the keychain name, authentication key updates can occur without interrupting routing and signaling protocols.

The authentication keychain contains one or more keychains. Each keychain contains one or more keys. Each key holds the secret data and the time at which the key becomes valid. The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

BFD allows multiple clients per session, and each client can have its own keychain and algorithm defined. To avoid confusion, we recommend specifying only one security authentication keychain.

### ***Strict Versus Loose Authentication***

By default, strict authentication is enabled, and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure *loose checking*. When loose checking is configured, packets are accepted without authentication being checked at each end of the session. This feature is intended for transitional periods only.

### **Example: Configuring BFD Authentication for Static Routes**

---

This example shows how to configure Bidirectional Forwarding Detection (BFD) authentication for static routes.

- [Requirements on page 2931](#)
- [Overview on page 2931](#)
- [Configuration on page 2932](#)
- [Verification on page 2935](#)

#### ***Requirements***

Junos OS Release 9.6 or later (Canda and United States version).

BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

#### ***Overview***

You can configure authentication for BFD sessions running over IPv4 and IPv6 static routes. Routing instances and logical systems are also supported.

The following steps are needed to configure authentication on a BFD session:

1. Specify the BFD authentication algorithm for the static route.
2. Associate the authentication keychain with the static route.
3. Configure the related security authentication keychain. This must be configured on the main router.

**TIP:** We recommend that you specify loose authentication checking if you are transitioning from nonauthenticated sessions to authenticated sessions.

[edit]

```
user@host> set routing-options static route ipv4 bfd-liveness-detection
authentication loose-check
```

Figure 58 on page 2932 shows the sample network.

**Figure 58: Customer Routes Connected to a Service Provider**

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level.

#### Device B

```
set interfaces ge-1/2/0 unit 0 description B->D
set interfaces ge-1/2/0 unit 0 family inet address 172.16.1.1/24
set interfaces lo0 unit 57 family inet address 10.0.0.1/32
set interfaces lo0 unit 57 family inet address 10.0.0.2/32
set routing-options static route 192.168.47.0/24 next-hop 172.16.1.2
set routing-options static route 192.168.47.0/24 bfd-liveness-detection minimum-interval
1000
set routing-options static route 192.168.47.0/24 bfd-liveness-detection authentication
key-chain bfd-kc4
set routing-options static route 192.168.47.0/24 bfd-liveness-detection authentication
algorithm keyed-sha-1
set security authentication-key-chains key-chain bfd-kc4 key 5 secret
"$9$JhZHmn6Ap0In/9ApOcSs24oaZikPft3wY24ZG.mz36AtOIEyMWxSrlKvM-dbs2a
DkP5Ft0IQFcleV7N"
set security authentication-key-chains key-chain bfd-kc4 key 5 start-time
"2011-1-12:00:00 -0800"
```

**Device D**

```

set interfaces ge-1/2/0 unit 1 description D->B
set interfaces ge-1/2/0 unit 1 family inet address 172.16.1.2/24
set interfaces lo0 unit 2 family inet address 192.168.47.5/32
set interfaces lo0 unit 2 family inet address 192.168.47.6/32
set routing-options static route 0.0.0.0/0 next-hop 172.16.1.1
set routing-options static route 0.0.0.0/0 bfd-liveness-detection minimum-interval 1000
set routing-options static route 0.0.0.0/0 bfd-liveness-detection authentication key-chain
  bfd-kc4
set routing-options static route 0.0.0.0/0 bfd-liveness-detection authentication algorithm
  keyed-sha-1
set security authentication-key-chains key-chain bfd-kc4 key 5 secret
  "$9$JhZHmn6Ap0In/9ApOcSs24oaZikPft3wY24ZG.mz36AtOIEyMWxSrlKvM-dbs2a
  DkP5FtOIQFclev7N"
set security authentication-key-chains key-chain bfd-kc4 key 5 start-time
  "2011-1-1.12:00:00 -0800"

```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure BFD for static routes:

1. On Device B, configure the interfaces.

```

[edit interfaces]
user@B# set ge-1/2/0 unit 0 description B->D
user@B# set ge-1/2/0 unit 0 family inet address 172.16.1.1/24

```

```

user@B# set lo0 unit 57 family inet address 10.0.0.1/32
user@B# set lo0 unit 57 family inet address 10.0.0.2/32

```

2. On Device B, create a static route and set the next-hop address.

```

[edit routing-options]
user@B# set static route 192.168.47.0/24 next-hop 172.16.1.2

```

3. On Device B, configure BFD for the static route.

```

[edit routing-options]
user@B# set static route 192.168.47.0/24 bfd-liveness-detection minimum-interval
  1000

```

4. On Device B, specify the algorithm (**keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**, or **simple-password**) to use for BFD authentication on the static route.

```

[edit routing-options]
user@B# set static route 192.168.47.0/24 bfd-liveness-detection authentication
  algorithm keyed-sha-1

```

**NOTE:** Nonstop active routing (NSR) is not supported with the **meticulous-keyed-md5** and **meticulous-keyed-sha-1** authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

5. On Device B, specify the keychain to be used to associate BFD sessions on the specified route with the unique security authentication keychain attributes.

This should match the keychain name configured at the **[edit security authentication key-chains]** hierarchy level.

```
[edit routing-options]
user@B# set static route 192.168.47.0/24 bfd-liveness-detection authentication
key-chain bfd-kc4
```

6. On Device B, specify the unique security authentication information for BFD sessions:

- The matching keychain name as specified in Step 5.
- At least one key, a unique integer between 0 and 63. Creating multiple keys allows multiple clients to use the BFD session.
- The secret data used to allow access to the session.
- The time at which the authentication key becomes active, in the format *yyyy-mm-dd.hh:mm:ss*.

```
[edit security authentication-key-chains key-chain bfd-kc4]
user@B# set key 5 secret
"$9$JhZHmn6Ap0In/9ApOcSs24oaZikPft3wY24ZG.mz36AtOIeyMWxSrlKvM-dbs2a
DkP5Ft0IQFclev7N"
user@B# set key 5 start-time "2011-1-12:00:00 -0800"
```

7. If you are done configuring Device B, commit the configuration.

```
[edit]
user@B# commit
```

8. Repeat the configuration on Device D.

The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

### Results

Confirm your configuration by issuing the **show interfaces**, **show routing-options**, and **show security** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
Device B user@B# show interfaces
ge-1/2/0 {
  unit 0 {
    description B->D;
    family inet {
      address 172.16.1.1/24;
    }
  }
}
lo0 {
  unit 57 {
    family inet {
      address 10.0.0.1/32;
    }
  }
}
```

```

        address 10.0.0.2/32;
    }
}

user@B# show routing-options
static {
    route 192.168.47.0/24 {
        next-hop 172.16.1.2;
        bfd-liveness-detection {
            minimum-interval 1000;
            authentication {
                key-chain bfd-kc4;
                algorithm keyed-sha-1;
            }
        }
    }
}

user@B# show security
authentication-key-chains {
    key-chain bfd-kc4 {
        key 5 {
            secret
            "$9$JhZHmn6Ap0In/9ApOcSs24oaZikPfT3wY24ZG.mz36AtOIEyMWxSrlKvM-dbs2a
            DkP5FtOIQFclev7N"; ## SECRET-DATA
            start-time "2011-1-1.12:00:00 -0800";
        }
    }
}

```

### Verification

Confirm that the configuration is working properly.

- [Verifying That BFD Sessions Are Up on page 2935](#)
- [Viewing Details About the BFD Session on page 2936](#)
- [Viewing Extensive BFD Session Information on page 2936](#)

### Verifying That BFD Sessions Are Up

**Purpose** Verify that the BFD sessions are up.

**Action** From operational mode, enter the **show bfd session** command.

```
user@B> show bfd session
```

| Address    | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2 | Up    | ge-1/2/0.0 | 3.000       | 1.000             | 3          |

1 sessions, 1 clients

Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps

**Meaning** The command output shows that the BFD session is up.

**Viewing Details About the BFD Session**

**Purpose** View details about the BFD sessions and make sure that authentication is configured.

**Action** From operational mode, enter the **show bfd session detail** command.

```
user@B> show bfd session detail
```

| Address    | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2 | Up    | ge-1/2/0.0 | 3.000       | 1.000             | 3          |

Client Static, TX interval 1.000, RX interval 1.000, **Authenticate**  
 Session up time 00:53:58  
 Local diagnostic NbrSignal, remote diagnostic None  
 Remote state Up, version 1  
 Logical system 9, routing table index 22

1 sessions, 1 clients  
 Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps

**Meaning** In the command output, **Authenticate** is displayed to indicate that BFD authentication is configured.

**Viewing Extensive BFD Session Information**

**Purpose** View more detailed information about the BFD sessions.

**Action** From operational mode, enter the **show bfd session extensive** command.

```
user@B> show bfd session extensive
```

| Address    | State | Interface  | Time  | Interval | Multiplier |
|------------|-------|------------|-------|----------|------------|
| 172.16.1.2 | Up    | ge-1/2/0.0 | 3.000 | 1.000    | 3          |

Client Static, TX interval 1.000, RX interval 1.000, **Authenticate**  
 keychain bfd-kc4, algo keyed-sha-1, mode strict  
 Session up time 01:39:45  
 Local diagnostic NbrSignal, remote diagnostic None  
 Remote state Up, version 1  
 Logical system 9, routing table index 22  
 Min async interval 1.000, min slow interval 1.000  
 Adaptive async TX interval 1.000, RX interval 1.000  
 Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3  
 Remote min TX interval 1.000, min RX interval 1.000, multiplier 3  
 Local discriminator 3, remote discriminator 4  
 Echo mode disabled/inactive  
 Authentication enabled/active, keychain bfd-kc4, algo keyed-sha-1, mode strict

1 sessions, 1 clients  
 Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps

**Meaning** In the command output, **Authenticate** is displayed to indicate that BFD authentication is configured. The output for the **extensive** command provides the keychain name, the authentication algorithm, and the mode for each client in the session.

## aggregate (Routing)

|                     |   |
|---------------------|---|
| Syntax              | <pre> aggregate {   defaults {     ... aggregate-options ...   }   route destination-prefix {     policy policy-name;     ... aggregate-options ...   } } </pre>  |
| Hierarchy Level     | <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options <b>rib</b> <i>routing-table-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options <b>rib</b> <i>routing-table-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options <b>rib</b> <i>routing-table-name</i>],</p> <p>[edit routing-options],</p> <p>[edit routing-options <b>rib</b> <i>routing-table-name</i>]</p>  |
| Release Information | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p>  |
| Description         | Configure aggregate routes.   |
| Options             | <p><b>aggregate-options</b>—Additional information about aggregate routes that is included with the route when it is installed in the routing table. Specify zero or more of the following options in <b>aggregate-options</b>. Each option is explained separately.</p> <ul style="list-style-type: none"> <li>• (<b>active</b>   <b>passive</b>);</li> <li>• <b>as-path</b> &lt;<i>as-path</i>&gt; &lt;origin (egp   igp   incomplete)&gt; &lt;atomic-aggregate&gt; &lt;aggregator <i>as-number</i> <i>ip-address</i>&gt;;</li> <li>• (<b>brief</b>   <b>full</b>);</li> <li>• <b>community</b> [ <i>community-ids</i> ];</li> <li>• <b>discard</b>;</li> <li>• (<b>metric</b>   <b>metric2</b>   <b>metric3</b>   <b>metric4</b>) <i>value</i> &lt;type <i>type</i>&gt;;</li> <li>• (<b>preference</b>   <b>preference2</b>   <b>color</b>   <b>color2</b>) <i>preference</i> &lt;type <i>type</i>&gt;;</li> <li>• <b>tag</b> <i>metric type number</i>;</li> </ul> <p><b>defaults</b>—Specify global aggregate route options. These options only set default attributes inherited by all newly created aggregate routes. These are treated as global defaults</p> |

and apply to all the aggregate routes you configure in the **aggregate** statement. This part of the **aggregate** statement is optional.

**route *destination-prefix***—Configure a nondefault aggregate route:

- **default**—For the default route to the destination. This is equivalent to specifying an IP address of **0.0.0.0/0**.
- ***destination-prefix/prefix-length***—***destination-prefix*** is the network portion of the IP address, and ***prefix-length*** is the destination prefix length.

The **policy** statement is explained separately.

## as-path (Routing Options)

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | <code>as-path &lt;as-path&gt; &lt;aggregator as-number ip-address&gt; &lt;atomic-aggregate&gt; &lt;origin (egp   igp   incomplete)&gt;;</code>   |
| <b>Hierarchy Level</b>     | <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options (<b>aggregate</b>   <b>generate</b>   static) (defaults   route)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options rib <i>routing-table-name</i> (<b>aggregate</b>   <b>generate</b>   static) (defaults   route)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options (<b>aggregate</b>   <b>generate</b>   static) (defaults   route)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options rib <i>routing-table-name</i> (<b>aggregate</b>   <b>generate</b>   static) (defaults   route)],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options (<b>aggregate</b>   <b>generate</b>   static) (defaults   route)],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options rib <i>routing-table-name</i> (<b>aggregate</b>   <b>generate</b>   static) (defaults   route)],</p> <p>[edit routing-options (<b>aggregate</b>   <b>generate</b>   static) (defaults   route)],</p> <p>[edit routing-options rib <i>routing-table-name</i> (<b>aggregate</b>   <b>generate</b>   static) (defaults   route)]</p> |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p>   |
| <b>Description</b>         | <p>Associate BGP autonomous system (AS) path information with a static, aggregate, or generated route.</p> <p>In Junos OS Release 9.1 and later, the numeric range for the AS number is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, <i>BGP Support for Four-octet AS Number Space</i>. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of Junos OS support 2-byte AS numbers.</p> <p>In Junos OS Release 9.2 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: <i>&lt;16-bit high-order value in decimal&gt;.&lt;16-bit low-order value in decimal&gt;</i>. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format. You can specify a value in the range from 0.0 through 65535.65535 in AS-dot notation format.</p>  |
| <b>Default</b>             | No AS path information is associated with static routes.   |
| <b>Options</b>             | <p><b>aggregator</b>—(Optional) Attach the BGP <b>aggregator</b> path attribute to the aggregate route. You must specify the last AS number that formed the aggregate route (encoded as two octets) for <i>as-number</i>, followed by the IP address of the BGP system that formed the aggregate route for <i>ip-address</i>.</p>  |

**as-path**—(Optional) AS path to include with the route. It can include a combination of individual AS path numbers and AS sets. Enclose sets in brackets ( [ ] ). The first AS number in the path represents the AS immediately adjacent to the local AS. Each subsequent number represents an AS that is progressively farther from the local AS, heading toward the origin of the path. You cannot specify a regular expression for **as-path**. You must use a complete, valid AS path.

**atomic-aggregate**—(Optional) Attach the BGP **atomic-aggregate** path attribute to the aggregate route. This path attribute indicates that the local system selected a less specific route instead of a more specific route.

**origin egp**—(Optional) BGP origin attribute that indicates that the path information originated in another AS.

**origin igp**—(Optional) BGP origin attribute that indicates that the path information originated within the local AS.

**origin incomplete**—(Optional) BGP origin attribute that indicates that the path information was learned by some other means.

## autonomous-system

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | <pre>autonomous-system <i>autonomous-system</i> &lt;asdot-notation&gt; &lt;loops <i>number</i>&gt; {     independent-domain &lt;no-attrset&gt;; }</pre>   |
| <b>Hierarchy Level</b>     | <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options],</p> <p>[edit routing-options]</p>  |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>asdot-notation</b> option introduced in Junos OS Release 9.3.</p> <p><b>asdot-notation</b> option introduced in Junos OS Release 9.3 for EX Series switches.</p> <p><b>no-attrset</b> option introduced in Junos OS Release 10.4.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p>  |
| <b>Description</b>         | <p>Specify the routing device's AS number.</p> <p>An autonomous system (AS) is a set of routing devices that are under a single technical administration and that generally use a single interior gateway protocol (IGP) and metrics to propagate routing information within the set of routing devices. An AS appears to other ASs to have a single, coherent interior routing plan and presents a consistent picture of what destinations are reachable through it. ASs are identified by a number that is assigned by the Network Information Center (NIC) in the United States (<a href="http://www.isi.edu">http://www.isi.edu</a>).</p> <p>If you are using BGP on the routing device, you must configure an AS number.</p> <p>The AS path attribute is modified when a route is advertised to an EBGP peer. Each time a route is advertised to an EBGP peer, the local routing device prepends its AS number to the existing path attribute, and a value of 1 is added to the AS number.</p> <p>In Junos OS Release 9.1 and later, the numeric range is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, <i>BGP Support for Four-octet AS Number Space</i>. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of Junos OS support 2-byte AS numbers.</p> <p>In Junos OS Release 9.3 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: <i>&lt;16-bit high-order value in decimal&gt;.&lt;16-bit low-order value in decimal&gt;</i>. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.</p> |
| <b>Options</b>             | <p><b><i>autonomous-system</i></b>—AS number. Use a number assigned to you by the NIC.</p>  |

**Range:** 1 through 4,294,967,295 ( $2^{32} - 1$ ) in plain-number format for 4-byte AS numbers

In this example, the 4-byte AS number 65,546 is represented in plain-number format:

```
[edit]
routing-options {
  autonomous-system 65546;
}
```

**Range:** 0.0 through 65535.65535 in AS-dot notation format for 4-byte numbers

In this example, 1.10 is the AS-dot notation format for 65,546:

```
[edit]
routing-options {
  autonomous-system 1.10;
}
```

**Range:** 1 through 65,535 in plain-number format for 2-byte AS numbers (this is a subset of the 4-byte range)

In this example, the 2-byte AS number 60,000 is represented in plain-number format:

```
[edit]
routing-options {
  autonomous-system 60000;
}
```

**asdot-notation**—(Optional) Display the configured 4-byte autonomous system number in the AS-dot notation format.

**Default:** Even if a 4-byte AS number is configured in the AS-dot notation format, the default is to display the AS number in the plain-number format.

**loops number**—(Optional) Specify the number of times detection of the AS number in the AS\_PATH attribute causes the route to be discarded or hidden. For example, if you configure **loops 1**, the route is hidden if the AS number is detected in the path one or more times. This is the default behavior. If you configure **loops 2**, the route is hidden if the AS number is detected in the path two or more times.

**Range:** 1 through 10

**Default:** 1

**NOTE:** When you specify the same AS number in more than one routing instance on the local routing device, you must configure the same number of loops for the AS number in each instance. For example, if you configure a value of 3 for the loops statement in a VRF routing instance that uses the same AS number as that of the master instance, you must also configure a value of 3 loops for the AS number in the master instance.

Use the **independent-domain** option if the loops statement must be enabled only on a subset of routing instances.

---

The remaining statement is explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.

| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p><b>detection-time threshold</b> and <b>transmit-interval threshold</b> options introduced in Junos OS Release 8.2.</p> <p><b>local-address</b> statement introduced in Junos OS Release 8.2.</p> <p><b>minimum-receive-ttl</b> statement introduced in Junos OS Release 8.2.</p> <p>Support for logical routers introduced in Junos OS Release 8.3.</p> <p><b>holddown-interval</b> statement introduced in Junos OS Release 8.5.</p> <p><b>no-adaptation</b> statement introduced in Junos OS Release 9.0.</p> <p>Support for IPv6 static routes introduced in Junos OS Release 9.1.</p> <p><b>authentication algorithm</b>, <b>authentication key-chain</b>, and <b>authentication loose-check</b> statements introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p> |
| <b>Description</b>         | <p>Configure bidirectional failure detection timers and authentication criteria for static routes.</p>  |

**Options**    **authentication algorithm** *algorithm-name* —Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, or **meticulous-keyed-sha-1**.

**authentication key-chain** *key-chain-name* —Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

**authentication loose-check**—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

**detection-time threshold** *milliseconds*—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**holddown-interval** *milliseconds*—Configure an interval specifying how long a BFD session must remain up before a state change notification is sent. If the BFD session goes down and then comes back up during the hold-down interval, the timer is restarted.

**Range:** 0 through 255,000

**Default:** 0

**local-address** *ip-address*—Enable a multihop BFD session and configure the source address for the BFD session.

**minimum-interval** *milliseconds*—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the **transmit-interval**, **minimum-interval** and **minimum-receive-interval** statements.

**Range:** 1 through 255,000

**minimum-receive-interval** *milliseconds*—Configure the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the **minimum-interval** statement at the **[edit routing-options static route destination-prefix bfd-liveness-detection]** hierarchy level.

**Range:** 1 through 255,000

**minimum-receive-ttl** *number*—Configure the time to live (TTL) for the multihop BFD session.

**Range:** 1 through 255

**Default:** 255

**multiplier** *number*—Configure number of hello packets not received by the neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255

**Default:** 3

**neighbor *address***—Configure a next-hop address for the BFD session for a next hop specified as an interface name.

**no-adaptation**—Specify for BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

**transmit-interval threshold *milliseconds***—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295

**transmit-interval minimum-interval *milliseconds***—Configure the minimum interval at which the routing device transmits hello packets to a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement at the **[edit routing-options static route *destination-prefix* bfd-liveness-detection]** hierarchy level.

**Range:** 1 through 255,000

**version**—Configure the BFD version to detect: **1** (BFD version 1) or **automatic** (autodetect the BFD version).

**Default:** automatic

## discard

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | discard;   |
| <b>Hierarchy Level</b>          | <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options (<b>aggregate</b>   <b>generate</b>) (defaults   route)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options rib <i>routing-table-name</i> (<b>aggregate</b>   <b>generate</b>) (defaults   route)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options (<b>aggregate</b>   <b>generate</b>) (defaults   route)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options rib <i>routing-table-name</i> (<b>aggregate</b>   <b>generate</b>) (defaults   route)],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options (<b>aggregate</b>   <b>generate</b>) (defaults   route)],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options rib <i>routing-table-name</i> (<b>aggregate</b>   <b>generate</b>) (defaults   route)],</p> <p>[edit routing-options (<b>aggregate</b>   <b>generate</b>) (defaults   route)],</p> <p>[edit routing-options rib <i>routing-table-name</i> (<b>aggregate</b>   <b>generate</b>) (defaults   route)]</p> |
| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p>   |
| <b>Description</b>              | <p>Do not forward packets addressed to this destination. Instead, drop the packets, do not send ICMP unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.</p> <p>To propagate static routes into the routing protocols, include the <b>discard</b> statement when you define the route, along with a routing policy.</p>  |
|                                 | <p> <b>NOTE:</b> In other vendors' software, a common way to propagate static routes into routing protocols is to configure the routes so that the next-hop routing device is the loopback address (commonly, 127.0.0.1). However, configuring static routes in this way (by including a statement such as <b>route <i>address/mask-length</i> next-hop 127.0.0.1</b>) does not propagate the static routes, because the forwarding table ignores static routes whose next-hop routing device is the loopback address.</p>  |
| <b>Default</b>                  | When an aggregate route becomes active, it is installed in the routing table with a reject next hop, which means that ICMP unreachable messages are sent.  |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |

## export-rib

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | <code>export-rib <i>routing-table-name</i>;</code>  |
| <b>Hierarchy Level</b>     | <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i></code><br><code>routing-options <b>rib-groups</b> <i>group-name</i>],</code><br><code>[edit logical-systems <i>logical-system-name</i> routing-options <b>rib-groups</b> <i>group-name</i>],</code><br><code>[edit routing-instances <i>routing-instance-name</i> routing-options <b>rib-groups</b> <i>group-name</i>],</code><br><code>[edit routing-options <b>rib-groups</b> <i>group-name</i>]</code> |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p>  |
| <b>Description</b>         | <p>Specify the name of the routing table from which Junos OS should export routing information. For any individual RIB group, only one table can be specified in the <b>export-rib</b> statement.</p>   |

The **export-rib** statement specifies the source table from which routing information is advertised.

One common use of the **export-rib** statement is interdomain routing. The export RIB is the table used when BGP extracts routes to advertise to peers. In multicast interdomain routing, for example, the export RIB is likely to be inet.2.

Another use of **export-rib** is dynamic route leaking between the global routing table (inet.0) and a VRF routing table (*instance.inet.0*). For example, you can use a RIB group to copy routes learned in the VRF into the global routing table, inet.0, or copy routes learned in inet.0 into a VRF. You define the use of this RIB group in the VRF's BGP configuration. In a routing policy you can do dynamic filtering of routes. For instance, you can use an import policy to only copy routes with certain communities into the global routing table.

For example:

```
rib-groups {
  rib-interface-routes-v4 {
    import-rib [ inet.0 VRF.inet.0 ];
  }
  rib-import-VRF-routes-to-inet0-v4 {
    export-rib VRF.inet.0;
    import-rib [ VRF.inet.0 inet.0 ];
    import-policy rib-import-VRF-routes-to-inet0-v4;
  }
  rib-import-inet0-routes-to-VRF-v4 {
    export-rib inet.0;
    import-rib [ inet.0 VRF.inet.0 ];
    import-policy rib-import-inet0-routes-to-VRF-v4;
  }
}
routing-options {
  interface-routes {
    rib-group {
```

```

        inet rib-interface-routes-v4;
    }
}
protocols {
    bgp {
        group iBGP-peers {
            type internal;
            family inet {
                unicast {
                    rib-group rib-import-inet0-routes-to-VRF-v4;
                }
            }
        }
    }
}
routing-instances {
    VRF {
        routing-options {
            interface-routes {
                rib-group {
                    inet rib-interface-routes-v4;
                }
            }
        }
        protocols {
            bgp {
                group peersin-VRF {
                    family inet {
                        unicast {
                            rib-group rib-import-VRF-routes-to-inet0-v4;
                        }
                    }
                }
            }
        }
    }
}
}

```

**Options** *routing-table-name*—Routing table group name.

## forwarding-options (chassis)

**Syntax** forwarding options *profile-name* {  
     num-65-127-prefix *value*  
     lpm-profile *prefix-65-127-disable*  
 }

**Hierarchy Level** [edit *chassis*]

**Release Information** Statement introduced in Junos 13.2 for the QFX Series.

**Description** Configure a unified forwarding table profile to allocate the amount a memory available for the following:

- MAC addresses
- Layer 3 host entries
- Longest prefix match table entries

**Options** *profile-name*—name of the profile to use for memory allocation in the unified forwarding table. [Table 112 on page 1724](#) lists the profiles you can choose and the associated values for each type of entry.

**Table 271: Unified Forwarding Table Profiles**

| Profile Name               | MAC Table     | Host Table (unicast and multicast addresses) |              |             |             |             |             |
|----------------------------|---------------|--|--------------|-------------|-------------|-------------|-------------|
|                            | MAC Addresses | IPv4 unicast                                 | IPv6 unicast | IPv4 (*, G) | IPv4 (S, G) | IPv6 (*, G) | IPv6 (S, G) |
| l2-profile-one             | 288K          | 16K  | 8K           | 8K          | 8K          | 4K          | 4K          |
| l2-profile-two             | 224K          | 80K  | 40K          | 40K         | 40K         | 20K         | 20K         |
| l2-profile-three (default) | 160K          | 144K   | 72K          | 72K         | 72K         | 36K         | 36K         |
| l3-profile                 | 96K           | 208K   | 104K         | 104K        | 104K        | 52K         | 52K         |
| lpm-profile*               | 32K           | 16K  | 8K           | 8K          | 8K          | 4K          | 4K          |

\* This profile supports only IPv4 in Junos OS 13.2X51-D10. With Junos OS 13.2X51-D15 it supports IPv4 and IPv6.

Note that if the host stores the maximum number of entries for any given type, the entire table is full and is unable to accommodate *any* entries of any other type. For information about valid combinations of table entries see [“Understanding the Unified Forwarding Table” on page 1545](#).

You configure the memory allocation for LPM table entries differently depending on whether you use Junos OS 13.2X51-D10 or Junos OS 13.2X51-D15 and later. To learn

how to configure memory allocation for LPM table entries see [“Configuring the Unified Forwarding Table” on page 1697](#).

## graceful-restart (Enabling Globally)

---

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | <pre>graceful-restart {<br/>    disable;<br/>    helper-disable;<br/>    maximum-helper-recovery-time <i>seconds</i>;<br/>    maximum-helper-restart-time <i>seconds</i>;<br/>    notify-duration <i>seconds</i>;<br/>    recovery-time <i>seconds</i>;<br/>    restart-duration <i>seconds</i>;<br/>    stale-routes-time <i>seconds</i>;<br/>}</pre> |
| <b>Hierarchy Level</b>     | [edit logical-systems <i>logical-system-name</i> routing-options],<br>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options],<br>[edit routing-options],<br>[edit routing-instances <i>routing-instance-name</i> routing-options]  |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.   |
| <b>Description</b>         | Configure graceful restart globally to enable the feature. You cannot enable graceful restart for specific protocols unless graceful restart is also enabled globally. You can, optionally, modify the global settings at the individual protocol level.   |

### NOTE:

- For VPNs, the `graceful-restart` statement allows a router whose VPN control plane is undergoing a restart to continue to forward traffic while recovering its state from neighboring routers.
  - For BGP, if you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.
  - LDP sessions flap when `graceful-restart` configurations change.
- 

|                                 |   |
|---------------------------------|---|
| <b>Default</b>                  | Graceful restart is disabled by default.  |
| <b>Options</b>                  | The remaining statements are explained separately.  |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.   |

## import-policy

---

|   |   |
|---|---|
| Syntax  | import-policy [ <i>policy-names</i> ];  |
| Hierarchy Level   | [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options <b>rib-groups</b> <i>group-name</i> ],<br>[edit logical-systems <i>logical-system-name</i> routing-options <b>rib-groups</b> <i>group-name</i> ],<br>[edit routing-instances <i>routing-instance-name</i> routing-options <b>rib-groups</b> <i>group-name</i> ],<br>[edit routing-options <b>rib-groups</b> <i>group-name</i> ] |
| Release Information   | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.  |
| Description   | Apply one or more policies to routes imported into the routing table group. The <b>import-policy</b> statement complements the <b>import-rib</b> statement and cannot be used unless you first specify the routing tables to which routes are being imported.   |
| <div> <b>NOTE:</b> On EX Series switches, only dynamically learned routes can be imported from one routing table group to another.</div> |   |
| Options   | <i>policy-names</i> —Name of one or more policies.  |
| Required Privilege Level  | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.   |
| Related Documentation   | <ul style="list-style-type: none"><li>• <i>Example: Exporting Specific Routes from One Routing Table Into Another Routing Table</i></li><li>• <a href="#">export-rib on page 2966</a></li><li>• <i>passive</i></li></ul>  |

## import-rib

|   |  |
|---|--|
| <b>Syntax</b>   | <code>import-rib [ <i>routing-table-names</i> ];</code>  |
| <b>Hierarchy Level</b>  | <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options <b>rib-groups</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options <b>rib-groups</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options <b>rib-groups</b> <i>group-name</i>],</p> <p>[edit routing-options <b>rib-groups</b> <i>group-name</i>]</p>   |
| <b>Release Information</b>  | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>  |
| <b>Description</b>  | <p>Specify the name of the routing table into which Junos OS should import routing information. The first routing table name you enter is the primary routing table. Any additional names you enter identify secondary routing tables. When a protocol imports routes, it imports them into the primary and any secondary routing tables. If the primary route is deleted, the secondary route also is deleted. For IPv4 import routing tables, the primary routing table must be <b>inet.0</b> or <b>routing-instance-name.inet.0</b>. For IPv6 import routing tables, the primary routing table must be <b>inet6.0</b>.</p> <p>In Junos OS Release 9.5 and later, you can configure an IPv4 import routing table that includes both IPv4 and IPv6 routing tables. Including both types of routing tables permits you, for example, to populate an IPv6 routing table with IPv6 addresses that are compatible with IPv4. In releases prior to Junos OS Release 9.5, you could configure an import routing table with only either IPv4 or IPv6 routing tables.</p> |
| <div>  <b>NOTE:</b> On EX Series switches, only dynamically learned routes can be imported from one routing table group to another. </div> |  |
| <b>Options</b>  | <b><i>routing-table-names</i></b> —Name of one or more routing tables.   |
| <b>Required Privilege Level</b>   | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>  | <ul style="list-style-type: none"> <li>• <i>Example: Exporting Specific Routes from One Routing Table Into Another Routing Table</i></li> <li>• <a href="#">export-rib on page 2966</a></li> <li>• <i>passive</i></li> </ul>   |

## indirect-next-hop

---

|  |  |
|--|--|
| <b>Syntax</b>  | (indirect-next-hop   no-indirect-next-hop);  |
| <b>Hierarchy Level</b>   | [edit logical-systems <i>logical-system-name</i> routing-options forwarding-table],<br>[edit routing-options forwarding-table]   |
| <b>Release Information</b>   | Statement introduced in Junos OS Release 8.2.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.   |
| <b>Description</b>   | Enable indirectly connected next hops for route convergence. This statement is implemented on the Packet Forward Engine to speed up forwarding information base (FIB) updates. Configuring this statement significantly speeds convergence times. The only downside of configuring this statement is that some additional FIB memory overhead is required. Unless routes have an extremely high number of next hops, this increased memory usage should not be noticeable. |
| <div> <b>NOTE:</b><ul style="list-style-type: none"><li>• When virtual private LAN service (VPLS) is configured on the routing device, the <b>indirect-next-hop</b> statement is configurable at the [edit routing-options forwarding-table] hierarchy level. However, this configuration is not applicable to indirect nexthops specific to VPLS routing instances.</li><li>• By default, the Junos Trio Modular Port Concentrator (MPC) chipset on MX Series routers is enabled with indirectly connected next hops, and this cannot be disabled using the <b>no-indirect-next-hop</b> statement.</li><li>• By default, indirectly connected next hops are enabled on PTX Series routers.</li></ul></div> |  |
| <b>Default</b>   | Disabled.  |
| <b>Options</b>   | <b>indirect-next-hop</b> —Enable indirectly connected next hops.<br><b>no-indirect-next-hop</b> —Explicitly disable indirect next hops.  |
| <b>Required Privilege Level</b>  | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.  |
| <b>Related Documentation</b>   | <ul style="list-style-type: none"><li>• <i>Example: Optimizing Route Reconvergence by Enabling Indirect Next Hops on the Packet Forwarding Engine</i></li></ul>  |

## install (Routing Options)

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | (install   no-install);   |
| <b>Hierarchy Level</b>          | <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options static (defaults   route)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options rib <i>routing-table-name</i> static (defaults   route)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options rib <i>routing-table-name</i> static (defaults   route)],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options static (defaults   route)],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options rib <i>routing-table-name</i> static (defaults   route)],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options static (defaults   route)],</p> <p>[edit routing-options rib <i>routing-table-name</i> static (defaults   route)]</p> <p>[edit routing-options static (defaults   route)]</p> |
| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>   |
| <b>Description</b>              | Configure whether Junos OS installs all static routes into the forwarding table. Even if you configure a route so it is not installed in the forwarding table, the route is still eligible to be exported from the routing table to other protocols.  |
| <b>Options</b>                  | <p><b>install</b>—Explicitly install all static routes into the forwarding table. Include this statement when configuring an individual route in the <b>route</b> portion of the <b>static</b> statement to override a <b>no-install</b> option specified in the <b>defaults</b> portion of the statement.</p> <p><b>no-install</b>—Do not install the route into the forwarding table, even if it is the route with the lowest preference.</p> <p><b>Default:</b> install</p>  |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <i>Examples: Configuring Static Routes</i></li> <li>• <i>static</i></li> </ul>   |

## instance-export

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>instance-export [ <i>policy-names</i> ];</code>   |
| <b>Hierarchy Level</b>          | [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options],<br>[edit logical-systems <i>logical-system-name</i> routing-options],<br>[edit routing-instances <i>routing-instance-name</i> routing-options],<br>[edit routing-options] |

## interface (Multicast Static Routes)

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <pre>interface <i>interface-names</i> {<br/>    disable;<br/>    maximum-bandwidth <i>bps</i>;<br/>    no-qos-adjust;<br/>    reverse-oif-mapping {<br/>        no-qos-adjust;<br/>    }<br/>    subscriber-leave-timer <i>seconds</i>;<br/>}</pre>   |
| <b>Hierarchy Level</b>          | <pre>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i><br/>    routing-options <a href="#">multicast</a>],<br/>[edit logical-systems <i>logical-system-name</i> routing-options <a href="#">multicast</a>],<br/>[edit routing-instances <i>routing-instance-name</i> routing-options <a href="#">multicast</a>],<br/>[edit routing-options <a href="#">multicast</a>]</pre>   |
| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>   |
| <b>Description</b>              | <p>Enable multicast traffic on an interface.</p> <p>By default, multicast packets are forwarded by enabling Protocol Independent Multicast (PIM) on an interface. PIM adds multicast routes into the routing table.</p> <p>You can also configure multicast packets to be forwarded over a static route, such as a static route associated with an LSP next hop. Multicast packets are accepted on an interface and forwarded over a static route in the forwarding table. This is useful when you want to enable multicast traffic on a specific interface without configuring PIM on the interface.</p> <p>You cannot enable multicast traffic on an interface and configure PIM on the same interface simultaneously.</p> <p>Static routes must be configured before you can enable multicast on an interface. Configuring the <b>interface</b> statement alone does not install any routes into the routing table. This feature relies on the static route configuration.</p> |
| <b>Options</b>                  | <p><b><i>interface-names</i></b>—Name of one or more interfaces on which to enable multicast traffic.</p> <p>The remaining statements are explained separately.</p>   |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <i>Example: Defining Interface Bandwidth Maximums</i></li><li>• <i>Example: Configuring Multicast with Subscriber VLANs</i></li></ul>   |

## interface (Routing Instances)

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | <code>interface <i>interface-name</i>;</code>                     |
| <b>Hierarchy Level</b>     | [edit <a href="#">routing-instances</a> ]                         |
| <b>Release Information</b> | Statement introduced in Junos OS Release 11.3 for the QFX Series. |
| <b>Description</b>         | For virtual router routing instances, configure an interface.     |

### NOTE:

- You must configure only interfaces from the Node devices assigned to the network Node group. If you try to configure interfaces from the Node devices assigned to server Node groups, the configuration does not commit.
- You can configure an interface for one routing instance only.

|                                 |   |
|---------------------------------|---|
| <b>Options</b>                  | <i>interface-name</i> —Name of an interface.  |

[edit logical-systems *logical-system-name* routing-options],  
[edit routing-instances *routing-instance-name* routing-options],  
[edit routing-options]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**NOTE:** On EX Series switches, only dynamically learned routes can be imported from one routing table group to another.

**Description** Associate a routing table group with the routing device's interfaces, and specify routing table groups into which interface routes are imported.

By default, IPv4 interface routes (also called direct routes) are imported into routing table **inet.0**, and IPv6 interface routes are imported into routing table **inet6.0**. If you are configuring alternate routing tables for use by some routing protocols, it might be necessary to import the interface routes into the alternate routing tables. To define the routing tables into which interface routes are imported, you create a routing table group and associate it with the routing device's interfaces.

To create the routing table groups, include the **passive** statement at the **[edit routing-options]** hierarchy level.

If you have configured a routing table, configure the OSPF primary instance at the **[edit protocols ospf]** hierarchy level with the statements needed for your network so that routes are installed in **inet.0** and in the forwarding table. Make sure to include the routing table group.

To export local routes, include the **export** statement.

To export LAN routes, include the **lan** option. To export point-to-point routes, include the **point-to-point** option.

Only local routes on point-to-point interfaces configured with a destination address are exportable.

**Options** **inet**—Specify the IPv4 address family.

**inet6**—Specify the IPv6 address family.

**lan**—Export LAN routes.

**point-to-point**—Export point-to-point routes.

The remaining statements are explained separately.

**Required Privilege** **routing**—To view this statement in the configuration.

**Level** **routing-control**—To add this statement to the configuration.

## local-address (Routing Options)

---

**Syntax** **local-address** *address*;

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast **backup-pe-group** *group-name*],  
[edit logical-systems *logical-system-name* routing-options multicast **backup-pe-group** *group-name*],  
[edit routing-instances *routing-instance-name* routing-options multicast **backup-pe-group** *group-name*],  
[edit routing-options multicast **backup-pe-group** *group-name*]

**Release Information** Statement introduced in Junos OS Release 9.0.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Configure the address of the local PE for ingress PE redundancy when point-to-multipoint LSPs are used for multicast distribution.

**Options** **address**—Address of local PEs in the backup group.

**Required Privilege** **routing**—To view this statement in the configuration.

**Level** **routing-control**—To add this statement to the configuration.

## maximum-bandwidth (Routing Options)

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>maximum-bandwidth <i>bps</i>;</code>  |
| <b>Hierarchy Level</b>          | <code>[edit dynamic-profiles <i>profile-name</i> routing-instances <i>instance-name</i> routing-options multicast interface <i>interface-name</i>],</code><br><code>[edit dynamic-profiles <i>profile-name</i> routing-options multicast interface <i>interface-name</i>]</code><br><code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast interface <i>interface-name</i>],</code><br><code>[edit logical-systems <i>logical-system-name</i> routing-options multicast interface <i>interface-name</i>],</code><br><code>[edit routing-instances <i>routing-instance-name</i> routing-options multicast interface <i>interface-name</i>],</code><br><code>[edit routing-options multicast interface <i>interface-name</i>]</code> |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.3.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.<br><b>dynamic-profiles</b> hierarchy level added in Junos OS Release 11.2.   |
| <b>Description</b>              | Configure the multicast bandwidth for the interface.  |
| <b>Options</b>                  | <b><i>bps</i></b> —Bandwidth rate, in bits per second, for the multicast interface.<br><b>Range:</b> 0 through any amount of bandwidth  |
| <b>Required Privilege Level</b> | <code>routing</code> —To view this statement in the configuration.<br><code>routing-control</code> —To add this statement to the configuration.   |
| <b>Related Documentation</b>    | • <i>Example: Defining Interface Bandwidth Maximums</i>   |

## maximum-paths

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | <code>maximum-paths <i>path-limit</i> &lt;log-interval <i>seconds</i>&gt; &lt;log-only   threshold <i>value</i>&gt;;</code>   |
| <b>Hierarchy Level</b>     | [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options],<br>[edit logical-systems <i>logical-system-name</i> routing-options],<br>[edit routing-instances <i>routing-instance-name</i> routing-options],<br>[edit routing-options] |
| <b>Release Information</b> | Statement introduced in Junos OS Release 8.0.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.  |
| <b>Description</b>         | Configure a limit for the number of routes installed in a routing table based upon the route path.  |

**NOTE:** The `maximum-paths` statement is similar to the `maximum-prefixes` statement. The `maximum-prefixes` statement limits the number of unique destinations in a routing instance. For example, suppose a routing instance has the following routes:

```
OSPF 10.10.10.0/24
ISIS 10.10.10.0/24
```

These are two routes, but only one destination (prefix). The `maximum-paths` limit applies the total number of routes (two). The `maximum-prefixes` limit applies to the total number of unique prefixes (one).

|                |   |
|----------------|---|
| <b>Options</b> | <p><code>log-interval <i>seconds</i></code>—(Optional) Minimum time interval (in seconds) between log messages.<br/> <b>Range:</b> 5 through 86,400</p> <p><code>log-only</code>—(Optional) Sets the route limit as an advisory limit. An advisory limit triggers only a warning, and additional routes are not rejected.</p> <p><code><i>path-limit</i></code>—Maximum number of routes. If this limit is reached, a warning is triggered and additional routes are rejected.<br/> <b>Range:</b> 1 through 4,294,967,295 (<math>2^{32} - 1</math>)<br/> <b>Default:</b> No default</p> <p><code>threshold <i>value</i></code>—(Optional) Percentage of the maximum number of routes that starts triggering a warning. You can configure a percentage of the <code><i>path-limit</i></code> value that starts triggering the warnings.<br/> <b>Range:</b> 1 through 100</p> |
|----------------|---|

NOTE: When the number of routes reaches the threshold value, routes are still installed into the routing table while warning messages are sent. When the number of routes reaches the *path-limit* value, then additional routes are rejected.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation** • *Limiting the Number of Paths and Prefixes Accepted from CE Routers in Layer 3 VPNs*

## maximum-prefixes

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | <code>maximum-prefixes <i>prefix-limit</i> &lt;log-interval <i>seconds</i>&gt; &lt;log-only   threshold <i>percentage</i>&gt;;</code>  |
| <b>Hierarchy Level</b>     | [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options],<br>[edit logical-systems <i>logical-system-name</i> routing-options],<br>[edit routing-instances <i>routing-instance-name</i> routing-options],<br>[edit routing-options]                              |
| <b>Release Information</b> | Statement introduced in Junos OS Release 8.0.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.   |
| <b>Description</b>         | Configure a limit for the number of routes installed in a routing table based upon the route prefix.<br><br>Using a prefix limit, you can curtail the number of prefixes received from a CE router in a VPN. Prefix limits apply only to dynamic routing protocols and are not applicable to static or interface routes. |

**NOTE:** The `maximum-prefixes` statement is similar to the `maximum-paths` statement. The `maximum-prefixes` statement limits the number of unique destinations in a routing instance. For example, suppose a routing instance has the following routes:

```
OSPF 10.10.10.0/24
ISIS 10.10.10.0/24
```

These are two routes, but only one destination (prefix). The `maximum-paths` limit applies the total number of routes (two). The `maximum-prefixes` limit applies to the total number of unique prefixes (one).

|                |   |
|----------------|---|
| <b>Options</b> | <p><code>log-interval <i>seconds</i></code>—(Optional) Minimum time interval (in seconds) between log messages.</p> <p><b>Range:</b> 5 through 86,400</p> <p><code>log-only</code>—(Optional) Sets the prefix limit as an advisory limit. An advisory limit triggers only a warning, and additional routes are not rejected.</p> <p><code>prefix-limit</code>—Maximum number of route prefixes. If this limit is reached, a warning is triggered and any additional routes are rejected.</p> <p><b>Range:</b> 1 through 4,294,967,295</p> <p><b>Default:</b> No default</p> <p><code>threshold <i>value</i></code>—(Optional) Percentage of the maximum number of prefixes that starts triggering a warning. You can configure a percentage of the <code>prefix-limit</code> value that starts triggering the warnings.</p> |
|----------------|---|

**Range:** 1 through 100

**NOTE:** When the number of routes reaches the threshold value, routes are still installed into the routing table while warning messages are sent. When the number of routes reaches the *prefix-limit* value, then additional routes are rejected.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## med-igp-update-interval

---

**Syntax** med-igp-update-interval *minutes*;

**Hierarchy Level** [edit routing-options]

**Release Information** Statement introduced in Junos OS Release 9.0  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Configure a timer for how long to delay updates for the multiple exit discriminator (MED) path attribute for BGP groups and peers configured with the **metric-out igp offset delay-med-update** statement. The timer delays MED updates for the interval configured unless the MED is lower than the previously advertised attribute or another attribute associated with the route has changed or if the BGP peer is responding to a refresh route request.

**Options** *minutes*—Interval to delay MED updates.  
**Range:** 10 through 600  
**Default:** 10 minutes

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

## policy (Aggregate and Generated Routes)

---

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | <code>policy <i>policy-name</i>;</code>   |
| <b>Hierarchy Level</b>     | <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options (<b>aggregate</b>   <b>generate</b>) (defaults   route)],</code><br><code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options rib <i>routing-table-name</i> (<b>aggregate</b>   <b>generate</b>) (defaults   route)],</code><br><code>[edit logical-systems <i>logical-system-name</i> routing-options (<b>aggregate</b>   <b>generate</b>) (defaults   route)],</code><br><code>[edit logical-systems <i>logical-system-name</i> routing-options rib <i>routing-table-name</i> (<b>aggregate</b>   <b>generate</b>) (defaults   route)],</code><br><code>[edit routing-instances <i>routing-instance-name</i> routing-options (<b>aggregate</b>   <b>generate</b>) (defaults   route)],</code><br><code>[edit routing-instances <i>routing-instance-name</i> routing-options rib <i>routing-table-name</i> (<b>aggregate</b>   <b>generate</b>) (defaults   route)],</code><br><code>[edit routing-options (<b>aggregate</b>   <b>generate</b>) (defaults   route)],</code><br><code>[edit routing-options rib <i>routing-table-name</i> (<b>aggregate</b>   <b>generate</b>) (defaults   route)]</code>   |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.<br>Statement introduced in Junos OS Release 12.3 for ACX Series routers.   |
| <b>Description</b>         | <p>Associate a routing policy when configuring an aggregate or generated route's destination prefix in the <b>routes</b> part of the <b>aggregate</b> or <b>generate</b> statement. This provides the equivalent of an import routing policy filter for the destination prefix. That is, each potential contributor to an aggregate route, along with any aggregate options, is passed through the policy filter. The policy then can accept or reject the route as a contributor to the aggregate route.</p> <p>If the contributor is accepted, the policy can modify the default preferences. The contributor with the numerically smallest prefix becomes the most preferred, or <i>primary</i>, contributor. A rejected contributor still can contribute to a less specific aggregate route. If you do not specify a policy filter, all candidate routes contribute to an aggregate route.</p> <p>The following algorithm is used to compare two generated contributing routes in order to determine which one is the primary or preferred contributor:</p> <ol style="list-style-type: none"><li>1. Compare the protocol's <b>preference</b> of the contributing routes. The lower the preference, the better the route. This is similar to the comparison that is done while determining the best route for the routing table.</li><li>2. Compare the protocol's <b>preference2</b> of the contributing routes. The lower <b>preference2</b> value is better. If only one route has <b>preference2</b>, then this route is preferred.</li><li>3. The preference values are the same. Proceed with a numerical comparison of the prefixes' values.<ol style="list-style-type: none"><li>a. The primary contributor is the numerically smallest prefix value.</li><li>b. If the two prefixes are numerically equal, the primary contributor is the route that has the smallest prefix length value.</li></ol></li></ol> |

At this point, the two routes are the same. The primary contributor does not change. An additional next hop is available for the existing primary contributor.

A rejected contributor still can contribute to less specific generated route. If you do not specify a policy filter, all candidate routes contribute to a generated route.

## policy (Flow Maps)

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>policy [ <i>policy-names</i> ];</code>  |
| <b>Hierarchy Level</b>          | [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast <b>flow-map</b> <i>flow-map-name</i> ],<br>[edit logical-systems <i>logical-system-name</i> routing-options multicast <b>flow-map</b> <i>flow-map-name</i> ],<br>[edit routing-instances <i>routing-instance-name</i> routing-options multicast <b>flow-map</b> <i>flow-map-name</i> ],<br>[edit routing-options multicast <b>flow-map</b> <i>flow-map-name</i> ] |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.2.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.<br>Statement introduced in Junos OS Release 12.3 for ACX Series routers.   |
| <b>Description</b>              | Configure a flow map policy.  |
| <b>Options</b>                  | <i>policy-names</i> —Name of one or more policies for flow mapping.   |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.  |

## policy-options

---

**Syntax**    `policy-options`

```
  application-maps application-map-name {
    application application-name {
      code-points [ aliases ] [ bit-patterns ];
    }
  }
  policy-statement policy-name {
    term term-name {
      from {
        family family-name;
        match-conditions;
        policy subroutine-policy-name;
        prefix-list prefix-list-name;
        prefix-list-filter prefix-list-name match-type <actions>;
        route-filter destination-prefix match-type <actions>;
        source-address-filter source-prefix match-type <actions>;
      }
      to {
        match-conditions;
        policy subroutine-policy-name;
      }
      then actions;
    }
  }
```

**Hierarchy Level**    [edit]

**Release Information**    Statement introduced in Junos OS Release 12.1 for the QFX Series.  
Statement introduced in Junos OS Release 12.1 for the EX Series.

**Description**    Configure options such as application maps for DCBX application protocol exchange and policy statements.

**Required Privilege Level**    storage—To view this statement in the configuration.  
storage-control—To add this statement to the configuration.

## policy-statement

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | <pre> policy-statement <i>policy-name</i> {   term <i>term-name</i> {     from {       family <i>family-name</i>;       match-conditions;       policy <i>subroutine-policy-name</i>;       prefix-list <i>prefix-list-name</i>;       prefix-list-filter <i>prefix-list-name</i> match-type &lt;actions&gt;;       route-filter <i>destination-prefix</i> match-type &lt;actions&gt;;       source-address-filter <i>source-prefix</i> match-type &lt;actions&gt;;     }     to {       match-conditions;       policy <i>subroutine-policy-name</i>;     }     then <i>actions</i>;   } } </pre>   |
| <b>Hierarchy Level</b>     | <p>[edit dynamic policy-options],</p> <p>[edit logical-systems <i>logical-system-name</i> policy-options],</p> <p>[edit policy-options]</p>  |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for configuration in the dynamic database introduced in Junos OS Release 9.5.</p> <p>Support for configuration in the dynamic database introduced in Junos OS Release 9.5 for EX Series switches.</p> <p><b>inet-mdt</b> option introduced in Junos OS Release 10.0R2.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p><b>route-target</b> option introduced in Junos OS Release 12.2.</p>   |
| <b>Description</b>         | <p>Define a routing policy, including subroutine policies.</p> <p>A <i>term</i> is a named structure in which match conditions and actions are defined. Routing policies are made up of one or more terms. Each routing policy term is identified by a term name. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks.</p> <p>Each term contains a set of match conditions and a set of actions:</p> <ul style="list-style-type: none"> <li>• Match conditions are criteria that a route must match before the actions can be applied. If a route matches all criteria, one or more actions are applied to the route.</li> <li>• Actions specify whether to accept or reject the route, control how a series of policies are evaluated, and manipulate the characteristics associated with a route.</li> </ul> <p>Generally, a router compares a route against the match conditions of each term in a routing policy, starting with the first and moving through the terms in the order in which they are defined, until a match is made and an explicitly configured or default action of</p> |

**accept** or **reject** is taken. If none of the terms in the policy match the route, the router compares the route against the next policy, and so on, until either an action is taken or the default policy is evaluated.

If none of the match conditions of each term evaluates to true, the final action is executed. The final action is defined in an unnamed term. Additionally, you can define a default action (either **accept** or **reject**) that overrides any action intrinsic to the protocol.

The order of match conditions in a term is not relevant, because a route must match all match conditions in a term for an action to be taken.

To list the routing policies under the **[edit policy-options]** hierarchy level by **policy-statement *policy-name*** in alphabetical order, enter the **show policy-options** configuration command.

**Options** *actions*—(Optional) One or more actions to take if the conditions match. The actions are described in *Configuring Flow Control Actions*.

**family** *family-name*—(Optional) Specify an address family protocol. Specify **inet** for IPv4. Specify **inet6** for 128-bit IPv6, and to enable interpretation of IPv6 router filter addresses. For IS-IS traffic, specify **iso**. For IPv4 multicast VPN traffic, specify **inet-mvpn**. For IPv6 multicast VPN traffic, specify **inet6-mvpn**. For multicast-distribution-tree (MDT) IPv4 traffic, specify **inet-mdt**. For BGP route target VPN traffic, specify **route-target**.

**NOTE:** When *family* is not specified, the routing device or routing instance uses the address family or families carried by BGP. If multiprotocol BGP (MP-BGP) is enabled, the policy defaults to the protocol family or families carried in the network layer reachability information (NLRI) as configured in the *family* statement for BGP. If MP-BGP is not enabled, the policy uses the default BGP address family unicast IPv4.

**from**—(Optional) Match a route based on its source address.

**match-conditions**—(Optional in **from** statement; required in **to** statement) One or more conditions to use to make a match. The qualifiers are described in *Routing Policy Match Conditions*.

**policy** *subroutine-policy-name*—Use another policy as a match condition within this policy. The name identifying the subroutine policy can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" "). Policy names cannot take the form **\_\_.\*-internal\_\_**, as this form is reserved. For information about how to configure subroutines, see *Understanding Policy Subroutines in Routing Policy Match Conditions*.

**policy-name**—Name that identifies the policy. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" ").

**prefix-list** *prefix-list-name*—Name of a list of IPv4 or IPv6 prefixes.

**prefix-list-filter** *prefix-list-name*—Name of a prefix list to evaluate using qualifiers; *match-type* is the type of match (see *Configuring Prefix List Filters*), and *actions* is the action to take if the prefixes match.

**route-filter** *destination-prefix match-type <actions>*—(Optional) List of routes on which to perform an immediate match; *destination-prefix* is the IPv4 or IPv6 route prefix to match, *match-type* is the type of match (see *Configuring Route Lists*), and *actions* is the action to take if the *destination-prefix* matches.

**source-address-filter** *source-prefix match-type <actions>*—(Optional) Unicast source addresses in multiprotocol BGP (MBGP) and Multicast Source Discovery Protocol (MSDP) environments on which to perform an immediate match. *source-prefix* is

the IPv4 or IPv6 route prefix to match, **match-type** is the type of match (see *Configuring Route Lists*), and **actions** is the action to take if the **source-prefix** matches.

**term term-name**—Name that identifies the term. The term name must be unique in the policy. It can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" "). A policy statement can include multiple terms. We recommend that you name all terms. However, you do have the option to include an unnamed term which must be the final term in the policy. To configure an unnamed term, omit the **term** statement when defining match conditions and actions.

**to**—(Optional) Match a route based on its destination address or the protocols into which the route is being advertised.

**then**—(Optional) Actions to take on matching routes. The actions are described in *Configuring Flow Control Actions* and *Configuring Actions That Manipulate Route Characteristics*.

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-instances *routing-instance-name*],  
[edit routing-instances *routing-instance-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.

Support for RIPng introduced in Junos OS Release 9.0.  
Statement introduced in Junos OS Release 11.1 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Specify the protocol for a routing instance. You can configure multiple instances of many protocol types. Not all protocols are supported on the switches. See the switch CLI.

**Options** **bgp**—Specify BGP as the protocol for a routing instance.  
**isis**—Specify IS-IS as the protocol for a routing instance.  
**ldp**—Specify LDP as the protocol for a routing instance.  
**l2vpn**—Specify Layer 2 VPN as the protocol for a routing instance.  
**msdp**—Specify the Multicast Source Discovery Protocol (MSDP) for a routing instance.  
**mstp**—Specify the Multiple Spanning Tree Protocol (MSTP) for a virtual switch routing instance.  
**ospf**—Specify OSPF as the protocol for a routing instance.  
**ospf3**—Specify OSPF version 3 (OSPFv3) as the protocol for a routing instance.

**NOTE:** OSPFv3 supports the **no-forwarding**, **virtual-router**, and **vrf** routing instance types only.

---

**pim**—Specify the Protocol Independent Multicast (PIM) protocol for a routing instance.  
**rip**—Specify RIP as the protocol for a routing instance.  
**ripng**—Specify RIP next generation (RIPng) as the protocol for a routing instance.  
**rstp**—Specify the Rapid Spanning Tree Protocol (RSTP) for a virtual switch routing instance.  
**vstp**—Specify the VLAN Spanning Tree Protocol (VSTP) for a virtual switch routing instance.  
**vpls**—Specify VPLS as the protocol for a routing instance.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.  
 Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description** Configure a static route with multiple possible next hops, each of which can have its own preference value, IGP metric that is used when the route is exported into an IGP, and Bidirectional Forwarding Detection (BFD) settings. If multiple links are operational, the one with the most preferred next hop is used. The most preferred next hop is the one with the lowest preference value.

**Options** *address*—IPv4, IPv6, or ISO network address of the next hop.  
*interface-name*—Name of the interface on which to configure an independent metric or preference for a static route. To configure an unnumbered interface as the next-hop

interface for a static route, specify **qualified-next-hop *interface-name***, where *interface-name* is the name of the IPv4 or IPv6 unnumbered interface.

**NOTE:** For an Ethernet interface to be configured as the qualified next hop for a static route, it must be an unnumbered interface.

To configure an Ethernet interface as an unnumbered interface, configure the `unnumbered-address <interface-name>` statement at the `[edit interfaces <interface-name> unit <logical-unit-number> family <family-name>]` hierarchy level as described in *Configuring an Unnumbered Interface*.

## resolution

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <pre> resolution {     rib <i>routing-table-name</i> {         import [ <i>policy-names</i> ];         resolution-ribs [ <i>routing-table-names</i> ];     } } </pre>  |
| <b>Hierarchy Level</b>          | <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options],</p> <p>[edit routing-options]</p>   |
| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>  |
| <b>Description</b>              | <p>Configure the router to perform custom route resolution on protocol next hops of routes in a certain routing table. The protocol next hop is used to determine the forwarding next-hop.</p> <p>For example, you might want to direct <b>inet.2</b> route resolution to use topology routing tables <b>:red.inet.0</b> and <b>:blue.inet.0</b> for protocol next-hop IP address lookups. Or you might want to direct <b>bgp.l3vpn.0</b> to use the information in <b>inet.0</b> to resolve routes, thus overriding the default behavior, which is to use <b>inet.3</b>.</p> <p>You can specify up to two routing tables in the <b>resolution-ribs</b> statement. The route resolution scheme first checks the first-listed routing table for the protocol next-hop address. If the address is found, it uses this entry. If it is not found, the resolution scheme checks second-listed routing table. Hence, only one routing table is used for each protocol nexthop address. For example, if you configure <b>resolution rib bgp.l3vpn.0 resolution-ribs [inet.0 inet.3]</b>, <b>inet.0</b> is checked first and then <b>inet.3</b> is checked.</p> |
|                                 | <p> <b>NOTE:</b> Customizing route resolution might cause the routing protocol process (rpd) to consume more memory resources than it ordinarily would. When you customize route resolution, we recommend that you check the memory resources by running the <b>show system processes</b> and the <b>show task memory</b> commands. For more information, see <i>Routing Protocol Process Memory FAQs</i>.</p>  |
|                                 | <p>The remaining statements are explained separately.</p>  |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |

}
```

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],  
[edit logical-systems *logical-system-name* routing-options],  
[edit routing-instances *routing-instance-name* routing-options],  
[edit routing-options]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Create a routing table.

Explicitly creating a routing table with ***routing-table-name*** is optional if you are not adding any static, martian, aggregate, or generated routes to the routing table and if you also are creating a routing table group.

**NOTE:** The IPv4 multicast routing table (`inet.1`) and the IPv6 multicast routing table (`inet6.1`) are not supported for this statement.

**Default** If you do not specify a routing table name with the *routing-table-name* option, the software uses the default routing tables, which are `inet.0` for unicast routes and `inet.1` for the multicast cache.

**Options** *routing-table-name*—Name of the routing table, in the following format:  
*protocol [.identifier]*.

In a routing instance, the routing table name must include the routing instance name.

For example, if the routing instance name is `link0`, the routing table name might be `link0.inet6.0`.

- *protocol* is the protocol family. It can be `inet6` for the IPv6 family, `inet` for the IPv4 family, `iso` for the ISO protocol family, or *instance-name.iso.0* for an ISO routing instance.
- *identifier* is a positive integer that specifies the instance of the routing table.

**Default:** `inet.0`

The remaining statements are explained separately.

**Required Privilege Level** `routing`—To view this statement in the configuration.  
`routing-control`—To add this statement to the configuration.

| <b>Options</b>                  | <p><b><i>group-name</i></b>—Name of the routing table group. The name must start with a letter and can include letters, numbers, and hyphens. It generally does not make sense to specify more than a single routing table group.</p>  |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <i>Example: Importing Direct and Static Routes Into a Routing Instance</i></li> <li>• <i>Example: Exporting Specific Routes from One Routing Table Into Another Routing Table</i></li> <li>• <a href="#">interface-routes on page 2989</a></li> <li>• <a href="#">rib-groups on page 3032</a></li> </ul>  |

## rib-groups

---

|                     |  |
|---------------------|--|
| Syntax              | <pre>rib-groups {<br/>    group-name {<br/>        export-rib group-name;<br/>        import-policy [ policy-names ];<br/>        import-rib [ group-names ];<br/>    }<br/>}</pre>  |
| Hierarchy Level     | [edit logical-systems <i>logical-system-name</i> routing-options],<br>[edit routing-options]   |
| Release Information | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.   |
| Description         | <p>Group one or more routing tables to form a routing table group. A routing protocol can import routes into all the routing tables in the group and can export routes from a single routing table.</p> <p>Each routing table group must contain one or more routing tables that Junos OS uses when importing routes (specified in the <b>import-rib</b> statement) and optionally can contain one routing table group that Junos OS uses when exporting routes to the routing protocols (specified in the <b>export-rib</b> statement).</p> <p>The first routing table you specify is the <i>primary routing table</i>, and any additional routing tables are the <i>secondary routing tables</i>.</p> <p>The primary routing table determines the address family of the routing table group. To configure an IP version 4 (IPv4) routing table group, specify <b>inet.0</b> as the primary routing table. To configure an IP version 6 (IPv6) routing table group, specify <b>inet6.0</b> as the primary routing table. If you configure an IPv6 routing table group, the primary and all secondary routing tables must be IPv6 routing tables (<b>inet6.x</b>).</p> <p>In Junos OS Release 9.5 and later, you can include both IPv4 and IPv6 routing tables in an IPv4 import routing table group using the <b>import-rib</b> statement. In releases prior to Junos OS Release 9.5, you can only include either IPv4 or IPv6 routing tables in the same <b>import-rib</b> statement. The ability to configure an import routing table group with both IPv4 and IPv6 routing tables enables you, for example, to populate the <b>inet6.3</b> routing table with IPv6 addresses that are compatible with IPv4. Specify <b>inet.0</b> as the primary routing table, and specify <b>inet6.3</b> as a secondary routing table.</p> |

**NOTE:** On EX Series switches, only dynamically learned routes can be imported from one routing table group to another.

---

**NOTE:** If you configure an import routing table group that includes both IPv4 and IPv6 routing tables, any corresponding export routing table group must include only IPv4 routing tables.

If you have configured a routing table, configure the OSPF primary instance at the **[edit protocols ospf]** hierarchy level with the statements needed for your network so that routes are installed in **inet.0** and in the forwarding table. Make sure to include the routing table group. For more information, see *Example: Configuring Multiple Routing Instances of OSPF*.

After specifying the routing table from which to import routes, you can apply one or more policies to control which routes are installed in the routing table group. To apply a policy to routes being imported into the routing table group, include the **import-policy** statement.

**Options** *group-name*—Name of the routing table group. The name must start with a letter and can include letters, numbers, and hyphens.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## route-record

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | route-record;   |
| <b>Hierarchy Level</b>          | [edit logical-systems <i>logical-system-name</i> routing-options],<br>[edit routing-options]  |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.                                    |
| <b>Description</b>              | Export the AS path and routing information to the traffic sampling process.<br><br>Before you can perform flow aggregation, the routing protocol process must export the AS path and routing information to the sampling process. |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <i>Enabling Flow Aggregation</i></li><li>• <i>Junos OS Services Interfaces Library for Routing Devices</i></li></ul>  |

## router-id

---

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | <code>router-id address;</code>  |
| <b>Hierarchy Level</b>     | [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options],<br>[edit logical-systems <i>logical-system-name</i> routing-options],<br>[edit routing-instances <i>routing-instance-name</i> routing-options],<br>[edit routing-options]  |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.<br>Statement introduced in Junos OS Release 12.3 for ACX Series routers.  |
| <b>Description</b>         | Specify the routing device's IP address.<br><br>The router identifier is used by BGP and OSPF to identify the routing device from which a packet originated. The router identifier usually is the IP address of the local routing device. If you do not configure a router identifier, the IP address of the first interface to come online is used. This is usually the loopback interface. Otherwise, the first hardware interface with an IP address is used. |

**NOTE:** We strongly recommend that you configure the router identifier under the [edit routing-options] hierarchy level to avoid unpredictable behavior if the interface address on a loopback interface changes.

For more information about the router identifier in OSPF, see [“Example: Configuring an OSPF Router Identifier” on page 4048](#).

You must configure a router-id in order for BGP and OSPF to function in a routing instance. Use the **show route instance detail** command to display the router-id value for a routing instance. If the router-id is **0.0.0.0**, then the routing instance has no router-id.

For more information about the router identifier in OSPF, see [“Example: Configuring an OSPF Router Identifier” on page 4048](#).

**NOTE:** If you run OSPF for IPv6 or BGP for IPv6 in a routing instance, you must configure an IPv4 router identifier (router-id) in the routing instance itself. In other words, the IPv4 router-id in the main routing instance is not inherited by other routing instances. Even if you run *only* IPv6 OSPF or BGP in a routing instance, the IPv4 router-id must be configured because OSPF and BGP, even when used exclusively with IPv6, use the IPv4 router-id for handshaking. If you do not configure the IPv4 router-id in the IPv6 OSPF or BGP routing instance, then the IPv6 protocols will use invalid IPv4 address 0.0.0.0 and the adjacencies and connections will fail.

|                                 |  |
|---------------------------------|--|
| <b>Options</b>                  | <p><b>address</b>—IP address of the routing device.</p> <p><b>Default:</b> Address of the first interface encountered by Junos OS</p>  |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |

## scope

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | scope <i>scope-name</i> {<br>interface [ <i>interface-names</i> ];<br>prefix <i>destination-prefix</i> ;<br>}   |
| <b>Hierarchy Level</b>          | [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast],<br>[edit logical-systems <i>logical-system-name</i> routing-options multicast],<br>[edit routing-instances <i>routing-instance-name</i> routing-options multicast],<br>[edit routing-options multicast] |
| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.<br>Statement introduced in Junos OS Release 12.3 for ACX Series routers.   |
| <b>Description</b>              | Configure multicast scoping.  |
| <b>Options</b>                  | <i>scope-name</i> —Name of the multicast scope.<br><br>The remaining statements are explained separately.   |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Example: Creating a Named Scope for Multicast Scoping</a></li></ul>   |

## scope-policy

**Syntax** `scope-policy [ policy-names ];`

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-options multicast],  
[edit routing-options multicast]

**NOTE:** You can configure a scope policy at these two hierarchy levels only. You cannot apply a scope policy to a specific routing instance, because all scoping policies are applied to all routing instances. However, you can apply the `scope` statement to a specific routing instance at the [edit routing-instances *routing-instance-name* routing-options multicast] or [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast] hierarchy level.

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.  
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description** Apply policies for scoping. The policy must be correctly configured at the **edit policy-options policy-statement** hierarchy level.

**Options** *policy-names*—Name of one or more multicast scope policies.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

- [scope on page 3038](#)

## static (Routes)

---

|                     |  |
|---------------------|--|
| Syntax              | <pre>static {   defaults {     static-options;   }   rib-group group-name;   route destination-prefix {     next-hop address;     next-hop options;     qualified-next-hop address {       metric metric;       preference preference;     }     static-options;   } }</pre>   |
| Hierarchy Level     | [edit routing-options],<br>[edit routing-options rib <i>routing-table-name</i> ]   |
| Release Information | Statement introduced in Junos OS Release 11.1 for the QFX Series.  |
| Description         | Configure static routes to be installed in the routing table. You can specify any number of routes within a single <b>static</b> statement, and you can specify any number of <b>static</b> options in the configuration.  |
| Options             | <p><b>defaults</b>—Specify global static route options. These options only set default attributes inherited by all newly created static routes. These are treated as global defaults and apply to all the static routes you configure in the <b>static</b> statement. This part of the <b>static</b> statement is optional.</p> <p><b>route destination-prefix</b>—Destination of the static route.</p> <ul style="list-style-type: none"><li>• <b>defaults</b>—For the default route to the destination. This is equivalent to specifying an IP address of <b>0.0.0.0/0</b>.</li><li>• <b>destination-prefix/prefix-length</b>—<b>destination-prefix</b> is the network portion of the IP address, and <b>prefix-length</b> is the destination prefix length.</li><li>• <b>next-hop address</b>—Reach the next-hop routing device by specifying an IP address, an interface name, or an ISO network entity title (NET).</li><li>• <b>nsap-prefix</b>—<b>nsap-prefix</b> is the network service access point (NSAP) address for ISO.</li></ul> <p><b>next-hop options</b>—Additional information for how to manage forwarding of packets to the next hop.</p> <ul style="list-style-type: none"><li>• <b>discard</b>—Do not forward packets addressed to this destination. Instead, drop the packets, do not send ICMP unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.</li></ul> |

- **iso-net**—Reach the next-hop routing device by specifying an ISO NSAP.
- **next-table *routing-table-name***—Name of the next routing table to the destination.
- **receive**—Install a receive route for this destination into the routing table.
- **reject**—Do not forward packets addressed to this destination. Instead, drop the packets, send ICMP unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.

**static-options**—(Optional under **route**) Additional information about static routes, which is included with the route when it is installed in the routing table.

You can specify one or more of the following in **static-options**. Each of the options is explained separately.

- **(active | passive);**
- **(install | no-install);**
- **(metric | metric2 | metric3 | metric4) *value* <type type>;**
- **(preference | preference2 | color | color2) *preference* <type type>;**
- **(resolve | no-resolve);**
- **(no-retain | retain);**

The remaining statements are explained separately.

|                                 |   |
|---------------------------------|---|
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration. |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Configuring Static Routing on page 2904</a></li> </ul>         |

## subscriber-leave-timer

---

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | <code>subscriber-leave-timer seconds;</code>  |
| <b>Hierarchy Level</b>          | [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast <a href="#">interface interface-name</a> ],<br>[edit logical-systems <i>logical-system-name</i> routing-options multicast <a href="#">interface interface-name</a> ],<br>[edit routing-instances <i>routing-instance-name</i> routing-options multicast <a href="#">interface interface-name</a> ],<br>[edit routing-options multicast <a href="#">interface interface-name</a> ] |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.2.<br>Statement introduced in Junos OS Release 9.2 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.<br>Statement introduced in Junos OS Release 12.3 for ACX Series routers.   |
| <b>Description</b>              | Length of time before the multicast VLAN updates QoS data (for example, available bandwidth) for subscriber interfaces after it receives an IGMP leave message.   |
| <b>Options</b>                  | <b>seconds</b> —Length of time before the multicast VLAN updates QoS data (for example, available bandwidth) for subscriber interfaces after it receives an IGMP leave message. Specifying a value of 0 results in an immediate update. This is the same as if the statement were not configured.<br><b>Range:</b> 0 through 30<br><b>Default:</b> 0 seconds  |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.   |

## threshold (Multicast Forwarding Cache)

---

|                          |  |
|--------------------------|--|
| Syntax                   | <pre>threshold {<br/>    log-warning <i>value</i>;<br/>    suppress <i>value</i> &lt;reuse <i>value</i>&gt;;<br/>}</pre>   |
| Hierarchy Level          | <pre>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i><br/>  routing-options multicast forwarding-cache],<br/>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i><br/>  routing-options multicast forwarding-cache family (inet   inet6)],<br/>[edit logical-systems <i>logical-system-name</i> routing-options multicast forwarding-cache],<br/>[edit logical-systems <i>logical-system-name</i> routing-options multicast forwarding-cache<br/>  family (inet   inet6)],<br/>[edit routing-instances <i>routing-instance-name</i> routing-options multicast forwarding-cache],<br/>[edit routing-instances <i>routing-instance-name</i> routing-options multicast forwarding-cache<br/>  (inet   inet6)],<br/>[edit routing-options multicast forwarding-cache],<br/>[edit routing-options multicast forwarding-cache family (inet   inet6)]</pre> |
| Release Information      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p>   |
| Description              | <p>Configure the global suppression, reuse, and warning log message thresholds for multicast forwarding cache limits. You can configure the thresholds globally for the multicast forwarding cache or individually for the IPv4 and IPv6 multicast forwarding caches. Configuring the <b>threshold</b> statement globally for the multicast forwarding cache or including the <b>family</b> statement to configure the thresholds for the IPv4 and IPv6 multicast forwarding caches are mutually exclusive.</p> <p>To confirm the configured threshold values, use the <b>show multicast forwarding-cache statistics</b> command.</p>  |
| Options                  | <p><b>reuse <i>value</i></b>—(Optional) Value at which to begin creating new multicast forwarding cache entries. If configured, this number should be less than the <b>suppress</b> value.</p> <p><b>Range:</b> 1 through 200,000</p> <p><b>suppress <i>value</i></b>—Value at which to begin suppressing new multicast forwarding cache entries. This value is mandatory. This number should be greater than the <b>reuse</b> value.</p> <p><b>Range:</b> 1 through 200,000</p> <p>The remaining statement is explained separately.</p>   |
| Required Privilege Level | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |
| Related Documentation    | <ul style="list-style-type: none"><li>• <i>Examples: Configuring the Multicast Forwarding Cache</i></li></ul>  |

## timeout (Flow Maps)

|                                 |   |
|---------------------------------|---|
| <b>Syntax</b>                   | timeout (never non-discard-entry-only   <i>minutes</i> );   |
| <b>Hierarchy Level</b>          | [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast <b>flow-map</b> <i>flow-map-name</i> ],<br>[edit logical-systems <i>logical-system-name</i> routing-options multicast <b>flow-map</b> <i>flow-map-name</i> ],<br>[edit routing-instances <i>routing-instance-name</i> routing-options multicast <b>flow-map</b> <i>flow-map-name</i> ],<br>[edit routing-options multicast <b>flow-map</b> <i>flow-map-name</i> ]   |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.2.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.<br>Statement introduced in Junos OS Release 12.3 for ACX Series routers.   |
| <b>Description</b>              | Configure the timeout value for multicast forwarding cache entries associated with the flow map.  |
| <b>Options</b>                  | <b>minutes</b> —Length of time that the forwarding cache entry remains active.<br><b>Range:</b> 1 through 720<br><br><b>never non-discard-entry-only</b> —Specify that the forwarding cache entry always remain active. If you omit the <b>non-discard-entry-only</b> option, all multicast forwarding entries, including those in forwarding and pruned states, are kept forever. If you include the <b>non-discard-entry-only</b> option, entries with forwarding states are kept forever, and entries with pruned states time out. |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.   |

## timeout (Multicast)

---

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | timeout <i>minutes</i> <family (inet   inet6)>;  |
| <b>Hierarchy Level</b>          | [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast forwarding-cache],<br>[edit logical-systems <i>logical-system-name</i> routing-options multicast forwarding-cache],<br>[edit routing-instances <i>routing-instance-name</i> routing-options multicast forwarding-cache],<br>[edit routing-options multicast forwarding-cache]  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.2.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.<br>Statement introduced in Junos OS Release 12.3 for ACX Series routers.  |
| <b>Description</b>              | Configure the timeout value for multicast forwarding cache entries.  |
| <b>Options</b>                  | <b>minutes</b> —Length of time that the forwarding cache limit remains active.<br><b>Range:</b> 1 through 720<br><br><b>family (inet   inet6)</b> —(Optional) Apply the configured timeout to either IPv4 or IPv6 multicast forwarding cache entries. Configuring the <b>timeout</b> statement globally for the multicast forwarding cache or including the <b>family</b> statement to configure the timeout value for the IPv4 and IPv6 multicast forwarding caches are mutually exclusive.<br><br><b>Default:</b> By default, the configured timeout applies to both IPv4 and IPv6 multicast forwarding cache entries. |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <i>Example: Configuring the Multicast Forwarding Cache</i></li></ul>   |

## traceoptions (Routing Options)

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | <pre> traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;disable&gt;; } </pre>  |
| <b>Hierarchy Level</b>     | <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options multicast],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options multicast],</p> <p>[edit routing-options],</p> <p>[edit routing-options flow],</p> <p>[edit routing-options multicast]</p>   |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p><b>nsr-synchronization</b> flag for BGP, IS-IS, LDP, and OSPF added in Junos OS Release 8.4.</p> <p><b>nsr-synchronization</b> and <b>nsr-packet</b> flags for BFD sessions added in Junos OS Release 8.5.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>nsr-synchronization</b> flag for RIP and RIPng added in Junos OS Release 9.0.</p> <p><b>nsr-synchronization</b> flag for Layer 2 VPNs and VPLS added in Junos OS Release 9.1.</p> <p><b>nsr-synchronization</b> flag for PIM added in Junos OS Release 9.3.</p> <p><b>nsr-synchronization</b> flag for MPLS added in Junos OS Release 10.1.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p><b>nsr-synchronization</b> flag for MSDP added in Junos OS Release 12.1.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p> |
| <b>Description</b>         | <p>Define tracing operations that track all routing protocol functionality in the routing device.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>  |
| <b>Default</b>             | If you do not include this statement, no global tracing operations are performed.  |
| <b>Options</b>             | <p><b>Values:</b></p> <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place global routing protocol tracing output in the file <b>routing-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and</p>   |

so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 10 files

**flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. These are the global routing protocol tracing options:

- **all**—All tracing operations
- **condition-manager**—Condition-manager events
- **config-internal**—Configuration internals
- **general**—All normal operations and routing table changes (a combination of the **normal** and **route** trace operations)
- **graceful-restart**—Graceful restart operations
- **normal**—All normal operations
- **nsr-packet**—Detailed trace information for BFD nonstop active routing only
- **nsr-synchronization**—Tracing operations for nonstop active routing
- **nsr-synchronization-detail**—(MPLS only) Tracing operations for nonstop active routing in detail
- **parse**—Configuration parsing
- **policy**—Routing policy operations and actions
- **regex-parse**—Regular-expression parsing
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

## upstream-interface

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>upstream-interface [ <i>interface-names</i> ];</code>  |
| <b>Hierarchy Level</b>          | <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast <b>pim-to-igmp-proxy</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast <b>pim-to-mld-proxy</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options multicast <b>pim-to-igmp-proxy</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options multicast <b>pim-to-mld-proxy</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options multicast <b>pim-to-igmp-proxy</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options multicast <b>pim-to-mld-proxy</b>],</p> <p>[edit routing-options multicast <b>pim-to-igmp-proxy</b>],</p> <p>[edit routing-options multicast <b>pim-to-mld-proxy</b>]</p> |
| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 9.6 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p>   |
| <b>Description</b>              | <p>Configure at least one, but not more than two, upstream interfaces on the rendezvous point (RP) routing device that resides between a customer edge-facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain. The RP routing device translates PIM join or prune messages into corresponding IGMP report or leave messages (if you include the <b>pim-to-igmp-proxy</b> statement), or into corresponding MLD report or leave messages (if you include the <b>pim-to-mld-proxy</b> statement). The routing device then proxies the IGMP or MLD report or leave messages to one or both upstream interfaces to forward IPv4 multicast traffic (for IGMP) or IPv6 multicast traffic (for MLD) across the PIM domains.</p>  |
| <b>Options</b>                  | <p><b><i>interface-names</i></b>—Names of one or two upstream interfaces to which the RP routing device proxies IGMP or MLD report or leave messages for transmission of multicast traffic across PIM domains. You can specify a maximum of two upstream interfaces on the RP routing device. To configure a set of two upstream interfaces, specify the full interface names, including all physical and logical address components, within square brackets ( [ ] ).</p>  |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |

# Administration

- [Routine Monitoring on page 3055](#)
- [Operational Commands on page 3057](#)

## Routine Monitoring

- [Monitoring Routing Information on page 3055](#)
- [Verifying That Virtual Router Routing Instances Are Working on page 3056](#)

### Monitoring Routing Information

- Purpose** Use the monitoring functionality to view the `inet.0` routing table on the routing device.
- Action** To view the routing table, enter the following commands in the CLI interface:
- `show route terse`
  - `show route detail`
- Meaning** [Table 272 on page 3055](#) describes the different filters, their functions, and the associated actions.
- [Table 273 on page 3056](#) summarizes key output fields in the routing information display.

Table 272: Filtering Route Messages

| Field               | Function   | Your Action                                 |
|---------------------|--|---|
| Destination Address | Specifies the destination address of the route.  | Enter the destination address.              |
| Next hop address    | Specifies the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it. | Enter the next hop address.                 |
| Best route          | Specifies only the best route available.   | Select the view details of the best route.  |
| Inactive routes     | Specifies the inactive routes.   | Select the view details of inactive routes. |
| Exact route         | Specifies the exact route.   | Select the view details of the exact route. |

Table 272: Filtering Route Messages (*continued*)

| Field         | Function   | Your Action   |
|---------------|--|---|
| Hidden routes | Specifies the hidden routes.                                     | Select the view details of hidden routes.                       |
| Search        | Applies the specified filter and displays the matching messages. | To apply the filter and display messages, click <b>Search</b> . |

Table 273: Summary of Key Routing Information Output Fields

| Field                  | Values   | Additional Information  |
|------------------------|--|---|
| Static Route Addresses | The list of static route addresses.  |   |
| Protocol               | Protocol from which the route was learned: <b>Static</b> , <b>Direct</b> , <b>Local</b> .                              |   |
| Preference             | The preference is the individual preference value for the route.   | The route preference is used as one of the route selection criteria.  |
| Next-Hop               | Network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it. | <p>If a next hop is listed as <b>Discard</b>, all traffic with that destination address is discarded rather than routed. This value generally means that the route is a static route for which the <b>discard</b> attribute has been set.</p> <p>If a next hop is listed as <b>Reject</b>, all traffic with that destination address is rejected. This value generally means that the address is unreachable. For example, if the address is a configured interface address and the interface is unavailable, traffic bound for that address is rejected.</p> <p>If a next hop is listed as <b>Local</b>, the destination is an address on the host (either the loopback address or Ethernet management port 0 address, for example).</p> |
| Age                    | How long the route has been active.  |   |
| State                  | Flags for this route.  | There are many possible flags.  |

## Verifying That Virtual Router Routing Instances Are Working

**Purpose** After creating a virtual router routing instance, verify that it has been set up properly.

**Action** 1. Use the **show route instance** command to list all the routing instances and their properties:

```
user@switch> show route instance
```

| Instance                    | Type           | Active/holddown/hidden |
|-----------------------------|----------------|------------------------|
| Primary RIB                 |                |                        |
| master                      | forwarding     |                        |
| inet.0                      |                | 4/0/1                  |
| __juniper_private1__        | forwarding     |                        |
| __juniper_private1__.inet.0 |                | 1/0/3                  |
| __juniper_private2__        | forwarding     |                        |
| __juniper_private2__.inet.0 |                | 0/0/1                  |
| __juniper_private3__        | forwarding     |                        |
| __juniper_private3__.inet.0 |                | 1/0/2                  |
| __juniper_private4__        | forwarding     |                        |
| __juniper_private4__.inet.0 |                | 4/0/2                  |
| __master.anon__             | forwarding     |                        |
| r1                          | virtual-router |                        |
| r2                          | virtual-router |                        |

- Use the **show route forwarding-table** command to view the forwarding table information for each routing instance:

```

user@switch> show route forwarding-table
Routing table: r1---qfabric.inet
Internet:
Destination      Type RtRef Next hop      Type Index NhRef Netif
default          perm  0      0              rjct 1628  1
0.0.0.0/32       perm  0      0              dscd 1626  1
224.0.0.0/4      perm  0      0              mdsc 1627  1
224.0.0.1/32     perm  0 224.0.0.1     mcst 1623  1
255.255.255.255/32 perm  0      0              bcst 1624  1

```

**Meaning** The output displays the routing table information and confirms that the virtual router routing instances have been created and the links are up.

| Release Information         | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br>Command introduced in Junos OS Release 11.3 for the QFX Series.  |
| Description                 | <p>Display the distribution of autonomous system (AS) paths that the local routing device is using (usually through the routing table). Use this command to debug problems for AS paths and to understand how AS paths have been manipulated through a policy (through the <b>as-path-prepend</b> action) or through aggregation.</p> <p>AS paths are stored in a hash table. A hash table is one method for fast lookup. Each entry in the table is called a bucket. Junos OS computes a hash value that indicates in which bucket the AS path is stored. The AS paths are dispersed among the hash buckets so that a manageable number of AS paths is stored in each bucket. Only unique AS paths are stored. Duplicate AS paths increase a reference count, but do not increase the number of AS paths stored in the hash table.</p> |
| Options                     | <p><b>none</b>—Display basic information about AS paths that the local routing device is using (same as brief).</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>  |

| <b>Syntax (EX Series Switches)</b> | show as-path summary  |
| <b>Release Information</b>         | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.   |
| <b>Description</b>                 | <p>Display autonomous system (AS) path summary information.</p> <p>AS paths are stored in a hash table. A hash table is one method for fast lookup. Each entry in the table is called a bucket. Junos OS computes a hash value that indicates in which bucket the AS path is stored. The AS paths are dispersed among the hash buckets so that a manageable number of AS paths is stored in each bucket. Only unique AS paths are stored. Duplicate AS paths increase a reference count, but do not increase the number of AS paths stored in the hash table.</p> |
| <b>Options</b>                     | <p><b>none</b>—(Optional) Display AS path summary information for all routing instances.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>  |

| <b>Output Fields</b>            | <p><a href="#">Table 278 on page 3071</a> describes the output fields for the <b>show ipv6 router-advertisement</b> command. Output fields are listed in the approximate order in which they appear.</p>   |

Table 278: show ipv6 router-advertisement Output Fields

| Field Name          | Field Description   |
|---------------------|---|
| Interface           | Name of the interface.  |
| Advertisements sent | Number of router advertisements sent and the elapsed time since they were sent. |

Table 278: show ipv6 router-advertisement Output Fields (*continued*)

| Field Name              | Field Description   |
|-------------------------|---|
| Solicits received       | Number of solicitation messages received.   |
| Advertisements received | Number of router advertisements received.   |
| Advertisements from     | Names of interfaces from which router advertisements have been received and the elapsed time since the last one was received. |
| Managed                 | Managed address configuration flag: 0 (stateless) or 1 (stateful).  |
| Other configuration     | Other stateful configuration flag: 0 (stateless) or 1 (stateful).   |
| Reachable time          | Time that a node identifies a neighbor as reachable after receiving a reachability confirmation, in milliseconds.             |
| Default lifetime        | Default lifetime, in seconds: from 0 seconds to 18.2 hours. A setting of 0 indicates that the router is not a default router. |
| Retransmit timer        | Time between retransmitted Neighbor Solicitation messages, in milliseconds.   |
| Current hop limit       | Configured current hop limit.   |
| Prefix                  | Name and length of the prefix.  |
| Valid lifetime          | How long the prefix remains valid for onlink determination.   |
| Preferred lifetime      | How long the prefix generated by stateless autoconfiguration remains preferred.   |
| On link                 | Onlink flag: 0 (not onlink) or 1 (onlink).  |
| Autonomous              | Autonomous address configuration flag: 0 (not autonomous) or 1 (autonomous).  |

## Sample Output

### show ipv6 router-advertisement

```

user@host> show ipv6 router-advertisement
Interface: fe-0/1/1.0
  Advertisements sent: 0
  Solicits received: 0
  Advertisements received: 0
Interface: fxp0.0
  Advertisements sent: 0
  Solicits received: 0
  Advertisements received: 1
  Advertisement from fe80::2d0:b7ff:fe1e:7b0e, heard 00:00:13 ago
  Managed: 0
  Other configuration: 0 [1]
  Reachable time: 0 ms
  Default lifetime: 1800 sec

```

```
Retransmit timer: 0 ms
Current hop limit: 64
```

#### show ipv6 router-advertisement conflicts

```
user@host> show ipv6 router-advertisement conflicts
Interface: fxp0.0
  Advertisement from fe80::2d0:b7ff:fe1e:7b0e, heard 00:01:08 ago
  Other configuration: 0 [1]
```

#### show ipv6 router-advertisement prefix

```
user@host> show ipv6 router-advertisement prefix 8040::/16
Interface: fe-0/1/3.0
  Advertisements sent: 3, last sent 00:04:11 ago
  Solicits received: 0
  Advertisements received: 3
  Advertisement from fe80::290:69ff:fe9a:5403, heard 00:00:05 ago
  Managed: 0
  Other configuration: 0
  Reachable time: 0 ms
  Default lifetime: 180 sec [1800 sec]
  Retransmit timer: 0 ms
  Current hop limit: 64
  Prefix: 8040:1::/64
    Valid lifetime: 2592000 sec
    Preferred lifetime: 604800 sec
    On link: 1
    Autonomous: 1
```

[show route destination-prefix on page 3078](#)

[show route extensive on page 3078](#)

**Output Fields** [Table 279 on page 3075](#) describes the output fields for the **show route** command. Output fields are listed in the approximate order in which they appear.

**Table 279: show route Output Fields**

| Field Name                 | Field Description  |
|----------------------------|--|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).   |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.  |
| <i>number routes</i>       | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive). A holddown route was once the active route and is no longer the active route. The route is in the holddown state because a protocol still has interest in the route, meaning that the interest bit is set. A protocol might have its interest bit set on the previously active route because the protocol is still advertising the route. The route will be deleted after all protocols withdraw their advertisement of the route and remove their interest bit. A persistent holddown state often means that the interested protocol is not releasing its interest bit properly.</li> </ul> <p>However, if you have configured advertisement of multiple routes (with the <b>add-path</b> or <b>advertise-inactive</b> statement), the holddown bit is most likely set because BGP is advertising the route as an active route. In this case, you can ignore the holddown state because nothing is wrong.</p> <ul style="list-style-type: none"> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul> |
| <i>destination-prefix</i>  | <p>Route destination (for example:10.0.0.1/24). Sometimes the route information is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only. For example, 10.1.1.195:NoCtrlWord:1:1:Local/96): <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul>  |

Table 279: show route Output Fields (*continued*)

| Field Name  | Field Description  |
|---|--|
| [ <i>protocol, preference</i> ]                   | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• - —A hyphen indicates the last active route.</li> <li>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>   |
| <i>weeks:days</i><br><i>hours:minutes:seconds</i> | How long the route been known (for example, <b>2w4d 13:11:14</b> , or 2 weeks, 4 days, 13 hours, 11 minutes, and 14 seconds).  |
| metric  | Cost value of the indicated route. For routes within an AS, the cost is determined by the IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.  |
| localpref   | Local preference value included in the route.  |
| from  | Interface from which the route was received.   |
| AS path   | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• I—IGP.</li> <li>• E—EGP.</li> <li>• ?—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• ( )—Parentheses enclose a confederation.</li> <li>• ( [ ] )—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |

Table 279: show route Output Fields (*continued*)

| Field Name              | Field Description  |
|-------------------------|--|
| <b>validation-state</b> | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>  |
| <b>to</b>               | <p>Next hop to the destination. An angle bracket (&gt;) indicates that the route is the selected route.</p> <p>If the destination is <b>Discard</b>, traffic is dropped.</p>   |
| <b>via</b>              | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> <li>• <b>lsp-path-name</b>—Name of the LSP used to reach the next hop.</li> <li>• <b>label-action</b>—MPLS label and operation occurring at the next hop. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label). For VPNs, expect to see multiple <b>push</b> operations, corresponding to the inner and outer labels required for VPN routes (in the case of a direct PE-to-PE connection, the VPN route would have the inner label push only).</li> </ul> |

## Sample Output

### show route

```

user@host> show route
inet.0: 11 destinations, 12 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

1:65500:1:10.0.0.20/240
    *[MVPN/70] 19:53:41, metric2 1
    Indirect
1:65500:1:10.0.0.40/240
    *[BGP/170] 19:53:29, localpref 100, from 10.0.0.30
    AS path: I
    > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
    [BGP/170] 19:53:26, localpref 100, from 10.0.0.33
    AS path: I
    > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
1:65500:1:10.0.0.60/240
    *[BGP/170] 19:53:29, localpref 100, from 10.0.0.30

```

```

AS path: I
> to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF
[BGP/170] 19:53:25, localpref 100, from 10.0.0.33
AS path: I
> to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF

```

## show route

The following sample output shows a VPN route with composite next hops enabled. The first **Push** operation corresponds to the outer label. The second **Push** operation corresponds to the inner label.

```

user@host> show route 70.0.0.0

13979:665001.inet.0: 871 destinations, 3556 routes (871 active, 0 holddown, 0
hidden)
+ = Active Route, - = Last Active, * = Both

70.0.0.0/24      @[BGP/170] 00:28:32, localpref 100, from 10.9.9.160
                  AS path: 13980 ?, validation-state: unverified
                  > to 10.100.0.42 via ae2.0, Push 16, Push 300368(top)

| Output Fields                            | <a href="#">Table 280 on page 3099</a> lists the output fields for the <b>show route damping</b> command. Output fields are listed in the approximate order in which they appear.   |

Table 280: show route damping Output Fields

| Field Name                                   | Field Description   | Level of Output         |
|--|---|-------------------------|
| <i>routing-table-name</i>                    | Name of the routing table—for example, <b>inet.0</b> .  | All levels              |
| <b>destinations</b>                          | Number of destinations for which there are routes in the routing table.   | All levels              |
| <b>number routes</b>                         | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b></li> <li>• <b>holdddown</b> (routes that are in a pending state before being declared inactive)</li> <li>• <b>hidden</b> (the routes are not used because of a routing policy)</li> </ul>  | All levels              |
| <b>destination-prefix (entry, announced)</b> | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.   | <b>detail extensive</b> |
| <b>[protocol, preference]</b>                | Protocol from which the route was learned and the preference value for the route. <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p> | All levels              |
| <b>Next-hop reference count</b>              | Number of references made to the next hop.  | <b>detail extensive</b> |
| <b>Source</b>                                | IP address of the route source.   | <b>detail extensive</b> |
| <b>Next hop</b>                              | Network layer address of the directly reachable neighboring system.   | <b>detail extensive</b> |
| <b>via</b>                                   | Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b> .  | <b>detail extensive</b> |
| <b>Protocol next hop</b>                     | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.  | <b>detail extensive</b> |
| <b>Indirect next hop</b>                     | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.   | <b>detail extensive</b> |
| <b>State</b>                                 | Flags for this route. For a description of possible values for this field, see the output field table for the <a href="#">show route detail</a> command.  | <b>detail extensive</b> |

Table 280: show route damping Output Fields (*continued*)

| Field Name        | Field Description   | Level of Output  |
|-------------------|---|------------------|
| Local AS          | AS number of the local routing device.  | detail extensive |
| Peer AS           | AS number of the peer routing device.   | detail extensive |
| Age               | How long the route has been known.  | detail extensive |
| Metric            | Metric for the route.   | detail extensive |
| Task              | Name of the protocol that has added the route.  | detail extensive |
| Announcement bits | List of protocols that announce this route. <i>n-Resolve inet</i> indicates that the route is used for route resolution for next hops found in the routing table. <i>n</i> is an index used by Juniper Networks customer support only.  | detail extensive |
| AS path           | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• I—IGP.</li> <li>• E—EGP.</li> <li>• ?—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device or if AS path prepending is configured.</li> <li>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• ( )—Parentheses enclose a confederation.</li> <li>• ( [ ] )—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> | All levels       |
| to                | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.   | brief none       |
| via               | Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b> .  | brief none       |
| Communities       | Community path attribute for the route. See the output field table for the <a href="#">show route detail</a> command.   | detail extensive |
| Localpref         | Local preference value included in the route.   | All levels       |
| Router ID         | BGP router ID as advertised by the neighbor in the open message.  | detail extensive |

Table 280: show route damping Output Fields (*continued*)

| Field Name                     | Field Description  | Level of Output         |
|--------------------------------|--|-------------------------|
| <b>Merit (last update/now)</b> | Last updated and current figure-of-merit value.  | <b>detail extensive</b> |
| <b>damping-parameters</b>      | Name that identifies the damping parameters used, which is defined in the damping statement at the <b>[edit policy-options]</b> hierarchy level.                         | <b>detail extensive</b> |
| <b>Last update</b>             | Time of most recent change in path attributes.   | <b>detail extensive</b> |
| <b>First update</b>            | Time of first change in path attributes, which started the route damping process.  | <b>detail extensive</b> |
| <b>Flaps</b>                   | Number of times the route has gone up or down or its path attributes have changed.   | <b>detail extensive</b> |
| <b>Suppressed</b>              | ( <b>suppressed</b> keyword only) This route is currently suppressed. A suppressed route does not appear in the forwarding table and routing protocols do not export it. | All levels              |
| <b>Reusable in</b>             | ( <b>suppressed</b> keyword only) Time when a suppressed route will again be available.  | All levels              |
| <b>Preference will be</b>      | ( <b>suppressed</b> keyword only) Preference value that will be applied to the route when it is again active.  | All levels              |

## Sample Output

### show route damping decayed detail

```

user@host> show route damping decayed detail
inet.0: 173319 destinations, 1533668 routes (172625 active, 4 holddown, 108083
hidden)
10.0.111.0/24 (7 entries, 1 announced)

| <b>Output Fields</b>               | Table 281 on page 3103 describes the output fields for the <b>show route detail</b> command. Output fields are listed in the approximate order in which they appear.  |

Table 281: show route detail Output Fields

| Field Name                 | Field Description   |
|----------------------------|---|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).  |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.   |
| <i>number routes</i>       | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active)</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul> |

Table 281: show route detail Output Fields (*continued*)

| Field Name                                     | Field Description   |
|--|---|
| <i>route-destination</i><br>(entry, announced) | <p>Route destination (for example:10.0.0.1/24). The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul> |
| <b>label stacking</b>                          | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>  |
| <i>[protocol, preference]</i>                  | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+—</b>A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>- —</b>A hyphen indicates the last active route.</li> <li>• <b>*—</b>An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>   |
| <b>Level</b>                                   | <p>(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.</p>  |
| <b>Route Distinguisher</b>                     | IP subnet augmented with a 64-bit prefix.   |
| <b>PMSI</b>                                    | Provider multicast service interface (MVPN routing table).  |
| <b>Next-hop type</b>                           | Type of next hop. For a description of possible values for this field, see <a href="#">Table 282 on page 3108</a> .   |

Table 281: show route detail Output Fields (*continued*)

| Field Name   | Field Description   |
|--|---|
| <b>Next-hop reference count</b>                      | Number of references made to the next hop.  |
| <b>Flood nexthop branches exceed maximum message</b> | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.   |
| <b>Source</b>  | IP address of the route source.   |
| <b>Next hop</b>                                      | Network layer address of the directly reachable neighboring system.   |
| <b>via</b>   | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul> |
| <b>Label-switched-path<br/>lsp-path-name</b>         | Name of the LSP used to reach the next hop.   |
| <b>Label operation</b>                               | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).  |
| <b>Interface</b>                                     | (Local only) Local interface name.  |
| <b>Protocol next hop</b>                             | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.  |
| <b>Indirect next hop</b>                             | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.   |
| <b>State</b>   | State of the route (a route can be in more than one state). See <a href="#">Table 283 on page 3109</a> .  |
| <b>Local AS</b>                                      | AS number of the local routing device.  |
| <b>Age</b>   | How long the route has been known.  |
| <b>AIGP</b>  | Accumulated interior gateway protocol (AIGP) BGP attribute.   |
| <b>Metricn</b>                                       | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.   |

Table 281: show route detail Output Fields (*continued*)

| Field Name                 | Field Description   |
|----------------------------|---|
| <b>MED-plus-IGP</b>        | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.   |
| <b>TTL-Action</b>          | <p>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</p> <p>For sample output, see <a href="#">show route table</a>.</p>   |
| <b>Task</b>                | Name of the protocol that has added the route.  |
| <b>Announcement bits</b>   | List of protocols that announce this route. <b>n-Resolve inet</b> indicates that the route is used for route resolution for next hops found in the routing table. <b>n</b> is an index used by Juniper Networks customer support only.  |
| <b>AS path</b>             | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.</li> <li>• <b>[ ]</b>—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| <b>validation-state</b>    | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>   |
| <b>FECs bound to route</b> | Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.   |

Table 281: show route detail Output Fields (*continued*)

| Field Name                | Field Description   |
|---------------------------|---|
| Primary Upstream          | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path. |
| RPF Nexthops              | When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.   |
| Label                     | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.                         |
| weight                    | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.  |
| VC Label                  | MPLS label assigned to the Layer 2 circuit virtual connection.  |
| MTU                       | Maximum transmission unit (MTU) of the Layer 2 circuit.   |
| VLAN ID                   | VLAN identifier of the Layer 2 circuit.   |
| Prefixes bound to route   | Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.  |
| Communities               | Community path attribute for the route. See <a href="#">Table 284 on page 3111</a> for all possible values for this field.  |
| Layer2-info: encaps       | Layer 2 encapsulation (for example, VPLS).  |
| control flags             | Control flags: <b>none</b> or <b>Site Down</b> .  |
| mtu                       | Maximum transmission unit (MTU) information.  |
| Label-Base, range         | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.  |
| status vector             | Layer 2 VPN and VPLS network layer reachability information (NLRI).   |
| Accepted Multipath        | Current active path when BGP multipath is configured.   |
| Accepted MultipathContrib | Path currently contributing to BGP multipath.   |
| Localpref                 | Local preference value included in the route.   |
| Router ID                 | BGP router ID as advertised by the neighbor in the open message.  |
| Primary Routing Table     | In a routing table group, the name of the primary routing table in which the route resides.   |
| Secondary Tables          | In a routing table group, the name of one or more secondary tables in which the route resides.  |

Table 282 on page 3108 describes all possible values for the Next-hop Types output field.

**Table 282: Next-hop Types Output Field Values**

| Next-Hop Type                   | Description  |
|---------------------------------|--|
| <b>Broadcast (bcast)</b>        | Broadcast next hop.  |
| <b>Deny</b>                     | Deny next hop.   |
| <b>Discard</b>                  | Discard next hop.  |
| <b>Flood</b>                    | Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast. |
| <b>Hold</b>                     | Next hop is waiting to be resolved into a unicast or multicast type.   |
| <b>Indexed (idxd)</b>           | Indexed next hop.  |
| <b>Indirect (indr)</b>          | Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.   |
| <b>Interface</b>                | Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.   |
| <b>Local (locl)</b>             | Local address on an interface. This next-hop type causes packets with this destination address to be received locally.   |
| <b>Multicast (mcst)</b>         | Wire multicast next hop (limited to the LAN).  |
| <b>Multicast discard (mdsc)</b> | Multicast discard.   |
| <b>Multicast group (mgrp)</b>   | Multicast group member.  |
| <b>Receive (recv)</b>           | Receive.   |
| <b>Reject (rjct)</b>            | Discard. An ICMP unreachable message was sent.   |
| <b>Resolve (rslv)</b>           | Resolving next hop.  |
| <b>Routed multicast (mcrt)</b>  | Regular multicast next hop.  |

Table 282: Next-hop Types Output Field Values (*continued*)

| Next-Hop Type         | Description  |
|-----------------------|--|
| <b>Router</b>         | <p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> <li>• Must not be a direct or local subnet for the routing device.</li> <li>• Must have a next hop that is directly connected to the routing device.</li> </ul> |
| <b>Table</b>          | Routing table next hop.  |
| <b>Unicast (ucst)</b> | Unicast.   |
| <b>Unilist (ulst)</b> | List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.  |

Table 283 on page 3109 describes all possible values for the State output field. A route can be in more than one state (for example, <Active NoReadvrt Int Ext>).

Table 283: State Output Field Values

| Value  | Description  |
|--|--|
| <b>Accounting</b>                            | Route needs accounting.  |
| <b>Active</b>                                | Route is active.   |
| <b>Always Compare MED</b>                    | Path with a lower multiple exit discriminator (MED) is available.                |
| <b>AS path</b>                               | Shorter AS path is available.  |
| <b>Cisco Non-deterministic MED selection</b> | Cisco nondeterministic MED is enabled, and a path with a lower MED is available. |
| <b>Clone</b>                                 | Route is a clone.  |
| <b>Cluster list length</b>                   | Length of cluster list sent by the route reflector.                              |
| <b>Delete</b>                                | Route has been deleted.  |
| <b>Ex</b>                                    | Exterior route.  |
| <b>Ext</b>                                   | BGP route received from an external BGP neighbor.                                |

Table 283: State Output Field Values (*continued*)

| Value  | Description  |
|--|--|
| <b>FlashAll</b>  | Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes. |
| <b>Hidden</b>  | Route not used because of routing policy.  |
| <b>IfCheck</b>   | Route needs forwarding RPF check.  |
| <b>IGP metric</b>  | Path through next hop with lower IGP metric is available.  |
| <b>Inactive reason</b>                                   | Flags for this route, which was not selected as best for a particular destination.   |
| <b>Initial</b>   | Route being added.   |
| <b>Int</b>   | Interior route.  |
| <b>Int Ext</b>   | BGP route received from an internal BGP peer or a BGP confederation peer.  |
| <b>Interior &gt; Exterior &gt; Exterior via Interior</b> | Direct, static, IGP, or EBGP path is available.  |
| <b>Local Preference</b>                                  | Path with a higher local preference value is available.  |
| <b>Martian</b>   | Route is a martian (ignored because it is obviously invalid).  |
| <b>MartianOK</b>   | Route exempt from martian filtering.   |
| <b>Next hop address</b>                                  | Path with lower metric next hop is available.  |
| <b>No difference</b>                                     | Path from neighbor with lower IP address is available.   |
| <b>NoReadvrt</b>   | Route not to be advertised.  |
| <b>NotBest</b>   | Route not chosen because it does not have the lowest MED.  |
| <b>Not Best in its group</b>                             | Incoming BGP AS is not the best of a group (only one AS can be the best).  |
| <b>NotInstall</b>  | Route not to be installed in the forwarding table.   |
| <b>Number of gateways</b>                                | Path with a greater number of next hops is available.  |
| <b>Origin</b>  | Path with a lower origin code is available.  |
| <b>Pending</b>   | Route pending because of a hold-down configured on another route.  |

Table 283: State Output Field Values (*continued*)

| Value                                 | Description   |
|---------------------------------------|---|
| <b>Release</b>                        | Route scheduled for release.  |
| <b>RIB preference</b>                 | Route from a higher-numbered routing table is available.  |
| <b>Route Distinguisher</b>            | 64-bit prefix added to IP subnets to make them unique.  |
| <b>Route Metric or MED comparison</b> | Route with a lower metric or MED is available.  |
| <b>Route Preference</b>               | Route with lower preference value is available  |
| <b>Router ID</b>                      | Path through a neighbor with lower ID is available.   |
| <b>Secondary</b>                      | Route not a primary route.  |
| <b>Unusable path</b>                  | Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> <li>• The route is damped.</li> <li>• The route is rejected by an import policy.</li> <li>• The route is unresolved.</li> </ul> |
| <b>Update source</b>                  | Last tiebreaker is the lowest IP address value.   |

Table 284 on page 3111 describes the possible values for the Communities output field.

Table 284: Communities Output Field Values

| Value   | Description   |
|---|---|
| <i>area-number</i>                                      | 4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.  |
| <b>bandwidth: local AS number:link-bandwidth-number</b> | Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute. |
| <b>domain-id</b>  | Unique configurable number that identifies the OSPF domain.   |
| <b>domain-id-vendor</b>                                 | Unique configurable number that further identifies the OSPF domain.   |
| <i>link-bandwidth-number</i>                            | Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second).   |
| <i>local AS number</i>                                  | Local AS number: from 1 through 65,535.   |
| <i>options</i>  | 1 byte. Currently this is only used if the route type is 5 or 7. Setting the least significant bit in the field indicates that the route carries a type 2 metric.   |

Table 284: Communities Output Field Values (*continued*)

| Value                                | Description   |
|--------------------------------------|---|
| <b>origin</b>                        | (Used with VPNs) Identifies where the route came from.  |
| <b>ospf-route-type</b>               | 1 byte, encoded as 1 or 2 for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); 3 for summary routes; 5 for external routes (area number must be 0); 7 for NSSA routes; or 129 for sham link endpoint addresses. |
| <b>route-type-vendor</b>             | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x8000</b> . The format is <b>area-number:ospf-route-type:options</b> .  |
| <b>rte-type</b>                      | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x0306</b> . The format is <b>area-number:ospf-route-type:options</b> .  |
| <b>target</b>                        | Defines which VPN the route participates in; <b>target</b> has the format <b>32-bit IP address:16-bit number</b> . For example, 10.19.0.0:100.  |
| <b>unknown IANA</b>                  | Incoming IANA codes with a value between <b>0x1</b> and <b>0x7fff</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.  |
| <b>unknown OSPF vendor community</b> | Incoming IANA codes with a value above <b>0x8000</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.   |

| <b>Output Fields</b>               | <a href="#">Table 285 on page 3122</a> lists the output fields for the <b>show route export</b> command. Output fields are listed in the approximate order in which they appear.  |

Table 285: show route export Output Fields

| Field Name                 | Field Description   | Level of Output   |
|----------------------------|---|-------------------|
| Table or <i>table-name</i> | Name of the routing tables that either import or export routes.   | All levels        |
| Routes                     | Number of routes exported from this table into other tables. If a particular route is exported to different tables, the counter will only increment by one. | <b>brief</b> none |

Table 285: show route export Output Fields (*continued*)

| Field Name    | Field Description   | Level of Output   |
|---------------|---|-------------------|
| Export        | Whether the table is currently exporting routes to other tables: <b>Y</b> or <b>N</b> (Yes or No).  | <b>brief</b> none |
| Import        | Tables currently importing routes from the originator table. (Not displayed for tables that are not exporting any routes.)  | <b>detail</b>     |
| Flags         | ( <b>instance</b> keyword only) Flags for this feature on this instance: <ul style="list-style-type: none"> <li><b>config auto-policy</b>—The policy was deduced from the configured IGP export policies.</li> <li><b>cleanup</b>—Configuration information for this instance is no longer valid.</li> <li><b>config</b>—The instance was explicitly configured.</li> </ul> | <b>detail</b>     |
| Options       | ( <b>instance</b> keyword only) Configured option displays the type of routing tables the feature handles: <ul style="list-style-type: none"> <li><b>unicast</b>—Indicates <i>instance.inet.0</i>.</li> <li><b>multicast</b>—Indicates <i>instance.inet.2</i>.</li> <li><b>unicast multicast</b>—Indicates <i>instance.inet.0</i> and <i>instance.inet.2</i>.</li> </ul>    | <b>detail</b>     |
| Import policy | ( <b>instance</b> keyword only) Policy that <b>route export</b> uses to construct the import-export matrix. Not displayed if the instance type is <b>vrf</b> .  | <b>detail</b>     |
| Instance      | ( <b>instance</b> keyword only) Name of the routing instance.   | <b>detail</b>     |
| Type          | ( <b>instance</b> keyword only) Type of routing instance: <b>forwarding</b> , <b>non-forwarding</b> , or <b>vrf</b> .   | <b>detail</b>     |

| <b>Output Fields</b>               | Table 286 on page 3125 describes the output fields for the <b>show route extensive</b> command. Output fields are listed in the approximate order in which they appear.  |

**Table 286: show route extensive Output Fields**

| Field Name                 | Field Description   |
|----------------------------|---|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                        |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table. |

Table 286: show route extensive Output Fields (*continued*)

| Field Name                                     | Field Description   |
|--|---|
| <i>number routes</i>                           | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive).</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul>   |
| <i>route-destination</i><br>(entry, announced) | <p>Route destination (for example: 10.0.0.1/24). The <b>entry</b> value is the number of route for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul> |
| <b>TSI</b>                                     | Protocol header information.  |
| <b>label stacking</b>                          | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of two or more exits this router with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>  |
| <b>[protocol, preference]</b>                  | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>  |

Table 286: show route extensive Output Fields (*continued*)

| Field Name   | Field Description   |
|--|---|
| <b>Level</b>   | (IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.   |
| <b>Route Distinguisher</b>                           | IP subnet augmented with a 64-bit prefix.   |
| <b>PMSI</b>  | Provider multicast service interface (MVPN routing table).  |
| <b>Next-hop type</b>                                 | Type of next hop. For a description of possible values for this field, see the Output Field table in the <a href="#">show route detail</a> command.   |
| <b>Next-hop reference count</b>                      | Number of references made to the next hop.  |
| <b>Flood nexthop branches exceed maximum message</b> | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.   |
| <b>Source</b>  | IP address of the route source.   |
| <b>Next hop</b>                                      | Network layer address of the directly reachable neighboring system.   |
| <b>via</b>   | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul> |
| <b>Label-switched-path lsp-path-name</b>             | Name of the LSP used to reach the next hop.   |
| <b>Label operation</b>                               | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).  |
| <b>Offset</b>  | Whether the metric has been increased or decreased by an offset value.  |
| <b>Interface</b>                                     | (Local only) Local interface name.  |
| <b>Protocol next hop</b>                             | Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.  |

Table 286: show route extensive Output Fields (*continued*)

| Field Name                    | Field Description  |
|-------------------------------|--|
| <b><i>label-operation</i></b> | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).   |
| <b>Indirect next hops</b>     | <p>When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved.</p> <p>When BGP PIC Edge is enabled, the output lines that contain <b>Indirect next hop: weight</b> follow next hops that the software can use to repair paths where a link failure occurs. The next-hop weight has one of the following values:</p> <ul style="list-style-type: none"> <li>• 0x1 indicates active next hops.</li> <li>• 0x4000 indicates passive next hops.</li> </ul> |
| <b>State</b>                  | State of the route (a route can be in more than one state). See the Output Field table in the <a href="#">show route detail</a> command.   |
| <b>Session ID</b>             | The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA).  |
| <b>Weight</b>                 | <p>Weight for the backup path. If the weight of an indirect next hop is larger than zero, the weight value is shown.</p> <p>For sample output, see <a href="#">show route table</a>.</p>   |

Table 286: show route extensive Output Fields (*continued*)

| Field Name      | Field Description   |
|-----------------|---|
| Inactive reason | <p>If the route is inactive, the reason for its current state is indicated. Typical reasons include:</p> <ul style="list-style-type: none"> <li>• <b>Active preferred</b>—Currently active route was selected over this route.</li> <li>• <b>Always compare MED</b>—Path with a lower multiple exit discriminator (MED) is available.</li> <li>• <b>AS path</b>—Shorter AS path is available.</li> <li>• <b>Cisco Non-deterministic MED selection</b>—Cisco nondeterministic MED is enabled and a path with a lower MED is available.</li> <li>• <b>Cluster list length</b>—Path with a shorter cluster list length is available.</li> <li>• <b>Forwarding use only</b>—Path is only available for forwarding purposes.</li> <li>• <b>IGP metric</b>—Path through the next hop with a lower IGP metric is available.</li> <li>• <b>IGP metric type</b>—Path with a lower OSPF link-state advertisement type is available.</li> <li>• <b>Interior &gt; Exterior &gt; Exterior via Interior</b>—Direct, static, IGP, or EBGP path is available.</li> <li>• <b>Local preference</b>—Path with a higher local preference value is available.</li> <li>• <b>Next hop address</b>—Path with a lower metric next hop is available.</li> <li>• <b>No difference</b>—Path from a neighbor with a lower IP address is available.</li> <li>• <b>Not Best in its group</b>—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed).</li> <li>• <b>Number of gateways</b>—Path with a higher number of next hops is available.</li> <li>• <b>Origin</b>—Path with a lower origin code is available.</li> <li>• <b>OSPF version</b>—Path does not support the indicated OSPF version.</li> <li>• <b>RIB preference</b>—Route from a higher-numbered routing table is available.</li> <li>• <b>Route distinguisher</b>—64-bit prefix added to IP subnets to make them unique.</li> <li>• <b>Route metric or MED comparison</b>—Route with a lower metric or MED is available.</li> <li>• <b>Route preference</b>—Route with a lower preference value is available.</li> <li>• <b>Router ID</b>—Path through a neighbor with a lower ID is available.</li> <li>• <b>Unusable path</b>—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved.</li> <li>• <b>Update source</b>—Last tiebreaker is the lowest IP address value.</li> </ul> |
| Local AS        | Autonomous system (AS) number of the local routing device.  |
| Age             | How long the route has been known.  |
| AIGP            | Accumulated interior gateway protocol (AIGP) BGP attribute.   |
| Metric          | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.   |
| MED-plus-IGP    | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.   |
| TTL-Action      | <p>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</p> <p>For sample output, see <a href="#">show route table</a>.</p>   |

Table 286: show route extensive Output Fields (*continued*)

| Field Name                           | Field Description   |
|--------------------------------------|---|
| <b>Task</b>                          | Name of the protocol that has added the route.  |
| <b>Announcement bits</b>             | List of protocols that announce this route. <b>n-Resolve inet</b> indicates that the route is used for route resolution for next hops found in the routing table. <b>n</b> is an index used by Juniper Networks customer support only.  |
| <b>AS path</b>                       | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| <b>validation-state</b>              | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>  |
| <b>FECs bound to route</b>           | Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.   |
| <b>AS path: I &lt;Originator&gt;</b> | (For route reflected output only) Originator ID attribute set by the route reflector.   |
| <b>Primary Upstream</b>              | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.   |
| <b>RPF Nexthops</b>                  | When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.   |

Table 286: show route extensive Output Fields (*continued*)

| Field Name              | Field Description  |
|-------------------------|--|
| Label                   | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.                      |
| weight                  | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.   |
| VC Label                | MPLS label assigned to the Layer 2 circuit virtual connection.   |
| MTU                     | Maximum transmission unit (MTU) of the Layer 2 circuit.  |
| VLAN ID                 | VLAN identifier of the Layer 2 circuit.  |
| Cluster list            | (For route reflected output only) Cluster ID sent by the route reflector.  |
| Originator ID           | (For route reflected output only) Address of router that originally sent the route to the route reflector.   |
| Prefixes bound to route | Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.   |
| Communities             | Community path attribute for the route. See the Output Field table in the <a href="#">show route detail</a> command for all possible values for this field.  |
| Layer2-info: encaps     | Layer 2 encapsulation (for example, VPLS).   |
| control flags           | Control flags: <b>none</b> or Site Down.   |
| mtu                     | Maximum transmission unit (MTU) information.   |
| Label-Base, range       | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.   |
| status vector           | Layer 2 VPN and VPLS network layer reachability information (NLRI).  |
| Localpref               | Local preference value included in the route.  |
| Router ID               | BGP router ID as advertised by the neighbor in the open message.   |
| Primary Routing Table   | In a routing table group, the name of the primary routing table in which the route resides.  |
| Secondary Tables        | In a routing table group, the name of one or more secondary tables in which the route resides.   |
| Originating RIB         | Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of inet.0 resolving through inet.0 and inet.3, this field indicates which routing table, inet.0 or inet.3, provided the best path for a particular prefix. |
| Node path count         | Number of nodes in the path.   |

Table 286: show route extensive Output Fields (*continued*)

| Field Name                 | Field Description   |
|----------------------------|---|
| <b>Forwarding nexthops</b> | Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it. |

## Sample Output

### show route extensive

```

user@host> show route extensive
inet.0: 22 destinations, 23 routes (21 active, 0 holddown, 1 hidden)

|---------------------------|--|-----------------|
| <i>routing-table-name</i> | Name of the routing table (for example, inet.0). | All levels      |
| <i>prefix</i>             | Route address.                                   | All levels      |
| Active unicast route      | Active route in the routing table.               | All levels      |

Table 287: show route flow validation Output Fields (*continued*)

| Field Name                  | Field Description   | Level of Output |
|-----------------------------|---|-----------------|
| Dependent flow destinations | Number of flows for which there are routes in the routing table.        | All levels      |
| Origin                      | Source of the route flow.   | All levels      |
| Neighbor AS                 | Autonomous system identifier of the neighbor.                           | All levels      |
| Flow destination            | Number of entries and number of destinations that match the route flow. | All levels      |
| Unicast best match          | Destination that is the best match for the route flow.                  | All levels      |
| Flags                       | Information about the route flow.                                       | All levels      |

## Sample Output

### show route flow validation

```

user@host> show route flow validation
inet.0:
10.0.5.0/24Active unicast route
Dependent flow destinations: 1
Origin: 192.168.224.218, Neighbor AS: 65001
Flow destination (3 entries, 1 match origin)
Unicast best match: 10.0.5.0/24
Flags: SubtreeApex Consistent

```

## show route forwarding-table

| <b>Release Information</b>                           | Command introduced before Junos OS Release 7.4.<br>Option <b>bridge-domain</b> introduced in Junos OS Release 7.5<br>Option <b>learning-vlan-id</b> introduced in Junos OS Release 8.4  |

Options **all** and **vlan** introduced in Junos OS Release 9.6.  
 Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

**NOTE:** The Routing Engine copies the forwarding table to the Packet Forwarding Engine, the part of the router that is responsible for forwarding packets. To display the entries in the Packet Forwarding Engine's forwarding table, use the **show pfe route** command.

**Options** **none**—Display the routes in the forwarding tables. By default, the **show route forwarding-table** command does not display information about private, or internal, forwarding tables.

**detail | extensive | summary**—(Optional) Display the specified level of output.

**all**—(Optional) Display routing table entries for all forwarding tables, including private, or internal, tables.

**bridge-domain (all | bridge-domain-name)**—(MX Series routers only) (Optional) Display route entries for all bridge domains or the specified bridge domain.

**ccc interface-name**—(Optional) Display route entries for the specified circuit cross-connect interface.

**destination destination-prefix**—(Optional) Destination prefix.

**family family**—(Optional) Display routing table entries for the specified family: **fibre-channel**, **fmembers**, **inet**, **inet6**, **iso**, **mpls**, **tnp**, **unix**, **vpls**, or **vlan-classification**.

**interface-name interface-name**—(Optional) Display routing table entries for the specified interface.

**label name**—(Optional) Display route entries for the specified label.

**lcc number**—(TX Matrix and TX matrix Plus routers only) (Optional) On a routing matrix composed of a TX Matrix router and T640 routers, display information for the specified T640 router (or line-card chassis) connected to the TX Matrix router. On a routing matrix composed of the TX Matrix Plus router and T1600 or T4000 routers, display information for the specified router (line-card chassis) connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**learning-vlan-id** *learning-vlan-id*—(MX Series routers only) (Optional) Display learned information for all VLANs or for the specified VLAN.

**matching** *matching*—(Optional) Display routing table entries matching the specified prefix or prefix length.

**multicast**—(Optional) Display routing table entries for multicast routes.

**table** (**default** | *logical-system-name/routing-instance-name* | *routing-instance-name*)—(Optional) Display route entries for all the routing tables in the main routing instance or for the specified routing instance. If your device supports logical systems, you can also display route entries for the specified logical system and routing instance. To view the routing instances on your device, use the [show route instance](#) command.

**vlan** (**all** | *vlan-name*)—(Optional) Display information for all VLANs or for the specified VLAN.

**vpn** *vpn*—(Optional) Display routing table entries for a specified VPN.

**Required Privilege Level**

view

**Output Fields** [Table 288 on page 3147](#) lists the output fields for the **show route forwarding-table** command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified, or when the **detail** keyword is used instead of the **extensive** keyword.

**Table 288: show route forwarding-table Output Fields**

| Field Name              | Field Description  | Level of Output         |
|-------------------------|--|-------------------------|
| Logical system          | Name of the logical system. This field is displayed if you specify the <b>table logical-system-name/routing-instance-name</b> option on a device that is configured for and supports logical systems.  | All levels              |
| Routing table           | Name of the routing table (for example, inet, inet6, mpls).  | All levels              |
| Address family          | Address family (for example, IP, IPv6, ISO, MPLS, and VPLS).   | All levels              |
| Destination             | Destination of the route.  | <b>detail extensive</b> |
| Route Type (Type)       | How the route was placed into the forwarding table. When the <b>detail</b> keyword is used, the route type might be abbreviated (as shown in parentheses): <ul style="list-style-type: none"> <li><b>cloned (clon)</b>—(TCP or multicast only) Cloned route.</li> <li><b>destination (dest)</b>—Remote addresses directly reachable through an interface.</li> <li><b>destination down (iddn)</b>—Destination route for which the interface is unreachable.</li> <li><b>interface cloned (ifcl)</b>—Cloned route for which the interface is unreachable.</li> <li><b>route down (ifdn)</b>—Interface route for which the interface is unreachable.</li> <li><b>ignore (ignr)</b>—Ignore this route.</li> <li><b>interface (intf)</b>—Installed as a result of configuring an interface.</li> <li><b>permanent (perm)</b>—Routes installed by the kernel when the routing table is initialized.</li> <li><b>user</b>—Routes installed by the routing protocol process or as a result of the configuration.</li> </ul> | All levels              |
| Route Reference (RtRef) | Number of routes to reference.   | <b>detail extensive</b> |
| Flags                   | Route type flags: <ul style="list-style-type: none"> <li><b>none</b>—No flags are enabled.</li> <li><b>accounting</b>—Route has accounting enabled.</li> <li><b>cached</b>—Cache route.</li> <li><b>incoming-iface interface-number</b>—Check against incoming interface.</li> <li><b>prefix load balance</b>—Load balancing is enabled for this prefix.</li> <li><b>rt nh decoupled</b>—Route has been decoupled from the next hop to the destination.</li> <li><b>sent to PFE</b>—Route has been sent to the Packet Forwarding Engine.</li> <li><b>static</b>—Static route.</li> </ul>   | <b>extensive</b>        |
| Next hop                | IP address of the next hop to the destination.   | <b>detail extensive</b> |

Table 288: show route forwarding-table Output Fields (*continued*)

| Field Name                 | Field Description  | Level of Output              |
|----------------------------|--|------------------------------|
| Next hop Type (Type)       | <p>Next-hop type. When the <b>detail</b> keyword is used, the next-hop type might be abbreviated (as indicated in parentheses):</p> <ul style="list-style-type: none"> <li>• <b>broadcast (bcst)</b>—Broadcast.</li> <li>• <b>deny</b>—Deny.</li> <li>• <b>discard (dscd)</b>—Discard.</li> <li>• <b>hold</b>—Next hop is waiting to be resolved into a unicast or multicast type.</li> <li>• <b>indexed (idxd)</b>—Indexed next hop.</li> <li>• <b>indirect (indr)</b>—Indirect next hop.</li> <li>• <b>local (locl)</b>—Local address on an interface.</li> <li>• <b>routed multicast (mcrst)</b>—Regular multicast next hop.</li> <li>• <b>multicast (mcst)</b>—Wire multicast next hop (limited to the LAN).</li> <li>• <b>multicast discard (mdsc)</b>—Multicast discard.</li> <li>• <b>multicast group (mgrp)</b>—Multicast group member.</li> <li>• <b>receive (rcv)</b>—Receive.</li> <li>• <b>reject (rjct)</b>—Discard. An ICMP unreachable message was sent.</li> <li>• <b>resolve (rslv)</b>—Resolving the next hop.</li> <li>• <b>unicast (ucst)</b>—Unicast.</li> <li>• <b>unilist (ulst)</b>—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.</li> </ul> | <b>detail extensive</b>      |
| Index                      | Software index of the next hop that is used to route the traffic for a given prefix.   | <b>detail extensive none</b> |
| Route interface-index      | Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned.   | <b>extensive</b>             |
| Reference (NhRef)          | Number of routes that refer to this next hop.  | <b>detail extensive none</b> |
| Next-hop interface (Netif) | Interface used to reach the next hop.  | <b>detail extensive none</b> |
| Weight                     | Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible (see the <b>Balance</b> field description).  | <b>extensive</b>             |
| Balance                    | Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a router is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.   | <b>extensive</b>             |
| RPF interface              | List of interfaces from which the prefix can be accepted. Reverse path forwarding (RPF) information is displayed only when <b>rpf-check</b> is configured on the interface.  | <b>extensive</b>             |

#### show route forwarding-table extensive (RPF)

The next example is based on the following configuration, which enables an RPF check on all routes that are learned from this interface, including the interface route:

```
so-1/1/0 {
  unit 0 {
    family inet {
      rpf-check;
      address 15.95.1.2/30;
    }
  }
}
```

```
user@host> show route forwarding-table extensive
```

```
Routing table: inet [Index 0]
Internet:
...
...
Destination: 15.95.1.3/32
Route type: destination
Route reference: 0                               Route interface-index: 67
```

```

Flags: sent to PFE
Nexthop: 15.95.1.3
Next-hop type: broadcast          Index: 328      Reference: 1
Next-hop interface: so-1/1/0.0
RPF interface: so-1/1/0.0

```

### show route forwarding-table family mpls

| <b>Syntax (EX Series Switches)</b> | show route receive-protocol <i>protocol neighbor-address</i><br><brief   detail   extensive   terse>  |
| <b>Release Information</b>         | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.   |
| <b>Description</b>                 | Display the routing information as it was received through a particular neighbor using a particular dynamic routing protocol.   |
| <b>Options</b>                     | <b>brief   detail   extensive   terse</b> —(Optional) Display the specified level of output.<br><br><b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.<br><br><b><i>protocol neighbor-address</i></b> —Protocol transmitting the route ( <b>bgp</b> , <b>dvmrp</b> , <b>msdp</b> , <b>pim</b> , <b>rip</b> , or <b>ripng</b> ) and address of the neighboring router from which the route entry was received.  |
| <b>Additional Information</b>      | The output displays the selected routes and the attributes with which they were received, but does not show the effects of import policy on the routing attributes.   |
| <b>Required Privilege Level</b>    | view  |
| <b>List of Sample Output</b>       | <a href="#">show route receive-protocol bgp on page 3206</a><br><a href="#">show route receive-protocol bgp extensive on page 3206</a><br><a href="#">show route receive-protocol bgp table extensive on page 3206</a><br><a href="#">show route receive-protocol bgp logical-system extensive on page 3207</a><br><a href="#">show route receive-protocol bgp detail (Layer 2 VPN) on page 3208</a><br><a href="#">show route receive-protocol bgp extensive (Layer 2 VPN) on page 3208</a><br><a href="#">show route receive-protocol bgp (Layer 3 VPN) on page 3209</a><br><a href="#">show route receive-protocol bgp detail (Layer 3 VPN) on page 3209</a><br><a href="#">show route receive-protocol bgp extensive (Layer 3 VPN) on page 3210</a> |
| <b>Output Fields</b>               | <a href="#">Table 291 on page 3203</a> describes the output fields for the <b>show route receive-protocol</b> command. Output fields are listed in the approximate order in which they appear.  |

Table 291: show route receive-protocol Output Fields

| Field Name                | Field Description                              | Level of Output |
|---------------------------|--|-----------------|
| <i>routing-table-name</i> | Name of the routing table—for example, inet.0. | All levels      |

Table 291: show route receive-protocol Output Fields (*continued*)

| Field Name                                      | Field Description  | Level of Output         |
|---|--|-------------------------|
| <i>number destinations</i>                      | Number of destinations for which there are routes in the routing table.  | All levels              |
| <i>number routes</i>                            | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b></li> <li>• <b>holddown</b> (routes that are in pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul> | All levels              |
| Prefix  | Destination prefix.  | none <b>brief</b>       |
| MED   | Multiple exit discriminator value included in the route.   | none <b>brief</b>       |
| <i>destination-prefix</i><br>(entry, announced) | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.  | <b>detail extensive</b> |
| Route Distinguisher                             | 64-bit prefix added to IP subnets to make them unique.   | <b>detail extensive</b> |
| Label-Base, range                               | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.   | <b>detail extensive</b> |
| VPN Label                                       | Virtual private network (VPN) label. Packets are sent between CE and PE routing devices by advertising VPN labels. VPN labels transit over either an RSVP or an LDP label-switched path (LSP) tunnel.  | <b>detail extensive</b> |
| Next hop  | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.  | All levels              |
| Localpref or Lclpref                            | Local preference value included in the route.  | All levels              |

Table 291: show route receive-protocol Output Fields (*continued*)

| Field Name          | Field Description  | Level of Output  |
|---------------------|--|------------------|
| AS path             | <p>Autonomous system (AS) path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used the AS-path merge process, as defined in RFC 4893.</li> <li>• <b>[ ]</b>—If more than one AS number is configured on the router, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> | All levels       |
| Cluster list        | (For route reflected output only) Cluster ID sent by the route reflector.  | detail extensive |
| Originator ID       | (For route reflected output only) Address of routing device that originally sent the route to the route reflector.   | detail extensive |
| Communities         | Community path attribute for the route. See the Output Field table in the <a href="#">show route detail</a> command for all possible values for this field.  | detail extensive |
| AIGP                | Accumulated interior gateway protocol (AIGP) BGP attribute.  | detail extensive |
| Attrset AS          | Number, local preference, and path of the AS that originated the route. These values are stored in the <b>Attrset</b> attribute at the originating routing device.   | detail extensive |
| Layer2-info: encaps | Layer 2 encapsulation (for example, VPLS).   | detail extensive |
| control flags       | Control flags: <b>none</b> or <b>Site Down</b> .   | detail extensive |
| mtu                 | Maximum transmission unit (MTU) of the Layer 2 circuit.  | detail extensive |

## Sample Output

### show route receive-protocol bgp

```
user@host> show route receive-protocol bgp 10.255.245.215

inet.0: 28 destinations, 33 routes (27 active, 0 holddown, 1 hidden)
Prefix          Next hop          MED      Lclpref  AS path
10.22.1.0/24     10.255.245.215    0        100      I
10.22.2.0/24     10.255.245.215    0        100      I
```

### show route receive-protocol bgp extensive

```
user@host> show route receive-protocol bgp 10.255.245.63 extensive

**Output Fields** Table 292 on page 3212 describes the output fields for the **show route resolution** command. Output fields are listed in the approximate order in which they appear.

**Table 292: show route resolution Output Fields**

| Field Name                         | Field Description   |
|------------------------------------|---|
| <i>routing-table-name</i>          | Name of the routing table whose prefixes are resolved using the entries in the route resolution database. For routing table groups, this is the name of the primary routing table whose prefixes are resolved using the entries in the route resolution database.   |
| <b>Tree index</b>                  | Tree index identifier.  |
| <b>Nodes</b>                       | Number of nodes in the tree.  |
| <b>Reference count</b>             | Number of references made to the next hop.  |
| <b>Contributing routing tables</b> | Routing tables used for next-hop resolution.  |
| <b>Originating RIB</b>             | Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of <b>inet.0</b> resolving through <b>inet.0</b> and <b>inet.3</b> , this field indicates which routing table, <b>inet.0</b> or <b>inet.3</b> , provided the best path for a particular prefix. |
| <b>Metric</b>                      | Metric associated with the forwarding next hop.   |
| <b>Node path count</b>             | Number of nodes in the path.  |
| <b>Forwarding next hops</b>        | Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.   |

## Sample Output

### show route resolution detail

```

user@host> show route resolution detail
Tree Index: 1, Nodes 0, Reference Count 1
Contributing routing tables: inet.3
Tree Index: 2, Nodes 23, Reference Count 1

| <b>Syntax</b>                      | <pre>show route summary &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;table <i>routing-table-name</i>&gt;</pre>  |
| <b>Syntax (EX Series Switches)</b> | show route summary   |
| <b>Release Information</b>         | <p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p>   |
| <b>Description</b>                 | <p>Display summary statistics about the entries in the routing table.</p> <p>CPU utilization might increase while the device learns routes. We recommend that you use the <b>show route summary</b> command after the device learns and enters the routes into the routing table. Depending on the size of your network, this might take several minutes. If you receive a “timeout communicating with routing daemon” error when using the <b>show route summary</b> command, wait several minutes before attempting to use the command again. This is not a critical system error, but you might experience a delay in using the command-line interface (CLI).</p> |
| <b>Options</b>                     | <p><b>none</b>—Display summary statistics about the entries in the routing table.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>table <i>routing-table-name</i></b>—(Optional) Display summary statistics for all routing tables whose name begins with this string (for example, <b>inet.0</b> and <b>inet6.0</b> are both displayed when you run the <b>show route summary table inet</b> command). If you only want to display statistics for a specific routing table, make sure to enter the exact name of that routing table.</p>      |
| <b>Required Privilege Level</b>    | view   |
| <b>List of Sample Output</b>       | <a href="#">show route summary on page 3229</a><br><a href="#">show route summary table on page 3230</a><br><a href="#">show route summary table (with Route Limits Configured for the Routing Table) on page 3230</a>   |
| <b>Output Fields</b>               | <p><a href="#">Table 293 on page 3228</a> lists the output fields for the <b>show route summary</b> command. Output fields are listed in the approximate order in which they appear.</p>   |

**Table 293: show route summary Output Fields**

| Field Name | Field Description                    |
|------------|--------------------------------------|
| Router ID  | Address of the local routing device. |

Table 293: show route summary Output Fields (*continued*)

| Field Name                | Field Description   |
|---------------------------|---|
| <i>routing-table-name</i> | Name of the routing table (for example, <b>inet.0</b> ).  |
| <b>destinations</b>       | Number of destinations for which there are routes in the routing table.   |
| <b>routes</b>             | Number of routes in the routing table: <ul style="list-style-type: none"> <li><b>active</b>—Number of routes that are active.</li> <li><b>holddown</b>—Number of routes that are in the hold-down state before being declared inactive.</li> <li><b>hidden</b>—Number of routes that are not used because of routing policy.</li> </ul>   |
| <b>Limit/Threshold</b>    | Displays the configured route limits for the routing table set with the <b>maximum-prefixes</b> and the <b>maximum-paths</b> statements. If you do not configure route limits for the routing table, the show output does not display this information. <ul style="list-style-type: none"> <li><b>destinations</b>—The first number represents the maximum number of route prefixes installed in the routing table. The second number represents the number of route prefixes that trigger a warning message.</li> <li><b>routes</b>—The first number represents the maximum number of routes. The second number represents the number of routes that trigger a warning message.</li> </ul> |
| <b>Direct</b>             | Routes on the directly connected network.   |
| <b>Local</b>              | Local routes.   |
| <i>protocol-name</i>      | Name of the protocol from which the route was learned. For example, <b>OSPF</b> , <b>RSVP</b> , and <b>Static</b> .   |

## show route terse

**List of Syntax** [Syntax on page 3246](#)  
[Syntax \(EX Series Switches\) on page 3246](#)

**Syntax** show route terse  
 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches)** show route terse

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Display a high-level summary of the routes in the routing table.

**NOTE:** For BGP routes, the **show route terse** command displays the local preference attribute and MED instead of the metric1 and metric2 values. This is mostly due to historical reasons.

To display the metric1 and metric2 value of a BGP route, use the [show route extensive](#) command.

**Options** **none**—Display a high-level summary of the routes in the routing table.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**List of Sample Output** [show route terse on page 3248](#)

**Output Fields** [Table 294 on page 3246](#) describes the output fields for the **show route terse** command. Output fields are listed in the approximate order in which they appear.

**Table 294: show route terse Output Fields**

| Field Name                 | Field Description   |
|----------------------------|---|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).  |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.   |
| <i>number routes</i>       | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li><b>active</b> (routes that are active)</li> <li><b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li><b>hidden</b> (routes that are not used because of a routing policy)</li> </ul> |

Table 294: show route terse Output Fields (*continued*)

| Field Name       | Field Description  |
|------------------|--|
| <i>route key</i> | Key for the state of the route: <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul>  |
| <b>A</b>         | Active route. An asterisk (*) indicates this is the active route.  |
| <b>V</b>         | Validation status of the route: <ul style="list-style-type: none"> <li>• <b>?</b>—Not evaluated. Indicates that the route was not learned through BGP.</li> <li>• <b>I</b>—Invalid. Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>N</b>—Unknown. Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>V</b>—Valid. Indicates that the prefix and autonomous system pair are found in the database.</li> </ul> |
| Destination      | Destination of the route.  |
| <b>P</b>         | Protocol through which the route was learned: <ul style="list-style-type: none"> <li>• <b>A</b>—Aggregate</li> <li>• <b>B</b>—BGP</li> <li>• <b>C</b>—CCC</li> <li>• <b>D</b>—Direct</li> <li>• <b>G</b>—GMPLS</li> <li>• <b>I</b>—IS-IS</li> <li>• <b>L</b>—L2CKT, L2VPN, LDP, Local</li> <li>• <b>K</b>—Kernel</li> <li>• <b>M</b>—MPLS, MSDP</li> <li>• <b>O</b>—OSPF</li> <li>• <b>P</b>—PIM</li> <li>• <b>R</b>—RIP, RIPng</li> <li>• <b>S</b>—Static</li> <li>• <b>T</b>—Tunnel</li> </ul>   |
| <b>Prf</b>       | Preference value of the route. In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.  |
| Metric 1         | First metric value in the route. For routes learned from BGP, this is the MED metric.  |
| Metric 2         | Second metric value in the route. For routes learned from BGP, this is the IGP metric.   |

Table 294: show route terse Output Fields (*continued*)

| Field Name | Field Description  |
|------------|--|
| Next hop   | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.  |
| AS path    | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>I—IGP.</li> <li>E—EGP.</li> <li>?—Incomplete; typically, the AS path was aggregated.</li> </ul> |

## Sample Output

## Troubleshooting Virtual Routing Instances

- [Direct Routes Not Leaked Between Routing Instances on page 3249](#)

### Direct Routes Not Leaked Between Routing Instances

---

**Problem** **Description:** Direct routes are not exported (leaked) between virtual routing instances. For example, consider the following scenario:

- Switch with two virtual routing instances:
  - Routing instance 1 connects to downstream device through interface xe-0/0/1.
  - Routing instance 2 connects to upstream device through interface xe-0/0/2.

If you enable route leaking between the routing instances (by using the **rib-group** statement, for example), the downstream device cannot connect to the upstream device because the switch connects to the upstream device over a direct route and these routes are not leaked between instances.

**NOTE:** You can see a route to the upstream device in the routing table of the downstream device, but this route is not functional.

Indirect routes *are* leaked between routing instances, so the downstream device can connect to any upstream devices that are connected to the switch over indirect routes.

**Solution** This is expected behavior.

- [Understanding the Advertisement of Multiple Paths to a Single Destination in BGP on page 3258](#)

## Understanding BGP

BGP is an exterior gateway protocol (EGP) that is used to exchange routing information among routers in different autonomous systems (ASs). BGP routing information includes the complete route to each destination. BGP uses the routing information to maintain a database of network reachability information, which it exchanges with other BGP systems. BGP uses the network reachability information to construct a graph of AS connectivity, which enables BGP to remove routing loops and enforce policy decisions at the AS level.

Multiprotocol BGP (MBGP) extensions enable BGP to support IP version 6 (IPv6). MBGP defines the attributes MP\_REACH\_NLRI and MP\_UNREACH\_NLRI, which are used to carry IPv6 reachability information. Network layer reachability information (NLRI) update messages carry IPv6 address prefixes of feasible routes.

BGP allows for policy-based routing. You can use routing policies to choose among multiple paths to a destination and to control the redistribution of routing information.

BGP uses TCP as its transport protocol, using port 179 for establishing connections. Running over a reliable transport protocol eliminates the need for BGP to implement update fragmentation, retransmission, acknowledgment, and sequencing.

The Junos OS routing protocol software supports BGP version 4. This version of BGP adds support for Classless Interdomain Routing (CIDR), which eliminates the concept of network classes. Instead of assuming which bits of an address represent the network by looking at the first octet, CIDR allows you to explicitly specify the number of bits in the network address, thus providing a means to decrease the size of the routing tables. BGP version 4 also supports aggregation of routes, including the aggregation of AS paths.

This section discusses the following topics:

- [Autonomous Systems on page 3254](#)
- [AS Paths and Attributes on page 3254](#)
- [External and Internal BGP on page 3255](#)
- [Multiple Instances of BGP on page 3255](#)

---

### Autonomous Systems

An *autonomous system* (AS) is a set of routers that are under a single technical administration and normally use a single interior gateway protocol and a common set of metrics to propagate routing information within the set of routers. To other ASs, an AS appears to have a single, coherent interior routing plan and presents a consistent picture of what destinations are reachable through it.

---

### AS Paths and Attributes

The routing information that BGP systems exchange includes the complete route to each destination, as well as additional information about the route. The route to each destination is called the *AS path*, and the additional route information is included in *path attributes*. BGP uses the AS path and the path attributes to completely determine the network topology. Once BGP understands the topology, it can detect and eliminate

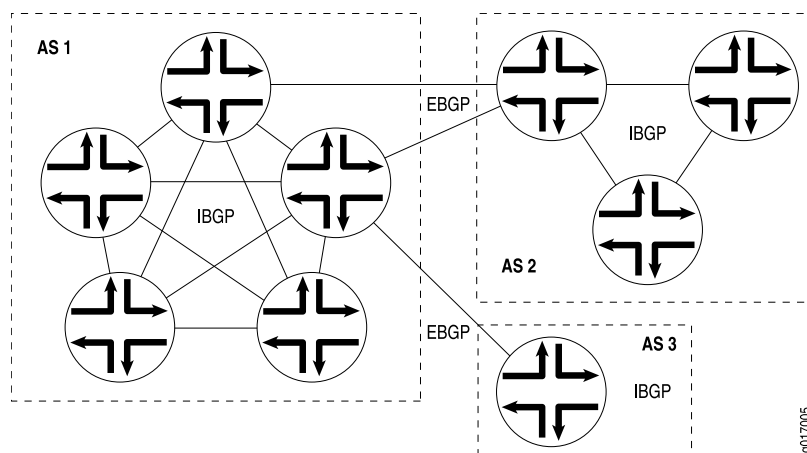

routing loops and select among groups of routes to enforce administrative preferences and routing policy decisions.

### External and Internal BGP

BGP supports two types of exchanges of routing information: exchanges among different ASs and exchanges within a single AS. When used among ASs, BGP is called *external BGP* (EBGP) and BGP sessions perform *inter-AS routing*. When used within an AS, BGP is called *internal BGP* (IBGP) and BGP sessions perform *intra-AS routing*.

Figure 59 on page 3255 illustrates ASs, IBGP, and EBGP.

Figure 59: ASs, EBGP, and IBGP

A BGP system shares network reachability information with adjacent BGP systems, which are referred to as *neighbors* or *peers*.

BGP systems are arranged into *groups*. In an IBGP group, all peers in the group—called *internal peers*—are in the same AS. Internal peers can be anywhere in the local AS and do not have to be directly connected to one another. Internal groups use routes from an IGP to resolve forwarding addresses. They also propagate external routes among all other internal routers running IBGP, computing the next hop by taking the BGP next hop received with the route and resolving it using information from one of the interior gateway protocols.

In an EBGP group, the peers in the group—called *external peers*—are in different ASs and normally share a subnet. In an external group, the next hop is computed with respect to the interface that is shared between the external peer and the local router.

### Multiple Instances of BGP

You can configure multiple instances of BGP at the following hierarchy levels:

- [edit routing-instances *routing-instance-name* protocols]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols]

Multiple instances of BGP are primarily used for Layer 3 VPN support.

IGP peers and external BGP (EBGP) peers (both nonmultihop and multihop) are all supported for routing instances. BGP peering is established over one of the interfaces configured under the **routing-instances** hierarchy.

**NOTE:** When a BGP neighbor sends BGP messages to the local routing device, the incoming interface on which these messages are received must be configured in the same routing instance that the BGP neighbor configuration exists in. This is true for neighbors that are a single hop away or multiple hops away.

Routes learned from the BGP peer are added to the **instance-name.inet.0** table by default. You can configure import and export policies to control the flow of information into and out of the instance routing table.

For Layer 3 VPN support, configure BGP on the provider edge (PE) router to receive routes from the customer edge (CE) router and to send the instances' routes to the CE router if necessary. You can use multiple instances of BGP to maintain separate per-site forwarding tables for keeping VPN traffic separate on the PE router.

You can configure import and export policies that allow the service provider to control and rate-limit traffic to and from the customer.

You can configure an EBGP multihop session for a VRF routing instance. Also, you can set up the EBGP peer between the PE and CE routers by using the loopback address of the CE router instead of the interface addresses.

## BGP Routes Overview

A BGP route is a destination, described as an IP address prefix, and information that describes the path to the destination.

The following information describes the path:

- AS path, which is a list of numbers of the ASs that a route passes through to reach the local router. The first number in the path is that of the last AS in the path—the AS closest to the local router. The last number in the path is the AS farthest from the local router, which is generally the origin of the path.
- Path attributes, which contain additional information about the AS path that is used in routing policy.

BGP peers advertise routes to each other in update messages.

BGP stores its routes in the Junos OS routing table (**inet.0**). The routing table stores the following information about BGP routes:

- Routing information learned from update messages received from peers

- Local routing information that BGP applies to routes because of local policies
- Information that BGP advertises to BGP peers in update messages

For each prefix in the routing table, the routing protocol process selects a single best path, called the active path. Unless you configure BGP to advertise multiple paths to the same destination, BGP advertises only the active path.

The BGP router that first advertises a route assigns it one of the following values to identify its origin. During route selection, the lowest origin value is preferred.

- **0**—The router originally learned the route through an IGP (OSPF, IS-IS, or a static route).
- **1**—The router originally learned the route through an EGP (most likely BGP).
- **2**—The route's origin is unknown.

**Related  
Documentation**

- [Understanding BGP Path Selection](#)
- [Example: Advertising Multiple Paths in BGP on page 3495](#)

## BGP Messages Overview

All BGP messages have the same fixed-size header, which contains a marker field that is used for both synchronization and authentication, a length field that indicates the length of the packet, and a type field that indicates the message type (for example, open, update, notification, keepalive, and so on).

This section discusses the following topics:

- [Open Messages on page 3257](#)
- [Update Messages on page 3258](#)
- [Keepalive Messages on page 3258](#)
- [Notification Messages on page 3258](#)

### Open Messages

After a TCP connection is established between two BGP systems, they exchange BGP open messages to create a BGP connection between them. Once the connection is established, the two systems can exchange BGP messages and data traffic.

Open messages consist of the BGP header plus the following fields:

- **Version**—The current BGP version number is 4.
- **Local AS number**—You configure this by including the **autonomous-system** statement at the **[edit routing-options]** or **[edit logical-systems *logical-system-name* routing-options]** hierarchy level.
- **Hold time**—Proposed hold-time value. You configure the local hold time with the BGP **hold-time** statement.
- **BGP identifier**—IP address of the BGP system. This address is determined when the system starts and is the same for every local interface and every BGP peer. You can

configure the BGP identifier by including the **router-id** statement at the **[edit routing-options]** or **[edit logical-systems *logical-system-name* routing-options]** hierarchy level. By default, BGP uses the IP address of the first interface it finds in the router.

- Parameter field length and the parameter itself—These are optional fields.

---

### Update Messages

BGP systems send update messages to exchange network reachability information. BGP systems use this information to construct a graph that describes the relationships among all known ASs.

Update messages consist of the BGP header plus the following optional fields:

- Unfeasible routes length—Length of the withdrawn routes field
- Withdrawn routes—IP address prefixes for the routes being withdrawn from service because they are no longer deemed reachable
- Total path attribute length—Length of the path attributes field; it lists the path attributes for a feasible route to a destination
- Path attributes—Properties of the routes, including the path origin, the multiple exit discriminator (MED), the originating system's preference for the route, and information about aggregation, communities, confederations, and route reflection
- Network layer reachability information (NLRI)—IP address prefixes of feasible routes being advertised in the update message

---

### Keepalive Messages

BGP systems exchange keepalive messages to determine whether a link or host has failed or is no longer available. Keepalive messages are exchanged often enough so that the hold timer does not expire. These messages consist only of the BGP header.

---

### Notification Messages

BGP systems send notification messages when an error condition is detected. After the message is sent, the BGP session and the TCP connection between the BGP systems are closed. Notification messages consist of the BGP header plus the error code and subcode, and data that describes the error.

## Understanding the Advertisement of Multiple Paths to a Single Destination in BGP

BGP peers advertise routes to each other in update messages. BGP stores its routes in the Junos OS routing table (**inet.0**). For each prefix in the routing table, the routing protocol process selects a single best path, called the active path. Unless you configure BGP to advertise multiple paths to the same destination, BGP advertises only the active path.

Instead of advertising only the active path to a destination, you can configure BGP to advertise multiple paths to the destination. Within an autonomous system (AS), the availability of multiple exit points to reach a destination provides the following benefits:

- **Fault tolerance**—Path diversity leads to reduction in restoration time after failure. For instance, a border after receiving multiple paths to the same destination can precompute a backup path and have it ready so that when the primary path becomes invalid, the border routing device can use the backup to quickly restore connectivity. Without a backup path, the restoration time depends on BGP reconvergence, which includes withdraw and advertisement messages in the network before a new best path can be learned.
- **Load balancing**—The availability of multiple paths to reach the same destination enables load balancing of traffic, if the routing within the AS meets certain constraints.
- **Maintenance**—The availability of alternate exit points allows for graceful maintenance operation of routers.

The following limitations apply to advertising multiple routes in BGP:

- Address families supported:
  - IPv4 unicast (**family inet unicast**)
  - IPv6 unicast (**family inet6 unicast**)
  - IPv4 labeled unicast (**family inet labeled-unicast**)
  - IPv6 labeled unicast (**family inet6 labeled-unicast**)
- Internal BGP (IBGP) peers only. No support on external BGP (EBGP) peers.
- Master instance only. No support for routing instances.
- Graceful restart and nonstop active routing (NSR) are supported.
- No BGP Monitoring Protocol (BMP) support.
- No support for EBGP sessions between confederations.
- Prefix policies enable you to filter routes on a router that is configured to advertise multiple paths to a destination. Prefix policies can only match prefixes. They cannot match route attributes, and they cannot change the attributes of routes.

- [Example: Configuring External BGP Point-to-Point Peer Sessions on page 3262](#)
- [Example: Configuring External BGP on Logical Systems with IPv6 Interfaces on page 3269](#)

#### Understanding External BGP Peering Sessions

---

To establish point-to-point connections between peer autonomous systems (ASs), you configure a BGP session on each interface of a point-to-point link. Generally, such sessions are made at network exit points with neighboring hosts outside the AS.

[Figure 60 on page 3262](#) shows an example of a BGP peering session.

Figure 60: BGP Peering Session

In [Figure 60 on page 3262](#), Router A is a gateway router for AS 3, and Router B is a gateway router for AS 10. For traffic internal to either AS, an interior gateway protocol (IGP) is used (OSPF, for instance). To route traffic between peer ASs, a BGP session is used.

You arrange BGP routing devices into groups of peers. Different peer groups can have different group types, AS numbers, and route reflector cluster identifiers.

To define a BGP group that recognizes only the specified BGP systems as peers, statically configure all the system's peers by including one or more **neighbor** statements. The peer neighbor's address can be either an IPv6 or IPv4 address.

As the number of external BGP (EBGP) groups increases, the ability to support a large number of BGP sessions might become a scaling issue. The preferred way to configure a large number of BGP neighbors is to configure a few groups consisting of multiple neighbors per group. Supporting fewer EBGP groups generally scales better than supporting a large number of EBGP groups. This becomes more evident in the case of hundreds of EBGP groups when compared with a few EBGP groups with multiple peers in each group.

After the BGP peers are established, BGP routes are not automatically advertised by the BGP peers. At each BGP-enabled device, policy configuration is required to export the local, static, or IGP-learned routes into the BGP RIB and then advertise them as BGP routes to the other peers. BGP's advertisement policy, by default, does not advertise any non-BGP routes (such as local routes) to peers.

### Example: Configuring External BGP Point-to-Point Peer Sessions

This example shows how to configure BGP point-to-point peer sessions.

- [Requirements on page 3262](#)
- [Overview on page 3263](#)
- [Configuration on page 3263](#)
- [Verification on page 3265](#)

#### Requirements

Before you begin, if the default BGP policy is not adequate for your network, configure routing policies to filter incoming BGP routes and to advertise BGP routes.

### Overview

Figure 61 on page 3263 shows a network with BGP peer sessions. In the sample network, Device E in AS 17 has BGP peer sessions to a group of peers called **external-peers**. Peers A, B, and C reside in AS 22 and have IP addresses 10.10.10.2, 10.10.10.6, and 10.10.10.10. Peer D resides in AS 79, at IP address 10.21.7.2. This example shows the configuration on Device E.

Figure 61: Typical Network with BGP Peer Sessions

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set interfaces ge-1/2/0 unit 0 description to-A
set interfaces ge-1/2/0 unit 0 family inet address 10.10.10.1/30
set interfaces ge-0/0/1 unit 5 description to-B
set interfaces ge-0/0/1 unit 5 family inet address 10.10.10.5/30
set interfaces ge-0/1/0 unit 9 description to-C
set interfaces ge-0/1/0 unit 9 family inet address 10.10.10.9/30
set interfaces ge-1/2/1 unit 21 description to-D
set interfaces ge-1/2/1 unit 21 family inet address 10.21.7.1/30
set protocols bgp group external-peers type external
set protocols bgp group external-peers peer-as 22
set protocols bgp group external-peers neighbor 10.10.10.2
set protocols bgp group external-peers neighbor 10.10.10.6
set protocols bgp group external-peers neighbor 10.10.10.10
set protocols bgp group external-peers neighbor 10.21.7.2 peer-as 79
set routing-options autonomous-system 17
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the BGP peer sessions:

1. Configure the interfaces to Peers A, B, C, and D.

```
[edit interfaces]
user@E# set ge-1/2/0 unit 0 description to-A
user@E# set ge-1/2/0 unit 0 family inet address 10.10.10.1/30
user@E# set ge-0/0/1 unit 5 description to-B
user@E# set ge-0/0/1 unit 5 family inet address 10.10.10.5/30
user@E# set ge-0/1/0 unit 9 description to-C
user@E# set ge-0/1/0 unit 9 family inet address 10.10.10.9/30
user@E# set ge-1/2/1 unit 21 description to-D
user@E# set ge-1/2/1 unit 21 family inet address 10.21.7.1/30
```

2. Set the autonomous system (AS) number.

```
[edit routing-options]
user@E# set autonomous-system 17
```

3. Create the BGP group, and add the external neighbor addresses.

```
[edit protocols bgp group external-peers]
user@E# set neighbor 10.10.10.2
user@E# set neighbor 10.10.10.6
user@E# set neighbor 10.10.10.10
```

4. Specify the autonomous system (AS) number of the external AS.

```
[edit protocols bgp group external-peers]
user@E# set peer-as 22
```

5. Add Peer D, and set the AS number at the individual neighbor level.

The neighbor configuration overrides the group configuration. So, while **peer-as 22** is set for all the other neighbors in the group, **peer-as 79** is set for neighbor 10.21.7.2.

```
[edit protocols bgp group external-peers]
user@E# set neighbor 10.21.7.2 peer-as 79
```

6. Set the peer type to external BGP (EBGP).

```
[edit protocols bgp group external-peers]
user@E# set type external
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@E# show interfaces
ge-1/2/0 {
  unit 0 {
    description to-A;
    family inet {
      address 10.10.10.1/30;
```

```

    }
  }
}
ge-0/0/1 {
  unit 5 {
    description to-B;

### Example: Configuring External BGP on Logical Systems with IPv6 Interfaces

This example shows how to configure external BGP (EBGP) point-to-point peer sessions on logical systems with IPv6 interfaces.

- [Requirements on page 3269](#)
- [Overview on page 3269](#)
- [Configuration on page 3270](#)
- [Verification on page 3279](#)

#### Requirements

In this example, no special configuration beyond device initialization is required.

#### Overview

Junos OS supports EBGP peer sessions by means of IPv6 addresses. An IPv6 peer session can be configured when an IPv6 address is specified in the **neighbor** statement. This example uses EUI-64 to generate IPv6 addresses that are automatically applied to the interfaces. An EUI-64 address is an IPv6 address that uses the IEEE EUI-64 format for the interface identifier portion of the address (the last 64 bits).

**NOTE:** Alternatively, you can configure EBGP sessions using manually assigned 128-bit IPv6 addresses.

If you use 128-bit link-local addresses for the interfaces, you must include the **local-interface** statement. This statement is valid only for 128-bit IPv6 link-local addresses and is mandatory for configuring an IPv6 EBGP link-local peer session.

Configuring EBGP peering using link-local addresses is only applicable for directly connected interfaces. There is no support for multihop peering.

After your interfaces are up, you can use the **show interfaces terse** command to view the EUI-64-generated IPv6 addresses on the interfaces. You must use these generated

addresses in the BGP **neighbor** statements. This example demonstrates the full end-to-end procedure.

In this example, Frame Relay interface encapsulation is applied to the logical tunnel (lt) interfaces. This is a requirement because only Frame Relay encapsulation is supported when IPv6 addresses are configured on the lt interfaces.

Figure 62 on page 3270 shows a network with BGP peer sessions. In the sample network, Router R1 has five logical systems configured. Device E in autonomous system (AS) 17 has BGP peer sessions to a group of peers called **external-peers**. Peers A, B, and C reside in AS 22. This example shows the step-by-step configuration on Logical System A and Logical System E.

Figure 62: Typical Network with BGP Peer Sessions

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

#### Device A

```
set logical-systems A interfaces lt-0/1/0 unit 1 description to-E
set logical-systems A interfaces lt-0/1/0 unit 1 encapsulation frame-relay
set logical-systems A interfaces lt-0/1/0 unit 1 dlci 1
```

```

set logical-systems A interfaces lt-0/1/0 unit 1 peer-unit 25
set logical-systems A interfaces lt-0/1/0 unit 1 family inet6 address 2001:db8:0:1::/64
  eui-64
set logical-systems A interfaces lo0 unit 1 family inet6 address 2001:db8::1/128
set logical-systems A protocols bgp group external-peers type external
set logical-systems A protocols bgp group external-peers peer-as 17
set logical-systems A protocols bgp group external-peers neighbor
  2001:db8:0:1:2a0:a502:0:19da
set logical-systems A routing-options router-id 1.1.1.1
set logical-systems A routing-options autonomous-system 22

```

**Device B**

```

set logical-systems B interfaces lt-0/1/0 unit 6 description to-E
set logical-systems B interfaces lt-0/1/0 unit 6 encapsulation frame-relay
set logical-systems B interfaces lt-0/1/0 unit 6 dlci 6
set logical-systems B interfaces lt-0/1/0 unit 6 peer-unit 5
set logical-systems B interfaces lt-0/1/0 unit 6 family inet6 address 2001:db8:0:2::/64
  eui-64
set logical-systems B interfaces lo0 unit 2 family inet6 address 2001:db8::2/128
set logical-systems B protocols bgp group external-peers type external
set logical-systems B protocols bgp group external-peers peer-as 17
set logical-systems B protocols bgp group external-peers neighbor
  2001:db8:0:2:2a0:a502:0:5da
set logical-systems B routing-options router-id 2.2.2.2
set logical-systems B routing-options autonomous-system 22

```

**Device C**

```

set logical-systems C interfaces lt-0/1/0 unit 10 description to-E
set logical-systems C interfaces lt-0/1/0 unit 10 encapsulation frame-relay
set logical-systems C interfaces lt-0/1/0 unit 10 dlci 10
set logical-systems C interfaces lt-0/1/0 unit 10 peer-unit 9
set logical-systems C interfaces lt-0/1/0 unit 10 family inet6 address 2001:db8:0:3::/64
  eui-64
set logical-systems C interfaces lo0 unit 3 family inet6 address 2001:db8::3/128
set logical-systems C protocols bgp group external-peers type external
set logical-systems C protocols bgp group external-peers peer-as 17
set logical-systems C protocols bgp group external-peers neighbor
  2001:db8:0:3:2a0:a502:0:9da
set logical-systems C routing-options router-id 3.3.3.3
set logical-systems C routing-options autonomous-system 22

```

**Device D**

```

set logical-systems D interfaces lt-0/1/0 unit 7 description to-E
set logical-systems D interfaces lt-0/1/0 unit 7 encapsulation frame-relay
set logical-systems D interfaces lt-0/1/0 unit 7 dlci 7
set logical-systems D interfaces lt-0/1/0 unit 7 peer-unit 21
set logical-systems D interfaces lt-0/1/0 unit 7 family inet6 address 2001:db8:0:4::/64
  eui-64
set logical-systems D interfaces lo0 unit 4 family inet6 address 2001:db8::4/128
set logical-systems D protocols bgp group external-peers type external
set logical-systems D protocols bgp group external-peers peer-as 17
set logical-systems D protocols bgp group external-peers neighbor
  2001:db8:0:4:2a0:a502:0:15da
set logical-systems D routing-options router-id 4.4.4.4
set logical-systems D routing-options autonomous-system 79

```

**Device E**

```

set logical-systems E interfaces lt-0/1/0 unit 5 description to-B
set logical-systems E interfaces lt-0/1/0 unit 5 encapsulation frame-relay

```

```

set logical-systems E interfaces lt-0/1/0 unit 5 dlci 6
set logical-systems E interfaces lt-0/1/0 unit 5 peer-unit 6
set logical-systems E interfaces lt-0/1/0 unit 5 family inet6 address 2001:db8:0:2::/64
    eui-64
set logical-systems E interfaces lt-0/1/0 unit 9 description to-C
set logical-systems E interfaces lt-0/1/0 unit 9 encapsulation frame-relay
set logical-systems E interfaces lt-0/1/0 unit 9 dlci 10
set logical-systems E interfaces lt-0/1/0 unit 9 peer-unit 10
set logical-systems E interfaces lt-0/1/0 unit 9 family inet6 address 2001:db8:0:3::/64
    eui-64
set logical-systems E interfaces lt-0/1/0 unit 21 description to-D
set logical-systems E interfaces lt-0/1/0 unit 21 encapsulation frame-relay
set logical-systems E interfaces lt-0/1/0 unit 21 dlci 7
set logical-systems E interfaces lt-0/1/0 unit 21 peer-unit 7
set logical-systems E interfaces lt-0/1/0 unit 21 family inet6 address 2001:db8:0:4::/64
    eui-64
set logical-systems E interfaces lt-0/1/0 unit 25 description to-A
set logical-systems E interfaces lt-0/1/0 unit 25 encapsulation frame-relay
set logical-systems E interfaces lt-0/1/0 unit 25 dlci 1
set logical-systems E interfaces lt-0/1/0 unit 25 peer-unit 1
set logical-systems E interfaces lt-0/1/0 unit 25 family inet6 address 2001:db8:0:1::/64
    eui-64
set logical-systems E interfaces lo0 unit 5 family inet6 address 2001:db8::5/128
set logical-systems E protocols bgp group external-peers type external
set logical-systems E protocols bgp group external-peers peer-as 22
set logical-systems E protocols bgp group external-peers neighbor
    2001:db8:0:1:2a0:a502:0:1da
set logical-systems E protocols bgp group external-peers neighbor
    2001:db8:0:2:2a0:a502:0:6da
set logical-systems E protocols bgp group external-peers neighbor
    2001:db8:0:3:2a0:a502:0:ada
set logical-systems E protocols bgp group external-peers neighbor
    2001:db8:0:4:2a0:a502:0:7da peer-as 79
set logical-systems E routing-options router-id 5.5.5.5
set logical-systems E routing-options autonomous-system 17

```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the BGP peer sessions:

1. Run the **show interfaces terse** command to verify that the physical router has a logical tunnel (lt) interface.

```

user@R1> show interfaces terse
Interface           Admin Link Proto  Local          Remote
...
lt-0/1/0             up    up
...

```

2. On Logical System A, configure the interface encapsulation, peer-unit number, and DLCI to reach Logical System E.

```

user@R1> set cli logical-system A
Logical system: A
[edit]

```

```

user@R1:A> edit
Entering configuration mode
[edit]
user@R1:A# edit interfaces
[edit interfaces]
user@R1:A# set lt-0/1/0 unit 1 encapsulation frame-relay
user@R1:A# set lt-0/1/0 unit 1 dlci 1
user@R1:A# set lt-0/1/0 unit 1 peer-unit 25

```

3. On Logical System A, configure the network address for the link to Peer E, and configure a loopback interface.

```

[edit interfaces]
user@R1:A# set lt-0/1/0 unit 1 description to-E
user@R1:A# set lt-0/1/0 unit 1 family inet6 address 2001:db8:0:1::/64 eui-64
user@R1:A# set lo0 unit 1 family inet6 address 2001:db8::1/128

```

4. On Logical System E, configure the interface encapsulation, peer-unit number, and DLCI to reach Logical System A.

```

user@R1> set cli logical-system E
Logical system: E
[edit]
user@R1:E> edit
Entering configuration mode
[edit]
user@R1:E# edit interfaces
[edit interfaces]
user@R1:E# set lt-0/1/0 unit 25 encapsulation frame-relay
user@R1:E# set lt-0/1/0 unit 25 dlci 1
user@R1:E# set lt-0/1/0 unit 25 peer-unit 1

```

5. On Logical System E, configure the network address for the link to Peer A, and configure a loopback interface.

```

[edit interfaces]
user@R1:E# set lt-0/1/0 unit 25 description to-A
user@R1:E# set lt-0/1/0 unit 25 family inet6 address 2001:db8:0:1::/64 eui-64
user@R1:E# set lo0 unit 5 family inet6 address 2001:db8::5/128

```

6. Run the **show interfaces terse** command to see the IPv6 addresses that are generated by EUI-64.

The 2001 addresses are used in this example in the BGP **neighbor** statements.

**NOTE:** The fe80 addresses are link-local addresses and are not used in this example.

```

user@R1:A> show interfaces terse
Interface          Admin Link Proto  Local              Remote
Logical system: A

betsy@tp8:A> show interfaces terse
Interface          Admin Link Proto  Local              Remote
lt-0/1/0
lt-0/1/0.1         up    up    inet6    2001:db8:0:1:2a0:a502:0:1da/64

```

```

                                fe80::2a0:a502:0:1da/64

```

7. Repeat the interface configuration on the other logical systems.

### Configuring the External BGP Sessions

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the BGP peer sessions:

1. On Logical System A, create the BGP group, and add the external neighbor address.
 

```
[edit protocols bgp group external-peers]
user@R1:A# set neighbor 2001:db8:0:1:2a0:a502:0:19da
```
2. On Logical System E, create the BGP group, and add the external neighbor address.
 

```
[edit protocols bgp group external-peers]
user@R1:E# set neighbor 2001:db8:0:1:2a0:a502:0:1da
```
3. On Logical System A, specify the autonomous system (AS) number of the external AS.
 

```
[edit protocols bgp group external-peers]
user@R1:A# set peer-as 17
```
4. On Logical System E, specify the autonomous system (AS) number of the external AS.
 

```
[edit protocols bgp group external-peers]
user@R1:E# set peer-as 22
```
5. On Logical System A, set the peer type to EBGP.
 

```
[edit protocols bgp group external-peers]
user@R1:A# set type external
```
6. On Logical System E, set the peer type to EBGP.
 

```
[edit protocols bgp group external-peers]
user@R1:E# set type external
```
7. On Logical System A, set the autonomous system (AS) number and router ID.
 

```
[edit routing-options]
user@R1:A# set router-id 1.1.1.1
user@R1:A# set autonomous-system 22
```

8. On Logical System E, set the AS number and router ID.

```
[edit routing-options]
user@R1:E# set router-id 5.5.5.5
user@R1:E# set autonomous-system 17
```

9. Repeat these steps for Peers A, B, C, and D.

**Results** From configuration mode, confirm your configuration by entering the **show logical-systems** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@R1# show logical-systems

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying BGP Neighbors on page 3279](#)
- [Verifying BGP Groups on page 3282](#)
- [Verifying BGP Summary Information on page 3282](#)
- [Checking the Routing Table on page 3282](#)

### Verifying BGP Neighbors

**Purpose** Verify that BGP is running on configured interfaces and that the BGP session is active for each neighbor address.

**Action** From operational mode, run the **show bgp neighbor** command.

```

user@R1:E> show bgp neighbor

### Understanding Internal BGP Peering Sessions

When two BGP-enabled devices are in the same autonomous system (AS), the BGP session is called an *internal* BGP session, or IBGP session. BGP uses the same message types on IBGP and external BGP (EBGP) sessions, but the rules for when to send each message and how to interpret each message differ slightly. For this reason, some people refer to IBGP and EBGP as two separate protocols.

Figure 63: Internal and External BGP

In [Figure 63 on page 3284](#), Device Jackson, Device Memphis, and Device Biloxi have IBGP peer sessions with each other. Likewise, Device Miami and Device Atlanta have IBGP peer sessions between each other.

The purpose of IBGP is to provide a means by which EBGP route advertisements can be forwarded throughout the network. In theory, to accomplish this task you could redistribute all of your EBGP routes into an interior gateway protocol (IGP), such as OSPF or IS-IS. This, however, is not recommended in a production environment because of the large number of EBGP routes in the Internet and because of the way that IGPs operate. In short, with that many routes the IGP churns or crashes.

Generally, the loopback interface (lo0) is used to establish connections between IBGP peers. The loopback interface is always up as long as the device is operating. If there is a route to the loopback address, the IBGP peering session stays up. If a physical interface address is used instead and that interface goes up and down, the IBGP peering session also goes up and down. Thus the loopback interface provides fault tolerance in case the physical interface or the link goes down, if the device has link redundancy.

While IBGP neighbors do not need to be directly connected, they do need to be fully meshed. In this case, fully meshed means that each device is logically connected to every

other device through neighbor peer relationships. The **neighbor** statement creates the mesh. Because of the full mesh requirement of IBGP, you must configure individual peering sessions between all IBGP devices in the AS. The full mesh need not be physical links. Rather, the configuration on each routing device must create a full mesh of peer sessions (using multiple **neighbor** statements).

**NOTE:** The requirement for a full mesh is waived if you configure a confederation or route reflection.

To understand the full-mesh requirement, consider that an IBGP-learned route cannot be readvertised to another IBGP peer. The reason for preventing the readvertisement of IBGP routes and requiring the full mesh is to avoid routing loops within an AS. The AS path attribute is the means by which BGP routing devices avoid loops. The path information is examined for the local AS number only when the route is received from an EBGP peer. Because the attribute is only modified across AS boundaries, this system works well. However, the fact that the attribute is only modified across AS boundaries presents an issue inside the AS. For example, suppose that routing devices A, B, and C are all in the same AS. Device A receives a route from an EBGP peer and sends the route to Device B, which installs it as the active route. The route is then sent to Device C, which installs it locally and sends it back to Device A. If Device A installs the route, a loop is formed within the AS. The routing devices are not able to detect the loop because the AS path attribute is not modified during these advertisements. Therefore, the BGP protocol designers decided that the only assurance of never forming a routing loop was to prevent an IBGP peer from advertising an IBGP-learned route within the AS. For route reachability, the IBGP peers are fully meshed.

IBGP supports multihop connections, so IBGP neighbors can be located anywhere within the AS and often do not share a link. A recursive route lookup resolves the loopback peering address to an IP forwarding next hop. The lookup service is provided by static routes or an IGP such as OSPF, or BGP routes.

### Example: Configuring Internal BGP Peer Sessions

This example shows how to configure internal BGP peer sessions.

- [Requirements on page 3285](#)
- [Overview on page 3285](#)
- [Configuration on page 3287](#)
- [Verification on page 3294](#)

#### **Requirements**

No special configuration beyond device initialization is required before you configure this example.

#### **Overview**

In this example, you configure internal BGP (IBGP) peer sessions. The loopback interface (lo0) is used to establish connections between IBGP peers. The loopback interface is always up as long as the device is operating. If there is a route to the loopback address,

the IBGP peer session stays up. If a physical interface address is used instead and that interface goes up and down, the IBGP peer session also goes up and down. Thus, if the device has link redundancy, the loopback interface provides fault tolerance in case the physical interface or one of the links goes down.

When a device peers with a remote device's loopback interface address, the local device expects BGP update messages to come from (be sourced by) the remote device's loopback interface address. The **local-address** statement enables you to specify the source information in BGP update messages. If you omit the **local-address** statement, the expected source of BGP update messages is based on the device's source address selection rules, which normally results in the egress interface address being the expected source of update messages. When this happens, the peer session is not established because a mismatch exists between the expected source address (the egress interface of the peer) and the actual source (the loopback interface of the peer). To make sure that the expected source address matches the actual source address, specify the loopback interface address in the **local-address** statement.

Because IBGP supports multihop connections, IBGP neighbors can be located anywhere within the autonomous system (AS) and often do not share a link. A recursive route lookup resolves the loopback peer address to an IP forwarding next hop. In this example, this service is provided by OSPF. Although interior gateway protocol (IGP) neighbors do not need to be directly connected, they do need to be fully meshed. In this case, fully meshed means that each device is logically connected to every other device through neighbor peer relationships. The **neighbor** statement creates the mesh.

**NOTE:** The requirement for a full mesh is waived if you configure a confederation or route reflection.

---

After the BGP peers are established, BGP routes are not automatically advertised by the BGP peers. At each BGP-enabled device, policy configuration is required to export the local, static, or IGP-learned routes into the BGP routing information base (RIB) and then advertise them as BGP routes to the other peers. BGP's advertisement policy, by default, does not advertise any non-BGP routes (such as local routes) to peers.

In the sample network, the devices in AS 17 are fully meshed in the group **internal-peers**. The devices have loopback addresses 192.168.6.5, 192.163.6.4, and 192.168.40.4.

Figure 64 on page 3287 shows a typical network with internal peer sessions.

- [Configuring Device B on page 3290](#)
- [Configuring Device C on page 3292](#)

**CLI Quick Configuration**

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device A**

```

set interfaces ge-0/1/0 unit 1 description to-B
set interfaces ge-0/1/0 unit 1 family inet address 10.10.10.1/30
set interfaces lo0 unit 1 family inet address 192.168.6.5/32
set protocols bgp group internal-peers type internal
set protocols bgp group internal-peers description "connections to B and C"
set protocols bgp group internal-peers local-address 192.168.6.5
set protocols bgp group internal-peers export send-direct
set protocols bgp group internal-peers neighbor 192.163.6.4
set protocols bgp group internal-peers neighbor 192.168.40.4
set protocols ospf area 0.0.0.0 interface lo0.1 passive
set protocols ospf area 0.0.0.0 interface ge-0/1/0.1
set policy-options policy-statement send-direct term 2 from protocol direct
set policy-options policy-statement send-direct term 2 then accept
set routing-options router-id 192.168.6.5
set routing-options autonomous-system 17

```

**Device B**

```

set interfaces ge-0/1/0 unit 2 description to-A
set interfaces ge-0/1/0 unit 2 family inet address 10.10.10.2/30
set interfaces ge-0/1/1 unit 5 description to-C
set interfaces ge-0/1/1 unit 5 family inet address 10.10.10.5/30
set interfaces lo0 unit 2 family inet address 192.163.6.4/32
set protocols bgp group internal-peers type internal
set protocols bgp group internal-peers description "connections to A and C"
set protocols bgp group internal-peers local-address 192.163.6.4
set protocols bgp group internal-peers export send-direct
set protocols bgp group internal-peers neighbor 192.168.40.4
set protocols bgp group internal-peers neighbor 192.168.6.5

```

```
set protocols ospf area 0.0.0.0 interface lo0.2 passive
set protocols ospf area 0.0.0.0 interface ge-0/1/0.2
set protocols ospf area 0.0.0.0 interface ge-0/1/1.5
set policy-options policy-statement send-direct term 2 from protocol direct
set policy-options policy-statement send-direct term 2 then accept
set routing-options router-id 192.163.6.4
set routing-options autonomous-system 17
```

Device C

```
set interfaces ge-0/1/0 unit 6 description to-B
set interfaces ge-0/1/0 unit 6 family inet address 10.10.10.6/30
set interfaces lo0 unit 3 family inet address 192.168.40.4/32
set protocols bgp group internal-peers type internal
set protocols bgp group internal-peers description "connections to A and B"
set protocols bgp group internal-peers local-address 192.168.40.4
set protocols bgp group internal-peers export send-direct
set protocols bgp group internal-peers neighbor 192.163.6.4
set protocols bgp group internal-peers neighbor 192.168.6.5
set protocols ospf area 0.0.0.0 interface lo0.3 passive
set protocols ospf area 0.0.0.0 interface ge-0/1/0.6
set policy-options policy-statement send-direct term 2 from protocol direct
set policy-options policy-statement send-direct term 2 then accept
set routing-options router-id 192.168.40.4
set routing-options autonomous-system 17
```

### Configuring Device A

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure internal BGP peer sessions on Device A:

1. Configure the interfaces.

```
[edit interfaces ge-0/1/0 unit 1]
user@A# set description to-B
user@A# set family inet address 10.10.10.1/30
```

```
[edit interfaces]
user@A# set lo0 unit 1 family inet address 192.168.6.5/32
```

2. Configure BGP.

The **neighbor** statements are included for both Device B and Device C, even though Device A is not directly connected to Device C.

```
[edit protocols bgp group internal-peers]
user@A# set type internal
user@A# set description "connections to B and C"
user@A# set local-address 192.168.6.5
user@A# set export send-direct
user@A# set neighbor 192.163.6.4
user@A# set neighbor 192.168.40.4
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
```

```
user@A# set interface lo0.1 passive
user@A# set interface ge-0/1/0.1
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 2]
user@A# set from protocol direct
user@A# set then accept
```

5. Configure the router ID and the AS number.

```
[edit routing-options]
user@A# set router-id 192.168.6.5
user@A# set autonomous-system 17
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@A# show interfaces
ge-0/1/0 {
  unit 1 {
    description to-B;
    family inet {
      address 10.10.10.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.6.5/32;
    }
  }
}

user@A# show policy-options
policy-statement send-direct {
  term 2 {
    from protocol direct;
    then accept;
  }
}

user@A# show protocols
bgp {
  group internal-peers {
    type internal;
    description "connections to B and C";
    local-address 192.168.6.5;
    export send-direct;
    neighbor 192.163.6.4;
    neighbor 192.168.40.4;
```

```
}
}
ospf {
  area 0.0.0.0 {
    interface lo0.1 {
      passive;
    }
    interface ge-0/1/0.1;
  }
}

user@A# show routing-options
router-id 192.168.6.5;
autonomous-system 17;
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Configuring Device B**

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure internal BGP peer sessions on Device B:

1. Configure the interfaces.

```
[edit interfaces ge-0/1/0 unit 2]
user@B# set description to-A
user@B# set family inet address 10.10.10.2/30
```

```
[edit interfaces ge-0/1/1]
user@B# set unit 5 description to-C
user@B# set unit 5 family inet address 10.10.10.5/30
```

```
[edit interfaces]
user@B# set lo0 unit 2 family inet address 192.163.6.4/32
```

2. Configure BGP.

The **neighbor** statements are included for both Device B and Device C, even though Device A is not directly connected to Device C.

```
[edit protocols bgp group internal-peers]
user@B# set type internal
user@B# set description "connections to A and C"
user@B# set local-address 192.163.6.4
user@B# set export send-direct
user@B# set neighbor 192.168.40.4
user@B# set neighbor 192.168.6.5
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@B# set interface lo0.2 passive
user@B# set interface ge-0/1/0.2
user@B# set interface ge-0/1/1.5
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 2]
user@B# set from protocol direct
user@B# set then accept
```

5. Configure the router ID and the AS number.

```
[edit routing-options]
user@B# set router-id 192.163.6.4
user@B# set autonomous-system 17
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@B# show interfaces
ge-0/1/0 {
  unit 2 {
    description to-A;
    family inet {
      address 10.10.10.2/30;
    }
  }
}
ge-0/1/1 {
  unit 5 {
    description to-C;
    family inet {
      address 10.10.10.5/30;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 192.163.6.4/32;
    }
  }
}

user@B# show policy-options
policy-statement send-direct {
  term 2 {
    from protocol direct;
    then accept;
  }
}

user@B# show protocols
bgp {
  group internal-peers {
    type internal;
```

```
        description "connections to A and C";
        local-address 192.163.6.4;
        export send-direct;
        neighbor 192.168.40.4;
        neighbor 192.168.6.5;
    }
}
ospf {
    area 0.0.0.0 {
        interface lo0.2 {
            passive;
        }
        interface ge-0/1/0.2;
        interface ge-0/1/1.5;
    }
}
```

```
user@B# show routing-options
router-id 192.163.6.4;
autonomous-system 17;
```

If you are done configuring the device, enter **commit** from configuration mode.

### *Configuring Device C*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure internal BGP peer sessions on Device C:

1. Configure the interfaces.

```
[edit interfaces ge-0/1/0 unit 6]
user@C# set description to-B
user@C# set family inet address 10.10.10.6/30

[edit interfaces]
user@C# set lo0 unit 3 family inet address 192.168.40.4/32
```

2. Configure BGP.

The **neighbor** statements are included for both Device B and Device C, even though Device A is not directly connected to Device C.

```
[edit protocols bgp group internal-peers]
user@C# set type internal
user@C# set description "connections to A and B"
user@C# set local-address 192.168.40.4
user@C# set export send-direct
user@C# set neighbor 192.163.6.4
user@C# set neighbor 192.168.6.5
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@C# set interface lo0.3 passive
user@C# set interface ge-0/1/0.6
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 2]
user@C# set from protocol direct
user@C# set then accept
```

5. Configure the router ID and the AS number.

```
[edit routing-options]
user@C# set router-id 192.168.40.4
user@C# set autonomous-system 17
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@C# show interfaces
ge-0/1/0 {
  unit 6 {
    description to-B;
    family inet {
      address 10.10.10.6/30;
    }
  }
}
lo0 {
  unit 3 {
    family inet {
      address 192.168.40.4/32;
    }
  }
}

user@C# show policy-options
policy-statement send-direct {
  term 2 {
    from protocol direct;
    then accept;
  }
}

user@C# show protocols
bgp {
  group internal-peers {
    type internal;
    description "connections to A and B";
    local-address 192.168.40.4;
    export send-direct;
    neighbor 192.163.6.4;
    neighbor 192.168.6.5;
  }
}
ospf {
```

```
area 0.0.0.0 {  
    interface lo0.3 {  
        passive;  
    }  
    interface ge-0/1/0.6;  
}  
}
```

```
user@C# show routing-options  
router-id 192.168.40.4;  
autonomous-system 17;
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying BGP Neighbors on page 3294](#)
- [Verifying BGP Groups on page 3295](#)
- [Verifying BGP Summary Information on page 3296](#)
- [Verifying That BGP Routes Are Installed in the Routing Table on page 3296](#)

### **Verifying BGP Neighbors**

**Purpose** Verify that BGP is running on configured interfaces and that the BGP session is active for each neighbor address.

**Action** From operational mode, enter the **show bgp neighbor** command.

```
user@A> show bgp neighbor  
Peer: 192.163.6.4+179 AS 17    Local: 192.168.6.5+58852 AS 17

### Verifying BGP Groups

**Purpose** Verify that the BGP groups are configured correctly.

**Action** From operational mode, enter the **show bgp group** command.

```

user@A> show bgp group
Group Type: Internal   AS: 17                               Local AS: 17
Name: internal-peers   Index: 0                               Flags: <Export Eval>
Export: [ send-direct ]
Holdtime: 0

### Verifying BGP Summary Information

**Purpose** Verify that the BGP configuration is correct.

**Action** From operational mode, enter the **show bgp summary** command.

```
user@A> show bgp summary
Groups: 1 Peers: 2 Down peers: 0
Table Tot Paths Act Paths Suppressed History Damp State Pending
inet.0 5 0 0 0 0 0 0
Peer AS InPkt OutPkt OutQ Flaps Last Up/Dwn
State|#Active/Received/Accepted/Damped...
192.163.6.4 17 2441 2432 0 0 18:18:52
0/3/3/0 0/0/0/0
192.168.40.4 17 2432 2430 0 0 18:18:48
0/2/2/0 0/0/0/0
```

### Verifying That BGP Routes Are Installed in the Routing Table

**Purpose** Verify that the export policy configuration is causing the BGP routes to be installed in the routing tables of the peers.

**Action** From operational mode, enter the **show route protocol bgp** command.

```
user@A> show route protocol bgp
inet.0: 7 destinations, 12 routes (7 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.10.10.0/30 [BGP/170] 07:09:57, localpref 100, from 192.163.6.4
AS path: I
> to 10.10.10.2 via ge-0/1/0.1
10.10.10.4/30 [BGP/170] 07:09:57, localpref 100, from 192.163.6.4
AS path: I
> to 10.10.10.2 via ge-0/1/0.1
[BGP/170] 07:07:12, localpref 100, from 192.168.40.4
AS path: I
> to 10.10.10.2 via ge-0/1/0.1
192.163.6.4/32 [BGP/170] 07:09:57, localpref 100, from 192.163.6.4
AS path: I
> to 10.10.10.2 via ge-0/1/0.1
192.168.40.4/32 [BGP/170] 07:07:12, localpref 100, from 192.168.40.4
AS path: I
> to 10.10.10.2 via ge-0/1/0.1
```

### Example: Configuring Internal BGP Peering Sessions on Logical Systems

This example shows how to configure internal BGP peer sessions on logical systems.

- [Requirements on page 3297](#)
- [Overview on page 3297](#)

- [Configuration on page 3297](#)
- [Verification on page 3304](#)

### Requirements

In this example, no special configuration beyond device initialization is required.

### Overview

In this example, you configure internal BGP (IBGP) peering sessions.

In the sample network, the devices in AS 17 are fully meshed in the group **internal-peers**. The devices have loopback addresses 192.168.6.5, 192.163.6.4, and 192.168.40.4.

[Figure 65 on page 3297](#) shows a typical network with internal peer sessions.

**Figure 65: Typical Network with IBGP Sessions**

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set logical-systems A interfaces lt-0/1/0 unit 1 description to-B
set logical-systems A interfaces lt-0/1/0 unit 1 encapsulation ethernet
set logical-systems A interfaces lt-0/1/0 unit 1 peer-unit 2
set logical-systems A interfaces lt-0/1/0 unit 1 family inet address 10.10.10.1/30
set logical-systems A interfaces lo0 unit 1 family inet address 192.168.6.5/32
set logical-systems A protocols bgp group internal-peers type internal
set logical-systems A protocols bgp group internal-peers local-address 192.168.6.5
set logical-systems A protocols bgp group internal-peers export send-direct
set logical-systems A protocols bgp group internal-peers neighbor 192.163.6.4
set logical-systems A protocols bgp group internal-peers neighbor 192.168.40.4
set logical-systems A protocols ospf area 0.0.0.0 interface lo0.1 passive
set logical-systems A protocols ospf area 0.0.0.0 interface lt-0/1/0.1
set logical-systems A policy-options policy-statement send-direct term 2 from protocol
  direct
set logical-systems A policy-options policy-statement send-direct term 2 then accept
set logical-systems A routing-options router-id 192.168.6.5
```

```
set logical-systems A routing-options autonomous-system 17
set logical-systems B interfaces lt-0/1/0 unit 2 description to-A
set logical-systems B interfaces lt-0/1/0 unit 2 encapsulation ethernet
set logical-systems B interfaces lt-0/1/0 unit 2 peer-unit 1
set logical-systems B interfaces lt-0/1/0 unit 2 family inet address 10.10.10.2/30
set logical-systems B interfaces lt-0/1/0 unit 5 description to-C
set logical-systems B interfaces lt-0/1/0 unit 5 encapsulation ethernet
set logical-systems B interfaces lt-0/1/0 unit 5 peer-unit 6
set logical-systems B interfaces lt-0/1/0 unit 5 family inet address 10.10.10.5/30
set logical-systems B interfaces lo0 unit 2 family inet address 192.163.6.4/32
set logical-systems B protocols bgp group internal-peers type internal
set logical-systems B protocols bgp group internal-peers local-address 192.163.6.4
set logical-systems B protocols bgp group internal-peers export send-direct
set logical-systems B protocols bgp group internal-peers neighbor 192.168.40.4
set logical-systems B protocols bgp group internal-peers neighbor 192.168.6.5
set logical-systems B protocols ospf area 0.0.0.0 interface lo0.2 passive
set logical-systems B protocols ospf area 0.0.0.0 interface lt-0/1/0.2
set logical-systems B protocols ospf area 0.0.0.0 interface lt-0/1/0.5
set logical-systems B policy-options policy-statement send-direct term 2 from protocol
    direct
set logical-systems B policy-options policy-statement send-direct term 2 then accept
set logical-systems B routing-options router-id 192.163.6.4
set logical-systems B routing-options autonomous-system 17
set logical-systems C interfaces lt-0/1/0 unit 6 description to-B
set logical-systems C interfaces lt-0/1/0 unit 6 encapsulation ethernet
set logical-systems C interfaces lt-0/1/0 unit 6 peer-unit 5
set logical-systems C interfaces lt-0/1/0 unit 6 family inet address 10.10.10.6/30
set logical-systems C interfaces lo0 unit 3 family inet address 192.168.40.4/32
set logical-systems C protocols bgp group internal-peers type internal
set logical-systems C protocols bgp group internal-peers local-address 192.168.40.4
set logical-systems C protocols bgp group internal-peers export send-direct
set logical-systems C protocols bgp group internal-peers neighbor 192.163.6.4
set logical-systems C protocols bgp group internal-peers neighbor 192.168.6.5
set logical-systems C protocols ospf area 0.0.0.0 interface lo0.3 passive
set logical-systems C protocols ospf area 0.0.0.0 interface lt-0/1/0.6
set logical-systems C policy-options policy-statement send-direct term 2 from protocol
    direct
set logical-systems C policy-options policy-statement send-direct term 2 then accept
set logical-systems C routing-options router-id 192.168.40.4
set logical-systems C routing-options autonomous-system 17
```

### **Device A**

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure internal BGP peer sessions on Device A:

1. Configure the interfaces.  

```
[edit logical-systems A interfaces lt-0/1/0 unit 1]
user@R1# set description to-B
user@R1# set encapsulation ethernet
user@R1# set peer-unit 2
user@R1# set family inet address 10.10.10.1/30
```

```

user@R1# set family inet address 192.168.6.5/32
user@R1# up
user@R1# up
[edit logical-systems A interfaces]
user@R1# set lo0 unit 1 family inet address 192.168.6.5/32
user@R1# exit
[edit]
user@R1# edit logical-systems B interfaces lt-0/1/0
[edit logical-systems B interfaces lt-0/1/0]
user@R1# set unit 2 description to-A
user@R1# set unit 2 encapsulation ethernet
user@R1# set unit 2 peer-unit 1
user@R1# set unit 2 family inet address 10.10.10.2/30
user@R1# set unit 5 description to-C
user@R1# set unit 5 encapsulation ethernet
user@R1# set unit 5 peer-unit 6
user@R1# set family inet address 10.10.10.5/30
user@R1# up
[edit logical-systems B interfaces]
user@R1# set lo0 unit 2 family inet address 192.163.6.4/32
user@R1# exit
[edit]
user@R1# edit logical-systems C interfaces lt-0/1/0 unit 6
[edit logical-systems C interfaces lt-0/1/0 unit 6]
set description to-B
set encapsulation ethernet
set peer-unit 5
set family inet address 10.10.10.6/30
user@R1# up
user@R1# up
[edit logical-systems C interfaces]
set lo0 unit 3 family inet address 192.168.40.4/32

```

## 2. Configure BGP.

On Logical System A, the **neighbor** statements are included for both Device B and Device C, even though Logical System A is not directly connected to Device C.

```

[edit logical-systems A protocols bgp group internal-peers]
user@R1# set type internal
user@R1# set local-address 192.168.6.5
user@R1# set export send-direct
user@R1# set neighbor 192.163.6.4
user@R1# set neighbor 192.168.40.4

```

```

[edit logical-systems B protocols bgp group internal-peers]
user@R1# set type internal
user@R1# set local-address 192.163.6.4
user@R1# set export send-direct
user@R1# set neighbor 192.168.40.4
user@R1# set neighbor 192.168.6.5

```

```

[edit logical-systems C protocols bgp group internal-peers]
user@R1# set type internal
user@R1# set local-address 192.168.40.4
user@R1# set export send-direct

```

```
user@R1# set neighbor 192.163.6.4
user@R1# set neighbor 192.168.6.5
```

3. Configure OSPF.

```
[edit logical-systems A protocols ospf area 0.0.0.0]
user@R1# set interface lo0.1 passive
user@R1# set interface lt-0/1/0.1
```

```
[edit logical-systems A protocols ospf area 0.0.0.0]
user@R1# set interface lo0.2 passive
user@R1# set interface lt-0/1/0.2
user@R1# set interface lt-0/1/0.5
```

```
[edit logical-systems A protocols ospf area 0.0.0.0]
user@R1# set interface lo0.3 passive
user@R1# set interface lt-0/1/0.6
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit logical-systems A policy-options policy-statement send-direct term 2]
user@R1# set from protocol direct
user@R1# set then accept
```

```
[edit logical-systems B policy-options policy-statement send-direct term 2]
user@R1# set from protocol direct
user@R1# set then accept
```

```
[edit logical-systems C policy-options policy-statement send-direct term 2]
user@R1# set from protocol direct
user@R1# set then accept
```

5. Configure the router ID and the autonomous system (AS) number.

```
[edit logical-systems A routing-options]
user@R1# set router-id 192.168.6.5
user@R1# set autonomous-system 17
```

```
[edit logical-systems B routing-options]
user@R1# set router-id 192.163.6.4
user@R1# set autonomous-system 17
```

```
[edit logical-systems C routing-options]
user@R1# set router-id 192.168.40.4
user@R1# set autonomous-system 17
```

**Results** From configuration mode, confirm your configuration by entering the **show logical-systems** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R1# show logical-systems
A {
```

```

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying BGP Neighbors on page 3304](#)
- [Verifying BGP Groups on page 3305](#)
- [Verifying BGP Summary Information on page 3305](#)
- [Verifying That BGP Routes Are Installed in the Routing Table on page 3306](#)

### Verifying BGP Neighbors

**Purpose** Verify that BGP is running on configured interfaces and that the BGP session is active for each neighbor address.

**Action** From the operational mode, enter the **show bgp neighbor** command.

```
user@R1> show bgp neighbor logical-system A
Peer: 192.163.6.4+179 AS 17    Local: 192.168.6.5+58852 AS 17

### Verifying BGP Groups

**Purpose** Verify that the BGP groups are configured correctly.

**Action** From the operational mode, enter the **show bgp group** command.

```

user@A> show bgp group logical-system A
Group Type: Internal    AS: 17                      Local AS: 17
Name: internal-peers   Index: 0                    Flags: <Export Eval>
Export: [ send-direct ]

## Configuring BGP Monitoring Protocol Version 3

BGP Monitoring Protocol (BMP) allows the Junos OS to send the BGP route information from the router to a monitoring application on a separate device. The monitoring application is called the BMP monitoring station or BMP station. To deploy BMP in your network, you need to configure BMP on each router and you also need to configure at least one BMP station. This procedure describes how to configure BMP on a router.

You can specify these settings for all BMP stations by configuring the statements described here at the **[edit routing-options bmp]** hierarchy level. You can also configure settings for specific BMP stations by configuring these statements at the **[edit routing-options bmp station station-name]** hierarchy level.

The following procedure describes how to configure BMP version 3 on the router:

1. Specify the name or address for the BMP monitoring station by configuring the **station-address** statement. You can specify one or the other but not both. The address must be a valid IPv4 or IPv6 address.

```
station-address (station-address | station-name);
```

2. Specify the authentication algorithm used to encrypt authentication between the BMP-enabled router and the BMP station using the **authentication-algorithm** statement.

```
authentication-algorithm algorithm;
```

You can specify one of the following types of authentication algorithms:

- **aes-128-cmac-96**—Cipher-based message authentication code (AES128, 96 bits).
  - **hmac-sha-1-96**—Hash-based message authentication code (SHA1, 96 bits).
  - **md5**—Message digest 5.
3. Specify an MD5 authentication key (password) using the **authentication-key** statement.

```
authentication-key key;
```

4. Specify the authentication key chain using the **authentication-key-chain** statement.

```
authentication-key-chain key-chain;
```

The authentication key chain itself needs to be configured at the **[edit security authentication-key-chains key-chain]** hierarchy level. For a detailed example, see [“Example: Configuring Route Authentication for BGP” on page 3572](#).

5. Specify how to handle a BMP station flap by configuring the **hold-down** statement. A flap is when the TCP session unexpectedly switches from established to non-established. The BMP station can be prevented from attempting to reconnect to the device for a specified period of time.

```
hold-down {
  seconds;
  flaps number;
  period seconds;
}
```

You can specify the following options for the **hold-down** statement:

- **seconds**—Specify the time in seconds to wait before allowing the BMP station to reconnect to the device.
  - **flaps number**—Specify the number of BMP station flaps allowed before terminating the connection to the BMP station and triggering the hold down timer.
  - **period seconds**—Specify the time in seconds between BMP station flaps before terminating the connection to the BMP station and triggering the hold down timer.
6. (Optional) Specify an initiation message to be sent to the BMP station using the **initiation-message** statement. This statement allows you to provide some information to the BMP station system administrator (for example, a contact phone number).

**initiation-message** *text*;

7. Specify the connection mode for the connection between the BMP-enabled router and the BMP station using the **connection-mode** statement. The connection mode can be **active** or **passive**:
- **active**—BMP initiates the connection to the BMP station. If you configure active mode, you must also configure a station port using the **station-port** statement. However, you must not configure a local port (active mode).
  - **passive**—BMP does not initiate a connection the BMP station. However, it does listen for a connection request from active BMP stations and will connect if a station is available. If you configure passive mode, you must not configure a station port. However, you must configure a local port using the **local-port** statement (passive mode).

**connection-mode** (active | passive);

8. Specify the port number for the BMP monitoring station by configuring the **station-port** statement. See also **connection-mode**.

**station-port** *port*;

9. Specify the listening port for the BMP station connection using the **local-port** statement. See also **connection-mode**.

If you change the local port, the BMP station connection flaps when you commit the configuration.

**local-port**

10. (Optional) Specify the IPv4 or IPv6 address for the BMP connection on the device using the **local-address** statement. For both active and passive connections, configure a loopback local address. This provides a consistent local endpoint, is useful for debugging, and assures greater reliability for the BMP connection since it is not tied to a single router interface.

For passive mode, specifying a local address is required. It also provides some security against a malicious BMP connection. For active mode, we also recommend configuring a local address to help ensure reliability.

If you change the local address, the BMP station connection flaps when you commit the configuration.

**local-address** *address*;

11. BMP monitoring is enabled by default. You can explicitly enable BMP monitoring or disable it. You can also selectively enable or disable BMP monitoring at various hierarchy levels (for example, `[edit protocols bgp group group-name]` or `[edit protocols bgp group group-name neighbor address]`). If you disable BMP monitoring, withdrawal messages are sent for any previously advertised routes. These are followed by a down message. If you enable BMP monitoring, an up message is sent first and then the route advertisements follow.

`monitor` (enable | disable);

12. Specify the dispatch priority for BMP by configuring the `priority` statement. The dispatch priority controls the frequency with which the device is able to forward BMP messages to BMP stations. You can configure the dispatch priority as either **high**, **medium**, or **low**.

`priority` (high | medium | low);

13. Specify whether BMP should send pre-policy route monitoring messages, post-policy route monitoring messages, both types of messages, or none at all. The pre-policy can be configured to exclude routes that are non-feasible for the decision process (for example, a route loop) by including the **non-feasible** option for the **pre-policy** statement. This represents the view of the BGP routes before running the import policy.

The post-policy can be configured to exclude routes that are not eligible for the decision process (for example, protocol nexthop not resolved) by including the **exclude-non-eligible** option for the **post-policy** statement. This represents the view of the BGP routes after running the import policy. If the import policy has rejected the BGP route, the route does not exist in the post policy view.

You can explicitly disable route monitoring by specifying the **none** option for the **route-monitoring** statement. This is the default behavior.

```
route-monitoring {
  none;
  post-policy {
    exclude-non-eligible;
  }
  pre-policy {
    exclude-non-feasible;
  }
}
```

14. Configure how often statistics messages are sent to the BMP monitoring station by specifying the number of seconds between message transmissions using **statistics-timeout** statement. If you configure a value of 0, no statistics messages are sent.

`statistics-timeout` *seconds*;

### Example: Configuring BGP Local Preference

- [Understanding the BGP Local Preference on page 3310](#)
- [Example: Configuring the Local Preference Value for BGP Routes on page 3310](#)

#### Understanding the BGP Local Preference

---

Internal BGP (IBGP) sessions use a metric called the *local preference*, which is carried in IBGP update packets in the path attribute LOCAL\_PREF. When an autonomous system (AS) has multiple routes to another AS, the local preference indicates the degree of preference for one route over the other routes. The route with the highest local preference value is preferred.

The LOCAL\_PREF path attribute is always advertised to IBGP peers and to neighboring confederations. It is never advertised to external BGP (EBGP) peers. The default behavior is to not modify the LOCAL\_PREF path attribute if it is present.

The LOCAL\_PREF path attribute applies at export time only, when the routes are exported from the routing table into BGP.

If a BGP route is received without a LOCAL\_PREF attribute, the route is stored in the routing table and advertised by BGP as if it were received with a LOCAL\_PREF value of 100. A non-BGP route that is advertised by BGP is advertised with a LOCAL\_PREF value of 100 by default.

#### Example: Configuring the Local Preference Value for BGP Routes

---

This example shows how to configure local preference in internal BGP (IBGP) peer sessions.

- [Requirements on page 3310](#)
- [Overview on page 3310](#)
- [Configuration on page 3311](#)
- [Verification on page 3321](#)

##### **Requirements**

No special configuration beyond device initialization is required before you configure this example.

##### **Overview**

To change the local preference metric advertised in the path attribute, you must include the **local-preference** statement, specifying a value from 0 through 4,294,967,295 ( $2^{32} - 1$ ).

There are several reasons you might want to prefer one path over another. For example, compared to other paths, one path might be less expensive to use, might have higher bandwidth, or might be more stable.

Figure 66 on page 3311 shows a typical network with internal peer sessions and multiple exit points to a neighboring AS.

Figure 66: Typical Network with IBGP Sessions and Multiple Exit Points

To reach Device R4, Device R1 can take a path through either Device R2 or Device R3. By default, the local preference is 100 for either route. When the local preferences are equal, Junos OS has rules for breaking the tie and choosing a path. (See *Understanding BGP Path Selection*.) In this example, the active route is through Device R2 because the router ID of Device R2 is lower than the router ID of Device R3. The following example shows how to override the default behavior with an explicit setting for the local preference. The example configures a local preference of 300 on Device R3, thereby making Device R3 the preferred path to reach Device R4.

### Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```
set interfaces fe-1/2/0 unit 1 family inet address 12.12.12.1/24
set interfaces fe-1/2/1 unit 2 family inet address 13.13.13.1/24
```

```
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.1.1
set protocols bgp group internal export send-direct
set protocols bgp group internal neighbor 192.168.2.1
set protocols bgp group internal neighbor 192.168.3.1
set protocols ospf area 0.0.0.0 interface lo0.1 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.1
set protocols ospf area 0.0.0.0 interface fe-1/2/1.2
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 123
set routing-options router-id 192.168.1.1
```

Device R2

```
set interfaces fe-1/2/0 unit 3 family inet address 12.12.12.2/24
set interfaces fe-1/2/1 unit 4 family inet address 24.24.24.2/24
set interfaces lo0 unit 2 family inet address 192.168.2.1/32
set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.2.1
set protocols bgp group internal export send-direct

set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 4
set protocols bgp group external neighbor 34.34.34.4
set protocols ospf area 0.0.0.0 interface lo0.3 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.5
set protocols ospf area 0.0.0.0 interface fe-1/2/1.6
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 123
set routing-options router-id 192.168.3.1
```

Device R4

```
set interfaces fe-1/2/0 unit 7 family inet address 24.24.24.4/24
```

```

set interfaces fe-1/2/1 unit 8 family inet address 34.34.34.4/24
set interfaces lo0 unit 4 family inet address 192.168.4.1/32
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 123
set protocols bgp group external neighbor 34.34.34.3
set protocols bgp group external neighbor 24.24.24.2
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 4
set routing-options router-id 192.168.4.1

```

### Configuring Device R1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.
 

```

[edit interfaces fe-1/2/0 unit 1]
user@R1# set family inet address 12.12.12.1/24

[edit interfaces fe-1/2/1 unit 2]
user@R1# set family inet address 13.13.13.1/24

[edit interfaces lo0 unit 1]
user@R1# set family inet address 192.168.1.1/32

```
2. Configure BGP.
 

```

[edit protocols bgp group internal]
user@R1# set type internal
user@R1# set local-address 192.168.1.1
user@R1# set export send-direct
user@R1# set neighbor 192.168.2.1
user@R1# set neighbor 192.168.3.1

```
3. Configure OSPF.
 

```

[edit protocols ospf area 0.0.0.0]
user@R1# set interface lo0.1 passive
user@R1# set interface fe-1/2/0.1
user@R1# set interface fe-1/2/1.2

```
4. Configure a policy that accepts direct routes.

**NOTE:** Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```

[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct

```

```
user@R1# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
```

```
user@R1# set autonomous-system 123
```

```
user@R1# set router-id 192.168.1.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
```

```
fe-1/2/0 {
```

```
  unit 1 {
```

```
    family inet {
```

```
      address 12.12.12.1/24;
```

```
    }
```

```
  }
```

```
fe-1/2/1 {
```

```
  unit 2 {
```

```
    family inet {
```

```
      address 13.13.13.1/24;
```

```
    }
```

```
  }
```

```
}
```

```
lo0 {
```

```
  unit 1 {
```

```
    family inet {
```

```
      address 192.168.1.1/32;
```

```
    }
```

```
  }
```

```
}
```

```
user@R1# show policy-options
```

```
policy-statement send-direct {
```

```
  term 1 {
```

```
    from protocol direct;
```

```
    then accept;
```

```
  }
```

```
}
```

```
user@R1# show protocols
```

```
bgp {
```

```
  group internal {
```

```
    type internal;
```

```
    local-address 192.168.1.1;
```

```
    export send-direct;
```

```
    neighbor 192.168.2.1;
```

```
    neighbor 192.168.3.1;
```

```
  }
```

```
}
```

```
ospf {
```

```
  area 0.0.0.0 {
```

```

interface lo0.1 {
    passive;
}
interface fe-1/2/0.1;
interface fe-1/2/1.2;
}
}

user@R1# show routing-options
autonomous-system 123;
router-id 192.168.1.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Device R2

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.
 

```

[edit interfaces fe-1/2/0 unit 3]
user@R2# set family inet address 12.12.12.21/24

[edit interfaces fe-1/2/1 unit 4]
user@R2# set family inet address 24.24.24.2/24

[edit interfaces lo0 unit 2]
user@R2# set family inet address 192.168.2.1/32

```
2. Configure BGP.
 

```

[edit protocols bgp group internal]
user@R2# set type internal
user@R2# set local-address 192.168.2.1
user@R2# set export send-direct
user@R2# set neighbor 192.168.1.1
user@R2# set neighbor 192.168.3.1

[edit protocols bgp group external]
user@R2# set type external
user@R2# set export send-direct
user@R2# set peer-as 4
user@R2# set neighbor 24.24.24.4

```
3. Configure OSPF.
 

```

[edit protocols ospf area 0.0.0.0]
user@R2# set interface lo0.2 passive
user@R2# set interface fe-1/2/0.3
user@R2# set interface fe-1/2/1.4

```
4. Configure a policy that accepts direct routes.

**NOTE:** Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R2# set from protocol direct
user@R2# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R2# set autonomous-system 123
user@R2# set router-id 192.168.2.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 3 {
    family inet {
      address 12.12.12.2/24;
    }
  }
}
fe-1/2/1 {
  unit 4 {
    family inet {
      address 24.24.24.2/24;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 192.168.2.1/32;
    }
  }
}

user@R2# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R2# show protocols
bgp {
  group internal {
    type internal;
  }
}
```

```

    local-address 192.168.2.1;
    export send-direct;
    neighbor 192.168.1.1;
    neighbor 192.168.3.1;
  }
  group external {
    type external;
    export send-direct;
    peer-as 4;
    neighbor 24.24.24.4;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.2 {
      passive;
    }
    interface fe-1/2/0.3;
    interface fe-1/2/1.4;
  }
}

user@R2# show routing-options
autonomous-system 123;
router-id 192.168.2.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Device R3

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R3:

1. Configure the interfaces.
 

```

[edit interfaces fe-1/2/0 unit 5]
user@R3# set family inet address 13.13.13.3/24

[edit interfaces fe-1/2/1 unit 6]
user@R3# set family inet address 34.34.34.3/24

[edit interfaces lo0 unit 3]
user@R3# set family inet address 192.168.3.1/32

```
2. Configure BGP.
 

```

[edit protocols bgp group internal]
user@R3# set type internal
user@R3# set local-address 192.168.3.1
user@R3# set export send-direct
user@R3# set neighbor 192.168.1.1
user@R3# set neighbor 192.168.2.1

```

```
[edit protocols bgp group external]
user@R3# set type external
user@R3# set export send-direct
user@R3# set peer-as 4
user@R3# set neighbor 34.34.34.4
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R3# set interface lo0.3 passive
user@R3# set interface fe-1/2/0.5
user@R3# set interface fe-1/2/1.6
```

4. Configure a policy that accepts direct routes.

**NOTE:** Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R3# set from protocol direct
user@R3# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R3# set autonomous-system 123
user@R3# set router-id 192.168.3.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
fe-1/2/0 {
  unit 5 {
    family inet {
      address 13.13.13.3/24;
    }
  }
}
fe-1/2/1 {
  unit 6 {
    family inet {
      address 34.34.34.3/24;
    }
  }
}
lo0 {
  unit 3 {
    family inet {
      address 192.168.3.1/32;
    }
  }
}
```

```

}

user@R3# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R3# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.3.1;
    export send-direct;
    neighbor 192.168.1.1;
    neighbor 192.168.2.1;
  }
  group external {
    type external;
    export send-direct;
    peer-as 4;
    neighbor 34.34.34.4;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.3 {
      passive;
    }
    interface fe-1/2/0.5;
    interface fe-1/2/1.6;
  }
}

user@R3# show routing-options
autonomous-system 123;
router-id 192.168.3.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Device R4

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R4:

1. Configure the interfaces.
 

```

[edit interfaces fe-1/2/0 unit 7]
user@R4# set family inet address 24.24.24.4/24

[edit interfaces fe-1/2/1 unit 8]
user@R4# set family inet address 34.34.34.4/24

```

```
[edit interfaces lo0 unit 4]
user@R4# set family inet address 192.168.4.1/32
```

2. Configure BGP.

```
[edit protocols bgp group external]
user@R4# set type external
user@R4# set export send-direct
user@R4# set peer-as 123
user@R4# set neighbor 34.34.34.3
user@R4# set neighbor 24.24.24.2
```

3. Configure a policy that accepts direct routes.

**NOTE:** Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R4# set from protocol direct
user@R4# set then accept
```

4. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R4# set autonomous-system 4
user@R4# set router-id 192.168.4.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R4# show interfaces
fe-1/2/0 {
  unit 7 {
    family inet {
      address 24.24.24.4/24;
    }
  }
}
fe-1/2/1 {
  unit 8 {
    family inet {
      address 34.34.34.4/24;
    }
  }
}
lo0 {
  unit 4 {
    family inet {
      address 192.168.4.1/32;
    }
  }
}
```

```

user@R4# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R4# show protocols
bgp {
  group external {
    type external;
    export send-direct;
    peer-as 123;
    neighbor 34.34.34.3;
    neighbor 24.24.24.2;
  }
}

user@R4# show routing-options
autonomous-system 4;
router-id 192.168.4.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Checking the Active Path From Device R1 to Device R4 on page 3321](#)
- [Altering the Local Preference to Change the Path Selection on page 3322](#)
- [Rechecking the Active Path From Device R1 to Device R4 on page 3322](#)

### Checking the Active Path From Device R1 to Device R4

**Purpose** Verify that the active path from Device R1 to Device R4 goes through Device R2.

**Action** From operational mode, enter the **show route protocol bgp** command.

```

user@R1> show route protocol bgp
inet.0: 11 destinations, 18 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

12.12.12.0/24      [BGP/170] 00:11:48, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
13.13.13.0/24      [BGP/170] 00:11:48, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
24.24.24.0/24      [BGP/170] 00:11:48, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
34.34.34.0/24      [BGP/170] 00:11:48, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
192.168.2.1/32     [BGP/170] 00:11:48, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1

```

```
192.168.3.1/32      [BGP/170] 00:11:48, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
192.168.4.1/32      *[BGP/170] 00:05:14, localpref 100, from 192.168.2.1
                  AS path: 4 I
                  > to 12.12.12.2 via fe-1/2/0.1
                  [BGP/170] 00:05:14, localpref 100, from 192.168.3.1
                  AS path: 4 I
                  > to 13.13.13.3 via fe-1/2/1.2
```

**Meaning** The asterisk (\*) shows that the preferred path is through Device R2. In the default configuration, Device R2 has a lower router ID than Device R3. The router ID is controlling the path selection.

#### *Altering the Local Preference to Change the Path Selection*

**Purpose** Change the path so that it goes through Device R3.

**Action** From configuration mode, enter the **set local-preference 300** command.

```
[edit protocols bgp group internal]
user@R3# set local-preference 300
user@R3# commit
```

#### *Rechecking the Active Path From Device R1 to Device R4*

**Purpose** Verify that the active path from Device R1 to Device R4 goes through Device R3.

**Action** From operational mode, enter the **show route protocol bgp** command.

```
user@R1> show route protocol bgp
inet.0: 11 destinations, 17 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

12.12.12.0/24      [BGP/170] 00:16:48, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
13.13.13.0/24      [BGP/170] 00:00:22, localpref 300, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
24.24.24.0/24      [BGP/170] 00:16:48, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
34.34.34.0/24      [BGP/170] 00:00:22, localpref 300, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
192.168.2.1/32      [BGP/170] 00:16:48, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
192.168.3.1/32      [BGP/170] 00:00:22, localpref 300, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
192.168.4.1/32      *[BGP/170] 00:00:21, localpref 300, from 192.168.3.1
                  AS path: 4 I
                  > to 13.13.13.3 via fe-1/2/1.2
```

**Meaning** The asterisk (\*) shows that the preferred path is through Device R3. In the altered configuration, Device R3 has a higher local preference than Device R2. The local preference is controlling the path selection.

## Examples: Configuring BGP MED

- [Understanding the MED Attribute on page 3323](#)
- [Example: Configuring the MED Attribute Directly on page 3325](#)
- [Example: Configuring the MED Using Route Filters on page 3338](#)
- [Example: Configuring the MED Using Communities on page 3351](#)
- [Example: Associating the MED Path Attribute with the IGP Metric and Delaying MED Updates on page 3352](#)

### Understanding the MED Attribute

The BGP multiple exit discriminator (MED, or MULTI\_EXIT\_DISC) is a non-transitive attribute, meaning that it is not propagated throughout the Internet, but only to adjacent autonomous systems (ASs). The MED attribute is optional, meaning that it is not always sent with the BGP updates. The purpose of MED is to influence how other ASs enter your AS to reach a certain prefix.

The MED attribute has a value that is referred to as a *metric*. If all other factors in determining an exit point are equal, the exit point with the lowest metric is preferred.

If a MED is received over an external BGP link, it is propagated over internal links to other BGP-enabled devices within the AS.

BGP update messages include a MED metric if the route was learned from BGP and already had a MED metric associated with it, or if you configure the MED metric in the configuration file.

A MED metric is advertised with a route according to the following general rules:

- A more specific metric overrides a less specific metric. That is, a group-specific metric overrides a global BGP metric, and a peer-specific metric overrides a global BGP or group-specific metric.
- A metric defined with a routing policy overrides a metric defined with the **metric-out** statement.
- If any metric is defined, it overrides a metric received in a route.
- If the received route does not have an associated MED metric, and if you do not explicitly configure a metric value, no metric is advertised. When you do not explicitly configure a metric value, the MED value is equivalent to zero (0) when advertising an active route.

Because the AS path rather than the number of hops between hosts is the primary criterion for BGP route selection, an AS with multiple connections to a peer AS can have multiple equivalent AS paths. When the routing table contains two routes to the same host in a neighboring AS, a MED metric assigned to each route can determine which to include in the forwarding table. The MED metric you assign can force traffic through a particular exit point in an AS.

[Figure 67 on page 3324](#) illustrates how MED metrics are used to determine route selection.

**Figure 67: Default MED Example**

[Figure 67 on page 3324](#) shows AS 1 and AS 2 connected by two separate BGP links to Routers C and D. Host E in AS 1 is located nearer to Router C. Host F, also in AS 1, is located nearer to Router D. Because the AS paths are equivalent, two routes exist for each host, one through Router C and one through Router D. To force all traffic destined for Host E through Router C, the network administrator for AS 1 assigns a MED metric for each router to Host E at its exit point. A MED metric of 10 is assigned to the route to Host E through Router C, and a MED metric of 20 is assigned to the route to Host E through Router D. BGP routers in AS 2 select the route with the lower MED metric for the forwarding table.

By default, only the MEDs of routes that have the same peer ASs are compared. However, you can configure the routing table path selection options listed in [Table 295 on page 3325](#) to compare MEDs in different ways. The MED options are not mutually exclusive and can be configured in combination or independently. For the MED options to take effect, you must configure them uniformly all through your network. The MED option or options you configure determine the route selected. Thus we recommend that you carefully evaluate your network for preferred routes before configuring the MED options.

Table 295: MED Options for Routing Table Path Selection

| Option (Name)   | Function   | Use  |
|---|--|--|
| Always comparing MEDs<br>( <b>always-compare-med</b> )                          | Ensures that the MEDs for paths from peers in different ASs are always compared in the route selection process.  | Useful when all enterprises participating in a network agree on a uniform policy for setting MEDs. For example, in a network shared by two ISPs, both must agree that a certain path is the better path to configure the MED values correctly. |
| Adding IGP cost to MED ( <b>med-plus-igp</b> )                                  | <p>Before comparing MED values for path selection, adds to the MED the cost of the IGP route to the BGP next-hop destination.</p> <p>This option replaces the MED value for the router, but does not affect the IGP metric comparison. As a result, when multiple routes have the same value after the MED-plus-IGP comparison, and route selection continues, the IGP route metric is also compared, even though it was added to the MED value and compared earlier in the selection process.</p>                                   | Useful when the downstream AS requires the complete cost of a certain route that is received across multiple ASs.  |
| Applying Cisco IOS nondeterministic behavior ( <b>cisco-non-deterministic</b> ) | <p>Specifies the nondeterministic behavior of the Cisco IOS software:</p> <ul style="list-style-type: none"> <li>The active path is always first. All nonactive but eligible paths follow the active path and are maintained in the order in which they were received. Ineligible paths remain at the end of the list.</li> <li>When a new path is added to the routing table, path comparisons are made among all routes, including those paths that must never be selected because they lose the MED tie-breaking rule.</li> </ul> | We recommend that you do not configure this option, because the nondeterministic behavior sometimes prevents the system from properly comparing the MEDs between paths.  |

### Example: Configuring the MED Attribute Directly

This example shows how to configure a multiple exit discriminator (MED) metric to advertise in BGP update messages.

- [Requirements on page 3325](#)
- [Overview on page 3326](#)
- [Configuration on page 3327](#)
- [Verification on page 3337](#)

#### Requirements

No special configuration beyond device initialization is required before you configure this example.

### Overview

To directly configure a MED metric to advertise in BGP update messages, include the **metric-out** statement:

**metric-out** (*metric* | **minimum-igp** *offset* | **igp** **delay-med-update** | *offset*);

**metric** is the primary metric on all routes sent to peers. It can be a value in the range from 0 through 4,294,967,295 ( $2^{32} - 1$ ).

The following optional settings are also supported:

- **minimum-igp**—Sets the metric to the minimum metric value calculated in the interior gateway protocol (IGP) to get to the BGP next hop. If a newly calculated metric is greater than the minimum metric value, the metric value remains unchanged. If a newly calculated metric is lower, the metric value is lowered to that value.
- **igp**—Sets the metric to the most recent metric value calculated in the IGP to get to the BGP next hop.
- **delay-med-update**—Delays sending MED updates when the MED value increases. Include the **delay-med-update** statement when you configure the **igp** statement. The default interval to delay sending updates, unless the MED is lower or another attribute associated with the route has changed is 10 minutes. Include the **med-igp-update-interval** *minutes* statement at the **[edit routing-options]** hierarchy level to modify the default interval.
- **offset**—Specifies a value for **offset** to increase or decrease the metric that is used from the metric value calculated in the IGP. The metric value is offset by the value specified. The metric calculated in the IGP (by specifying either **igp** or **igp-minimum**) is increased if the **offset** value is positive. The metric calculated in the IGP (by specifying either **igp** or **igp-minimum**) is decreased if the **offset** value is negative.

**offset** can be a value in the range from  $-2^{31}$  through  $2^{31} - 1$ . Note that the adjusted metric can never go below 0 or above  $2^{32} - 1$ .

Figure 68 on page 3327 shows a typical network with internal peer sessions and multiple exit points to a neighboring autonomous system (AS).

Figure 68: Typical Network with IBGP Sessions and Multiple Exit Points

Device R4 has multiple loopback interfaces configured to simulate advertised prefixes. The extra loopback interface addresses are 44.44.44.44/32 and 144.144.144.144/32. This example shows how to configure Device R4 to advertise a MED value of 30 to Device R3 and a MED value of 20 to Device R2. This causes all of the devices in AS 123 to prefer the path through Device R2 to reach AS 4.

### Configuration

- [Configuring Device R1 on page 3329](#)
- [Configuring Device R2 on page 3331](#)
- [Configuring Device R3 on page 3333](#)
- [Configuring Device R4 on page 3335](#)

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 1 family inet address 12.12.12.1/24
set interfaces fe-1/2/1 unit 2 family inet address 13.13.13.1/24
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.1.1
set protocols bgp group internal export send-direct
set protocols bgp group internal neighbor 192.168.2.1
set protocols bgp group internal neighbor 192.168.3.1
set protocols ospf area 0.0.0.0 interface lo0.1 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.1
set protocols ospf area 0.0.0.0 interface fe-1/2/1.2
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept

```

```
set routing-options autonomous-system 123
set routing-options router-id 192.168.1.1
```

**Device R2**

```
set interfaces fe-1/2/0 unit 3 family inet address 12.12.12.2/24
set interfaces fe-1/2/1 unit 4 family inet address 24.24.24.2/24
set interfaces lo0 unit 2 family inet address 192.168.2.1/32
set protocols bgp group internal type internal

```

### Configuring Device R1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.

```
[edit interfaces fe-1/2/0 unit 1]
user@R1# set family inet address 12.12.12.1/24
```

```
[edit interfaces fe-1/2/1 unit 2]
user@R1# set family inet address 13.13.13.1/24
```

```
[edit interfaces lo0 unit 1]
user@R1# set family inet address 192.168.1.1/32
```

2. Configure BGP.

```
[edit protocols bgp group internal]
user@R1# set type internal
user@R1# set local-address 192.168.1.1
user@R1# set export send-direct
user@R1# set neighbor 192.168.2.1
user@R1# set neighbor 192.168.3.1
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R1# set interface lo0.1 passive
user@R1# set interface fe-1/2/0.1
user@R1# set interface fe-1/2/1.2
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct
user@R1# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R1# set autonomous-system 123
user@R1# set router-id 192.168.1.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 12.12.12.1/24;
    }
  }
}
fe-1/2/1 {
  unit 2 {
    family inet {
      address 13.13.13.1/24;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.1.1/32;
    }
  }
}

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R1# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.1.1;
    export send-direct;
    neighbor 192.168.2.1;
    neighbor 192.168.3.1;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.1 {
      passive;
    }
    interface fe-1/2/0.1;
    interface fe-1/2/1.2;
  }
}

user@R1# show routing-options
autonomous-system 123;
router-id 192.168.1.1;
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Device R2

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.

```
[edit interfaces fe-1/2/0 unit 3]
user@R2# set family inet address 12.12.12.21/24
```

```
[edit interfaces fe-1/2/1 unit 4]
user@R2# set family inet address 24.24.24.2/24
```

```
[edit interfaces lo0 unit 2]
user@R2# set family inet address 192.168.2.1/32
```

2. Configure BGP.

```
[edit protocols bgp group internal]
user@R2# set type internal
user@R2# set local-address 192.168.2.1
user@R2# set export send-direct
user@R2# set neighbor 192.168.1.1
user@R2# set neighbor 192.168.3.1
```

```
[edit protocols bgp group external]
user@R2# set type external
user@R2# set export send-direct
user@R2# set peer-as 4
user@R2# set neighbor 24.24.24.4
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R2# set interface lo0.2 passive
user@R2# set interface fe-1/2/0.3
user@R2# set interface fe-1/2/1.4
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R2# set from protocol direct
user@R2# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R2# set autonomous-system 123
user@R2# set router-id 192.168.2.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 3 {
    family inet {
      address 12.12.12.2/24;
    }
  }
}
fe-1/2/1 {
  unit 4 {
    family inet {
      address 24.24.24.2/24;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 192.168.2.1/32;
    }
  }
}

user@R2# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R2# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.2.1;
    export send-direct;
    neighbor 192.168.1.1;
    neighbor 192.168.3.1;
  }
  group external {
    type external;
    export send-direct;
    peer-as 4;
    neighbor 24.24.24.4;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.2 {
      passive;
    }
  }
}
```

```

    }
    interface fe-1/2/0.3;
    interface fe-1/2/1.4;
  }
}

user@R2# show routing-options
autonomous-system 123;
router-id 192.168.2.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Device R3

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R3:

1. Configure the interfaces.

```

[edit interfaces fe-1/2/0 unit 5]
user@R3# set family inet address 13.13.13.3/24

```

```

[edit interfaces fe-1/2/1 unit 6]
user@R3# set family inet address 34.34.34.3/24

```

```

[edit interfaces lo0 unit 3]
user@R3# set family inet address 192.168.3.1/32

```

2. Configure BGP.

```

[edit protocols bgp group internal]
user@R3# set type internal
user@R3# set local-address 192.168.3.1
user@R3# set export send-direct
user@R3# set neighbor 192.168.1.1
user@R3# set neighbor 192.168.2.1

```

```

[edit protocols bgp group external]
user@R3# set type external
user@R3# set export send-direct
user@R3# set peer-as 4
user@R3# set neighbor 34.34.34.4

```

3. Configure OSPF.

```

[edit protocols ospf area 0.0.0.0]
user@R3# set interface lo0.3 passive
user@R3# set interface fe-1/2/0.5
user@R3# set interface fe-1/2/1.6

```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R3# set from protocol direct
user@R3# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R3# set autonomous-system 123
user@R3# set router-id 192.168.3.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
fe-1/2/0 {
  unit 5 {
    family inet {
      address 13.13.13.3/24;
    }
  }
}
fe-1/2/1 {
  unit 6 {
    family inet {
      address 34.34.34.3/24;
    }
  }
}
lo0 {
  unit 3 {
    family inet {
      address 192.168.3.1/32;
    }
  }
}

user@R3# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R3# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.3.1;
    export send-direct;
    neighbor 192.168.1.1;
    neighbor 192.168.2.1;
  }
  group external {
```

```

        type external;
        export send-direct;
        peer-as 4;
        neighbor 34.34.34.4;
    }
}
ospf {
    area 0.0.0.0 {
        interface lo0.3 {
            passive;
        }
        interface fe-1/2/0.5;
        interface fe-1/2/1.6;
    }
}

user@R3# show routing-options
autonomous-system 123;
router-id 192.168.3.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Device R4

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R4:

1. Configure the interfaces.

```

[edit interfaces fe-1/2/0 unit 7]
user@R4# set family inet address 24.24.24.4/24

```

```

[edit interfaces fe-1/2/1 unit 8]
user@R4# set family inet address 34.34.34.4/24

```

```

[edit interfaces lo0 unit 4]
user@R4# set family inet address 192.168.4.1/32
user@R4# set family inet address 44.44.44.44/32
user@R4# set family inet address 144.144.144.144/32

```

Device R4 has multiple loopback interface addresses to simulate advertised prefixes.

2. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```

[edit policy-options policy-statement send-direct term 1]
user@R4# set from protocol direct
user@R4# set then accept

```

3. Configure BGP.

```

[edit protocols bgp group external]
user@R4# set type external

```

```
user@R4# set export send-direct
user@R4# set peer-as 123
```

4. Configure a MED value of 30 for neighbor Device R3, and a MED value of 20 for neighbor Device R2.

```
[edit protocols bgp group external]
user@R4# set neighbor 34.34.34.3 metric-out 30
user@R4# set neighbor 24.24.24.2 metric-out 20
```

This configuration causes autonomous system (AS) 123 (of which Device R1, Device R2, and Device R3 are members) to prefer the path through Device R2 to reach AS 4.

5. Configure the router ID and AS number.

```
[edit routing-options]
user@R4# set autonomous-system 4
user@R4# set router-id 192.168.4.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R4# show interfaces
fe-1/2/0 {
  unit 7 {
    family inet {
      address 24.24.24.4/24;
    }
  }
}
fe-1/2/1 {
  unit 8 {
    family inet {
      address 34.34.34.4/24;
    }
  }
}
lo0 {
  unit 4 {
    family inet {
      address 192.168.4.1/32;
      address 44.44.44.44/32;
      address 144.144.144.144/32;
    }
  }
}

user@R4# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}
```

```

user@R4# show protocols
bgp {
  group external {
    type external;
    export send-direct;
    peer-as 123;
    neighbor 34.34.34.3 {
      metric-out 30;
    }
    neighbor 24.24.24.2 {
      metric-out 20;
    }
  }
}

user@R4# show routing-options
autonomous-system 4;
router-id 192.168.4.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Checking the Active Path From Device R1 to Device R4 on page 3337](#)
- [Verifying That Device R4 Is Sending Its Routes Correctly on page 3338](#)

### Checking the Active Path From Device R1 to Device R4

**Purpose** Verify that the active path goes through Device R2.

**Action** From operational mode, enter the **show route protocol bgp** command.

```

user@R1> show route protocol bgp
inet.0: 13 destinations, 19 routes (13 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

12.12.12.0/24      [BGP/170] 3d 22:52:38, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
13.13.13.0/24      [BGP/170] 3d 03:15:16, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
24.24.24.0/24      [BGP/170] 3d 22:52:38, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
34.34.34.0/24      [BGP/170] 3d 03:15:16, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
44.44.44.44/32     *[BGP/170] 01:41:11, MED 20, localpref 100, from 192.168.2.1
                  AS path: 4 I
                  > to 12.12.12.2 via fe-1/2/0.1
144.144.144.144/32 *[BGP/170] 00:08:13, MED 20, localpref 100, from 192.168.2.1
                  AS path: 4 I
                  > to 12.12.12.2 via fe-1/2/0.1
192.168.2.1/32     [BGP/170] 3d 22:52:38, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1

```

```

192.168.3.1/32      [BGP/170] 3d 03:15:16, localpref 100, from 192.168.3.1
                   AS path: I
                   > to 13.13.13.3 via fe-1/2/1.2
192.168.4.1/32      *[BGP/170] 01:41:11, MED 20, localpref 100, from 192.168.2.1
                   AS path: 4 I
                   > to 12.12.12.2 via fe-1/2/0.1

```

**Meaning** The asterisk (\*) shows that the preferred path is through Device R2. The reason for the path selection is listed as MED 20.

### *Verifying That Device R4 Is Sending Its Routes Correctly*

**Purpose** Make sure that Device R4 is sending update messages with a value of 20 to Device R2 and a value of 30 to Device R3.

**Action** From operational mode, enter the **show route advertising-protocol bgp 24.24.24.2** command.

```

user@R4> show route advertising-protocol bgp 24.24.24.2
inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
  Prefix                Nexthop      MED      Lclpref  AS path
* 24.24.24.0/24         Self                20              I
* 34.34.34.0/24         Self                20              I
* 44.44.44.44/32        Self                20              I
* 144.144.144.144/32    Self                20              I
* 192.168.4.1/32        Self                20              I

```

```

user@R4> show route advertising-protocol bgp 34.34.34.3
inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
  Prefix                Nexthop      MED      Lclpref  AS path
* 24.24.24.0/24         Self                30              I
* 34.34.34.0/24         Self                30              I
* 44.44.44.44/32        Self                30              I
* 144.144.144.144/32    Self                30              I
* 192.168.4.1/32        Self                30              I

```

**Meaning** The MED column shows that Device R4 is sending the correct MED values to its two external BGP (EBGP) neighbors.

### Example: Configuring the MED Using Route Filters

This example shows how to configure a policy that uses route filters to modify the multiple exit discriminator (MED) metric to advertise in BGP update messages.

- [Verification on page 3350](#)

#### **Requirements**

No special configuration beyond device initialization is required before you configure this example.

### Overview

To configure a route-filter policy that modifies the advertised MED metric in BGP update messages, include the **metric** statement in the policy action.

Figure 69 on page 3339 shows a typical network with internal peer sessions and multiple exit points to a neighboring autonomous system (AS).

Figure 69: Typical Network with IBGP Sessions and Multiple Exit Points

Device R4 has multiple loopback interfaces configured to simulate advertised prefixes. The extra loopback interface addresses are 44.44.44.44/32 and 144.144.144.144/32. This example shows how to configure Device R4 to advertise a MED value of 30 to Device R3 for all routes except 144.144.144.144. For 144.144.144.144, a MED value of 10 is advertised to Device 3. A MED value of 20 is advertised to Device R2, regardless of the route prefix.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 1 family inet address 12.12.12.1/24
set interfaces fe-1/2/1 unit 2 family inet address 13.13.13.1/24
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.1.1
set protocols bgp group internal export send-direct
set protocols bgp group internal neighbor 192.168.2.1
set protocols bgp group internal neighbor 192.168.3.1
set protocols ospf area 0.0.0.0 interface lo0.1 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.1
set protocols ospf area 0.0.0.0 interface fe-1/2/1.2

```

```
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 123
set routing-options router-id 192.168.1.1
```

**Device R2**

```
set interfaces fe-1/2/0 unit 3 family inet address 12.12.12.2/24
set interfaces fe-1/2/1 unit 4 family inet address 24.24.24.2/24
set interfaces lo0 unit 2 family inet address 192.168.2.1/32
set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.2.1
set protocols bgp group internal export send-direct
set protocols bgp group internal neighbor 192.168.1.1
set protocols bgp group internal neighbor 192.168.3.1
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 4
set protocols bgp group external neighbor 24.24.24.4
set protocols ospf area 0.0.0.0 interface lo0.2 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.3
set protocols ospf area 0.0.0.0 interface fe-1/2/1.4
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 123
set routing-options router-id 192.168.2.1
```

**Device R3**

```
set interfaces fe-1/2/0 unit 5 family inet address 13.13.13.3/24
set interfaces fe-1/2/1 unit 6 family inet address 34.34.34.3/24
set interfaces lo0 unit 3 family inet address 192.168.3.1/32
set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.3.1
set protocols bgp group internal export send-direct
set protocols bgp group internal neighbor 192.168.1.1
set protocols bgp group internal neighbor 192.168.2.1
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 4
set protocols bgp group external neighbor 34.34.34.4
set protocols ospf area 0.0.0.0 interface lo0.3 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.5
set protocols ospf area 0.0.0.0 interface fe-1/2/1.6
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 123
set routing-options router-id 192.168.3.1
```

**Device R4**

```
set interfaces fe-1/2/0 unit 7 family inet address 24.24.24.4/24
set interfaces fe-1/2/1 unit 8 family inet address 34.34.34.4/24
set interfaces lo0 unit 4 family inet address 192.168.4.1/32
set interfaces lo0 unit 4 family inet address 44.44.44.44/32
set interfaces lo0 unit 4 family inet address 144.144.144.144/32
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 123
set protocols bgp group external neighbor 34.34.34.3 export med-10
set protocols bgp group external neighbor 34.34.34.3 export med-30
```

```

set protocols bgp group external neighbor 24.24.24.2 metric-out 20
set policy-options policy-statement med-10 from route-filter 144.144.144.144/32 exact
set policy-options policy-statement med-10 then metric 10
set policy-options policy-statement med-10 then accept
set policy-options policy-statement med-30 from route-filter 0.0.0.0/0 longer
set policy-options policy-statement med-30 then metric 30
set policy-options policy-statement med-30 then accept
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 4
set routing-options router-id 192.168.4.1

```

### Configuring Device R1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the device interfaces.

```

[edit interfaces fe-1/2/0 unit 1]
user@R1# set family inet address 12.12.12.1/24

```

```

[edit interfaces fe-1/2/1 unit 2]
user@R1# set family inet address 13.13.13.1/24

```

```

[edit interfaces lo0 unit 1]
user@R1# set family inet address 192.168.1.1/32

```

2. Configure BGP.

```

[edit protocols bgp group internal]
user@R1# set type internal
user@R1# set local-address 192.168.1.1
user@R1# set export send-direct
user@R1# set neighbor 192.168.2.1
user@R1# set neighbor 192.168.3.1

```

3. Configure OSPF.

```

[edit protocols ospf area 0.0.0.0]
user@R1# set interface lo0.1 passive
user@R1# set interface fe-1/2/0.1
user@R1# set interface fe-1/2/1.2

```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```

[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct
user@R1# set then accept

```

5. Configure the router ID and autonomous system (AS) number.

```

[edit routing-options]

```

```
user@R1# set autonomous-system 123
user@R1# set router-id 192.168.1.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 12.12.12.1/24;
    }
  }
}
fe-1/2/1 {
  unit 2 {
    family inet {
      address 13.13.13.1/24;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.1.1/32;
    }
  }
}

user@R1# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.1.1;
    export send-direct;
    neighbor 192.168.2.1;
    neighbor 192.168.3.1;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.1 {
      passive;
    }
    interface fe-1/2/0.1;
    interface fe-1/2/1.2;
  }
}

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}
```

```

    }
}

user@R1# show routing-options
autonomous-system 123;
router-id 192.168.1.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Device R2

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the device interfaces.

```

[edit interfaces fe-1/2/0 unit 3]
user@R2# set family inet address 12.12.12.21/24

```

```

[edit interfaces fe-1/2/1 unit 4]
user@R2# set family inet address 24.24.24.2/24

```

```

[edit interfaces lo0 unit 2]
user@R2# set family inet address 192.168.2.1/32

```

2. Configure BGP.

```

[edit protocols bgp group internal]
user@R2# set type internal
user@R2# set local-address 192.168.2.1
user@R2# set export send-direct
user@R2# set neighbor 192.168.1.1
user@R2# set neighbor 192.168.3.1

```

```

[edit protocols bgp group external]
user@R2# set type external
user@R2# set export send-direct
user@R2# set peer-as 4
user@R2# set neighbor 24.24.24.4

```

3. Configure OSPF.

```

[edit protocols ospf area 0.0.0.0]
user@R2# set interface lo0.2 passive
user@R2# set interface fe-1/2/0.3
user@R2# set interface fe-1/2/1.4

```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```

[edit policy-options policy-statement send-direct term 1]
user@R2# set from protocol direct
user@R2# set then accept

```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R2# set autonomous-system 123
user@R2# set router-id 192.168.2.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 3 {
    family inet {
      address 12.12.12.2/24;
    }
  }
}
fe-1/2/1 {
  unit 4 {
    family inet {
      address 24.24.24.2/24;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 192.168.2.1/32;
    }
  }
}

user@R2# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.2.1;
    export send-direct;
    neighbor 192.168.1.1;
    neighbor 192.168.3.1;
  }
  group external {
    type external;
    export send-direct;
    peer-as 4;
    neighbor 24.24.24.4;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.2 {
      passive;
    }
    interface fe-1/2/0.3;
```

```

        interface fe-1/2/1.4;
    }
}

user@R2# show policy-options
policy-statement send-direct {
    term 1 {
        from protocol direct;
        then accept;
    }
}

user@R2# show routing-options
autonomous-system 123;
router-id 192.168.2.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Device R3

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R3:

1. Configure the device interfaces.

```

[edit interfaces fe-1/2/0 unit 5]
user@R3# set family inet address 13.13.13.3/24

```

```

[edit interfaces fe-1/2/1 unit 6]
user@R3# set family inet address 34.34.34.3/24

```

```

[edit interfaces lo0 unit 3]
user@R3# set family inet address 192.168.3.1/32

```

2. Configure BGP.

```

[edit protocols bgp group internal]
user@R3# set type internal
user@R3# set local-address 192.168.3.1
user@R3# set export send-direct
user@R3# set neighbor 192.168.1.1
user@R3# set neighbor 192.168.2.1

```

```

[edit protocols bgp group external]
user@R3# set type external
user@R3# set export send-direct
user@R3# set peer-as 4
user@R3# set neighbor 34.34.34.4

```

3. Configure OSPF.

```

[edit protocols ospf area 0.0.0.0]
user@R3# set interface lo0.3 passive
user@R3# set interface fe-1/2/0.5

```

```
user@R3# set interface fe-1/2/1.6
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
```

```
user@R3# set from protocol direct
```

```
user@R3# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
```

```
user@R3# set autonomous-system 123
```

```
user@R3# set router-id 192.168.3.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
```

```
fe-1/2/0 {  
  unit 5 {  
    family inet {  
      address 13.13.13.3/24;  
    }  
  }  
}  
fe-1/2/1 {  
  unit 6 {  
    family inet {  
      address 34.34.34.3/24;  
    }  
  }  
}  
lo0 {  
  unit 3 {  
    family inet {  
      address 192.168.3.1/32;  
    }  
  }  
}
```

```
user@R3# show protocols
```

```
bgp {  
  group internal {  
    type internal;  
    local-address 192.168.3.1;  
    export send-direct;  
    neighbor 192.168.1.1;  
    neighbor 192.168.2.1;  
  }  
  group external {  
    type external;  
    export send-direct;  
  }  
}
```

```

        peer-as 4;
        neighbor 34.34.34.4;
    }
}
ospf {
    area 0.0.0.0 {
        interface lo0.3 {
            passive;
        }
        interface fe-1/2/0.5;
        interface fe-1/2/1.6;
    }
}

user@R3# show policy-options
policy-statement send-direct {
    term 1 {
        from protocol direct;
        then accept;
    }
}

user@R3# show routing-options
autonomous-system 123;
router-id 192.168.3.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Device R4

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R4:

1. Configure the device interfaces.

```

[edit interfaces fe-1/2/0 unit 7]
user@R4# set family inet address 24.24.24.4/24

```

```

[edit interfaces fe-1/2/1 unit 8]
user@R4# set family inet address 34.34.34.4/24

```

```

[edit interfaces lo0 unit 4]
user@R4# set family inet address 192.168.4.1/32
user@R4# set family inet address 44.44.44.44/32
user@R4# set family inet address 144.144.144.144/32

```

Device R4 has multiple loopback interface addresses to simulate advertised prefixes.

2. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```

[edit policy-options policy-statement send-direct term 1]

```

```
user@R4# set from protocol direct
user@R4# set then accept
```

3. Configure BGP.

```
[edit protocols bgp group external]
user@R4# set type external
user@R4# set export send-direct
user@R4# set peer-as 123
```

4. Configure the two MED policies.

```
[edit policy-options]
set policy-statement med-10 from route-filter 144.144.144.144/32 exact
set policy-statement med-10 then metric 10
set policy-statement med-10 then accept
```

```
set policy-statement med-30 from route-filter 0.0.0.0/0 longer
set policy-statement med-30 then metric 30
set policy-statement med-30 then accept
```

5. Configure the two EBGP neighbors, applying the two MED policies to Device R3, and a MED value of 20 to Device R2.

```
[edit protocols bgp group external]
user@R4# set neighbor 34.34.34.3 export med-10
user@R4# set neighbor 34.34.34.3 export med-30
user@R4# set neighbor 24.24.24.2 metric-out 20
```

6. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R4# set autonomous-system 4
user@R4# set router-id 192.168.4.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R4# show interfaces
fe-1/2/0 {
  unit 7 {
    family inet {
      address 24.24.24.4/24;
    }
  }
}
fe-1/2/1 {
  unit 8 {
    family inet {
      address 34.34.34.4/24;
    }
  }
}
lo0 {
  unit 4 {
```

```

        family inet {
            address 192.168.4.1/32;
            address 44.44.44.44/32;
            address 144.144.144.144/32;
        }
    }
}

user@R4# show protocols
bgp {
    group external {
        type external;
        export send-direct;
        peer-as 123;
        neighbor 24.24.24.2 {
            metric-out 20;
        }
        neighbor 34.34.34.3 {
            export [ med-10 med-30 ];
        }
    }
}

user@R4# show policy-options
policy-statement med-10 {
    from {
        route-filter 144.144.144.144/32 exact;
    }
    then {
        metric 10;
        accept;
    }
}
policy-statement med-30 {
    from {
        route-filter 0.0.0.0/0 longer;
    }
    then {
        metric 30;
        accept;
    }
}
policy-statement send-direct {
    term 1 {
        from protocol direct;
        then accept;
    }
}

user@R4# show routing-options
autonomous-system 4;
router-id 192.168.4.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Checking the Active Path from Device R1 to Device R4 on page 3350](#)
- [Verifying That Device R4 Is Sending Its Routes Correctly on page 3350](#)

### Checking the Active Path from Device R1 to Device R4

**Purpose** Verify that the active path goes through Device R2.

**Action** From operational mode, enter the **show route protocol bgp** command.

```
user@R1> show route protocol bgp
inet.0: 13 destinations, 19 routes (13 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

12.12.12.0/24      [BGP/170] 4d 01:13:32, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
13.13.13.0/24      [BGP/170] 3d 05:36:10, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
24.24.24.0/24      [BGP/170] 4d 01:13:32, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
34.34.34.0/24      [BGP/170] 3d 05:36:10, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
44.44.44.44/32     *[BGP/170] 00:06:03, MED 20, localpref 100, from 192.168.2.1
                  AS path: 4 I
                  > to 12.12.12.2 via fe-1/2/0.1
144.144.144.144/32 *[BGP/170] 00:06:03, MED 10, localpref 100, from 192.168.3.1
                  AS path: 4 I
                  > to 13.13.13.3 via fe-1/2/1.2
192.168.2.1/32      [BGP/170] 4d 01:13:32, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
192.168.3.1/32      [BGP/170] 3d 05:36:10, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
192.168.4.1/32     *[BGP/170] 00:06:03, MED 20, localpref 100, from 192.168.2.1
                  AS path: 4 I
                  > to 12.12.12.2 via fe-1/2/0.1
```

**Meaning** The output shows that the preferred path to the routes advertised by Device R4 is through Device R2 for all routes except 144.144.144.144/32. For 144.144.144.144/32, the preferred path is through Device R3.

### Verifying That Device R4 Is Sending Its Routes Correctly

**Purpose** Make sure that Device R4 is sending update messages with a value of 20 to Device R2 and a value of 30 to Device R3.

**Action** From operational mode, enter the **show route advertising-protocol bgp** command.

```
user@R4> show route advertising-protocol bgp 24.24.24.2
```

```
inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
  Prefix                Nexthop          MED      Lclpref   AS path
* 24.24.24.0/24         Self              20                I
* 34.34.34.0/24         Self              20                I
* 44.44.44.44/32        Self              20                I
* 144.144.144.144/32    Self              20                I
* 192.168.4.1/32        Self              20                I
```

```
user@R4> show route advertising-protocol bgp 34.34.34.3
inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
  Prefix                Nexthop          MED      Lclpref   AS path
* 24.24.24.0/24         Self              30                I
* 34.34.34.0/24         Self              30                I
* 44.44.44.44/32        Self              30                I
* 144.144.144.144/32    Self              10                I
* 192.168.4.1/32        Self              30                I
```

**Meaning** The MED column shows that Device R4 is sending the correct MED values to its two EBGp neighbors.

### Example: Configuring the MED Using Communities

Set the multiple exit discriminator (MED) metric to 20 for all routes from a particular community.

```
[edit]
routing-options {
  router-id 10.0.0.1;
  autonomous-system 23;
}
policy-options {
  policy-statement from-otago {
    from community otago;
    then metric 20;
  }
  community otago members [56:2379 23:46944];
}
protocols {
  bgp {
    import from-otago;
    group 23 {
      type external;
      peer-as 56;
      neighbor 192.168.0.1 {
        traceoptions {
          file bgp-log-peer;
          flag packets;
        }
        log-updown;
      }
    }
  }
}
```

### Example: Associating the MED Path Attribute with the IGP Metric and Delaying MED Updates

---

This example shows how to associate the multiple exit discriminator (MED) path attribute with the interior gateway protocol (IGP) metric, and configure a timer to delay update of the MED attribute.

- [Requirements on page 3352](#)
- [Overview on page 3352](#)
- [Configuration on page 3354](#)
- [Verification on page 3360](#)

#### **Requirements**

No special configuration beyond device initialization is required before you configure this example.

#### **Overview**

BGP can be configured to advertise the MED attribute for a route based on the IGP distance of its internal BGP (IBGP) route next-hop. The IGP metric enables internal routing to follow the shortest path according to the administrative setup. In some deployments, it might be ideal to communicate IGP shortest-path knowledge to external BGP (EBGP) peers in a neighboring autonomous system (AS). This allows those EBGP peers to forward traffic into your AS using the shortest paths possible.

Routes learned from an EBGP peer usually have a next hop on a directly connected interface, and thus the IGP value is equal to zero. Zero is the value advertised. The IGP metric is a nonzero value when a BGP peer sends third-party next hops that require the local system to perform next-hop resolution—IBGP configurations, configurations within confederation peers, or EBGP configurations that include the **multihop** command. In these scenarios, it might make sense to associate the MED value with the IGP metric by including the **metric-out minimum-igp** or **metric-out igp** option.

The drawback of associating the MED with the IGP metric is the risk of excessive route advertisements when there are IGP instabilities in the network. Configuring a delay for the MED update provides a mechanism to reduce route advertisements in such scenarios. The delay works by slowing down MED updates when the IGP metric for the next hop changes. The approach uses a timer to periodically advertise MED updates. When the timer expires, the MED attribute for routes with **metric-out igp delay-updates** configured is updated to the current IGP metric of the next hop. The BGP-enabled device sends out advertisements for routes for which the MED attribute has changed.

The **delay-updates** option identifies the BGP groups (or peers) for which the MED updates must be suppressed. The time for advertising MED updates is set to 10 minutes by default. You can increase the interval up to 600 minutes by including the **med-igp-update-interval** statement in the **routing-options** configuration.

**NOTE:** If you have nonstop active routing (NSR) enabled and a switchover occurs, the delayed MED updates might be advertised as soon as the switchover occurs.

When you configure the **metric-out igp** option, the IGP metric directly tracks the IGP cost to the IBGP peer. When the IGP cost goes down, so does the advertised MED value. Conversely, when the IGP cost goes up, the MED value goes up as well.

When you configure the **metric-out minimum-igp** option, the advertised MED value changes only when the IGP cost to the IBGP peer goes down. An increase in the IGP cost does not affect the MED value. The router monitors and remembers the lowest IGP cost until the routing process (rpd) is restarted. The BGP peer sends an update only if the MED is lower than the previously advertised value or another attribute associated with the route has changed, or if the BGP peer is responding to a refresh route request.

This example uses the **metric** statement in the OSPF configuration to demonstrate that when the IGP metric changes, the MED also changes after the configured delay interval. The OSPF metric can range from 1 through 65,535.

[Figure 70 on page 3354](#) shows the sample topology.

Figure 70: Topology for Delaying the MED Update

In this example, the MED value advertised by Device R1 is associated with the IGP running in AS 1. The MED value advertised by Device R1 impacts the decisions of the neighboring AS (AS 2) when AS 2 is forwarding traffic into AS 1.

#### Configuration

- [Configuring Device R1 on page 3358](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
Device R1 set interfaces fe-1/2/0 unit 2 description R1->R2
set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.1/30
set interfaces fe-1/2/1 unit 7 description R1->R4
set interfaces fe-1/2/1 unit 7 family inet address 172.16.0.1/30
set interfaces lo0 unit 1 family inet address 192.168.0.1/32
set protocols bgp group internal type internal
```

```

set protocols bgp group internal local-address 192.168.0.1
set protocols bgp group internal export send-direct
set protocols bgp group internal neighbor 192.168.0.2
set protocols bgp group internal neighbor 192.168.0.3
set protocols bgp group external type external
set protocols bgp group external metric-out igp delay-med-update
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 2
set protocols bgp group external neighbor 172.16.0.2
set protocols ospf area 0.0.0.0 interface fe-1/2/0.2 metric 600
set protocols ospf area 0.0.0.0 interface lo0.1 passive
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options med-igp-update-interval 12
set routing-options router-id 192.168.0.1
set routing-options autonomous-system 1

```

**Device R2**

```

set interfaces fe-1/2/0 unit 1 description R2->R1
set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 4 description R2->R3
set interfaces fe-1/2/1 unit 4 family inet address 10.0.2.2/30
set interfaces lo0 unit 2 family inet address 192.168.0.2/32
set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.0.2
set protocols bgp group internal export send-direct
set protocols bgp group internal neighbor 192.168.0.1
set protocols bgp group internal neighbor 192.168.0.3
set protocols ospf area 0.0.0.0 interface fe-1/2/0.1
set protocols ospf area 0.0.0.0 interface fe-1/2/1.4
set protocols ospf area 0.0.0.0 interface lo0.2 passive
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options router-id 192.168.0.2
set routing-options autonomous-system 1

```

**Device R3**

```

set interfaces fe-1/2/0 unit 3 description R3->R2
set interfaces fe-1/2/0 unit 3 family inet address 10.0.2.1/30
set interfaces fe-1/2/1 unit 5 description R3->R5
set interfaces fe-1/2/1 unit 5 family inet address 172.16.0.5/30
set interfaces lo0 unit 3 family inet address 192.168.0.3/32

```

### Configuring Device R1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.

```
[edit interfaces fe-1/2/0 unit 2]
user@R1# set description R1->R2
user@R1# set family inet address 10.0.0.1/30
```

```
[edit interfaces fe-1/2/1 unit 7]
user@R1# set description R1->R4
user@R1# set family inet address 172.16.0.1/30
```

```
[edit interfaces lo0 unit 1]
user@R1# set family inet address 192.168.0.1/32
```

2. Configure IBGP.

```
[edit protocols bgp group internal]
user@R1# set type internal
user@R1# set local-address 192.168.0.1
user@R1# set export send-direct
user@R1# set neighbor 192.168.0.2
user@R1# set neighbor 192.168.0.3
```

3. Configure EBGP.

```
[edit protocols bgp group external]
user@R1# set type external
user@R1# set export send-direct
user@R1# set peer-as 2
user@R1# set neighbor 172.16.0.2
```

4. Associate the MED value with the IGP metric.

```
[edit protocols bgp group external]
user@R1# set metric-out igp delay-med-update
```

The default for the MED update is 10 minutes when you include the **delay-med-update** option. When you exclude the **delay-med-update** option, the MED update occurs immediately after the IGP metric changes.

5. (Optional) Configure the update interval for the MED update.

```
[edit routing-options]
user@R1# set med-igp-update-interval 12
```

You can configure the interval from 10 minutes through 600 minutes.

6. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R1# set interface fe-1/2/0.2 metric 600
user@R1# set interface lo0.1 passive
```

The **metric** statement is used here to demonstrate what happens when the IGP metric changes.

7. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct
user@R1# set then accept
```

8. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R1# set router-id 192.168.0.1
user@R1# set autonomous-system 1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 2 {
    description R1->R2;
    family inet {
      address 10.0.0.1/30;
    }
  }
}
fe-1/2/1 {
  unit 7 {
    description R1->R4;
    family inet {
      address 172.16.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.0.1/32;
    }
  }
}

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R1# show protocols
```

```
bgp {
  group internal {
    type internal;
    local-address 192.168.0.1;
    export send-direct;
    neighbor 192.168.0.2;
    neighbor 192.168.0.3;
  }
  group external {
    type external;
    metric-out igp delay-med-update;
    export send-direct;
    peer-as 2;
    neighbor 172.16.0.2;
  }
}
ospf {
  area 0.0.0.0 {
    interface fe-1/2/0.2 {
      metric 600;
    }
    interface lo0.1 {
      passive;
    }
  }
}
```

```
user@R1# show routing-options
med-igp-update-interval 12;
router-id 192.168.0.1;
autonomous-system 1;
```

If you are done configuring the device, enter **commit** from configuration mode. Repeat the configuration steps on the other devices in the topology, as needed for your network.

### **Verification**

Confirm that the configuration is working properly.

- [Checking the BGP Advertisements on page 3360](#)
- [Verifying That the MED Value Changes When the OSPF Metric Changes on page 3361](#)
- [Testing the minimum-igp Setting on page 3361](#)

### **Checking the BGP Advertisements**

**Purpose** Verify that Device R1 is advertising to Device R4 a BGP MED value that reflects the IGP metric.

**Action** From operational mode, enter the **show route advertising-protocol bgp** command.

```
user@R1> show route advertising-protocol bgp 172.16.0.2
inet.0: 19 destinations, 33 routes (19 active, 0 holddown, 0 hidden)
  Prefix                Nexthop        MED      Lc1pref  AS path
* 10.0.0.0/30           Self           0         I         I
* 172.16.0.0/30         Self           0         I         I
```

|                  |      |     |   |
|------------------|------|-----|---|
| * 172.16.0.4/30  | Self | 601 | I |
| * 192.168.0.1/32 | Self | 0   | I |

**Meaning** The 601 value in the MED column shows that the MED value has been updated to reflect the configured OSPF metric.

#### *Verifying That the MED Value Changes When the OSPF Metric Changes*

**Purpose** Make sure that when you raise the OSPF metric to 700, the MED value is updated to reflect this change.

**Action** From configuration mode, enter the **set protocols ospf area 0 interface fe-1/2/0.2 metric 700** command.

```
user@R1# set protocols ospf area 0 interface fe-1/2/0.2 metric 700
user@R1# commit
```

After waiting 12 minutes (the configured delay period), enter the **show route advertising-protocol bgp** command from operational mode.

```
user@R1> show route advertising-protocol bgp 172.16.0.2
inet.0: 19 destinations, 33 routes (19 active, 0 holddown, 0 hidden)
  Prefix            Nexthop      MED      Lclpref  AS path
* 10.0.0.0/30       Self         0         I
* 172.16.0.0/30     Self         0         I
* 172.16.0.4/30     Self         701        I
* 192.168.0.1/32    Self         0         I
```

**Meaning** The 701 value in the MED column shows that the MED value has been updated to reflect the configured OSPF metric.

#### *Testing the minimum-igp Setting*

**Purpose** Change the configuration to use the **minimum-igp** statement instead of the **igp** statement. When you increase the OSPF metric, the MED value remains unchanged, but when you decrease the OSPF metric, the MED value reflects the new OSPF metric.

**Action** From configuration mode, delete the **igp** statement, add the **minimum-igp** statement, and increase the OSPF metric.

```
user@R1# delete protocols bgp group external metric-out igp
user@R1# set protocols bgp group external metric-out minimum-igp
user@R1# set protocols ospf area 0 interface fe-1/2/0.2 metric 800
user@R1# commit
```

From operational mode, enter the **show route advertising-protocol bgp** command to make sure that the MED value does not change.

```
user@R1> show route advertising-protocol bgp 172.16.0.2
inet.0: 19 destinations, 33 routes (19 active, 0 holddown, 0 hidden)
  Prefix            Nexthop      MED      Lclpref  AS path
* 10.0.0.0/30       Self         0         I
* 172.16.0.0/30     Self         0         I
* 172.16.0.4/30     Self         701        I
* 192.168.0.1/32    Self         0         I
```

From configuration mode, decrease the OSPF metric.

```
user@R1# set protocols ospf area 0 interface fe-1/2/0.2 metric 20
user@R1# commit
```

From operational mode, enter the **show route advertising-protocol bgp** command to make sure that the MED value does change.

```
user@R1> show route advertising-protocol bgp 172.16.0.2
inet.0: 19 destinations, 33 routes (19 active, 0 holddown, 0 hidden)
  Prefix                Nexthop          MED      Lclpref    AS path
* 10.0.0.0/30           Self             0                I
* 172.16.0.0/30          Self             0                I
* 172.16.0.4/30          Self             21               I
* 192.168.0.1/32         Self             0                I
```

**Meaning** When the **minimum-igp** statement is configured, the MED value changes only when a shorter path is available.

### Understanding the BGP Local AS Attribute

When an Internet service provider (ISP) acquires a network that belongs to a different autonomous system (AS), there is no seamless method for moving the BGP peers of the acquired network to the AS of the acquiring ISP. The process of configuring the BGP peers with the new AS number can be time-consuming and cumbersome. Sometimes customers do not want to or are not immediately able to modify their peer arrangements or configuration. During this kind of transition period, it can be useful to configure BGP-enabled devices in the new AS to use the former AS number in BGP updates. This former AS number is called a *local AS*.

Using a local AS number permits the routing devices in an acquired network to appear to belong to the former AS.

For example, ISP A, with an AS of 200, acquires ISP B, with an AS of 250. ISP B has a customer, ISP C, that does not want to change its configuration. After ISP B becomes part of ISP A, a local AS number of 250 is configured for use in EBGp peer sessions with ISP C. Consequently, the local AS number of 250 is either prepended before or used instead of the global AS number of 200 in the AS path used to export routes to direct external peers in ISP C.

If the route is received from an internal BGP (IBGP) peer, the AS path includes the local AS number prepended before the global AS number.

The local AS number is used instead of the global AS number if the route is an external route, such as a static route or an interior gateway protocol (IGP) route that is imported into BGP. If the route is external and you want the global AS number to be included in the AS path, you can apply a routing policy that uses **as-path-expand** or **as-path-prepend**. Use the **as-path-expand** policy action to place the global AS number behind the local AS number. Use the **as-path-prepend** policy action to place the global AS number in front of the local AS number.

For example:

```

user@R2# show policy-options
policy-statement prepend-global {
  term 1 {
    from protocol static;
    then {
      as-path-prepend 200; # or use as-path-expand
      accept;
    }
  }
}

user@R2# show protocols bgp
group ext {
  export prepend-global;
  type external;
  local-as 250;
  neighbor 10.0.0.1 {
    peer-as 100;
  }
  neighbor 10.1.0.2 {
    peer-as 300;
  }
}

user@R2# show routing-options
static {
  route 1.1.1.1/32 next-hop 10.0.0.1;
}
autonomous-system 200;

user@R3# run show route 1.1.1.1 protocol bgp
inet.0: 6 destinations, 6 routes (6 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

1.1.1.1/32          *[BGP/170] 00:05:11, localpref 100
                   AS path: 200 250 I, validation-state: unverified
                   > to 10.1.0.1 via 1t-1/2/0.4

```

In a Layer 3 VPN scenario, in which a provider edge (PE) device uses external BGP (EBGP) to peer with a customer edge (CE) device, the **local-as** statement behaves differently than in the non-VPN scenario. In the VPN scenario, the global AS number defined in the master instance is prepended to the AS path by default. To override this behavior, you can configure the **no-prepend-global-as** in the routing-instance BGP configuration on the PE device, as shown here:

```

user@R2# show routing-instances

```

```
red {  
  instance-type vrf;  
  interface fe-1/2/0.2;  
  route-distinguisher 2:1;  
  vrf-target target:2:1;  
  protocols {  
    bgp {  
      group toR1 {  
        type external;  
        peer-as 1;  
        local-as 200 no-prepend-global-as;  
        neighbor 10.1.1.1;  
      }  
    }  
  }  
}
```

The Junos operating system (Junos OS) implementation of the local AS attribute supports the following options:

- **Local AS with private option**—When you use the **private** option, the local AS is used during the establishment of the BGP session with an EBGP neighbor but is hidden in the AS path sent to other EBGP peers. Only the global AS is included in the AS path sent to external peers.

The **private** option is useful for establishing local peering with routing devices that remain configured with their former AS or with a specific customer that has not yet modified its peer arrangements. The local AS is used to establish the BGP session with the EBGP neighbor but is hidden in the AS path sent to external peers in another AS.

Include the **private** option so that the local AS is not prepended before the global AS in the AS path sent to external peers. When you specify the **private** option, the local AS is prepended only in the AS path sent to the EBGP neighbor.

For example, in [Figure 71 on page 3365](#), Router 1 and Router 2 are in AS 64496, Router 4 is in AS 64511, and Router 3 is in AS 64510. Router 2 formerly belonged to AS 64497, which has merged with another network and now belongs to AS 64496. Because Router 3 still peers with Router 2 using its former AS (64497), Router 2 needs to be configured with a local AS of 64497 in order to maintain peering with Router 3. Configuring a local AS of 64497 permits Router 2 to add AS 64497 when advertising routes to Router 3. Router 3 sees an AS path of 64497 64496 for the prefix 10/8.

**Figure 71: Local AS Configuration**

To prevent Router 2 from adding the local AS number in its announcements to other peers, use the **local-as 64497 private** statement. This statement configures Router 2 to not include local AS 64497 when announcing routes to Router 1 and to Router 4. In this case, Router 4 sees an AS path of 64496 64510 for the prefix 10.222/16.

- **Local AS with alias option**—In Junos OS Release 9.5 and later, you can configure a local AS as an alias. During the establishment of the BGP open session, the AS used in the open message alternates between the local AS and the global AS. If the local AS is used to connect with the EBGP neighbor, then only the local AS is prepended to the AS path when the BGP peer session is established. If the global AS is used to connect with the EBGP neighbor, then only the global AS is prepended to the AS path when the BGP peer session is established. The use of the **alias** option also means that

the local AS is not prepended to the AS path for any routes learned from that EBGp neighbor. Therefore, the local AS remains hidden from other external peers.

Configuring a local AS with the **alias** option is especially useful when you are migrating the routing devices in an acquired network to the new AS. During the migration process, some routing devices might be configured with the new AS while others remain configured with the former AS. For example, it is good practice to start by first migrating to the new AS any routing devices that function as route reflectors. However, as you migrate the route reflector clients incrementally, each route reflector has to peer with routing devices configured with the former AS, as well as peer with routing devices configured with the new AS. To establish local peer sessions, it can be useful for the BGP peers in the network to use both the local AS and the global AS. At the same time, you want to hide this local AS from external peers and use only the global AS in the AS path when exporting routes to another AS. In this kind of situation, configure the **alias** option.

Include the **alias** option to configure the local AS as an alias to the global AS configured at the **[edit routing-options]** hierarchy level. When you configure a local AS as an alias, during the establishment of the BGP open session, the AS used in the open message alternates between the local AS and the global AS. The local AS is prepended to the AS path only when the peer session with an EBGp neighbor is established using that local AS. The local AS is hidden in the AS path sent to any other external peers. Only the global AS is prepended to the AS path when the BGP session is established using the global AS.

**NOTE:** The **private** and **alias** options are mutually exclusive. You cannot configure both options with the same **local-as** statement.

---

- **Local AS with option not to prepend the global AS**—In Junos OS Release 9.6 and later, you can configure a local AS with the option not to prepend the global AS. Only the local AS is included in the AS path sent to external peers.

Use the **no-prepend-global-as** option when you want to strip the global AS number from outbound BGP updates in a virtual private network (VPN) scenario. This option is useful in a VPN scenario in which you want to hide the global AS from the VPN.

Include the **no-prepend-global-as** option to have the global AS configured at the **[edit routing-options]** hierarchy level removed from the AS path sent to external peers. When you use this option, only the local AS is included in the AS path for the routes sent to a customer edge (CE) device.

- **Number of loops option**—The local AS feature also supports specifying the number of times that detection of the AS number in the AS\_PATH attribute causes the route to be discarded or hidden. For example, if you configure **loops 1**, the route is hidden if the AS number is detected in the path one or more times. This is the default behavior. If you configure **loops 2**, the route is hidden if the AS number is detected in the path two or more times.

For the **loops number** statement, you can configure 1 through 10.

**NOTE:** If you configure the local AS values for any BGP group, the detection of routing loops is performed using both the AS and the local AS values for all BGP groups.

If the local AS for the EBGP or IBGP peer is the same as the current AS, do not use the `local-as` statement to specify the local AS number.

When you configure the local AS within a VRF, this impacts the AS path loop-detection mechanism. All of the `local-as` statements configured on the device are part of a single AS domain. The AS path loop-detection mechanism is based on looking for a matching AS present in the domain.

### Example: Configuring a Local AS for EBGP Sessions

This example shows how to configure a local autonomous system (AS) for a BGP peer so that both the global AS and the local AS are used in BGP inbound and outbound updates.

- [Requirements on page 3367](#)
- [Overview on page 3367](#)
- [Configuration on page 3368](#)
- [Verification on page 3374](#)

#### Requirements

No special configuration beyond device initialization is required before you configure this example.

#### Overview

Use the `local-as` statement when ISPs merge and want to preserve a customer's configuration, particularly the AS with which the customer is configured to establish a peer relationship. The `local-as` statement simulates the AS number already in place in customer routers, even if the ISP's router has moved to a different AS.

This example shows how to use the `local-as` statement to configure a local AS. The `local-as` statement is supported for BGP at the global, group, and neighbor hierarchy levels.

When you configure the `local-as` statement, you must specify an AS number. You can specify a number from 1 through 4,294,967,295 in plain-number format. In Junos OS Release 9.1 and later, the range for AS numbers is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*. In Junos OS Release 9.3 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format. You can specify a value from 0.0 through 65535.65535 in AS-dot notation format. Junos

OS continues to support 2-byte AS numbers. The 2-byte AS number range is 1 through 65,535 (this is a subset of the 4-byte range).

Figure 72 on page 3368 shows the sample topology.

**Figure 72: Topology for Configuring the Local AS**

In this example, Device R2 formerly belonged to AS 250 and now is in AS 200. Device R1 and Device R3 are configured to peer with AS 250 instead of with the new AS number (AS 200). Device R2 has the new AS number configured with the **autonomous-system 200** statement. To enable the peering sessions to work, the **local-as 250** statement is added in the BGP configuration. Because **local-as 250** is configured, Device R2 includes both the global AS (200) and the local AS (250) in its BGP inbound and outbound updates.

#### Configuration

- [Configuring Device R1 on page 3369](#)
- [Configuring Device R2 on page 3371](#)
- [Configuring Device R3 on page 3373](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
Device R1  set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
           set interfaces lo0 unit 1 family inet address 192.168.0.1/32
           set protocols bgp group ext type external
           set protocols bgp group ext export send-direct
           set protocols bgp group ext export send-static
           set protocols bgp group ext peer-as 250
           set protocols bgp group ext neighbor 10.0.0.2
           set policy-options policy-statement send-direct term 1 from protocol direct
           set policy-options policy-statement send-direct term 1 then accept
           set policy-options policy-statement send-static term 1 from protocol static
           set policy-options policy-statement send-static term 1 then accept
           set routing-options static route 10.1.0.0/30 next-hop 10.0.0.2
           set routing-options autonomous-system 100
```

```
Device R2  set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
           set interfaces fe-1/2/1 unit 3 family inet address 10.1.0.1/30
           set interfaces lo0 unit 2 family inet address 192.168.0.2/32
           set protocols bgp group ext type external
```

```

set protocols bgp group ext export send-direct
set protocols bgp group ext export send-static
set protocols bgp group ext local-as 250
set protocols bgp group ext neighbor 10.0.0.1 peer-as 100
set protocols bgp group ext neighbor 10.1.0.2 peer-as 300
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options autonomous-system 200

```

**Device R3**

```

set interfaces fe-1/2/0 unit 4 family inet address 10.1.0.2/30
set interfaces lo0 unit 3 family inet address 192.168.0.3/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct
set protocols bgp group ext export send-static
set protocols bgp group ext peer-as 250
set protocols bgp group ext neighbor 10.1.0.1
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 10.0.0.0/30 next-hop 10.1.0.1
set routing-options autonomous-system 300

```

### Configuring Device R1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.  

```

[edit interfaces]
user@R1# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30

user@R1# set lo0 unit 1 family inet address 192.168.0.1/32

```
2. Configure external BGP (EBGP).  

```

[edit protocols bgp group ext]
user@R1# set type external
user@R1# set export send-direct
user@R1# set export send-static
user@R1# set peer-as 250
user@R1# set neighbor 10.0.0.2

```
3. Configure the routing policy.  

```

[edit policy-options]
user@R1# set policy-statement send-direct term 1 from protocol direct
user@R1# set policy-statement send-direct term 1 then accept
user@R1# set policy-statement send-static term 1 from protocol static
user@R1# set policy-statement send-static term 1 then accept

```

4. Configure a static route to the remote network between Device R2 and Device R3.

```
[edit routing-options]
user@R1# set static route 10.1.0.0/30 next-hop 10.0.0.2
```

5. Configure the global AS number.

```
[edit routing-options]
user@R1# set autonomous-system 100
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.0.1/32;
    }
  }
}

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}
policy-statement send-static {
  term 1 {
    from protocol static;
    then accept;
  }
}

user@R1# show protocols
bgp {
  group ext {
    type external;
    export [ send-direct send-static ];
    peer-as 250;
    neighbor 10.0.0.2;
  }
}

user@R1# show routing-options
static {
```

```

    route 10.1.0.0/30 next-hop 10.0.0.2;
}
autonomous-system 100;

```

When you are done configuring the device, enter **commit** from configuration mode.

### Configuring Device R2

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.
 

```

[edit interfaces]
user@R2# set fe-1/2/0 unit 2 family inet address 10.0.0.2/30

user@R2# set fe-1/2/1 unit 3 family inet address 10.1.0.1/30

user@R2# set lo0 unit 2 family inet address 192.168.0.2/32

```
2. Configure EBGP.
 

```

[edit protocols bgp group ext]
user@R2# set type external
user@R2# set export send-direct
user@R2# set export send-static
user@R2# set neighbor 10.0.0.1 peer-as 100
user@R2# set neighbor 10.1.0.2 peer-as 300

```
3. Configure the local autonomous system (AS) number.
 

```

[edit protocols bgp group ext]
user@R2# set local-as 250

```
4. Configure the global AS number.
 

```

[edit routing-options]
user@R2# set autonomous-system 200

```
5. Configure the routing policy.
 

```

[edit policy-options]
user@R2# set policy-statement send-direct term 1 from protocol direct
user@R2# set policy-statement send-direct term 1 then accept
user@R2# set policy-statement send-static term 1 from protocol static
user@R2# set policy-statement send-static term 1 then accept

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R2# show interfaces
fe-1/2/0 {
  unit 2 {

```

```
        family inet {
            address 10.0.0.2/30;
        }
    }
}
fe-1/2/1 {
    unit 3 {
        family inet {
            address 10.1.0.1/30;
        }
    }
}
lo0 {
    unit 2 {
        family inet {
            address 192.168.0.2/32;
        }
    }
}

user@R2# show policy-options
policy-statement send-direct {
    term 1 {
        from protocol direct;
        then accept;
    }
}
policy-statement send-static {
    term 1 {
        from protocol static;
        then accept;
    }
}

user@R2# show protocols
bgp {
    group ext {
        type external;
        export [ send-direct send-static ];
        local-as 250;
        neighbor 10.0.0.1 {
            peer-as 100;
        }
        neighbor 10.1.0.2 {
            peer-as 300;
        }
    }
}

user@R2# show routing-options
autonomous-system 200;
```

When you are done configuring the device, enter **commit** from configuration mode.

### Configuring Device R3

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R3:

1. Configure the interfaces.  

```
[edit interfaces]
user@R3# set fe-1/2/0 unit 4 family inet address 10.1.0.2/30

user@R3# set lo0 unit 3 family inet address 192.168.0.3/32
```
2. Configure EBGP.  

```
[edit protocols bgp group ext]
user@R3# set type external
user@R3# set export send-direct
user@R3# set export send-static
user@R3# set peer-as 250
user@R3# set neighbor 10.1.0.1
```
3. Configure the global autonomous system (AS) number.  

```
[edit routing-options]
user@R3# set autonomous-system 300
```
4. Configure a static route to the remote network between Device R1 and Device R2.  

```
[edit routing-options]
user@R3# set static route 10.0.0.0/30 next-hop 10.1.0.1
```
5. Configure the routing policy.  

```
[edit policy-options]
user@R3# set policy-statement send-direct term 1 from protocol direct
user@R3# set policy-statement send-direct term 1 then accept
user@R3# set policy-statement send-static term 1 from protocol static
user@R3# set policy-statement send-static term 1 then accept
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
fe-1/2/0 {
  unit 4 {
    family inet {
      address 10.1.0.2/30;
    }
  }
}
lo0 {
  unit 3 {
```

```
family inet {
    address 192.168.0.3/32;
}
}

user@R3# show policy-options
policy-statement send-direct {
    term 1 {
        from protocol direct;
        then accept;
    }
}
policy-statement send-static {
    term 1 {
        from protocol static;
        then accept;
    }
}

user@R3# show protocols
bgp {
    group ext {
        type external;
        export [ send-direct send-static ];
        peer-as 250;
        neighbor 10.1.0.1;
    }
}

user@R3# show routing-options
static {
    route 10.0.0.0/30 next-hop 10.1.0.1;
}
autonomous-system 300;
```

When you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Checking the Local and Global AS Settings on page 3374](#)
- [Checking the BGP Peering Sessions on page 3376](#)
- [Verifying the BGP AS Paths on page 3376](#)

### **Checking the Local and Global AS Settings**

**Purpose** Make sure that Device R2 has the local and global AS settings configured.

**Action** From operational mode, enter the **show bgp neighbors** command.

```
user@R2> show bgp neighbors
Peer: 10.0.0.1+179 AS 100      Local: 10.0.0.2+61036 AS 250
Type: External    State: Established    Flags: <Sync>
Last State: OpenConfirm    Last Event: RecvKeepAlive
Last Error: None
```

```

Export: [ send-direct send-static ]

    Output messages: Total 256   Updates 2     Refreshes 0   Octets 4999
    Output Queue[0]: 0

```

**Meaning** The Local AS: 250 and Local System AS: 200 output shows that Device R2 has the expected settings. Additionally, the output shows that the options list includes LocalAS.

### *Checking the BGP Peering Sessions*

**Purpose** Ensure that the sessions are established and that the local AS number 250 is displayed.

**Action** From operational mode, enter the **show bgp summary** command.

```

user@R1> show bgp summary
Groups: 1 Peers: 1 Down peers: 0
Table      Tot Paths  Act Paths Suppressed  History  Damp State  Pending
inet.0      4          2          0          0        0      0        0
Peer        AS      InPkt    OutPkt    OutQ   Flaps  Last Up/Dwn
State|#Active/Received/Accepted/Damped...
10.0.0.2      250      232      233       0        4    1:42:37
2/4/4/0      0/0/0/0

```

```

user@R3> show bgp summary
Groups: 1 Peers: 1 Down peers: 0
Table      Tot Paths  Act Paths Suppressed  History  Damp State  Pending
inet.0      4          2          0          0        0      0        0
Peer        AS      InPkt    OutPkt    OutQ   Flaps  Last Up/Dwn
State|#Active/Received/Accepted/Damped...
10.1.0.1      250      235      236       0        4    1:44:25
2/4/4/0      0/0/0/0

```

**Meaning** Device R1 and Device R3 appear to be peering with a device in AS 250, even though Device R2 is actually in AS 200.

### *Verifying the BGP AS Paths*

**Purpose** Make sure that the routes are in the routing tables and that the AS paths show the local AS number 250.

**Action** From configuration mode, enter the **set route protocol bgp** command.

```

user@R1> show route protocol bgp
inet.0: 6 destinations, 8 routes (6 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.0/30      [BGP/170] 01:46:44, localpref 100
                 AS path: 250 I
                 > to 10.0.0.2 via fe-1/2/0.1
10.1.0.0/30      [BGP/170] 01:46:44, localpref 100
                 AS path: 250 I
                 > to 10.0.0.2 via fe-1/2/0.1
192.168.0.2/32   *[BGP/170] 01:46:44, localpref 100
                 AS path: 250 I
                 > to 10.0.0.2 via fe-1/2/0.1

```

```

192.168.0.3/32      *[BGP/170] 01:46:40, localpref 100
                   AS path: 250 300 I
                   > to 10.0.0.2 via fe-1/2/0.1

user@R3> show route protocol bgp

inet.0: 6 destinations, 8 routes (6 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.0/30        [BGP/170] 01:47:10, localpref 100
                   AS path: 250 I
                   > to 10.1.0.1 via fe-1/2/0.4
10.1.0.0/30        [BGP/170] 01:47:10, localpref 100
                   AS path: 250 I
                   > to 10.1.0.1 via fe-1/2/0.4
192.168.0.1/32     *[BGP/170] 01:47:10, localpref 100
                   AS path: 250 100 I
                   > to 10.1.0.1 via fe-1/2/0.4
192.168.0.2/32     *[BGP/170] 01:47:10, localpref 100
                   AS path: 250 I
                   > to 10.1.0.1 via fe-1/2/0.4

```

**Meaning** The output shows that Device R1 and Device R3 appear to have routes with AS paths that include AS 250, even though Device R2 is actually in AS 200.

### Example: Configuring a Private Local AS for EBGp Sessions

This example shows how to configure a private local autonomous system (AS) number. The local AS is considered to be private because it is advertised to peers that use the local AS number for peering, but is hidden in the announcements to peers that can use the global AS number for peering.

- [Requirements on page 3377](#)
- [Overview on page 3377](#)
- [Configuration on page 3378](#)
- [Verification on page 3381](#)

#### Requirements

No special configuration beyond device initialization is required before you configure this example.

#### Overview

Use the **local-as** statement when ISPs merge and want to preserve a customer's configuration, particularly the AS with which the customer is configured to establish a peer relationship. The **local-as** statement simulates the AS number already in place in customer routers, even if the ISP's router has moved to a different AS.

When you use the **private** option, the local AS is used during the establishment of the BGP session with an external BGP (EBGP) neighbor, but is hidden in the AS path sent to other EBGp peers. Only the global AS is included in the AS path sent to external peers.

The **private** option is useful for establishing local peering with routing devices that remain configured with their former AS or with a specific customer that has not yet modified its

peer arrangements. The local AS is used to establish the BGP session with the EBGP neighbor, but is hidden in the AS path sent to external peers in another AS.

Include the **private** option so that the local AS is not prepended before the global AS in the AS path sent to external peers. When you specify the **private** option, the local AS is prepended only in the AS path sent to the EBGP neighbor.

Figure 73 on page 3378 shows the sample topology.

**Figure 73: Topology for Configuring a Private Local AS**

Device R1 is in AS 64496. Device R2 is in AS 64510. Device R3 is in AS 64511. Device R4 is in AS 64512. Device R1 formerly belonged to AS 64497, which has merged with another network and now belongs to AS 64496. Because Device R3 still peers with Device R1, using its former AS, 64497, Device R1 needs to be configured with a local AS of 64497 in order to maintain peering with Device R3. Configuring a local AS of 64497 permits Device R1 to add AS 64497 when advertising routes to Device R3. Device R3 sees an AS path of 64497 64496 for the prefix 10.1.1.2/32, which is Device R2's loopback interface. Device R4, which is behind Device R3, sees an AS path of 64511 64497 64496 64510 to Device R2's loopback interface. To prevent Device R1 from adding the local AS number in its announcements to other peers, this example includes the **local-as 64497 private** statement. The **private** option configures Device R1 to not include the local AS 64497 when announcing routes to Device R2. Device R2 sees an AS path of 64496 64511 to Device R3 and an AS path of 64496 64511 64512 to Device R4. The **private** option in Device R1's configuration causes the AS number 64497 to be missing from the AS paths that Device R1 readvertises to Device R2.

Device R2 is hiding the private local AS from all the routers, except Device R3. The **private** option applies to the routes that Device R1 receives (learns) from Device R3 and that Device R1, in turn, readvertises to other routers. When these routes learned from Device R3 are readvertised by Device R1 to Device R2, the private local AS is missing from the AS path advertised to Device R2.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 3 family inet address 192.168.1.1/24
set interfaces fe-1/2/1 unit 5 family inet address 192.168.10.1/24
set interfaces lo0 unit 2 family inet address 10.1.1.1/32
set protocols bgp group external-AS64511 type external
set protocols bgp group external-AS64511 peer-as 64511
set protocols bgp group external-AS64511 local-as 64497
set protocols bgp group external-AS64511 local-as private
set protocols bgp group external-AS64511 neighbor 192.168.1.2
set protocols bgp group external-AS64510 type external
set protocols bgp group external-AS64510 peer-as 64510
set protocols bgp group external-AS64510 neighbor 192.168.10.2
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 64496

```

**Device R2**

```

set interfaces fe-1/2/0 unit 6 family inet address 192.168.10.2/24
set interfaces lo0 unit 3 family inet address 10.1.1.2/32
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 64496
set protocols bgp group external neighbor 192.168.10.1
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 64510

```

**Device R3**

```

set interfaces fe-1/2/0 unit 4 family inet address 192.168.1.2/24
set interfaces fe-1/2/1 unit 7 family inet address 192.168.5.1/24
set interfaces lo0 unit 4 family inet address 10.1.1.3/32
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external neighbor 192.168.1.1 peer-as 64497
set protocols bgp group external neighbor 192.168.5.2 peer-as 64512
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 64511

```

**Device R4**

```

set interfaces fe-1/2/0 unit 8 family inet address 192.168.5.2/24
set interfaces lo0 unit 5 family inet address 10.1.1.4/32
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 64511
set protocols bgp group external neighbor 192.168.5.1
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 64512

```

### Configuring Device R1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.  

```
[edit interfaces fe-1/2/0 unit 3]
user@R1# set family inet address 192.168.1.1/24

[edit interfaces fe-1/2/1 unit 5]
user@R1# set family inet address 192.168.10.1/24

[edit interfaces lo0 unit 2]
user@R1# set family inet address 10.1.1.1/32
```
2. Configure the EBGP peering session with Device R2.  

```
[edit protocols bgp group external-AS64510]
user@R1# set type external
user@R1# set peer-as 64510
user@R1# set neighbor 192.168.10.2
```
3. Configure the EBGP peering session with Device R3.  

```
[edit protocols bgp group external-AS64511]
user@R1# set type external
user@R1# set peer-as 64511
user@R1# set local-as 64497
user@R1# set local-as private
user@R1# set neighbor 192.168.1.2
```
4. Configure the routing policy.  

```
[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct
user@R1# set then accept
```
5. Configure the global autonomous system (AS) number.  

```
[edit routing-options]
user@R1# set autonomous-system 64496
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 3 {
    family inet {
      address 192.168.1.1/24;
    }
  }
}
```

```

    }
  }
  fe-1/2/1 {
    unit 5 {
      family inet {
        address 192.168.10.1/24;
      }
    }
  }
  lo0 {
    unit 2 {
      family inet {
        address 10.1.1.1/32;
      }
    }
  }
}

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R1# show protocols
bgp {
  group external-AS64511 {
    type external;
    peer-as 64511;
    local-as 64497 private;
    neighbor 192.168.1.2;
  }
  group external-AS64510 {
    type external;
    peer-as 64510;
    neighbor 192.168.10.2;
  }
}

user@R1# show routing-options
autonomous-system 64496;

```

If you are done configuring the device, enter **commit** from configuration mode.

Repeat the configuration as needed for the other devices in the topology.

### Verification

Confirm that the configuration is working properly.

- [Checking Device R2's AS Paths on page 3382](#)
- [Checking Device R3's AS Paths on page 3382](#)

### ***Checking Device R2's AS Paths***

**Purpose** Make sure that Device R2 does not have AS 64497 in its AS paths to Device R3 and Device R4.

**Action** From operational mode, enter the **show route protocol bgp** command.

```
user@R2> show route protocol bgp
inet.0: 6 destinations, 6 routes (6 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.1.1.3/32      *[BGP/170] 01:33:11, localpref 100
                  AS path: 64496 64511 I
                  > to 192.168.10.1 via fe-1/2/0.6
10.1.1.4/32      *[BGP/170] 01:33:11, localpref 100
                  AS path: 64496 64511 64512 I
                  > to 192.168.10.1 via fe-1/2/0.6
192.168.5.0/24   *[BGP/170] 01:49:15, localpref 100
                  AS path: 64496 64511 I
                  > to 192.168.10.1 via fe-1/2/0.6
```

**Meaning** Device R2's AS paths do not include AS 64497.

### ***Checking Device R3's AS Paths***

**Purpose** Make sure that Device R3 does not have AS 64497 in its AS path to Device R4.

**Action** From operational mode, enter the **show route protocol bgp** command.

```
user@R3> show route protocol bgp
inet.0: 7 destinations, 8 routes (7 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.1.1.2/32      *[BGP/170] 01:35:11, localpref 100
                  AS path: 64497 64496 64510 I
                  > to 192.168.1.1 via fe-1/2/0.4
10.1.1.4/32      *[BGP/170] 01:35:11, localpref 100
                  AS path: 64512 I
                  > to 192.168.5.2 via fe-1/2/1.7
192.168.5.0/24   [BGP/170] 01:51:15, localpref 100
                  AS path: 64512 I
                  > to 192.168.5.2 via fe-1/2/1.7
```

**Meaning** Device R3's route to Device R2 (prefix 10.1.1.2) includes both the local and the global AS configured on Device R1 (64497 and 64496, respectively).

### Understanding the Accumulated IGP Attribute for BGP

The interior gateway protocols (IGPs) are designed to handle routing within a single domain or an autonomous system (AS). Each link is assigned a particular value called a metric. The distance between the two nodes is calculated as a sum of all the metric values of links along the path. The IGP selects the shortest path between two nodes based on distance.

BGP is designed to provide routing over a large number of independent ASs with limited or no coordination among respective administrations. BGP does not use metrics in the path selection decisions.

The accumulated IGP (AIGP) metric attribute for BGP enables deployment in which a single administration can run several contiguous BGP ASs. Such deployments allow BGP to make routing decisions based on the IGP metric. In such networks, it is possible for BGP to select paths based on metrics as is done by IGPs. In this case, BGP chooses the shortest path between two nodes, even though the nodes might be in two different ASs.

The AIGP attribute is particularly useful in networks that use tunneling to deliver a packet to its BGP next hop. The Juniper Networks® Junos® operating system (Junos OS) currently supports the AIGP attribute for two BGP address families, **family inet labeled-unicast** and **family inet6 labeled-unicast**.

AIGP impacts the BGP best-route decision process. The AIGP attribute preference rule is applied after the local-preference rule. The AIGP distance is compared to break a tie. The BGP best-route decision process also impacts the way the interior cost rule is applied if the resolving next hop has an AIGP attribute. Without AIGP enabled, the interior cost of a route is based on the calculation of the metric to the next hop for the route. With AIGP enabled, the resolving AIGP distance is added to the interior cost.

The AIGP attribute is an optional non-transitive BGP path attribute and is specified in Internet draft draft-ietf-idr-aigp-06, *The Accumulated IGP Metric Attribute for BGP*.

### Example: Configuring the Accumulated IGP Attribute for BGP

This example shows how to configure the accumulated IGP (AIGP) metric attribute for BGP.

#### Requirements

This example uses the following hardware and software components:

- Seven BGP-speaking devices.
- Junos OS Release 12.1 or later.

### Overview

The AIGP attribute enables deployments in which a single administration can run several contiguous BGP autonomous systems (ASs). Such deployments allow BGP to make routing decisions based on the IGP metric. With AIGP enabled, BGP can select paths based on IGP metrics. This enables BGP to choose the shortest path between two nodes, even though the nodes might be in different ASs. The AIGP attribute is particularly useful in networks that use tunneling to deliver a packet to its BGP next hop. This example shows AIGP configured with MPLS label-switched paths.

To enable AIGP, you include the **aigp** statement in the BGP configuration on a protocol family basis. Configuring AIGP on a particular family enables sending and receiving of the AIGP attribute on that family. By default, AIGP is disabled. An AIGP-disabled neighbor does not send an AIGP attribute and silently discards a received AIGP attribute.

Junos OS supports AIGP for **family inet labeled-unicast** and **family inet6 labeled-unicast**. The **aigp** statement can be configured for a given family at the global BGP, group, or neighbor level.

By default, the value of the AIGP attribute for a local prefix is zero. An AIGP-enabled neighbor can originate an AIGP attribute for a given prefix by export policy, using the **aigp-originate** policy action. The value of the AIGP attribute reflects the IGP distance to the prefix. Alternatively, you can specify a value, by using the **aigp-originate distance distance** policy action. The configurable range is 0 through 4,294,967,295. Only one node needs to originate an AIGP attribute. The AIGP attribute is retained and readvertised if the neighbors are AIGP enabled with the **aigp** statement in the BGP configuration.

The policy action to originate the AIGP attribute has the following requirements:

- Neighbor must be AIGP enabled.
- Policy must be applied as an export policy.
- Prefix must have no current AIGP attribute.
- Prefix must export with next-hop self.
- Prefix must reside within the AIGP domain. Typically, a loopback IP address is the prefix to originate.

The policy is ignored if these requirements are not met.

### Topology Diagram

[Figure 74 on page 3385](#) shows the topology used in this example. OSPF is used as the interior gateway protocol (IGP). Internal BGP (IBGP) is configured between Device PE1 and Device PE4. External BGP (EBGP) is configured between Device PE7 and Device PE1, between Device PE4 and Device PE3, and between Device PE4 and Device PE2. Devices PE4, PE2, and PE3 are configured for multihop. Device PE4 selects a path based on the AIGP value and then readvertises the AIGP value based on the AIGP and policy configuration. Device PE1 readvertises the AIGP value to Device PE7, which is in another administrative domain. Every device has two loopback interface addresses: 10.9.9.x is used for BGP peering and the router ID, and 10.100.1.x is used for the BGP next hop.

The network between Device PE1 and PE3 has IBGP peering and multiple OSPF areas. The external link to Device PE7 is configured to show that the AIGP attribute is readvertised to a neighbor outside of the administrative domain, if that neighbor is AIGP enabled.

**Figure 74: Advertisement of Multiple Paths in BGP**

For origination of an AIGP attribute, the BGP next hop is required to be itself. If the BGP next hop remains unchanged, the received AIGP attribute is readvertised, as is, to another AIGP neighbor. If the next hop changes, the received AIGP attribute is readvertised with an increased value to another AIGP neighbor. The increase in value reflects the IGP distance to the previous BGP next hop. To demonstrate, this example uses loopback interface addresses for Device PE4's EBGP peering sessions with Device PE2 and Device PE3. Multihop is enabled on these sessions so that a recursive lookup is performed to determine the point-to-point interface. Because the next hop changes, the IGP distance is added to the AIGP distance.

set protocols bgp group external export SET_EXPORT_ROUTES
set protocols bgp group external peer-as 13979
set protocols bgp group external neighbor 10.0.0.9
set policy-options policy-statement SET_EXPORT_ROUTES term 10 from protocol direct
```

```

set policy-options policy-statement SET_EXPORT_ROUTES term 10 from protocol bgp
set policy-options policy-statement SET_EXPORT_ROUTES term 10 then next-hop
  10.100.1.7
set policy-options policy-statement SET_EXPORT_ROUTES term 10 then accept
set routing-options router-id 10.9.9.7
set routing-options autonomous-system 7019

```

### Configuring Device P1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device P1:

1. Configure the interfaces.

```

[edit interfaces]
user@P1# set fe-1/2/0 unit 1 description P1-to-PE1
user@P1# set fe-1/2/0 unit 1 family inet address 10.0.0.2/30
user@P1# set fe-1/2/0 unit 1 family mpls
user@P1# set fe-1/2/1 unit 4 description P1-to-P2
user@P1# set fe-1/2/1 unit 4 family inet address 10.0.0.29/30
user@P1# set fe-1/2/1 unit 4 family mpls
user@P1# set fe-1/2/2 unit 8 description P1-to-PE4
user@P1# set fe-1/2/2 unit 8 family inet address 10.0.0.17/30
user@P1# set fe-1/2/2 unit 8 family mpls
user@P1# set lo0 unit 3 family inet address 10.9.9.2/32
user@P1# set lo0 unit 3 family inet address 10.100.1.2/32

```

2. Configure MPLS and a signaling protocol, such as RSVP or LDP.

```

[edit protocols]
user@P1# set rsvp interface fe-1/2/0.1
user@P1# set rsvp interface fe-1/2/2.8
user@P1# set rsvp interface fe-1/2/1.4
user@P1# set mpls label-switched-path P1-to-P2 to 10.9.9.3
user@P1# set mpls label-switched-path P1-to-PE1 to 10.9.9.1
user@P1# set mpls label-switched-path P1-to-PE4 to 10.9.9.4
user@P1# set mpls interface fe-1/2/0.1
user@P1# set mpls interface fe-1/2/2.8
user@P1# set mpls interface fe-1/2/1.4

```

3. Configure BGP.

```

[edit protocols bgp group internal]
user@P1# set type internal
user@P1# set local-address 10.9.9.2
user@P1# set neighbor 10.9.9.1
user@P1# set neighbor 10.9.9.3
user@P1# set neighbor 10.9.9.4

```

4. Enable AIGP.

```

[edit protocols bgp group internal]
user@P1# set family inet labeled-unicast aigp

```

5. Configure an IGP, such as OSPF, RIP, or IS-IS.

```
[edit protocols ospf]
user@P1# set area 0.0.0.1 interface fe-1/2/0.1 metric 1
user@P1# set area 0.0.0.1 interface fe-1/2/1.4 metric 1
user@P1# set area 0.0.0.0 interface fe-1/2/2.8 metric 1
user@P1# set area 0.0.0.0 interface 10.9.9.2 passive
user@P1# set area 0.0.0.0 interface 10.9.9.2 metric 1
user@P1# set area 0.0.0.0 interface 10.100.1.2 passive
user@P1# set area 0.0.0.0 interface 10.100.1.2 metric 1
```

6. Configure the router ID and the autonomous system number.

```
[edit routing-options]
user@P1# set router-id 10.9.9.2
user@P1# set autonomous-system 13979
```

7. If you are done configuring the device, commit the configuration.

```
user@P1# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@P1# show interfaces
fe-1/2/0 {
  unit 1 {

### Configuring Device P2

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device P2:

1. Configure the interfaces.

```
[edit interfaces]  
user@P2# set fe-1/2/0 unit 3 description P2-to-PE1  
user@P2# set fe-1/2/0 unit 3 family inet address 10.0.0.6/30  
user@P2# set fe-1/2/0 unit 3 family mpls  
user@P2# set fe-1/2/1 unit 5 description P2-to-P1  
user@P2# set fe-1/2/1 unit 5 family inet address 10.0.0.30/30  
user@P2# set fe-1/2/1 unit 5 family mpls  
user@P2# set fe-1/2/2 unit 6 description P2-to-PE4  
user@P2# set fe-1/2/2 unit 6 family inet address 10.0.0.13/30  
user@P2# set fe-1/2/2 unit 6 family mpls  
user@P2# set lo0 unit 5 family inet address 10.9.9.3/32  
user@P2# set lo0 unit 5 family inet address 10.100.1.3/32
```

2. Configure MPLS and a signaling protocol, such as RSVP or LDP.

```
[edit protocols]  
user@P2# set rsvp interface fe-1/2/1.5  
user@P2# set rsvp interface fe-1/2/2.6  
user@P2# set rsvp interface fe-1/2/0.3  
user@P2# set mpls label-switched-path P2-to-PE1 to 10.9.9.1  
user@P2# set mpls label-switched-path P2-to-P1 to 10.9.9.2  
user@P2# set mpls label-switched-path P2-to-PE4 to 10.9.9.4  
user@P2# set mpls interface fe-1/2/1.5  
user@P2# set mpls interface fe-1/2/2.6  
user@P2# set mpls interface fe-1/2/0.3
```

3. Configure BGP.

```
[edit protocols bgp group internal]  
user@P2# set type internal  
user@P2# set local-address 10.9.9.3  
user@P2# set neighbor 10.9.9.1  
user@P2# set neighbor 10.9.9.2  
user@P2# set neighbor 10.9.9.4
```

4. Enable AIGP.

```
[edit protocols bgp group internal]
user@P2# set family inet labeled-unicast aigp
```

5. Configure an IGP, such as OSPF, RIP, or IS-IS.

```
[edit protocols ospf]
user@P2# set area 0.0.0.0 interface fe-1/2/2.6 metric 1
user@P2# set area 0.0.0.0 interface 10.9.9.3 passive
user@P2# set area 0.0.0.0 interface 10.9.9.3 metric 1
user@P2# set area 0.0.0.0 interface 10.100.1.3 passive
user@P2# set area 0.0.0.0 interface 10.100.1.3 metric 1
```

6. Configure the router ID and the autonomous system number.

```
[edit routing-options]
user@P2# set router-id 10.9.9.3
user@P2# set autonomous-system 13979
```

7. If you are done configuring the device, commit the configuration.

```
user@P2# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@P2# show interfaces

```

### Configuring Device PE4

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device PE4:

1. Configure the interfaces.

```

[edit interfaces]
user@PE4# set fe-1/2/0 unit 7 description PE4-to-P2
user@PE4# set fe-1/2/0 unit 7 family inet address 10.0.0.14/30
user@PE4# set fe-1/2/0 unit 7 family mpls
user@PE4# set fe-1/2/1 unit 9 description PE4-to-P1
user@PE4# set fe-1/2/1 unit 9 family inet address 10.0.0.18/30
user@PE4# set fe-1/2/1 unit 9 family mpls
user@PE4# set fe-1/2/2 unit 10 description PE4-to-PE2
user@PE4# set fe-1/2/2 unit 10 family inet address 10.0.0.21/30
user@PE4# set fe-1/2/2 unit 10 family mpls
user@PE4# set fe-1/0/2 unit 12 description PE4-to-PE3
user@PE4# set fe-1/0/2 unit 12 family inet address 10.0.0.25/30
user@PE4# set fe-1/0/2 unit 12 family mpls
user@PE4# set lo0 unit 7 family inet address 10.9.9.4/32
user@PE4# set lo0 unit 7 family inet address 10.100.1.4/32

```

2. Configure MPLS and a signaling protocol, such as RSVP or LDP.

```

[edit protocols]
user@PE4# set rsvp interface fe-1/2/0.7
user@PE4# set rsvp interface fe-1/2/1.9
user@PE4# set rsvp interface fe-1/2/2.10
user@PE4# set rsvp interface fe-1/0/2.12
user@PE4# set mpls label-switched-path PE4-to-PE2 to 10.9.9.5
user@PE4# set mpls label-switched-path PE4-to-PE3 to 10.9.9.6
user@PE4# set mpls label-switched-path PE4-to-P1 to 10.9.9.2
user@PE4# set mpls label-switched-path PE4-to-P2 to 10.9.9.3
user@PE4# set mpls interface fe-1/2/0.7
user@PE4# set mpls interface fe-1/2/1.9
user@PE4# set mpls interface fe-1/2/2.10
user@PE4# set mpls interface fe-1/0/2.12

```

3. Configure BGP.

```

[edit protocols bgp]
user@PE4# set export next-hop
user@PE4# set export aigp
user@PE4# set group internal type internal
user@PE4# set group internal local-address 10.9.9.4
user@PE4# set group internal neighbor 10.9.9.1
user@PE4# set group internal neighbor 10.9.9.3

```

```
user@PE4# set group internal neighbor 10.9.9.2
user@PE4# set group external type external
user@PE4# set group external multihop ttl 2
user@PE4# set group external local-address 10.9.9.4
user@PE4# set group external peer-as 7018
user@PE4# set group external neighbor 10.9.9.5
user@PE4# set group external neighbor 10.9.9.6
```

4. Enable AIGP.

```
[edit protocols bgp]
user@PE4# set group external family inet labeled-unicast aigp
user@PE4# set group internal family inet labeled-unicast aigp
```

5. Originate a prefix, and configure an AIGP distance.

By default, a prefix is originated using the current IGP distance. Optionally, you can configure a distance for the AIGP attribute, using the **distance** option, as shown here.

```
[edit policy-options policy-statement aigp term 10]
user@PE4# set from protocol static
user@PE4# set from route-filter 44.0.0.0/24 exact
user@PE4# set then aigp-originate distance 200
user@PE4# set then next-hop 10.100.1.4
user@PE4# set then accept
```

6. Enable the policies.

```
[edit policy-options policy-statement next-hop]
user@PE4# set term 10 from protocol bgp
user@PE4# set term 10 then next-hop 10.100.1.4
user@PE4# set term 10 then accept
user@PE4# set term 20 from protocol direct
user@PE4# set term 20 from route-filter 10.9.9.4/32 exact
user@PE4# set term 20 from route-filter 10.100.1.4/32 exact
user@PE4# set term 20 then next-hop 10.100.1.4
user@PE4# set term 20 then accept
```

7. Configure a static route.

```
[edit routing-options]
user@PE4# set static route 44.0.0.0/24 discard
```

8. Configure an IGP, such as OSPF, RIP, or IS-IS.

```
[edit protocols ospf]
user@PE4# set area 0.0.0.0 interface fe-1/2/1.9 metric 1
user@PE4# set area 0.0.0.0 interface fe-1/2/0.7 metric 1
user@PE4# set area 0.0.0.0 interface 10.9.9.4 passive
user@PE4# set area 0.0.0.0 interface 10.9.9.4 metric 1
user@PE4# set area 0.0.0.0 interface 10.100.1.4 passive
user@PE4# set area 0.0.0.0 interface 10.100.1.4 metric 1
user@PE4# set area 0.0.0.2 interface fe-1/2/2.10 metric 1
user@PE4# set area 0.0.0.3 interface fe-1/0/2.12 metric 1
```

9. Configure the router ID and the autonomous system number.

```
[edit routing-options]
```

```

user@PE4# set router-id 10.9.9.4
user@PE4# set autonomous-system 13979

```

10. If you are done configuring the device, commit the configuration.

```

user@PE4# commit

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

### *Configuring Device PE1*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device PE1:

1. Configure the interfaces.

```
[edit interfaces]  
user@PE1# set fe-1/2/0 unit 0 description PE1-to-P1  
user@PE1# set fe-1/2/0 unit 0 family inet address 10.0.0.1/30  
user@PE1# set fe-1/2/0 unit 0 family mpls  
user@PE1# set fe-1/2/1 unit 2 description PE1-to-P2  
user@PE1# set fe-1/2/1 unit 2 family inet address 10.0.0.5/30  
user@PE1# set fe-1/2/1 unit 2 family mpls  
user@PE1# set fe-1/2/2 unit 14 description PE1-to-PE7  
user@PE1# set fe-1/2/2 unit 14 family inet address 10.0.0.9/30  
user@PE1# set lo0 unit 1 family inet address 10.9.9.1/32  
user@PE1# set lo0 unit 1 family inet address 10.100.1.1/32
```

2. Configure MPLS and a signaling protocol, such as RSVP or LDP.

```
[edit protocols]  
user@PE1# set rsvp interface fe-1/2/0.0  
user@PE1# set rsvp interface fe-1/2/1.2  
user@PE1# set rsvp interface fe-1/2/2.14  
user@PE1# set mpls label-switched-path PE1-to-P1 to 10.9.9.2  
user@PE1# set mpls label-switched-path PE1-to-P2 to 10.9.9.3  
user@PE1# set mpls interface fe-1/2/0.0  
user@PE1# set mpls interface fe-1/2/1.2  
user@PE1# set mpls interface fe-1/2/2.14
```

3. Configure BGP.

```
[edit protocols bgp]  
user@PE1# set group internal type internal  
user@PE1# set group internal local-address 10.9.9.1  
user@PE1# set group internal export SET_EXPORT_ROUTES  
user@PE1# set group internal vpn-apply-export
```

```

user@PE1# set group internal neighbor 10.9.9.4
user@PE1# set group internal neighbor 10.9.9.2
user@PE1# set group internal neighbor 10.9.9.3
user@PE1# set group external type external
user@PE1# set group external export SET_EXPORT_ROUTES
user@PE1# set group external peer-as 7019
user@PE1# set group external neighbor 10.0.0.10

```

4. Enable AIGP.

```

[edit protocols bgp]
user@PE1# set group internal family inet labeled-unicast aigp
user@PE1# set group external family inet labeled-unicast aigp

```

5. Enable the policies.

```

[edit policy-options policy-statement SET_EXPORT_ROUTES term 10]
user@PE1# set from protocol direct
user@PE1# set from protocol bgp
user@PE1# set then next-hop 10.100.1.1
user@PE1# set then accept

```

6. Configure an IGP, such as OSPF, RIP, or IS-IS.

```

[edit protocols ospf area 0.0.0.1]
user@PE1# set interface fe-1/2/0.0 metric 1
user@PE1# set interface fe-1/2/1.2 metric 1
user@PE1# set interface 10.9.9.1 passive
user@PE1# set interface 10.9.9.1 metric 1
user@PE1# set interface 10.100.1.1 passive
user@PE1# set interface 10.100.1.1 metric 1

```

7. Configure the router ID and the autonomous system number.

```

[edit routing-options]
user@PE1# set router-id 10.9.9.1
user@PE1# set autonomous-system 13979

```

8. If you are done configuring the device, commit the configuration.

```

user@PE1# commit

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@PE1# show interfaces

### Configuring Device PE2

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device PE2:

1. Configure the interfaces.

```
[edit interfaces]
user@PE2# set fe-1/2/0 unit 11 description PE2-to-PE4
user@PE2# set fe-1/2/0 unit 11 family inet address 10.0.0.22/30
user@PE2# set fe-1/2/0 unit 11 family mpls
user@PE2# set lo0 unit 9 family inet address 10.9.9.5/32 primary
user@PE2# set lo0 unit 9 family inet address 10.100.1.5/32
```

2. Configure MPLS and a signaling protocol, such as RSVP or LDP.

```
[edit protocols]
user@PE2# set rsvp interface fe-1/2/0.11
user@PE2# set mpls label-switched-path PE2-to-PE4 to 10.9.9.4
user@PE2# set mpls interface fe-1/2/0.11
```

3. Configure BGP.

```
[edit protocols bgp]
user@PE2# set group external type external
user@PE2# set group external multihop ttl 2
user@PE2# set group external local-address 10.9.9.5
user@PE2# set group external export next-hop
user@PE2# set group external export aigp
user@PE2# set group external export SET_EXPORT_ROUTES
user@PE2# set group external vpn-apply-export
user@PE2# set group external peer-as 13979
user@PE2# set group external neighbor 10.9.9.4
```

4. Enable AIGP.

```
[edit protocols bgp]
user@PE2# set group external family inet labeled-unicast aigp
```

5. Originate a prefix, and configure an AIGP distance.

By default, a prefix is originated using the current IGP distance. Optionally, you can configure a distance for the AIGP attribute, using the **distance** option, as shown here.

```
[edit policy-options policy-statement aigp]
user@PE2# set term 10 from route-filter 55.0.0.0/24 exact
user@PE2# set term 10 then aigp-originate distance 20
user@PE2# set term 10 then next-hop 10.100.1.5
user@PE2# set term 10 then accept
user@PE2# set term 20 from route-filter 99.0.0.0/24 exact
user@PE2# set term 20 then aigp-originate distance 30
user@PE2# set term 20 then next-hop 10.100.1.5
user@PE2# set term 20 then accept
```

6. Enable the policies.

```
[edit policy-options]
user@PE2# set policy-statement SET_EXPORT_ROUTES term 10 from protocol
direct
user@PE2# set policy-statement SET_EXPORT_ROUTES term 10 from protocol
static
user@PE2# set policy-statement SET_EXPORT_ROUTES term 10 from protocol
bgp
user@PE2# set policy-statement SET_EXPORT_ROUTES term 10 then next-hop
10.100.1.5
user@PE2# set policy-statement SET_EXPORT_ROUTES term 10 then accept
user@PE2# set policy-statement next-hop term 10 from protocol bgp
user@PE2# set policy-statement next-hop term 10 then next-hop 10.100.1.5
user@PE2# set policy-statement next-hop term 10 then accept
user@PE2# set policy-statement next-hop term 20 from protocol direct
user@PE2# set policy-statement next-hop term 20 from route-filter 10.9.9.5/32
exact
user@PE2# set policy-statement next-hop term 20 from route-filter 10.100.1.5/32
exact
user@PE2# set policy-statement next-hop term 20 then next-hop 10.100.1.5
user@PE2# set policy-statement next-hop term 20 then accept
```

7. Enable some static routes.

```
[edit routing-options]
user@PE2# set static route 99.0.0.0/24 discard
user@PE2# set static route 55.0.0.0/24 discard
```

8. Configure an IGP, such as OSPF, RIP, or IS-IS.

```
[edit protocols ospf area 0.0.0.2]
user@PE2# set interface 10.9.9.5 passive
user@PE2# set interface 10.9.9.5 metric 1
user@PE2# set interface 10.100.1.5 passive
user@PE2# set interface 10.100.1.5 metric 1
user@PE2# set interface fe-1/2/0.11 metric 1
```

9. Configure the router ID and the autonomous system number.

```
[edit routing-options]
user@PE2# set router-id 10.9.9.5
user@PE2# set autonomous-system 7018
```

10. If you are done configuring the device, commit the configuration.

```
user@PE2# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@PE2# show interfaces
fe-1/2/0 {
  unit 11 {

### **Configuring Device PE3**

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device PE3:

1. Configure the interfaces.

```
[edit interfaces]
user@PE3# set fe-1/2/0 unit 13 description PE3-to-PE4
user@PE3# set fe-1/2/0 unit 13 family inet address 10.0.0.26/30
user@PE3# set fe-1/2/0 unit 13 family mpls
user@PE3# set lo0 unit 11 family inet address 10.9.9.6/32
user@PE3# set lo0 unit 11 family inet address 10.100.1.6/32
```

2. Configure MPLS and a signaling protocol, such as RSVP or LDP.

```
[edit protocols]
user@PE3# set rsvp interface fe-1/2/0.13
user@PE3# set mpls label-switched-path PE3-to-PE4 to 10.9.9.4
user@PE3# set mpls interface fe-1/2/0.13
```

3. Configure BGP.

```
[edit protocols bgp group external]
user@PE3# set type external
user@PE3# set multihop ttl 2
user@PE3# set local-address 10.9.9.6
user@PE3# set export next-hop
user@PE3# set export SET_EXPORT_ROUTES
user@PE3# set vpn-apply-export
user@PE3# set peer-as 13979
user@PE3# set neighbor 10.9.9.4
```

4. Enable AIGP.

```
[edit protocols bgp group external]
user@PE3# set family inet labeled-unicast aigp
```

5. Enable the policies.

```
[edit policy-options]
user@PE3# set policy-statement SET_EXPORT_ROUTES term 10 from protocol
    direct
user@PE3# set policy-statement SET_EXPORT_ROUTES term 10 from protocol
    static
```

```

user@PE3# set policy-statement SET_EXPORT_ROUTES term 10 from protocol
bgp
user@PE3# set policy-statement SET_EXPORT_ROUTES term 10 then next-hop
10.100.1.6
user@PE3# set policy-statement SET_EXPORT_ROUTES term 10 then accept
user@PE3# set policy-statement next-hop term 10 from protocol bgp
user@PE3# set policy-statement next-hop term 10 then next-hop 10.100.1.6
user@PE3# set policy-statement next-hop term 10 then accept
user@PE3# set policy-statement next-hop term 20 from protocol direct
user@PE3# set policy-statement next-hop term 20 from route-filter 10.9.9.6/32
exact
user@PE3# set policy-statement next-hop term 20 from route-filter 10.100.1.6/32
exact
user@PE3# set policy-statement next-hop term 20 then next-hop 10.100.1.6
user@PE3# set policy-statement next-hop term 20 then accept

```

6. Configure an IGP, such as OSPF, RIP, or IS-IS.

```

[edit protocols ospf area 0.0.0.3]
user@PE3# set interface 10.9.9.6 passive
user@PE3# set interface 10.9.9.6 metric 1
user@PE3# set interface 10.100.1.6 passive
user@PE3# set interface 10.100.1.6 metric 1
user@PE3# set interface fe-1/2/0.13 metric 1

```

7. Configure the router ID and the autonomous system number.

```

[edit routing-options]
user@PE3# set router-id 10.9.9.6
user@PE3# set autonomous-system 7018

```

8. If you are done configuring the device, commit the configuration.

```

user@PE3# commit

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@PE3# show interfaces

autonomous-system 7018;

```

### Configuring Device PE7

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device PE7:

1. Configure the interfaces.

```

[edit interfaces]
user@PE7# set fe-1/2/0 unit 15 description PE7-to-PE1
user@PE7# set fe-1/2/0 unit 15 family inet address 10.0.0.10/30
user@PE7# set lo0 unit 13 family inet address 10.9.9.7/32
user@PE7# set lo0 unit 13 family inet address 10.100.1.7/32

```

2. Configure BGP.

```

[edit protocols bgp group external]
user@PE7# set type external
user@PE7# set export SET_EXPORT_ROUTES
user@PE7# set peer-as 13979
user@PE7# set neighbor 10.0.0.9

```

3. Enable AIGP.

```

[edit protocols bgp group external]
user@PE7# set family inet labeled-unicast aigp

```

4. Configure the routing policy.

```

[edit policy-options policy-statement SET_EXPORT_ROUTES term 10]
user@PE7# set from protocol direct

```

```
user@PE7# set from protocol bgp
user@PE7# set then next-hop 10.100.1.7
user@PE7# set then accept
```

5. Configure the router ID and the autonomous system number.

```
[edit routing-options]
user@PE7# set router-id 10.9.9.7
user@PE7# set autonomous-system 7019
```

6. If you are done configuring the device, commit the configuration.

```
user@PE7# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@PE7# show interfaces
interfaces {
  fe-1/2/0 {
    unit 15 {
      description PE7-to-PE1;
      family inet {
        address 10.0.0.10/30;
      }
    }
  }
  lo0 {
    unit 13 {
      family inet {
        address 10.9.9.7/32;
        address 10.100.1.7/32;
      }
    }
  }
}

user@PE7# show policy-options
policy-statement SET_EXPORT_ROUTES {
  term 10 {
    from protocol [ direct bgp ];
    then {
      next-hop 10.100.1.7;
      accept;
    }
  }
}

user@PE7# show protocols
bgp {
  group external {
    type external;
    family inet {
      labeled-unicast {
        aigp;
      }
    }
  }
}
```

```

    }
  }
  export SET_EXPORT_ROUTES;
  peer-as 13979;
  neighbor 10.0.0.9;
}
}

user@PE7# show routing-options
router-id 10.9.9.7;
autonomous-system 7019;

```

### Verification

Confirm that the configuration is working properly.

- [Verifying That Device PE4 Is Receiving the AIGP Attribute from Its EBGp Neighbor PE2 on page 3415](#)
- [Checking the IGP Metric on page 3415](#)
- [Verifying That Device PE4 Adds the IGP Metric to the AIGP Attribute on page 3416](#)
- [Verifying That Device PE7 Is Receiving the AIGP Attribute from Its EBGp Neighbor PE1 on page 3416](#)
- [Verifying the Resolving AIGP Metric on page 3417](#)
- [Verifying the Presence of AIGP Attributes in BGP Updates on page 3420](#)

### *Verifying That Device PE4 Is Receiving the AIGP Attribute from Its EBGp Neighbor PE2*

**Purpose** Make sure that the AIGP policy on Device PE2 is working.

**Action**

```

user@PE4> show route receive-protocol bgp 10.9.9.5 extensive
* 55.0.0.0/24 (1 entry, 1 announced)
  Accepted
  Route Label: 299888
  Nexthop: 10.100.1.5
  AS path: 7018 I
  AIGP: 20

* 99.0.0.0/24 (1 entry, 1 announced)
  Accepted
  Route Label: 299888
  Nexthop: 10.100.1.5
  AS path: 7018 I
  AIGP: 30

```

**Meaning** On Device PE2, the **aigp-originate** statement is configured with a distance of 20 (**aigp-originate distance 20**). This statement is applied to route 55.0.0.0/24. Likewise, the **aigp-originate distance 30** statement is applied to route 99.0.0.0/24. Thus, when Device PE4 receives these routes, the AIGP attribute is attached with the configured metrics.

### *Checking the IGP Metric*

**Purpose** From Device PE4, check the IGP metric to the BGP next hop 10.100.1.5.

**Action** user@PE4> show route 10.100.1.5  
inet.0: 30 destinations, 40 routes (30 active, 0 holddown, 0 hidden)  
+ = Active Route, - = Last Active, \* = Both

10.100.1.5/32      \*[OSPF/10] 05:35:50, metric 2  
                         > to 10.0.0.22 via fe-1/2/2.10  
                         [BGP/170] 03:45:07, localpref 100, from 10.9.9.5  
                         AS path: 7018 I  
                         > to 10.0.0.22 via fe-1/2/2.10

**Meaning** The IGP metric for this route is 2.

***Verifying That Device PE4 Adds the IGP Metric to the AIGP Attribute***

**Purpose** Make sure that Device PE4 adds the IGP metric to the AIGP attribute when it readvertises routes to its IBGP neighbor, Device PE1.

**Action** user@PE4> show route advertising-protocol bgp 10.9.9.1 extensive

\* 55.0.0.0/24 (1 entry, 1 announced)  
BGP group internal type Internal  
Route Label: 300544  
Nexthop: 10.100.1.4  
Flags: Nexthop Change  
Localpref: 100  
AS path: [13979] 7018 I  
AIGP: 22

\* 99.0.0.0/24 (1 entry, 1 announced)  
BGP group internal type Internal  
Route Label: 300544  
Nexthop: 10.100.1.4  
Flags: Nexthop Change  
Localpref: 100  
AS path: [13979] 7018 I  
AIGP: 32

**Meaning** The IGP metric is added to the AIGP metric ( $20 + 2 = 22$  and  $30 + 2 = 32$ ), because the next hop is changed for these routes.

***Verifying That Device PE7 Is Receiving the AIGP Attribute from Its EBGp Neighbor PE1***

**Purpose** Make sure that the AIGP policy on Device PE1 is working.

**Action** user@PE7> show route receive-protocol bgp 10.0.0.9 extensive

\* 44.0.0.0/24 (1 entry, 1 announced)

Accepted  
Route Label: 300096  
Nexthop: 10.0.0.9  
AS path: 13979 I  
AIGP: 203

\* 55.0.0.0/24 (1 entry, 1 announced)

Accepted  
Route Label: 300112  
Nexthop: 10.0.0.9  
AS path: 13979 7018 I  
AIGP: 25

\* 99.0.0.0/24 (1 entry, 1 announced)

Accepted  
Route Label: 300112  
Nexthop: 10.0.0.9  
AS path: 13979 7018 I  
AIGP: 35

**Meaning** The 44.0.0.0/24 route is originated at Device PE4. The 55.0.0.0/24 and 99.0.0.0/24 routes are originated at Device PE2. The IGP distances are added to the configured AIGP distances.

#### *Verifying the Resolving AIGP Metric*

**Purpose** Confirm that if the prefix is resolved through recursion and the recursive next hops have AIGP metrics, the prefix has the sum of the AIGP values that are on the recursive BGP next hops.

**Action** 1. Add a static route to 66.0.0.0/24.

```
[edit routing-options]
user@PE2# set static route 66.0.0.0/24 discard
```

2. Delete the existing terms in the **aigp** policy statement on Device PE2.

```
[edit policy-options policy-statement aigp]
user@PE2# delete term 10
user@PE2# delete term 20
```

3. Configure a recursive route lookup for the route to 66.0.0.0.

The policy shows the AIGP metric for prefix 66.0.0.0/24 (none) and its recursive next hop. Prefix 66.0.0.0/24 is resolved by 55.0.0.1. Prefix 66.0.0.0/24 does not have its own AIGP metric being originated, but its recursive next hop, 55.0.0.1, has an AIGP value.

```
[edit policy-options policy-statement aigp]
user@PE2# set term 10 from route-filter 55.0.0.1/24 exact
user@PE2# set term 10 then aigp-originate distance 20
user@PE2# set term 10 then next-hop 10.100.1.5
user@PE2# set term 10 then accept
user@PE2# set term 20 from route-filter 66.0.0.0/24 exact
user@PE2# set term 20 then next-hop 55.0.0.1
```

user@PE2# set term 20 then accept

4. On Device PE4, run the **show route 55.0.0.0 extensive** command.

The value of Metric2 is the IGP metric to the BGP next hop. When Device PE4 readvertises these routes to its IBGP peer, Device PE1, the AIGP metric is the sum of AIGP + its Resolving AIGP metric + Metric2.

Prefix 55.0.0.0 shows its own IGP metric 20, as defined and advertised by Device PE2. It does not show a resolving AIGP value because it does not have a recursive BGP next hop. The value of Metric2 is 2.

```
user@PE4> show route 55.0.0.0 extensive
inet.0: 31 destinations, 41 routes (31 active, 0 holddown, 0 hidden)
55.0.0.0/24 (1 entry, 1 announced)
TSI:
KRT in-kernel 55.0.0.0/24 -> {indirect(262151)}
Page 0 idx 0 Type 1 val 928d1b8
  Flags: Nexthop Change
  Nexthop: 10.100.1.4
  Localpref: 100
  AS path: [13979] 7018 I
  Communities:
  AIGP: 22
Path 55.0.0.0 from 10.9.9.5 Vector len 4. Val: 0

              Nexthop: 10.0.0.22 via fe-1/2/2.10

```

### *Verifying the Presence of AIGP Attributes in BGP Updates*

**Purpose** If the AIGP attribute is not enabled under BGP (or the **group** or **neighbor** hierarchies), the AIGP attribute is silently discarded. Enable **traceoptions** and include the **packets** flag in the **detail** option in the configuration to confirm the presence of the AIGP attribute in transmitted or received BGP updates. This is useful when debugging AIGP issues.

**Action** 1. Configure Device PE2 and Device PE4 for **traceoptions**.

```
user@host> show protocols bgp
traceoptions {
  file bgp size 1m files 5;
  flag packets detail;
}
```

2. Check the **traceoptions** file on Device PE2.

The following sample shows Device PE2 advertising prefix 99.0.0.0/24 to Device PE4 (10.9.9.4) with an AIGP metric of 20:

```
user@PE2> show log bgp
Mar 22 09:27:18.982150 BGP SEND 10.9.9.5+49652 -> 10.9.9.4+179
Mar 22 09:27:18.982178 BGP SEND message type 2 (Update) length 70
Mar 22 09:27:18.982198 BGP SEND Update PDU length 70
Mar 22 09:27:18.982248 BGP SEND flags 0x40 code Origin(1): IGP
Mar 22 09:27:18.982273 BGP SEND flags 0x40 code ASPath(2) length 6: 7018
Mar 22 09:27:18.982295 BGP SEND flags 0x80 code AIGP(26): AIGP: 20
Mar 22 09:27:18.982316 BGP SEND flags 0x90 code MP_reach(14): AFI/SAFI 1/4
Mar 22 09:27:18.982341 BGP SEND      nhop 10.100.1.5 len 4
Mar 22 09:27:18.982372 BGP SEND    99.0.0.0/24 (label 301664)
Mar 22 09:27:33.665412 bgp_send: sending 19 bytes to abcd::10:255:170:84
(External AS 13979)
```

3. Verify that the route was received on Device PE4 using the **show route receive-protocol** command.

AIGP is not enabled on Device PE4, so the AIGP attribute is silently discarded for prefix 99.0.0.0/24 and does not appear in the following output:

```
user@PE4> show route receive-protocol bgp 10.9.9.5 extensive | find 55.0.0.0
* 99.0.0.0/24 (2 entries, 1 announced)
  Accepted
  Route Label: 301728
  Nexthop: 10.100.1.5
  AS path: 7018 I
```

4. Check the **traceoptions** file on Device PE4.

The following output from the **traceoptions** log shows that the 99.0.0.0/24 prefix was received with the AIGP attribute attached:

```
user@PE4> show log bgp
Mar 22 09:41:39.650295 BGP RECV 10.9.9.5+64690 -> 10.9.9.4+179
Mar 22 09:41:39.650331 BGP RECV message type 2 (Update) length 70
Mar 22 09:41:39.650350 BGP RECV Update PDU length 70
Mar 22 09:41:39.650370 BGP RECV flags 0x40 code Origin(1): IGP
Mar 22 09:41:39.650394 BGP RECV flags 0x40 code ASPath(2) length 6: 7018
Mar 22 09:41:39.650415 BGP RECV flags 0x80 code AIGP(26): AIGP: 20
Mar 22 09:41:39.650436 BGP RECV flags 0x90 code MP_reach(14): AFI/SAFI 1/4
Mar 22 09:41:39.650459 BGP RECV      nhop 10.100.1.5 len 4
```

```

Mar 22 09:41:39.650495 BGP RECV    99.0.0.0/24 (label 301728)
Mar 22 09:41:39.650574 bgp_rcv_nlri: 99.0.0.0/24
Mar 22 09:41:39.650607 bgp_rcv_nlri: 99.0.0.0/24 belongs to meshgroup
Mar 22 09:41:39.650629 bgp_rcv_nlri: 99.0.0.0/24 qualified bnp->ribact 0x0
12afcb 0x0

```

**Meaning** Performing this verification helps with AIGP troubleshooting and debugging issues. It enables you to verify which devices in your network send and receive AIGP attributes.

### Example: Configuring BGP Interactions with IGPs

- [Understanding Routing Policies on page 3421](#)
- [Example: Injecting OSPF Routes into the BGP Routing Table on page 3422](#)

#### Understanding Routing Policies

Each routing policy is identified by a policy name. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks. Each routing policy name must be unique within a configuration.

Once a policy is created and named, it must be applied before it is active. You apply routing policies using the **import** and **export** statements at the **protocols>protocol-name** level in the configuration hierarchy.

In the **import** statement, you list the name of the routing policy to be evaluated when routes are imported into the routing table from the routing protocol.

In the **export** statement, you list the name of the routing policy to be evaluated when routes are being exported from the routing table into a dynamic routing protocol. Only active routes are exported from the routing table.

To specify more than one policy and create a policy chain, you list the policies using a space as a separator. If multiple policies are specified, the policies are evaluated in the order in which they are specified. As soon as an accept or reject action is executed, the policy chain evaluation ends.

### Example: Injecting OSPF Routes into the BGP Routing Table

---

This example shows how to create a policy that injects OSPF routes into the BGP routing table.

- [Requirements on page 3422](#)
- [Overview on page 3422](#)
- [Configuration on page 3422](#)
- [Verification on page 3424](#)
- [Troubleshooting on page 3424](#)

#### Requirements

Before you begin:

- Configure network interfaces.
- Configure external peer sessions. See [“Example: Configuring External BGP Point-to-Point Peer Sessions” on page 3262](#).
- Configure interior gateway protocol (IGP) sessions between peers.

#### Overview

In this example, you create a routing policy called **injectpolicy1** and a routing term called **injectterm1**. The policy injects OSPF routes into the BGP routing table.

#### Configuration

- [Configuring the Routing Policy on page 3422](#)
- [Configuring Tracing for the Routing Policy on page 3423](#)

#### Configuring the Routing Policy

##### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set policy-options policy-statement injectpolicy1 term injectterm1 from protocol ospf
set policy-options policy-statement injectpolicy1 term injectterm1 from area 0.0.0.1
set policy-options policy-statement injectpolicy1 term injectterm1 then accept
set protocols bgp export injectpolicy1
```

##### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To inject OSPF routes into a BGP routing table:

1. Create the policy term.

```
[edit policy-options policy-statement injectpolicy1]
user@host# set term injectterm1
```

- Specify OSPF as a match condition.

```
[edit policy-options policy-statement injectpolicy1 term injectterm1]
user@host# set from protocol ospf
```

- Specify the routes from an OSPF area as a match condition.

```
[edit policy-options policy-statement injectpolicy1 term injectterm1]
user@host# set from area 0.0.0.1
```

- Specify that the route is to be accepted if the previous conditions are matched.

```
[edit policy-options policy-statement injectpolicy1 term injectterm1]
user@host# set then accept
```

- Apply the routing policy to BGP.

```
[edit]
user@host# set protocols bgp export injectpolicy1
```

**Results** Confirm your configuration by entering the **show policy-options** and **show protocols bgp** commands from configuration mode. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show policy-options
policy-statement injectpolicy1 {
  term injectterm1 {
    from {
      protocol ospf;
      area 0.0.0.1;
    }
    then accept;
  }
}

user@host# show protocols bgp
export injectpolicy1;
```

If you are done configuring the device, enter **commit** from configuration mode.

### *Configuring Tracing for the Routing Policy*

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set policy-options policy-statement injectpolicy1 term injectterm1 then trace
set routing-options traceoptions file ospf-bgp-policy-log
set routing-options traceoptions file size 5m
set routing-options traceoptions file files 5
set routing-options traceoptions flag policy
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Include a trace action in the policy.

```
[edit policy-options policy-statement injectpolicy] term injectterm1]
user@host# then trace
```

2. Configure the tracing file for the output.

```
[edit routing-options traceoptions]
user@host# set file ospf-bgp-policy-log
user@host# set file size 5m
user@host# set file files 5
user@host# set flag policy
```

**Results** Confirm your configuration by entering the **show policy-options** and **show routing-options** commands from configuration mode. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show policy-options
policy-statement injectpolicy1 {
  term injectterm1 {
    then {
      trace;
    }
  }
}

user@host# show routing-options
traceoptions {
  file ospf-bgp-policy-log size 5m files 5;
  flag policy;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

### **Verifying That the Expected BGP Routes Are Present**

**Purpose** Verify the effect of the export policy.

**Action** From operational mode, enter the **show route** command.

### **Troubleshooting**

- [Using the show log Command to Examine the Actions of the Routing Policy on page 3424](#)

### **Using the show log Command to Examine the Actions of the Routing Policy**

**Problem** The routing table contains unexpected routes, or routes are missing from the routing table.

**Solution** If you configure policy tracing as shown in this example, you can run the **show log ospf-bgp-policy-log** command to diagnose problems with the routing policy. The **show log ospf-bgp-policy-log** command displays information about the routes that the **injectpolicy1** policy term analyzes and acts upon.

## Example: Configuring BGP Route Advertisement

- [Understanding Route Advertisement on page 3425](#)
- [Example: Configuring BGP Prefix-Based Outbound Route Filtering on page 3429](#)

### Understanding Route Advertisement

All routing protocols use the Junos OS routing table to store the routes that they learn and to determine which routes they should advertise in their protocol packets. Routing policy allows you to control which routes the routing protocols store in and retrieve from the routing table. For information about routing policy, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

When configuring BGP routing policy, you can perform the following tasks:

- [Applying Routing Policy on page 3425](#)
- [Setting BGP to Advertise Inactive Routes on page 3426](#)
- [Configuring BGP to Advertise the Best External Route to Internal Peers on page 3426](#)
- [Configuring How Often BGP Exchanges Routes with the Routing Table on page 3428](#)
- [Disabling Suppression of Route Advertisements on page 3429](#)

### Applying Routing Policy

You define routing policy at the **[edit policy-options]** hierarchy level. To apply policies you have defined for BGP, include the **import** and **export** statements within the BGP configuration.

You can apply policies as follows:

- BGP global **import** and **export** statements—Include these statements at the **[edit protocols bgp]** hierarchy level (for routing instances, include these statements at the **[edit routing-instances routing-instance-name protocols bgp]** hierarchy level).
- Group **import** and **export** statements—Include these statements at the **[edit protocols bgp group group-name]** hierarchy level (for routing instances, include these statements at the **[edit routing-instances routing-instance-name protocols bgp group group-name]** hierarchy level).
- Peer **import** and **export** statements—Include these statements at the **[edit protocols bgp group group-name neighbor address]** hierarchy level (for routing instances, include these statements at the **[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address]** hierarchy level).

A peer-level **import** or **export** statement overrides a group **import** or **export** statement. A group-level **import** or **export** statement overrides a global BGP **import** or **export** statement.

To apply policies, see the following sections:

- [Applying Policies to Routes Being Imported into the Routing Table from BGP on page 3426](#)
- [Applying Policies to Routes Being Exported from the Routing Table into BGP on page 3426](#)

#### ***Applying Policies to Routes Being Imported into the Routing Table from BGP***

To apply policy to routes being imported into the routing table from BGP, include the **import** statement, listing the names of one or more policies to be evaluated:

```
import [ policy-names ];
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

If you specify more than one policy, they are evaluated in the order specified, from first to last, and the first matching filter is applied to the route. If no match is found, BGP places into the routing table only those routes that were learned from BGP routing devices.

#### ***Applying Policies to Routes Being Exported from the Routing Table into BGP***

To apply policy to routes being exported from the routing table into BGP, include the **export** statement, listing the names of one or more policies to be evaluated:

```
export [ policy-names ];
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

If you specify more than one policy, they are evaluated in the order specified, from first to last, and the first matching filter is applied to the route. If no routes match the filters, the routing table exports into BGP only the routes that it learned from BGP.

#### ***Setting BGP to Advertise Inactive Routes***

By default, BGP stores the route information it receives from update messages in the Junos OS routing table, and the routing table exports only active routes into BGP, which BGP then advertises to its peers. To have the routing table export to BGP the best route learned by BGP even if Junos OS did not select it to be an active route, include the **advertise-inactive** statement:

```
advertise-inactive;
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

#### ***Configuring BGP to Advertise the Best External Route to Internal Peers***

In general, deployed BGP implementations do not advertise the external route with the highest local preference value to internal peers unless it is the best route. Although this behavior was required by an earlier version of the BGP version 4 specification, RFC 1771, it was typically not followed in order to minimize the amount of advertised information

and to prevent routing loops. However, there are scenarios in which advertising the best external route is beneficial, in particular, situations that can result in IBGP route oscillation.

In Junos OS Release 9.3 and later, you can configure BGP to advertise the best external route into an internal BGP (IBGP) mesh group, a route reflector cluster, or an autonomous system (AS) confederation, even when the best route is an internal route.

**NOTE:** In order to configure the `advertise-external` statement on a route reflector, you must disable intracluster reflection with the `no-client-reflect` statement.

When a routing device is configured as a route reflector for a cluster, a route advertised by the route reflector is considered internal if it is received from an internal peer with the same cluster identifier or if both peers have no cluster identifier configured. A route received from an internal peer that belongs to another cluster, that is, with a different cluster identifier, is considered external.

In a confederation, when advertising a route to a confederation border router, any route from a different confederation sub-AS is considered external.

You can also configure BGP to advertise the external route only if the route selection process reaches the point where the multiple exit discriminator (MED) metric is evaluated. As a result, an external route with an AS path worse (that is, longer) than that of the active path is not advertised.

Junos OS also provides support for configuring a BGP export policy that matches on the state of an advertised route. You can match on either active or inactive routes. For more information, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

To configure BGP to advertise the best external path to internal peers, include the `advertise-external` statement:

```
advertise-external;
```

**NOTE:** The `advertise-external` statement is supported at both the group and neighbor level. If you configure the statement at the neighbor level, you must configure it for all neighbors in a group. Otherwise, the group is automatically split into different groups.

For a complete list of hierarchy levels at which you can configure this statement, see the statement summary section for this statement.

To configure BGP to advertise the best external path only if the route selection process reaches the point where the MED value is evaluated, include the `conditional` statement:

```
advertise-external {
  conditional;
}
```

### *Configuring How Often BGP Exchanges Routes with the Routing Table*

BGP stores the route information it receives from update messages in the routing table, and the routing table exports active routes from the routing table into BGP. BGP then advertises the exported routes to its peers. By default, the exchange of route information between BGP and the routing table occurs immediately after the routes are received. This immediate exchange of route information might cause instabilities in the network reachability information. To guard against this, you can delay the time between when BGP and the routing table exchange route information.

To configure how often BGP and the routing table exchange route information, include the **out-delay** statement:

**out-delay** *seconds*;

By default, the routing table retains some of the route information learned from BGP. To have the routing table retain all or none of this information, include the **keep** statement:

**keep** (all | none);

For a list of hierarchy levels at which you can include these statements, see the statement summary sections for these statements.

The routing table can retain the route information learned from BGP in one of the following ways:

- Default (omit the **keep** statement)—Keep all route information that was learned from BGP, except for routes whose AS path is looped and whose loop includes the local AS.
- **keep all**—Keep all route information that was learned from BGP.
- **keep none**—Discard routes that were received from a peer and that were rejected by import policy or other sanity checking, such as AS path or next hop. When you configure **keep none** for the BGP session and the inbound policy changes, Junos OS forces readvertisement of the full set of routes advertised by the peer.

In an AS path healing situation, routes with looped paths theoretically could become usable during a soft reconfiguration when the AS path loop limit is changed. However, there is a significant memory usage difference between the default and **keep all**.

Consider the following scenarios:

- A peer readvertises routes back to the peer from which it learned them.

This can happen in the following cases:

- Another vendor's routing device advertises the routes back to the sending peer.
- The Junos OS peer's default behavior of not readvertising routes back to the sending peer is overridden by configuring **advertise-peer-as**.
- A provider edge (PE) routing device discards any VPN route that does not have any of the expected route targets.

When **keep all** is configured, the behavior of discarding routes received in the above scenarios is overridden.

### *Disabling Suppression of Route Advertisements*

Junos OS does not advertise the routes learned from one EBGp peer back to the same external BGP (EBGP) peer. In addition, the software does not advertise those routes back to any EBGp peers that are in the same AS as the originating peer, regardless of the routing instance. You can modify this behavior by including the **advertise-peer-as** statement in the configuration. To disable the default advertisement suppression, include the **advertise-peer-as** statement:

```
advertise-peer-as;
```

**NOTE:** The route suppression default behavior is disabled if the **as-override** statement is included in the configuration.

If you include the **advertise-peer-as** statement in the configuration, BGP advertises the route regardless of this check.

To restore the default behavior, include the **no-advertise-peer-as** statement in the configuration:

```
no-advertise-peer-as;
```

If you include both the **as-override** and **no-advertise-peer-as** statements in the configuration, the **no-advertise-peer-as** statement is ignored. You can include these statements at multiple hierarchy levels.

For a list of hierarchy levels at which you can include these statements, see the statement summary section for these statements.

### Example: Configuring BGP Prefix-Based Outbound Route Filtering

This example shows how to configure a Juniper Networks router to accept route filters from remote peers and perform outbound route filtering using the received filters.

- [Requirements on page 3429](#)
- [Overview on page 3430](#)
- [Configuration on page 3430](#)
- [Verification on page 3432](#)

#### **Requirements**

Before you begin:

- Configure the router interfaces.
- Configure an interior gateway protocol (IGP).

### Overview

You can configure a BGP peer to accept route filters from remote peers and perform outbound route filtering using the received filters. By filtering out unwanted updates, the sending peer saves resources needed to generate and transmit updates, and the receiving peer saves resources needed to process updates. This feature can be useful, for example, in a virtual private network (VPN) in which subsets of customer edge (CE) devices are not capable of processing all the routes in the VPN. The CE devices can use prefix-based outbound route filtering to communicate to the provider edge (PE) routing device to transmit only a subset of routes, such as routes to the main data centers only.

The maximum number of prefix-based outbound route filters that a BGP peer can accept is 5000. If a remote peer sends more than 5000 outbound route filters to a peer address, the additional filters are discarded, and a system log message is generated.

You can configure interoperability for the routing device as a whole or for specific BGP groups or peers only.

### Topology

In the sample network, Device CE1 is a router from another vendor. The configuration shown in this example is on Juniper Networks Router PE1.

Figure 75 on page 3430 shows the sample network.

Figure 75: BGP Prefix-Based Outbound Route Filtering

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
PE1 set protocols bgp group cisco-peers type external
    set protocols bgp group cisco-peers description "to CE1"
    set protocols bgp group cisco-peers local-address 192.168.165.58
    set protocols bgp group cisco-peers peer-as 35
    set protocols bgp group cisco-peers outbound-route-filter bgp-orf-cisco-mode
    set protocols bgp group cisco-peers outbound-route-filter prefix-based accept inet
    set protocols bgp group cisco-peers neighbor 192.168.165.56
    set routing-options autonomous-system 65500
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Router PE1 to accept route filters from Device CE1 and perform outbound route filtering using the received filters:

1. Configure the local autonomous system.

```
[edit routing-options]
user@PE1# set autonomous-system 65500
```

2. Configure external peering with Device CE1.

```
[edit protocols bgp group cisco-peers]
user@PE1# set type external
user@PE1# set description "to CE1"
user@PE1# set local-address 192.168.165.58
user@PE1# set peer-as 35
user@PE1# set neighbor 192.168.165.56
```

3. Configure Router PE1 to accept IPv4 route filters from Device CE1 and perform outbound route filtering using the received filters.

```
[edit protocols bgp group cisco-peers]
user@PE1# set outbound-route-filter prefix-based accept inet
```

4. (Optional) Enable interoperability with routing devices that use the vendor-specific compatibility code of 130 for outbound route filters and the code type of 128.

The IANA standard code is 3, and the standard code type is 64.

```
[edit protocols bgp group cisco-peers]
user@PE1# set outbound-route-filter bgp-orf-cisco-mode
```

**Results** From configuration mode, confirm your configuration by entering the **show protocols** and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@PE1# show protocols
group cisco-peers {
  type external;
  description "to CE1";
  local-address 192.168.165.58;
  peer-as 35;
  outbound-route-filter {
    bgp-orf-cisco-mode;
    prefix-based {
      accept {
        inet;
      }
    }
  }
  neighbor 192.168.165.56;
}

user@PE1# show routing-options
autonomous-system 65500;
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying the Outbound Route Filter on page 3432](#)
- [Verifying the BGP Neighbor Mode on page 3432](#)

### **Verifying the Outbound Route Filter**

**Purpose** Display information about the prefix-based outbound route filter received from Device CE1.

**Action** From operational mode, enter the [show bgp neighbor orf detail](#) command.

```
user@PE1> show bgp neighbor orf 192.168.165.56 detail
Peer: 192.168.165.56 Type: External
Group: cisco-peers

inet-unicast
Filter updates rcv:          4 Immediate:          0
Filter: prefix-based         receive
Updates rcv:                4
Received filter entries:
  seq 10 2.2.0.0/16 deny minlen 0 maxlen 0
  seq 20 3.3.0.0/16 deny minlen 24 maxlen 0
  seq 30 4.4.0.0/16 deny minlen 0 maxlen 28
  seq 40 5.5.0.0/16 deny minlen 24 maxlen 28
```

### **Verifying the BGP Neighbor Mode**

**Purpose** Verify that the **bgp-orf-cisco-mode** setting is enabled for the peer by making sure that the **ORFCiscoMode** option is displayed in the **show bgp neighbor** command output.

**Action** From operational mode, enter the [show bgp neighbor](#) command.

```
user@PE1> show bgp neighbor
Peer: 192.168.165.56 AS 35           Local: 192.168.165.58 AS 65500

## Example: Configuring EBGP Multihop

- [Understanding BGP Multihop on page 3433](#)
- [Example: Configuring EBGP Multihop Sessions on page 3433](#)

### Understanding BGP Multihop

---

When external BGP (EBGP) peers are not directly connected to each other, they must cross one or more non-BGP routers to reach each other. Configuring multihop EBGP enables the peers to pass through the other routers to form peer relationships and exchange update messages. This type of configuration is typically used when a Juniper Networks routing device needs to run EBGP with a third-party router that does not allow direct connection of the two EBGP peers. EBGP multihop enables a neighbor connection between two EBGP peers that do not have a direct connection.

### Example: Configuring EBGP Multihop Sessions

---

This example shows how to configure an external BGP (EBGP) peer that is more than one hop away from the local router. This type of session is called a *multihop* BGP session.

- [Requirements on page 3433](#)
- [Overview on page 3433](#)
- [Configuration on page 3434](#)
- [Verification on page 3440](#)

#### Requirements

No special configuration beyond device initialization is required before you configure this example.

#### Overview

The configuration to enable multihop EBGP sessions requires connectivity between the two EBGP peers. This example uses static routes to provide connectivity between the devices.

Unlike directly connected EBGP sessions in which physical address are typically used in the **neighbor** statements, you must use loopback interface addresses for multihop EBGP by specifying the loopback interface address of the indirectly connected peer. In this way, EBGP multihop is similar to internal BGP (IBGP).

Finally, you must add the **multihop** statement. Optionally, you can set a maximum time-to-live (TTL) value with the **ttl** statement. The TTL is carried in the IP header of BGP packets. If you do not specify a TTL value, the system's default maximum TTL value is used. The default TTL value is 64 for multihop EBGP sessions. Another option is to retain the BGP next-hop value for route advertisements by including the **no-nexthop-change** statement.

[Figure 76 on page 3434](#) shows a typical EBGP multihop network.

Device C and Device E have an established EBGP session. Device D is not a BGP-enabled device. All of the devices have connectivity via static routes.

Figure 76: Typical Network with EBGP Multihop Sessions

**Configuration**

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device C**

```

set interfaces fe-1/2/0 unit 9 description to-D
set interfaces fe-1/2/0 unit 9 family inet address 10.10.10.9/30
set interfaces lo0 unit 3 family inet address 192.168.40.4/32
set protocols bgp group external-peers type external
set protocols bgp group external-peers multihop ttl 2
set protocols bgp group external-peers local-address 192.168.40.4
set protocols bgp group external-peers export send-static
set protocols bgp group external-peers peer-as 18
set protocols bgp group external-peers neighbor 192.168.6.7
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 10.10.10.14/32 next-hop 10.10.10.10
set routing-options static route 192.168.6.7/32 next-hop 10.10.10.10
set routing-options router-id 192.168.40.4
set routing-options autonomous-system 17

```

**Device D**

```

set interfaces fe-1/2/0 unit 10 description to-C
set interfaces fe-1/2/0 unit 10 family inet address 10.10.10.10/30
set interfaces fe-1/2/1 unit 13 description to-E
set interfaces fe-1/2/1 unit 13 family inet address 10.10.10.13/30
set interfaces lo0 unit 4 family inet address 192.168.6.6/32
set routing-options static route 192.168.40.4/32 next-hop 10.10.10.9
set routing-options static route 192.168.6.7/32 next-hop 10.10.10.14
set routing-options router-id 192.168.6.6

```

**Device E**

```

set interfaces fe-1/2/0 unit 14 description to-D
set interfaces fe-1/2/0 unit 14 family inet address 10.10.10.14/30
set interfaces lo0 unit 5 family inet address 192.168.6.7/32
set protocols bgp group external-peers multihop ttl 2
set protocols bgp group external-peers local-address 192.168.6.7
set protocols bgp group external-peers export send-static
set protocols bgp group external-peers peer-as 17
set protocols bgp group external-peers neighbor 192.168.40.4
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept

```

```

set routing-options static route 10.10.10.8/30 next-hop 10.10.10.13
set routing-options static route 192.168.40.4/32 next-hop 10.10.10.13
set routing-options router-id 192.168.6.7
set routing-options autonomous-system 18

```

### Device C

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device C:

1. Configure the interface to the directly connected device (to-D), and configure the loopback interface.

```

[edit interfaces fe-1/2/0 unit 9]
user@C# set description to-D
user@C# set family inet address 10.10.10.9/30

```

```

[edit interfaces lo0 unit 3]
user@C# set family inet address 192.168.40.4/32

```

2. Configure an EBGP session with Device E.

The **neighbor** statement points to the loopback interface on Device E.

```

[edit protocols bgp group external-peers]
user@C# set type external
user@C# set local-address 192.168.40.4
user@C# set export send-static
user@C# set peer-as 18
user@C# set neighbor 192.168.6.7

```

3. Configure the multihop statement to enable Device C and Device E to become EBGP peers.

Because the peers are two hops away from each other, the example uses the **ttl 2** statement.

```

[edit protocols bgp group external-peers]
user@C# set multihop ttl 2

```

4. Configure connectivity to Device E, using static routes.

You must configure a route to both the loopback interface address and to the address on the physical interface.

```

[edit routing-options]
user@C# set static route 10.10.10.14/32 next-hop 10.10.10.10
user@C# set static route 192.168.6.7/32 next-hop 10.10.10.10

```

5. Configure the local router ID and the autonomous system (AS) number.

```

[edit routing-options]
user@C# set router-id 192.168.40.4
user@C# set autonomous-system 17

```

6. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-static term 1]
user@C# set from protocol static
user@C# set then accept
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@C# show interfaces
fe-1/2/0 {
  unit 9 {
    description to-D;
    family inet {
      address 10.10.10.9/30;
    }
  }
}
lo0 {
  unit 3 {
    family inet {
      address 192.168.40.4/32;
    }
  }
}

user@C# show protocols
bgp {
  group external-peers {
    type external;
    multihop {
      ttl 2;
    }
    local-address 192.168.40.4;
    export send-static;
    peer-as 18;
    neighbor 192.168.6.7;
  }
}

user@C# show policy-options
policy-statement send-static {
  term 1 {
    from protocol static;
    then accept;
  }
}

user@C# show routing-options
static {
  route 10.10.10.14/32 next-hop 10.10.10.10;
  route 192.168.6.7/32 next-hop 10.10.10.10;
}
```

```
router-id 192.168.40.4;
autonomous-system 17;
```

If you are done configuring the device, enter **commit** from configuration mode.  
Repeat these steps for all BFD sessions in the topology.

### Configuring Device D

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device D:

1. Set the CLI to Device D.

```
user@host> set cli logical-system D
```

2. Configure the interfaces to the directly connected devices, and configure a loopback interface.

```
[edit interfaces fe-1/2/0 unit 10]
user@D# set description to-C
user@D# set family inet address 10.10.10.10/30
```

```
[edit interfaces fe-1/2/1 unit 13]
user@D# set description to-E
user@D# set family inet address 10.10.10.13/30
```

```
[edit interfaces lo0 unit 4]
user@D# set family inet address 192.168.6.6/32
```

3. Configure connectivity to the other devices using static routes to the loopback interface addresses.

On Device D, you do not need static routes to the physical addresses because Device D is directly connected to Device C and Device E.

```
[edit routing-options]
user@D# set static route 192.168.40.4/32 next-hop 10.10.10.9
user@D# set static route 192.168.6.7/32 next-hop 10.10.10.14
```

4. Configure the local router ID.

```
[edit routing-options]
user@D# set router-id 192.168.6.6
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces** and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@D# show interfaces
fe-1/2/0 {
  unit 10 {
    description to-C;
    family inet {
      address 10.10.10.10/30;
```

```
    }  
  }  
}  
fe-1/2/1 {  
  unit 13 {  
    description to-E;  
    family inet {  
      address 10.10.10.13/30;  
    }  
  }  
}  
lo0 {  
  unit 4 {  
    family inet {  
      address 192.168.6.6/32;  
    }  
  }  
}  
}  
  
user@D# show protocols  
  
user@D# show routing-options  
static {  
  route 192.168.40.4/32 next-hop 10.10.10.9;  
  route 192.168.6.7/32 next-hop 10.10.10.14;  
}  
router-id 192.168.6.6;
```

If you are done configuring the device, enter **commit** from configuration mode.  
Repeat these steps for all BFD sessions in the topology.

### **Configuring Device E**

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device E:

1. Set the CLI to Device E.
2. Configure the interface to the directly connected device (to-D), and configure the loopback interface.

```
[edit interfaces fe-1/2/0 unit 14]  
user@E# set description to-D  
user@E# set family inet address 10.10.10.14/30
```

```
[edit interfaces lo0 unit 5]  
user@E# set family inet address 192.168.6.7/32
```

3. Configure an EBGP session with Device E.

The **neighbor** statement points to the loopback interface on Device C.

```
[edit protocols bgp group external-peers]
```

```

user@E# set local-address 192.168.6.7
user@E# set export send-static
user@E# set peer-as 17
user@E# set neighbor 192.168.40.4

```

4. Configure the **multihop** statement to enable Device C and Device E to become EBGp peers.

Because the peers are two hops away from each other, the example uses the **ttl 2** statement.

```

[edit protocols bgp group external-peers]
user@E# set multihop ttl 2

```

5. Configure connectivity to Device E, using static routes.

You must configure a route to both the loopback interface address and to the address on the physical interface.

```

[edit routing-options]
user@E# set static route 10.10.10.8/30 next-hop 10.10.10.13
user@E# set static route 192.168.40.4/32 next-hop 10.10.10.13

```

6. Configure the local router ID and the autonomous system (AS) number.

```

[edit routing-options]
user@E# set router-id 192.168.6.7
user@E# set autonomous-system 18

```

7. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```

[edit policy-options policy-statement send-static term 1]
user@E# set from protocol static
user@E# set then accept

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@E# show interfaces
fe-1/2/0 {
  unit 14 {
    description to-D;
    family inet {
      address 10.10.10.14/30;
    }
  }
}
lo0 {
  unit 5 {
    family inet {
      address 192.168.6.7/32;
    }
  }
}

```

```
}
user@E# show protocols
bgp {
  group external-peers {
    multihop {
      ttl 2;
    }
    local-address 192.168.6.7;
    export send-static;
    peer-as 17;
    neighbor 192.168.40.4;
  }
}

user@E# show policy-options
policy-statement send-static {
  term 1 {
    from protocol static;
    then accept;
  }
}

user@E# show routing-options
static {
  route 10.10.10.8/30 next-hop 10.10.10.13;
  route 192.168.40.4/32 next-hop 10.10.10.13;
}
router-id 192.168.6.7;
autonomous-system 18;
```

If you are done configuring the device, enter **commit** from configuration mode.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying Connectivity on page 3440](#)
- [Verifying That BGP Sessions Are Established on page 3441](#)
- [Viewing Advertised Routes on page 3441](#)

### **Verifying Connectivity**

**Purpose** Make sure that Device C can ping Device E, specifying the loopback interface address as the source of the ping request.

The loopback interface address is the source address that BGP will use.

**Action** From operational mode, enter the **ping 10.10.10.14 source 192.168.40.4** command from Device C, and enter the **ping 10.10.10.9 source 192.168.6.7** command from Device E.

```
user@C> ping 10.10.10.14 source 192.168.40.4
```

```
PING 10.10.10.14 (10.10.10.14): 56 data bytes
64 bytes from 10.10.10.14: icmp_seq=0 ttl=63 time=1.262 ms
64 bytes from 10.10.10.14: icmp_seq=1 ttl=63 time=1.202 ms
^C
```

```

--- 10.10.10.14 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.202/1.232/1.262/0.030 ms

```

```
user@E> ping 10.10.10.9 source 192.168.6.7
```

```

PING 10.10.10.9 (10.10.10.9): 56 data bytes
64 bytes from 10.10.10.9: icmp_seq=0 ttl=63 time=1.255 ms
64 bytes from 10.10.10.9: icmp_seq=1 ttl=63 time=1.158 ms
^C
--- 10.10.10.9 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.158/1.206/1.255/0.049 ms

```

**Meaning** The static routes are working if the pings work.

### *Verifying That BGP Sessions Are Established*

**Purpose** Verify that the BGP sessions are up.

**Action** From operational mode, enter the `show bgp summary` command.

```
user@C> show bgp summary
```

```

Groups: 1 Peers: 1 Down peers: 0
Table      Tot Paths  Act Paths Suppressed  History  Damp State  Pending
inet.0          2        0          0          0          0          0          0
Peer        AS      InPkt    OutPkt    OutQ   Flaps  Last Up/Dwn
State|#Active/Received/Accepted/Damped...
192.168.6.7      18      147      147        0        1    1:04:27
0/2/2/0          0/0/0/0

```

```
user@E> show bgp summary
```

```

Groups: 1 Peers: 1 Down peers: 0
Table      Tot Paths  Act Paths Suppressed  History  Damp State  Pending
inet.0          2        0          0          0          0          0          0
Peer        AS      InPkt    OutPkt    OutQ   Flaps  Last Up/Dwn
State|#Active/Received/Accepted/Damped...
192.168.40.4     17      202      202        0        1    1:02:18
0/2/2/0          0/0/0/0

```

**Meaning** The output shows that both devices have one peer each. No peers are down.

### *Viewing Advertised Routes*

**Purpose** Check to make sure that routes are being advertised by BGP.

**Action** From operational mode, enter the `show route advertising-protocol bgp neighbor` command.

```
user@C> show route advertising-protocol bgp 192.168.6.7
```

```

inet.0: 5 destinations, 7 routes (5 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED    Lclpref  AS path
* 10.10.10.14/32    Self              0
* 192.168.6.7/32    Self              0

```

```
user@E> show route advertising-protocol bgp 192.168.40.4
```

```
inet.0: 5 destinations, 7 routes (5 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lclpref   AS path
* 10.10.10.8/30      Self              0         0         I
* 192.168.40.4/32    Self              0         0         I
```

**Meaning** The **send-static** routing policy is exporting the static routes from the routing table into BGP. BGP is advertising these routes between the peers because the BGP peer session is established.

## Example: Configuring BGP Route Preference (Administrative Distance)

- [Understanding Route Preference Values on page 3442](#)
- [Example: Configuring the Preference Value for BGP Routes on page 3443](#)

### Understanding Route Preference Values

The Junos OS routing protocol process assigns a default preference value (also known as an *administrative distance*) to each route that the routing table receives. The default value depends on the source of the route. The preference value is a value from 0 through 4,294,967,295 ( $2^{32} - 1$ ), with a lower value indicating a more preferred route.

[Table 296 on page 3442](#) lists the default preference values.

**Table 296: Default Route Preference Values**

| How Route Is Learned         | Default Preference | Statement to Modify Default Preference  |
|------------------------------|--------------------|---|
| Directly connected network   | 0                  | —   |
| System routes                | 4                  | —   |
| Static and Static LSPs       | 5                  | <i>static</i>   |
| RSVP-signaled LSPs           | 7                  | RSVP <b>preference</b> as described in the <i>Junos OS MPLS Applications Library for Routing Devices</i>  |
| LDP-signaled LSPs            | 9                  | LDP <b>preference</b> , as described in the <i>Junos OS MPLS Applications Library for Routing Devices</i> |
| OSPF internal route          | 10                 | OSPF <b>preference</b>  |
| IS-IS Level 1 internal route | 15                 | IS-IS <b>preference</b>   |
| IS-IS Level 2 internal route | 18                 | IS-IS <b>preference</b>   |

Table 296: Default Route Preference Values (*continued*)

| How Route Is Learned         | Default Preference | Statement to Modify Default Preference   |
|------------------------------|--------------------|--|
| Redirects                    | 30                 | –  |

In general, the narrower the scope of the statement, the higher precedence its preference value is given, but the smaller the set of routes it affects. To modify the default preference value for routes learned by routing protocols, you generally apply routing policy when configuring the individual routing protocols. You also can modify some preferences with other configuration statements, which are indicated in the table.

#### Example: Configuring the Preference Value for BGP Routes

This example shows how to specify the preference for routes learned from BGP. Routing information can be learned from multiple sources. To break ties among equally specific routes learned from multiple sources, each source has a preference value. Routes that are learned through explicit administrative action, such as static routes, are preferred over routes learned from a routing protocol, such as BGP or OSPF. This concept is called *administrative distance* by some vendors.

- [Overview on page 3444](#)

- [Configuration on page 3445](#)
- [Verification on page 3447](#)

### **Requirements**

No special configuration beyond device initialization is required before you configure this example.

### **Overview**

Routing information can be learned from multiple sources, such as through static configuration, BGP, or an interior gateway protocol (IGP). When Junos OS determines a route's preference to become the active route, it selects the route with the lowest preference as the active route and installs this route into the forwarding table. By default, the routing software assigns a preference of 170 to routes that originated from BGP. Of all the routing protocols, BGP has the highest default preference value, which means that routes learned by BGP are the least likely to become the active route.

Some vendors have a preference (distance) of 20 for external BGP (EBGP) and a distance of 200 for internal BGP (IBGP). Junos OS uses the same value (170) for both EBGP and IBGP. However, this difference between vendors has no operational impact because Junos OS always prefers EBGP routes over IBGP routes.

Another area in which vendors differ is in regard to IGP distance compared to BGP distance. For example, some vendors assign a distance of 110 to OSPF routes. This is higher than the EBGP distance of 20, and results in the selection of an EBGP route over an equivalent OSPF route. In the same scenario, Junos OS chooses the OSPF route, because of the default preference 10 for an internal OSPF route and 150 for an external OSPF route, which are both lower than the 170 preference assigned to all BGP routes.

In a multivendor environment, you might want to change the preference value for BGP routes so that Junos OS chooses an EBGP route instead of an OSPF route. To accomplish this goal, one option is to include the [preference](#) statement in the EBGP configuration. To modify the default BGP preference value, include the **preference** statement, specifying a value from 0 through 4,294,967,295 ( $2^{32} - 1$ ).

**TIP:** Another way to achieve multivendor compatibility is to include the [advertise-inactive](#) statement in the EBGP configuration. This causes the routing table to export to BGP the best route learned by BGP even if Junos OS did not select it to be an active route. By default, BGP stores the route information it receives from update messages in the Junos OS routing table, and the routing table exports only active routes into BGP, which BGP then advertises to its peers. The `advertise-inactive` statement causes Junos OS to advertise the best BGP route that is inactive because of IGP preference. When you use the `advertise-inactive` statement, the Junos OS device uses the OSPF route for forwarding, and the other vendor's device uses the EBGP route for forwarding. However, from the perspective of an EBGP peer in a neighboring AS, both vendors' devices appear to behave the same way.

---

### Topology

In the sample network, Device R1 and Device R2 have EBGP routes to each other and also OSPF routes to each other.

This example shows the routing tables in the following cases:

- Accept the default preference values of 170 for BGP and 10 for OSPF.
- Change the BGP preference to 8.

Figure 77 on page 3445 shows the sample network.

**Figure 77: BGP Preference Value Topology**

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 4 family inet address 1.12.0.1/30
set interfaces lo0 unit 2 family inet address 10.255.71.24/32
set protocols bgp export send-direct
set protocols bgp group ext type external
set protocols bgp group ext preference 8
set protocols bgp group ext peer-as 65000
set protocols bgp group ext neighbor 1.12.0.2
set protocols ospf area 0.0.0.0 interface fe-1/2/0.4
set protocols ospf area 0.0.0.0 interface 10.255.71.24
set policy-options policy-statement send-direct term 1 from protocol direct

```

```
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 65500
```

**Device R2**

```
set interfaces fe-1/2/0 unit 6 family inet address 1.12.0.2/30
set interfaces lo0 unit 3 family inet address 10.255.14.177/32
set protocols bgp export send-direct
set protocols bgp group ext type external
set protocols bgp group ext peer-as 65500
set protocols bgp group ext neighbor 1.12.0.1
set protocols ospf area 0.0.0.0 interface fe-1/2/0.6
set protocols ospf area 0.0.0.0 interface 10.255.14.177
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 65000
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.  

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 4 family inet address 1.12.0.1/30
user@R1# set lo0 unit 2 family inet address 10.255.71.24/32
```
2. Configure the local autonomous system.  

```
[edit routing-options]
user@R1# set autonomous-system 65500
```
3. Configure the external peering with Device R2.  

```
[edit protocols bgp]
user@R1# set export send-direct
user@R1# set group ext type external
user@R1# set group ext preference 8
user@R1# set group ext peer-as 65000
user@R1# set group ext neighbor 1.12.0.2
```
4. Configure OSPF.  

```
[edit protocols ospf area 0.0.0.0]
user@R1# set interface fe-1/2/0.4
user@R1# set interface 10.255.71.24
```
5. Configure the routing policy.  

```
[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct
user@R1# set then accept
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R1# show interfaces
fe-1/2/0 {
  unit 4 {
    family inet {
      address 1.12.0.1/30;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 10.255.71.24/32;
    }
  }
}

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R1# show protocols
protocols {
  bgp {
    export send-direct;
    group ext {
      type external;
      preference 8;
      peer-as 65000;
      neighbor 1.12.0.2;
    }
  }
  ospf {
    area 0.0.0.0 {
      interface fe-1/2/0.4;
      interface 10.255.71.24;
    }
  }
}

user@R1# show routing-options
autonomous-system 65500;

```

If you are done configuring the device, enter **commit** from configuration mode. Repeat these steps on Device R2.

### Verification

Confirm that the configuration is working properly.

### ***Verifying the Preference***

**Purpose** Make sure that the routing tables on Device R1 and Device R2 reflect the fact that Device R1 is using the configured EBGp preference of 8, and Device R2 is using the default EBGp preference of 170.

**Action** From operational mode, enter the **show route** command.

```
user@R1> show route
inet.0: 5 destinations, 7 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
1.12.0.0/30      *[Direct/0] 3d 07:03:01
                  > via fe-1/2/0.4
                  [BGP/8] 01:04:49, localpref 100
                  AS path: 65000 I
                  > to 1.12.0.2 via fe-1/2/0.4
1.12.0.1/32      *[Local/0] 3d 07:03:01
                  Local via fe-1/2/0.4
10.255.14.177/32 *[BGP/8] 01:04:49, localpref 100
                  AS path: 65000 I
                  > to 1.12.0.2 via fe-1/2/0.4
                  [OSPF/10] 3d 07:02:16, metric 1
                  > to 1.12.0.2 via fe-1/2/0.4
10.255.71.24/32  *[Direct/0] 3d 07:03:01
                  > via lo0.2
224.0.0.5/32     *[OSPF/10] 5d 03:42:16, metric 1
                  MultiRecv
```

```
user@R2> show route
inet.0: 5 destinations, 7 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
1.12.0.0/30      *[Direct/0] 3d 07:03:30
                  > via fe-1/2/0.6
                  [BGP/170] 00:45:36, localpref 100
                  AS path: 65500 I
                  > to 1.12.0.1 via fe-1/2/0.6
1.12.0.2/32      *[Local/0] 3d 07:03:30
                  Local via fe-1/2/0.6
10.255.14.177/32 *[Direct/0] 3d 07:03:30
                  > via lo0.3
10.255.71.24/32  *[OSPF/10] 3d 07:02:45, metric 1
                  > to 1.12.0.1 via fe-1/2/0.6
                  [BGP/170] 00:45:36, localpref 100
                  AS path: 65500 I
                  > to 1.12.0.1 via fe-1/2/0.6
224.0.0.5/32     *[OSPF/10] 5d 03:42:45, metric 1
                  MultiRecv
```

**Meaning** The output shows that on Device R1, the active path to Device R2's loopback interface (10.255.14.177/32) is a BGP route. The output also shows that on Device R2, the active path to Device R1's loopback interface (10.255.71.24/32) is an OSPF route.

## Example: Configuring BGP Path Selection

- [Example: Ignoring the AS Path Attribute When Selecting the Best Path on page 3449](#)

### Example: Ignoring the AS Path Attribute When Selecting the Best Path

If multiple BGP routes to the same destination exist, BGP selects the best path based on the route attributes of the paths. One of the route attributes that affects the best-path decision is the length of the AS paths of each route. Routes with shorter AS paths are preferred over those with longer AS paths. Although not typically practical, some scenarios might require that the AS path length be ignored in the route selection process. This example shows how to configure a routing device to ignore the AS path attribute.

- [Requirements on page 3449](#)
- [Overview on page 3449](#)
- [Configuration on page 3450](#)
- [Verification on page 3455](#)

#### Requirements

No special configuration beyond device initialization is required before you configure this example.

#### Overview

On externally connected routing devices, the purpose of skipping the AS path comparison might be to force an external BGP (EBGP) versus internal BGP (IBGP) decision to remove traffic from your network as soon as possible. On internally connected routing devices, you might want your IBGP-only routers to default to the local externally connected gateway. The local IBGP-only (internal) routers skip the AS path comparison and move down the decision tree to use the closest interior gateway protocol (IGP) gateway (lowest IGP metric). Doing this might be an effective way to force these routers to use a LAN connection instead of their WAN connection.

**CAUTION:** When you include the `as-path-ignore` statement on a routing device in your network, you might need to include it on all other BGP-enabled devices in your network to prevent routing loops and convergence issues. This is especially true for IBGP path comparisons.

In this example, Device R2 is learning about the loopback interface address on Device R4 (4.4.4.4/32) from Device R1 and Device R3. Device R1 is advertising 4.4.4.4/32 with an AS-path of 1 5 4, and Device R3 is advertising 4.4.4.4/32 with an AS-path of 3 4. Device R2 selects the path for 4.4.4.4/32 from Device R3 as the best path because the AS path is shorter than the AS path from Device R1.

This example modifies the BGP configuration on Device R2 so that the AS-path length is not used in the best-path selection.

Device R1 has a lower router ID (1.1.1.1) than Device R3 (3.3.3.3). If all other path selection criteria are equal (or, as in this case, ignored), the route learned from Device R1 is used. Because the AS-path attribute is being ignored, the best path is toward Device R1 because of its lower router ID value.

Figure 78 on page 3450 shows the sample topology.

**Figure 78: Topology for Ignoring the AS-Path Length**

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

Device R1
set interfaces fe-1/2/0 unit 1 family inet address 192.168.10.1/24
set interfaces fe-1/2/1 unit 10 family inet address 192.168.50.2/24
set interfaces lo0 unit 1 family inet address 1.1.1.1/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct

```

```

set protocols bgp group ext export send-static
set protocols bgp group ext export send-local
set protocols bgp group ext neighbor 192.168.10.2 peer-as 2
set protocols bgp group ext neighbor 192.168.50.1 peer-as 5
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options policy-statement send-local term 1 from protocol local
set policy-options policy-statement send-local term 1 then accept
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 192.168.20.0/24 next-hop 192.168.10.2
set routing-options static route 192.168.30.0/24 next-hop 192.168.10.2
set routing-options static route 192.168.40.0/24 next-hop 192.168.50.1
set routing-options router-id 1.1.1.1
set routing-options autonomous-system 1

```

Device R2

```

set interfaces fe-1/2/0 unit 2 family inet address 192.168.10.2/24
set interfaces fe-1/2/1 unit 3 family inet address 192.168.20.2/24
set interfaces lo0 unit 2 family inet address 2.2.2.2/32
set protocols bgp path-selection as-path-ignore
set protocols bgp group ext type external
set protocols bgp group ext export send-direct
set protocols bgp group ext export send-static
set protocols bgp group ext export send-local
set protocols bgp group ext neighbor 192.168.10.1 peer-as 1

```

### *Configuring Device R2*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.

```
[edit interfaces]
user@R2# set fe-1/2/0 unit 2 family inet address 192.168.10.2/24
user@R2# set fe-1/2/1 unit 3 family inet address 192.168.20.2/24
user@R2# set lo0 unit 2 family inet address 2.2.2.2/32
```

2. Configure EBGp.

```
[edit protocols bgp group ext]
user@R2# set type external
user@R2# set export send-direct
user@R2# set export send-static
user@R2# set export send-local
user@R2# set neighbor 192.168.10.1 peer-as 1
user@R2# set neighbor 192.168.20.1 peer-as 3
```

3. Configure the autonomous system (AS) path attribute to be ignored in the Junos OS path selection algorithm.

```
[edit protocols bgp]
user@R2# set path-selection as-path-ignore
```

4. Configure the routing policy.

```
[edit policy-options]
user@R2# set policy-statement send-direct term 1 from protocol direct
user@R2# set policy-statement send-direct term 1 then accept
user@R2# set policy-statement send-local term 1 from protocol local
user@R2# set policy-statement send-local term 1 then accept
user@R2# set policy-statement send-static term 1 from protocol static
user@R2# set policy-statement send-static term 1 then accept
```

5. Configure some static routes.

```
[edit routing-options static]
user@R2# set route 192.168.50.0/24 next-hop 192.168.10.1
user@R2# set route 192.168.40.0/24 next-hop 192.168.10.1
user@R2# set route 192.168.30.0/24 next-hop 192.168.20.1
```

6. Configure the autonomous system (AS) number and the router ID.

```
[edit routing-options]
user@R2# set router-id 2.2.2.2
user@R2# set autonomous-system 2
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 2 {
    family inet {
      address 192.168.10.2/24;
    }
  }
}
fe-1/2/1 {
```

```
    unit 3 {
      family inet {
        address 192.168.20.2/24;
      }
    }
  }
lo0 {
  unit 2 {
    family inet {
      address 2.2.2.2/32;
    }
  }
}

user@R2# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}
policy-statement send-local {
  term 1 {
    from protocol local;
    then accept;
  }
}
policy-statement send-static {
  term 1 {
    from protocol static;
    then accept;
  }
}

user@R2# show protocols
bgp {
  path-selection as-path-ignore;
  group ext {
    type external;
    export [ send-direct send-static send-local ];
    neighbor 192.168.10.1 {
      peer-as 1;
    }
    neighbor 192.168.20.1 {
      peer-as 3;
    }
  }
}

user@R2# show routing-options
static {
  route 192.168.50.0/24 next-hop 192.168.10.1;
  route 192.168.40.0/24 next-hop 192.168.10.1;
  route 192.168.30.0/24 next-hop 192.168.20.1;
}
router-id 2.2.2.2;
autonomous-system 2;
```

If you are done configuring the device, enter **commit** from configuration mode. Repeat the configuration on the other devices in the network, changing the interface names and IP addresses, as needed.

### Verification

Confirm that the configuration is working properly.

- [Checking the Neighbor Status on page 3455](#)

### Checking the Neighbor Status

**Purpose** Make sure that from Device R2, the active path to get to AS 4 is through AS 1 and AS 5, not through AS 3.

**NOTE:** To verify the functionality of the `as-path-ignore` statement, you might need to run the `restart routing` command to force reevaluation of the active path. This is because for BGP, if both paths are external, the Junos OS behavior is to prefer the currently active path. This behavior helps to minimize route-flapping. Use caution when restarting the routing protocol process in a production network.

**Action** From operational mode, enter the `restart routing` command.

```
user@R2> restart routing
Routing protocols process started, pid 49396
```

From operational mode, enter the `show route 4.4.4.4 protocol bgp` command.

```
user@R2> show route 4.4.4.4 protocol bgp
inet.0: 12 destinations, 25 routes (12 active, 0 holddown, 4 hidden)
+ = Active Route, - = Last Active, * = Both

4.4.4.4/32          *[BGP/170] 00:00:12, localpref 100
                    AS path: 154 I
                    > to 192.168.10.1 via fe-1/2/0.2
                    [BGP/170] 00:00:08, localpref 100
                    AS path: 34 I
                    > to 192.168.20.1 via fe-1/2/1.3
```

**Meaning** The asterisk (\*) is next to the path learned from R1, meaning that this is the active path. The AS path for the active path is 1 5 4, which is longer than the AS path (3 4) for the nonactive path learned from Router R3.

## Example: Removing Private AS Numbers

- [Understanding Private AS Number Removal from AS Paths on page 3456](#)
- [Example: Removing Private AS Numbers from AS Paths on page 3457](#)

### Understanding Private AS Number Removal from AS Paths

---

By default, when BGP advertises AS paths to remote systems, it includes all AS numbers, including private AS numbers. You can configure the software so that it removes private AS numbers from AS paths. Doing this is useful when any of the following circumstances are true:

- A remote AS for which you provide connectivity is multihomed, but only to the local AS.
- The remote AS does not have an officially allocated AS number.
- It is not appropriate to make the remote AS a confederation member AS of the local AS.

Most companies acquire their own AS number. Some companies also use private AS numbers to connect to their public AS network. These companies might use a different private AS number for each region in which their company does business. In any implementation, announcing a private AS number to the Internet must be avoided. Service providers can use the **remove-private** statement to prevent advertising private AS numbers to the Internet.

In an enterprise scenario, suppose that you have multiple AS numbers in your company, some of which are private AS numbers, and one with a public AS number. The one with a public AS number has a direct connection to the service provider. In the AS that connects directly to the service provider, you can use the **remove-private** statement to filter out any private AS numbers in the advertisements that are sent to the service provider.

**CAUTION:** Changing configuration statements that affect BGP peers, such as enabling or disabling **remove-private** or renaming a BGP group, resets the BGP sessions. Changes that affect BGP peers should only be made when resetting a BGP session is acceptable.

The AS numbers are stripped from the AS path starting at the left end of the AS path (the end where AS paths have been most recently added). The routing device stops searching for private ASs when it finds the first nonprivate AS or a peer's private AS. If the AS path contains the AS number of the external BGP (EBGP) neighbor, BGP does not remove the private AS number.

**NOTE:** As of Junos OS 10.0R2 and later, if there is a need to send prefixes to an EBGP peer that has an AS number that matches an AS number in the AS path, consider using the **as-override** statement instead of the **remove-private** statement.

The operation takes place after any confederation member ASs have already been removed from the AS path, if applicable.

The software is preconfigured with knowledge of the set of AS numbers that is considered private, a range that is defined in the Internet Assigned Numbers Authority (IANA) assigned numbers document. The set of AS numbers reserved as private are in the range from 64,512 through 65,534, inclusive.

### Example: Removing Private AS Numbers from AS Paths

This example demonstrates the removal of a private AS number from the advertised AS path to avoid announcing the private AS number to the Internet.

- [Requirements on page 3457](#)
- [Overview on page 3457](#)
- [Configuration on page 3458](#)
- [Verification on page 3460](#)

#### Requirements

No special configuration beyond device initialization is required before you configure this example.

#### Overview

Service providers and enterprise networks use the **remove-private** statement to prevent advertising private AS numbers to the Internet. The **remove-private** statement works in the outbound direction. You configure the **remove-private** statement on a device that has a public AS number and that is connected to one or more devices that have private AS numbers. Generally, you would not configure this statement on a device that has a private AS number.

[Figure 79 on page 3457](#) shows the sample topology.

**Figure 79: Topology for Removing a Private AS from the Advertised AS Path**

In this example, Device R1 is connected to its service provider using private AS number 65535. The example shows the **remove-private** statement configured on Device ISP to prevent Device R1's private AS number from being announced to Device R2. Device R2 sees only the AS number of the service provider.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```
set interfaces fe-1/2/0 unit 1 family inet address 192.168.10.1/24
set interfaces lo0 unit 1 family inet address 10.10.10.1/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct
set protocols bgp group ext export send-static
set protocols bgp group ext peer-as 100
set protocols bgp group ext neighbor 192.168.10.10
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 192.168.20.0/24 next-hop 192.168.10.10
set routing-options autonomous-system 65535
```

**Device ISP**

```
set interfaces fe-1/2/0 unit 2 family inet address 192.168.10.10/24
set interfaces fe-1/2/1 unit 3 family inet address 192.168.20.20/24
set interfaces lo0 unit 2 family inet address 10.10.0.1/32
set protocols bgp group ext type external
set protocols bgp group ext neighbor 192.168.10.1 peer-as 65535
set protocols bgp group ext neighbor 192.168.20.1 remove-private
set protocols bgp group ext neighbor 192.168.20.1 peer-as 200
set routing-options autonomous-system 100
```

**Device R2**

```
set interfaces fe-1/2/0 unit 4 family inet address 192.168.20.1/24
set interfaces lo0 unit 3 family inet address 10.10.20.1/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct
set protocols bgp group ext export send-static
set protocols bgp group ext peer-as 100
set protocols bgp group ext neighbor 192.168.20.20
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 192.168.10.0/24 next-hop 192.168.20.20
set routing-options autonomous-system 200
```

### Device ISP

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device ISP:

1. Configure the interfaces.  
[edit interfaces]

```

user@ISP# set fe-1/2/0 unit 2 family inet address 192.168.10.10/24
user@ISP# set fe-1/2/1 unit 3 family inet address 192.168.20.20/24
user@ISP# set lo0 unit 2 family inet address 10.10.0.1/32

```

2. Configure EBGP.

```

[edit protocols bgp group ext]
user@ISP# set type external
user@ISP# set neighbor 192.168.10.1 peer-as 65535
user@ISP# set neighbor 192.168.20.1 peer-as 200

```

3. For the neighbor in autonomous system (AS) 200 (Device R2), remove private AS numbers from the advertised AS paths.

```

[edit protocols bgp group ext]
user@ISP# set neighbor 192.168.20.1 remove-private

```

4. Configure the AS number.

```

[edit routing-options]
user@ISP# set autonomous-system 100

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@ISP# show interfaces
fe-1/2/0 {
  unit 2 {
    family inet {
      address 192.168.10.10/24;
    }
  }
}
fe-1/2/1 {
  unit 3 {
    family inet {
      address 192.168.20.20/24;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 10.10.0.1/32;
    }
  }
}
}

user@ISP# show protocols
bgp {
  group ext {
    type external;
    neighbor 192.168.10.1 {
      peer-as 65535;
    }
    neighbor 192.168.20.1 {
      remove-private;
    }
  }
}

```

```
        peer-as 200;
    }
}
}
```

```
user@ISP# show routing-options
autonomous-system 100;
```

If you are done configuring the device, enter **commit** from configuration mode. Repeat the configuration on Device R1 and Device R2, changing the interface names and IP address, as needed, and adding the routing policy configuration.

### **Verification**

Confirm that the configuration is working properly.

- [Checking the Neighbor Status on page 3460](#)
- [Checking the Routing Tables on page 3461](#)
- [Checking the AS Path When the remove-private Statement Is Deactivated on page 3461](#)

### **Checking the Neighbor Status**

**Purpose** Make sure that Device ISP has the **remove-private** setting enabled in its neighbor session with Device R2.

**Action** From operational mode, enter the **show bgp neighbor 192.168.20.1** command.

```
user@ISP> show bgp neighbor 192.168.20.1
Peer: 192.168.20.1+179 AS 200 Local: 192.168.20.20+60216 AS 100
  Type: External State: Established Flags: <ImportEval Sync>
  Last State: OpenConfirm Last Event: RecvKeepAlive
  Last Error: None
  Options: <Preference RemovePrivateAS PeerAS Refresh>
  Holdtime: 90 Preference: 170
  Number of flaps: 0
  Peer ID: 10.10.20.1 Local ID: 10.10.0.1 Active Holdtime: 90
  Keepalive Interval: 30 Peer index: 0
  BFD: disabled, down
  Local Interface: fe-1/2/1.3
  NLRI for restart configured on peer: inet-unicast
  NLRI advertised by peer: inet-unicast
  NLRI for this session: inet-unicast
  Peer supports Refresh capability (2)
  Stale routes from peer are kept for: 300
  Peer does not support Restarter functionality
  NLRI that restart is negotiated for: inet-unicast
  NLRI of received end-of-rib markers: inet-unicast
  NLRI of all end-of-rib markers sent: inet-unicast
  Peer supports 4 byte AS extension (peer-as 200)
  Peer does not support Addpath
  Table inet.0 Bit: 10001
    RIB State: BGP restart is complete
    Send state: in sync
    Active prefixes: 1
    Received prefixes: 3
    Accepted prefixes: 2
    Suppressed due to damping: 0
    Advertised prefixes: 1
```

```

Last traffic (seconds): Received 10    Sent 16    Checked 55
Input messages: Total 54    Updates 3    Refreshes 0    Octets 1091
Output messages: Total 54    Updates 1    Refreshes 0    Octets 1118
Output Queue[0]: 0

```

**Meaning** The `RemovePrivateAS` option shows that Device ISP has the expected setting.

### *Checking the Routing Tables*

**Purpose** Make sure that the devices have the expected routes and AS paths.

**Action** From operational mode, enter the `show route protocol bgp` command.

```

user@R1> show route protocol bgp
inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.10.20.1/32    *[BGP/170] 00:28:57, localpref 100
                 AS path: 100 200 I
                 > to 192.168.10.10 via fe-1/2/0.1

user@ISP> show route protocol bgp

inet.0: 7 destinations, 11 routes (7 active, 0 holddown, 2 hidden)
+ = Active Route, - = Last Active, * = Both

10.10.10.1/32    *[BGP/170] 00:29:40, localpref 100
                 AS path: 65535 I
                 > to 192.168.10.1 via fe-1/2/0.2
10.10.20.1/32    *[BGP/170] 00:29:36, localpref 100
                 AS path: 200 I
                 > to 192.168.20.1 via fe-1/2/1.3
192.168.10.0/24  [BGP/170] 00:29:40, localpref 100
                 AS path: 65535 I
                 > to 192.168.10.1 via fe-1/2/0.2
192.168.20.0/24  [BGP/170] 00:29:36, localpref 100
                 AS path: 200 I
                 > to 192.168.20.1 via fe-1/2/1.3

user@R2> show route protocol bgp
inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.10.10.1/32    *[BGP/170] 00:29:53, localpref 100
                 AS path: 100 I
                 > to 192.168.20.20 via fe-1/2/0.4

```

**Meaning** Device ISP has the private AS number 65535 in its AS path to Device R1. However, Device ISP does not advertise this private AS number to Device R2. This is shown in the routing table of Device R2. Device R2's path to Device R1 contains only the AS number for Device ISP.

### *Checking the AS Path When the remove-private Statement Is Deactivated*

**Purpose** Verify that without the `remove-private` statement, the private AS number appears in Device R2's routing table.

**Action** From configuration mode on Device ISP, enter the **deactivate remove-private** command and then recheck the routing table on Device R2.

```
[protocols bgp group ext neighbor 192.168.20.1]
user@ISP# deactivate remove-private
user@ISP# commit

user@R2> show route protocol bgp
inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.10.10.1/32      *[BGP/170] 00:00:54, localpref 100
                   AS path: 100 65535 I
                   > to 192.168.20.20 via fe-1/2/0.4
```

**Meaning** Private AS number 65535 appears in Device R2's AS path to Device R1.

#### Understanding BFD for BGP

The Bidirectional Forwarding Detection (BFD) protocol is a simple hello mechanism that detects failures in a network. Hello packets are sent at a specified, regular interval. A neighbor failure is detected when the routing device stops receiving a reply after a specified interval. BFD works with a wide variety of network environments and topologies. The failure detection timers for BFD have shorter time limits than default failure detection mechanisms for BGP, so they provide faster detection.

The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the **clear bfd adaptation** command to return BFD interval timers to their configured values. The **clear bfd adaptation** command is hitless, meaning that the command does not affect traffic flow on the routing device.

In Junos OS Release 8.3 and later, BFD is supported on internal BGP (IBGP) and multihop external BGP (EBGP) sessions as well as on single-hop EBGP sessions. In Junos OS Release 9.1 through Junos OS Release 11.1, BFD supports IPv6 interfaces in static routes only. In Junos OS Release 11.2 and later, BFD supports IPv6 interfaces with BGP.

### Example: Configuring BFD on Internal BGP Peer Sessions

---

This example shows how to configure internal BGP (IBGP) peer sessions with the Bidirectional Forwarding Detection (BFD) protocol to detect failures in a network.

- [Requirements on page 3463](#)
- [Overview on page 3463](#)
- [Configuration on page 3464](#)
- [Verification on page 3468](#)

#### **Requirements**

No special configuration beyond device initialization is required before you configure this example.

#### **Overview**

The minimum configuration to enable BFD on IBGP sessions is to include the **bfd-liveness-detection minimum-interval** statement in the BGP configuration of all neighbors participating in the BFD session. The **minimum-interval** statement specifies the minimum transmit and receive intervals for failure detection. Specifically, this value represents the minimum interval after which the local routing device transmits hello packets as well as the minimum interval that the routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a value from 1 through 255,000 milliseconds.

Optionally, you can specify the minimum transmit and receive intervals separately using the **transmit-interval minimum-interval** and **minimum-receive-interval** statements. For information about these and other optional BFD configuration statements, see [bfd-liveness-detection](#).

**NOTE:** BFD is an intensive protocol that consumes system resources. Specifying a minimum interval for BFD less than 100 ms for Routing Engine-based sessions and less than 10 ms for distributed BFD sessions can cause undesired BFD flapping.

Depending on your network environment, these additional recommendations might apply:

- For large-scale network deployments with a large number of BFD sessions, specify a minimum interval of 300 ms for Routing Engine-based sessions and 100 ms for distributed BFD sessions.
- For very large-scale network deployments with a large number of BFD sessions, contact Juniper Networks customer support for more information.
- For BFD sessions to remain up during a Routing Engine switchover event when nonstop active routing (NSR) is configured, specify a minimum interval of 2500 ms for Routing Engine-based sessions. For distributed BFD sessions with NSR configured, the minimum interval recommendations are unchanged and depend only on your network deployment.

BFD is supported on the default routing instance (the main router), routing instances, and logical systems. This example shows BFD on logical systems.

Figure 80 on page 3464 shows a typical network with internal peer sessions.

**Figure 80: Typical Network with IBGP Sessions**

#### Configuration

##### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

##### Device A

```
set logical-systems A interfaces lt-1/2/0 unit 1 description to-B
set logical-systems A interfaces lt-1/2/0 unit 1 encapsulation ethernet
set logical-systems A interfaces lt-1/2/0 unit 1 peer-unit 2
```

```

set logical-systems A interfaces lt-1/2/0 unit 1 family inet address 10.10.10.1/30
set logical-systems A interfaces lo0 unit 1 family inet address 192.168.6.5/32
set logical-systems A protocols bgp group internal-peers type internal
set logical-systems A protocols bgp group internal-peers traceoptions file bgp-bfd
set logical-systems A protocols bgp group internal-peers traceoptions flag bfd detail
set logical-systems A protocols bgp group internal-peers local-address 192.168.6.5
set logical-systems A protocols bgp group internal-peers export send-direct
set logical-systems A protocols bgp group internal-peers bfd-liveness-detection
    minimum-interval 1000
set logical-systems A protocols bgp group internal-peers neighbor 192.163.6.4
set logical-systems A protocols bgp group internal-peers neighbor 192.168.40.4
set logical-systems A protocols ospf area 0.0.0.0 interface lo0.1 passive
set logical-systems A protocols ospf area 0.0.0.0 interface lt-1/2/0.1
set logical-systems A policy-options policy-statement send-direct term 2 from protocol
    direct
set logical-systems A policy-options policy-statement send-direct term 2 then accept
set logical-systems A routing-options router-id 192.168.6.5
set logical-systems A routing-options autonomous-system 17

```

**Device B**

```

set logical-systems B interfaces lt-1/2/0 unit 2 description to-A
set logical-systems B interfaces lt-1/2/0 unit 2 encapsulation ethernet
set logical-systems B interfaces lt-1/2/0 unit 2 peer-unit 1
set logical-systems B interfaces lt-1/2/0 unit 2 family inet address 10.10.10.2/30
set logical-systems B interfaces lt-1/2/0 unit 5 description to-C
set logical-systems B interfaces lt-1/2/0 unit 5 encapsulation ethernet
set logical-systems B interfaces lt-1/2/0 unit 5 peer-unit 6
set logical-systems B interfaces lt-1/2/0 unit 5 family inet address 10.10.10.5/30
set logical-systems B interfaces lo0 unit 2 family inet address 192.163.6.4/32
set logical-systems B protocols bgp group internal-peers type internal
set logical-systems B protocols bgp group internal-peers local-address 192.163.6.4
set logical-systems B protocols bgp group internal-peers export send-direct
set logical-systems B protocols bgp group internal-peers bfd-liveness-detection
    minimum-interval 1000
set logical-systems B protocols bgp group internal-peers neighbor 192.168.40.4
set logical-systems B protocols bgp group internal-peers neighbor 192.168.6.5
set logical-systems B protocols ospf area 0.0.0.0 interface lo0.2 passive
set logical-systems B protocols ospf area 0.0.0.0 interface lt-1/2/0.2
set logical-systems B protocols ospf area 0.0.0.0 interface lt-1/2/0.5

set logical-systems C protocols ospf area 0.0.0.0 interface lt-1/2/0.6
set logical-systems C policy-options policy-statement send-direct term 2 from protocol
  direct
set logical-systems C policy-options policy-statement send-direct term 2 then accept
set logical-systems C routing-options router-id 192.168.40.4
set logical-systems C routing-options autonomous-system 17
```

### *Configuring Device A*

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device A:

1. Set the CLI to Logical System A.

```
user@host> set cli logical-system A
```

2. Configure the interfaces.

```
[edit interfaces lt-1/2/0 unit 1]
user@host:A# set description to-B
user@host:A# set encapsulation ethernet
user@host:A# set peer-unit 2
user@host:A# set family inet address 10.10.10.1/30
```

```
[edit interfaces lo0 unit 1]
user@host:A# set family inet address 192.168.6.5/32
```

3. Configure BGP.

The **neighbor** statements are included for both Device B and Device C, even though Device A is not directly connected to Device C.

```
[edit protocols bgp group internal-peers]
user@host:A# set type internal
user@host:A# set local-address 192.168.6.5
user@host:A# set export send-direct
user@host:A# set neighbor 192.163.6.4
user@host:A# set neighbor 192.168.40.4
```

4. Configure BFD.

```
[edit protocols bgp group internal-peers]
user@host:A# set bfd-liveness-detection minimum-interval 1000
```

You must configure the same minimum interval on the connecting peer.

5. (Optional) Configure BFD tracing.

```
[edit protocols bgp group internal-peers]
user@host:A# set traceoptions file bgp-bfd
user@host:A# set traceoptions flag bfd detail
```

6. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
```

```
user@host:A# set interface lo0.1 passive
user@host:A# set interface lt-1/2/0.1
```

7. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 2]
user@host:A# set from protocol direct
user@host:A# set then accept
```

8. Configure the router ID and the autonomous system (AS) number.

```
[edit routing-options]
user@host:A# set router-id 192.168.6.5
user@host:A# set autonomous-system 17
```

9. If you are done configuring the device, enter **commit** from configuration mode. Repeat these steps to configure Device B and Device C.

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host:A# show interfaces
lt-1/2/0 {
  unit 1 {
    description to-B;
    encapsulation ethernet;
    peer-unit 2;
    family inet {
      address 10.10.10.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.6.5/32;
    }
  }
}

user@host:A# show policy-options
policy-statement send-direct {
  term 2 {
    from protocol direct;
    then accept;
  }
}

user@host:A# show protocols
bgp {
  group internal-peers {
    type internal;
    traceoptions {
```

```
        file bgp-bfd;
        flag bfd detail;
    }
    local-address 192.168.6.5;
    export send-direct;
    bfd-liveness-detection {
        minimum-interval 1000;
    }
    neighbor 192.163.6.4;
    neighbor 192.168.40.4;
}
}
ospf {
    area 0.0.0.0 {
        interface lo0.1 {
            passive;
        }
        interface lt-1/2/0.1;
    }
}

user@host:A# show routing-options
router-id 192.168.6.5;
autonomous-system 17;
```

### **Verification**

Confirm that the configuration is working properly.

- [Verifying That BFD Is Enabled on page 3468](#)
- [Verifying That BFD Sessions Are Up on page 3469](#)
- [Viewing Detailed BFD Events on page 3469](#)
- [Viewing Detailed BFD Events After Deactivating and Reactivating a Loopback Interface on page 3470](#)

### **Verifying That BFD Is Enabled**

**Purpose** Verify that BFD is enabled between the IBGP peers.

**Action** From operational mode, enter the **show bgp neighbor** command. You can use the **| match bfd** filter to narrow the output.

```
user@host:A> show bgp neighbor | match bfd
Options: <BfdEnabled>
  BFD: enabled, up
  Trace file: /var/log/A/bgp-bfd size 131072 files 10
Options: <BfdEnabled>
  BFD: enabled, up
  Trace file: /var/log/A/bgp-bfd size 131072 files 10
```

**Meaning** The output shows that Logical System A has two neighbors with BFD enabled. When BFD is not enabled, the output displays **BFD: disabled, down**, and the **<BfdEnabled>** option is absent. If BFD is enabled and the session is down, the output displays **BFD: enabled, down**. The output also shows that BFD-related events are being written to a log file because trace operations are configured.

**Verifying That BFD Sessions Are Up**

**Purpose** Verify that the BFD sessions are up, and view details about the BFD sessions.

**Action** From operational mode, enter the **show bfd session extensive** command.

```
user@host:A> show bfd session extensive
```

| Address     | State | Interface | Detect Time | Transmit Interval | Multiplier |
|-------------|-------|-----------|-------------|-------------------|------------|
| 192.163.6.4 | Up    |           | 3.000       | 1.000             | 3          |

Client BGP, TX interval 1.000, RX interval 1.000  
Session up time 00:54:40  
Local diagnostic None, remote diagnostic None  
Remote state Up, version 1  
Logical system 12, routing table index 25  
Min async interval 1.000, min slow interval 1.000  
Adaptive async TX interval 1.000, RX interval 1.000  
Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3  
Remote min TX interval 1.000, min RX interval 1.000, multiplier 3  
Local discriminator 10, remote discriminator 9  
Echo mode disabled/inactive  
Multi-hop route table 25, local-address 192.168.6.5

| Address      | State | Interface | Detect Time | Transmit Interval | Multiplier |
|--------------|-------|-----------|-------------|-------------------|------------|
| 192.168.40.4 | Up    |           | 3.000       | 1.000             | 3          |

Client BGP, TX interval 1.000, RX interval 1.000  
Session up time 00:48:03  
Local diagnostic None, remote diagnostic None  
Remote state Up, version 1  
Logical system 12, routing table index 25  
Min async interval 1.000, min slow interval 1.000  
Adaptive async TX interval 1.000, RX interval 1.000  
Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3  
Remote min TX interval 1.000, min RX interval 1.000, multiplier 3  
Local discriminator 14, remote discriminator 13  
Echo mode disabled/inactive  
Multi-hop route table 25, local-address 192.168.6.5

2 sessions, 2 clients  
Cumulative transmit rate 2.0 pps, cumulative receive rate 2.0 pps

**Meaning** The TX interval 1.000, RX interval 1.000 output represents the setting configured with the **minimum-interval** statement. All of the other output represents the default settings for BFD. To modify the default settings, include the optional statements under the **bfd-liveness-detection** statement.

**Viewing Detailed BFD Events**

**Purpose** View the contents of the BFD trace file to assist in troubleshooting, if needed.

**Action** From operational mode, enter the **file show /var/log/A/bgp-bfd** command.

```
user@host:A> file show /var/log/A/bgp-bfd

#### Understanding BFD Authentication for BGP

Bidirectional Forwarding Detection protocol (BFD) enables rapid detection of communication failures between adjacent systems. By default, authentication for BFD sessions is disabled. However, when you run BFD over Network Layer protocols, the risk of service attacks can be significant. We strongly recommend using authentication if you are running BFD over multiple hops or through insecure tunnels. Beginning with Junos OS Release 9.6, Junos OS supports authentication for BFD sessions running over BGP. BFD authentication is not supported on MPLS OAM sessions. BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

You authenticate BFD sessions by specifying an authentication algorithm and keychain, and then associating that configuration information with a security authentication keychain using the keychain name.

The following sections describe the supported authentication algorithms, security keychains, and level of authentication that can be configured:

- [BFD Authentication Algorithms on page 3472](#)
- [Security Authentication Keychains on page 3472](#)
- [Strict Versus Loose Authentication on page 3473](#)

### **BFD Authentication Algorithms**

Junos OS supports the following algorithms for BFD authentication:

- **simple-password**—Plain-text password. One to 16 bytes of plain text are used to authenticate the BFD session. One or more passwords can be configured. This method is the least secure and should be used only when BFD sessions are not subject to packet interception.
- **keyed-md5**—Keyed Message Digest 5 hash algorithm for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed MD5 uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than or equal to the last sequence number received. Although more secure than a simple password, this method is vulnerable to replay attacks. Increasing the rate at which the sequence number is updated can reduce this risk.
- **meticulous-keyed-md5**—Meticulous keyed Message Digest 5 hash algorithm. This method works in the same manner as keyed MD5, but the sequence number is updated with every packet. Although more secure than keyed MD5 and simple passwords, this method might take additional time to authenticate the session.
- **keyed-sha-1**—Keyed Secure Hash Algorithm I for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed SHA uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. The key is not carried within the packets. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than the last sequence number received.
- **meticulous-keyed-sha-1**—Meticulous keyed Secure Hash Algorithm I. This method works in the same manner as keyed SHA, but the sequence number is updated with every packet. Although more secure than keyed SHA and simple passwords, this method might take additional time to authenticate the session.

**NOTE:** Nonstop active routing (NSR) is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

---

### **Security Authentication Keychains**

The security authentication keychain defines the authentication attributes used for authentication key updates. When the security authentication keychain is configured and associated with a protocol through the keychain name, authentication key updates can occur without interrupting routing and signaling protocols.

The authentication keychain contains one or more keychains. Each keychain contains one or more keys. Each key holds the secret data and the time at which the key becomes valid. The algorithm and keychain must be configured on both ends of the BFD session,

and they must match. Any mismatch in configuration prevents the BFD session from being created.

BFD allows multiple clients per session, and each client can have its own keychain and algorithm defined. To avoid confusion, we recommend specifying only one security authentication keychain.

### ***Strict Versus Loose Authentication***

By default, strict authentication is enabled and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure *loose checking*. When loose checking is configured, packets are accepted without authentication being checked at each end of the session. This feature is intended for transitional periods only.

### **Example: Configuring BFD Authentication for BGP**

Beginning with Junos OS Release 9.6, you can configure authentication for BFD sessions running over BGP. Only three steps are needed to configure authentication on a BFD session:

1. Specify the BFD authentication algorithm for the BGP protocol.
2. Associate the authentication keychain with the BGP protocol.
3. Configure the related security authentication keychain.

The following sections provide instructions for configuring and viewing BFD authentication on BGP:

- [Configuring BFD Authentication Parameters on page 3473](#)
- [Viewing Authentication Information for BFD Sessions on page 3475](#)

### ***Configuring BFD Authentication Parameters***

BFD authentication can be configured for the entire BGP protocol, or a specific BGP group, neighbor, or routing instance.

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure BFD authentication:

1. Specify the algorithm (**keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**, or **simple-password**) to use.

[edit]

```
user@host# set protocols bgp bfd-liveness-detection authentication algorithm
keyed-sha-1
```

```
user@host# set protocols bgp group bgp-gr1 bfd-liveness-detection authentication
algorithm keyed-sha-1
```

```
user@host# set protocols bgp group bgp-gr1 neighbor 10.10.10.7 bfd-liveness-detection
authentication algorithm keyed-sha-1
```

**NOTE:** Nonstop active routing is not supported with meticulous-keyed-md5 and meticulous-keyed-sha-1 authentication algorithms. BFD sessions using these algorithms might go down after a switchover.

2. Specify the keychain to be used to associate BFD sessions on BGP with the unique security authentication keychain attributes.

The keychain name you specify must match a keychain name configured at the **[edit security authentication key-chains]** hierarchy level.

```
[edit]
user@host# set protocols bgp bfd-liveness-detection authentication keychain bfd-bgp
user@host# set protocols bgp group bgp-gr1 bfd-liveness-detection authentication
keychain bfd-bgp
user@host# set protocols bgp group bgp-gr1 neighbor 10.10.10.7 bfd-liveness-detection
authentication keychain bfd-bgp
```

**NOTE:** The algorithm and keychain must be configured on both ends of the BFD session, and they must match. Any mismatch in configuration prevents the BFD session from being created.

3. Specify the unique security authentication information for BFD sessions:

- The matching keychain name as specified in Step 2.
- At least one key, a unique integer between 0 and 63. Creating multiple keys allows multiple clients to use the BFD session.
- The secret data used to allow access to the session.
- The time at which the authentication key becomes active, in the format *yyyy-mm-dd.hh:mm:ss*.

```
[edit security]
user@host# set authentication-key-chains key-chain bfd-bgp key 53 secret
$9$ggaJDmPQ6/tJgF/AtREVsyPsnCtUHm start-time 2009-06-14.10:00:00
```

4. (Optional) Specify loose authentication checking if you are transitioning from nonauthenticated sessions to authenticated sessions.

```
[edit]
user@host# set protocols bgp bfd-liveness-detection authentication loose-check
user@host# set protocols bgp group bgp-gr1 bfd-liveness-detection authentication
loose-check
user@host# set protocols bgp group bgp-gr1 neighbor 10.10.10.7 bfd-liveness-detection
authentication loose-check
```

5. (Optional) View your configuration using the **show bfd session detail** or **show bfd session extensive** command.
6. Repeat these steps to configure the other end of the BFD session.

**NOTE:** BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.

### Viewing Authentication Information for BFD Sessions

You can view the existing BFD authentication configuration using the **show bfd session detail** and **show bfd session extensive** commands.

The following example shows BFD authentication configured for the **bgp-gr1** BGP group. It specifies the keyed SHA-1 authentication algorithm and a keychain name of **bfd-bgp**. The authentication keychain is configured with two keys. Key 1 contains the secret data “\$9\$ggaJDmPQ6/tJgF/AtREvsyPsnCtUHm” and a start time of June 1, 2009, at 9:46:02 AM PST. Key 2 contains the secret data “\$9\$a5jiKW9L.reP38ny.TszF2/9” and a start time of June 1, 2009, at 3:29:20 PM PST.

```
[edit protocols bgp]
group bgp-gr1 {
  bfd-liveness-detection {
    authentication {
      algorithm keyed-sha-1;
      key-chain bfd-bgp;
    }
  }
}
[edit security]
authentication key-chains {
  key-chain bfd-bgp {
    key 1 {
      secret "$9$ggaJDmPQ6/tJgF/AtREvsyPsnCtUHm";
      start-time "2009-6-1.09:46:02 -0700";
    }
    key 2 {
      secret "$9$a5jiKW9L.reP38ny.TszF2/9";
      start-time "2009-6-1.15:29:20 -0700";
    }
  }
}
```

If you commit these updates to your configuration, you see output similar to the following. In the output for the **show bfd session detail** command, **Authenticate** is displayed to indicate that BFD authentication is configured. For more information about the configuration, use the **show bfd session extensive** command. The output for this command provides the keychain name, the authentication algorithm and mode for each client in the session, and the overall BFD authentication configuration status, keychain name, and authentication algorithm and mode.

### show bfd session detail

```
user@host# show bfd session detail
```

| Address   | State | Interface  | Detect Time | Transmit Interval | Multiplier |

---

#### Understanding BGP Multipath

BGP multipath allows you to select multiple internal or external BGP peers as active paths. Selecting multiple paths enables BGP peering to load-balance traffic across an Autonomous System (AS) confederation boundary.

A path is considered a BGP equal-cost path (and is used for forwarding) if a tie-break is performed. The tie-break is performed after the BGP route path selection step that chooses the next-hop path that is resolved through the IGP route with the lowest metric. All paths with the same neighboring AS, learned by a multipath-enabled BGP neighbor are considered in the path selection process.

BGP, typically selects only one best path for each prefix and installs that route in the routing table. When BGP multipath is enabled, the device selects multiple equal-cost EBGp paths as the best paths to reach a given destination, and all these paths are installed in the routing table. BGP advertises only the active path to its neighbors. However, you can configure BGP to advertise multiple paths to the same destination for redundancy and load balancing.

The Junos OS BGP multipath feature supports the following applications:

- Load balancing across multiple links between two routing devices belonging to different autonomous systems (ASs)
- Load balancing across a common subnet or multiple subnets to different routing devices belonging to the same peer AS
- Load balancing across multiple links between two routing devices belonging to different external confederation peers
- Load balancing across a common subnet or multiple subnets to different routing devices belonging to external confederation peers

In a common scenario for load balancing, a customer is multihomed to multiple routers in a point of presence (POP). The default behavior is to send all traffic across only one of the available links. Load balancing causes traffic to use two or more of the links.

**NOTE:** BGP multipath does not apply to paths that share the same MED-plus-IGP cost, yet differ in IGP cost. Multipath path selection is based on the IGP cost metric, even if two paths have the same MED-plus-IGP cost.

### Example: Load Balancing BGP Traffic

This example shows how to configure BGP to select multiple equal-cost external BGP (EBGP) or internal BGP (IBGP) paths as active paths.

- [Requirements on page 3477](#)
- [Overview on page 3478](#)
- [Configuration on page 3479](#)
- [Verification on page 3481](#)

#### Requirements

Before you begin:

- Configure the device interfaces.
- Configure an interior gateway protocol (IGP).
- Configure BGP.
- Configure a routing policy that exports routes (such as direct routes or IGP routes) from the routing table into BGP.

## Overview

The following steps show how to configure per-packet load balancing:

1. Define a load-balancing routing policy by including one or more **policy-statement** statements at the **[edit policy-options]** hierarchy level, defining an action of **load-balance per-packet**:

```
policy-statement policy-name {  
  from {  
    match-conditions;  
    route-filter destination-prefix match-type <actions>;  
    prefix-list name;  
  }  
  then {  
    load-balance per-packet;  
  }  
}
```

2. Apply the policy to routes exported from the routing table to the forwarding table. To do this, include the **forwarding-table** and **export** statements:

```
forwarding-table {  
  export policy-name;  
}
```

You cannot apply the export policy to VRF routing instances.

3. Specify all next hops of that route, if more than one exists, when allocating a label corresponding to a route that is being advertised.
4. Configure the forwarding-options hash key for MPLS to include the IP payload.

**NOTE:** On some platforms, you can increase the number of paths that are load balanced by using the **chassis maximum-ecmp** statement. With this statement, you can change the maximum number of equal-cost load-balanced paths to 32 or 64.

---

In this example, Device R1 is in AS 65000 and is connected to both Device R2 and Device R3, which are in AS 65001. This example shows the configuration on Device R1.

## Topology

[Figure 81 on page 3479](#) shows the topology used in this example.

Figure 81: BGP Load Balancing

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set protocols bgp group external type external
set protocols bgp group external peer-as 65001
set protocols bgp group external multipath
set protocols bgp group external neighbor 10.0.1.1
set protocols bgp group external neighbor 10.0.0.2
set policy-options policy-statement loadbal from route-filter 10.0.0.0/16 orlonger
set policy-options policy-statement loadbal then load-balance per-packet
set routing-options forwarding-table export loadbal
set routing-options autonomous-system 65000
```

#### Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the BGP peer sessions:

1. Configure the BGP group.
 

```
[edit protocols bgp group external]
user@R1# set type external
user@R1# set peer-as 65001
user@R1# set neighbor 10.0.1.1
user@R1# set neighbor 10.0.0.2
```
2. Enable the BGP group to use multiple paths.

**NOTE:** To disable the default check requiring that paths accepted by BGP multipath must have the same neighboring autonomous system (AS), include the `multiple-as` option.

```
[edit protocols bgp group external]
user@R1# set multipath
```

3. Configure the load-balancing policy.

```
[edit policy-options policy-statement loadbal]
user@R1# set from route-filter 10.0.0.0/16 orlonger
user@R1# set then load-balance per-packet
```

4. Apply the load-balancing policy.

```
[edit routing-options]
user@R1# set forwarding-table export loadbal
```

5. Configure the local autonomous system (AS) number.

```
[edit routing-options]
user@R1# set autonomous-system 65000
```

**Results** From configuration mode, confirm your configuration by entering the **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@R1# show protocols
bgp {
  group external {
    type external;
    peer-as 65001;
    multipath;
    neighbor 10.0.1.1;
    neighbor 10.0.0.2;
  }
}
```

```
[edit]
user@R1# show policy-options
policy-statement loadbal {
  from {
    route-filter 10.0.0.0/16 orlonger;
  }
  then {
    load-balance per-packet;
  }
}
```

```
[edit]
user@R1# show routing-options
autonomous-system 65000;
forwarding-table {
```

```
export loadbal;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly:

- [Verifying Routes on page 3481](#)
- [Verifying Forwarding on page 3482](#)

### Verifying Routes

**Purpose** Verify that routes are learned from both routers in the neighboring AS.

**Action** From operational mode, run the **show route** command.

```
user@R1> show route 10.0.2.0
inet.0: 12 destinations, 15 routes (12 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.2.0/30          *[BGP/170] 03:12:32, localpref 100
                    AS path: 65001 I
                    to 10.0.1.1 via ge-1/2/0.0
                    > to 10.0.0.2 via ge-1/2/1.0
                    [BGP/170] 03:12:32, localpref 100
                    AS path: 65001 I
                    > to 10.0.1.1 via ge-1/2/0.0

user@R1> show route 10.0.2.0 detail
inet.0: 12 destinations, 15 routes (12 active, 0 holddown, 0 hidden)
10.0.2.0/30 (2 entries, 1 announced)
   *BGP      Preference: 170/-101

             Inactive reason: Not Best in its group - Active preferred
             Local AS: 65000 Peer AS: 65001
             Age: 3:18:30
             Task: BGP_65001.10.0.1.1+53135
             AS path: 65001 I
```

Accepted  
Localpref: 100  
Router ID: 192.168.3.1

**Meaning** The active path, denoted with an asterisk (\*), has two next hops: 10.0.1.1 and 10.0.0.2 to the 10.0.2.0 destination. The 10.0.1.1 next hop is copied from the inactive path to the active path.

**NOTE:** The `show route detail` command output designates one gateway as selected. This output is potentially confusing in the context of load balancing. The selected gateway is used for many purposes in addition to deciding which gateway to install into the kernel when Junos OS is not performing per-packet load-balancing. For instance, the `ping mpls` command uses the selected gateway when sending packets. Multicast protocols use the selected gateway in some cases to determine the upstream interface. Therefore, even when Junos OS is performing per-packet load-balancing by way of a forwarding-table policy, the selected gateway information is still required for other purposes. It is useful to display the selected gateway for troubleshooting purposes. Additionally, it is possible to use forwarding-table policy to override what is installed into the kernel (for example, by using the `install-nexthop` action). In this case, the next-hop gateway installed in the forwarding table might be a subset of the total gateways displayed in the `show route` command.

---

### Verifying Forwarding

**Purpose** Verify that both next hops are installed in the forwarding table.

**Action** From operational mode, run the `show route forwarding-table` command.

```
user@R1> show route forwarding-table destination 10.0.2.0
Routing table: default.inet
Internet:
Destination      Type RtRef Next hop          Type Index NhRef Netif
10.0.2.0/30      user  0         10.0.1.1             ucst  602   5 ge-1/2/0.0
                  10.0.0.2             ucst  522   6 ge-1/2/1.0
```

### Example: Configuring Single-Hop EBGPeers to Accept Remote Next Hops

---

This example shows how to configure a single-hop external BGP (EBGP) peer to accept a remote next hop with which it does not share a common subnet.

- [Requirements on page 3483](#)
- [Overview on page 3483](#)
- [Configuration on page 3484](#)
- [Verification on page 3491](#)

### Requirements

No special configuration beyond device initialization is required before you configure this example.

### Overview

In some situations, it is necessary to configure a single-hop EBGP peer to accept a remote next hop with which it does not share a common subnet. The default behavior is for any next-hop address received from a single-hop EBGP peer that is not recognized as sharing a common subnet to be discarded. The ability to have a single-hop EBGP peer accept a remote next hop to which it is not directly connected also prevents you from having to configure the single-hop EBGP neighbor as a multihop session. When you configure a multihop session in this situation, all next-hop routes learned through this EBGP peer are labeled indirect even when they do share a common subnet. This situation breaks multipath functionality for routes that are recursively resolved over routes that include these next-hop addresses. Configuring the `accept-remote-nexthop` statement allows a single-hop EBGP peer to accept a remote next hop, which restores multipath functionality for routes that are resolved over these next-hop addresses. You can configure this statement at the global, group, and neighbor hierarchy levels for BGP. The statement is also supported on logical systems and the VPN routing and forwarding (VRF) routing instance type. Both the remote next-hop and the EBGP peer must support BGP route refresh as defined in RFC 2918, *Route Refresh Capability in BGP-4*. If the remote peer does not support BGP route refresh, the session is reset.

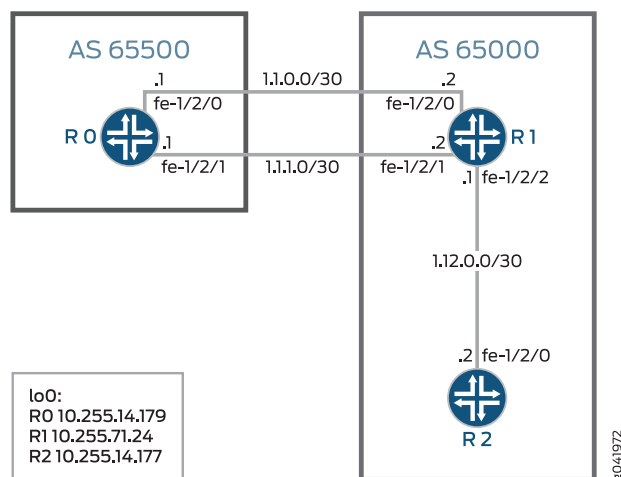

**NOTE:** You cannot configure both the `multihop` and `accept-remote-nexthop` statements for the same EBGP peer.

When you enable a single-hop EBGP peer to accept a remote next hop, you must also configure an import routing policy on the EBGP peer that specifies the remote next-hop address.

This example includes an import routing policy, `agg_route`, that enables a single-hop external BGP peer (Device R1) to accept the remote next-hop 1.1.10.10 for the route to the 1.1.230.0/23 network. At the `[edit protocols bgp]` hierarchy level, the example includes the `import agg_route` statement to apply the policy to the external BGP peer and includes the `accept-remote-nexthop` statement to enable the single-hop EBGP peer to accept the remote next hop.

Figure 82 on page 3484 shows the sample topology.

Figure 82: Topology for Accepting a Remote Next Hop

**Configuration**

- [Device R0 on page 3485](#)
- [Configuring Device R1 on page 3487](#)
- [Configuring Device R2 on page 3490](#)

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R0**

```

set interfaces fe-1/2/0 unit 1 family inet address 1.1.0.1/30
set interfaces fe-1/2/1 unit 2 family inet address 1.1.1.1/30
set interfaces lo0 unit 1 family inet address 10.255.14.179/32
set protocols bgp group ext type external
set protocols bgp group ext export test_route
set protocols bgp group ext export agg_route
set protocols bgp group ext peer-as 65000
set protocols bgp group ext multipath
set protocols bgp group ext neighbor 1.1.0.2
set protocols bgp group ext neighbor 1.1.1.2
set policy-options policy-statement agg_route term 1 from protocol static
set policy-options policy-statement agg_route term 1 from route-filter 1.1.230.0/23 exact

```

### Device R0

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R0:

1. Configure the interfaces.
 

```

[edit interfaces fe-1/2/0 unit 1]
user@R0# set family inet address 1.1.0.1/30

[edit interfaces fe-1/2/1 unit 2]
user@R0# set family inet address 1.1.1.1/30

[edit interfaces lo0 unit 1]
user@R0# set family inet address 10.255.14.179/32

```
2. Configure EBGp.
 

```

[edit protocols bgp group ext]
user@R0# set type external
user@R0# set peer-as 65000
user@R0# set neighbor 1.1.0.2
user@R0# set neighbor 1.1.1.2

```
3. Enable multipath BGP between Device R0 and Device R1.
 

```

[edit protocols bgp group ext]
user@R0# set multipath

```

4. Configure static routes to remote networks.  
These routes are not part of the topology. The purpose of these routes is to demonstrate the functionality in this example.

```
[edit routing-options]
user@R0# set static route 1.1.10.10/32 reject
user@R0# set static route 1.1.230.0/23 reject
```

5. Configure routing policies that accept the static routes.

```
[edit policy-options policy-statement agg_route term 1]
user@R0# set from protocol static
user@R0# set from route-filter 1.1.230.0/23 exact
user@R0# set then accept
```

```
[edit policy-options policy-statement test_route term 1]
user@R0# set from protocol static
user@R0# set from route-filter 1.1.10.10/32 exact
user@R0# set then accept
```

6. Export the **agg\_route** and **test\_route** policies from the routing table into BGP.

```
[edit protocols bgp group ext]
user@R0# set export test_route
user@R0# set export agg_route
```

7. Configure the autonomous system (AS) number.

```
[edit routing-options]
user@R0# set autonomous-system 65500
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R0# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 1.1.0.1/30;
    }
  }
}
fe-1/2/1 {
  unit 2 {
    family inet {
      address 1.1.1.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 10.255.14.179/32;
    }
  }
}
```

```

}

user@R0# show policy-options
policy-statement agg_route {
  term 1 {
    from {
      protocol static;
      route-filter 1.1.230.0/23 exact;
    }
    then accept;
  }
}
policy-statement test_route {
  term 1 {
    from {
      protocol static;
      route-filter 1.1.10.10/32 exact;
    }
    then accept;
  }
}

user@R0# show protocols
bgp {
  group ext {
    type external;
    export [ test_route agg_route ];
    peer-as 65000;
    multipath;
    neighbor 1.1.0.2;
    neighbor 1.1.1.2;
  }
}

user@R0# show routing-options
static {
  route 1.1.10.10/32 reject;
  route 1.1.230.0/23 reject;
}
autonomous-system 65500;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Device R1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.
 

```

[edit interfaces fe-1/2/0 unit 3]
user@R1# set family inet address 1.1.0.2/30

[edit interfaces fe-1/2/1 unit 4]

```

```
user@R1# set family inet address 1.12.0.1/30
```

```
[edit interfaces fe-1/2/2 unit 5]
```

```
user@R1# set family inet address 1.1.1.2/30
```

```
[edit interfaces lo0 unit 2]
```

```
user@R1# set family inet address 10.255.71.24/32
```

2. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
```

```
user@R1# set interface fe-1/2/1.4
```

```
user@R1# set interface 10.255.71.24
```

3. Enable Device R1 to accept the remote next hop.

```
[edit protocols bgp]
```

```
user@R1# set accept-remote-nexthop
```

4. Configure IBGP.

```
[edit protocols bgp group int]
```

```
user@R1# set type internal
```

```
user@R1# set local-address 10.255.71.24
```

```
user@R1# set neighbor 10.255.14.177
```

5. Configure EBGP.

```
[edit protocols bgp group ext]
```

```
user@R1# set type external
```

```
user@R1# set peer-as 65500
```

```
user@R1# set neighbor 1.1.0.1
```

```
user@R1# set neighbor 1.1.1.1
```

6. Enable multipath BGP between Device R0 and Device R1.

```
[edit protocols bgp group ext]
```

```
user@R1# set multipath
```

7. Configure a routing policy that enables a single-hop external BGP peer (Device R1) to accept the remote next-hop 1.1.10.10 for the route to the 1.1.230.0/23 network.

```
[edit policy-options policy-statement agg_route term 1]
```

```
user@R1# set from protocol bgp
```

```
user@R1# set from route-filter 1.1.230.0/23 exact
```

```
user@R1# set then next-hop 1.1.10.10
```

```
user@R1# set then accept
```

8. Import the **agg\_route** policy into the routing table on Device R1.

```
[edit protocols bgp group ext]
```

```
user@R1# set import agg_route
```

9. Configure the autonomous system (AS) number.

```
[edit routing-options]
```

```
user@R1# set autonomous-system 65000
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show protocols**, and **show routing-options** commands. If the output

does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R1# show interfaces
fe-1/2/0 {
  unit 3 {
    family inet {
      address 1.1.0.2/30;
    }
  }
}
fe-1/2/1 {
  unit 4 {
    family inet {
      address 1.12.0.1/30;
    }
  }
}
fe-1/2/2 {
  unit 5 {
    family inet {
      address 1.1.1.2/30;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 10.255.71.24/32;
    }
  }
}

user@R1# show policy-options
policy-statement agg_route {
  term 1 {
    from {
      protocol bgp;
      route-filter 1.1.230.0/23 exact;
    }
    then {
      next-hop 1.1.10.10;
      accept;
    }
  }
}

user@R1# show protocols
bgp {
  accept-remote-nexthop;
  group ext {
    type external;
    import agg_route;
    peer-as 65500;
    multipath;
    neighbor 1.1.0.1;
  }
}

```

```
        neighbor 1.1.1.1;
    }
    group int {
        type internal;
        local-address 10.255.71.24;
        neighbor 10.255.14.177;
    }
}
ospf {
    area 0.0.0.0 {
        interface fe-1/2/1.4;
        interface 10.255.71.24;
    }
}
```

```
user@R1# show routing-options
autonomous-system 65000;
```

If you are done configuring the device, enter **commit** from configuration mode.

### *Configuring Device R2*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.  

```
[edit interfaces fe-1/2/0 unit 6]
user@R2# set family inet address 1.12.0.2/30

[edit interfaces lo0 unit 3]
user@R2# set family inet address 10.255.14.177/32
```
2. Configure OSPF.  

```
[edit protocols ospf area 0.0.0.0]
user@R2# set interface fe-1/2/0.6
user@R2# set interface 10.255.14.177
```
3. Configure IBGP.  

```
[edit protocols bgp group int]
user@R2# set type internal
user@R2# set local-address 10.255.14.177
user@R2# set neighbor 10.255.71.24
```
4. Configure the autonomous system (AS) number.  

```
[edit routing-options]
user@R1# set autonomous-system 65000
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R2# show interfaces
fe-1/2/0 {
  unit 6 {
    family inet {
      address 1.12.0.2/30;
    }
  }
}
lo0 {
  unit 3 {
    family inet {
      address 10.255.14.177/32;
    }
  }
}

user@R2# show protocols
bgp {
  group int {
    type internal;
    local-address 10.255.14.177;
    neighbor 10.255.71.24;
  }
}
ospf {
  area 0.0.0.0 {
    interface fe-1/2/0.6;
    interface 10.255.14.177;
  }
}

user@R2# show routing-options
autonomous-system 65000;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying That the Multipath Route with the Indirect Next Hop Is in the Routing Table on page 3491](#)
- [Deactivating and Reactivating the accept-remote-nexthop Statement on page 3493](#)

### Verifying That the Multipath Route with the Indirect Next Hop Is in the Routing Table

**Purpose** Verify that Device R1 has a route to the 1.1.230.0/23 network.

**Action** From operational mode, enter the **show route 1.1.230.0 extensive** command.

```

user@R1> show route 1.1.230.0 extensive
inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
Restart Complete
1.1.230.0/23 (2 entries, 1 announced)

  Nexthop: 1.1.1.1 via fe-1/2/2.5

```

**Meaning** The output shows that Device R1 has a route to the 1.1.230.0 network with the multipath feature enabled (**Accepted Multipath**). The output also shows that the route has an indirect next hop of 1.1.10.10.

### *Deactivating and Reactivating the accept-remote-nexthop Statement*

**Purpose** Make sure that the multipath route with the indirect next hop is removed from the routing table when you deactivate the **accept-remote-nexthop** statement.

**Action** 1. From configuration mode, enter the **deactivate protocols bgp accept-remote-nexthop** command.

```

user@R1# deactivate protocols bgp accept-remote-nexthop
user@R1# commit

```

2. From operational mode, enter the **show route 1.1.230.0** command.

```

user@R1> show route 1.1.230.0

```

3. From configuration mode, reactivate the statement by entering the **activate protocols bgp accept-remote-nexthop** command.

```

user@R1# activate protocols bgp accept-remote-nexthop
user@R1# commit

```

4. From operational mode, reenter the **show route 1.1.230.0** command.

```

user@R1> show route 1.1.230.0

```

```

inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both

```

```

1.1.230.0/23      *[BGP/170] 03:13:19, localpref 100
                  AS path: 65500 I
                  > to 1.1.0.1 via fe-1/2/0.3
                  to 1.1.1.1 via fe-1/2/2.5
                  [BGP/170] 03:13:15, localpref 100, from 1.1.1.1
                  AS path: 65500 I
                  > to 1.1.0.1 via fe-1/2/0.3
                  to 1.1.1.1 via fe-1/2/2.5

```

**Meaning** When the **accept-remote-nexthop** statement is deactivated, the multipath route to the 1.1.230.0 network is removed from the routing table .

### Understanding the Advertisement of Multiple Paths to a Single Destination in BGP

---

BGP peers advertise routes to each other in update messages. BGP stores its routes in the Junos OS routing table (**inet.0**). For each prefix in the routing table, the routing protocol process selects a single best path, called the active path. Unless you configure BGP to advertise multiple paths to the same destination, BGP advertises only the active path.

Instead of advertising only the active path to a destination, you can configure BGP to advertise multiple paths to the destination. Within an autonomous system (AS), the availability of multiple exit points to reach a destination provides the following benefits:

- **Fault tolerance**—Path diversity leads to reduction in restoration time after failure. For instance, a border after receiving multiple paths to the same destination can precompute a backup path and have it ready so that when the primary path becomes invalid, the border routing device can use the backup to quickly restore connectivity. Without a backup path, the restoration time depends on BGP reconvergence, which includes withdraw and advertisement messages in the network before a new best path can be learned.
- **Load balancing**—The availability of multiple paths to reach the same destination enables load balancing of traffic, if the routing within the AS meets certain constraints.
- **Maintenance**—The availability of alternate exit points allows for graceful maintenance operation of routers.

The following limitations apply to advertising multiple routes in BGP:

- Address families supported:
  - IPv4 unicast (**family inet unicast**)
  - IPv6 unicast (**family inet6 unicast**)
  - IPv4 labeled unicast (**family inet labeled-unicast**)
  - IPv6 labeled unicast (**family inet6 labeled-unicast**)
- Internal BGP (IBGP) peers only. No support on external BGP (EBGP) peers.
- Master instance only. No support for routing instances.
- Graceful restart and nonstop active routing (NSR) are supported.
- No BGP Monitoring Protocol (BMP) support.

- No support for EBGP sessions between confederations.
- Prefix policies enable you to filter routes on a router that is configured to advertise multiple paths to a destination. Prefix policies can only match prefixes. They cannot match route attributes, and they cannot change the attributes of routes.

### Example: Advertising Multiple Paths in BGP

In this example, BGP routers are configured to advertise multiple paths instead of advertising only the active path. Advertising multiple paths in BGP is specified in Internet draft draft-ietf-idr-add-paths-04, *Advertisement of Multiple Paths in BGP*.

- [Overview on page 3495](#)
- [Configuration on page 3496](#)
- [Verification on page 3515](#)

#### Requirements

This example uses the following hardware and software components:

- Eight BGP-enabled devices.
- Five of the BGP-enabled devices do not necessarily need to be routers. For example, they can be EX Series Ethernet Switches.
- Three of the BGP-enabled devices are configured to send multiple paths or receive multiple paths (or both send and receive multiple paths). These three BGP-enabled devices must be M Series Multiservice Edge Routers, MX Series 3D Universal Edge Routers, or T Series Core Routers.
- The three routers must be running Junos OS Release 11.4 or later.

#### Overview

The following statements are used for configuring multiple paths to a destination:

```
[edit protocols bgp group group-name family family]
add-path {
  receive;
  send {
    path-count number;
    prefix-policy [ policy-names ];
  }
}
```

In this example, Router R5, Router R6, and Router R7 redistribute static routes into BGP. Router R1 and Router R4 are route reflectors. Router R2 and Router R3 are clients to Route Reflector R1. Router R8 is a client to Route Reflector R4.

Route reflection is optional when multiple-path advertisement is enabled in BGP.

With the **add-path send path-count 6** configuration, Router R1 is configured to send up to six paths (per destination) to Router R4.

With the **add-path receive** configuration, Router R4 is configured to receive multiple paths from Router R1.

With the **add-path send path-count 6** configuration, Router R4 is configured to send up to six paths to Router R8.

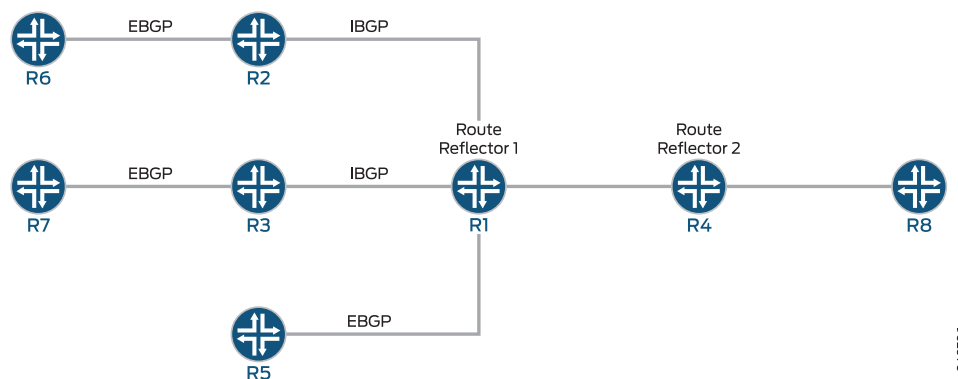

With the **add-path receive** configuration, Router R8 is configured to receive multiple paths from Router R4.

The **add-path send prefix-policy allow\_199** policy configuration (along with the corresponding route filter) limits Router R4 to sending multiple paths for only the 199.1.1.1/32 route.

### Topology Diagram

Figure 83 on page 3496 shows the topology used in this example.

```

### Configuring Router R1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Router R1:

1. Configure the interfaces to Router R2, Router R3, Router R4, and Router R5, and configure the loopback (lo0) interface.

```

[edit interfaces]
user@R1# set fe-0/0/0 unit 12 family inet address 10.0.12.1/24

user@R1# set fe-0/0/1 unit 13 family inet address 10.0.13.1/24

user@R1# set fe-1/0/0 unit 14 family inet address 10.0.14.1/24

user@R1# set fe-1/2/0 unit 15 family inet address 10.0.15.1/24

user@R1# set lo0 unit 10 family inet address 10.0.0.10/32

```

2. Configure BGP on the interfaces, and configure IBGP route reflection.

```

[edit protocols bgp]
user@R1# set group rr type internal
user@R1# set group rr local-address 10.0.0.10
user@R1# set group rr cluster 10.0.0.10
user@R1# set group rr neighbor 10.0.0.20
user@R1# set group rr neighbor 10.0.0.30

user@R1# set group rr_rr type internal
user@R1# set group rr_rr local-address 10.0.0.10

user@R1# set group e1 type external
user@R1# set group e1 neighbor 10.0.15.2 local-address 10.0.15.1
user@R1# set group e1 neighbor 10.0.15.2 peer-as 2

```

3. Configure Router R1 to send up to six paths to its neighbor, Router R4.

The destination of the paths can be any destination that Router R1 can reach through multiple paths.

```

[edit protocols bgp]
user@R1# set group rr_rr neighbor 10.0.0.40 family inet unicast add-path send
path-count 6

```

4. Configure OSPF on the interfaces.

```
[edit protocols ospf]
user@R1# set area 0.0.0.0 interface lo0.10 passive
user@R1# set area 0.0.0.0 interface fe-0/0/0.12
user@R1# set area 0.0.0.0 interface fe-0/0/1.13
user@R1# set area 0.0.0.0 interface fe-1/0/0.14
user@R1# set area 0.0.0.0 interface fe-1/2/0.15
```

5. Configure the router ID and the autonomous system number.

```
[edit routing-options]
user@R1# set router-id 10.0.0.10
user@R1# set autonomous-system 1
```

6. If you are done configuring the device, commit the configuration.

```
user@R1# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-0/0/0 {
  unit 12 {
    family inet {
      address 10.0.12.1/24;
    }
  }
}

        interface fe-0/0/1.13;
        interface fe-1/0/0.14;
        interface fe-1/2/0.15;
    }
}
}
user@R1# show routing-options
router-id 10.0.0.10;
autonomous-system 1;

```

### *Configuring Router R2*

#### **Step-by-Step Procedure**

To configure Router R2:

1. Configure the loopback (lo0) interface and the interfaces to Router R6 and Router R1.

```
[edit interfaces]
```

```
user@R2# set fe-1/2/0 unit 21 family inet address 10.0.12.2/24
```

```
user@R2# set fe-1/2/1 unit 26 family inet address 10.0.26.1/24
```

```
user@R2# set lo0 unit 20 family inet address 10.0.0.20/32
```

2. Configure BGP and OSPF on Router R2's interfaces.

```
[edit protocols]
```

```
user@R2# set bgp group rr type internal
```

```
user@R2# set bgp group rr local-address 10.0.0.20
```

```
user@R2# set bgp group e1 type external
```

```
user@R2# set bgp group e1 neighbor 10.0.26.2 peer-as 2
```

```
user@R2# set ospf area 0.0.0.0 interface lo0.20 passive
```

```
user@R2# set ospf area 0.0.0.0 interface fe-1/2/0.21
```

```
user@R2# set ospf area 0.0.0.0 interface fe-1/2/1.28
```

3. For routes sent from Router R2 to Router R1, advertise Router R2 as the next hop, because Router R1 does not have a route to Router R6's address on the 10.0.26.0/24 network.

```
[edit]
```

```
user@R2# set policy-options policy-statement set_nh_self then next-hop self
```

```
user@R2# set protocols bgp group rr neighbor 10.0.0.10 export set_nh_self
```

4. Configure the autonomous system number.

```
[edit]
```

```
user@R2# set routing-options autonomous-system 1
```

5. If you are done configuring the device, commit the configuration.

```
user@R2# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces

### Configuring Router R3

#### Step-by-Step Procedure

To configure Router R3:

1. Configure the loopback (lo0) interface and the interfaces to Router R7 and Router R1.

```
[edit interfaces]
```

```
user@R3# set fe-1/0/1 unit 31 family inet address 10.0.13.2/24
```

```
user@R3# set fe-1/0/2 unit 37 family inet address 10.0.37.1/24
```

```
user@R3# set lo0 unit 30 family inet address 10.0.0.30/32
```

2. Configure BGP and OSPF on Router R3's interfaces.

```
[edit protocols]
```

```
user@R3# set bgp group rr type internal
```

```
user@R3# set bgp group rr local-address 10.0.0.30
```

```
user@R3# set bgp group e1 type external
```

```
user@R3# set bgp group e1 neighbor 10.0.37.2 peer-as 2
```

```
user@R3# set ospf area 0.0.0.0 interface lo0.30 passive
```

```
user@R3# set ospf area 0.0.0.0 interface fe-1/0/1.31
```

```
user@R3# set ospf area 0.0.0.0 interface fe-1/0/2.37
```

3. For routes sent from Router R3 to Router R1, advertise Router R3 as the next hop, because Router R1 does not have a route to Router R7's address on the 10.0.37.0/24 network.

```
[edit]
```

```
user@R3# set policy-options policy-statement set_nh_self then next-hop self
```

```
user@R3# set protocols bgp group rr neighbor 10.0.0.10 export set_nh_self
```

4. Configure the autonomous system number.

```
[edit]
```

```
user@R3# set routing-options autonomous-system 1
```

5. If you are done configuring the device, commit the configuration.

```
user@R3# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
fe-1/0/1 {
  unit 31 {
    family inet {
      address 10.0.13.2/24;
```

```

    }
  }
}
fe-1/0/2 {
  unit 37 {
    family inet {
      address 10.0.37.1/24;
    }
  }
}
lo0 {
  unit 30 {
    family inet {
      address 10.0.0.30/32;
    }
  }
}
}

user@R3# show protocols

  then {
    next-hop self;
  }
}

user@R3# show routing-options
autonomous-system 1;

```

### ***Configuring Router R4***

#### **Step-by-Step Procedure**

To configure Router R4:

1. Configure the interfaces to Router R1 and Router R8, and configure the loopback (lo0) interface.

```
[edit interfaces]
```

```
user@R4# set fe-1/2/0 unit 41 family inet address 10.0.14.2/24
```

```
user@R4# set fe-1/2/1 unit 48 family inet address 10.0.48.1/24
```

```
user@R4# set lo0 unit 40 family inet address 10.0.0.40/32
```

2. Configure BGP on the interfaces, and configure IBGP route reflection.

```
[edit protocols bgp]
```

```
user@R4# set group rr type internal
```

```
user@R4# set group rr local-address 10.0.0.40
```

```
user@R4# set group rr neighbor 10.0.0.10
```

```
user@R4# set group rr_client type internal
```

```
user@R4# set group rr_client local-address 10.0.0.40
```

```
user@R4# set group rr_client cluster 10.0.0.40
```

3. Configure Router R4 to send up to six paths to its neighbor, Router R8.

The destination of the paths can be any destination that Router R4 can reach through multiple paths.

```
[edit protocols bgp]
```

```
user@R4# set group rr_client neighbor 10.0.0.80 family inet unicast add-path send  
path-count 6
```

4. Configure Router R4 to receive multiple paths from its neighbor, Router R1.

The destination of the paths can be any destination that Router R1 can reach through multiple paths.

```
[edit protocols bgp group rr family inet unicast]
```

```
user@R4# set add-path receive
```

5. Configure OSPF on the interfaces.

```
[edit protocols ospf area 0.0.0.0]
```

```
user@R4# set interface fe-1/2/0.41
```

```
user@R4# set interface lo0.40 passive
```

```
user@R4# set interface fe-1/2/1.48
```

6. Configure a policy that allows Router R4 to send Router R8 multiple paths to the 199.1.1.1/32 route.

- Router R4 receives multiple paths for the 198.1.1.1/32 route and the 199.1.1.1/32 route. However, because of this policy, Router R4 only sends multiple paths for the 199.1.1.1/32 route.

```
[edit protocols bgp group rr_client neighbor 10.0.0.80 family inet unicast]
```

```
user@R4# set add-path send prefix-policy allow_199
```

```
[edit policy-options policy-statement allow_199]
user@R4# set from route-filter 199.1.1/32 exact
user@R4# set then accept
```

- Router R4 can also be configured to send up-to 20 BGP **add-path** routes for a subset of *add-path advertised prefixes*.

```
[edit policy-options policy-statement allow_199]
user@R4# set term match_199 from prefix-list match_199
user@R4# set then add-path send-count 20
```

7. Configure the autonomous system number.

```
[edit routing-options]
user@R4# set autonomous-system 1
```

8. If you are done configuring the device, commit the configuration.

```
user@R4# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R4# show interfaces

        route-filter 199.1.1.1/32 exact;
    }
    from term match_199 {
        prefix-list match_199;
    }
    then add-path send-count 20;
    then accept;
}
}
user@R4# show routing-options
autonomous-system 1;
```

### Configuring Router R5

## Step-by-Step Procedure

To configure Router R5:

1. Configure the loopback (lo0) interface and the interface to Router R1.

[edit interfaces]

```
user@R5# set fe-1/2/0 unit 51 family inet address 10.0.15.2/24
```

```
user@R5# set lo0 unit 50 family inet address 10.0.0.50/32
```

2. Configure BGP on Router R5's interface.

```
[edit protocols bgp group e1]
user@R5# set type external
user@R5# set neighbor 10.0.15.1 peer-as 1
```

3. Create static routes for redistribution into BGP.

```
[edit routing-options]
user@R5# set static route 199.1.1.1/32 reject
user@R5# set static route 198.1.1.1/32 reject
```

4. Redistribute static and direct routes into BGP.

```
[edit protocols bgp group e1 neighbor 10.0.15.1]
user@R5# set export s2b
```

```
[edit policy-options policy-statement s2b]
user@R5# set from protocol static
user@R5# set from protocol direct
user@R5# set then as-path-expand 2
user@R5# set then accept
```

5. Configure the autonomous system number.

```
[edit routing-options]
user@R5# set autonomous-system 2
```

6. If you are done configuring the device, commit the configuration.

```
user@R5# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R5# show interfaces
fe-1/2/0 {
  unit 51 {
    family inet {
      address 10.0.15.2/24;
    }
  }
}
lo0 {
  unit 50 {
    family inet {
      address 10.0.0.50/32;
    }
  }
}

user@R5# show protocols
bgp {
  group e1 {
```

```
type external;
neighbor 10.0.15.1 {
    export s2b;
    peer-as 1;
}
}
}

user@R5# show policy-options
policy-statement s2b {
    from protocol [ static direct ];
    then {
        as-path-expand 2;
        accept;
    }
}

user@R5# show routing-options
static {
    route 198.1.1.1/32 reject;
    route 199.1.1.1/32 reject;
}
autonomous-system 2;
```

### ***Configuring Router R6***

#### **Step-by-Step Procedure**

To configure Router R6:

1. Configure the loopback (lo0) interface and the interface to Router R2.  
  
[edit interfaces]  
user@R6# set fe-1/2/0 unit 62 family inet address 10.0.26.2/24  
  
user@R6# set lo0 unit 60 family inet address 10.0.0.60/32
2. Configure BGP on Router R6's interface.  
  
[edit protocols]  
user@R6# set bgp group e1 type external  
user@R6# set bgp group e1 neighbor 10.0.26.1 peer-as 1
3. Create static routes for redistribution into BGP.  
  
[edit]  
user@R6# set routing-options static route 199.1.1.1/32 reject  
user@R6# set routing-options static route 198.1.1.1/32 reject
4. Redistribute static and direct routes from Router R6's routing table into BGP.  
  
[edit protocols bgp group e1 neighbor 10.0.26.1]  
user@R6# set export s2b  
  
[edit policy-options policy-statement s2b]  
user@R6# set from protocol static  
user@R6# set from protocol direct  
user@R6# set then accept

5. Configure the autonomous system number.

```
[edit routing-options]
user@R6# set autonomous-system 2
```

6. If you are done configuring the device, commit the configuration.

```
user@R6# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R6# show interfaces
fe-1/2/0 {
  unit 62 {
    family inet {
      address 10.0.26.2/24;
    }
  }
}
lo0 {
  unit 60 {
    family inet {
      address 10.0.0.60/32;
    }
  }
}

user@R6# show protocols
bgp {
  group e1 {
    type external;
    neighbor 10.0.26.1 {
      export s2b;
      peer-as 1;
    }
  }
}

user@R6# show policy-options

  route 198.1.1.1/32 reject;
  route 199.1.1.1/32 reject;
}
autonomous-system 2;
```

### *Configuring Router R7*

#### **Step-by-Step Procedure**

To configure Router R7:

1. Configure the loopback (lo0) interface and the interface to Router R3.  
  
[edit interfaces]  
user@R7# set fe-1/2/0 unit 73 family inet address 10.0.37.2/24  
  
user@R7# set lo0 unit 70 family inet address 10.0.0.70/32
2. Configure BGP on Router R7's interface.  
  
[edit protocols bgp group e1]  
user@R7# set type external  
user@R7# set neighbor 10.0.37.1 peer-as 1
3. Create a static route for redistribution into BGP.  
  
[edit]  
user@R7# set routing-options static route 199.1.1.1/32 reject
4. Redistribute static and direct routes from Router R7's routing table into BGP.  
  
[edit protocols bgp group e1 neighbor 10.0.37.1]  
user@R7# set export s2b  
  
[edit policy-options policy-statement s2b]  
user@R7# set from protocol static  
user@R7# set from protocol direct  
user@R7# set then accept
5. Configure the autonomous system number.  
  
[edit routing-options]  
user@R7# set autonomous-system 2
6. If you are done configuring the device, commit the configuration.  
  
user@R7# commit

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R7# show interfaces
fe-1/2/0 {
  unit 73 {
    family inet {
      address 10.0.37.2/24;
    }
  }
}
lo0 {
  unit 70 {
    family inet {
```

```

        address 10.0.0.70/32;
    }
}
}

user@R7# show protocols
bgp {
    group e1 {
        type external;
        neighbor 10.0.37.1 {
            export s2b;
            peer-as 1;
        }
    }
}

user@R7# show policy-options
policy-statement s2b {
    from protocol [ static direct ];
    then accept;
}

user@R7# show routing-options
static {
    route 199.1.1.1/32 reject;
}
autonomous-system 2;

```

### Configuring Router R8

#### Step-by-Step Procedure

To configure Router R8:

1. Configure the loopback (lo0) interface and the interface to Router R4.

```

[edit interfaces]
user@R8# set fe-1/2/0 unit 84 family inet address 10.0.48.2/24

user@R8# set lo0 unit 80 family inet address 10.0.0.80/32

```

2. Configure BGP and OSPF on Router R8's interface.

```

[edit protocols]
user@R8# set bgp group rr type internal
user@R8# set bgp group rr local-address 10.0.0.80

user@R8# set ospf area 0.0.0.0 interface lo0.80 passive
user@R8# set ospf area 0.0.0.0 interface fe-1/2/0.84

```

3. Configure Router R8 to receive multiple paths from its neighbor, Router R4.

The destination of the paths can be any destination that Router R4 can reach through multiple paths.

```

[edit protocols]
user@R8# set bgp group rr neighbor 10.0.0.40 family inet unicast add-path receive

```

4. Configure the autonomous system number.

```

[edit]

```

```
user@R8# set routing-options autonomous-system 1
```

5. If you are done configuring the device, commit the configuration.

```
user@R8# commit
```

### Results

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R8# show interfaces
fe-1/2/0 {
  unit 84 {
    family inet {
      address 10.0.48.2/24;
    }
  }
}
lo0 {
  unit 80 {
    family inet {
      address 10.0.0.80/32;
    }
  }
}

user@R8# show protocols
bgp {
  group rr {
    type internal;
    local-address 10.0.0.80;
    neighbor 10.0.0.40 {
      family inet {
        unicast {
          add-path {
            receive;
          }
        }
      }
    }
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.80 {
      passive;
    }
    interface fe-1/2/0.84;
  }
}

user@R8# show routing-options
autonomous-system 1;
```

**Verification**

Confirm that the configuration is working properly.

- [Verifying That the BGP Peers Have the Ability to Send and Receive Multiple Paths on page 3515](#)
- [Verifying That Router R1 Is Advertising Multiple Paths on page 3515](#)
- [Verifying That Router R4 Is Receiving and Advertising Multiple Paths on page 3516](#)
- [Verifying That Router R8 Is Receiving Multiple Paths on page 3517](#)
- [Checking the Path ID on page 3517](#)

**Verifying That the BGP Peers Have the Ability to Send and Receive Multiple Paths**

**Purpose** Make sure that one or both of the following strings appear in the output of the **show bgp neighbor** command:

- NLRI's for which peer can receive multiple paths: inet-unicast
- NLRI's for which peer can send multiple paths: inet-unicast

**Action**

```

user@R1> show bgp neighbor 10.0.0.40
Peer: 10.0.0.40+179 AS 1      Local: 10.0.0.10+65237 AS 1
  Type: Internal  State: Established  Flags: <Sync>
... NLRI's for which peer can receive multiple paths: inet-unicast
...

user@R4> show bgp neighbor 10.0.0.10
Peer: 10.0.0.10+65237 AS 1      Local: 10.0.0.40+179 AS 1

**Verifying That Router R1 Is Advertising Multiple Paths**

**Purpose** Make sure that multiple paths to the 198.1.1/32 destination and multiple paths to the 199.1.1/32 destination are advertised to Router R4.

**Action** user@R1> show route advertising-protocol bgp 10.0.0.40  
 inet.0: 21 destinations, 25 routes (21 active, 0 holddown, 0 hidden)

| Prefix         | Nexthop   | MED | Lc1pref | AS path |
|----------------|-----------|-----|---------|---------|
| * 10.0.0.50/32 | 10.0.15.2 |     | 100     | 2 2 I   |
| * 10.0.0.60/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 10.0.0.70/32 | 10.0.0.30 |     | 100     | 2 I     |
| * 198.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 199.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.0.30 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 200.1.1.0/30 | 10.0.0.20 |     | 100     | 2 I     |

**Meaning** When you see one prefix and more than one next hop, it means that multiple paths are advertised to Router R4.

#### *Verifying That Router R4 Is Receiving and Advertising Multiple Paths*

**Purpose** Make sure that multiple paths to the 199.1.1.1/32 destination are received from Router R1 and advertised to Router R8. Make sure that multiple paths to the 198.1.1.1/32 destination are received from Router R1, but only one path to this destination is advertised to Router R8.

**Action** user@R4> show route receive-protocol bgp 10.0.0.10  
 inet.0: 19 destinations, 22 routes (19 active, 0 holddown, 0 hidden)

| Prefix         | Nexthop   | MED | Lc1pref | AS path |
|----------------|-----------|-----|---------|---------|
| * 10.0.0.50/32 | 10.0.15.2 |     | 100     | 2 2 I   |
| * 10.0.0.60/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 10.0.0.70/32 | 10.0.0.30 |     | 100     | 2 I     |
| * 198.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 199.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.0.30 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 200.1.1.0/30 | 10.0.0.20 |     | 100     | 2 I     |

user@R4> show route advertising-protocol bgp 10.0.0.80  
 inet.0: 19 destinations, 22 routes (19 active, 0 holddown, 0 hidden)

| Prefix         | Nexthop   | MED | Lc1pref | AS path |
|----------------|-----------|-----|---------|---------|
| * 10.0.0.50/32 | 10.0.15.2 |     | 100     | 2 2 I   |
| * 10.0.0.60/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 10.0.0.70/32 | 10.0.0.30 |     | 100     | 2 I     |
| * 198.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 199.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.0.30 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 200.1.1.0/30 | 10.0.0.20 |     | 100     | 2 I     |

**Meaning** The **show route receive-protocol** command shows that Router R4 receives two paths to the 198.1.1.1/32 destination and three paths to the 199.1.1.1/32 destination. The **show route advertising-protocol** command shows that Router R4 advertises only one path to the 198.1.1.1/32 destination and advertises all three paths to the 199.1.1.1/32 destination.

Because of the prefix policy that is applied to Router R4, Router R4 does not advertise multiple paths to the 198.1.1.1/32 destination. Router R4 advertises only one path to the 198.1.1.1/32 destination even though it receives multiple paths to this destination.

### *Verifying That Router R8 Is Receiving Multiple Paths*

**Purpose** Make sure that Router R8 receives multiple paths to the 199.1.1.1/32 destination through Router R4. Make sure that Router R8 receives only one path to the 198.1.1.1/32 destination through Router R4.

**Action** user@R8> show route receive-protocol bgp 10.0.0.40  
 inet.0: 18 destinations, 20 routes (18 active, 0 holddown, 0 hidden)

| Prefix         | Nexthop   | MED | Lc1pref | AS path |
|----------------|-----------|-----|---------|---------|
| * 10.0.0.50/32 | 10.0.15.2 |     | 100     | 2 2 I   |
| * 10.0.0.60/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 10.0.0.70/32 | 10.0.0.30 |     | 100     | 2 I     |
| * 198.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 199.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.0.30 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 200.1.1.0/30 | 10.0.0.20 |     | 100     | 2 I     |

### *Checking the Path ID*

**Purpose** On the downstream devices, Router R4 and Router R8, verify that a path ID uniquely identifies the path. Look for the **Addpath Path ID:** string.

**Action** user@R4> show route 199.1.1.1/32 detail

```

  - [BGP Configuration Overview](#)

## Example: Advertising Multiple Paths in BGP

In this example, BGP routers are configured to advertise multiple paths instead of advertising only the active path. Advertising multiple paths in BGP is specified in Internet draft draft-ietf-idr-add-paths-04, *Advertisement of Multiple Paths in BGP*.

- [Requirements on page 3520](#)
- [Overview on page 3520](#)
- [Configuration on page 3521](#)
- [Verification on page 3540](#)

### Requirements

---

This example uses the following hardware and software components:

- Eight BGP-enabled devices.
- Five of the BGP-enabled devices do not necessarily need to be routers. For example, they can be EX Series Ethernet Switches.
- Three of the BGP-enabled devices are configured to send multiple paths or receive multiple paths (or both send and receive multiple paths). These three BGP-enabled devices must be M Series Multiservice Edge Routers, MX Series 3D Universal Edge Routers, or T Series Core Routers.
- The three routers must be running Junos OS Release 11.4 or later.

### Overview

---

The following statements are used for configuring multiple paths to a destination:

```
[edit protocols bgp group group-name family family]  
add-path {  
  receive;  
  send {  
    path-count number;  
    prefix-policy [ policy-names ];  
  }  
}
```

In this example, Router R5, Router R6, and Router R7 redistribute static routes into BGP. Router R1 and Router R4 are route reflectors. Router R2 and Router R3 are clients to Route Reflector R1. Router R8 is a client to Route Reflector R4.

Route reflection is optional when multiple-path advertisement is enabled in BGP.

With the **add-path send path-count 6** configuration, Router R1 is configured to send up to six paths (per destination) to Router R4.

With the **add-path receive** configuration, Router R4 is configured to receive multiple paths from Router R1.

With the **add-path send path-count 6** configuration, Router R4 is configured to send up to six paths to Router R8.

With the **add-path receive** configuration, Router R8 is configured to receive multiple paths from Router R4.

The **add-path send prefix-policy allow\_199** policy configuration (along with the corresponding route filter) limits Router R4 to sending multiple paths for only the 199.1.1.1/32 route.

### Topology Diagram

Figure 83 on page 3496 shows the topology used in this example.

set protocols bgp group rr local-address 10.0.0.80
set protocols bgp group rr neighbor 10.0.0.40 family inet unicast add-path receive
set protocols ospf area 0.0.0.0 interface lo0.80 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.84
set routing-options autonomous-system 1
```

### *Configuring Router R1*

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Router R1:

1. Configure the interfaces to Router R2, Router R3, Router R4, and Router R5, and configure the loopback (lo0) interface.

```
[edit interfaces]
```

```
user@R1# set fe-0/0/0 unit 12 family inet address 10.0.12.1/24
```

```
user@R1# set fe-0/0/1 unit 13 family inet address 10.0.13.1/24
```

```
user@R1# set fe-1/0/0 unit 14 family inet address 10.0.14.1/24
```

```
user@R1# set fe-1/2/0 unit 15 family inet address 10.0.15.1/24
```

```
user@R1# set lo0 unit 10 family inet address 10.0.0.10/32
```

2. Configure BGP on the interfaces, and configure IBGP route reflection.

```
[edit protocols bgp]
```

```
user@R1# set group rr type internal
```

```
user@R1# set group rr local-address 10.0.0.10
```

```
user@R1# set group rr cluster 10.0.0.10
```

```
user@R1# set group rr neighbor 10.0.0.20
```

```
user@R1# set group rr neighbor 10.0.0.30
```

```
user@R1# set group rr_rr type internal
```

```
user@R1# set group rr_rr local-address 10.0.0.10
```

```
user@R1# set group e1 type external
```

```
user@R1# set group e1 neighbor 10.0.15.2 local-address 10.0.15.1
```

```
user@R1# set group e1 neighbor 10.0.15.2 peer-as 2
```

3. Configure Router R1 to send up to six paths to its neighbor, Router R4.

The destination of the paths can be any destination that Router R1 can reach through multiple paths.

```
[edit protocols bgp]
```

```
user@R1# set group rr_rr neighbor 10.0.0.40 family inet unicast add-path send
path-count 6
```

4. Configure OSPF on the interfaces.

```
[edit protocols ospf]
user@R1# set area 0.0.0.0 interface lo0.10 passive
user@R1# set area 0.0.0.0 interface fe-0/0/0.12
user@R1# set area 0.0.0.0 interface fe-0/0/1.13
user@R1# set area 0.0.0.0 interface fe-1/0/0.14
user@R1# set area 0.0.0.0 interface fe-1/2/0.15
```

5. Configure the router ID and the autonomous system number.

```
[edit routing-options]
user@R1# set router-id 10.0.0.10
user@R1# set autonomous-system 1
```

6. If you are done configuring the device, commit the configuration.

```
user@R1# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-0/0/0 {
  unit 12 {
    family inet {
      address 10.0.12.1/24;
    }
  }
}
fe-0/0/1 {
  unit 13 {
    family inet {
      address 10.0.13.1/24;
    }
  }
}
fe-1/0/0 {
  unit 14 {
    family inet {
      address 10.0.14.1/24;
    }
  }
}
fe-1/2/0 {
  unit 15 {
    family inet {
      address 10.0.15.1/24;
    }
  }
}
```

```
lo0 {
  unit 10 {
    family inet {
      address 10.0.0.10/32;
    }
  }
}

user@R1# show protocols
bgp {
  group rr {
    type internal;
    local-address 10.0.0.10;
    cluster 10.0.0.10;
    neighbor 10.0.0.20;
    neighbor 10.0.0.30;
  }
  group e1 {
    type external;
    neighbor 10.0.15.2 {
      local-address 10.0.15.1;
      peer-as 2;
    }
  }
  group rr_rr {
    type internal;
    local-address 10.0.0.10;
    neighbor 10.0.0.40 {
      family inet {
        unicast {
          add-path {
            send {
              path-count 6;
            }
          }
        }
      }
    }
  }
}

ospf {
  area 0.0.0.0 {
    interface lo0.10 {
      passive;
    }
    interface fe-0/0/0.12;
    interface fe-0/0/1.13;
    interface fe-1/0/0.14;
    interface fe-1/2/0.15;
  }
}

user@R1# show routing-options
router-id 10.0.0.10;
autonomous-system 1;
```

**Configuring Router R2****Step-by-Step Procedure**

To configure Router R2:

1. Configure the loopback (lo0) interface and the interfaces to Router R6 and Router R1.

```
[edit interfaces]
```

```
user@R2# set fe-1/2/0 unit 21 family inet address 10.0.12.2/24
```

```
user@R2# set fe-1/2/1 unit 26 family inet address 10.0.26.1/24
```

```
user@R2# set lo0 unit 20 family inet address 10.0.0.20/32
```

2. Configure BGP and OSPF on Router R2's interfaces.

```
[edit protocols]
```

```
user@R2# set bgp group rr type internal
```

```
user@R2# set bgp group rr local-address 10.0.0.20
```

```
user@R2# set bgp group e1 type external
```

```
user@R2# set bgp group e1 neighbor 10.0.26.2 peer-as 2
```

```
user@R2# set ospf area 0.0.0.0 interface lo0.20 passive
```

```
user@R2# set ospf area 0.0.0.0 interface fe-1/2/0.21
```

```
user@R2# set ospf area 0.0.0.0 interface fe-1/2/1.28
```

3. For routes sent from Router R2 to Router R1, advertise Router R2 as the next hop, because Router R1 does not have a route to Router R6's address on the 10.0.26.0/24 network.

```
[edit]
```

```
user@R2# set policy-options policy-statement set_nh_self then next-hop self
```

```
user@R2# set protocols bgp group rr neighbor 10.0.0.10 export set_nh_self
```

4. Configure the autonomous system number.

```
[edit]
```

```
user@R2# set routing-options autonomous-system 1
```

5. If you are done configuring the device, commit the configuration.

```
user@R2# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 21 {
    family inet {
      address 10.0.12.2/24;
```

```
    }
  }
}
fe-1/2/1 {
  unit 26 {
    family inet {
      address 10.0.26.1/24;
    }
  }
}
lo0 {
  unit 20 {
    family inet {
      address 10.0.0.20/32;
    }
  }
}

user@R2# show protocols
bgp {
  group rr {
    type internal;
    local-address 10.0.0.20;
    neighbor 10.0.0.10 {
      export set_nh_self;
    }
  }
  group e1 {
    type external;
    neighbor 10.0.26.2 {
      peer-as 2;
    }
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.20 {
      passive;
    }
    interface fe-1/2/0.21;
    interface fe-1/2/1.28;
  }
}

user@R2# show policy-options
policy-statement set_nh_self {
  then {
    next-hop self;
  }
}

user@R2# show routing-options
autonomous-system 1;
```

**Configuring Router R3****Step-by-Step Procedure**

To configure Router R3:

1. Configure the loopback (lo0) interface and the interfaces to Router R7 and Router R1.

```
[edit interfaces]
```

```
user@R3# set fe-1/0/1 unit 31 family inet address 10.0.13.2/24
```

```
user@R3# set fe-1/0/2 unit 37 family inet address 10.0.37.1/24
```

```
user@R3# set lo0 unit 30 family inet address 10.0.0.30/32
```

2. Configure BGP and OSPF on Router R3's interfaces.

```
[edit protocols]
```

```
user@R3# set bgp group rr type internal
```

```
user@R3# set bgp group rr local-address 10.0.0.30
```

```
user@R3# set bgp group e1 type external
```

```
user@R3# set bgp group e1 neighbor 10.0.37.2 peer-as 2
```

```
user@R3# set ospf area 0.0.0.0 interface lo0.30 passive
```

```
user@R3# set ospf area 0.0.0.0 interface fe-1/0/1.31
```

```
user@R3# set ospf area 0.0.0.0 interface fe-1/0/2.37
```

3. For routes sent from Router R3 to Router R1, advertise Router R3 as the next hop, because Router R1 does not have a route to Router R7's address on the 10.0.37.0/24 network.

```
[edit]
```

```
user@R3# set policy-options policy-statement set_nh_self then next-hop self
```

```
user@R3# set protocols bgp group rr neighbor 10.0.0.10 export set_nh_self
```

4. Configure the autonomous system number.

```
[edit]
```

```
user@R3# set routing-options autonomous-system 1
```

5. If you are done configuring the device, commit the configuration.

```
user@R3# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
fe-1/0/1 {
  unit 31 {
    family inet {
      address 10.0.13.2/24;
```

```
    }  
  }  
}  
fe-1/0/2 {  
  unit 37 {  
    family inet {  
      address 10.0.37.1/24;  
    }  
  }  
}  
lo0 {  
  unit 30 {  
    family inet {  
      address 10.0.0.30/32;  
    }  
  }  
}  
}  
  
user@R3# show protocols  
bgp {  
  group rr {  
    type internal;  
    local-address 10.0.0.30;  
    neighbor 10.0.0.10 {  
      export set_nh_self;  
    }  
  }  
  group e1 {  
    type external;  
    neighbor 10.0.37.2 {  
      peer-as 2;  
    }  
  }  
}  
ospf {  
  area 0.0.0.0 {  
    interface lo0.30 {  
      passive;  
    }  
    interface fe-1/0/1.31;  
    interface fe-1/0/2.37;  
  }  
}  
  
user@R3# show policy-options  
policy-statement set_nh_self {  
  then {  
    next-hop self;  
  }  
}  
  
user@R3# show routing-options  
autonomous-system 1;
```

**Configuring Router R4****Step-by-Step Procedure**

To configure Router R4:

1. Configure the interfaces to Router R1 and Router R8, and configure the loopback (lo0) interface.

```
[edit interfaces]
```

```
user@R4# set fe-1/2/0 unit 41 family inet address 10.0.14.2/24
```

```
user@R4# set fe-1/2/1 unit 48 family inet address 10.0.48.1/24
```

```
user@R4# set lo0 unit 40 family inet address 10.0.0.40/32
```

2. Configure BGP on the interfaces, and configure IBGP route reflection.

```
[edit protocols bgp]
```

```
user@R4# set group rr type internal
```

```
user@R4# set group rr local-address 10.0.0.40
```

```
user@R4# set group rr neighbor 10.0.0.10
```

```
user@R4# set group rr_client type internal
```

```
user@R4# set group rr_client local-address 10.0.0.40
```

```
user@R4# set group rr_client cluster 10.0.0.40
```

3. Configure Router R4 to send up to six paths to its neighbor, Router R8.

The destination of the paths can be any destination that Router R4 can reach through multiple paths.

```
[edit protocols bgp]
```

```
user@R4# set group rr_client neighbor 10.0.0.80 family inet unicast add-path send path-count 6
```

4. Configure Router R4 to receive multiple paths from its neighbor, Router R1.

The destination of the paths can be any destination that Router R1 can reach through multiple paths.

```
[edit protocols bgp group rr family inet unicast]
```

```
user@R4# set add-path receive
```

5. Configure OSPF on the interfaces.

```
[edit protocols ospf area 0.0.0.0]
```

```
user@R4# set interface fe-1/2/0.41
```

```
user@R4# set interface lo0.40 passive
```

```
user@R4# set interface fe-1/2/1.48
```

6. Configure a policy that allows Router R4 to send Router R8 multiple paths to the 199.1.1.1/32 route.

- Router R4 receives multiple paths for the 198.1.1.1/32 route and the 199.1.1.1/32 route. However, because of this policy, Router R4 only sends multiple paths for the 199.1.1.1/32 route.

```
[edit protocols bgp group rr_client neighbor 10.0.0.80 family inet unicast]
```

```
user@R4# set add-path send prefix-policy allow_199
```

```
[edit policy-options policy-statement allow_199]
user@R4# set from route-filter 199.1.1/32 exact
user@R4# set then accept
```

- Router R4 can also be configured to send up-to 20 BGP **add-path** routes for a subset of *add-path advertised prefixes*.

```
[edit policy-options policy-statement allow_199]
user@R4# set term match_199 from prefix-list match_199
user@R4# set then add-path send-count 20
```

7. Configure the autonomous system number.

```
[edit routing-options]
user@R4# set autonomous-system 1
```

8. If you are done configuring the device, commit the configuration.

```
user@R4# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R4# show interfaces
fe-1/2/0 {
  unit 41 {
    family inet {
      address 10.0.14.2/24;
    }
  }
}
fe-1/2/1 {
  unit 48 {
    family inet {
      address 10.0.48.1/24;
    }
  }
}
lo0 {
  unit 40 {
    family inet {
      address 10.0.0.40/32;
    }
  }
}
```

```
user@R4# show protocols
bgp {
  group rr {
    type internal;
    local-address 10.0.0.40;
    family inet {
      unicast {
        add-path {
          receive;
        }
      }
    }
  }
}
```

### Configuring Router R5

To configure Router R5:

- 
- Copyright © 2014, Juniper Networks, Inc. 3533

```
user@R5# set lo0 unit 50 family inet address 10.0.0.50/32
```

2. Configure BGP on Router R5's interface.

```
[edit protocols bgp group e1]
user@R5# set type external
user@R5# set neighbor 10.0.15.1 peer-as 1
```

3. Create static routes for redistribution into BGP.

```
[edit routing-options]
user@R5# set static route 199.1.1.1/32 reject
user@R5# set static route 198.1.1.1/32 reject
```

4. Redistribute static and direct routes into BGP.

```
[edit protocols bgp group e1 neighbor 10.0.15.1]
user@R5# set export s2b
```

```
[edit policy-options policy-statement s2b]
user@R5# set from protocol static
user@R5# set from protocol direct
user@R5# set then as-path-expand 2
user@R5# set then accept
```

5. Configure the autonomous system number.

```
[edit routing-options]
user@R5# set autonomous-system 2
```

6. If you are done configuring the device, commit the configuration.

```
user@R5# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R5# show interfaces
fe-1/2/0 {
  unit 51 {
    family inet {
      address 10.0.15.2/24;
    }
  }
}
lo0 {
  unit 50 {
    family inet {
      address 10.0.0.50/32;
    }
  }
}

user@R5# show protocols
bgp {
  group e1 {
```

```

        type external;
        neighbor 10.0.15.1 {
            export s2b;
            peer-as 1;
        }
    }
}

user@R5# show policy-options
policy-statement s2b {
    from protocol [ static direct ];
    then {
        as-path-expand 2;
        accept;
    }
}

user@R5# show routing-options
static {
    route 198.1.1.1/32 reject;
    route 199.1.1.1/32 reject;
}
autonomous-system 2;

```

### Configuring Router R6

#### Step-by-Step Procedure

To configure Router R6:

1. Configure the loopback (lo0) interface and the interface to Router R2.
 

```

[edit interfaces]
user@R6# set fe-1/2/0 unit 62 family inet address 10.0.26.2/24

user@R6# set lo0 unit 60 family inet address 10.0.0.60/32

```
2. Configure BGP on Router R6's interface.
 

```

[edit protocols]
user@R6# set bgp group e1 type external
user@R6# set bgp group e1 neighbor 10.0.26.1 peer-as 1

```
3. Create static routes for redistribution into BGP.
 

```

[edit]
user@R6# set routing-options static route 199.1.1.1/32 reject
user@R6# set routing-options static route 198.1.1.1/32 reject

```
4. Redistribute static and direct routes from Router R6's routing table into BGP.
 

```

[edit protocols bgp group e1 neighbor 10.0.26.1]
user@R6# set export s2b

[edit policy-options policy-statement s2b]
user@R6# set from protocol static
user@R6# set from protocol direct
user@R6# set then accept

```

5. Configure the autonomous system number.

```
[edit routing-options]
user@R6# set autonomous-system 2
```

6. If you are done configuring the device, commit the configuration.

```
user@R6# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R6# show interfaces
fe-1/2/0 {
  unit 62 {
    family inet {
      address 10.0.26.2/24;
    }
  }
}
lo0 {
  unit 60 {
    family inet {
      address 10.0.0.60/32;
    }
  }
}

```

*Configuring Router R7***Step-by-Step Procedure**

To configure Router R7:

1. Configure the loopback (lo0) interface and the interface to Router R3.  
  

```
[edit interfaces]
user@R7# set fe-1/2/0 unit 73 family inet address 10.0.37.2/24

user@R7# set lo0 unit 70 family inet address 10.0.0.70/32
```
2. Configure BGP on Router R7's interface.  
  

```
[edit protocols bgp group e1]
user@R7# set type external
user@R7# set neighbor 10.0.37.1 peer-as 1
```
3. Create a static route for redistribution into BGP.  
  

```
[edit]
user@R7# set routing-options static route 199.1.1.1/32 reject
```
4. Redistribute static and direct routes from Router R7's routing table into BGP.  
  

```
[edit protocols bgp group e1 neighbor 10.0.37.1]
user@R7# set export s2b

[edit policy-options policy-statement s2b]
user@R7# set from protocol static
user@R7# set from protocol direct
user@R7# set then accept
```
5. Configure the autonomous system number.  
  

```
[edit routing-options]
user@R7# set autonomous-system 2
```
6. If you are done configuring the device, commit the configuration.  
  

```
user@R7# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R7# show interfaces
fe-1/2/0 {
  unit 73 {
    family inet {
      address 10.0.37.2/24;
    }
  }
}
lo0 {
  unit 70 {
    family inet {
```

```
        address 10.0.0.70/32;
    }
}

user@R7# show protocols
bgp {
    group e1 {
        type external;
        neighbor 10.0.37.1 {
            export s2b;
            peer-as 1;
        }
    }
}

user@R7# show policy-options
policy-statement s2b {
    from protocol [ static direct ];
    then accept;
}

user@R7# show routing-options
static {
    route 199.1.1.1/32 reject;
}
autonomous-system 2;
```

### ***Configuring Router R8***

#### **Step-by-Step Procedure**

To configure Router R8:

1. Configure the loopback (lo0) interface and the interface to Router R4.

[edit interfaces]

```
user@R8# set fe-1/2/0 unit 84 family inet address 10.0.48.2/24
```

```
user@R8# set lo0 unit 80 family inet address 10.0.0.80/32
```

2. Configure BGP and OSPF on Router R8's interface.

[edit protocols]

```
user@R8# set bgp group rr type internal
```

```
user@R8# set bgp group rr local-address 10.0.0.80
```

```
user@R8# set ospf area 0.0.0.0 interface lo0.80 passive
```

```
user@R8# set ospf area 0.0.0.0 interface fe-1/2/0.84
```

3. Configure Router R8 to receive multiple paths from its neighbor, Router R4.

The destination of the paths can be any destination that Router R4 can reach through multiple paths.

[edit protocols]

```
user@R8# set bgp group rr neighbor 10.0.0.40 family inet unicast add-path receive
```

4. Configure the autonomous system number.

[edit]

```
user@R8# set routing-options autonomous-system 1
```

5. If you are done configuring the device, commit the configuration.

```
user@R8# commit
```

### Results

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R8# show interfaces
fe-1/2/0 {
  unit 84 {
    family inet {
      address 10.0.48.2/24;
    }
  }
}
lo0 {
  unit 80 {
    family inet {
      address 10.0.0.80/32;
    }
  }
}

user@R8# show protocols
bgp {
  group rr {
    type internal;
    local-address 10.0.0.80;
    neighbor 10.0.0.40 {
      family inet {
        unicast {
          add-path {
            receive;
          }
        }
      }
    }
  }
}

ospf {
  area 0.0.0.0 {
    interface lo0.80 {
      passive;
    }
    interface fe-1/2/0.84;
  }
}

user@R8# show routing-options
autonomous-system 1;
```

## Verification

---

Confirm that the configuration is working properly.

- [Verifying That the BGP Peers Have the Ability to Send and Receive Multiple Paths on page 3540](#)
- [Verifying That Router R1 Is Advertising Multiple Paths on page 3540](#)
- [Verifying That Router R4 Is Receiving and Advertising Multiple Paths on page 3541](#)
- [Verifying That Router R8 Is Receiving Multiple Paths on page 3542](#)
- [Checking the Path ID on page 3542](#)

### *Verifying That the BGP Peers Have the Ability to Send and Receive Multiple Paths*

**Purpose** Make sure that one or both of the following strings appear in the output of the **show bgp neighbor** command:

- NLRI's for which peer can receive multiple paths: inet-unicast
- NLRI's for which peer can send multiple paths: inet-unicast

**Action**

```
user@R1> show bgp neighbor 10.0.0.40
Peer: 10.0.0.40+179 AS 1      Local: 10.0.0.10+65237 AS 1
Type: Internal    State: Established    Flags: <Sync>
... NLRI's for which peer can receive multiple paths: inet-unicast
...

user@R4> show bgp neighbor 10.0.0.10
Peer: 10.0.0.10+65237 AS 1    Local: 10.0.0.40+179 AS 1
Type: Internal    State: Established    Flags: <Sync>
...
NLRI's for which peer can send multiple paths: inet-unicast
...

user@R4> show bgp neighbor 10.0.0.80
Peer: 10.0.0.80+55416 AS 1    Local: 10.0.0.40+179 AS 1
Type: Internal    State: Established (route reflector client)Flags: <Sync>
...
NLRI's for which peer can receive multiple paths: inet-unicast
...

user@R8> show bgp neighbor 10.0.0.40
Peer: 10.0.0.40+179 AS 1      Local: 10.0.0.80+55416 AS 1
Type: Internal    State: Established    Flags: <Sync>
...
NLRI's for which peer can send multiple paths: inet-unicast
...
```

### *Verifying That Router R1 Is Advertising Multiple Paths*

**Purpose** Make sure that multiple paths to the 198.1.1.1/32 destination and multiple paths to the 199.1.1.1/32 destination are advertised to Router R4.

**Action** user@R1> show route advertising-protocol bgp 10.0.0.40  
 inet.0: 21 destinations, 25 routes (21 active, 0 holddown, 0 hidden)

| Prefix         | Nexthop   | MED | Lc1pref | AS path |
|----------------|-----------|-----|---------|---------|
| * 10.0.0.50/32 | 10.0.15.2 |     | 100     | 2 2 I   |
| * 10.0.0.60/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 10.0.0.70/32 | 10.0.0.30 |     | 100     | 2 I     |
| * 198.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 199.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.0.30 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 200.1.1.0/30 | 10.0.0.20 |     | 100     | 2 I     |

**Meaning** When you see one prefix and more than one next hop, it means that multiple paths are advertised to Router R4.

### *Verifying That Router R4 Is Receiving and Advertising Multiple Paths*

**Purpose** Make sure that multiple paths to the 199.1.1.1/32 destination are received from Router R1 and advertised to Router R8. Make sure that multiple paths to the 198.1.1.1/32 destination are received from Router R1, but only one path to this destination is advertised to Router R8.

**Action** user@R4> show route receive-protocol bgp 10.0.0.10  
 inet.0: 19 destinations, 22 routes (19 active, 0 holddown, 0 hidden)

| Prefix         | Nexthop   | MED | Lc1pref | AS path |
|----------------|-----------|-----|---------|---------|
| * 10.0.0.50/32 | 10.0.15.2 |     | 100     | 2 2 I   |
| * 10.0.0.60/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 10.0.0.70/32 | 10.0.0.30 |     | 100     | 2 I     |
| * 198.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 199.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.0.30 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 200.1.1.0/30 | 10.0.0.20 |     | 100     | 2 I     |

user@R4> show route advertising-protocol bgp 10.0.0.80  
 inet.0: 19 destinations, 22 routes (19 active, 0 holddown, 0 hidden)

| Prefix         | Nexthop   | MED | Lc1pref | AS path |
|----------------|-----------|-----|---------|---------|
| * 10.0.0.50/32 | 10.0.15.2 |     | 100     | 2 2 I   |
| * 10.0.0.60/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 10.0.0.70/32 | 10.0.0.30 |     | 100     | 2 I     |
| * 198.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 199.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.0.30 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 200.1.1.0/30 | 10.0.0.20 |     | 100     | 2 I     |

**Meaning** The **show route receive-protocol** command shows that Router R4 receives two paths to the 198.1.1.1/32 destination and three paths to the 199.1.1.1/32 destination. The **show route advertising-protocol** command shows that Router R4 advertises only one path to the 198.1.1.1/32 destination and advertises all three paths to the 199.1.1.1/32 destination.

Because of the prefix policy that is applied to Router R4, Router R4 does not advertise multiple paths to the 198.1.1.1/32 destination. Router R4 advertises only one path to the 198.1.1.1/32 destination even though it receives multiple paths to this destination.

### ***Verifying That Router R8 Is Receiving Multiple Paths***

**Purpose** Make sure that Router R8 receives multiple paths to the 199.1.1.1/32 destination through Router R4. Make sure that Router R8 receives only one path to the 198.1.1.1/32 destination through Router R4.

**Action** user@R8> **show route receive-protocol bgp 10.0.0.40**  
inet.0: 18 destinations, 20 routes (18 active, 0 holddown, 0 hidden)  
Prefix Nexthop MED Lc1pref AS path  
\* 10.0.0.50/32 10.0.15.2 100 2 2 I  
\* 10.0.0.60/32 10.0.0.20 100 2 I  
\* 10.0.0.70/32 10.0.0.30 100 2 I  
\* 198.1.1.1/32 10.0.0.20 100 2 I  
\* 199.1.1.1/32 10.0.0.20 100 2 I  
10.0.0.30 100 2 I  
10.0.15.2 100 2 2 I  
\* 200.1.1.0/30 10.0.0.20 100 2 I

### ***Checking the Path ID***

**Purpose** On the downstream devices, Router R4 and Router R8, verify that a path ID uniquely identifies the path. Look for the **Addpath Path ID:** string.

**Action** user@R4> show route 199.1.1.1/32 detail

```
inet.0: 18 destinations, 20 routes (18 active, 0 holddown, 0 hidden)

## Configuring ECMP Next Hops for RSVP and LDP LSPs for Load Balancing

The Junos OS supports configurations of 16, 32, or 64 equal-cost multipath (ECMP) next hops for RSVP and LDP LSPs on M10i routers with an Enhanced CFEB, M320, M120, MX Series, and T Series routers, and routing devices. For networks with high-volume traffic, this provides more flexibility to load-balance the traffic over as many as 64 LSPs.

To configure the maximum limit for ECMP next hops, include the **maximum-ecmp next-hops** statement at the **[edit chassis]** hierarchy level:

```
[edit chassis]
maximum-ecmp next-hops;
```

You can configure a maximum ECMP next-hop limit of 16, 32, or 64 using this statement. The default limit is 16.

**NOTE:** MX Series routers with one or more Modular Port Concentrator (MPC) cards and with Junos OS 11.4 or earlier installed, support the configuration of the **maximum-ecmp** statement with only 16 next hops. You should *not* configure the **maximum-ecmp** statement with 32 or 64 next hops. When you commit the configuration with 32 or 64 next hops, the following warning message appears:

**Error: Number of members in Unilist NH exceeds the maximum supported 16 on Trio.**

The following types of routes support the ECMP maximum next-hop configuration for as many as 64 ECMP gateways:

- Static IPv4 and IPv6 routes with direct and indirect next-hop ECMPs
- LDP ingress and transit routes learned through associated IGP routes
- RSVP ECMP next hops created for LSPs
- OSPF IPv4 and IPv6 route ECMPs
- ISIS IPv4 and IPv6 route ECMPs
- EBGp IPv4 and IPv6 route ECMPs
- IBGP (resolving over IGP routes) IPv4 and IPv6 route ECMPs

The enhanced ECMP limit of up to 64 ECMP next hops is also applicable for Layer 3 VPNs, Layer 2 VPNs, Layer 2 circuits, and VPLS services that resolve over an MPLS route, because the available ECMP paths in the MPLS route can also be used by such traffic.

**NOTE:**

The following FPCs on M320, T640, and T1600 routers only support 16 ECMP next hops:

- (M320, T640, and T1600 routers only) Enhanced II FPC1
- (M320, T640, and T1600 routers only) Enhanced II FPC2
- (M320 and T640 routers only) Enhanced II FPC3
- (T640 and T1600 routers only) FPC2
- (T640 and T1600 routers only) FPC3

If a maximum ECMP next-hop limit of 32 or 64 is configured on an M320, T640, or T1600 router with any of these FPCs installed, the Packet Forwarding Engines on these FPCs use only the first 16 ECMP next hops. For Packet Forwarding Engines on FPCs that support only 16 ECMP next hops, the Junos OS generates a system log message if a maximum ECMP next-hop limit of 32 or 64 is configured. However, for Packet Forwarding Engines on other FPCs installed on the router, a maximum configured ECMP limit of 32 or 64 ECMP next hops is applicable.

**NOTE:** If RSVP LSPs are configured with bandwidth allocation, for ECMP next hops with more than 16 LSPs, traffic is not distributed optimally based on bandwidths configured. Some LSPs with smaller allocated bandwidths receive more traffic than the ones configured with higher bandwidths. Traffic distribution does not strictly comply with the configured bandwidth allocation. This caveat is applicable to the following routers:

- T1600 and T640 routers with Enhanced Scaling FPC1, Enhanced Scaling FPC2, Enhanced Scaling FPC3, Enhanced Scaling FPC 4, and all Type 4 FPCs
- M320 routers with Enhanced III FPC1, Enhanced III FPC2, and Enhanced III FPC3
- MX Series routers with all types of FPCs and DPCs, excluding MPCs. This caveat is not applicable to MX Series routers with line cards based on the Junos Trio chipset.
- M120 routers with Type 1, Type 2, and Type 3 FPCs
- M10i routers with Enhanced CFEB

Next-hop cloning and permutations are disabled on T Series routers with Enhanced Scaling FPCs (Enhanced Scaling FPC1, Enhanced Scaling FPC2, Enhanced Scaling FPC3,

and Enhanced Scaling FPC 4) that support enhanced load-balancing capability. As a result, memory utilization is reduced for a highly scaled system with a high number of next hops on ECMP or aggregated interfaces. Next-hop cloning and permutations are also disabled on T Series routers with Type-4 FPCs.

To view the details of the ECMP next hops, issue the **show route** command. The **show route summary** command also shows the current configuration for the maximum ECMP limit. To view details of the ECMP LDP paths, issue the **traceroute mpls ldp** command.

### Example: Configuring BGP Route Reflectors

- [Understanding BGP Route Reflectors on page 3547](#)
- [Example: Configuring a Route Reflector on page 3549](#)

#### Understanding BGP Route Reflectors

Because of the internal BGP (IBGP) full-mesh requirement, most networks use route reflectors to simplify configuration. The formula to compute the number of sessions required for a full mesh is  $v * (v - 1) / 2$ , where  $v$  is the number of BGP-enabled devices. The full-mesh model does not scale well. Using a route reflector, you group routers into clusters, which are identified by numeric identifiers unique to the autonomous system (AS). Within the cluster, you must configure a BGP session from a single router (the route reflector) to each internal peer. With this configuration, the IBGP full-mesh requirement is met.

To use route reflection in an AS, you designate one or more routers as a route reflector—typically, one per point of presence (POP). Route reflectors have the special BGP ability to readvertise routes learned from an internal peer to other internal peers. So rather than requiring all internal peers to be fully meshed with each other, route reflection requires only that the route reflector be fully meshed with all internal peers. The route reflector and all of its internal peers form a cluster, as shown in [Figure 85 on page 3548](#).

**NOTE:** For some Juniper Networks devices, you must have an Advanced BGP Feature license installed on each device that uses a route reflector. For license details, see the *Junos OS Initial Configuration Guide for Security Devices*.

**Figure 85: Simple Route Reflector Topology (One Cluster)**

Figure 85 on page 3548 shows Router RR configured as the route reflector for Cluster 127. The other routers are designated internal peers within the cluster. BGP routes are advertised to Router RR by any of the internal peers. RR then readvertises those routes to all other peers within the cluster.

You can configure multiple clusters and link them by configuring a full mesh of route reflectors (see Figure 86 on page 3548).

**Figure 86: Basic Route Reflection (Multiple Clusters)**

Figure 86 on page 3548 shows Route Reflectors RR 1, RR 2, RR 3, and RR 4 as fully meshed internal peers. When a router advertises a route to RR 1, RR 1 readvertises the route to the other route reflectors, which, in turn, readvertise the route to the remaining routers within the AS. Route reflection allows the route to be propagated throughout the AS without the scaling problems created by the full mesh requirement.

However, as clusters become large, a full mesh with a route reflector becomes difficult to scale, as does a full mesh between route reflectors. To help offset this problem, you can group clusters of routers together into clusters of clusters for hierarchical route reflection (see [Figure 87 on page 3549](#)).

**Figure 87: Hierarchical Route Reflection (Clusters of Clusters)**

[Figure 87 on page 3549](#) shows RR 2, RR 3, and RR 4 as the route reflectors for Clusters 127, 19, and 45, respectively. Rather than fully mesh those route reflectors, the network administrator has configured them as part of another cluster (Cluster 6) for which RR 1 is the route reflector. When a router advertises a route to RR 2, RR 2 readvertises the route to all the routers within its own cluster, and then readvertises the route to RR 1. RR 1 readvertises the route to the routers in its cluster, and those routers propagate the route down through their clusters.

### Example: Configuring a Route Reflector

This example shows how to configure a route reflector.

- [Requirements on page 3549](#)
- [Overview on page 3549](#)
- [Configuration on page 3551](#)
- [Verification on page 3559](#)

#### Requirements

No special configuration beyond device initialization is required before you configure this example.

#### Overview

Generally, internal BGP (IBGP)-enabled devices need to be fully meshed, because IBGP does not readvertise updates to other IBGP-enabled devices. The full mesh is a logical mesh achieved through configuration of multiple **neighbor** statements on each IBGP-enabled device. The full mesh is not necessarily a physical full mesh. Maintaining a full mesh (logical or physical) does not scale well in large deployments.

Figure 88 on page 3551 shows an IBGP network with Device A acting as a route reflector. Device B and Device C are clients of the route reflector. Device D and Device E are outside the cluster, so they are nonclients of the route reflector.

On Device A (the route reflector), you must form peer relationships with all of the IBGP-enabled devices by including the **neighbor** statement for the clients (Device B and Device C) and the nonclients (Device D and Device E). You must also include the **cluster** statement and a cluster identifier. The cluster identifier can be any 32-bit value. This example uses the loopback interface IP address of the route reflector.

On Device B and Device C, the route reflector clients, you only need one **neighbor** statement that forms a peer relationship with the route reflector, Device A.

On Device D and Device E, the nonclients, you need a **neighbor** statement for each nonclient device (D-to-E and E-to-D). You also need a **neighbor** statement for the route reflector (D-to-A and E-to-A). Device D and Device E do not need **neighbor** statements for the client devices (Device B and Device C).

**TIP:** Device D and Device E are considered to be nonclients because they have explicitly configured peer relationships with each other. To make them RRroute reflector clients, remove the **neighbor 192.168.5.5** statement from the configuration on Device D, and remove the **neighbor 192.168.0.1** statement from the configuration on Device E.

```

### Configuring the Route Reflector

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure IBGP in the network using Juniper Networks Device A as a route reflector:

1. Configure the interfaces.

```

[edit interfaces]
user@A# set fe-0/0/0 unit 1 description to-B
user@A# set fe-0/0/0 unit 1 family inet address 10.10.1/30
user@A# set fe-0/0/1 unit 3 description to-D
user@A# set fe-0/0/1 unit 3 family inet address 10.10.9/30
user@A# set lo0 unit 1 family inet address 192.168.6.5/32

```

2. Configure BGP, including the cluster identifier and neighbor relationships with all IBGP-enabled devices in the autonomous system (AS).

Also apply the policy that redistributes OSPF routes into BGP.

```

[edit protocols bgp group internal-peers]
user@A# set type internal
user@A# set local-address 192.168.6.5
user@A# set export send-ospf
user@A# set cluster 192.168.6.5
user@A# set neighbor 192.163.6.4
user@A# set neighbor 192.168.40.4
user@A# set neighbor 192.168.0.1
user@A# set neighbor 192.168.5.5

```

3. Configure static routing or an interior gateway protocol (IGP).

This example uses OSPF.

```

[edit protocols ospf area 0.0.0.0]
user@A# set interface lo0.1 passive
user@A# set interface fe-0/0/0.1
user@A# set interface fe-0/0/1.3

```

4. Configure the policy that redistributes OSPF routes into BGP.

```

[edit policy-options policy-statement send-ospf term 2]
user@A# set from protocol ospf
user@A# set then accept

```

5. Configure the router ID and the autonomous system (AS) number.

```
[edit routing-options]
user@A# set router-id 192.168.6.5
user@A# set autonomous-system 17
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@A# show interfaces
fe-0/0/0 {
  unit 1 {
    description to-B;
    family inet {
      address 10.10.10.1/30;
    }
  }
}
fe-0/0/1 {
  unit 3 {
    description to-D;
    family inet {
      address 10.10.10.9/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.6.5/32;
    }
  }
}

user@A# show protocols
bgp {
  group internal-peers {
    type internal;
    local-address 192.168.6.5;
    export send-ospf;
    cluster 192.168.6.5;
    neighbor 192.163.6.4;
    neighbor 192.168.40.4;
    neighbor 192.168.0.1;
    neighbor 192.168.5.5;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.1 {
      passive;
    }
    interface fe-0/0/0.1;
    interface fe-0/0/1.3;
```

```

    }
  }

user@A# show policy-options
policy-statement send-ospf {
  term 2 {
    from protocol ospf;
    then accept;
  }
}

user@A# show routing-options
router-id 192.168.6.5;
autonomous-system 17;

```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** Repeat these steps for each nonclient BGP peer within the cluster that you are configuring, if the other nonclient devices are from Juniper Networks. Otherwise, consult the device's documentation for instructions.

### Configuring Client Peers

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure client peers:

1. Configure the interfaces.
 

```

[edit interfaces]
user@B# set fe-0/0/0 unit 2 description to-A
user@B# set fe-0/0/0 unit 2 family inet address 10.10.10.2/30
user@B# set fe-0/0/1 unit 5 description to-C
user@B# set fe-0/0/1 unit 5 family inet address 10.10.10.5/30
user@B# set lo0 unit 2 family inet address 192.163.6.4/32
      
```

2. Configure the BGP neighbor relationship with the route reflector.

Also apply the policy that redistributes OSPF routes into BGP.

```

[edit protocols bgp group internal-peers]
user@B# set type internal
user@B# set local-address 192.163.6.4
user@B# set export send-ospf
user@B# set neighbor 192.168.6.5

```

3. Configure OSPF.
 

```

[edit protocols ospf area 0.0.0.0]
user@B# set interface lo0.2 passive
user@B# set interface fe-0/0/0.2
user@B# set interface fe-0/0/1.5
      
```
4. Configure the policy that redistributes OSPF routes into BGP.

```
[edit policy-options policy-statement send-ospf term 2]
user@B# set from protocol ospf
user@B# set then accept
```

5. Configure the router ID and the AS number.

```
[edit routing-options]
user@B# set router-id 192.163.6.4
user@B# set autonomous-system 17
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@B# show interfaces
fe-0/0/0 {
  unit 2 {
    description to-A;
    family inet {
      address 10.10.10.2/30;
    }
  }
}
fe-0/0/1 {
  unit 5 {
    description to-C;
    family inet {
      address 10.10.10.5/30;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 192.163.6.4/32;
    }
  }
}

user@B# show protocols
bgp {
  group internal-peers {
    type internal;
    local-address 192.163.6.4;
    export send-ospf;
    neighbor 192.168.6.5;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.2 {
      passive;
    }
    interface fe-0/0/0.2;
    interface fe-0/0/1.5;
```

```

    }
  }

user@B# show policy-options
policy-statement send-ospf {
  term 2 {
    from protocol ospf;
    then accept;
  }
}

user@B# show routing-options
router-id 192.163.6.4;
autonomous-system 17;

```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** Repeat these steps for each client BGP peer within the cluster that you are configuring if the other client devices are from Juniper Networks. Otherwise, consult the device's documentation for instructions.

### Configuring Nonclient Peers

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure nonclient peers:

1. Configure the interfaces.
 

```

[edit interfaces]
user@D# set fe-0/0/0 unit 4 description to-A
user@D# set fe-0/0/0 unit 4 family inet address 10.10.10.10/30
user@D# set fe-0/0/1 unit 7 description to-E
user@D# set fe-0/0/1 unit 7 family inet address 10.10.10.13/30
user@D# set lo0 unit 4 family inet address 192.168.0.1/32
      
```
2. Configure the BGP neighbor relationships with the RRroute reflector and with the other nonclient peers.

Also apply the policy that redistributes OSPF routes into BGP.

```

[edit protocols bgp group internal-peers]
user@D# set type internal
user@D# set local-address 192.168.0.1
user@D# set export send-ospf
user@D# set neighbor 192.168.6.5
user@D# set neighbor 192.168.5.5

```

3. Configure OSPF.
 

```

[edit protocols ospf area 0.0.0.0]
user@D# set interface lo0.4 passive
user@D# set interface fe-0/0/0.4
      
```

```
user@D# set interface fe-0/0/1.7
```

4. Configure the policy that redistributes OSPF routes into BGP.

```
[edit policy-options policy-statement send-ospf term 2]
user@D# set from protocol ospf
user@D# set then accept
```

5. Configure the router ID and the AS number.

```
[edit routing-options]
user@D# set router-id 192.168.0.1
user@D# set autonomous-system 17
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@D# show interfaces
fe-0/0/0 {
  unit 4 {
    description to-A;
    family inet {
      address 10.10.10.10/30;
    }
  }
}
fe-0/0/1 {
  unit 7 {
    description to-E;
    family inet {
      address 10.10.10.13/30;
    }
  }
}
lo0 {
  unit 4 {
    family inet {
      address 192.168.0.1/32;
    }
  }
}
```

```
user@D# show protocols
bgp {
  group internal-peers {
    type internal;
    local-address 192.168.0.1;
    export send-ospf;
    neighbor 192.168.6.5;
    neighbor 192.168.5.5;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.4 {
```

```

        passive;
    }
    interface fe-0/0/0.4;
    interface fe-0/0/1.7;
}
}

user@D# show policy-options
policy-statement send-ospf {
    term 2 {
        from protocol ospf;
        then accept;
    }
}

user@D# show routing-options
router-id 192.168.0.1;
autonomous-system 17;

```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** Repeat these steps for each nonclient BGP peer within the cluster that you are configuring if the other nonclient devices are from Juniper Networks. Otherwise, consult the device's documentation for instructions.

### Verification

Confirm that the configuration is working properly.

- [Verifying BGP Neighbors on page 3559](#)
- [Verifying BGP Groups on page 3562](#)
- [Verifying BGP Summary Information on page 3562](#)
- [Verifying Routing Table Information on page 3562](#)

### Verifying BGP Neighbors

**Purpose** Verify that BGP is running on configured interfaces and that the BGP session is established for each neighbor address.

**Action** From operational mode, enter the **show bgp neighbor** command.

```

user@A> show bgp neighbor
Peer: 192.163.6.4+179 AS 17    Local: 192.168.6.5+62857 AS 17
  Type: Internal    State: Established (route reflector client)Flags: <Sync>
  Last State: OpenConfirm    Last Event: RecvKeepAlive
  Last Error: None
  Export: [ send-ospf ]
  Options: <Preference LocalAddress Cluster Refresh>
  Local Address: 192.168.6.5 Holdtime: 90 Preference: 170
  Number of flaps: 0
  Peer ID: 192.163.6.4    Local ID: 192.168.6.5    Active Holdtime: 90
  Keepalive Interval: 30    Peer index: 0
  BFD: disabled, down

```

```

NLRI for restart configured on peer: inet-unicast
NLRI advertised by peer: inet-unicast
NLRI for this session: inet-unicast
Peer supports Refresh capability (2)
Restart time configured on the peer: 120
Stale routes from peer are kept for: 300

## Example: Configuring BGP Confederations

- [Understanding BGP Confederations on page 3564](#)
- [Example: Configuring BGP Confederations on page 3565](#)

### Understanding BGP Confederations

---

BGP confederations are another way to solve the scaling problems created by the BGP full mesh requirement. BGP confederations effectively break up a large autonomous system (AS) into subautonomous systems (sub-ASs). Each sub-AS must be uniquely identified within the confederation AS by a sub-AS number. Typically, sub-AS numbers are taken from the private AS numbers between 64,512 and 65,535.

Within a sub-AS, the same internal BGP (IBGP) full mesh requirement exists. Connections to other confederations are made with standard external BGP (EBGP), and peers outside the sub-AS are treated as external. To avoid routing loops, a sub-AS uses a confederation sequence, which operates like an AS path but uses only the privately assigned sub-AS numbers.

The confederation AS appears whole to other confederation ASs. The AS path received by other ASs shows only the globally assigned AS number. It does not include the confederation sequence or the privately assigned sub-AS numbers. The sub-AS numbers are removed when the route is advertised out of the confederation AS.

[Figure 89 on page 3565](#) shows an AS divided into four confederations.

Figure 89: BGP Confederations

Figure 89 on page 3565 shows AS 3 divided into four sub-ASs, 64517, 64550, 65300, and 65410, which are linked through EBGP sessions. Because the confederations are connected by EBGP, they do not need to be fully meshed. EBGP routes are readvertised to other sub-ASs.

### Example: Configuring BGP Confederations

This example shows how to configure BGP confederations.

- [Requirements on page 3565](#)
- [Overview on page 3565](#)
- [Configuration on page 3566](#)
- [Verification on page 3568](#)

#### Requirements

- Configure network interfaces.
- Configure external peer sessions. See [“Example: Configuring External BGP Point-to-Point Peer Sessions” on page 3262](#).
- Configure interior gateway protocol (IGP) sessions between peers.
- Configure a routing policy to advertise the BGP routes.

#### Overview

Within a BGP confederation, the links between the confederation member autonomous systems (ASs) must be external BGP (EBGP) links, not internal BGP (IBGP) links.

Similar to route reflectors, BGP confederations reduce the number of peer sessions and TCP sessions to maintain connections between IBGP routing devices. BGP confederation is one method used to solve the scaling problems created by the IBGP full mesh requirement. BGP confederations effectively break up a large AS into subautonomous

systems. Each sub-AS must be uniquely identified within the confederation AS by a sub-AS number. Typically, sub-AS numbers are taken from the private AS numbers between 64512 and 65535. Within a sub-AS, the same IBGP full mesh requirement exists. Connections to other confederations are made with standard EBGP, and peers outside the sub-AS are treated as external. To avoid routing loops, a sub-AS uses a confederation sequence, which operates like an AS path but uses only the privately assigned sub-AS numbers.

Figure 90 on page 3566 shows a sample network in which AS 17 has two separate confederations: sub-AS 64512 and sub-AS 64513, each of which has multiple routers. Within a sub-AS, an IGP is used to establish network connectivity with internal peers. Between sub-ASs, an EBGP peer session is established.

**Figure 90: Typical Network Using BGP Confederations**

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

|                               |   |

```
    peer-as 64513;
    neighbor 192.168.5.2;
  }
  group sub-AS-64512 {
    type internal;
    local-address 192.168.5.1;
    neighbor 192.168.8.1;
    neighbor 192.168.15.1;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.  
Repeat these steps for sSub-AS 64513.

### **Verification**

Confirm that the configuration is working properly.

- [Verifying BGP Neighbors on page 3568](#)
- [Verifying BGP Groups on page 3569](#)
- [Verifying BGP Summary Information on page 3570](#)

### **Verifying BGP Neighbors**

**Purpose** Verify that BGP is running on configured interfaces and that the BGP session is active for each neighbor address.

**Action** From the CLI, enter the **show bgp neighbor** command.

### **Sample Output**

```
user@host> show bgp neighbor
Peer: 10.255.245.12+179 AS 35 Local: 10.255.245.13+2884 AS 35
  Type: Internal State: Established (route reflector client)Flags: Sync

**Meaning** The output shows a list of the BGP neighbors with detailed session information. Verify the following information:

- Each configured peering neighbor is listed.
- For **State**, each BGP session is **Established**.
- For **Type**, each peer is configured as the correct type (either internal or external).
- For **AS**, the AS number of the BGP neighbor is correct.

#### *Verifying BGP Groups*

**Purpose** Verify that the BGP groups are configured correctly.

**Action** From the CLI, enter the **show bgp group** command.

### Sample Output

```

user@host> show bgp group
Group Type: Internal  AS: 10045      Local AS: 10045
Name: pe-to-asbr2
Export: [ match-all ]
Total peers: 1      Established: 1

```

**Meaning** The output shows a list of the BGP groups with detailed group information. Verify the following information:

- Each configured group is listed.
- For **AS**, each group's remote AS is configured correctly.
- For **Local AS**, each group's local AS is configured correctly.
- For **Group Type**, each group has the correct type (either internal or external).

- For **Total peers**, the expected number of peers within the group is shown.
- For **Established**, the expected number of peers within the group have BGP sessions in the **Established** state.
- The IP addresses of all the peers within the group are present.

### Verifying BGP Summary Information

**Purpose** Verify that the BGP configuration is correct.

**Action** From the CLI, enter the **show bgp summary** command.

### Sample Output

```
user@host> show bgp summary
Groups: 1 Peers: 3 Down peers: 0
Table      Tot Paths  Act Paths  Suppressed    History Damp State    Pending
inet.0           6           4           0           0      0      0      0
Peer      AS      InPkt    OutPkt    OutQ    Flaps  Last Up/Dwn

10.0.0.2    65002    88675    88652      0        2      42:38 2/4/0
           0/0/0
10.0.0.3    65002    54528    54532      0        1     2w4d22h 0/0/0
           0/0/0
10.0.0.4    65002    51597    51584      0        0     2w3d22h 2/2/0
           0/0/0
```

**Meaning** The output shows a summary of BGP session information. Verify the following information:

- For **Groups**, the total number of configured groups is shown.
- For **Peers**, the total number of BGP peers is shown.
- For **Down Peers**, the total number of unestablished peers is 0. If this value is not zero, one or more peering sessions are not yet established.
- Under **Peer**, the IP address for each configured peer is shown.
- Under **AS**, the peer AS for each configured peer is correct.
- Under **Up/Dwn State**, the BGP state reflects the number of paths received from the neighbor, the number of these paths that have been accepted, and the number of routes being damped (such as 0/0/0). If the field is **Active**, it indicates a problem in the establishment of the BGP session.

### Understanding Route Authentication

The use of router and route authentication and route integrity greatly mitigates the risk of being attacked by a machine or router that has been configured to share incorrect routing information with another router. In this kind of attack, the attacked router can be tricked into creating a routing loop, or the attacked router's routing table can be greatly increased thus impacting performance, or routing information can be redirected to a place in the network for the attacker to analyze it. Bogus route advertisements can be sent out on a segment. These updates can be accepted into the routing tables of neighbor routers unless an authentication mechanism is in place to verify the source of the routes.

Router and route authentication enables routers to share information only if they can verify that they are talking to a trusted source, based on a password (key). In this method, a hashed key is sent along with the route being sent to another router. The receiving router compares the sent key to its own configured key. If they are the same, it accepts the route. By using a hashing algorithm, the key is not sent over the wire in plain text. Instead, a hash is calculated using the configured key. The routing update is used as the input text, along with the key, into the hashing function. This hash is sent along with the route update to the receiving router. The receiving router compares the received hash with a hash it generates on the route update using the preshared key configured on it. If the two hashes are the same, the route is assumed to be from a trusted source. The key is known only to the sending and receiving routers.

To further strengthen security, you can configure a series of authentication keys (a *keychain*). Each key has a unique start time within the keychain. Keychain authentication allows you to change the password information periodically without bringing down peering sessions. This keychain authentication method is referred to as *hitless* because the keys roll over from one to the next without resetting any peering sessions or interrupting the routing protocol.

The sending peer uses the following rules to identify the active authentication key:

- The start time is less than or equal to the current time (in other words, not in the future).
- The start time is greater than that of all other keys in the chain whose start time is less than the current time (in other words, closest to the current time).

The receiving peer determines the key with which it authenticates based on the incoming key identifier.

The sending peer identifies the current authentication key based on a configured start time and then generates a hash value using the current key. The sending peer then inserts a TCP-enhanced authentication option object into the BGP update message. The object contains an object ID (assigned by IANA), the object length, the current key, and a hash value.

The receiving peer examines the incoming TCP-enhanced authentication option, looks up the received authentication key, and determines whether the key is acceptable based on the start time, the system time, and the tolerance parameter. If the key is accepted, the receiving peer calculates a hash and authenticates the update message.

Initial application of a keychain to a TCP session causes the session to reset. However, once the keychain is applied, the addition or removal of a password from the keychain does not cause the TCP session to reset. Also, the TCP session does not reset when the keychain changes from one authentication algorithm to another.

### Example: Configuring Route Authentication for BGP

---

All BGP protocol exchanges can be authenticated to guarantee that only trusted routing devices participate in autonomous system (AS) routing updates. By default, authentication is disabled.

- [Requirements on page 3572](#)
- [Overview on page 3572](#)
- [Configuration on page 3573](#)
- [Verification on page 3575](#)

#### **Requirements**

Before you begin:

- Configure the router interfaces.
- Configure an interior gateway protocol (IGP).

#### **Overview**

When you configure authentication, the algorithm creates an encoded checksum that is included in the transmitted packet. The receiving routing device uses an authentication key (password) to verify the packet's checksum.

This example includes the following statements for configuring and applying the keychain:

- **key**—A keychain can have multiple keys. Each key within a keychain must be identified by a unique integer value. The range of valid identifier values is from 0 through 63.  
  
The key can be up to 126 characters long. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").
- **tolerance**—(Optional) For each keychain, you can configure a clock-skew tolerance value in seconds. The clock-skew tolerance is applicable to the receiver accepting keys for BGP updates. The configurable range is 0 through 999,999,999 seconds. During the tolerance period, either the current or previous password is acceptable.
- **key-chain**—For each keychain, you must specify a name. This example defines one keychain: **bgp-auth**. You can have multiple keychains on a routing device. For example, you can have a keychain for BGP, a keychain for OSPF, and a keychain for LDP.

- **secret**—For each key in the keychain, you must set a secret password. This password can be entered in either encrypted or plain text format in the **secret** statement. It is always displayed in encrypted format.
- **start-time**—Each key must specify a start time in UTC format. Control gets passed from one key to the next. When a configured start time arrives (based on the routing device's clock), the key with that start time becomes active. Start times are specified in the local time zone for a routing device and must be unique within the keychain.
- **authentication-key-chain**—Enables you to apply a keychain at the global BGP level for all peers, for a group, or for a neighbor. This example applies the keychain to the peers defined in the external BGP (EBGP) group called **ext**.
- **authentication-algorithm**—For each keychain, you can specify a hashing algorithm. The algorithm can be AES-128, MD5, or SHA-1.

You associate a keychain and an authentication algorithm with a BGP neighboring session.

This example configures a keychain named **bgp-auth**. Key 0 will be sent and accepted starting at 2011-6-23.20:19:33 -0700, and will stop being sent and accepted when the next key in the keychain (key 1) becomes active. Key 1 becomes active one year later at 2012-6-23.20:19:33 -0700, and will not stop being sent and accepted unless another key is configured with a start time that is later than the start time of key 1. A clock-skew tolerance of 30 seconds applies to the receiver accepting the keys. During the tolerance period, either the current or previous key is acceptable. The keys are shared-secret passwords. This means that the neighbors receiving the authenticated routing updates must have the same authentication keychain configuration, including the same keys (passwords). So Router R0 and Router R1 must have the same authentication-key-chain configuration if they are configured as peers. This example shows the configuration on only one of the routing devices.

### Topology Diagram

Figure 91 on page 3573 shows the topology used in this example.

Figure 91: Authentication for BGP

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set protocols bgp group ext type external
set protocols bgp group ext peer-as 65530
set protocols bgp group ext neighbor 172.16.2.1
set routing-options autonomous-system 65533
```

```
set protocols bgp group ext authentication-key-chain bgp-auth
set protocols bgp group ext authentication-algorithm md5
set security authentication-key-chains key-chain bgp-auth tolerance 30
set security authentication-key-chains key-chain bgp-auth key 0 secret
  this-is-the-secret-password
set security authentication-key-chains key-chain bgp-auth key 0 start-time
  2011-6-23.20:19:33-0700
set security authentication-key-chains key-chain bgp-auth key 1 secret
  this-is-another-secret-password
set security authentication-key-chains key-chain bgp-auth key 1 start-time
  2012-6-23.20:19:33-0700
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Router R1 to accept route filters from Device CE1 and perform outbound route filtering using the received filters:

1. Configure the local autonomous system.

```
[edit routing-options]
user@R1# set autonomous-system 65533
```

2. Configure one or more BGP groups.

```
[edit protocols bgp group ext]
user@R1# set type external
user@R1# set peer-as 65530
user@R1# set neighbor 172.16.2.1
```

3. Configure authentication with multiple keys.

```
[edit security authentication-key-chains key-chain bgp-auth]
user@R1# set key 0 secret this-is-the-secret-password
user@R1# set key 0 start-time 2011-6-23.20:19:33-0700
user@R1# set key 1 secret this-is-another-secret-password
user@R1# set key 1 start-time 2012-6-23.20:19:33-0700
```

The start time of each key must be unique within the keychain.

4. Apply the authentication keychain to BGP, and set the hashing algorithm.

```
[edit protocols bgp group ext]
user@R1# set authentication-key-chain bgp-auth
user@R1# set authentication-algorithm md5
```

5. (Optional) Apply a clock-skew tolerance value in seconds.

```
[edit security authentication-key-chains key-chain bgp-auth]
user@R1# set tolerance 30
```

**Results** From configuration mode, confirm your configuration by entering the **show protocols**, **show routing-options**, and **show security** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show protocols
bgp {
```

```

group ext {
  type external;
  peer-as 65530;
  neighbor 172.16.2.1;
  authentication-key-chain bgp-auth;
  authentication-algorithm md5;
}
}

user@R1# show routing-options
autonomous-system 65533;

user@R1# show security
authentication-key-chains {
  key-chain bgp-auth {
    tolerance 30;
    key 0 {
      secret
      "$9$ST6AREyK8RhXNdwaJn/Ct0IcykWWx9AyIMWdVgoJDqP5FCA0z3IEhcMWLxNbgJDiF6A";
      ## SECRET-DATA
      start-time "2011-6-23.20:19:33 -0700";
    }
    key 1 {
      secret "$9$UyD.59Cu0Ih9AylKW-dqmfT369CuRhSP5hrvMN-JGDiqfu0lleWpuh.";
      ## SECRET-DATA
      start-time "2012-6-23.20:19:33 -0700";
    }
  }
}
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Repeat the procedure for every BGP-enabled device in the network, using the appropriate interface names and addresses for each BGP-enabled device.

### Verification

Confirm that the configuration is working properly.

- [Verifying Authentication for the Neighbor on page 3575](#)
- [Verifying That Authorization Messages Are Sent on page 3576](#)
- [Checking Authentication Errors on page 3577](#)
- [Verifying the Operation of the Keychain on page 3577](#)

### Verifying Authentication for the Neighbor

**Purpose** Make sure that the **AuthKeyChain** option appears in the output of the **show bgp neighbor** command.

**Action** From operational mode, enter the **show bgp neighbor** command.

```

user@R1> show bgp neighbor
Peer: 172.16.2.1+179 AS 65530  Local: 172.16.2.2+1222 AS 65533

Output messages: Total 22    Updates 1    Refreshes 0    Octets 471
Output Queue[0]: 0

```

### Verifying That Authorization Messages Are Sent

**Purpose** Confirm that BGP has the enhanced authorization option.

**Action** From operational mode, enter the `monitor traffic interface fe-0/0/1` command.

```

user@R1> monitor traffic interface fe-0/0/1
verbose output suppressed, use <detail> or <extensive> for full protocol decode
Listening on fe-0/0/1, capture size 96 bytes

### Understanding Security Options for BGP with TCP

Among routing protocols, BGP is unique in using TCP as its transport protocol. BGP peers are established by manual configuration between routing devices to create a TCP session on port 179. A BGP-enabled device periodically sends keepalive messages to maintain the connection.

Over time, BGP has become the dominant interdomain routing protocol on the Internet. However, it has limited guarantees of stability and security. Configuring security options for BGP must balance suitable security measures with acceptable costs. No one method

has emerged as superior to other methods. Each network administrator must configure security measures that meet the needs of the network being used.

For detailed information about the security issues associated with BGP's use of TCP as a transport protocol, see RFC 4272, *BGP Security Vulnerabilities Analysis*.

### Example: Configuring a Filter to Block TCP Access to a Port Except from Specified BGP Peers

This example shows how to configure a standard stateless firewall filter that blocks all TCP connection attempts to port 179 from all requesters except from specified BGP peers.

- [Requirements on page 3578](#)
- [Overview on page 3578](#)
- [Configuration on page 3578](#)
- [Verification on page 3581](#)

#### Requirements

No special configuration beyond device initialization is required before you configure this example.

#### Overview

In this example, you create a stateless firewall filter that blocks all TCP connection attempts to port 179 from all requesters except the specified BGP peers.

The stateless firewall filter **filter\_bgp179** matches all packets from the directly connected interfaces on Device A and Device B to the destination port number 179.

Figure 92 on page 3578 shows the topology used in this example. Device C attempts to make a TCP connection to Device E. Device E blocks the connection attempt. This example shows the configuration on Device E.

Figure 92: Typical Network with BGP Peer Sessions

#### Configuration

##### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

Device C    set interfaces ge-1/2/0 unit 10 description to-E
            set interfaces ge-1/2/0 unit 10 family inet address 10.10.10.10/30
            set protocols bgp group external-peers type external
            set protocols bgp group external-peers peer-as 17
            set protocols bgp group external-peers neighbor 10.10.10.9
            set routing-options autonomous-system 22

Device E    set interfaces ge-1/2/0 unit 0 description to-A
            set interfaces ge-1/2/0 unit 0 family inet address 10.10.10.1/30
            set interfaces ge-1/2/1 unit 5 description to-B
            set interfaces ge-1/2/1 unit 5 family inet address 10.10.10.5/30
            set interfaces ge-1/0/0 unit 9 description to-C
            set interfaces ge-1/0/0 unit 9 family inet address 10.10.10.9/30
            set interfaces lo0 unit 2 family inet filter input filter_bgp179
            set interfaces lo0 unit 2 family inet address 192.168.0.1/32
            set protocols bgp group external-peers type external
            set protocols bgp group external-peers peer-as 22
            set protocols bgp group external-peers neighbor 10.10.10.2
            set protocols bgp group external-peers neighbor 10.10.10.6
            set protocols bgp group external-peers neighbor 10.10.10.10
            set routing-options autonomous-system 17
            set firewall family inet filter filter_bgp179 term 1 from source-address 10.10.10.2/32
            set firewall family inet filter filter_bgp179 term 1 from source-address 10.10.10.6/32
            set firewall family inet filter filter_bgp179 term 1 from destination-port bgp
            set firewall family inet filter filter_bgp179 term 1 then accept
            set firewall family inet filter filter_bgp179 term 2 then reject

```

### Configuring Device E

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device E with a stateless firewall filter that blocks all TCP connection attempts to port 179 from all requestors except specified BGP peers:

1. Configure the interfaces.
 

```

user@E# set interfaces ge-1/2/0 unit 0 description to-A
user@E# set interfaces ge-1/2/0 unit 0 family inet address 10.10.10.1/30

user@E# set interfaces ge-1/2/1 unit 5 description to-B
user@E# set interfaces ge-1/2/1 unit 5 family inet address 10.10.10.5/30

user@E# set interfaces ge-1/0/0 unit 9 description to-C
user@E# set interfaces ge-1/0/0 unit 9 family inet address 10.10.10.9/30

```
2. Configure BGP.
 

```

[edit protocols bgp group external-peers]
user@E# set type external
user@E# set peer-as 22
user@E# set neighbor 10.10.10.2
user@E# set neighbor 10.10.10.6
user@E# set neighbor 10.10.10.10

```

3. Configure the autonomous system number.

```
[edit routing-options]
user@E# set autonomous-system 17
```

4. Define the filter term that accepts TCP connection attempts to port 179 from the specified BGP peers.

```
[edit firewall family inet filter filter_bgp179]
user@E# set term 1 from source-address 10.10.10.2/32
user@E# set term 1 from source-address 10.10.10.6/32
user@E# set term 1 from destination-port bgp
user@E# set term 1 then accept
```

5. Define the other filter term to reject packets from other sources.

```
[edit firewall family inet filter filter_bgp179]
user@E# set term 2 then reject
```

6. Apply the firewall filter to the loopback interface.

```
[edit interfaces lo0 unit 2 family inet]
user@E# set filter input filter_bgp179
user@E# set address 192.168.0.1/32
```

**Results** From configuration mode, confirm your configuration by entering the **show firewall**, **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@E# show firewall
family inet {
  filter filter_bgp179 {
    term 1 {
      from {
        source-address {
          10.10.10.2/32;
          10.10.10.6/32;
        }
        destination-port bgp;
      }
      then accept;
    }
    term 2 {
      then {
        reject;
      }
    }
  }
}

user@E# show interfaces
lo0 {
  unit 2 {
    family inet {
      filter {
        input filter_bgp179;
```

```

        }
        address 192.168.0.1/32;
    }
}
ge-1/2/0 {
    unit 0 {
        description to-A;
        family inet {
            address 10.10.10.1/30;
        }
    }
}
ge-1/2/1 {
    unit 5 {
        description to-B;
        family inet {
            address 10.10.10.5/30;
        }
    }
}
ge-1/0/0 {
    unit 9 {
        description to-C;
        family inet {
            address 10.10.10.9/30;
        }
    }
}
}

user@E# show protocols
bgp {
    group external-peers {
        type external;
        peer-as 22;
        neighbor 10.10.10.2;
        neighbor 10.10.10.6;
        neighbor 10.10.10.10;
    }
}

user@E# show routing-options
autonomous-system 17;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying That the Filter Is Configured on page 3582](#)
- [Verifying the TCP Connections on page 3582](#)
- [Monitoring Traffic on the Interfaces on page 3582](#)

*Verifying That the Filter Is Configured*

**Purpose** Make sure that the filter is listed in output of the **show firewall filter** command.

**Action** user@E> show firewall filter filter\_bgp179  
Filter: filter\_bgp179

*Verifying the TCP Connections*

**Purpose** Verify the TCP connections.

**Action** From operational mode, run the **show system connections extensive** command on Device C and Device E.

The output on Device C shows the attempt to establish a TCP connection. The output on Device E shows that connections are established with Device A and Device B only.

user@C> show system connections extensive | match 10.10.10

|      |   |   |                  |                 |          |
|------|---|---|------------------|-----------------|----------|
| tcp4 | 0 | 0 | 10.10.10.9.51872 | 10.10.10.10.179 | SYN_SENT |
|------|---|---|------------------|-----------------|----------|

user@E> show system connections extensive | match 10.10.10

|      |   |   |                  |                  |             |
|------|---|---|------------------|------------------|-------------|
| tcp4 | 0 | 0 | 10.10.10.5.179   | 10.10.10.6.62096 | ESTABLISHED |
| tcp4 | 0 | 0 | 10.10.10.6.62096 | 10.10.10.5.179   | ESTABLISHED |
| tcp4 | 0 | 0 | 10.10.10.1.179   | 10.10.10.2.61506 | ESTABLISHED |
| tcp4 | 0 | 0 | 10.10.10.2.61506 | 10.10.10.1.179   | ESTABLISHED |

*Monitoring Traffic on the Interfaces*

**Purpose** Use the **monitor traffic** command to compare the traffic on an interface that establishes a TCP connection with the traffic on an interface that does not establish a TCP connection.

**Action** From operational mode, run the **monitor traffic** command on the Device E interface to Device B and on the Device E interface to Device C. The following sample output verifies that in the first example, acknowledgment (**ack**) messages are received. In the second example, **ack** messages are not received.

```
user@E> monitor traffic size 1500 interface ge-1/2/1.5
19:02:49.700912 Out IP 10.10.10.5.bgp > 10.10.10.6.62096: P

### Example: Configuring a Filter to Limit TCP Access to a Port Based On a Prefix List

This example shows how to configure a standard stateless firewall filter that limits certain TCP and Internet Control Message Protocol (ICMP) traffic destined for the Routing Engine by specifying a list of prefix sources that contain allowed BGP peers.

- [Requirements on page 3583](#)
- [Overview on page 3583](#)
- [Configuration on page 3583](#)
- [Verification on page 3585](#)

#### Requirements

No special configuration beyond device initialization is required before configuring this example.

#### Overview

In this example, you create a stateless firewall filter that blocks all TCP connection attempts to port 179 from all requesters except BGP peers that have a specified prefix.

A source prefix list, **plist\_bgp179**, is created that specifies the list of source prefixes that contain allowed BGP peers.

The stateless firewall filter **filter\_bgp179** matches all packets from the source prefix list **plist\_bgp179** to the destination port number 179.

#### Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

- [Configure the Filter on page 3584](#)
- [Results on page 3584](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

set policy-options prefix-list plist_bgp179 apply-path "protocols bgp group <*> neighbor
<*>"
set firewall family inet filter filter_bgp179 term 1 from source-address 0.0.0.0/0

```

```
set firewall family inet filter filter_bgp179 term 1 from source-prefix-list plist_bgp179 except
set firewall family inet filter filter_bgp179 term 1 from destination-port bgp
set firewall family inet filter filter_bgp179 term 1 then reject
set firewall family inet filter filter_bgp179 term 2 then accept
set interfaces lo0 unit 0 family inet filter input filter_bgp179
set interfaces lo0 unit 0 family inet address 127.0.0.1/32
```

### Configure the Filter

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the filter:

1. Expand the prefix list **bgp179** to include all prefixes pointed to by the BGP peer group defined by **protocols bgp group <\*> neighbor <\*>**.

```
[edit policy-options prefix-list plist_bgp179]
user@host# set apply-path "protocols bgp group <*> neighbor <*>"
```

2. Define the filter term that rejects TCP connection attempts to port 179 from all requesters except the specified BGP peers.

```
[edit firewall family inet filter filter_bgp179]
user@host# set term term1 from source-address 0.0.0.0/0
user@host# set term term1 from source-prefix-list bgp179 except
user@host# set term term1 from destination-port bgp
user@host# set term term1 then reject
```

3. Define the other filter term to accept all packets.

```
[edit firewall family inet filter filter_bgp179]
user@host# set term term2 then accept
```

4. Apply the firewall filter to the loopback interface.

```
[edit interfaces lo0 unit 0 family inet]
user@host# set filter input filter_bgp179
user@host# set address 127.0.0.1/32
```

### Results

From configuration mode, confirm your configuration by entering the **show firewall**, **show interfaces**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show firewall
family inet {
  filter filter_bgp179 {
    term 1 {
      from {
        source-address {
          0.0.0.0/0;
        }
        source-prefix-list {
          plist_bgp179 except;
        }
      }
    }
  }
}
```

```

    }
    destination-port bgp;
  }
  then {
    reject;
  }
}
term 2 {
  then {
    accept;
  }
}
}
}

user@host# show interfaces
lo0 {
  unit 0 {
    family inet {
      filter {
        input filter_bgp179;
      }
      address 127.0.0.1/32;
    }
  }
}

user@host# show policy-options
prefix-list plist_bgp179 {
  apply-path "protocols bgp group <*> neighbor <*>";
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Repeat the procedure, where appropriate, for every BGP-enabled device in the network, using the appropriate interface names and addresses for each BGP-enabled device.

### Verification

Confirm that the configuration is working properly.

### Displaying the Firewall Filter Applied to the Loopback Interface

**Purpose** Verify that the firewall filter **filter\_bgp179** is applied to the IPv4 input traffic at logical interface **lo0.0**.

**Action** Use the **show interfaces statistics** operational mode command for logical interface **lo0.0**, and include the **detail** option. Under the **Protocol inet** section of the command output section, the **Input Filters** field displays the name of the stateless firewall filter applied to the logical interface in the input direction:

```

[edit]
user@host> show interfaces statistics lo0.0 detail
Logical interface lo0.0 (Index 321) (SNMP ifIndex 16) (Generation 130)
Flags: SNMP-Traps Encapsulation: Unspecified
Traffic statistics:
Input bytes : 0

```

```
Output bytes : 0
Input packets: 0
Output packets: 0
Local statistics:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0
Transit statistics:
Input bytes : 0 0 bps
Output bytes : 0 0 bps
Input packets: 0 0 pps
Output packets: 0 0 pps
Protocol inet, MTU: Unlimited, Generation: 145, Route table: 0
Flags: Sendbroadcast-pkt-to-re
Input Filters: filter_bgp179
Addresses, Flags: Primary
Destination: Unspecified, Local: 127.0.0.1, Broadcast: Unspecified,
Generation: 138
```

---

### Example: Limiting TCP Segment Size for BGP

This example shows how to avoid Internet Control Message Protocol (ICMP) vulnerability issues by limiting TCP segment size when you are using maximum transmission unit (MTU) discovery. Using MTU discovery on TCP paths is one method of avoiding BGP packet fragmentation.

- [Requirements on page 3586](#)
- [Overview on page 3586](#)
- [Configuration on page 3587](#)
- [Verification on page 3589](#)
- [Troubleshooting on page 3589](#)

#### **Requirements**

No special configuration beyond device initialization is required before you configure this example.

#### **Overview**

TCP negotiates a maximum segment size (MSS) value during session connection establishment between two peers. The MSS value negotiated is primarily based on the maximum transmission unit (MTU) of the interfaces to which the communicating peers are directly connected. However, due to variations in link MTU on the path taken by the TCP packets, some packets in the network that are well within the MSS value might be fragmented when the packet size exceeds the link's MTU.

To configure the TCP MSS value, include the **tcp-mss** statement with a segment size from 1 through 4096.

If the router receives a TCP packet with the SYN bit and the MSS option set, and the MSS option specified in the packet is larger than the MSS value specified by the **tcp-mss** statement, the router replaces the MSS value in the packet with the lower value specified by the **tcp-mss** statement.

The configured MSS value is used as the maximum segment size for the sender. The assumption is that the TCP MSS value used by the sender to communicate with the BGP neighbor is the same as the TCP MSS value that the sender can accept from the BGP neighbor. If the MSS value from the BGP neighbor is less than the MSS value configured, the MSS value from the BGP neighbor is used as the maximum segment size for the sender.

This feature is supported with TCP over IPv4 and TCP over IPv6.

### Topology Diagram

Figure 93 on page 3587 shows the topology used in this example.

**Figure 93: TCP Maximum Segment Size for BGP**

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
R0
set interfaces fe-1/2/0 unit 1 family inet address 1.1.0.1/30
set interfaces lo0 unit 1 family inet address 10.255.14.179/32
set protocols bgp group-int tcp-mss 2020
set protocols bgp group int type internal
set protocols bgp group int local-address 10.255.14.179
set protocols bgp group int mtu-discovery
set protocols bgp group int neighbor 10.255.71.24 tcp-mss 2000
set protocols bgp group int neighbor 10.255.14.177
set protocols bgp group int neighbor 10.0.14.4 tcp-mss 4000
set protocols ospf area 0.0.0.0 interface fe-1/2/0.1
set protocols ospf area 0.0.0.0 interface 10.255.14.179
set routing-options autonomous-system 65000
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Router R0:

1. Configure the interfaces.  

```
[edit interfaces]
user@R0# set fe-1/2/0 unit 1 family inet address 1.1.0.1/30
user@R0# set lo0 unit 1 family inet address 10.255.14.179/32
```
2. Configure an interior gateway protocol (IGP), OSPF in this example.  

```
[edit protocols ospf area 0.0.0.0]
```

```
user@R0# set interface fe-1/2/0.1
user@R0# set interface 10.255.14.179
```

3. Configure one or more BGP groups.

```
[edit protocols bgp group int]
user@R0# set type internal
user@R0# set local-address 10.255.14.179
```

4. Configure MTU discovery to prevent packet fragmentation.

```
[edit protocols bgp group int]
user@R0# set mtu-discovery
```

5. Configure the BGP neighbors, with the TCP MSS set globally for the group or specifically for the various neighbors.

```
[edit protocols bgo group int]
user@R0# set tcp-mss 2020
user@R0# set neighbor 10.255.14.177
user@R0# set neighbor 10.255.71.24 tcp-mss 2000
user@R0# set neighbor 10.0.14.4 tcp-mss 4000
```

**NOTE:** The TCP MSS neighbor setting overrides the group setting.

---

6. Configure the local autonomous system.

```
[edit routing-options]
user@R0# set autonomous-system 65000
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R0# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 1.1.0.1/30;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 10.255.14.179/32;
    }
  }
}

user@R0# show protocols
bgp {
  group int {
    type internal;
    local-address 10.255.14.179;
```

```

mtu-discovery;
tcp-mss 2020;
neighbor 10.255.71.24 {
    tcp-mss 2000;
}
neighbor 10.255.14.177;
neighbor 10.0.14.4 {
    tcp-mss 4000;
}
}
}
ospf {
    area 0.0.0.0 {
        interface fe-1/2/0.1;
        interface 10.255.14.179;
    }
}
}

user@R0# show routing-options
autonomous-system 65000;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

To confirm that the configuration is working properly, run the following commands:

- **show system connections extensive | find <neighbor-address>**, to check the negotiated TCP MSS value.
- **monitor traffic interface**, to monitor BGP traffic and to make sure that the configured TCP MSS value is used as the MSS option in the TCP SYN packet.

### Troubleshooting

- [MSS Calculation with MTU Discovery on page 3589](#)

### MSS Calculation with MTU Discovery

**Problem** Consider an example in which two routing devices (R1 and R2) have an internal BGP (IBGP) connection. On both of the routers, the connected interfaces have 4034 as the IPv4 MTU.

```

user@R1# show protocols bgp | display set
[edit]
set protocols bgp group ibgp type internal
set protocols bgp group ibgp local-address 45.45.45.2
set protocols bgp group ibgp mtu-discovery
set protocols bgp group ibgp neighbor 45.45.45.1

```

```

user@R1# run show interfaces xe-0/0/3 extensive | match mtu

```

```

Link-level type: Ethernet, MTU: 4048, LAN-PHY mode, Speed: 10Gbps,
FIFO errors: 0, HS link CRC errors: 0, MTU errors: 0, Resource errors: 0
Protocol inet, MTU: 4034, Generation: 180, Route table: 0
Protocol multiservice, MTU: Unlimited, Generation: 181, Route table: 0

```

In the following packet capture on Device R1, the negotiated MSS is 3994. In the **show system connections extensive** information for MSS, it is set to 2048.

```

**Solution** This is expected behavior with Junos OS. The MSS value is equal to the MTU value minus the IP or IPv6 and TCP headers. This means that the MSS value is generally 40 bytes less than the MTU (for IPv4) and 60 bytes less than the MTU (for IPv6). This value is negotiated between the peers. In this example, it is  $4034 - 40 = 3994$ . Junos OS then rounds this value to a multiple of 2 KB. The value is  $3994 / 2048 * 2048 = 2048$ . So it is not necessary to see same MSS value with in the **show system connections** output.

$3994 / 2048 = 1.95$

1.95 is rounded to 1.

$1 * 2048 = 2048$

### Example: Preventing BGP Session Resets

- [Understanding BGP Session Resets on page 3591](#)
- [Example: Preventing BGP Session Flaps When VPN Families Are Configured on page 3591](#)

#### Understanding BGP Session Resets

Certain configuration actions and events cause BGP sessions to be reset (dropped and then reestablished).

If you configure both route reflection and VPNs on the same routing device, the following modifications to the route reflection configuration cause current BGP sessions to be reset:

- Adding a cluster ID—If a BGP session shares the same autonomous system (AS) number with the group where you add the cluster ID, all BGP sessions are reset regardless of whether the BGP sessions are contained in the same group.
- Creating a new route reflector—If you have an internal BGP (IBGP) group with an AS number and create a new route reflector group with the same AS number, all BGP sessions in the IBGP group and the new route reflector group are reset.
- Changing configuration statements that affect BGP peers, such as renaming a BGP group, resets the BGP sessions.
- If you change the address family specified in the **[edit protocols bgp family]** hierarchy level, all current BGP sessions on the routing device are dropped and then reestablished.

#### Example: Preventing BGP Session Flaps When VPN Families Are Configured

This example shows a workaround for a known issue in which BGP sessions sometimes go down and then come back up (in other words, flap) when virtual private network (VPN) families are configured. If any VPN family (for example, **inet-vpn**, **inet6-vpn**, **inet-mpvn**, **inet-mdt**, **inet6-mpvn**, **l2vpn**, **iso-vpn**, and so on) is configured on a BGP master instance, a flap of either a route reflector (RR) internal BGP (IBGP) session or an external BGP (EBGP) session causes flaps of other BGP sessions configured with the same VPN family.

- [Requirements on page 3592](#)
- [Overview on page 3593](#)
- [Configuration on page 3595](#)
- [Verification on page 3598](#)

### ***Requirements***

Before you begin:

- Configure router interfaces.
- Configure an interior gateway protocol (IGP).
- Configure BGP.
- Configure VPNs.

## *Overview*

When a router or switch is configured as either a route reflector (RR) or an AS boundary router (an external BGP peer) and a VPN family (for example, the **family inet-vpn unicast** statement) is configured, a flap of either the RR IBGP session or the EBGP session causes flaps of all other BGP sessions that are configured with the **family inet-vpn unicast** statement. This example shows how to prevent these unnecessary session flaps.

The reason for the flapping behavior is related to BGP operation in Junos OS when originating VPN routes.

BGP has the following two modes of operation with respect to originating VPN routes:

- If BGP does not need to propagate VPN routes because the session has no EBGP peer and no RR clients, BGP exports VPN routes directly from the *instance.inet.0* routing table to other PE routers. This behavior is efficient in that it avoids the creation of two copies of many routes (one in the *instance.inet.0* table and one in the *bgp.l3vpn.0* table).
- If BGP does need to propagate VPN routes because the session has an EBGP peer or RR clients, BGP first exports the VPN routes from the *instance.inet.0* table to the *bgp.l3vpn.0* table. Then BGP exports the routes to other PE routers. In this scenario, two copies of the route are needed to enable best-route selection. A PE router might receive the same VPN route from a CE device and also from an RR client or EBGP peer.

.....

**NOTE:** The route export is not performed if the route in *instance.inet.0* is a secondary route. In Junos OS, a route is only exported one time from one routing table as a primary route to another routing table as a secondary route. Because the route in *instance.inet.0* is already a secondary route, it is not allowed to be moved again to the *bgp.l3vpn.0* table, as needed to be advertised. The route does not reach the *bgp.l3vpn.0* table and thus is not advertised. One workaround is to send the routes that should be advertised to *inet.0* so that they are advertised.

.....

When, because of a configuration change, BGP transitions from needing two copies of a route to not needing two copies of a route (or the reverse), all sessions over which VPN routes are exchanged go down and then come back up. Although this example focuses on the **family inet-vpn unicast** statement, the concept applies to all VPN network layer reachability information (NLRI) families. This issue impacts logical systems as well. All BGP sessions in the master instance related to the VPN NLRI family are brought down to implement the table advertisement change for the VPN NLRI family. Changing an RR to a non-RR or the reverse (by adding or removing the **cluster** statement) causes the table advertisement change. Also, configuring the first EBGP session or removing the EBGP session from the configuration in the master instance for a VPN NLRI family causes the table advertisement change.

The way to prevent these unnecessary session flaps is to configure an extra RR client or EBGP session as a passive session with a neighbor address that does not exist. This example focuses on the EBGP case, but the same workaround works for the RR case.

When a session is passive, the routing device does not send Open requests to a peer. Once you configure the routing device to be passive, the routing device does not originate the TCP connection. However, when the routing device receives a connection from the peer and an Open message, it replies with another BGP Open message. Each routing device declares its own capabilities.

Figure 94 on page 3595 shows the topology for the EBGp case. Router R1 has an IBGP session with Routers R2 and R3 and an EBGp session with Router R4. All sessions have the **family inet-vpn unicast** statement configured. If the R1-R4 EBGp session flaps, the R1-R2 and R1-R3 BGP sessions flap also.

Figure 94: Topology for the EBGp Case

Figure 95 on page 3595 shows the topology for the RR case. Router R1 is the RR, and Router R3 is the client. Router R1 has IBGP sessions with Routers R2 and R3. All sessions have the **family inet-vpn unicast** statement configured. If the R1-R3 session flaps, the R1-R2 and R1-R4 sessions flap also.

Figure 95: Topology for the RR Case

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set protocols bgp family inet-vpn unicast
set protocols bgp family l2vpn signaling
set protocols bgp group R1-R4 type external
set protocols bgp group R1-R4 local-address 4.4.4.2
set protocols bgp group R1-R4 neighbor 4.4.4.1 peer-as 200
set protocols bgp group R1-R2-R3 type internal
set protocols bgp group R1-R2-R3 log-updown
set protocols bgp group R1-R2-R3 local-address 15.15.15.15
set protocols bgp group R1-R2-R3 neighbor 12.12.12.12
set protocols bgp group R1-R2-R3 neighbor 13.13.13.13
set protocols bgp group Fake type external
set protocols bgp group Fake passive
set protocols bgp group Fake neighbor 100.100.100.100 peer-as 500
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the EBGp scenario:

1. Configure one or more VPN families.

```
[edit protocols bgp]
user@R1# set family inet-vpn unicast
user@R1# set family l2vpn signaling
```

2. Configure the EBGp session.

```
[edit protocols bgp]
user@R1# set group R1-R4 type external
user@R1# set group R1-R4 local-address 4.4.4.2
user@R1# set group R1-R4 neighbor 4.4.4.1 peer-as 200
```

3. Configure the IBGP sessions.

```
[edit protocols bgp]
user@R1# set group R1-R2-R3 type internal
user@R1# set group R1-R2-R3 local-address 15.15.15.15
user@R1# set group R1-R2-R3 neighbor 12.12.12.12
user@R1# set group R1-R2-R3 neighbor 13.13.13.13
```

4. (Optional) Configure BGP so that it generates a **syslog** message whenever a BGP peer makes a state transition.

```
[edit protocols bgp]
user@R1# set group R1-R2-R3 log-updown
```

Enabling the **log-updown** statement causes BGP state transitions to be logged at **warning** level.

**Step-by-Step Procedure** To verify that unnecessary session flaps are occurring:

1. Run the **show bgp summary** command to verify that the sessions have been established.

```
user@R1> show bgp summary
Groups: 2 Peers: 3 Down peers: 0
Table      Tot Paths Act Paths Suppressed History Damp State Pending
```

```

bgp.13vpn.0 0      0      0      0      0      0
bgp.12vpn.0 0      0      0      0      0      0
inet.0      0      0      0      0      0      0
Peer        AS  InPkt OutPkt OutQ Flaps Last Up/Dwn
State|#Active/Received/Accepted/Damped...
4.4.4.1     200 6      5      0      0      1:08 Establ
bgp.13vpn.0: 0/0/0/0
bgp.12vpn.0: 0/0/0/0
12.12.12.12 100 3      7      0      0      1:18 Establ
bgp.13vpn.0: 0/0/0/0
bgp.12vpn.0: 0/0/0/0
13.13.13.13 100 3      6      0      0      1:14 Establ
bgp.13vpn.0: 0/0/0/0
bgp.12vpn.0: 0/0/0/0

```

2. Deactivate the EBGp session.

```

user@R1# deactivate group R1-R4
user@R1# commit

```

```

bgp.12vpn.0: 0/0/0/0

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To prevent unnecessary BGP session flaps:

1. Add a passive EBGP session with a neighbor address that does not exist in the peer autonomous system (AS).

```
[edit protocols bgp]
user@R1# set group Fake type external
user@R1# set group Fake passive
user@R1# set neighbor 100.100.100.100 peer-as 500
```

2. Run the **show bgp summary** command to verify that the real sessions have been established and the passive session is idle.

```
user@R1> show bgp summary
Groups: 3 Peers: 4 Down peers: 1
Table Tot Paths Act Paths Suppressed History Damp State Pending
bgp.13vpn.0 0 0 0 0 0 0
bgp.12vpn.0 0 0 0 0 0 0

### Verification

Confirm that the configuration is working properly.

- [Bringing Down the EBGP Session on page 3598](#)
- [Verifying That the IBGP Sessions Remain Up on page 3598](#)

### Bringing Down the EBGP Session

**Purpose** Try to cause the flap issue after the workaround is configured.

**Action** user@R1# deactivate group R1-R4  
user@R1# commit

### Verifying That the IBGP Sessions Remain Up

**Purpose** Make sure that the IBGP sessions do not flap after the EBGP session is deactivated.

```

### Understanding BGP Route Flap Damping Parameters

BGP *route flapping* describes the situation in which BGP systems send an excessive number of update messages to advertise network reachability information. BGP *flap damping* is a method of reducing the number of update messages sent between BGP peers, thereby reducing the load on these peers, without adversely affecting the route convergence time for stable routes.

Flap damping reduces the number of update messages by marking routes as ineligible for selection as the active or preferable route. Marking routes in this way leads to some delay, or *suppression*, in the propagation of route information, but the result is increased network stability. You typically apply flap damping to external BGP (EBGP) routes (routes in different ASs). You can also apply flap damping within a confederation, between confederation member ASs. Because routing consistency within an AS is important, do

not apply flap damping to internal BGP (IBGP) routes. (If you do, it is ignored.) The exception to this rule is when flap damping is applied at the address family level, which is supported in Junos OS Release 12.2 and later. When you apply flap damping at the address family level, it works for both IBGP and EBGP.

By default, route flap damping is not enabled. Damping is applied to external peers and to peers at confederation boundaries.

When you enable damping, default parameters are applied, as summarized in [Table 297 on page 3600](#).

**Table 297: Damping Parameters**

| Damping Parameter                  | Description   | Default Value | Possible Values  |
|------------------------------------|---|---------------|------------------|
| <b>half-life <i>minutes</i></b>    | Decay half-life—Number of minutes after which an arbitrary value is halved if a route stays stable.                     | 15 (minutes)  | 1 through 45     |
| <b>max-suppress <i>minutes</i></b> | Maximum hold-down time for a route, in minutes.   | 60 (minutes)  | 1 through 720    |
| <b>reuse</b>                       | Reuse threshold—Arbitrary value below which a suppressed route can be used again.                                       | 750           | 1 through 20,000 |
| <b>suppress</b>                    | Cutoff (suppression) threshold—Arbitrary value above which a route can no longer be used or included in advertisements. | 3000          | 1 through 20,000 |

To change the default BGP flap damping values, you define actions by creating a named set of damping parameters and including it in a routing policy with the damping action. For the damping routing policy to work, you also must enable BGP route flap damping.

#### **Example: Configuring BGP Route Flap Damping Parameters**

This example shows how to configure damping parameters.

- [Requirements on page 3600](#)
- [Overview on page 3600](#)
- [Configuration on page 3601](#)
- [Verification on page 3605](#)

#### **Requirements**

Before you begin, configure router interfaces and configure routing protocols.

#### **Overview**

This example has three routing devices. Device R2 has external BGP (EBGP) connections with Device R1 and Device R3.

Device R1 and Device R3 have some static routes configured for testing purposes, and these static routes are advertised through BGP to Device R2.

Device R2 damps routes received from Device R1 and Device R3 according to these criteria:

- Damp all prefixes with a mask length equal to or greater than 17 more aggressively than routes with a mask length between 9 and 16.
- Damp routes with a mask length between 0 and 8, inclusive, less than routes with a mask length greater than 8.
- Do not damp the 10.128.0.0/9 prefix at all.

The routing policy is evaluated when routes are being exported from the routing table into the forwarding table. Only the active routes are exported from the routing table.

Figure 96 on page 3601 shows the sample network.

**Figure 96: BGP Flap Damping Topology**

"CLI Quick Configuration" on page 3601 shows the configuration for all of the devices in Figure 96 on page 3601.

The section "Step-by-Step Procedure" on page 3602 describes the steps on Device R2.

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

Device R1  set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.1/30
            set interfaces lo0 unit 0 family inet address 192.168.0.1/32
            set protocols bgp group ext type external
            set protocols bgp group ext export send-direct-and-static
            set protocols bgp group ext peer-as 200
            set protocols bgp group ext neighbor 10.0.0.2
            set policy-options policy-statement send-direct-and-static term 1 from protocol direct
            set policy-options policy-statement send-direct-and-static term 1 from protocol static
            set policy-options policy-statement send-direct-and-static term 1 then accept
            set routing-options static route 172.16.0.0/16 reject
            set routing-options static route 172.16.128.0/17 reject
            set routing-options static route 172.16.192.0/20 reject
            set routing-options static route 10.0.0.0/9 reject
            set routing-options static route 224.0.0.0/7 reject
            set routing-options static route 10.224.0.0/11 reject
            set routing-options static route 0.0.0.0/0 reject
            set routing-options autonomous-system 100

Device R2  set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.2/30
            set interfaces fe-1/2/1 unit 0 family inet address 10.1.0.1/30
            set interfaces lo0 unit 0 family inet address 192.168.0.2/32
  
```

```
set protocols bgp damping
set protocols bgp group ext type external
set protocols bgp group ext import damp
set protocols bgp group ext export send-direct
set protocols bgp group ext neighbor 10.0.0.1 peer-as 100
set protocols bgp group ext neighbor 10.1.0.2 peer-as 300
set policy-options policy-statement damp term 1 from route-filter 10.128.0.0/9 exact
  damping dry
set policy-options policy-statement damp term 1 from route-filter 0.0.0.0/0
  prefix-length-range /0-/8 damping timid
set policy-options policy-statement damp term 1 from route-filter 0.0.0.0/0
  prefix-length-range /17-/32 damping aggressive
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options damping aggressive half-life 30
set policy-options damping aggressive suppress 2500
set policy-options damping timid half-life 5
set policy-options damping dry disable
set routing-options autonomous-system 200
```

Device R3

```
set interfaces fe-1/2/1 unit 0 family inet address 10.1.0.2/30
set interfaces lo0 unit 0 family inet address 192.168.0.3/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct-and-static
set protocols bgp group ext peer-as 200
set protocols bgp group ext neighbor 10.1.0.1
set policy-options policy-statement send-direct-and-static term 1 from protocol direct
set policy-options policy-statement send-direct-and-static term 1 from protocol static
set policy-options policy-statement send-direct-and-static term 1 then accept
set routing-options static route 10.128.0.0/9 reject
set routing-options autonomous-system 300
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure damping parameters:

1. Configure the interfaces.

```
[edit interfaces]
user@R2# set fe-1/2/0 unit 0 family inet address 10.0.0.2/30

user@R2# set fe-1/2/1 unit 0 family inet address 10.1.0.1/30

user@R2# set lo0 unit 0 family inet address 192.168.0.2/32
```

2. Configure the BGP neighbors.

```
[edit protocols bgp group ext]
user@R2# set type external
user@R2# set neighbor 10.0.0.1 peer-as 100
user@R2# set neighbor 10.1.0.2 peer-as 300
```

3. Create and configure the damping parameter groups.

```
[edit policy-options]
user@R2# set damping aggressive half-life 30
user@R2# set damping aggressive suppress 2500
user@R2# set damping timid half-life 5
user@R2# set damping dry disable
```

4. Configure the damping policy.

```
[edit policy-options policy-statement damp term 1]
user@R2# set from route-filter 10.128.0.0/9 exact damping dry
user@R2# set from route-filter 0.0.0.0/0 prefix-length-range /0-/8 damping timid
user@R2# set from route-filter 0.0.0.0/0 prefix-length-range /17-/32 damping
    aggressive
```

5. Enable damping for BGP.

```
[edit protocols bgp]
user@R2# set damping
```

6. Apply the policy as an import policy for the BGP neighbor.

```
[edit protocols bgp group ext]
user@R2# set import damp
```

**NOTE:** You can refer to the same routing policy one or more times in the same or different import statements.

7. Configure an export policy.

```
[edit policy-options policy-statement send-direct term 1]
user@R2# set from protocol direct
user@R2# set then accept
```

8. Apply the export policy.

```
[edit protocols bgp group ext]
user@R2# set export send-direct
```

9. Configure the autonomous system (AS) number.

```
[edit routing-options]
user@R2# set autonomous-system 200
```

**Results** From configuration mode, confirm your configuration by issuing the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 0 {
    family inet {
      address 10.0.0.2/30;
    }
  }
}
```

```
    }
  }
  fe-1/2/1 {
    unit 0 {
      family inet {
        address 10.1.0.1/30;
      }
    }
  }
  lo0 {
    unit 0 {
      family inet {
        address 192.168.0.2/32;
      }
    }
  }
}

user@R2# show protocols
bgp {
  damping;
  group ext {
    type external;
    import damp;
    export send-direct;
    neighbor 10.0.0.1 {
      peer-as 100;
    }
    neighbor 10.1.0.2 {
      peer-as 300;
    }
  }
}

user@R2# show policy-options
policy-statement damp {
  term 1 {
    from {
      route-filter 10.128.0.0/9 exact damping dry;
      route-filter 0.0.0.0/0 prefix-length-range /0-/8 damping timid;
      route-filter 0.0.0.0/0 prefix-length-range /17-/32 damping aggressive;
    }
  }
}
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}
damping aggressive {
  half-life 30;
  suppress 2500;
}
damping timid {
  half-life 5;
}
damping dry {
```

```

    disable;
}

user@R2# show routing-options
autonomous-system 200;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Causing Some Routes to Flap on page 3605](#)
- [Checking the Route Flaps on page 3605](#)
- [Verifying Route Flap Damping on page 3606](#)
- [Displaying the Details of a Damped Route on page 3607](#)
- [Verifying That Default Damping Parameters Are in Effect on page 3607](#)
- [Filtering the Damping Information on page 3608](#)

### Causing Some Routes to Flap

**Purpose** To verify your route flap damping policy, some routes must flap. Having a live Internet feed almost guarantees that a certain number of route flaps will be present. If you have control over a remote system that is advertising the routes, you can modify the advertising router's policy to effect the advertisement and withdrawal of all routes or of a given prefix. In a test environment, you can cause routes to flap by clearing the BGP neighbors or by restarting the routing process on the BGP neighbors, as shown here.

**Action** From operational mode on Device R1 and Device R3, enter the **restart routing** command.

**CAUTION:** Use this command cautiously in a production network.

```
user@R1> restart routing
```

```
R1 started, pid 10474
```

```
user@R3> restart routing
```

```
R3 started, pid 10478
```

**Meaning** On Device R2, all of the routes from the neighbors are withdrawn and re-advertised.

### Checking the Route Flaps

**Purpose** View the number of neighbor flaps.

**Action** From operational mode, enter the **show bgp summary** command.

```
user@R2> show bgp summary
```

```

Groups: 1 Peers: 2 Down peers: 0
Table      Tot Paths  Act Paths Suppressed  History  Damp State  Pending
inet.0
          12         1         11         0         11         0
Peer      AS      InPkt   OutPkt   OutQ   Flaps  Last  Up/Dwn
State|#Active/Received/Accepted/Damped...
10.0.0.1   100        10       10       0       4      2:50
0/9/0/9    0/0/0/0
10.1.0.2   300        10       10       0       4      2:53
1/3/1/2    0/0/0/0

```

**Meaning** This output was captured after the routing process was restarted on Device R2's neighbors four times.

### *Verifying Route Flap Damping*

**Purpose** Verify that routes are being hidden due to damping.

**Action** From operational mode, enter the **show route damping suppressed** command.

```
user@R2> show route damping suppressed
```

```
inet.0: 15 destinations, 17 routes (6 active, 0 holddown, 11 hidden)
+ = Active Route, - = Last Active, * = Both
```

```

0.0.0.0/0      [BGP ] 00:00:12, localpref 100
                AS path: 100 I, validation-state: unverified
                > to 10.0.0.1 via fe-1/2/0.0
10.0.0.0/9     [BGP ] 00:00:12, localpref 100
                AS path: 100 I, validation-state: unverified

192.168.0.1/32 [BGP ] 00:00:12, localpref 100
                AS path: 100 I, validation-state: unverified
                > to 10.0.0.1 via fe-1/2/0.0
192.168.0.3/32 [BGP ] 00:00:15, localpref 100
                AS path: 300 I, validation-state: unverified
                > to 10.1.0.2 via fe-1/2/1.0
224.0.0.0/7    [BGP ] 00:00:12, localpref 100
                AS path: 100 I, validation-state: unverified
                > to 10.0.0.1 via fe-1/2/0.0

```

**Meaning** The output shows some routing instability. Eleven routes are hidden due to damping.

### *Displaying the Details of a Damped Route*

**Purpose** Display the details of damped routes.

**Action** From operational mode, enter the **show route damping suppressed 172.16.192.0/20 detail** command.

```
user@R2> show route damping suppressed 172.16.192.0/20 detail

inet.0: 15 destinations, 17 routes (6 active, 0 holddown, 11 hidden)
172.16.192.0/20 (1 entry, 0 announced)
    BGP                /-101
        Next hop type: Router, Next hop index: 758
        Address: 0x9414484
        Next-hop reference count: 9
        Source: 10.0.0.1
        Next hop: 10.0.0.1 via fe-1/2/0.0, selected
        Session Id: 0x100201
        State: <Hidden Ext>
        Local AS: 200 Peer AS: 100
        Age: 52
        Validation State: unverified
        Task: BGP_100.10.0.0.1+55922
        AS path: 100 I
        Localpref: 100
        Router ID: 192.168.0.1
        Merit (last update/now): 4278/4196
        damping-parameters: aggressive
        Last update: 00:00:52 First update: 01:01:55
        Flaps: 8
        Suppressed. Reusable in: 01:14:40
        Preference will be: 170
```

**Meaning** This output indicates that the displayed route has a mask length that is equal to or greater than /17, and confirms that it has been correctly mapped to the aggressive damping profile. You can also see the route's current (and last) figure of merit value, and when the route is expected to become active if it remains stable.

### *Verifying That Default Damping Parameters Are in Effect*

**Purpose** Locating a damped route with a /16 mask confirms that the default parameters are in effect.

**Action** From operational mode, enter the **show route damping suppressed detail | match 0/16** command.

```
user@R2> show route damping suppressed detail | match 0/16

172.16.0.0/16 (1 entry, 0 announced)

user@R2> show route damping suppressed 172.16.0.0/16 detail

inet.0: 15 destinations, 17 routes (6 active, 0 holddown, 11 hidden)
172.16.0.0/16 (1 entry, 0 announced)
```

```
BGP                               /-101
Next hop type: Router, Next hop index: 758
Address: 0x9414484
Next-hop reference count: 9
Source: 10.0.0.1
Next hop: 10.0.0.1 via fe-1/2/0.0, selected
Session Id: 0x100201
State: <Hidden Ext>
Local AS: 200 Peer AS: 100
Age: 1:58
Validation State: unverified
Task: BGP_100.10.0.0.1+55922
AS path: 100 I
Localpref: 100
Router ID: 192.168.0.1
Merit (last update/now): 3486/3202
Default damping parameters used
Last update: 00:01:58 First update: 01:03:01
Flaps: 8
Suppressed. Reusable in: 00:31:40
Preference will be: 170
```

**Meaning** Routes with a /16 mask are not impacted by the custom damping rules. Therefore, the default damping rules are in effect.

To repeat, the custom rules are as follows:

- Damp all prefixes with a mask length equal to or greater than 17 more aggressively than routes with a mask length between 9 and 16.
- Damp routes with a mask length between 0 and 8, inclusive, less than routes with a mask length greater than 8.
- Do not damp the 10.128.0.0/9 prefix at all.

#### *Filtering the Damping Information*

**Purpose** Use OR groupings or cascaded piping to simplify the determination of what damping profile is being used for routes with a given mask length.

**Action** From operational mode, enter the **show route damping suppressed** command.

```
user@R2> show route damping suppressed detail | match "0 announced | damp"
```

```
0.0.0.0/0 (1 entry, 0 announced)
    damping-parameters: timid
10.0.0.0/9 (1 entry, 0 announced)
    Default damping parameters used
    damping-parameters: aggressive
    damping-parameters: aggressive
10.224.0.0/11 (1 entry, 0 announced)
    Default damping parameters used
172.16.0.0/16 (1 entry, 0 announced)
    Default damping parameters used
172.16.128.0/17 (1 entry, 0 announced)
    damping-parameters: aggressive
172.16.192.0/20 (1 entry, 0 announced)
    damping-parameters: aggressive
192.168.0.1/32 (1 entry, 0 announced)
```

```

damping-parameters: aggressive
192.168.0.3/32 (1 entry, 0 announced)
damping-parameters: aggressive
224.0.0.0/7 (1 entry, 0 announced)
damping-parameters: timid

```

**Meaning** When you are satisfied that your EBGp routes are correctly associated with a damping profile, you can issue the **clear bgp damping** operational mode command to restore an active status to your damped routes, which will return your connectivity to normal operation.

### Example: Configuring BGP Route Flap Damping Based on the MBGP MVPN Address Family

This example shows how to configure an multiprotocol BGP multicast VPN (also called Next-Generation MVPN) with BGP route flap damping.

- [Requirements on page 3609](#)
- [Overview on page 3609](#)
- [Configuration on page 3610](#)
- [Verification on page 3617](#)

#### Requirements

This example uses Junos OS Release 12.2. BGP route flap damping support for MBGP MVPN, specifically, and on an address family basis, in general, is introduced in Junos OS Release 12.2.

#### Overview

BGP route flap damping helps to diminish route instability caused by routes being repeatedly withdrawn and readvertised when a link is intermittently failing.

This example uses the default damping parameters and demonstrates an MBGP MVPN scenario with three provider edge (PE) routing devices, three customer edge (CE) routing devices, and one provider (P) routing device.

[Figure 97 on page 3609](#) shows the topology used in this example.

**Figure 97: MBGP MVPN with BGP Route Flap Damping**

On PE Device R4, BGP route flap damping is configured for address family **inet-mvpn**. A routing policy called **dampPolicy** uses the **nlri-route-type** match condition to damp only MVPN route types 3, 4, and 5. All other MVPN route types are not damped.

This example shows the full configuration on all devices in the “[CLI Quick Configuration](#)” on page 3610 section. The “[Configuring Device R4](#)” on page 3613 section shows the step-by-step configuration for PE Device R4.

### *Configuration*

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
Device R1    set interfaces ge-1/2/0 unit 1 family inet address 10.1.1.1/30
              set interfaces ge-1/2/0 unit 1 family mpls
              set interfaces lo0 unit 1 family inet address 1.1.1.1/32
              set protocols ospf area 0.0.0.0 interface lo0.1 passive
              set protocols ospf area 0.0.0.0 interface ge-1/2/0.1
              set protocols pim rp static address 100.1.1.2
              set protocols pim interface all
              set routing-options router-id 1.1.1.1

Device R2    set interfaces ge-1/2/0 unit 2 family inet address 10.1.1.2/30
              set interfaces ge-1/2/0 unit 2 family mpls
              set interfaces ge-1/2/1 unit 5 family inet address 10.1.1.5/30
              set interfaces ge-1/2/1 unit 5 family mpls
              set interfaces vt-1/2/0 unit 2 family inet
              set interfaces lo0 unit 2 family inet address 1.1.1.2/32
              set interfaces lo0 unit 102 family inet address 100.1.1.2/32
              set protocols mpls interface ge-1/2/1.5
              set protocols bgp group ibgp type internal
              set protocols bgp group ibgp local-address 1.1.1.2
              set protocols bgp group ibgp family inet-vpn any
              set protocols bgp group ibgp family inet-mvpn signaling
              set protocols bgp group ibgp neighbor 1.1.1.4
              set protocols bgp group ibgp neighbor 1.1.1.5
              set protocols ospf area 0.0.0.0 interface lo0.2 passive
              set protocols ospf area 0.0.0.0 interface ge-1/2/1.5
              set protocols ldp interface ge-1/2/1.5
              set protocols ldp p2mp
              set policy-options policy-statement parent_vpn_routes from protocol bgp
              set policy-options policy-statement parent_vpn_routes then accept
              set routing-instances vpn-1 instance-type vrf
              set routing-instances vpn-1 interface ge-1/2/0.2
              set routing-instances vpn-1 interface vt-1/2/0.2
              set routing-instances vpn-1 interface lo0.102
              set routing-instances vpn-1 route-distinguisher 100:100
              set routing-instances vpn-1 provider-tunnel ldp-p2mp
              set routing-instances vpn-1 vrf-target target:1:1
              set routing-instances vpn-1 protocols ospf export parent_vpn_routes
              set routing-instances vpn-1 protocols ospf area 0.0.0.0 interface lo0.102 passive
              set routing-instances vpn-1 protocols ospf area 0.0.0.0 interface ge-1/2/0.2
              set routing-instances vpn-1 protocols pim rp static address 100.1.1.2
```

```

set routing-instances vpn-1 protocols pim interface ge-1/2/0.2 mode sparse
set routing-instances vpn-1 protocols mvpn
set routing-options router-id 1.1.1.2
set routing-options autonomous-system 1001

```

Device R3

set protocols pim interface all
set routing-options router-id 1.1.1.7

```

### Configuring Device R4

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R4:

1. Configure the interfaces.

```

[edit interfaces]
user@R4# set ge-1/2/0 unit 10 family inet address 10.1.1.10/30
user@R4# set ge-1/2/0 unit 10 family mpls

user@R4# set ge-1/2/1 unit 17 family inet address 10.1.1.17/30
user@R4# set ge-1/2/1 unit 17 family mpls

user@R4# set vt-1/2/0 unit 4 family inet

user@R4# set lo0 unit 4 family inet address 1.1.1.4/32
user@R4# set lo0 unit 104 family inet address 100.1.1.4/32

```

2. Configure MPLS and the signaling protocols on the interfaces.

```

[edit protocols]
user@R4# set mpls interface all
user@R4# set mpls interface ge-1/2/0.10
user@R4# set rsvp interface all aggregate
user@R4# set ldp interface ge-1/2/0.10
user@R4# set ldp p2mp

```

3. Configure BGP.

The BGP configuration enables BGP route flap damping for the **inet-mvpn** address family. The BGP configuration also imports into the routing table the routing policy called **dampPolicy**. This policy is applied to neighbor PE Device R2.

```

[edit protocols bgp group ibgp]
user@R4# set type internal

```

```
user@R4# set local-address 1.1.1.4
user@R4# set family inet-vpn unicast
user@R4# set family inet-vpn any
user@R4# set family inet-mvpn signaling damping
user@R4# set neighbor 1.1.1.2 import dampPolicy
user@R4# set neighbor 1.1.1.5
```

4. Configure an interior gateway protocol.

```
[edit protocols ospf]
user@R4# set traffic-engineering
```

```
[edit protocols ospf area 0.0.0.0]
user@R4# set interface all
user@R4# set interface lo0.4 passive
user@R4# set interface ge-1/2/0.10
```

5. Configure a damping policy that uses the **nlri-route-type** match condition to damp only MVPN route types 3, 4, and 5.

```
[edit policy-options policy-statement dampPolicy term term1]
user@R4# set from family inet-mvpn
user@R4# set from nlri-route-type 3
user@R4# set from nlri-route-type 4
user@R4# set from nlri-route-type 5
user@R4# set then accept
```

6. Configure the **damping** policy to disable BGP route flap damping.

The **no-damp** policy (**damping no-damp disable**) causes any damping state that is present in the routing table to be deleted. The **then damping no-damp** statement applies the **no-damp** policy as an action and has no **from** match conditions. Therefore, all routes that are not matched by **term1** are matched by this term, with the result that all other MVPN route types are not damped.

```
[edit policy-options policy-statement dampPolicy]
user@R4# set then damping no-damp
user@R4# set then accept
```

```
[edit policy-options]
user@R4# set damping no-damp disable
```

7. Configure the **parent\_vpn\_routes** to accept all other BGP routes that are not from the **inet-mvpn** address family.

This policy is applied as an OSPF export policy in the routing instance.

```
[edit policy-options policy-statement parent_vpn_routes]
user@R4# set from protocol bgp
user@R4# set then accept
```

8. Configure the VPN routing and forwarding (VRF) instance.

```
[edit routing-instances vpn-1]
user@R4# set instance-type vrf
user@R4# set interface vt-1/2/0.4
user@R4# set interface ge-1/2/1.17
user@R4# set interface lo0.104
```

```

user@R4# set route-distinguisher 100:100
user@R4# set vrf-target target:1:1
user@R4# set protocols ospf export parent_vpn_routes
user@R4# set protocols ospf area 0.0.0.0 interface lo0.104 passive
user@R4# set protocols ospf area 0.0.0.0 interface ge-1/2/1.17
user@R4# set protocols pim rp static address 100.1.1.2
user@R4# set protocols pim interface ge-1/2/1.17 mode sparse
user@R4# set protocols mvpn

```

9. Configure the router ID and the autonomous system (AS) number.

```

[edit routing-options]
user@R4# set router-id 1.1.1.4
user@R4# set autonomous-system 1001

```

10. If you are done configuring the device, commit the configuration.

```

user@R4# commit

```

### Results

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, **show routing-instances**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R4# show interfaces
ge-1/2/0 {
  unit 10 {
    family inet {
      address 10.1.1.10/30;
    }
    family mpls;
  }
}
ge-1/2/1 {
  unit 17 {
    family inet {
      address 10.1.1.17/30;
    }
    family mpls;
  }
}
vt-1/2/0 {
  unit 4 {
    family inet;
  }
}
lo0 {
  unit 4 {
    family inet {
      address 1.1.1.4/32;
    }
  }
}
unit 104 {
  family inet {

```

```
        address 100.1.1.4/32;
    }
}
}
user@R4# show protocols

```

### Verification

Confirm that the configuration is working properly.

- [Verifying That Route Flap Damping Is Disabled on page 3618](#)
- [Verifying Route Flap Damping on page 3618](#)

**Verifying That Route Flap Damping Is Disabled**

**Purpose** Verify the presence of the **no-damp** policy, which disables damping for MVPN route types other than 3, 4, and 5.

**Action** From operational mode, enter the **show policy damping** command.

```
user@R4> show policy damping
Default damping information:
  Halflife: 15 minutes
  Reuse merit: 750 Suppress/cutoff merit: 3000
  Maximum suppress time: 60 minutes
  Computed values:
    Merit ceiling: 12110
    Maximum decay: 6193
Damping information for "no-damp":
  Damping disabled
```

**Meaning** The output shows that the default damping parameters are in effect and that the **no-damp** policy is also in effect for the specified route types.

**Verifying Route Flap Damping**

**Purpose** Check whether BGP routes have been damped.

**Action** From operational mode, enter the **show bgp summary** command.

```
user@R4> show bgp summary
Groups: 1 Peers: 2 Down peers: 0
Table Tot Paths Act Paths Suppressed History Damp State Pending
bgp.13vpn.0
      6      6      0      0      0      0
bgp.13vpn.2
      0      0      0      0      0      0
bgp.mvpn.0
      2      2      0      0      0      0
Peer AS InPkt OutPkt OutQ Flaps Last Up/Dwn
State|#Active/Received/Accepted/Damped...
1.1.1.2 1001 3159 3155 0 0 23:43:47
Establ
  bgp.13vpn.0: 3/3/3/0
  bgp.13vpn.2: 0/0/0/0
  bgp.mvpn.0: 1/1/1/0
  vpn-1.inet.0: 3/3/3/0
  vpn-1.mvpn.0: 1/1/1/0
1.1.1.5 1001 3157 3154 0 0 23:43:40
Establ
  bgp.13vpn.0: 3/3/3/0
  bgp.13vpn.2: 0/0/0/0
  bgp.mvpn.0: 1/1/1/0
  vpn-1.inet.0: 3/3/3/0
  vpn-1.mvpn.0: 1/1/1/0
```

**Meaning** The Damp State field shows that zero routes in the bgp.mvpn.0 routing table have been damped. Further down, the last number in the State field shows that zero routes have been damped for BGP peer 1.1.1.2.

#### Understanding Trace Operations for BGP Protocol Traffic

---

You can trace various BGP protocol traffic to help you debug BGP protocol issues. To trace BGP protocol traffic, include the **traceoptions** statement at the **[edit protocols bgp]** hierarchy level. For routing instances, include the **traceoptions** statement at the **[edit routing-instances routing-instance-name protocols bgp]** hierarchy level.

```
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable>;
  flag flag <flag-modifier> <disable>;
}
```

You can specify the following BGP protocol-specific trace options using the **flag** statement:

- **4byte-as**—4-byte AS events.
- **bfd**—BFD protocol events.
- **damping**—Damping operations.
- **graceful-restart**—Graceful restart events.
- **keepalive**—BGP keepalive messages.
- **nsr-synchronization**—Nonstop active routing synchronization events.
- **open**—BGP open packets. These packets are sent between peers when they are establishing a connection.
- **packets**—All BGP protocol packets.
- **refresh**—BGP refresh packets.
- **update**—BGP update packets. These packets provide routing updates to BGP systems.

Global tracing options are inherited from the configuration set by the **traceoptions** statement at the **[edit routing-options]** hierarchy level. You can override the following global trace options for the BGP protocol using the **traceoptions flag** statement included at the **[edit protocols bgp]** hierarchy level:

- **all**—All tracing operations
- **general**—All normal operations and routing table changes (a combination of the normal and route trace operations)
- **normal**—Normal events
- **policy**—Policy processing
- **route**—Routing information
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

You can optionally specify one or more of the following flag modifiers:

- **detail**—Detailed trace information.
- **filter**—Filter trace information. Applies only to **route** and **damping** tracing flags.
- **receive**—Packets being received.
- **send**—Packets being transmitted.

**NOTE:** Use the **all** trace flag and the **detail** flag modifier with caution because these might cause the CPU to become very busy.

---

**NOTE:** If you only enable the **update** flag, received keepalive messages do not generate a trace message.

---

You can filter trace statements and display only the statement information that passes through the filter by specifying the **filter** flag modifier. The **filter** modifier is only supported for the **route** and **damping** tracing flags.

The **match-on** statement specifies filter matches based on prefixes. It is used to match on route filters.

**NOTE:** Per-neighbor trace filtering is not supported on a BGP per-neighbor level for **route** and **damping** flags. Trace option filtering support is on a peer group level.

---

### Example: Viewing BGP Trace Files on Logical Systems

This example shows how to list and view files that are stored on a logical system.

- [Requirements on page 3621](#)
- [Overview on page 3621](#)
- [Configuration on page 3622](#)
- [Verification on page 3625](#)

#### Requirements

- You must have the **view** privilege for the logical system.
- Configure a network, such as the BGP network shown in “[Example: Configuring Internal BGP Peering Sessions on Logical Systems](#)” on page 3296.

#### Overview

Logical systems have their individual directory structure created in the `/var/logical-systems/logical-system-name` directory. It contains the following subdirectories:

- **/config**—Contains the active configuration specific to the logical system.
- **/log**—Contains system log and tracing files specific to the logical system.

To maintain backward compatibility for the log files with previous versions of Junos OS, a symbolic link (symlink) from the `/var/logs/logical-system-name` directory to the `/var/logical-systems/logical-system-name` directory is created when a logical system is configured.

- **/tmp**—Contains temporary files specific to the logical system.

The file system for each logical system enables logical system users to view trace logs and modify logical system files. Logical system administrators have full access to view and modify all files specific to the logical system.

Logical system users and administrators can save and load configuration files at the logical-system level using the **save** and **load** configuration mode commands. In addition, they can also issue the **show log**, **monitor**, and **file** operational mode commands at the logical-system level.

This example shows how to configure and view a BGP trace file on a logical system. The steps can be adapted to apply to trace operations for any Junos OS hierarchy level that supports trace operations.

**TIP:** To view a list of hierarchy levels that support tracing operations, enter the **help apropos traceoptions** command in configuration mode.

### **Configuration**

- [Configuring Trace Operations on page 3622](#)
- [Viewing the Trace File on page 3622](#)
- [Deactivating and Reactivating Trace Logging on page 3624](#)
- [Results on page 3625](#)

#### **CLI Quick Configuration**

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set logical-systems A protocols bgp group internal-peers traceoptions file bgp-log
set logical-systems A protocols bgp group internal-peers traceoptions file size 10k
set logical-systems A protocols bgp group internal-peers traceoptions file files 2
set logical-systems A protocols bgp group internal-peers traceoptions flag update detail
```

### **Configuring Trace Operations**

#### **Step-by-Step Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the trace operations:

1. Configure trace operations on the logical system.

```
[edit logical-systems A protocols bgp group internal-peers]
user@host# set traceoptions file bgp-log
user@host# set traceoptions file size 10k
user@host# set traceoptions file files 2
user@host# set traceoptions flag update detail
```

2. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

### **Viewing the Trace File**

#### **Step-by-Step Procedure**

To view the trace file:

1. In operational mode on the main router, list the directories on the logical system.

```
user@host> file list /var/logical-systems/A
/var/logical-systems/A:
config/
log/
tmp/
```

2. In operational mode on the main router, list the log files on the logical system.

```
user@host> file list /var/logical-systems/A/log/
/var/logical-systems/A/log:
bgp-log
```

3. View the contents of the **bgp-log** file.

```

user@host> file show /var/logical-systems/A/log/bgp-log
Aug 10 17:12:01 trace_on: Tracing to "/var/log/A/bgp-log" started
Aug 10 17:14:22.826182 bgp_peer_mgmt_clear:5829: NOTIFICATION sent to
192.163.6.4 (Internal AS 17): code 6 (Cease) subcode 4 (Administratively
Reset), Reason: Management session cleared BGP neighbor
Aug 10 17:14:22.826445 bgp_send: sending 21 bytes to 192.163.6.4 (Internal
AS 17)
Aug 10 17:14:22.826499
Aug 10 17:14:22.826499 BGP SEND 192.168.6.5+64965 -> 192.163.6.4+179
Aug 10 17:14:22.826559 BGP SEND message type 3 (Notification) length 21
Aug 10 17:14:22.826598 BGP SEND Notification code 6 (Cease) subcode 4
(Administratively Reset)
Aug 10 17:14:22.831756 bgp_peer_mgmt_clear:5829: NOTIFICATION sent to
192.168.40.4 (Internal AS 17): code 6 (Cease) subcode 4 (Administratively
Reset), Reason: Management session cleared BGP neighbor
Aug 10 17:14:22.831851 bgp_send: sending 21 bytes to 192.168.40.4 (Internal
AS 17)
Aug 10 17:14:22.831901
Aug 10 17:14:22.831901 BGP SEND 192.168.6.5+53889 -> 192.168.40.4+179
Aug 10 17:14:22.831959 BGP SEND message type 3 (Notification) length 21
Aug 10 17:14:22.831999 BGP SEND Notification code 6 (Cease) subcode 4
(Administratively Reset)
...

```

4. Filter the output of the log file.

```

user@host> file show /var/logical-systems/A/log/bgp-log | match "flags 0x40"
Aug 10 17:14:54.867460 BGP SEND flags 0x40 code Origin(1): IGP
Aug 10 17:14:54.867595 BGP SEND flags 0x40 code ASPath(2) length 0: <null>
Aug 10 17:14:54.867650 BGP SEND flags 0x40 code NextHop(3): 192.168.6.5
Aug 10 17:14:54.867692 BGP SEND flags 0x40 code LocalPref(5): 100
Aug 10 17:14:54.884529 BGP RECV flags 0x40 code Origin(1): IGP
Aug 10 17:14:54.884581 BGP RECV flags 0x40 code ASPath(2) length 0: <null>
Aug 10 17:14:54.884628 BGP RECV flags 0x40 code NextHop(3): 192.163.6.4
Aug 10 17:14:54.884667 BGP RECV flags 0x40 code LocalPref(5): 100
Aug 10 17:14:54.911377 BGP RECV flags 0x40 code Origin(1): IGP
Aug 10 17:14:54.911422 BGP RECV flags 0x40 code ASPath(2) length 0: <null>
Aug 10 17:14:54.911466 BGP RECV flags 0x40 code NextHop(3): 192.168.40.4
Aug 10 17:14:54.911507 BGP RECV flags 0x40 code LocalPref(5): 100
Aug 10 17:14:54.916008 BGP SEND flags 0x40 code Origin(1): IGP
Aug 10 17:14:54.916054 BGP SEND flags 0x40 code ASPath(2) length 0: <null>
Aug 10 17:14:54.916100 BGP SEND flags 0x40 code NextHop(3): 192.168.6.5
Aug 10 17:14:54.916143 BGP SEND flags 0x40 code LocalPref(5): 100
Aug 10 17:14:54.920304 BGP RECV flags 0x40 code Origin(1): IGP
Aug 10 17:14:54.920348 BGP RECV flags 0x40 code ASPath(2) length 0: <null>
Aug 10 17:14:54.920393 BGP RECV flags 0x40 code NextHop(3): 10.0.0.10
Aug 10 17:14:54.920434 BGP RECV flags 0x40 code LocalPref(5): 100

```

5. View the tracing operations in real time.

```

user@host> clear bgp neighbor logical-system A
Cleared 2 connections

```

**CAUTION:** Clearing the BGP neighbor table is disruptive in a production environment.

6. Run the **monitor start** command with an optional **match** condition.

```

user@host> monitor start A/bgp-log | match 0.0.0.0/0

```

```
Aug 10 19:21:40.773467 BGP RECV          0.0.0.0/0
Aug 10 19:21:40.773685 bgp_rcv_nlri: 0.0.0.0/0
Aug 10 19:21:40.773778 bgp_rcv_nlri: 0.0.0.0/0 belongs to meshgroup
Aug 10 19:21:40.773832 bgp_rcv_nlri: 0.0.0.0/0 qualified bnp->ribact 0x0
12afcb 0x0
```

7. Pause the **monitor** command by pressing Esc-Q.  
To unpause the output, press Esc-Q again.
8. Halt the **monitor** command by pressing Enter and typing **monitor stop**.  
[Enter]  
user@host> **monitor stop**
9. When you are finished troubleshooting, consider deactivating trace logging to avoid any unnecessary impact to system resources.

```
[edit protocols bgp group internal-peers]
user@host:A# deactivate traceoptions
user@host:A# commit
```

When configuration is deactivated, it appears in the configuration with the **inactive** tag. To reactivate trace operations, use the **activate** configuration-mode statement.

```
[edit protocols bgp group internal-peers]
user@host:A# show
```

```
type internal;
inactive: traceoptions {
  file bgp-log size 10k files 2;
  flag update detail;
  flag all;
}
local-address 192.168.6.5;
export send-direct;
neighbor 192.163.6.4;
neighbor 192.168.40.4;
```

10. To reactivate trace operations, use the **activate** configuration-mode statement.  
[edit protocols bgp group internal-peers]  
user@host:A# **activate traceoptions**  
user@host:A# **commit**

### ***Deactivating and Reactivating Trace Logging***

#### **Step-by-Step Procedure**

To deactivate and reactivate the trace file:

1. When you are finished troubleshooting, consider deactivating trace logging to avoid an unnecessary impact to system resources.  
[edit protocols bgp group internal-peers]  
user@host:A# **deactivate traceoptions**  
user@host:A# **commit**

When configuration is deactivated, the statement appears in the configuration with the **inactive** tag.

```
[edit protocols bgp group internal-peers]
user@host:A# show
```

```

type internal;
inactive: traceoptions {
    file bgp-log size 10k files 2;
    flag update detail;
    flag all;
}
local-address 192.168.6.5;
export send-direct;
neighbor 192.163.6.4;
neighbor 192.168.40.4;

```

2. To reactivate logging, use the **activate** configuration-mode statement.

```

[edit protocols bgp group internal-peers]
user@host:A# activate traceoptions
user@host:A# commit

```

### Results

From configuration mode, confirm your configuration by entering the **show logical-systems A protocols bgp group internal-peers** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@host# show logical-systems A protocols bgp group internal-peers
traceoptions {
    file bgp-log size 10k files 2;
    flag update detail;
}

```

### Verification

Confirm that the configuration is working properly.

#### Verifying That the Trace Log File Is Operating

**Purpose** Make sure that events are being written to the log file.

**Action** user@host:A> **show log bgp-log**  
Aug 12 11:20:57 trace\_on: Tracing to "/var/log/A/bgp-log" started

**Related Documentation**

- [BGP Configuration Overview](#)

## Tracing BMP Operations

You can trace BMP operations for all BMP stations by configuring the **traceoptions** statement at the **[edit routing-options bmp]** hierarchy level or for specific BMP stations at the **[edit routing-options bmp station station-name]** hierarchy level.

To trace BMP operations, complete the following steps:

1. Configure the **traceoptions** statement:

```

traceoptions {

```

```
file filename <files number> <size size> <world-readable | no-world-readable>;  
flag flag <flag-modifier> <disable>;  
}
```

2. Specify the name of the file to receive the output of the tracing operation using the **file** option. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. We recommend that you place BMP tracing output in the file **bmp-log**.
3. (Optional) Specify the maximum number of trace files using the **files** option. When a trace file named **trace-file.0** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.
4. (Optional) Specify the maximum size of each trace file using the **size** option in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.
5. (Optional) You can specify that the log files are either **world-readable** (accessible to all users on the device) or **no-world-readable** (not accessible to all users on the device).
6. You can specify the following BMP-specific trace options using the **flag** statement:
  - **all**—Trace all BMP monitoring operations.
  - **down**—Down messages.
  - **error**—Error conditions.
  - **event**—Major events, station establishment, errors, and events.
  - **general**—General events.
  - **normal**—Normal events.
  - **packets**—All messages.
  - **policy**—Policy processing.
  - **route**—Routing information.
  - **route-monitoring**—Route monitoring messages.
  - **state**—State transitions.
  - **statistics**—Statistics messages.
  - **task**—Routing protocol task processing.
  - **timer**—Routing protocol timer processing.
  - **up**—Up messages.
  - **write**—Writing of messages.

You can optionally specify one or more of the following flag modifiers:

- **detail**—Provide detailed trace information.
- **disable**—Disable the tracing flag.
- **receive**—Trace the packets being received.
- **send**—Trace the packets being transmitted.

**NOTE:** Use the all trace flag and the detail flag modifier with caution due to the increased computer processing power required.

| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 9.3.</p> <p>Statement introduced in Junos OS Release 9.3 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>   |
| <b>Description</b>         | <p>Specify BGP to advertise the best external route into an IBGP mesh group, a route reflector cluster, or an AS confederation even if the best route is an internal route.</p> <p>In general, deployed BGP implementations do not advertise the external route with the highest local preference value to internal peers unless it is the best route. Although this behavior was required by an earlier version of the BGP version 4 specification, RFC 1771, it was typically not followed in order to minimize the amount of advertised information and to prevent routing loops. However, there are scenarios in which advertising the best external route is beneficial, in particular, situations that can result in IBGP route oscillation.</p> <p>The <b>advertise-external</b> statement is supported at both the group and neighbor level. If you configure the statement at the neighbor level, you must configure it for all neighbors in a group. Otherwise, the group is automatically split into different groups.</p> <p>In a confederation, when advertising a route to a confederation border router, any route from a different confederation sub-AS is considered external. When configuring the <b>advertise-external</b> statement for an AS confederation, it is recommended that EBGp peers belonging to different autonomous systems are configured in a separate EBGp peer group. This ensures consistency while BGP sends the best external route to peers in the configured peer group.</p> <p>To configure the <b>advertise-external</b> statement on a route reflector, you must disable intracluster reflection with the <b>no-client-reflect</b> statement.</p> <p>When a routing device is configured as a route reflector for a cluster, a route advertised by the route reflector is considered internal if it is received from an internal peer with the same cluster identifier or if both peers have no cluster identifier configured. A route received from an internal peer that belongs to another cluster, that is, with a different cluster identifier, is considered external.</p> <p>The <b>conditional</b> option causes BGP to advertise the external route only if the route selection process reaches the point where the multiple exit discriminator (MED) metric</p> |

is evaluated. As a result, an external route with an AS path longer than that of the active path is not advertised.

Junos OS also provides support for configuring a BGP export policy that matches on the state of an advertised route. You can match on either active or inactive routes.

**Default** BGP does not advertise the external route with the highest local preference value to internal peers unless it is the best route.

**Options** **conditional**—(Optional) Advertise the best external path only if the route selection process reaches the point at which the multiple exit discriminator (MED) metric is evaluated. The **conditional** option restricts advertisement to when the best external path and the active path are equal until the MED step of the route selection process. This implies that external routes with a longer AS path length than the active path, for instance, are not advertised. The criteria used for selecting the best external path is the same whether or not the **conditional** option is configured.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Hierarchy Level</b>          | <p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>]</p> |
| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>   |
| <b>Description</b>              | <p>Configure the routing table to export to BGP the best route learned by BGP even if Junos OS did not select this route to be an active route.</p> <p>One way to achieve multivendor compatibility is to include the <b>advertise-inactive</b> statement in the external BGP (EBGP) configuration. By default, BGP stores the route information it receives from update messages in the Junos OS routing table, and the routing table exports only active routes into BGP, which BGP then advertises to its peers. The <b>advertise-inactive</b> statement causes Junos OS to advertise the best BGP route that is inactive because of IGP preference. When you use the <b>advertise-inactive</b> statement, the Junos OS device uses, for example, the OSPF route for forwarding, and the other vendor's device uses the EBGP route for forwarding. However, from the perspective of an EBGP peer in a neighboring AS, both vendors' devices appear to behave the same way.</p>   |
| <b>Default</b>                  | By default, BGP stores the route information it receives from update messages in the Junos OS routing table, and the routing table exports only active routes into BGP, which BGP then advertises to its peers.   |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>  |

## algorithm (BGP BFD Authentication)

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | <code>algorithm <i>algorithm-name</i>;</code>  |
| <b>Hierarchy Level</b>     | <p>[edit logical-systems <i>logical-system-name</i> protocols bgp bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection authentication],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection authentication],</p> <p>[edit protocols bgp bgp bfd-liveness-detection authentication],</p> <p>[edit protocols bgp group <i>group-name</i> bfd-liveness-detection authentication],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection authentication],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp bgp bfd-liveness-detection authentication],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection authentication],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection authentication]</p> |
| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for BFD authentication introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>  |
| <b>Description</b>         | Configure the algorithm used to authenticate the specified BFD session.  |
| <b>Options</b>             | <p><b><i>algorithm-name</i></b>—Authentication algorithm name: <b>simple-password</b>, <b>keyed-md5</b>, <b>keyed-sha-1</b>, <b>meticulous-keyed-md5</b>, <b>meticulous-keyed-sha-1</b>.</p> <p><b>simple-password</b>—Plain-text password. One to 16 bytes of plain text are used to authenticate the BFD session. One or more passwords can be configured. This method is the least secure and should be used only when BFD sessions are not subject to packet interception.</p> <p><b>keyed-md5</b>—Keyed Message Digest 5 hash algorithm for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed MD5 uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than or equal to the last sequence number received. Although more secure than a simple password, this method is vulnerable to replay attacks. Increasing the rate at which the sequence number is updated can reduce this risk.</p>   |

**meticulous-keyed-md5**—Meticulous keyed Message Digest 5 hash algorithm. This method works in the same manner as keyed MD5, but the sequence number is updated with every packet. Although more secure than keyed MD5 and simple passwords, this method can take additional time to authenticate the session.

**keyed-sha-1**—Keyed Secure Hash Algorithm I for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed SHA uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. The key is not carried within the packets. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than the last sequence number received.

**meticulous-keyed-sha-1**—Meticulous keyed Secure Hash Algorithm I. This method works in the same manner as keyed SHA, but the sequence number is updated with every packet. Although more secure than keyed SHA and simple passwords, this method can take additional time to authenticate the session.

 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.  
 Statement introduced for BMP in Junos OS Release 13.2X51-D15 for the QFX Series.  
 Statement introduced for BMP in Junos OS Release 13.3.

**Description** Configure an authentication algorithm type.

**Options** *algorithm*—Specify one of the following types of authentication algorithms:

- **aes-128-cmac-96**—Cipher-based message authentication code (AES128, 96 bits).
- **hmac-sha-1-96**—Hash-based message authentication code (SHA1, 96 bits).
- **md5**—Message digest 5.

**Default:** hmac-sha-1-96

**NOTE:** The default is not displayed in the output of the `show bgp bmp` command unless a key or key-chain is also configured.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Release Information** Statement introduced in Junos OS Release 8.1.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
**detection-time threshold** and **transmit-interval threshold** options introduced in Junos OS Release 8.2  
 Support for logical routers introduced in Junos OS Release 8.3.  
 Support for IBGP and multihop EBGP sessions introduced in Junos OS Release 8.3.  
**holddown-interval** statement introduced in Junos OS Release 8.5. You can configure this statement only for EBGP peers at the [edit protocols bgp group *group-name* neighbor *address*] hierarchy level.  
**no-adaptation** statement introduced in Junos OS Release 9.0.  
 Support for BFD authentication introduced in Junos OS Release 9.6.

Support for BFD on IPv6 interfaces with BGP introduced in Junos OS Release 11.2.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description** Configure bidirectional failure detection (BFD) timers and authentication for BGP.

For IBGP and multihop EBGp support, configure the **bfd-liveness-detection** statement at the global **[edit bgp protocols]** hierarchy level. You can also configure IBGP and multihop support for a routing instance or a logical system.

**Options** **authentication algorithm** *algorithm-name* (Optional)—Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**.

**authentication key-chain** *key-chain-name* (Optional)—Associate a security key with the specified BFD session using the name of the security keychain. The keychain name must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

**authentication loose-check**—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

**detection-time threshold** *milliseconds* (Optional)—Configure a threshold. When the BFD session detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**holddown-interval** *milliseconds* (Optional)—Configure an interval specifying how long a BFD session must remain up before a state change notification is sent. When you configure the hold-down interval for the BFD protocol for EBGp, the BFD session is unaware of the BGP session during this time. In this case, if the BGP session goes down during the configured hold-down interval, BFD already assumes it is down and does not send a state change notification. The **holddown-interval** statement is supported only for EBGp peers at the **[edit protocols bgp group group-name neighbor address]** hierarchy level. If the BFD session goes down and then comes back up during the configured hold-down interval, the timer is restarted. You must configure the hold-down interval on both EBGp peers. If you configure the hold-down interval for a multihop EBGp session, you must also configure a local IP address by including the **local-address** statement at the **[edit protocols bgp group group-name]** hierarchy level.

**Range:** 0 through 255,000

**Default:** 0

**minimum-interval** *milliseconds* (Required)—Configure the minimum intervals at which the local routing device transmits hello packets and then expects to receive a reply from a neighbor with which it has established a BFD session. This value represents the minimum interval at which the local routing device transmits hello packets as well as the minimum interval that the routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a value in the range from 1 through 255,000 milliseconds. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately (using the **minimum-receive-interval** and **transmit-interval** statements).

**Range:** 1 through 255,000

**minimum-receive-interval** *milliseconds* (Optional)—Configure only the minimum interval at which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session.

**Range:** 1 through 255,000

**multiplier *number*** (Optional)—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255

**Default:** 3

**no-adaptation** (Optional)—Configure BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable to not to have BFD adaptation enabled in your network.

**transmit-interval threshold *milliseconds*** (Optional)—Configure a threshold. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**transmit-interval minimum-interval *milliseconds*** (Optional)—Configure only the minimum interval at which the local routing device transmits hello packets to a neighbor with which it has established a BFD session.

**Range:** 1 through 255,000

**version** (Optional)—Configure the BFD version to detect.

**Range:** 1 or **automatic** (autodetect the BFD version)

**Default:** **automatic**

The remaining statements are explained separately.

## cluster

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | <code>cluster <i>cluster-identifier</i>;</code>  |
| <b>Hierarchy Level</b>     | <p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>]</p> |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>  |
| <b>Description</b>         | Specify the cluster identifier to be used by the route reflector cluster in an internal BGP group.   |

### CAUTION:

If you configure both route reflection and VPNs on the same routing device, the following modifications to the route reflection configuration cause current BGP sessions to be reset:

- Adding a cluster ID—If a BGP session shares the same AS number with the group where you add the cluster ID, all BGP sessions are reset regardless of whether the BGP sessions are contained in the same group.
- Creating a new route reflector—If you have an IBGP group with an AS number and create a new route reflector group with the same AS number, all BGP sessions in the IBGP group and the new route reflector group are reset.

**NOTE:** If you change the address family specified in the [edit protocols bgp family] hierarchy level, all current BGP sessions on the routing device are dropped and then reestablished.

| <b>Hierarchy Level</b>     | <p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp family <i>family</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp family <i>family</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> family <i>family</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i> family <i>family</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i> family <i>family</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp family <i>family</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp family <i>family</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> family <i>family</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> family <i>family</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i> family <i>family</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i> family <i>family</i>],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i> family <i>family</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp family <i>family</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> family <i>family</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>]</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i> family <i>family</i>]</p> |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Support for flap damping at the address family level introduced in Junos OS Release 12.2.</p>  |
| <b>Description</b>         | <p>Enable route flap damping. BGP route flapping describes the situation in which BGP systems send an excessive number of update messages to advertise network reachability information. Flap damping reduces the number of update messages sent between BGP</p>  |

peers, thereby reducing the load on these peers, without adversely affecting the route convergence time for stable routes.

You typically apply flap damping to external BGP (EBGP) routes (that is, to routes in different ASs). You can also apply it within a confederation, between confederation member ASs. Because routing consistency within an AS is important, do not apply flap damping to internal BGP (IBGP) routes. (If you do, it is ignored.) The exception to this rule is when flap damping is applied at the address family level. When you apply flap damping at the address family level, it works for both IBGP and EBGP.

**Default** Flap damping is disabled on the routing device.

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 8.2.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for BFD authentication introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2 for Layer 2 VPNs and VPLS.</p>   |
| <b>Description</b>         | <p>Enable BFD failure detection. The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance</p>   |

is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the **clear bfd adaptation** command to return BFD interval timers to their configured values. The **clear bfd adaptation** command is hitless, meaning that the command does not affect traffic flow on the routing device.

The remaining statement is explained separately.

## disable (BGP Graceful Restart)

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | disable;   |
| <b>Hierarchy Level</b>     | [edit logical-systems <i>logical-system-name</i> protocols bgp graceful-restart],<br>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> graceful-restart],<br>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i> graceful-restart],<br>[edit protocols bgp graceful-restart],<br>[edit protocols bgp <b>group</b> <i>group-name</i> graceful-restart],<br>[edit protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i> graceful-restart] |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.   |
| <b>Description</b>         | Disable graceful restart for BGP. Graceful restart allows a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition.   |

**NOTE:** When you disable graceful restart at one level in the configuration statement hierarchy, it is also disabled at lower levels in the same hierarchy. For example, if you disable graceful restart at the [edit protocols bgp group *group-name*] hierarchy level, it is disabled for all the peers in the group. Therefore, if you want to enable graceful restart for some peers in a group and disable it for others, enable graceful restart at the [edit protocols bgp group *group-name*] hierarchy level and disable graceful restart for each peer at the [edit protocols bgp group *group-name* neighbor *address*] hierarchy level.

| <b>Description</b>              | <p>Apply one or more policies to routes being exported from the routing table into BGP.</p> <p>If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no routes match the filters, the routing table exports into BGP only the routes that it learned from BGP. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route's metric to 500, this route matches the criterion of <b>metric 500</b> defined in the next policy.</p>  |

| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p><b>inet-mvpn</b> and <b>inet6-mvpn</b> statements introduced in Junos OS Release 8.4.</p> <p><b>inet-mdt</b> statement introduced in Junos OS Release 9.4.</p> <p>Support for the <b>loops</b> statement introduced in Junos OS Release 9.6.</p> <p><b>evpn</b> statement introduced in Junos OS Release 13.2.</p>   |
| <b>Description</b>         | <p>Enable multiprotocol BGP (MP-BGP) by configuring BGP to carry network layer reachability information (NLRI) for address families other than unicast IPv4, to specify MP-BGP to carry NLRI for the IPv6 address family, or to carry NLRI for VPNs.</p>  |

- Options**
- any**—Configure the family type to be both unicast and multicast.
  - evpn**—Configure NLRI parameters for Ethernet VPNs (EVPNs).
  - inet**—Configure NLRI parameters for IPv4.
  - inet6**—Configure NLRI parameters for IPv6.
  - inet-mdt**—Configure NLRI parameters for the multicast distribution tree (MDT) subaddress family identifier (SAFI) for IPv4 traffic in Layer 3 VPNs.
  - inet-mvpn**—Configure NLRI parameters for IPv4 for multicast VPNs.
  - inet6-mvpn**—Configure NLRI parameters for IPv6 for multicast VPNs.
  - inet-vpn**—Configure NLRI parameters for IPv4 for Layer 3 VPNs.
  - inet6-vpn**—Configure NLRI parameters for IPv6 for Layer 3 VPNs.
  - iso-vpn**—Configure NLRI parameters for IS-IS for Layer 3 VPNs.
  - l2vpn**—Configure NLRI parameters for IPv4 for MPLS-based Layer 2 VPNs and VPLS.
  - labeled-unicast**—Configure the family type to be labeled-unicast. This means that the BGP peers are being used only to carry the unicast routes that are being used by labeled-unicast for resolving the labeled-unicast routes. This statement is supported only with **inet** and **inet6**.
  - multicast**—Configure the family type to be multicast. This means that the BGP peers are being used only to carry the unicast routes that are being used by multicast for resolving the multicast routes.
  - unicast**—Configure the family type to be unicast. This means that the BGP peers only carry the unicast routes that are being used for unicast forwarding purposes. The default family type is **unicast**.

The remaining statements are explained separately.

- Required Privilege Level**
- routing—To view this statement in the configuration.
  - routing-control—To add this statement to the configuration.

## hold-down

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <pre>hold-down {     seconds;     flaps number;     period seconds; }</pre>  |
| <b>Hierarchy Level</b>          | <pre>[edit logical-systems logical-system-name routing-options bmp], [edit logical-systems logical-system-name routing-options bmp station station-name], [edit routing-options bmp], [edit routing-options bmp station station-name]</pre>  |
| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.3.</p>  |
| <b>Description</b>              | <p>If the connection to a BMP station flaps and the <b>hold-down</b> statement is configured, the station is prevented from reconnecting to the device for the specified period of time. A flap is when the TCP session unexpectedly switches from established to non-established. If you alter the configuration of the <b>hold-down</b> statement, the hold down timer and flap counter are reset.</p> <p>You can effectively disable the <b>hold-down</b> statement by setting the <b>flaps</b> option to 10 and the <b>period</b> option to 30 seconds.</p>  |
| <b>Options</b>                  | <p><b>seconds</b>—Specify the time in seconds to wait before allowing the BMP station to reconnect to the device.</p> <p><b>Default:</b> 600 seconds</p> <p><b>Range:</b> 30 through 65,535 seconds</p> <p><b>flaps number</b>—Specify the number of BMP station flaps allowed before terminating the connection to the BMP station and triggering the hold down timer.</p> <p><b>Default:</b> 3 flaps</p> <p><b>Range:</b> 2 to 10 flaps</p> <p><b>period seconds</b>—Specify the time in seconds for the BGP station flaps (specified using the <b>flaps</b> option) to occur before triggering the hold down timer. Every time a flap occurs, the number of flaps in the last time period is checked to see if the criteria is met.</p> <p>For example, if you defined the <b>period</b> as 60 seconds and the <b>flaps</b> as 4 and the BGP station flaps just 2 times in a 60 second period, the hold down timer would not be triggered. However, if the BGP station flaps 4 times in a 60 second period, the hold down timer would be triggered.</p> <p><b>Default:</b> 300 seconds</p> <p><b>Range:</b> 30 through 65,535 seconds</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 8.5.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for BFD authentication introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>  |
| <b>Description</b>              | <p>Configure an interval specifying how long a BFD session must remain up before a state change notification is sent.</p> <p>When you configure the hold-down interval for the BFD protocol for EBGp, the BFD session is unaware of the BGP session during this time. In this case, if the BGP session goes down during the configured hold-down interval, BFD already assumes the BGP session is down and does not send a state change notification. The <b>holddown-interval</b> statement is supported only for EBGp peers at the <b>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i>]</b> hierarchy level. If the BFD session goes down and then comes back up during the configured hold-down interval, the timer is restarted. You must configure the hold-down interval on both EBGp peers. If you configure the hold-down interval for a multihop EBGp session, you must also configure a local IP address by including the <b>local-address</b> statement at the <b>[edit protocols bgp group <i>group-name</i>]</b> hierarchy level.</p>  |
| <b>Options</b>                  | <p><b><i>milliseconds</i></b>—Specify the hold-down interval value.</p> <p><b>Range:</b> 0 through 255,000</p> <p><b>Default:</b> 0</p>  |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |

## hold-time (Protocols BGP)

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | <code>hold-time seconds;</code>   |
| <b>Hierarchy Level</b>     | <pre> [edit logical-systems <i>logical-system-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> protocols bgp <i>group group-name</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp <i>group group-name</i> <i>neighbor address</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name neighbor address</i>], [edit protocols bgp], [edit protocols bgp <i>group group-name</i>], [edit protocols bgp <i>group group-name neighbor address</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp], [edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i> <i>neighbor address</i>] </pre>   |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>   |
| <b>Description</b>         | <p>Specify the hold-time value to use when negotiating a connection with the peer. The hold-time value is advertised in open packets and indicates to the peer the length of time that it should consider the sender valid. If the peer does not receive a keepalive, update, or notification message within the specified hold time, the BGP connection to the peer is closed and routing devices through that peer become unavailable.</p> <p>The hold time is three times the interval at which keepalive messages are sent.</p> <p>BGP on the local routing device uses the smaller of either the local hold-time value or the peer's hold-time value received in the open message as the hold time for the BGP connection between the two peers.</p> <p>Starting in Junos OS Release 12.3, the BGP hold-time value can be zero (0). This implies that the speaker does not expect keepalive messages from its peer to maintain the BGP session. When negotiating between two peers, if one side requests a nonzero hold time and the other requests a zero hold time, the negotiation settles on the nonzero value and keepalive intervals are determined accordingly. Both sides must be set to zero for keepalive messages to stop being sent.</p> |
| <b>Options</b>             | <p><b>seconds</b>—Hold time.</p> <p><b>Range:</b> 10 through 65,535 seconds (or 0 for infinite hold time)</p> <p><b>Default:</b> 90 seconds</p>   |

**TIP:** When you set a hold-time value of 1 through 19 seconds, we recommend that you also configure the BGP `precision-timers` statement. The `precision-timers` statement ensures that if scheduler slip messages occur, the routing device continues to send keepalive messages. When the `precision-timers` statement is included, keepalive message generation is performed in a dedicated kernel thread, which helps to prevent BGP session flaps.

## import (Protocols BGP)

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | <code>import [ <i>policy-names</i> ];</code>  |
| <b>Hierarchy Level</b>     | <p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>]</p>  |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>   |
| <b>Description</b>         | <p>Apply one or more routing policies to routes being imported into the Junos OS routing table from BGP.</p> <p>If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no match is found, BGP places into the routing table only those routes that were learned from BGP routing devices. The policy framework software evaluates the routing policies in a chain sequentially. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route's metric to 500, this route matches the criterion of <b>metric 500</b> defined in the next policy.</p> <p>It is also important to understand that in Junos OS, although an import policy (inbound route filter) might reject a route, not use it for traffic forwarding, and not include it in an advertisement to other peers, the router retains these routes as hidden routes. These hidden routes are not available for policy or routing purposes. However, they do occupy memory space on the router. A service provider filtering routes to control the amount of information being kept in memory and processed by a router might want the router to entirely drop the routes being rejected by the import policy.</p> <p>Hidden routes can be viewed by using the <b>show route receive-protocol bgp neighbor-address hidden</b> command. The hidden routes can then be retained or dropped from the routing table by configuring the <b>keep all   none</b> statement at the <b>[edit protocols bgp]</b> or <b>[edit protocols bgp group group-name]</b> hierarchy level.</p> |

The rules of BGP route retention are as follows:

- By default, all routes learned from BGP are retained, except those where the AS path is looped. (The AS path includes the local AS.)
- By configuring the **keep all** statement, all routes learned from BGP are retained, even those with the local AS in the AS path.
- By configuring the **keep none** statement, all routes received are discarded. When this statement is configured and the inbound policy changes, Junos OS re-advertises all the routes advertised by the peer.

**Options**    *policy-names*—Name of one or more policies.

**Required Privilege**    routing—To view this statement in the configuration.  
**Level**    routing-control—To add this statement to the configuration.

## keep

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | keep (all   none);   |
| <b>Hierarchy Level</b>     | <pre>[edit logical-systems <i>logical-system-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> protocols bgp <i>group group-name</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp <i>group group-name</i> <i>neighbor address</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name neighbor address</i>], [edit protocols bgp], [edit protocols bgp <i>group group-name</i>], [edit protocols bgp <i>group group-name neighbor address</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp], [edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i> <i>neighbor address</i>]</pre>  |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>  |
| <b>Description</b>         | <p>Control whether or not Junos OS keeps in memory and hides certain routes.</p> <p>If the <b>keep none</b> statement is used, Junos OS does not retain in memory and hide routes that are rejected because of a BGP import policy. Nor does BGP keep in memory and hide routes that are declared unfeasible due to BGP sanity checks. The <b>keep none</b> statement causes Junos OS to discard from memory the routes that are rejected due to BGP-specific logic or BGP evaluation. When a route is rejected because of some non-BGP-specific reason, the <b>keep none</b> statement has no effect on this route. This rejected route is retained in memory and hidden even though <b>keep none</b> is configured. An example of this type of hidden route is a route for which the protocol nexthop is unresolved.</p> <p>The routing table can retain the route information learned from BGP in one of the following ways:</p> <ul style="list-style-type: none"> <li>• Default (omit the <b>keep</b> statement)—Keep all route information that was learned from BGP, except for routes whose AS path is looped and whose loop includes the local AS.</li> <li>• <b>keep all</b>—Keep all route information that was learned from BGP.</li> <li>• <b>keep none</b>—Discard routes that were received from a peer and that were rejected by import policy or other sanity checking, such as AS path or next hop. When you configure <b>keep none</b> for the BGP session and the inbound policy changes, Junos OS forces readvertisement of the full set of routes advertised by the peer.</li> </ul> |

In an AS path healing situation, routes with looped paths theoretically could become usable during a soft reconfiguration when the AS path loop limit is changed. However, there is a significant memory usage difference between the default and **keep all**.

Consider the following scenarios:

- A peer readvertises routes back to the peer from which it learned them.

This can happen in the following cases:

- Another vendor's routing device advertises the routes back to the sending peer.
- The Junos OS peer's default behavior of not readvertising routes back to the sending peer is overridden by configuring **advertise-peer-as**.
- A provider edge (PE) routing device discards any VPN route that does not have any of the expected route targets.

When **keep all** is configured, the behavior of discarding routes received in the above scenarios is overridden.

**CAUTION:** If you add or remove **keep all** or **keep none** and the peer does not support session restart, the associated BGP sessions are restarted (flapped). To determine if a peer supports refresh, check for **Peer supports Refresh capability** in the output of the **show bgp neighbor** command.

|                                 |  |
|---------------------------------|--|
| <b>Default</b>                  | By default, BGP retains incoming rejected routes in memory and hides them. If you do not include the <b>keep</b> statement, most routes are retained in the routing table. BGP keeps all route information that was learned from BGP, except for routes whose AS path is looped and whose loop includes the local AS.                        |
| <b>Options</b>                  | <b>all</b> —Retain all routes.<br><br><b>none</b> —Discard routes that were received from a peer and that were rejected by import policy or other sanity checking. When <b>keep none</b> is configured for the BGP session and the inbound policy changes, Junos OS forces readvertisement of the full set of routes advertised by the peer. |

## local-address (Protocols BGP)

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | <code>local-address address;</code>  |
| <b>Hierarchy Level</b>     | <p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>]</p>   |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>  |
| <b>Description</b>         | <p>Specify the address of the local end of a BGP session. This address is used to accept incoming connections to the peer and to establish connections to the remote peer. When none of the operational interfaces are configured with the specified local address, a session with a BGP peer is placed in the idle state.</p> <p>You generally configure a local address to explicitly configure the system's IP address from BGP's point of view. This IP address can be either an IPv6 or IPv4 address. Typically, an IP address is assigned to a loopback interface, and that IP address is configured here.</p> <p>For internal BGP (IBGP) peering sessions, generally the loopback interface (lo0) is used to establish connections between the IBGP peers. The loopback interface is always up as long as the device is operating. If there is a route to the loopback address, the IBGP peering session stays up. If a physical interface address is used instead and that interface goes up and down, the IBGP peering session also goes up and down. Thus, the loopback interface provides fault tolerance in case the physical interface or the link goes down, if the device has link redundancy.</p> <p>When a device peers with a remote device's loopback interface address, the local device expects BGP update messages to come from (be sourced by) the remote device's loopback interface address. The <b>local-address</b> statement enables you to specify the source information in BGP update messages. If you omit the <b>local-address</b> statement, the expected source of BGP update messages is based on the device's source address selection rules, which normally result in the egress interface address being the expected source of update messages. When this happens, the peering session is not established because a mismatch exists between the expected source address (the egress interface</p> |

of the peer) and the actual source (the loopback interface of the peer). To ensure that the expected source address matches the actual source address, specify the loopback interface address in the **local-address** statement.

**NOTE:** Although a BGP session can be established when only one of the paired routing devices has **local-address** configured, we strongly recommend that you configure **local-address** on both paired routing devices for IBGP and multihop EBGP sessions. The **local-address** statement ensures that deterministic fixed addresses are used for the BGP session end-points.

If you include the **default-address-selection** statement in the configuration, the software chooses the system default address as the source for most locally generated IP packets. For protocols in which the local address is unconstrained by the protocol specification, for example IBGP and multihop EBGP, if you do not configure a specific local address when configuring the protocol, the local address is chosen using the same methods as other locally generated IP packets.

**Default** If you do not configure a local address, BGP uses the routing device's source address selection rules to set the local address.

**Options** **address**—IPv6 or IPv4 address of the local end of the connection.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## local-as

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | <code>local-as <i>autonomous-system</i> &lt;loops <i>number</i>&gt; &lt;private   alias&gt; &lt;no-prepend-global-as&gt;;</code>  |
| <b>Hierarchy Level</b>     | <pre>[edit logical-systems <i>logical-system-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> protocols bgp <i>group</i> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp <i>group</i> <i>group-name</i> neighbor <i>address</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp <i>group</i> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp <i>group</i> <i>group-name</i> neighbor <i>address</i>], [edit protocols bgp], [edit protocols bgp <i>group</i> <i>group-name</i>], [edit protocols bgp <i>group</i> <i>group-name</i> neighbor <i>address</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp], [edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group</i> <i>group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group</i> <i>group-name</i> neighbor   <i>address</i>]</pre> |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p><b>alias</b> option introduced in Junos OS Release 9.5.</p> <p><b>no-prepend-global-as</b> option introduced in Junos OS Release 9.6.</p>  |
| <b>Description</b>         | <p>Specify the local autonomous system (AS) number. An AS is a set of routing devices that are under a single technical administration and generally use a single interior gateway protocol (IGP) and metrics to propagate routing information within the set of routing devices.</p> <p>Internet service providers (ISPs) sometimes acquire networks that belong to a different AS. When this occurs, there is no seamless method for moving the BGP peers of the acquired network to the AS of the acquiring ISP. The process of configuring the BGP peers with the new AS number can be time-consuming and cumbersome. In this case, it might not be desirable to modify peer arrangements or configuration. During this kind of transition period, it can be useful to configure BGP-enabled devices in the new AS to use the former AS number in BGP updates. This former AS number is called a <i>local</i> AS.</p>   |

**NOTE:** If you are using BGP on the routing device, you must configure an AS number before you specify the local as number.

In Junos OS Release 9.1 and later, the AS numeric range in plain-number format is extended to provide BGP support for 4-byte AS numbers, as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*.

In Junos OS Release 9.3 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For

example, the 4-byte AS number of 65546 in plain-number format is represented as 1.10 in the AS-dot notation format.

**Options** **alias**—(Optional) Configure the local AS as an alias of the global AS number configured for the router at the **[edit routing-options]** hierarchy level. As a result, a BGP peer considers any local AS to which it is assigned as equivalent to the primary AS number configured for the routing device. When you use the **alias** option, only the AS (global or local) used to establish the BGP session is prepended in the AS path sent to the BGP neighbor.

**autonomous-system**—AS number.

**Range:** 1 through 4,294,967,295 ( $2^{32} - 1$ ) in plain-number format

**Range:** 0.0 through 65535.65535 in AS-dot notation format

**loops number**—(Optional) Specify the number of times detection of the AS number in the AS\_PATH attribute causes the route to be discarded or hidden. For example, if you configure **loops 1**, the route is hidden if the AS number is detected in the path one or more times. This is the default behavior. If you configure **loops 2**, the route is hidden if the AS number is detected in the path two or more times.

**NOTE:** If you configure the local AS values for any BGP group, the detection of routing loops is performed using both the AS and the local AS values for all BGP groups.

If the local AS for the EBGP or IBGP peer is the same as the current AS, do not use the **local-as** statement to specify the local AS number.

When you configure the local AS within a VRF, this impacts the AS path loop-detection mechanism. All of the **local-as** statements configured on the device are part of a single AS domain. The AS path loop-detection mechanism is based on looking for a matching AS present in the domain.

**Range:** 1 through 10

**Default:** 1

**no-prepend-global-as**—(Optional) Specify to strip the global AS and to prepend only the local AS in AS paths sent to external peers.

**private**—(Optional) Configure to use the local AS only during the establishment of the BGP session with a BGP neighbor but to hide it in the AS path sent to external BGP peers. Only the global AS is included in the AS path sent to external peers.

**NOTE:** The **private** and **alias** options are mutually exclusive. You cannot configure both options with the same **local-as** statement.

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** Globally, for the local-AS BGP attribute, or the specified address family, allow the local device's AS number to be in the received AS paths, and specify the number of times detection of the local device's AS number in the AS\_PATH attribute causes the route to be discarded or hidden. For example, if you configure **loops 1**, the route is hidden if the local device's AS number is detected in the path one or more times. This prevents routing loops and is the default behavior. If you configure **loops 2**, the route is hidden if the local device's AS number is detected in the path two or more times.

Some examples of BGP address families are as follows:

- **inet unicast**
- **inet-vpn multicast**
- **inet6 any**
- **l2vpn auto-discovery-only**
- ...

This list is truncated for brevity. For a complete list of protocol families for which you can specify the **loops** statement, enter the **help apropos loops** configuration command at the **[edit protocols bgp]** hierarchy level on your device.

```
[edit protocols bgp]
user@host# help apropos loops
set family inet unicast loops
    Allow local AS in received AS paths
set family inet unicast loops <loops>
    AS-Path loop count
set family inet multicast loops
```

```
    Allow local AS in received AS paths
set family inet multicast loops <loops>
    AS-Path loop count
set family inet flow loops
    Allow local AS in received AS paths
set family inet flow loops <loops>
    AS-Path loop count
set family inet any loops
    Allow local AS in received AS paths
set family inet any loops <loops>
    AS-Path loop count
set family inet labeled-unicast loops
    Allow local AS in received AS paths
...
```

**NOTE:** When you configure the `loops` statement for a specific BGP address family, that value is used to evaluate the AS path for routes received by a BGP peer for the specified address family, rather than the `loops` value configured for the global AS number with the `loops` statement at the `[edit routing-options autonomous-system as-number]` hierarchy level.

**Options** *number*—Number of times detection of the AS number in the AS\_PATH attribute causes the route to be discarded or hidden.

**Range:** 1 through 10

**Default:** 1

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## metric-out (Protocols BGP)

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | <code>metric-out (<i>metric</i>   minimum-igp <i>offset</i>   igp (delay-med-update   <i>offset</i>);</code>  |
| <b>Hierarchy Level</b>     | <p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <i>group group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <i>group group-name neighbor address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name neighbor address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <i>group group-name</i>],</p> <p>[edit protocols bgp <i>group group-name neighbor address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group group-name neighbor address</i>]</p>  |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Option <b>delay-med-update</b> introduced in Junos OS Release 9.0.</p>   |
| <b>Description</b>         | <p>Specify the metric for all routes sent using the multiple exit discriminator (MED, or <b>MULTI_EXIT_DISC</b>) path attribute in update messages. This path attribute is used to discriminate among multiple exit points to a neighboring AS. If all other factors are equal, the exit point with the lowest metric is preferred.</p> <p>You can specify a constant metric value by including the <b>metric</b> option. For configurations in which a BGP peer sends third-party next hops that require the local system to perform next-hop resolution—IBGP configurations, configurations within confederation peers, or EBGP configurations that include the <b>multihop</b> command—you can specify a variable metric by including the <b>minimum-igp</b> or <b>igp</b> option.</p> <p>You can increase or decrease the variable metric calculated from the IGP metric (either from the <b>igp</b> or <b>minimum-igp</b> statement) by specifying a value for <b>offset</b>. The metric is increased by specifying a positive value for <b>offset</b>, and decreased by specifying a negative value for <b>offset</b>.</p> <p>In Junos OS Release 9.0 and later, you can specify that a BGP group or peer not advertise updates for the MED path attributes used to calculate IGP costs for BGP next hops unless the MED is lower. You can also configure an interval to delay when MED updates are sent by including the <b>med-igp-update-interval minutes</b> statement at the [edit routing-options] hierarchy level.</p> |
| <b>Options</b>             | <p><b>delay-med-update</b>—Specify that a BGP group or peer configured with the <b>metric-out igp</b> statement not advertise MED updates unless the current MED value is lower than</p>  |

the previously advertised MED value, or another attribute associated with the route has changed, or the BGP peer is responding to a refresh route request.

**NOTE:** You cannot configure the `delay-med-update` statement at the global BGP level.

**igp**—Set the metric to the most recent metric value calculated in the IGP to get to the BGP next hop. Routes learned from an EBGP peer usually have a next hop on a directly connected interface and thus the IGP value is equal to zero. This is the value advertised.

**metric**—Primary metric on all routes sent to peers.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**Default:** No metric is sent.

**minimum-igp**—Set the metric to the minimum metric value calculated in the IGP to get to the BGP next hop. If a newly calculated metric is greater than the minimum metric value, the metric value remains unchanged. If a newly calculated metric is lower, the metric value is lowered to that value. When you change a neighbor's export policy from any configuration to a configuration that sets the minimum IGP offset on an exported route, the advertised MED is not updated if the value would increase as a result, even if the previous configuration does not use a minimum IGP-based MED value. This behavior helps to prevent unnecessary route flapping when an IGP cost changes, by not forcing a route update if the metric value increases past the previous lowest known value.

**offset**—Increases or decreases the metric by this value.

**Range:**  $-2^{31}$  through  $2^{31} - 1$

**Default:** None

## monitor (Protocols BMP)

---

**Syntax** monitor (enable | disable);

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols bgp [bmp](#)],  
[edit logical-systems *logical-system-name* protocols bgp group *group-name* bmp],  
[edit logical-systems *logical-system-name* protocols bgp group *group-name* neighbor *address* bmp],  
[edit logical-systems *logical-system-name* routing-options [bmp](#)],  
[edit logical-systems *logical-system-name* routing-options bmp [station](#) *station-name*],  
[edit protocols bgp [bmp](#)],  
[edit protocols bgp group *group-name* bmp],  
[edit protocols bgp group *group-name* neighbor *address* bmp],  
[edit routing-options [bmp](#)],  
[edit routing-options bmp [station](#) *station-name*]

**Release Information** Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.  
Statement introduced in Junos OS Release 13.3.

**Description** BMP monitoring is enabled by default. You can explicitly enable BMP monitoring or disable it. You can also selectively enable or disable BMP monitoring at various hierarchy levels (for example, [edit protocols bgp group *group-name*] or [edit protocols bgp group *group-name* neighbor *address*]). If you disable BMP monitoring, withdrawal messages are sent for any previously advertised routes. These are followed by a down message. If you enable BMP monitoring, an up message is sent first and then the route advertisements follow.

**Options** **enable**—Enable BMP monitoring.  
**Default:** BMP monitoring is enabled by default.  
**disable**—Disable BMP monitoring.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## mtu-discovery

|                                 |   |

| <b>Description</b>              | <p>Configure TCP path maximum transmission unit (MTU) discovery.</p> <p>TCP path MTU discovery enables BGP to automatically discover the best TCP path MTU for each BGP session. In Junos OS, TCP path MTU discovery is disabled by default for all BGP neighbor sessions.</p> <p>When MTU discovery is disabled, TCP sessions that are not directly connected transmit packets of 512-byte maximum segment size (MSS). These small packets minimize the chances of packet fragmentation at a device along the path to the destination. However, because most links use an MTU of at least 1500 bytes, 512-byte packets do not result in the most efficient use of link bandwidth. For directly connected EBGP sessions, MTU mismatches prevent the BGP session from being established. As a workaround, enable path MTU discovery within the EBGP group.</p> <p>Path MTU discovery dynamically determines the MTU size on the network path between the source and the destination, with the goal of avoiding IP fragmentation. Path MTU discovery works by setting the Don't Fragment (DF) bit in the IP headers of outgoing packets. When a device along the path has an MTU that is smaller than the packet, the device drops the packet. The device also sends back an ICMP Fragmentation Needed (Type 3, Code 4) message that contains the device's MTU, thus allowing the source to reduce its path MTU appropriately. The process repeats until the MTU is small enough to traverse the entire path without fragmentation.</p> |

| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.<br/>         Statement introduced in Junos OS Release 9.0 for EX Series switches.<br/>         Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>   |
| <b>Description</b>         | <p>Configure an EBGp multihop session.</p> <p>For Layer 3 VPNs, you configure the EBGp multihop session between the PE and CE routing devices. This allows you to configure one or more routing devices between the PE and CE routing devices.</p> <p>An external confederation peer is a special case that allows unconnected third-party next hops. You do not need to configure multihop sessions explicitly in this particular case because multihop behavior is implied.</p> <p>If you have external BGP confederation peer-to-loopback addresses, you still need the multihop configuration.</p>  |
|                            | <div>  <p><b>NOTE:</b> You cannot configure the <code>accept-remote-nexthop</code> statement at the same time.</p> </div>  |
| <b>Default</b>             | <p>If you omit this statement, all EBGp peers are assumed to be directly connected (that is, you are establishing a nonmultihop, or “regular,” BGP session), and the default time-to-live (TTL) value is 1.</p>   |

The remaining statements are explained separately.

| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>  |
| <b>Description</b>              | <p>Prevent different routing devices within an AS from creating aggregate routes that contain different AS paths.</p> <p>Junos OS performs route aggregation, which is the process of combining the characteristics of different routes so that only a single route is advertised. Aggregation reduces the amount of information that BGP must store and exchange with other BGP systems. When aggregation occurs, the local routing device adds the local AS number and the router ID to the aggregator path attribute. The <b>no-aggregator-id</b> statement causes Junos OS to place a 0 in the router ID field and thus eliminate the possibility of having multiple aggregate advertisements in the network, each with different path information.</p>  |
| <b>Default</b>                  | If you omit this statement, the router ID is included in the BGP aggregator path attribute.  |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |

## out-delay

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | <code>out-delay seconds;</code>   |
| <b>Hierarchy Level</b>     | <p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>address</i>]</p>  |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>   |
| <b>Description</b>         | <p>Control how often BGP and the routing table exchange route information by specifying how long a route must be present in the Junos OS routing table before it is exported to BGP. Use this time delay to help bundle routing updates and to avoid sending updates too often.</p> <p>Alternatively or in addition, external BGP (EBGP) sessions can also use the route-flap damping mechanism upon the reception of BGP messages coming from an external neighbor.</p> <p>BGP stores the route information it receives from update messages in the routing table, and the routing table exports active routes from the routing table into BGP. BGP then advertises the exported routes to its peers. The <b>out-delay</b> statement enables a form of rate limiting. The delay is added to each update for each prefix individually. When a routing device changes its best path to a destination prefix, the device does not inform its peer about the change unless the route has been present in its routing table for the specified <b>out-delay</b>. If you use <b>out-delay</b> to perform rate-limiting, you can expect a less bursty pattern of updates. You will see a pattern in which updates arrive in a steady flow, and two updates for the same prefix are always spaced by at least the <b>out-delay</b> timer value (for example, 30 seconds). Thus, the <b>out-delay</b> setting is useful for limiting oscillation (sometimes called <i>churn</i>) in a network. Keep in mind that, regardless of the <b>out-delay</b> setting, BGP peers exchange routes immediately after neighbor establishment. The <b>out-delay</b> setting is only designed to delay the exchange of routes between BGP and the local routing table.</p> |

Caution is warranted because an **out-delay** can delay convergence. If your network is configured in a way that avoids oscillation, setting an **out-delay** is not necessary.

When configured, the **out-delay** value displays as **Outbound Timer** when using **show bgp group** or **show bgp group neighbor** commands.

**Default** By default, the exchange of route information between BGP and the routing table occurs immediately after the routes are received. This immediate exchange of route information might cause instabilities in the network reachability information. If you omit this statement, routes are exported to BGP immediately after they have been added to the routing table.

**Options** *seconds*—Output delay time.  
**Range:** 0 through 65,535 seconds  
**Default:** 0 seconds

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## path-selection

---

|                            |   |
|----------------------------|---|
| <b>Syntax</b>              | <pre>path-selection {<br/>  (always-compare-med   cisco-non-deterministic   external-router-id);<br/>  as-path-ignore;<br/>  l2vpn-use-bgp-rules;<br/>  med-plus-igp {<br/>    igp-multiplier <i>number</i>;<br/>    med-multiplier <i>number</i>;<br/>  }<br/>}</pre>  |
| <b>Hierarchy Level</b>     | [edit logical-systems <i>logical-system-name</i> protocols bgp],<br>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],<br>[edit protocols bgp],<br>[edit routing-instances <i>routing-instance-name</i> protocols bgp]   |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.<br><b>med-plus-igp</b> option introduced in Junos OS Release 8.1.<br><b>as-path-ignore</b> and <b>l2vpn-use-bgp-rules</b> options introduced in Junos OS Release 10.2. |
| <b>Description</b>         | Configure BGP path selection.   |
| <b>Default</b>             | If the <b>path-selection</b> statement is not included in the configuration, only the multiple exit discriminators (MEDs) of routes that have the same peer ASs are compared.   |
| <b>Options</b>             | <b>always-compare-med</b> —Always compare MEDs whether or not the peer ASs of the compared routes are the same.   |

**NOTE:** We recommend that you configure the **always-compare-med** option.

---

**as-path-ignore**—In the best-path algorithm, skip the step that compares the autonomous system (AS) path lengths. By default, the best-path algorithm evaluates the length of the AS paths and prefers the route with the shortest AS path length.

---

**NOTE:** The **as-path-ignore** statement is not supported with routing instances.

---

**cisco-non-deterministic**—Emulate the Cisco IOS default behavior. This mode evaluates routes in the order that they are received and does not group them according to their neighboring AS. With **cisco-non-deterministic** mode, the active path is always first. All inactive, but eligible, paths follow the active path and are maintained in the order

in which they were received, with the most recent path first. Ineligible paths remain at the end of the list.

As an example, suppose you have three path advertisements for the 192.168.1.0 /24 route:

- Path 1—learned through EBGp; AS Path of 65010; MED of 200
- Path 2—learned through IBGP; AS Path of 65020; MED of 150; IGP cost of 5
- Path 3—learned through IBGP; AS Path of 65010; MED of 100; IGP cost of 10

These advertisements are received in quick succession, within a second, in the order listed. Path 3 is received most recently, so the routing device compares it against path 2, the next most recent advertisement. The cost to the IBGP peer is better for path 2, so the routing device eliminates path 3 from contention. When comparing paths 1 and 2, the routing device prefers path 1 because it is received from an EBGp peer. This allows the routing device to install path 1 as the active path for the route.

**NOTE:** We do not recommend using this configuration option in your network. It is provided solely for interoperability to allow all routing devices in the network to make consistent route selections.

**external-router-id**—Compare the router ID between external BGP paths to determine the active path.

**igp-multiplier *number***—The multiplier value for the IGP cost to a next-hop address. This option is useful for making the MED and IGP cost comparable.

**Range:** 1 through 1000

**Default:** 1

**med-multiplier *number***—The multiplier value for the MED calculation. This option is useful for making the MED and IGP cost comparable.

**Range:** 1 through 1000

**Default:** 1

**med-plus-igp**—Add the IGP cost to the indirect next-hop destination to the MED before comparing MED values for path selection. This statement only affects best-path selection. It does not affect the advertised MED.

The other option is explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## peer-as (Protocols BGP)

|                            |  |
|----------------------------|--|
| <b>Syntax</b>              | <code>peer-as <i>autonomous-system</i>;</code>   |
| <b>Hierarchy Level</b>     | <p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>]</p>   |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>  |
| <b>Description</b>         | <p>Specify the neighbor (peer) autonomous system (AS) number.</p> <p>For EBGP, the peer is in another AS, so the AS number you specify in the <b>peer-as</b> statement must be different from the local router's AS number, which you specify in the <b>autonomous-system</b> statement. For IBGP, the peer is in the same AS, so the two AS numbers that you specify in the <b>autonomous-system</b> and <b>peer-as</b> statements must be the same.</p> <p>The AS numeric range in plain-number format has been extended in Junos OS Release 9.1 to provide BGP support for 4-byte AS numbers, as defined in RFC 4893, <i>BGP Support for Four-octet AS Number Space</i>. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of the Junos OS support 2-byte AS numbers.</p> <p>In Junos OS Release 9.2 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: <i>&lt;16-bit high-order value in decimal&gt;.&lt;16-bit low-order value in decimal&gt;</i>. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.</p> <p>With the introduction of 4-byte AS numbers, you might have a combination of routers that support 4-byte AS numbers and 2-byte AS numbers. For more information about what happens when establishing BGP peer relationships between 4-byte and 2-byte capable routers, see the following topics:</p> |

- *Using 4-Byte Autonomous System Numbers in BGP Networks Technology Overview.*

**Options** *autonomous-system*—AS number.  
**Range:** 1 through 4,294,967,295 ( $2^{32} - 1$ ) in plain-number format for 4-byte AS numbers  
**Range:** 1 through 65,535 in plain-number format for 2-byte AS numbers (this is a subset of the 4-byte range)  
**Range:** 0.0 through 65535.65535 in AS-dot notation format for 4-byte AS numbers

## priority (Protocols BMP)

---

|   |   |
|---|---|
| <b>Syntax</b>   | priority (high   medium   low);   |
| <b>Hierarchy Level</b>  | [edit logical-systems <i>logical-system-name</i> routing-options <b>bmp</b> ],<br>[edit logical-systems <i>logical-system-name</i> routing-options bmp <b>station station-name</b> ],<br>[edit routing-options <b>bmp</b> ],<br>[edit routing-options bmp <b>station station-name</b> ]   |
| <b>Release Information</b>  | Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.<br>Statement introduced in Junos OS Release 13.3.  |
| <b>Description</b>  | Specifies the dispatch priority for BMP. The dispatch priority controls the frequency with which the device is able to forward BMP messages to BMP stations.  |
| <b>Options</b>  | <b>high</b> —Specifies that the routing protocol process handle BMP requests with high urgency.<br><br><b>medium</b> —Specifies that the routing protocol process handle BMP requests with medium urgency.<br><br><b>low</b> —Specifies that the routing protocol process handle BMP requests with low urgency.<br><b>Default:</b> The default dispatch priority is <b>low</b> to minimize interference with other routing protocol process priorities and to match the behavior of previous versions of BMP. |
| <div> <b>NOTE:</b> Setting high or medium priority may reduce the performance of the routing protocol process in its handling route convergence or other work.</div> |   |
| <b>Required Privilege Level</b>   | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.   |
| <b>Related Documentation</b>  | <ul style="list-style-type: none"><li>• <a href="#">Configuring BGP Monitoring Protocol Version 3 on page 3307</a></li></ul>  |

## remove-private

|  |  |
|--|--|
| <b>Syntax</b>  | remove-private all replace nearest;  |
| <b>Hierarchy Level</b>   | <p>[edit logical-systems <i>logical-system-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>group</b> <i>group-name</i> neighbor <i>address</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit protocols bgp],</p> <p>[edit protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> <b>neighbor</b> <i>address</i>]</p> |
| <b>Release Information</b>   | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>  |
| <b>Description</b>   | <p>When advertising AS paths to remote systems, have the local system strip private AS numbers from the AS path. The numbers are stripped from the AS path starting at the left end of the AS path (the end where AS paths have been most recently added). The routing device stops searching for private ASs when it finds the first nonprivate AS or a peer's private AS. If the AS path contains the AS number of the external BGP (EBGP) neighbor, BGP does not remove the private AS number.</p>  |
| <div>  <p><b>NOTE:</b> As of Junos OS 10.0R2 and higher, if there is a need to send prefixes to an EBGP peer that has an AS number that matches an AS number in the AS path, consider using the <code>as-override</code> statement instead of the <code>remove-private</code> statement.</p> </div>                 |  |
| <p>The operation takes place after any confederation member ASs have already been removed from the AS path, if applicable.</p> <p>The Junos OS recognizes the set of AS numbers that is considered private, a range that is defined in the Internet Assigned Numbers Authority (IANA) assigned numbers document.</p> <p>The set of reserved AS numbers is in the range from 64,512 through 65,535.</p> |  |
| <b>Options</b>   | <p><b>all</b>—Remove all private AS numbers from the original path. Do not stop the process of removing private AS numbers, even if a public AS number is encountered.</p>   |

**nearest**—When you use the **all** and **replace** options, choose the last (right-most) public AS number encountered in the original AS path for the replacement value, as the AS path is processed from left to right. If no public AS number is encountered, the default replacement value is used. (See the **replace** option for information about the default replacement value.)

**replace**—When you use the **all** option, instead of removing private AS numbers, perform a replace operation. The default replacement value for the private AS number is the local AS number at the BGP group level for the BGP peer. If you are unsure about the replacement value, check the local AS value displayed in the output of the **show bgp group group-name** command.

## route-monitoring

---

|                          |  |
|--------------------------|--|
| Syntax                   | <pre>route-monitoring {<br/>    none;<br/>    post-policy {<br/>        exclude-non-eligible;<br/>    }<br/>    pre-policy {<br/>        exclude-non-feasible;<br/>    }<br/>}</pre>   |
| Hierarchy Level          | <p>[edit logical-systems <i>logical-system-name</i> protocols bgp <b>bmp</b>],<br/>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> bmp],<br/>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bmp],<br/>[edit logical-systems <i>logical-system-name</i> routing-options <b>bmp</b>],<br/>[edit logical-systems <i>logical-system-name</i> routing-options bmp <b>station</b> <i>station-name</i>],<br/>[edit protocols bgp <b>bmp</b>],<br/>[edit protocols bgp group <i>group-name</i> bmp],<br/>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i> bmp],<br/>[edit routing-options <b>bmp</b>],<br/>[edit routing-options bmp <b>station</b> <i>station-name</i>]</p> |
| Release Information      | <p>Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.3.</p>  |
| Description              | <p>Specify whether BMP should send pre-policy route monitoring messages, post-policy route monitoring messages, both types of messages, or none at all. The pre-policy can be configured to exclude routes that are non-feasible for the decision process (for example, a route loop). The post-policy can be configured to exclude routes that are not eligible for the decision process (for example, protocol nexthop not resolved).</p> <p>You can also selectively enable or disable BMP route monitoring at various hierarchy levels (for example, [edit protocols bgp group <i>group-name</i>] or [edit protocols bgp group <i>group-name</i> neighbor <i>address</i>]).</p>  |
| Options                  | <p><b>none</b>—Explicitly disables BMP route monitoring.</p> <p><b>Default:</b> If you configure the <b>route-monitoring</b> statement at the [edit routing-options <b>bmp</b>] hierarchy level, the default option is <b>pre-policy</b>. If you configure the <b>route-monitoring</b> statement at any of the [edit protocols bgp] hierarchy levels, the default option is to inherit the configuration from the <b>route-monitoring</b> statement configured at the [edit routing-options <b>bmp</b>] hierarchy level.</p> <p>The other statements are explained separately.</p>   |
| Required Privilege Level | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |
| Related Documentation    | <ul style="list-style-type: none"><li>• <a href="#">Configuring BGP Monitoring Protocol Version 3 on page 3307</a></li></ul>   |

## session-mode

|                                 |  |
|---------------------------------|--|
| <b>Syntax</b>                   | <code>session-mode (automatic   multihop   single-hop);</code>   |
| <b>Hierarchy Level</b>          | <p>[edit logical-systems <i>logical-system-name</i> protocols bgp bfd-liveness-detection],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection],</p> <p>[edit protocols bgp group <i>group-name</i> bfd-liveness-detection],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp bfd-liveness-detection],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> bfd-liveness-detection],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> bfd-liveness-detection]</p> |
| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 11.1.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>   |
| <b>Description</b>              | <p>Configure BFD session mode to be single-hop or multihop. By default, BGP uses single-hop BFD sessions if the peer is directly connected to the router's interface. BGP uses multihop BFD sessions if the peer is not directly connected to the router's interface. If the peer session's <b>local-address</b> option is configured, the directly connected check is based partly on the source address that would be used for BGP and BFD.</p> <p>For backward compatibility, you can override the default behavior by configuring the <b>single-hop</b> or <b>multihop</b> option. Before Junos OS Release 11.1, the behavior was to assume that IBGP peer sessions were multihop.</p>   |
| <b>Options</b>                  | <p><b>automatic</b>—Configure BGP to use single-hop BFD sessions if the peer is directly connected to the router's interface, and multihop BFD sessions if the peer is not directly connected to the router's interface</p> <p><b>multihop</b>—Configure BGP to use multihop BFD sessions.</p> <p><b>single-hop</b>—Configure BGP to use single-hop BFD sessions.</p> <p><b>Default:</b> automatic</p>   |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>   |

## traceoptions (Protocols BGP)

|  |   |
|--|---|
| <b>Syntax</b>  | <pre> traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;flag-modifier&gt; &lt;disable&gt;; } </pre>   |
| <b>Hierarchy Level</b>   | <pre> [edit logical-systems <i>logical-system-name</i> protocols bgp], [edit logical-systems <i>logical-system-name</i> protocols bgp <i>group</i> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> protocols bgp <i>group</i> <i>group-name</i> neighbor <i>address</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp <i>group</i> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   bgp <i>group</i> <i>group-name</i> neighbor <i>address</i>], [edit protocols bgp], [edit protocols bgp <i>group</i> <i>group-name</i>], [edit protocols bgp <i>group</i> <i>group-name</i> neighbor <i>address</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp], [edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group</i> <i>group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols bgp <i>group</i> <i>group-name</i> neighbor   <i>address</i>] </pre> |
| <b>Release Information</b>   | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p><b>4byte-as</b> statement introduced in Junos OS Release 9.2.</p> <p><b>4byte-as</b> statement introduced in Junos OS Release 9.2 for EX Series switches.</p>  |
| <b>Description</b>   | Configure BGP protocol-level tracing options. To specify more than one tracing operation, include multiple flag statements.   |
| <div>  <b>NOTE:</b> The <b>traceoptions</b> statement is not supported on QFabric systems. </div> |   |
| <b>Default</b>   | The default BGP protocol-level tracing options are inherited from the routing protocols <b>traceoptions</b> statement included at the <b>[edit routing-options]</b> hierarchy level. The default group-level trace options are inherited from the BGP protocol-level <b>traceoptions</b> statement. The default peer-level trace options are inherited from the group-level <b>traceoptions</b> statement.  |
| <b>Options</b>   | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>name</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place BGP tracing output in the file <b>bgp-log</b>.</p>   |

**files *number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file.0*** reaches its maximum size, it is renamed ***trace-file.0***, then ***trace-file.1***, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 10 files

**flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

#### BGP Tracing Flags

- **4byte-as**—4-byte AS events.
- **bfd**—BFD protocol events.
- **damping**—Damping operations.
- **graceful-restart**—Graceful restart events.
- **keepalive**—BGP keepalive messages. If you enable the the BGP **update** flag only, received keepalive messages do not generate a trace message.
- **nsr-synchronization**—Nonstop routing synchronization events.
- **open**—Open packets. These packets are sent between peers when they are establishing a connection.
- **packets**—All BGP protocol packets.
- **refresh**—BGP refresh packets.
- **update**—Update packets. These packets provide routing updates to BGP systems. If you enable only this flag, received keepalive messages do not generate a trace message. Use the **keepalive** flag to generate a trace message for keepalive messages.

#### Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **filter**—Provide filter trace information. Applies only to **route**, **damping**, and **update** tracing flags.
- **receive**—Trace the packets being received.
- **send**—Trace the packets being transmitted.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.
